Table 12-85 Properties

Properties	Read	Write	Description
ActualPointIndex (Page 5230)	P	P	Specifies the number of the current corner point of the selected object.
ActualPointLeft (Page 5230)	P	P	Specifies the X coordinate of the current corner point with reference to the screen origin.
ActualPointTop (Page 5231)	P	P	Specifies the Y coordinate of the current corner point with reference to the screen origin.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P, A	P, A	Defines the fill pattern of the specified object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 5280)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
EdgeStyle (Page 5320)	A	A	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Properties	Read	Write	Description
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
Points	-	-	Specifies the corner points.
PointsCount (Page 5454)	P	-	Specifies the number of corner points of the polyline or of the polygon.
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
RotationAngle (Page 5463)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 5463)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 5464)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-86 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Properties	Read	Write	Description
ActualPointIndex (Page 5230)	P	P	Specifies the number of the current corner point of the selected object.
ActualPointLeft (Page 5230)	P	P	Specifies the X coordinate of the current corner point with reference to the screen origin.
ActualPointTop (Page 5231)	P	P	Specifies the Y coordinate of the current corner point with reference to the screen origin.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.

Properties	Read	Write	Description
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BorderEndStyle (Page 5270)	P; A	P	Specifies the type of line ends for the selected object.
BorderStyle (Page 5278)	P, A	P	Specifies the type of border lines for the selected object.
Color (Page 5296)	P, A	P, A	Specifies the line color of the selected object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
EndStyle (Page 5326)	A	A	Specifies how the line end of the selected object is displayed.
FillStyle	A	A	Defines the fill pattern of the specified object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
LineWidth (Page 5400)	P, A	P, A	Specifies the line thickness of the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
Points	-	-	Specifies the corner points.
PointsCount (Page 5454)	P	-	Specifies the number of corner points of the polyline or of the polygon.
RotationAngle (Page 5463)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 5463)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 5464)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
StartStyle	A	A	Specifies how the line start of the selected object is displayed.
Style (Page 5523)	A	A	Specifies the line style of the selected object.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-88 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.

Table 12-89 Properties

Properties	Read	Write	Description
BackColor	-	-	Specifies the background color of the selected object.
BackFillStyle	-	-	Defines the fill pattern of the specified object.
BorderBackColor (Page 5266)	-	-	Specifies the background color of the broken border line for the selected object.
BorderColor	-	-	Specifies the line color of the object.
BorderWidth	-	-	Specifies the line thickness of the object.
EdgeStyle (Page 5320)		-	Specifies the line style of the selected object.
FillPatternColor (Page 5336)	-	-	Specifies the color of the fill pattern for the selected object.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	-	-	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	-	-	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	-	-	Specifies the font of the selected object.
FontSize (Page 5351)	-	-	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	-	-	Specifies whether the text of the selected object is underlined.
ForeColor	-	-	Specifies the font color of the text for the selected object.
Format	-	-	Specifies that the format of the text block is displayed.
Height (Page 5358)	-	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment	-	-	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	-	-	Specifies the value of the X coordinate of the object.
LineWrap	-	-	Specifies the line break within the object.
Name (Page 5426)	-	-	Returns the object name as STRING.
Top (Page 5582)	-	-	Specifies the value of the Y coordinate of the object.
VerticalAlignment	-	-	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645)	-	-	Specifies whether the selected object is visible.
Width (Page 5655)	-	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

None of the properties are visible in the ES.

Table 12-97 Properties

Properties	Read	Write	Description
AllowEdit	-	-	Enables editing.
Authorization (Page 5245)	-	-	Specifies the operating rights of the selected object in runtime.
BackButtonVisible	-	-	Enables display of the "Back" button.
BackColor	A	A	Specifies the background color of the selected object.
ComboBoxFont	-	-	Sets the font type for selection list.
DataRecordNameCaption	-	-	Sets the caption for the name of the data record.
DataRecordNrCaption	-	-	Sets the caption for the number of the data record.
Display3D	-	-	Sets the 3D view.
DisplayButton2Plc	-	-	Enables the display of the "Write to PLC" button.
DisplayButtonComparison	-	-	Enables the display of the "Synchronization" button.
DisplayButtonDelete	-	-	Enables the display of the "Delete data record" button.
DisplayButtonFromPlc	-	-	Enables the display of the "Read from PLC" button.
DisplayButtonHelp	-	-	Enables the display of the "Tooltip" button.
DisplayButtonNew	-	-	Enables the display of the "Add data record" button.
DisplayButtonSave	-	-	Enables the display of the "Save" button.
DisplayButtonSaveAs	-	-	Enables the display of the "Save As" button.
DisplayComboBox	-	-	Enables the display of the selection list.
DisplayGridlines	-	-	Enables the display of grid lines.
DisplayLabeling	-	-	Enables the display labelings.
DisplayNumbers	-	-	Enables the display of numbers.
DisplaySize *	-	-	
DisplayStatusBar	-	-	Specifies that the status bar is displayed.
DisplayTable	-	-	Enablers the display of the table.
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
EntryNameCaption	-	-	Sets the caption for the name of the recipe element.
EntryValueColFirst	-	-	Sets the "Entry value" column to first place.
EntryValueFieldLength	-	-	Sets the field length for the element value.
EntryValuePos	-	-	Sets the position of the first value.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
FixedRecipeNumber *	-	-	
Flashing	-	-	Specifies that the text block flashes.
FocusColor	A	A	Specifies the color for the focus frame of the selected object when it is in focus.

Properties	Read	Write	Description
FocusWidth	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 5348)	-	-	Specifies or returns the font.
ForeColor	A	A	Specifies the font color of the text for the selected object.
HeaderFont	-	-	Sets the header font.
Height (Page 5358)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
KeyboardOnline	-	-	Enables the use of key combinations.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
ListAreaHeight	-	-	
ListAreaWidth	-	-	
MenuButtonVisible	-	-	Enables visibility of the menu buttons.
Name (Page 5426)	A	-	Returns the object name as STRING.
NameColumnWidth	-	-	
NumberOfLines	-	-	Sets the number of rows of the selection list for the text list object, or returns the value.
Recipe	-	-	Sets the recipe.
RecipeNameCaption	-	-	Sets the caption for the name of the recipe.
RecipeNameSelected *	-	-	
RecipeNrCaption	-	-	Specifies that the "Recipe number" column is in first place.
RecipeNrColFirst	-	-	Specifies that the "Recipe number" column is in first place.
RecipeVarSelected *	-	-	
Record *	-	-	
RecordNameSelected *	-	-	
RecordNrColFirst	-	-	Specifies that the "Data record number" column is in first place.
RecordVarSelected *	-	-	
RenameButtonVisible	-	-	Enables the display of the "Rename" button.
SelectionBackColor (Page 5484)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 5485)	A	A	Specifies the foreground color of the selected cells.
StatusFont	-	-	
TableBackColor (Page 5525)	A	A	Specifies the background color of the table cells for the selected object.
TableForeColor	A	A	
TableGridlineColor (Page 5528)	A	A	Specifies the color for the grid lines.
TableHeaderBackColor (Page 5529)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderForeColor (Page 5530)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
ValueCaption	-	-	Sets the labeling for values.
ValueColumnWidth	-	-	
VerticalScrolling	-	-	Sets the display of a scroll bar for the selected object.
ViewType	-	-	Specifies the alarm view type.

Properties	Read	Write	Description
ViewTypeForSaveStream *	-	-	Specifies the display type for the Save Stream.
Visible (Page 5645)	A	A	Specifies whether the selected object is visible.
VisibleItems	-	-	Sets the maximum number of visible entries.
Width (Page 5655)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderBrightColor3D (Page 5268)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderShadeColor3D (Page 5277)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 5281)	P	P	Specifies the width of the border for 3D display of the selected object.
CornerStyle (Page 5306) *	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	P	P	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.

Properties	Read	Write	Description
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 5353)	P	P	Specifies the font color of the text for the selected object.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 5372)	P	P	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399) *	-	-	Specifies the shape of the line ends.
Mode (Page 5424)	P	P	Specifies the field type of the selected object.
Name (Page 5426)	P	-	Returns the object name as STRING.
PictureAlignment (Page 5451)	P	P	Specifies or returns the display type of the background image in the process picture.
PictureDeactivated (Page 5452)	P	P	Specifies the picture that is displayed in the "Disabled" state.
PictureOff (Page 5452)	P	P	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 5453)	P	P	Specifies the screen to be displayed in the "On" state.
Pressed (Page 5455)	P	P	Specifies whether the selected object is displayed in a pressed state.
Radius	P	P	Sets the radius of the specified "Circle" object.
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 5524)	P	P	Specifies the display style for the object:
Text (Page 5533)	P	P	Specifies the label for the text field.
TextOrientation (Page 5536)	P	P	Specifies the text orientation of the selected object.
Toggle (Page 5562)	P	P	Specifies whether the selected object engages after it has been operated in runtime.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.

Properties	Read	Write	Description
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColorDeactivatedPicture (Page 5587)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOff (Page 5588)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOn (Page 5589)	P	P	Specifies the color to be set to "transparent" for the "On" state of the assigned bitmap object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColorDeactivated-Picture (Page 5632)	P	P	Enables the use of the transparency color specified with the "TransparentColorDeactivatedPicture" property for the "Disabled" state.
UseTransparentColorPictureOff (Page 5633)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOff" property is used for the "Off" state.
UseTransparentColorPictureOn (Page 5633)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOn" property is used for the "On" state.
VerticalAlignment (Page 5643)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-102 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-103 Properties

Properties	Read	Write	Description
AdaptScreenToWindow (Page 5232)	-	-	Specifies whether or not the screen visualized in a screen window is adapted to fit the size of the screen window in runtime.
AdaptWindowToScreen (Page 5233)	-	-	Specifies whether or not the screen window is adapted to fit the screen it visualizes in runtime.
BorderEnabled (Page 5270)	-	-	TRUE, if the window is visualized with a border in runtime.

Properties	Read	Write	Description
CaptionText (Page 5288)	P	P	Specifies the text that is displayed in the header of the selected object.
Flashing *	-	-	Specifies that the text block flashes.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalScrollbarPosition (Page 5373)	P	P	Sets horizontal positioning of the scroll bar in a screen window with slider, or returns its value.
IndependentWindow	-	-	Specifies whether the screen window is embedded in a screen or displayed as independent screen window.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LeftOffset (Page 5389)	P	P	Sets horizontal shift of the display of a graphic object that is larger than the screen window.
MenuToolBarConfig (Page 5406)	-	-	Loads the specified configuration file with configured menu and toolbars, or returns the name of the configuration file.
MonitorNumber	-	-	Sets the monitor number.
Name (Page 5426)	P	-	Returns the object name as STRING.
ScreenName (Page 5475)	P	P	Specifies the screen to be displayed in the screen window, or returns the screen name.
ShowCaption (Page 5494)	-	-	Hides or shows the caption.
ShowScrollBars (Page 5500)	-	-	Enables the display of scroll bars.
TagPrefix (Page 5530)	P	P	Sets the prefix for all tags that exist in the screen.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
TopOffset (Page 5584)	P	P	Sets or returns the offset of the screen from the top edge of the screen window.
VerticalScrollbarPosition (Page 5644)	P	P	Specifies the vertical positioning of the scroll bar in a screen window with slider, or returns its value.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowCloseEnabled (Page 5657)	-	-	Enables closing of the window in runtime.
WindowMaximizeEnabled (Page 5657)	-	-	TRUE, if the window can be maximized in runtime.
WindowMovingEnabled (Page 5658)	-	-	TRUE, if the window can be moved in runtime.
WindowOnTop (Page 5658)	-	-	TRUE, if the object is always in the foreground in runtime.
WindowSizingEnabled (Page 5659)	-	-	Enables resizing of the specified object in runtime.
WindowStartupPosition	-	-	??
ZoomFactor (Page 5679)	P	P	Sets or reads the zoom factor of a screen or screen window.

* not visible in the ES

Table 12-104 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-107 Properties

Properties	Read	Write	Description
Authorization (Page 5245)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackPicture	-	-	Specifies a graphic for the background.
BarBackColor (Page 5259)	P, A	P, A	Specifies the color of the bar background for the selected object.
BarColor (Page 5262)	P, A	P, A	Sets the color of the slider in the "Slider" object.
BorderBrightColor3D (Page 5268)	P, A	P, A	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderInnerStyle3D (Page 5275)	P	P	Specifies the representation of the inner part of the object border.
BorderInnerWidth3D (Page 5276)	P, A	P, A	Specifies the width of the inner border for 3D presentation of the selected object.
BorderOuterStyle3D (Page 5276)	P	P	Specifies the representation of the outer part of the object border.
BorderOuterWidth3D (Page 5277)	P, A	P, A	Sets the width of the outer border for 3D presentation of the selected object.
BorderShadeColor3D (Page 5277)	P, A	P, A	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderWidth (Page 5280)	P, A	P, A	Specifies the line thickness of the object.
Caption (Page 5287)	P, A	P, A	Specifies the text that is displayed in the header of the selected object.
ContinousChange (Page 5305)	P	P	Specifies whether to transfer the value of the "ProcessValue" when the mouse button is released, or immediately on a change of the slider position in runtime.
Enabled (Page 5323)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 5346)	P, A	P, A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 5347)	P, A	P, A	Specifies the border width of the specified object when the object is in focus.
Font	-	-	Specifies or returns the font.
ForeColor (Page 5353)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
LabelColor (Page 5380)	P, A	P, A	Sets the color of the scale labeling in the "Slider" object.
Layer (Page 5384)	-	-	Specifies the value of the X coordinate of the object.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
MaximumValue (Page 5406)	P, A	P, A	Specifies the maximum value of the scale in the selected object.

Properties	Read	Write	Description
MinimumValue (Page 5422)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
PositionFont	-	-	Sets the font type for the labeling.
ProcessValue (Page 5456)	P, A	P, A	Specifies the default for the value to be displayed.
ShowBar (Page 5493)	P, A	P, A	Specifies whether to display the process value along with a filled bar in the "Slider" object.
ShowPosition (Page 5497)	P, A	P, A	Adds a numerical display of the value of the slider position.
ShowThumb (Page 5503)	P, A	P, A	Displays the slider of the "Slider" object.
ShowTickLabels (Page 5503)	P, A	P, A	Specifies whether the label is shown in the scale.
ShowTicks (Page 5504)	P, A	P, A	Specifies whether the tick marks are displayed in the scale of the object.
ThumbBackColor (Page 5536)	P, A	P, A	Specifies the background color of the slider in the "Slider" object.
ThumbPicture	-	-	Specifies a graphic object for the slider.
TickStyle (Page 5538)	P	P	Specifies the scale display.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-108 Methods

Methods	Validity	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-109 Properties

Properties	Read	Write	Description
AllowMenu (Page 5241)	-	-	Specifies whether the shortcut menu is enabled to control the Sm@rtClient view.
ConnectionType (Page 5304)	-	-	Specifies the type of connector. You can select one of two connection types.
ConnectOnStart	-	-	Sets up the connection at startup.
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 5348)	-	-	Specifies or returns the font.
Height (Page 5358)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
LocalCursor (Page 5402)	-	-	Specifies whether the cursor data is transferred separately in order to increase the performance.
MachineName (Page 5405)	A	A	Sets the network ID of the device that is to be monitored.
Name (Page 5426)	A	-	Returns the object name as STRING.
Password (Page 5450)	A	A	Sets the password for remote monitoring.
ScaleDenominator (Page 5473)	-	-	Sets the scaling numerator on the client.
ScaleNumerator (Page 5470)	-	-	Sets the scaling numerator on the client.
Scaling (Page 5474)	-	-	TRUE, if an additional scale is used to visualize the values.
ServerScale (Page 5491)	-	-	Specifies whether the Sm@rtClient view can be zoomed in or out.
Shared (Page 5492)	-	-	Specifies that an HMI device is shared by several Sm@rtClient Views.
ShowControls	-	-	Specifies that a toolbar is displayed.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
UseCursorKeyScroll	-	-	Sets the use of the background color of the object for printing.
ViewOnly (Page 5645)	A	A	Enables the use of the Sm@rtClient view for remote monitoring or remote maintenance.
Visible (Page 5645) *	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-111 Properties

Properties	Read	Write	Description
Appearance	-	-	Specifies the layout for this NC subroutine.
BackColor	A	A	Specifies the background color of the selected object.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 5309) *	-	-	Specifies the number of lines contained in the selection list.
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth	A	A	Specifies the border width of the specified object when the object is in focus.
Height (Page 5358)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 5426)	A	-	Returns the object name as STRING.
PLCFilter	-	-	Sets the controller type.
SelectionBackColor (Page 5484)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 5485)	A	A	Specifies the foreground color of the selected cells.
SetOfVisibleColumns	-	-	Sets the visible columns.
ShowReadButton	-	-	Enables the display of the "Read" button.
ShowTableGridlines (Page 5502)	A	A	Enables the display of gridlines in the table of the specified object.
ShowWriteButton	-	-	Enables the display of the "Write" button.
TableBackColor (Page 5525)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor	A	A	??
TableHeaderBackColor (Page 5529)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 5530)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
Visible (Page 5645) *	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-113 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 5224)	-	-	Sets the color of the specified object for the "High limit violated" event.
Authorization (Page 5245)	-	-	Specifies the operating rights of the selected object in runtime.
AutoSizing	-	-	Specifies that the size of the object should be automatically adapted to the content.
BackColor (Page 5251)	A	A	Specifies the background color of the selected object.
BackFlashingColorOff (Page 5256) *	-	-	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257) *	-	-	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258) *	-	-	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258) *	-	-	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 5263)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BorderColor (Page 5268) *	-	-	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272) *	-	-	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274) *	-	-	Specifies the flash rate of the border line for the selected object.
BorderStyle3D	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280) *	-	-	Specifies the line thickness of the object.

Properties	Read	Write	Description
BorderWidth3D (Page 5281) *	-	-	Specifies the width of the border for 3D display of the selected object.
CaptionColor (Page 5288)	A	A	Specifies the color of the text that is displayed in the header of the selected object.
CaptionFont	-	-	Specifies the character set for the caption.
CaptionText (Page 5288)	A	A	Specifies the text that is displayed in the header of the selected object.
CornerStyle (Page 5306) *	-	-	Specifies the type of border lines for the selected object.
EdgeStyle *	-	-	Specifies the line style of the selected object.
Enabled (Page 5323)	A	A	Specifies whether the selected object can be operated in runtime.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342) *	-	-	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 5344) *	-	-	Specifies the flash rate of the border line for the selected object.
FocusColor (Page 5346)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 5347)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 5348)	-	-	Specifies or returns the font.
ForeColor (Page 5353)	A	A	Specifies the font color of the text for the selected object.
Height (Page 5358)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 5372)	A	A	Specifies the horizontal alignment of the text within the selected object.
InnerBackColorOff (Page 5376)	A	A	Sets the color underneath the slider of the "Switch" object for the object in OFF state.
InnerBackColorOn (Page 5377)	A	A	Sets the color underneath the slider of the "Switch" object for the object in ON state.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399) *	-	-	Specifies the shape of the line end.
Mode (Page 5424)	-	-	Specifies the field type of the selected object.
Name (Page 5426)	A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
PictureOff (Page 5452)	-	-	Specifies the screen to be displayed in the "Off" state.

Properties	Read	Write	Description
PictureOn (Page 5453)	-	-	Specifies the screen to be displayed in the "On" state.
ProcessValue	-	-	Specifies the default for the value to be displayed.
SwitchOrientation	-	-	Specifies the line color of the object.
TextOff (Page 5534)	A	A	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn	A	A	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 5536) *	-	-	Specifies the text orientation of the selected object.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
VerticalAlignment (Page 5643)	A	A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645) *	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

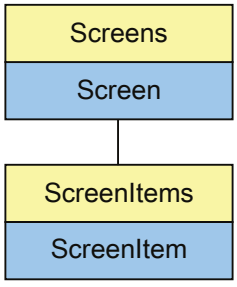
SymbolicIOField

Description



Represents the "SymbolicIOField" object. The SymbolicIOField object is an element of the ScreenItems list.

The availability of the following object properties depends on the selected mode:

Property	"Input"	"Output"	"Input/Output"	"Two states"
BackColor	x	x	x	x
BorderColor	--	x	--	x
BorderWidth	--	--	--	x
BorderStyle3D	--	x	--	--
Enabled	x	--	x	--
HelpText	x	--	x	--
VerticalAlignment	--	x	--	x
HorizontalAlignment	--	x	--	x

Table 12-115 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 5224)	-	-	Sets the color of the specified object for the "High limit violated" event.
AcceptOnExit (Page 5225)	P	P	Specifies whether the input field is confirmed automatically when it is left.
AdaptBorder (Page 5232)	-	-	Specifies whether the border of the specified object is dynamically adapted to the text size.
AskOperationMotive (Page 5244)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 5263)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BitNumber (Page 5264)	P	P	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280)	P, A	P, A	Specifies the line thickness of the object.

Properties	Read	Write	Description
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
CaptionBackColor (Page 5287)	P	P	Specifies the background color of the caption for the selected object.
CaptionColor (Page 5288)	P	P	Specifies the color of the text that is displayed in the header of the selected object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
CountVisibleItems (Page 5309)	P	P	Specifies the number of lines contained in the selection list.
CursorControl (Page 5310)	P	P	Specifies whether the mouse cursor jumps to the next field of the TAB sequence after leaving a field.
DrawInsideFrame (Page 5319)	-	-	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	P	P	Specifies the line style of the selected object.
EditOnFocus (Page 5322)	P	P	Specifies whether data input is immediately possible if the input field is selected using the "Tab" key.
Enabled (Page 5323)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FieldLength	-	-	Specifies that the "field length string" field is read-only.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
FocusColor (Page 5346)	-	-	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 5347)	-	-	Specifies the border width of the specified object when the object is in focus.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 5353)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Properties	Read	Write	Description
HelpText	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 5372)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
InputValue (Page 5377)	-	-	Defines the value entered by the user in the IO field.
ItemBorderStyle (Page 5379)	P	P	Sets the separation line style in the selection list of the specified object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	-	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
LogOperation (Page 5403)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Mode (Page 5424)	P	P	Specifies the field type of the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
ProcessValue (Page 5456)	P	P	Specifies the default for the value to be displayed.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
SelectBackColor (Page 5478)	P	P	Specifies the background color of the selected cells.
SelectForeColor (Page 5483)	P	P	Specifies the foreground color of the selected cells.
SeparatorBackColor (Page 5488)	P	P	Specifies the background color of the broken separation lines in the selection list of the specified object.
SeparatorColor (Page 5489)	P	P	Sets the color of the separation lines in the selection list of the specified object.
SeparatorCornerStyle (Page 5490)	P	P	Sets the shape of corners for the object of the type "ScreenItem" with "SymbolicIOField" format.
SeparatorLineEndShapeStyle (Page 5491)	P	P	Sets the shape of line ends for the object of the type "ScreenItem" with "SymbolicIOField" format.
SeparatorStyle (Page 5490)	P	P	Sets the separation line style in the selection list of the specified object.
SeparatorWidth (Page 5490)	P	P	Sets the width separation lines in the selection list of the specified object.
ShowBadTagState (Page 5493)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowDropDownButton	-	-	Sets the display of a button for the selection list.
ShowDropDownList	-	-	Specifies selection of the entry from a selection list.
TextList (Page 5534)	-	-	Specifies the label for the text field.
TextOff (Page 5534)	-	-	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn	-	-	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 5536)	P	P	Specifies the text orientation of the selected object.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.

Properties	Read	Write	Description
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 5643)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-116 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-117 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 5224)	-	-	Sets the color of the specified object for the "High limit violated" event.
Authorization (Page 5245)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.

Properties	Read	Write	Description
BelowLowerLimitColor (Page 5263)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BlinkColor (Page 5264)	P, A	P, A	Sets the flashing color for the "SymbolLibrary" object.
BlinkMode (Page 5265)	P	P	Sets the type of flashing graphic for the specified object.
BlinkSpeed (Page 5265)	P	P	Sets the flash rate.
ChangeMouseCursor (Page 5293)	P	P	Specifies the appearance of the cursor after its transformation in mouse over icon mode in runtime.
Enabled (Page 5323)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FillColorMode (Page 5336)	P	P	Sets the type of foreground for the specified object.
FixedAspectRatio (Page 5340)	P	P	Specifies whether the aspect ratio should be retained on changes of the icon size, or follow the change dynamically.
Flashing	-	-	Specifies that the text block flashes.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
Flip (Page 5346)	P	P	Flips the symbol on the vertical and / or horizontal center axis of the icon.
ForeColor (Page 5353)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
ProcessValue	-	-	Specifies the default for the value to be displayed.
Rotation (Page 5462)	P	P	Specifies the angle of rotation in degrees of the selected object.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-118 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-119 Properties

Properties	Read	Write	Description
Authorization (Page 5245)	A	A	Specifies the operating rights of the selected object in runtime.
BackgroundColor	A	A	Specifies the background color.
ComponentInfoText	A	A	Specifies the tooltip of the system diagnostics view in runtime.

Properties	Read	Write	Description
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
Height (Page 5358)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
InfoArea_BackgroundColor	A	A	Specifies the background for grid control elements.
InfoArea_ColumnsMovable	A	A	Specifies the mobility of columns.
InfoArea_DefaultTextColor	A	A	Sets the text color.
InfoArea_ErrorTextBackgroundColor	A	A	Specifies the background color of a cell in error case.
InfoArea_ErrorTextColor	A	A	Sets the text color of a cell in error case.
InfoArea_FocusFrameColor	A	A	Sets the color of the focus frame.
InfoArea_FocusFrameWidth	A	A	Sets the line thickness of the focus rectangle.
InfoArea_Font	A	A	Sets the fonts of the grid views.
InfoArea_ShowGridLines	A	A	Sets the grid lines.
InfoArea_TableHeaderBackgroundCol-or	A	A	Specifies the background color of the table header.
InfoArea_TableHeaderTextColor	A	A	Sets the text color of the table header.
InputAddressText	A	A	Sets the input address.
ItemText_AKZ	A	A	Specifies the header for the "AKZ" column.
ItemText_Descriptor	A	A	Specifies the header for the "Descriptor" column.
ItemText_ErrorText	A	A	Specifies the header for the "ErrorText" column.
ItemText_InstallationDate	A	A	Specifies the header for the "InstallationDate" column.
ItemText_LADDR	A	A	Specifies the header for the "LADDR" column.
ItemText_Name	A	A	Sets the labeling of the "Name" column.
ItemText_OKZ	A	A	Specifies the header for the "OKZ" column.
ItemText_OperationState	A	A	Specifies the header for the "OperationState" column.
ItemText_OrderID	A	A	Specifies the header for the "OrderID" column.
ItemText_Rack	A	A	Specifies the header for the "Rack" column.
ItemText_Slot	A	A	Specifies the header for the "Slot" column.
ItemText_SoftwareRevision	A	A	Specifies the header for the "SoftwareRevision" column.
ItemText_State	A	A	Specifies the header for the "State" column.
ItemText_Station	A	A	Specifies the header for the "Station" column.
ItemText_SubAddress	A	A	Specifies the header for the "SubAddress" column.
ItemText_SubSlot	A	A	Specifies the header for the "SubSlot" column.
ItemText_SubSystem	A	A	Specifies the header for the "SubSystem" column.
ItemText_Type	A	A	Specifies the header for the "Type" column.
IV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
IV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
IV_ShowItem_ErrorText	A	A	Enables the display of the "ErrorText" column.
IV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
IV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
IV_ShowItem_Name	A	A	Enables the display of the "Name" column.
IV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
IV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.

Properties	Read	Write	Description
IV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
IV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
IV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
IV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
IV_ShowItem_State	A	A	Enables the display of the "State" column.
IV_ShowItem_Station	A	A	Enables the display of the "Station" column.
IV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
IV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
IV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
IV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Layer (Page 5384)	A	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
NavigationPath_Font	A	A	Sets the font type of the navigation path.
NavigationPath_TextColor	A	A	Sets the text color of the navigation path.
ObjectName (Page 5706)	A	-	Returns the object name as STRING.
OutputAddressText	A	A	Specifies the text for the output address.
ShowNavigationButtons	A	A	Enables the display of navigation buttons.
ShowPathInformation	A	A	Enables the display of the navigation path.
ShowSplittedView	A	A	Enables a split view.
TableHeaderFont	A	A	Specifies the text color of the header.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
Type (Page 5809)	A	-	Returns the type of the specified object as STRING.
Parent (Page 5791)	A	-	Returns the screen in which the specified object is embedded.
UV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
UV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
UV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
UV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
UV_ShowItem_Name	A	A	Enables the display of the "Name" column.
UV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
UV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
UV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
UV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
UV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
UV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
UV_ShowItem_State	A	A	Enables the display of the "State" column.
UV_ShowItem_Station	A	A	Enables the display of the "Station" column.
UV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
UV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
UV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
UV_ShowItem_Type	A	A	Enables the display of the "Type" column.

Properties	Read	Write	Description
Visible (Page 5645)	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	A	Enables the display of the "Slot" column.

Table 12-121 Properties

Properties	Read	Write	Description
Authorization (Page 5245)	A	A	Specifies the operating rights of the selected object in runtime.
BackgroundColor	A	A	Specifies the background color.
Caption (Page 5287)	A	A	Specifies the text that is displayed in the header of the selected object.
CaptionActive	A	A	Enables display of the caption.
Closable (Page 5295)	A	A	Specifies that the control can be closed in runtime.
ComponentInfoText	A	A	Specifies the tooltip of the system diagnostics view in runtime.
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
Height (Page 5358)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
InfoArea_BackgroundColor	A	A	Specifies the background for grid control elements.
InfoArea_ColumnsMovable	A	A	Specifies the mobility of columns.
InfoArea_DefaultTextColor	A	A	Sets the text color.
InfoArea_ErrorTextBackgroundColor	A	A	Specifies the background color of a cell in error case.
InfoArea_ErrorTextColor	A	A	Sets the text color of a cell in error case.
InfoArea_FocusFrameColor	A	A	Sets the color of the focus frame.
InfoArea_FocusFrameWidth	A	A	Sets the line thickness of the focus rectangle.
InfoArea_Font	A	A	Sets the fonts of the grid views.
InfoArea_ShowGridLines	A	A	Sets the grid lines.
InfoArea_TableHeaderBackgroundColor	A	A	Specifies the background color of the table header.
InfoArea_TableHeaderTextColor	A	A	Sets the text color of the table header.
InputAddressText	A	A	Sets the input address.
ItemText_AKZ	A	A	Specifies the header for the "AKZ" column.
ItemText_Descriptor	A	A	Specifies the header for the "Descriptor" column.
ItemText_ErrorText	A	A	Specifies the header for the "ErrorText" column.
ItemText_InstallationDate	A	A	Specifies the header for the "InstallationDate" column.
ItemText_LADDR	A	A	Specifies the header for the "LADDR" column.
ItemText_Name	A	A	Sets the labeling of the "Name" column.

Properties	Read	Write	Description
ItemText_OKZ	A	A	Specifies the header for the "OKZ" column.
ItemText_OperationState	A	A	Specifies the header for the "OperationState" column.
ItemText_OrderID	A	A	Specifies the header for the "OrderID" column.
ItemText_Rack	A	A	Specifies the header for the "Rack" column.
ItemText_Slot	A	A	Specifies the header for the "Slot" column.
ItemText_SoftwareRevision	A	A	Specifies the header for the "SoftwareRevision" column.
ItemText_State	A	A	Specifies the header for the "State" column.
ItemText_Station	A	A	Specifies the header for the "Station" column.
ItemText_SubAddress	A	A	Specifies the header for the "SubAddress" column.
ItemText_SubSlot	A	A	Specifies the header for the "SubSlot" column.
ItemText_SubSystem	A	A	Specifies the header for the "SubSystem" column.
ItemText_Type	A	A	Specifies the header for the "Type" column.
IV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
IV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
IV_ShowItem_ErrorText	A	A	Enables the display of the "ErrorText" column.
IV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
IV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
IV_ShowItem_Name	A	A	Enables the display of the "Name" column.
IV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
IV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
IV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
IV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
IV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
IV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
IV_ShowItem_State	A	A	Enables the display of the "State" column.
IV_ShowItem_Station	A	A	Enables the display of the "Station" column.
IV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
IV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
IV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
IV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Layer (Page 5384)	A	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
Modal	A	A	Specifies that you must acknowledge the alarm view before continuing with your work.
NavigationPath_Font	A	A	Sets the font type of the navigation path.
NavigationPath_TextColor	A	A	Sets the text color of the navigation path.
ObjectName (Page 5706)	A	-	Returns the object name as STRING.
OutputAddressText	A	A	Specifies the text for the output address.
Resizable	A	A	Enables resizing of the window.
ShowNavigationButtons	A	A	Enables the display of navigation buttons.
ShowPathInformation	A	A	Enables the display of the navigation path.
ShowSplittedView	A	A	Enables a split view.

Properties	Read	Write	Description
TableHeaderFont	A	A	Specifies the text color of the header.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
Type (Page 5809)	A	-	Returns the type of the specified object as STRING.
Parent (Page 5791)	A	-	Returns the screen in which the specified object is embedded.
UV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
UV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
UV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
UV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
UV_ShowItem_Name	A	A	Enables the display of the "Name" column.
UV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
UV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
UV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
UV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
UV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
UV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
UV_ShowItem_State	A	A	Enables the display of the "State" column.
UV_ShowItem_Station	A	A	Enables the display of the "Station" column.
UV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
UV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
UV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
UV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Visible (Page 5645)	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowMode	A	A	Sets the window mode.

Table 12-123 Properties

Properties	Read	Write	Description
AdaptBorder (Page 5232)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256)	P	P	Specifies the background color for flash state "Off".

Properties	Read	Write	Description
BackFlashingColorOn (Page 5257)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280)	P, A	P, A	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	A	A	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.

Properties	Read	Write	Description
ForeColor (Page 5353)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 5372)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	-	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
LineWrap *	-	-	Specifies the line break within the object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
RotationAngle (Page 5463)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 5463)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 5464)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
Text (Page 5533)	P, A	P, A	Specifies the label for the text field.
TextOrientation (Page 5536)	P	P	Specifies the text orientation of the selected object.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 5643)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-124 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

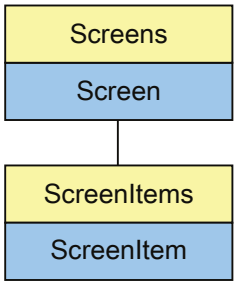
Screen object (list) (Page 5007)

TrendRulerControl

Description



Represents the "Value table" object. The TrendRulerControl object is an element of the ScreenItems list.

Type identifier in VBS

HMITrendRulerControl

Example

In the following example, the object with the name "Control1" is moved 16 pixels to the right:

```
'VBS60
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 16
```

Table 12-125 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode	-	-	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 5247)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 5247)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.
AutoPosition	P	P	Sets the automatic repositioning mode.
AutoSelectionColors (Page 5248)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 5249)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
AutoShow	P	P	Specifies the automatic display of the value table.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BlockAlign *	P	P	Sets the alignment.
BlockAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
BlockCaption *	P	P	Sets the caption.
BlockCount *	P	P	Sets the number of blocks.
BlockDateFormat *	P	P	Specifies the date format.
BlockExponentialFormat *	P	P	Enables the use of the exponential notation.
BlockHideText *	P	P	Specifies whether the text is displayed.
BlockHideTitleText *	P	P	Specifies whether the text is displayed.
BlockId *	P	P	Sets the ID.
BlockIndex	P	P	The index specifies the block to which other properties such as names are referenced.
BlockLength *	P	P	Specifies the number of displayed characters.
BlockName *	P	P	Sets the name of a block.
BlockPrecisions *	P	P	Specifies the number of displayed decimal places.

Properties	Read	Write	Description
Blocks	-	-	Sets the alarm blocks.
BlockShowDate *	P	P	Specifies that the date is to be displayed.
BlockShowIcon *	P	P	Specifies the tooltip text.
BlockShowTitleIcon *	P	P	Enables the display of title as icon.
BlockTimeFormat *	P	P	Specifies the time format.
BlockUseSourceFormat *	P	P	Enables the use of the source format.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
Caption (Page 5287)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 5289)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 5290)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 5290)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 5291)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 5291)	P	P	Specifies the top margin of the table cells.
Closeable (Page 5295)	P	P	Specifies that the control can be closed in runtime.
ColumnAdd *	P	P	Adds a column.
ColumnCount *	P	P	Displays the number of columns.
ColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ColumnName *	P	P	Specifies the name of a column.
ColumnRemove *	P	P	Removes a column.
ColumnRepos *	P	P	Repositions the column.
ColumnResize (Page 5299)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 5300)	P	P	Specifies the scroll bar type.
ColumnSort *	P	P	Sets the type of sorting.
ColumnSortIndex *	P	P	Specifies the sorting order.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 5303)	P	P	Specifies whether the column header is displayed.
ColumnVisible *	P	P	Enables the visibility of a column.
ControlDesignMode (Page 5507)	P	P	Specifies the design.
ExportDirectoryChangeable (Page 5328)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 5329)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 5330)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 5330)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 5331)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 5331)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 5332)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.

Properties	Read	Write	Description
ExportParameters (Page 5332)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 5333)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 5334)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 5348)	-	-	Specifies or returns the font.
GridLineColor (Page 5356)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 5357)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 5358)	P	-	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 5373)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 5375)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 5398)	P	P	Sets the color of the window separation lines.
LineWidth (Page 5400)	P	P	Specifies the line thickness of the selected object.
Moveable (Page 5425)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 5426)	P	-	Returns the object name as STRING.
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 5465)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 5466)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencePasswordLevel (Page 5716)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 5467)	-	-	Specifies how online configurations of WinCC are retained.
RulerType	P	P	Sets the ruler type.
SelectedCellColor (Page 5478)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 5479)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 5480)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 5481)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 5482)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 5482)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 5485)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 5486)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 5486)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".

Properties	Read	Write	Description
SelectionRectWidth (Page 5487)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 5488)	P	P	Specifies the number of lines you can mark.
ShareSpaceWithSourceControl	P	P	Enables the display of the value table in the visualization range of the data source.
ShowSortButton (Page 5500)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 5501)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 5501)	P	P	
ShowTitle (Page 5504)	P	P	Specifies the layout of the control window's header.
Sizeable (Page 5506)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 5508)	P	P	Specifies how the sorting order can be changed by mouse click.
SourceControl	P	P	Sets the data source.
SourceControlType	P	P	Sets the data source type.
StatusbarBackColor (Page 5511)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 5512) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 5512) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 5513) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 5514) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 5514) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 5515)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 5516) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 5516) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 5517) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 5517)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 5518) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 5518) *	P	P	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 5519) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 5519) *	P	P	Specifies the width of the selected status bar element in pixels.

Properties	Read	Write	Description
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 5520)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 5521)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 5521)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 5522)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 5523)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 5526)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 5526)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 5527)	P	P	
TableForeColor2 (Page 5528)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 5540)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut (Page 5557)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 5558)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 5559)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 5559)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 5560)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 5561)	P	P	Specifies how sorting by column header is triggered.
TitleStyle (Page 5561)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 5568)	P	P	Specifies or returns the position of the toolbar.
ToolbarBackColor (Page 5568)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 5569) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 5570) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 5570) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 5571) *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 5572) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 5572) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 5573) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 5573)	P	P	References a button function.
ToolbarButtonLocked (Page 5574) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 5575) *	P	P	Shows the name of the selected button function.
ToolbarButtonPasswordLevel (Page 5575) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 5576) *	P	P	Removes the selected button function from the list.

Properties	Read	Write	Description
ToolbarButtonRename (Page 5576) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 5577) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 5577) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 5578) *	P	P	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 5579)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 5579)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 5580)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 5580)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
UseSelectedTitleColor (Page 5630)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseSourceBackColors	P	P	Specifies the use of the background color of the data source.
UseSourceForeColors	P	P	Specifies the use of the foreground color of the data source.
UseTableColor2 (Page 5631)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 5644)	P	P	Specifies whether vertical separation lines are displayed.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	-	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-126 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
Export (Page 5838)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRow (Page 5850)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 5851)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetRulerBlock (Page 5853)	P	Returns the block object of the evaluation table designated by name or index as "ICCAxRulerBlock" type.

Methods	Valid	Description
GetRulerBlockCollection (Page 5854)	P	Returns the list of all block objects of the evaluation table as "ICCAxCollection" type.
GetRulerColumn (Page 5855)	P	Returns the column object of the evaluation table designated by name or index as "ICCAxRulerColumn" type.
GetRulerColumnCollection (Page 5856)	P	Returns the list of all column objects of the evaluation table as "ICCAxCollection" type.
GetSelectedRow (Page 5858)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5859)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatisticAreaColumn (Page 5861)	P	Returns the column object of the statistic area window of the evaluation table designated by name or index as "ICCAxRulerColumn" type.
GetStatisticAreaColumnCollection (Page 5862)	P	Returns the list of all column objects of the statistic area window of the evaluation table as "ICCAxCollection" type.
GetStatisticResultColumn (Page 5863)	P	Returns the column object of the statistic window of the evaluation table designated by name or index as "ICCAxRulerColumn" type.
GetStatisticResultColumnCollection (Page 5864)	P	Returns the list of all column objects of the statistic window of the evaluation table as "ICCAxCollection" type.
GetStatusbarElement (Page 5865)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5866)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 5873)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 5874)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
Print (Page 5903)	P, A	Executes the "Print" button function of the control.
SelectAll (Page 5918)	P	Selects all rows in a table-based control.
SelectRow (Page 5919)	P	Selects a specific row in a table-based control.
ShowHelp (Page 5923)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5927)	P, A	Executes the "Configuration dialog" button function of the control.
UnselectAll (Page 5936)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5936)	P	Removes the selections from a specific cell of a table-based control.

Table 12-127 Properties

Properties	Read	Write	Description
Authorization (Page 5245)	-	-	Specifies the operating rights of the selected object in runtime.
AxisXBunchCount	-	-	Sets the step width of the large ticks for the X axis.
AxisXMarkCount	-	-	Sets the step width of the ticks for the X axis.
AxisXNoOfDigits	-	-	
AxisXShowBunchValues	-	-	Enables scale labeling of the interim values for the X axis.

Properties	Read	Write	Description
AxisXStyle *	-	-	
AxisY1BunchCount	-	-	Sets the step width of the large ticks for the Y axis.
AxisY1MarkCount	-	-	Sets the step width of the large ticks for the left Y axis.
AxisY1ShowBunchValues	-	-	Enables scale labeling of the interim values for the left Y axis.
AxisY2BunchCount	-	-	Sets the step width of the large ticks for the right Y axis.
AxisY2MarkCount	-	-	Sets the step width of the ticks for the right Y axis.
AxisY2ShowBunchValues	-	-	Enables scale labeling of the interim values for the right Y axis.
BackColor	A	A	Specifies the background color of the selected object.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 5309)	-	-	Specifies the number of lines contained in the selection list.
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
EnableNavigateButtons	-	-	
EnableNavigateKeys	-	-	Specifies keyboard operation.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 5348)	-	-	Specifies or returns the font.
Height (Page 5358)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 5362)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
Look3D	-	-	Activates 3D visualization.
Name (Page 5426)	A	-	Returns the object name as STRING.
RulerColor (Page 5468)	A	A	Specifies the color of the scale gradation (auxiliary line) of the axis labelling in the "OnlineTrendControl" object.
ScaleColor (Page 5469)	A	A	Specifies the color of the scale of the selected object.
SelectionBackColor *	-	-	Specifies the background color of the selected cells.
SelectionForeColor *	-	-	Specifies the foreground color of the selected cells.
ShowRuler	A	A	Specifies whether a scale gradation (auxiliary line) is shown for the axis label of the "OnlineTrendControl" object.
ShowTableGridLines	-	--	Enables the display of grid lines in the table.
ShowTimeAxis	-	-	Enables the display of the X axis.
ShowTimeAxisLabeling	-	-	Enables the display of the X axis labeling.
ShowValueAxis1	-	-	Enables the display of the left Y axis.
ShowValueAxis1Label	-	-	Enables the display of the labeling for left Y axis.
ShowValueAxis2	-	-	Enables the display of the right Y axis.

Properties	Read	Write	Description
ShowValueAxis2Label	-	-	Sets the window title.
ShowValueTable	-	-	Enables the display of the table of values.
ShowY1HlpLine	-	-	Enables the display of the auxiliary line.
ShowY2HlpLine	-	-	Enables the display of the auxiliary line.
TableBackColor (Page 5525)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableGridLineColor (Page 5528)	A	A	Sets the color of the gridlines in the table of the specified object.
TableHeaderBackColor (Page 5529)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 5530)	A	A	Specifies the text color in the header of the table of the selected object.
TagForExternalTime	-	-	Sets the tag for the external time.
TimeAxisBegin	-	-	Sets the start value for the time axis.
TimeAxisBeginTime	-	-	Specifies the starting time for the display of the selected trend.
TimeAxisCountPoints	-	-	Sets the number of values for the time axis.
TimeAxisEnd	-	-	Sets the end value for the time axis.
TimeAxisMode	-	-	Sets the time axis mode.
TimeAxisRange (Page 5540)	-	-	Period displayed by the time axis.
TimeAxisSide	-	-	Sets the page for new values on the time axis.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarEnabled *	-	-	Enables the use of a toolbar in the trend view.
ToolbarStyle	-	-	Sets the appearance of the toolbar.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
TrendsForPrinting *	-	-	
ValueAxis1AutoRange *	-	-	Sets the automatic adaptation of the data area.
ValueAxis1Begin	-	-	Sets the start value for the axis.
ValueAxis1End	-	-	Sets the end value for the axis.
ValueAxis1LabelLength	-	-	Sets the length of axis labeling.
ValueAxis1Style *	-	-	
ValueAxis2AutoRange *	-	-	Sets the automatic adaptation of the data area.
ValueAxis2Begin	-	-	Sets the start value for the axis.
ValueAxis2End	-	-	Sets the end value for the axis.
ValueAxis2LabelLength	-	-	Sets the length of axis labeling.
ValueAxis2Style *	-	-	Sets the automatic adaptation of the data area.
ValueY1HlpLine	-	-	Sets the value for the auxiliary line.
ValueY2HlpLine	-	-	Value for the auxiliary line on the right Y axis.
Visible (Page 5645)	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-129 Properties

Properties	Read	Write	Description
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
Color (Page 5296)	P	P	Specifies the line color of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
EndAngle (Page 5325)	P	P	Specifies the angle at which the end point of the selected object deviates from the zero position (0°).
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineWidth (Page 5400)	P	P	Specifies the line thickness of the selected object.
Name (Page 5426)	P	-	Returns the object name as STRING.
RadiusHeight	P	P	Specifies the minor axis of the "Ellipsis" object.
RadiusWidth	P	P	Specifies the major axis of the "Ellipsis" object.
StartAngle (Page 5509)	P	P	Specifies the SQL statement.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-130 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-137 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode	-	-	Specifies that the project settings are used for the design.
ArchiveName *	P	P	Sets the log name.
ArchiveType	P	-	Sets the log type.
AutoCompleteColumns (Page 5247)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 5247)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.

Properties	Read	Write	Description
AutoSelectionColors (Page 5248)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 5249)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
Blocks	-	-	Sets the alarm blocks.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
Caption (Page 5287)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 5289)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 5290)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 5290)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 5291)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 5291)	P	P	Specifies the top margin of the table cells.
Closeable (Page 5295)	P	P	Specifies that the control can be closed in runtime.
ColumnAlign (Page 5298) *	P	P	Specifies how the selected column is aligned.
ColumnAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
ColumnCaption *	P	P	Sets the caption.
ColumnCount *	P	-	Displays the number of columns.
ColumnDateFormat (Page 5298) *	-	P	Sets the display format for date information.
ColumnExponentialFormat *	P	P	Specifies that exponential notation is used in a column.
ColumnHideText *	P	P	Specifies whether the text is displayed.
ColumnHideTitleText *	P	P	Specifies whether the text is displayed.
ColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ColumnLeadingZeros *	P	P	Specifies that leading zeros should be displayed.
ColumnLength *	P	P	Specifies the number of displayed characters.
ColumnName *	P	-	Displays the name of the selected column.
ColumnPrecisions *	P	P	Sets the number of decimal places.
ColumnReadonly *	P	P	Sets the read-only mode for the values in the column.
ColumnRepos *	P	P	Repositions the column.
ColumnResize (Page 5299)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 5300)	P	P	Specifies the scroll bar type.
ColumnShowDate *	P	P	Specifies that the date is to be displayed.
ColumnShowIcon *	P	P	Enables the display of an icon.
ColumnShowTitleIcon *	P	P	Enables the display of an icon.
ColumnSort *	P	P	Sets the type of sorting.
ColumnSortIndex *	P	P	Specifies the sorting order.
ColumnTimeFormat *	-	P	Sets the display format for time information.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.

Properties	Read	Write	Description
ColumnTitles (Page 5303)	P	P	Specifies whether the column header is displayed.
ColumnVisible *	P	P	Enables the visibility of a column.
ControlDesignMode (Page 5507)	-	P	Specifies the design.
DataSource	-	-	Sets the data source.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
EnableDelete	P	P	Enables the deletion of data.
EnableEdit (Page 5324)	P	P	Specifies whether the data shown can be edited in runtime.
EnableInsert	P	P	Enables insertion of data.
ExportDirectoryChangeable (Page 5328)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 5329)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 5330)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 5330)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 5331)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 5331)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 5332)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 5332)	-	-	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 5333)	P	P	Specifies which runtime data of the control is exported.
ExportShowDialog (Page 5334)	P	P	Specifies whether the data export dialog is shown in runtime.
Filters	-	-	Specifies database criteria in SQL syntax.
FilterSQL	P	-	Sets an SQL statement for the filter criterion.
Font (Page 5348)	-	-	Specifies or returns the font.
GridLineColor (Page 5356)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 5357)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 5373)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 5375)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 5398)	P	P	Sets the color of the window separation lines.
LineWidth (Page 5400)	P	P	Specifies the line thickness of the selected object.
Moveable (Page 5425)	P	P	Specifies whether the window can be moved in runtime.
ObjectName (Page 5706)	P	-	Returns the object name as STRING.
PrintJobName (Page 5714)	P	P	Specifies a print job.

Properties	Read	Write	Description
RowScrollbar (Page 5465)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 5466)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencePasswordLevel (Page 5716)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 5467)	-	-	Specifies how online configurations of WinCC are retained.
SelectArchiveName *	P	P	Specifies definition of the log by name.
SelectedCellColor (Page 5478)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 5479)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 5480)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 5481)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 5482)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 5482)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 5485)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 5486)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 5486)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 5487)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 5488)	P	P	Specifies the number of lines you can mark.
ShowSortButton (Page 5500)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 5501)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 5501)	P	P	Specifies whether a sort index is displayed.
ShowTitle (Page 5504)	P	P	Specifies the layout of the control window's header.
Sizeable	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 5511)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 5512) *	-	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 5512) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 5513) *	P	-	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 5514) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 5514) *	P	-	Returns the ID number of the selected status bar element.
StatusbarElementIndex (Page 5515)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.

Properties	Read	Write	Description
StatusbarElementName (Page 5516) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 5516) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 5517) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 5517)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 5518) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 5518) *	P	-	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 5519) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 5519) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 5520)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 5521)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 5521)	P	-	Returns the standard text of the status bar.
StatusbarUseBackColor (Page 5522)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 5523)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 5526)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 5526)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 5527)	P	P	
TableForeColor2 (Page 5528)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 5540)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut (Page 5557)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 5558)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 5559)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 5559)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 5560)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 5561)	P	P	Specifies how sorting by column header is triggered.
TitleStyle (Page 5561)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 5568)	P	P	Specifies or returns the position of the toolbar.

Properties	Read	Write	Description
ToolbarBackColor (Page 5568)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 5569) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 5570) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 5570) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 5571) *	P	-	Returns the number of buttons contained in the toolbar.
ToolbarButtonEnabled (Page 5572) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 5572) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 5573) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 5573)	P	P	References a button function.
ToolbarButtonLocked (Page 5574) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 5575) *	P	-	Displays the name of the selected button of the toolbar.
ToolbarButtonPasswordLevel (Page 5575) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 5576) *	-	P	Removes the selected button function from the list.
ToolbarButtonRename (Page 5576) *	-	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 5577) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 5577) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 5578) *	P	-	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 5579)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 5579)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 5580)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 5580)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
UseSelectedTitleColor (Page 5630)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 5631)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 5644)	P	P	Specifies whether vertical separation lines are displayed.
Visibility	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-138 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property with VBScript during runtime.
CopyRows (Page 5833)	P	Executes the "Copy rows" button function of the control.
CutRows (Page 5834)	P	Executes the "Cut rows" button function of the recipe view.
DeleteRows (Page 5837)	P	Executes the "Delete rows" button function of the recipe view.
Export (Page 5838)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetColumn (Page 5839)	P	Returns the column object of the recipe view designated by name or index as "ICCAxUAColumn" type.
GetColumnCollection (Page 5840)	P	Returns the list of all column objects of the recipe view as "ICCAxCollection" type.
GetRow (Page 5850)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 5851)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 5858)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5859)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusbarElement (Page 5865)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5866)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 5873)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 5874)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
MoveToFirst (Page 5894)	P	Executes the "First line" button function of the control.
MoveToLast (Page 5896)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 5897)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 5899)	P	Executes the "Previous data record" button function of the control.
PasteRows (Page 5902)	P	Executes the "Insert rows" button function of the recipe view.
Print (Page 5903)	P, A	Executes the "Print" button function of the control.
ReadTags (Page 5905)	P	Executes the "Read tags" button function of the recipe view.
SelectAll (Page 5918)	P	Selects all rows in a table-based control.
SelectRow (Page 5919)	P	Selects a specific row in a table-based control.
ServerExport (Page 5920)	P	Executes the "Export log" button function of the recipe view.
ServerImport (Page 5920)	P	Executes the "Import log" button function of the recipe view.
ShowHelp (Page 5923)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5927)	P, A	Executes the "Configuration dialog" button function of the control.
ShowSelectArchive (Page 5928)	P	Executes the "Select data connection" button function of the recipe view.
ShowSelection (Page 5928)	P	Executes the "Selection dialog" button function of the recipe view.

Methods	Valid	Description
ShowSelectTimeBase (Page 5929)	P	Executes the "Timebase dialog" button function of the recipe view.
ShowSort (Page 5930)	P	Executes the "Sorting dialog" button function of the recipe view.
UnselectAll (Page 5936)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5936)	P	Removes the selections from a specific cell of a table-based control.
WriteTags (Page 5940)	P	Executes the "Write tags" button function of the recipe view.

Table 12-139 Properties

Properties	Read	Write	Description
Appearance (Page 5000)	-	-	Specifies the layout for this NC subroutine.
Authorization (Page 5245) *	-	-	Specifies the operating rights of the selected object in runtime.
BackColor	A	A	Specifies the background color of the selected object.
Columns	-	-	Specifies the columns to be displayed.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 5309)	-	-	Specifies the number of lines contained in the selection list.
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
Height (Page 5358)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 5426)	A	-	Returns the object name as STRING.
SelectionBackColor (Page 5484)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 5485)	A	A	Specifies the foreground color of the selected cells.
ShowTableGridlines (Page 5502)	-	-	Enables the display of gridlines in the table of the specified object.
TableBackColor (Page 5525)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor	A	A	
TableGridlineColor (Page 5528)	A	A	Specifies the color for the grid lines.
TableHeaderBackColor (Page 5529)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 5530)	A	A	Specifies the text color in the header of the table of the selected object.

Properties	Read	Write	Description
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
Visible (Page 5645) *	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-140 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-141 Properties

Properties	Read	Write	Description
AskOperationMotive (Page 5244)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BackColorBottom (Page 5253)	P	P	Specifies the color for the lower / right part of the .
BackColorTop (Page 5254)	P	P	Sets the color for the upper / left part of the slider.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 5306)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	-	-	Specifies the line style of the selected object.

Properties	Read	Write	Description
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HighLimitColor (Page 5363)	P	P	Specifies the color of the top or right scroll button in a scroll bar.
JumpToLimitsAfterMouseClick (Page 5379)	P	P	Specifies the length of the long tick marks of a scale.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	-	-	Specifies the shape of the line end.
LogOperation (Page 5403)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
LowLimitColor (Page 5404)	P	P	Specifies the color of the bottom or left scroll button in a scroll bar.
MarginToBorder (Page 5405)	P	P	Specifies the width of the 3D border in pixels.
MaximumValue (Page 5406)	P	P	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 5422)	P	P	Specifies the minimum value of the scale in the selected object.
Name (Page 5426)	P	-	Returns the object name as STRING.
OperationSteps (Page 5435)	P	P	Specifies by how many steps the slider of the scrollbar is moved with one mouseclick.
ProcessValue (Page 5456)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 5493)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 5524)	P	P	Specifies the display style for the object:
TextOrientation (Page 5536)	P	P	Specifies the text orientation of the selected object.
ThumbBackColor (Page 5536)	P	P	Specifies the background color of the slider in the "Slider" object.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowsStyle (Page 5659)	P	P	Specifies whether the object is displayed in the general Windows style.

Table 12-142 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Screen (Page 4976)

ScreenItem (Page 4977)

ScreenItems (Page 4979)

Properties

Properties A

AboveUpperLimitColor

Description

Defines the color of the specified object for the case "High limit exceeded".

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**AboveUpperLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- IOField

You have no access in runtime with the following format:

- GraphicIOField
- Switch
- SymbolLibrary
- SymbolicIOField

Color

Optional A value or a constant that specifies the color of the specified object for the "Higher limit violated" case.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

AcceptOnExit

Description

Specifies whether the input field will be confirmed automatically when it is left.

Access in runtime: Read and write

Syntax

Object.**AcceptOnExit**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- IOField
- SymbolicIOField

BOOLEAN

Optional TRUE, if the input field will be confirmed automatically when it is left.

AcceptOnFull

Description

Specifies whether the input field will be left and confirmed automatically when the set number of values have been entered.

Access in runtime: Read and write

Syntax

Object.**AcceptOnFull**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- IOField

BOOLEAN

Optional TRUE, if the input field will be left and confirmed automatically when the set number of values have been entered.

AccessPath

Description

Returns the storage path of a screen.

Access during runtime: Read

Syntax

Object.**AccessPath**

Object

Necessary. A "Screen" object.

Example

In the following example, the path of the picture "ScreenWindow1" is issued:

```
'VBS67
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
MsgBox objScreen.AccessPath
```

See also

Screen (Page 5000)

ActiveProject

Description

Returns the specified project.

Access in Runtime: Read

Syntax

Object.**ActiveProject**

Object

Required A "HMIRuntime" object.

See also

HMIRuntime (Page 4993)

Project (Page 4999)

ActiveScreen

Description

Returns a "Screen" type object, which represents the screen which has the focus at the moment.

Note

If you query the "ActiveScreen" property in a user-defined function, it may be due to a screen saver that the property does not return a valid "screen" object but "Nothing". A system message will be issued.

Access in Runtime: Read

Syntax

Object.ActiveScreen

Object

Required An object of the "HMIRuntime" type.

Comments

Which screen is returned depends on whether the root screen or the permanent window has the focus.

The ActiveScreen property returns NOTHING if no screen has the focus. That is the case, for example, when another window has the focus. With the statement "If not [expression] is nothing" you are able to interrogate whether a screen is to be returned:

```
VBS example ActiveScreen
Dim objActiveScreen
Set objActiveScreen = HmiRuntime.ActiveScreen
If not objActiveScreen is nothing then
'found an active screen
HmiRuntime.Trace("There is an active screen." & vbCrLf)
Else
'found NO active screen
HmiRuntime.Trace("There is NO active screen." & vbCrLf)
End if
```

ActiveScreen

Description

Returns an object of type "Screen" which shows the screen that currently has the focus.

Note

If you query the "ActiveScreen" property in a function, it may be due to a ScreenSavers that the property does not return a valid "Screen" object but "Nothing" and a system alarm is displayed.

Access during runtime: Read

Syntax

Object.ActiveScreen

Object

Necessary. An object of the "HMIRuntime" type.

Comments

Which screen is returned depends on whether the root screen or the permanent window has the focus.

The ActiveScreen property returns NOTHING if no screen has the focus. This is the case, for example, if a different window has the focus. With the instruction "If not [printout] Is Nothing" you can query whether a screen is going to be returned:

```
'VBS_Example_ActiveScreen
Dim objActiveScreen
Set objActiveScreen = HmiRuntime.ActiveScreen
If Not objActiveScreen Is Nothing Then
'found an active screen
HmiRuntime.Trace("There is an active screen." & vbCrLf)
Else
'found NO active screen
HmiRuntime.Trace("There is NO active screen." & vbCrLf)
End If
```

ActiveScreenItem

Description

References the screen object that currently has the focus.

It is only if the screen of the respective "Screen" object is currently selected and has an input field that the "ActiveScreenItem" property of the "Screen" object will be occupied with a valid

"ScreenItem" object. In all other cases if, for example, another screen from the "Screens" list, an independent window within WinCC or another application is selected, this property is not supplied on the screens, i.e. assigned "Nothing".

Application

You use the "ActiveScreenItem" object to address the properties of the object that has the focus in Runtime.

ActiveScreenItem

Description

References the screen object which currently has the focus.

The "ActiveScreenItem" property of the "Screen" object is only assigned a valid "ScreenItem" object if the screen of the corresponding "Screen" object is active and has an input field. In all other cases, for example, with a different screen from the "Screens" list, an independent window within WinCC or a different application will be selected, this property will not apply to the screens and will be occupied with "Nothing".

Application

The "ActiveScreenItem" object is used to address the object property which has the focus in runtime.

ActualPointIndex

Description

Specifies the number of the current corner point of the selected object.

Access in runtime: Read and write

Syntax

Object.**ActualPointIndex**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Polygon
- Polyline
- Tubepolyline

You have no access in runtime with the following format:

- Line

Int32

Optional A value or a constant that specifies the number of the current corner point of the selected object.

ActualPointLeft

Description

Specifies the X coordinate of the current corner point with reference to the screen origin. The screen source is at the top left of the object. Every corner is identified by an index which is derived from the number ("PointCount") of the existing corners.

Access in runtime: Read and write

Syntax

Object.**ActualPointLeft**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Polygon
- Polyline
- Tubepolyline

You have no access in runtime with the following format:

- Line

Int32

Optional A value or a constant that specifies the X coordinate of the current corner point with reference to the screen origin.

Comments

Changing the value can have an effect on the properties "Width" (object width) and "Left" (X coordinate of the object position).

ActualPointTop

Description

Specifies the Y coordinate of the current corner point with reference to the screen origin. The screen source is at the top left of the object.

Access in runtime: Read and write

Syntax

Object.**ActualPointTop**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Polygon
- Polyline
- Tubepolyline

You have no access in runtime with the following format:

- Line

Int32

Optional A value or a constant that specifies the Y coordinate of the current corner point with reference to the screen origin.

Comments

Changing the value can have an effect on the properties "Height" (object height) and "Top" (X coordinate of the object position).

AdaptBorder

Description

Specifies whether the border of the selected object will be dynamically adapted to the text size.

Access in runtime: Read and write

Syntax

Object.**AdaptBorder**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- Button
- IOField
- OptionGroup
- SymbolicIOField
- TextField

You have no access in runtime with the following format:

- Checkbox

BOOLEAN

Optional TRUE, if the border of the selected object will be dynamically adapted to the text size.

AdaptPicture

Description

No access in runtime.

AdaptScreenToWindow

Description

Specifies whether or not the screen displayed in a screen window adapts to the size of the screen window in Runtime.

Access in runtime: Read

Syntax

Object.**AdaptScreenToWindow**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Screenwindow

BOOLEAN

TRUE, if the screen adapts to the screen window size.

FALSE, if the screen does not adapt to the screen window size.

AdaptWindowtoScreen

Description

Specifies whether the screen window adapts to the screen it displays in Runtime.

Access in runtime: Read

Syntax

Object.**AdaptWindowtoScreen**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Screenwindow

BOOLEAN

TRUE, if the screen window size adapts to the screen.

FALSE, if the screen window size does not adapt to the screen.

Address

Description

Specifies the web address that will be opened in the HTML browser.

Access in Runtime: Read and write

Syntax

Object.**Address**[=STRING]

Object

Required. An object of the "ScreenItem" type with the format:

- HTML-Browser

STRING

Optional A value or a constant that contains the web address.

AddressEnabled

Description

No access in runtime.

AdressPreview

Description

No access in runtime.

Alarm

Description

Specifies the limit for the storage space display as of which an alarm will be reported.

Access in runtime: Read and write

Syntax

Object.**Alarm**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

Int32

Optional A value or a constant that specifies the limit for the disk space view as of which an alarm will be reported.

AlarmClasses

Description

No access in runtime.

AlarmColor

Description

Specifies the color in which the bars will be shown as soon as the alarm area is reached.

Access in runtime: Read and write

Syntax

Object.**AlarmColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

Color

Optional A value or a constant that specifies the color in which the bar will be shown as soon as the warning area is exceeded.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0-255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

AlarmID

Description

Returns the AlarmID of the Alarm object. The AlarmID is unique and is assigned by the system.

AlarmID (readonly)

See also

Alarms (list) (Page 4984)

AlarmLog

Description

No access in runtime.

AlarmLogs

Description

Returns an object of type "AlarmLogs".

Access in Runtime: Read

Syntax

Object.**AlarmLogs**

Object

Required A "Logging" object.

See also

Logging (Page 4998)

AlarmLowerLimit

Description

Specifies the low limit at which the alarm is triggered.

Access in runtime: Read and write

Syntax

Object.**AlarmLowerLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the low limit at which the alarm is triggered.

Comments

The type of evaluation (percentage or absolute) is defined using the "AlarmLowerLimitRelative" property.

The "AlarmLowerLimitEnable" property defines whether or not monitoring of this limit is enabled.

AlarmLowerLimitColor

Description

Specifies the bar color of the "AlarmLowerLimit" limit.

The "AlarmLowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in runtime: Read and write

Syntax

Object.**AlarmLowerLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

You have no access in runtime with the following format:

- Slider

Color

Optional A value or a constant that specifies the bar color for the "AlarmLowerLimit" limit.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

AlarmLowerLimitEnabled

Description

Specifies whether the "AlarmLowerLimit" limit is monitored.

Access in runtime: Read and write

Syntax

Object.**AlarmLowerLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the "AlarmLowerLimit" limit is monitored.

Comments

The following values will be defined via the properties "AlarmLowerLimit", "AlarmLowerLimitColor" and "AlarmLowerLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

AlarmLowerLimitRelative

Description

Establish whether the lower limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

Access in runtime: Read and write

Syntax

Object.**AlarmLowerLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the lower limit at which the interrupt is triggered is evaluated as a percentage.

AlarmSource

Description

No access in runtime.

AlarmUpperLimit

Description

Establishes the upper limit at which the interrupt will be triggered.

Access in runtime: Read and write

Syntax

Object.**AlarmUpperLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that defines the upper limit at which an interrupt will be triggered.

Comments

The type of evaluation (percentage or absolute) is defined using the "AlarmUpperLimitRelative" property.

The "AlarmUpperLimitEnable" property defines whether or not monitoring of this limit is enabled.

AlarmUpperLimitColor

Description

Defines the bar color for the "AlarmUpperLimit" limit.

The "AlarmUpperLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in runtime: Read and write

Syntax

Object.**AlarmUpperLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar

You have no access in runtime with the following format:

- Slider

Color

Optional A value or a constant that defines the bar color for the "AlarmUpperLimit" limit.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

AlarmUpperLimitEnabled

Description

Specifies whether the "AlarmUpperLimit" limit is monitored.

Access in runtime: Read and write

Syntax

Object.**AlarmUpperLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the "AlarmUpperLimit" limit is monitored.

Comments

The following values will be defined via the properties "AlarmUpperLimit", "AlarmUpperLimitColor" and "AlarmUpperLimitRelative":

- Limit
- Representation upon reaching the limit
- Type of evaluation

AlarmUpperLimitRelative

Description

Establish whether the upper limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

Access in runtime: Read and write

Syntax

Object.**AlarmUpperLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the high limit at which the interrupt is triggered is evaluated as a percentage.

AllFilters

Description

No access in runtime.

AllFiltersForHitlist

Description

No access in runtime.

AllowEdit

Description

No access in runtime.

AllowMenu

Description

No access in runtime

Analog

Description

Specifies whether the clock should be shown as an analog clock.

Access in runtime: Read and write

Syntax

Object.**Analog**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Clock

BOOLEAN

Optional TRUE, if the clock should be shown as an analog clock.

AngleMax

Description

Specifies the angle of the scale end of the "Gauge" object.

Access in runtime: Read and write

Syntax

Object.**AngleMax**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

DOUBLE

Optional A value or a constant that specifies the angle in degrees.

Comments

The start and end of the scale gradations are described with the properties "AngleMin" and "AngleMax" in angle degrees.

The value of the AngleMin property must always be less than the value of the AngleMax property. The zero degree angle is located at the 3 o´clock position on the scale. Positive angle values are counted clockwise.

AngleMin

Description

Specifies the angle of the scale start of the "Gauge" object.

Access in runtime: Read and write

Syntax

Object.**AngleMin**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

DOUBLE

Optional A value or a constant that specifies the angle in degrees.

Comments

The start and end of the scale gradations are described with the properties "AngleMin" and "AngleMax" in angle degrees.

The value of the AngleMin property must always be less than the value of the AngleMax property.

The zero degree angle is located at the 3 o´clock position on the scale. Positive angle values are counted clockwise.

Appearance

Description

No access in runtime.

ApplyProjectSettings

Description

Specifies whether the project settings are applied from the "HMI alarms" editor.

Access in runtime: Read and write

Syntax

Object.**ApplyProjectSettings**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The alarm text blocks configured in the "HMI alarms" editor are applied in the alarm view with their properties. The alarm text blocks are displayed with these properties in the alarm view.

FALSE: The properties are not applied.

ApplyProjectSettingsForDesignMode

Description

No access in runtime.

AskOperationMotive

Description

Specifies whether the reason for operating this object will be logged. When operating the specified object in Runtime, a dialog opens in which the operator enters the reason for the operation in text format.

Access in runtime: Read and write

Syntax

Object.**AskOperationMotive**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- ComboBox
- IOField
- ListBox
- SymbolicIOField
- WindowsSlider

BOOLEAN

Optional TRUE, if the reason for operating this object will be logged.

Assignments

Description

Specifies a list which contains the assignments between the output value and the output text actually to be output. The assignments are dependent on the set list type. You define the list type with the ListType property.

Access in runtime: Read and write

Syntax

Object.**Assignments**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

STRING

Optional Specifies a list which contains the assignments between the output value and the output text actually to be output.

AssociatedS7GraphDBTag

Description

No access in runtime.

Authorization

Description

Specifies the operating rights of the selected object in Runtime.

Access in runtime: Read and write

Syntax

Object.**Authorization**[=HMIRTAuthorization]

Object

Required. An object of the "ScreenItem" type with the format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- CircularArc
- ComboBox
- DateTimeField
- Ellipse
- EllipseSegment
- EllipticalArc
- GraphicIOField
- GraphicView
- IOField
- Line
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Polyline
- RecipeView
- Rectangle
- RoundButton
- Slider
- StatusForce

- Switch
- SymbolLibrary
- SymbolicIOField
- SysDiagControl
- TextField
- TrendView
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject
- Tubepolyline
- UserView
- WindowsSlider

You have no access in runtime with the following format:

- AlarmView
- PLCCodeViewer
- ProtectedAreaNameView
- RangeLabelView
- S7GraphOverview

HMIRTAuthorization

Optional A value or a constant that establishes the operating rights of the specified object in Runtime.

AutoCompleteColumns

Description

Adds empty columns if the Control width is greater than the width of columns configured.

Access in runtime: Read and write

Syntax

Object.**AutoCompleteColumns**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl

- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The empty columns are displayed.

FALSE: The empty columns are not displayed.

AutoCompleteRows

Description

Enables the insertion of empty rows if the Control length is greater than the number of rows configured.

Access in runtime: Read and write

Syntax

Object.**AutoCompleteRows**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The empty rows are displayed.

FALSE: The empty rows are not displayed.

AutoScroll

Description

Specifies how the alarm window reacts when new alarms appear.

The specific choice of alarm lines is only possible if "AutoScroll" is not enabled.

The "AutoScroll" property is disabled if the "MsgCtrlFlag" = "-1" attribute is set. The most recent alarm is shown at the top in the alarm window.

Access in runtime: Read and write

Syntax

Object.**AutoScroll**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

Optional

TRUE: A new alarm is appended to and selected from the list shown in the alarm window. If necessary, the visible area of the alarm window can be moved.

FALSE: A new alarm is not selected. The visible area of the alarm window is not altered.

AutoSelectionColors

Description

Enables the display of default system colors as selection color for cells and rows.

Access in runtime: Read and write

Syntax

Object.**AutoSelectionColors**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The system color is used.

FALSE: The customized color is used.

AutoSelectionRectColor

Description

Specifies whether the selection frame is shown with the specified color.

Access in runtime: Read and write

Syntax

Object.**AutoSelectionRectColors**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The system color is used.

FALSE: The customized color is used.

AutoSizing

Description

No access in runtime.

AverageLast15Values

Description

Specifies whether a mean value is shown from the last 15 values.

Access in Runtime: Read and write

Syntax

Object.**AverageLast15Value**s[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional. TRUE, if a mean value is shown from the last 15 values.

AxisXBunchCount

Description

No access in runtime.

AxisXMarkCount

Description

No access in runtime.

AxisXShowBunchValues

Description

No access in runtime.

AxisY1BunchCount

Description

No access in runtime.

AxisY1MarkCount

Description

No access in runtime.

AxisY1ShowBunchValues

Description

No access in runtime.

AxisY2BunchCount

Description

No access in runtime.

AxisY2MarkCount

Description

No access in runtime.

AxisY2ShowBunchValues

Description

No access in runtime.

Properties B

BackColor

Description

Specifies the background color of the selected object.

Access in runtime: Read and write

Syntax

Object.**BackColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- AlarmView
- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- CircularArc
- ComboBox
- DateTimeField
- Ellipse
- EllipseSegment
- EllipticalArc

- FunctionTrendControl
- Gauge
- GraphicView
- IOField
- Line
- ListBox
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- Polygon
- Polyline
- RecipeView
- Rectangle
- RoundButton
- Slider
- StatusForce
- Switch
- SymbolLibrary
- SymbolicIOField
- TextField
- TrendRulerControl
- TrendView
- TubeArcObject
- UserArchiveControl
- UserView
- WindowsSlider

You have no access in runtime with the following format:

- GraphicIOField

Color

Optional A value or a constant that specifies the background color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

The background color is not visible if the "BorderStyle" property has the value "0".

BackColorBottom

Description

Specifies the color for the lower / right part of the Slider object.

Access in runtime: Read and write

Syntax

Object.**BackColorBottom**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- WindowsSlider

Color

Optional A value or a constant that specifies the color for the lower / right part of the Slider object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0-255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BackColorTop

Description

Specifies the color for the upper / left part of the Slider object.

Access in runtime: Read and write

Syntax

Object.**BackColorTop**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- WindowsSlider

Color

Optional A value or a constant that specifies the color for the upper / left part of the Slider object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0-255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BackFillStyle

Description

Determines the fill style of the specified object.

Access in runtime: Read and write

Syntax

Object.**BackFillStyle**[=FillStyle]

Object

Required. A "ScreenItem" object with the following format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- Clock
- ComboBox
- Ellipse
- EllipseSegment
- Gauge
- GraphicView
- IOField
- ListBox

- OptionGroup
- Polygon
- Rectangle
- RoundButton
- Slider
- SymbolLibrary
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- DateTimeField
- GraphicIOField
- Switch

FillStyle

Optional A value or a constant that specifies the fill style.

hmiFillStyleTransparent (65536): Transparent fill

hmiFillStyleSolid (0): Object is filled with the specified color

Default setting: hmiFillStyleSolid

BackFlashingColorOff

Description

Specifies the color of the background for the flashing status "off".

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BackFlashingColorOff**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- GraphicView
- IOField

- OptionGroup
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch

Color

Optional A value or a constant that specifies the color of the background for the flashing status "off".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

BackFlashingColorOn

Description

Specifies the color of the background for the flashing status "on".

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BackFlashingColorOn**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- GraphicView
- IOField
- OptionGroup
- RoundButton

- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch

Color

Optional A value or a constant that specifies the color of the background for the flashing status "on".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

BackFlashingEnabled

Description

Specifies whether the background of the specified object will flash in Runtime.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BackFlashingEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- GraphicView
- IOField
- OptionGroup
- RoundButton
- SymbolicIOField

- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch

BOOLEAN

Optional TRUE, if the background of the specified object is flashing in Runtime.

BackFlashingRate

Description

Specifies the flash rate of the background for the specified object.

Access in Runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BackFlashingRate**[=FlashingRate]

Object

Required. An object of the "ScreenItem" type with the format:

- Bar
- Button
- GraphicView
- IOField
- OptionGroup
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing interval is 250 ms.

hmiFlashingRateMedium (1): The length of the flashing interval is 500 ms.

hmiFlashingRateFast (2): The length of the flashing interval is 1000 ms.

BackgroundColor

Description

No access in runtime.

BarBackColor

Description

Specifies the color of the bar background for the selected object.

Access in runtime: Read and write

Syntax

Object.**BarBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar
- Slider

Color

Optional A value or a constant that specifies the color of the bar background.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

BarBackFillStyle

Description

Specifies the fill style for the bar.

Access in runtime: Read and write

Syntax

Object.**BarBackFillStyle**[=FillStyle]

Object

Required. A "ScreenItem" object with the following format:

- Bar

FillStyle

hmiFillStyleTransparent (65536): Transparent fill style

hmiFillStyleSolid (0): Solid fill style

hmiFillStyleBackwardDiagonal (131075): Diagonal fill style striped towards the top right

hmiFillStyleCross (131076): Checked fill style

hmiFillStyleDiagonalCross (131077): Diagonal checked fill style

BarBackFlashingColorOff

Description

No access in runtime.

BarBackFlashingColorOn

Description

No access in runtime.

BarBackFlashingEnabled

Description

No access in runtime.

BarBackFlashingRate

Description

No access in runtime.

BarColor

Description

Specifies the color of the bar in the "Slider" object.

Access in runtime: Read and write

Syntax

Object.**BarColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Slider

Color

Optional A value or a constant that specifies the color of the slider.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

The range extends from "RangeMin" to the position of the controller.

BarEdgeStyle

Description

No access in runtime.

BaseScreenName

Description

Reads the name of the current root screen or triggers a root screen change by setting a new screen name.

Access in Runtime: Read and write

Syntax

Object.**BaseScreenName**[= STRING]

Object

Required An "HMIRuntime" object.

STRING

Optional A value or a constant that contains the screen name.

Comments

You can also use the property to establish which screen is currently being displayed.

BelowLowerLimitColor

Description

No access in runtime.

BitNumber

Description

Specifies the bit whose status must change to trigger a value change.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BitNumber**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- SymbolicIOField

You have no access in runtime with the following format:

- Button
- GraphicIOField

Int32

Optional Specifies the bit whose status must change to trigger a value change.

Comments

The tag being used must be of type BYTE, WORD or DWORD.

BlinkColor

Description

Specifies the color in which the "SymbolLibrary" object will flash.

Access in runtime: Read and write

Syntax

Object.**BlinkColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- SymbolLibrary

Color

Optional A value or a constant that specifies the flash color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

BlinkMode

Description

Sets the type of flash picture for the specified object.

Access in runtime: Read and write

Syntax

Object.**BlinkMode**[=SymbolLibraryBlinkMode]

Object

Required. A "ScreenItem" object with the following format:

- SymbolLibrary

SymbolLibraryBlinkMode

hmiSymbolLibraryFlashingNone (0): Flashing is switched off.

hmiSymbolLibraryFlashingInvisible (1): The flash picture is invisible.

hmiSymbolLibraryFlashingShaded (2): The flash picture is given a colored, shaded surface. The color of the surface corresponds to the settings in the property "BlinkColor".

hmiSymbolLibraryFlashingSolid (3): The flash picture is given a colored, unshaded surface. The color of the surface corresponds to the settings in the property "BlinkColor".

BlinkSpeed

Description

Specifies the flash rate.

Fast - 250: The length of the flashing rate is 250 ms. Medium - 500: The length of the flashing rate is 500 ms.

Slow - 1000: The length of the flashing rate is 1000 ms. The default value is medium - 500.

Access in runtime: Read and write

Syntax

Object.**BlinkSpeed**[=FlashingRate]

Object

Required. A "ScreenItem" object with the following format:

- SymbolLibrary

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing rate is 250 ms.

hmiFlashingRateMedium (1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast (2): The length of the flashing rate is 1000 ms.

Blocks

Description

No access in runtime.

BorderBackColor

Description

Specifies the background color of the broken border line for the specified object.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BorderBackColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- ComboBox
- Ellipse
- EllipseSegment
- GraphicIOField
- GraphicView
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- AlarmView
- Clock

- DateTimeField
- Gauge
- RecipeView
- Slider
- StatusForce
- Switch
- SysDiagControl
- TrendView
- UserView

Color

Optional A value or a constant that specifies the background color of the broken border line for the specified object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BorderBrightColor3D

Description

Specifies the frame color of the following frame parts in case of a 3D display of the specified object:

- External frame parts at the top and bottom
- Internal frame parts at the top and right

Access in runtime: Read and write

Syntax

Object.**BorderBrightColor3D**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Button
- RoundButton
- Slider

You have no access in runtime with the following format:

- Switch

Color

Optional A value or a constant that specifies the frame color. Default setting is white.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BorderColor

Description

Specifies the line color of the specified object.

Access in runtime: Read and write

Syntax

Object.**BorderColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- AlarmView
- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- ComboBox
- DateTimeField
- Ellipse
- EllipseSegment
- FunctionTrendControl
- GraphicIOField
- GraphicView
- IOField

- ListBox
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- TrendRulerControl
- UserArchiveControl
- WindowsSlider

You have no access in runtime with the following format:

- Clock
- Gauge
- RecipeView
- Slider
- StatusForce
- Switch
- SysDiagControl
- TrendView
- UserView

Color

Optional A value or a constant that specifies the line color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BorderEnabled

Description

Returns whether the window is displayed with a border in runtime.

Access in runtime: Read

Syntax

Object.**BorderEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- ApplicationWindow
- Screenwindow

BOOLEAN

Optional TRUE if the window is displayed with a border in runtime.

BorderEndStyle

Description

Specifies the type of line-end shapes for the specified object.

Access in runtime: Read and write

Syntax

Object.**BorderEndStyle**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Line
- Polyline

Int32

Optional A value or a constant that specifies the type of line-end shapes for the specified object.

BorderFlashingColorOff

Description

Specifies the color of the border line for the selected object for the flashing status "off".

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BorderFlashingColorOff**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- Circle
- CircleSegment
- Ellipse
- EllipseSegment
- GraphicIOField
- GraphicView
- IOField
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "off".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BorderFlashingColorOn

Description

Specifies the color of the border line for the selected object for the flashing status "on".

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BorderFlashingColorOn**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- Circle
- CircleSegment
- Ellipse
- EllipseSegment
- GraphicIOField
- GraphicView
- IOField
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "on".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BorderFlashingEnabled

Description

Specifies whether the border line of the selected object will flash in Runtime.

Access in Runtime: Read and write

Syntax

Object.**BorderFlashingEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

BOOLEAN

Optional. TRUE, if the border line of the object is flashing.

BorderFlashingRate

Description

Specifies the flash rate of the border line for the selected object.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read/Write

Syntax

Object.**BorderFlashingRate**[=FlashingRate]

Object

Required. An object of the "ScreenItem" type with the format:

- Bar
- Button
- Circle
- CircleSegment
- Ellipse
- EllipseSegment
- GraphicIOField
- GraphicView
- IOField
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing interval is 250 ms.

hmiFlashingRateMedium (1): The length of the flashing interval is 500 ms.

hmiFlashingRateFast (2): The length of the flashing interval is 1000 ms.

BorderInnerStyle3D

Description

Specifies the display of the internal part of the object border.

Access in Runtime: Read and write

Syntax

Object.**BorderInnerStyle3D**[=SliderBorder3DStyle]

Object

Required A "ScreenItem" object with following format:

- Gauge
- Slider

SliderBorder3DStyle

hmiGaugeBorder3DStyleNone (0): There is no inside part of the object border.

hmiGaugeBorder3DStyleRecessed (1): The object border is shown in relief.

hmiGaugeBorder3DStyleRaised (2): The object border is shown raised.

hmiGaugeBorder3DStyleGray (3): The object border has a uniform gray border.

hmiGaugeBorder3DStyleColored (4): The object border has a uniform colored border. The border color corresponds to the background color.

BorderInnerWidth3D

Description

Specifies the width of the inner border for the 3D presentation of the selected object.

Access in runtime: Read and write

Syntax

Object.**BorderInnerWidth3D**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Slider

Int32

Optional A value or a constant that specifies the width of the inner border in pixels.

BorderOuterStyle3D

Description

Specifies the display of the external part of the object border.

Access in Runtime: Read and write

Syntax

Object.**BorderOuterStyle3D**[=GaugeBorder3DStyle]

Object

Required A "ScreenItem" object with following format:

- Gauge
- Slider

GaugeBorder3DStyle

hmiGaugeBorder3DStyleNone (0): There is no inside part of the object border.

hmiGaugeBorder3DStyleRecessed (1): The object border is shown in relief.

hmiGaugeBorder3DStyleRaised (2): The object border is shown raised.

hmiGaugeBorder3DStyleGray (3): The object border has a uniform gray border.

hmiGaugeBorder3DStyleColored (4): The object border has a uniform colored border. The border color corresponds to the background color.

BorderOuterWidth3D

Description

Specifies the width of the outer border for the 3D presentation of the selected object.

Access in runtime: Read and write

Syntax

Object.**BorderOuterWidth3D**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Slider

Int32

Optional A value or a constant that specifies the width of the outer border in pixels.

BorderShadeColor3D

Description

Specifies the frame color of the following frame parts in case of a 3D display of the specified object:

- Internal frame parts at the top and bottom
- External frame parts at the bottom and right

Access in runtime: Read and write

Syntax

Object.**BorderShadeColor3D**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Button
- RoundButton
- Slider

You have no access in runtime with the following format:

- Switch

Color

Optional A value or a constant that specifies the color of the shading.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

BorderStyle

Description

Specifies the type of border lines for the specified object.

Access in runtime: Read and write

Syntax

Object.**BorderStyle**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Bar
- Button
- CheckBox
- ComboBox
- GraphicIOField
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- RoundButton
- SymbolicIOField
- WindowsSlider

Int32

Optional A value or a constant that specifies the type of border lines for the specified object.

0 = filled line

1 = broken line

2 = dotted line

3 = dashed and dotted line

4 = dash - dot - dot line

BorderStyle3D

Description

Determines whether the given object has 3D border shading.

Access in runtime:

- RT Advanced: Read and write
- RT Professional: No access

Syntax

Object.**BorderStyle3D**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- DateTimeField
- IOField
- Switch
- TextField

You have no access in runtime with the following format:

- Bar
- Button
- GraphicIOField
- GraphicView
- SymbolicIOField

BOOLEAN

Optional TRUE if the object has a 3D border shadow.

BorderWidth

Description

Specifies the line weight of the selected object.

Access in runtime: Read and write

Syntax

Object.**BorderWidth**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- AlarmView
- Bar

- Button
- CheckBox
- Circle
- CircleSegment
- ComboBox
- Ellipse
- EllipseSegment
- FunctionTrendControl
- Gauge
- GraphicIOField
- GraphicView
- IOField
- ListBox
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- Slider
- SymbolicIOField
- TextField
- TrendRulerControl
- UserArchiveControl
- WindowsSlider

You have no access in runtime with the following format:

- Clock
- DateTimeField
- RecipeView
- StatusForce
- Switch
- SysDiagControl
- TrendView
- UserView

Int32

Optional A value or a constant that specifies the line weight in pixels.

BorderWidth3D

Description

Specifies the width of the inner border for the 3D presentation of the selected object.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**BorderWidth3D**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Button
- Gauge
- RoundButton

You have no access in runtime with the following format:

- Bar
- IOField
- Switch

Int32

Optional A value or constant that determines the width of the inside border for 3D display in pixels.

Properties C

Caption

Description

Specifies the text that will be displayed in the title line of the selected object.

Access in runtime: Read and write

Syntax

Object.**Caption**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl

- OnlineTrendControl
- TrendRulerControl
- Slider
- UserArchiveControl

STRING

Optional A value or a constant that contains the text that will be shown in the title line.

CaptionBackColor

Description

Specifies the background color of the title line for the selected object.

Access in runtime: Read and write

Syntax

Object.**CaptionBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

Color

Optional A value or a constant that specifies the background color of the title line for the selected object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0-255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

CaptionColor

Description

Specifies the color of the text that will be displayed in the title line of the selected object.

Access in runtime: Read and write

Syntax

Object.**CaptionColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Gauge
- Switch
- SymbolicIOField

Color

Optional A value or a constant that specifies the text color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

CaptionText

Description

Specifies the text that will be displayed in the title line of the selected object.

Access in Runtime: Read and write

Syntax

Object.**CaptionText**[= STRING]

Object

Required. An object of the "ScreenItem" type with the format:

- Gauge
- ScreenWindow
- Switch

STRING

Optional A value or a constant that contains the text that will be shown in the title line.

CaptionTop

Description

Specifies the distance of the instrument labels to the upper edge of the selected object. You can position the instrument labels only in line with the vertical diameter of the scale. The value of the attribute refers to the height of the specified object. The height specifies the upper edge of the specified object and the lower edge of the lettering.

Access in runtime: Read and write

Syntax

Object.**CaptionTop**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

DOUBLE

Optional A value or a constant that specifies the distance of the instrument labels to the upper edge of the selected object.

Value range from 0 to 1

0: The lower edge of the lettering is positioned on the upper limit of the selected object. The text is no longer visible as it is positioned outside of the selected object.

1: The lower edge of the lettering is positioned on the lower limit of the selected object.

CellCut

Description

Specifies whether the contents of the cells are abbreviated if the cells are too narrow.

Access in runtime: Read and write

Syntax

Object.**CellCut**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE, if the contents are abbreviated.

CellSpaceBottom

Description

Defines the bottom margin of the table cells.

Access in runtime: Read and write

Syntax

Object.**CellSpaceBottom**[=Int32]

Object

Required. A "ScreenItem" object with the following formats:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchivControl

Int32

Optional A value or constant that defines the bottom margin used in the table cells.

CellSpaceLeft

Description

Specifies the left indent used in the table cells.

Access in runtime: Read and write

Syntax

Object.**CellSpaceLeft**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or parameter that defines the left indent in the table cells.

CellSpaceRight

Description

Specifies the right indent used in the table cells.

Access in runtime: Read and write

Syntax

Object.**CellSpaceRight**[=Int32]

Object

Required. A "ScreenItem" object with the following formats:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or constant that defines the right indent used in the table cells.

CellSpaceTop

Description

Defines the top margin of the table cells.

Access in runtime: Read and write

Syntax

Object.**CellSpaceTop**[=Int32]

Object

Required. A "ScreenItem" object with the following formats:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or constant that defines the top margin used in the table cells.

CenterColor

Description

Specifies the color of the center of the "Gauge" object.

Access in runtime: Read and write

Syntax

Object.**CenterColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

Color

Optional A value or a constant that specifies the color of the center.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

CenterSize

Description

Specifies the diameter of the scale center point.

Access in runtime: Read and write

Syntax

Object.**CenterSize**[=SINGLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

SINGLE

Optional A value or a constant that specifies the diameter of the round scale center point.

Value range from 0.03 to 1

1: The diameter corresponds to the smaller value of the geometry attribute "Width" or "Height".

ChangeMouseCursor

Description

Specifies how the appearance of the cursor changes in Runtime when it is above the icon.

Access in runtime: Read and write

Syntax

Object.**ChangeMouseCursor**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- SymbolLibrary

BOOLEAN

Optional TRUE, if the mouse cursor has the appearance of an arrow even when it is positioned above the icon.

FALSE, if the mouse cursor has the appearance of a 3D arrow with a green lightning symbol. This indicates in Runtime that the respective objective can be operated.

CheckMarkAlignment

Description

Specifies whether the fields are right aligned.

Access in runtime: Read and write

Syntax

Object.**CheckMarkAlignment**[=ContentAlignment]

Object

Required. An object of the "ScreenItem" type with the format:

- OptionGroup

You have no access in runtime with the following format:

- CheckBox

ContentAlignment

(0): The fields are arranged left aligned.

(1): The fields are arranged right aligned.

CheckMarkCount

Description

Specifies the number of fields.

Access in runtime: Read and write

Syntax

Object.**CheckMarkCount**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- OptionGroup

You have no access in runtime with the following format:

- CheckBox

Int32

Optional A value or a constant that specifies the number of fields. Value range from 0 to 31

ClearOnError

Description

Specifies whether an invalid input in this object will be deleted automatically.

Access in runtime: Read and write

Syntax

Object.**ClearOnError**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- IOField

BOOLEAN

Optional TRUE, if an invalid input in this object will be deleted automatically.

ClearOnFocus

Description

Specifies whether the field entry will be deleted as soon as the I/O field is activated.

Access in runtime: Read and write

Syntax

Object.**ClearOnFocus**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- IOField

BOOLEAN

Optional TRUE, if the field entry is deleted as soon as the I/O field is activated.

Closeable

Description

Specifies whether the window can be closed in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Closeable**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional. TRUE, if the window can be closed in Runtime.

SystemDiagnoseWindow (Page 5180)

TrendRulerControl (Page 5187)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

OnlineTrendControl (Page 5122)

Color

Description

Specifies the line color of the specified object.

Access in runtime: Read and write

Syntax

Object.**Color**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- CircularArc
- EllipticalArc
- Line
- Polyline
- TubeArcObject
- TubeDoubleTeeObject
- Tubepolyline
- TubeTeeObject

Color

Optional A value or a constant that specifies the line color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

ColorChangeHysteresis

Description

Specifies hysteresis as a percentage of the display value.

The "ColorChangeHysteresisEnable" property must have the value TRUE so that the hysteresis can be calculated.

Access in runtime: Read and write

Syntax

Object.**ColorChangeHysteresis**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the hysteresis as a percentage of the display value.

ColorChangeHysteresisEnabled

Description

Determines whether the object will be displayed with a hysteresis.

Access in runtime: Read and write

Syntax

Object.**ColorChangeHysteresisEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the object will be displayed with a hysteresis.

ColumnAlignment

Description

Specifies how the selected column is aligned.

The following settings are possible:

Value	Description	Explanation
0	Left	The column selected is displayed left-justified.
1	Centered	The column selected is displayed centered.
2	Right	The column selected is displayed right-justified.

The attribute can be assigned dynamic properties by means of the name **ColumnAlignment**. The data type is LONG.

ColumnDateFormat

Description

Defines the date format to be used for visualization. The "ColumnIndex" property is used to reference the date column of the recipe view. The attribute can be assigned dynamic properties by means of the name **ColumnDateFormat**.

Access in Runtime: Write

Syntax

Object.**ColumnDateFormat**(=String)

Object

Required An object of the "ScreenItem" type with the characteristic "UserArchiveControl".

String

The following date formats are available:

Value	Explanation
dd.MM.yy	Day.Month.Year, e.g., 24.12.13.
dd.yyyyd.MM	Day.Month.Year, e.g., 24.12.2013.
dd/MM/yy	Day/Month/Year, e.g., 24/12/13.
dd/MM/yyyy	Day/Month/Year, e.g., 24/12/2013.

See also

UserArchiveControl (Page 5207)

ColumnResize

Description

Enables changes to the width of columns.

Access in runtime: Read and write

Syntax

Object.**ColumnResize**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: You can change the width of the columns.

FALSE: You cannot change the width of the columns.

Columns

Description

No access in runtime.

ColumnScrollbar

Description

Enables the display of column scroll bars.

Access in Runtime: Read

Syntax

Object.**ColumnScrollbar**[=Scrollbar]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

Scrollbar

0 = (No) The column scrollbars are not displayed.

1 = (if required) The column scrollbars are displayed if the space requirement of the control is greater in vertical direction than the available display area.

2 = (always) The column scrollbars are always displayed.

ColumnSettings

Description

No access in runtime.

ColumnSettingsBufferView

Description

No access in runtime.

ColumnsMoveable

Description

No access in runtime.

ColumnTextAckGroup

Description

No access in runtime.

ColumnTextAlarmState

Description

No access in runtime.

ColumnTextAlarmText

Description

No access in runtime.

ColumnTextClassName

Description

No access in runtime.

ColumnTextDate

Description

No access in runtime.

ColumnTextDevice

Description

No access in runtime.

ColumnTextDiagnosable

Description

No access in runtime.

ColumnTextNumber

Description

No access in runtime.

ColumnTextTime

Description

No access in runtime.

ColumnTimeFormat

Description

Defines the time format to be used for visualization. The "ColumnIndex" property is used to reference the time column of the recipe view. The attribute can be assigned dynamic properties by means of the name **ColumnTimeFormat**.

Access in Runtime: Write

Syntax

Object.**ColumnTimeFormat**(=String)

Object

Required. An object of the "ScreenItem" type with the characteristic "UserArchiveControl".

String

The following time formats are available:

Value	Explanation
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

ColumnTitleAlignment

Description

Specifies the type of column title alignment.

Access in Runtime: Read

Syntax

Object.**ColumnTitleAlignment**[=GridColumnHeaderHorizontalAlignment]

Object

Required. An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

GridColumnHeaderHorizontalAlignment

0 = The column headers are shown left aligned.

1 = The column headers are shown centered.

2 = The column headers are shown right aligned.

3 = The column headers are aligned as the corresponding content.

See also

AlarmControl (Page 5018)

ColumnTitles

Description

Enables the display of the column header.

Access in runtime: Read and write

Syntax

Object.**ColumnTitles**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchivControl

BOOLEAN

TRUE: The column header is displayed.

FALSEThe column header is not displayed.

ComboboxFont

Description

No access in runtime.

Dublette_CompatibilityMode

Description

No access in runtime.

ComputerName

Description

Returns the name of the computer on which the alarm object was triggered.

ComputerName (readonly)

ConnectionType

Description

No access in runtime

ConnectOnStart

Description

No access in runtime.

ConnectTrendWindows

Description

Specifies whether the configured trend views are connected. The requirement is that you have configured several trend views.

The connected trend views have the following properties:

- A common X axis
- A scrollbar
- A ruler

Access in runtime: Read and write

Syntax

Object.**ConnectTrendWindows**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: All configured trend views are connected.

FALSE: The trend views are displayed separately.

Context

Description

Reads or sets the alarm object server prefix.

ContinousChange

Description

Specifies whether the value of the "ProcessValue" property will be transferred when the mouse button is released or as soon as the slider position changes in Runtime.

Access in runtime: Read and write

Syntax

Object.**ContinousChange**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Slider

BOOLEAN

Optional TRUE, if the value of the property "ProcessValue" will be transferred when the mouse button is released or as soon as the slider position changes in Runtime.

CornerRadius

Description

No access in runtime.

CornerStyle

Description

Specifies the type of border lines for the specified object.

Access in Runtime: Read-only

Syntax

Object.**CornerStyle**[=Int]

Object

Required. An object of the "ScreenItem" type with the format:

- Bar
- Button
- CheckBox
- Circle

- CircleSegment
- CircularArc
- ComboBox
- EllipseSegment
- GraphicIOField
- GraphicView
- IOField
- Line
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- Tubepolyline
- WindowsSlider

You have no access in runtime with the following format:

- Ellipse
- EllipticalArc
- Switch
- TubeArcObject

Int

Optional A value or a constant that specifies the type of border lines for the specified object.

0 = filled line

1 = broken line

2 = dotted line

3 = dashed and dotted line

4 = dash - dot - dot line

Count

Description

Returns the number of elements in the specified list.

Access in Runtime: Read

Syntax

Object.Count

Object

Required A "Collection" object.

CountDivisions

Description

Specifies the number of segments in which the bar will be divided by the large marking lengths of the scale.

Access in runtime: Read and write

Syntax

Object.**CountDivisions**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Int32

Optional A value or a constant that specifies the number of segments in which the bar will be divided by the large marking lengths of the scale.

0-100: An object can be divided into a maximum of 100 segments

= 0: The optimum number of segments will be established automatically.

See also

Bar (Page 5033)

CountOfLinesPerAlarms

Description

No access in runtime.

CountOfVisibleAlarms

Description

No access in runtime.

CountSubDivisions

Description

No access in runtime.

CountVisibleItems

Description

Specifies how many lines the selection list will contain. If the number of configured texts is greater than this value, then the selection list will have a vertical scroll bar.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**CountVisibleItems**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- ComboBox
- ListBox
- SymbolicIOField

You have no access in runtime with the following format:

- StatusForce
- TrendView
- UserView

Int32

Optional A value or a constant that specifies how many lines the selection list will contain.

CurrentContext

Description

Returns a character string depending on the use of the function.

If the function is contained in a screen in the screen window, CurrentContext returns the symbolic server name which supplies the screen. Example: "WinCCProject_MyComputer::"

If the function is contained in the main screen, an empty character string is returned.

Access in Runtime: Read

Syntax

Object.**CurrentContext**

Object

Required A "HMIRuntime" object.

See also

HMIRuntime (Page 4993)

CursorControl

Description

Specifies whether the mouse cursor jumps to the next field of the TAB sequence after leaving the field.

Access in runtime: Read and write

Syntax

Object.**CursorControl**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- IOField
- SymbolicIOField

BOOLEAN

Optional TRUE, if the mouse cursor jumps to the next field of the TAB-order after leaving the field.

Comments

For this purpose, the "CursorMode" property must be set to TRUE.

Curves

Description

No access in runtime.

Properties D

DangerRangeColor

Description

Specifies the color of the warning range of the scale of the "Gauge" object.

The "DangerRangeVisible" property must have the value TRUE so that the warning range is displayed.

Access in runtime: Read and write

Syntax

Object.**DangerRangeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

Color

Optional A value or a constant that specifies the color of the warning range.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

DangerRangeStart

Description

Specifies at which scale value the warning range of the "Gauge" object will start.

The "DangerRangeColor" property must have the value TRUE so that the warning range is displayed.

Access in runtime: Read and write

Syntax

Object.**DangerRangeStart**[=SINGLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

SINGLE

Optional A value or a constant that specifies the scale value for the start of the warning range.

Comments

The range extends from the value "Gefahr" through to the end of the scale.

DangerRangeVisible

Description

Specifies whether the warning range in the scale of the "Gauge" object will be displayed.

Access in runtime: Read and write

Syntax

Object.**DangerRangeVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

BOOLEAN

Optional TRUE, if the warning range will be displayed in the scale.

Comments

Specifies the color of the warning range with the "DangerRangeColor" property.

Specifies the start of the warning range with the "DangerRangeStart" property.

DataFormat

Description

Returns the data type of the I/O field object.

Access in runtime: Read

Syntax

Object.**DataFormat**[=IOFieldDataFormat]

Object

Required. An object of the "ScreenItem" type with the following format:

- IOField

IOFieldDataFormat

Optional. A value or a constant that returns the data type of the I/O field object.

Value range from 0 to 3.

- 0: Binary
- 1: Decimal
- 2: String
- 3: Hexadecimal

DataLogs

Description

Returns an object of type "DataLogs".

Access in Runtime: Read

Syntax

Object.**DataLogs**

Object

Required A "Logging" object.

See also

Logging (Page 4998)

DataRecordNameCaption

Description

No access in runtime.

DataRecordNrCaption

Description

No access in runtime.

DataSet

Description

Returns an object of type "DataSet".

Access in Runtime: Read

Syntax

Object.**DataSet**

Object

Required A "Screen" object.

See also

HMIRuntime (Page 4993)

Screen (Page 5000)

DialColor

Description

Specifies the color of the dial for the selected object.

Access in runtime: Read and write

Syntax

Object.**DialColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Clock
- Gauge

Color

Optional A value or a constant that specifies the color of the dial.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

DialFillStyle

Description

Specifies the type of background of the selected object.

Access in Runtime: Read and write

Syntax

Object.**DialFillStyle**[=GaugeFillStyle]

Object

Required A "ScreenItem" object with following format:

- Gauge

GaugeFillStyle

hmiGaugeBackStyleSolid (0): The rectangular background of the display is filled with the specified border color. The scale is filled with the specified background color.

hmiGaugeBackStyleFrameTransparent (1): The rectangular background of the Gauge is transparent. The scale is filled with the specified background color. As a result, a circular display can be shown.

hmiGaugeBackStyleTransparent (2): The rectangular background and the scale are transparent.

DialSize

Description

Specifies the diameter of the scale in relation to the smaller value of the geometry attributes "Width" and "Height".

Access in runtime: Read and write

Syntax

Object.**DialSize**[=SINGLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

SINGLE

Optional A value or a constant that specifies the diameter of the scale in relation to the smaller value of the geometry attributes "Width" and "Height".

DisplayButton2Plc

Description

No access in runtime.

DisplayButtonComparison

Description

No access in runtime.

DisplayButtonDelete

Description

No access in runtime.

DisplayButtonFromPlc

Description

No access in runtime.

DisplayButtonHelp

Description

No access in runtime.

DisplayButtonNew

Description

No access in runtime.

DisplayButtonSave

Description

No access in runtime.

DisplayButtonSaveAs

Description

No access in runtime.

DisplayComboBox

Description

No access in runtime.

DisplayGridLines

Description

No access in runtime.

DisplayLabeling

Description

No access in runtime.

DisplayNumbers

Description

No access in runtime.

DisplayOptions

Description

Specifies whether alarms whose view was suppressed are displayed.

Access in Runtime: Read and write

Syntax

Object.**DisplayOptions**[=AlarmDisplayOptions]

Object

Required. An object of the "ScreenItem" type with the format:

- AlarmControl

AlarmDisplayOptions

0: All messages

1: Only displayed messages

2: Only hidden messages

DisplayStatusBar

Description

No access in runtime.

DisplayTable

Description

No access in runtime.

DoubleClickAction

Description

Specifies the action to be executed in Runtime by double-clicking on a message line.

Access in Runtime: Read and write

Syntax

Object.**DoubleClickAction**[=AlarmControlActions]

Object

Required A "ScreenItem" object with following format:

- AlarmControl

AlarmControlActions

Value	Description	Explanation
0	None	No action.
1	Loop-in-alarm	Calls the "Loop-in-alarm" function.
2	Open comments dialog	Calls the "Comments dialog" button function.
3	Open Infotext dialog	Calls the "Infotext dialog" button function.
4	Column-dependent	The action is determined by the column in which you double-clicked.

DrawInsideFrame

Description

Specifies whether the border line of the selected object should be illustrated with a line weight greater than 1 within the border or symmetrically to the border.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**DrawInsideFrame**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- Circle
- CircleSegment
- CircularArc
- Ellipse
- EllipseSegment

- EllipticalArc
- GraphicIOField
- GraphicView
- OptionGroup
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox
- Switch
- TubeArcObject

BOOLEAN

Optional TRUE, if the border line of the specified object will be illustrated with a line weight greater than 1 within the border.

Drive

Description

Specifies the characters of the drive that is to be monitored.

Access in runtime: Read and write

Syntax

Object.**Drive**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

STRING

Optional A value or a constant that specifies the characters of the drive that is to be monitored.

Properties E-F

EdgeStyle

Description

Specifies the line style of the selected object.

Access in runtime: Read and write

Syntax

Object.**EdgeStyle**[=LineStyle]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- ComboBox
- Ellipse
- EllipseSegment
- GraphicIOField
- GraphicView
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- AlarmView
- Clock

- DateTimeField
- Gauge
- RecipeView
- Slider
- StatusForce
- Switch
- SysDiagControl
- TrendView
- UserView

LineStyle

Optional A value or a constant that specifies the line style. Value range from -1 to 4.

The objects "Ellipse", "Circle", "Rectangle" and "Polygon" support the line styles:

- hmiLineStyleSolid (0): solid line
- hmiLineStyleDash (1): broken line
- hmiLineStyleDot (2): dotted line
- hmiLineStyleDashDot (3): dash - dot line
- hmiLineStyleDashDotDot (4): dash - dot - dot line

The objects "TextField" and "IOField" support only the line styles:

- hmiLineStyleNone (-1): no line
- hmiLineStyleSolid (0): solid line

Default setting: hmiLineStyleSolid

EditOnFocus

Description

Specifies whether the data input is immediately possible if the input field is selected using the <Tab> key.

Access in runtime: Read and write

Syntax

Object.**EditOnFocus**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- IOField
- SymbolicIOField

BOOLEAN

Optional TRUE, if the data input is immediately possible and the input field has been selected using the <Tab> key.

Enabled

Description

Specifies whether the selected object can be operated in Runtime.

Access in runtime: Read and write

Syntax

Object.**Enabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- AlarmView
- Bar
- Button
- ChannelDiagnose
- CheckBox
- Circle
- CircleSegment
- CircularArc
- Clock
- ComboBox
- DateTimeField
- DiscSpaceView
- Ellipse
- EllipseSegment
- EllipticalArc
- FunctionTrendControl
- Gauge
- GraphicIOField
- GraphicView
- HTML-Browser

- IOField
- Line
- ListBox
- MediaPlayer
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- PLCCodeViewer
- Polygon
- Polyline
- RecipeView
- Rectangle
- RoundButton
- S7GraphOverview
- Slider
- SmartClientView
- StatusForce
- Switch
- SymbolicIOField
- SymbolLibrary
- SysDiagControl
- TextField
- TrendRulerControl
- TrendView
- TubeArcObject
- TubeDoubleTeeObject
- Tubepolyline
- TubeTeeObject
- UserArchiveControl
- UserView
- WindowsSlider

BOOLEAN

Optional TRUE, if the specified object can be operated in Runtime.

EnableEdit

Description

Enables editing of the data displayed during runtime.

Access in runtime: Read and write

Syntax

Object.**EnableEdit**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl
- UserArchiveControl

BOOLEAN

TRUE: The data can be changed in Runtime.

FALSE: The data cannot be changed.

EnableNavigateKeys

Description

No access in runtime.

EndAngle

Description

Specifies the angle at which the end point of the selected object deviates from the zero position (0°).

Access in runtime: Read and write

Syntax

Object.**EndAngle**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- CircleSegment
- CircularArc
- EllipseSegment

- EllipticalArc
- TubeArcObject

Int32

Optional A value or a constant that specifies the angle at which the end point of the selected object deviates from the zero position (0°).

EndLeft

Description

No access in runtime.

EndStyle

Description

Specifies how the line-end shapes of the selected object will be displayed.

Access in runtime: Read and write

Syntax

Object.**EndStyle**[=LineEndStyle]

Object

Required. A "ScreenItem" object with the following format:

- Line
- Polyline

LineEndStyle

Optional A value or a constant that specifies the line-end shapes. Value range from 0 to 6.

hmiLineEndStyleNone (0): The line has no end symbol.

hmiLineEndStyleArrow (1): The line ends with an arrow.

hmiLineEndStyleFilledArrow (2): The line ends with a filled arrowhead.

hmiLineEndStyleFilledArrowReversed (3): The line ends with a reversed arrow.

hmiLineEndStyleLine (4): The line ends with a vertical line.

hmiLineEndStyleCircle (5): The line ends with a circle.

hmiLineEndStyleFilledCircle (6): The line ends with a filled circle.

EndTop

Description

No access in runtime.

EntryNameCaption

Description

No access in runtime.

ErrorDescription

Description

Returns one of the following error descriptions in English:

Output	Description
" "	OK
"Operation Failed"	Execution error
"Variable not found"	Tag error
"Server down"	Server not available.
"An error occured for one or several tags"	Multi Tag Error (Error in one or several tags)

To obtain an error description, first of all carry out the Read method.

Note

If the error occurs when accessing via the TagSet object, evaluate the ErrorDescription property for each tag of the TagSet object.

Access in Runtime: Read

Syntax

Object.**ErrorDescription**

Object

Required A "Tag" object.

Example

The following example shows the error description for the "Tag1" tag:

```
'VBS72
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objtag.Read
MsgBox objTag.ErrorDescription
```

The following example adds two tags to the TagSet list and outputs the ErrorDescription property as Trace:

```
'VBS179
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "ErrorDescription: " & group.ErrorDescription & vbNewLine
```

The ErrorDescription property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "ErrorDescription: " & group("Motor1").ErrorDescription & vbNewLine
```

See also

Tag (Page 5012)

TagSet (list) (Page 5016)

EvenRowBackColor

Description

No access in runtime.

ExportDelimiter

Description

No access in runtime.

ExportDirectoryChangeable

Description

Enables changing of the directory for data export in Runtime.

Syntax

Object.**ExportDirectoryChangeable**=[BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The directory for data export can be changed in runtime.

FALSE: The directory for data export cannot be changed in runtime.

ExportDirectoryname

Description

Defines the directory to which the exported Runtime data is written.

Access in runtime: Read and write

Syntax

Object.**ExportDirectoryname**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl

- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant which specifies the directory.

ExportFileExtension

Description

Specifies the file extension of the export file. Only the file extension "csv" is supported.

Access in runtime: Read and write

Syntax

Object.**ExportFileExtension**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional Specifies the file extension of the export file.

ExportFilename

Description

Defines the name of the file which is to receive the exported Runtime data.

Access in runtime: Read and write

Syntax

Object.**ExportFilename**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional Defines the name of the file which is to receive the exported Runtime data.

ExportFilenameChangeable

Description

Enables renaming of the export file in Runtime.

Syntax

Object.**ExportFilenameChangeable**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The file name of the export file can be changed in runtime.

FALSE: The file name of the export file cannot be changed in runtime.

ExportFormatGuid

Description

Specifies the assignment of ID number and export provider.

Access in runtime: Read and write

Syntax

Object.**ExportFormatGuid**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or constant that specifies the assignment of ID number and export provider.

ExportFormatName

Description

Defines the export file format. Only the "csv" file format is currently available for the export.

Access in runtime: Read and write

Syntax

Object.**ExportFormatName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that defines the file format for export.

ExportParameters

Description

Specifies the parameters of the selected format by means of the properties dialog.

Access in runtime: Read and write

Syntax

Object.**ExportParameters**

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

ExportParameters

Optional A value or constant that specifies the parameters of the selected format in the Properties dialog.

ExportSelection

Description

Specifies which runtime data of the control is exported.

Access in Runtime: Read and write

Syntax

Object.**ExportSelection**[=ExportRange]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl

- TrendRulerControl
- UserArchiveControl

ExportRange

Value	Description	Explanation
0	all	All Runtime data of the control is exported.
1	Selection	Selected Runtime data of the control is exported.

ExportShowDialog

Description

Enables the display of the export dialog during runtime.

Access in runtime: Read and write

Syntax

Object.**ExportShowDialog**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

Optional TRUE, if the dialog box is shown in Runtime.

ExtendedZoomingEnable

Description

Specifies whether the operator can zoom the screen in or out in runtime by turning the mouse wheel.

Access during runtime: Read and write

Syntax

Object.**ExtendedZoomingEnable**[=BOOLEAN]

Object

Necessary. A "Screen" object.

BOOLEAN

Optional TRUE, if the operator can zoom the screen in and out in runtime.

Example

The following example shows how the extended zoom can be enabled for the NewPDL1 screen:

```
'VBS155
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
objScreen.ExtendedZoomingEnable = 1
```

See also

Screen (Page 5000)

FieldLength

Description

Specifies that the "field length string" field is read-only.

Access in Runtime: Read and write

Syntax

Object.**FieldLength**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional. TRUE, if the "field length string" can only be read.

Used for the following object types

IOField

See also

IOField (Page 5098)

FieldLength

Description

No access in runtime.

FillColorMode

Description

Specifies the type of foreground for the selected object.

Access in Runtime: Read and write

Syntax

Object.**FillColorMode**[=SymbolLibraryColorMode]

Object

Required A "ScreenItem" object with following format:

- SymbolLibrary

SymbolLibraryColorMode

hmiSymbolLibraryAppearanceOriginal (0): The surface is gray.

hmiSymbolLibraryAppearanceShaded (1): The display is shaded.

hmiSymbolLibraryAppearanceSolid (2): The display is solid.

hmiSymbolLibraryAppearanceTransparent (3): The display is gray.

FillPatternColor

Description

Specifies the color of the fill pattern for the selected object.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**FillPatternColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- ComboBox
- Ellipse
- EllipseSegment
- GraphicView
- IOField
- ListBox
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- AlarmControl
- DateTimeField
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant that establishes the color of the fill pattern for the specified object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

FillStyle

Description

Determines the fill style of the specified object.

Access in runtime: Read and write

Syntax

Object.**FillStyle**[=LineFillStyle]

Object

Required. A "ScreenItem" object with the following format:

- Line
- Polyline

LineFillStyle

Optional A value or a constant that specifies the fill style.

hmiLineFillStyleTransparent (0): Transparent fill

hmiLineFillStyleSolid (1): Object is filled with the specified color

Default setting: hmiLineFillStyleSolid

FillstyleAlignment

Description

Specifies the alignment within the specified object.

Filter

Description

No access in runtime.

FilterTag

Description

No access in runtime.

FilterText

Description

No access in runtime.

FirstConnectedObjectIndex

Description

Specifies the index number of the upper connector point.

Access in Runtime: Read and write

Syntax

Object.**FirstConnectedObjectIndex**[=Int]

Object

Required A "ScreenItem" object with the format "Connector".

Int

Int

See also

Connector (Page 5058)

FirstConnectedObjectName

Description

Specifies the object name of the object that is docked at the upper connector point.

Access in Runtime: Read and write

Syntax

Object.**FirstConnectedObjectName**[=String]

Object

Required A "ScreenItem" object with the format "Connector".

String

String

See also

Connector (Page 5058)

FitToLargest

Description

No access in runtime.

FitToSize

Description

No access in runtime.

FixedAspectRatio

Description

Specifies whether the aspect ratio should be maintained or changed when the symbol size is altered.

Access in runtime: Read and write

Syntax

Object.**FixedAspectRatio**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- SymbolLibrary

BOOLEAN

Optional TRUE, if the aspect ratio should be maintained when the symbol size is altered.

FlashingColorOff

Description

Specifies the color of the border line for the selected object for the flashing status "off".

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**FlashingColorOff**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Button
- Circle
- CircleSegment
- CircularArc
- Ellipse
- EllipseSegment
- EllipticalArc
- IOField
- Line
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- SymbolicIOField
- TextField

You have no access in runtime with the following format:

- Bar
- CheckBox
- Switch
- TubeArcObject

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "off".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

FlashingColorOn

Description

Specifies the color of the border line for the selected object for the flashing status "on".

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**FlashingColorOn**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Button
- Circle
- CircleSegment
- CircularArc
- Ellipse
- EllipseSegment
- EllipticalArc
- IOField
- Line
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- SymbolicIOField
- TextField

You have no access in runtime with the following format:

- Bar
- CheckBox
- Switch
- TubeArcObject

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "on".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

FlashingEnabled

Description

Specifies whether the border line of the selected object will flash in Runtime.

Access in Runtime: Read and write

Syntax

Object.**FlashingEnable**d[=BOOLEAN]

Object

Required. A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

BOOLEAN

Optional. TRUE, if the border line of the object is flashing.

FlashingOnLimitViolation

Description

No access in runtime.

FlashingRate

Description

Specifies the flash rate of the border line for the selected object.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read/Write

Syntax

Object.**FlashingRate**[=FlashingRate]

Object

Required. An object of the "ScreenItem" type with the format:

- Button
- Circle
- CircleSegment
- CircularArc
- Ellipse
- EllipseSegment

- EllipticalArc
- GraphicIOField
- IOField
- Line
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- SymbolicIOField
- TextField

You have no access in runtime with the following format:

- Bar
- CheckBox
- Switch
- TubeArcObject

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing interval is 1000 ms.

hmiFlashingRateMedium (1): The length of the flashing interval is 500 ms.

hmiFlashingRateFast (2): The length of the flashing interval is 250 ms.

FlashTransparentColor

Description

Specifies the color of the bitmap object of a flashing graphic that is set to "transparent".

Access in Runtime: Read and write

Syntax

Object.**FlashTransparentColor**[=Color]

Object

Required A "ScreenItem" object with the format "GraphicIOField".

Color

Optional A value or a constant that specifies the color of the bitmap object of a flashing graphic that is set to "transparent".

See also

GraphicIOField (Page 5088)

Flip

Description

Flips the symbol on the vertical and / or horizontal center axis of the symbol.

Access in Runtime: Read and write

Syntax

Object.**Flip**[=SymbolLibraryFlip]

Object

Required A "ScreenItem" object with following format:

- SymbolLibrary

SymbolLibraryFlip

hmiSymbolLibraryFlipNone (0): The symbol is not flipped.

hmiSymbolLibraryFlipHorizontal (1): The symbol is flipped horizontally.

hmiSymbolLibraryFlipVertical (2): The symbol is flipped vertically.

hmiSymbolLibraryFlipBoth (3): The symbol is flipped horizontally and vertically.

FocusColor

Description

Specifies that the color for the focus border of the selected object is currently active.

Access in runtime: Read and write

Syntax

Object.**FocusColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- AlarmView
- RecipeView
- Slider
- StatusForce

- Switch
- TrendView

You have no access in runtime with the following format:

- Button
- GraphicIOField
- SymbolicIOField

Color

Optional A value or a constant that specifies the color of the focus border.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

FocusWidth

Description

Specifies the border width of the specified object if the object is currently active.

Access in runtime: Read and write

Syntax

Object.**FocusWidth**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmView
- RecipeView
- Slider
- StatusForce
- Switch
- TrendView

You have no access in runtime with the following format:

- Button
- GraphicIOField
- SymbolicIOField

Int32

Optional A value or a constant that specifies the border width in pixels. Value range from 1 to 10.

Font

Description

Specifies or returns the font.

The font object has the following sub-properties

- Size (Font Size)
- Bold (yes/no)
- Name (font name)
- Italic (yes/no)
- Underline (underline yes/no)
- StrikeThrough (yes/no)

If two font properties are directly assigned, only the default property "Name" is assumed.

Access during runtime: Read and write

Syntax

Object.**Font**[=Font]

Object

Required. An object of the "ScreenItem" type with the format:

AlarmControl

Clock

FunctionTrendControl

OnlineTableControl

OnlineTrendControl

Slider

TrendRulerControl

UserArchiveControl

You have no access in runtime with the following format:

- Bar
- Button
- CheckBox
- ComboBox

- DateTimeField
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- ProtectedAreaNameView
- RangeLabelView
- RecipeView
- RoundButton
- SmartClientView
- Switch
- SymbolicIOField
- TextField
- TrendView
- ZoneLabelView

Font

Font

Example

```
'VBS74
Dim objControl1
Dim objControl2
Set objControl1 = ScreenItems("Control1")
Set objControl2 = ScreenItems("Control2")
objControl2.Font = objControl1.Font ' take over only the type of font
```

FontBold

Description

Specifies whether the text of the selected object should be shown in bold.

Access in runtime: Read and write

Syntax

Object.**FontBold**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- TextField
- Bar
- Button
- CheckBox
- ComboBox
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- RoundButton
- SymbolicIOField

BOOLEAN

Optional TRUE, if the text of the selected object should be shown in bold.

FontItalic

Description

Specifies whether the text of the selected object should be shown in italic.

Access in runtime: Read and write

Syntax

Object.**FontItalic**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- TextField
- Button
- CheckBox
- ComboBox
- IOField
- ListBox
- MultiLineEdit
- OptionGroup

- RoundButton
- SymbolicIOField

BOOLEAN

Optional TRUE, if the text of the selected object should be shown in italic.

FontName

Description

Specifies the font of the selected object.

Access in runtime: Read and write

Syntax

Object.**FontName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- TextField
- Bar
- Button
- CheckBox
- ComboBox
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- RoundButton
- SymbolicIOField

STRING

Optional A value or a constant that specifies the font of the selected object.

FontSize

Description

Specifies the font size of the text for the selected object.

Access in runtime: Read and write

Syntax

Object.**FontSize**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- TextField
- Bar
- Button
- CheckBox
- ComboBox
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- RoundButton
- SymbolicIOField

Int32

Optional A value or a constant that specifies the font size of the text for the selected object.

FontUnderline

Description

Specifies whether the text of the selected object should be underlined.

Access in runtime: Read and write

Syntax

Object.**FontUnderline**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- TextField
- Button
- CheckBox
- ComboBox
- IOField
- ListBox

- MultiLineEdit
- OptionGroup
- RoundButton
- SymbolicIOField

BOOLEAN

Optional TRUE, if the text of the selected object should be shown underlined.

ForeColor

Description

Specifies the font color of the text for the selected object.

Access in runtime: Read and write

Syntax

Object.**ForeColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Button
- CheckBox
- ComboBox
- DateTimeField
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- RecipeView
- RoundButton
- Slider
- Switch
- SymbolLibrary
- SymbolicIOField
- TextField

You have no access in runtime with the following format:

- AlarmView

Color

Optional A value or a constant that specifies the font color of the text for the selected object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

ForeColorTransparency

Description

No access in runtime.

FormatPattern

Description

Specifies the format of the output value.

Access in runtime: Read

Syntax

Object.**FormatPattern**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- IOField

STRING

Optional A value or a constant that specifies the format of the output value.

Free

Description

Returns the size of the free disk space.

Access in runtime: Read and write

Syntax

Object.**Free**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

DOUBLE

Optional A value or a constant that returns the size of the free disk space.

FreePercent

Description

Returns the measured values for the free disk space as a percentage. The values can be queried in Runtime. The values cannot be predefined.

Access in runtime: Read and write

Syntax

Object.**FreePercent**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

Int32

Optional A value or a constant that returns the measured values for the free disk space as a percentage.

Properties G-H

Gradation

Description

Specifies the value difference between two main marking lengths of the "Gauge" object.

Access in runtime: Read and write

Syntax

Object.**Gradation**[=SINGLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

SINGLE

Optional A value or a constant that specifies the value difference.

GraphDirection

Description

Specifies at which border of the trend view the current values are displayed.

Access in Runtime: Read and write

Syntax

Object.**GraphDirection**[=GraphDirection]

Object

Required A "ScreenItem" object with following format:

- FunctionTrendControl
- OnlineTrendControl

GraphDirection

0: Positive values run to the right and upwards.

-1: Positive values run to the left and upwards.

-2: Positive values run to the right and upwards.

-3: Positive values run to the right and downwards.

GridLineColor

Description

Specifies the color for the grid lines.

Access in runtime: Read and write

Syntax

Object.**GridLineColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- AlarmView
- OnlineTableControl

- TrendRulerControl
- UserArchiveControl

You have no access in runtime with the following format:

- TrendView

Color

Optional A value or a constant that specifies the color of the grid lines.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

GridlineFillColor

Description

No access in runtime.

GridlineStyle

Description

No access in runtime.

GridLineWidth

Description

Defines the line weight of the row/column dividers in pixels.

Access in runtime: Read and write

Syntax

Object.**GridLineWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl

- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant which specifies the width of the grid line.

HeaderFont

Description

No access in runtime.

Height

Description

Specifies the height of the specified object.

Access in runtime: Read and write

Syntax

Object.**Height**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- AlarmView
- ApplicationWindow
- Bar
- BatteryView
- Button
- ChannelDiagnose
- CheckBox
- Circle
- CircleSegment
- CircularArc
- Clock
- ComboBox
- DateTimeField
- DiscSpaceView

- Ellipse
- EllipseSegment
- EllipticalArc
- FunctionTrendControl
- Gauge
- GraphicIOField
- GraphicView
- HTML-Browser
- IOField
- Line
- ListBox
- MediaPlayer
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- PLCCodeViewer
- Polygon
- Polyline
- ProtectedAreaNameView
- RangeLabelView
- RangeQualityView
- RecipeView
- Rectangle
- RoundButton
- Screenwindow
- Slider
- SmartClientView
- StatusForce
- Switch
- SymbolLibrary
- SymbolicIOField
- SysDiagControl
- TextField
- TrendRulerControl

- TrendView
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject
- Tubepolyline
- UserArchiveControl
- UserView
- WLanQualityView
- WindowsSlider
- ZoneLabelView
- ZoneQualityView

You have no access in runtime with the following format:

- S7GraphOverview

Int32

Optional A value or a constant that specifies the height in pixels.

Example

The following example halves the height of all objects of the image "NewPDL1", whose name starts with "Circle":

```
'VBS75
Dim objScreen
Dim objCircle
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'Searching all circles
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
If "Circle" = Left(strName, 6) Then
'
'to halve the height of the circles
Set objCircle = objScreen.ScreenItems(strName)
objCircle.Height = objCircle.Height / 2
End If
Next
```

HelpText

Description

Returns the tooltip that is shown in Runtime as an operating aid for the specified object.

Access in runtime: Read

Syntax

Object.**HelpText**[=STRING]

Object

Required. An object of the "ScreenItem" type with the format:

- Button
- DateTimeField
- GraphicIOField
- IOField
- Switch
- SymbolicIOField
- TrendView

STRING

Optional. A value or constant that specifies the contents of the tooltip that is shown in runtime as an operator aid for the specified object.

HiddenInput

Description

Specifies whether the input value or a * for each character will be shown during the input.

Access in runtime: Read and write

Syntax

Object.**HiddenInput**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- IOField

BOOLEAN

Optional TRUE, if the input value is not shown during the input. An * is shown for each character.

HighLimitColor

Description

Specifies the color of the top or right scroll button in a scroll bar.

Access in runtime: Read and write

Syntax

Object.**HighLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- WindowsSlider

Color

Optional A value or a constant that specifies the color of the top or right scroll button in a scroll bar.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

Hitlist

Description

No access in runtime.

HitlistColumnAdd

Description

Transfers the selected alarm text block from the list of available alarm text blocks to the list of selected alarm text blocks.

Access in runtime: Read and write

Syntax

Object.**HitlistColumnAdd**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Transfers the selected alarm text block from the list of available alarm text blocks to the list of selected alarm text blocks.

HitlistColumnCount

Description

Specifies the number of alarm text blocks displayed in the hit list in Runtime.

Access in runtime: Read and write

Syntax

Object.**HitlistColumnCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Specifies the number of alarm text blocks displayed in the hit list in Runtime.

HitlistColumnIndex

Description

References a alarm text block selected for the hit list. Using this attribute you can assign the values of other attributes to a specific alarm text block of the hit list.

Values between 0 and "HitlistColumnCount" minus 1 are valid for "HitlistColumnIndex". The attribute "HitlistColumnCount" defines the number of alarm text blocks selected for the hit list. The "HitlistColumnIndex" attribute can be dynamized with the **HitlistColumnRepos** attribute.

Access in runtime: Read and write

Syntax

Object.**HitlistColumnIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional References a alarm text block selected for the hit list.

HitlistColumnName

Description

Specifies the name of the alarm text block of the hit list that is referenced with the "HitlistColumnIndex" attribute. You cannot edit this name.

Access in runtime: Read and write

Syntax

Object.**HitlistColumnName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies the name of the alarm text block of the hit list that is referenced with the "HitlistColumnIndex" attribute.

HitlistColumnRemove

Description

Removes the marked alarm text block from the list of selected alarm text blocks and inserts it in the list of existing alarm text blocks.

Access in runtime: Read and write

Syntax

Object.**HitlistColumnRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Removes the marked alarm text block from the list of selected alarm text blocks and inserts it in the list of existing alarm text blocks.

HitlistColumnRepos

Description

Changes the order of the alarm text blocks. The "Up" and "Down" commands move the selected alarm text block accordingly in the list. This moves the alarm text block in Runtime Control towards the front or towards the back.

Access in runtime: Read and write

Syntax

Object.**HitlistColumnRepos**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Changes the order of the alarm text blocks.

HitlistColumnSort

Description

Specifies the sorting order in the hit list for the alarm text block that is referenced in "HitlistColumnIndex".

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnSort**[**=**SortMode]

Object

Required A "ScreenItem" object with following format:

- AlarmControl

SortMode

0: No sorting.

1: Ascending sorting from the lowest to highest value

2 Descending sorting from the highest to lowest value

HitlistColumnSortIndex

Description

Defines the sorting order of the alarm text block referenced in "HitlistColumnIndex" in the hit list. If you set the value to "0", the sorting criterion is removed in "HitlistColumnSort".

Access in runtime: Read and write

Syntax

Object.**HitlistColumnSortIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Defines the sorting order of the alarm text block referenced in "HitlistColumnIndex" in the hit list. If you set the value to "0", the sorting criterion is removed in "HitlistColumnSort".

HitlistColumnVisible

Description

Specifies a list with the selected alarm text blocks of the hit list which are used in the control in Runtime.

Access in runtime: Read and write

Syntax

Object.**HitlistColumnVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

Optional Specifies a list with the selected alarm text blocks of the hit list which are used in the control in Runtime.

HitlistDefaultSort

Description

Defines the default sorting order in the table columns of the hit list.

Access in Runtime: Read and write

Syntax

Object.**HitlistDefaultSort**[=SortMode]

Object

Required A "ScreenItem" object with following format:

- AlarmControl

SortMode

0: The list is sorted in ascending order of frequency.

1:: The list is sorted in descending order of frequency.

HitlistMaxSourceItems

Description

Specifies the maximum number of data records that can be used from the alarm log to create the hit list. The value can be anything between "0 - 10000".

Access in runtime: Read and write

Syntax

Object.**HitlistMaxSourceItems**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional A value or a constant that specifies the maximum number of data records that can be used from the alarm log to create the hit list.

HitlistMaxSourceItemsWarn

Description

Specifies whether a warning should be given if the maximum number of data records that is defined in "HitlistMaxSourceItems" is reached.

Access in Runtime: Read and write

Syntax

Object.**HitlistMaxSourceItemsWarn**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional. TRUE, if a warning is given as soon as the maximum number of data records that is defined in "HitlistMaxSourceItems" is reached.

See also

AlarmControl (Page 5018)

HitListRelTimeFactor

Description

Specifies the time factor which, alongside the time type "HitlistRelTimeFactorType", determines the time period in which the statistics of the hit list will be created.

If you do not wish to specify a period of time, set the time factor to "0".

Access in Runtime: Read and write

Syntax

Object.**HitlistRelTimeFactor**[=Long]

Object

Required. A "ScreenItem" object with the format "AlarmControl".

Long

Optional. A value or a constant that specifies the time factor.

See also

AlarmControl (Page 5018)

HitlistRelTimeFactorType

Description

Specifies the time type which, alongside the time factor "HitlistRelTimeFactor", determines the time period in which the statistics of the hit list will be created.

Access in Runtime: Read and write

Syntax

Object.**HitlistRelTimeFactorType**[=AlarmViewAdvancedTimeFactorUnit]

Object

Required. A "ScreenItem" object with the format "AlarmControl".

AlarmViewAdvancedTimeFactorUnit

hmiAlarmViewAdvancedTimeFactorUnitMinute (0): The time range for the statistics will be measured in minutes.

hmiAlarmViewAdvancedTimeFactorUnitHour (1): The time range for the statistics will be measured in hours.

hmiAlarmViewAdvancedFactorUnitDay (2): The time range for the statistics will be measured in days.

hmiAlarmViewAdvancedTimeFactorUnitWeek (3): The time range for the statistics will be measured in weeks.

hmiAlarmViewAdvancedTimeFactorUnitMonth (4): The time range for the statistics will be measured in months.

See also

AlarmControl (Page 5018)

HitListRelTime

Description

Sets a time range for the statistics.

If you do not wish to specify a time period, set the time factor to "0".

Access in runtime: Read and write

Syntax

Object.**HitListRelTime** [=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: If no time range is specified in the selection, the specified time range is used for the statistics.

FALSE: The specified time range is not used.

HorizontalAlignment

Description

Specifies the horizontal alignment of the text within the specified object.

Access in runtime: Read and write

Syntax

Object.**HorizontalAlignment**[=HorizontalAlignment]

Object

Required. A "ScreenItem" object with the following format:

- Button
- CheckBox
- ComboBox
- DateTimeField
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- RoundButton
- Switch
- SymbolicIOField
- TextField

HorizontalAlignment

Optional A value or a constant that specifies the horizontal alignment of the text.

hmiAlignmentLeft (0):The text is arranged flush left in the object.

hmiAlignmentCentered (1): The text is arranged horizontally centered in the object.

hmiAlignmentRight (2): The text is arranged flush right in the object.

HorizontalGridLines

Description

Defines whether horizontal separating lines will be displayed.

Access in runtime: Read and write

Syntax

Object.**HorizontalGridLines**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: Horizontal grid lines are displayed.

FALSE: Horizontal grid lines are not displayed.

HorizontalScrollBarPosition

Description

Specifies the horizontal offset of the scroll bar in a screen window with scroll bar.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the screen as a cutout where the scroll bars are located at the left and top edge of the screen, use the OffsetLeft" and "OffsetTop" properties as the source of this cutout.

Access in runtime: Read and write

Syntax

Object.**HorizontalScrollBarPosition**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- ScreenWindow

Int32

Optional A value or constant that specifies the horizontal offset of the scroll bar in a screen window with scroll bar.

Hotkey

Description

Returns the function key related to the mouse operation in respect of a button object.

Read only access.

See also

Button (Page 5040)

HourNeedleHeight

Description

Specifies the length of the hour hand in the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**HourNeedleHeight**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Int32

Optional A value or a constant that specifies the length of the hour hand.

Specify the length of the hour hand as a percentage relating to the radius of the clock face.

HourNeedleWidth

Description

Specifies the width of the hour hand in the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**HourNeedleWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Int32

Optional A value or a constant that specifies the width of the hour hand.

Specify the width of the hour hand as a percentage relating to double the length of the clock face.

Properties I-J

IconSpace

Description

Defines the spacing between the icons and text in the table cells. The value is active if and icon and text are displayed.

Access in runtime: Read and write

Syntax

Object.**IconSpace**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional Value that specifies the spacing.

Index

Description

Specifies the index for the selected text field.

Access in runtime: Read and write

Syntax

Object.**Index**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- CheckBox
- ComboBox
- ListBox
- OptionGroup

Int32

Optional A value or a constant that specifies the index of the selected text field.

InnerBackColorOff

Description

Specifies the color under the slider of the "Switch" object if the object is in OFF status.

Access in runtime: Read and write

Syntax

Object.**InnerBackColorOff**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Switch

Color

Optional A value or a constant that specifies the color for the OFF status.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

InnerBackColorOn

Description

Specifies the color under the slider of the "Switch" object if the object is in ON status.

Access in runtime: Read and write

Syntax

Object.**InnerBackColorOn**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Switch

Color

Optional A value or a constant that specifies the color for the ON status.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

InputValue

Description

Defines the value entered by the user in the IO field. The value is not displayed in the I/O field when the property is set.

If you want the value to be displayed in the I/O field after confirmation with the <Return> key, configure a direct connection between the "input value" and "output value" properties. The direct connection is only useful when no tag connection is configured at the output value but the user still wants to query the specified value, for example with a script.

Access in runtime: Read and write

Syntax

Object.**InputValue**[=Object]

Object

Required. A "ScreenItem" object with the following format:

- IOField
- SymbolicIOField

Object

Optional A value or a constant that specifies the input value.

Instance

Description

Returns an instance of the alarm object.

IntegerDigits

Description

Establishes the number of integer digits (0 to 20).

Access in runtime: Read and write

Syntax

Object.**IntegerDigits**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Int32

Optional A value or a constant that specifies the number of integer digits (0 to 20).

Interval

Description

Specifies the time interval for updating the displayed measured value. You enter the value in minutes.

Access in runtime: Read and write

Syntax

Object.**Interval**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

Int32

Optional A value or a constant that specifies the time interval for updating the measured values.

ItemBorderStyle

Description

Specifies the line style of the separation lines in the selection list of the selected object.

Access in runtime: Read and write

Syntax

Object.**ItemBorderStyle**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

Int32

hmiLineStyleNone (-1): The selection list has no separation lines.

hmiLineStyleSolid (0): The selection list has solid separation lines.

hmiLineStyleDash (1): The selection list has broken separation lines.

hmiLineStyleDot (2): The selection list has dotted separation lines.

hmiLineStyleDashDot (3): The selection list has dash - dot lines as separation lines.

hmiLineStyleDashDotDot (4): The selection list has dash - dot - dot lines as separation lines.

JumpToLimitsAfterMouseClick

Description

Specifies whether the slider will be set to the associated end value. The end value is the minimum or maximum value. To set the slider to the end value, users click on the area outside of the current slider setting.

Access in runtime: Read and write

Syntax

Object.**JumpToLimitsAfterMouseClick**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- WindowsSlider

BOOLEAN

Optional TRUE, if the slider will be set to the associated end value.

Properties K-L

LabelColor

Description

Specifies the color of the scale label in the "Slider" object.

Access in runtime: Read and write

Syntax

Object.**LabelColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Slider

Color

Optional A value or a constant that specifies the color of the scale label.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

Language

Description

Determines the current Runtime language.

Access in Runtime: Read and write

Syntax

Object.**Language**[= LONG]

Object

Required A "HMIRuntime" object.

LONG

Optional A value or a constant that specifies the national code.

Comments

Specify the Runtime language in VBS with a national code, e.g. 1031 for German, 2057 for English etc.. Refer to the VBScript basics under the topic "Current local ID (LCID) diagram" for an overview of all the national codes.

See also

HMIRuntime (Page 4993)

LargeTicksBold

Description

Specifies whether the long marking lengths of a scale are shown in bold.

Access in runtime: Read and write

Syntax

Object.**LargeTicksBold**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the long marking lengths of a scale are shown in bold.

LargeTicksSize

Description

Specifies the length of the long marking lengths of a scale.

Access in runtime: Read and write

Syntax

Object.**LargeTicksSize**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Int32

Optional A value or a constant that specifies the length of the long marking lengths of a scale.

LastConnectedObjectIndex

Description

Specifies the index number of the connection point for the last, connected object.

Access in Runtime: Read and write

Syntax

Object.**LastConnectedObjectIndex**[=Int]

Object

Required A "ScreenItem" object with the format "Connector".

Int

Int

See also

Connector (Page 5058)

LastConnectedObjectName

Description

Specifies the object name of the object that is docked at the lower connector point.

Access in Runtime: Read and write

Syntax

Object.**LastConnectedObjectName**[=String]

Object

Required A "ScreenItem" object with the format "Connector".

String

String

See also

Connector (Page 5058)

LastError

Description

Returns an error code regarding the success of the last operation, e.g. information on a tag write or read process:

Code in hexadecimal notation	Description
0x00000000	OK
0x80040001	Execution error
0x80040002	Tag error
0x80040003	Server not available.
0x80040004	Multi Tag Error; error in one or several tags

To obtain an error description, first of all carry out the Read method.

Note

If the error occurs when accessing via the TagSet object, evaluate the LastError property for each tag of the TagSet object.

To obtain a statement about the quality of the supplied value, use the "QualityCode" property. To obtain a description of the error, use the "ErrorDescription" property.

Access during runtime: Read

Syntax

Object.**LastError**

Object

Necessary. A "Tag" object.

Example

The following example shows the error code for the "Tag1" tag:

```
'VBS77
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.LastError
```

The following example adds two tags to the TagSet list and outputs the LastError property as Trace:

```
'VBS178
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "LastError: " & group.LastError & vbNewLine
```

The LastError property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "LastError: " & group("Motor1").LastError & vbNewLine
```

See also

Tag (Page 5012)

TagSet (list) (Page 5016)

Layer

Description

Returns the layer that contains an object as LONG in the screen. There is a total of 32 layers available, whereby Layer "0" is the bottom layer and Layer "31" the top layer.

The configured objects are initially in the background of a layer.

Access during runtime: Read

Syntax

Object.**Layer**

Object

Necessary. A "ScreenItem" object.

Note

The Layer property specifies the layer in which the object is located. The layer "0" is output as layer "0".

When accessed, the layers are counted up from 1 in VBS. Therefore, address the level "1" with layers(2).

Example

The following example displays the name and layer of all objects in the screen "NewPDL1":

```
'VBS78
Dim objScreen
Dim objScrItem
Dim lngAnswer
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
lngAnswer = MsgBox(strName & " is in layer  " & objScrItem.Layer,vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

LayerDeclutteringEnable

Description

Indicates whether the layers of a screen can be shown or hidden dependent on the set minimum and maximum zoom.

Access during runtime: Read

Syntax

Object.**LayerDeclutteringEnable**

Object

Necessary. A "Screen" object.

Example:

The example outputs the LayerDecluttering property of the "NewPDL1" screen as Trace.

```
'VBS156
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 5000)

Layers

Description

Returns an object of type "Layers".

Access in Runtime: Read

Syntax

Object.**Layers**

Object

Required A "Screen" object.

See also

Screen (Page 5000)

Left

Description

Specifies the value of the X coordinate of the selected object.

Access in runtime: Read and write

Syntax

Object.**Left**[=DOUBLE]

Object

Required. A "ScreenItem" object. This property is a standard property of the ScreenItem-Objekts and is therefore available for all formats.

DOUBLE

Optional A value or a constant that contains the value of the X coordinate in pixels (measured from the top left edge of the screen).

Comments

The X coordinate refers to the top left corner of the rectangle that surrounds the object. The screen limits are also monitored in runtime. If the assigned coordinate value exceeds the display size, the user-defined function is interrupted with an error message.

Used for the following object types:

Auto-Hotspot

Auto-Hotspot

Auto-Hotspot

LeftOffset

Description

Specifies the distance between the screen and the left screen window margin.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the screen in the screen window with horizontal and vertical offset of the screen scroll bars, use the "HorizontalScrollBarPosition" and "VerticalScrollBarPosition properties for the offset.

Access in runtime: Read and write

Syntax

Object.**LeftOffset**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Screenwindow

Int32

Optional A value or a constant that specifies the distance between the screen and the left screen window margin.

Limit4LowerLimit

Description

Specifies the lower limit for ""Reserve4".

The "Limit4LowerLimitEnabled" property must be set to TRUE so that the limit "Reserve4"" can be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit4LowerLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the low limit for "Reserve4".

Comments

The "Limit4LowerLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

Limit4LowerLimitColor

Description

Specifies the color for the lower limit "Reserve4".

The "Limit4LowerLimitEnabled" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in runtime: Read and write

Syntax

Object.**Limit4LowerLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the lower limit ""Reserve4".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

Limit4LowerLimitEnabled

Description

Specifies whether the lower limit ""Reserve4"" is to be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit4LowerLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the lower limit ""Reserve4" is to be monitored.

Comments

The following values will be specified with the properties ""Limit4LowerLimit", "Limit4LowerLimitColor" and "Limit4LowerLimitRelative"":

- Limit
- Representation upon reaching the limit
- Type of evaluation

Limit4LowerLimitRelative

Description

Specifies whether the lower limit "Reserve4" is evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**Limit4LowerLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional

TRUE: The lower limit "Reserve4" is evaluated as a percentage.

FALSE: The lower limit "Reserve4" is evaluated as an absolute value.

Limit4UpperLimit

Description

Specifies the lower limit for "Reserve4".

The "Limit4UpperLimitEnabled"" property must be set to TRUE so that the limit ""Reserve4" can be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit4UpperLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the upper limit for "Reserve4".

Comments

The "Limit4UpperLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

Limit4UpperLimitColor

Description

Specifies the color for the upper limit ""Reserve4".

The "Limit4UpperLimitEnabled"" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in runtime: Read and write

Syntax

Object.**Limit4UpperLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the upper limit "Reserve4".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

Limit4UpperLimitEnabled

Description

Specifies whether the upper limit "Reserve4" is to be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit4UpperLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the upper limit ""Reserve4" is to be monitored.

Comments

The following values are defined via the properties ""Limit4UpperLimit", "Limit4UpperLimitColor" and "Limit4UpperLimitRelative":

- Limit
- Representation upon reaching the limit
- Type of evaluation

Limit4UpperLimitRelative

Description

Specifies whether the upper limit "Reserve4" is to be evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**Limit4UpperLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional

TRUE: The lower limit "Reserve4" is evaluated as a percentage.

FALSE: The lower limit "Reserve4" is evaluated as an absolute value.

Limit5LowerLimit

Description

Specifies the lower limit for "Reserve5"".

The "Limit5LowerLimitEnabled" property must be set to TRUE so that the limit ""Reserve5" can be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit5LowerLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the lower limit for "Reserve5"".

Comments

The "Limit5LowerLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

Limit5LowerLimitColor

Description

Specifies the color for the lower limit ""Reserve5"".

The "Limit5LowerLimitEnabled" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in runtime: Read and write

Syntax

Object.**Limit5LowerLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the lower limit ""Reserve5".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

Limit5LowerLimitEnabled

Description

Specifies whether the lower limit "Reserve5" is to be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit5LowerLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the lower limit ""Reserve5" is to be monitored.

Comments

The following values will be defined via the properties "Limit5LowerLimit", "Limit5LowerLimitColor" and "Limit5LowerLimitRelative":

- Limit
- Representation upon reaching the limit
- Type of evaluation

Limit5LowerLimitRelative

Description

Specifies whether the lower limit ""Reserve5" is to be evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**Limit5LowerLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional

TRUE: The lower limit "Reserve5" is evaluated as a percentage.

FALSE: The lower limit "Reserve5" is evaluated as an absolute value.

Limit5UpperLimit

Description

Specifies the lower limit for "Reserve5".

The ""Limit5UpperLimitEnabled" property must be set to TRUE so that the limit ""Reserve5" can be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit5UpperLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the upper limit for ""Reserve5".

Comments

The "TypeLimitHigh5" property specifies whether the object is evaluated as a percentage or absolutely.

Limit5UpperLimitColor

Description

Specifies the color for the upper limit "Reserve5"".

The "Limit5UpperLimitEnabled" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in runtime: Read and write

Syntax

Object.**Limit5UpperLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the upper limit ""Reserve5".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

Limit5UpperLimitEnabled

Description

Specifies whether the upper limit "Reserve5" is to be monitored.

Access in runtime: Read and write

Syntax

Object.**Limit5UpperLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the upper limit ""Reserve5"" is to be monitored.

Limit5UpperLimitRelative

Description

Specifies whether the upper limit "Reserve5" is to be evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**Limit5UpperLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional

TRUE: The higher limit "Reserve5" is evaluated as a percentage.

FALSE: The higher limit "Reserve5" is evaluated as an absolute value.

LineColor

Description

Defines the color of the window separation lines. Open the "Color selection" dialog by clicking the button.

Access in runtime: Read and write

Syntax

Object.**LineColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant that specifies the color of the window separation lines.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

LineEndShapeStyle

Description

Specifies the shape of the line ends.

Access in runtime: Read and write

Syntax

Object.**LineEndShapeStyle**[=LineEndShapeStyle]

Object

Required. An object of the "ScreenItem" type with the following format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- CircularArc
- ComboBox
- Ellipse
- EllipseSegment

- EllipticalArc
- GraphicIOField
- GraphicView
- IOField
- Line
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- SymbolicIOField
- TextField
- WindowsSlider
- Switch

You have no access in runtime with the following formats:

- Switch
- TubeArcObect

LineEndShapeStyle

Optional. A value or a constant that specifies the form of the line ends.

LineWidth

Description

Specifies the line weight of the selected object.

Access in runtime: Read and write

Syntax

Object.**LineWidth**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- CircularArc
- EllipticalArc

- FunctionTrendControl
- Line
- OnlineTableControl
- OnlineTrendControl
- Polyline
- TrendRulerControl
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject
- Tubepolyline
- UserArchiveControl

You have no access in runtime with the following format:

- Polygon

Int32

Optional A value or a constant that specifies the line weight in pixels.

LoadDataImmediately

Description

Specifies whether in the event of a screen refresh the tag values should be downloaded from the archives for the time range that is to be shown.

Access in runtime: Read and write

Syntax

Object.**LoadDataImmediately**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl

BOOLEAN

Optional TRUE, if in the event of a screen the tag values should be downloaded from the archives for the time range that is to be shown.

LocalCursor

Description

No access in runtime.

LockSquaredExtent

Description

Specifies whether the size of the clock can be adjusted with the mouse.

Access in runtime: Read and write

Syntax

Object.**LockSquaredExtent**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Clock
- Gauge

BOOLEAN

Optional TRUE, if the size of the clock can be adjusted by dragging the mouse on the selection points to the desired aspect ratio.

Logging

Description

Returns an object of type "Logging".

Access in Runtime: Read

Syntax

Object.**Logging**

Object

Required A "HMIRuntime" object.

See also

HMIRuntime (Page 4993)

LogOperation

Description

Specifies whether, after operating this object, an alarm is output on the alarm system.

Access in runtime: Read and write

Syntax

Object.**LogOperation**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- CheckBox
- ComboBox
- IOField
- ListBox
- OptionGroup
- SymbolicIOField
- WindowsSlider

BOOLEAN

Optional TRUE, if, after operating this object, an alarm is output on the alarm system.

LongTermArchiveConsistency

Description

This setting defines how alarms are displayed in the historical alarm list (long-term).

Access in runtime: Read and write

Syntax

Object.**LongTermArchiveConsistency**[= BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl

BOOLEAN

Value	Explanation
TRUE	The 1000 most recent alarms are displayed on the client of all servers or the redundant server pair in the historical alarm list (long-term)
FALSE	1000 alarms are displayed in the historical alarm list (long-term) on the single-user system, server or client for each server, or for each redundant server pair.

LowerLimit

Description

Specifies the lower limit for input values.

Access in runtime: Read and write

Syntax

Object.**LowerLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- IOField

DOUBLE

Optional A value or a constant that specifies the lower limit for input values.

LowLimitColor

Description

Specifies the color of the bottom or left scroll button in a scroll bar.

Access in runtime: Read and write

Syntax

Object.**LowLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- WindowsSlider

Color

Optional A value or a constant that specifies the color of the bottom or left scroll button in a scroll bar.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

Properties M-N

MachineName

Description

Specifies the network code of the device that is to be monitored.

Enter the name or the port of the device as the network code.

Access in runtime: Read and write

Syntax

Object.**MachineName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- SmartClientView

STRING

Optional A value or a constant that contains the network code.

MarginToBorder

Description

Specifies the width of the 3D border in pixels. The value of the width is dependent on the size of the object.

Access in runtime: Read and write

Syntax

Object.**MarginToBorder**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- WindowsSlider

Int32

Optional A value or a constant that specifies the width of the 3D border in pixels.

MaximumValue

Description

Specifies the maximum value of the scale in the selected object.

Access in runtime: Read and write

Syntax

Object.**MaximumValue**[=DOUBLE | Int32 | SINGLE]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Gauge
- Slider
- WindowsSlider

DOUBLE | Int32 | SINGLE

Optional A value or a constant that specifies the maximum value. The data type depends on the format.

- DOUBLE: Bar
- Int32: Slider, WindowsSlider
- SINGLE: Gauge

MenuToolBarConfig

Description

Loads the given configuration file with configured menu and toolbars or returns the name of the configuration file.

Access in Runtime: Read and write

Syntax

Object.**MenuToolBarConfig**[=HmiObjectHandle]

Object

Required. An object of the "ScreenItem" type with the format:

- Screenwindow

HmiObjectHandle

Optional The configuration file with user-defined menu and toolbars.

MessageBlockAlignment

Description

Aligns the contents of a selected message block in the table.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockAlignment** [=HorizontalAlignment]

Object

Required. An object of the "ScreenItem" type with the format "AlarmContro", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

HorizontalAlignment

Value	Description	Explanation
0	Left	Aligns the contents of a selected message block to the left.
1	Centered	Aligns the contents of a selected message block to the center.
2	Right	Aligns the contents of a selected message block to the right.

See also

AlarmControl (Page 5018)

MessageBlockAutoPrecisions

Description

Enables automatic setting of the number of decimal places.

Access in runtime: Read and write

Syntax

Object.**MessageBlockAutoPrecisions**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value in the "Decimal places" field is effective.

MessageBlockCaption

Description

Specifies the caption of the column header in the alarm view for the selected alarm text block. You can only edit the labels after having disabled the "Apply project settings" option. The entered caption is effective in all Runtime languages.

Access in runtime: Read and write

Syntax

Object.**MessageBlockCaption**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies the caption of the column header in the alarm view for the selected alarm text block.

MessageBlockCount

Description

Specifies the number of existing alarm text blocks that are available for the alarm list and hit list.

Access in runtime: Read and write

Syntax

Object.**MessageBlockCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Specifies the number of existing alarm text blocks that are available for the alarm list and hit list.

MessageBlockDateFormat

Description

Defines the date format for displaying messages.

Access in runtime: Read and write

Syntax

Object.**MessageBlockDateFormat**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.10.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2010.
dd/MM/yy	Day/Month/Year, e.g. 24/12/10.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2010.

MessageBlockExponentialFormat

Description

Specifies the exponential notation for visualization of the values of a selected alarm text block.

Access in runtime: Read and write

Syntax

Object.**MessageBlockExponentialFormat**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are displayed in decimal format.

MessageBlockFlashOn

Description

Enables flashing of the selected alarm text block in Runtime after a message was activated.

Access in runtime: Read and write

Syntax

Object.**MessageBlockFlashOn**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The content of the alarm text block flashes.

FALSE: The content of the alarm text block does not flash.

MessageBlockHideText

Description

Enables the textual display of the content of a selected alarm text block.

Access in runtime: Read and write

Syntax

Object.**MessageBlockHideText**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The content is not shown as a text. The option is not activated.

FALSE: The content is shown as a text. The option is activated.

MessageBlockHideTitleText

Description

Specifies whether the header of the selected alarm text block is displayed as a text.

Access in runtime: Read and write

Syntax

Object.**MessageBlockHideTitleText**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The header is not shown as text. The option is not activated.

FALSE: The header is shown as text. The option is activated.

MessageBlockId

Description

Specifies the assignment of ID number and alarm text block in the alarm view.

Access in runtime: Read and write

Syntax

Object.**MessageBlockId**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Specifies the assignment of ID number and alarm text block in the alarm view.

MessageBlockIndex

Description

References an existing alarm text block. You can assign the values of other attributes to a certain alarm text block by using the attribute. Values between 0 and "MessageBlockCount minus 1 are valid for "MessageBlockIndex".

The "MessageBlockIndex" attribute can be dynamized with the **MessageBlockRepos** attribute.

Access in runtime: Read and write

Syntax

Object.**MessageBlockIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional References an existing alarm text block. Values between 0 and "MessageBlockCount minus 1 are valid for "MessageBlockIndex".

MessageBlockLeadingZeros

Description

Enables the display of selected alarm text blocks with leading zero format.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockLeadingZeros**[=Int32]

Object

Required A "ScreenItem" object with following format:

- AlarmControl

Int32

TRUE: Leading zeros are displayed. You specify the number of leading zeros in the properties.

FALSE: Leading zeros are not displayed.

MessageBlockLength

Description

Defines the length of the alarm text block selected based on the number of characters. You can only enter a value if the "Apply project settings" field is disabled.

Access in runtime: Read and write

Syntax

Object.**MessageBlockLength**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Value which specifies the length of the alarm text block.

MessageBlockName

Description

Specifies the name for the selected alarm text block.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockName**[=STRING]

Object

Required A "ScreenItem" object with the format "AlarmControl".

STRING

Optional Specifies the name for the selected alarm text block.

MessageBlockPrecisions

Description

Specifies the decimal precision of the values of a selected alarm text block. You can only enter the value if the "Automatic" option is deactivated.

Access in runtime: Read and write

Syntax

Object.**MessageBlockPrecisions**[=Int16]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int16

Optional Specifies the number of decimal places.

MessageBlockSelected

Description

The available alarm text blocks can be used in Runtime control for the alarm list or hit list.

Select the "Alarm text blocks" tab to activate existing alarm text blocks as required in the Control. Select the "Hitlist" and "Alarm list" tabs to configure the hit list and alarm list based on the available blocks.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockSelected**[=BOOLEAN]

Object

Required A "ScreenItem" object with following format:

- AlarmControl

BOOLEAN

Optional Select the "Alarm text blocks" tab to activate existing alarm text blocks as required in the Control. Select the "Hitlist" and "Alarm list" tabs to configure the hit list and alarm list based on the available blocks.

MessageBlockShowDate

Description

Enables the display of a date in the "Time" alarm text block in addition to the time.

Access in runtime: Read and write

Syntax

Object.**MessageBlockShowDate**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The date and the time are displayed.

FALSE: The time is displayed.

MessageBlockShowIcon

Description

Enables the display of the content of a selected alarm text block as icon.

Access in runtime: Read and write

Syntax

Object.**MessageBlockShowIcon**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The content is shown as a symbol.

FALSE: The content is not shown as a symbol.

MessageBlockShowTitleIcon

Description

Specifies whether the header of the selected alarm text block is displayed as a text.

Access in runtime: Read and write

Syntax

Object.**MessageBlockShowTitleIcon**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The header is shown as a symbol.

FALSE: The header is not shown as a symbol.

MessageBlockTextId

Description

Specifies the caption of the selected alarm text block using a Text ID which was derived from the text library. The caption is adapted automatically if a user changes the Runtime language.

You can only enter a text ID after having disabled the "Apply project settings" option.

Access in runtime: Read and write

Syntax

Object.**MessageBlockTextId**[=Int32]

Object

Required. A "ScreenItem" object with the format "AlarmControl".

Int32

Optional Specifies the name of the selected alarm text block using a text ID number.

MessageBlockTimeFormat

Description

Defines which time format or duration format is used for displaying the messages.

Access in runtime: Read and write

Syntax

Object.**MessageBlockTimeFormat**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss	Hours:Minutes:Seconds, e.g. 15:35:44
HH:mm:ss.ms	Hours:Minutes:Seconds.Milliseconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The following duration formats are available:

Value	Explanation
Automatic	The duration format is determined automatically.
d H:mm:ss	Day Hours:Minutes:Seconds, e.g. 1 2:03:55.
H:mm:ss.	Hours:Minutes:Seconds, e.g. 26:03:55.
m:ss	Minutes:Seconds, Example: 1563:55.
s	Seconds, e.g. 93835.

MessageBlockType

Description

Specifies the number of available message blocks which are available for the message list and hit list.

Access in runtime: Read

Syntax

Object.**MessageBlockType**[=AlarmBlockType]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl

AlarmBlockType

Value	Description	Description
0	System block	The message block belongs to the system block category
1	Text block	The message block belongs to the user text block category
2	Process value block	The message block belongs to the process value block category
3	Hitlist block	The message block belongs to the message blocks of the hitlist.

MessageColumnAdd

Description

Adds the selected alarm text block from the list of existing alarm text blocks to the list of selected alarm text blocks.

Access in runtime: Read and write

Syntax

Object.**MessageColumnAdd**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Applies the selected alarm text block from the list of existing alarm text blocks to the list of selected alarm text blocks.

MessageColumnCount

Description

Specifies the number of selected alarm text blocks displayed in the alarm list in Runtime.

Access in runtime: Read and write

Syntax

Object.**MessageColumnCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Specifies the number of selected alarm text blocks displayed in the alarm list in Runtime.

MessageColumnIndex

Description

References a alarm text block selected for the alarm list. Using this attribute you can assign the values of other attributes to a specific alarm text block of the alarm list.

Valid values for "MessageColumnIndex" are between 0 and "MessageColumnCount" minus 1. The "MessageColumnIndex" attribute can be dynamized by the attribute **MessageColumnRepos**.

Access in runtime: Read and write

Syntax

Object.**MessageColumnIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional References a alarm text block selected for the alarm list. Valid values for "MessageColumnIndex" are between 0 and "MessageColumnCount" minus 1.

MessageColumnName

Description

Specifies the name of the alarm text block in the alarm list which is referenced with the "MessageColumnIndex" property.

Access in runtime: Read and write

Syntax

Object.**MessageColumnName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies the name of the alarm text block in the alarm list which is referenced with the "MessageColumnIndex" property.

MessageColumnRemove

Description

Removes the marked alarm text block from the list of selected alarm text blocks and inserts it in the list of existing alarm text blocks.

Access in runtime: Read and write

Syntax

Object.**MessageColumnRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Removes the marked alarm text block from the list of selected alarm text blocks and inserts it in the list of existing alarm text blocks.

MessageColumnRepos

Description

Specifies the order of the alarm text blocks. The "Up" and "Down" commands move the selected alarm text block accordingly in the list. This places the alarm text block further forward or back in the alarm view in Runtime.

Access in runtime: Read and write

Syntax

Object.**MessageColumnRepos**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Value which specifies the order of the alarm text blocks in the list.

MessageColumnSort

Description

Defines the sorting order of the alarm text block referenced in "MessageColumnIndex" .

Access in Runtime: Read and write

Syntax

Object.**MessageColumnSort**[=SortMode]

Object

Required A "ScreenItem" object with following format:

- AlarmControl

SortMode

0: No sorting.

1: Ascending sorting from the lowest to highest value

2 Descending sorting from the highest to lowest value

MessageColumnSortIndex

Description

Defines the sorting order of the alarm text block referenced in "MessageColumnIndex". If you set the value to "0", the sorting criterion is removed in "MessageColumnSort".

Access in runtime: Read and write

Syntax

Object.**MessageColumnSortIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Defines the sorting order of the alarm text block referenced in "MessageColumnIndex".

MessageColumnVisible

Description

Specifies whether alarm text blocks are displayed in the alarm view.

Access in runtime: Read and write

Syntax

Object.**MessageColumnVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

Optional

TRUE: Alarm text blocks are displayed in the alarm view.

FALSE: Alarm text blocks are not displayed in the alarm view.

MessageListType

Description

This setting defines which alarm lists are displayed in the picture.

Access in runtime: Read and write

Syntax

Object.**MessageListType**[=AlarmListType]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

AlarmListType

Value	Description	Explanation
0	Alarm list	The currently active messages are displayed after a picture was called.
1	Short-term archive list	A short-term archive list displays the logged messages after the picture was called. The display is updated immediately on activation of new messages.
2	Long-term archive list	A long-term archive list displays the logged messages after a picture was called.
3	Lock list	Only the currently locked messages are displayed after a picture was called.
4	Hit list	The configured statistics data is displayed after a picture was called.
5	List of messages to be hidden	The messages to be hidden are displayed at the call of a picture.

MinimumValue

Description

Specifies the minimum value of the scale in the selected object.

Access in runtime: Read and write

Syntax

Object.**MinimumValue**[=DOUBLE | Int32 | SINGLE]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Gauge
- Slider
- WindowsSlider

DOUBLE | Int32 | SINGLE

Optional A value or a constant that specifies the minimum value. The data type depends on the format.

- DOUBLE: Bar
- Int32: Slider, WindowsSlider
- SINGLE: Gauge

MinuteNeedleHeight

Description

Specifies the length of the minute hand in the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**MinuteNeedleHeight**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Int32

Optional A value or a constant that specifies the length of the minute hand.

Specify the length of the minute hand as a percentage relating to the radius of the clock face.

MinuteNeedleWidth

Description

Specifies the width of the minute hand in the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**MinuteNeedleWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Int32

Optional A value or a constant that specifies the width of the minute hand.

Specify the width as a percentage relating to double the length of the minute hand.

Mode

Description

Specifies the field type of the selected object.

Access in Runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**Mode**[=IOFieldType]

Object

Required A "ScreenItem" object with following format:

- Button
- IOField
- RoundButton
- SymbolicIOField

You have no access in runtime with the following format:

- DateTimeField
- GraphicIOField
- Switch

IOFieldType

hmiIOFieldInput (1): Input field

hmiIOFieldOutput (0): Output field

hmiIOFieldInOutput (2): Input and output field

Moveable

Description

Specifies whether the window can be moved in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Moveable**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional. TRUE, if the window can be moved in Runtime.

OnlineTrendControl (Page 5122)

MsgFilterSQL

Description

Specifies one or more SQL statements for the customized selection of the messages. Several customized selections are connected with "OR". If you have configured a fixed selection "DefaultMsgFilterSQL", the SQL statements of "DefaultMsgFilterSQL" and "MsgFilterSQL" are connected with "AND".

Access in runtime: Read and write

Syntax

Object.**MsgFilterSQL**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional A value or constant that specifies the SQL statements for user-defined selection of messages.

Name

Description

Returns the object name as STRING. The returned value is dependent upon the used object.

Access during runtime: Read

Syntax

Object.**Name**[=STRING]

Object

Required. An object of the "ScreenItem" type with the format:

- BatteryView
- Clock
- Ellipse
- Gauge
- Slider

You have no access in runtime with the following format:

- AlarmControl
- AlarmView
- ApplicationWindow
- Bar
- Button
- ChannelDiagnose
- CheckBox
- Circle
- CircleSegment
- CircularArc
- ComboBox
- DateTimeField
- DiscSpaceView
- EllipseSegment
- EllipticalArc

- FunctionTrendControl
- GraphicIOField
- GraphicView
- HTML-Browser
- IOField
- Line
- ListBox
- MediaPlayer
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- PLCCodeViewer
- Polygon
- Polyline
- ProtectedAreaNameView
- RangeLabelView
- RangeQualityView
- RecipeView
- Rectangle
- RoundButton
- S7GraphOverview
- Screenwindow
- SmartClientView
- StatusForce
- Switch
- SymbolLibrary
- SymbolicIOField
- SysDiagControl
- TextField
- TrendRulerControl
- TrendView
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject

- Tubepolyline
- UserArchiveControl
- UserView
- WLanQualityView
- WindowsSlider
- ZoneLabelView
- ZoneQualityView

Comments

Dependent on the specified object, the following object names will be returned:

- Tag: Name of the tag without server and tag prefix.
- Project: Name of the current Runtime project.
- DataItem: Name of the DataItem object.
- Layer: Name of the layer.
- FunctionTrendControl : Name of the trend referenced by the "Index" property.

Note

Use the "Name" property to address a tag in the Tags" list. Tag names are structured in WinCC according to the following scheme:

<Tag prefix><Name of tag>

If you only specify the tag name, the tag prefix is applied from the screen window shortcut.

Example

The following example returns the name of the current Runtime project as Trace:

```
'VBS160
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
```

NeedleBorderColor

Description

Specifies the line color of the pointer in the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**NeedleBorderColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Color

Optional A value or a constant that specifies the line color of the pointer.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

NeedleColor

Description

Specifies the hand color of the "Clock" object.

You must have configured the "NeedleFillStyle" property as "Transparent" for the pointer color to be shown.

Access in runtime: Read and write

Syntax

Object.**NeedleColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Color

Optional A value or a constant that specifies the pointer color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

NeedleFillStyle

Description

Specifies whether the pointers are displayed as filled or transparent:

Access in runtime: Read and write

Syntax

Object.**NeedleFillStyle**[=THmiFillStyle]

Object

Required. A "ScreenItem" object with the following format:

- Clock

THmiFillStyle

hmiFillStyleTransparent (65536): The pointers are filled in the pointer fill color and shown with a border in the foreground color.

hmiFillStyleSolid (0): The pointers are displayed as transparent with a border in the foreground color.

NormalRangeColor

Description

Specifies the color of the normal range on the scale of the "Gauge" object.

The "NormalRangeVisible" property must have the value TRUE for the normal range to be displayed.

Access in runtime: Read and write

Syntax

Object.**NormalRangeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

Color

Optional A value or a constant that specifies the color of the normal range.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

NormalRangeVisible

Description

Specifies whether the normal range in the scale of the "Gauge" object is displayed.

Access in runtime: Read and write

Syntax

Object.**NormalRangeVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

BOOLEAN

Optional TRUE, if the normal range will be displayed in the scale.

Comments

Specify the color of the normal range with the "NormalRangeColor" property.

Properties O-P

Object

Description

If you use a Control that is not a standard WinCC control, it could be that the properties provided by the Control have the same names as the general ScreenItem properties. In this case, the ScreenItem properties take priority. You can access the "hidden" properties of an outside provider Controls with the additional "object" property.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**Object**

Object

Required. An object of the "ScreenItem" type with the format:

- AlarmControl
- AlarmView
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl

You have no access in runtime with the following format:

- RecipeView
- SmartClientView
- StatusForce
- SymbolLibrary
- UserArchiveControl

Application example

To do this, address the properties of an outside provider control in the following way:

Control.object.type

If you are using only the form Control.type, the properties of the ScreenItem object will be used in case of identical names.

ObjectSizeDeclutteringEnable

Description

Specifies whether only the objects within a set size range are displayed.

Access during runtime: Read

Syntax

Object.**ObjectSizeDeclutteringEnable**

Object

Necessary. A "Screen" object.

Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 5000)

ObjectSizeDeclutteringMax

Description

Returns the upper size range for the display suppression of objects of the specified screen as LONG.

Access during runtime: Read

Syntax

Object.**ObjectSizeDeclutteringMax**

Object

Necessary. A "Screen" object.

Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 5000)

ObjectSizeDeclutteringMin

Description

Returns the lower size range for the display suppression of objects of the specified screen as LONG.

Access during runtime: Read

Syntax

Object.**ObjectSizeDeclutteringMin**

Object

Necessary. A "Screen" object.

Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 5000)

OCXState

Description

No access in runtime.

Online

Description

Specifies start and stop of the updating.

Access in runtime: Read and write

Syntax

Object.**Online**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTrendControl
- FunctionTrendControl
- OnlineTableControl

BOOLEAN

Optional

TRUE: The updated display is stopped. The values are buffered and updated when the button is clicked again.

FALSE: The updated display is continued.

OperationSteps

Description

Specifies by how many steps the slider of the scrollbar is moved with one mouse click.

Access in runtime: Read and write

Syntax

Object.**OperationSteps**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- WindowSlider

Int32

Optional A value or a constant which specifies by how many steps the slider of the scrollbar is moved with one mouse-click.

OperatorMessageId

Description

Specifies the assignment of ID number and trigger event in the alarm view.

Access in runtime: Read and write

Syntax

Object.**OperatorMessageId**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Value	Description	Explanation
0	Lock	Trigger event "Lock"
1	Unlock	"Unlock" Trigger Event
2	Hide	Trigger event "Hide"
3	Unhide	Trigger event "Unhide"
4	Ackn	Trigger event "Acknowledge"

OperatorMessageIndex

Description

References an operator message event. You can assign the values of other properties to a specific operator message by using the property.

Access in runtime: Read and write

Syntax

Object.**OperatorMessageIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Value	Explanation
0	Message event "Lock"
1	"Unlock" Message Event
2	Message event "Hide"
3	Message event "Unhide"
4	Message event "Acknowledge"

OperatorMessageName

Description

Specifies the name which is referenced with the "OperatorMessageIndex" event in message events for operator messages.

Access in runtime: Read and write

Syntax

Object.**OperatorMessageName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Value	Explanation
Lock	Message event "Lock"
Unlock	Message event "Enable"
Hide	Message event "Hide"
Unhide	Message event "Unhide"
Quit	Message event "Ackn."

OperatorMessageNumber

Description

Specifies a message number for the operator message of the selected message event if you do *not* use the operator message of WinCC.

Access in runtime: Read and write

Syntax

Object.**OperatorMessageNumber**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional Specifies a message number for the operator message of the selected message event.

OperatorMessageSelected

Description

Activates the message events in the list that trigger operator messages.

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSelected**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

Optional Activates the message events in the list that trigger operator messages.

OperatorMessageSource1

Description

Specifies a alarm text block of the operated message to be added to "Process value block 1" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 1" of the operator message. Select "1" at process value as the alarm text block lock of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource1**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 1" of the operator message configured here.

OperatorMessageSource2

Description

Specifies a alarm text block of the operated message to be added to "Process value block 2" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 2" of the operator message. Select "2" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource2**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 2" of the operator message configured here.

OperatorMessageSource3

Description

Specifies a alarm text block of the operated message to be added to "Process value block 3" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 3" of the operator message. Select "3" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource3**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 3" of the operator message configured here.

OperatorMessageSource4

Description

Specifies a alarm text block of the operated message to be added to "Process value block 4" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 4" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 4" of the operator message. Select "4" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource4**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 4" of the operator message configured here.

OperatorMessageSource5

Description

Specifies a alarm text block of the operated message to be added to "Process value block 5" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 5" of the operator message. Select "5" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource5**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 5" of the operator message configured here.

OperatorMessageSource6

Description

Specifies a alarm text block of the operated message to be added to "Process value block 6" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 6" of the operator message. Select "6" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource6**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 6" of the operator message configured here.

OperatorMessageSource7

Description

Specifies a alarm text block of the operated message to be added to "Process value block 7" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 7" of the operator message. Select "7" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource7**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 7" of the operator message configured here.

OperatorMessageSource8

Description

Specifies a alarm text block of the operated message to be added to "Process value block 8" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 8" of the operator message. Select "8" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource8**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 8" of the operator message configured here.

OperatorMessageSource9

Description

Specifies a alarm text block of the operated message to be added to "Process value block 9" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process

value block 9" of the operator message. Select "9" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource9**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional Specifies a alarm text block of the operated message to be added to "Process value block 9" of the operator message configured here.

OperatorMessageSource10

Description

Specifies a alarm text block of the operated message to be added to "Process value block 10" of the operator message configured here.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 10" of the operator message. Select "10" at process value as the alarm text block of the operated alarm "User text block 1".

Access in runtime: Read and write

Syntax

Object.**OperatorMessageSource10**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Specifies a alarm text block of the operated message to be added to "Process value block 10" of the operator message configured here.

OperatorMessageSourceType1

Description

Specifies the format of the source content for the transfer.

Syntax

Object.**OperatorMessageType1**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Description
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType2

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType2**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType3

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType1**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType4

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType4**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType5

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType5**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType6

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType6**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType7

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType7**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType8

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType8**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType9

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType9**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

OperatorMessageSourceType10

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType10**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 5018)

PageMode

Description

Enables paging is in the long-term archive list. Allows you to display all messages of the short-term archive in the long-term archive list. Use the "PageModeMessageNumber" property to determine the number of messages displayed per page.

The page up/down buttons of the toolbar can be used if paging is enabled.

Access in runtime: Read and write

Syntax

Object.**PageMode**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: Scrolling in the long-term log list is possible.

FALSE: Scrolling in the long-term log list is not possible.

PageModeMessageNumber

Description

Defines the number of messages shown per page when paging the long-term archive list.

Access in runtime: Read and write

Syntax

Object.**PageModeMessageNumber**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

Int32

Optional A value or constant that specifies the number of messages per page.

Path

Description

Returns the path of the current project without the file names as STRING. For a WinCC client without its own path, the path is returned in UNC format, otherwise the local path is returned.

Access during runtime: Read

Syntax

Object.**Path**

Object

Necessary. A "Project" object.

Example

The following example returns the project path as Trace:

```
'VBS161
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

See also

Project (Page 4999)

Password

Description

Determines the password for the loading of the remote monitor.

Access in runtime: Read and write

Syntax

Object.**Password**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- SmartClientView

STRING

Optional A value or constant that contains the password for establishing remote monitoring.

PicAlignment

Description

Specifies the alignment within the specified object.

Picture

Description

Specifies the screen that will be displayed in the graphics object in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Picture**[=Image]

Object

Required A ""ScreenItem" object with following format:

- GraphicView
- Clock

Image

Optional A value or a constant that specifies the screen that will be displayed in the graphics object in Runtime.

Comments

The picture (*.BMP or *.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.

PictureAlignment

Description

Specifies the display type for the background screen in the process image.

Access in runtime: Read and write

Syntax

Object.**PictureAlignment**[=PictureAlignment]

Object

Required. A "ScreenItem" object with the following format:

- Button
- RoundButton

PictureAlignment

Optional A value or a constant that specifies the display type for the background screen in the process image.

PictureDeactivated

Description

Specifies the picture that is displayed in the "Deactivated" state.

Access in Runtime: Read and write

Syntax

Object.**PictureDeactivated**[=Image]

Object

Required A ""ScreenItem" object with following format:

- Roundbutton

Image

Optional A value or a constant that specifies the picture that will be displayed in the "Deactivated" status.

Comments

The picture must be located in the "GraCS" folder of the current project in order to integrate it.

PictureOff

Description

Specifies the picture that is displayed in the "Off" status.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**PictureOff**[=HmiObjectHandle]

Object

Required. A "ScreenItem" object with the format:

- Button
- GraphicIOField
- RoundButton

You have no access in runtime with the following format:

- Switch

HmiObjectHandle

Optional A value or a constant that specifies the picture that will be displayed in the "Off" status.

Comments

The picture (*.BMP or *.DIB) must be in the "GraCS" folder of the current project so that you can integrate it.

PictureOn

Description

Specifies the screen that will be displayed in the "on" state.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read and write

Syntax

Object.**PictureOn**[=HmiObjectHandle]

Object

Required. A "ScreenItem" object with the format:

- Button
- GraphicIOField
- RoundButton

You have no access in runtime with the following format:

- Switch

HmiObjectHandle

Optional A value or a constant that specifies the screen that will be displayed in the "on" state.

Comments

The screen (*.BMP or *.DIB) must be in the "GraCS" folder of the current project in order to be able to integrate it.

PointerColor

Description

Specifies the pointer color of the "Gauge" object.

Access in runtime: Read and write

Syntax

Object.**PointerColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

Color

Optional A value or a constant that specifies the pointer color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

PointsCount

Description

Specifies the number of corner points of the polyline or of the polygon.

Access in runtime: Read and write

Syntax

Object.**PointsCount**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Polygon
- Polyline
- Tubepolyline

You have no access in runtime with the following format:

- Line

Int32

Optional A value or a constant that specifies the number of corner points of the polyline.

Precision

Description

Specifies the number of decimal places (0 to 20).

Access in runtime: Read and write

Syntax

Object.**Precision**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Int32

Optional A value or a constant that specifies the number of decimal places (0 to 20).

Pressed

Description

Specifies whether the selected object is displayed in a pressed state.

Access in runtime: Read and write

Syntax

Object.**Pressed**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Button
- RoundButton

BOOLEAN

Optional TRUE, if the selected object is displayed in a pressed state.

ProcessValue

Description

Specifies the default for the value to be displayed.

This value will be used in runtime if the associated tag is not connected or has not been updated when the screen starts.

Access in runtime: Read and write

Syntax

Object.**ProcessValue**[=DOUBLE | Int32 | Object | SINGLE]

Object

Required. A "ScreenItem" object with the format:

- Bar
- Gauge
- GraphicIOField
- IOField
- OptionGroup
- Slider
- SymbolicIOField
- WindowsSlider

You have no access in runtime with the following format:

- Button
- CheckBox
- DateTimeField
- Switch
- SymbolLibrary

DOUBLE | Int32 | SINGLE

Optional A value or a constant that includes the default value. The data type depends on the format.

- DOUBLE: Bar
- Int32: GraphicIOField, OptionGroup, Slider, SymbolicIOField, WindowsSlider
- Object: IOField
- SINGLE: Gauge

Comments

If you want to assign the "ProcessValue" SmartTags property, then you must formulate the assignment as follows:

'Examples for the assignment of SmartTags

```
'Example 1
IOField.ProcessValue = SmartTags("TagName").Value
'Example 2
HmiRuntime.Screens("Screen_1").ScreenItems("IOField_1").ProcessValue =
SmartTags("Tag_1").Value
```

ProgID

Description

In the case of non-WinCC controls, the version-independent ProgID is returned as the type.

See also

ForeignControl (Page 5072)

Properties Q-R

QualityCode

Description

Returns the quality of a tag value after reading the tag as SHORT. After a tag has been written, the value is invalid.

Access during runtime: Read

Syntax

Object.**QualityCode**

Object

Necessary. An object of the "HMIRuntime" type.

Example

The following example indicates the quality of the read value when no errors have occurred during the reading process:

```
'VBS83
Dim objTag
Dim lngLastErr
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
lngLastErr = objTag.LastError
If 0 = lngLastErr Then
MsgBox objTag.QualityCode
End If
```

See also

Tag (Page 5012)

Radius

Description

Determines the radius of the given object "Circle."

Access in runtime: Read and write

Syntax

Object.**Radius**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Circle
- CircleSegment
- CircularArc
- RoundButton

Int32

Optional A value or constant which determines the radius in pixels.

RadiusHeight

Description

Specifies the secondary axis of the specified object.

Access in runtime: Read and write

Syntax

Object.**RadiusHeight**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Ellipse
- EllipseSegment
- EllipticalArc
- TubeArcObject

You have no access in runtime with the following format:

- Circle

Int32

Optional A value or constant which determines the secondary axis in pixels.

RadiusWidth

Description

Specifies the main axis of the specified object.

Access in runtime: Read and write

Syntax

Object.**RadiusWidth**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Ellipse
- EllipseSegment
- EllipticalArc
- TubeArcObject

You have no access in runtime with the following format:

- Circle

Int32

Optional A value or constant which determines the main axis in pixels.

RecipeName

Description

Returns the name of the recipe that is currently being displayed in the "Recipe view".

Access in runtime: Read

Syntax

Object.**RecipeName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- RecipeView

STRING

Optional A value or a constant that returns the name of the recipe.

RecipeNumber

Description

Returns the number of the recipe that is currently being displayed in the "Recipe view".

Access in runtime: Read

Syntax

Object.**RecipeNumber**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- RecipeView

Int32

Optional A value or a constant that returns the number of the recipe.

RecordName

Description

Returns the name of the recipe data record that is currently being displayed in the "Recipe view".

Access in runtime: Read

Syntax

Object.**RecordName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- RecipeView

STRING

Optional A value or a constant that returns the name of the recipe data record.

RecordNumber

Description

Returns the number of the recipe data record that is currently being displayed in the "Recipe view".

Access in runtime: Read

Syntax

Object.**RecordNumber**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- RecipeView

Int32

Optional A value or a constant that returns the number of the recipe data record.

RelativeFillLevel

Description

Specifies the fill percentage for the object.

Access in runtime: Read and write

Syntax

Object.**RelativeFillLevel**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- Button
- Circle
- CircleSegment
- Ellipse
- EllipseSegment
- GraphicView
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox

Int32

Optional A value or a constant that specifies the fill percentage of the object.

Rotation

Description

Specifies the angle of rotation in degrees of the selected object. The angle of rotation is measured counterclockwise.

Access in runtime: Read and write

Syntax

Object.**Rotation**[=SymbolLibraryRotation]

Object

Required. A "ScreenItem" object with the following format:

- SymbolLibrary

SymbolLibraryRotation

hmiSymbolLibraryRotationNone (0): The object rotates by 0 degrees.

hmiSymbolLibraryRotation90Degree (90): The object rotates by 90 degrees.

hmiSymbolLibraryRotation180Degree (180): The object rotates by 180 degrees.

hmiSymbolLibraryRotation270Degree (270): The object rotates by 270 degrees.

RotationAngle

Description

Specifies the angle of rotation in degrees.

Access in runtime: Read and write

Syntax

Object.**RotationAngle**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Line
- Polygon
- Polyline
- TextField
- TubeTeeObject

Int32

Optional A value or a constant that specifies the angle of rotation in degrees.

Comments

In Runtime the object rotates clockwise on the reference point.

RotationCenterLeft

Description

Establishes the X coordinates of the pivot point to rotate the object in Runtime.

Access in Runtime: Read and write

Syntax

Object.**RotationCenterLeft**[=Int32]

Object

Required. An object of the "ScreenItem" type with the format:

- Line
- Polygon
- Polyline
- TextField

Int32

Optional A value or a constant that specifies the X coordinates of the pivot point to rotate the object in runtime.

Comments

The value of the X coordinate is relative to the object width. Specify the value as a percentage from the left edge of the rectangle that surrounds the object.

RotationCenterTop

Description

Specifies the Y coordinates of the pivot point to rotate the object in Runtime.

Access in Runtime: Read and write

Syntax

Object.**RotationCenterTop**[=Int32]

Object

Required. An object of the "ScreenItem" type with the format:

- Line
- Polygon
- Polyline
- TextField

Int32

Optional A value or a constant that specifies the Y coordinates of the pivot point to rotate the object in Runtime.

Comments

The value of the Y coordinate is relative to the object width. Specify the value as a percentage from the upper edge of the rectangle that surrounds the object.

RoundCornerHeight

Description

Specifies the corner radius. Enter the value as a percentage of half the height of the object.

Access in runtime: Read and write

Syntax

Object.**RoundCornerHeight**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Rectangle

Int32

Optional A value or a constant that specifies the corner radius.

RoundCornerWidth

Description

Specifies the corner radius. Enter the value as a percentage of half the width of the object.

Access in runtime: Read and write

Syntax

Object.**RoundCornerWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Rectangle

Int32

Optional A value or a constant that specifies the corner radius.

RowScrollbar

Description

Enables the display of row scroll bars.

Access in Runtime: Read and write

Syntax

Object.**RowScrollbar**[=ScrollbarVisibility]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

ScrollbarVisibility

Value	Description	Explanation
0	No	No row scroll bars.
1	as required	Row scroll bars are displayed if horizontal space requirements of the control are greater than the actually available display area.
2	always	Row scroll bars are always displayed.

RowTitleAlignment

Description

Specifies the type of row label alignment.

The following settings are available:

Value	Description	Explanation
0	Left	The row headers are aligned left.
1	Centered	The row headers are aligned to center.
2	Right	The row headers are aligned right.

The attribute can be assigned dynamic properties by means of the name **RowTitleAlignment** .

See also

AlarmControl (Page 5018)

RTPersistence

Description

Specifies how online configurations of WinCC are retained.

Access in runtime: Read and write

Syntax

Object.**RTPersistence**[=RTPersistence]

Object

Required. An object of the "ScreenItem" type with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

You have no access in runtime with the following format:

- SysDiagControl
- UserView

RTPersistence

Value	Description	Explanation
0	Discard	The current online configurations are discarded at the next picture change.
1	Retain	The current online configurations are retained at the next picture change.
2	Reset	All online configurations made are lost. The picture is set to the contents found in the configuration system.

RTPersistenceType

Description

Specifies how online configurations of WinCC are retained.

Syntax

Object.**RTPersistenceType**[=RTPersistenceType]

Object

Required. An object of the "ScreenItem" type with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

You have no access in runtime with the following format:

- SysDiagControl
- UserView

RTPersistenceType

Value	Description	Explanation
0	Do not retain	Online configurations are not retained. These are lost at the next picture change.
1	Retain during Runtime	Online configurations are retained during Runtime. These are lost on exiting.
2	Retain permanently	Online configurations are retained permanently. These are also available after restart.

RulerColor

Description

Specifies the color of the scale gradation (help line) of the axis label in the "OnlineTrendControl" object.

Access in runtime: Read and write

Syntax

Object.**RulerColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- TrendView

Color

Optional A value or a constant that specifies the color of the scale gradation.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

Properties S

ScaleColor

Description

Specifies the color of the scale of the selected object.

Access in runtime: Read and write

Syntax

Object.**ScaleColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- TrendView
- Bar

Color

Optional A value or a constant that specifies the color of the scale.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

ScreenItem object with the format "Bar": For the color to be displayed, the property ""ShowScale" must have the value TRUE.

ScaleGradation

Description

Specifies the distance between two large marking lengths of the scale.

Access in runtime: Read and write

Syntax

Object.**ScaleGradation**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the distance between two large marking lengths of the scale.

ScaleLabelColor

Description

Specifies the color of the label for the scale gradation of the "Gauge" object.

Access in runtime: Read and write

Syntax

Object.**ScaleLabelColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

Color

Optional A value or a constant that specifies the label color of the scale gradation.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

ScaleNumerator

Description

No access in runtime.

ScalePosition

Description

Specifies the position of the scale of the selected object. The "ShowScale" property must be set to TRUE so that the scale can be displayed.

Access in Runtime: Read and write

Syntax

Object.**ScalePosition**[=ScalePosition]

Object

Required. An object of the "ScreenItem" type with the format:

- Bar

You have no access in runtime with the following format:

- Slider

ScalePosition

hmiScalePositionLeftUp (0): For a vertical bar, the scale is displayed at the top. For a horizontal bar the scale will be shown at the left.

hmiScalePositionRightDown (1): For a vertical bar, the scale is displayed at the bottom. For a horizontal bar the scale will be shown at the right.

ScaleTickColor

Description

Specifies the color of the scale gradation of the "Gauge" object.

Access in runtime: Read and write

Syntax

Object.**ScaleTickColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

Gauge

Color

Optional A value or a constant that specifies the color of the scale gradation.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

ScaleTickLabelPosition

Description

Specifies the diameter of the assumed circle on which the label of the scale divisions is located.

Access in runtime: Read and write

Syntax

Object.**ScaleTickLabelPosition**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

DOUBLE

Optional A value or a constant that specifies the diameter of the assumed circle on which the label of the scale division is located.

Value range from 0 to 1

0: The label is located in the center of the scale.

1: The diameter of the assumed circle for the label is the smaller value of the geometry properties "Width" and "Height". A part of the label can lie outside the object limits and is therefore invisible.

ScaleTickLength

Description

Specifies the length of the main markings for the scale division. The value refers to half the smaller value of the geometry properties "Width" and "Height".

The length of the marking lengths for the fine divisions is 0.5* scale width.

Access in runtime: Read and write

Syntax

Object.**ScaleTickLength**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

DOUBLE

Optional A value or a constant that specifies the length of the main markings of the scale.

Value range 0 to scale end value

0: There are no scale divisions. The divisions of the scale in the areas are not visible.

Scale end value: The scale division ranges from the mid-point of the scale disc to the value specified by the scale end value.

ScaleTickPosition

Description

Specifies the diameter of the assumed circle on which the scale divisions are located.

The main markings of the scale divisions lie with their outward-facing ends on this circle.

Access in runtime: Read and write

Syntax

Object.**ScaleTickPosition**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

DOUBLE

Optional A value or a constant that specifies the diameter of the assumed circle on which the scale divisions are located.

Value range from 0 to 1

0: The scale divisions are located in the center of the scale.

1: The diameter of the assumed circle for the label is the scale divisions is the smaller value of the geometry properties ""Width" and "Height".

ScaleDenominator

Description

Defines the counter for scaling on the client.

Syntax

Object.ScaleDenominator=[Int]

Object

Required. A "ScreenItem" object with the format "SmartClientView".

Int

Optional. A value or a constant that specifies the value.

See also

SmartClientView (Page 5162)

Scaling

Description

No access in runtime.

ScalingType

Description

Specifies the type of bar scaling.

Access in Runtime: Read and write

Syntax

Object.**ScalingType**[=BarScalingType]

Object

Required A "ScreenItem" object with following format:

- Bar

BarScalingType

Optional A value or a constant that specifies the type of bar scaling.

- hmiBarScalingLinear (0): Linear
  The large marks are distributed evenly over the scale. The distance between the large marks corresponds to the value of the "axis section" attribute.
- hmiBarScalingLogarithmic (1): Logarithmic
  The distribution of the large marks on the scale follows a logarithmic function.
  The representation of low values is very strongly highlighted.
- hmiBarScalingNegativeLogarithmic (2): Negative logarithmic
  The distribution of the large marks on the scale follows a negative logarithmic function. The representation of high values is very strongly highlighted.
- hmiBarScalingAutomatic (3): Automatic
  The large marks are distributed evenly over the scale. The distance between the large marks is specified automatically.

- hmiBarScalingTangent (4): Tangents
  The distribution of the large marks on the scale highlights the representation of the low and high values.
- hmiBarScalingQuadratic (5): Square
  The distribution of the large marks follows a square function. The representation of high values is highlighted.
- hmiBarScalingCubic (6): Cubic
  The distribution of the large marks on the scale follows a cubic function. This highlights the representation of large values.

Comments

For the color to be displayed, the property "ShowScale" must have the value TRUE.

See also

Bar (Page 5033)

ScreenItems

Description

Returns the ScreenItems list.

Access in Runtime: Read

Syntax

Object.ScreenItems

Object

Required A "ScreenItems"." object.

ScreenName

Description

Specifies the screen to be displayed in the screen window in runtime.

Access in runtime: Read and write

Syntax

Object.**ScreenName**[=HmiObjectHandle]

Object

Required. A "ScreenItem" object with the following format:

- ScreenWindow

HmiObjectHandle

Optional A value or a constant that specifies the screen to be displayed in the screen window in runtime.

Screens

Description

Returns the Screens list. The Screens list contains two elements: The first element with the index 0 represents the permanent window. The second element with the index 1 represents the root screen. Alternatively, the two elements can be addressed by means of their names. Use "Overview" for the permanent window and "Base" for the root screen.

Note

The alarm window and the alarm indicator are not contained in the Screens list, even if they have the focus in Runtime.

Access in Runtime: Read

Syntax

Object.Screens

Object

Required A "Screens" object.

SecondNeedleHeight

Description

Specifies the length of the second hand in the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**SecondNeedleHeight**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Int32

Optional A value or a constant that specifies the length of the second hand.

Specify the length of the second hand as a percentage relating to the radius of the clock face.

SecondNeedleWidth

Description

Specifies the width of the second hand in the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**SecondNeedleWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Int32

Optional A value or a constant that specifies the width of the second hand. Specify the width as a percentage relating to double the length of the second hand.

SegmentColoring

Description

Specifies the type of color change that should be displayed in the "Bar" if the limits are exceeded.

Access in runtime: Read and write

Syntax

Object.**SegmentColoring**[=THmiBarColorType]

Object

Required. A "ScreenItem" object with the following format:

- Bar

THmiBarColorType

Optional A value or a constant that specifies the type of color change. Value range from 0 to 1.

hmiBarColorEntire (0): Color change applied to the entire bar.

hmiBarColorSegmented (1): Color change applied to segments.

SelectedText

Description

Shows the text defined with the "Selected field" (SelIndex) attribute which is highlighted in the combobox or list box.

See also

Listbox (Page 5104)

SelectBackColor

Description

Specifies the background color of the selected text entry for the selected object.

Access in runtime: Read and write

Syntax

Object.**SelectBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

Color

Optional A value or a constant that specifies the background color of the selected text entry of the selected object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectedCellColor

Description

Specifies the background color of the selected cell. You open a color selection dialog box with the button.

Access in runtime: Read and write

Syntax

Object.**SelectedCellColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant which specifies the background color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectedCellForeColor

Description

Specifies the font color of the selected cell. You open a color selection dialog box with the button.

Access in runtime: Read and write

Syntax

Object.**SelectedCellForeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant which specifies the font color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectedIndex

Description

Defines the index of which the associated text is highlighted in the combo box or list box.

The maximum value is the number of lines (NumberLines) of the object.

Access in runtime: Read and write

Syntax

Object.**SelectedIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- ComboBox
- ListBox

Int32

Optional A value or a constant that specifies the index of the text highlighted.

SelectedRowColor

Description

Specifies the background color of the selected row. You open a color selection dialog box with the button.

Access in runtime: Read and write

Syntax

Object.**SelectedRowColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant which specifies the background color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectedRowForeColor

Description

Specifies the font color of the selected row. You open a color selection dialog box with the button.

Access in runtime: Read and write

Syntax

Object.**SelectedRowForeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant which specifies the font color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectedTitleColor

Description

Specifies the background color of the selected table header. You open a color selection dialog box with the button.

The setting is only effective in Runtime when the "Marking color" option is activated.

Access in runtime: Read and write

Syntax

Object.**SelectedTitleColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant which specifies the background color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectedTitleForeColor

Description

Specifies the font color of the selected table header. You open a color selection dialog box with the button.

The setting is only effective in Runtime when the "Marking color" option is activated.

Access in runtime: Read and write

Syntax

Object.**SelectedTitleForeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant which specifies the font color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

See also

UserArchiveControl (Page 5207)

TrendRulerControl (Page 5187)

OnlineTableControl (Page 5114)

AlarmControl (Page 5018)

SelectForeColor

Description

Specifies the color of the selected text entry for the selected object.

Access in runtime: Read and write

Syntax

Object.**SelectForeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

Color

Optional A value or a constant that specifies the color of the selected text entry of the selected object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectionBackColor

Description

Determines the background color of the selected cells.

Access in runtime: Read and write

Syntax

Object.**SelectionBackColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- AlarmView
- RecipeView
- StatusForce
- UserView

You have no access in runtime with the following format:

- TrendView

Color

Optional A value or constant that specifies the background color of the selected row.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

SelectionColoring

Description

Enables the use of selection colors for cells or rows.

Access in Runtime: Read and write

Syntax

Object.**SelectionColoring**[=GridSelectionColoring]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

GridSelectionColoring

Value	Description	Explanation
0	None	No selection colors for cells and rows.
1	Cell	Selection color for cell.
2	Row	Selection color for row.
3	Cell and row	Selection colors for cell and row.

SelectionForeColor

Description

Determines the foreground color of the selected cells.

Access in runtime: Read and write

Syntax

Object.**SelectionForeColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- AlarmView
- RecipeView
- StatusForce
- UserView

You have no access in runtime with the following format:

- TrendView

Color

Optional A value or constant that specifies the background color of the selected row.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

SelectionRect

Description

Enables the use of a selection border for selected cells or rows.

Access in Runtime: Read and write

Syntax

Object.**SelectionRect**[=GridSelectionBorder]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

GridSelectionBorder

Value	Description	Explanation
0	None	No selection border is drawn for selected cells or rows.
1	Cell	A selection border is drawn for the selected cell.
2	Row	A selection border is drawn for the selected row.

SelectionRectColor

Description

Specifies the color of the rectangle in the alarm window if SelectionType is "1".

Access in runtime: Read and write

Syntax

Object.**SelectionRectColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant which specifies the color.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SelectionRectWidth

Description

Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".

Access in runtime: Read and write

Syntax

Object.**SelectionRectWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant which specifies the line width.

SelectionType

Description

Specifies the number of lines you can mark.

Access in runtime: Read and write

Syntax

Object.**SelectionType**[=GridSelectionType]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

GridSelectionType

Optional A value or a constant that specifies the number of lines that you can select.

The following settings are available:

Value	Description	Explanation
0	None	No line is selected.
1	Single selection	One line can be selected.
2	Multiple selection	Several lines can be selected.

SeparatorBackColor

Description

Specifies the background color of the broken separation lines in the selection list of the specified object.

Access in runtime: Read and write

Syntax

Object.**SeparatorBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

Color

Optional A value or a constant that specifies the background color of the broken separation lines in the selection list of the specified object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SeparatorColor

Description

Specifies the color of the separation lines in the selection list of the specified object.

Access in runtime: Read and write

Syntax

Object.**SeparatorColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- SymbolicIOField

You have no access in runtime with the following format:

- S7GraphOverview

Color

Optional A value or a constant that specifies the color of the separation lines in the selection list of the specified object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

SeparatorCornerStyle

Description

No access in runtime

SeparatorStyle

Description

Specifies the line style of the separation lines in the selection list of the selected object.

Access in runtime: Read and write

Syntax

Object.**SeparatorStyle**[=LineStyle]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

LineStyle

hmiLineStyleNone (-1): The selection list has no separation lines.

hmiLineStyleSolid (0): The selection list has solid separation lines.

hmiLineStyleDash (1): The selection list has dashed separation lines.

hmiLineStyleDot (2): The selection list has dotted separation lines.

hmiLineStyleDashDot (3): The selection list has dash - dot lines as separation lines.

hmiLineStyleDashDotDot (4): The selection list has dash - dot - dot lines as separation lines.

SeparatorWidth

Description

Specifies the width of the separation lines in the selection list of the specified object.

Access in runtime: Read and write

Syntax

Object.**SeparatorWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

Int32

Optional A value or a constant that specifies the width of the separation lines in the selection list of the specified object.

SeparatorLineEndShapeStyle

Description

Specifies the shape of the line ends for the object of the type "ScreenItem" with the format "SymbolicIOField".

See also

SymbolicIOField (Page 5170)

ServerScale

Description

No access in runtime.

ServerNames

Description

Specifies the servers of a distributed system from which the alarm view draws data. The information is given in form of: NameServer1;NameServer2;NameServer3.

Access in runtime: Read and write

Syntax

Object.**ServerNames**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

STRING

Optional A value or a constant that specifies the server of a distributed system from which the alarm window receives information.

ServerPrefix

Description

No access in runtime

Shared

Description

No access in runtime.

ShiftDecimalPoint

Description

Specifies that the "Shift decimal point" field can only be read.

Access in Runtime: Read and write

Syntax

Object.**ShiftDecimalPoint**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional. TRUE, if the "Shift decimal point" field can only be read.

See also

IOField (Page 5098)

ShowAlarmsFromDate

Description

Specifies that only those message events are displayed that are saved in this tag.

Access in runtime: Read and write

Syntax

Object.**ShowAlarmsFromDate**[=HmiObjectHandle]

Object

Required. A "ScreenItem" object with the format:

- AlarmView

HmiObjectHandle

Optional A value or a constant which specifies that only those message events are displayed that are saved in this tag.

ShowBadTagState

Description

Defines whether the object is grayed out when a bad quality code or tag status is detected.

Access in runtime: Read and write

Syntax

Object.**ShowBadTagState**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar
- IOField
- OptionGroup
- SymbolicIOField
- WindowsSlider

You have no access in runtime with the following formats:

- CheckBox

BOOLEAN

TRUE	If the quality code or the the tag status are poor, the object is grayed out or the settings for the grid color are used.
FALSE	If the quality code or the the tag status are poor, the object is not grayed out or the settings for the grid color are not used.

ShowBar

Description

Specifies whether the displayed process value in the "Slider" object is also shown by a filled bar.

Access in runtime: Read and write

Syntax

Object.**ShowBar**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Slider

BOOLEAN

Optional TRUE, if the process value is also shown by a filled bar.

ShowCaption

Description

Specifies whether the title line is hidden or shown.

Access in runtime: Read and write

Syntax

Object.**ShowCaption**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- ApplicationWindow
- Screenwindow

You have no access in runtime with the following format:

- Switch

BOOLEAN

Optional TRUE, if the title line is shown.

ShowDecimalPoint

Description

Specifies whether the scale is identified with decimal figures (decimal point and one decimal place) or with whole integers.

Access in runtime: Read and write

Syntax

Object.**ShowDecimalPoint**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

BOOLEAN

Optional TRUE, if the scale is identified with decimal figures (decimal point and one decimal place).

ShowFillLevel

Description

Specifies whether the selected object is filled.

Access in runtime: Read and write

Syntax

Object.**ShowFillLevel**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- Button
- Circle
- CircleSegment
- Ellipse
- EllipseSegment
- GraphicView
- OptionGroup
- Polygon
- Rectangle
- RoundButton
- TextField
- WindowsSlider

You have no access in runtime with the following format:

- CheckBox

BOOLEAN

Optional TRUE, if the selected object is filled.

ShowFocusRectangle

Description

Specifies whether the button is given a selection border when it is activated in Runtime.

Access in runtime: Read and write

Syntax

Object.**ShowFocusRectangle**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Clock

BOOLEAN

Optional TRUE, if the button is given a selection border when it is activated in Runtime.

ShowLargeTicksOnly

Description

Specifies whether only large scale marks are shown.

Access in runtime: Read and write

Syntax

Object.**ShowLargeTicksOnly**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE if only large scale marks are shown.

ShowLimitMarkers

Description

Specifies whether the limit value is shown as a scale value.

Access in runtime: Read and write

Syntax

Object.**ShowLimitMarkers**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- Bar

You have no access in runtime with the following format:

- Slider

BOOLEAN

Optional TRUE, if the limit value is shown as a scale value.

ShowPeakValuePointer

Description

Specifies whether a slave pointer will be used for the selected object.

The slave pointer shows the maximum pointer deflection provided in Runtime while the process screen is loaded. If you reload the process screen, the slave pointer will be reset.

Access in runtime: Read and write

Syntax

Object.**ShowPeakValuePointer**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

BOOLEAN

Optional TRUE, if the slave pointer is used.

ShowPosition

Description

Specifies whether the value of the current slider position should also be displayed numerically. The value is then displayed beneath the slider.

Access in runtime: Read and write

Syntax

Object.**ShowPosition**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Slider

BOOLEAN

Optional TRUE if the value is also shown numerically.

RowTitles

Description

Specifies whether the message view contains a column with consecutive numbering of the existing messages.

Access in Runtime: Read and write

Syntax

Object.**RowTitles**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional. TRUE, if the message view contains a column with consecutive numbering of the existing messages.

See also

AlarmControl (Page 5018)

ShowRuler

Description

Specifies whether a scale division (help line) is displayed for an axis label of the object "OnlineTrendControl".

Access in runtime: Read and write

Syntax

Object.**ShowRuler**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl
- TrendView

BOOLEAN

Optional TRUE, if the scale gradation is shown.

ShowRulerInAxis

Description

Enables the display of rulers in the time axis.

Access in runtime: Read and write

Syntax

Object.**ShowRulerInAxis**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The rulers are also displayed in the time axes.

FALSE: The rulers are not displayed in the time axes.

ShowScale

Description

Specifies whether the values will also be shown in a scale.

Access in runtime: Read and write

Syntax

Object.**ShowScale**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- Bar

You have no access in runtime with the following format:

- Slider

BOOLEAN

Optional TRUE, if the values will also be shown in a scale.

ShowScrollbars

Description

Enables the display of scroll bars.

Access in runtime: Read and write

Syntax

Object.**ShowScrollbars**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the format:

- FunctionTrendControl
- OnlineTrendControl
- Screenwindow

ShowScrollbars

Optional. TRUE if scroll bars are shown.

ShowSortButton

Description

Enables the display of a sorting button above the vertical scroll bar. Click this sorting button to sort the selected column based on the configured sorting criteria. The sorting button is not displayed if the table does not contain a vertical scroll bar.

Access in runtime: Read and write

Syntax

Object.**ShowSortButton**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The sorting key is displayed. You can sort the selected column.

FALSE: The sorting key is not displayed.

ShowSortIcon

Description

Enables the display of the sorting icon.

Access in runtime: Read and write

Syntax

Object.**ShowSortIcon**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The sorting icon is displayed.

FALSE: The sorting icon is not displayed.

ShowSortIndex

Description

Specifies whether a sort index is displayed.

Access in runtime: Read and write

Syntax

Object.**ShowSortIndex**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: A sort index is displayed.

FALSE: A sort index is not displayed.

ShowStatusBar

Description

Specifies whether the status bar is shown.

Access in runtime: Read and write

Syntax

Object.**ShowStatusBar**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- HTML-Browser

You have no access in runtime with the following format:

- MediaPlayer

BOOLEAN

Optional TRUE, if the status bar is shown.

ShowTableGridlines

Description

Determines whether gridlines are shown in the table of the given object.

Access in runtime: Read and write

Syntax

Object.**ShowTableGridlines**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- StatusForce

You have no access in runtime with the following format:

- TrendView
- UserView

BOOLEAN

Optional TRUE if gridlines in the table are shown.

ShowThumb

Description

Specifies whether the slider of the "Slider" object will be displayed.

Access in runtime: Read and write

Syntax

Object.**ShowThumb**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Slider

BOOLEAN

Optional TRUE, if the slider is shown.

ShowTickLabels

Description

Specifies whether the label is shown in the scale.

Access in runtime: Read and write

Syntax

Object.**ShowTickLabels**[= BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the format:

- Slider

You have no access in runtime with the following format:

- Bar

BOOLEAN

Optional TRUE, if the label is shown.

Comments

The increments for the measured value are automatically established dependent upon the specified measurement range and the size of the object.

ShowTicks

Description

Specifies whether the marking lengths are shown in the scale of the selected object.

Access in runtime: Read and write

Syntax

Object.**ShowTicks**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Clock
- Slider

BOOLEAN

Optional TRUE, if the marking lengths are shown.

ShowTitle

Description

Defines representation the Control window header.

Access in Runtime: Read and write

Syntax

Object.**ShowTitle**[=WindowHeaderStyle]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

WindowHeaderStyle

Value	Designation	Description
0	No	No window title.
1	Normal	The window title consists of a WinCC icon and text. The text is entered in the "Text" field.
2	Narrow	The window title consists only of text. The text is entered in the "Text" field.

ShowToolBar

Description

Specifies whether the toolbar is shown.

Access in runtime: Read and write

Syntax

Object.**ShowToolBar**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- HTMLBrowser

BOOLEAN

Optional TRUE, if a toolbar will be displayed.

ShowTrendIcon

Description

Enables the display of an icon below the value axes. The icon indicates the trend currently displayed in the foreground.

Access in runtime: Read and write

Syntax

Object.**ShowTrendIcon**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The icon is displayed.

FALSE: The icon is not displayed.

ShowTrendIndicator

Description

Specifies whether the tendency (increasing or falling) of the measurement value that is to be monitored is shown with a small arrow.

Access in runtime: Read and write

Syntax

Object.**ShowTrendIndicator**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the tendency (increasing or falling) of the measurement value that is to be monitored is shown with a small arrow.

Sizeable

Description

TRUE, when it should be possible to change the size of the object in Runtime. BOOLEAN write-read access.

In the case of application window and picture window: Read only access

See also

OnlineTableControl (Page 5114)

OnlineTrendControl (Page 5122)

AlarmControl (Page 5018)

ControlDesignMode

Description

The control style can be defined in this selection field.

Access in Runtime: Write

Syntax

Object.**ControlDesignMode**[=RTControlModes]

Object

Required. An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView", "RulerControl".

RTControlModes

The following settings are available:

Value	Designation	Description
	Project setting	The style corresponds to the project settings in WinCC Explorer.
0	Classic	"Classic" WinCC style
1	Standard	New WinCC V7 style

SmartTags

Description

Returns the SmartTags list.

Access in Runtime: Read

Syntax

Object.SmartTags

Object

Required A ""HMIRuntime" object.

SortByTimeDirection

Description

Specifies whether the last incoming message is shown at the top of the "AlarmControl" object (ascending sorting order).

Access in Runtime: Read and write

Syntax

Object.**SortByTimeDirection**[=SortByTimeDirection]

Object

Required A "ScreenItems" object with following format:

- AlarmView

SortByTimeDirection

Optional TRUE, if the last incoming alarm is shown at the top.

SortByTimeEnabled

Description

Specifies whether the sorting of the messages can be altered according to the time in the "AlarmView" object.

Access in runtime: Read and write

Syntax

Object.**SortByTimeEnabled**[=BOOLEAN]

Object

Required. A "ScreenItems" object with the following format:

- AlarmView

BOOLEAN

Optional TRUE, if the sorting can be altered by the device operator.

SortSequence

Description

Specifies how to change the sorting order by mouse click.

Access in Runtime: Read and write

Syntax

Object.**SortSequence**[=GridSortSequence]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveConrol

GridSortSequence

Value	Description	Explanation
0	Up/down/none	You can toggle between ascending, descending and no sorting by means of mouse click.
1	Up/down	You can toggle between ascending and descending sorting order by means of mouse click.

StartAngle

Description

Specifies the angle at which the start point of the selected object deviates from the zero position (0°).

Access in runtime: Read and write

Syntax

Object.**StartAngle**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- CircleSegment
- CircularArc
- EllipseSegment
- EllipticalArc
- TubeArcObject

Int32

Optional A value or a constant that specifies the angle at which the start point of the specified object deviates from the zero position (0°).

StartStyle

Description

Determines how the line start of the given object is displayed.

Access in runtime: Read and write

Syntax

Object.**StartStyle**[=LineEndStyle]

Object

Required. A "ScreenItem" object with the following format:

- Line
- Polyline

LineEndStyle

Optional A value or constant which determines the line start. Value range from 0 to 6.

hmiLineEndStyleNone (0): The line has no start symbol.

hmiLineEndStyleArrow (1): The line starts with an arrow.

hmiLineEndStyleFilledArrow (2): The line starts with a filled arrow.

hmiLineEndStyleFilledArrowReversed (3): The line starts with a reversed arrow.

hmiLineEndStyleLine (4): The line starts with a vertical line.

hmiLineEndStyleCircle (5): The line starts with a circle.

hmiLineEndStyleFilledCircle (6): The line starts with a filled circle.

StartTop

Description

No access in runtime.

StartValue

Description

Defines the absolute value of the zero point of the scale indicator.

Access in runtime: Read and write

Syntax

Object.**StartValue**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the absolute value of the zero point for the scale indicator.

State

Description

Returns the status of a message.

The following table shows the possible states of a message:

State	Alarm Log Status
1	Came In
2	Went Out
5	Came in and comment
6	Gone and comment

StatusbarBackColor

Description

Specifies the background color for status bars. You open a color selection dialog box with the button. Enable the "Display" option to active the setting.

Access in runtime: Read and write

Syntax

Object.**StatusbarBackColor**[=Color]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant that specifies the background color of the status bar.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

StatusbarElementAdd

Description

Creates a new, user-defined status bar element. You can change the name assigned by WinCC in the "Object name" field.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementAdd**[=STRING]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that specifies a new, user-defined element in the status bar.

StatusbarElementAutoSize

Description

Enables autosizing of the width of a status bar element selected.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementAutoSize**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The width of the selected element is set automatically.

FALSE: The width of the selected element is not set automatically.

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

OnlineTrendControl (Page 5122)

AlarmControl (Page 5018)

StatusbarElementCount

Description

Specifies the number of configurable status bar elements.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementCount**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl

- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant that specifies the number of configurable status bar elements.

StatusbarElementIconId

Description

Specifies the ID number and symbol assignment of a status bar element.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementIconId**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or constant that specifies the ID number and symbol assignment of a status bar element.

StatusbarElementID

Description

Specifies the ID number of the selected status bar element.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementID**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or constant that specifies the ID number of the selected status bar element.

StatusbarElementIndex

Description

Specifies the reference for a status bar element.

Values between 0 and "StatusbarElementCount minus 1 are valid for "StatusbarElementIndex".

Access in runtime: Read and write

Syntax

Object.**StatusbarElementIndex**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant that specifies the reference for a status bar element.

StatusbarElementName

Description

Specifies the object name of the selected status bar element.

You can rename the objects of custom status bar elements. The "StatusbarElementName" property for user-defined elements can be dynamized with the "StatusbarElementRename" property.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementName**[=STRING]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or constant that specifies the object name of the selected status bar element.

StatusbarElementRemove

Description

Removes the selected user-defined status bar element.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementRemove**[=STRING]

Object

Required. A "ScreenItem" object with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl

- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that specifies the name of the user-defined status bar element to be removed.

StatusbarElementRename

Description

Changes the name of the user-defined status bar element that is referenced by the "StatusbarElementIndex" property.

The property with the name "StatusbarElementRename" can be dynamized for user-defined elements. With "StatusbarElementRename" you also dynamize the "StatusbarElementName" property.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementRename**[=STRING]

Object

Required. An object of the "ScreenItem" type with the format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional. A value or constant that specifies the new object name of the selected status bar element.

StatusbarElements

Description

Specifies the elements that are to be shown in the status bar.

No access in runtime.

StatusbarElementTooltipText

Description

Specifies the tooltip text for the selected user-defined status bar element.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementTooltipText**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that specifies the tooltip text for the selected user-defined status bar element.

StatusbarElementUserDefined

Description

Specifies whether the configuration engineer has added the status bar element as a new user-defined element.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementUserDefined**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl

- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The element of the status bar is customized.

FALSE: The element of the status bar is specified by the system.

StatusbarElementVisible

Description

Specifies whether the selected user-defined status bar element is displayed in runtime.

In the list, select the status bar elements that you want to display in runtime.

Click a list entry to adapt the properties, or to change its position in the status bar of the Control by means of the "Up" and "Down" buttons.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementVisible**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The selected user-defined status bar element is displayed.

FALSE: The selected user-defined status bar element is not displayed.

StatusbarElementWidth

Description

Defines the width of the selected status bar element in pixels.

You can define the width if the "Automatic" option is not activated.

Access in runtime: Read and write

Syntax

Object.**StatusbarElementWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or constant that defines the width of the selected user-defined status bar element in pixels.

StatusbarFontColor

Description

Specifies the color of the texts in the status bar.

Access in runtime: Read and write

Syntax

Object.**StatusbarFontColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or constant that specifies the color of the texts in the status bar.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

StatusbarShowTooltips

Description

Enables the display of tooltips for the status bar elements in Runtime.

Access in runtime: Read and write

Syntax

Object.**StatusbarShowTooltips**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The tooltips are displayed.

FALSE: The tooltips are not displayed.

StatusbarText

Description

Specifies the default text in the status bar.

Access in runtime: Read and write

Syntax

Object.**StatusbarText**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that specifies the default text in the status bar.

StatusbarUseBackColor

Description

Sets a background color for the status bar.

Access in runtime: Read and write

Syntax

Object.**StatusbarUseBackColor**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The background color of the status bar is displayed.

FALSE: The background color of the status bar is not displayed.

StatusbarVisible

Description

Enables the display of the status bar of a control.

Access in Runtime: Read and write

Syntax

Object.**StatusbarVisible**[=BOOLEAN]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The status bar is displayed.

FALSE: The status bar is not displayed.

Style

Description

Specifies the line style of the selected object.

Access in runtime: Read and write

Syntax

Object.**Style**[=LineStyle]

Object

Required. A "ScreenItem" object with the following format:

- CircularArc
- EllipticalArc
- Line
- Polyline

LineStyle

Optional A value or a constant that specifies the line style. Value range from 0 to 4.

hmiLineStyleSolid (0): solid line

hmiLineStyleDash (1): broken line

hmiLineStyleDot (2): dotted line

hmiLineStyleDashDot (3): dash - dot line

hmiLineStyleDashDotDot (4): dash - dot - dot line

Default setting: hmiLineStyleSolid

StyleSettings

Description

Defines the style in which the object is displayed.

Access in runtime: Read and write

Syntax

Object.**StyleSettings**[=WinCCStyle]

Object

Required. An object of the "ScreenItem" type with the following format:

- Button
- RoundButton
- WindowsSlider

WinCCStyle

Optional. A value or a constant that specifies the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

SwapFirstWithLastConnection

Description

Specifies whether the text in the object is shown horizontally.

Access in Runtime: Read and write

Syntax

Object.**SwapFirstWithLastConnection**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Connector".".

BOOLEAN

Optional TRUE, if the text in the object is shown horizontally.

See also

Connector (Page 5058)

Properties T

TableBackColor

Description

Determines the background color of the table cells of the given object.

Access in runtime: Read and write

Syntax

Object.**TableBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmView
- RecipeView
- StatusForce
- TrendView
- UserView

Color

Optional A value or constant which determines the background color of the table cells.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TableColor

Description

Specifies the background color of the rows.

You open a color selection dialog box with the button.

Access in runtime: Read and write

Syntax

Object.**TableColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional. A value or constant that specifies the background color of the table rows.

Comments

You can use the "RGB" function to define the colors in RGB format (red, green, blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TableColor2

Description

Specifies the second background color of the rows.

You open a color selection dialog box with the button.

The settings are only active in Runtime if the "Row color 2" option is enabled. "Row color 1" and "Row color 2" are then used alternately for the row background.

Access in runtime: Read and write

Syntax

Object.**TableColor2**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional. A value or constant that specifies the second background color of the table rows.

Comments

You can use the "RGB" function to define the colors in RGB format (red, green, blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TableForeColor

Description

Specifies the text color used in the table cells of the selected object.

Access in runtime: Read and write

Syntax

Object.**TableForeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- AlarmView
- OnlineTableControl
- RecipeView
- StatusForce
- TrendRulerControl
- UserArchiveControl
- UserView

Color

Optional A value or a constant that specifies the text color used in the table cells.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TableForeColor2

Description

Specifies the second font color.

You open a color selection dialog box with the button.

The settings are only active in Runtime if the "Row color 2" option is enabled. The "Row color 1" and "Row color 2" font colors are then used alternately.

Access in runtime: Read and write

Syntax

Object.**TableForeColor2**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional. A value or a constant that specifies the second font color used in the table cells.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TableGridLineColor

Description

Determines the color of the gridlines in the table of the given object.

Access during runtime: Read and Write

Syntax

Object.**TableGridLineColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the format:

- RecipeView
- TrendView
- UserView

You have no access in runtime with the following format:

- StatusForce
- SysDiagControl

Color

Optional A value or constant which determines the color of the gridlines of the table.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TableHeaderBackColor

Description

Specifies the background color in the header of the table of the selected object.

Access in runtime: Read and write

Syntax

Object.**TableHeaderBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmView
- RecipeView
- StatusForce
- TrendView
- UserView

Color

Optional A value or a constant that specifies the background color in the header.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TableHeaderForeColor

Description

Specifies the text color in the header of the table of the selected object.

Access in runtime: Read and write

Syntax

Object.**TableHeaderForeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmView
- RecipeView
- StatusForce
- TrendView
- UserView

Color

Optional A value or a constant that specifies the text color in the header.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TagPrefix

Description

Specifies a prefix for all tags used in the screen.

A tag prefix can be assigned for a screen window. This prefix is then prefixed to all tags used in the screen. In this way, a picture that is embedded in a picture window retains access to its own tags while another accesses other tags.

The change to the tag prefix does not become effective until the screen is reloaded. This happens automatically upon screen change; otherwise, the screen name must be reassigned.

The prefix is freely definable but must match the name of the structure tag.

Access in runtime: Read and write

Syntax

Object.**TagPrefix**[= STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- Screenwindow

STRING

Optional. A value or a constant that specifies the tag prefix.

Example

The "InOutput" screen should be displayed in the screen window. The "InOutput" screen contains three I/O fields that are linked to a structure tag. The structure tag consists of the elements IO1, IO2, IO3; one element for each I/O field.

Three such structure tags with the structure names Struct1, Struct2 and Struct3 are defined in the project, for example.

In this case, the tag prefix is the structure name with a following period. For example, if you specify Struct2. as the tag prefix (the period is necessary for addressing the elements of the structure tags as structure elements with the correct syntax), the I/O fields in the "InOutput" screen are linked to the elements of structure tag Struct2:

Tag prefix: "Struct2."

- Output value (first I/O field): EA1
- Output value (second I/O field): EA2
- Output value (third I/O field): EA3

The current tag binding in the screen window is therefore

- Output value (first I/O field): Struct2.EA1
- Output value (second I/O field): Struct2.EA2
- Output value (third I/O field): Struct2.EA3

Tags

Description

Returns an object of type "Tags".

Access during runtime: Read

Syntax

Object.**Tags**

Object

Necessary. An object of the "HMIRuntime" type.

Example

The following example accesses the tag "Tag1":

```
'VBS86
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
```

See also

HMIRuntime (Page 4993)

Template

Description

Specifies the template for displaying window content in the "Application window" object.

Access in runtime: Read and write

Syntax

Object.**Template**[=TemplateType]

Object

Required. An object of the "ScreenItem" type with the following format:

- ApplicationWindow

TemplateType

Optional. A value or a constant that specifies the template.

The following templates are possible depending on the property value:

Window Contents = Global Script

- "GSC diagnostics"
  The application window is supplied by applications of the Global Script. The results of the diagnosis system are displayed.
- "GSC Runtime"
  The application window is supplied by applications of the Global Script. The analysis results regarding characteristics in Runtime are displayed.

Window Contents = Print Jobs

- "All Jobs":
  The application window is supplied by the logging system. The available reports are displayed as a list.
- "All Jobs - Context Menu":
  The application window is supplied by the logging system. The available reports are displayed as a list. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.
- "Job Detail View":
  The application window is supplied by the logging system. The available reports are displayed in a selection menu. Detailed information is displayed for the selected report.
- "Selected Jobs - Context Menu":
  The application window is supplied by the logging system. The available reports are displayed as a list. This list only contains reports which you have activated the option "Mark for print job list" in the "Print Job Properties" dialog. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

Text

Description

Specifies the labeling for the text field.

Access in runtime: Read and write

Syntax

Object.**Text**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- TextField
- CheckBox
- ComboBox
- ListBox
- MultiLineEdit

- OptionGroup
- RoundButton

STRING

Optional A value or a constant that specifies the labeling.

TextList

Description

Returns a list containing the output text actually to be output for each output value.

The assignments are dependent on the set list type. You define the list type with the "ListType" property.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read

Syntax

Object.**TextList**[=HmiObjectHandle]

Object

Required. A "ScreenItem" object with the following format:

- SymbolicIOField

You have no access in runtime with the following formats:

- Button

HmiObjectHandle

A list which contains the assignments between the output value and the output text actually to be output.

TextOff

Description

Specifies the text that will be displayed in the "off" status of the selected object.

Access in runtime: Read and write

Syntax

Object.**TextOff**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- Button
- Switch

You have no access in runtime with the following formats:

- SymbolicIOField

STRING

Optional A value or a constant that specifies the labeling for the "off" status.

Comments

The property is only available if the referenced object "SymbolicIOField", Button" or "Switch" is of the "Text" type.

TextOn

Description

Specifies the text that will be displayed in the "on" status of the selected object.

Access in runtime: Read and write

Syntax

Object.**TextOn**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- Switch

You have no access in runtime with the following formats:

- Button
- SymbolicIOField

STRING

Optional A value or a constant that specifies the labeling for the "on" status.

Comments

The property is only available if the referenced object "SymbolicIOField", Button" or "Switch" is of the "Text" type.

TextOrientation

Description

Specifies the text direction (orientation) of the selected object.

Access in runtime:

- RT Advanced: No access
- RT Professional: Read/Write

Syntax

Object.**TextOrientation**[=TextOrientation]

Object

Required. An object of the "ScreenItem" type with the following format:

- Button
- IOField
- OptionGroup
- RoundButton
- SymbolicIOField
- TextField
- WindowSlider

You have no access in runtime with the following formats:

- CheckBox
- DateTimeField
- Switch

TextOrientation

hmiTextHorizontal (0): The text is shown horizontally.

hmiTextRotated90Degree (-1): The text is shown vertically and left justified.

hmiTextRotated270Degree (1): The text is shown vertically and right-justified.

ThumbBackColor

Description

Specifies the background color of the slider in the ""Slider" object.

Access in runtime: Read and write

Syntax

Object.**ThumbBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Slider
- WindowsSlider

Color

Optional A value or a constant that specifies the background color of the slider.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TicksColor

Description

Specifies the color of the hour markers on the face of the "Clock" object.

Access in runtime: Read and write

Syntax

Object.**TicksColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Clock

Color

Optional A value or a constant that specifies the color of the hour markers.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TickStyle

Description

Specifies the scale display.

Access in runtime: Read and write

Syntax

Object.**TickStyle**[=SliderTickStyle]

Object

Required. A "ScreenItem" object with the following format:

- Slider

You have no access in runtime with the following formats:

- Clock

SliderTickStyle

hmiSliderTickStyleNone (0): The object has no scale.

hmiSliderTickStyleEffect1(1): The scale consists of main gradations only. The scale is black on a white background.

hmiSliderTickStyleEffect2 (2): The scale consists of main gradations only. The scale is white on a black background.

hmiSliderTickStyleNormal (3): The scale consists of simple gradations.

Comments

Because of automatic scaling, two scale marks may in some cases be positioned directly adjacent to one another (this looks like a thicker scale mark). You can correct this effect by slightly lengthening or shortening the slider object.

You you can also completely suppress the display of the scale ("WithAxes").

TimeAxisBeginTime(i)

Description

Specifies the start time for the display of the selected trend. The ""UseTimeRange(i)" and "ShareTimeAxis" properties determine whether or not the information is evaluated.

Access in runtime: Read and write

Syntax

Object.**TimeAxisBeginTime**(i)[=DateTime]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTrendControl

You have no access in runtime with the following format:

- TrendView

DateTime

Optional A value or a constant that specifies the start time for the display of the specified trend.

TimeAxisEndTime

Description

Specifies the end time for the display of the selected trend. Whether or not the information is evaluated depends on the "Autorange", "UseTimeRange(i)" and "ShareTimeAxis" properties.

Access in runtime: Read and write

Syntax

Object.**TimeAxisEndTime**[=DateTime]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTrendControl

DateTime

Optional A value or a constant that specifies the end time for the display of the specified trend.

TimeAxisLabel(i)

Description

Specifies the labeling of the time axis. Whether or not the information is evaluated depends on the "ConfigureTimeAxis(i)" property.

Access in runtime: Read and write

Syntax

Object.**TimeAxisLabel**(i)[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTrendControl

STRING

Optional A value or a constant that specifies the labeling of the time axis.

Comments

The parameter i indicates the number of the trend.

TimeAxisRange

Description

No access in runtime.

TimeAxisTimeFormat(i)

Description

Specifies the format of the information along the time axis for the selected trend.

Access in runtime: Read and write

Syntax

Object.**TimeAxisTimeFormat**(i)[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTrendControl

STRING

Optional A value or a constant which defines the format for the time axis.

Comments

The parameter i indicates the number of the trend.

TimeBase

Description

Specifies the time zone in which the time values will be displayed.

Access in Runtime: Read and write

Syntax

Object.**TimeBase**[=TimeBase]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- UserArchiveControl

TimeBase

hmiTimeBaseLocalTimezone (0): Local time

hmiTimeBaseServerTimezone (1): Time zone of the server

hmiTimeBaseUTC (2): UTC (Universal Time Coordinated)

hmiTimeBaseProjectSetting (3): Project settings

Comments

Set the time mode in accordance with the computer settings on the properties page of the computer in WinCC Explorer.

TimeColumnActualize

Description

Specifies whether the values of the selected column are updated.

Access in runtime: Read and write

Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

BOOLEAN

TRUE: The time column is actualized.

FALSE: The time column is not actualized. This setting can be useful when comparing tables.

TimeColumnAdd

Description

Creates a new time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnAdd**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

STRING

Optional A value or constant which specifies a new time column.

TimeColumnAlignment

Description

Defines the mode of alignment of the time column selected.

Access in runtime: Read and write

Syntax

Object.**TimeColumnAlignment** [=HorizontalAlignment]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

HorizontalAlignment

Value	Description	Explanation
0	Left	The time column selected is displayed on the left.
1	Centered	The time column selected is aligned to center.
2	Right	The time column selected is displayed on the right.

See also

OnlineTableControl (Page 5114)

TimeColumnAlignment(i)

Description

Specifies the alignment of the time column of a column pair i. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnAlignment**(i)[=AlignmentHorizontal]

Object

Required A "ScreenItem" object with the format "TableView".".

AlignmentHorizontal

hmiAlignmentLeft (0): The text is shown left justified.

hmiAlignmentCentered (1): The text is shown centered.

hmiAlignmentRight (2): The text is shown right justified.

See also

OnlineTableControl (Page 5114)

TimeColumnBackColor

Description

Specifies the background color of the selected time column.

The setting is effective:

- When the option "in the colors of the value column" is not activated.
- When the "Font color" option is activated in the "Use column color" area of the "General" tab.

Access in runtime: Read and write

Syntax

Object.**TimeColumnBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

Color

Optional A value or a constant that specifies the background color of the selected time column.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TimeColumnBeginTime

Description

Defines the start of the time range for a selected time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnBeginTime**[=DateTime]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

DateTime

Optional A value or a constant that specifies the starting time for the selected time column.

TimeColumnCaption

Description

Defines the caption of the time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnCaption**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

STRING

Optional A value or a constant that specifies the caption of the time column.

TimeColumnCount

Description

Specifies the number of configured time columns.

Access in runtime: Read and write

Syntax

Object.**TimeColumnCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

Int32

Optional A value or a constant that specifies the number of configured time columns.

TimeColumnDateFormat

Description

Defines the date format for visualizing a selected time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnDateFormat**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

STRING

The following date formats are available:

Value	Explanation
dd.MM.yy	Day.Month.Year, e.g., 24.12.13.
dd.yyyyd.MM	Day.Month.Year, e.g., 24.12.2013.
dd/MM/yy	Day/Month/Year, e.g., 24/12/13.
dd/MM/yyyy	Day/Month/Year, e.g., 24/12/2013.

TimeColumnEndTime

Description

Defines the end of the time range of a selected time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnBeginTime**[=DateTime]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

DateTime

Optional A value or constant that specifies the end time.

TimeColumnForeColor

Description

Specifies the font color of the selected time column.

The setting is effective:

- When the option "in the colors of the value column" is not activated.
- When the "Font color" option is activated in the "Use column color" area of the "General" tab.

Access in runtime: Read and write

Syntax

Object.**TimeColumnForeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

OnlineTableControl

Color

Optional A value or a constant that specifies the font color of the selected time column.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TimeColumnHideText

Description

Sets text format for displaying the content of a time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnHideText**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

BOOLEAN

TRUE: The content is not shown as a text.

FALSE: The content is shown as a text.

TimeColumnHideTitleText

Description

Sets text format for displaying the time column header.

Access in runtime: Read and write

Syntax

Object.**TimeColumnHideTitleText**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

BOOLEAN

TRUE: The header is not shown as text.

FALSE: The header is shown as text.

TimeColumnIndex

Description

References a configured time column. You can assign the values of other properties to a specific time column by using the property.

Valid values for "TimeColumnIndex" are between 0 and "TimeColumnCount" minus 1. The "TimeColumnCount" property indicates the number of configured time columns.

Syntax

Object.**TimeColumnIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

Int32

Optional A value or constant which references a configured time span.

TimeColumnLength

Description

Specifies the width of a selected time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnLength**[=Int32]

Object

Required. A "ScreenItem" object with the format:

- OnlineTableControl

Int32

Optional A value or a constant that specifies the width of the selected time column.

TimeColumnMeasurePoints

Description

Defines the number of measurement points to be displayed in the time column selected.

Access in runtime: Read and write

Syntax

Object.**TimeColumnMeasurePoints**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

Int32

Optional A value or constant that specifies the number of measurement points.

TimeColumnName

Description

Specifies the name of a selected time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

STRING

Optional A value or a constant that specifies the name of the selected time column.

TimeColumnRangeType

Description

Defines the time range setting for the time column selected.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnRangeType**[=TimeRangeMode]

Object

Required A "ScreenItem" object with following format:

- OnlineTableControl

TimeRangeMode

Value	Description	Explanation
0	Time range	Defines the start time and time range of the time column.
1	Start to end time	Defines the start and end time for the time column.
2	Number of measurement points	Defines the start time and the number of measurement points for the time column.

TimeColumnRemove

Description

Removes the selected time column from the list.

Access in runtime: Read and write

Syntax

Object.**TimeColumnRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

STRING

Optional Removes the selected time column from the list.

TimeColumnRename

Description

Changes the name of the time column which is referenced by the "TimeColumnIndex" property. With "TimeColumnRename" you also dynamize the "TimeColumnName" property.

Access in runtime: Read and write

Syntax

Object.**TimeColumnRename**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

STRING

Optional Changes the name of the time column which is referenced by the "TimeColumnIndex" property.

TimeColumnRepos

Description

Repositions the order of time columns and of corresponding value columns. "Up" and "Down" move the time column selected up or down in the list. This moves the time column and corresponding value columns in the table towards the front or towards the back.

Access in runtime: Read and write

Syntax

Object.**TimeColumnRepos**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

Int32

Optional Value or constant that changes the order of time columns and corresponding value columns.

TimeColumnShowDate

Description

Enables the display of the date and time in the time column selected.

Access in runtime: Read and write

Syntax

Object.**TimeColumnShowDate**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

BOOLEAN

TRUE: The date and the time are displayed. The date format is defined in the "Date format" field.

FALSE: The date is not displayed. Only the time is displayed.

TimeColumnShowIcon

Description

Enables the display of time column contents as icon.

Access in runtime: Read and write

Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the format:

- OnlineTableControl

BOOLEAN

TRUE: The content is shown as a symbol.

FALSE: The content is not shown as an icon.

TimeColumnShowTitleIcon

Description

Specifies whether the header is shown as a symbol.

Access in runtime: Read and write

Syntax

Object.**TimeColumnShowTitleIcon**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

BOOLEAN

TRUE: The header is shown as a symbol.

FALSE: The header is not shown as a symbol.

TimeColumnSort

Description

Specifies how the time column referenced in "TimeColumnIndex" is sorted.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnSort**[=SortMode]

Object

Required A "ScreenItem" object with following format:

- OnlineTableControl

SortMode

Value	Description	Explanation
0	No	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

TimeColumnSortIndex

Description

Specifies the sorting order of the time column referenced in "TimeColumnIndex". If you set the value to "0", the sorting criterion is removed in "TimeColumnSort".

Syntax

Object.**TimeColumnSortIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

Int32

Optional Value or constant that specifies the sorting order of the time column referenced in "TimeColumnIndex". If you set the value to "0", the sorting criterion is removed in "TimeColumnSort".

TimeColumnTimeFormat

Description

Defines the time format for visualizing a selected time column.

Access in runtime: Read and write

Syntax

Object.**TimeColumnTimeFormat**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

STRING

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

TimeColumnTimeRangeBase

Description

Specifies the time unit for calculating the time range.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnTimeRangeBase**[=TagLoggingTimeUnit]

Object

Required A "ScreenItem" object with following format:

- OnlineTableControl

TagLoggingTimeUnit

Value	Description
500	500 ms
1000	1 second
60000	1 minute

Value	Description
3600000	1 hour
86400000	1 day

TimeColumnTimeRangeFactor

Description

Defines the factor for calculating the time range. Only integer factors are valid.

Access in runtime: Read and write

Syntax

Object.**TimeColumnTimeRangeFactor**[=Int16]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

Int16

Optional A value or a constant that specifies the factor to determine the time range.

TimeColumnUseValueColumnColors

Description

Defines whether the selected time column will be displayed in the value column colors.

Access in runtime: Read and write

Syntax

Object.**TimeColumnUseValueColumnColors**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

BOOLEAN

TRUE: The selected time column is displayed in the colors of the value column. The settings in the "Font color" and "Background color" fields are disabled.

FALSE: The selected time column is displayed in the colors which are specified in the "Font color" and "Background color" fields.

TimeColumnVisible

Description

The list shows the time columns you created. Select the time columns to be displayed in the table from the list.

Click a time column entry in the list to adapt the properties and to define the time range of the time column.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnVisible**[=BOOLEAN]

Object

Required A "ScreenItem" object with following format:

- OnlineTableControl

BOOLEAN

Optional. TRUE if the time column is displayed in the table.

Timestamp

Description

Returns the time stamp of the last read access of a tag in local time as DATE.

Access in Runtime: Read

Syntax

Object.**TimeStamp**

Object

Required A "Tag" object.

Comments

To show the TimeStamp property in plain text, use the VBS function "FormatDateTime(Date[, NamedFormat])". The output is dependent on the language setting. To adjust the language, use the VBS function "SetLocale´()".

If you want to return the time stamp sorted by date, day and time, use the NamedFormat parameter or the VBS functions like Year, WeekDay, Day, Hour, Minute, Second. The name of a week day can be obtained using the VBS function WeekdayName.

Examples

The following example issues the time stamp of the tag "Tag11" with the aid of the function "FormatDateTime":

```
'VBS87
Dim objTag
Dim lngCount
lngCount = 0
Set objTag = HMIRuntime.Tags("Tag11")
objTag.Read
SetLocale("en-gb")
MsgBox FormatDateTime(objTag.TimeStamp)    'Output: e.g. 06/08/2002 9:07:50
MsgBox Year(objTag.TimeStamp)    'Output: e.g. 2002
MsgBox Month(objTag.TimeStamp)    'Output: e.g. 8
MsgBox Weekday(objTag.TimeStamp)    'Output: e.g. 3
MsgBox WeekdayName(Weekday(objTag.TimeStamp))    'Output: e.g. Tuesday
MsgBox Day(objTag.TimeStamp)    'Output: e.g. 6
MsgBox Hour(objTag.TimeStamp)    'Output: e.g. 9
MsgBox Minute(objTag.TimeStamp)    'Output: e.g. 7
MsgBox Second(objTag.TimeStamp)    'Output: e.g. 50
For lngCount = 0 To 4
MsgBox FormatDateTime(objTag.TimeStamp, lngCount)
Next
'lngCount = 0: Output: e.g. 06/08/2002 9:07:50
'lngCount = 1: Output: e.g. 06 August 2002
'lngCount = 2: Output: e.g. 06/08/2002
'lngCount = 3: Output: e.g. 9:07:50
'lngCount = 4: Output: e.g. 9:07
```

The following example issues the time stamp of the tag "Tag1":

```
'VBS88
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.TimeStamp
```

Tag (Page 5012)

TitleCut

Description

Specifies whether the content of the fields in a title bar is to be shortened if the column is too narrow.

Access in runtime: Read and write

Syntax

Object.**TitleCut**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

Optional TRUE if the column headers in the title bar are shortened if the column is too narrow.

TitleDarkShadowColor

Description

Specifies the color for the dark side of the shading.

You open a color selection with the button. The settings are only active if the "Shading Color" option is enabled.

Access in runtime: Read and write

Syntax

Object.**TitleDarkShadowColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional. A value or a constant that specifies the color for the dark side of the shading.

Comments

You can use the "RGB" function to define the colors in RGB format (red, green, blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TitleForeColor

Description

Specifies the font color of the table header for the selected status.

You open a color selection dialog box with the button.

Access in runtime: Read and write

Syntax

Object.**TitleForeColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional. A value or constant that specifies the font color in the title bar of the table.

Comments

You can use the "RGB" function to define the colors in RGB format (red, green, blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TitleGridLineColor

Description

Specifies the color of the separation lines in the title bar of the table.

You open a color selection dialog box with the button.

Access in runtime: Read and write

Syntax

Object.**TitleGridLineColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional. A value or a constant that specifies the color of the separation lines in the title bar of the table.

Comments

You can use the "RGB" function to define the colors in RGB format (red, green, blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TitleLightShadowColor

Description

Specifies the color for the light side of the shading.

You open a color selection dialog box with the button. The setting is only effective when the "Shading color" option is activated.

Access in runtime: Read and write

Syntax

Object.**TitleLightShadowColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

Color

Optional. A value or a constant that specifies the color for the light side of the shading.

Comments

You can use the "RGB" function to define the colors in RGB format (red, green, blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed and vbGreen.

TitleSort

Description

Defines how to trigger sorting by column title. The "Auto-scrolling" option must be disabled to sort by column title.

Access in Runtime: Read and write

Syntax

Object.**TitleSort**[=GridSortTrigger]

Object

Required An object of the type "ScreenItem" with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

GridSortTrigger

Value	Description	Explanation
0	No	Sorting by column header is disabled.
1	With click	Sorting is triggered by clicking in the column header.
2	With double-click	Sorting is triggered by double-clicking in the column title.

TitleStyle

Description

Specifies whether to set a shading color for the table header.

Access in Runtime: Read and write

Syntax

Object.**TitleStyle**[=GridHeaderStyle]

Object

Required A "ScreenItem" object with following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

GridHeaderStyle

Value	Description	Explanation
0	Flat	Disables the use of shading colors. Flat header style.
1	Button	Enables the use of shading colors. 3D representation of the header.

Toggle

Description

Specifies whether the selected object engages after it has been operated in Runtime.

Access in runtime: Read and write

Syntax

Object.**Toggle**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Button
- RoundButton

BOOLEAN

Optional TRUE, if the selected object engages after it has been operated in Runtime.

Tolerance

Description

Specifies the limit for the disk space view as of which a deviation will be reported.

Access in runtime: Read and write

Syntax

Object.**Tolerance**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

Int32

Optional A value or a constant that specifies the limit for the disk space view as of which a deviation will be reported.

ToleranceColor

Description

Specifies the colors in which the bars of the storage space display will be shown as soon as the tolerance range is exceeded.

Access in runtime: Read and write

Syntax

Object.**ToleranceColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

Color

Optional A value or a constant that specifies the colors in which the bars of the storage space display will be shown as soon as the tolerance range is exceeded.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

ToleranceLowerLimit

Description

Sets the low limit for tolerance 1.

Access in runtime: Read and write

Syntax

Object.**ToleranceLowerLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the format:

- Bar

DOUBLE

Optional A value or a constant that specifies the low limit for tolerance 1.

Comments

The following values will be defined via the properties "ToleranceLowerLimit", "ToleranceLowerLimitColor" and "ToleranceLowerLimitRelative":

- Limit
- Representation upon reaching the limit
- Type of evaluation

ToleranceLowerLimitColor

Description

Specifies the color for the lower limit "ToleranceLowerLimit"".

Access in runtime: Read and write

Syntax

Object.**ToleranceLowerLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the lower limit "ToleranceLowerLimit" ".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

The "ToleranceLowerLimitEnabled" property must have the value TRUE if the bar color is to change once the limit has been reached.

ToleranceLowerLimitEnabled

Description

Specifies whether the "ToleranceLowerLimit" limit is monitored. The limit, the display when the limit has been reached, and the type of evaluation are set with the properties "ToleranceLowerLimit", "ToleranceLowerLimitColor" and "ToleranceLowerLimitRelative".

Access in runtime: Read and write

Syntax

Object.**ToleranceLowerLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the "ToleranceLowerLimit" limit is monitored.

ToleranceLowerLimitRelative

Description

Specifies whether the lower limit "ToleranceLowerLimit" is evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**ToleranceLowerLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional

TRUE: The lower limit "ToleranceLowerLimit" is evaluated as a percentage.

FALSE: The lower limit "ToleranceLowerLimit" is evaluated as an absolute value.

ToleranceUpperLimit

Description

Sets the high limit for tolerance 1.

Access in runtime: Read and write

Syntax

Object.**ToleranceUpperLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the format:

- Bar

DOUBLE

Optional A value or a constant that specifies the high limit for tolerance 1.

Comments

The following values will be specified via the properties "ToleranceUpperLimit", "ToleranceUpperLimitColor" and "ToleranceUpperLimitRelative":

- Limit
- Representation upon reaching the limit
- Type of evaluation

ToleranceUpperLimitColor

Description

Specifies the color for the upper limit "ToleranceUpperLimit".

Access in runtime: Read and write

Syntax

Object.**ToleranceUpperLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the upper limit "ToleranceUpperLimit"".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

ToleranceUpperLimitEnabled

Description

Specifies whether the "ToleranceUpperLimit"" limit is to be monitored.

Access in runtime: Read and write

Syntax

Object.**ToleranceUpperLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the "ToleranceUpperLimit" limit is to be monitored.

Comments

The following values will be specified with the properties "ToleranceUpperLimit",", "ToleranceUpperLimitColor" and "ToleranceUpperLimitRelative":

- Limit
- Representation upon reaching the limit
- Type of evaluation

ToleranceUpperLimitRelative

Description

Specifies whether the higher limit "ToleranceUpperLimit"" is to be evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**ToleranceUpperLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional

TRUE: The higher limit "ToleranceUpperLimit" is evaluated as a percentage.

FALSE: The higher limit "ToleranceUpperLimit" is evaluated as an absolute value.

ToolbarAlignment

Description

Specifies the position of the toolbar.

Access in runtime: Read and write

Syntax

Object.**ToolbarAlignment**[=ToolbarPosition]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

You have no access in runtime with the following format:

- SysDiagControl

ToolbarPosition

Optional. A value or a constant that specifies the position of the toolbar.

ToolbarBackColor

Description

Background color - ToolbarBackColor

Specifies the background color of the toolbar. Open the "Color selection" dialog by clicking the button.

The background color you configured is only displayed if the "Display" option is enabled.

Access in runtime: Read and write

Syntax

Object.**ToolbarBackColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Color

Optional A value or a constant that specifies the background color of the toolbar.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

ToolbarButtonActive

Description

Activates a button function in Runtime. Clicking the button in Runtime triggers the corresponding function.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonActive**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl

- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The function connected to the key is active.

FALSE: The function connected to the key is not active. You can connect your own functions to the key by local scripts.

ToolbarButtonAdd

Description

Creates a new, user-defined key function.

You can change the name assigned by WinCC in the "Object name" field.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonAdd**[=STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional. A value or a constant that specifies the name of the new key function.

ToolbarButtonBeginGroup

Description

Inserts a leading separator (vertical line) for the selected button function on the toolbar. These separators can be used to group the icons of the button functions.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonBeginGroup**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The separator is inserted in front of the selected key function.

FALSE: The separator is not inserted in front of the selected key function.

ToolbarButtonCount

Description

Specifies the number of buttons in the toolbar.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant that specifies the number of buttons in the toolbar.

ToolbarButtonEnabled

Description

Enables operation of custom toolbar buttons.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

Optional TRUE if operation is enabled for the selected user-defined key in the toolbar.

ToolbarButtonHotKey

Description

Specifies the hotkey for the selected button function.

You create or edit a hotkey by clicking in the "Hotkey" field and pressing the key or key shortcut required.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonHotKey**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl

- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant that specifies the hotkey for the selected key function.

ToolbarButtonID

Description

Specifies a unique ID number for the selected button function.

WinCC sets this read only ID.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonID**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or constant that specifies the ID number of the selected key function.

ToolbarButtonIndex

Description

References a button function.

Using this attribute you can assign the values of other attributes to a specific button function.

Values between 0 and "ToolbarButtonCount" minus 1 are valid for "ToolbarButtonIndex". The attribute "ToolbarButtonCount" specifies the number of configurable key functions.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant that specifies the number of the selected key function.

ToolbarButtonLocked

Description

Enables/disables display of the locked, pressed state for a user-defined toolbar button.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonLocked**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

Optional TRUE if the pressed state is displayed for the selected user-defined button in the toolbar.

ToolbarButtonName

Description

Specifies the name of the selected user-defined button.

You can change the name of a user-defined button. The "ToolbarButtonName" property for user-defined buttons can be dynamized with the "ToolbarButtonRename" property.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that specifies the name of the selected user-defined button.

ToolbarButtonAuthorization

Description

Shows the authorization for a button function selected. You can edit the authorization using the selection button. The authorizations are configured in the user administration.

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

OnlineTrendControl (Page 5122)

ToolbarButtonRemove

Description

Removes the selected user-defined button.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that specifies the name of the user-defined button to be removed.

ToolbarButtonRename

Description

Returns the name of the user-defined toolbar button that is being referenced via the "ToolbarButtonID" property.

With "ToolbarButtonRename" you also dynamize the "ToolbarButtonName" property.

Access in Runtime: Read and write

Syntax

Object.**ToolbarButtonRename**[=STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl

- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional. A value or a constant that specifies the new name of the selected user-defined button.

ToolbarButtonRepos

Description

Changes the sorting order of user-defined key functions in the toolbar.

"Up" and "Down" move the button function selected up or down in the list. This moves the button function in the toolbar of a Control towards the front or towards the back.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonRepos**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Int32

Optional A value or a constant that specifies the position of the selected user-defined button in the toolbar.

ToolbarButtonTooltipText

Description

Specifies the tooltip text for the user-defined button in the toolbar.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonTooltipText**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

STRING

Optional A value or a constant that specifies the tooltip text for the selected user-defined button.

ToolbarButtonUserDefined

Description

Specifies whether the project engineer has added the toolbar button as new user-defined button.

Access in runtime: Read and write

Syntax

Object.**ToolbarButtonUserDefined**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

Boolean

TRUE: The key of the toolbar is customized.

FALSE: The key of the toolbar is specified by the system.

ToolbarShowTooltips

Description

Enables the display of tooltips for the button functions in Runtime. The property can be dynamized with the ToolbarShowTooltips name. The property for specifying the tooltip text is "ToolbarButtonTooltipText".

Access in runtime: Read and write

Syntax

Object.**ToolbarShowTooltips**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The tooltips are displayed.

FALSE: The tooltips are not displayed.

ToolbarUseBackColor

Description

Enables the display of the background color for a toolbar.

Access in runtime: Read and write

Syntax

Object.**ToolbarUseBackColor**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl

- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The background color of the toolbar is displayed.

FALSE: The background color of the toolbar is not displayed.

ToolbarUseHotKeys

Description

Activates the hotkeys for button functions in Runtime. You insert the hotkeys for button functions in the "Hotkey" field.

Access in runtime: Read and write

Syntax

Object.**ToolbarUseHotKeys**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The hotkeys are activated.

FALSE: The hotkeys are not activated.

ToolbarVisible

Description

Specifies whether the toolbar of the control is displayed.

Access in runtime: Read and write

Syntax

Object.**ToolbarVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- FunctionTrendControl
- OnlineTableControl
- OnlineTrendControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The toolbar is displayed.

FALSE: The toolbar is not displayed.

ToolTipText

Description

Specifies the tooltip text.

Access in Runtime: Read and write

Syntax

Object.**ToolTipText**[=STRING]

ToolTipText

Required. An object of the "ScreenItem" type with the format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- CircularArc
- ComboBox
- Ellipse
- EllipseSegment
- EllipticalArc

- GraphicIOField
- GraphicView
- IOField
- Line
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- StatusForce
- Switch
- SymbolicIOField
- TextField
- TubeArcObject

STRING

Optional A value or a constant that specifies the tooltip text.

Top

Description

Specifies the value of the Y coordinate of the selected object.

Access in runtime: Read and write

Syntax

Object.**Top**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- AlarmView
- ApplicationWindow
- Bar
- BatteryView
- Button

- ChannelDiagnose
- CheckBox
- Circle
- CircleSegment
- CircularArc
- Clock
- ComboBox
- DateTimeField
- DiscSpaceView
- Ellipse
- EllipseSegment
- EllipticalArc
- FunctionTrendControl
- Gauge
- GraphicIOField
- GraphicView
- HTML-Browser
- IOField
- Line
- ListBox
- MediaPlayer
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- PLCCodeViewer
- Polygon
- Polyline
- ProtectedAreaNameView
- RangeLabelView
- RangeQualityView
- RecipeView
- Rectangle
- RoundButton
- Screenwindow

- Slider
- SmartClientView
- StatusForce
- Switch
- SymbolLibrary
- SymbolicIOField
- SysDiagControl
- TextField
- TrendRulerControl
- TrendView
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject
- Tubepolyline
- UserArchiveControl
- UserView
- WLanQualityView
- WindowsSlider
- ZoneLabelView
- ZoneQualityView

You have no access in runtime with the following format:

- S7GraphOverview

Int32

Optional A value or a constant that contains the value of the Y coordinate in pixels (measured from the top left edge of the screen).

Comments

The Y coordinate refers to the top left corner of the rectangle that surrounds the object. The screen limits are also monitored in runtime. If the assigned coordinate value exceeds the display size, the user-defined function is interrupted with an error message.

TopOffset

Description

Specifies the distance between the screen and the top screen window margin.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the screen in the screen window with horizontal and vertical offset of the screen scroll bars, use the "HorizontalScrollBarPosition" and "VerticalScrollBarPosition properties for the offset.

Access in runtime: Read and write

Syntax

Object.**TopOffset**[=Int32]

Object

Required. An object of the "ScreenItem" type with the following format:

- Screenwindow

Int32

Optional. A value or a constant that specifies the distance between the screen and the top screen window margin.

Total

Description

Specifies the memory capacity.

Access in runtime: Read and write

Syntax

Object.**Total**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- DiskSpaceView

DOUBLE

Optional A value or a constant that specifies the memory capacity.

Transparency

Description

Defines the object transparency in percent.

0 = no transparency; 100 = complete transparency (invisible).

The text and fields of the graphic objects are only transparent with "100."

In runtime, a completely transparent object (invisible) is also functional.

Access in runtime: Read and write

Syntax

Object.**Transparency**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- CircularArc
- Clock
- ComboBox
- Ellipse
- EllipseSegment
- EllipticalArc
- Gauge
- GraphicIOField
- GraphicView
- IOField
- Line
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- Slider
- SymbolicIOField
- TextField
- TubeArcObject
- TubeDoubleTeeObject

- TubeTeeObject
- Tubepolyline
- WindowsSlider

Int32

Optional A value or constant that specifies the transparency of the object in percent.

TransparentColor

Description

Specifies which color of the allocated graphic (*.bmp, *dib) of the specified object will be set to "transparent".

The "UseTransparentColor" property must have the value TRUE so that the color will be shown as transparent.

Access in runtime: Read and write

Syntax

Object.**TransparentColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- GraphicView
- GraphicIOField

Color

Optional A value or a constant that specifies the color that will be shown transparent.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TransparentColorDeactivatedPicture

Description

Sets the color of the assigned bitmap object to "transparent" for the "disabled" status.

Access in runtime: Read and write

Syntax

Object.**TransparentColorDeactivatedPicture**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- RoundButton

Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to transparent" for the status "disabled".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

The "PicDeactUseTransColor" property must have the value TRUE so that the color can be set to "transparent".

TransparentColorPictureOff

Description

Specifies which color of the allocated bitmap object will be set to transparent" for the "off" status.

Access in runtime: Read and write

Syntax

Object.**TransparentColorPictureOff**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Button
- RoundButton

Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to transparent" for the "off" status.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TransparentColorPictureOn

Description

Specifies which color of the allocated bitmap object will be set to transparent" for the "on" status.

Access in runtime: Read and write

Syntax

Object.**TransparentColorPictureOn**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Button
- RoundButton

Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to "transparent" for the "on" status.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

The "PicDownUseTransColor" property must have the value TRUE so that the color can be set to "transparent".

TrendActualize

Description

Enables the update of a selected trend.

Access in runtime: Read and write

Syntax

Object.**TrendActualize**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The selected trend is always actualized.

FALSE: The selected trend is not actualized. This setting is useful when a logged trend is compared with a current trend.

TrendAdd

Description

Creates a new trend.

Access in runtime: Read and write

Syntax

Object.**TrendAdd**[=STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional. The name of the new trend.

TrendBeginTime

Description

Defines the start time of the time range for data transfer to the selected trend.

Access in runtime: Read and write

Syntax

Object.**TrendBeginTime**[=DateTime]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

DateTime

Optional Defines the start time for data supply for the selected trend.

TrendColor

Description

Specifies or returns the object color.

The trend indicator shows the trend (rising or falling) in the measurement value to be monitored with a small arrow. In order to activate the trend display, the "Trend" property must be set to "TRUE".

Access in runtime: Read and write

Syntax

Object.**TrendColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the color of the object.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendCount

Description

Specifies the number of configured trends.

Access in runtime: Read and write

Syntax

Object.**TrendCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional A value or a constant that specifies the number of trends in the selected object.

TrendEndTime

Description

Defines the end of the time range for data connections of a selected trend.

Access in runtime: Read and write

Syntax

Object.**TrendEndTime**[=DateTime]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

DateTime

Optional Specifies the end time for data supply for the selected trend.

TrendExtendedColorSet

Description

Enables configuration of the point and fill colors and the display of colors in Runtime.

Access in runtime: Read and write

Syntax

Object.**TrendExtendedColorSet**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The settings in the "Point color" and "Fill color" fields are configurable and effective in Runtime.

FALSE: The settings in the "Point color" and "Fill color" fields are configurable and not effective in Runtime.

See also

FunctionTrendControl (Page 5077)

OnlineTrendControl (Page 5122)

TrendFill

Description

Specifies if the area beneath the trend is to be filled.

Access in runtime: Read and write

Syntax

Object.**TrendFill**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The area beneath the trend is shown filled. f the "Advanced" option is disabled, the trend color is used as fill color.

FALSE: The trend is not shown filled.

TrendFillColor

Description

Defines the fill color of the trend.

The settings are only active if the "Filled" option is enabled. Open the "Color selection" dialog by clicking the button.

The settings are only active if the "Advanced" option is enabled.

Access in runtime: Read and write

Syntax

Object.**TrendFillColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the fill color of the selected trend.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendIndex

Description

References a configured trend. You can assign the values of other properties to a specific trend using this property. The index must always be set before you change the properties of a trend in runtime.

Values of between 0 and "TrendCount" minus 1 are valid for "TrendIndex". The property "TrendCount" specifies the number of configured trends.

Access in runtime: Read and write

Syntax

Object.**TrendIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional A value or a constant that specifies the number of the selected trend.

TrendIndicatorColor

Description

Specifies the color for the trend indicator. The trend indicator represents the tendency (rising or falling) of the measurement value that is to be monitored with a small arrow. To activate the trend indicator, the property "ShowTrendIndicator" must have the value "TRUE".

Access in runtime: Read and write

Syntax

Object.**TrendIndicatorColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color of the trend indicator.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendLabel

Description

Defines the label of the trend selected. The label is displayed in runtime if the value at the "UseTrendNameAsLabel" attribute is "FALSE".

Access in runtime: Read and write

Syntax

Object.**TrendLabel**[=STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional. A value or a constant that specifies the label of the selected trend.

TrendLineStyle

Example

Defines the line style for trend visualization.

Access in Runtime: Read and write

Syntax

Object.**TrendLineStyle**[=LineStyle]

Object

Required. An object of the "ScreenItem" type with the format:

- FunctionTrendControl
- OnlineTrendControl

LineStyle

Value	Description	Explanation
0	Solid	The trend is visualized as solid line.
1	Dashed	The trend is visualized as dashed line.
2	Dots	The trend is visualized as dotted line.
3	Dash dot	The trend is visualized as dot-dash line.
4	Dash Dot Dot	The trend is visualized as dash-dot-dot line.

TrendLineType

Description

Defines how to visualize a trend.

Access in Runtime: Read and write

Syntax

Object.**TrendLineType**[=TrendLineTypeScada]

Object

Required. An object of the "ScreenItem" type with the format:

FunctionTrendControl

OnlineTrendControl

TrendLineTypeScada

Value	Description	Explanation
0	None	Only the dots are displayed.
1	Line	Visualizes a trend with linear interconnection of points.
2	Stepped	Visualizes a stepped trend and its interconnected points.

TrendLineWidth

Description

Defines the line weight of the selected trend in pixels.

Access in runtime: Read and write

Syntax

Object.**TrendLineWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional A value or a constant that specifies the line weight of the selected trend in pixels.

TrendLowerLimit

Description

Specifies the low limit of a tag. If the tag drops below the value of "TrendLowerLimit", the values are marked in the color set in "TrendLowerLimitColor". The specification is effective if the "TrendLowerLimitColoring" property has the value "TRUE".

Access in runtime: Read and write

Syntax

Object.**TrendLowerLimit**[=DOUBLE]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

DOUBLE

Optional. A value or a constant that specifies the lower limit for a tag.

TrendLowerLimitColor

Description

Specifies the color which marks tag values which are below the value of "TrendLowerLimit". The setting is effective if the "TrendLowerLimitColoring" attribute has the value "TRUE".

Syntax

Object.**TrendLowerLimitColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the color of tag values below the "TrendLowerLimit" value.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendLowerLimitColoring

Description

Specifies if the "TrendLowerLimitColor" attribute is used to identify tag values which are less than the value at "TrendLowerLimit".

Syntax

Object.**TrendLowerLimitColoring**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The "TrendLowerLimitColor" property is effective.

FALSE: The "TrendLowerLimitColor" property is not effective.

TrendMeasurePoints

Description

Defines the number of measurement points for visualization of selected trends.

Defines the number of value pairs provided to the trend from a user archive.

Access in runtime: Read and write

Syntax

Object.**TrendMeasurePoints**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Int32

Optional A value or a constant that specifies the number of measurement points or value pairs for the selected trend.

TrendName

Description

Displays the name of the selected trend. The name is defined on the "Trends" tab. The "TrendName" property can be dynamized with the "TrendRename" property.

Access in runtime: Read and write

Syntax

Object.**TrendName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or a constant that specifies the name of the selected trend.

TrendPointColor

Description

Defines the color of the dots in the selected trend.

Open the "Color selection" dialog by clicking the button.

The settings are only active if the "Advanced" option is enabled.

Access in runtime: Read and write

Syntax

Object.**TrendPointColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the color of the dots in the selected trend.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendPointStyle

Description

Defines the dot style for trend visualization.

Access in Runtime: Read and write

Syntax

Object.**TrendPointStyle**[=PointStyle]

Object

Required A "ScreenItem" object with following format:

- FunctionTrendControl
- OnlineTrendControl

PointStyle

Value	Description	Explanation
0	None	The points are not displayed.
1	Dots	The trend points are visualized with a size of one pixel. The setting in the "Dot width" field is disabled.
2	Squares	The dots are displayed as square. The setting in the "Dot width" field is active.
3	Circles	The dots are displayed as circles. The setting in the "Dot width" field is active.

TrendPointWidth

Description

Specifies the dot weight in pixels. You can only define the dot weight for "square" and "circular" dots.

Access in runtime: Read and write

Syntax

Object.**TrendPointWidth**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional A value or a constant that specifies the dot weight of the selected trend in pixels.

TrendProvider

Description

Specifies the data source for a selected trend.

Access in Runtime: Read and write

Syntax

Object.**TrendProvider**[=Provider]

Object

Required A "ScreenItem" object with following format:

- FunctionTrendControl
- OnlineTrendControl

Provider

Value	Description	Explanation
0	None	No data source configured for implementation in Runtime by means of a user-defined function.
1	Archive tags	Data source with archive tags of a process value archive.
2	HMI tags	Data supply with tag values of HMI tags
3	Recipe data	Data supply with columns of a recipe

TrendRangeType

Description

Specifies the time range for which the trend is supplied with data.

You can only define the number of measuring points if you select user archives as the data source.

Access in Runtime: Read and write

Syntax

Object.**TrendRangeType**[=RangeType]

Object

Required A "ScreenItem" object with following format:

- FunctionTrendControl

RangeType

Value	Description	Explanation
0	Time range	Defines the start time and the time range for the data connection.
1	Start to end time	Defines the start and end time for the data connection.
2	Number of measurement points	Defines the start time and the number of measurement points for the data connection.

TrendRemove

Description

Removes selected trends from the list.

Access in runtime: Read and write

Syntax

Object.**TrendRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or a constant that specifies the name of the trend to be removed.

TrendRename

Description

Changes the name of the trend referenced by the "TrendIndex" property.

With "TrendRename", you also dynamize the "TrendName" property.

Access in runtime: Read and write

Syntax

Object.**TrendRename**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or a constant that specifies the new name of the selected trend.

TrendRepos

Description

Repositions the trend in the trend window.

"Up" and "Down" move the selected trend up or down in the list. This moves the trend towards the foreground or background for visualization in Runtime.

Access in runtime: Read and write

Syntax

Object.**TrendRepos**[=Int32]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional. A value or a constant that specifies the new position of the selected trend.

TrendSelectTagNameX

Description

Opens the dialog box for selecting the tag name for the data supply of the X axis in the f(x) trend view. Programmers can use the property to let the user select a tag name with a button for example.

Access in runtime: Read and write

Syntax

Object.**TrendSelectTagNameX**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE:

FALSE:

TrendSelectTagNameY

Description

Opens the dialog for selecting the tag name for data supply of the Y-axis in the f(x) trend view. Programmers can use the property to let the user select a tag name with a button for example.

Access in runtime: Read and write

Syntax

Object.**TrendSelectTagNameY**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE:

FALSE:

TrendTagNameX

Description

Specifies the name of the connected HMI tag or column for the X-axis. You select an HMI tag or a column with the selection button.

Access in runtime: Read and write

Syntax

Object.**TrendTagNameX**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the name of the HMI tag or column for the X axis.

TrendTagNameY

Description

Specifies the name of the connected HMI tag or column for the Y-axis. You select an HMI tag or a column with the selection button.

Access in runtime: Read and write

Syntax

Object.**TrendTagNameY**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the name of the HMI tag or column for the Y axis.

TrendTimeRangeBase

Description

Specifies the time unit for calculating the time range.

Access in Runtime: Read and write

Syntax

Object.**TrendTimeRangeBase**[=TagLoggingTimeUnit]

Object

Required A "ScreenItem" object with following format:

- FunctionTrendControl

TagLoggingTimeUnit

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

TrendTimeRangeFactor

Description

Defines the factor for calculating the time range. Only integer factors are valid.

Access in runtime: Read and write

Syntax

Object.**TimeRangeFactor**[=Int32]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

Int32

Optional. A value or a constant that specifies the factor for determining the time range.

TrendTrendWindow

Description

Defines the trend window for visualizing the trend selected.

Define the available trend windows in the "Trend window" tab.

Access in runtime: Read and write

Syntax

Object.**TrendTrendWindow**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or constant that specifies the name of the trend window for the selected trend.

TrendUncertainColor

Description

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used.

With the "TrendUncertainColor" property you specify the color which is used for marking these values. Whether or not the information is evaluated depends on the "TrendUncertainColoring" property.

Access in runtime: Read and write

Syntax

Object.**TrendUncertainColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional A value or a constant that specifies the color of the values of uncertain status in the selected trend.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendUncertainColoring

Description

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. The "TrendUncertainColoring" attribute is used to enable identification of such values based on the color set in "TrendUncertainColor".

Access in runtime: Read and write

Syntax

Object.**TrendUncertainColoring**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The setting of the "TrendUncertainColor" property is effective.

FALSE: The setting of the "TrendUncertainColor" property is not effective.

TrendUpperLimit

Description

Specifies the high limit of a tag.

If the tag drops below the value of "TrendUpperLimit", the values are shown in the color set in "TrendUpperLimitColor". The specification is effective if the "TrendUpperLimitColoring" attribute has the value "TRUE".

Access in runtime: Read and write

Syntax

Object.**TrendUpperLimit**[=DOUBLE]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

DOUBLE

Optional. A value or a constant that specifies the higher limit for values in the selected trend.

TrendUpperLimitColor

Description

Specifies the color that marks tag values that are below the value of "TrendLowerLimit". The setting is effective if the "TrendUpperLimitColoring" attribute has the value "TRUE".

Access in runtime: Read and write

Syntax

Object.**TrendUpperLimitColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the color for values below the limit for the selected trend.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendUpperLimitColoring

Description

Specifies whether the selection frame is shown with the specified color.

Access in runtime: Read and write

Syntax

Object.**TrendUpperLimitColoring**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The setting for the "TrendUpperLimitColor" attribute is effective.

FALSE: The setting for the "TrendUpperLimitColor" attribute is not effective.

TrendVisible

Description

Specifies whether or not the selected trend is displayed.

The list contains all the trends that you have created.

Select the trends to be displayed in the trend window from the list.

Click a trend entry in the list to adapt the properties and to assign axes and trend windows to the trend.

Access in runtime: Read and write

Syntax

Object.**TrendVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The selected trend is displayed.

FALSE: The selected trend is not displayed.

TrendWindowAdd

Description

Creates a new trend view.

Access in runtime: Read and write

Syntax

Object.**TrendWindowAdd**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or a constant that specifies the name of the new trend view.

TrendWindowCoarseGrid

Description

Enables the display of grid lines for the main scale.

Access in runtime: Read and write

Syntax

Object.**TrendWindowCoarseGrid**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The grid lines for the main scaling are displayed.

FALSE: The grid lines for the main scaling are not displayed.

TrendWindowCoarseGridColor

Description

Specifies the grid color of the main scale.

Open the "Color selection" dialog by clicking the button.

Access in runtime: Read and write

Syntax

Object.**TrendWindowCoarseGridColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the grid line color for the main scale.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendWindowFineGrid

Description

Enables the display of grid lines for the secondary scale.

Access in runtime: Read and write

Syntax

Object.**TrendWindowFineGrid**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The grid lines for the auxiliary scaling are displayed.

FALSE: The grid lines for the auxiliary scaling are not displayed.

TrendWindowFineGridColor

Description

Specifies the grid color of the main scale.

Open the "Color selection" dialog by clicking the button.

Access in runtime: Read and write

Syntax

Object.**TrendWindowFineGridColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the grid line color for the auxiliary scale.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendWindowForegroundTrendGrid

Description

Enables the display of grid lines only for the foreground trend in the trend window.

Access in runtime: Read and write

Syntax

Object.**TrendWindowForegroundTrendGrid**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The grid lines for the foreground trend are displayed in the trend window.

FALSE: The grid lines for the foreground trend are not displayed in the trend window.

TrendWindowGridInTrendColor

Description

Sets the trend color for the visualization of the grid lines for the main scale.

Access in runtime: Read and write

Syntax

Object.**TrendWindowGridInTrendColor**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The grid lines are displayed in the trend color.

FALSE: The grid lines are displayed with the color set in the "Color" field.

TrendWindowHorizontalGrid

Description

Enables the display of horizontal grid lines.

Access in runtime: Read and write

Syntax

Object.**TrendWindowHorizontalGrid**[=BOOLEAN]

Object

- FunctionTrendControl

BOOLEAN

TRUE: The horizontal grid lines are displayed.

FALSE: The horizontal grid lines are not displayed.

TrendWindowIndex

Description

References a configured trend view. You can assign the values of other properties to a specific trend window by using the property.

Values of between 0 and "TrendWindowCount" minus 1 are valid for "TrendWindowIndex". The property "TrendWindowCount" specifies the number of configured trend windows.

Access in runtime: Read and write

Syntax

Object.**TrendWindowIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional A value or a constant that specifies the number of the selected trend window.

TrendWindowName

Description

Defines the name of the trend window selected.

Access in runtime: Read and write

Syntax

Object.**TrendWindowName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or a constant that specifies the name of the selected trend window.

TrendWindowRemove

Description

Removes the selected trend view from the list.

Access in runtime: Read and write

Syntax

Object.**TrendWindowRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or a constant that specifies the name of the trend window to be removed.

TrendWindowRename

Description

Changes the name of the trend window referenced by the "TrendWindowIndex" property.

With "TrendWindowRename", you also dynamize the ""TrendWindowName" property.

Access in runtime: Read and write

Syntax

Object.**TrendWindowRename**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

STRING

Optional A value or a constant that specifies the new name of the selected trend view.

TrendWindowRepos

Description

Changes the order of the trend view.

"Up" and "Down" move the selected trend up or down in the list. The sorting order in the list defines the position in the Control. The first trend view is shown in the lowest position, the last trend view in the highest position.

Access in runtime: Read and write

Syntax

Object.**TrendWindwRepos**[=Int32]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional. A value or a constant that specifies the new position of the selected trend view.

TrendWindowRulerColor

Description

Specifies the ruler color.

Open the "Color selection" dialog by clicking the button. The color can be configured and displayed if "1 - graphic" is set for visualization.

Access in runtime: Read and write

Syntax

Object.**TrendWindowRulerColor**[=Color]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Color

Optional. A value or a constant that specifies the color of the ruler.

Comments

You can use the "RGB" function to define the color in RGB format (red, green blue). Enter the corresponding decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

TrendWindowRulerLayer

Description

Specifies the display layer of the ruler in the trend view.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowRulerLayer**[=RulerLayer]

Object

Required A "ScreenItem" object with following format:

- FunctionTrendControl
- OnlineTrendControl

RulerLayer

Value	Description	Explanation
0	Under grid	The ruler is visualized on a layer under the grid.
1	Between grid and trend	The ruler is positioned on top of the trend and under the grid.
2	On top of trend	The ruler is positioned on top of the trend.

TrendWindowRulerStyle

Description

Defines the appearance of the ruler.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowRulerStyle**[=RulerStyle]

Object

Required A "ScreenItem" object with following format:

- FunctionTrendControl
- OnlineTrendControl

RulerStyle

TRUE: The ruler is displayed as a single black line.

FALSE: The ruler is displayed in the configured "Color" and "Width".

TrendWindowRulerWidth

Description

Defines the width of the ruler in pixels.

The width can be configured and displayed if "1 - graphic" is set for visualization.

Access in runtime: Read and write

Syntax

Object.**TrendWindowRulerWidth**[=Int32]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional. A value or a constant that specifies the width of the ruler in pixels.

TrendWindowSpacePortion

Description

Specifies the proportion of the trend widow to be used for the selected curve.

Access in runtime: Read and write

Syntax

Object.**TrendWindowSpacePortion**[=Int32]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl
- OnlineTrendControl

Int32

Optional. A value or constant that specifies the proportion of the selected trend window in the control in percent.

TrendWindowVerticalGrid

Description

Enables the display of vertical grid lines.

Access in runtime: Read and write

Syntax

Object.**TrendWindowVerticalGrid**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The vertical grid lines are displayed.

FALSE: The vertical grid lines are not displayed.

TrendWindowVisible

Description

Specifies whether or not the selected trend window is displayed.

The list contains the trend views that you have created.

Activate the trend views in the list which you want to display in the control.

Click a list entry to adapt the ruler and grid line properties.

Access in runtime: Read and write

Syntax

Object.**TrendWindowVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The selected trend window is displayed.

FALSE: The selected trend window is not displayed.

TrendXAxis

Description

Defines the X axis to be used for the trend selected.

Define the available X axes inn the "X Axes" tab.

Access in runtime: Read and write

Syntax

Object.**TrendXAxis**[=STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

STRING

Optional. A value or constant that specifies the name of the X-axis used for the selected trend.

TrendYAxis

Description

Defines the Y axis to be used for the trend selected.

Define the available Y axes inn the "Y Axes" tab.

Access in runtime: Read and write

Syntax

Object.**TrendYAxis**[=STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

STRING

Optional. A value or constant that specifies the name of the Y-axis used for the selected trend.

Properties U-W

Unit

Description

Specifies the unit of measurement.

Access in runtime: Read and write

Syntax

Object.**Unit**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- Bar
- IOField

STRING

Optional A value or a constant that specifies the unit of measurement.

UnitColor

Description

Specifies the text color for the unit of measurement in the Gauge" object

Access in runtime: Read and write

Syntax

Object.**UnitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

Color

Optional A value or a constant that specifies the text color for the measurement unit.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

UnitText

Description

Specifies the text for the measurement unit of the selected object.

Access in runtime: Read and write

Syntax

Object.**UnitText**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

STRING

Optional A value or a constant that specifies the text for the measurement unit.

Comments

Enter a text to show, for example, the physical unit of the displayed value. It is standard for no text to be set as a default.

UnitTop

Description

Specifies the distance of the measurement unit to the upper edge of the selected object. The lettering can be positioned only in line with the vertical diameter of the scale. The value of the property refers to the height of the selected object and is measured from the upper edge of the selected object to the lower edge of the lettering.

Access in runtime: Read and write

Syntax

Object.**UnitTop**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

DOUBLE

Optional A value or a constant that specifies the distance of the measurement unit to the upper edge of the selected object.

Value range from 0 to 1

0: The lower edge of the lettering is positioned on the upper limit of the selected object. The text is no longer visible as it is positioned outside of the selected object.

1: The lower edge of the lettering is positioned on the lower limit of the selected object.

UpperLimit

Description

Specifies the upper limit for input values.

Access in runtime: Read and write

Syntax

Object.**UpperLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- IOField

DOUBLE

Optional A value or a constant that specifies the upper limit for input values.

Used

Description

Returns the size of the used disk space.

Access in runtime: Read and write

Syntax

Object.**Used**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

DOUBLE

Optional A value or a constant that returns the size of the used disk space.

UseDesignColorSchema

Description

Specifies whether the colors defined in the global color scheme of the current design are used for this object.

Access in runtime: Read and write

Syntax

Object.**UseDesignColorSchema**[=BOOLEAN]

Object

Required. An object of the "ScreenItem"" type with the following format:

- Bar
- Button
- CheckBox
- Circle
- CircleSegment
- CircularArc
- Clock
- ComboBox
- Ellipse
- EllipseSegment
- EllipticalArc
- Gauge
- GraphicView
- IOField
- Line
- ListBox
- MultiLineEdit
- OptionGroup
- Polygon
- Polyline
- Rectangle
- RoundButton
- Slider
- SymbolicIOField
- TextField
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject
- Tubepolyline
- WindowsSlider

You have no access in runtime with the following format:

- AlarmView
- DateTimeField

- RecipeView
- StatusForce
- Switch
- SysDiagControl
- TrendView
- UserView

BOOLEAN

Optional. TRUE if the object is displayed with the colors from the global color scheme defined for this object type.

FALSE if the object is displayed with the colors as per the settings in the object.

UseDesignShadowSettings

Description

Defines whether the object will be displayed with the shadowing defined in the active design.

Access in runtime: Read and write

Syntax

Object.**UseDesignShadowSettings**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Circle
- CircleSegment
- CircularArc
- Ellipse
- EllipseSegment
- EllipticalArc
- GraphicView
- Line
- Polygon
- Polyline
- Rectangle
- TextField
- TubeArcObject
- TubeDoubleTeeObject

- Tubepolyline
- TubeTeeObject
- Bar
- Button
- CheckBox
- Clock
- ComboBox
- Gauge
- GraphicIOField
- IOField
- ListBox
- MultiLineEdit
- OptionGroup
- RoundButton
- Slider
- SymbolicIOField
- WindowsSlider

BOOLEAN

TRUE: The object is displayed with the global shading defined for this object type.

FALSE: The object is displayed without shadows.

UsedPercent

Description

Specifies the measured value for the used disk space as a percentage. The values can be queried in Runtime. The values cannot be predefined.

Access in runtime: Read and write

Syntax

Object.**UsedPercent**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- DiscSpaceView

Int32

Optional A value or a constant that returns the measured values for the used disk space as a percentage.

UseExponentialFormat

Description

Specifies whether the figures are shown exponentially (e.g. "1.00e+000").

Access in runtime: Read and write

Syntax

Object.**UseExponentialFormat**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the figures are shown exponentially (e.g. "1.00e+000").

UseFlashTransparentColor

Description

Specifies whether the color of the bitmap object of a flashing graphic will be set to ""transparent".

Access in Runtime: Read and write

Syntax

Object.**UseFlashTransparentColor**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "GraphicIOField".

BOOLEAN

Optional TRUE, if the color of the bitmap object of a flashing graphic will be set to "transparent".

See also

GraphicIOField (Page 5088)

UseMessageColor

Description

Specifies whether the agreed colors of the message classes are displayed.

Access in runtime: Read and write

Syntax

Object.**UseMessageColor** [=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl

BOOLEAN

TRUE: The colors are displayed.

FALSE: The color settings specified for the table content on the "Layout" tab are effective.

UseSelectedTitleColor

Description

Specifies whether to use a selection color for the headers of selected table cells.

Access in runtime: Read and write

Syntax

Object.**UseSelectedTitleColor**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: A marking color is used. The "Background" and "Font" settings are active in Runtime.

FALSE: A marking color is not used. The "Background" and "Font" settings are disabled in Runtime.

UseTableColor2

Description

Specifies whether to use a second row color for the representation of the table.

Access in runtime: Read and write

Syntax

Object.**UseTableColor2**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: The settings of "RowColor 2" are used in alternation with "RowColor1".

FALSE: The settings of "RowColor 1" are used for all rows.

UseTagLimitColors

Description

Specifies that the colors are used.

Access in runtime: Read and write

Syntax

Object.**UseTagLimitColors**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the following format:

- IOField

BOOLEAN

Optional. TRUE if the colors are used.

UseTransparentColor

Description

Specifies whether the color described with the property "TransparentColor" will be shown as transparent for the selected object.

Access in runtime: Read and write

Syntax

Object.**UseTransparentColor**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- GraphicView
- GraphicIOField

BOOLEAN

Optional TRUE, if the specified color is to be shown as transparent.

UseTransparentColorDeactivatedPicture

Description

Specifies if the transparent color defined with the property "TransparentColorDeactivatedPicture" for the status "disabled" will be used.

Access in runtime: Read and write

Syntax

Object.**UseTransparentColorDeactivatedPicture**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- RoundButton

BOOLEAN

Optional TRUE, if the transparent color defined with the property "TransparentColorDeactivatedPicture" for the status "disabled" will be used.

UseTransparentColorPictureOff

Description

Specifies if the transparent color defined with the property "TransparentColorPictureOff" for the "off" status will be used.

Access in runtime: Read and write

Syntax

Object.**UseTransparentColorPictureOff**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Button
- RoundButton

BOOLEAN

Optional TRUE, if the transparent color defined with the property "TransparentColorPictureOff" for the "off" status will be used.

UseTransparentColorPictureOn

Description

Specifies if the transparent color defined with the property "TransparentColorPictureOn" for the "on" status will be used.

Access in runtime: Read and write

Syntax

Object.**UseTransparentColorPictureOn**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Button
- RoundButton

BOOLEAN

Optional TRUE, if the transparent color defined with the property "TransparentColorPictureOn" for the "on" status will be used.

UseTrendNameAsLabel

Description

Specifies whether the "Name" or "Label" property is used as a designation for the trend in runtime.

Access in runtime: Read and write

Syntax

Object.**UseTrendNameAsLabel**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl
- OnlineTrendControl

BOOLEAN

TRUE: The name configured under "Properties > Properties > Trends > Name" is used.

FALSE: The name configured under "Properties > Properties > Trends > Label" is used.

UserName

Description

Returns the name of the user who triggered the alarm object.

Value

Description

Specifies a value for the object being used or returns it.

Access during runtime: Read and write

Syntax

Object.**Value**[=VARIANT]

Object

Necessary. An object of type "Tag", "DataItem" or "ScreenItem" with the format "Gauge".

VARIANT

Optional The value that is specified dependent on the object being used:

- Tag.Value: returns the tag value for the last read access or specifies the future tag value. Use the "Read" method to read the tag value from the "Value" property. You assign a new tag value to the "Value" property with the "Write" method.
- Dataset.Value: Specifies a value or returns a copy of the value or the object reference. When returning object references, ensure that the object reference is multithread-capable.
- ScreenItem("Gauge_1").Value: Specifies the value to which the pointer points. The value range within the values set via the properties "ValueMin",and "ValueMax".

Examples

The following example writes a new value in the "Tag1" tag:

```
'VBS94
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Value = 50
objTag.Write
```

The example shows how to add a value to a list of tags and output it as a trace. After that, the value is changed, output again and then removed. It make sense to perform this in several different actions:

```
'VBS198
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet("motor1").Value = 55
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet.Remove("motor1")
```

DataItem (Page 4987)

Tag (Page 5012)

ValueAxisAutoRange(i)

Description

Specifies whether the value range of the Y axis is determined automatically or via the values "ValueAxisBegin(i)" and "ValueAxisEnd(i)".

Access in runtime: Read and write

Syntax

Object.**ValueAxisAutoRange**(i)[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTrendControl

BOOLEAN

Optional TRUE, if the value range of the Y axis is established automatically or via the values "ValueAxisBegin(i)" and "ValueAxisEnd(i)"".

ValueAxisLabel(i)

Description

Specifies the labeling of the value axis. Whether or not the information is evaluated depends on the "ConfigureTimeAxis(i)" property.

Access in runtime: Read and write

Syntax

Object.ValueAxisLabel(i)[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTrendControl

STRING

Optional A value or a constant that specifies the labeling of the value axis.

ValueAxisScalingType(i)

Description

Specifies the type of axis scaling.

Access in Runtime: Read and write

Syntax

Object.ValueAxisScalingType(i)[=AxisScalingType]

Object

Required An object of the type "ScreenItem" with the following format:

- OnlineTrendControl

AxisScalingType

hmiBarScalingLinear (0): Linear axis scaling

hmiBarScalingLogarithmic (1): Logarithmic axis scaling

hmiBarScalingNegativeLogarithmic (2): Negative logarithmic axis scaling

Comments

The parameter i indicates the number of the trend.

ValueColumnAlignment(i)

Description

Specifies the alignment of the tag values of this column pair. The parameter i indicates the number of the column pair.

Access in runtime: Read and write

Syntax

Object.ValueColumnAlignment(i)[=HorizontalAlignment]

Object

Required. A "ScreenItem" object with the following format:

- OnlineTableControl

HorizontalAlignment

hmiAlignmentLeft (0): The text is left-justified.

hmiAlignmentCentered (1): The text is centered.

hmiAlignmentRight (2): The text is right-justified.

VerticalAlignment

Description

Specifies the vertical alignment of the text in the specified object.

Access in runtime: Read and write

Syntax

Object.**VerticalAlignment**[=VerticalAlignment]

Object

Required. A "ScreenItem" object with the following format:

- Button
- DateTimeField
- IOField
- OptionGroup
- RoundButton
- Switch
- SymbolicIOField
- TextField

You have no access in runtime with the following format:

- CheckBox

VerticalAlignment

Optional A value that specifies the vertical alignment.

hmiAlignmentTop (0): The text is shown at the top.

hmiAlignmentMiddle (1): The text is shown in the middle.

hmiAlignmentBottom (2): The text is shown at the bottom.

VerticalGridLines

Description

Enables the display of vertical dividers.

Access in runtime: Read and write

Syntax

Object.**VerticalGridLines**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- OnlineTableControl
- TrendRulerControl
- UserArchiveControl

BOOLEAN

TRUE: Vertical grid lines are displayed.

FALSE: Vertical grid lines are not displayed.

VerticalScrollbarPosition

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the screen as a cutout where the scroll bars are located at the left and top edge of the screen, use the OffsetLeft" and "OffsetTop" properties as the source of this cutout.

Access in runtime: Read and write

Syntax

Object.**VerticalScrollBarPosition**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Screenwindow

Int32

Optional A value or constant that specifies the offset of the vertical scroll bar.

ViewOnly

Description

Specifies whether the Sm@rtClient display will be used for remote monitoring or remote maintenance.

Remote maintenance means that settings can be changed on the monitored device.

Remote monitoring means that settings of the monitored device cannot be changed.

Access in runtime: Read and write

Syntax

Object.**ViewOnly**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- SmartClientView

BOOLEAN

Optional TRUE, if the Sm@rtClient display is to be used only for remote monitoring.

Visible

Description

Specifies whether the selected object is visible.

Access in runtime: Read and write

Syntax

Object.**Visible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- AlarmView
- ApplicationWindow
- Bar
- BatteryView

- Button
- ChannelDiagnose
- CheckBox
- Circle
- CircleSegment
- CircularArc
- Clock
- ComboBox
- DateTimeField
- DiscSpaceView
- Ellipse
- EllipseSegment
- EllipticalArc
- FunctionTrendControl
- Gauge
- GraphicIOField
- HTML-Browser
- IOField
- Line
- ListBox
- MediaPlayer
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- PLCCodeViewer
- Polygon
- Polyline
- ProtectedAreaNameView
- RangeLabelView
- RangeQualityView
- RecipeView
- Rectangle
- RoundButton
- Screenwindow

- Slider
- SmartClientView
- StatusForce
- Switch
- SymbolLibrary
- SymbolicIOField
- SysDiagControl
- TextField
- TrendRulerControl
- TrendView
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject
- Tubepolyline
- UserArchiveControl
- UserView
- WLanQualityView
- WindowsSlider
- ZoneLabelView
- ZoneQualityView

You have no access in runtime with the following format:

- S7GraphOverview

BOOLEAN

Optional TRUE, if the object is visible.

Warning

Description

Specifies the percentage of used storage space as of which a warning is to be generated.

Access in runtime: Read and write

Syntax

Object.**Warning**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- DiskSpaceView

Int32

Optional A value or a constant that specifies the percentage of used storage space as of which a warning is generated.

WarningColor

Description

Specifies the color in which the bar of the storage space display will be shown as soon as the warning area is reached.

Access in runtime: Read and write

Syntax

Object.**WarningColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- DiskSpaceView

Color

Optional A value or a constant that specifies the color in which the bar of the storage space display will be shown as soon as the warning area is exceeded.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

WarningLowerLimit

Description

Specifies the lower limit for "WarningLowerLimit".

The "WarningLowerLimitEnable" property must have the value "TRUE" for the limit to be monitored.

Access in runtime: Read and write

Syntax

Object.**WarningLowerLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the lower limit for "WarningLowerLimit".

Comments

The following values will be specified with the properties "WarningLowerLimitColor" and "WarningLowerLimitRelative":

- Representation upon reaching the limit
- Type of evaluation

WarningLowerLimitColor

Description

Specifies the color for the lower limit "WarningLowerLimit".

The "WarningLowerLimitEnable" property must have the value "TRUE" if the bar color is to change when the limit is reached.

Access in runtime: Read and write

Syntax

Object.**WarningLowerLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the lower limit "WarningLowerLimit".

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

The following values are defined with the "WarningUpperLimit", "WarningUpperLimitColor" and "WarningUpperLimitRelative" properties:

- Limit
- Representation upon reaching the limit
- Type of evaluation

WarningLowerLimitEnabled

Description

Specifies whether the "WarningLowerLimit" limit is to be monitored.

Access in runtime: Read and write

Syntax

Object.**WarningLowerLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the "WarningLowerLimit" limit is monitored.

Comments

The following values will be defined via the properties "WarningLowerLimit", "WarningLowerLimitColor" and "WarningLowerLimitRelative":

- Limit
- Representation upon reaching the limit
- Type of evaluation

WarningLowerLimitRelative

Description

Specifies whether the lower limit "WarningLowerLimit" is evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**WarningLowerLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional

TRUE: The lower limit "WarningLowerLimit" is evaluated as a percentage.

FALSE: The lower limit "WarningLowerLimit" is evaluated as an absolute value.

WarningRangeColor

Description

Specifies the color of the warning range on the scale of the "Gauge" object.

The "WarningRangeVisible" property must have the value TRUE so that the warning range is displayed.

Access in runtime: Read and write

Syntax

Object.**WarningRangeColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

Color

Optional A value or a constant that specifies the color of the warning range.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

WarningRangeStart

Description

Specifies at which scale value the warning range of the "Gauge" object will start.

The "WarningRangeVisible" property must have the value TRUE so that the warning range is displayed.

Access in runtime: Read and write

Syntax

Object.**WarningRangeStart**[=SINGLE]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

SINGLE

Optional A value or a constant that contains the scale value for the start of the warning range.

Comments

The range extends from the value "Warning" through to the value "Danger". If no range is activated for "Danger", the range for "Warning" extends to the end of the scale.

WarningRangeVisible

Description

Specifies whether the warning range in the scale of the "Gauge" object will be displayed.

Access in runtime: Read and write

Syntax

Object.**WarningRangeVisible**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Gauge

BOOLEAN

Optional TRUE, if the warning range will be displayed in the scale.

Comments

Specifies the color of the warning range with the "WarningRangeColor" property.

Specifies the start of the warning range with the "WarningRangeStart" property.

WarningUpperLimit

Description

Specifies the upper warning limit.

The "WarningUpperLimitEnabled"" property must have the value TRUE so that the limit is monitored.

Access in runtime: Read and write

Syntax

Object.**WarningUpperLimit**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- Bar

DOUBLE

Optional A value or a constant that specifies the higher limit.

Comments

"WarningUpperLimitColor" defines the display for when the limit is reached.

"WarningUpperLimitRelative" specifies the type of evaluation.

WarningUpperLimitColor

Description

Defines the color for the lower warning limit.

The ""WarningUpperLimitEnabled" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in runtime: Read and write

Syntax

Object.**WarningUpperLimitColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Color

Optional A value or a constant that specifies the color for the higher limit.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

WarningUpperLimitEnabled

Description

Specifies whether the higher limit is to be monitored.

Access in runtime: Read and write

Syntax

Object.**WarningUpperLimitEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE if the higher limit is monitored.

WarningUpperLimitRelative

Description

Determines whether the lower limit "WarningUpperLimit" is to be evaluated as a percentage or as an absolute value.

Access in runtime: Read and write

Syntax

Object.**WarningUpperLimitRelative**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE, if the lower limit "WarningUpperLimit" is to be evaluated as a percentage.

Width

Description

Specifies the width of the object in pixels.

Access in runtime: Read and write

Syntax

Object.**Width**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- AlarmControl
- AlarmView
- ApplicationWindow
- Bar
- BatteryView
- Button
- ChannelDiagnose
- CheckBox
- Circle
- CircleSegment
- CircularArc
- Clock
- ComboBox
- DateTimeField
- DiscSpaceView
- Ellipse
- EllipseSegment
- EllipticalArc
- FunctionTrendControl
- Gauge
- GraphicIOField
- GraphicView
- HTML-Browser
- IOField
- Line

- ListBox
- MediaPlayer
- MultiLineEdit
- OnlineTableControl
- OnlineTrendControl
- OptionGroup
- PLCCodeViewer
- Polygon
- Polyline
- ProtectedAreaNameView
- RangeLabelView
- RangeQualityView
- RecipeView
- Rectangle
- RoundButton
- Screenwindow
- Slider
- SmartClientView
- StatusForce
- Switch
- SymbolLibrary
- SymbolicIOField
- SysDiagControl
- TextField
- TrendRulerControl
- TrendView
- TubeArcObject
- TubeDoubleTeeObject
- TubeTeeObject
- Tubepolyline
- UserArchiveControl
- UserView
- WLanQualityView
- WindowsSlider

- ZoneLabelView
- ZoneQualityView

You have no access in runtime with the following format:

- S7GraphOverview

Int32

Optional A value or a constant that specifies the width of the object in pixels.

WindowCloseEnabled

Description

Indicates whether a window can be closed in runtime.

Access in runtime: Read

Syntax

Object.**WindowCloseEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- ApplicationWindow
- ScreenWindow

BOOLEAN

Optional TRUE, if the window can be closed in Runtime.

WindowMaximizeEnabled

Description

Returns whether the object can be maximized in runtime.

Access in runtime: Read

Syntax

Object.**WindowMaximizeEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- ApplicationWindow
- Screenwindow

BOOLEAN

TRUE: The object can be maximized in runtime.

FALSE: The object cannot be maximized in runtime.

WindowMovingEnabled

Description

Returns whether the object can be moved in runtime.

Access in runtime: Read

Syntax

Object.**WindowMovingEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- ApplicationWindow
- Screenwindow

BOOLEAN

TRUE: The object can be moved in runtime.

FALSE: The object cannot be moved in runtime.

WindowOnTop

Description

Returns whether the object always remains in the foreground in runtime.

Access in runtime: Read

Syntax

Object.**WindowOnTop**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- ApplicationWindow
- Screenwindow

BOOLEAN

TRUE: The object remains in the foreground in runtime.

FALSE: The object does not always remain in the foreground in runtime.

WindowsContents

Description

Supplies the content of the application window Read only access.

See also

ScriptDiagnostics (Page 5157)

WindowSizingEnabled

Description

Indicates whether the size of the specified object can be changed in runtime.

Access in runtime: Read

Syntax

Object.**WindowSizingEnabled**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- ApplicationWindow
- ScreenWindow

BOOLEAN

Optional TRUE, if the size of the selected object can be changed in runtime.

WindowsStyle

Description

Specifies whether the object will be displayed in the general Windows style.

Access in runtime: Read and write

Syntax

Object.**WindowsStyle**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Button
- WindowSlider

You have no access in runtime with the following format:

- Switch

BOOLEAN

Optional TRUE, if the object will be displayed in the general Windows style.

Properties X-Z

XAxisAdd

Description

Creates a new X axis.

Syntax

Object.**XAxisAdd**[=STRING]

Object

Required. An object of the "ScreenItem" type with the format:

- FunctionTrendControl

STRING

Optional. A value or a constant, which????

XAxisAlignment

Description

Specifies how the selected axis is aligned.

Syntax

Object.**XAxisAlignment**[=AxisAlignment]

Object

Required. A "ScreenItem" object with the format "FunctionTrendControl".

AxisAlignment

Value	Description	Explanation
0	Bottom	The X axis selected is displayed below the trend.
1	Top	The X axis selected is displayed above the trend.

XAxisAutoPrecisions

Description

Enables automatic setting of the decimal precision.

Access in runtime: Read and write

Syntax

Object.**XAxisAutoPrecisions**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value configured under "Properties > X axis > Format > Decimal places" is effective.

XAxisAutoRange(i)

Description

Specifies whether the value range of the X-axis is determined automatically or with the "XAxisBegin(i)" and "XAxisEnd(i)" attributes.

Access in runtime: Read and write

Syntax

Object.**XAxisAutoRange(i)**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

Optional TRUE if the value range of the X-axis is established automatically or with the "XAxisBegin(i)" and "XAxisEnd(i)" attributes.

XAxisBeginValue

Description

Specifies the lower end of the value range of the selected X-axis.

To configure the value, deselect the "Automatic" option under "Value range".

Access in runtime: Read and write

Syntax

Object.**XAxisBeginValue**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

DOUBLE

Optional A value or a constant that specifies the lower limit of the value range of the selected X-axis.

XAxisColor

Description

Use this attribute to define the color for the common X-axis.

Access in runtime: Read and write

Syntax

Object.**XAxisColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Color

A value or a constant that specifies the color used for the common X-axis.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

XAxisCount

Description

Specifies the number of X-axes.

Access in runtime: Read and write

Syntax

Object.**XAxisCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Int32

Optional A value or a constant that specifies the number of X-axes.

XAxisEndValue

Description

Specifies the upper end of the value range of the selected X-axis.

To configure the value, deselect the "Automatic" option under "Value range".

Access in runtime: Read and write

Syntax

Object.**XAxisEndValue**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

DOUBLE

Optional A value or a constant that specifies the upper limit of the value range of the selected X-axis.

XAxisExponentialFormat

Description

Enables the exponential notation for visualization of a selected axis.

Access in runtime: Read and write

Syntax

Object.**XAxisExponentialFormat**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are not displayed in exponential format.

XAxisIndex

Description

References a configured X axis. You can assign the values of other properties to a specific X axis by using the property.

Values of between 0 and "XAxisCount" minus 1 are valid for "XAxisIndex". The property "ToolbarButtonCount" specifies the number of configured X-axes.

Access in runtime: Read and write

Syntax

Object.**XAxisIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Int32

Optional A value or a constant that specifies the number of the selected X-axis.

XAxisInTrendColor

Description

Specifies whether the selected axis is shown in the trend color. The color of the first trend is used if there are several trends displayed in the trend window. The order of the trends is defined in the "Trends" properties.

Access in runtime: Read and write

Syntax

Object.**XAxisInTrendColor**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The selected axis is displayed in the trend color. The setting in the "Color" field is disabled.

FALSE: The selected axis is displayed in the color which is set in the "Color" field.

XAxisLabel(i)

Description

In line with the value of "XAxisMode(i)", specifies the X-axis labeling of a trend that is referenced with "CurrentCurveIndex".

Access in Runtime: Read and write

Syntax

Object.XAxisLabel(i)[=STRING]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

STRING

Optional. A value or a constant that specifies the labeling of the X-axis of a trend referenced with "CurrentCurveIndex".

XAxisName

Description

Specifies the name of the selected axis.

Access in runtime: Read and write

Syntax

Object.**XAxisName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the name of the selected axis.

XAxisPrecisions

Description

Specifies the number of decimal places to be displayed for the values of the selected X-axis.

To enter the value, deselect the "Automatic" option under "Format".

Access in runtime: Read and write

Syntax

Object.**XAxisPrecisions**[=Int16]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Int16

Optional A value or a constant that specifies the number of decimal places.

XAxisRemove

Description

Removes the selected axis from the list.

Access in runtime: Read and write

Syntax

Object.**XAxisRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the axis that is to be removed from the list.

XAxisRepos

Description

Specifies the order of the axes. The order in the list determines the position of the axis in the trend view in Runtime. The axis is displayed further away from the trend if it is higher up the list and the alignment is the same.

Access in runtime: Read and write

Syntax

Object.**XAxisRepos**[=Int32]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

Int32

Optional. A value or a constant that specifies the order of the axes???

XAxisScalingType(i)

Description

Specifies the type of scaling for the X axis. Whether the information is evaluated depends on the value of the "XAxisMode(i)" attribute.

Access in Runtime: Read and write

Syntax

Object.**XAxisScalingType**(i)[=AxisScalingType]

Object

Required An object of the type "ScreenItem" with the following format:

- FunctionTrendControl

AxisScalingType

hmiBarScalingLinear (0): Linear axis scaling.

hmiBarScalingLogarithmic (1): Logarithmic axis scaling

hmiBarScalingNegativeLogarithmic (2): Negative logarithmic axis scaling

Comments

The parameter i indicates the number of the trend.

XAxisTrendWindow

Description

Specifies the trend window in which the selected axis is used. The available trend windows are specified in the properties under "Trends".

Access in runtime: Read and write

Syntax

Object.**XAxisTrendWindow**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the name of the trend window.

XAxisVisible

Description

The list shows all axes that you have created.

From the list, select the axes that are to be displayed in the trend views.

Click on an axis in the list to adapt the properties and to assign the axis to a trend view.

Access in runtime: Read and write

Syntax

Object.**XAxisVisible**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

BOOLEAN

Optional. Specifies whether the X-axis is to be visible.

YAxisAdd

Description

Creates a new Y axis.

Syntax

Object.**YAxisAdd**[=STRING]

Object

Required An object of the type "ScreenItem" with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies ???.

YAxisAlignment

Description

Specifies how the selected axis is aligned.

Syntax

Object.YAxisAlignment[=AxisAlignment]

Object

Required. A "ScreenItem" object with the format "FunctionTrendControl".

AxisAlignment

Value	Description	Explanation
0	Left	The X axis selected is displayed on left side of the trend.
1	Right	The selected Y axis is displayed to the right of the trend.

YAxisAutoPrecisions

Description

Enables automatic setting of the decimal precision.

Access in runtime: Read and write

Syntax

Object.**YAxisAutoPrecisions**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value configured in the Inspector window under "Properties > Y-axis > Format > Decimal places" is effective.

YAxisAutoRange

Description

Specifies whether the value range of the selected Y-axis is calculated automatically.

Access in runtime: Read and write

Syntax

Object.**YAxisAutoRange**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

Value	Explanation
TRUE	The range of values is calculated automatically.
FALSE	The range of values is calculated based in the values configured in the "from" and "to" fields.

YAxisBeginValue

Description

Specifies the lower end of the value range of the selected Y-axis.

To configure the value, deselect the "Automatic" option under "Value range".

Access in runtime: Read and write

Syntax

Object.**YAxisBeginValue**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

DOUBLE

Optional A value or a constant that specifies the lower limit of the value range of the selected Y-axis.

YAxisColor

Description

Specifies the color of the selected axis. Open the "Color selection" dialog by clicking the button. The setting is only active if the "Use trend color" field is not selected.

Access in runtime: Read and write

Syntax

Object.**YAxisColor**[=Color]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Color

Optional A value or a constant that specifies the color of the selected axis.

Comments

You can use the "RGB" function to define the color in RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown like this: RGB(255, 0, 0). You can also use the VBS color constants such as vbRed and vbGreen.

YAxisCount

Description

Specifies the number of configured Y-axes.

Access in runtime: Read and write

Syntax

Object.**YAxisCount**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Int32

Optional A value or a constant that specifies the number of configured Y-axes.

YAxisEndValue

Description

Specifies the upper end of the value range of the selected Y-axis.

To configure the value, deselect the "Automatic" option under "Value range".

Access in runtime: Read and write

Syntax

Object.**YAxisEndValue**[=DOUBLE]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

DOUBLE

Optional A value or a constant that specifies the upper limit of the value range of the selected Y-axis.

YAxisExponentialFormat

Description

Enables the exponential notation for visualization of a selected axis.

Access in runtime: Read and write

Syntax

Object.**YAxisExponentialFormat**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are not displayed in exponential format.

YAxisIndex

Description

References a configured Y axis. You can assign the values of other properties to a specific Y axis by using the property.

Values of between 0 and "YAxisCount" minus 1 are valid for "YAxisIndex". The property "ToolbarButtonCount" specifies the number of configured Y-axes.

Access in runtime: Read and write

Syntax

Object.**YAxisIndex**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Int32

Optional A value or a constant that specifies the number of the selected Y-axis.

YAxisInTrendColor

Description

Specifies whether the selected axis is shown in the trend color. The color of the first trend is used if there are several trends displayed in the trend window. The order of the trends is defined in the "Trends" properties.

Access in runtime: Read and write

Syntax

Object.**YAxisInTrendColor**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

BOOLEAN

TRUE: The selected axis is displayed in the trend color. The setting in the "Color" field is disabled.

FALSE: The selected axis is displayed in the color set in the "Color" field.

YAxisLabel

Description

Defines the label text for a selected axis.

Access in runtime: Read and write

Syntax

Object.**YAxisLabel**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the label text for the selected Y-axis.

YAxisName

Description

Specifies the name of the selected axis.

Access in runtime: Read and write

Syntax

Object.**YAxisName**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the name of the selected axis.

YAxisPrecisions

Description

Specifies the number of decimal places to be displayed for the values of the selected Y-axis.

To enter the value, deselect the "Automatic" option under "Format".

Access in runtime: Read and write

Syntax

Object.**YAxisPrecisions**[=Int16]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

Int16

Optional A value or a constant that specifies the number of decimal places.

YAxisRemove

Description

Removes the selected axis from the list.

Access in runtime: Read and write

Syntax

Object.**YAxisRemove**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the name of the selected axis.

YAxisRename

Description

Changes the name of the Y axis which is referenced by the "YAxisIndex" property.

Access in runtime: Read and write

Syntax

Object.**YAxisRename**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the new name of the selected Y-axis.

YAxisRepos

Description

Changes the sorting order of the axes. "Up" and "Down" move the axis selected up or down in the list.

The order in the list determines the position of the axis in the trend view in Runtime. The axis output position is moved away from the trend if the axis is moved further up in the list and the orientation is the same.

Access in runtime: Read and write

Syntax

Object.**YAxisRepos**[=Int32]

Object

Required An object of the type "ScreenItem" with the following format:

- FunctionTrendControl

Int32

Optional ##########.

YAxisScalingType

Description

Specifies how the Y-axis is scaled.

Access in runtime: Read and write

Syntax

Object.**YAxisScalingType**[=AxisScalingType]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

AxisScalingType

The following settings are available:

Value	Description
0	Linear
1	Logarithmic
2	Negative logarithmic

YAxisTrendWindow

Description

Specifies the trend window in which the selected axis is used. The available trend windows are specified in the properties under "Trends".

Access in runtime: Read and write

Syntax

Object.**YAxisTrendWindow**[=STRING]

Object

Required. A "ScreenItem" object with the following format:

- FunctionTrendControl

STRING

Optional A value or a constant that specifies the name of the trend window.

YAxisVisible

Description

The list shows all axes that you have created.

From the list, select the axes that are to be displayed in the trend views.

Click on an axis in the list to adapt the properties and to assign the axis to a trend view.

Access in runtime: Read and write

Syntax

Object.**YAxisVisible**[=BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the following format:

- FunctionTrendControl

BOOLEAN

Optional. Specifies whether the selected Y-axis is to be visible.

ZeroPoint

Description

Specifies the position of the zero point as a percentage of the bar height. The zero point can also be located outside of the displayed area.

The "ScalingType" property must be set to "Auto".

The "ShowScale" property must be set to "TRUE".

Access in runtime: Read and write

Syntax

Object.**ZeroPoint**[=Int32]

Object

Required. A "ScreenItem" object with the following format:

- Bar

Int32

Optional A value or a constant that specifies the position of the zero point as a percentage of the bar height.

Zoom/ZoomFactor

Description

Sets or reads the zoom factor of a screen or screen window.

If the indicated zoom factor is smaller than the minimum value, the zoom factor is automatically set to the minimum value. If the indicated zoom factor is larger than the minimum value, the zoom factor is automatically set to the maximum value.

The minimum value of the zoom factor is at 2%, the maximum value at 800%.

With the Screen Object the zoom factor is indicated as a numeric value and with a picture window object, it is indicated in percent.

Zoom: Zoom factor of picture

Zoomfactor: Zoom factor of picture window

Example

The following example doubles the zoom factor of the current picture:

```
'VBS97
HMIRuntime.ActiveScreen.Zoom = HMIRuntime.ActiveScreen.Zoom * 2
```

ScreenWindow (Page 5155)

1

AlarmLow

Description

Defines the bottom limit value at which an alarm should be triggered or returned.
The type of evaluation (percentage or absolute) is specified with the "TypeAlarmLow" property.

Access in Runtime: Write and read

Syntax

Object.AlarmLow[=REAL]

Object

Required A "ScreenItem" object with the format "Bar".

REAL

Value for the lower limit

See also

Bar (Page 5033)

AlignmentTop

Description

Defines or returns the vertical alignment of the text. Value range from 0 to 2.

Access in Runtime: Read and write

Syntax

Object.**AlignmentTopt**[=VerticalAlignment]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "RoundButton", "CheckBox", "OptionGroup".

VerticalAlignment

0: Alignment left

1: Alignment centered

2: Alignment right

Application

Description

Supplies the content of the application window Read only access.

See also

ScriptDiagnostics (Page 5157)

AssumeOnExit

Description

Specifies whether the entered text is applied after leaving the input field, e.g. with the <TAB> key or a mouseclick.

Access in Runtime: Read and write

Syntax

Object.**AssumeOnExit**

Object

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField".

See also

IOField (Page 5098)

SymbolicIOField (Page 5170)

AssumeOnFull

Description

Specifies whether the input field is left automatically after a complete input (the specified number of characters was entered) and the input is applied.

Access in Runtime: Read and write

Syntax

Object.AssumeOnFull[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField".

BOOLEAN

TRUE: is applied.

FALSE: is not applied.

See also

IOField (Page 5098)

SymbolicIOField (Page 5170)

BackBorderWidth

Description

Defines or returns the width of the 3D border in pixels. The value for the width is dependent on the size of the object.

BackColor3 property

Description

Defines or returns the color of the bar background. LONG write-read access.

BackFlashColorOff

Description

Defines or returns the color of the object background for the flash status "Off". LONG write-read access.

BackFlashColorOn

Description

Defines or returns the color of the object background for the flash status "On". LONG write-read access.

BorderFlashColorOff

Description

Defines or returns the color of the object lines for the flashing status "Off". LONG write-read access.

BorderFlashColorOn

Description

Defines or returns the color of the object lines for the flashing status "On". LONG write-read access.

BottomConnectedConnectionPointIndex

Description

Specifies or sets the index number of the bottom connecting point.

LONG write-read access.

BottomConnectedObjectName

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

BoxAlignment

Description

TRUE, when the fields are arranged aligned to the right. BOOLEAN write-read access.

BoxCount

Description

Defines or returns the number of fields. Value range from 0 to 31.

BoxType

Description

Defines or returns the field type. Value range from 0 to 2:

- 0: Edition
- 1: Input
- 2: I/O field

Button1Width

Description

Defines or returns the width of the Button 1 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

Button2Width

Description

Defines or returns the width of the Button 2 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

Button3Width

Description

Defines or returns the width of the Button 3 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

Button4Width

Description

Defines or returns the width of the Button 4 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

ButtonColor

Description

Defines or returns the color of the slider. LONG write-read access.

ButtonCommand

Description

Specifies the display in the message view.

Access in Runtime: Read and write

Syntax

Object.**ButtonCommand**[=Long]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Long

Optional A value or a constant which specifies the display in the message view.

See also

AlarmControl (Page 5018)

CheckAlarmHigh

Description

TRUE, when the "AlarmHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmHigh", "ColorAlarmHigh" and "TypeAlarmHigh" properties.

CheckAlarmLow

Description

TRUE, when the "AlarmLow" limit value is to be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmLow", "ColorAlarmLow" and "TypeAlarmLow" properties.

CheckLimitHigh4

Description

TRUE, when the "Reserve 4" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh4", "ColorLimitHigh4" and "TypeLimitHigh4" properties.

CheckLimitHigh5

Description

TRUE, when the "Reserve 5" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh5", "ColorLimitHigh5" and "TypeLimitHigh5" properties.

CheckLimitLow4

Description

TRUE, when the "Reserve 4" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow4", "ColorLimitLow4" and "TypeLimitLow4" properties.

CheckLimitLow5

Description

TRUE, when the "Reserve 5" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow5", "ColorLimitLow5" and "TypeLimitLow5" properties.

CheckToleranceHigh

Description

TRUE, when the "ToleranceHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceHigh", "ColorToleranceHigh" and "TypeToleranceHigh" properties.

CheckToleranceLow

Description

TRUE, when the "ToleranceLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceLow", "ColorToleranceLow" and "TypeToleranceLow" properties.

CheckWarningHigh

Description

TRUE, when the "WarningHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningHigh", "ColorWarningHigh" and "TypeWarningHigh" properties.

CheckWarningLow

Description

TRUE, when the "WarningLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningLow", "ColorWarningLow" and "TypeWarningLow" properties.

ClearOnNew

Description

TRUE, when the field entry is deleted as soon as the I/O field has the focus. BOOLEAN write-read access.

ColorAlarmHigh

Description

Defines or returns the bar color for the "AlarmHigh" limit value. LONG write/read access. The "CheckAlarmHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorAlarmLow

Description

Defines or returns the bar color for the "AlarmLow" limit value. LONG write/read access. The "CheckAlarmLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorLimitHigh4

Description

Defines or returns the color for the "Reserve 4" upper limit value. LONG write/read access. The "CheckLimitHigh4" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorLimitHigh5

Description

Defines or returns the color for the "Reserve 5" upper limit value. LONG write/read access. The "CheckLimitHigh5" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorLimitLow4

Description

Defines or returns the color for the "Reserve 4" lower limit value. LONG write/read access. The "CheckLimitLow4" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorLimitLow5

Description

Defines or returns the color for the "Reserve 5" lower limit value. LONG write/read access. The "CheckLimitLow5" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorToleranceHigh

Description

Defines or returns the color for the "ToleranceHigh" upper limit value. LONG write/read access. The "CheckToleranceHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorToleranceLow

Description

Defines or returns the color for the "ToleranceLow" lower limit value. LONG write/read access. The "CheckToleranceLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorWarningHigh

Description

Defines or returns the color for the "WarningHigh" upper limit value. LONG write/read access. The "CheckWarningHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorWarningLow

Description

Defines or returns the color for the "WarningLow" lower limit value. LONG write/read access. The "CheckWarningLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

CountValueColumns

Description

Returns the number of configured trends or column pairs (visible and invisible) of the window.

Access in Runtime: Read and write

Syntax

Object.**CountValueColumns**[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Int

Optional A value or a constant that returns the number of configured trends or column pairs (visible and invisible) of the window.

See also

OnlineTableControl (Page 5114)

CurrentColumnIndex

Description

Specifies which settings can be assigned to a selected column pair. The property is evaluated by other properties. Valid values for the index have values from 0 to -1. The "CountValueColumns" property contains the number of column pairs that are to be shown.

Access in Runtime: Read and write

Syntax

Object.**CurrentColumnIndex**[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Int

Optional A value or a constant that specifies which settings can be assigned to a particular column pair.

Comments

The "NumItems" property contains the number of trends / column pairs to be shown.

See also

OnlineTableControl (Page 5114)

DeleteEnable

Description

Specifies whether the recipe view can be cleared in Runtime.

Access in Runtime: Read and write

Syntax

Object.**DeleteEnable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the recipe view can be cleared in Runtime.

DrawAlwaysInsideFrame

Description

Specifies whether the border line of the selected object should be illustrated with a line weight greater than 1 within the border or symmetrically to the border.

Access in Runtime: Read and write

Syntax

Object.**DrawAlwaysInsideFrame**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Rectangle".

BOOLEAN

Option TRUE, if the border line of the specified object will be illustrated with a line weight greater than 1 within the border.

See also

Rectangle (Page 5149)

DrawStylishButton

Description

Specifies whether the button will be displayed in the general Windows style.

Access in Runtime: Read and write

Syntax

Object.**DrawStylishButton**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Button".

BOOLEAN

Optional TRUE, if the button will be displayed in the general Windows style.

See also

Button (Page 5040)

EditAtOnce

Description

TRUE, if accessing the field with the <TAB> key permits input immediately and without further action. BOOLEAN write-read access.

Exponent

Description

TRUE, when the display of numbers should be with exponents (e.g."1.00e+000"). BOOLEAN write-read access.

FillColor

Description

Defines or returns the fill pattern color for the object.

Access during runtime: Read and write

Syntax

Object.**FillColor**[=LONG]

Object

Necessary. An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "Bar", "StatusForce", "Clock", "Gauge", "Slider", "Checkbox".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Enter the appropriate decimal value for each of the three RGB values.

Example:

RGB(200, 150, 100)

Example

The following example defines the fill color for "ScreenWindow1" to blue:

```
'VBS73
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.FillStyle = 131075
objScreen.FillColor = RGB(0, 0, 255)
```

Filling

Description

TRUE, when the object can be filled by closed border lines (e.g. representing the fill level of a tank). BOOLEAN write-read access.
The fill level of the object is set by means of the "FillingIndex" property.

FillingIndex

Description

Defines the %age value (related to the height of the object) to which the object with closed border line is to be filled.
The fill level is represented by the current background color. The unfilled background is transparent.

FillStyle2

Description

Defines or returns the fill style of the bar.

FlashBackColor

Description

TRUE, when flashing of the background is activated. BOOLEAN write-read access

FlashBorderColor

Description

TRUE, when flashing of the object lines is activated. BOOLEAN write-read access.

FlashRate

Description

Defines or returns the flash frequency. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashRateBackColor

Description

Defines or returns the flash frequency for the object background. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FormatType

Description

Specifies the data type of the selected object.

Access in Runtime: Read and write

Syntax

Object.**FormatType**[=IOFieldDataFormat]

Object

Required A "ScreenItem" object with the format "IOField".

IOFieldDataFormat

hmiOutputFormatString (2): String

hmiOutputFormatDecimal (1): Decimal

hmiOutputFormatHexadecimal (3): Hexadecimal

hmiOutputFormatBinary (0): Binary

hmiOutputFormatDate (4): Date

hmiOutputFormatTime (5): Time

hmiOutputFormatDateTime (6): Date and time

See also

IOField (Page 5098)

GridBackColor

Description

Specifies the background color for the recipe view in Runtime.

Access in Runtime: Read and write

Syntax

Object.**GridBackColor**[=Color]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

Color

Optional A value or a constant that specifies the background color in the recipe view in Runtime.

GridForeColor

Description

Defines the font color for the recipe view.

Access in Runtime: Read and write

Syntax

Object.**GridForeColor**[=Color]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

Color

Optional A value or a constant that specifies the font color for the recipe view.

Hysteresis property

Description

TRUE, when the display should appear with hysteresis. BOOLEAN write-read access.

HysteresisRange

Description

Defines the hysteresis in % of the displayed value or returns it.
The Hysteresis property must be set to TRUE for the hysteresis to be calculated.

InsertEnable

Description

Specifies whether an entry can be made in the recipe view in Runtime.

Access in Runtime: Read and write

Syntax

Object.**InsertEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if an entry can be made in the recipe view in Runtime.

ItemBorderBackColor

Description

Defines or returns the background color for dividing lines in the selection list of the text list object. LONG write-read access. The background color is only visible with the property setting ItemBorderStyle > 0.

ItemBorderColor

Description

Defines or returns the color for deviding lines in the selection list of the text list object. LONG write-read access.

ItemBorderWidth

Description

Defines or returns the dividing line weight in pixels in the selection list of the text list object.

LeftComma property

Description

Defines or returns the number of digits to the left of the decimal point (0 to 20).

LimitHigh4

Description

Determines the upper limit value for "Reserve 4" or returns it.
The CheckLimitHigh4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh4 property.

LimitHigh5

Description

Determines the upper limit value for "Reserve 5" or returns it.
The CheckLimitHigh5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh5 property.

LimitLow4

Description

Determines the lower limit value for "Reserve 4" or returns it.
The CheckLimitLow4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow4 property.

LimitLow5

Description

Determines the lower limit value for "Reserve 5" or returns it.
The CheckLimitLow5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow5 property.

LimitMax

Description

Determines the upper limit value as an absolute value depending on the data format or returns it.
If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

LimitMin

Description

Determines the lower limit value as an absolute value depending on the data format or returns it.
If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

LockStatus

Description

TRUE, when a locked measuring point should be displayed. BOOLEAN write-read access.

LockText

Description

Defines the label of a button for a locked measuring point.
The LockStatus property must be set to TRUE for the label to be displayed.

LockTextColor

Description

Defines or returns the color of the button label for a locked measuring point. LONG write/read access.
The LockStatus property must be set to TRUE for the background color to be displayed.

LongStrokesBold

Description

TRUE, when the long sections of a scale should be displayed in bold face. BOOLEAN write-read access.

LongStrokesOnly

Description

TRUE, when only the long sections of a scale should be displayed . BOOLEAN write-read access.

LongStrokesSize

Description

Specifies whether only large scale marks are shown.

Access in runtime: Read and write

Syntax

Object.**ShowLargeTicksOnly**[=BOOLEAN]

Object

Required. A "ScreenItem" object with the following format:

- Bar

BOOLEAN

Optional TRUE if only large scale marks are shown.

LongStrokesTextEach

Description

Returns the value which defines which sections of the scale displayed should be labeled (1 = every section, 2 = every second section, etc.). Read only access

LowerLimitColor(i)

Description

Specifies the color that identifies the tag values for the selected trend and which lie below the value of "LowerLimitValue(i)". Whether the information is evaluated depends on the property "LowerLimitEnabled(i)".

Access in Runtime: Read and write

Syntax

Object.**LowerLimitColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

Color

Optional A value or a constant which specifies the color which identifies tag values of the specified trend which are below the value of "LowerLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

LowerLimitEnabled(i)

Description

Specifies whether the information from "LowerLimitColor(i)" is used to identify the tag values that lie beneath the value of "LowerLimitValue(i)".

Access in Runtime: Read and write

Syntax

Object.**LowerLimitEnabled**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the information from "LowerLimitColor(i)" is used to identify the tag values that lie beneath the value of "LowerLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

LowerLimitValue(i)

Description

???Specifies whether the tag values which drop below the value of "LowerLimitValue(i)" are marked by the color specified in "LowerLimitColor(i)". Whether the specification is evaluated depends on the attribute "LowerLimitEnabled(i)".

Access in Runtime: Read and write

Syntax

Object.**LowerLimitValue**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that determines if the tag values that fall short of the "LowerLimitValue(i)" are to be identified with the color specified in "LowerLimitColor(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

Marker property

Description

TRUE, when the limit values should be displayed as scale values. BOOLEAN write-read access.

MaximizeButton property

Description

TRUE, when the object can be maximized in Runtime. Read only access.

MCGUBackColorOff

Description

Defines or returns the background color for flash status "Off" in the case of the "Departed Unacknowledged" status. LONG write-read access.

MCGUBackColorOn

Description

Defines or returns the background color for flash status "On" in the case of the "Departed Unacknowledged" status. LONG write-read access.

MCGUBackFlash

Description

TRUE, when the background should flash when a message departs unacknowledged. BOOLEAN write-read access.

MCGUTextColorOff

Description

Defines or returns the color of the text for flash status "Off" for the "Outgoing unacknowledged" status. LONG write-read access.

MCGUTextColorOn

Description

Defines or returns the background color of the text for flash status "On" for the "Outgoing unacknowledged" status. LONG write-read access.

MCGUTextFlash

Description

TRUE, when the font should flash when a message departs unacknowledged. BOOLEAN write-read access.

MCKOBackColorOff

Description

Defines or returns the background color for flash status "Off" in the case of the "Arrived" status. LONG write-read access.

MCKOBackColorOn

Description

Defines or returns the background color for flash status "On" in the case of the "Arrived" status. LONG write-read access.

MCKOBackFlash

Description

TRUE, when the background should flash when a message arrives. BOOLEAN write-read access.

MCKOTextColorOff

Description

Defines or returns the color of the text for flash status "Off" for the "Incoming" status. LONG write-read access.

MCKOTextColorOn

Description

Defines or returns the background color of the text for flash status "On" for the "Incoming" status. LONG write-read access.

MCKOTextFlash

Description

TRUE, when the font should flash when a message arrives. BOOLEAN write-read access.

MCKQBackColorOff

Description

Defines or returns the background color for flash status "Off" in the case of the "Departed Acknowledged" status. LONG write-read access.

MCKQBackColorOn

Description

Defines or returns the background color for flash status "On" in the case of the "Departed Acknowledged" status. LONG write-read access.

MCKQBackFlash

Description

TRUE, when the background should flash when a message departs acknowledged. BOOLEAN write-read access.

MCKQTextColorOff

Description

Defines or returns the color of the text for flash status "Off" for the "Outgoing acknowledged" status. LONG write-read access.

MCKQTextColorOn

Description

Defines or returns the background color of the text for flash status "On" for the "Outgoing acknowledged" status. LONG write-read access.

MCKQTextFlash

Description

TRUE, when the font should flash when a message departs acknowledged. BOOLEAN write-read access.

MCText

Description

Defines or returns the label for the respective message class.

MessageClass

Description

Defines the respective limit violation (Alarm High, Alarm Low, Warning High, Warning Low, etc.) for which the "Display Text", "Incoming -", "Incoming acknowledged -", and "Outgoing unacknowledged -" settings have been configured.

NumberLines

Description

Defines or return the number of lines the text list object should contain. If the amount of configured text is larger than this value, the selection list receives a vertical scroll bar.

ObjectName

Description

Returns the name of the specified object.

Access in Runtime: Read

Syntax

Object.ObjectName

Object

Required A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

ChannelDiagnose (Page 5044)
ScriptDiagnostics (Page 5157)
Group (Page 5094)

OnTop

Description

TRUE, when the object should remain in the foreground in Runtime. Read only access.

OperationMessage property

Description

TRUE, if an alarm should be output when an operation is performed. BOOLEAN write-read access.
The operation is sent to the alarm system and is logged. The alarm system can be used to output an alarm in an alarm line, for example.

Particularities for I/O field, text list, and slider

The reason for the operation can only be entered if the "OperationReport" property has been set to TRUE.

OperationReport property

Description

TRUE, if the reason for an operation should be recorded. BOOLEAN write/read access.
When the object is used or operated in Runtime, a dialog opens in which the operator can input the reason for the operation in the form of text. The operation is sent to the message system, and is archived.

Orientation

Description

Specifies the text direction (orientation) of the selected object.

Access in Runtime: Read and write

Syntax

Object.**Orientation**[=TextOrientation]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "Bar", "OnlineTrendControl", "FunctionTrendControl", "Checkbox", "OptionGroup" or "WindowSlider".

TextOrientation

hmiTextHorizontal (0): The text is shown horizontally.

hmiTextRotated90Degree (-1): The text is shown vertically and left justified.

hmiTextRotated270Degree (1): The text is shown vertically and right justified.

SymbolicIOField (Page 5170)

Button (Page 5040)

Switch (Page 5166)

Bar (Page 5033)

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

CheckBox (Page 5045)

OptionGroup (Page 5131)

WindowSlider (Page 5216)

OutputFormat

Description

Returns the value for the representation of the output value. The representation is dependent on the data format. Read only access.

OutputValue

Description

Determines the default setting for the value to be displayed or returns it.
This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

PersistentRTAuthorization

Description

Specifies the authorization for operators which is necessary to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration. Whether the information is evaluated depends on the value of the property "AllowPersistance". This does not apply for the message view.

Access in Runtime: Read and write

Syntax

Object.**PersistentRTAuthorization**[=RtAuthorization]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

RtAuthorization

Optional A value or a constant that specifies the authorization for operators to change the persistence setting.

See also

AlarmControl (Page 5018)

PersistentRuntime

Description

Specifies whether changed settings in the window will also be maintained after a screen change.

Access in Runtime: Read and write

Syntax

Object.**PersistentRuntime**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" oder "OnlineTableControl".

BOOLEAN

Optional. TRUE, if changed settings in the window will also be maintained after a screen change.

Comments

The "AllowPersistance" property specifies whether the information will be evaluated.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

PersistentRuntimeAuthorization

Description

Specifies the access authorization to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration.

Access in Runtime: Read and write

Syntax

Object.**PersistentRuntimeAuthorization**[=HmiRTAuthorization]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

HmiRTAuthorization

Optional A value or a constant that specifies the access authorization required to change the persistence setting in Runtime.

Comments

The "AllowPersistance" property specifies whether the information will be evaluated. This does not apply for the message view.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

PicDeactReferenced

Description

TRUE, when the picture assigned for the "Disable" status should be saved in the RoundButton object. Otherwise, only the associated object reference is saved. Read only access.

PicDeactTransparent

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Disabled" status should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicDeactUseTransColor" property is "True".

PicDeactUseTransColor

Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

PicDownTransparent

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "On" status should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicDownUseTransColor" property is "True".

PicDownUseTransColor

Description

TRUE, when the transparent color defined by the "PicDownTransparent" property for the "On" status should be used. BOOLEAN write-read access.

PicTransColor

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicUseTransColor" property is "True".

PictureName

Description

Defines the path and file name of the background image in the process picture or returns it. LONG write-read access.

PictureUp

Description

Defines the picture to be displayed in the "Off" status or returns the picture name.
The picture (*.BMP or *.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.

PicUpTransparent

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Off" status should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicUpUseTransColor" property is "True".

PicUpUseTransColor

Description

TRUE, when the transparent color defined by the "PicUpTransparent" property for "Off" status should be used. BOOLEAN write-read access.

PicUseTransColor

Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

Pinned

Description

Defines whether the display of the picture window in Runtime depends on the process picture in which the picture window was configured.

PointCount

Description

Defines or returns the number of corner points. Each corner point has position coordinates and is identified via an index.

PrintJobName

Description

Defines the print job triggered by the print function of the "Print" toolbar button. The recommended print job is set for the control by default.

Open the "Select Print Job" dialog using the selection button.

Syntax

Object.**PrintJobName**]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "FunctionTrendControl", "OnlineTableControl", "OnlineTrendControl", "TrendRulerControl", "UserArchiveControl".

See also

AlarmControl (Page 5018)

PrintVisibleColumnsOnly

Description

Specifies whether only the current visible columns should be output in quick print.

Access in Runtime: Read and write

Syntax

Object.**PrintVisibleColumnsOnly**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if only the current visible columns should be output in quick print.

Process

Description

Defines or returns presetting for the value to be displayed.
This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

ReadOnly

Description

Specifies whether the Control has read and write access in Runtime.

Access in Runtime: Read and write

Syntax

Object.**ReadOnly**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the Control has read and write access in Runtime.

ReferenceRotationLeft

Description

Defines or returns the X-coordinate of the reference point about which the object should be rotated in Runtime.
The value of the x coordinate is relative to the object width. Enter the value in percent starting from the left edge of the rectangle enclosing the object.

ReferenceRotationTop

Description

Defines or returns the Y-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the Y-coordinate is relative to the object height. Enter the value in percent starting from the top edge of the rectangle enclosing the object.

Relevant property

Description

TRUE, when the object will be taken into account when forming the group display. BOOLEAN write-read access.

RightComma property

Description

Defines or returns the number of decimal places (0 to 20).

RTPersistencePasswordLevel

Description

Displays the authorization for online configuration. You can edit the authorization using the selection button. Authorizations are configured in the user administration.

Syntax

Object.**RTPersistencePasswordLevel**

Object

Required. An object of the "ScreenItem" type with the formats "AlarmControl", "OnlineTrendControl", "TrendRulerControl", "UserArchiveControl" or OnlineTableControl" ("Runtime Professional) or "HMITrendView" (Runtime Advanced).

See also

AlarmControl (Page 5018)

UserArchiveControl (Page 5207)

SameSize

Description

TRUE, when all four buttons of a Group Display object have the same size. BOOLEAN write-read access.

ScaleTicks

Description

Defines the number of segments into which the bar will be subdivided by large tick marks of the scale:
0-100: Object can be divided into a maximum of 100 segments
= 0: The optimum number of segments is set automatically.

ScrollBars

Description

TRUE, when the object is equipped with a scroll bar in Runtime. Read only access.

ScrollPositionX

Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

ScrollPositionY

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

SelBGColor

Description

Defines or returns the background color of the selected entry in a text list object. LONG write-read access.

SelectionMode

Description

Defines whether and how a message line can be selected.

.

Access in Runtime: Read and write

Syntax

Object.**SelectionMode**[=Mode]

Object

Required A "ScreenItem" object with the format "MessageView".

Mode

0 - NoSelection: Prevents the selection of a message. Acknowledgement affects the oldest pending message.

1 - Cell: Enables the selection of fields in the message line. Acknowledgement affects the selected message.

2 - Line: Enables the selection of a message line. Acknowledgement affects the selected message.

SelectionMode

Description

Specifies whether and how the alarm line can be selected.

Access in Runtime: Read and write

Syntax

Object.**SelectionMode**[=AlarmViewAdvancedSelectionMode]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

AlarmViewAdvancedSelectionMode

hmiAlarmViewAdvancedSelectionModeNone (0): Prevents the selection of an alarm. An acknowledgement always affects the oldest pending alarm.

hmiAlarmViewAdvancedSelectionModeCell (1): Enables the selection of fields in the alarm line. An acknowledgement always effects the selected alarm.

hmiAlarmViewAdvancedSelectionModeLine (2): Enables the selection of an alarm line. An acknowledgement always effects the selected alarm.

See also

AlarmControl (Page 5018)

SelTextColor

Description

Defines or returns the color of the text of the selected entry in the text list object. LONG write-read access.

ShortenCellText

Description

Specifies whether the content of the fields of an alarm line should be shortened if the column width is too small.

Access in Runtime: Read and write

Syntax

Object.**ShortenCellText**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the content of the fields of an alarm line should be shortened if the column width is too small.

See also

AlarmControl (Page 5018)

ShortenColumnHeaderText

Description

Specifies whether the content of the fields of a title line should be shortened if the column width is too small.

Access in Runtime: Read and write

Syntax

Object.**ShortenColumnHeaderText**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the content of the fields of a title line should be shortened if the column width is too small.

See also

AlarmControl (Page 5018)

ShowVerticalGridlines

Description

Specifies whether the columns of the message view are separated by vertical lines.

Access in Runtime: Read and write

Syntax

Object.**ShowVerticalGridlines**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the columns of the alarm window will be separated by vertical separation lines.

See also

AlarmControl (Page 5018)

ShowXValuesExponential(i)

Description

Specifies whether a value of the X coordinate is shown in exponential format. Whether the information is evaluated depends on the property "XAxisMode(i)".".

Access in Runtime: Read and write

Syntax

Object.**ShowXValuesExponential**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a value of the X coordinate is shown in exponential format.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the X coordinate of the measurement value.

See also

FunctionTrendControl (Page 5077)

ShowYValuesExponential(i)

Description

Specifies whether a value of the Y coordinate is shown in exponential format. Whether the information is evaluated depends on the property "XAxisMode(i)". ".

Access in Runtime: Read and write

Syntax

Object.**ShowYValuesExponential**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a value of the Y coordinate is shown in exponential format.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the Y coordinate of the measurement value.

See also

FunctionTrendControl (Page 5077)

SignificantMask property

Description

Is required in Runtime to display the active message class with the highest priority.
The value of the SignificantMask property represents an internal system output value does not require any specific configuration by the user. Updating is initiated in Runtime by clicking on the object.

SortByTimeEnable

Description

Specifies whether the sorting direction can be altered in Runtime.

Access in Runtime: Read and write

Syntax

Object.**SortByTimeEnable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the sorting direction can be altered in Runtime.

See also

AlarmView (Page 5029)

SortOnColumnHeaderClick

Description

Specifies whether the alarm text blocks can be sorted via the column header of the alarm text block.

Access in Runtime: Read and write

Syntax

Object.**SortOnColumnHeaderClick**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the message blocks can be sorted by the column header of the message blocks.

See also

AlarmControl (Page 5018)

SortTimeAscending

Description

Determines whether the last message received is displayed on top (ascending sorting order) in the "MessageView" object.

Access during runtime: Read and Write

Syntax

Object.SortTimeAscending [= BOOLEAN]

Object

Required. An object of the "MessageView" type.

BOOLEAN

Optional. TRUE, if the last message received is displayed on top.

SortTimeEnable

Description

Determines whether the sorting of messages can be changed according to time in the "MessageView" object.

Access during runtime: Read and Write

Syntax

Object.SortTimeEnable [= BOOLEAN]

Object

Required. An object of the "MessageView" type.

BOOLEAN

Optional. TRUE, if the sorting can be changed by the operator on the device.

StartPointLeft

Description

Specifies the horizontal distance in pixels from the left edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**StartPointLeft**[=Int]

Object

Required An object of the "ScreenItem type with the format "Line"".

Int

Optional A value that specifies the horizontal distance in pixels of the start point from the left edge of the screen.

See also

EllipseSegment (Page 5067)

CircleSegment (Page 5051)

EllipticalArc (Page 5070)

CircularArc (Page 5053)

TagName

Description

The "Index" property references a trend. "TagName" defines the tag linked to this trend. It is specified in the form "Archivname\Variablenname" to display tags in a process value archive or "TasgName" to display an internal or external tag which is not stored in an archive.

TimeAxisShowGridLines(i)

Description

Specifies whether the trend window is shown with grid lines that run parallel to the x axis.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisShowGridLines**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the x axis.

Comments

The distance between two grid lines can be altered with the "TimeAxisGridLineInterval(i)" property.

See also

OnlineTrendControl (Page 5122)

TimeColumnFormat(i)

Description

Specifies the format of the time columns for the selected column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnFormat**(i)[=TimeFormat]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

TimeFormat

(0): The information is carried out in the form hh:mm.

(1): The information is carried out in the form hh:mm:ss.

(2): The information is carried out in the form hh:mm:ss.ms.

(3): The information is carried out in the form hh:mm (full hours).

(4): The information is carried out in the form hh:mm:ss (full minutes).

(5): The information is carried out in the form hh:mm:ss:ms (full seconds).

(6): The information is carried out in the form dd_mm_yy_hh_mm.

(7): The information is carried out in the form dd_mm_yy_hh_mm (full hours).

(8): The information is carried out in the form dd_mm_yy.

(9): The information is carried out in the form dd_mm_yy_ (full days).

See also

OnlineTableControl (Page 5114)

TitleBackColor

Description

Specifies the background color of the table headers for the selected status. You open a color selection dialog box with the button.

Titleline

Description

TRUE, when the control has a title bar and it can be moved in Runtime. BOOLEAN write-read access.

ToleranceHigh property

Description

Defines or returns the limit value for "Tolerance high".
The type of the evaluation (in percent or absolute) is defined in the "TypeToleranceHigh" property.
The monitoring of the limit value is only valid if the "CheckToleranceHigh" property is set to "TRUE".

ToleranceLow property

Description

Defines or returns the limit value for "Tolerance low".
The type of the evaluation (in percent or absolute) is defined in the "TypeToleranceLow" property.
The monitoring of the limit value is only valid if the "CheckToleranceLow" property is set to "TRUE".

TopConnectedConnectionPointIndex

Description

Specifies or sets the index number of the top connecting point.

LONG write-read access.

TopConnectedObjectName

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

Trend

Description

TRUE, when the tendency (rising or falling) of the measuring value being monitored should be displayed by a small arrow. BOOLEAN write-read access.

TrendTag

Description

Specifies which tag is linked with the selected trend.

You enter the value either in the form "archive name/tag name", to show tags of a process value archive, or in the form "tag name" to show an internal or an external tag that will now be saved in an archive.

Access in Runtime: Read and write

Syntax

Object.**TrendTag**[=HmiTag]

Object

Required A ""ScreenItem" object with the format "OnlineTrend".

HmiTag

Optional A value or a constant that specifies which tags are linked with the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

TypeAlarmHigh

Description

TRUE, when the upper limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeAlarmLow

Description

TRUE, when the lower limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitHigh4

Description

TRUE, when the "Reserve 4" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitHigh5

Description

TRUE, when the "Reserve 5" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitLow4

Description

TRUE, when the "Reserve 4" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitLow5

Description

TRUE, when the "Reserve 5" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeToleranceHigh

Description

TRUE, when the "Tolerance high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeToleranceLow

Description

TRUE, when the "Tolerance low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeWarningHigh

Description

TRUE, when the "Warning high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeWarningLow

Description

TRUE, when the "Warning low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

UncertainStateColor(i)

Description

Specifies the color for the identification of values with an uncertain status.

Access in Runtime: Read and write

Syntax

Object.**UncertainStateColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Color

Optional A value or a constant that specifies the color for the identification of values with an uncertain status.

Comments

The parameter i indicates the number of the trend.

If the start value of a value is not known after Runtime has been activated or a substitute value is used, then this value has an uncertain status.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

UncertainStateEnabled(i)

Description

Specifies if values with an uncertain status are identified with the color set up in "ReplacementColor(i)"".

If the start value of a value is not known after Runtime has been activated or a substitute value is being used, then this value is considered to have an uncertain status.

Access in Runtime: Read and write

Syntax

Object.**UncertainStateEnabled**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if values with an uncertain status are identified with the color specified in ""ReplacementColor(i".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

UpdateEnable

Description

Specifies whether the recipe view can be altered in Runtime.

Access in Runtime: Read and write

Syntax

Object.**UpdateEnable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the recipe view can be altered in Runtime.

UpperLimitColor(i)

Description

Specifies the color that identifies the tag values that lie above the value of ""UpperLimitValue(i)". Whether the information is evaluated depends on the value of the property ""UpperLimitEnabled(i)".

Access in Runtime: Read and write

Syntax

Object.**UpperLimitColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

Color

Optional A value or a constant that identifies the tag values that lie above the value of ""UpperLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

UpperLimitEnabled(i)

Description

Specifies whether the information from "UpperLimitColor(i)" is used to identify the tag values that lie above the value of "UpperLimitValue(i)".

Access in Runtime: Read and write

Syntax

Object.**UpperLimitEnabled**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the information from "UpperLimitColor(i)"" is used to identify the tag values that lie above the value of "UpperLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

UpperLimitValue(i)

Description

Specifies whether the tag values that exceed the "UpperLimitValue(i)" are to be identified with the color specified in "UpperLimitColor(i)"". Whether the information is evaluated depends on the value of the property "UpperLimit(i)".".

Access in Runtime: Read and write

Syntax

Object.**UpperLimitValue**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies whether the tag values that exceed the ""UpperLimitValue(i)" value are to be identified with the color specified in UpperLimitColor(i)"".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

UseAllServers

Description

Specifies whether the data to be shown in the alarm window can be requested from all servers in a distributed system. Alarm Logging must be activated on the respective servers.

Access in Runtime: Read-only

Syntax

Object.**UseAllServers**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmView".

BOOLEAN

Optional. TRUE, if the data to be shown in the alarm window can be requested from all servers in a distributed system.

See also

AlarmControl (Page 5018)

UserValue1 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

UserValue2 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

UserValue3 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

UserValue4 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

ValueAxisDecimalPrecision(i)

Description

Specifies the number of decimal places for the value range of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisDecimalPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "FunctionTrendView".

Int

Optional A value or a constant that specifies the number of decimal places for the value range of the selected trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ValueAxisShowGridLines(i)

Description

Specifies whether the trend window is shown with grid lines that run parallel to the y axis.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisShowGridLines(**i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the y axis.

Comments

The distance between two grid lines can be altered with the "ValueAxisGridLineInterval(i)" property.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ValueColumnPrecision(i)

Description

Specifies the number of decimal places that are shown in this value column. The parameter i indicates the number of the column pair. A maximum of 16 decimal places can be shown.

Access in Runtime: Read and write

Syntax

Object.**ValueColumnPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Int

Optional A value or a constant that specifies the number of decimal places that are shown in this value column.

See also

OnlineTableControl (Page 5114)

WarningHigh

Description

Defines or returns the upper limit value for "Warning High".
In order that the limit value is monitored, the "CheckWarningHigh" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningHigh" and "TypeWarningHigh" properties.

WarningLow

Description

Defines or returns the lower limit value for "Warning Low".
In order that the limit value is monitored, the "CheckWarningLow" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningLow" and "TypeWarningLow" properties.

StyleSettings

Description

Defines the style in which the object is displayed.

Access in runtime: Read and write

Syntax

Object.**StyleSettings**[=WinCCStyle]

Object

Required. An object of the "ScreenItem" type with the following format:

- Button
- RoundButton
- WindowsSlider

WinCCStyle

Optional. A value or a constant that specifies the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

WindowBorder

Description

TRUE, when the window is displayed with borders in Runtime. Read only access.

XAxisBegin(i)

Description

Specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex". Whether the information is evaluated depends on the properties "XAxisAutorange(i)" and "ShareXAxis".

Access in Runtime: Read and write

Syntax

Object.**XAxisBegin**(i)[=String]

Object

Required A ""ScreenItem" object with the format ""FunctionTrendView".

String

Optional A value or a constant that specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

See also

FunctionTrendControl (Page 5077)

XAxisEnd(i)

Description

Specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex". Whether the information is evaluated depends on the properties "XAxisAutorange(i)"" and "ShareXAxis".

Access in Runtime: Read and write

Syntax

Object.**XAxisEnd**(i)[=String]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

String

Optional A value or a constant that specifies the upper limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

See also

FunctionTrendControl (Page 5077)

XAxisShowGridLines(i)

Description

Specifies whether the trend window is shown with grid lines that run parallel to the X axis. The distance between two grid lines can be altered with the ""XAxisGridLineInterval(i)" property.

Access in Runtime: Read and write

Syntax

Object.**XAxisShowGridLines**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the X axis.

See also

FunctionTrendControl (Page 5077)

2

Activate

Description

Determines whether the data to be displayed are requested by the alarm server.

Access in Runtime: Read and write

Syntax

Object.**Activate**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the data to be displayed are requested by the alarm server.

See also

AlarmControl (Page 5018)

AdjustBorder3DWithStyle

Description

Specifies whether the 3D border width will be displayed in the general Windows style.

Access in Runtime: Read and write

Syntax

Object.**AdjustBorder3DWithStyle**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Button".

BOOLEAN

Optional TRUE, if the 3D border width will be displayed in the general Windows style.

See also

Button (Page 5040)

AlarmFilter

Description

Specifies a SQL-Statement for selecting the alarms that will be shown in the alarm window.

Alarm list and hit list filtering and sorting settings

Access in Runtime: Read and write

Syntax

Object.**AlarmFilter**[=String]

Object

Required A "ScreenItem" object with the format "AlarmControl".

String

Optional A value or a constant that specifies a SQL-Statement for selecting the alarms that will be shown in the alarm window.

See also

AlarmControl (Page 5018)

AngleAlpha

Description

Defines or returns depth angle a for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

AngleBeta

Description

Defines or returns depth angle b for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

Axe property

Description

Defines or returns the position of the 3D bar in the coordinate system. Value range from 0 to 2.

0: The 3D-bar is displayed on the X-axis.

1: The 3D-bar is displayed on the Y-axis.

2: The 3D-bar is displayed on the Z-axis.

AxisSection

Description

Defines or returns the distance between two long axis sections. The information on the distance is given in scale units and is dependent on the minimum and maximum values configured.

Background

Description

TRUE, when the background of the 3D-bar graph object should be visible. BOOLEAN write-read access.

BarDepth

Description

Defines or returns the depth of the bar in pixels.

BarHeight property

Description

Defines or returns the height of the bar in pixels.

BaseX property

Description

Defines or returns the horizontal distance of the right bar edge to the left edge of the object field in pixels.

BaseY property

Description

Defines or returns the vertical distance of the bottom bar edge to the top edge of the objet field.

CloseButton

Description

TRUE, when the window is provided with a "Close" button. Read only access.

ColumnSizingEnable

Description

Specifies whether the width of the columns in the alarm window can be changed. The width of the columns can be changed only if the "AutoScroll" property is not enabled.

Access in Runtime: Read and write

Syntax

Object.**ColumnSizingEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE if the width of the columns in the alarm window can be changed.

See also

AlarmControl (Page 5018)

ForeFlashColorOff

Description

Defines or returns the color of the text for flash status "Off". LONG write-read access.

ForeFlashColorOn

Description

Defines or returns the color of the text for flash status "On". LONG write-read access.

InsertData(i)

Description

Specifies which data will be inserted for the active trend.

Access in Runtime: Read and write

Syntax

Object.**InsertData**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControi".

BOOLEAN

Optional TRUE, if "DataIndex(i)" is ignored and the data added to the rear of the data buffer.

FALSE, if the data is inserted at the position "DataIndex(i)" of the data buffer.

Comments

The trend view is redrawn in every operation with "InsertData(i)".

See also

FunctionTrendControl (Page 5077)

Layer00Checked

Description

TRUE, when limit 0 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer00Value and Layer00Color properties.

Layer00Color

Description

Defines or returns the color for limit 0. LONG write/read access.
When monitoring of the limit value is activated (Layer00Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer00Value

Description

Determines the value for "Limit 0" or returns it.
Monitoring only takes effect when the Layer00Checked property value is set to TRUE.

Layer01Checked

Description

TRUE, when limit 1 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer01Value and Layer01Color properties.

Layer01Color

Description

Defines or returns the color for limit 1. LONG write/read access.
When monitoring of the limit value is activated (Layer01Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer01Value

Description

Determines the value for "Limit 1" or returns it.
Monitoring only takes effect when the Layer01Checked property value is set to TRUE.

Layer02Checked

Description

TRUE, when limit 2 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer02Value and Layer02Color properties.

Layer02Color

Description

Defines or returns the color for limit 2. LONG write/read access.
When monitoring of the limit value is activated (Layer02Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer02Value

Description

Determines the value for "Limit 2" or returns it.
Monitoring only takes effect when the Layer02Checked property value is set to TRUE.

Layer03Checked

Description

TRUE, when limit 3 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer03Value and Layer03Color properties.

Layer03Color

Description

Defines or returns the color for limit 3. LONG write/read access.
When monitoring of the limit value is activated (Layer03Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer03Value

Description

Determines the value for "Limit 3" or returns it.
Monitoring only takes effect when the Layer03Checked property value is set to TRUE.

Layer04Checked

Description

TRUE, when limit 4 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer04Value and Layer04Color properties.

Layer04Color

Description

Defines or returns the color for limit 4. LONG write/read access.
When monitoring of the limit value is activated (Layer04Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer04Value

Description

Determines the value for "Limit 4" or returns it.
Monitoring only takes effect when the Layer04Checked property value is set to TRUE.

Layer05Checked

Description

TRUE, when limit 5 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer05Value and Layer05Color properties.

Layer05Color

Description

Defines or returns the color for limit 5. LONG write/read access.
When monitoring of the limit value is activated (Layer05Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer05Value

Description

Determines the value for "Limit 5" or returns it.
Monitoring only takes effect when the Layer05Checked property value is set to TRUE.

Layer06Checked

Description

TRUE, when limit 6 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer06Value and Layer06Color properties.

Layer06Color

Description

Defines or returns the color for limit 6. LONG write/read access.
When monitoring of the limit value is activated (Layer06Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer06Value

Description

Determines the value for "Limit 6" or returns it.
Monitoring only takes effect when the Layer06Checked property value is set to TRUE.

Layer07Checked

Description

TRUE, when limit 7 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer07Value and Layer07Color properties.

Layer07Color

Description

Defines or returns the color for limit 7. LONG write/read access.
When monitoring of the limit value is activated (Layer07Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer07Value

Description

Determines the value for "Limit 7" or returns it.
Monitoring only takes effect when the Layer07Checked property value is set to TRUE.

Layer08Checked

Description

TRUE, when limit 8 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer08Value and Layer08Color properties.

Layer08Color

Description

Defines or returns the color for limit 8. LONG write/read access.
When monitoring of the limit value is activated (Layer08Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer08Value

Description

Determines the value for "Limit 8" or returns it.
Monitoring only takes effect when the Layer08Checked property value is set to TRUE.

Layer09Checked property

Description

TRUE, when limit 9 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer09Value and Layer09Color properties.

Layer09Color

Description

Defines or returns the color for limit 9. LONG write/read access.
When monitoring of the limit value is activated (Layer09Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer09Value

Description

Determines the value for "Limit 9" or returns it.
Monitoring only takes effect when the Layer09Checked property value is set to TRUE.

Layer10Checked

Description

TRUE, when limit 10 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer10Value and Layer10Color properties.

Layer10Color

Description

Defines or returns the color for limit 10. LONG write/read access.
When monitoring of the limit value is activated (Layer10Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer10Value

Description

Determines the value for "Limit 10" or returns it.
Monitoring only takes effect when the Layer10Checked property value is set to TRUE.

LightEffect property

Description

TRUE, when the light effect should be activated. BOOLEAN write-read access.

ListType property

Description

Returns the data type displayed in the case of a text list object. Read only access.

Value range from 0 to 2.

0 = decimal

1 = binary

2 = bit

Localizable

Description

Specifies whether a font should be assigned and can be formatted for each Runtime language.

Access in Runtime: Read and write

Syntax

Object.**Localizable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

BOOLEAN

Optional TRUE, if a font should be assigned and can be formatted for each Runtime language.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

AlarmControl (Page 5018)

Max property

Description

Defines or returns the absolute value in the case of a full value display. This value is displayed if the scale display is active.

PersistentRTCSAuthorization

Description

Specifies the operator authorization to be able to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration. Whether the information is evaluated depends on the value of the property "AllowPersistance". This does not apply for the message view.

Access in Runtime: Read and write

Syntax

Object.**PersistentRTCSAuthorization**[=RtAuthorization]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

RtAuthorization

Optional A value or a constant that specifies the operator authorization to change the persistence setting.

See also

AlarmControl (Page 5018)

PersistentToDownload

Description

Specifies whether the settings will be maintained until the next ES download.

Access in Runtime: Read and write

Syntax

Object.**PersistentToDownload**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the settings will be maintained until the next ES download.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

PersistentToDownloadAuthorization

Description

Specifies the access authorization required to change the settings until the next ES download.

Access in Runtime: Read and write

Syntax

Object.**PersistentToDownloadAuthorization**[=HmiRTAuthorization]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

HmiRTAuthorization

Optional A value or a constant that specifies the access authorization required to change the settings until the next ES download.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

PicDownReferenced

Description

TRUE, when the picture assigned for the "On" status is to be saved. Otherwise, only the associated object reference is saved. Read only access.

PicReferenced

Description

TRUE, when the assigned picture is references the object and is not saved in it. Read only access.

Position

Description

Defines the presetting for the position of the slider.

This value is used as the start value in Runtime.

To operate the process value linked to this attribute, it is necessary that the process value is also linked to the "Position" event. You will find the event "Position" in the "Event" tab, in the topic tree under SliderCtrl\Property Topics\Control Properties\Value.

PredefinedAngles

Description

Defines or returns the depth of the display of the 3DBarGraph object. Value range from 0 to 3.

0 = cavalier

1 = isometric

2 = axionometric

3 = freely defined

PrintConfiguration

Description

Specifies the log for the printout.

Access in Runtime: Read and write

Syntax

Object.**PrintConfiguration**[=HMIPrintConfiguration]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

HMIPrintConfiguration

Optional A value or a constant which specifies the log for the printout.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

AlarmControl (Page 5018)

ProjectPath

Description

Contains the path and name of the associated project.

Access in Runtime: Read-only

Syntax

Object.**ProjectPath**[=String]

Object

Required A "ScreenItem" object with the format "AlarmControl".

String

Optional A value or a constant that specifies which path and name the associated project will contain.

See also

AlarmControl (Page 5018)

RowSizingEnable

Description

Specifies whether the row height can be changed.

The "RowSizingEnable" property is then only disabled if both properties "RowSizingEnable" and "AdaptFontSizeToLineHeight" have the value FALSE.

Access in Runtime: Read and write

Syntax

Object.**RowSizingEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the row height can be changed.

See also

AlarmControl (Page 5018)

Scrollable

Description

Specifies whether the DXF screen display supports the Scroll functions in Runtime mode.

Access in Runtime: Read and write

Syntax

Object.**Scrollable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "DXFView".

BOOLEAN

Optional TRUE, if the DXF screen display supports the Scroll functions in Runtime mode.

ShowMessagesAtDate

Description

Determines at which time the alarms will be displayed.

Note

This function does not filter out alarms, it positions the display range of the alarm list as of the specified date.

Access during runtime: Read and Write

Syntax

Object.ShowMessagesAtDate [= DATE]

Object

Required. An object of the "MessageView" type.

Remarks

To assign SmartTags to the "ShowMessagesAtDate" property, you must formulate the assignment as follows:

```
'Example 1
HmiRuntime.Screens("Screen_1").ScreenItems("Alarm
view_1").ShowMessagesAtDate = SmartTags("intern_1").Value
'Example 2
HmiRuntime.Screens("Screen_1").ScreenItems("Alarm
view_1").ShowMessagesAtDate = CDate(SmartTags("intern_1"))
SmartTag "intern_1" must be of the "DateTime" type.
```

See also

AlarmView (Page 5029)

Sort

Description

Specifies the sorting criteria in SQL syntax for the database.

Access in Runtime: Read and write

Syntax

Object.**Sort**[=String]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

String

Optional A value or a constant that specifies the sort criteria in SQL syntax for the database.

TableFocusOnButtonCommand

Description

Specifies whether by clicking on a Button in a script in Runtime the table of the Controls will be activated.

Access in Runtime: Read and write

Syntax

Object.**TableFocusOnButtonCommand**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmView".

BOOLEAN

Optional TRUE, if by clicking on a Button in a script in Runtime the table of the Controls will be activated.

See also

AlarmControl (Page 5018)

TimeRangeBase(i)

Description

Specifies the unit for determining the time interval of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**TimeRangeBase**(i)[=TagLoggingTimeUnit]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

TagLoggingTimeUnit

(1): The time intervals are set up in milliseconds.

hmiCurveTimeRangeBase500ms (500): The time intervals are set up in 500 ms.

hmiCurveTimeRangeBaseSecond (1000): The time intervals are set up in seconds.

hmiCurveTimeRangeBaseMinute (60000): The time intervals are set up in minutes.

hmiCurveTimeRangeBaseHour (3600000): The time intervals are set up in hours.

hmiCurveTimeRangeBaseDay (86400000): The time intervals are set up in days.

Comments

The time range to be displayed for the trend i is achieved by multiplying the values "TimeRangeBase(i)" and "TimeRangeFactor(i)", whereby the value of "TimeRangeBase(i)" is interpreted in milliseconds. The "TimeRangeBase(i" and "TimeRangeFactor(i)" properties are only evaluated if the "TimeRange" property has the value "-1".

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

TimeRangeFactor(i)

Description

Specifies the factor for determining the time interval of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**TimeRangeFactor**(i)[=Int]

Object

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

Int

Optional A value or a constant that specifies the factor for determining the time interval of the selected trend.

Comments

The time range to be displayed for the trend i is achieved by multiplying the values ""TimeRangeBase(i and "TimeRangeFactor(i)", whereby the value of "TimeRangeBase(i)" is interpreted in milliseconds. The "TimeRangeBase(i" and "TimeRangeFactor(i)" " properties are only evaluated if the property "TimeRange" has the value "-1".

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

UseTimeRange(i)

Description

Specifies how the time range that is to be shown for the selected trend will be defined.

Access in Runtime: Read and write

Syntax

Object.**UseTimeRange**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend","FunctionTrendView" or "TableView".

BOOLEAN

Optional TRUE, if the time range that is to be shown is defined by means of a start time ("TimeAxisBeginTime(i)") and an end time ("TimeAxisEndTime").

FALSE,, if the time range that is to be shown is defined by means of a start time ("TimeAxisBeginTime(i)") and an end time "TimeRangeBase(i)" and "TimeRangeFactor(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

ValidateFormatPattern

Description

Specifies that the "format pattern" field can be checked for specific characters.

Access in Runtime: Read and write

Syntax

Object.**ValidateFormatPattern**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the "format pattern" field can be checked for specific characters.

See also

IOField (Page 5098)

ValueAxisBegin(i)

Description

Specifies the lower limit of the value range for the selected trend that is to be displayed. Whether the information is evaluated depends on the properties "Autorange" and "ShareValueAxis".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisBegin**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the lower limit of the value range of the selected trend that is to be shown.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ValueAxisEnd(i)

Description

Specifies the upper limit of the value range of the selected trend that is to be displayed. Whether the information is evaluated depends on the properties "Autorange" and "ShareValueAxis".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisEnd**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the upper limit of the value range of the selected trend that is to be shown.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ZeroPointValue

Description

Defines the value of the zero point of the scale indicator.

Defines or returns the absolute value for the zero point.

Zoomable

Description

Specifies whether the DXF screen display supports the zoom functions in Runtime mode.

Access in Runtime: Read and write

Syntax

Object.**Zoomable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "DXFView".

BOOLEAN

Optional TRUE, if the DXF screen display supports the zoom functions in Runtime mode.

3

Active

Description

Specifies whether the data that is to be shown is requested by the log server.

Access in Runtime: Read and write

Syntax

Object.**Active**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl," or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the data that is to be shown is requested by the log server.

Comments

The screen opening times are reduced if you do not set this attribute. You can change the value dynamically.

To differentiate between the "Activate" property and the "Activate" methods, the property is addressed via "Object".

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

AdaptFontSizeToLineHeight

Description

Specifies whether the font size will be adapted to the line height.

Access in Runtime: Read and write

Syntax

Object.**AdaptFontSizeToLineHeight**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the font size will be adapted to the line height.

See also

AlarmControl (Page 5018)

AddAssignment

Description

Adds an entry.

AdjustRulerWindow

Description

Specifies whether the ruler window is adapted every time the trend view is displayed.

Access in Runtime: Read and write

Syntax

Object.**AdjustRulerWindow**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if the ruler window is adapted every time the trend view is displayed.

Comments

TRUE, if the ruler window will be moved and then shown and hidden, it will be displayed at the original position in the original size.

See also

OnlineTrendControl (Page 5122)

AlarmHigh

Description

Defines the top limit value at which an alarm should be triggered or returned.
The type of evaluation (percentage or absolute) is specified with the "TypeAlarmHigh" property.

Access in Runtime: Write and read

Syntax

Object.AlarmHigh[=REAL]

Object

Required A "ScreenItem" object with the format "Bar".

REAL

Value for the upper limit

See also

Bar (Page 5033)

Alignment

Description

Determines the layout of the scale (left/right or top/bottom) depending on the position of the bar object or returns it.

Access in Runtime: Read and write

Syntax

Object.**Alignment**[=ScalePosition]

Object

Required An object of the "ScreenItem" type with the format "Bar".

ScalePosition

1: Right or bottom .

0: Left or top.

See also

Bar (Page 5033)

AlignmentLeft

Description

Defines or returns the horizontal alignment of the text. Value range from 0 to 2.

Access in Runtime: Read and write

Syntax

Object.**AlignmentLeft**[=HorizontalAlignment]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "RoundButton", "CheckBox", "OptionGroup", "MultilineEdit", "ComboBox", "ListBox".

HorizontalAlignment

0: Alignment left

1: Alignment centered

2: Alignment right

AllowPersistence

Description

Specifies whether the persistence is adjustable.

Access in Runtime: Read and write

Syntax

Object.**AllowPersistence**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the persistence is adjustable.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

BackColor2

Description

Defines or returns the bar color for the display of the current value. LONG write-read access.

BackFillStyleReadOnlySpecial

Description

Specifies that the "Background fill style" can only be read.

Access in Runtime: Read and write

Syntax

Object.**BackFillStyleReadOnlySpecial**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the "Background fill style" can only be read.

See also

IOField (Page 5098)

BarStartValue

Description

Specifies the value of the zero point of the scale.

Access in Runtime: Read and write

Syntax

Object.**BarStartValue**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the value of the zero point for the scale.

See also

Bar (Page 5033)

BarWidth

Description

Defines or returns the width of the bar in pixels.

BeginTime(i)

Description

Specifies the start time of the time range to be shown in the trend view. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**BeginTime**(i)[=Time]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" oder "OnlineTableControl".

Time

Optional A value or a constant which determines the start time of the time range to be shown in the trend view.

Comments

The parameter i indicates the number of the trend.

If "BeginTime(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "BeginTime(i)".

See also

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

BorderColorBottom

Description

Defines or returns the border color for the bottom/right part of the object. LONG write-read access.

BorderColorTop

Description

Defines or returns the border color for the top/left part of the object. LONG write-read access.

CentrePoint

Description

Specifies the position of the center point.

Access in Runtime: Read and write

Syntax

Object.**CentrePoint**[=Point]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Point

Optional A value that specifies the position of the center point.

See also

EllipseSegment (Page 5067)

CircleSegment (Page 5051)

EllipticalArc (Page 5070)

CircularArc (Page 5053)

CentrePointLeft

Description

Specifies the horizontal distance in pixels of the center point from the left edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**CentrePointLeft**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the horizontal distance in pixels of the center point from the left edge of the screen.

See also

EllipseSegment (Page 5067)

CircleSegment (Page 5051)

EllipticalArc (Page 5070)

CircularArc (Page 5053)

CentrePointTop

Description

Specifies the vertical distance in pixels of the center point from the upper edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**CentrePointTop**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the vertical distance in pixels of the center point from the upper edge of the screen.

See also

EllipseSegment (Page 5067)

CircleSegment (Page 5051)

EllipticalArc (Page 5070)

CircularArc (Page 5053)

ColorBottom

Description

Defines or returns the color for the bottom/right stop of the slider object. LONG write-read access.

ColorChangeType

Description

TRUE, if the change of color should occur segment by segment in the case of a color change (e.g. on reaching a limit value). If set to FALSE, it defines the change of color for the entire bar. BOOLEAN write-read access.

ColorTop

Description

Defines or returns the color for the top/left stop of the slider object. LONG write-read access.

ColumnColor(i)

Description

Determines the color of the i column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**ColumnColor(i)**[=Color]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Color

Optional A value or a constant that specifies the color of the i column pair.

See also

OnlineTableControl (Page 5114)

ColumnDisplayName(i)

Description

Specifies the name for the selected column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**ColumnDisplayName(i)**[=String]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

String

Optional A value or a constant that specifies the name for the selected column pair.

See also

OnlineTableControl (Page 5114)

ColumnUpdateEnabled(i)

Description

Specifies whether the selected column pair will be shown statically or dynamically.

Access in Runtime: Read and write

Syntax

Object.**ColumnUpdateEnabled(i)**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE if the column pair is to be shown statically.

Comments

The "CurrentColumnIndex" property references the column pair that is currently active.

See also

OnlineTableControl (Page 5114)

Command

Description

Specifies whether there is a forced update of the values displayed in the control.

Access in Runtime: Read and write

Syntax

Object.**Command**[=String]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "OnlineTableControl".

String

Optional A value or a constant which specifies whether there is a forced update of the values displayed in the control.

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

Comment

Description

Reads or sets the Alarm object comment.

CommonTimeAxisColor

Description

Specifies the color of the mutual X axis.

Access in Runtime: Read and write

Syntax

Object.**CommonTimeAxisColor**[=Color]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

Color

Optional A value or a constant that specifies the color of the common x axis.

See also

OnlineTrendControl (Page 5122)

ConfigureTimeAxis(i)

Description

Specifies whether a common time axis is used for all the trends in the trend view.

Access in Runtime: Read and write

Syntax

Object.**ConfigureTimeAxis(i)**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if a common axis is used for all the trends in the trend view.

See also

OnlineTrendControl (Page 5122)

CurrentCurveIndex

Description

Specifies the index for the active trends.

Access in Runtime: Read and write

Syntax

Object.**CurrentCurveIndex**[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTrendControl".

Int

Optional A value or a constant that specifies the index of the trends that are currently active.

Comments

The "CurrentCurveIndex" property is evaluated by other properties so that their settings can be assigned to a specific trend. Valid values range from 0 to -1. The "CurvesCount" property contains the number of trends to be shown.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

CurveColor(i)

Description

Specifies the color of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**CurveColor(i)**[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Color

Optional A value or a constant that specifies the color of the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

CurveLineWidth(i)

Description

Specifies the line weight of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**CurveLineWidth(i)**[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

Int

Optional A value or a constant that specifies the line weight of the selected trend. Value range from 0 to 10.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

CurvesCount

Description

Returns the number of configured trends or column pairs (visible and invisible) of the window.

Access in Runtime: Read and write

Syntax

Object.**CurvesCount**[=Int]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Int

Optional A value or a constant that returns the number of configured trends or column pairs (visible and invisible) of the window.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

CurveUpdateEnabled(i)

Description

Specifies whether the selected trend will be shown statically or dynamically.

Access in Runtime: Read and write

Syntax

Object.**CurveUpdateEnabled(i)**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE if the trend is to be shown statically.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

DataIndex(i)

Description

Returns the current index for the data of the current trend.

Access in Runtime: Read and write

Syntax

Object.**DataIndex(i)**[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the current index of the data for the current trend.

See also

FunctionTrendControl (Page 5077)

DataLogTag

Description

Specifies which tag is linked with the selected trend.

Access in Runtime: Read and write

Syntax

Object.**DataLogTag**[=HmiLoggingTag]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "OnlineTableControl".

HmiLoggingTag

Optional A value or a constant that specifies which tags are linked to the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

DataX(i)

Description

Inserts one single data record and must be set prior to the call of "InsertData(i)".

Access in Runtime: Read and write

Syntax

Object.**DataX(i)**[=object]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

object

Optional A value or a constant that inserts one single data record.

See also

FunctionTrendControl (Page 5077)

DataXY(i)

Description

Inserts several data records as Array with value pairs and must be set before calling "InsertData(i)".

The data in the Array are applied if "DataX(i)" is a VT_EMPTY type. Otherwise, the single value pair resulting from "DataX(i)" and "DataY(i)" will be used in the attribute "InsertData(i)".

Access in Runtime: Read and write

Syntax

Object.**DataXY**(i)[=object]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

object

Optional A value or a constant which inserts several data records as Array with value pairs.

See also

FunctionTrendControl (Page 5077)

DataY(i)

Description

Inserts one single data record and must be set prior to the call of "InsertData(i)".

Access in Runtime: Read and write

Syntax

Object.**DataY**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Double

Optional A value or a constant that inserts one single data record.

See also

FunctionTrendControl (Page 5077)

DeleteData(i)

Description

Specifies which data from the data buffer of the active trend will be deleted.

TRUE:

Access in Runtime: Read and write

Syntax

Object.**DeleteData**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if all the data of the trend is to be deleted.

FALSE, if the value pair at position "DataIndex(i)" is to be deleted.

See also

FunctionTrendControl (Page 5077)

Direction

Description

Defines or returns the bar direction or the position of the slider object.

Access in Runtime: Read and write

Syntax

Object.**Direction** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "Bar" or "Slider".

BOOLEAN

0 = top

1 = bottom

2 = left

3 = right

DisplayName(i)

Description

Specifies the name for the selected trend.

Access in Runtime: Read and write

Syntax

Object.**DisplayName**(i)[=String]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

String

Optional A value or a constant that specifies the name for the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 5077)

DrawEnhancedHTMLBrowser

Description

Specifies the style of the HTML-Browsers.

Access in Runtime: Read and write

Syntax

Object.**DrawEnhancedHTMLBrowser**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "HTMLBrowser".

BOOLEAN

Optional TRUE, if an extended HTML-Browser will be displayed.

See also

HTMLBrowser (Page 5096)

Editable(i)

Description

Specifies whether a column pair can be edited. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**Editable**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if the column pair can be edited. The column pair is referenced by the parameter i.

See also

OnlineTableControl (Page 5114)

EditEnabled

Description

Specifies whether edit mode is enabled for a cell, if the property "Editable(i)" has the value TRUE.

Access in Runtime: Read and write

Syntax

Object.**EditEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if the edit mode is enabled for a cell if the property "Editable(i)" has the value TRUE.

See also

OnlineTableControl (Page 5114)

EndPoint

Description

Specifies the position of the end point.

Access in Runtime:

Syntax

Object.**EndPoint**[=Point]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Point

Optional A value that specifies the position of the end point.

See also

EllipseSegment (Page 5067)

CircleSegment (Page 5051)

EllipticalArc (Page 5070)

CircularArc (Page 5053)

EndPointLeft

Description

Specifies the horizontal distance in pixels of the end point from the left edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**EndPointLeft**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the horizontal distance in pixels of the end point from the left edge of the screen.

See also

EllipseSegment (Page 5067)

CircleSegment (Page 5051)

EllipticalArc (Page 5070)

CircularArc (Page 5053)

EndPointTop

Description

Specifies the vertical distance in pixels of the end point from the upper edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**EndPointTop**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the vertical distance in pixels of the end point from the upper edge of the screen.

See also

EllipseSegment (Page 5067)

CircleSegment (Page 5051)

EllipticalArc (Page 5070)

CircularArc (Page 5053)

EndTime(i)

Description

Specifies the end time of the time range to be shown in the trend view. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**EndTime**(i)[=Time]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTabelControl".

Time

Optional A value or a constant that specifies the end time of the time range that is to be shown in the trend window.

Comments

The parameter i indicates the number of the trend.

If "EndTime(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "EndTime(i)".

See also

FunctionTrendControl (Page 5077)

OnlineTableControl (Page 5114)

ExportXML

ExportXML

Only used internally.

The attribute can be assigned dynamic properties by means of the name **ExportXML**.

ExtendedOperation

Description

TRUE, when the slider regulator is set at the respective end value (minimum/maximum value). This is done by clicking the mouse in an area outside the current regulator setting. BOOLEAN write-read access.

ExtraSpaceForLabelDisplay

Description

Specifies the extra space required for the label.

Access in Runtime: Read and write

Syntax

Object.**ExtraSpaceForLabelDisplay**[=Int]

Object

Required A "ScreenItem" object with the format "Bar".

Int

Optional A value that specifies the extra space required for the label.

See also

Bar (Page 5033)

FlashFlashPicture

Description

TRUE, when flashing of the flash picture is activated. BOOLEAN write-read access.

FlashForeColor

Description

TRUE, when flashing of the text is activated. BOOLEAN write-read access.

FlashPicReferenced

Description

TRUE, when the assigned flash picture is to be saved. Otherwise, only the associated object reference is saved. Read only access.

FlashPicture

Description

Returns the flash picture. Read-only access.
The graphic (*.BMP or *.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.
In this context, the "FlashPicReferenced" property defines whether the flash picture should be saved or referenced together with the object.

FlashRateBorderColor

Description

Defines or returns the flash frequency for the lines of the object. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashRateFlashPic

Description

Defines or returns the flash frequency for the flash picture. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashRateForeColor

Description

Defines or returns the flash frequency for the object label. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FormatPatternReadOnlySpecial

Description

Specifies that the "format pattern" field can only be read.

Access in Runtime: Read and write

Syntax

Object.**FormatPatternReadOnlySpecial**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the "format pattern" field can only be read.

See also

IOField (Page 5098)

FreezeProviderConnections

Description

Specifies whether the properties for the data connection ("TagProviderType(i)", "Source.."...) can be changed without the change becoming effective immediately. If you change from, for example, "XDataLogTag(i)" illegal combinations with "YDataLogTag(i)" could arise.

This means attributes must have the value TRUE before changing the data connection "FreezeProviderConnections". After changing all the properties for the data connection, "FreezeProviderConnection" will be set to FALSE and the changes will become effective.

Access in Runtime: Read and write

Syntax

Object.**FreezeProviderConnections**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the properties for the data connection ("TagProviderType(i)", "Source.."...) can be changed without the change becoming effective immediately.

See also

FunctionTrendControl (Page 5077)

GetSelectionText

Description

Returns the selected text of the "MultiLineEdit" object.

HideTagNames

Description

Specifies whether the tag name is shown in the f/t() trend view.

Access in Runtime: Read and write

Syntax

Object.**HideTagNames**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if the tag names are displayed.

See also

OnlineTrendControl (Page 5122)

LanguageSwitch

Description

Returns the value which defines where the language dependent assigned texts are stored. Read only access.

TRUE, if the texts are managed in the project texts editor. Translations into other languages are made in the project texts editor.

FALSE, when the texts are managed directly in the object. Translations into other languages can be made by means of the export/import function.

LeaveMarginForBorder

Description

Specifies whether an additional margin will be left for borders.

Access in Runtime: Read and write

Syntax

Object**.LeaveMarginForBorder**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if an additional margin is enabled for borders.

See also

Bar (Page 5033)

LeaveMarginForMarkers

Description

Specifies whether an additional margin will be left for markers.

Access in Runtime: Read and write

Syntax

Object.**LeaveMarginForMarkers**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if an additional margin is enabled for markers.

See also

Bar (Page 5033)

Min

Description

Defines or returns the absolute value in the case of the smallest value display. This value is displayed if the scale display is active.

NumberOfValues(i)

Description

Specifies the number of values that are shown in the trend window. The property "TagProviderType(i)"" must have the value -1. Whether the information is evaluated depends on the property "UseMeasurePoints(i)".".

Access in Runtime: Read and write

Syntax

Object.**NumberOfValues**(i)[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of values that are shown in the trend window.

Comments

Number of value pairs for trend i (from tag provider)

See also

FunctionTrendControl (Page 5077)

Parent

Description

Returns the screen in which the specified object is embedded.

Access in Runtime: Read

Syntax

Object.Parent

Object

Required A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

Application example

The following example writes the name of the root screen in "BaseScreenName" tag:

```
'VBS_Example_Parent
Dim objScrItem, BaseScreenName
Set objScrItem = HMIRuntime.Screens(1).ScreenItems(1)
BaseScreenName = "Name of BaseScreen: " & objScrItem.Parent.ObjectName
```

PicUpReferenced

Description

TRUE, when the picture assigned for the "Off" status should be saved in the object. Otherwise, only the associated object reference is saved. Read only access.

RemoveAllAssignment

Description

Deletes all entries.

RemoveAssignment

Description

Removes an entry.

RowNumber

Description

Specifies the row number of the Row object of a Table Control.

See also

AlarmControl (Page 5018)

RulerPrecision(i)

Description

Specifies the number of decimal places with which a measurement value of the specified trend will be displayed if it is measured via the function "Display value here".

Access in Runtime: Read and write

Syntax

Object.**RulerPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the specified trend will be displayed if it is measured via the function "Display value here".

See also

OnlineTrendControl (Page 5122)

RulerXPrecision(i)

Description

Specifies the number of decimal places with which a measurement value of the X coordinate will be displayed. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".

Access in Runtime: Read and write

Syntax

Object.**RulerXPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the X coordinate will be displayed.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the X coordinate of the measurement value.

See also

FunctionTrendControl (Page 5077)

RulerYPrecision(i)

Description

Specifies the number of decimal places with which a measurement value of the Y coordinate will be displayed. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".".

Access in Runtime: Read and write

Syntax

Object.**RulerYPrecision**(i)[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the Y coordinate will be displayed.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the Y coordinate of the measurement value.

See also

FunctionTrendControl (Page 5077)

SetAllAssignment

Description

Sets all entries.

SetpointTrendArchiveStartId(i)

Description

Specifies the starting position from which the values of the setpoint trend will be read from the recipe. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

Syntax

Object.**SetpointTrendArchiveStartId**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the starting position from which the values of the setpoint trend will be read from the recipe.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 5077)

SetpointTrendColor(i)

Description

Specifies the color of a setpoint trend. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

Syntax

Object.**SetpointTrendColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Color

Optional A value or a constant that specifies the color of a setpoint trend.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 5077)

SetpointTrendNumberOfValues(i)

Description

Specifies the number of value pairs of a setpoint trend. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

Syntax

Object.**SetpointTrendNumberOfValues**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of value pairs of a setpoint trend.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 5077)

SetProps

Description

Sets the value of the property.

SetSelection

Description

Sets a list of the lines which are selected.

ShareTimeAxis

Description

Specifies whether the trends of a trend window are displayed with a shared X axis.

Access in Runtime: Read and write

Syntax

Object.**ShareTimeAxis**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional. TRUE, if the trends of the trend window are displayed with a shared X axis.

See also

OnlineTrendControl (Page 5122)

ShareTimeColumn

Description

Specifies whether a shared time column will be used in the table window.

Access in Runtime: Read and write

Syntax

Object.**ShareTimeColumn**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if a shared time column will be used in the table window.

See also

OnlineTableControl (Page 5114)

ShareValueAxis

Description

Specifies whether the trends of a trend window are displayed with a shared Y axis.

Access in Runtime: Read and write

Syntax

Object.**ShareValueAxis**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if the trends of the trend window are displayed with a shared Y axis.

See also

OnlineTrendControl (Page 5122)

ShareXAxis

Description

Specifies whether the trends of a trend window are displayed with a shared X axis.

Access in Runtime: Read and write

Syntax

Object.**ShareXAxis**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the trends of the trend window are displayed with a shared X axis.

See also

FunctionTrendControl (Page 5077)

ShareYAxis

Description

Specifies whether the trends of a trend window are displayed with a shared Y axis.

Access in Runtime: Read and write

Syntax

Object.**ShareYAxis**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the trends of the trend window are displayed with a shared Y axis.

See also

FunctionTrendControl (Page 5077)

ShowBorder

Description

Specifies whether the window will be shown with a border.

Access in Runtime: Read and write

Syntax

Object.**ShowBorder[**=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE if the window is to be shown with a border.

ShowColumn(i)

Description

Specifies whether a column pair that is referenced via the "CurrentColumnIndex" property is shown.

Access in Runtime: Read and write

Syntax

Object.**ShowColumn**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if a column pair that is referenced via the "CurrentColumnIndex" property is shown.

See also

OnlineTableControl (Page 5114)

ShowCurve(i)

Description

Specifies whether a trend that is referenced via the "CurrentCurveIndex" property is shown.

Access in Runtime: Read and write

Syntax

Object.**ShowCurve**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a trend that is referenced via the "CurrentCurveIndex" property is shown.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ShowInputControls

Description

Establishes whether additional fields exist for entering the address and password.

Syntax

Object.**ShowInputControls**

Object

Required A "ScreenItem" object with the format "SmartClientView".

ShowMainFrame

Description

Specifies whether the entire bar object is provided with a border.

Access in Runtime: Read and write

Syntax

Object.**ShowMainFrame**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Option TRUE, if the entire bar object is shown with a border.

See also

Bar (Page 5033)

ShowOverflowIndicator

Description

Specifies whether an overflow indicator is shown when the process value exceeds or falls short of the limit value.

Access in Runtime: Read and write

Syntax

Object.**ShowOverflowIndicator**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Bar".".

BOOLEAN

TRUE, if an overflow indicator is shown when the process value exceeds or falls short of the limit value.

See also

Bar (Page 5033)

ShowSetpointTrend(i)

Description

Specifies whether a setpoint trend that belongs to a trend that is referenced via "CurrentCurveIndex" should be shown.

Access in Runtime: Read and write

Syntax

Object.**ShowSetpointTrend**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a setpoint trend that belongs to a trend that is referenced via CurrentCurveIndex" should be shown.

See also

FunctionTrendControl (Page 5077)

SmallChange

Description

Defines how many steps the controller can be moved with one mouse click or returns the value.

StartPoint

Description

Specifies the beginning of the object or returns it.

StatusbarShowArchiveName

Description

Specifies whether the archive name will be displayed in the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowArchiveName**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the archive name will be displayed in the status bar.

StatusbarShowColumn

Description

Specifies whether the current number of selected data record columns will be displayed.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowColumn**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, specifies whether the current number of selected data record columns will be displayed.

StatusbarShowRecord

Description

Specifies whether the field coordinates of the selected data record will be displayed in the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowRecord**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the field coordinates of the selected data record will be displayed in the status bar.

StatusbarShowRow

Description

Specifies whether the current number of selected data record rows will be displayed.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowRow**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the current number of selected data record rows will be displayed.

StatusbarShowText

Description

Specifies whether the current status of the database will be displayed in the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowText**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, specifies whether the current status of the database will be displayed in the status bar.

SwapDimensionsWithOrientation

Description

Specifies whether the values for the height and width of the bar should be automatically replaced if the bar alignment is changed.

Access in Runtime: Read and write

Syntax

Object.**SwapDimensionsWithOrientation**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the values for the height and width of the bar should be automatically replaced if the bar alignment is changed.

See also

Bar (Page 5033)

TimeAxisShowLargeIncrements(i)

Description

Specifies whether the time axis is scaled with long marking lengths.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisShowLargeIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

BOOLEAN

Optional TRUE, if the time axis is scaled with long marking lengths.

Comments

The distance of two long marking lines can be altered with the ""TimeAxisLargeIncrementSize(i) property.

See also

OnlineTrendControl (Page 5122)

TimeAxisShowSmallIncrements(i)

Description

Specifies whether the time axis is scaled with short marking lengths.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisShowSmallIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

BOOLEAN

Optional TRUE, if the time axis is scaled with short marking lengths.

Comments

The distance of two short marking lines can be altered with the "TimeAxisSmallIncrementSize(i)" property.

See also

OnlineTrendControl (Page 5122)

TimeJumpColor(i)

Description

Specifies the color that is identified in the time jump available in the log. Whether the information is evaluated depends on the property "TimeJumpEnabled(i)".".

Access in Runtime: Read and write

Syntax

Object.**TimeJumpColor**(i)[=Color]

Object

Required A "ScreenItem"" object with the formats ""OnlineTrend" or ""TableView".".

Color

Optional A value or a constant that specifies the color that identifies the time jump available in the log.

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

TimeJumpEnabled(i)

Description

Specifies if the time jumps available in the log are identified in the color set up in "TimeJumpColor(i)".

Access in Runtime: Read and write

Syntax

Object.**TimeJumpEnabled**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or ""TableView".

BOOLEAN

Optional TRUE, if the time jumps available in the log are identified in the color specified in "TimeJumpColor(i)".

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

TimeOverlapColor(i)

Description

Specifies the color that is identified in the time overlap available in the log. Whether the information is evaluated depends on the attribute "TimeOverlapEnabled(i)".".

Access in Runtime: Read and write

Syntax

Object.**TimeOverlapColor**(i)[=Color]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or ""TableView".

Color

Optional A value or a constant that specifies the color that identifies the time overlap available in the log.

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

TimeOverlapEnabled(i)

Description

Specifies if the time overlaps available in the log are identified in the color set up in "TimeOverlapColor(i)".

Access in Runtime: Read and write

Syntax

Object.**TimeOverlapEnabled**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend"" or "TableView".

BOOLEAN

Optional TRUE, if the time jumps overlaps available in the log are identified in the color specified in ""TimeOverlapColor(i)"".

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

Type

Description

Returns the type of the specified object as STRING. Name diagram: Hmi<ObjectName>, e.g. HmiCircle for the "circle" screen object.

Access in Runtime: Read

Syntax

Object.Type

Object

Required A "ScreenItem" object.

UnselBGColor property

Description

Defines or returns the background color of entries in the text list object which are not selected. LONG write-read access.

UnselTextColor property

Description

Defines or returns the color of the text for entries in the text list object which are not selected. LONG write-read access.

UpdateCycle property

Description

Returns the type and frequency of updating the picture window in Runtime. Read only access.

UseBarBorderConstraints

Description

Specifies whether the bar border is restricted to specific values.

Access in Runtime: Read and write

Syntax

Object.**UseBarBorderConstraints**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional. TRUE, if the bar border is restricted to specific values.

See also

Bar (Page 5033)

UseEffectiveProcessValue

Description

Specifies whether an actual percentage made up of maximum value, minimum value, average of the last 15 values and hysteresis will be used.

Access in Runtime: Read and write

Syntax

Object.**UseEffectiveProcessValue**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if an actual percentage made up of maximum value, minimum value, average of the last 15 values and hysteresis will be used.

See also

Bar (Page 5033)

UseGDI

Description

Specifies whether the ellipse is shown via GDI or GDI+.

Access in Runtime: Read and write

Syntax

Object.**UseGDI**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Ellipse".

BOOLEAN

Optional TRUE, if the ellipse is shown via GDI.

See also

Ellipse (Page 5065)

UseMeasurePoints(i)

Description

Specifies whether the time range for the selected trend will be determined by measuring points or the end time. Whether the information is evaluated depends on the properties "TimeAxisEndTime", "TimeAxisBeginTime(i)".

Define time range for curve i through measure points (TRUE) or end time (FALSE) (for time based tag providers)

Access in Runtime: Read and write

Syntax

Object.**UseMeasurePoints**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl"or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the time range for the selected trend will be determined by measuring points.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

UseMultipleLimits

Description

Specifies whether one or more pairs of limits are shown as a selection or a line.

Access in Runtime: Read and write

Syntax

Object.**UseMultipleLimits**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Bar".

BOOLEAN

Optional TRUE, if one or more pairs of limits are displayed as a selection or a line.

See also

Bar (Page 5033)

UseScaleConstraints

Description

Specifies whether the distance between two large marking lengths of the scale are calculated from the minimum and maximum values.

Access in Runtime: Read and write

Syntax

Object.**UseScaleConstraints**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the distance between two large marking lengths of the scale are calculated from the minimum and maximum values.

See also

Bar (Page 5033)

UseScaledBarBorder

Description

Specifies whether the rectangle that surrounds the object is shown dependent of the scale or as a default.

Access in Runtime: Read and write

Syntax

Object.**UseScaledBarBorder**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".".

BOOLEAN

Optional TRUE, if the rectangle that surrounds the object is shown dependent on the scale.

See also

Bar (Page 5033)

UseSeparateDiagrams

Description

Specifies whether the trends are shown staggered.

Access in Runtime: Read and write

Syntax

Object.**UseSeparateDiagrams**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "FunctionTrendView".

BOOLEAN

Optional TRUE, if the trends are shown staggered.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

UseSimplePresicionOffset

Description

Specifies how the field length will be calculated for the labeling of the scale.

Access in Runtime: Read and write

Syntax

Object.**UseSimplePresicionOffset**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the field length will be calculated for the labeling of the scale.

See also

Bar (Page 5033)

UserArchiveNumberOfValues(i)

Description

Specifies the number of values that are loaded from the recipe. The "TagProviderType(i)"" property must have the value -2.

Access in Runtime: Read and write

Syntax

Object.**UserArchiveNumberOfValues**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Int

Optional A value or a constant that specifies the number of values that are loaded from the recipe.

Comments

The parameter i indicates the number of the trend.

If "UserArchiveNumberOfValues(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with ""FreezeProviderConnections"" before changing ""UserArchiveNumberOfValues(i)"".

See also

FunctionTrendControl (Page 5077)

UserArchiveStartId(i)

Description

Specifies the data record starting from which the values for the selected trend are loaded from the recipe. The "TagProviderType(i)"" property must have the value -2.

Access in Runtime: Read and write

Syntax

Object.**UserArchiveStartId**(i)[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the data record starting from which the values for the selected trend are loaded from the recipe.

Comments

The parameter i indicates the number of the trend.

If "UserArchiveStartId(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with ""FreezeProviderConnections" before changing ""UserArchiveStartId(i)".

See also

FunctionTrendControl (Page 5077)

UserData

Description

Specifies the value that is passed to the VB script when a user-defined menu entry or toolbar button is executed.

Use the "Data" field in the "Menus and toolbars" editor to pass a parameter to the procedure.

Access in Runtime: Read and write

Syntax

Object.**UserData**[=String]

Object

Required A "Item"-type object.

String

Optional. A value or constant that is passed to the VB script when a user-defined menu entry or toolbar button is executed.

ValueAxisGridLineInterval(i)

Description

Specifies the distance between two grid lines. Whether the information is evaluated depends on the properties "ValueAxisShowGridLines(i)" and "TimeAxisShowGridLines(i)".".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisGridLineInterval**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the distance between two grid lines.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ValueAxisLargeIncrementSize(i)

Description

Specifies the distance between two long marking lengths of the scale. Whether the information is evaluated depends on the properties "ValueAxisShowLargeIncrements(i)" and ""TimeAxisShowLargeIncrements(i)".".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisLargeIncrementSize**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the distance between two marking lengths of the scale.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ValueAxisShowLargeIncrements(i)

Description

Specifies whether the value axis is scaled with long marking lengths.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisShowLargeIncrements**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the value axis is scaled with long marking lengths.

Comments

The distance of two long marking lines can be altered with the "ValueAxisLargeIncrementSize(i)"" property.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ValueAxisShowSmallIncrements(i)

Description

Specifies whether the value axis is scaled with short marking lengths.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisShowSmallIncrements**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the value axis is scaled with short marking lengths.

Comments

The distance between two short marking lines can be altered with the "ValueAxisSmallIncrementSize(i)" property.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ValueAxisSmallIncrementSize(i)

Description

Specifies the distance between two short marking lengths of the scale. Whether the information is evaluated depends on the properties ""ValueAxisShowSmallIncrements(i)")" and ""TimeAxisShowSmallIncrements(i)".".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisSmallIncrementSize**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the distance between two short marking lengths of the scale.

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

XAxisDecimalPrecision(i)

Description

Specifies the number of decimal places with which the scaling value of the X axis will be displayed.

Access in Runtime: Read and write

Syntax

Object.**XAxisDecimalPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Int

Optional A value or a constant that specifies the number of decimal places with which the scaling value for the X axis will be displayed.

See also

FunctionTrendControl (Page 5077)

XAxisGridLineInterval(i)

Description

Specifies the distance between two grid lines of the X axis. Whether the information is evaluated depends on the value of the property ""XAxisShowGridLines(i)".".

Access in Runtime: Read and write

Syntax

Object.**XAxisGridLineInterval**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".".

Double

Optional A value or a constant that specifies the distance between two grid lines of the X axis.

See also

FunctionTrendControl (Page 5077)

XAxisLargeIncrementSize(i)

Description

Specifies the distance of two long marking lengths of the X axis. Whether the information is evaluated depends on the property "XAxisShowLargeIncrements(i)".".

Access in Runtime: Read and write

Syntax

Object.**XAxisLargeIncrementSize**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Double

Optional A value or a constant that specifies the distance of two long marking lengths of the scaling of the X axis.

See also

FunctionTrendControl (Page 5077)

XAxisMode(i)

Description

Specifies whether a mutual time axis will be used in the trend window for all trends.

Specifies time units used by tag logging controls.

Access in Runtime: Read and write

Syntax

Object.**XAxisMode**(i)[=TrendViewTimeAxisMode]

Object

Required A "ScreenItem" object with the format "FunctionTrendContol".

TrendViewTimeAxisMode

(1): The time axis will be scaled.

(2): No time range has been specified. Only a random sample will be displayed.

(3): The time range will be established via tags.

(4): The time range will be defined by constant values.

Comments

Specifies whether a mutual X axis will be used in the trend window for all trends.

See also

FunctionTrendControl (Page 5077)

XAxisShowLargeIncrements(i)

Description

Specifies whether the X axis is scaled with long marking lengths. The distance of two long marking lines can be altered with the "XAxisLargeIncrementSize(i)"" property.

Access in Runtime: Read and write

Syntax

Object.**XAxisShowLargeIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""FunctionTrendView".

BOOLEAN

Optional TRUE, if the X axis is scaled with long marking lengths.

See also

FunctionTrendControl (Page 5077)

XAxisShowSmallIncrements(i)

Description

Specifies whether the X axis is scaled with short marking lengths. The distance of two short marking lines can be altered with the "XAxisSmallIncrementSize(i)" property.

Access in Runtime: Read and write

Syntax

Object.**XAxisShowSmallIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

BOOLEAN

Optional TRUE, if the X axis is scaled with short marking lengths.

See also

FunctionTrendControl (Page 5077)

XAxisSmallIncrementSize(i)

Description

Specifies the distance of two short marking lengths of the X axis. Whether the information is evaluated depends on the property "XAxisShowSmallIncrements(i).".

Access in Runtime: Read and write

Syntax

Object.**XAxisSmallIncrementSize**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Double

Optional A value or a constant that specifies the distance of two short marking lengths of the X axis scaling.

See also

FunctionTrendControl (Page 5077)

XDataLogTag(i)

Description

Specifies the tag that will be shown along the X axis. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**XDataLogTag**(i)[=HmiLoggingTag]

Object

Required A ""ScreenItem" object with the format "FunctionTrendView".

HmiLoggingTag

Optional A value or a constant that specifies which tag will be shown along the X axis.

Comments

If "XOnlineTag(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent mmediate acceptance of the change with "FreezeProviderConnections before changing "XOnlineTag(i).

See also

FunctionTrendControl (Page 5077)

XOnlineTag(i)

Description

Specifies the tag that will be shown along the X axis. The property "TagProviderType(i)"" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**XOnlineTag**(i)[=HmiTag]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

HmiTag

Optional A value or a constant that specifies which tag will be shown along the X axis.

Comments

The parameter i indicates the number of the trend.

If "XOnlineTag(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "XOnlineTag(i)".

See also

FunctionTrendControl (Page 5077)

YDataLogTag(i)

Description

Specifies the tag that will be shown along the Y axis. The property "TagProviderType(i)"" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**YDataLogTag**(i)[=HmiLoggingTag]

Object

Required A "ScreenItem" object with the format "FunctionTrendView"".

HmiLoggingTag

Optional A value or a constant that specifies which tag will be shown along the Y axis.

Comments

If "YOnlineTag(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "YOnlineTag(i)"".

See also

FunctionTrendControl (Page 5077)

YOnlineTag(i)

Description

Specifies the tag that will be shown along the Y axis. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**YOnlineTag**(i)[=HmiTag]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

HmiTag

Optional A value or a constant that specifies which tag will be shown along the Y axis.

Comments

The parameter i indicates the number of the trend.

If "YOnlineTag(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "YOnlineTag(i)".

See also

FunctionTrendControl (Page 5077)

Methods

Methods A-G

Activate

Description

Activates the permanent window or the root screen.

To activate a not selected screen, use the "BaseScreenName" property.

It only makes sense to use the activate method with the following operable screen objects. An error message is output at screen objects which cannot be operated, for example rectangles.

- I/O field
- Switch
- Symbol library
- Trend view
- f(x) trend view
- HTML browser
- Slider
- Graphic I/O field
- Symbolic I/O field
- Button
- Alarm view
- User view
- Recipe view
- Sm@rtClient View
- Status/Force

Syntax

Expression.Activate

Expression

Necessary. An output which returns an object of the "Screen" or "ScreenItem" type.

Parameters

--

ActivateDynamic

Description

Dynamically activates a trigger and the specified cycle for a property at runtime. This requires a VB script at the property as well as a trigger set to "On demand". Every time the trigger is activated a different activation cycle can be used.

Syntax

```
Expression.ActivateDynamic (ByVAl bstrPropertyName As String, ByVal
bstrCycleName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameter	Description
bstrPropertyName	Name of property to which trigger relates.
bstrCycleName	Name of activation cycle, e.g. "CycleTime1s".

Add

Description of TagSet Object

Adds a tag to the list. A tag may be added to the tag object by using name or reference.

syntax

```
Expression.Add [Tag]
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be added to the list.

Example:

In the following example, a TagSet object is generated and a tag is added.

```
'VBS170
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
```

Tag objects may also be added as follows.

```
'VBS171
Dim Tag
Set Tag = HMIRuntime.Tags("Motor2")
Dim group2
Set group2 = HMIRuntime.Tags.CreateTagSet
group2.Add Tag
```

Description of DataSet Object

Adds a value or object reference to the list.

Note

The Data Set Object does not support classes.
Objects of type Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet cannot be included in the DataSet list.
For object references it must be ascertained that objects are multiread-enabled.

syntax

```
Expression.Add [vtName], [vtUserData]
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
vtName	Name by which value or tag are to be added to list.
vtUserData	Value to be added to list.

Example:

In this example, a value is included in the DataSet list.

```
'VBS172
HMIRuntime.DataSet.Add "Motor1",23
```

See also

DataSet (list) (Page 4990)

OnlineTrendControl (Page 5122)

AttachDB method

Description

Executes the "Connect backup" key function of the control.

Syntax

```
Ausdruck.AttachDB()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

FunctionTrendControl (Page 5077)

AlarmControl (Page 5018)

CalculateStatistic

Description

Executes the "calculate statistics" key function of the f(t) trend view.

Syntax

```
Ausdruck.CalculateStatistic()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

CopyRows

Description

Executes the "Copy lines" key function of the control.

Syntax

```
Ausdruck.CopyRows()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

--

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

UserArchiveControl (Page 5207)

AlarmControl (Page 5018)

Create

Description

Creates a new Alarm object.

Syntax

```
Expression.Create (VARIANT vtApplication)
```

Expression

Required An expression which returns an object of type "Alarm".

Parameters

```
VARIANT
```

Parameters	Description
vtApplication	Name of alarm object (optional)

See also

OnlineTrendControl (Page 5122)

CreateTagSet

Description

Creates a new TagSet object. This object may be used for optimized multi-tag access.

syntax

```
Expression.CreateTagSet()
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Example:

The following example shows how to create a TagSet object.

```
'VBS168
'Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
```

CutRows

Description

Executes the "Cut rows" key function of the recipe view.

Syntax

```
Ausdruck.CutRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

UserArchiveControl (Page 5207)

DeactivateDynamic

Description

Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/ during runtime.

Syntax

```
Ausdruck.DeactivateDynamic(ByVal bstrPropertyName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

String

Parameters	Description
bstrPropertyName	Name of property to which trigger relates.

DeleteRows

Description

Executes the "Delete rows" key function of the recipe view.

Syntax

```
Ausdruck.DeleteRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

UserArchiveControl (Page 5207)

DetachDB

Description

Executes the "Disconnect backup" key function of the control.

Syntax

```
Ausdruck.DetachDB()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

FunctionTrendControl (Page 5077)

AlarmControl (Page 5018)

Edit

Description

Executes the "Edit" key function of the table view.

Syntax

```
Ausdruck.Edit()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

AlarmControl (Page 5018)

Export

Description

Executes the "Export archive" or "Export data" key function of the control.

Syntax

```
Ausdruck.Export()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

FunctionTrendControl (Page 5077)

GetColumn

Description

Returns the column object of the recipe view designated by name or index as "ICCAxUAColumn" type.

Syntax

```
Ausdruck.GetColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the column of the recipe view

Example

```
'VBS312
Dim ctrl
Dim objColumn
Set ctrl = ScreenItems("RecipeControl")
Set objColumn = ctrl.GetColumn("Field1")
objColumn.Length = 30
Set objColumn = ctrl.GetColumn(3)
objColumn.Align = 2
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "Column" listing, for example, you write "objColumn.Align" instead of "objColumn.ColumnAlign".

GetColumnCollection

Description

Returns the list of all column objects of the recipe view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS313
Dim ctrl
Dim coll
Dim field
Set ctrl = ScreenItems("RecipeControl")
Set coll = ctrl.GetColumnCollection
HMIRuntime.Trace "Number of fields:" & coll.Count & vbCrLf
For Each field In coll
 HMIRuntime.Trace field.Name & vbCrLf
 HMIRuntime.Trace field.Type & vbCrLf
 HMIRuntime.Trace field.Length & vbCrLf
 HMIRuntime.Trace field.Caption & vbCrLf
Next
```

GetHistlistColumnCollection

Description

Returns the list of all column objects of the message view hit list as "ICCAxCollection" type.

Syntax

```
Expression.GetHitlisteColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS315
Dim ctrl
Dim coll
Dim hitlistcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetHitlistColumnCollection
HMIRuntime.Trace "Number of hitlist columns:" & coll.Count & vbCrLf
For Each hitlistcol In coll
 HMIRuntime.Trace hitlistcol.Index & vbCrLf
 HMIRuntime.Trace hitlistcol.Name & vbCrLf
 HMIRuntime.Trace hitlistcol.Sort & vbCrLf
 HMIRuntime.Trace hitlistcol.SortIndex & vbCrLf
Next
```

GetHitlistColumn

Description

Returns the column object of the message view hit list designated by name or index as "ICCAxMessageColumn" type.

Syntax

```
Expression.GetHitlistColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of hitlist column

Example

```
'VBS314
Dim ctrl
Dim objHitlistColumn
Set ctrl = ScreenItems("AlarmControl")
Set objHitlistColumn = ctrl.GetHitlistColumn("Date")
objHitlistColumn.Sort = 2
Set objHitlistColumn = ctrl.GetHitlistColumn("AverageComeGo")
objHitlistColumn.Visible = FALSE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "HitlistColumn" listing, for example, you write "objHitlistColumn.Visible" instead of "objHitlistColumn.HitlistColumnVisible".

GetMessageBlock

Description

Returns the message block of the message view designated by name or index as "ICCAxMessageBlock" type.

Syntax

```
Expression.GetMessageBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of message block.

Example

```
'VBS316
Dim ctrl
Dim objMsgBlock
Set ctrl = ScreenItems("AlarmControl")
Set objMsgBlock = ctrl.GetMessageBlock("Date")
objMsgBlock.Align = 2
Set objMsgBlock = ctrl.GetMessageBlock("Number")
objMsgBlock.LeadingZeros = 4
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageBlock" listing, for example, you write "objMsgBlock.Align" instead of "objMsgBlock.MessageBlockAlign".

GetMessageBlockCollection

Description

Returns the list of all message block objects of the message view as "ICCAxCollection" type.

Syntax

```
Expression.GetMessageBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS317
Dim ctrl
Dim coll
Dim msgblock
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageBlockCollection
For Each msgblock In coll
 msgblock.Align = 1
 msgblock.Length = 12
 msgblock.Selected = TRUE
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageBlock" listing, for example, you write "msgblock.Align" instead of "msgblock.MessageBlockAlign".

GetMessageColumn

Description

Returns the column object of the message view designated by name or index as "ICCAxMessageColumn" type.

Syntax

```
Expression.GetMessageColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column in message list.

Example

```
'VBS318
Dim ctrl
Dim objMessColumn
Set ctrl = ScreenItems("AlarmControl")
Set objMessColumn = ctrl.GetMessageColumn("Date")
objMessColumn.Visible = FALSE
Set objMessColumn = ctrl.GetMessageColumn("Number")
objMessColumn.Sort = 1
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageColumn" listing, for example, you write "objMessColumn.Visible" instead of "objMessColumn.MessageColumnVisible".

GetOperatorMessage

Description

Returns the operator message object of the message view designated by name or index as "ICCAxOperatorMessage" type.

Syntax

```
Expression.GetOperatorMessage(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of operator message

Example

```
'VBS320
Dim ctrl
Dim objOpMess
Set ctrl = ScreenItems("AlarmControl")
Set objOpMess = ctrl.GetOperatorMessage(0)
objOpMess.Source1 = "Number"
objOpMess.SourceType1 = 1
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "OperatorMessage" listing, for example, you write "objOpMess.Source1" instead of "objOpMess.OperatorMessageSource1".

```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS319
Dim ctrl
Dim coll
Dim msgcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageColumnCollection
HMIRuntime.Trace "Number of message columns:" & coll.Count & vbCrLf
For Each msgcol In coll
 HMIRuntime.Trace msgcol.Index & vbCrLf
 HMIRuntime.Trace msgcol.Name & vbCrLf
 HMIRuntime.Trace msgcol.Sort & vbCrLf
 HMIRuntime.Trace msgcol.SortIndex & vbCrLf
Next
```

GetOperatorMessageCollection

Description

Returns the list of all operator message objects of the message view as "ICCAxCollection" type.

Syntax

```
Expression.GetOperatorMessageCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS321
Dim ctrl
Dim coll
Dim opmsg
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetOperatorMessageCollection
For Each opmsg In coll
 HMIRuntime.Trace opmsg.Index & vbCrLf
 HMIRuntime.Trace opmsg.Name & vbCrLf
 HMIRuntime.Trace opmsg.Number & vbCrLf
 HMIRuntime.Trace opmsg.Selected & vbCrLf
Next
```

GetRow

Description

Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.

Syntax

```
Expression.GetRow(ByVal IRow As Long)
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the desired line of the control.

Example

```
'VBS356
Dim coll
Dim ctrl
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("UAControl")
Set coll = ctrl.GetRowCollection
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.trace ctrl.GetRow(0).CellText(lCellIndex) & "  "
  HMIRuntime.trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.trace vbNewLine
Next
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

GetRowCollection

Description

Returns the list of all row objects of the table-based controls type "ICCAxDataRowCollection".

Syntax

```
Expression.GetRowCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Properties of the ICCAxDataRowCollection

The ICCAxDataRowCollection refers to runtime data. The data is read-only. It is not possible to add and edit the data.

The following properties are available for the ICCAxDataRowCollection:

- Count - Determines the number of rows in the collection.
- Item - Access to an individual row within the collection via the row number. Numbering runs from 1 to Count. A Row object is returned.

Example

```
'VBS357
Dim ctrl
Dim coll
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetRowCollection
HMIRuntime.Trace "Number of message rows:" & coll.Count & vbCrLf
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.Trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.Trace ctrl.GetMessageColumn(lCellIndex -1).Name & " "
  HMIRuntime.Trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.Trace vbNewLine
Next
```

GetRulerBlock

Description

Returns the block object of the evaluation table designated by name or index as "ICCAxRulerBlock" type.

Syntax

```
Expression.GetRulerBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the block in the evaluation table

Example

```
'VBS322
Dim ctrl
Dim objRulerBlock
Set ctrl = ScreenItems("RulerControl")
Set objRulerBlock = ctrl.GetRulerBlock(0)
objRulerBlock.Caption = "RulerBlock1"
Set objRulerBlock = ctrl.GetRulerBlock("Name")
objRulerBlock.Length = 10
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerBlock" listing, for example, you write "objRulerBlock.Caption" instead of "objRulerBlock.BlockCaption".

GetRulerBlockCollection

Description

Returns the list of all block objects of the evaluation table as "ICCAxCollection" type.

Syntax

```
Expression.GetRulerBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS323
Dim ctrl
Dim coll
Dim rulerblock
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerBlockCollection
For Each rulerblock In coll
 rulerblock.Align = 1
 rulerblock.Length = 12
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerBlock" listing, for example, you write "rulerblock.Align" instead of "rulerblock.RulerBlockAlign".

GetRulerColumn

Description

Returns the column object of the evaluation table designated by name or index as "ICCAxRulerColumn" type.

Syntax

```
Expression.GetRulerColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the column of the evaluation

Example

```
'VBS324
Dim ctrl
Dim objRulercol
Set ctrl = ScreenItems("RulerControl")
Set objRulercol = ctrl.GetRulerColumn("Name")
objRulercol.Sort = 0
Set objRulercol = ctrl.GetRulerColumn("ValueY")
objRulercol.Visible = FALSE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerColumn" listing, for example, you write "objRulercol.Visible" instead of "objRulercol.ColumnVisible".

GetRulerColumnCollection

Description

Returns the list of all column objects of the evaluation table as "ICCAxCollection" type.

Syntax

```
Expression.GetRulerColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS325
Dim ctrl
Dim coll
Dim rulercol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerColumnCollection
HMIRuntime.Trace "Number of ruler columns:" & coll.Count & vbCrLf
For Each rulercol In coll
 HMIRuntime.Trace rulercol.Index & vbCrLf
 HMIRuntime.Trace rulercol.Name & vbCrLf
 HMIRuntime.Trace rulercol.Sort & vbCrLf
 HMIRuntime.Trace rulercol.SortIndex & vbCrLf
Next
```

GetRulerData

Description

Returns the value of the called trend at the ruler position.

Syntax

```
Expression.GetRulerData(ByVal RulerIndex As Long, pvValue As
Variant, Optional pvTimeStamp As Variant, Optional pvFlags As
Varian) Long
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
RulerIndex	0 =Ruler
pvValue	Value of X axis
pvTimeStamp	Time or value of the Y axis
pvFlags	Qualitycode

Example

```
'VBS326
Dim ctrl
Dim objTrend
Dim objIOField1
Dim objIOField2
Dim rulvalue
Dim rultime
Set ctrl = ScreenItems( "Control1" )
Set objTrend = ctrl.GetTrend( "Trend 1" )
Set objIOField1 = ScreenItems( "I/O Field1" )
Set objIOField2 = ScreenItems( "I/O Field2" )
objTrend.GetRulerData 0, rulvalue, rultime
objIOField1.OutputValue = rulvalue
objIOField2.OutputValue = rultime
```

GetSelectedRow

Description

Returns the selected row object of a table-based control as "ICCAxDataRow" type.

Syntax

```
Expression.GetSelectedRow()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Example

```
'VBS358
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim headingRow
 Dim selectedRow
 Set ctrl = ScreenItems("TableControl")
 Set headingRow = ctrl.GetRow(0)
 Set selectedRow = ctrl.GetSelectedRow
 lCellCount = headingRow.CellCount
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To lCellCount
  HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
  HMIRuntime.trace selectedRow.CellText(lCellIndex)
    HMIRuntime.trace vbNewLine
 Next
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

GetSelectedRows

Description

Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.

Syntax

```
Expression.GetSelectedRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Example

```
'VBS359
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim lRowIndex
 Dim lRowCount
 Dim headingRow
 Dim selectedRow
 Dim selectedRows
 Set ctrl = ScreenItems("TableControl")
 Set headingRow = ctrl.GetRow(0)
 Set selectedRows = ctrl.GetSelectedRows
 lCellCount = headingRow.CellCount
 lRowCount = selectedRows.Count
 'enumerate selected rows
 For lRowIndex = 1 To lRowCount
  Set selectedRow = selectedRows(lRowIndex)
  HMIRuntime.Trace "Row number: " & CStr(lRowIndex) & vbNewLine
  'enumerate and trace out column titles and cell texts
  For lCellIndex = 1 To lCellCount
   HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
   HMIRuntime.trace selectedRow.CellText(lCellIndex)
     HMIRuntime.trace vbNewLine
  Next
 Next
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

GetStatisticAreaColumn

Description

Returns the column object of the statistic area window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.

Syntax

```
Ausdruck.GetStatisticAreaColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics area window.

Example

```
'VBS327
Dim ctrl
Dim objStatAreaCol
Set ctrl = ScreenItems("RulerControl")
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("DatasourceY")
objStatAreaCol.Visible = FALSE
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("ValueY(LL)")
objStatAreaCol.Sort = 1
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatisticAreaColumn" listing, for example, you write "objStatAreaCol.Visible" instead of "objStatAreaCol.ColumnVisible".

GetStatisticAreaColumnCollection

Description

Returns the list of all column objects of the statistic area window of the evaluation table as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetStatisticAreaColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS328
Dim ctrl
Dim coll
Dim statcol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetStatisticAreaColumnCollection
HMIRuntime.Trace "Number of statistic Area columns:" & coll.Count & vbCrLf
For Each statcol In coll
 HMIRuntime.Trace statcol.Index & vbCrLf
 HMIRuntime.Trace statcol.Name & vbCrLf
 HMIRuntime.Trace statcol.Sort & vbCrLf

GetStatisticResultColumn

Description

Returns the column object of the statistic window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.

Syntax

```
Ausdruck.GetStatisticResultColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics window.

Example

```
'VBS329
Dim ctrl
Dim objStatResCol
Set ctrl = ScreenItems("RulerControl")
Set objStatResCol = ctrl.GetStatisticResultColumn("MaxValue")
objStatResCol.Visible = FALSE
Set objStatResCol = ctrl.GetStatisticResultColumn("Average")
objStatResCol.Sort = 2
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatisticResultColumn" listing, for example, you write "objStatResCol.Visible" instead of "objStatResCol.ColumnVisible".

GetStatisticResultColumnCollection

Description

Returns the list of all column objects of the statistic window of the evaluation table as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetStatisticResultColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS330
Dim ctrl
Dim coll
Dim statcol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetStatisticResultColumnCollection
HMIRuntime.Trace "Number of statistic result columns:" & coll.Count & vbCrLf
For Each statcol In coll
 HMIRuntime.Trace statcol.Index & vbCrLf
 HMIRuntime.Trace statcol.Name & vbCrLf
 HMIRuntime.Trace statcol.Sort & vbCrLf
 HMIRuntime.Trace statcol.SortIndex & vbCrLf
Next
```

GetStatusbarElement

Description

Returns the element of the control status bar designated as name or index as type "ICCAxStatusbarElement".

Syntax

```
Ausdruck.GetStatusbarElement(ByVal vIndex As Variant)
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of status bar element.

Example

```
'VBS331
Dim ctrl
Dim objStatusBar
Set ctrl = ScreenItems( "Control1" )
Set objStatusBar = ctrl.GetStatusbarElement(1)
objStatusBar.Visible = FALSE
Set objStatusBar = ctrl.GetStatusbarElement(3)
objStatusBar.Width = 10
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatusbarElement" listing, for example, you write "objStatusBar.Visible" instead of "objStatusBar.StatusbarElementVisible".

GetStatusbarElementCollection

Description

Returns the list of all status bar elements of the control as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatusbarElementCollection()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS332
Dim ctrl
Dim coll
Dim statelement
Set ctrl = ScreenItems.Item("Control1")
Set coll = ctrl.GetStatusbarElementCollection
HMIRuntime.Trace "Number of statusbar elements:" & coll.Count & vbCrLf
For Each statelement In coll
 HMIRuntime.Trace statelement.Name & vbCrLf
 HMIRuntime.Trace statelement.Width & vbCrLf
 HMIRuntime.Trace statelement.Text & vbCrLf
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatusbarElement" listing, for example, you write "statelement.Name" instead of "statelement.StatusbarElementName".

GetTimeAxis

Description

Returns the time object that is specified by name or index for the f(t) trend view as "ICCAxTimeAxis" type.

Syntax

```
Expression.GetTimeAxis(ByVal vIndex As Variant)
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time axis.

Example

```
'VBS333
Dim ctrl
Dim objTimeAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTimeAxis = ctrl.GetTimeAxis(1)
objTimeAxis.Visible = FALSE
Set objTimeAxis = ctrl.GetTimeAxis("axis 2")
objTimeAxis.Label = "Time axis 2"
objTimeAxis.DateFormat = "dd.MM.yy"
objTimeAxis.TimeFormat = "HH:mm:ss.ms"
objTimeAxis.RangeType = 2
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeAxis.BeginTime = "06.04.2010 9:33:18"
'objTimeAxis.BeginTime = "04/06/2010 9:33:18"
objTimeAxis.MeasurePoints = 100
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "TimeAxis" listing, for example, you write "objTimeAx.Visible" instead of "objTimeAx.TimeAxisVisible".

GetTimeAxisCollection

Description

Returns a list of all time objects of the f(t) trend view as "ICCAxCollection" type.

Syntax

```
Expression.GetTimeAxisCollection()
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for ICCAxCollection:

- Count
- Item

The following functions are available for ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS334
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis1
Dim objTimeAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis1 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2010")
Set objTimeAxis2 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2011")
objTimeAxis1.TrendWindow = objTrendWnd.Name
objTimeAxis1.Label = "2010"
objTimeAxis1.RangeType = 1
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeAxis1.BeginTime = "01.01.2010 0:00:00"
'objTimeAxis1.BeginTime = "01/01/2010 0:00:00"
objTimeAxis1.EndTime = "31.12.2010 11:59:59"
'objTimeAxis1.EndTime = "12/31/2010 11:59:59"
objTimeAxis2.TrendWindow = objTrendWnd.Name
objTimeAxis2.Label = "2011"
objTimeAxis2.RangeType = 1
objTimeAxis2.BeginTime = "01.01.2011 0:00:00"
'objTimeAxis2.BeginTime = "01/01/2011 0:00:00"
objTimeAxis2.EndTime = "31.12.2011 11:59:59"
'objTimeAxis2.EndTime = "12/31/2011 11:59:59"
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis2.Name
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "TimeAxis" listing, for example, you write "objTimeAxis1.Label" instead of "objTimeAxis1.TimeAxisLabel".

GetTimeColumn

Description

Returns the time column object of the table view designated by name or index as "ICCAxTime Column" type.

Syntax

```
Ausdruck.GetTimeColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time column.

Example

```
'VBS335
Dim ctrl
Dim objTimeCol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn1")
objTimeCol.ShowDate = FALSE
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn2")
objTimeCol.Visible = FALSE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "TimeColumn" listing, for example, you write "objTimeColumn.ShowDate" instead of "objTimeColumn.TimeColumnShowDate".

GetTimeColumnCollection

Description

Returns the list of all time column objects of the table view as "ICCAxCollection" type.

Syntax

```
Expression.GetTimeColumnCollection()
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for ICCAxCollection:

- Count
- Item

The following functions are available for ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS336
Dim ctrl
Dim objTimeCol1
Dim objTimeCol2
Dim coll
Dim timecol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol1 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2010")
Set objTimeCol2 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2011")
objTimeCol1.Caption = "2010"
objTimeCol1.RangeType = 1
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeCol1.BeginTime = "01.01.2010 0:00:00"
'objTimeCol1.BeginTime = "01/01/2010 0:00:00"
objTimeCol1.EndTime = "31.12.2010 11:59:59"
'objTimeCol1.EndTime = "12/31/2010 11:59:59"
objTimeCol2.Caption = "2011"
objTimeCol2.RangeType = 0
objTimeCol2.BeginTime = "01.01.2011 0:00:00"
'objTimeCol2.BeginTime = "01/01/2011 0:00:00"
objTimeCol2.TimeRangeFactor = 1
objTimeCol2.TimeRangeBase = 3600000
Set coll = ctrl.GetTimeColumnCollection
For Each timecol In coll
 timecol.Align = 1
 timecol.Length = 12
 timecol.BackColor = RGB(240,240,0)
 timecol.ForeColor = RGB(130,160,255)
Next
```

GetToolbarButton

Description

Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.

Syntax

```
Ausdruck.GetToolbarButton(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of toolbar button function.

Example

```
'VBS337
Dim ctrl
Set ctrl = ScreenItems( "Control1" )
Dim toolbu
Set toolbu = ctrl.GetToolbarButton ("ShowHelp")
HMIRuntime.Trace "Name: " & toolbu.Name & vbCrLf
HMIRuntime.Trace "Index: " & toolbu.Index & vbCrLf
HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "ToolbarButton" listing, for example, you write "toolbu.Index" instead of "toolbu.ToolbarButtonIndex".

GetToolbarButtonCollection

Description

Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetToolbarButtonCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following methods are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS338
Dim ctrl
Dim coll
Dim toolbu
Set ctrl = ScreenItems( "Control1" )
Set coll = ctrl.GetToolbarButtonCollection
HMIRuntime.Trace "Number of toolbar buttons:" & coll.Count & vbCrLf
For Each toolbu In coll
 HMIRuntime.Trace toolbu.Name & vbCrLf
 HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
 HMIRuntime.Trace "Authorization: " & toolbu.PasswordLevel & vbCrLf
Next

GetTrend

Description

Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.

Syntax

```
Ausdruck.GetTrend(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve.

Example for Runtime Professional

```
'VBS339
Dim ctrl
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrend = ctrl.GetTrend( "Trend 1" )
objTrend.PointStyle = 1
objTrend.LineWidth = 4
Set objTrend = ctrl.GetTrend(2)
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag2"
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Trend" listing, for example, you write "objTrend.PointStyle" instead of "objTrend.TrendPointStyle".

GetTrendCollection

Description

Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetTrendCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example for Runtime Professional

```
'VBS340
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
objValAxis.TrendWindow = objTrendWnd.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag1"
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValAxis.Name
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Trend" listing, for example, you write "objTrend.TagName" instead of "objTrend.TrendTagName".

GetTrendWindow

Description

Returns the trend view object of the f(t) trend view or the f(x) trend view designated by name or index as "ICCAxTrendWindow" type.

Syntax

```
Ausdruck.GetTrendWindow(ByVal vIndex As Variant)
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve window.

Example for Runtime Professional

```
'VBS341
Dim ctrl
Dim objTrendWnd
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindow(1)
objTrendWnd.Visible = FALSE
Set objTrendWnd = ctrl.GetTrendWindow("trend window 2")
objTrendWnd.VerticalGrid = TRUE
objTrendWnd.FineGrid = TRUE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "TrendWindow" listing, for example, you write "objTrendWnd.Visible" instead of "objTrendWnd.TrendWindowVisible".

GetTrendWindowCollection

Description

Returns the list of all trend window objects of the f(t) trend display or the f(x) trend display as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetTrendWindowCollection()
```

Expression

Required. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example for Runtime Professional

```
'VBS342
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")

GetValueAxis

Description

Returns the value axis object of the f(t) trend view designated by name or index as "ICCAxValueAxis" type.

Syntax

```
Ausdruck.GetValueAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the value axis

Example

```
'VBS343
Dim ctrl
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objValAxis = ctrl.GetValueAxis(1)
objValAxis.Visible = FALSE
Set objValAxis = ctrl.GetValueAxis("axis 2")
objValAxis.Label = "Value axis 2"
objValAxis.ScalingType = 0
objValAxis.Precisions = 2
objValAxis.AutoRange = TRUE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "ValueAxis" listing, for example, you write "objValueAx.Visible" instead of "objValueAx.ValueAxisVisible".

GetValueAxisCollection

Description

Returns the list of all value axis objects of the f(t) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetValueAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS344
Dim ctrl
Dim objTrendWnd
Dim objValAxis1
Dim objValAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objValAxis1 = ctrl.GetValueAxisCollection.AddItem("myValueAxis1")
Set objValAxis2 = ctrl.GetValueAxisCollection.AddItem("myValueAxis2")
objValAxis1.TrendWindow = objTrendWnd.Name
objValAxis1.Label = "Value1"
objValAxis2.TrendWindow = objTrendWnd.Name
objValAxis2.inTrendColor = TRUE
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis2.Name
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "ValueAxis" listing, for example, you write "objValueAxis1.Label" instead of "objValueAxis1.ValueAxisLabel".

GetValueColumn

Description

Returns the value column object defined by name or index for the tabular view as "ICCAxValueColumn" type.

Syntax

```
Expression.GetValueColumn(ByVal vIndex As Variant)
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the value column of the f(t) trend view.

Example

```
'VBS345
Dim ctrl
Dim objValueColumn
Set ctrl = ScreenItems("TableControl")
Set objValueColumn = ctrl.GetValueColumn("Valuecolumn1")
objValueColumn.Precisions = 4
Set objValueColumn = ctrl.GetValueColumn(2)
objValueColumn.ExponentialFormat = TRUE
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "ValueColumn" listing, for example, you write "objValueColumn.Precisions" instead of "objValueColumn.ValueColumnPrecisions".

GetValueColumnCollection

Description

Returns the list of all value column objects of the f(t) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetValueColulmnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS346
Dim ctrl
Dim objValCol1
Dim objValCol2
Dim coll
Dim valcol
Set ctrl = ScreenItems("TableControl")
Set objValCol1 = ctrl.GetValueColumnCollection.AddItem("ValueColumn1")
Set objValCol2 = ctrl.GetValueColumnCollection.AddItem("ValueColumn2")
objValCol1.Caption = "Value Archive"
objValCol1.Provider = 1
objValCol1.TagName = "ProcessValueArchive\arch1"
objValCol1.TimeColumn = "TimeColumn1"
objValCol2.Caption = "Value Tag"
objValCol2.Provider = 2
objValCol2.TagName = "tagxx"
objValCol2.TimeColumn = "TimeColumn2"
Set coll = ctrl.GetValueColumnCollection
For Each valcol In coll
 valcol.Align = 2
 valcol.Length = 10
 valcol.AutoPrecisions = TRUE
Next
```

GetXAxis

Description

Returns the X axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.

Syntax

```
Ausdruck.GetXAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of X axis.

Example

```
'VBS347
Dim ctrl
Dim objXAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAx = ctrl.GetXAxis(1)
objXAx.Visible = FALSE
Set objXAx = ctrl.GetXAxis("axis 2")
objXAx.Label = "X axis 2"
objXAx.ScalingType = 0
objXAx.Precisions = 2
objXAx.Color = RGB(109,109,109)
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "XAxis" listing, for example, you write "objXAx.Visible" instead of "objXAx.XAxisVisible".

GetXAxisCollection

Description

Returns the list of all X axis objects of the f(x) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetXAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS348
Dim ctrl
Dim objXAxis1
Dim objXAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAxis1 = ctrl.GetXAxisCollection.AddItem("myXAxis1")
objXAxis1.Label = "temperature"
Set objXAxis2 = ctrl.GetXAxisCollection.AddItem("myXAxis2")
objXAxis2.Label = "pressure"
Set coll = ctrl.GetXAxisCollection
HMIRuntime.Trace "Number of XAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "XAxis" listing, for example, you write "objXAxis1.Label" instead of "objXAxis1.XAxisLabel".

GetYAxis

Description

Returns the Y axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.

Syntax

```
Ausdruck.GetYAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of Y axis.

Example

```
'VBS349
Dim ctrl
Dim objYAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAx = ctrl.GetYAxis(1)
objYAx.Visible = FALSE
Set objYAx = ctrl.GetYAxis("axis 2")
objYAx.Label = "Y axis 2"
objYAx.Align = 0
objYAx.Precisions = 3
objYAx.EndValue = 90.000
objYAx.BeginValue = 10.000
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "YAxis" listing, for example, you write "objYAx.Visible" instead of "objYAx.YAxisVisible".

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

GetYAxisCollection

Description

Returns the list of all Y axis objects of the f(x) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetYAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS350
Dim ctrl
Dim objYAxis1
Dim objYAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAxis1 = ctrl.GetXAxisCollection.AddItem("myYAxis1")
objYAxis1.Label = "temperature"
Set objYAxis2 = ctrl.GetXAxisCollection.AddItem("myYAxis2")
objYAxis2.Label = "pressure"
Set coll = ctrl.GetYAxisCollection
HMIRuntime.Trace "Number of YAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "YAxis" listing, for example, you write "objYAxis1.Label" instead of "objYAxis1.YAxisLabel".

Methods H-R

HideAlarm

Description

Executes the "Hide alarm" button function of the alarm view.

Syntax

```
Expression.HideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

InsertData

Description

Adds data to the called trend.

Syntax

```
Expression.InsertData(dblAxisX As Variant, dblAxisY As Variant)
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
dblAxisX	Value of X axis
dblAxisY	Value of Y axis

Example

```
'VBS300
Dim lngFactor
Dim dblAxisX
Dim dblAxisY
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
For lngFactor = -100 To 100
dblAxisX = CDbl(lngFactor * 0.02)
dblAxisY = CDbl(dblAxisX * dblAxisX + 2 * dblAxisX + 1)
objTrend.InsertData dblAxisX, dblAxisY
Next
```

Item

Description

Returns an element from a list.

Syntax

Expression.Item(Index)

Expression

Necessary. An expression which returns a list.

Parameters

Index

The name or the index number of an element of the list:

- ScreenItems-Listing: Use an object name, e.g. "HmiRuntime.Screens(1).ScreenItems("Circle")", or the index number.
- Screens-Listing: Use either the name or the index number.
- SmartTags-Listing: You can only use the tag name as index in the SmartTags list. A counting of all tags is not possible.

If the transferred value does not correspond with an element in the list, an error occurs. The return value has the value "Nothing".

```
On Error Resume Next
Dim screen
Set screen = HmiRuntime.Screens("Screen_1")
If (screen is Nothing)
then...
Else...
End If
```

Best practice for optimizing auto-completion support is to use combined addressing by means of screen name and object name, e.g. `"HmiRuntime.Screens("Screen").ScreenItems("Circle")"`.

Example

The item method is the default method for lists. Therefore, the results are the same for the following two examples:

```
'VBS_Example_Item
HMIRuntime.Screens.Item(1)
HMIRuntime.Screens(1)
```

Both instructions reference the respective base screen.

ScreenItems (list) (Page 5005)

ScreenItem (Page 5003)

LockAlarm

Description

Executes the "Disable alarm" button function of the alarm view.

Syntax

```
Expression.LockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

AlarmControl (Page 5018)

LoopInAlarm

Description

Executes the "Loop in alarm" button function of the alarm view.

Syntax

```
Expression.LoopInAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

AlarmControl (Page 5018)

MoveAxis

Description

Executes the "Move axes area" button function of the f(t) and f(x) trend views.

Syntax

```
Expression.MoveAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

MoveToFirst

Description

Executes the "First line" button function of the control.

Syntax

```
Expression.MoveToFirst()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

UserArchiveControl (Page 5207)

MoveToFirstLine

Description

Executes the "First alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToFirstLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

MoveToFirstPage

Description

Executes the "First page" button function of the alarm view.

Syntax

```
Ausdruck.MoveToFirstPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

MoveToLast

Description

Executes the "last data record" button function of the control.

Syntax

```
Ausdruck.MoveToLast()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

UserArchiveControl (Page 5207)

MoveToLastLine

Description

Executes the "Last alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToLastLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

AlarmControl (Page 5018)

MoveToLastPage

Description

Executes the "Last page" button function of the alarm view.

Syntax

```
Ausdruck.MoveToLastPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

MoveToNext

Description

Executes the "next data record" button function of the control.

Syntax

```
Ausdruck.MoveToNext()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

UserArchiveControl (Page 5207)

MoveToNextLine

Description

Executes the "Next alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToNextLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

MoveToNextPage

Description

Executes the "Next page" button function of the alarm view.

Syntax

```
Ausdruck.MoveToNextPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

MoveToPrevious

Description

Executes the "previous data record" button function of the control.

Syntax

```
Ausdruck.MoveToPrevious()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

UserArchiveControl (Page 5207)

MoveToPreviousLine

Description

Executes the "Previous alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToPreviousLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

AlarmControl (Page 5018)

MoveToPreviousPage

Description

Executes the "Previous page" button function of the alarm view.

syntax

```
Ausdruck.MoveToPreviousPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

NextColumn

Description

Executes the "Next column" button function of the table view.

Syntax

```
Ausdruck.NextColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTableControl (Page 5114)

NextTrend

Description

Executes the "Next trend" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.NextTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

OneToOneView

Description

Executes the "Original view" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.OneToOneView()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

PasteRows

Description

Executes the "Insert rows" button function of the recipe view.

Syntax

```
Expression.PasteRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

PreviousColumn

Description

Executes the "Previous column" button function of the table view.

Syntax

```
Ausdruck.PreviousColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTableControl (Page 5114)

PreviousTrend

Description

Executes the "Previous trend" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.PreviousTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

Print

Description

Executes the "Print" button function of the control.

Syntax

```
Ausdruck.Print()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

FunctionTrendControl (Page 5077)

AlarmControl (Page 5018)

QuitHorn

Description

Executes the "Acknowledge central alarm generator" button function of the alarm view.

Syntax

```
Ausdruck.QuitHorn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

QuitSelected

Description

Executes the "Single acknowledgment" button function of the alarm view.

Syntax

```
Ausdruck.QuitSelected()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

QuitVisible

Description

Executes the "Group acknowledgment" button function of the alarm view.

Syntax

```
Ausdruck.QuitVisible()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ReadTags

Description

Executes the "Read tags" button function of the recipe view.

Syntax

```
Ausdruck.ReadTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

Read

Description of Tag Object

Reads out the status of a tag (tag object) shortly after the moment it was called. At the same time, the tag object is provided with the values read. Upon reading a tag, its value, quality code and time stamp are determined. The "LastError" property can be used to determine whether the call was successful.

The "Name" and "Tagprefix" properties are not changed by this.

If the value of the tag is read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values
Name	Tag name (unchanged)
QualityCode	Quality level
Timestamp	Current tag time stamp
LastError	0
ErrorDescription	" "

If the value of the tag is not read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	VT_Empty
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Read operation error codes
ErrorDescription	Error description on LastError

syntax

```
Expression.Read([Readmode])
```

Expression

Necessary. An expression which returns a tag object. The return value of the Read method is the value of the tag read out.

Parameters

The optional "Readmode" parameter enables the distinction between two types of reading:

Parameters	Description
0	The tag value is read from the process image (cache). 0 is the default value.
1	The value of a tag is read directly from AS or channel (direct).

If the "Readmode" parameter is omitted, the value is read from the process image by default. The return value of the Read method is the tag value read out as VARIANT.

Reading From the Process Image

When reading from the process image, the tag is logged on and, from that moment, polled cyclically from the PLC. The login cycle is dependent on the configured trigger. The value is read from the tag image by WinCC. For Close Picture, the tag actions are ended again. The call is characterized by the following:

- The value is read by WinCC from the tag image.
- The call is faster in comparison to direct reading (except with the first call: The first call basically takes longer because the value from the PLC must be read out and logged on.)
- The duration of the call is not dependent on the bus load or AS.

Behavior in actions with a tag trigger

All of the tags contained in the tag trigger are already known with Open Picture and are registered with the defined monitoring time. Since all tags are requested at once, the best possible optimization can be targeted from the channel. If a tag, contained in the trigger, is requested with Read during an action, the value already exists and is transferred directly to the call. If a tag is requested which is not contained in the trigger, the behavior is the same as with a standard trigger.

Behavior in actions with a cyclic trigger

tags are registered with half of the cycle time with the first call. For every other call, the value is present.

Behavior in event-driven actions

The tag is registered in the "upon change" mode with the first call. Process tags that are registered in the "upon change" mode correspond with a cyclic read job with a cycle time of 1s.

If an event (e.g. mouse click) requests a value asynchronously, the tag is transferred to the tag image. The tag is requested cyclically from the AS as of this point in time and therefore increases the basic load. To bypass this increase in the basic load, the value can also be read synchronously. The synchronous call causes a one-off increase in the communication load but the tag is not transferred to the tag image.

Direct reading

In the case of direct reading, the current value is returned. The tag is not registered cyclically, the value is requested from the AS one time only. Direct reading has the following properties:

- The value is read explicitly from the AS.
- The call takes longer compared to reading from the process image.
- The duration of the call is dependent on the bus load and AS, amongst other things.

Example

Reading a tag directly from AS or channel

```
'VBS100
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read(1)    'Read direct
MsgBox vntValue
```

Reading a tag from the process image

```
'VBS101
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read    'Read from cache
MsgBox vntValue
```

Description of TagSet Object

The TagSet object offers the option of reading several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Reading From the Process Image

The TagSet object offers the advantage of requesting several tags in one read command. The tags are registered in the process image as a group, improving performance in the process.

Direct reading

Since one call may process several read commands, performance is enhanced in comparison to single calls.

Example

The following example shows how tags are included in the TagSet list, how tag values are imported and subsequently read.

```
'VBS174
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Read
HMIRuntime.Trace "Motor1: " & group("Motor1").Value & vbNewLine
HMIRuntime.Trace "Motor2: " & group("Motor2").Value & vbNewLine
```

If the optional parameter "Readmode" is set to 1, the process tags are not registered but read directly from AS or channel.

```
group.Read 1
```

Refresh

Description

Drawing all visible pictures again.

syntax

```
Expression.Refresh
```

Expression

Necessary. An expression which returns a "Screens" or "Screen" type object.

Parameter

--

Examples

The first example forces all visible pictures to be drawn again:

```
'VBS149
HMIRuntime.Screens.Refresh
```

The second example forces the basic picture to be immediately redrawn:

```
'VBS150
HMIRuntime.Screens(1).Refresh
```

See also

Screen (Page 5000)

HMIRuntime (Page 4993)

Remove

Description of TagSet Object

Removes a tag from the TagSet list. The tag may be removed by name or reference to a tag object.

Syntax

```
Expression.Remove [Tag]
```

Expression

Required An expression that returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be removed from the list.

Example

The following example shows how several tags are included in the TagSet list, and how to remove a tag again.

```
'VBS175
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Remove "Motor1"
```

Description of DataSet Object

Deletes the element specified in parameter "Name" from a list.

Syntax

```
Expression.Remove [Name]
```

Expression

Required An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
Name	Name of the object to be removed from the list.

Example

The example shows how to remove the object "motor1" from the list.

```
'VBS166
HMIRuntime.DataSet.Remove("motor1")
```

Description of objects Logging, AlarmLogs, DataLogs

The method deletes previously swapped-in log segments from the Runtime project.

Log segments that were deleted using the "Remove" method are removed from the "Common logging" folder of the project.

The call may require a somewhat longer time period, depending on the log data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be avoided if you start the call in a Global Scripting action, such as starting the action through a trigger tag.

The process of disconnecting and clearing logs creates a CPU load. This will affect performance.

Note

Calling up the "Remove" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

Syntax

Objects Logging, AlarmLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [ServerPrefix]
```

Expression

Required An expression that returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [Type] [ServerPrefix]
```

Expression

Required An expression that returns an object of type "DataLogs".

Parameters

TimeFrom

Point in time, from which the logs are to be cleared.
When specifying the time information, a short form is also possible. This is described in the "Time format" section.

TimeTo

Time up to which log segments are to be cleared.
When specifying the time information, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type

Type of log.
The parameter can (optionally) be used only to delete log segments of the tag logging.
The following values can be entered:

Assigned value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred during deletion of the log segments, the method will return an error alarm. Additional information may be found under the subject heading "Error alarms from database area".

Time format

The format for specifying time information is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the time may be specified in the "YYYY-MM" or "YYYY-MM-DD hh" format. Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all log segments between September 2004 up to and including October 4.

Example

In the following example, log segments within a certain time period that were swapped in (again) after the fact are removed and the return value is output as a trace.

```
'VBS182
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("2004-08-22","2004-09-22",-1) &
vbNewLine
```

In the following example, all log segments that were swapped-in (again) after the fact are removed and the return value is output as a trace.

```
'VBS183
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("","",-1) & vbNewLine
```

RemoveAll

Description of TagSet Object

Deletes all tags from a TagSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

--

Example:

The following example shows how several tags are included in the TagSet list, and how to remove all tags again.

```
'VBS176
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.RemoveAll
```

Description of DataSet Object

Deletes all values or object references from a DataSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

--

Example:

The example shows how all objects are removed from the list.

```
'VBS167
HMIRuntime.DataSet.RemoveAll
```

See also

DataSet (list) (Page 4990)

Restore

Description of objects Logging, AlarmLogs, DataLogs

The method adds swapped-out log segments to the Runtime project.

Upon swapping-in, the log segments are copied to the "Common logging" folder of the project. Therefore the appropriate storage capacity must be available.

The call may require a somewhat longer time period, depending on the log data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be avoided if you start the call in a Global Scripting action, such as starting the action through a trigger tag.

The connecting/copying of the logs generates a CPU load because the SQL server experiences additional load, especially if signature checking is activated. Copying of log segments will slow down hard disk access.

If signature checking is activated, an error message is returned if an unsigned or modified log is to be swapped in. There is always only one error alarm returned, even if several errors occurred during a swap-in process. Additionally, a WinCC system alarm is generated for each log segment. An entry is added to the Windows event viewer in the "Application" section. This provides the opportunity to check which log segments are creating the error.

- With an unsigned log, the return value "0x8004720F" is returned. The event viewer contains the entry "Validation of database <db_name> failed! No signature found!".
  The log is swapped in.
- With a changed log, the return value "0x80047207" is returned. The event viewer contains the entry "Validation of database <db_name> failed!".
  The log is not swapped in.

Note

Calling up the "Restore" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

Syntax

Objects Logging, AlarmLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut]
[ServerPrefix]
```

Expression

Required An expression that returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut] [Type]
[ServerPrefix]
```

Expression

Required An expression that returns an object of type "DataLogs".

Parameters

SourcePath

Path to log data.

TimeFrom

Point in time, from which the logs are to be swapped in.
When specifying the time information, a short form is also possible. This is described in the "Time format" section.

TimeTo

Time up to which log segments are to be swapped in.
When specifying the time information, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type

Type of log.
The parameter can (optionally) be used only to store log segments of the tag logging.
The following values can be entered:

Assigned value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred while swapping in log segments, the method will return an error message. Additional information may be found under the subject heading "Error alarms from database area".

Time format

The format for specifying time information is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the statement may be in the form of "YYYY-MM" or "YYYY-MM-DD hh". Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all log segments between September 2004 up to and including October 4.

Example

In the following example, all log segments since the start of the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS184
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:\Folder","2004-09-14","",-1) &
vbNewLine
```

In the following example, all Tag Logging Slow log segments in the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS185
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:\Folder","2004-09-14
12:30:05","2004-09-20 18:30",-1,2) & vbNewLine
```

In the following example, all Alarm Logging log segments up to the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS186
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Remove("","2004-09-20",-1) &
vbNewLine
```

AlarmLogs (list) (Page 4986)

Methods S-Z

SelectAll

Description

Selects all rows in a table-based control.

Syntax

```
Expression.SelectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

AlarmControl (Page 5018)

SelectedStatisticArea

Description

Executes the "Set statistics range" button function of the table view.

Syntax

```
Ausdruck.SelectedStatisticArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTableControl (Page 5114)

SelectRow

Description

Selects a specific row in a table-based control.

Syntax

```
Expression.SelectRow(ByVal IRow As Long, Optional bExtendSelection
As Boolean)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameters	Description
IRow	Number of the row to be selected.
bExtendSelection	Indicates as an option whether the current selection will be extended. Is only relevant if multiple selections are possible.

Example

- Row 1 is currently selected. If SelectRow(2, True) is called, then row 1 and row 2 will be selected.
- Row 1 is currently selected. If SelectRow(2, False) or SelectRow(2) is called without an optional parameter, then only row 2 will be selected.

See also

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

AlarmControl (Page 5018)

ServerExport

Description

Executes the "Export log" button function of the recipe view.

Syntax

```
Ausdruck.ServerExport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

ServerImport

Description

Executes the "Import log" button function of the recipe view.

Syntax

```
Ausdruck.ServerImport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

ShowColumnSelection

Description

Executes the "Select columns" button function of the table view.

Syntax

```
Ausdruck.ShowColumnSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

OnlineTableControl (Page 5114)

ShowComment

Description

Executes the "Comment dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowComment()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

AlarmControl (Page 5018)

ShowDisplayOptionsDialog

Description

Executes the "Display options dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowDisplayOptionsDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowEmergencyQuitDialog

Description

Executes the "Single acknowledgment" button function of the alarm view.

Syntax

```
Ausdruck.ShowEmergencyQuitDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowHelp

Description

Executes the "Help" button function of the control.

Syntax

```
Ausdruck.ShowHelp()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

FunctionTrendControl (Page 5077)

AlarmControl (Page 5018)

ShowHideList

Description

Executes the "List of alarm to hide" button function of the alarm view.

Syntax

```
Ausdruck.ShowHideList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowHitList

Description

Executes the "Hitlist" button function of the alarm view.

Syntax

```
Ausdruck.ShowHitList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowInfoText

Description

Executes the "About dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowInfoText()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowLockDialog

Description

Executes the "Lock dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowLockDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowLockList

Description

Executes the "Lock list" button function of the alarm view.

Syntax

```
Ausdruck.ShowLockList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowLongTermArchiveList

Description

Executes the "Historical alarm list (long-term)" button function of the alarm view.

Syntax

```
Ausdruck.ShowLongTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowMessageList

Description

Executes the "Alarm list" button function of the alarm view.

Syntax

```
Ausdruck.ShowMessageList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowPercentageAxis

Description

Executes the "Relative axis" button function of the f(t) trend view.

Syntax

```
Ausdruck.ShowPercentageAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTrendControl (Page 5122)

ShowPropertyDialog

Description

Executes the "Configuration dialog" button function of the control.

Syntax

```
Ausdruck.ShowPropertyDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

FunctionTrendControl (Page 5077)

AlarmControl (Page 5018)

ShowSelectArchive

Description

Executes the "Select data connection" button function of the recipe view.

Syntax

```
Ausdruck.ShowSelectArchive()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

ShowSelection

Description

Executes the "Selection dialog" button function of the recipe view.

Syntax

```
Ausdruck.ShowSelection ()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

ShowSelectionDialog

Description

Executes the "Selection dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowSelectionDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

AlarmControl (Page 5018)

ShowSelectTimeBase

Description

Executes the "Timebase dialog" button function of the recipe view.

Syntax

```
Ausdruck.ShowSelectTimeBase()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

UserArchiveControl (Page 5207)

ShowShortTermArchiveList

Description

Executes the "Historical alarm list (short-term)" button function of the alarm view.

Syntax

```
Ausdruck.ShowShortTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowSort

Description

Executes the "Sorting dialog" button function of the recipe view.

Syntax

```
Ausdruck.ShowSort()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

ShowSortDialog

Description

Executes the "Sorting dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowSortDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

AlarmControl (Page 5018)

ShowTagSelection

Description

Executes the "Select data connection" button function of the control.

Syntax

```
Ausdruck.ShowTagSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

FunctionTrendControl (Page 5077)

ShowTimebaseDialog

Description

Executes the "Timebase dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowTimebaseDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

ShowTimeSelection

Description

Executes the "Select time range" button function of the control.

Syntax

```
Ausdruck.ShowTimeSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

FunctionTrendControl (Page 5077)

ShowTrendSelection

Description

Executes the "Select trends" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ShowTrendSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

-- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

FunctionTrendControl (Page 5077)

StartStopUpdate

Description

Executes the "Start" or "Stop" button function of the control.

Syntax

```
Ausdruck.StartStopUpdate()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

OnlineTableControl (Page 5114)

FunctionTrendControl (Page 5077)

Stop

Description

Closes WinCC Runtime.

Syntax

Expression.Stop

Expression

Required An expression which returns an "HMIRuntime" type object.

Parameters

--

See also

HMIRuntime (Page 4993)

Trace

Description

Returns a user-defined text through the operating system channel for debug alarms.

The methods HMIRuntime.Trace works only in a PC-based environment. The text transferred as parameter can be displayed using the diagnostics tools "GSC Diagnostics" or "ApDiag". You can use the "ShowSystemAlarm" system function if you need to run a trace without using external tools.

Syntax

Expression.Trace"STRING"

Expression

Required An expression which returns an "HMIRuntime" type object.

Parameters

STRING

The text which is issued as a debug alarm. The transferred text can be displayed using the diagnostics tools "GSC Diagnostics" or "ApDiag". You can use the "ShowSystemAlarm" system function if you need to run a trace without using external tools.

Example

In the following example a debug alarm is issued:

```
'VBS example trace
HMIRuntime.Trace "Customized error message"
```

See also

HMIRuntime (Page 4993)

UnhideAlarm

Description

Executes the "Unhide alarm" button function of the alarm view.

Syntax

```
Ausdruck.UnhideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

AlarmControl (Page 5018)

UnlockAlarm

Description

Executes the "Unlock alarm" button function of the alarm view.

Syntax

```
Ausdruck.UnlockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 5018)

UnselectAll

Description

Removes all selections from the cells of a table-based control.

Syntax

```
Expression.UnselectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

AlarmControl (Page 5018)

UnselectRow

Description

Removes the selections from a specific cell of a table-based control.

Syntax

```
Expression.UnselectRow(ByVal IRow As Long)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the row to be selected.

See also

OnlineTableControl (Page 5114)

TrendRulerControl (Page 5187)

UserArchiveControl (Page 5207)

AlarmControl (Page 5018)

Write

Description of Tag Object

Writes a value to a tag. The "LastError" property can be used to determine whether the call was successful.

If the value of the tag is set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	0
ErrorDescription	" "

If the value of the tag is not set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Write operation error codes
ErrorDescription	Error description on LastError

syntax

```
Expression.Write [Value],[Writemode]
```

Expression

Necessary. An expression which returns a tag object.

Parameters

The value to be written can be transferred directly to the method as a parameter. If the parameter is not specified, the value in the "Value" property is used. The "Writemode" option parameter can be used to select whether the tag value should be written synchronously or asynchronously. If the "Writemode" parameter is not used, writing is performed asynchronously as its default value.

During the writing process, no information is supplied on the status of the tags.

The "Value" property contains the value which was set before or during the writing operation, therefore is may not correspond to the real current value of the tag. If the data on the tag should be updated, use the Read method.

Parameters	Description
Value (optional)	The tag value is specified. The specified value overwrites the value in the "Value" property in the tag object. The tag value is not specified. The tag receives the current value from the "Value" property of the tag object.
Writemode (optional)	0 or empty: The tag value is written asynchronously. 0 is the default value. 1: The tag value is written synchronously.

On asynchronous writing, it is written immediately into the tag image. The user does not receive any feedback if the value has been written in the programmable controller, too.

In the case of synchronous writing (direct to the PLC), the writing operation actually occurs when the PLC is ready to operate. The use receives a check-back message if the writing operation was not successful.

Example

Asynchronous writing

```
'VBS104
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write
MsgBox objTag.Value
```

or

```
'VBS105
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5
MsgBox objTag.Value
```

Synchronous writing

```
'VBS106
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write ,1
MsgBox objTag.Value
```

or

```
'VBS107
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5, 1
MsgBox objTag.Value
```

Description of TagSet Object

The TagSet object offers the option of writing several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

In order to write different values, the "Value" property of individual tag objects must be set, and write must be called thereafter without the "Value" parameter. Since the write commands are grouped into one call, it results in improved performance compared to single calls.

In a TagSet object, it is not possible to pass on a value using the "Write" method. Individual values must be set using the "Value" property of the individual tag objects.

Example

The following example shows how tags are included in the TagSet list, how tag values are set and subsequently written.

```
'VBS173
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Wert1"
group.Add "Wert2"
group("Wert1").Value = 3
group("Wert2").Value = 9
group.Write
```

If you set the optional parameter "Writemode" equal to 1, the process tags are written synchronously (directly to AS).

```
group.Write 1
```

WriteTags

Description

Executes the "Write tags" button function of the recipe view.

Syntax

```
Expression.WriteTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 5207)

ZoomArea

Description

Executes the "Zoom area" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ZoomArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ZoomInOut

Description

Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ZoomInOut()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

ZoomInOutTime

Description

Executes the "Zoom time axis +/-" button function of the f(t) trend view.

Syntax

```
Ausdruck.ZoomInOutTime()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTrendControl (Page 5122)

ZoomInOutValues

Description

Executes the "Zoom value axis +/-" button function of the f(t) trend view.

Syntax

```
Ausdruck.ZoomInOutValues()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTrendControl (Page 5122)

ZoomInOutX

Description

Executes the "Zoom X axis +/-" button function of the f(x) trend view.

Syntax

```
Ausdruck.ZoomInOutX()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

FunctionTrendControl (Page 5077)

ZoomInOutY

Description

Executes the "Zoom Y axis +/-" button function of the f(x) trend view.

Syntax

```
Ausdruck.ZoomInOutY()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

FunctionTrendControl (Page 5077)

ZoomMove

Description

Executes the "Move trend area" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ZoomMove()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 5122)

FunctionTrendControl (Page 5077)

12.9 Mobile Panels

12.9.1 Field of application of the Mobile Panel Wireless

Introduction

The Mobile Panel Wireless enables you to move through the plant without restrictions and with or without security technology. You can operate and monitor moving machine parts or the entire plant depending on the situation. You can plan, configure, simulate and extend wireless networks quickly and reliably.

The Mobile Panels Wireless are based on standardized WLAN technology and are specially tailored to the requirements of automation.

WLAN area

A WLAN area is the area of the plant in which the HMI device communicates with the PLC over a wireless local area network. The wireless coverage of the network has a sufficient signal strength in this area.

The WLAN of a plant is formed by the radio area of one or more Access Points.

Access Point

The Access Point serves as a gateway between the wireless and hard-wired network. The HMI device communicates with an Access Point via WLAN. You can operate the different machines or plants without annoying cables. The HMI device is connected to a network in which it communicates with a PLC via the access point.

Effective range

Safety-related operator input is only possible in a limited part of a WLAN area upstream of a machine or plant known as the effective range. One exception to this rule is the emergency stop, which works in the entire WLAN area.

The configured effective ranges are stored in the HMI device. The HMI device can only log on to a machine within the effective range. This also requires there no other HMI device is logged on in the same effective range.

To ensure clear logon and machine operator inputs, one effective range must not overlap another effective range.

Tags

Effective ranges are formed by the spatial assignment of tags to a machine or plant. Tags create a geometrical space which is relevant for logon to a machine. After logon you operate the machine using acknowledgement buttons.

A distinction is made between two types of tags:

- Transponder
- RFID tag

Transponder

After successful logon to a machine, the spanned geometrical area will be monitored. The distance between the HMI device and the transponder can only be measured if the two devices are in the reception range of each other. When you leave the effective range, safety-related operator input of the machine with acknowledgment buttons is prevented.

Zones in the transponder system

Zones are configurable objects within a transponder system. A zone is defined by the maximum distance from one or more transponders. In a hard-wired Mobile Panel, the length of the connection cable defines a zone around a connection box.

Zones are operating areas in which safety-related operator input is not possible. To enter a zone, you have to configure a screen change to the correct process picture.

RFID tag

After successful logon to a machine, the spanned geometrical area is not monitored. Monitoring therefore calls for an additional organizational measure, for example: a light barrier or a protective fence. The protection area is separated from the plant by a security system. The protection area is the area in the plant in which you operate one or more machines in fail-safe operation. One or more RFID Tags are distributed within protection zones. The protection area is not a configurable object.

12.9.2 How does the transponder system work?

Overview

To give a basic understanding of all this, the following section describes the interaction between:

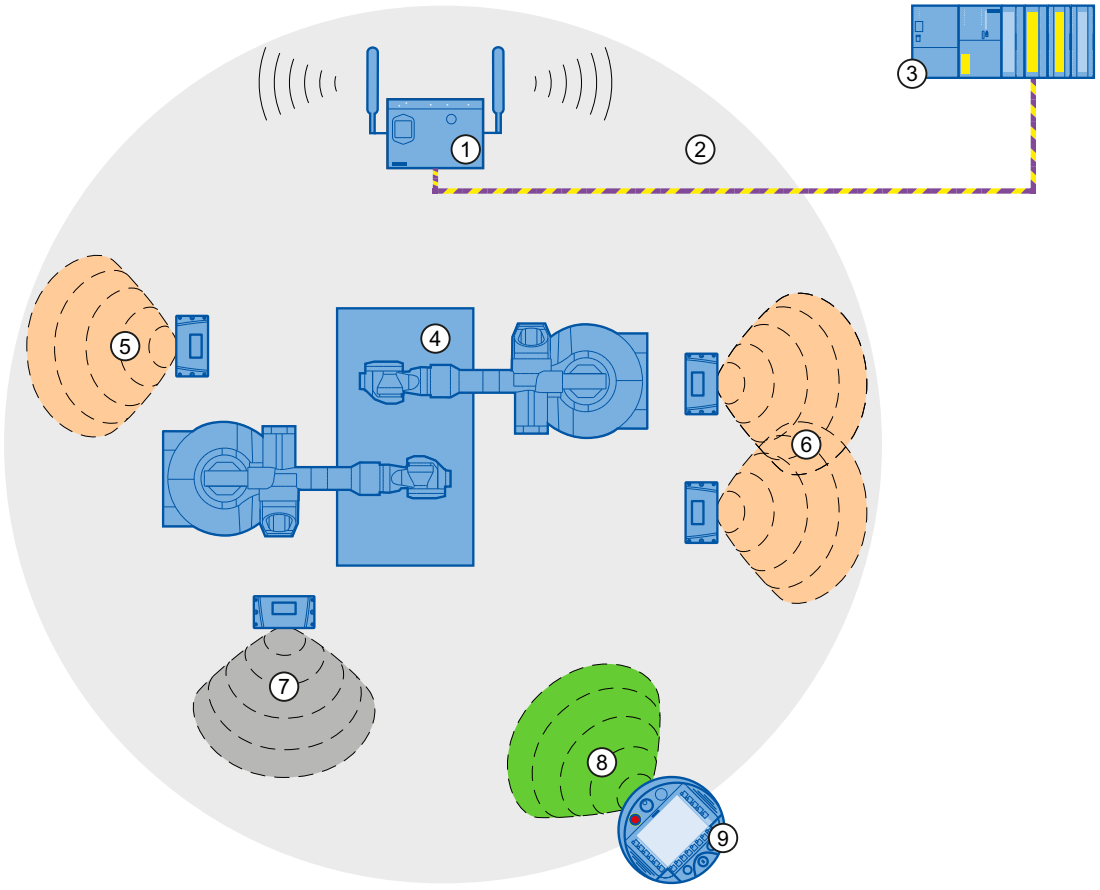
- HMI device
- Zone

- Effective range
- Transponder

Note

You should always assign administrator rights or set up encryption to protect the project containing a Mobile Panel Wireless for fail-safe operation against unauthorized access.

Principle of operation in the transponder system



1 Access Point
2 WLAN of the Access Point
3 PLC
4 Plant
5 Effective range "Robot 1" with a transponder
6 Effective range "Robot 2" with two transponders
7 Zone "Zone 1" with a transponder
8 Radio area of the HMI device
9 HMI device

Example:

- A screen change is configured for "Zone 1".
- Transponder1 is assigned to the "Robot 2" effective range.
- The operator enters the radio cone of the transponder to receive the transponder ID.

- To log onto the machine "Robot 2", the operator presses the object "Effective range - Name".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range ID and confirms with "OK". The dialog is closed.
- If the logon was successful, then the acknowledgement buttons will be active.
- The HMI device measures the distance from the transponder which is less than the configured distance of the effective range.

Result:

The operator is logged onto the machine "Robot 2". The operating element "Effective range - Name" is green and shows the name of the effective range "Robot 2".

If the HMI device is logged onto the effective range, then the following will apply:

- The operator may not leave the effective range without logging off. If the operator leaves the effective range without logging off for more than 30 seconds, a local rampdown will occur.
- No other HMI device can log onto the machine.

To log off from the machine, the operator presses the operating element "Effective range - Name". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot2".

When the operator enters "Zone 1", a screen change will take place.

12.9.3 How does the RFID system work?

Overview

RFID stands for radio frequency identification. RFID allows wireless identification of objects without contact or visual sighting.

For a basic understanding, the following section describes the interaction between:

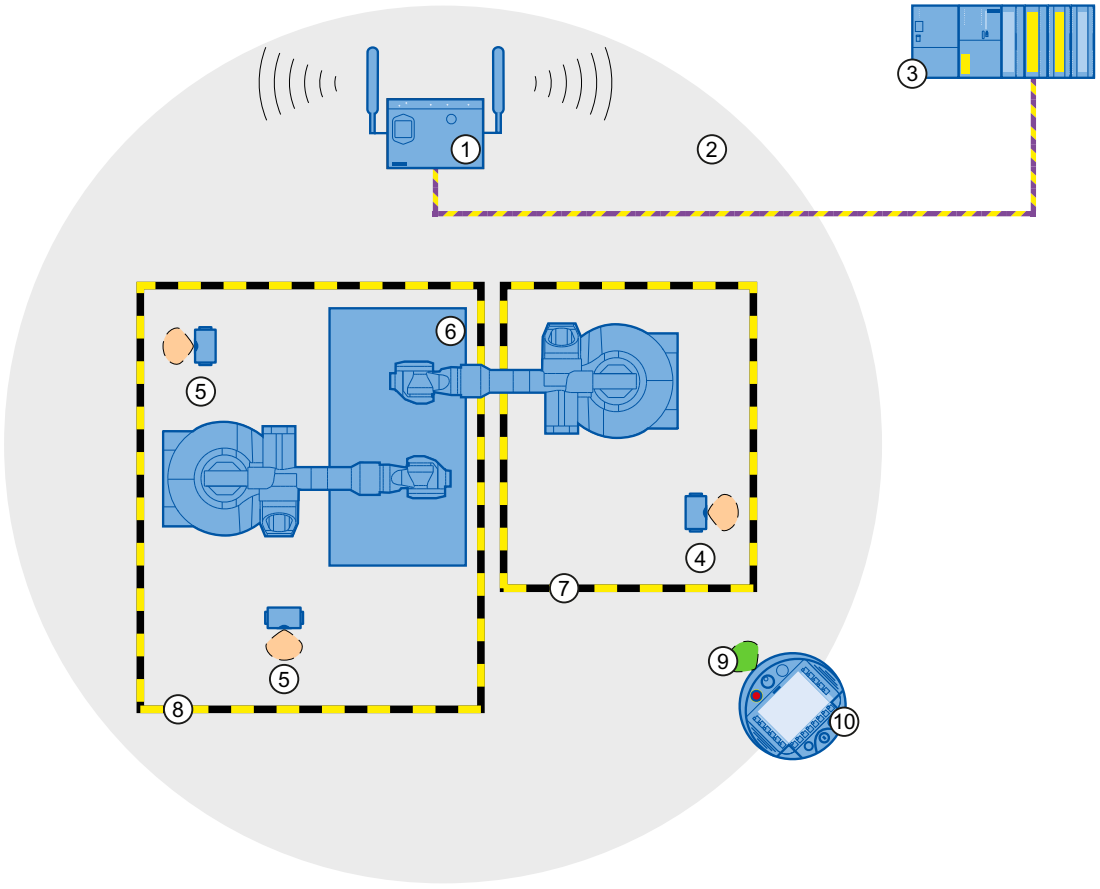
- HMI device
- Effective range (RFID)
- RFID tag

Note

RFID Tags in the plant area

You may only affix RFID Tags in restricted plant areas that are protected by additional protective measures, for example, protective railings.

Principle of operation in the RFID system



① Access Point
② WLAN of the Access Point
③ PLC
④ RFID tag with effective range (RFID) for logon to "Robot 1"
⑤ RFID tag with effective range (RFID) for logon to "Robot 2"
⑥ Plant
⑦ Protective area limit of the machine "Robot1"
⑧ Protective area limit of the machine "Robot2"
⑨ Radio area of the HMI device
⑩ HMI device

Example:

- "RFID Tag1" is assigned to the effective range (RFID) "Robot1".
- An operator enters the restricted plant area. The operator manually switches to the screen with the configured operating element "Effective range - Name (RFID)".

- At "RFID Tag1", he presses the "Scan" button.
  During the logon operation, the button is yellow and displays the text "Scanning…".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range (RFID) ID and confirms it with "OK". The dialog is closed.
- The "Confirmation of logon" dialog box opens. The operator confirms logon with the acknowledgment button.
- If logon was successful, the acknowledgement buttons are active.

Result:

The operator is logged on to the machine "Robot 1" and operates the machine within the protection area in fail-safe operation. The operating element "Effective range - Name (RFID)" is green and shows the name of the effective range (RFID) "Robot1".

If the HMI device is logged on to the machine, the following applies:

- The user may not leave the protection area without logging off from the machine. If the operator leaves the protection area without logging off, a local rampdown occurs.
- No other HMI device can log on to this machine.

To log off from the machine, the operator presses the operating element "Effective range - Name (RFID)". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot 1".

12.9.4 Configuring the Mobile Panel V2 for fail-safe operation (up to V12)

12.9.4.1 Configuration overview

Introduction

Additional steps in the TIA Portal are necessary before the configuration of the Mobile Panels V2 for fail-safe operation. This affects the following HMI devices:

- Mobile Panel 277F IWLAN V2
- Mobile Panel 277F IWLAN (RFID Tag)

Procedures overview

1. Creating PLC for fail-safe operation
2. Installing a general station description (GSD)
3. Creating a module from the GSD file
4. Creating a connection between a module from the GSD file and the PLC
5. Creating Mobile Panel V2 for fail-safe operation

See also

Creating Mobile Panel (Page 5956)

Creating a module from the GSD file (Page 5952)

Installing a general station description (GSD) (Page 5952)

Creating PLC for fail-safe operation (Page 5951)

Creating a connection between a module and the PLC (Page 5955)

12.9.4.2 Creating PLC for fail-safe operation

Requirement

A project is open

Procedure

1. Click "Add new device" in the project navigation.
2. Click "PLC" in the "Add new device" dialog.
3. Select a PLC for fail-safe operation, for example, CPU-315F-2PN/DP. The "Devices & Networks" editor opens.
4. Open the device view.
5. Select the device and click on "Device overview".
6. Select the device.
7. Click "Properties > PROFINET interface [X2] >Ethernet addresses > Interface connected with > Add new subnet" in the inspector window.
8. Enter the IP address under "IP protocol > Set IP address in the project".
9. Enter a time for "Properties > PROFINET interface [X2] > F parameter > Set default F monitoring time for F I/O of this interface".
10. Specify the properties for fail-safe operation in "Properties > Fail-safe"
    - "F-capability activated"
    - "Basis for PROFIsafe addresses"
11. Specify further properties for fail-safe operation as usual, for example, protection level.

Result

You have created a PLC in the project and made the settings for fail-safe operation.

See also

Configuration overview (Page 5948)

12.9.4.3 Installing a general station description (GSD)

Introduction

A GSD file (device master data file) contains all the IO device properties. The language used to describe the GSD files is GSDML (Generic Station Description Markup Language). Install a GSD file to expand the hardware catalog.

Requirement

- The "Devices & Networks" editor is open.
- The "Network view" is open.
- The GSD file is available on your PC.

The GSD file can be found online:

GSD file of Mobile Panel V2 for fail-safe operation (http://support.automation.siemens.com/WW/view/de/19241467)

Procedure

1. Click "Options > Install general station description (GSD)".
2. In the "Install general station description" dialog, choose the directory in which the GSD files are located.
3. Select the GSD file from the list.
4. Click the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.

Result

You have installed the GSD file. You can find the new devices installed by means of the GSD files in the hardware catalog under "Additional field devices > PROFINET". Any problems that occur during the installation can be traced using the log file.

See also

Configuration overview (Page 5948)

12.9.4.4 Creating a module from the GSD file

Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- The "Network view" is opened in the "Devices & Networks" editor.

Procedure

1. Open the hardware catalog.
2. Open the directory "Additional field devices > PROFINET-IO > HMI > Siemens AG > SIMATIC HMI > 277".
3. Now open the folder of the Mobile Panel V2 for fail-safe operation whose device type you also have as hardware:
   - Mobile Panel 277F IWLAN V2 or
   - Mobile Panel 277F IWLAN V2 (RFID tag)
4. For Mobile Panel 277F IWLAN V2, select the module with the order number 6AV6645-0EC01-0AX1.

5. For Mobile Panel 277F IWLAN V2 (RFID tag), select the module with the order number 6AV6645-0EF01-0AX1.

Note

The order number of the module in the GSD file has to match the order number of the Mobile Panel V2 in the software.

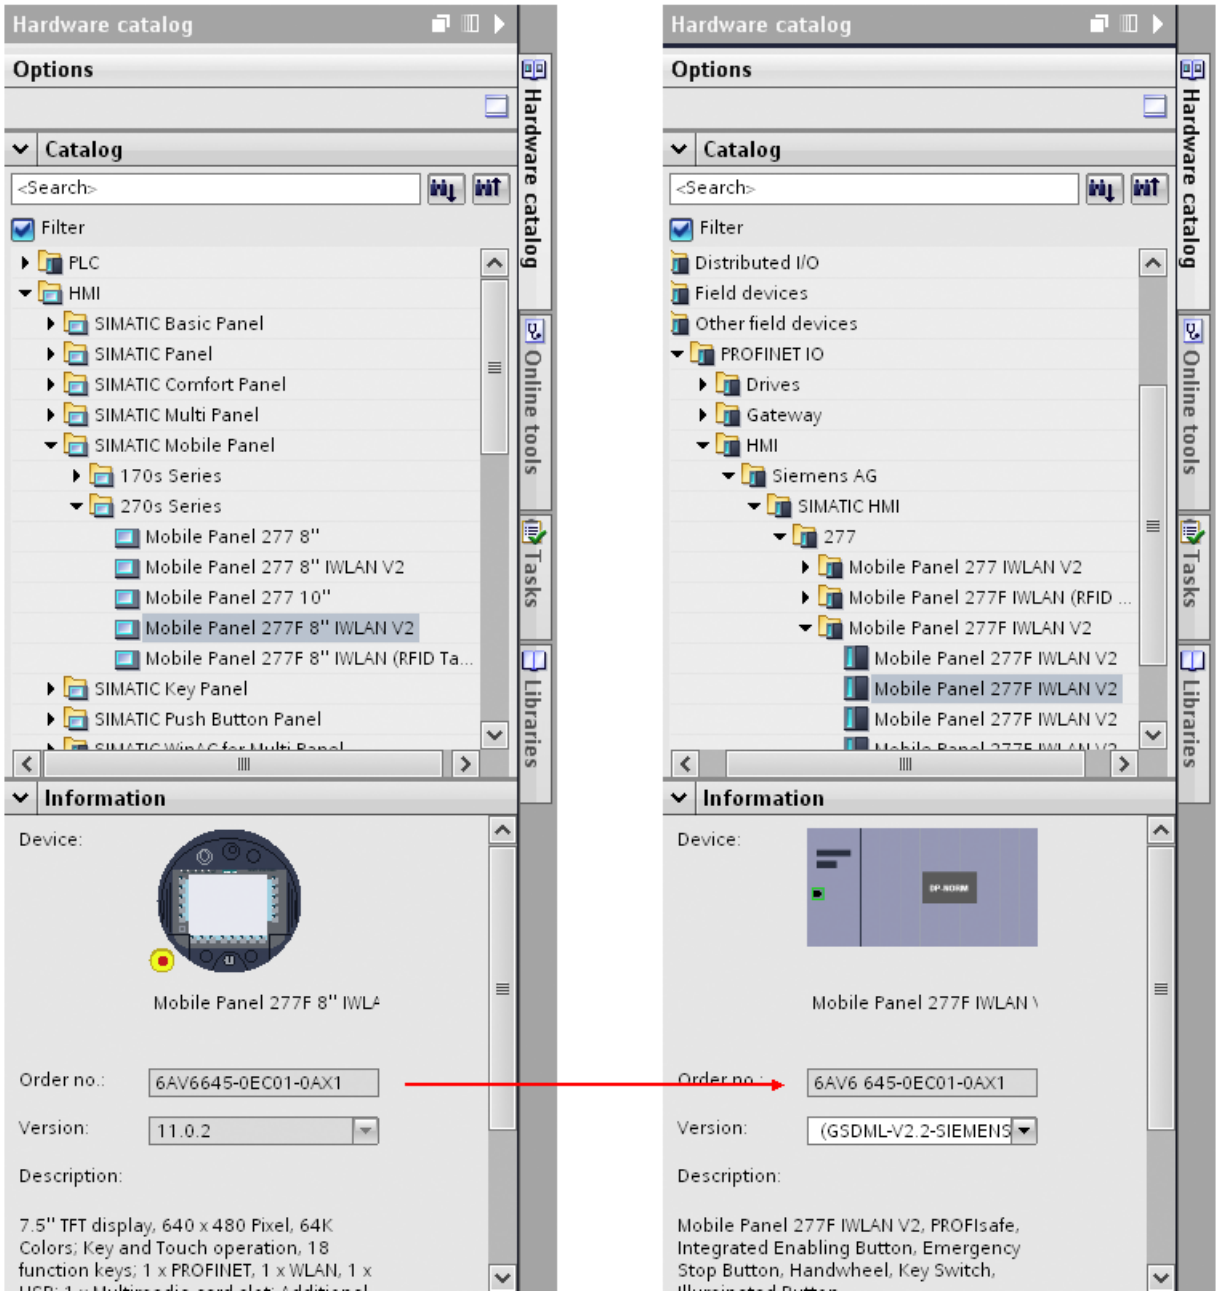


Figure 12-5 Left: Mobile Panel in the software. Right: Module in the GSD file

6. Drag-and-drop the desired module into the network view.

Result

You have created a module from the GSD file in your project.

PROFIsafe address (Page 5977)

Configuration overview (Page 5948)

12.9.4.5 Creating a connection between a module and the PLC

Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- A module from the GSD file has been created.
- The "Devices & Networks" editor is open.

Procedure

1. Open the "Network view".
2. Select the module and right-click on "Not assigned". The shortcut menu is opened.
3. Select "Assign new IO controller". A dialog box opens.
4. Select the IO controller and confirm with OK. A connection is established.
5. Open the device view
6. Click on "Mobile277Failsafe_IO_1" in the device overview.
7. Specify the properties for fail-safe operation in the inspector window under "Properties > PROFIsafe":
   - "F-block ID"
   - "F-Source-Add"
   - "F-Dest-Add"
8. Click on the module in the device view.
9. Assign a name under "Properties > General > Name" in the inspector window.
10. Assign an IP address under "PROFINET interface [X1] > Ethernet addresses > IP protocol > Set IP address in the project".

Result

The module from the GSD file is connected to the PLC. The module adopts the settings made in the PLC for PROFIsafe and PROFINET.

See also

Configuration overview (Page 5948)

12.9.4.6 Creating Mobile Panel

Requirement

- The inspector window is open.
- A PLC for fail-safe operation is created in the project, for example, CPU-315F-2PN/DP.
- The GSD device is created in the project.

Inserting Mobile Panel into the project.

1. Click "Add new device" in the project navigation.
2. Click on "HMI" in the "Add new device" dialog.
3. Select a Mobile Panel V2 for fail-safe operation, for example, Mobile Panel 277F IWLAN V2. The device is inserted into the project.

Note

Select the corresponding Mobile Panel for the module already installed from the GSD file.

Defining properties

1. Open the "Devices and Networks" editor.
2. Open the "Device view".
3. Select the Mobile Panel in the work area.
4. Open "Properties > General" in the inspector window.
5. To facilitate assignment in the project, enter the name of the associated module under "Name"
6. Enter the same IP address as in the module under "Set IP address in the project".
7. Activate "Set IP address using a different method".

Result

Entering the same IP address as in the device enables error-free communication. Alternatively, you can set the IP address on the Mobile Panel after loading the project.

Configuration overview (Page 5948)

12.9.5 Configuring KTP Mobile Panels for fail-safe operation

12.9.5.1 Creating KTP Mobile Panel for fail-safe operation

Introduction

Configure fail-safe operation in the "Devices & Networks" editor for the following KTP Mobile Panels:

- KTP400F Mobile Panel
- KTP700F Mobile Panel
- KTP900F Mobile Panel

Requirement

- The Inspector window is open.
- A PLC for fail-safe operation is created in the project, for example, CPU-1517F-2PN/DP.

Inserting a mobile panel into the project

1. Click "Add new device" in the project tree.
2. Click on "HMI" in the "Add new device" dialog.
3. Select a KTP Mobile Panel for fail-safe operation, for example, Mobile Panel KTP700F.
   The device is inserted into the project.

Configuring fail-safe operation for the mobile panel

1. Open the network view in the "Devices & Networks" editor.
2. Select the Mobile Panel in the work area.
3. In the Inspector window, select "Properties > General > Operating mode > IO device".
4. Assign the fail-safe PLC under "Assigned IO controller".
   PROFINET is activated and the transfer areas of the I-device communication are displayed.
5. In the Inspector window, click "Activate PROFIsafe" under "Properties > General" > PROFIsafe".
   PROFIsafe is activated and the F-parameters are displayed under "Properties > General> PROFIsafe parameters > F-parameters".
6. To enter a new F-monitoring time, select "Manual assignment of F-monitoring time".
7. Enter a F-monitoring time suitable for your HMI device and plant.

Result

The fail-safe operation of the KTP Mobile Panel is configured in WinCC. Now create the corresponding F-blocks in STEP 7 and interconnect them in the controller. Once the project is loaded, set the PROFIsafe address on the mobile panel.

You can find additional information on configuration and programming of fail-safe blocks in the manual "SIMATIC Safety - Configuration and Programming" of the STEP 7 documentation and in the device manual of your mobile panel.

12.9.5.2 Configuring the termination of the PROFIsafe connection

Procedure

Before you disconnect your Mobile Panel from a connection box, you have to terminate the connection to PROFIsafe.

Use the "Disconnect PROFIsafe" system function to close the PROFIsafe connection. The system function forwards your call to the fail-safe PROFINET module.

Requirements

- A mobile panel has been created for fail-safe operation, for example, KTP700F Mobile Panel.
- A screen has been created and opened.

Procedure

To configure the PROFIsafe the connection and disconnection, follow these steps:

- Configure the "Disconnect PROFIsafe" system function on a button, for example, or use it in a script.

Result

When you release the configured trigger to terminate the PROFIsafe connection in Runtime, a dialog opens.

12.9.6 Basics

12.9.6.1 Zones

Introduction

The section below applies to the following Mobile Panels:

- Mobile Panels Wireless, for example, Mobile Panel 277 IWLAN V2 and Mobile Panel 277F IWLAN V2
- KTP Mobile Panels, wired, e.g., Mobile Panel KTP700

A "Zones" work area is only visible for these HMI devices.

Note

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Depending on the HMI device selected, open the work area in the project window by double-clicking on "Zones" or "Zones and effective ranges".

Work area

For Mobile Panels Wireless, the "Zones" work area displays the zones that have been set up and the transponders assigned to them.

For wired Mobile Panels, the "Zones" work area shows the zones that have been set up and the associated box ID of the connection box.

Inspector window

When a zone is selected, edit the name and display name under "General".

For Mobile Panels Wireless, configure the limit of the zone around the transponder. The zone of a transponder has the events "Upon entry" and "Upon exit"

With wired Mobile Panels enter the box ID of the connection box. The zone of a connection box includes the event "Connected".

Configure the system function ActivateScreen" to the events.

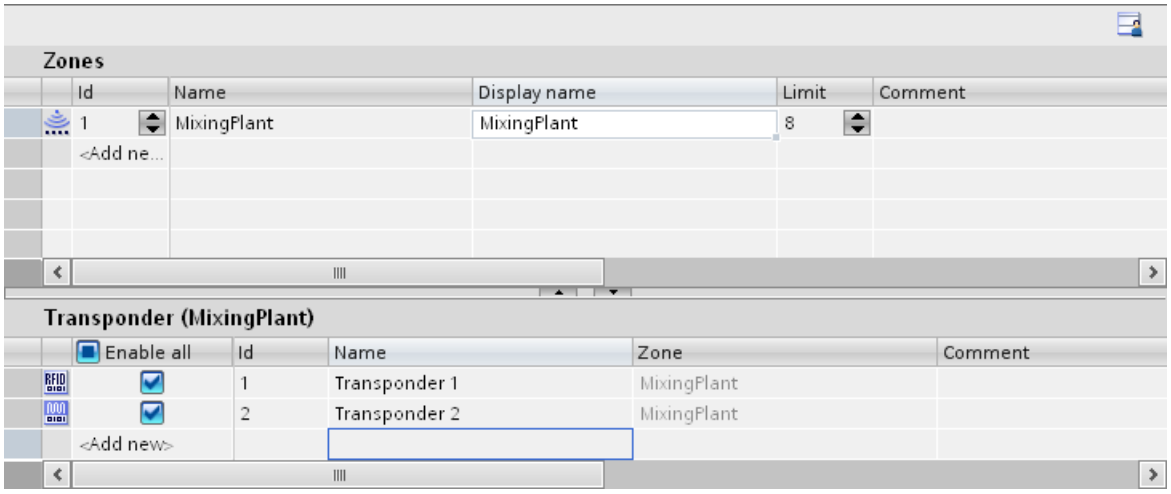
12.9.6.2 Zones work area at transponders

Introduction

The "Zones" work area displays the zones and the transponders assigned to them in table format. You create a list of transponders and assign certain transponders to a zone. The limit of the zone is defined by the maximum distance from the transponders.

Principle

The work area consists of the "Zones" and "Transponders" tables.



If you select a zone in the "Zones" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected zone.
- Transponder deactivated: The transponder is not yet assigned to any zone.
- Transponder not available: The transponder has already been assigned to another zone. To undo the assignment, switch to the relevant zone and deactivate the transponder.

The zone and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 254 zones may be configured.
- The zone ID must be unique and fall within the range from 1 - 254.
- You can initially configure transponders without assigning them to a zone.
- There may be no more than 255 transponders assigned to a zone.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

12.9.6.3 Zones work area on connection boxes

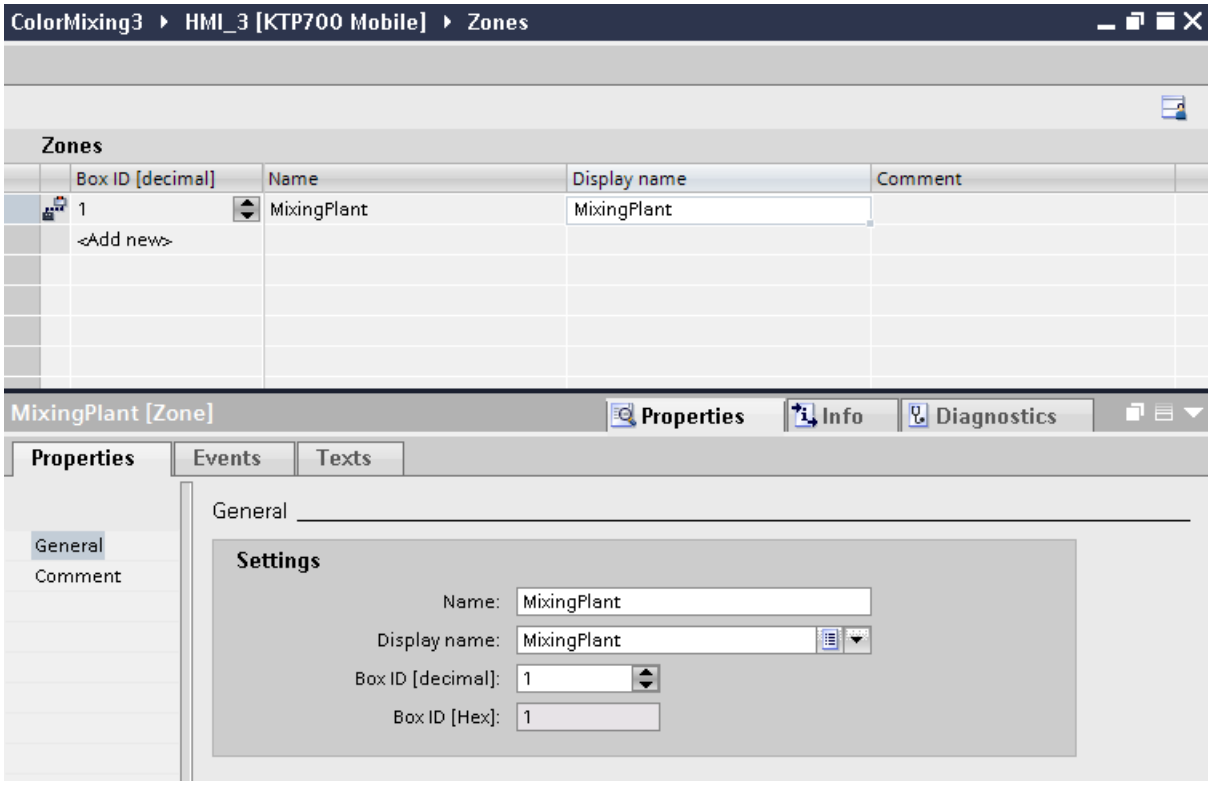
Introduction

The "Zones" work area displays the box IDs of the connection boxes and their zones in table format.

You create a list of box IDs of the connection boxes and assign specific connection boxes to a zone. The limit of the zone is defined by the length of the connecting cable to your Mobile Panel.

Principle

The work area consists of the "Zones" table.



The box ID is set on the connection box and can be read out from the HMI device.

12.9.6.4 Effective ranges

Introduction

The following section applies only to the Mobile Panels Wireless that support fail-safe operation, e.g. Mobile Panel 277F IWLAN V2. The "Effective ranges" work area is only visible for these HMI devices.

You set up effective ranges in order to control safety related operations. An effective range is defined by the maximum distance from one or more transponders.

Note

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Open the work area in the project window by double-clicking on "Zones & effective ranges". Click the "Effective ranges" tab.

Work area

The "Effective ranges" work area displays the effective ranges that have been set up and the transponders assigned to them.

Inspector window

When an effective range is selected, you can edit the names, display names and the limits of the effective range under the "General" category.

When you select a transponder, you can see both the effective range and the zone that are assigned to that transponder. You can only assign a transponder to one effective range so that the effective ranges do not overlap.

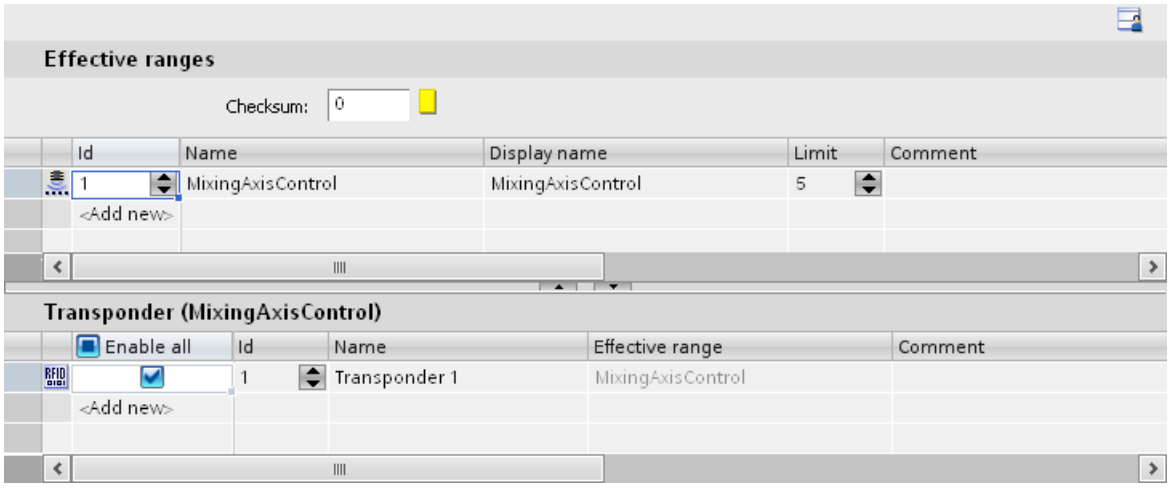
12.9.6.5 Effective ranges working area

Introduction

The "Effective ranges" work area displays the effective ranges and their transponders in table format. You create a list of transponders and assign certain transponders to an effective range. The limit of the effective range is defined by the maximum distance from the transponders.

Principle

The work area consists of the "Effective ranges" and "Transponders" tables.



The HMI device calculates a checksum from the local data so that the configured effective ranges and transponders reliably match those locally on the machine. The project cannot be started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges" editor.

When you select an effective range from the "Effective ranges" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected effective range.
- Transponder deactivated: The transponder is not yet assigned to any effective range.
- Transponder not available: The transponder has already been assigned to another effective range. To undo the assignment, switch to the relevant effective range and deactivate the transponder.
- The zone assigned to the transponder is displayed in addition to the effective range.

The effective range and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges may be configured.
- The effective range ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range must not be the same as its ID.
- You can initially configure transponders without assigning them to an effective range.
- There may be no more than 127 transponders assigned to an effective range.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

Effective range in Runtime

To log on to the effective range in Runtime, only the display name of the effective range appears to the operator in the Runtime language. The operator reads the effective range ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

12.9.6.6 Effective ranges (RFID)

Introduction

The following section only applies to the Mobile Panel 277F IWLAN (RFID tag) which supports fail-safe operation with RFID. The "Effective ranges (RFID)" work area is only visible with these HMI devices.

To monitor safety-related operator inputs, you set up effective ranges (RFID).

Note

For more information, refer to the operating instructions of the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Open the work area in the project window by double-clicking on "Effective ranges (RFID)".

Work area

The "Effective ranges (RFID)" work area displays the effective ranges that have been set up and the RFID Tags assigned to them.

Inspector window

When an effective range (RFID) is selected, you can edit the name, display name and ID of the effective range under the "General" category.

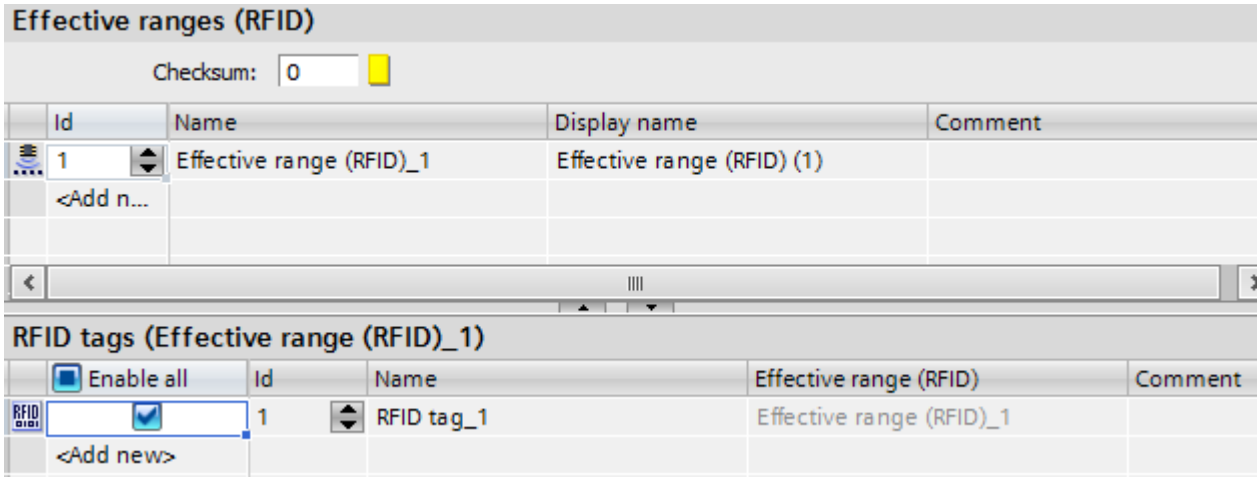
12.9.6.7 Work area for effective ranges (RFID)

Introduction

The "Effective ranges (RFID)" work area displays the effective ranges (RFID) and their RFID Tags in table format. You create a list of RFID Tags and assign specific RFID Tags to an effective range.

Principle

The work area consists of the "Effective ranges (RFID)" and "RFID Tags" tables.



The HMI device calculates a checksum from the local data so that the configured effective ranges (RFID) and RFID Tags reliably match those locally on the machine. The project cannot be started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges (RFID)" editor.

When you select an effective range (RFID) in the "Effective ranges (RFID)" table, the "RFID Tags" table displays the following:

- RFID Tag enabled: The RFID Tag is assigned to the selected effective range (RFID).
- RFID Tag disabled: The RFID Tag is not yet assigned to any effective range (RFID).
- RFID Tag not available: The RFID Tag has already been assigned to another effective range (RFID). To undo the assignment, switch to the relevant effective range (RFID) and deactivate the RFID Tag.

The IDs of the effective ranges (RFID) and RFID Tags are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges (RFID) may be configured.
- The effective range (RFID) ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range (RFID) must not be the same as its ID.
- You can initially configure RFID Tags without assigning them to an effective range (RFID).
- A maximum of 127 RFID Tags is available to assign to an effective range (RFID).
- The RFID Tag ID must be unique and fall within the range 1-65534.

The RFID Tag ID is written to the RFID Tag by the HMI device.

Effective range in Runtime

To log on to the effective range (RFID) in Runtime, only the display name of the effective range (RFID) is displayed to the operator in the Runtime language. The operator reads the effective range (RFID) ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

12.9.7 Working with zones on transponders

12.9.7.1 Configuring a zone in the transponder system

Validity

The next section applies to all Mobile Panels Wireless, e.g. Mobile Panel 277 IWLAN.

Introduction

You will have to set up a zone in order to carry out plant-specific operator control and monitoring tasks.

Requirements

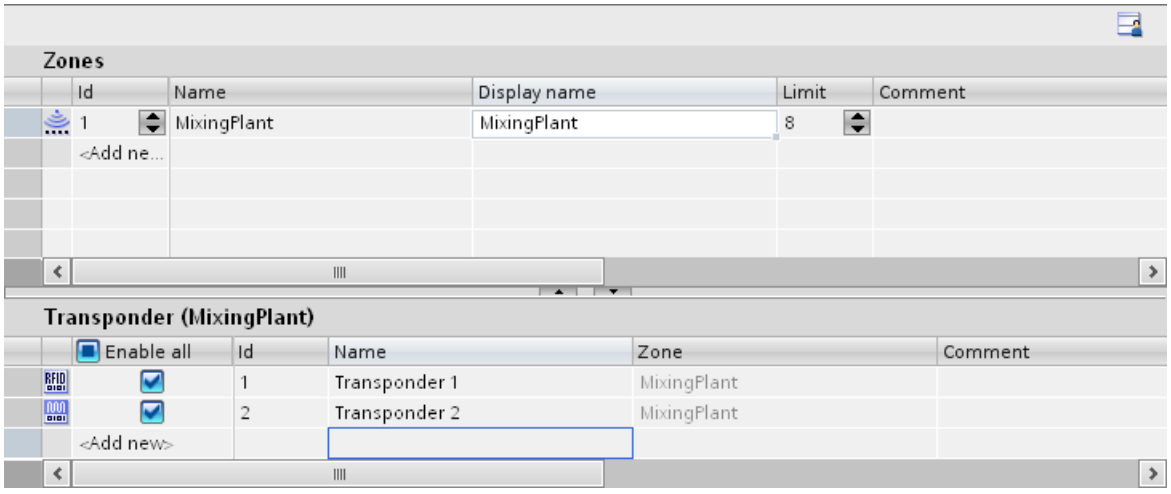
- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Zones" work area is open.

Procedure

1. Double-click "Add..." in the "Zones" table.
2. Enter the "MixingPlant" zone in the "Name" field.
3. Enter "MixingSystem" as the "Display name" for the zone at runtime. Enter zone "1" in the "ID" field.
4. Enter "8" meters as the zone "Limit".
5. Double-click "Add..." in the "Transponders" table.
6. Enter "Transponder 1" as the "Name" of the transponder.
7. Enter transponder "1" in the "ID" field.
   Then set transponder IDs on the transponder.
8. Enable the assignment of "Transponder 1".
   "Transponder 1" is assigned to the "MixingPlant" zone.
9. Repeat steps 6 to -9 accordingly for "Transponder 2".
   "Transponder 2" is assigned to the "MixingPlant" zone.

Result

The "MixingPlant" zone is configured as two conical areas arranged at a distance of 8 meters, regardless of the effective ranges: one area around "Transponder 1" and one around "Transponder 2".



The display name designates the zone in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.7.2 Displaying the screen on entering a zone

Introduction

Configure a screen change when entering and leaving the zone.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "MixingPlant" zone is configured.
- The "Plant_1" screen has been created and opened.
- The "MixingPlant_1" screen has been created and opened.
- The "Zones" work area is open.

Procedure

1. Select the "MixingPlant" zone from the "Zones" table.
2. Click "Properties> Events" in the Inspector window.
3. Click the event "On entry".

4. Select the "ActivateScreen" system function in the "function list".
5. Select "MixingPlant_1" as the "Screen name".
6. Click the event "On exit".
7. Select the "ActivateScreen" system function in the function list.
8. Select "Plant_1" as the "Screen name".

Result

The "MixingPlant_1" screen is displayed on the HMI device when you enter the "MixingPlant" zone. When you exit the zone, the "Plant_1" screen appears once more.

12.9.7.3 Displaying an object in relation to the zone

Validity

The following example is independent of the WLAN and applies to all Mobile Panels.

Introduction

You configure an I/O field that is only visible within a specific zone.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "Zone_id" variable of the "Int" data type has been created.
- A "Plant_1_Overview" screen has been created.

Procedure

1. Open the "Runtime Settings > General" editor.
2. Select the "Zone_id" tag as the "ID Zone/ Effective range".
3. Open the screen "Plant_1_Overview".
4. Drag and drop the "I/O box" object from the toolbox into the screen.
5. Click "Properties > Animations" in the Inspector window.
6. Click "Layout > Visibility."
7. Select "Zone_id" as the "tag".
8. Select "from" 1 "to" 1 as the "Range".
9. Enable "Visible".

Result

The IO field is only visible at runtime under the following conditions:

- The hard-wired Mobile Panel is connected to a connection box with ID = 1.
- The Mobile Panel Wireless is located in a zone with ID = 1, for example, the "MixingPlant" zone.

12.9.8 Working with zones on connection boxes

12.9.8.1 Configuring the zone of a connection box

Validity

The following section applies to all KTP Mobile Panels, for example, Mobile Panel KTP700.

Introduction

You will have to set up a zone in order to carry out plant-specific operator control and monitoring tasks.

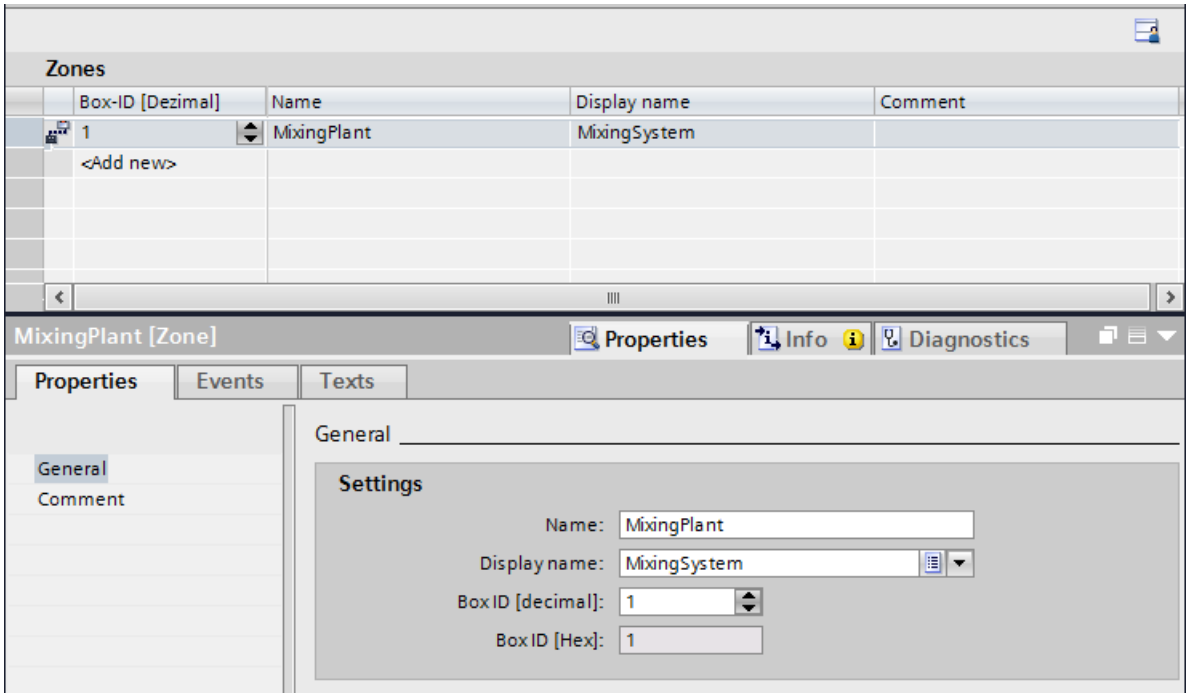
Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Zones" work area is open.

Procedure

1. Double-click "Add..." in the "Zones" table.
2. Enter the box ID of your connection box for "ID".
3. Enter the "MixingPlant" zone in the "Name" field.

4. Enter "MixingSystem" as the "Display name" for the zone at runtime.



5. Repeat these steps for all required connection boxes in the project.

Result

The "MixingPlant" zone is configured. The range of the zone is defined by the length of the connecting cable of the Mobile Panel.

The display name designates the zone in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.8.2 Configuring a screen for connection to connection box

Introduction

You configure the screen that is displayed when a Mobile Panel is connected to a connection box.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel KTP700.
- The "MixingPlant" zone is configured.
- The "Plant_1" screen has been created and opened.

- The "MixingPlant_1" screen has been created and opened.
- The "Zones" work area is open.

Procedure

1. Select the "MixingPlant" zone from the "Zones" table.
2. Click "Properties> Events" in the Inspector window.
3. Click on the "Connected" event.
4. Select the "ActivateScreen" system function in the "function list".
5. Select "MixingPlant_1" as "Screen name".

Result

When you connect your Mobile Panel to the connection box of the "MixingPlant" zone, the "MixingPlant_1" screen appears on the display of the HMI device.

12.9.9 Working with effective ranges

12.9.9.1 Overview

Introduction

The following configuration guide describes the steps needed to set up an effective range for fail-safe operation on a Mobile Panel Wireless.

Procedures overview

1. Configuring the effective range:
   You configure the "MixingAxisControl" effective range as a conical area around "Transponder1 " at a distance of 5 meters.
2. Configuring the name of the effective range:
   To ensure logon to the effective range, configure the object "Effective range - Name".
3. Configuring additional effective range objects:
   Configure additional objects for displaying the position and signal strength within an effective range.
4. Set parameters for loading:
   - PROFIsafe communication
   - WLAN network
   - Power management
   - Interface

5. Configure the data channel
6. Configure network operation
7. Set the transponder
8. Commissioning effective ranges
9. Switching on and Testing the HMI device
10. Start loading manually
11. Acknowledging the effective range at the plant:
    You acknowledge the effective ranges and their transponders.
12. Determine the checksum
13. Load the project once again with checksum:
    Enter the checksum you have determined in the project and load the project once again.
14. Test effective range

Note

For detailed information on items 5 to 14, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

12.9.9.2 Configure effective range

Introduction

You set up an effective range in order to control safety related operator input upstream of a machine or plant.

Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Effective ranges" work area is open.

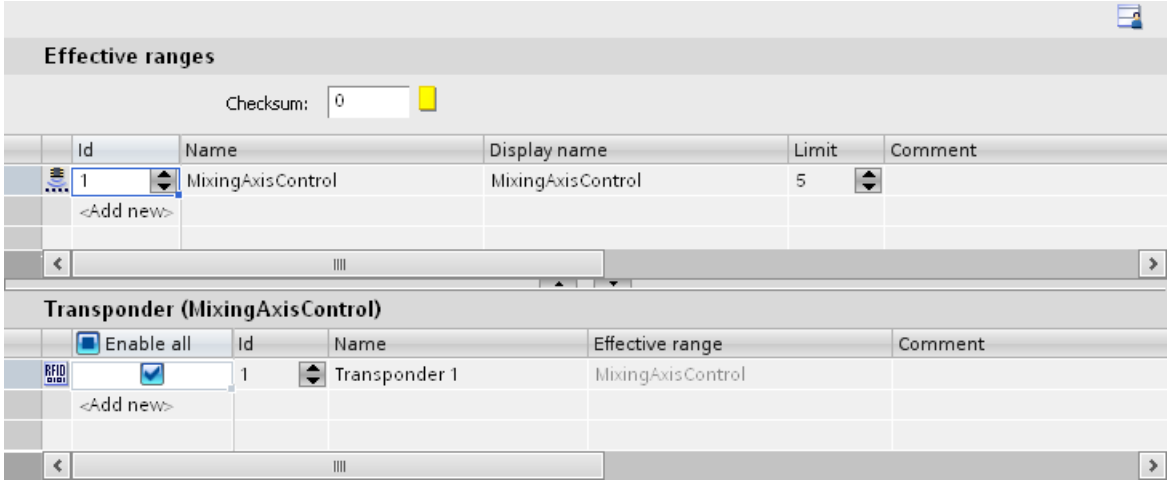
Procedure

1. Double-click "Add..." in the "Effective Ranges" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range.
3. Enter "Mixing_axis_PLC" as the "Display name" for the effective range at runtime.
4. Enter effective range "1" in the "ID" field.
   Make sure that the effective range ID matches the ID on the machine.
5. Enter "5" meters as the "Limit" of the effective range.

6. Double-click "Add..." in the "Transponders" table.
7. Enter "Transponder 1" as the "Name" of the transponder.
8. Enter transponder "1" in the "ID" field.
   Then set transponder IDs on the transponder.
9. Enable the assignment of "Transponder 1".
   "Transponder 1" is assigned to the "MixingAxisControl" effective range.

Result

You configure the "MixingAxisControl" effective range as a conical area around "Transponder 1" at a distance of 5 meters, regardless of the zones.



The display name designates the effective range in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.9.3 Configuring the effective range name

Introduction

Configure at least the "Effective range - Name" object so that an operator can log on and off a machine using an effective range. If you do not configure an effective range object for a Mobile Panel Wireless for fail-safe operation, a warning appears during generation.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range name" object from the "Elements" category in the toolbox.
2. Drag and drop the "Effective range - Name" object from the toolbox into the screen.

Result

If the operator clicks an object during runtime, he initiates logon or logoff of the HMI device to a machine that is assigned to an effective range.

12.9.9.4 Configuring additional Mobile Wireless objects

Introduction

You will need to configure other objects in order to display further information about the effective range during testing, for example.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range - Signal" object from the "Elements" category in the toolbox.
2. Drag and drop the "Effective range - Signal" object from the toolbox into the screen.
3. Repeat steps 1 and 2 with the "WLAN - Reception" object.

Result

The "Effective range - Signal" object indicates how accurately the Mobile Panel Wireless is within an effective range. The "WLAN - Reception Quality" object displays the signal strength of the WLAN wireless connection.

12.9.10 Working with effective ranges (RFID)

12.9.10.1 Overview

Validity

The next section applies only to Mobile Panels Wireless with RFID, for example, Mobile Panel 277F IWLAN (RFID Tag).

Introduction

The following configuration guide describes the steps required to set up an effective range (RFID) for fail-safe operation on a Mobile Panel Wireless with RFID.

Procedures overview

1. Configure effective range (RFID):
   You configure the effective range (RFID) "MixingAxisControl".
2. Configuring the name of the effective range (RFID):
   To ensure logon to the effective range, configure the object "Effective range - Name (RFID)".
3. Set parameters for loading
4. Configure the data channel
5. Configure network operation
6. Install RFID Tag in the plant
7. Turn on the HMI device and enable loading mode
8. Loading a project
9. Write the suitable IDs to the RFID Tags in the plant
10. Determine the checksum
11. Load the project once again with checksum:
    Enter the checksum you have determined in the project and load the project once again.
12. Test effective range (RFID)

Note

For detailed information on items 4 to 12, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

12.9.10.2 Configuring effective range (RFID)

Introduction

You set up an effective range (RFID) to control safety-related operator input upstream of a machine or plant.

Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Effective ranges (RFID)" work area is open.

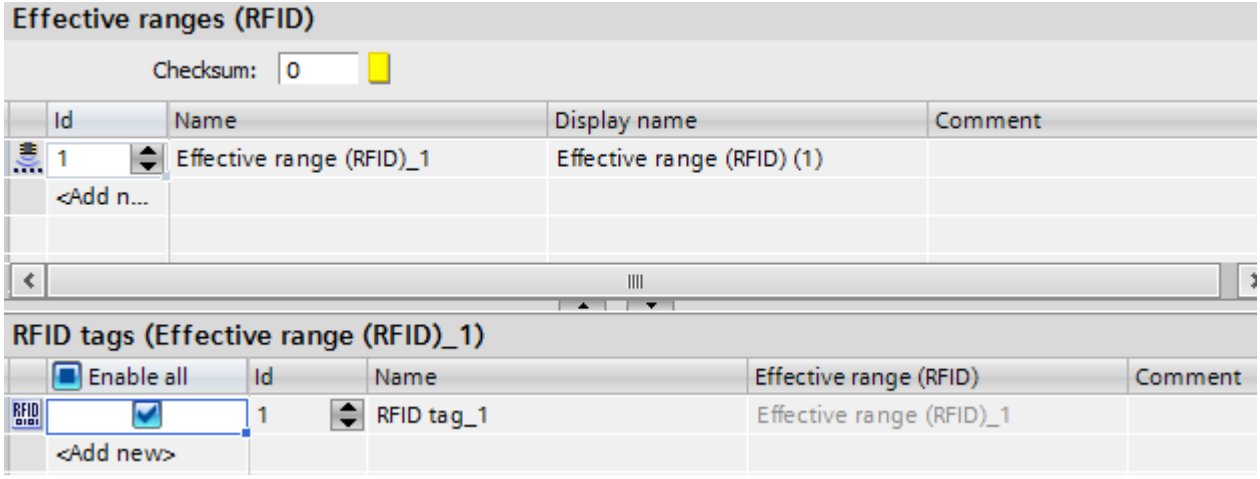
Procedure

1. Double-click "Add..." in the "Effective Ranges (RFID)" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range (RFID).
3. Enter "MixingAxisControl" in the "Display name" field of the effective range (RFID).

4. Enter "1" in the "ID" field of the effective range (RFID).
   Make sure that the effective range (RFID)-ID matches the ID on the machine.
5. Double-click "Add..." in the "RFID Tag table.
6. Enter "RFID Tag 1" as the "Name" of the RFID Tag.
7. Enter "1" as the "ID" of the RFID Tag. Then set the RFID Tag-ID for the RFID Tag.
8. Enable the assignment of "RFID Tag 1".
   "RFID Tag 1" is assigned to the effective range (RFID) "MixingAxisControl".

Result

The effective range (RFID) "MixingAxisControl" is configured.



The display name describes the effective range (RFID) in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.10.3 Configuring the effective range name (RFID)

Introduction

Configure the "Effective range - Name" object so that an operator can log on and off a machine using an effective range (RFID). If you do not configure the "Effective range-Name" object for a Mobile Panel Wireless RFID with (RFID), a warning will appear during generation.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range - Name (RFID)" object from "<Elements" in the toolbox.
2. Drag and drop the "Effective range - Name (RFID)" object from the toolbox into the screen.

Result

If the operator clicks an object during runtime, he will initiate logon or logoff of the HMI device to a machine which has been assigned to an effective range (RFID).

12.9.11 Reference

12.9.11.1 PROFIsafe address

Validity

The PROFIsafe address is only available for fail-safe operation for the Mobile Panel Wireless.

Note

Additional information on fail-safe operation can be found in the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

PROFIsafe address

The PROFIsafe address used for fail-safe I/Os in PROFIsafe communication is unique on the entire network and on all stations. On the Mobile Panel Wireless, you create a default value in the project and load it to the HMI device. You can also store a PROFIsafe address on the HMI device.

The PROFIsafe address fall within the range from 1 to 65534. The two PROFIsafe addresses (in the Engineering System and on the HMI device) are checked for formal validity.

The PROFIsafe address is loaded as follows at the start of Runtime:

- You programmed a valid PROFIsafe address in the Control Panel.
  The HMI loads the PROFIsafe address set in the Control Panel.
- You did not program a valid PROFIsafe address in the Control Panel.
  The HMI loads the PROFIsafe address set in the project.

  Note

  The invalid address 65.535 is programmed by default in the Control Panel of the HMI device. The HMI loads the address set in the project.

See also

Power Management (Page 5978)

Zone ID / connection point ID (Page 5978)

12.9.11.2 Power Management

Validity

In the "Runtime Settings > Power Management" editor, configure the energy-saving mode of a Mobile Panel.

Power Management

The Mobile Panel Wireless can save energy in the following ways:

- Reduce brightness - minimal saving
- Switch off display - significant saving

You can also indicate after how long without operator input the power management function is enabled. The communication link is maintained. The time for "Switch monitor off" is longer than the time for "Reduce brightness".

See also

PROFIsafe address (Page 5975)

12.9.11.3 Zone ID / connection point ID

Validity

In the "Runtime Settings > General" configure an internal tag which, depending on the value, shows specific information on the display of the HMI device.

Note

Mobile Panels Wireless with RFID

For Mobile Panels Wireless with RFID, the area "Zone ID / Connection point ID" is not available.

Zone ID / connection point ID

This field is used to configure an internal tag that contains the following value at runtime in relation to the type of HMI device:

- The ID of the connection box or effective range to which the hard-wired Mobile Panel is connected.
- The ID of the zone in which the Mobile Panel Wireless is located. If the value is set to 255, then the HMI device is not in any zone.

PROFIsafe address (Page 5975)

12.10 Planning tasks

12.10.1 Field of application of the Scheduler

Definition

You can use the Scheduler to configure tasks to run independent of the screen in the background. You create tasks by linking system functions or scripts to a trigger. The linked functions will be called when the triggering event occurs.

Example of an application

The Scheduler is used to execute event-controlled tasks automatically. For example, you use a task to automate the following:

- Regular swap out of log data
- Printout of an alarm report when an alarm buffer overflow occurs
- Printout of a report at shift end
- Monitoring a tag
- Monitoring of a user change

Note

The availability of the listed examples is determined by the HMI device.

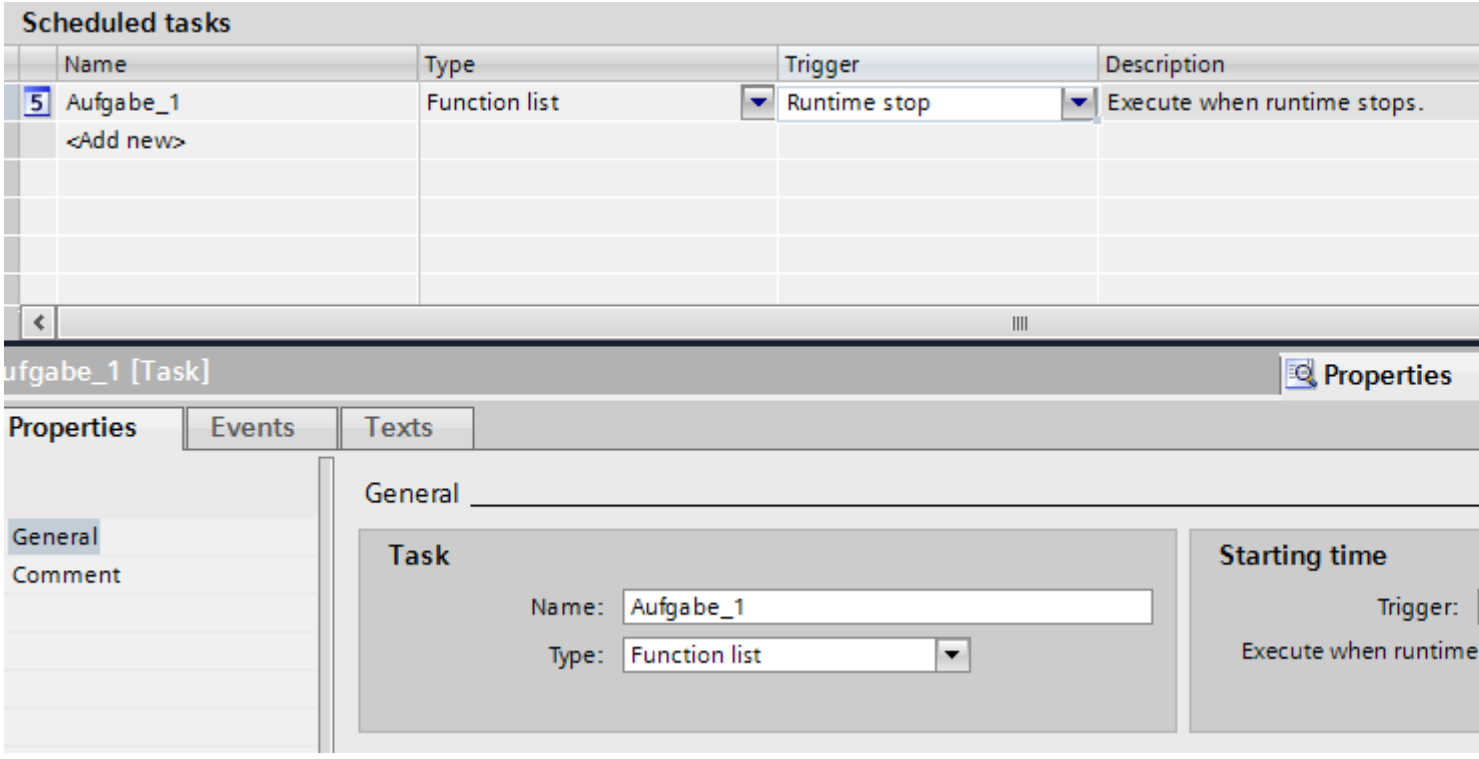
See also

Work area of the "Scheduler" editor (Page 5980)

12.10.2 Working with tasks and triggers

Introduction

A task consists of a trigger and a task type.



Starting a task

Controlled by a trigger, the Scheduler starts the task linked to the trigger.

12.10.3 Basics

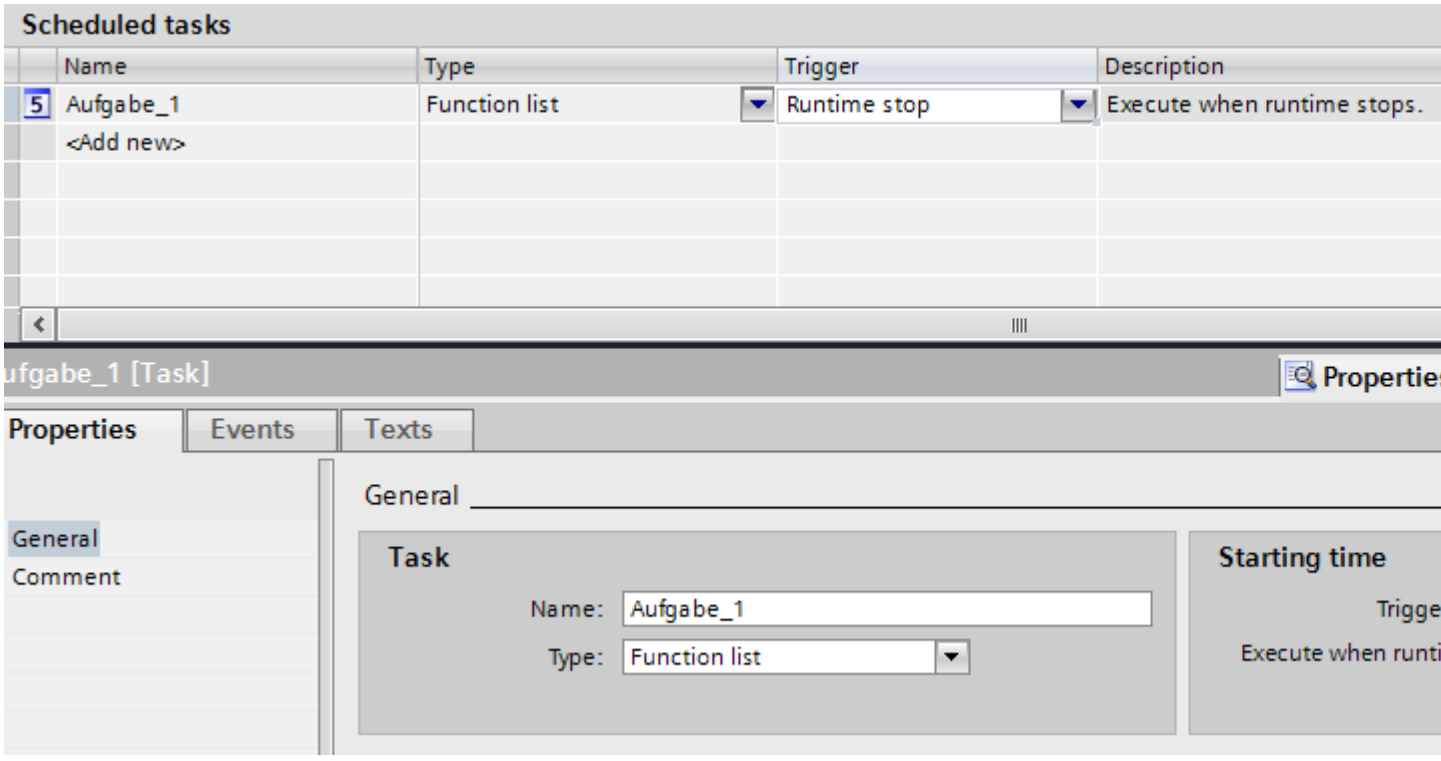
12.10.3.1 Work area of the "Scheduler" editor

Introduction

Double-click on "Scheduler" to open it in the project view. The work area shows the scheduled tasks, which consist of the trigger and the task type, for example, the function list.

Structure

The work area consists of the table of jobs.



The table of tasks shows specified tasks with their properties, such as triggers. You select a task type and a trigger. You assign a name and a comment to the task. The description provides a written summary of the task including the timing for the task.

Inspector window

The "Properties" tab of the Inspector window is split into two parts.

The "Job" area lists the name of the job and the job type. The "Starting time" area shows the trigger. The area is different depending on the trigger selected.

In the "Events" tab use the function list with system functions that will be executed in the task.

Note

You can obtain more detailed information about the elements of the user interface using the tooltips. To do so, move the mouse pointer to the relevant object or press <F1> if the object has already been selected.

See also

Field of application of the Scheduler (Page 5977)

Triggers (Page 5983)

12.10.3.2 Function list

Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function. You can configure exactly one function list for each task.

Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

12.10.3.3 Function list

Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function or a local script. You can configure exactly one function list for each task.

Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

Processing of system functions and scripts

System functions and scripts in a function list are processed in Runtime sequentially from top to bottom.

Auto-Hotspot

Use a script with loops, conditional statements and abort conditions to program non-sequential and conditional procedures.

12.10.3.4 Triggers

Triggers

Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

Event trigger

When a task is linked to a system event, the task will be triggered by the event. System events include, for example, Runtime stop, screen change, user change, etc.

Each system event can only be configured once for each HMI device.

Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the system event "Shutdown". This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "Runtime stop" system event available again.

Note

The available triggers depend on the HMI device.

See also

Work area of the "Scheduler" editor (Page 5978)

Triggers

Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

Types of triggers

The Scheduler recognizes different types of triggers:

Acyclic triggers

They consist of a specification for the date and time of day. Tasks with an acyclic trigger are performed once by the Scheduler on the specified date and at the specified time.

Cyclic triggers

Tasks linked to a cyclic trigger occur regularly at a specific point in time.

- Standard cycle: With a standard cycle, the beginning of the first interval coincides with the start of Runtime. The length of the interval is determined by the cycle.
- Trigger with defined starting time: You specify a start time and a time interval. You can use cyclic triggers to perform tasks on a daily or weekly basis, for example. For example, you can select a "Weekly" trigger to specify a week as the interval. You specify the beginning of the interval with the day of the week and the time of day.

Note

User-defined cycles

You have defined your own cycles. You can only use cycles in the Scheduler whose maximum value amounts to one hour.

Event trigger

When a task is linked to a system event, the task will be triggered by the event. In contrast to cyclic triggers, system events usually occur acyclically. A Runtime stop is a system event, for example.

Each system event can only be configured once for each HMI device.

Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the "User change" system event. This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "User change" system event available again.

Note

The available triggers depend on the HMI device.

Timers for cyclic triggers

Timers for cyclic and acyclic triggers

You have the option to change the start time of a task dynamically in Runtime. You can select an HMI variable as the timer. The value of the tag determines the start time for the task during Runtime.

Note

An HMI tag must be of the type "DateTime". A PLC tag must be of the type "Date and Time" or "DTL".

As long as the operator does not change the tag after Runtime starts, the start time configured in the task is valid. As soon as the operator enters a change to the tag, the current value of the tag is always the start time. To reset the configured time as the start time, the operator has to enter the configured time again.

12.10.4 Planning jobs

12.10.4.1 Planning tasks with acyclic triggers

Introduction

You are planning a one-time Runtime stop for maintenance work. The task starts a function which requires Runtime to stop.

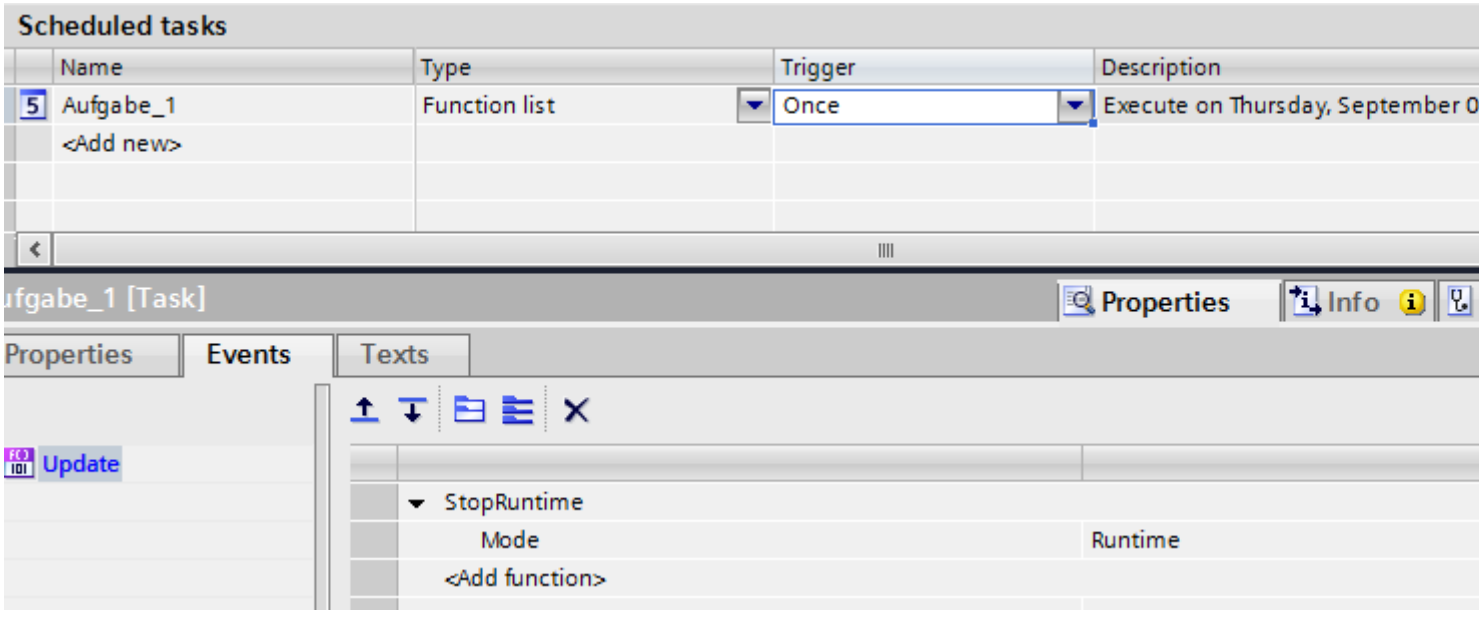
Requirements

- The "Scheduler" editor is open.
- The Inspector window is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Maintenance at end of year" as the "Name."
3. Select "Once" as the "Trigger."
4. Select "31.12.2008" in the "Properties > Properties > General > on" field of the Inspector window.
5. Enter the time "18:00" in the "at" field.
6. Click "Properties > Events" in the Inspector window.

7. Select the "StopRuntime" system function in the function list.
8. Select "Runtime" as the "Mode".



Result

The task is executed once. Runtime will be stopped at 18:00 on December 31, 2008.

Note

"StopRuntime" event on RT Professional

Please note that the "StopRuntime" event means runtime is in the process of ending and that some functionalities are therefore no longer available.

12.10.4.2 Planning tasks with cyclic triggers

Introduction

You plan a job that provides a weekly printout of a report.

Requirements

- A "Weekly report" report has been created.
- The "Scheduler" editor is open.
- The Inspector window is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Weekly report printout for end of shift" as the "Name."
3. Select "Weekly" as the "Event".
4. Open the "Properties" tab in the Inspector window.
5. Select "Friday" in the "on day" field of the "Starting point" area.
6. Enter the time "18:00" in the "at" field in the "Starting point" area.
7. Click in the "Events" tab of the "Function list" on the entry "No function."
8. Select "Print/PrintReport" as the function.
9. Select "Weekly report" report.

Result

The task is executed weekly. The report "Weekly report" will be printed every Friday at 18:00 hours.

12.10.4.3 Planning tasks with event triggers

Introduction

You plan a task that generates a screen change when the user changes.

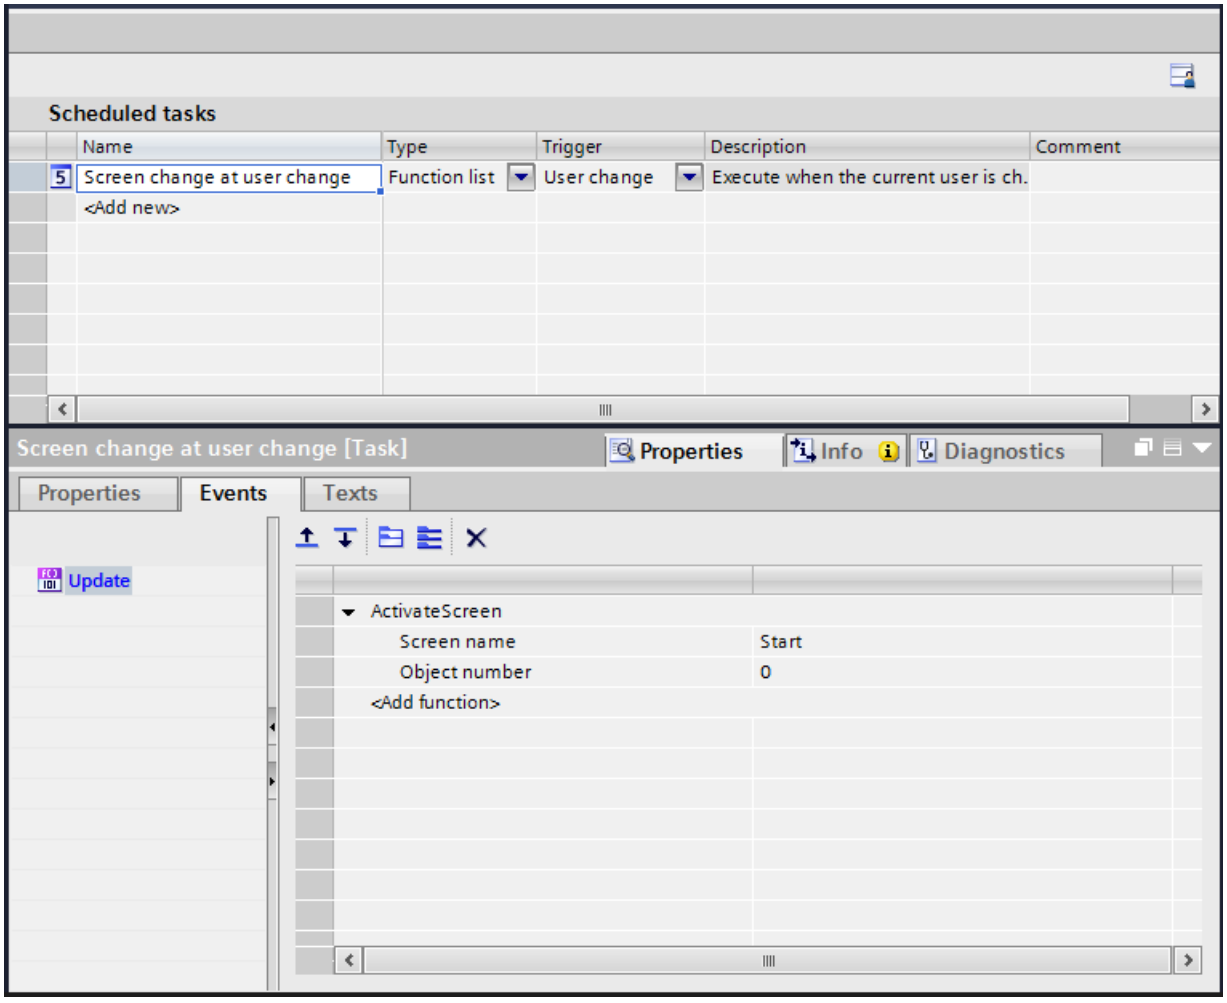
Requirements

- The "Scheduler" work area is open.
- You have created the "Start" screen.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Screen change at user change" as the "Name."
3. Select "User change" as the "Trigger."
4. In the Inspector window, select "Properties > Events".

5. Select the "Screen/ActivateScreen" system function in the function list.
6. Select the "Start" screen in the screen name field.



Result

The task is executed with the "User change" event. When a new user logs on successfully, the "Start" screen is called up.

12.10.4.4 Administer task

Changing the designation

1. In the work area, double-click the field in the "Name" column.
2. Change the name of the task.
3. Confirm your entry with <Return>.

As an alternative, you can change the designation in the "Job > Name" box of the Inspector window.

Changing triggers

1. In the work area, mark the field in the "Trigger" column.
2. Open the drop-down list using the button and select the trigger you require.

You can alternatively change the trigger in the "Starting time" area of the Inspector window.

Deleting a task

1. Select one or more lines for the tasks to be deleted.
2. Open the shortcut menu with the right button and select the menu command "Delete".

As an alternative, delete one or more tasks by using the <Del> button.

12.10.5 Examples

12.10.5.1 Example: Terminating Runtime every day

Task

You plan a job that terminates Runtime every day at the end of work.

Requirements

- The "Scheduler" work area is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Runtime stop at end of work" as the "Name."
3. Select "Daily" as the "Event."
4. Open the "Properties" tab in the Inspector window.
5. Enter the time "21:00" in the "at" field in the "Starting point" area.
6. Open the "Events" tab in the Inspector window.
7. Click the "No function" entry in the "Function list".
8. Select "System functions/System/StopRuntime" as the function.

Result

Runtime is terminated every day at 21:00.

12.10.5.2 Example: Update user following change of user

Task

Configure an I/O field which displays the logged on user. Configure a task which updates the I/O field when the logged on user changes.

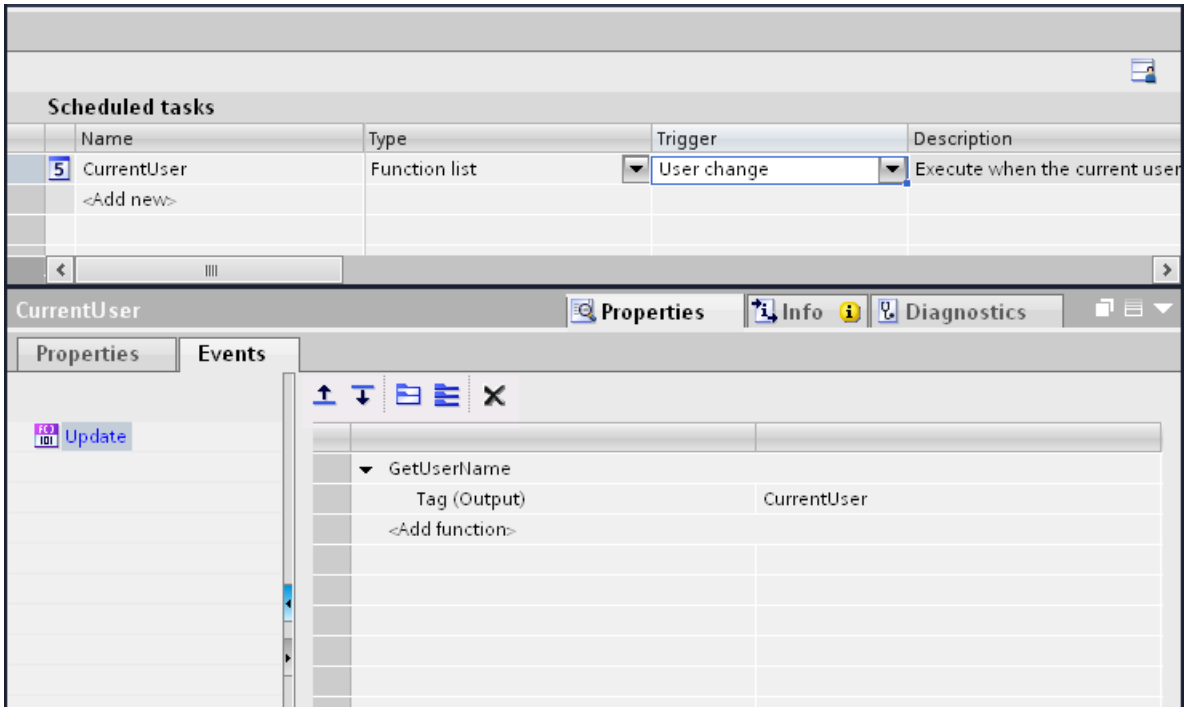
Requirements

- A "CurrentUser" tag of the "String" type is created.
- A screen has been created and opened.
- An I/O field is created in the screen.

Procedure

1. Click on the "I/O field" object.
2. In the Inspector window, select "Properties > Properties > General":
   - Select "String" as the "Display format."
   - Select "CurrentUser" as the "Variable."
   - Select "Output" as the mode.
3. Change to the work area of the Scheduler.
4. Click "Add..." in the table of the task area.
5. Enter "CurrentUser" as the "Name".
6. Select "User change" as the "Trigger."
7. In the Inspector window, select "Properties > Events".

8. Select the system function "ReadUserName" from the "User Management" group in the function list.
9. Select "CurrentUser" as the "Variable."



Result

When a new user logs on successfully, the "ReadUserName" function is called up. The "CurrentUser" tag is updated and displayed in the I/O field of the newly logged on user.

If a user does not log on successfully, the logged on user is logged off. The I/O field continues to display the user previously logged on until a new user logs on successfully.

12.10.5.3 Example: Changing the starting point of a job in Runtime

Example: Changing the starting point of a task in Runtime

Introduction

A cyclic trigger, for example "Starting daily at 18:00," is configured in the Engineering System. The time "18:00" is fixed as a constant. To change the start time in Runtime, select a tag as the "Timer." The value of the tag determines the start time of the task during Runtime.

Task

You plan a task that swaps out log data daily and has the "LogTime" tag as the timer. You configure a "LogTime" tag in an input field.

Requirements

- The "DataLogSource" source log has been created as a data log.
- The "DataLogDestination" destination log has been created as a data log.
- A "ChangeLogTime" screen has been created.

Procedures overview

1. Creating a timer tag: You create a tag with which you change the starting point of the log data swap in Runtime.
2. Configuring a Date/time field: The operator changes the starting point of the task by using the Date/Time field in Runtime.
3. Configure the task with a timer tag: You create a task whose start time can be changed dynamically in Runtime.

Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

See also

Example: 2. Configuring a Date/time field (Page 5993)

Example: 1. Configuring a tag for Runtime

Task

In the following example you configure the "LogTime" variable.

Procedure

1. Open the "HMI tags" editor.
2. Click "Add..." in the table of the task area.
3. Enter "LogTime" as the "Name" of the variable.
4. Select "Internal variable" in the "Connection" column.
5. Select "DateTime" in the "Date type" column.

Result

A variable of the "DateTime" type has been created.

Example: 2. Configuring a Date/time field

Task

In the following example you configure a Date/time field. To change the starting point of the task in Runtime, link the "LogTime" variable to the Date/time field.

Requirements

- The "LogTime" variable of the "DateTime" type has been created.
- The "ChangeLogTime" screen is open.

Procedure

1. In the toolbox view, drag-and-drop a "Date/time field" from the "Basic objects" category to the screen.
2. In the Inspector window, click "Properties >Properties > General".
3. Disable the "System time."
4. Click "Variable" and select "LogTime."
5. Disable "Display date" and enable "Display time."
6. Select "Input/output" as the "Mode."
7. Click "Properties > Miscellaneous."
8. Enter "LogDataTimeField" as the "Name".

Result

The operator enters a time using the created date/time field.

See also

Example: Changing the starting point of a task in Runtime (Page 5989)

Example: 3. Configuring a swap to archive with a timer variable

Task

In the following example you configure a task with a timer tag with which you change the starting point of the task in Runtime.

Requirements

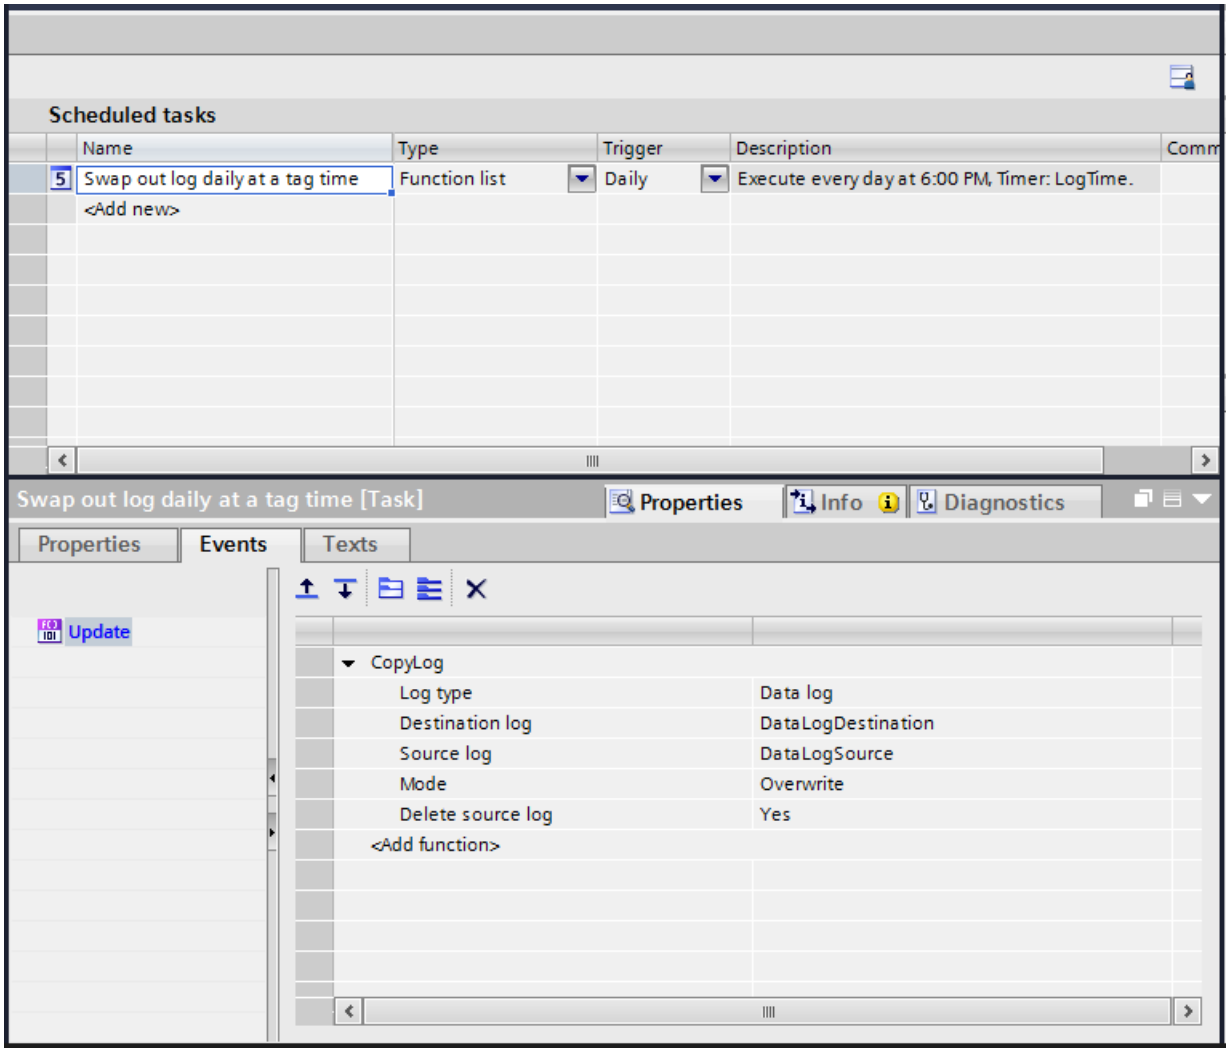
- The "LogTime" tag has been created.
- The "DataLogSource" source log has been created as a data log.

- The "DataLogDestination" destination log has been created as a data log.
- The Scheduler work area is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Swap out log daily at a tag time" as the "Name".
3. Select "Daily" as the "Trigger".
4. In the Inspector window "Properties >Properties > General > at" enter the time "18:00".
5. Select the "LogTime" tag as the "Standard timer".
6. In the Inspector window, open "Properties > Events".

7. Select the "System functions/Logs/CopyLog" system function in the function list.
8. Select these settings:
   - Select "Data log" as the "Log type".
   - Select "DataLogDestination" as the "Destination log".
   - Select "DataLogSource" as the "Source log".
   - Select "Overwrite" as the "Mode".
   - Select "Yes" for "Delete source log".



Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

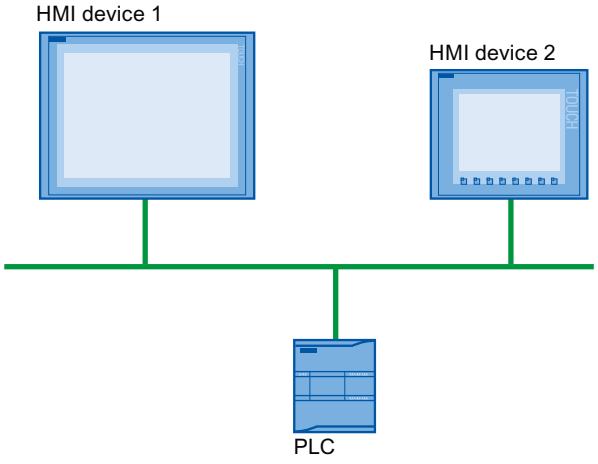
12.11 Communicating with PLCs

12.11.1 Basics of communication

12.11.1.1 Communication between devices

Communication

The data exchange between two devices is known as communication. The devices can be interconnected directly or via a network. The interconnected devices in communication are referred to as communication partners.



Data transferred between the communication partners may serve different purposes:

- Display processes
- Operate processes
- Output alarms
- Archive process values and alarms
- Document process values and alarms
- Administer process parameters and machine parameters

Communication partners

Communication between the following devices is described in more detail in this section:

- PLC
  The PLC controls a process by means of a user program.
- HMI device
  You use the HMI device to operate and monitor the process.

Basic information for all communication

The basis for all types of communication is a network configuration. In a network configuration, you specify the connection that exists between the configured devices.

With the network configuration, you also ensure the necessary prerequisites for communication, in other words:

- Every device in a network is assigned a unique address.
- The devices carry out communication with consistent transmission characteristics.

Automation system

The following characteristics describe an automation system:

- The PLC and HMI device are interconnected
- The network between the PLC and HMI device is configured

Communication between HMI devices

The HTTP protocol is available for communication between HMI devices.

For more detailed information, refer to the documentation on the SIMATIC HMI HTTP protocol.

Communication via a uniform and vendor-neutral interface

With OPC (Openess Productivity Collaboration), WinCC has a uniform and manufacturer-neutral software interface. This interface enables standardized data exchange between industrial, office, and manufacturing applications.

For more detailed information, refer to the documentation for OPC.

12.11.1.2 Devices and networks in the automation system

Introduction

To set up an automation system, you must configure, parameterize, and interconnect the individual devices.

You insert PLCs and HMI devices into the project in the same way. Likewise, you configure the two devices in the same way.

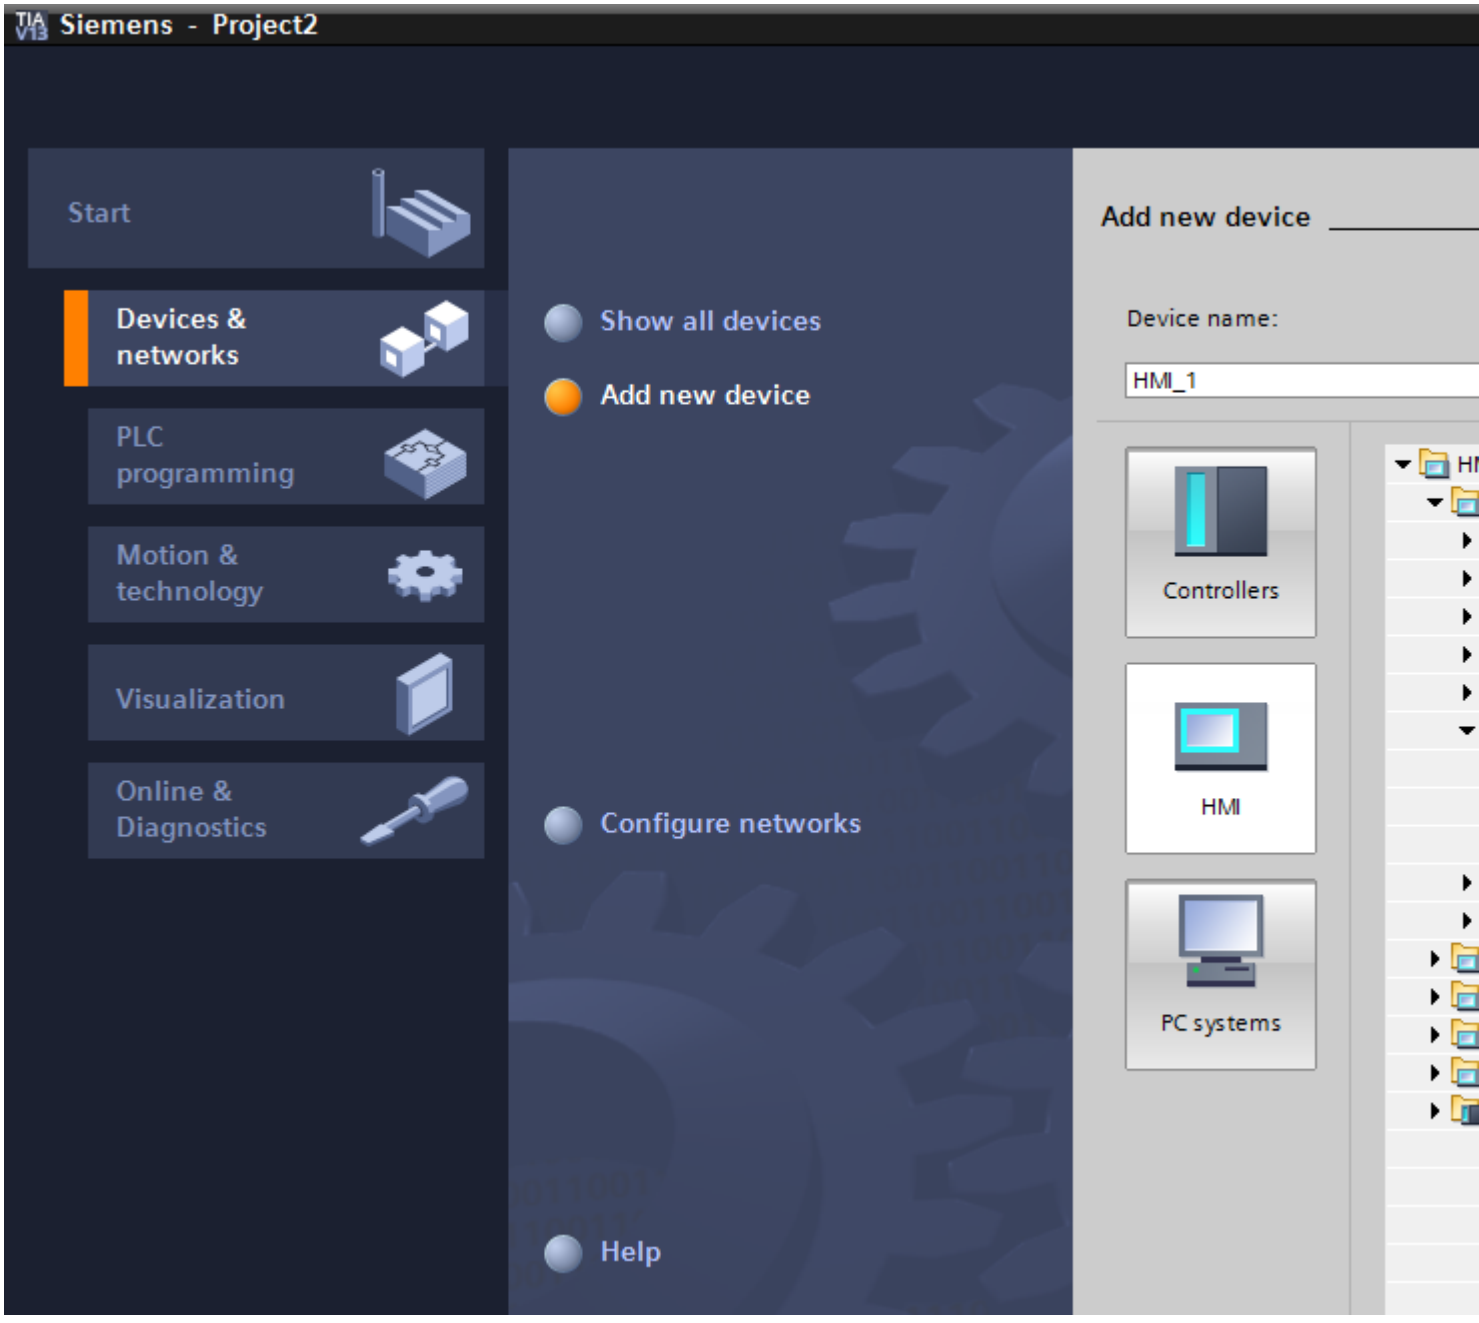
Automation system setup:

1. Insert PLC into the project.
2. Insert HMI device into the project.
3. Network the devices together.
4. Interconnect the devices.

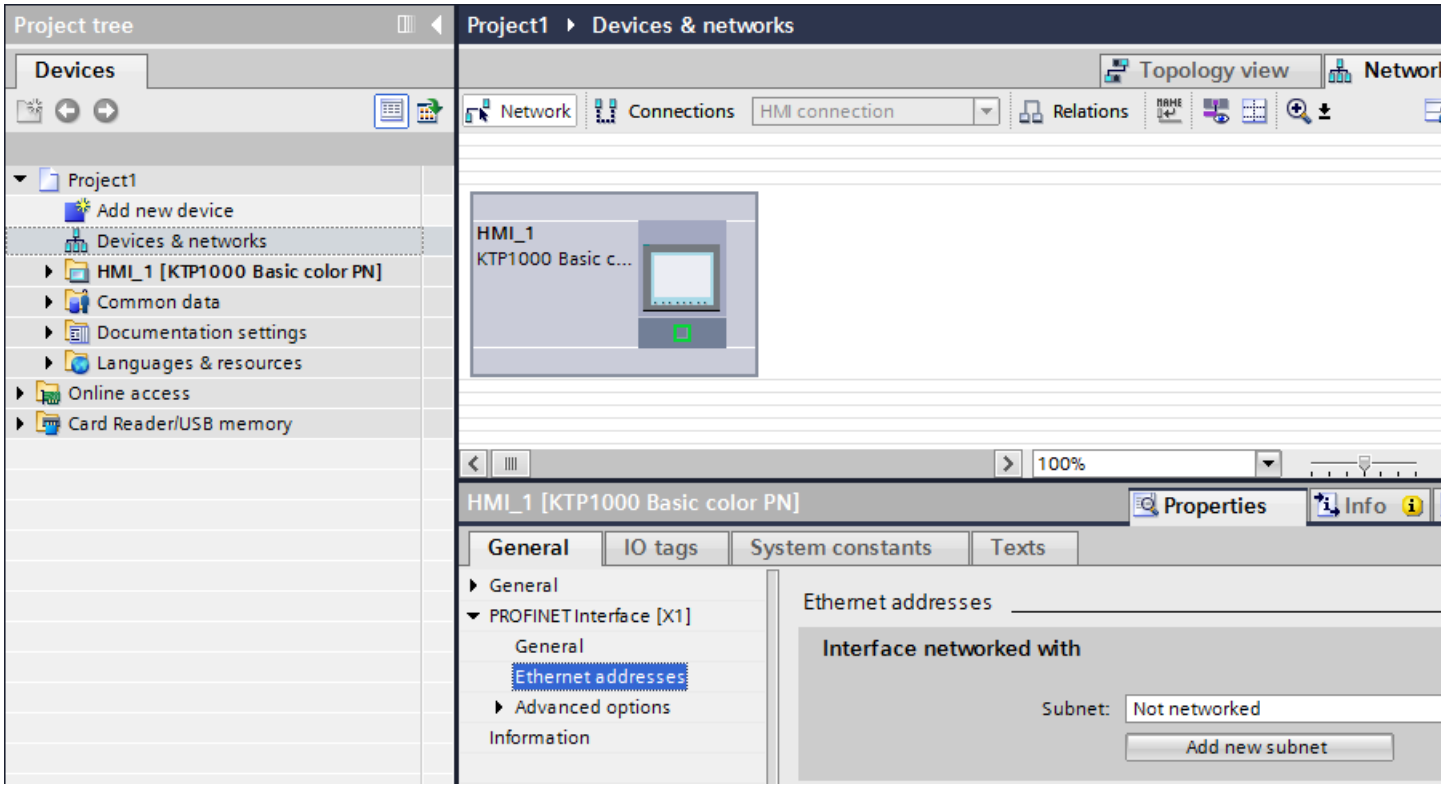
Inserting devices

If you have created a project, you can add a device in the portal view or project view.

- Portal view

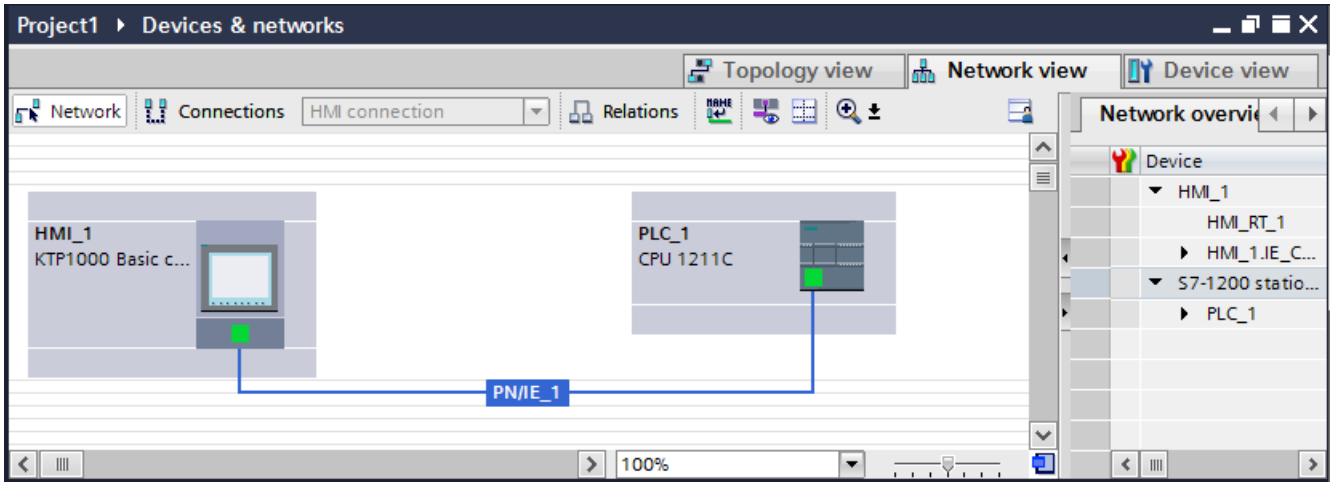


- Project view



Networking devices

You can network the interfaces of the communication-capable devices conveniently in the "Devices & Networks" editor. In the networking step, you configure the physical device connections.

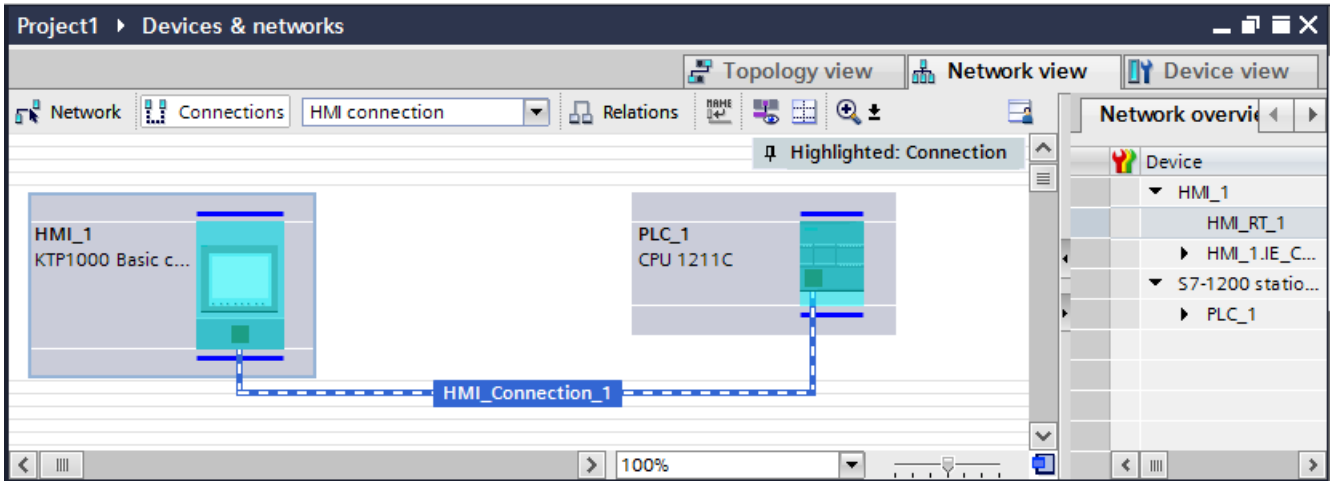


The tabular network overview supplements the graphical network view with the following additional functions:

- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect communication-capable components to subnets that have been created.

Connecting devices

After you network the devices together, you configure the connection. You configure the "HMI connection" connection type for communication with the HMI device.



12.11.1.3 Data exchange using tags

Communication using tags

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

Working with tags

See the chapter "Working with tags" for further information about configuring tags.

12.11.1.4 Data exchange using area pointers

Communication using area pointers

Area pointers are parameter fields. WinCC receives information from these parameter fields in Runtime during the course of the project. This information contains data on the location and size of data areas in the PLC.

During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

The area pointers are managed centrally in the "Connections" editor. Area pointers are used to exchange data from specific user data areas.

You use the following area pointers in WinCC:

- Data record
- Date/time
- Coordination
- Job mailbox
- Date/time PLC
- Project ID
- Screen number

The availability of the various area pointers is determined by the HMI device used.

12.11.1.5 Communication drivers

Communication drivers

A communication driver is a software component that establishes a connection between a PLC and an HMI device. The communication driver thus enables the assignment of process values to HMI tags.

The interface as well as the profile and transmission speed can be chosen, depending on the HMI device used and the connected communication partner.

12.11.2 Editors for communication

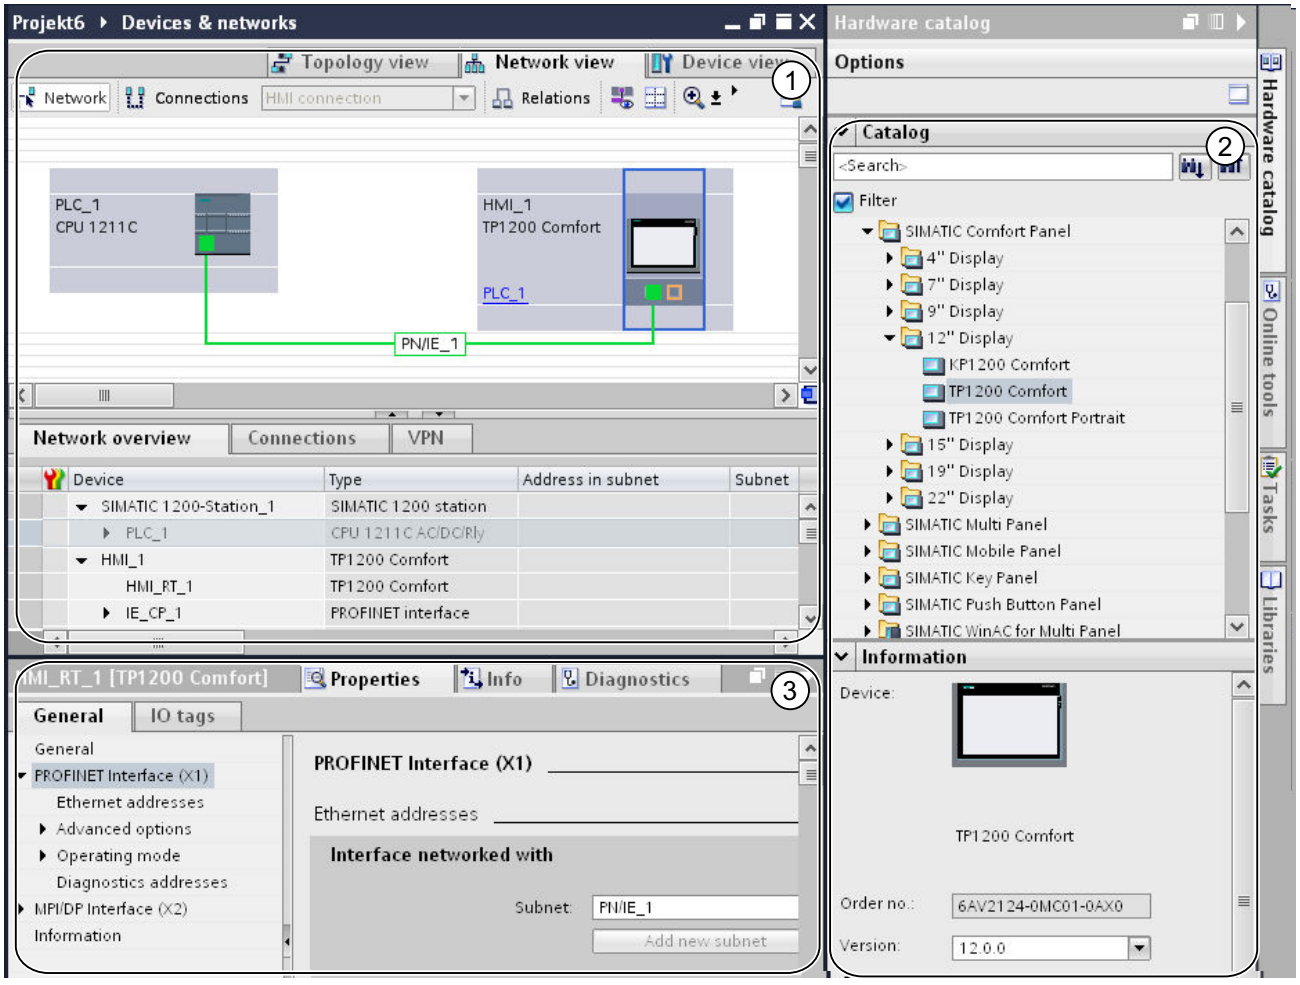
12.11.2.1 "Devices & networks" editor

Function of the hardware and network editor

The "Devices & networks" editor is the development environment for networking, configuring and assigning parameters to devices and modules.

Configuration

The "Devices & networks" editor consists of the following components:



1 Device view, network view, topology view
2 Hardware catalog
3 Inspector window

The "Devices & networks" editor provides you with three different views of your project. You can switch between these three views at any time depending on whether you want to produce and edit individual devices and modules, entire networks and device configurations or the topological structure of your project.

The inspector window contains information on the object currently marked. Here you can change the settings for the object marked.

Drag the devices and modules you need for your automation system from the hardware catalog to the network, device or topology view.

12.11.2.2 Network view

Introduction

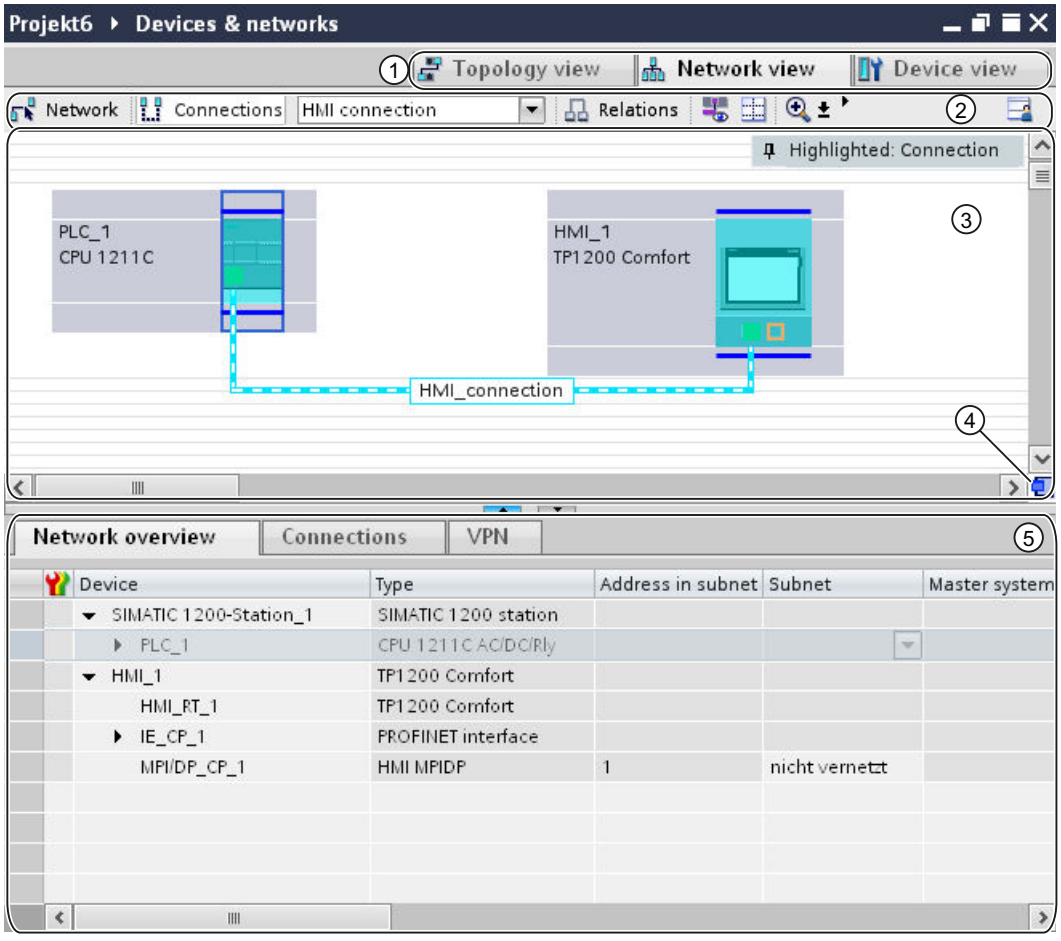
The network view is a working area of the hardware and network editor.

You undertake the following tasks in network view:

- Configuring and assign device parameters
- Networking devices with one another

Structure

The following diagram shows the components of the network view:



1 Changeover switch: network view/device view/topology view

2 Toolbar of network view

3 Graphic area of network view

4 Overview navigation

5 Table area of network view

You can use your mouse to change the spacing between the graphic and table areas of the network view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down.

You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Mode to network devices.
	Mode to create connections. You can select the connection type using the adjacent drop-down list.
	Mode to create relations.
	Show interface addresses.
	Adjust the zoom setting. You can select the zoom setting or enter it directly in the adjacent drop-down list. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables the page break preview. Dashed lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the network view displays any network-related devices, networks, connections and relations. In this area, you add devices from the hardware catalog, connect them with each other via their interfaces and configure the communication settings.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

The table area of the network view includes various tables for the devices, connections and communication settings present:

- Network overview
- Connections
- I/O communication

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

12.11.2.3 Network data

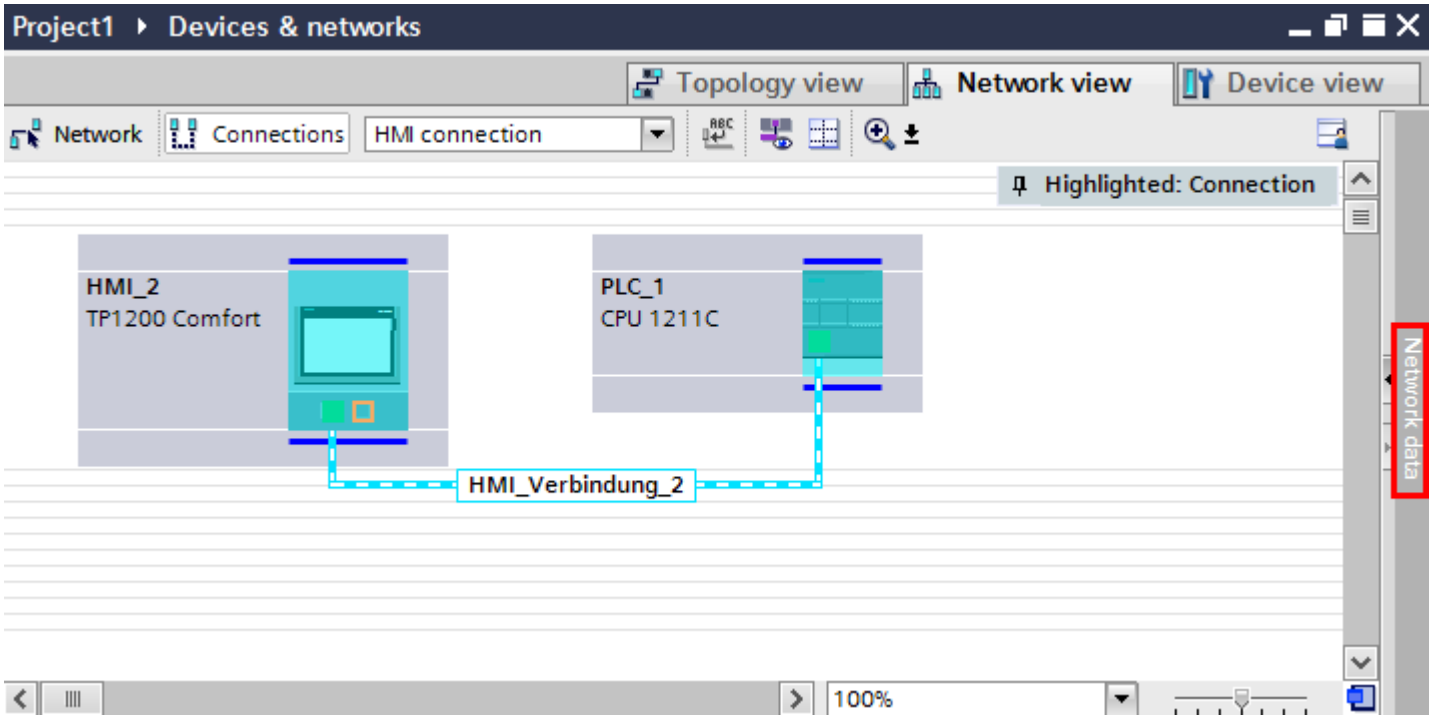
Introduction

The "Network view" editor also gives you a tabular view of the "Network data" in addition to the graphic network view.

You have the following selections in the "Network data" editor:

- Network overview
- Connections
- VPN
- I/O communication

You open the "Network data" below the graphic network overview.



Basic functions

The network data are displayed in tabular form and support the following basic functions for editing a table:

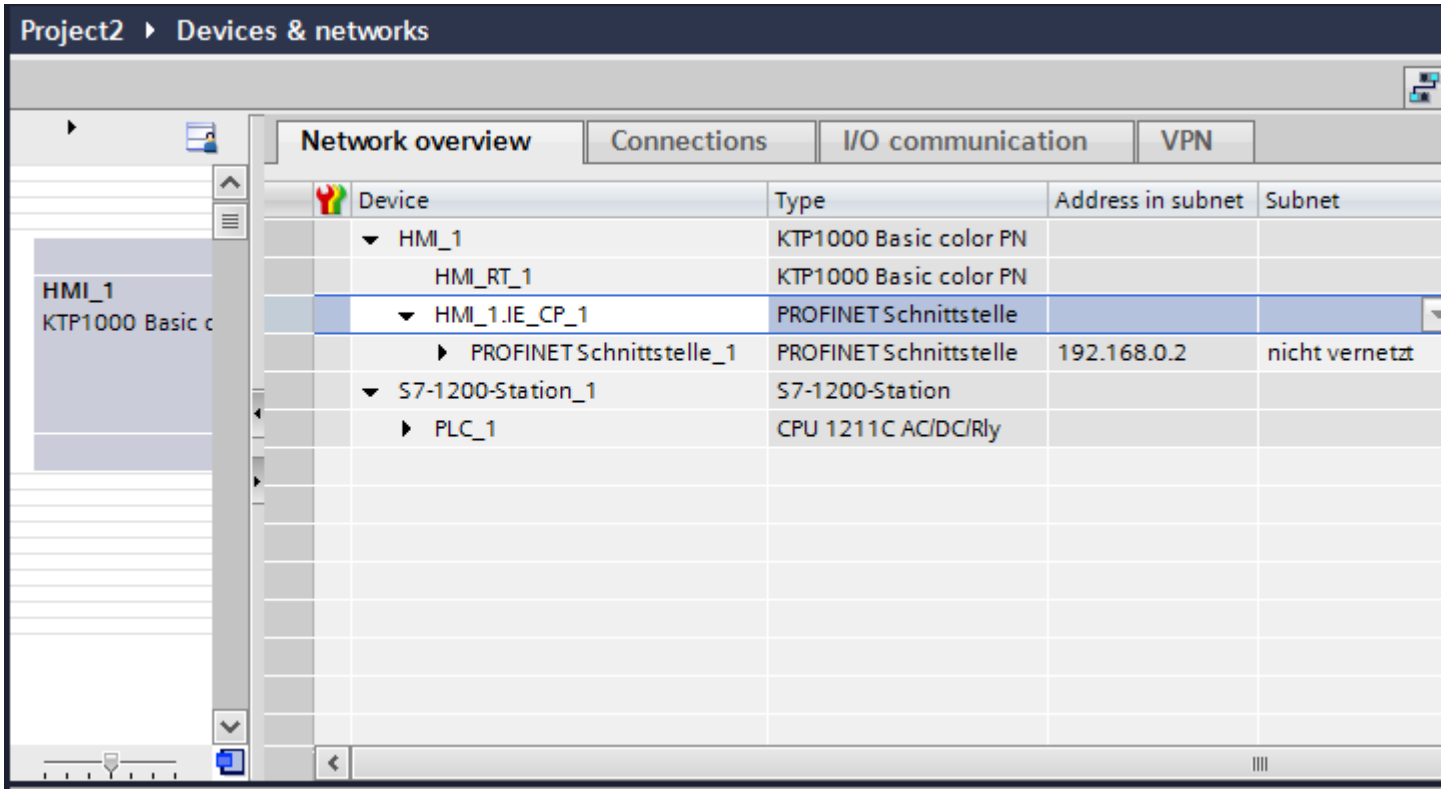
- Displaying and hiding table columns
  Note: The columns of relevance to configuration cannot be hidden.
- Optimizing column width
- Sorting table
- Displaying the meaning of a column, a row or cell using tooltips.

Network overview

The tabular network overview adds the following functions to the graphic network view:

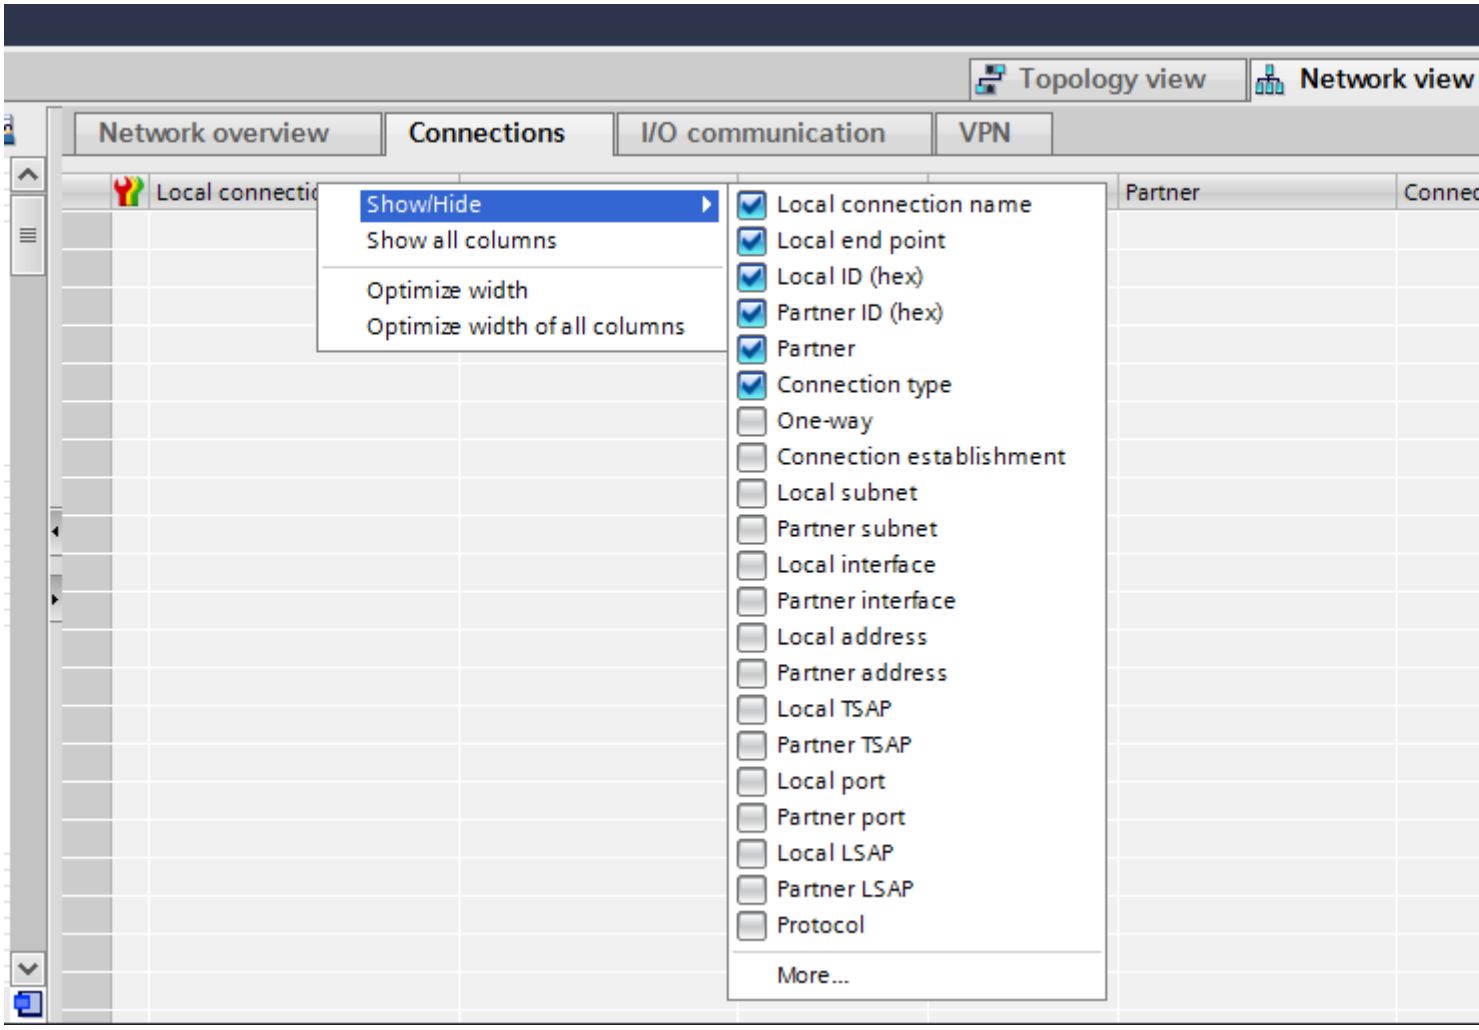
- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect components capable of communication with created subnets.

The



Connections

You will find additional network data under "Connections".



12.11.2.4 Diagnostics of online connections

Diagnostics of online connections

You can read out the diagnostics data of existing connections in the TIA Portal.

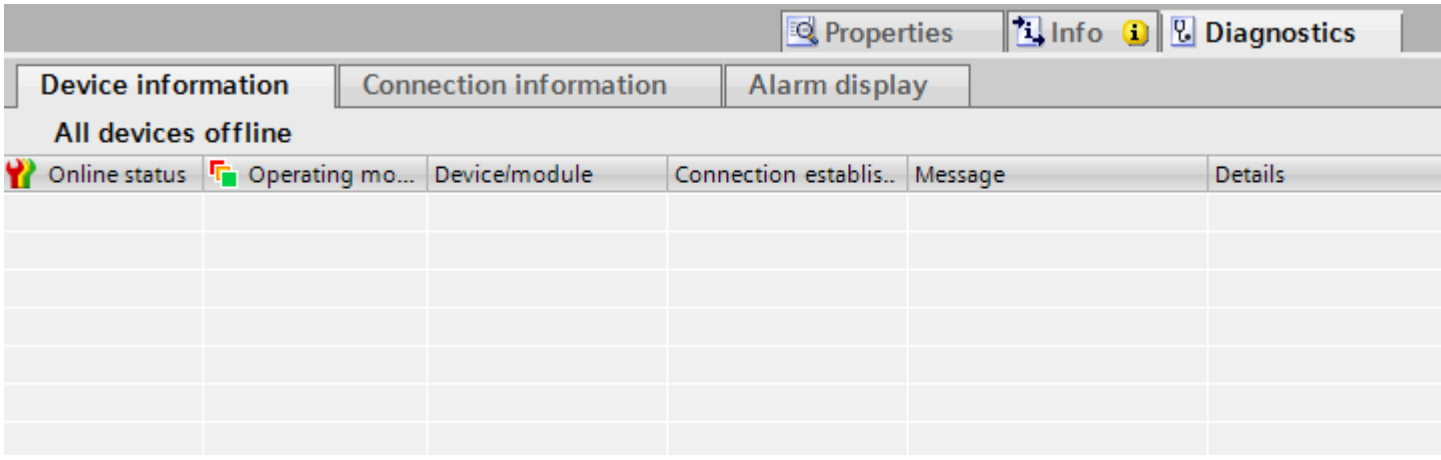
The "Diagnostics" function shows the connection data in tabular form in the Inspector window.

Requirements

- Devices must be in "Online" mode.

Device information

The diagnostics data of all devices in "Online" mode is displayed in the "Diagnostics > Device information" Inspector window.



The following data is displayed:

- Online status
- Operating mode

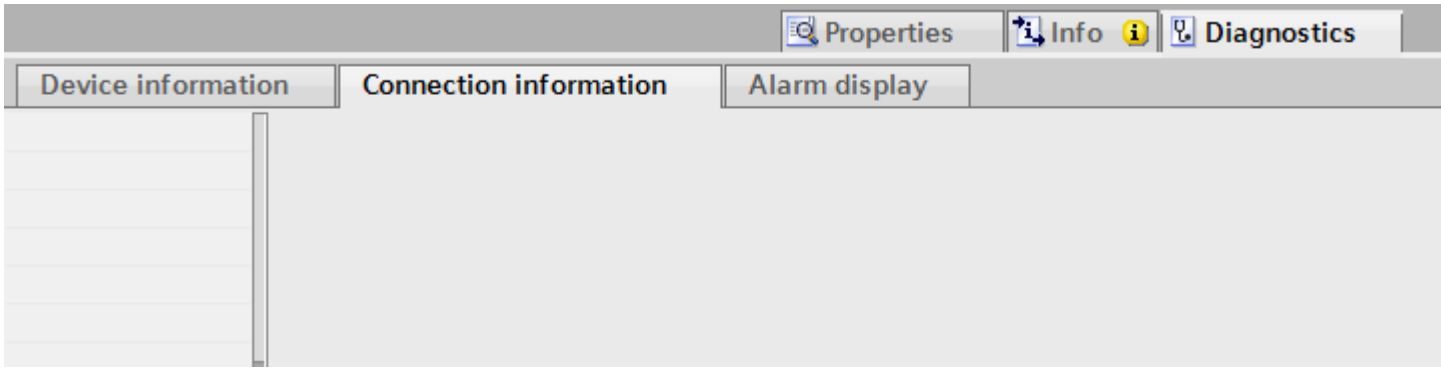
- Help

Connection information

Use the "Connection information" function to display the diagnostics data of the connection selected in the "Devices&Networks" editor.

A graphic displays the communication partners of the connection and by which communication driver they are connected with each other.



The following data is displayed:

- End point
- Interface
- Subnet
- Address
- TSAP
- Number of HMI resources

12.11.2.5 Device view

Introduction

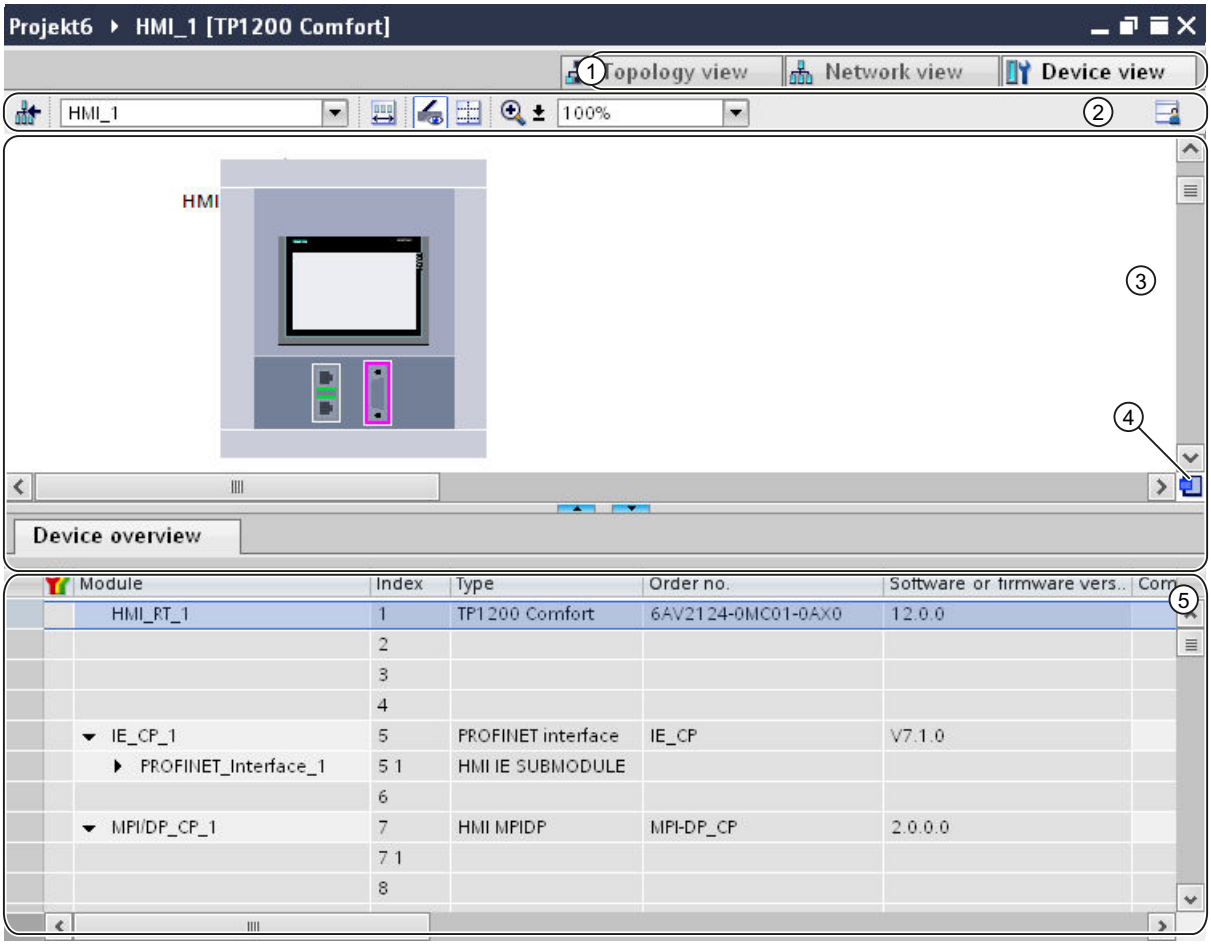
The device view is a working area of the hardware and network editor.

You undertake the following tasks in the device view:

- Configuring and assign device parameters
- Configuring and assign module parameters

Structure

The following diagram shows the components of the device view:



1 Changeover switch: network view/device view/topology view

2 Toolbar of device view

3 Graphic area of the device view

4 Overview navigation

5 Table area of device view

You can use your mouse to change the spacing between the graphic and table areas of the device view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Switches to the network view. Note: The device view can switch between the existing devices using the drop-down list.
	Show the area of unplugged modules.
	Show module labels.
	Adjust the zoom setting. Select the zoom setting or enter it directly in the adjacent drop-down list. You can use the Zoom button to zoom in or out incrementally or to drag a frame around an area to be enlarged. You can read the address descriptions of the I/O channels of signal modules at a zoom level setting of 200% or higher.
	Show page breaks Enables the page break preview. Dashed lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the device view displays hardware components and if necessary the associated modules that are assigned to each other via one or more racks. In the case of devices with racks, you have the option of installing additional hardware objects from the hardware catalog into the slots on the racks.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

The table area of the device view gives you an overview of the modules used and the most important technical and organizational data.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

12.11.2.6 Topology view

Introduction

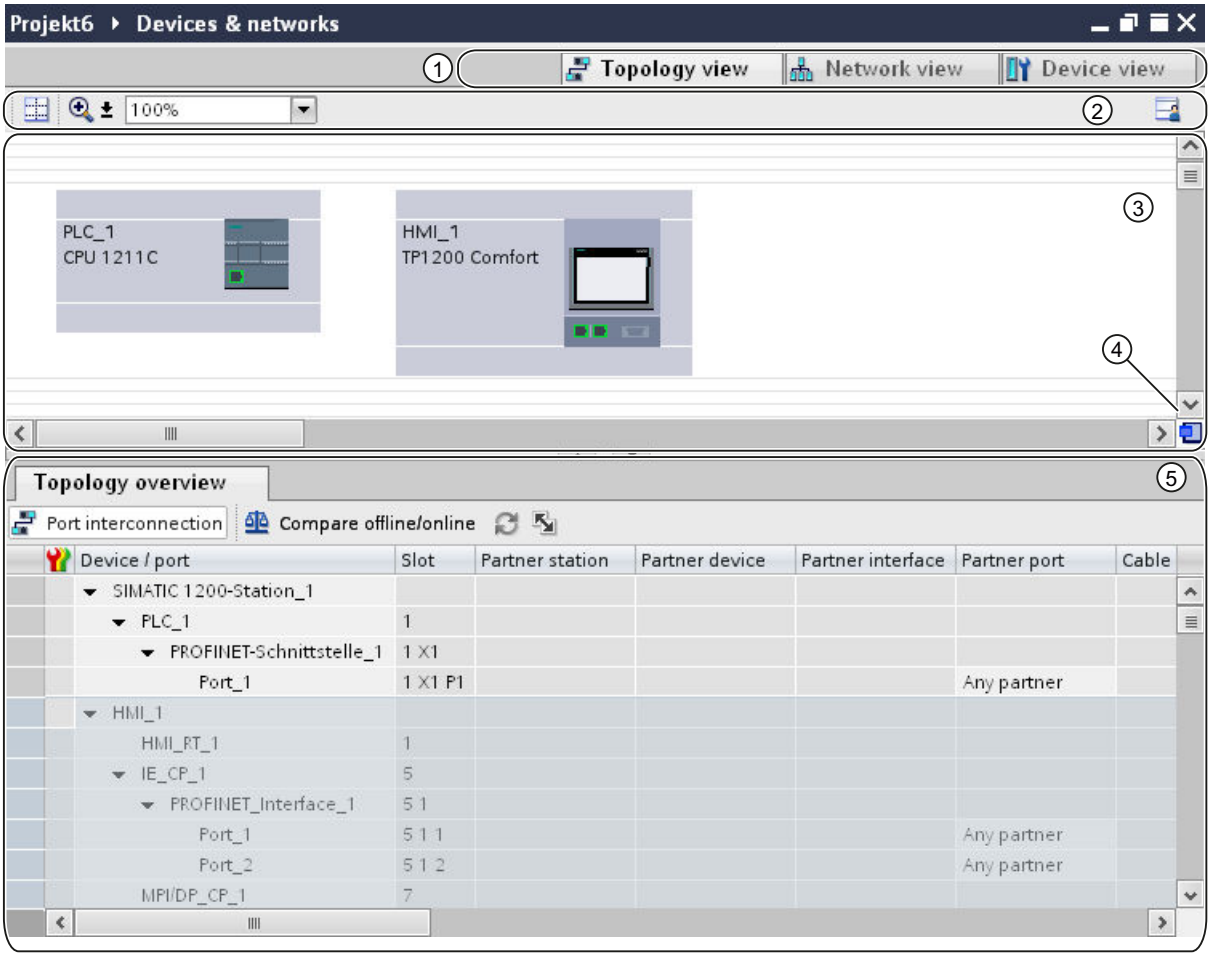
The topology view is a working area of the hardware and network editor.

You undertake the following tasks in topology view:

- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identify and minimize differences between the desired and actual topology

Structure

The following figure provides an overview of the topology view.



1 Changeover switch: device view / network view / topology view

2 Topology view toolbar

3 Graphic area of the topology view

4 Overview navigation

5 Table area of the topology view

You can use your mouse to change the spacing between the graphic and table areas of the topology view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Adjust the zoom setting. You can select the zoom setting via the adjacent drop-down list or enter it directly. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables the page break preview. Dashed lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the topology view displays Ethernet modules with their appropriate ports and port connections. Here you can add additional hardware objects with Ethernet interfaces.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

This displays the Ethernet or PROFINET modules with their appropriate ports and port connections in a table. This table corresponds to the network overview table in the network view.

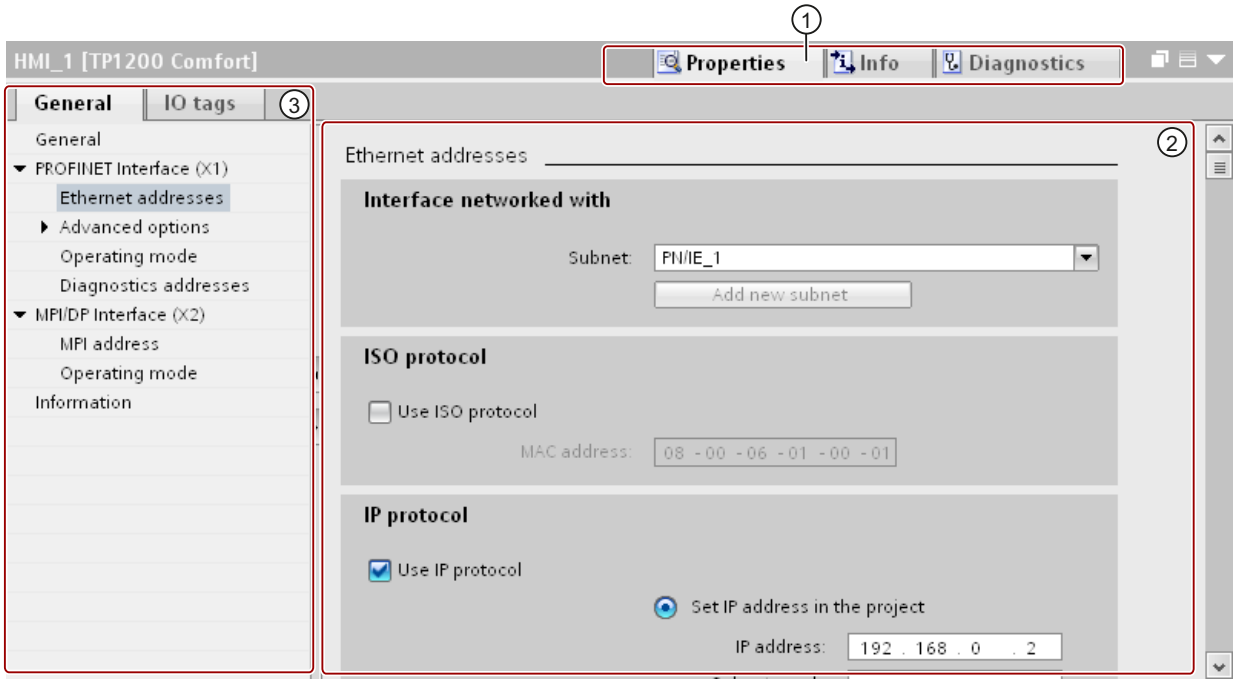
You can use the shortcut menu of the title bar of the table to adjust the tabular display.

12.11.2.7 Inspector window

The properties and parameters shown for the object selected can be edited in the inspector window.

Structure

The inspector window consists of the following components:



1	Switch between various information and work areas
2	Navigation between various pieces of information and parameters
3	Display showing the selected information and parameters

Function

The information and parameters in the inspector window are split into different types of information:

- Properties
- Info
- Diagnostics

To display the corresponding information and parameters, click in the area you want. The "Properties" area is the most important one for configuring an automation system. This area is displayed by default.

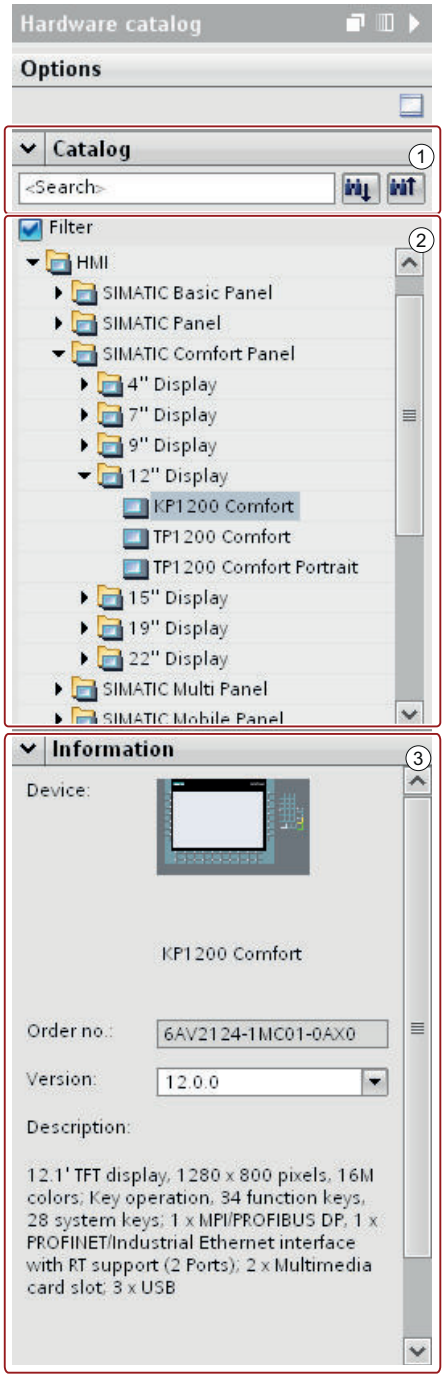
The left pane of the inspector window is used for area navigation. Information and parameters are arranged there in groups. If you click on the arrow symbol to the left of the group name, you can expand the group if sub-groups are available. If you select a group or sub-group, the corresponding information and parameters are displayed in the right pane of the inspector window and can be edited there too.

12.11.2.8 Hardware catalog

The "Hardware catalog" task card gives you easy access to a wide range of hardware components.

Structure

The "Hardware catalog" task card consists of the following panes:



1 "Catalog" pane, search and filter function

2 "Catalog" pane, component selection

3 "Information" pane

Search and filter function

The search and filter functions of the "Catalog" pane make it easy to search for particular hardware components. You can limit the display of the hardware components to certain criteria using the filter function. For example, you can limit the display to objects that you can also place within the current context or which contain certain functions.

Objects that can be used in the current context include, for example, interconnectable objects in the network view or only modules compatible with the device in the device view.

Component selection

The component selection in the "Catalog" pane contains the installed hardware components in a tree structure. You can move the devices or modules you want from the catalog to the graphic work area of the device or network view.

Installed hardware components without a license are grayed out. You cannot use non-licensed hardware components.

Hardware components belonging to various components groups thematically are partially implemented as linked objects. When you click on such linked hardware components, a catalog tree opens in which you can find the appropriate hardware components.

Information

The "Information" pane contains detailed information on the object selected from the catalog:

- Schematic representation
- Name
- Order number
- Version number
- Description

12.11.2.9 Information on hardware components

In the hardware catalog, you can display information on selected hardware components in the "Information" pane. You can also display further information on the selected hardware components using the shortcut menu.

Access to further information

If you select a hardware object in the hardware catalog and open the shortcut menu, you not only have the "Copy" function available but also three options for accessing information on Service & Support:

- Information regarding product support
- FAQs
- Manuals

The required information is displayed in the work area of the hardware and network editor.

Note

You can only access Service & Support when you are connected to the Internet and the function is enabled. By default, the function is disabled.

To enable the function, refer to the instructions in the section "Enabling product support".

Information regarding product support

Here, you have access to general information on hardware and software components. The order number of the selected hardware object is entered automatically in the search mask. You can, however, also search for other hardware and software components.

FAQs

Here, you have access to "Frequently Asked Questions" (FAQs). You can view various entries on hardware and software questions. Using a detailed search mask, you can filter the required topics.

Manuals

Here, you have access to the manuals of the various hardware components. This is particularly useful if the configuration, addressing or parameter assignment you are planning requires more detailed knowledge of the hardware you are using.

12.11.3 Networks and connections

12.11.3.1 SIMATIC communication networks

Communication networks

Overview

Communication networks are a central component of modern automation solutions. Industrial networks have to fulfill special requirements, for example:

- Coupling of automation systems as well as simple sensors, actuators, and computers.
- The information has to be correct and has to be transferred at the right moment.
- Robust against electromagnetic disturbances, mechanical stresses and soiling
- Flexible adaptation to the production requirements

Industrial networks belong to the LANs (Local Area Networks) and allow communication within a limited area.

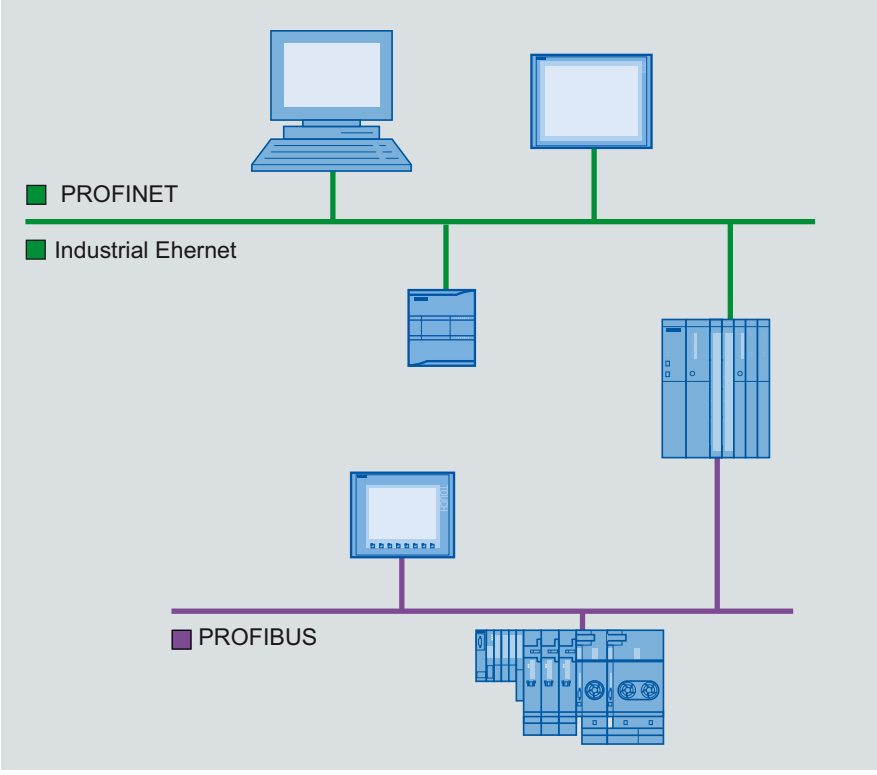
Industrial networks fulfill the following communication functions:

- Process and field communication of the automation systems including sensors and actuators
- Data communication between automation systems
- IT communication for integrating the modern information technology

Overview of the networks

This section examines the following networks:

- **Industrial Ethernet**
  The industrial network standard for all levels
- **PROFINET**
  The open Industrial Ethernet standard for automation
- **PROFIBUS**
  The international standard for the field area and market leader at the field busses
- **MPI**
  The integrated interface of the SIMATIC products
- **PPI**
  The integrated interface specially for the S7-200



PROFINET and Ethernet

Industrial Ethernet

Industrial Ethernet, which is based on IEEE 802.3, enables you to connect your automation system to your office networks. Industrial Ethernet provides IT services that you can use to access production data from the office environment.

Ethernet network

An Ethernet network allows you to interconnect all devices that are connected to the network via an integrated Ethernet interface or a communication module. This enables connection of multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

PROFINET

PROFINET is an open standard for industrial automation defined by IEEE 61158 and based on Industrial Ethernet. PROFINET makes use of IT standards all the way to the field level and enables plant-wide engineering.

With PROFINET, you can realize high-performance automation solutions for applications with stringent real-time requirements.

PROFIBUS

PROFIBUS DP

PROFIBUS DP (distributed I/O) is used to connect the following devices:

- PLCs, PCs, HMI devices
- Distributed I/O devices, e.g., SIMATIC ET 200
- Valves
- Drives

PROFIBUS DP's fast response times make it ideally suited for the manufacturing industry.

Its basic functionality includes cyclic exchange of process data between the master and PROFIBUS DP slaves, as well as diagnostics.

PROFIBUS network

You can connect an HMI device within the PROFIBUS network to any SIMATIC S7 module that has an integrated PROFIBUS or PROFIBUS DP interface. You can thereby connect multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

You configure the SIMATIC S7-200 PLC as a passive device in the network. You connect the SIMATIC S7-200 using the DP connector or a PROFIBUS communication module.

MPI

MPI

MPI (Multi-Point Interface) is the integrated interface for SIMATIC products:

- PLCs
- HMI devices
- Programming device/PC

Small subnets with the following characteristics are set up with MPI:

- Short distances
- Few devices
- Small data quantities

MPI network

You connect the HMI device to the MPI interface of the SIMATIC S7 PLC. This enables connection of multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

Network architectures

MPI is based on the PROFIBUS standard (IEC 61158 and EN 50170) and supports the following bus topologies:

- Line
- Star
- Tree

An MPI subnet contains a maximum of 127 devices and consists of multiple segments. Each segment contains a maximum of 32 devices and is limited by terminating resistors. Repeaters are used to connect segments. The maximum cable length without a repeater is 50 m.

PPI

Introduction

PPI (point-to-point interface) is an integrated interface that was developed specially for the SIMATIC S7-200. A PPI network typically connects S7-200 PLCs. However, other SIMATIC PLCs (e.g., S7-300 and S7-400) or HMI devices can communicate with a SIMATIC S7-200 in the PPI network.

PPI network

A PPI connection is a point-to-point connection. The HMI device is the master. The SIMATIC S7-200 is the slave.

You can connect a maximum of one SIMATIC S7-200 to an HMI device. You use the serial connector of the CPU to connect the HMI device. You can connect multiple HMI devices to one SIMATIC S7-200. From the perspective of the SIMATIC S7-200, only one connection at a time is possible.

Note

The PPI network can contain a maximum of four masters in addition to the HMI device. For performance reasons, do not configure more than four devices at a time as a master in the PPI network.

Network architectures

PPI is based on the PROFIBUS standard (IEC 61158 and EN 50170) and supports the following bus topologies:

- Line
- Star

Multi-master networks with a maximum of 32 masters are set up with PPI:

- An unlimited number of masters can communicate with each slave.
- A slave can be assigned to multiple masters.

The RS 485 repeater can be used to extend the PPI network. Modems can also be connected to the PPI network.

12.11.3.2 Configuring networks and connections

Networking devices

Introduction

The "Devices & Networks" editor is provided for configuring connections. You can network devices in the editor. You can also configure and assign parameters to devices and interfaces. You then configure the required connections between the networked devices.

In the "Devices & Networks" editor you configure HMI connections with the PLCs:

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

You configure the HMI connections to other PLCs in the "Connections" editor of the respective HMI device.

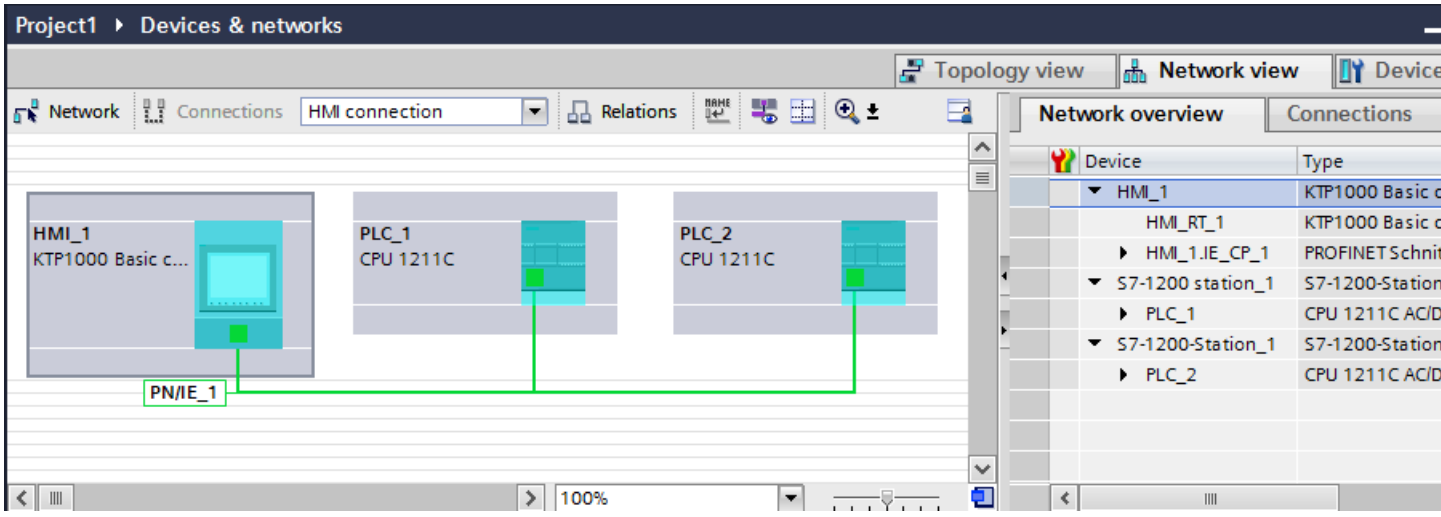
Networking devices

The network view of the "Devices & Networks" editor includes a graphical area and a tabular area. You can use the graphical area to network the devices in the project with drag-and-drop. The tabular area provides an overview of the devices and their components.

You can network the following PLCs together with HMI devices in the "Devices & Networks" area.

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

All other PLCs are available in the TIA Portal and are configured "not integrated". You configure "not integrated" connections in the "Connections" editor of the HMI device.



With the networking step, you configure the physical connection of the communication partners. The networking of devices is depicted by lines that are colored according to the interface.

Configuring an integrated connection in the "Devices & Networks" editor

Introduction

You configure an HMI connection between the HMI device and a SIMATIC S7 PLC in the "Devices & Networks" editor. This HMI connection is the direct connection between the communication partners that you have created in a project.

Integrated connections

Connections of devices within a project are referred to as integrated connections. In the case of integrated connections, you can directly configure addresses of PLC tags.

Note

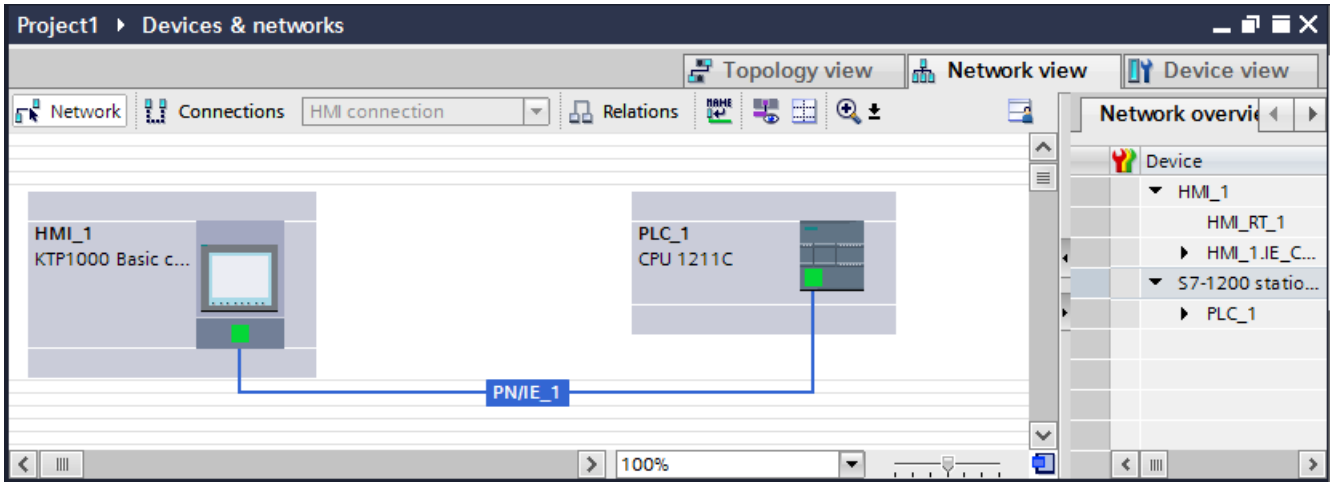
An HMI connection can be configured in the "Devices & Networks" editor for the following PLCs only:

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

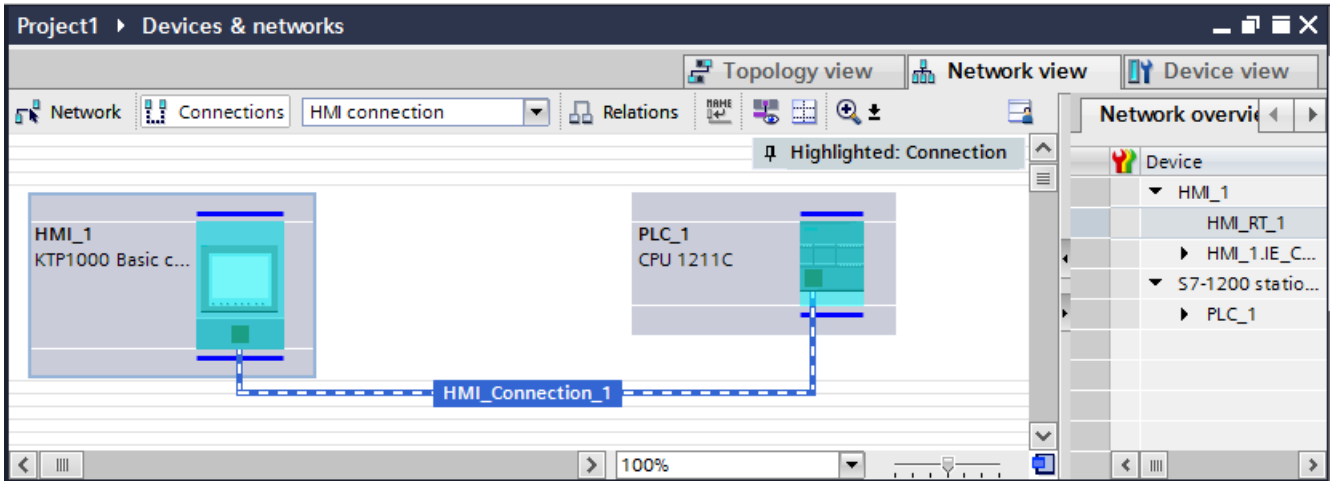
You configure the HMI connections to all other PLCs in the "Connections" editor of the HMI device.

Configuring an HMI connection in the "Devices & Networks" editor

1. Insert an HMI device and a SIMATIC S7 PLC in your project.



2. Switch to "Connections" mode.
3. Select the "HMI connection" connection type.
4. Use a drag-and-drop operation to interconnect the two PROFINET interfaces.



5. Change the IP address and subnet mask address parameters according to the requirements of your project.

Special considerations of the "Devices & Networks" editor

Introduction

If you are configuring or have already configured networks or HMI connections, the "Devices & Networks" editor supports you with the following functions:

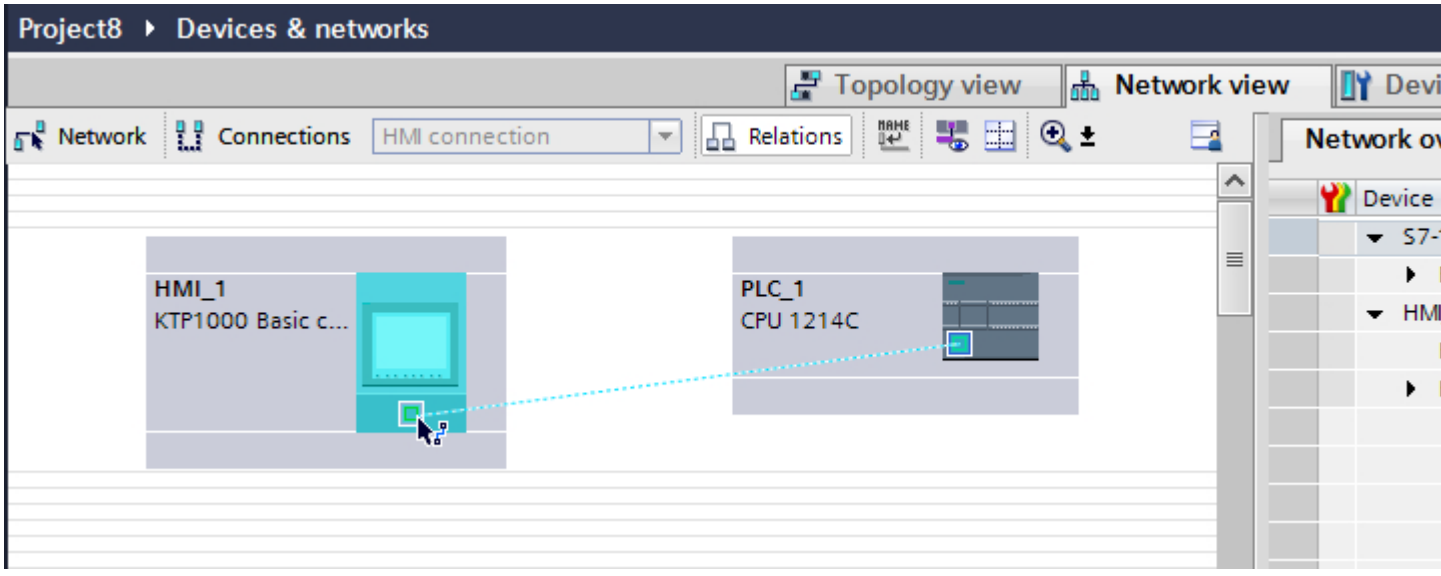
- Highlighting of communication partners
- Highlighting of HMI connections
- Automatic creation of subnets

Highlighting of communication partners

All communication partners for which an HMI connection is possible are highlighted in turquoise if you have selected the "HMI connection" type.

Starting from the interface of a device create an HMI connection to the device of another device using a drag-and-drop operation. During the drag-and-drop operation all potential communication partners are highlighted in turquoise.

Use the ESC key to stop connecting interfaces using a drag-and-drop operation.



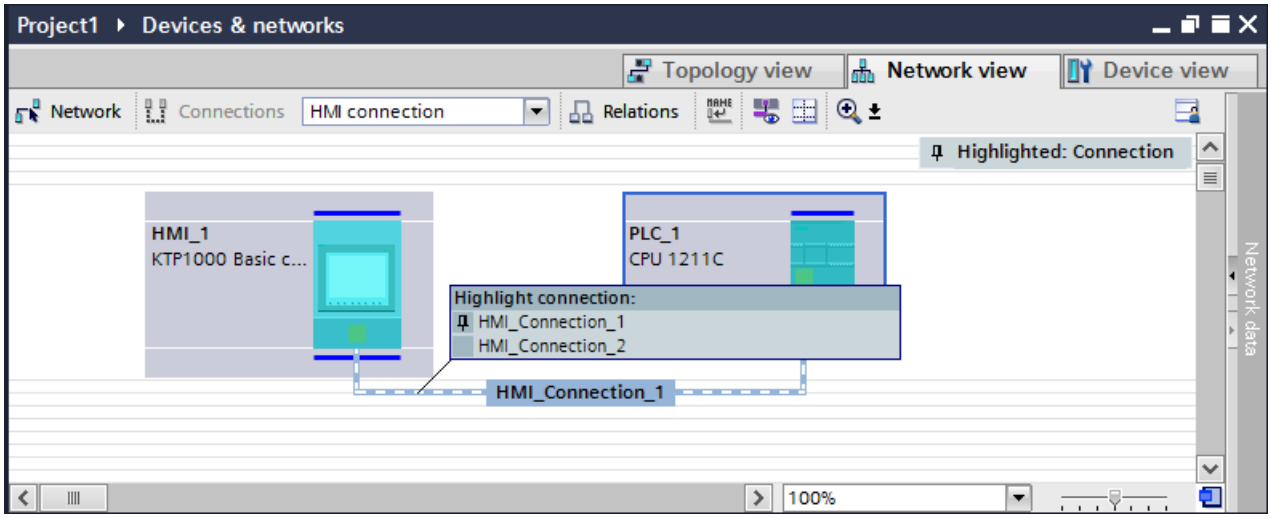
When the mouse pointer is moved over the interface of a device, the following icons indicate whether a connection is possible:

A connection is possible.

A connection is not possible.

Highlighting of HMI connections

A turquoise highlighting of the connection indicates that a HMI connection was created. If several HMI connections are created, you can select one of the already created HMI connections in a dialog.



Then you can configure the parameters of the selected HMI connection and the communication partners in the inspector window.

Subnets

Subnetworks are automatically created and used under the following conditions:

- If both communication partners are not already interconnected in different networks
- If a free interface is available to both communication partners.
- If a subnetwork already exists then that subnetwork is automatically used for the HMI connection.

Configuring a non-integrated connection in the "Connections" editor

Introduction

You use the "Connections" editor of the HMI device to configure a connection between an HMI device and a PLC that cannot be configured in the "Devices & Networks" editor.

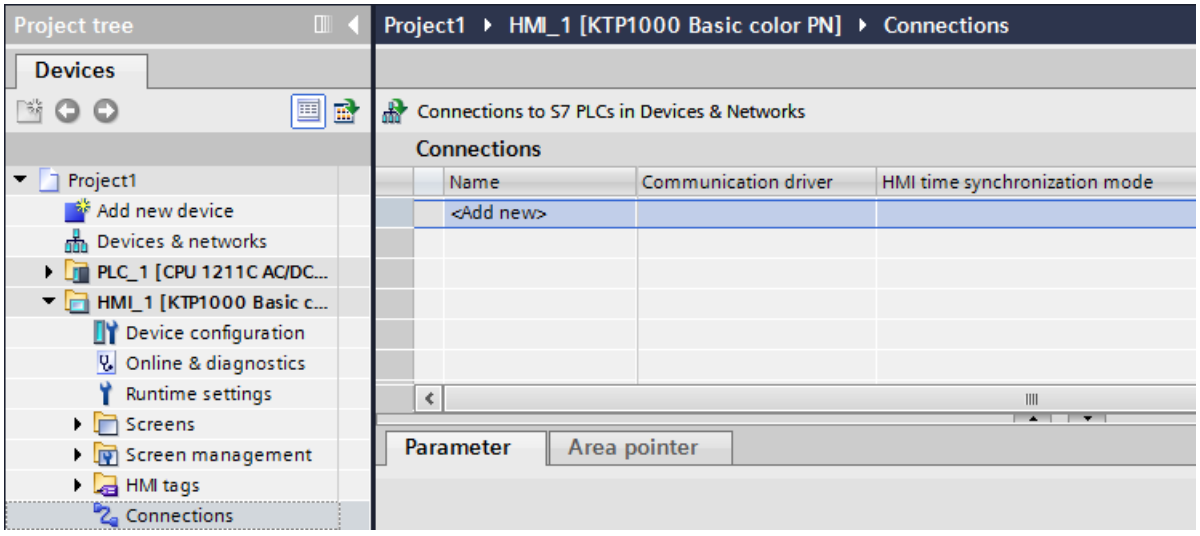
These connections are referred to as non-integrated connections.

Requirements

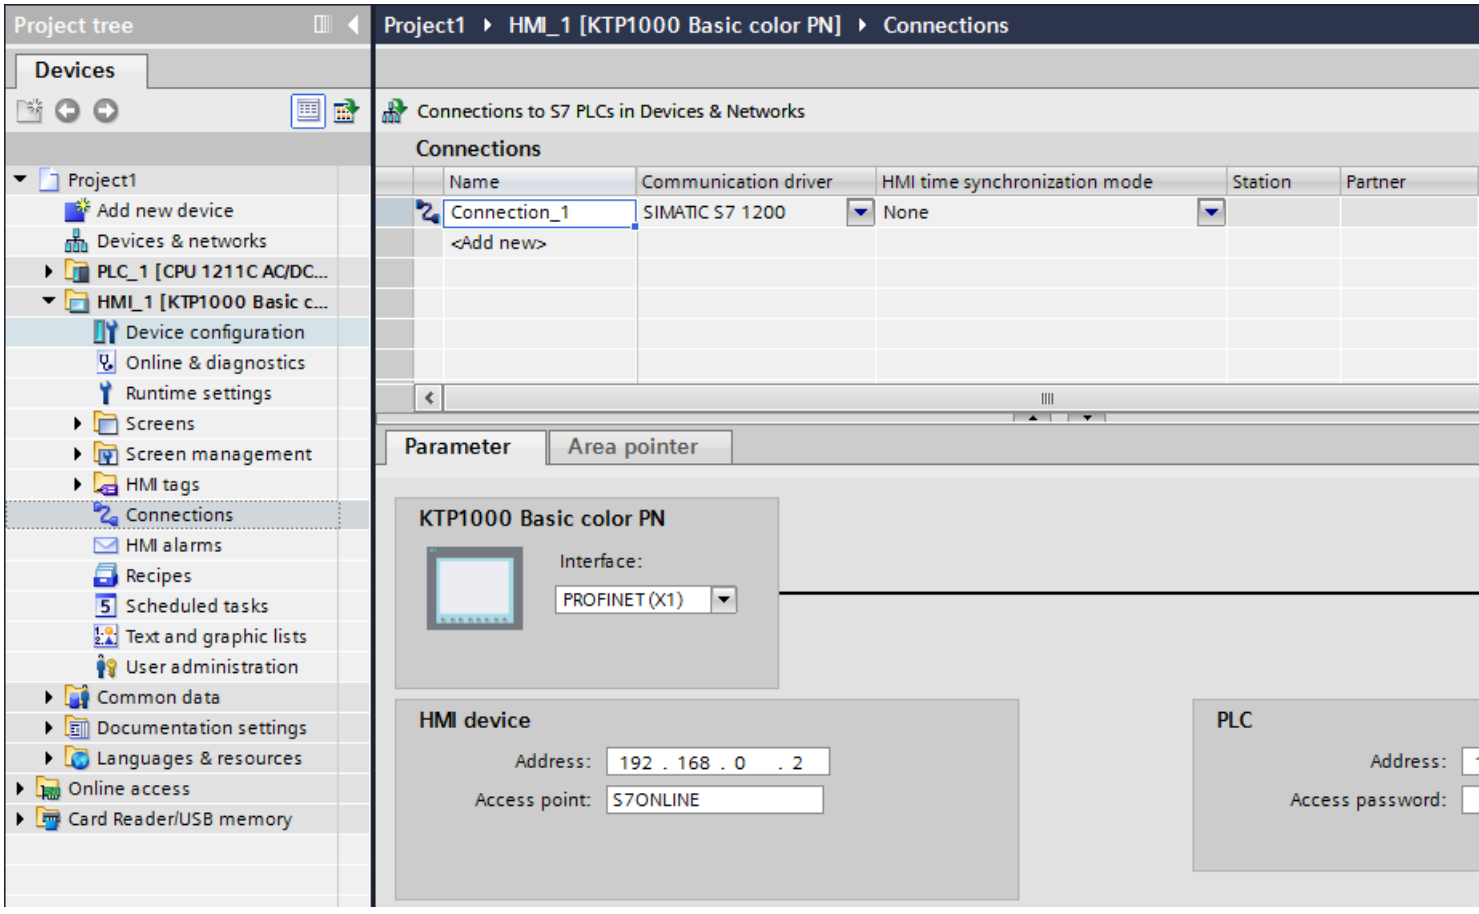
- A project is open.
- An HMI device has been created.

Configuring a connection in the "Connections" editor

1. Open the "Connections" editor of the HMI device.
2. Create a new connection.

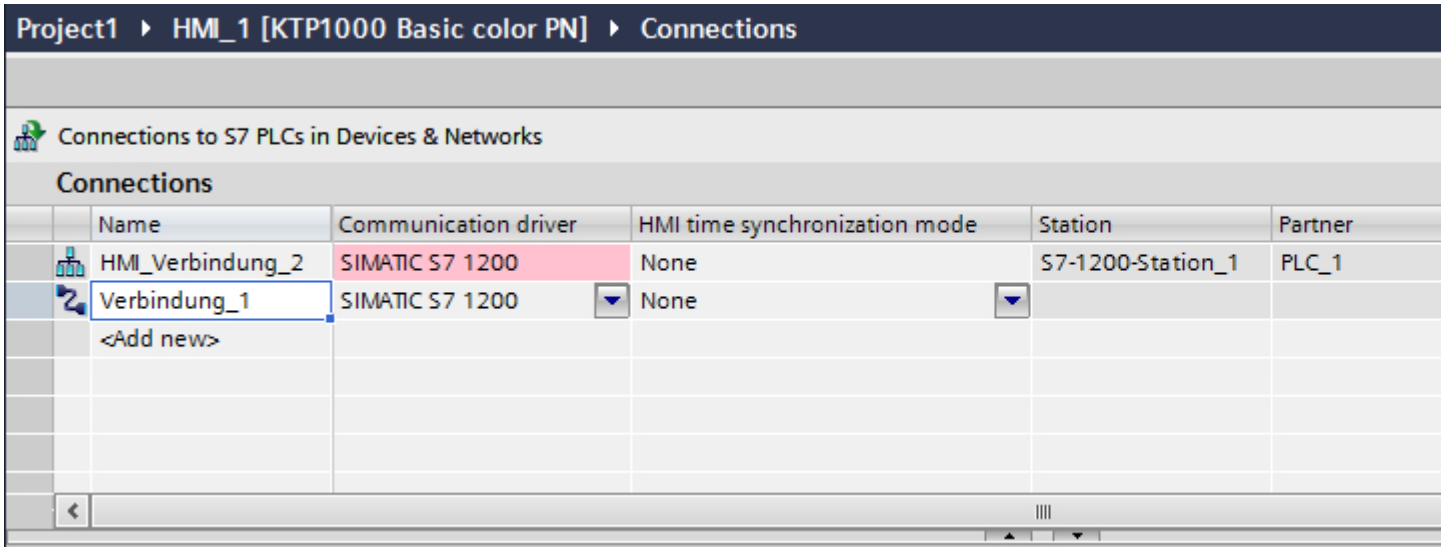


3. Select the communication driver.
4. Set the connection parameters.



Integrated connections in the "Connections" editor

If you have already configured the integrated connections of the HMI device in the "Devices & Networks" editor, they are also displayed in the "Connections" editor.



Meaning of the icons used:

- Integrated connection
- Non-integrated connection

Configuring a routed connection in the "Devices & Networks" editor

Introduction

You can configure a routed HMI connection to a PLC in another subnet in the "Devices & Networks" editor.

Note

A routed HMI connection can only be configured for the following PLCs:

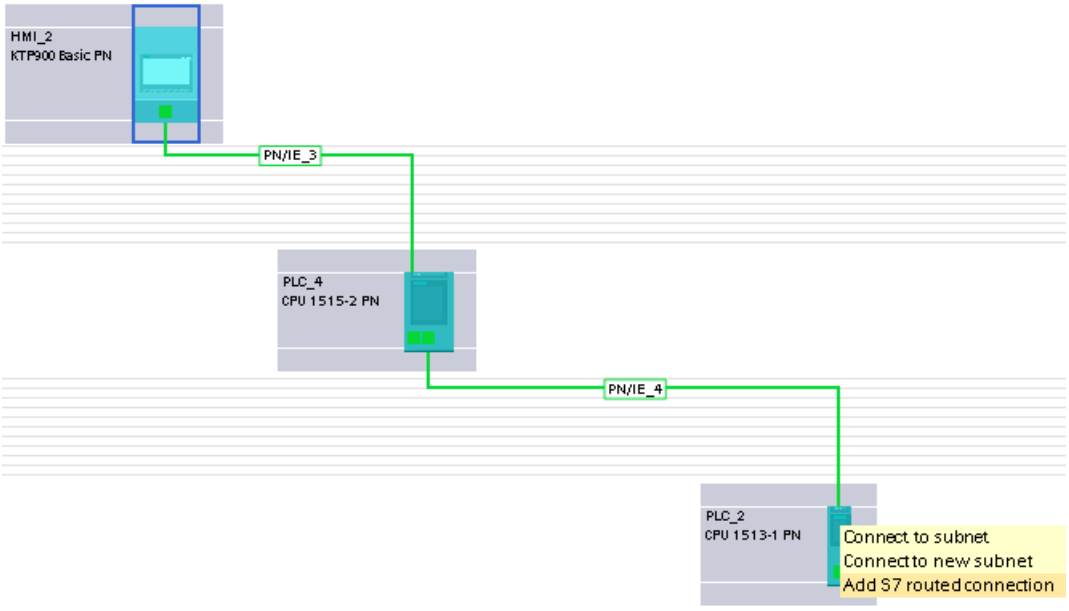
- SIMATIC S7 1500
- SIMATIC S7 1200

Requirement

- An HMI device has been created.
- PLCs have been set up in different networks
- The network view in the "Devices & Networks" editor is open.

Configuring a routed HMI connection

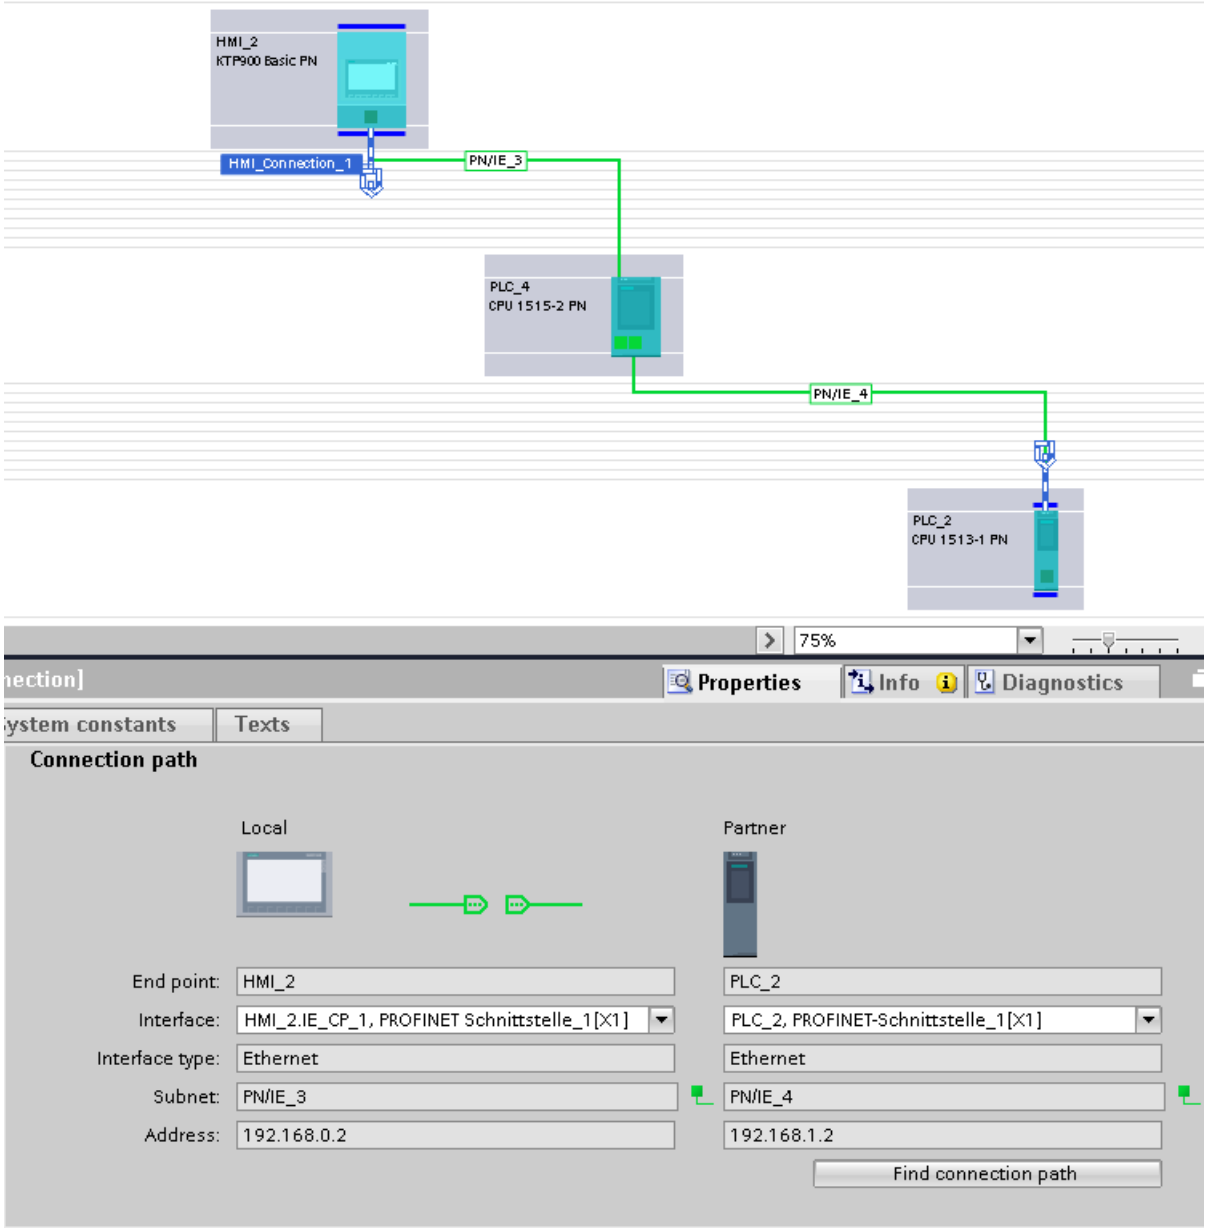
1. Switch to "Connections" mode.
2. Select the "HMI connection" connection type.
3. Drag-and-drop the HMI device to the PLC in the other subnet.
   A dialog opens.



4. Select "Add routed connection".

Result

The routed HMI connection has now been created. If you change the HMI device type or the configuration of the PLC, you will need to adapt the routed HMI connection again.



12.11.4 Data exchange

12.11.4.1 Data exchange using tags

Basics of tags

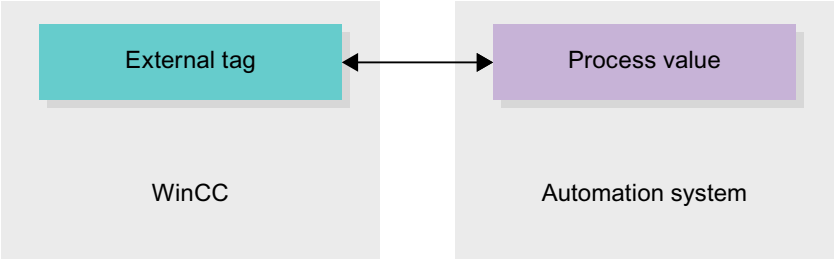
Introduction

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

The external tags form the link between WinCC and the automation systems. The values of external tags correspond to the process values from the memory of an automation system. The value of an external tag is determined by reading the process value from the memory of the automation system. It is also possible to rewrite a process value in the memory of the automation system.



Internal tags do not have a process link and only convey values within the WinCC. The tag values are only available as long as runtime is running.

Tags in WinCC

For external tags, the properties of the tag are used to define the connection that the WinCC uses to communicate with the automation system and form of data exchange.

Tags that are not supplied with values by the process - the internal tags - are not connected to the automation system. In the tag's "Connection" property, this is identified by the "Internal tag" entry.

You can create tags in different tag tables for greater clarity. You then directly access the individual tag tables in the "HMI tags" node in the project tree. The tags from all tag tables can be displayed with the help of the table "Show all tags".

With structures you bundle a number of different tags that form one logical unit. Structures are project-associated data and are available for all HMI devices of the project. You use the "Types" editor in the project library to create and edit a structure.

Overview of HMI tag tables

Introduction

HMI tag tables contain the definitions of the HMI tags that apply across all devices. A tag table is created automatically for each HMI device created in the project.

In the project tree there is an "HMI tags" folder for each HMI device. The following tables can be contained in this folder:

- Default tag table
- User-defined tag tables
- Table of all tags

In the project tree you can create additional tag tables in the HMI tags folder and use these to sort and group tags and constants. You can move tags to a different tag table using a drag-and-drop operation or with the help of the "Tag table" field. Activate the "Tags table" field using the shortcut menu of the column headings.

Default tag table

There is one default tag table for each HMI device of the project. It cannot be deleted or moved. The default tag table contains HMI tags and, depending on the HMI device, also system tags. You can declare all HMI tags in the standard tags table or, as necessary, additional user-defined tables of tags.

User-defined tag tables

You can create multiple user-defined tag tables for each HMI device in order to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. To group tag tables, create additional subfolders in the HMI tags folder.

All tags

The "All tags" table shows an overview of all HMI tags and system tags of the HMI device in question. This table cannot be deleted, renamed or moved. This table also contains the "Tags table" column, which indicates the tag table of where a tag is included. Using the "Tags table" field, the assignment of a tag to a tags table can be changed.

With devices for Runtime Professional, the table "All tags" contain an additional tab "System tags". The system tags are created by the system and used for internal management of the project. The names of the system tags begin with the "@" character. System tags cannot be deleted or renamed. You can evaluate the value of a system tag, but cannot modify it.

Additional tables

The following tables are also available in an HMI tag table:

- Discrete alarms
- Analog alarms
- Logging tags

With the help of these tables you configure alarms and logging tags for the currently selected HMI tag.

Discrete alarms table

In the "Discrete alarms" table, you configure discrete alarms to the HMI tag selected in the HMI tag table. When you configure a discrete alarm, multiple selection in the HMI tag table is not possible. You configure the discrete alarms for each HMI tag separately.

Analog alarms table

In the "Analog alarms" table, you configure analog alarms to the HMI tag selected in the HMI tag table. When you configure an analog alarm, multiple selection in the HMI tag table is not possible. You configure the analog alarms for each HMI tag separately.

Logging tags table

In the "Logging tags" table, you configure logging tags to the HMI tag selected in the HMI tag table. When you configure a logging tag, multiple selection in the HMI tag table is not possible. You configure the logging tags for each HMI tag separately. The "Logging tags" table is only available if the HMI device used supports logging.
If WinCC Runtime Professional is used, you can also assign several log tags to a tag. With the other HMI devices, you can only assign one log tag to a tag.

External tags

Introduction

External tags allow communication (data exchange) between the components of an automation system, for example, between an HMI device and a PLC.

Principle

An external tag is the image of a defined memory location in the PLC. You have read and write access to this storage location from both the HMI device and from the PLC.

Since external tags are the image of a storage location in the PLC, the applicable data types depend on the PLC which is connected to the HMI device.

If you write a PLC control program in STEP 7, the PLC tags created in the control program will be added to the PLC tag table. If you want to connect an external tag to a PLC tag, access the PLC tags directly via the PLC tag table and connect them to the external tag.

Data types

All the data types which are available at the connected PLC are available at an external tag in WinCC. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

See "Communication between devices (Page 5994)" for additional information.

Note

As well as external tags, area pointers are also available for communication between the HMI device and PLC. You can set up and enable the area indicators in the "Connections" editor.

Central tag management in STEP 7

You can connect also connect DB instances of user-defined PLC data types (UDT) to the HMI tags.

The PLC data type and the corresponding DB instances are created and updated centrally in STEP 7. In WinCC, you can use the following sources as PLC tag (DB instances):

- Data block elements that use a UDT as data type
- Data block instances of a UDT

The data type is taken from STEP 7 and is not converted to an HMI data type. The access mode is always "Symbolic access". Depending on the release for WinCC in STEP 7, elements and structured elements of the PLC data type are applied to WinCC. Elements of a structured UDT are applied and displayed in the PLC tag table if the instance-specific properties "Visible in HMI" and "Accessible from HMI" have been set.

Note

Accessing PLC data types

Access to PLC data types is available only in conjunction with SIMATIC S7-1200 or S7-1500.

Synchronization with PLC tags

A variety of options for synchronizing external tags with the PLC tags are available in the Runtime settings under "Settings for tags".

When you perform synchronization, you have the option of automatically applying the tag names of the PLC to external tags and reconnecting the existing tags.

The generated tag name is derived from the position of the data value in the hierarchical structure of the data block.

Update of tag values

For external tags, the current tag values are transmitted in Runtime via the communication connection between WinCC and the connected automation systems and then saved in the Runtime memory. Next, the tag value will be updated to the set cycle time. For use in the Runtime project, WinCC accesses tag values in the Runtime memory that were read from the PLC at the previous scan cycle checkpoint. As a result, the value in the PLC can already change whilst the value from the Runtime memory is being processed.

Note

PLC array elements in conjunction with S7-1200 or S7-1500

The index of the PLC array elements can begin with any number. In WinCC, indexing always starts with 0.

A PLC tag "Array [1..3] of Int", for example, is mapped to "Array [0..2] of Int" in WinCC.

When you access an array in a script, pay attention to the correct indexing.

Communication between devices (Page 5994)

Addressing external tags

Introduction

The options for addressing external tags depend on the type of connection between WinCC and the PLC in question. A distinction must be made between the following connection types:

- Integrated connection
  Connections of devices which are within a project and were created with the "Devices & Networks" editor are referred to as integrated connections.
- Non-integrated connection
  Connections of devices which were created with the "Connections" editor are referred to as non-integrated connections. It is not necessary that all of the devices be within a single project.

The connection type can also be recognized by its icon.

	Integrated connection
	Non-integrated connection

You can find additional information in the section "Basics of communication (Page 5994)".

Addressing with integrated connections

An integrated connection offers the advantage that you can address a tag both symbolically and absolutely.

For symbolic addressing, you select the PLC tag via its name and connect it to the HMI tag. The valid data type for the HMI tag is automatically selected by the system. You have to distinguish between the following cases when you address elements in data blocks:

Symbolic addressing of data blocks with optimized access and standard access:

During the symbolic addressing of a data block with optimized access and standard access, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change. You do not need to compile the connected data block or the WinCC project for this step.
For data blocks with optimized access, only symbolic addressing is available.

For symbolic addressing of elements in a data block, you only need to recompile and reload the WinCC project in case of the following changes:

- If the name or the data type of the linked data block element or global PLC tag has changed.
- If the name or the data type of the higher level structure node of a linked element in the data block element or global PLC tag has changed.
- If the name of the connected data block has changed.

Symbolic addressing is currently available with the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Symbolic addressing is also available if you have an integrated link.

You can also use absolute addressing with an integrated connection. You have to use absolute addressing for PLC tags from a SIMATIC S7 300/400 PLC. If you have connected an HMI tag with a PLC tag and the address of the PLC tag changes, you only have to recompile the control program to update the new address in WinCC. Then you recompile the WinCC project and load it onto the HMI device.

In WinCC, symbolic addressing is the default method. To change the default setting, select the menu command "Options > Settings". Select "Visualization > Tags" in the "Settings" dialog. If required, disable the "Symbolic access" option.

The availability of an integrated connection depends on the PLC used. The following table shows the availability:

PLC	Integrated connection	Comments
S7 300/400	Yes	The linking of tags is not checked in Runtime. If the tag address changes in the PLC and the HMI device is not compiled again and loaded, the change is not registered in runtime.
S7 1200	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.
S7-1500	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.

Create an integrated connection in the "Devices & Networks" editor. If the PLC is contained in the project and integrated connections are supported, you can then also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection with absolute addressing. Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to make the change in WinCC. The tag connection cannot be checked for validity in Runtime, an error message is not issued.

A non-integrated connection is available for all supported PLCs.

Symbolic addressing is not available in a non-integrated connection.

With a non-integrated connection, the control program does not need to be part of the WinCC project. You can perform the configuration of the PLC and the WinCC project independently of each other. For configuration in WinCC, only the addresses used in the PLC and their function have to be known.

Internal Tags

Introduction

Internal tags do not have any connection to the PLC. Internal tags transport values within the HMI device. The tag values are only available as long as runtime is running.

Principle

Internal tags are stored in the memory of the HMI device. Therefore, only this HMI device has read and write access to the internal tags. You can create internal tags to perform local calculations, for example.

You can use the HMI data types for internal tags. Availability depends on the HMI device being used.

The following HMI data types are available:

HMI data type	Data format
Array	One-dimensional array
Bool	Binary tag
DateTime	Date/time format
DInt	Signed 32-bit value
Int	Signed 16-bit value
LReal	Floating-point number 64-bit IEEE 754
Real	Floating-point number 32-bit IEEE 754
SInt	Signed 8-bit value
UDnt	Unsigned 32-bit value
UInt	Unsigned 16-bit value
USInt	Unsigned 8-bit value
WString	Text tag, 16-bit character set

12.11.4.2 Data exchange using area pointers

Basic information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

For example, area pointers are required for the following data:

- Recipes
- Job mailboxes
- Sign-of-life monitoring

Area pointer

The following area pointers are supported:

Area pointer

Area pointers can be configured for connections.

- Data record
- Date/time
- Coordination
- Job mailbox

Global area pointers of the HMI device

Global area pointers can be configured to only one connection for each project.

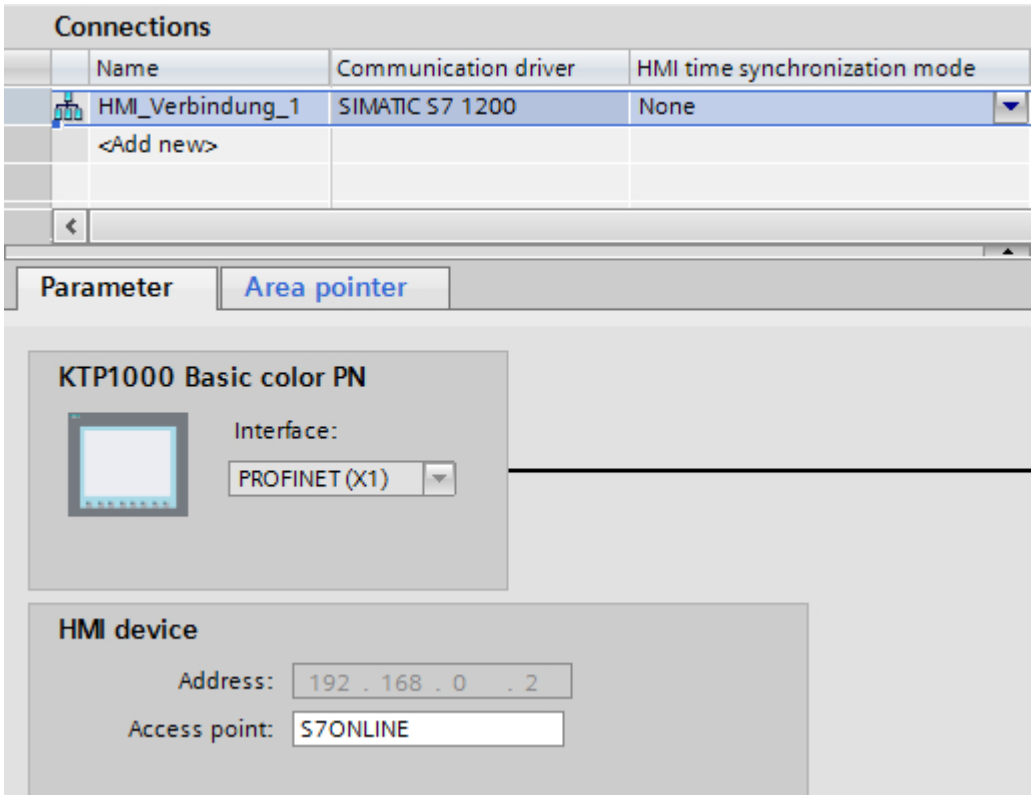
- Screen number
- Date/time PLC
- Project ID

Area pointers for connections

Introduction

Using the "Area pointer" tab of the "Connections" editor, you can configure the usage of the available area pointers.

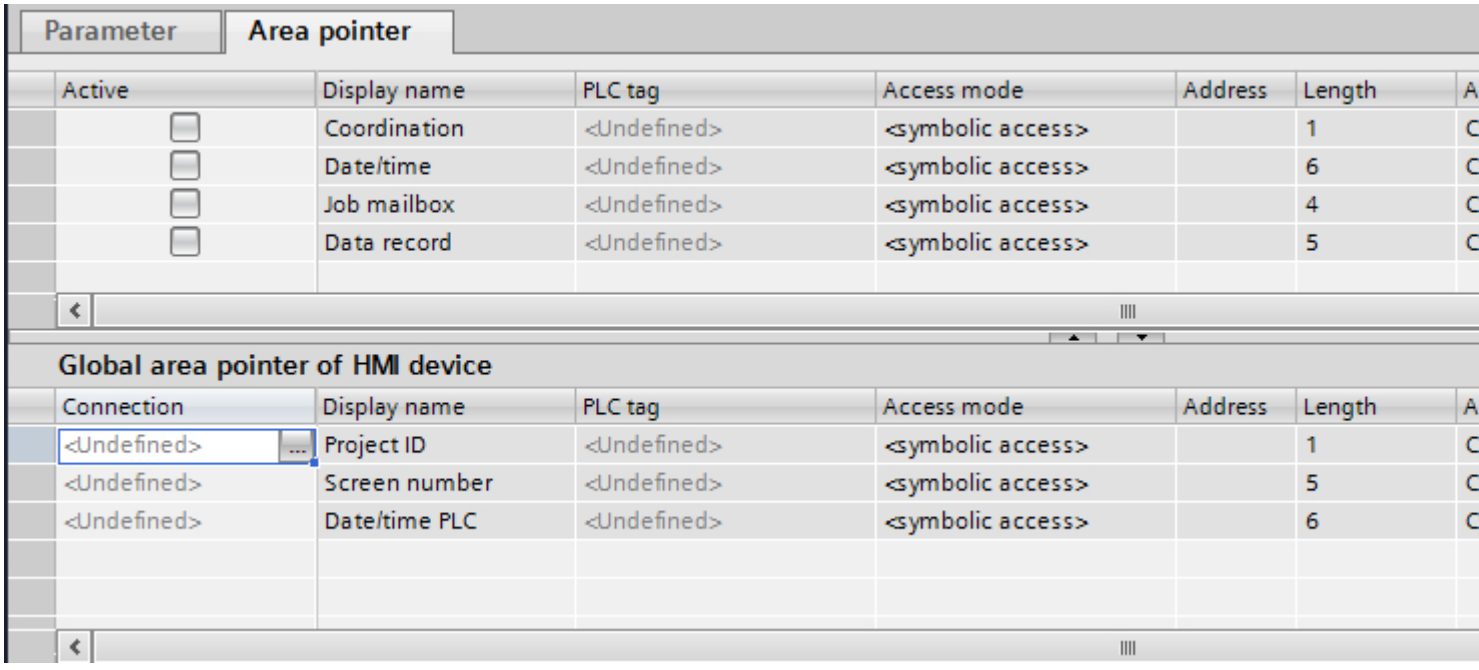
To configure the area pointers, open the "Connections" editor and open the "Area pointer" tab.



Structure

The "Area pointer" tab contains two tables of area pointers. The top part of the table contains the area pointers you can create and enable separately for each available connection.

The "Global area pointers of HMI device" table contains the area pointers which are created only once in the project and can be used for only one connection.

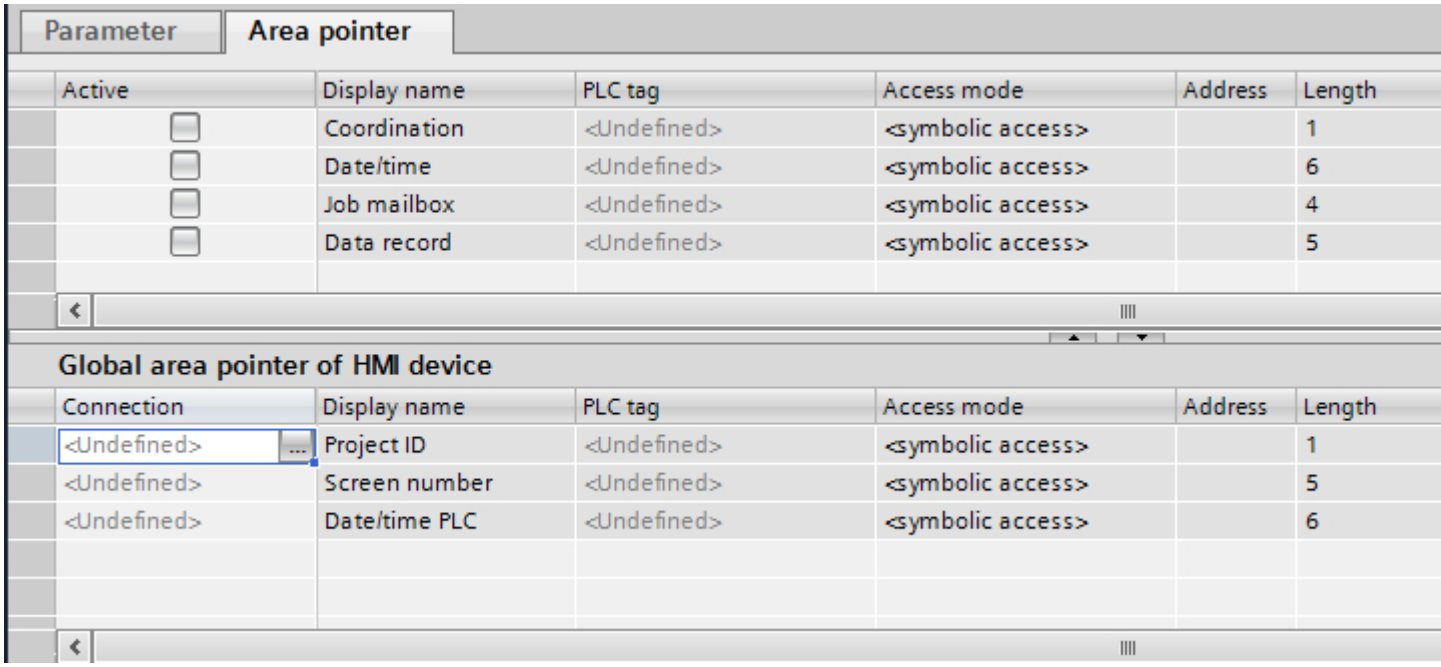


Use of area pointers

"Area pointer" tab

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You assign the following parameters in the "Area pointer" tab:



- Active
  Enables the area pointer.
- Pointer name
  Name of the area pointer specified by WinCC.
- PLC tag
  Here you select the PLC tag or the tag array that you have configured as the data area for the area pointer.
- Access mode
  Here you can select from the following access modes:
  - Symbolic access
  - Absolute access
- Address
  If you selected "Symbolic access", no address is entered in this field.
  If you selected "Absolute access", enter the address of a tag in the "Address" field.
- Length
  WinCC specifies the length of the area pointer.
- Acquisition cycle
  You specify the acquisition cycle in this field for area pointers that are read by the HMI device. Note that a very short acquisition time may have a negative impact on HMI device performance.
- Comment
  Enter a comment, for example, to describe the purpose of the area pointer.

Accessing data areas

Accessing data areas

Accessing data areas

The following table shows how HMI devices and PLCs access individual data areas for read (R) or write (W) operations.

Data area	Required for	HMI device	PLC
Screen number	Evaluation by the PLC in order to determine the active screen.	W	R
Data record	Transfer of data records with synchronization	R/W	R/W
Date/time	Transfer of the date and time from the HMI device to the PLC	W	R
Date/time PLC	Transfer of the date and time from the PLC to the HMI device	R	W
Coordination	Requesting the HMI device status in the PLC program	W	R
Project ID	Runtime checks for consistency between the WinCC project ID and the project in the PLC	R	W
Job mailbox	Triggering of HMI device functions by the PLC program	R/W	R/W

Configuring area pointers

Configuration of area pointers

Introduction

You use an area pointer to access a data area in the PLC. The data area is stored in the PLC.

Prior to configuring area pointers

Before you use the area pointer, you must enable and parameterize it under "Connections > Area Pointer".

Global data block

To access the data area in the PLC, you have to create a global data block in the PLC program. The following example shows the use of a data block.

Length of area pointers

For area pointers with a length >= 1, you set up the data area as a tag array in a global data block or instance data block.

You also have the option to use a PLC tag for area pointers with a length = 1.

The configuration of the tags in a data block is dependent on the length of the area pointer you want to use. The unit for the length of an area pointer is a 16-bit word.

If, for example, you want to use an area pointer with a length of "5", you must create an array with 5 array elements of the data type UINT in the data block.

Alternative procedure

Alternatively, you can also use the absolute access mode to access area pointers. Absolute access mode only works on standard PLC data blocks.

Parameterizing a global data block

Introduction

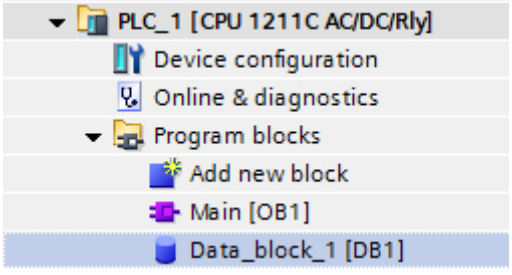
To access the data area in the PLC, a global data block for the area pointer must be parameterized in the PLC program.

Requirements

- A PLC is created in the project.
- A connection is configured between the PLC and the HMI device.
- The PLC program contains a global data block.

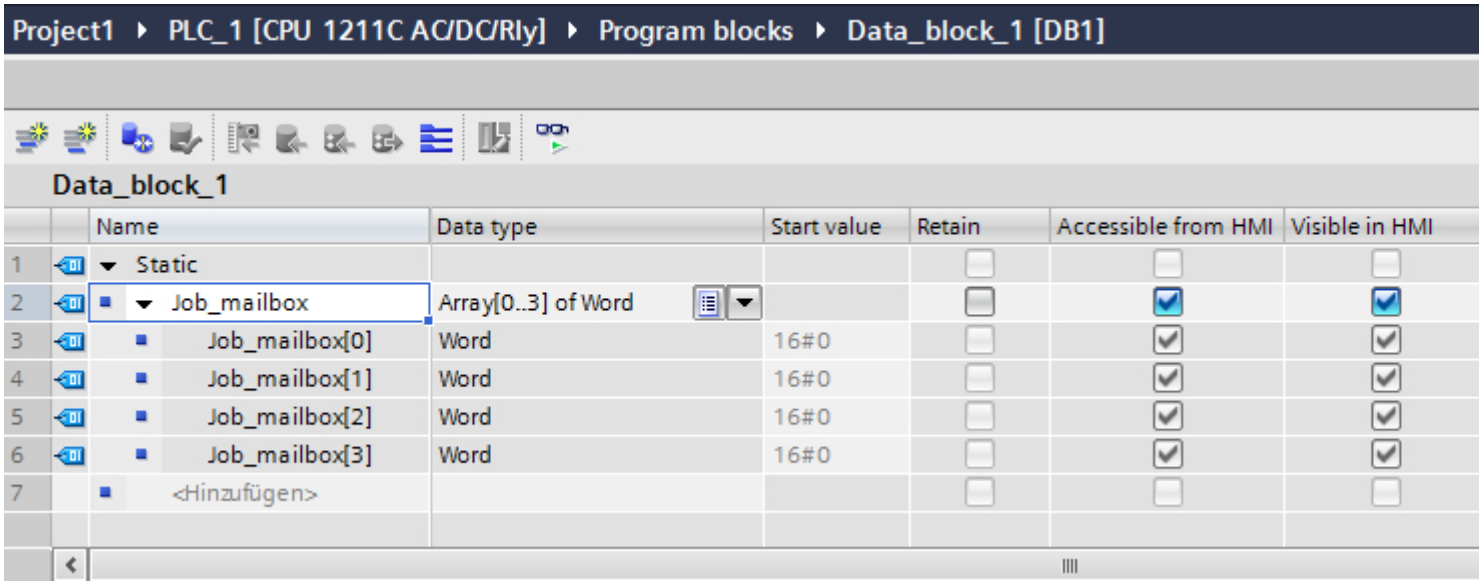
Procedure

1. Open "PLC > Program blocks" in the project tree.
2. Double-click the global data block you created previously.
   The data block opens.



3. Enter a tag name in the "Name" column.
4. Select "Array[lo .. hi] of type" as the data type in the "Data type" column.
5. Replace the "lo" entry by the low value for the dimension of the array.
6. Replace the "hi" entry by the high value for the dimension of the array.
   Example: If you configure an area pointer with the length "4", enter the value "0" for "lo" and the value "3" for "hi" inside the brackets.

7. Replace the "type" designation with the "word" data type.
   The full data type for an array of 4 tags appears as follows: "Array[0 .. 3] of word".
   The tag array is created after the entry is confirmed.
8. Click "Compile".
   The project is compiled.



Configuring an area pointer for a connection

Introduction

After you have parameterized the global data block, you now create the area pointer for the connection.

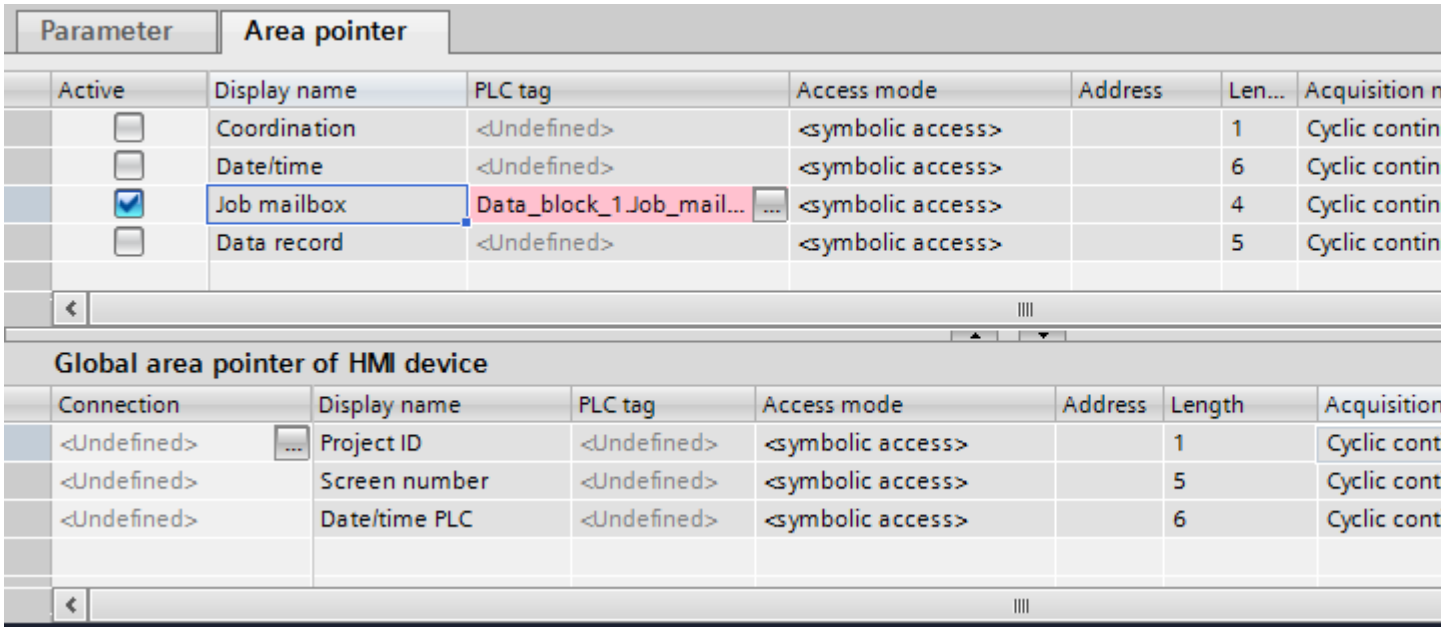
Requirements

- The global data block has been parameterized in the PLC program.

Procedure

1. Open "HMI >Connections" in the project tree.
2. Click the "Area pointer" tab.
3. Enable the required area pointer.
   You enable a global area pointer by selecting the connection in the "Connection" field.
4. Click the navigation button in the "PLC tag" field.
   The object list opens.

5. Navigate to the data block in the object list, and select the tag in the right window.
   You do not need an array tag to configure an area pointer with the length of "1".



6. Select the "Word" data type when creating the tag in the data block.

   If required, set additional parameters, such as the acquisition cycle, during configuration.

Result

The area pointer is enabled and connected to the PLC tag in the global data block.

12.11.5 Device dependency

12.11.5.1 Basic Panel

Communication drivers

SIMATIC communication drivers

Device dependency of the Basic Panels

Various communication drivers are configured for Basic Panels depending on the communication.

The following tables show the communication drivers released for integrated and non-integrated communication.

There are different versions of the HMI devices within the integrated communication.

Communication drivers for integrated communication (V11.0)

HMI devices	SIMATIC S7-1200 (V1)	SIMATIC S7-1200 (V2)	SIMATIC S7-1200 (V2.2)	SIMATIC S7-1200 (V3)	SIMATIC S7-1200 (V4)	SIMATIC S7-1500	SIMATIC S7-300/400

Area pointers for Basic Panels

Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

   Order number: 6AV6 671-8XE00-0AX0
2) only with RS422-RS232 converter (option)
   Order number: 6AV6 671-8XE00-0AX0
3) For serial communication, deselect "Remote Control" of "Channel 1" in the "File > Transfer >Options" menu.
4) "PROFINET IO Enabled" must be disabled.

Area pointers for Comfort Panel

Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Area pointer

Omron Host Link	IF1A [3], IF1B [3] [6] (terminal box)	—	IF1A [3], IF1B [3][6] (terminal box)	—	—	—

1) For SIMATIC S7-200 only
2) Depending on the terminal box used
3) For serial communication, deselect "Remote Control" of "Channel 1" in the "File > Transfer >Options" menu.
4) With PLC5 and KF2 module only
5) Can be selected and used, but not approved.
6) "PROFINET IO Enabled" must be disabled.

Area pointers for Mobile Panel

Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Area pointer

	Mobile Panel 177	Mobile Panel 277	Mobile Panel 277 IWLAN V2	Mobile Panel 277F IW-LAN V2	Mobile Panel 277F IW-LAN V2 (RFID tag)	KTP700 Mobile KTP700F Mobile	KTP900 Mobile KTP900F Mobile

Area pointers for PC systems

Introduction

Area pointers are parameter fields from which WinCC RT Advanced obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time

- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Table 12-154 WinCC RT Advanced

	WinCC RT Advanced
Screen number	Yes
Data record	Yes
Date/time	Yes
Date/time PLC	Yes
Coordination	Yes
Project ID	Yes
Job mailbox	Yes

12.11.5.7 Parallel communication

Parallel communication of communication drivers

The following table shows an overview of which communication drivers you can use simultaneously on one HMI device.

Note

Parallel communication is not approved for Basic Panels.

Parallel communication over Ethernet interfaces

The approved combinations can be operated via the same Ethernet interface. Several Ethernet interfaces are not required.

Parallel communication only concerns the Ethernet-based communication drivers.

	Allen-Bradley Ether-Net/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCPIP	OPC (DA/ XML DA)	OPC UA (DA)	SIMATIC LOGO!	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC HTTP protocol	Sinumerik NC

Parallel communication over serial interfaces

The following applies for parallel communication over serial interfaces:

- One communication driver per interface.
- One interface per communication driver.

12.11.6 Communicating with SIMATIC S7 1500

12.11.6.1 Communication with SIMATIC S7 1500

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 1500 PLC.

You can configure the following communication channels for the SIMATIC S7 1500 PLC:

- PROFINET
- PROFIBUS

HMI connection for communication

Configure connections between the HMI device and a SIMATIC S7 1500 in the "Devices & Networks" Editor.

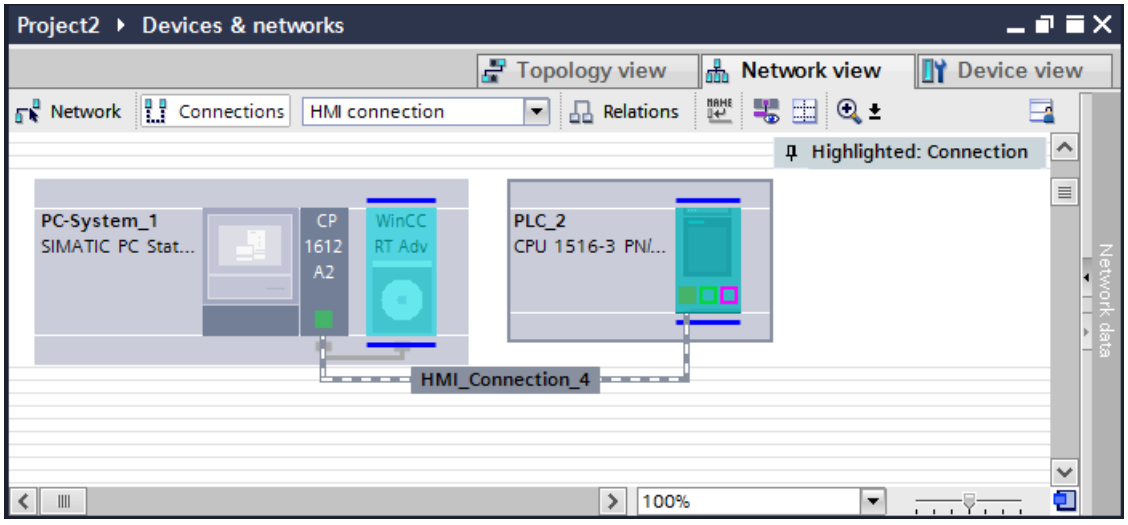
12.11.6.2 Communication via PROFINET

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 1500 into the project, interconnect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1500 via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

Requirements

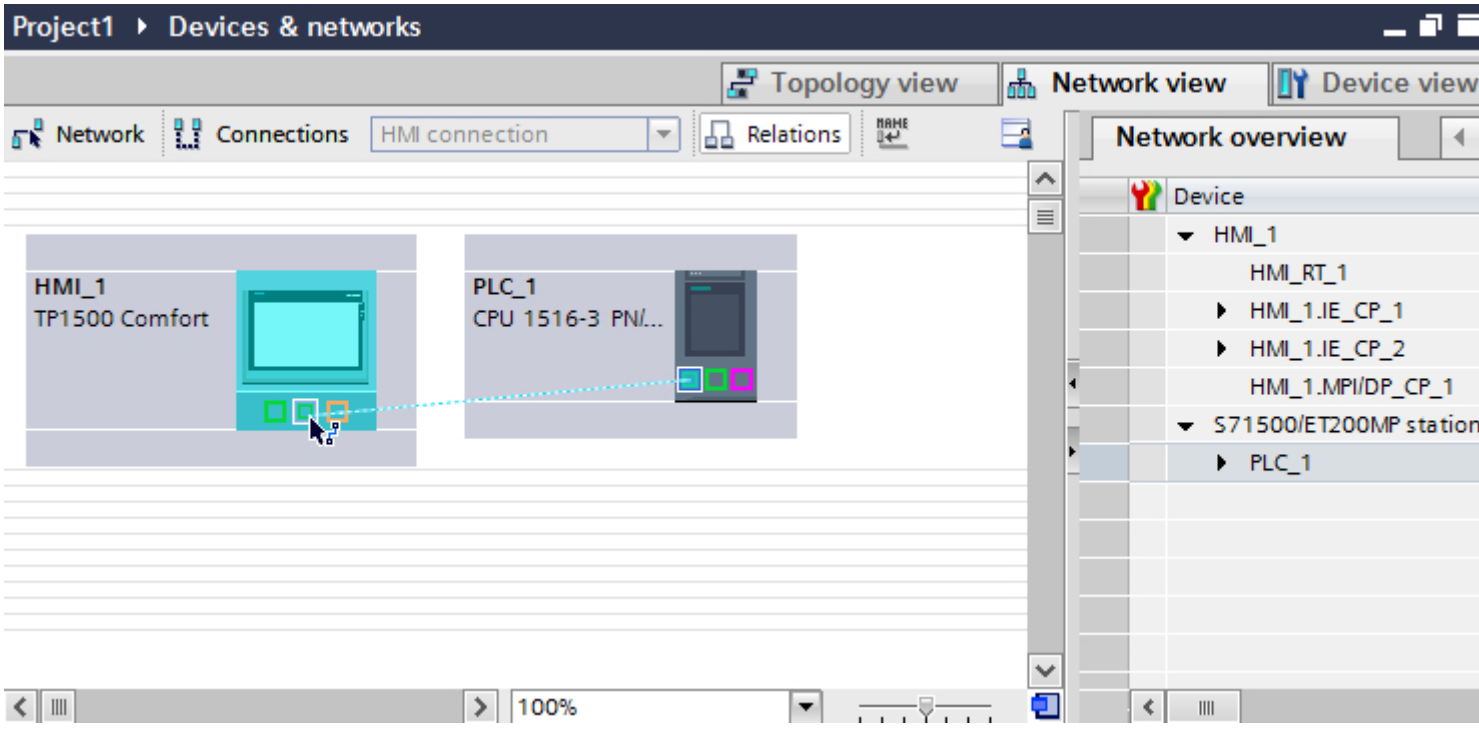
The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC S7 1500 with PROFINET interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.



4. Click the connecting line.
5. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6093)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This chapter describes communication over PROFINET between a WinCC Runtime and the SIMATIC S7 1500 PLC.

You can use the following WinCC Runtimes as an HMI device:

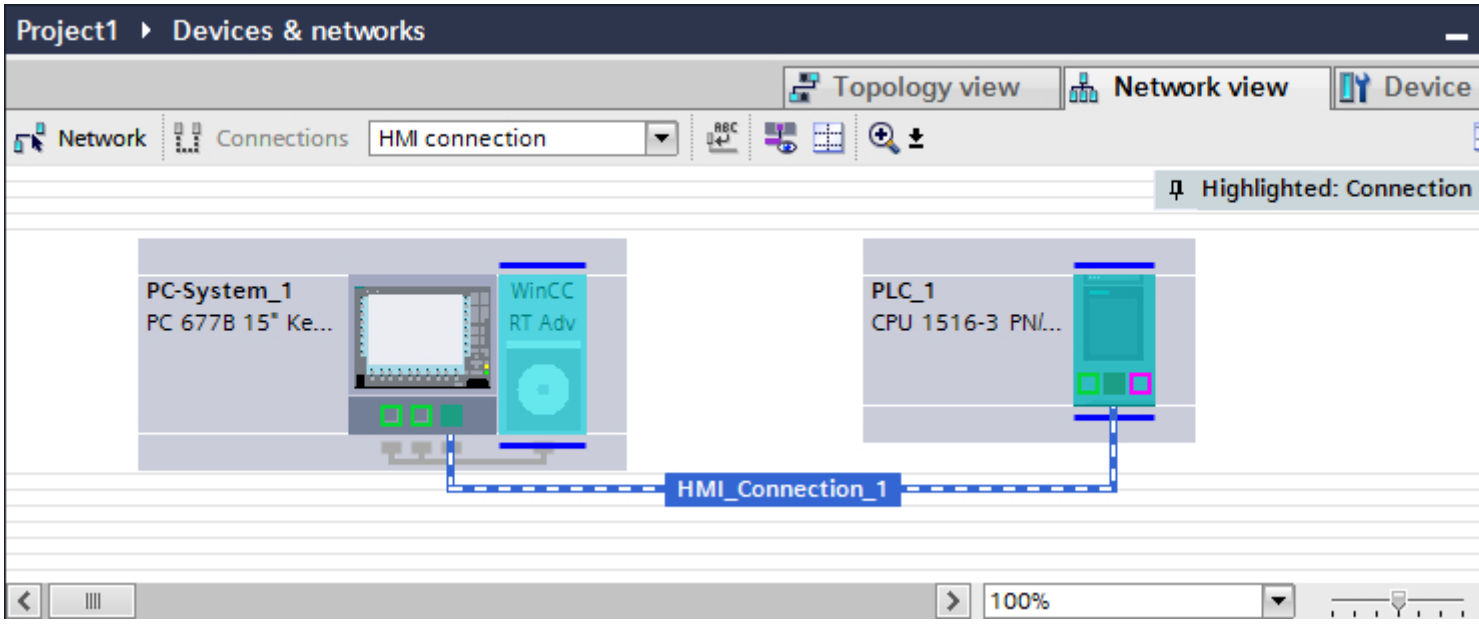
- WinCC RT Advanced

WinCC Runtime as HMI device

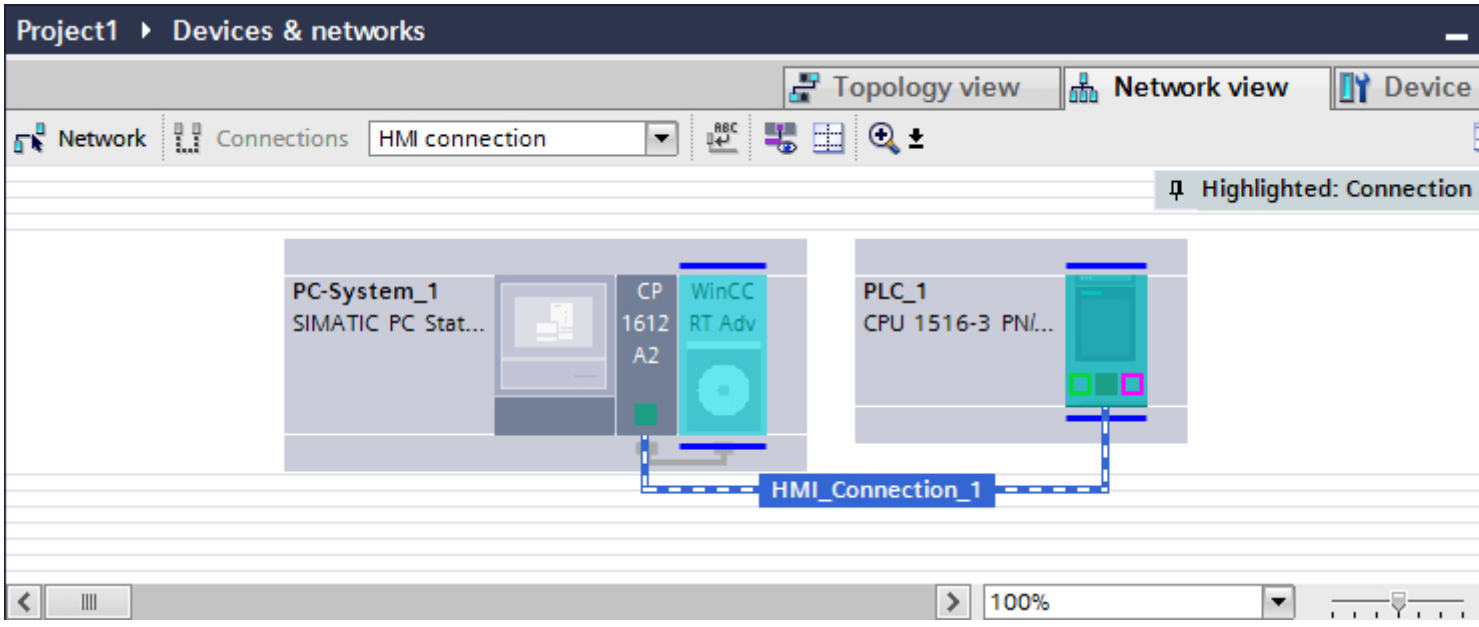
Configure the HMI connections between a WinCC Runtime and SIMATIC S7 1500 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection over PROFINET or Ethernet between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

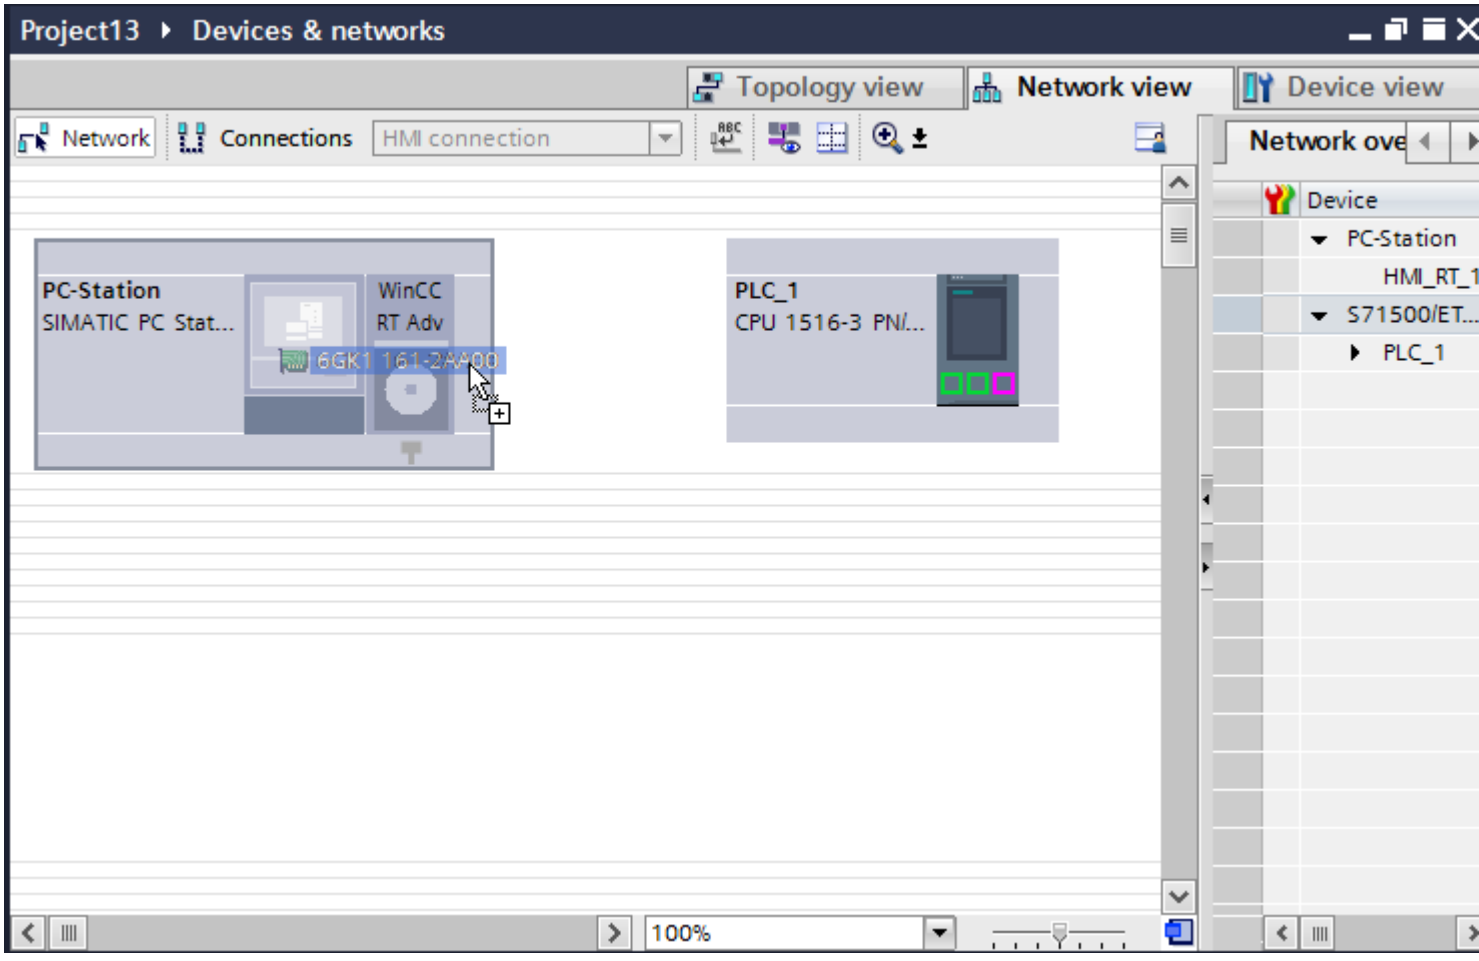
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFINET interface
- PC station with a "WinCC Runtime" application

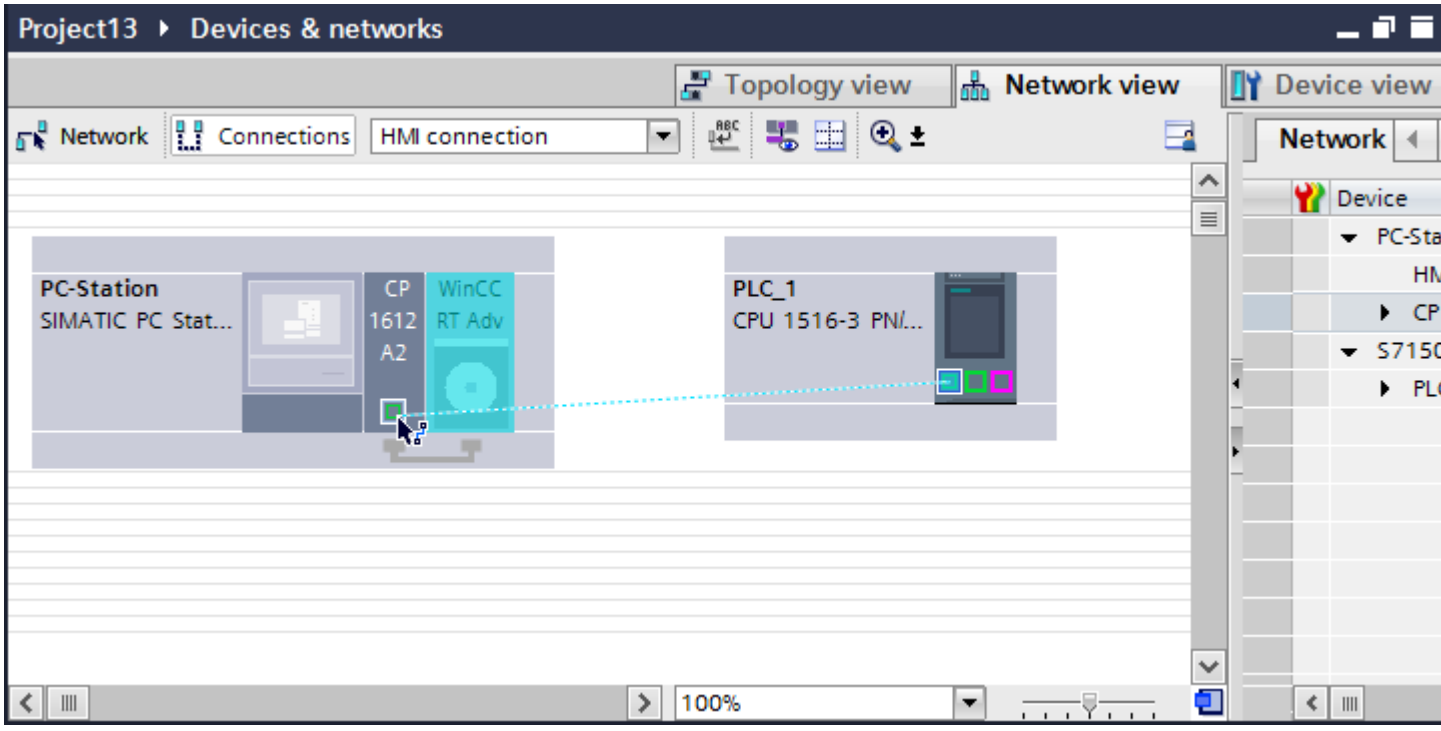
Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.



5. Click the connected interface on the PC station and select the entry "PC station" under "Interface assignment" in the Inspector window.
6. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6093)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection over PROFINET or Ethernet between HMI devices and SIMATIC S7 1500 in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

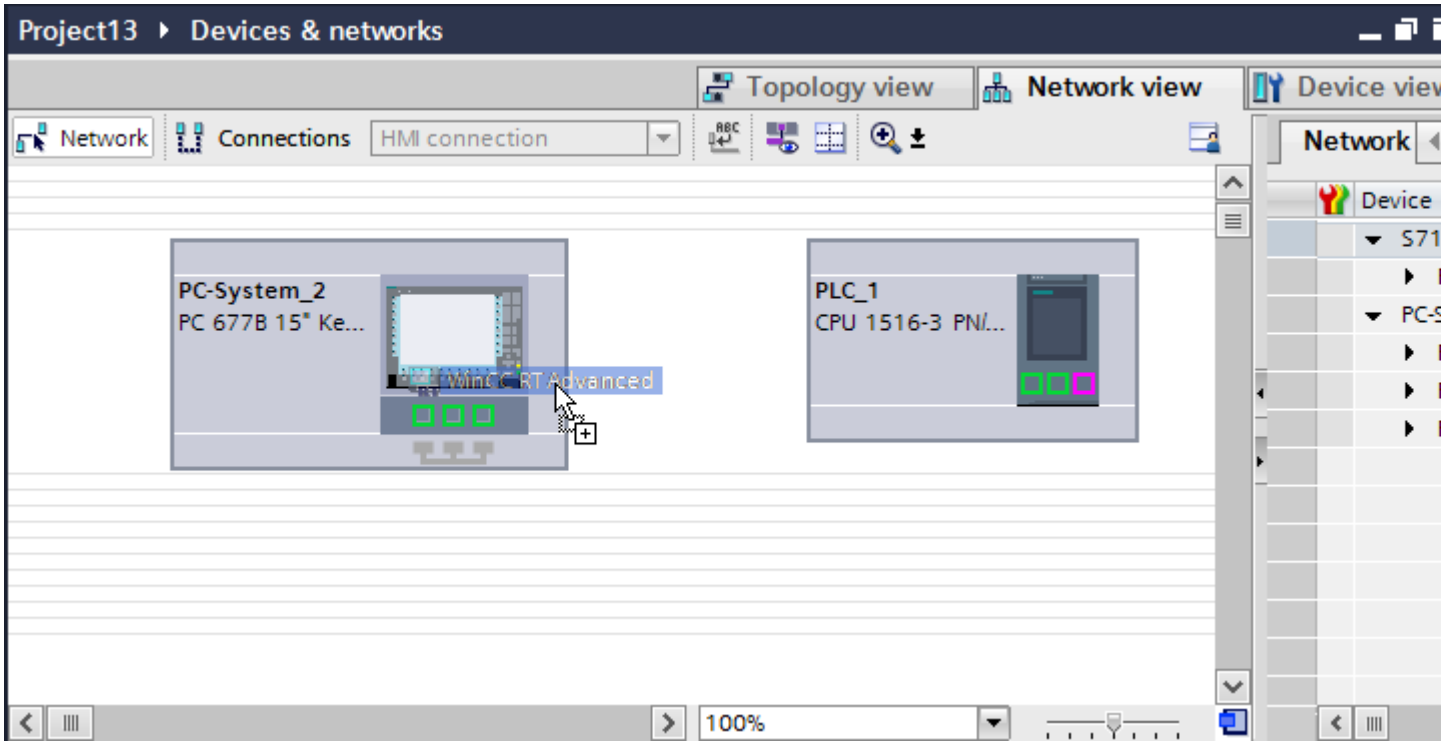
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFINET interface
- SIMATIC PC with PROFINET interface

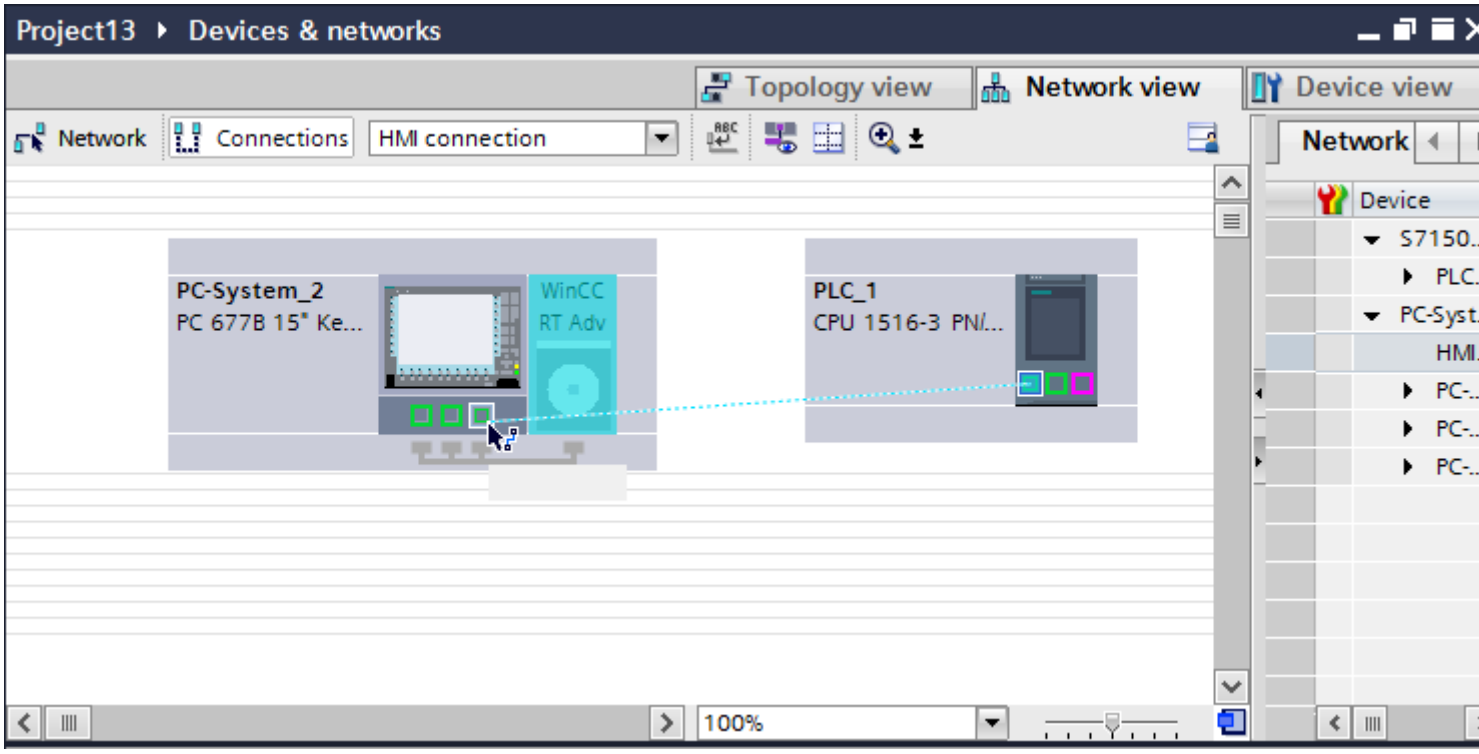
Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the PC.



5. Click the connected interface on the PC station and select the entry "PC station" under "Interface assignment" in the Inspector window.
6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6093)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

PROFINET parameters

PROFINET parameters for the HMI connection

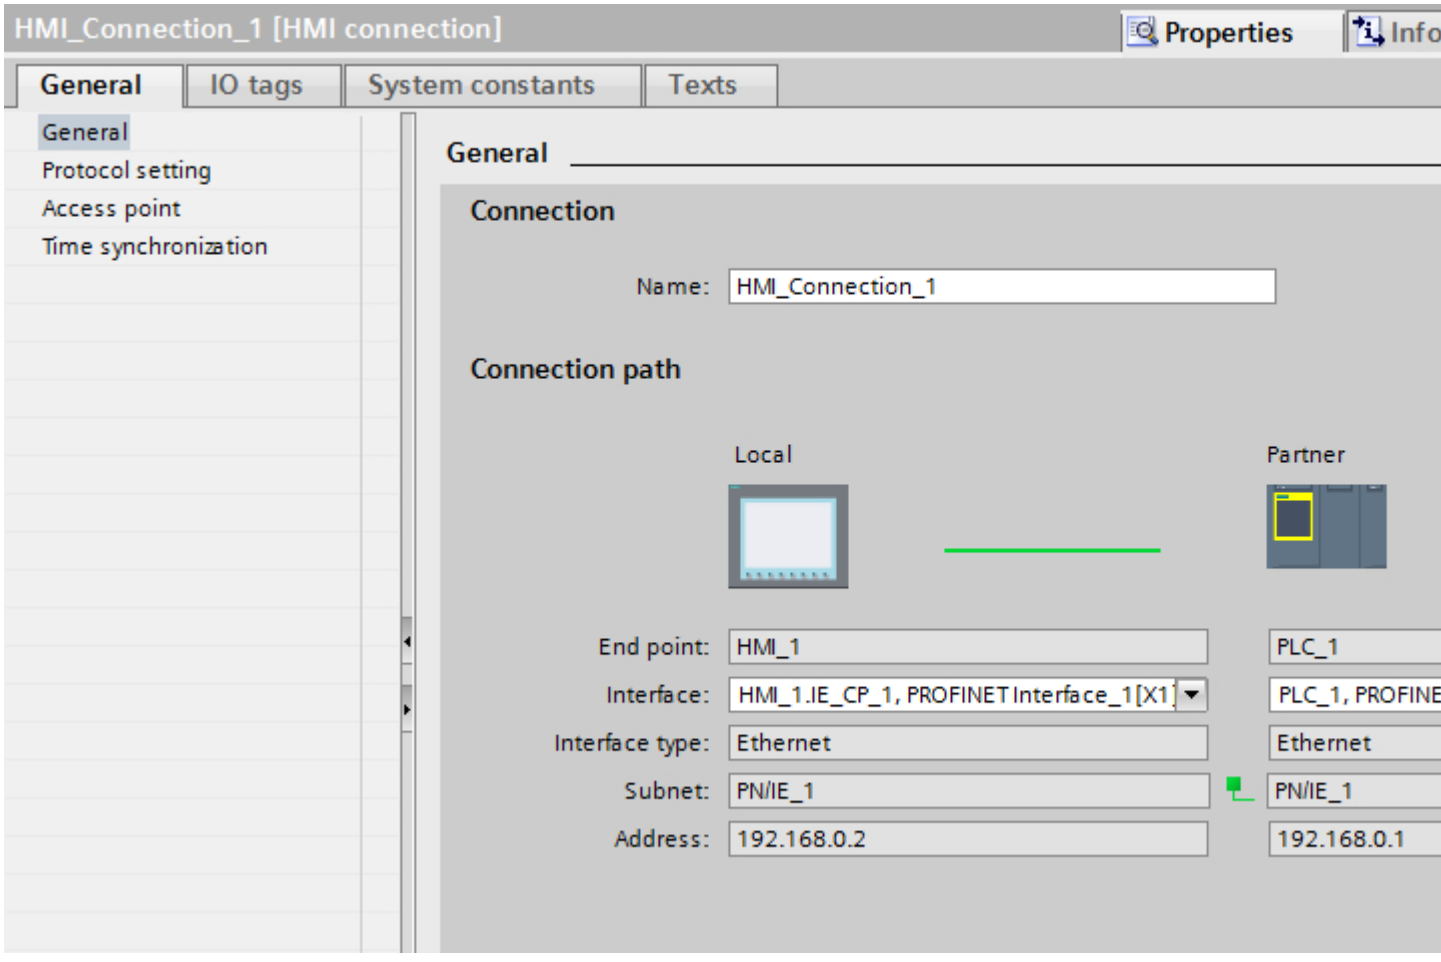
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Shows the name of the HMI connection.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

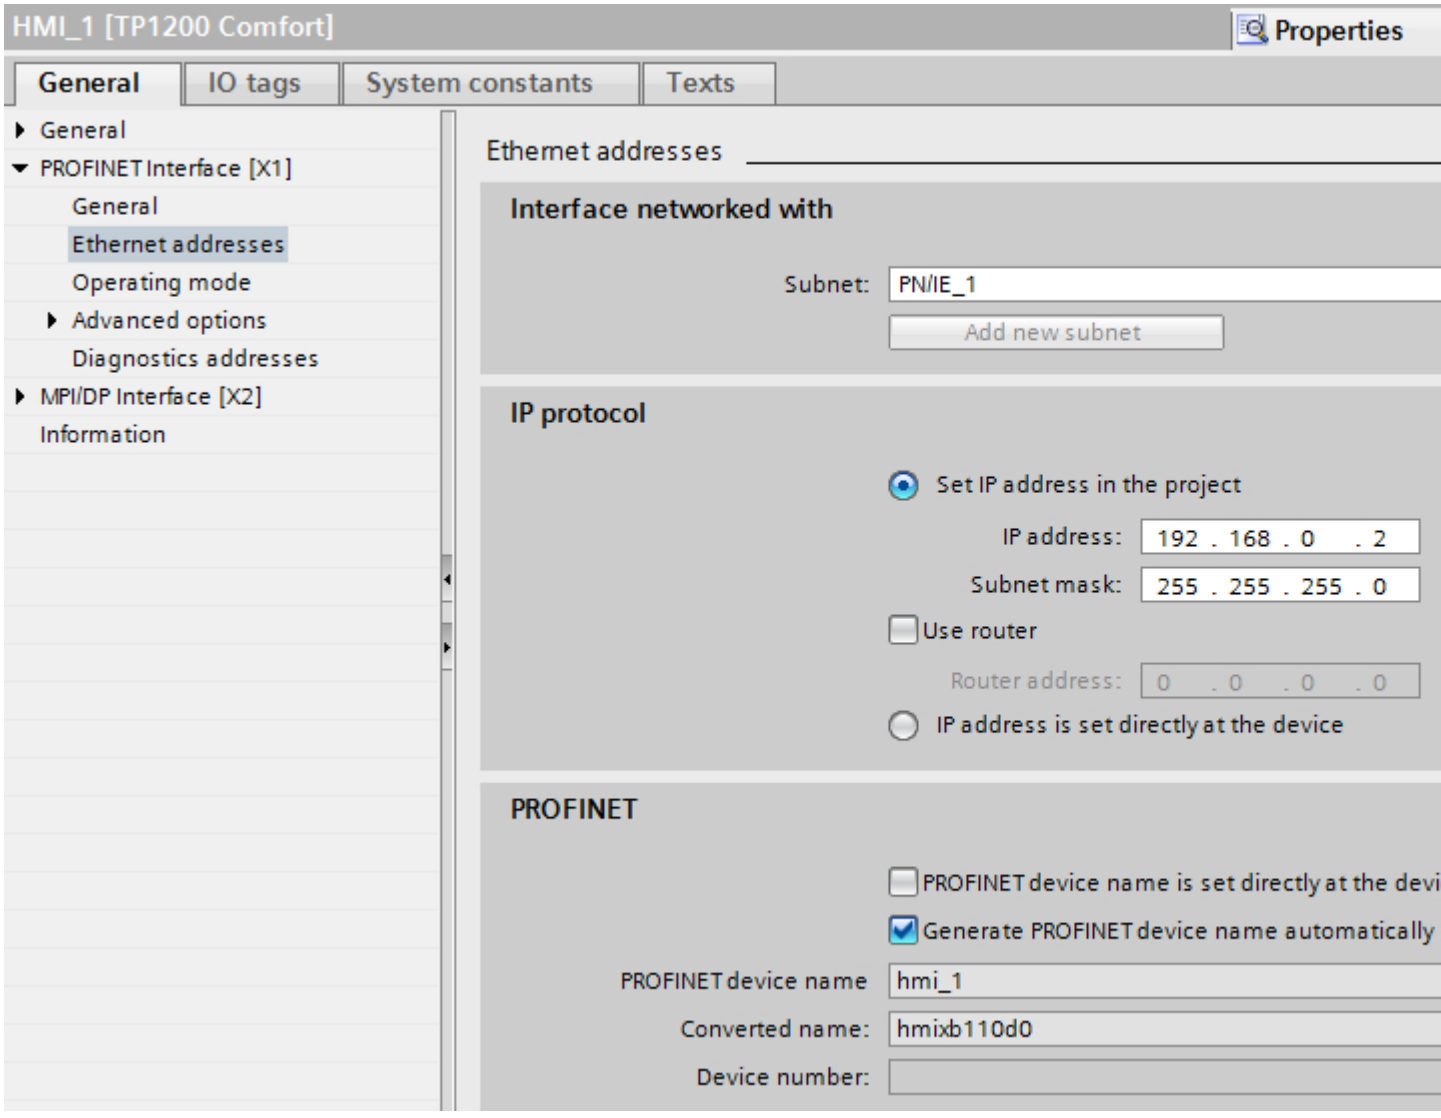
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address directly on the device"
  If the "Set IP address on the device" function is enabled, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

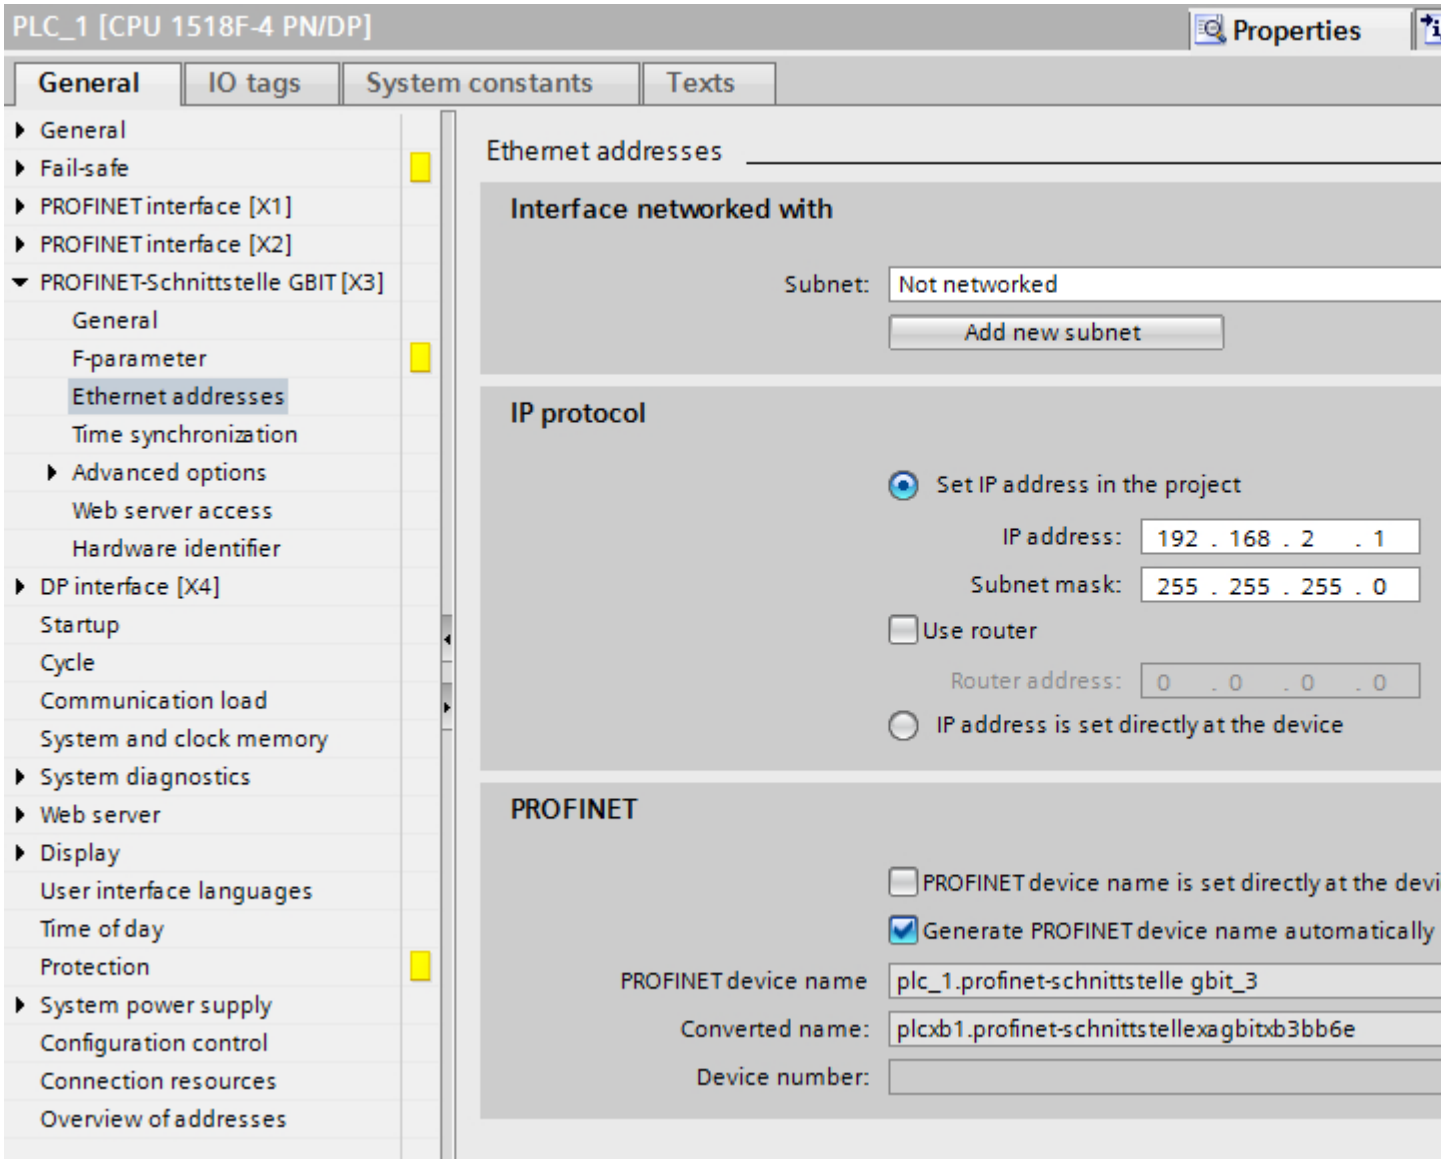
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Protection of communication

Security levels

If you want to protect the controller and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1500 controller, several aspects need to be considered when setting protection levels.

For additional information on this, see:Setting options for the protection (Page 6099)

Example

When configuring the controller, you select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU).

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Setting options for the protection

Access levels

The following section describes how to use the various access levels of the S7-1500 CPUs.

S7-1500 CPUs provide various access levels to limit the access to specific functions.

The individual access levels as well as their associated passwords are specified in the object properties of the CPU. You assign parameters for the access level in a table.

Access level	Access			Access permission
	HMI	Read	Write	Password
Full access (no protection)	✓	✓	✓	
Read access	✓	✓		
HMI access	✓			
No access (complete protection)				

The green checkmarks in the columns to the right of the respective access level specify which operations are possible without knowing the password of this access level.

If you want to use the functions of fields that are not selected in the "Access" column, a password has to be entered:

Example:

You set the access level "Read access". You can see from the table that write access is not possible during operation without entering a password.

The table also shows that full access is necessary for the "Write" function.

To use a function requiring write access during operation, the password for full access must therefore be entered.

Notice

Configuring an access level does not replace know-how protection

Configuring access levels offers a high degree of protection against unauthorized changes to the CPU by restricting download privileges to the CPU. However, blocks on the memory card are not write- or read-protected. Use know-how protection to protect the code of blocks on the memory card.

Default characteristics

The default access level is "Full access (no protection)". Every user can read and change the hardware configuration and the blocks. A password is not set and is also not required for online access.

The access levels in detail

Below you can find an explanation of the existing access levels and which functions are possible at the respective access level.

- Full access (no protection):
  The hardware configuration and the blocks can be read and changed by all users.
- Read access for F-blocks (F-CPUs only):
  F-blocks of the safety program cannot be changed without authorization by the password of this access level or a higher level.
  Further information is available in the programming and operating manual *SIMATIC Safety - Configuring and Programming.*
- Read access:
  With this access level, read-only access to the hardware configuration and the blocks is possible without entering a password, which means you can download hardware configuration and blocks to the programming device. In addition, HMI access and access to diagnostics data is possible, as is changing the operating state (RUN/STOP).
  You cannot load blocks or a hardware configuration into the CPU. Moreover, no writing test functions and firmware updates are possible.
- HMI access:
  Only HMI access and access to diagnostics data is possible. Tags can be read and written via a HMI device.
  At this access level, you can neither load blocks and the hardware configuration into the CPU nor load blocks and the hardware configuration from the CPU into the programming device.
  In addition, the following is **not** possible: Writing test functions, changing the operating state (RUN/STOP) and firmware updates.
- No access (complete protection):
  Only identification data can be read, via "Accessible devices", for example.
  Neither read nor write access to the hardware configuration and the blocks is possible. HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed).
  Legitimation with a configured password provides you with access in accordance with the associated protection level.

Behavior of functions at different access levels

The table below describes which online functions are possible in the various protection levels.

Function	Full access	Read access	HMI access	No access
Identification of the device, via "Accessible devices", for example	Yes	Yes	Yes	Yes
HMI diagnostics view	Yes	Yes	Yes	No
Monitoring tags (M, I, Q, DB content) via HMI device	Yes	Yes	Yes	No
Modifying tags (M, I, Q, DB content) via HMI device	Yes	Yes	Yes	No

Diagnostics display (for example, device information, connection display, alarm display, diagnostic buffer)	Yes	Yes	Yes	No
Reading cycle time statistics (Online & Diagnostics)	Yes	Yes	Yes	No
Reading information from the hardware configuration (Online & Diagnostics)	Yes	Yes	Yes	No
Reading time-of-day	Yes	Yes	Yes	No
Executing online functions within the hardware configuration (Online & Diagnostics)	Yes	Yes	Yes	No
Acknowledging alarms	Yes	Yes	Yes	No
Receiving alarms	Yes	Yes	Yes	No
Enabling/disabling alarms	Yes	Yes	No	No
Reading tags via test function (STEP 7, tag table or watch table)	Yes	Yes	No	No
Requesting operating state change online (RUN/STOP/ warm restart)	Yes	Yes	No	No
Downloading data blocks, code blocks, hardware configuration to PG/PC	Yes	Yes	No	No
Set time-of-day	Yes	Yes	No	No
Deleting data blocks, code blocks, hardware configuration in the CPU	Yes	No	No	No
Downloading individual data blocks, code blocks, hardware configurations to the CPU	Yes	No	No	No
Loading PLC program to the device and resetting	Yes	No	No	No
Firmware update of CPUs or I/O modules	Yes	No	No	No
Modifying tags via test function (STEP 7, watch table)	Yes	No	No	No
Reading tags in the program status	Yes	No	No	No
Online editing of blocks	Yes	No	No	No
Modifying outputs in STOP mode	Yes	No	No	No

Behavior of a password-protected module during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Before an online function is executed, the necessary permission is checked and, if necessary, the user is prompted to enter a password.

Example: The module was configured with read access and you want to execute the "Modify tags" function. This requires write access to a test function; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights".

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

Access to a password-protected S7-1500 CPU can be restricted locally on the display. The restriction is only in effect when the operating mode switch is set to RUN.

Access password for the HMI connection

Introduction

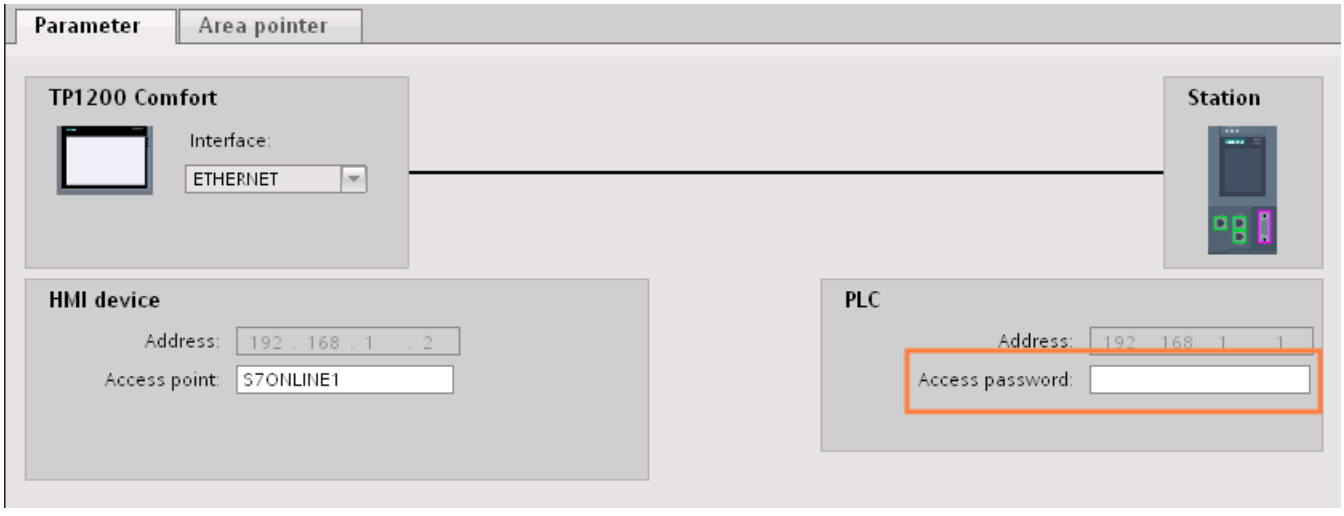
Communication with a PLC with the"Complete protection" protection level is protected by a password. The password is stored in the properties of the PLC.

Enter the password from the PLC in the "Access password" area.

Communication to the PLC is denied if an incorrect password or no password is entered.

Entering the access password

Enter the access password for the HMI connection in the "Connections" editor.



Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

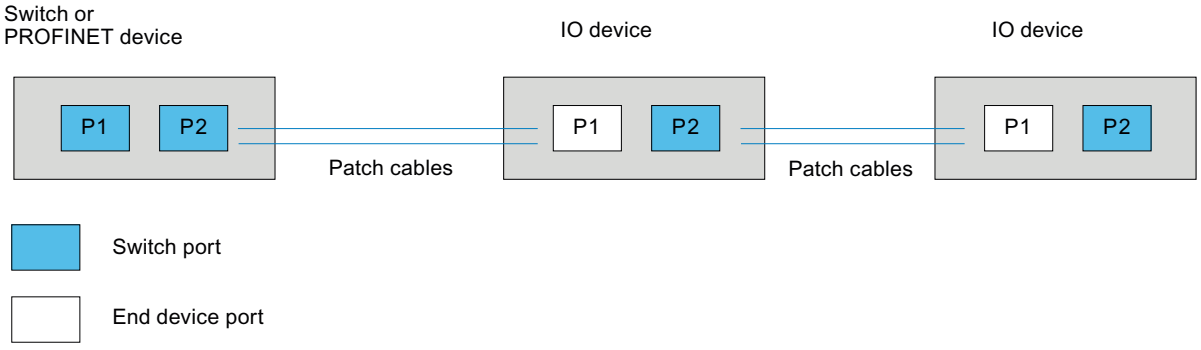
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"
  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"
  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.
  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

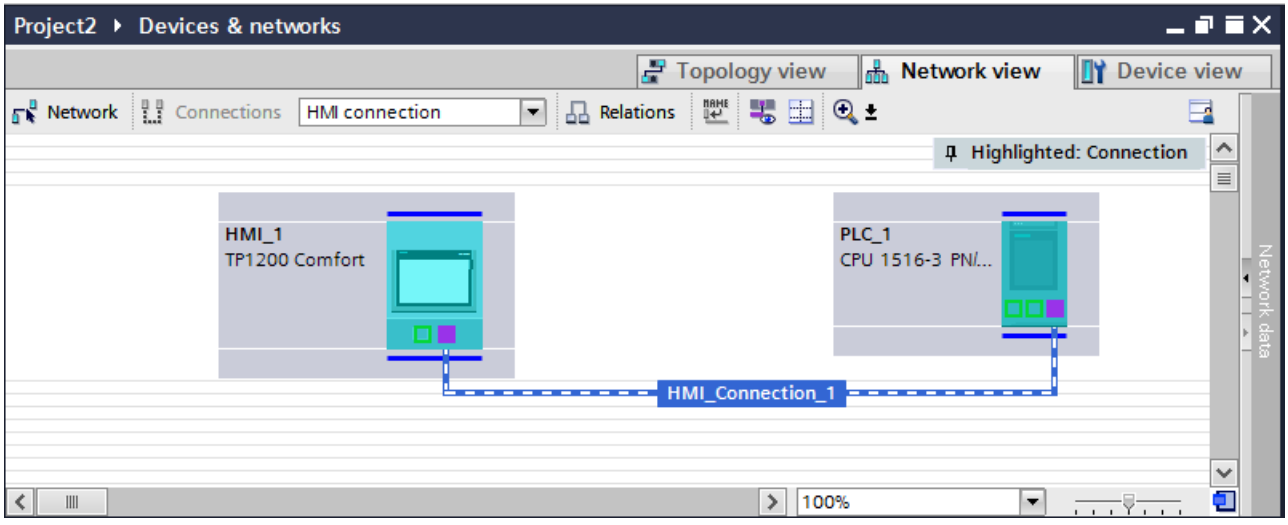
12.11.6.3 Communication via PROFIBUS

Configuring an HMI connection

Communication via PROFIBUS

HMI connections via PROFIBUS

If you have inserted an HMI device and a SIMATIC S7 1500 into the project, interconnect the two PROFIBUS interfaces in the "Devices & Networks" editor.



HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS

Introduction

You configure an HMI connection over PROFIBUS between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

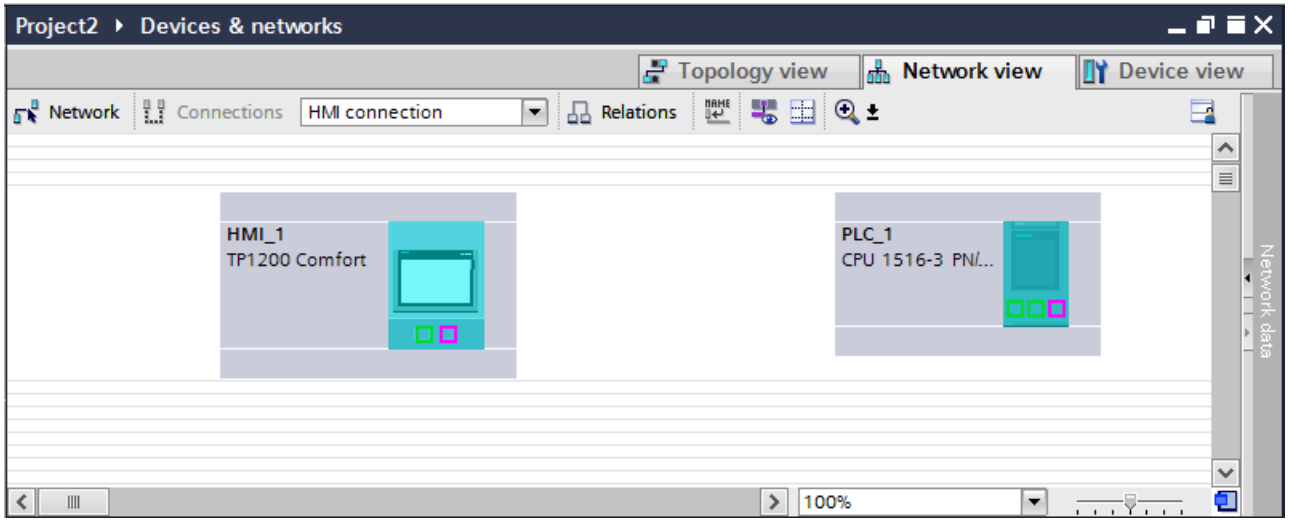
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7 1500 with PROFIBUS interface

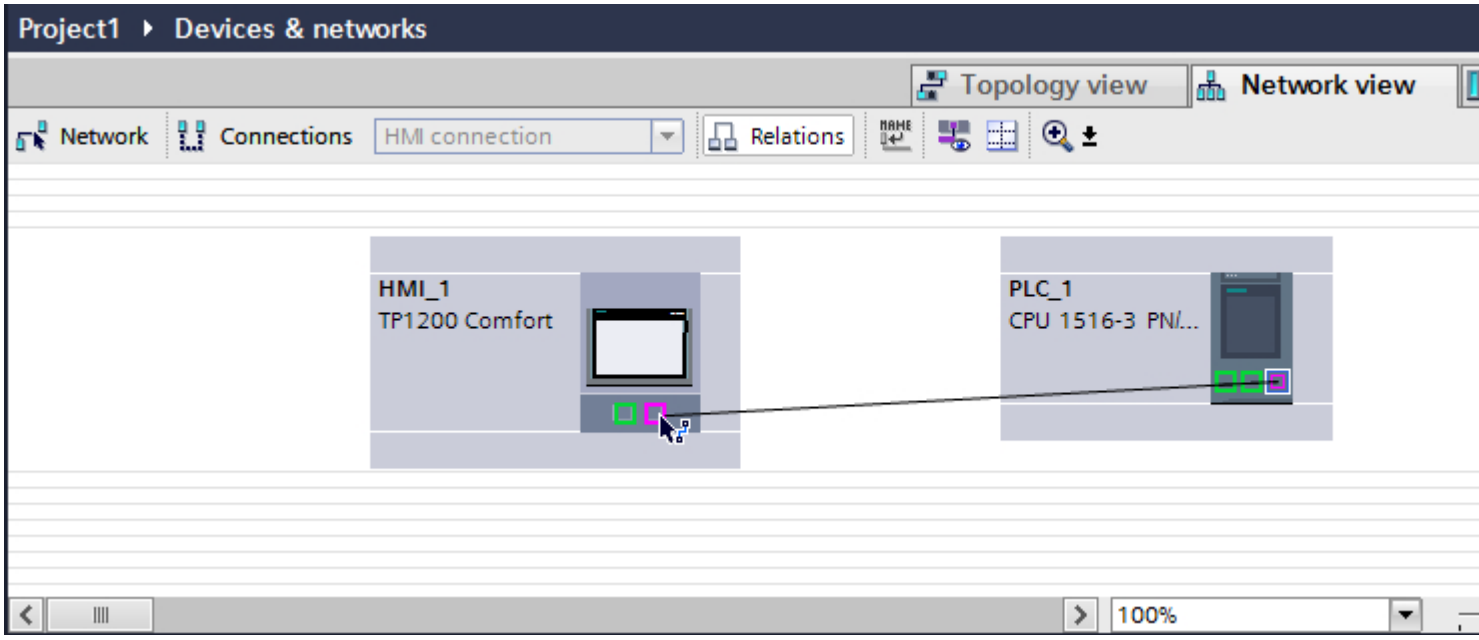
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.



2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Click the HMI device interface.
4. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > HMI MPIDP > Parameters".

5. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6116)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

Configuring an HMI connection

Communication via PROFIBUS

Communication via PROFIBUS

This chapter describes communication over PROFIBUS between a WinCC Runtime and the SIMATIC S7 1500 PLC.

You can use the following WinCC Runtimes as an HMI device:

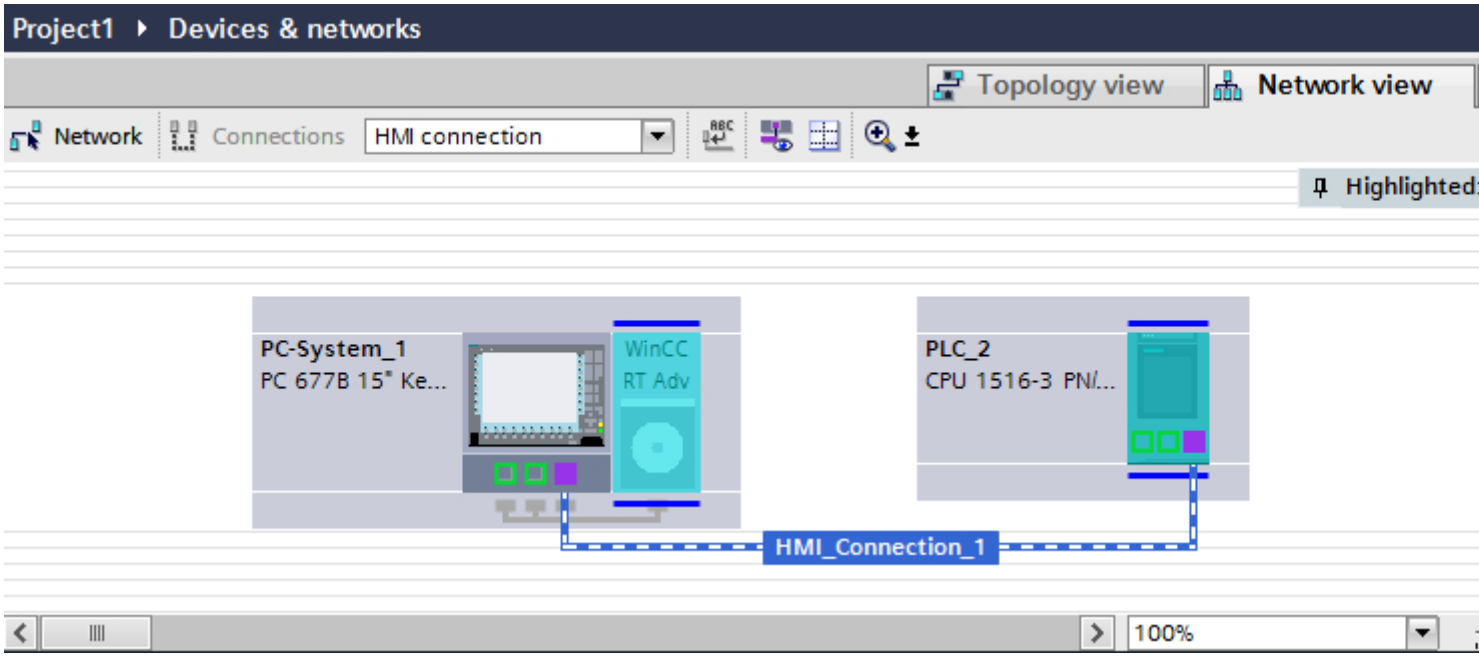
- WinCC RT Advanced
- WinCC RT Professional

WinCC Runtime as HMI device

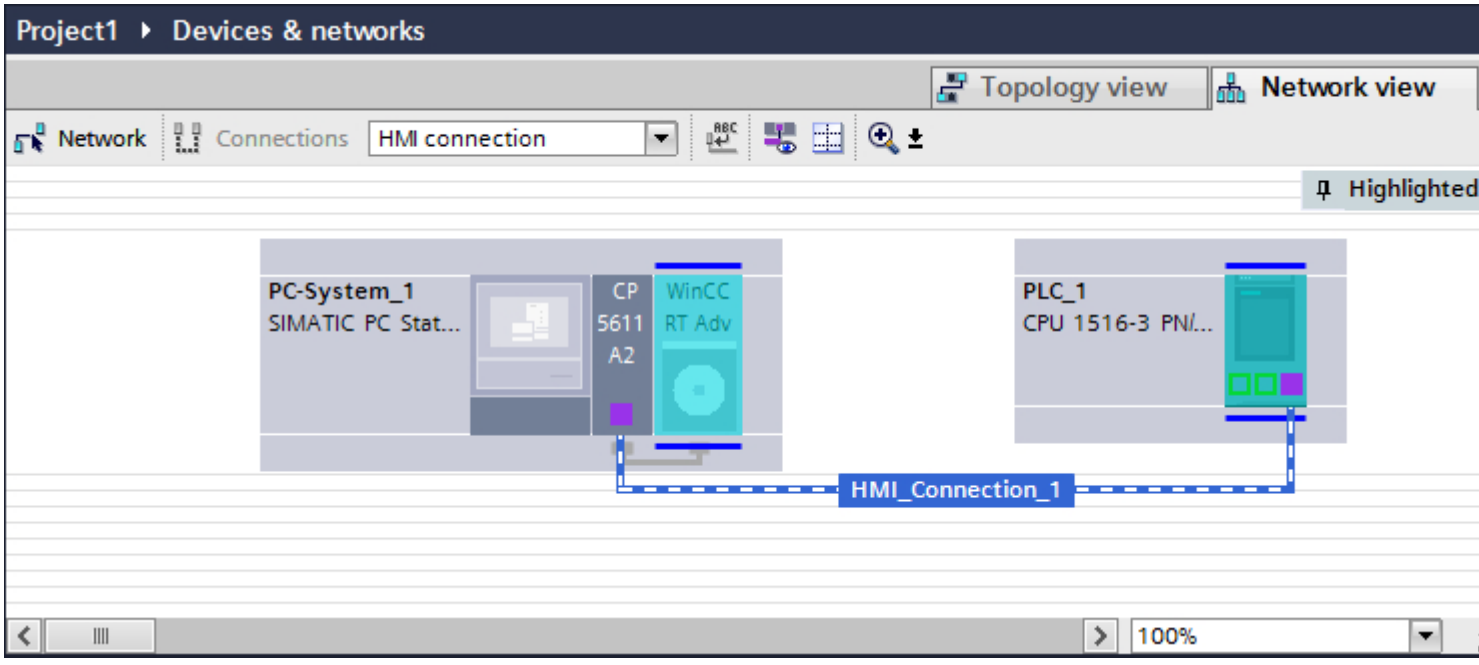
Configure the HMI connections between WinCC Runtime and SIMATIC S7 1500 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS with a PC

Introduction

You configure an HMI connection over PROFIBUS between the HMI device and SIMATIC S7 1500 in the "Devices & Networks" editor.

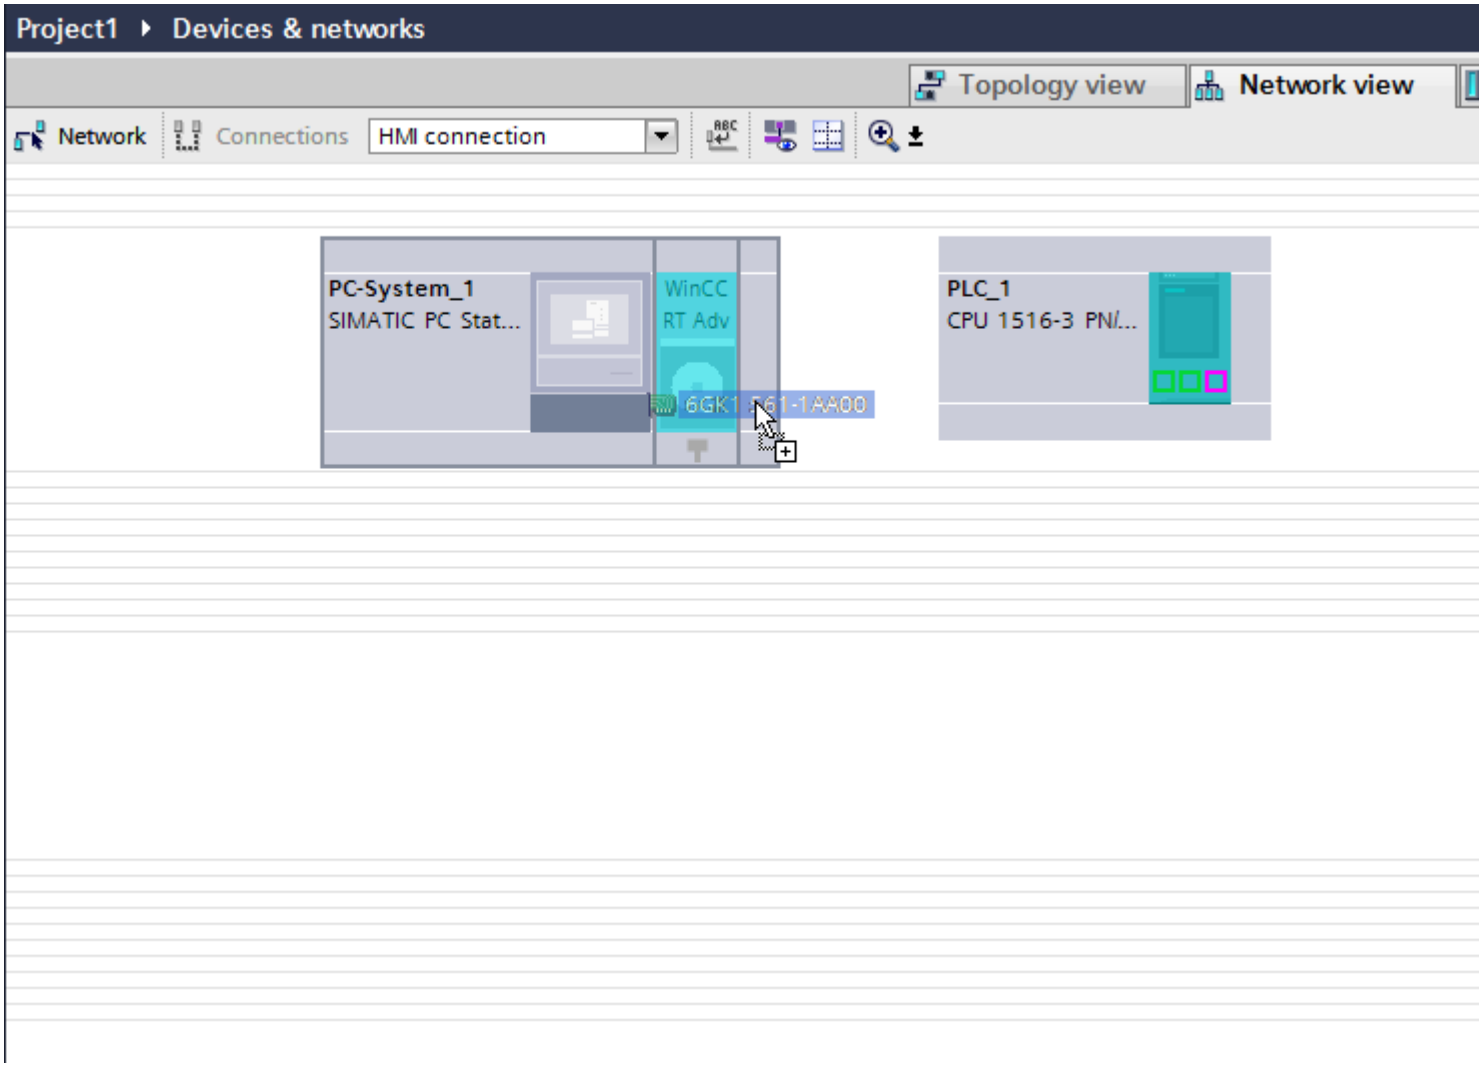
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFIBUS interface
- PC station with WinCC RT Advanced or WinCC RT Professional

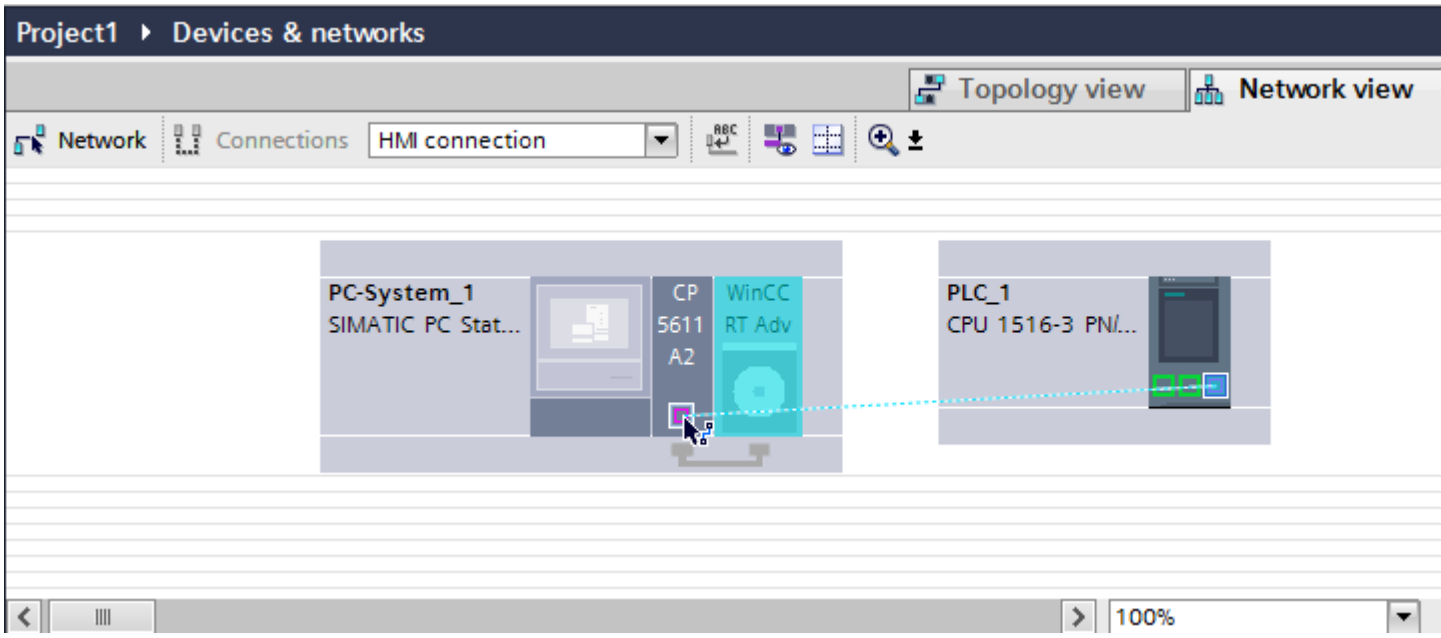
Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6116)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

Configuring an HMI connection via PROFIBUS with a SIMATIC PC

Introduction

You configure an HMI connection over PROFIBUS between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

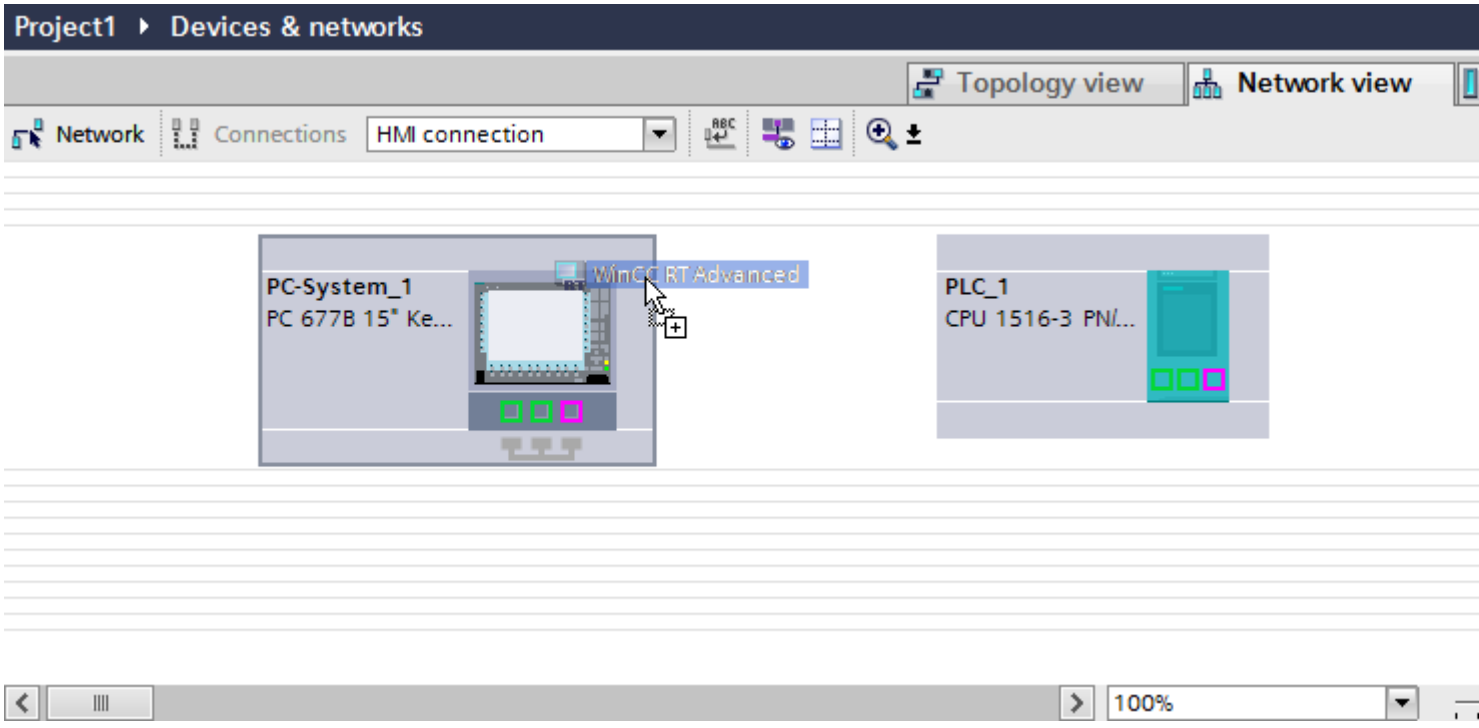
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFIBUS interface
- SIMATIC PC with PROFIBUS interface

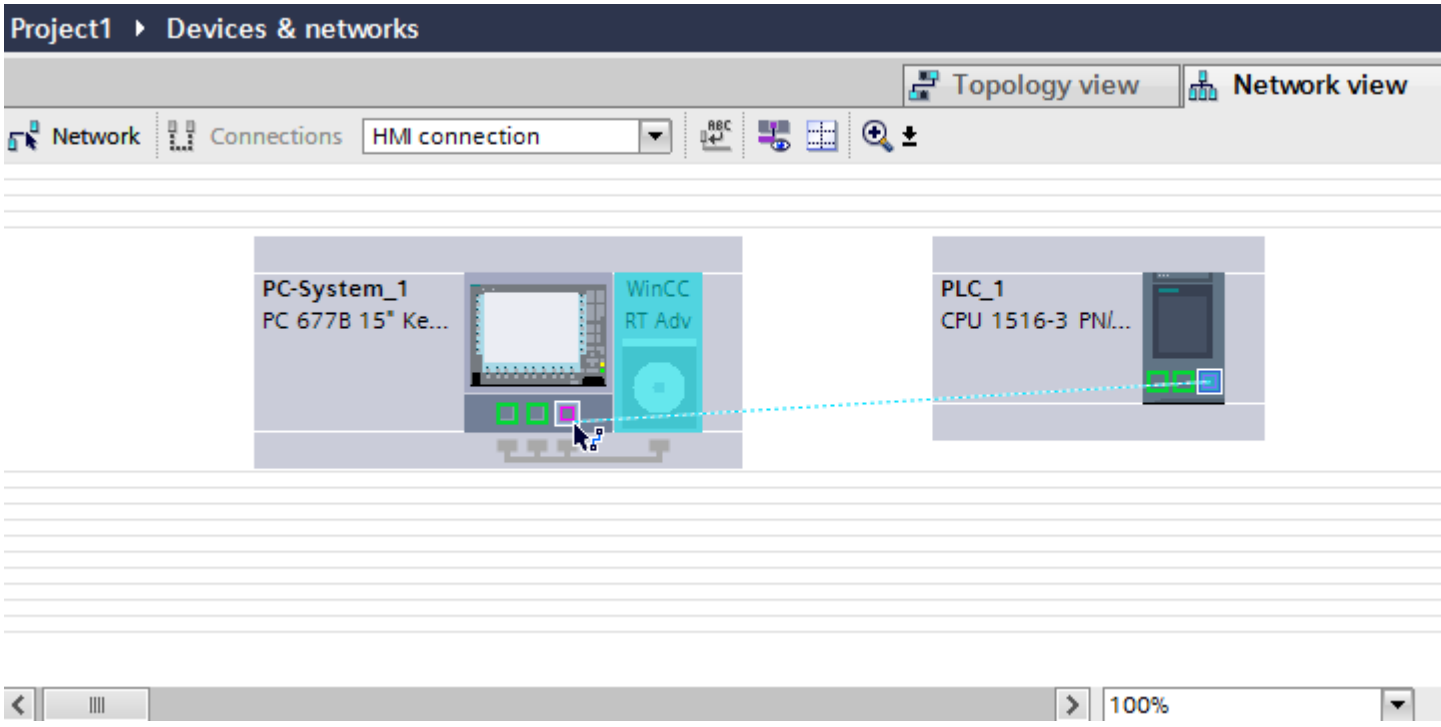
Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Click the MPI interface of the PC and select "PROFIBUS" for the interface type in the Inspector window.
3. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



4. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

5. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6116)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

PROFIBUS parameters

PROFIBUS parameters for the HMI connection

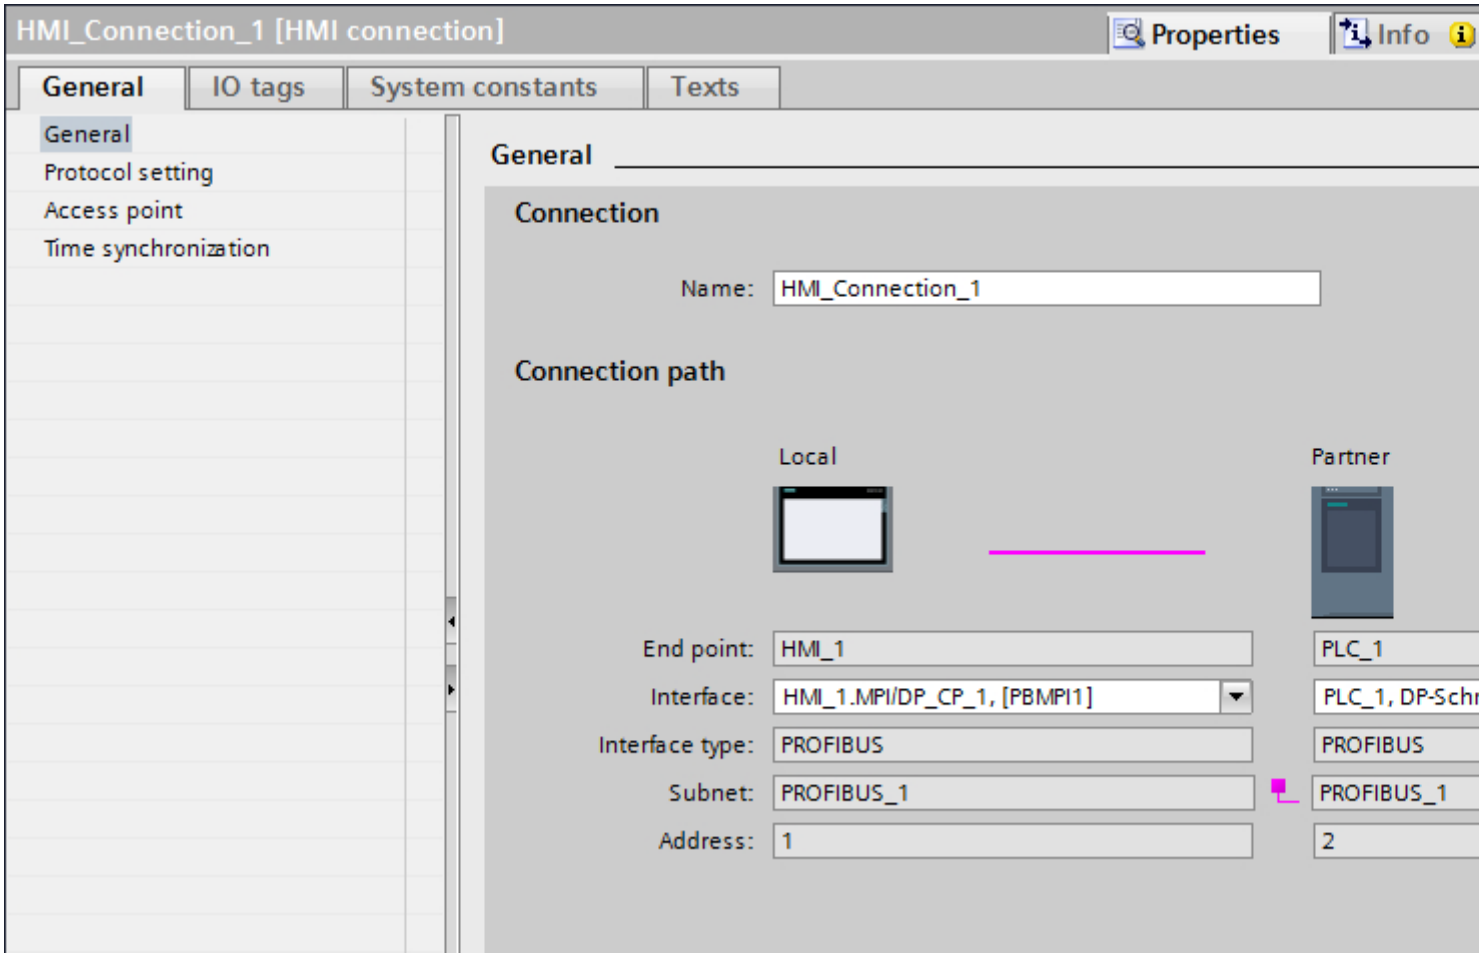
PROFIBUS parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Displays whether the devices are networked together.

 - displayed if the devices are networked together.

 - displayed if the devices are not networked together.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the PROFIBUS address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

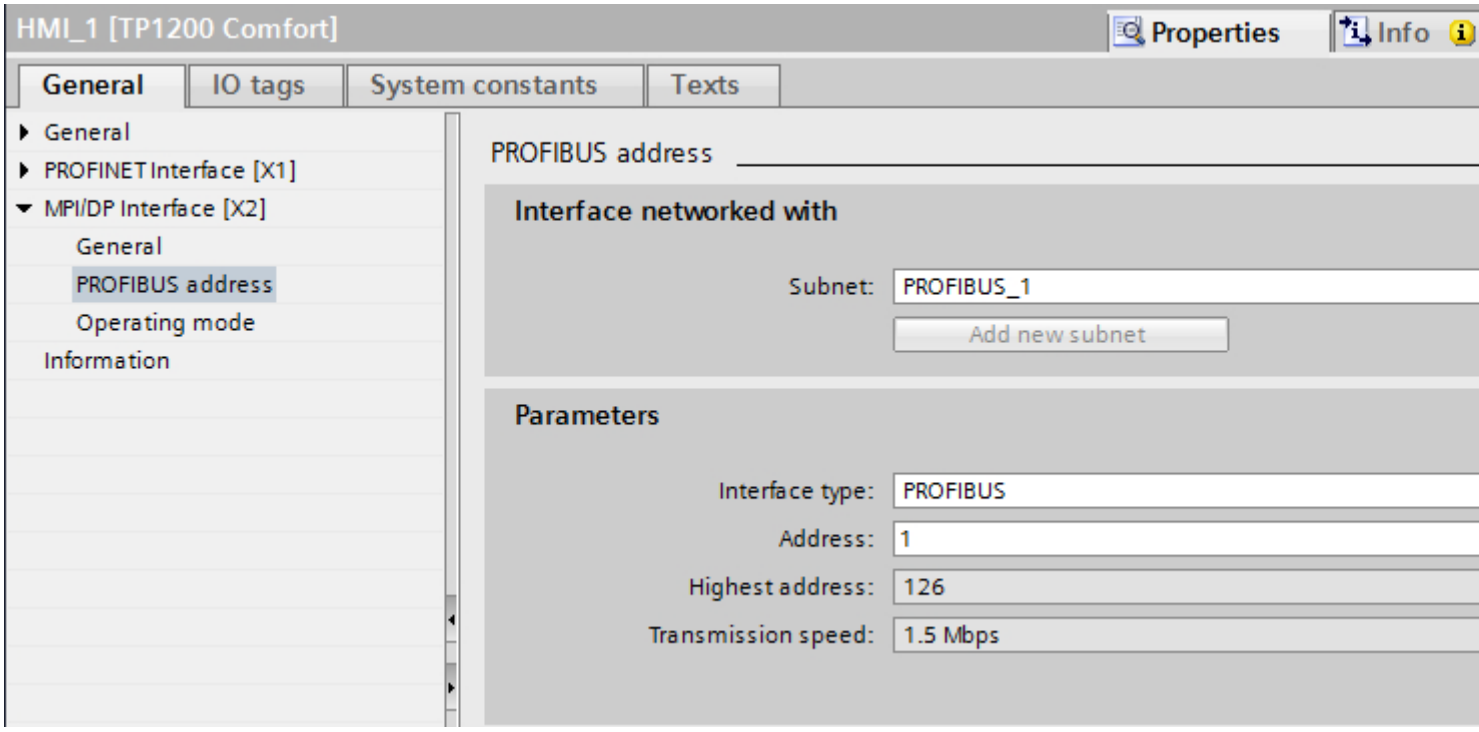
PROFIBUS parameters for the HMI device

PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

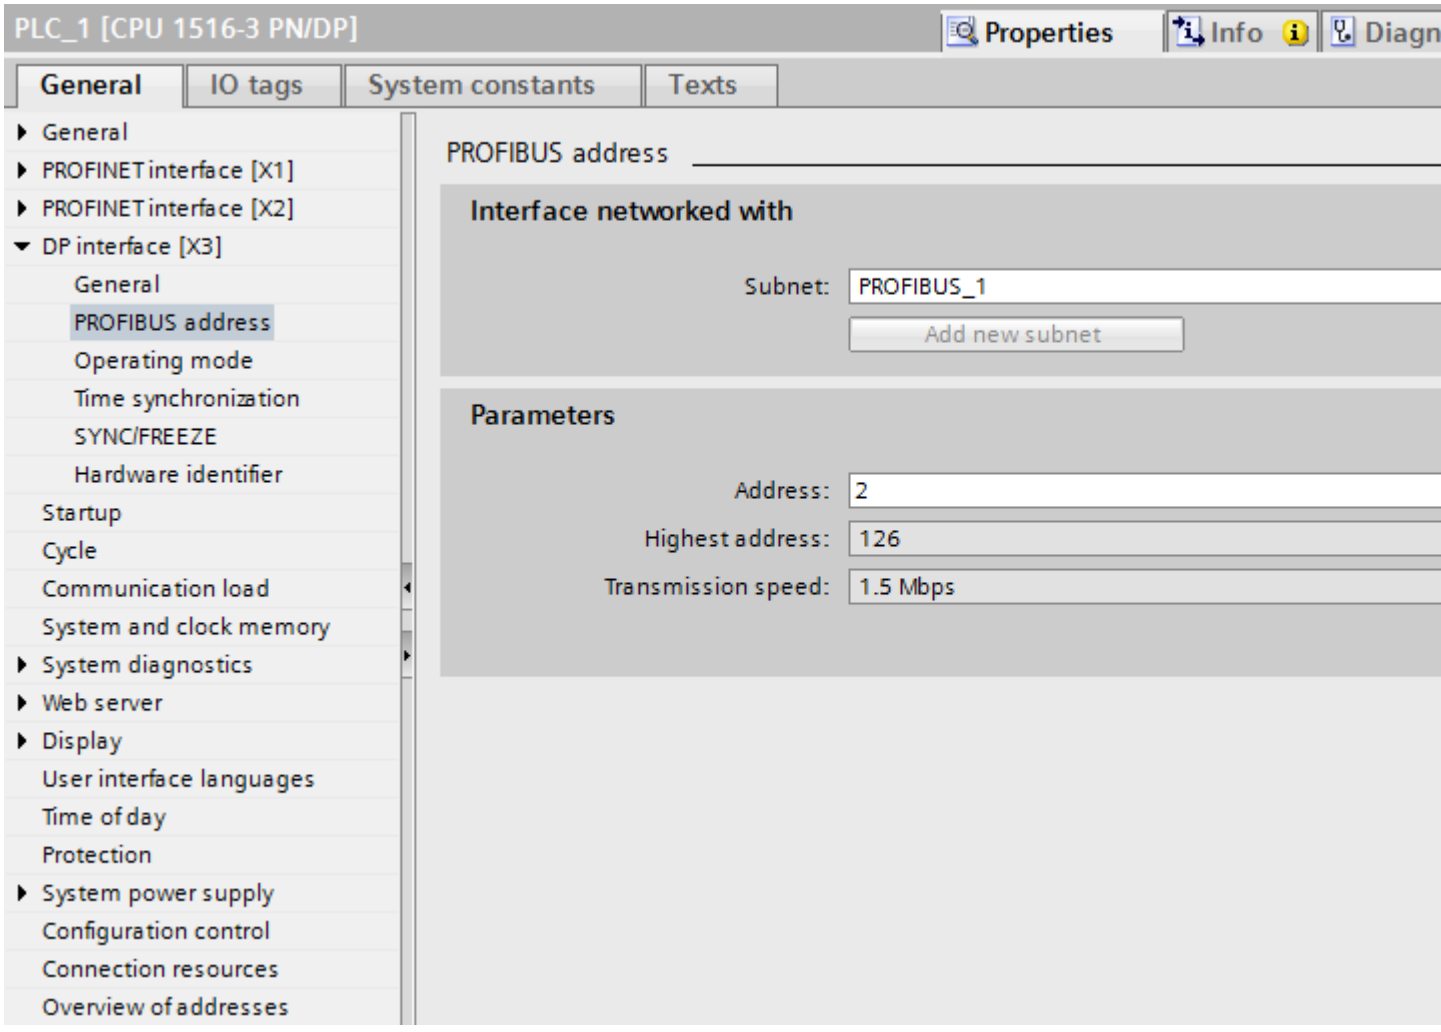
PROFIBUS parameters for the PLC

PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Protection of communication

Security levels

If you want to protect the PLC and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1200 controller, several aspects need to be considered when setting protection levels. For additional information on this, see: Auto-Hotspot

Example

You select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU) when configuring it.

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Access password for the HMI connection

Introduction

Secure access to a PLC by assigning a password.

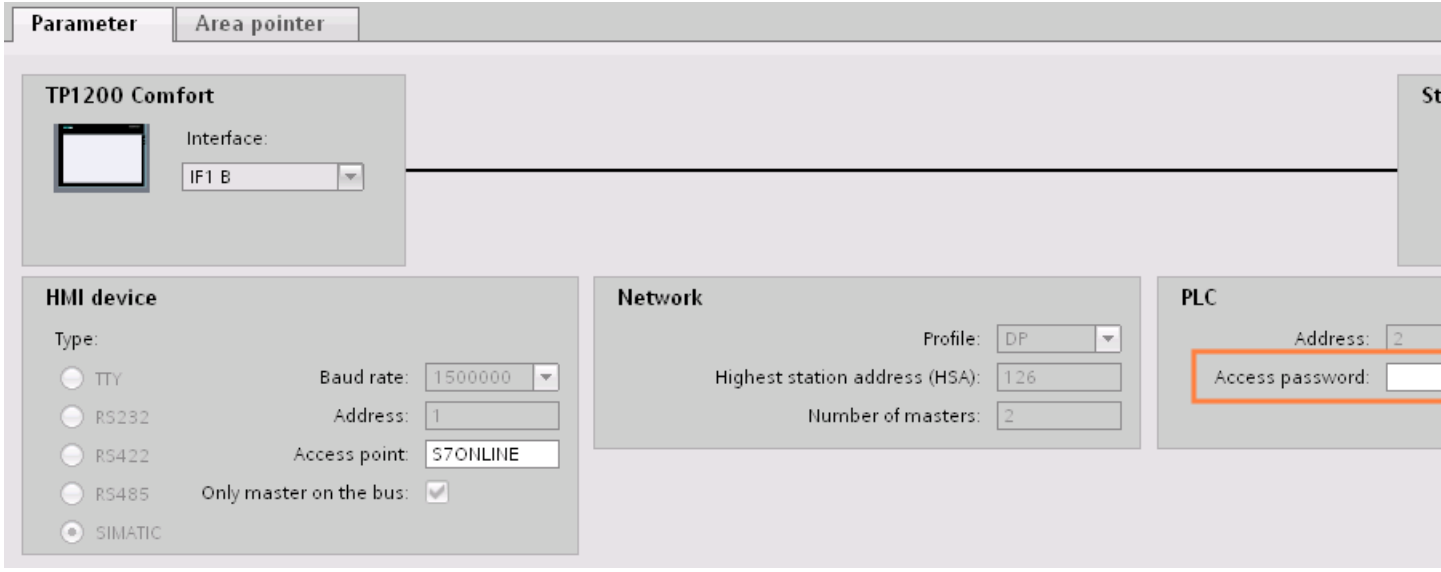
Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

Assigning password

Enter the "Access password" for the PLC in the "Connections" editor.



12.11.6.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Data exchange using area pointers (Page 5999)

Restrictions

You can only configure the following data types for communication with SIMATIC S7 1500 for data exchange using area pointers:

- UInt and array of UInt
- Word and array of Word
- Int and array of Int
- "Array[0..15] of Bool" for area pointer "Coordination"
- Date_And_Time
- DTL and LDT

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" or "40" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Using data types

The data types "Date_And_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE_AND_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE_AND_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Using data types

The data types "Date_And_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE_AND_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE_AND_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

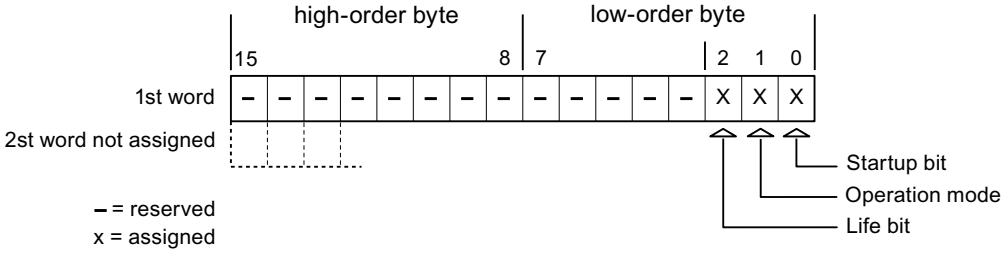
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

"Project ID" area pointer

Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

Use

Note

HMI connections cannot be switched "online".

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections" under "Address".

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

"Job mailbox" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)** [3) 4)]	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	

No.	Function	
14	**Set time (BCD-coded)**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [2]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

1)	Only for devices supporting recipes.
2)	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
3)	The weekday is ignored on HMI device KTP 600 BASIC PN.
4)	The weekday is ignored when you configure the "Date/Time PLC" area pointer.

"Data record" area pointer

"Data record" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization via the data mailbox

Data records are always transferred directly, which means that the tag values are read straight from an address or written straight to an address configured for this tag without being redirected via an interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system alarm.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then, for example, process, edit, or save these values in the HMI device.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data mailbox free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxs No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	

	Left byte (LB)	Right byte (RB)
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	

Step	Action	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible
- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 4270)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

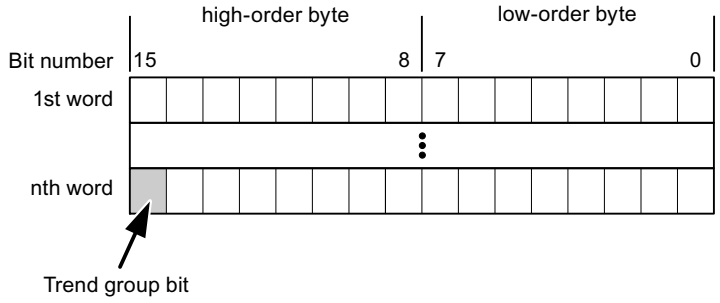
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Configuring Alarms (Page 4295)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

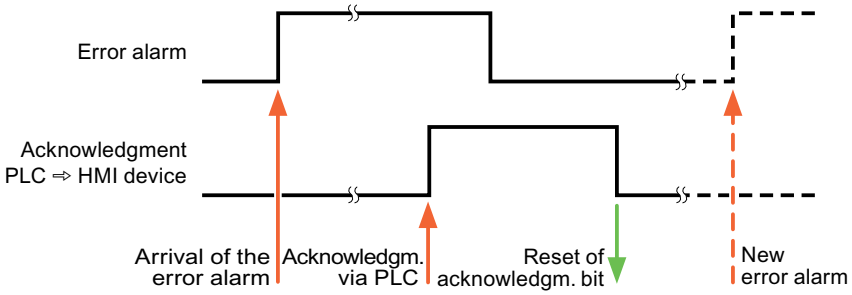
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

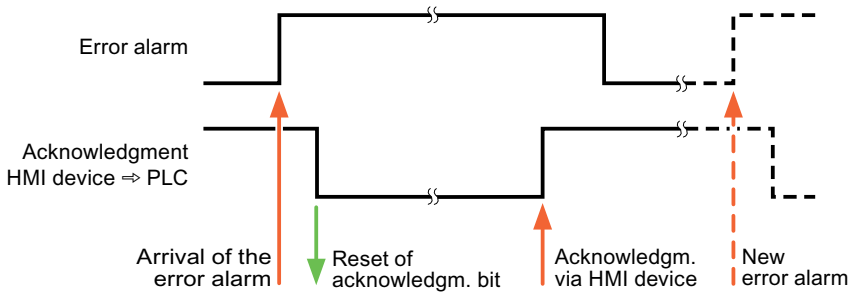
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

12.11.6.5 Performance features of communication

S7-1500 device dependency

Device dependency

If you use devices from an earlier version of the TIA Portal with TIA Portal V13, it may not be possible to configure connections to certain HMI devices.

USINT	1 byte	

12.11.6.6 Configuring connections in the "Connections" editor

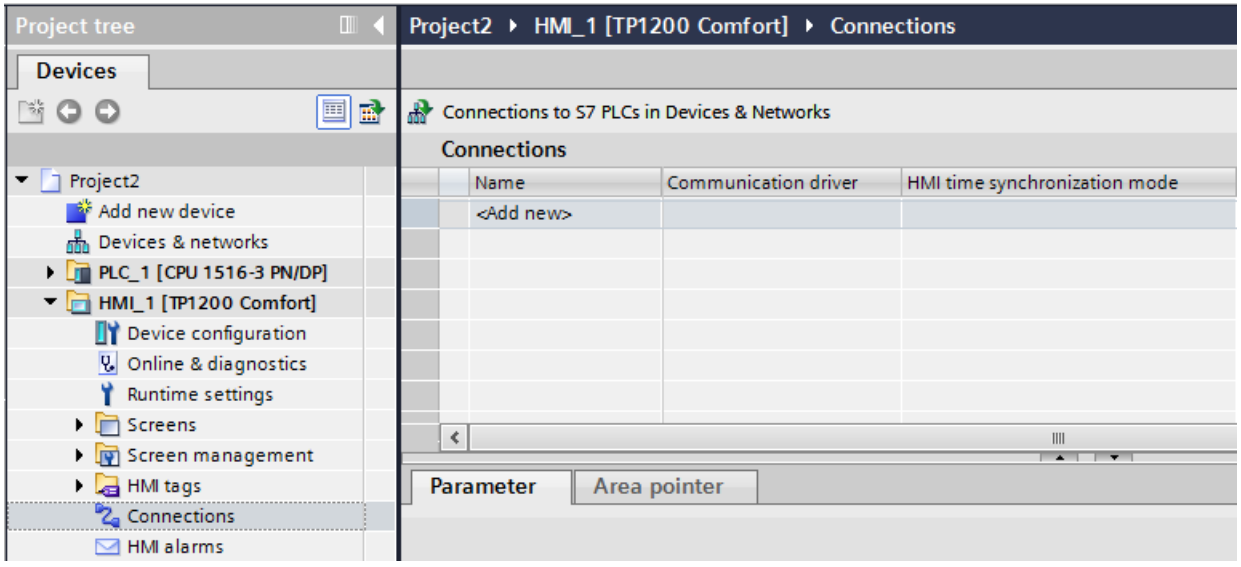
Creating a PROFINET connection

Requirements

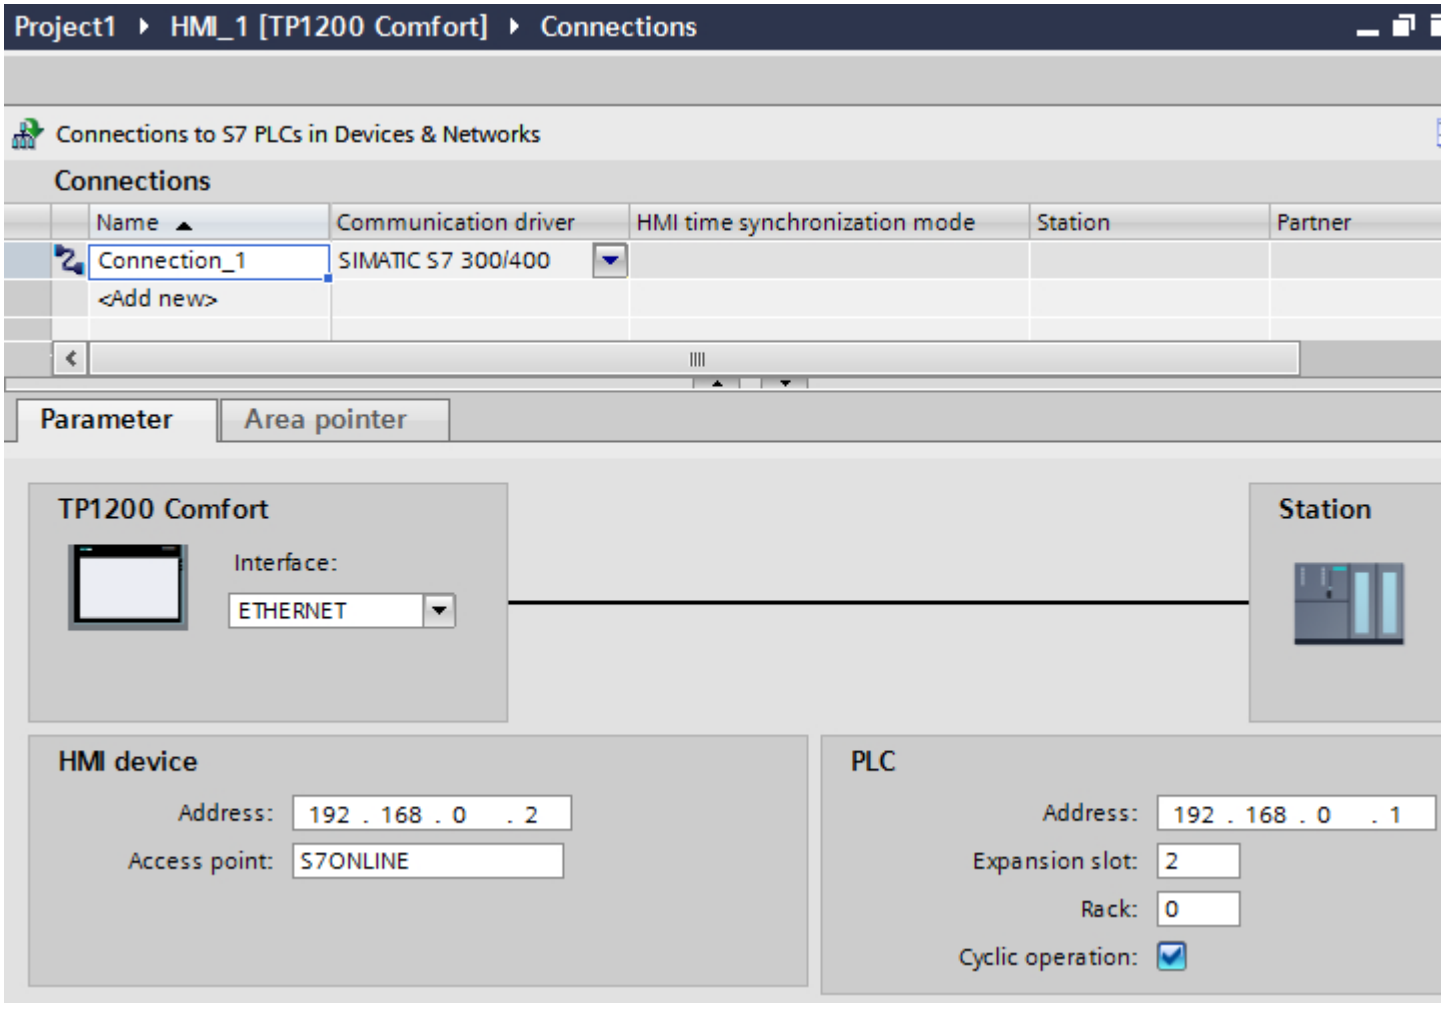
- A project is open.
- An HMI device with a PROFINET interface has been created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.



4. Click the name of the connection.
5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

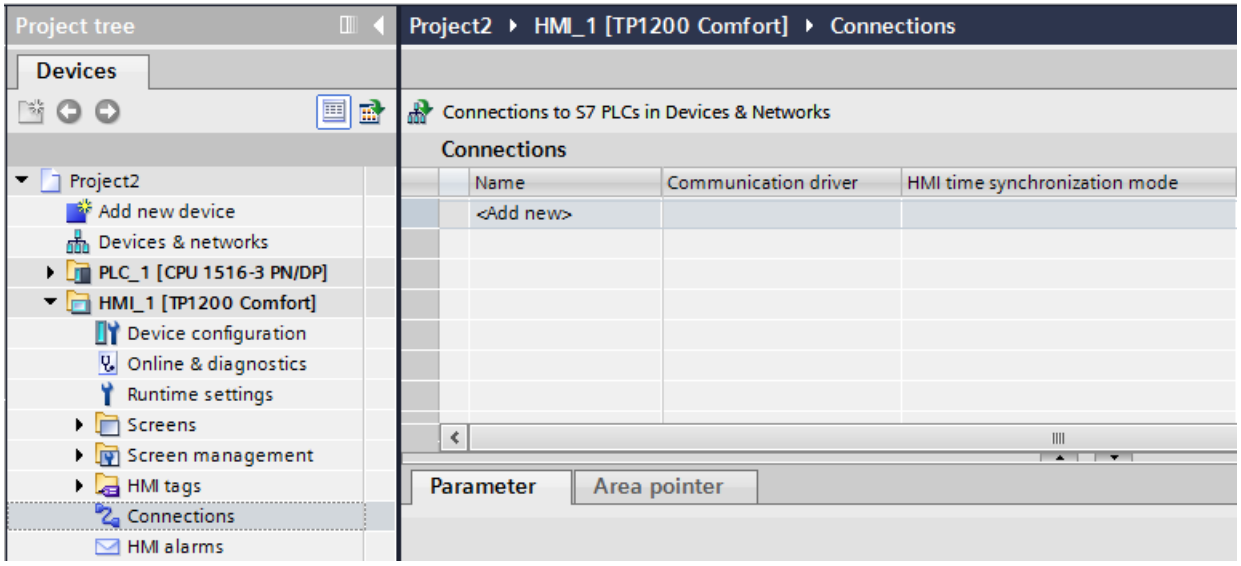
Creating a PROFIBUS connection

Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

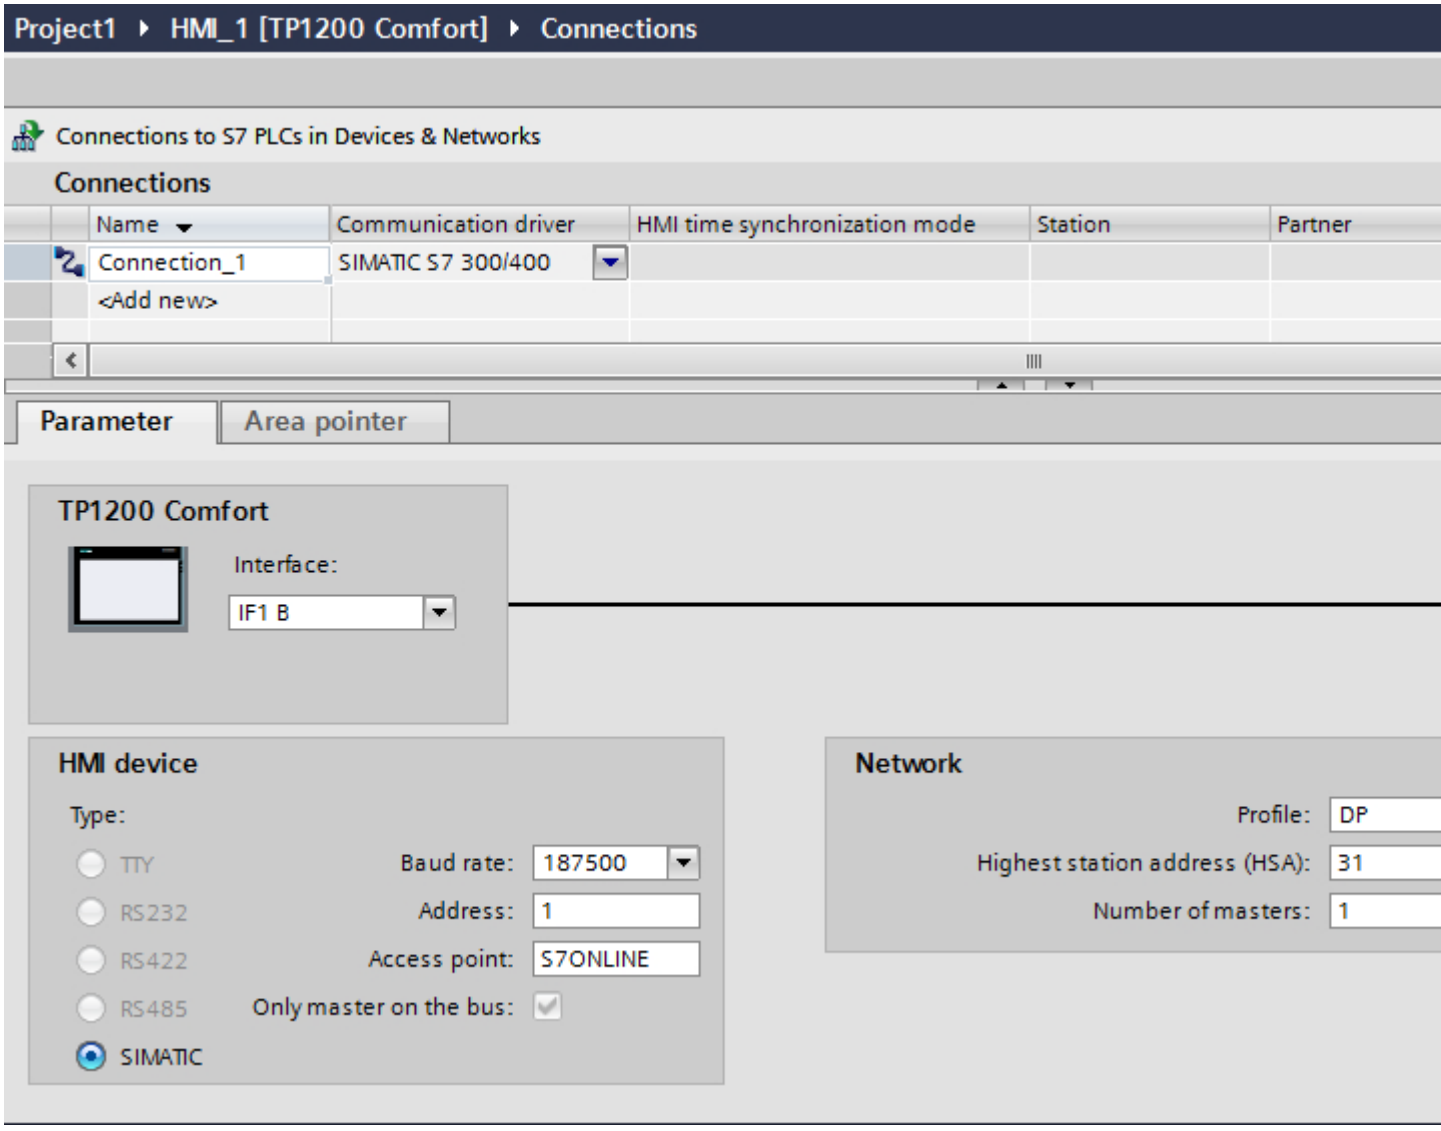
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "IF 1 B" interface from "Parameters > interface" in the Inspector window.

6. Select the "DP" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

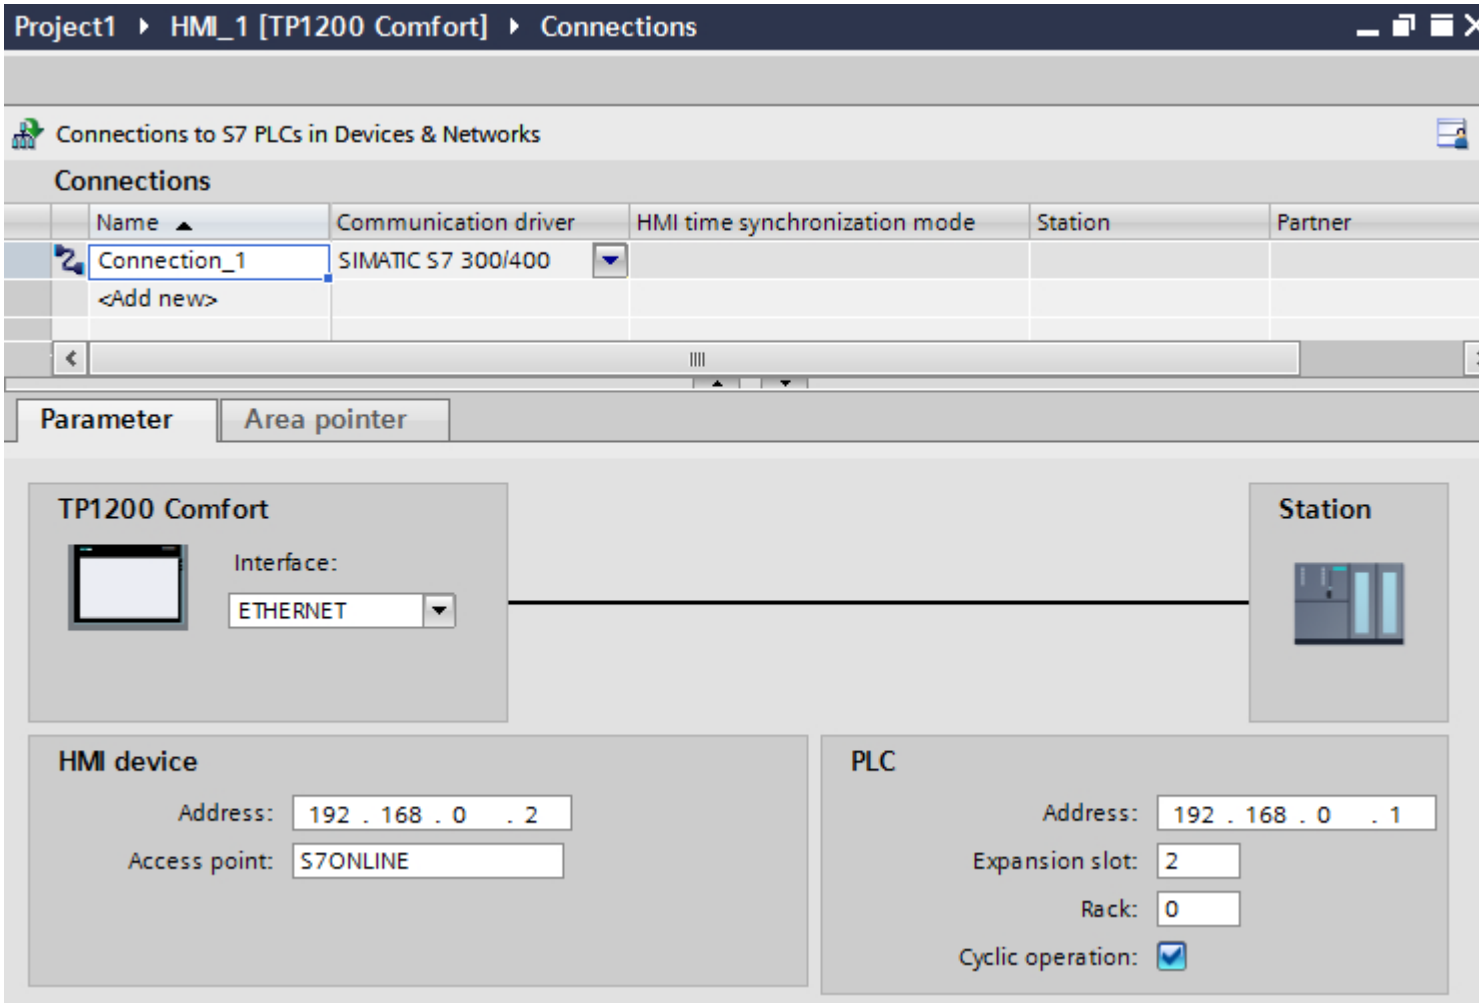
Connection parameters

Connection parameters

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.

- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Only master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7-200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.

- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

  Note

  You only need a password if you have set "Complete protection" at the PLC.

  No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"

- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

12.11.6.7 Configuring connections in the "Connections" editor

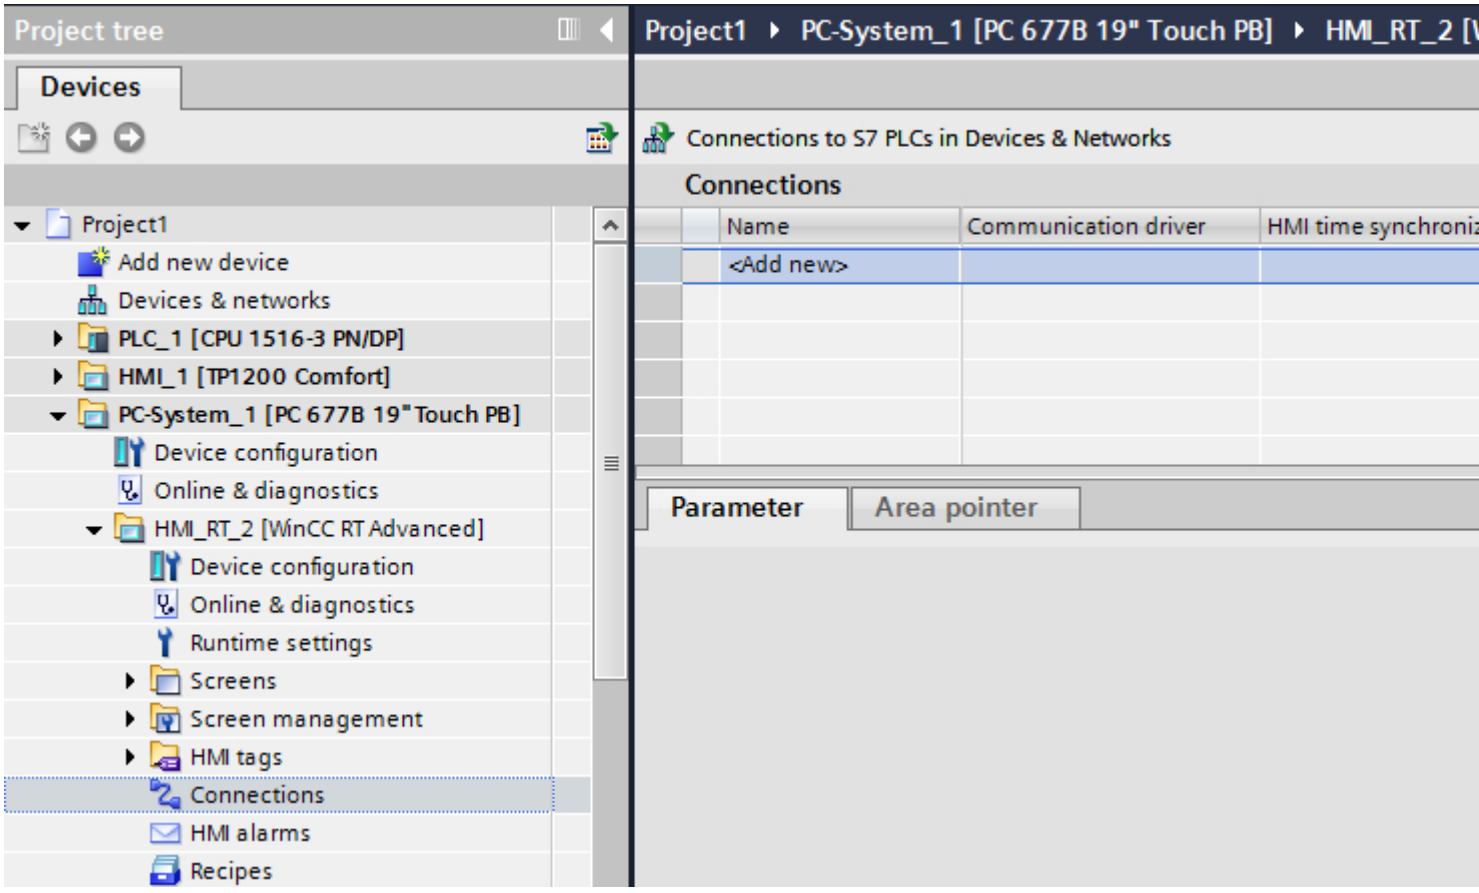
Creating a connection

Requirements

- A project is open.
- WinCC RT Advanced is created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select an interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the parameters for the connection in the Inspector window.

Interfaces

Select one of the following interfaces in the Inspector window under "Parameters > WinCC RT Advanced > Interfaces".:

- Industrial Ethernet
- MPI
- PROFIBUS

For additional information on the parameters of the interfaces see:

Connection parameters (Page 6157)

Connection parameters

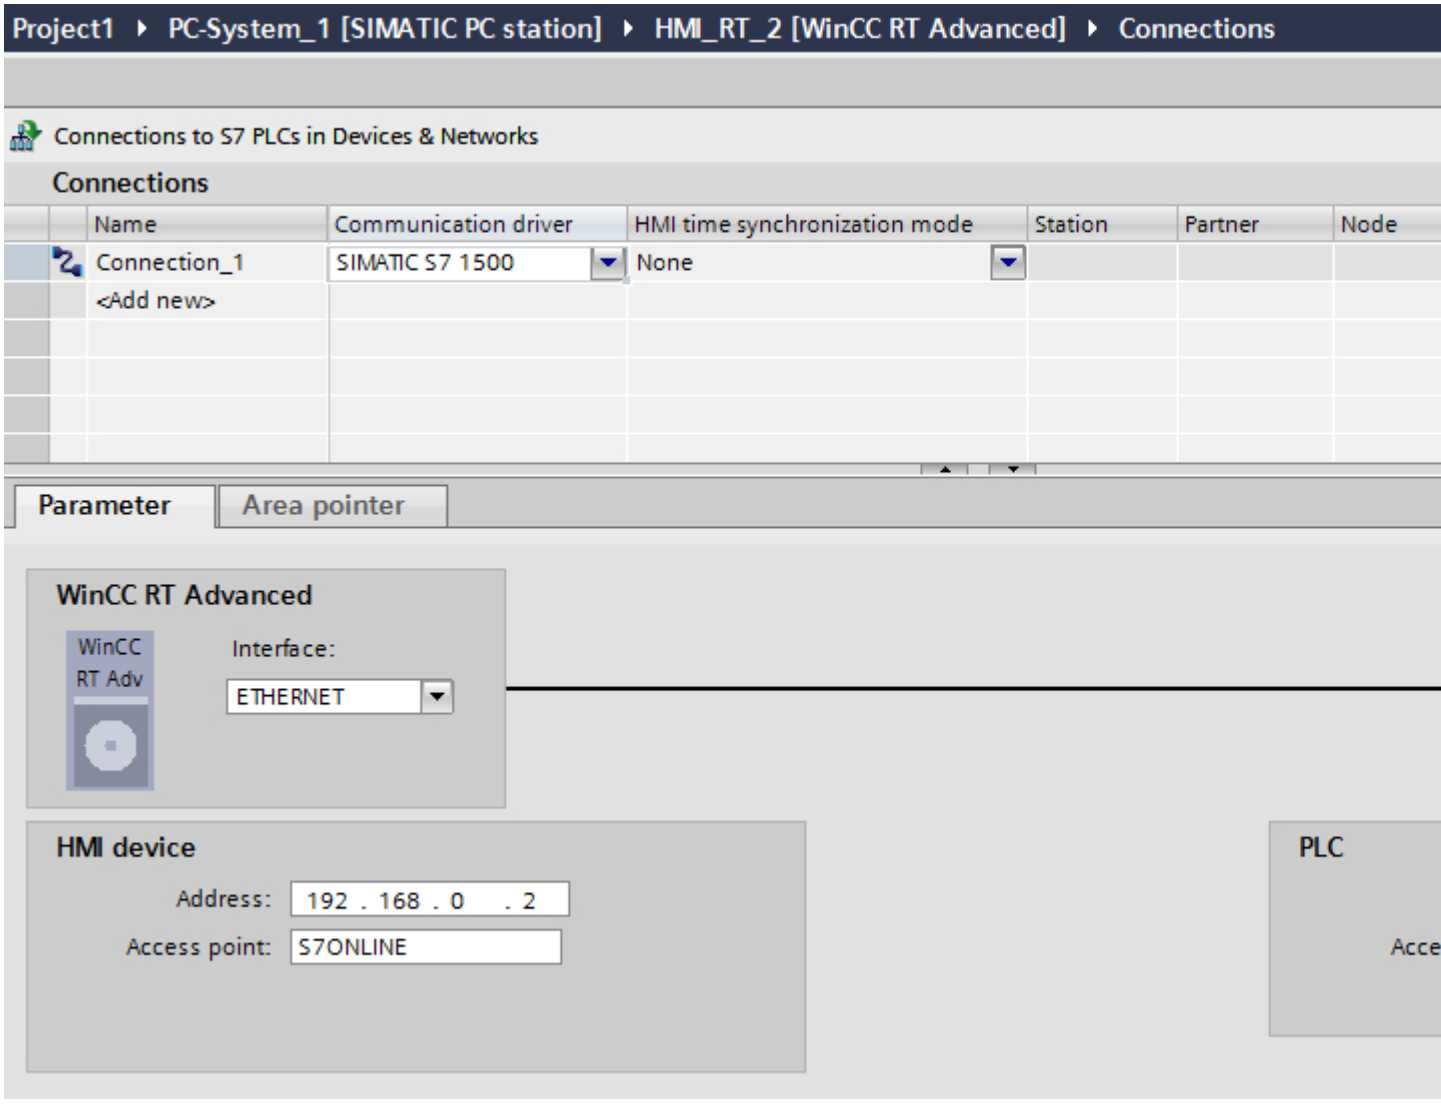
ETHERNET

Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- TCP/IP



HMI device

- "Address"
  Enter the IP address of the HMI device under "Address".
- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Controller

- "Address"
  Enter the IP address of the controller under "Address".
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the controller.

Note

You only need a password if you have set the "Complete protection" protection level at the controller.

No connection to the controller is established if the "Complete protection" protection level is stored on the controller and you do not enter a password.

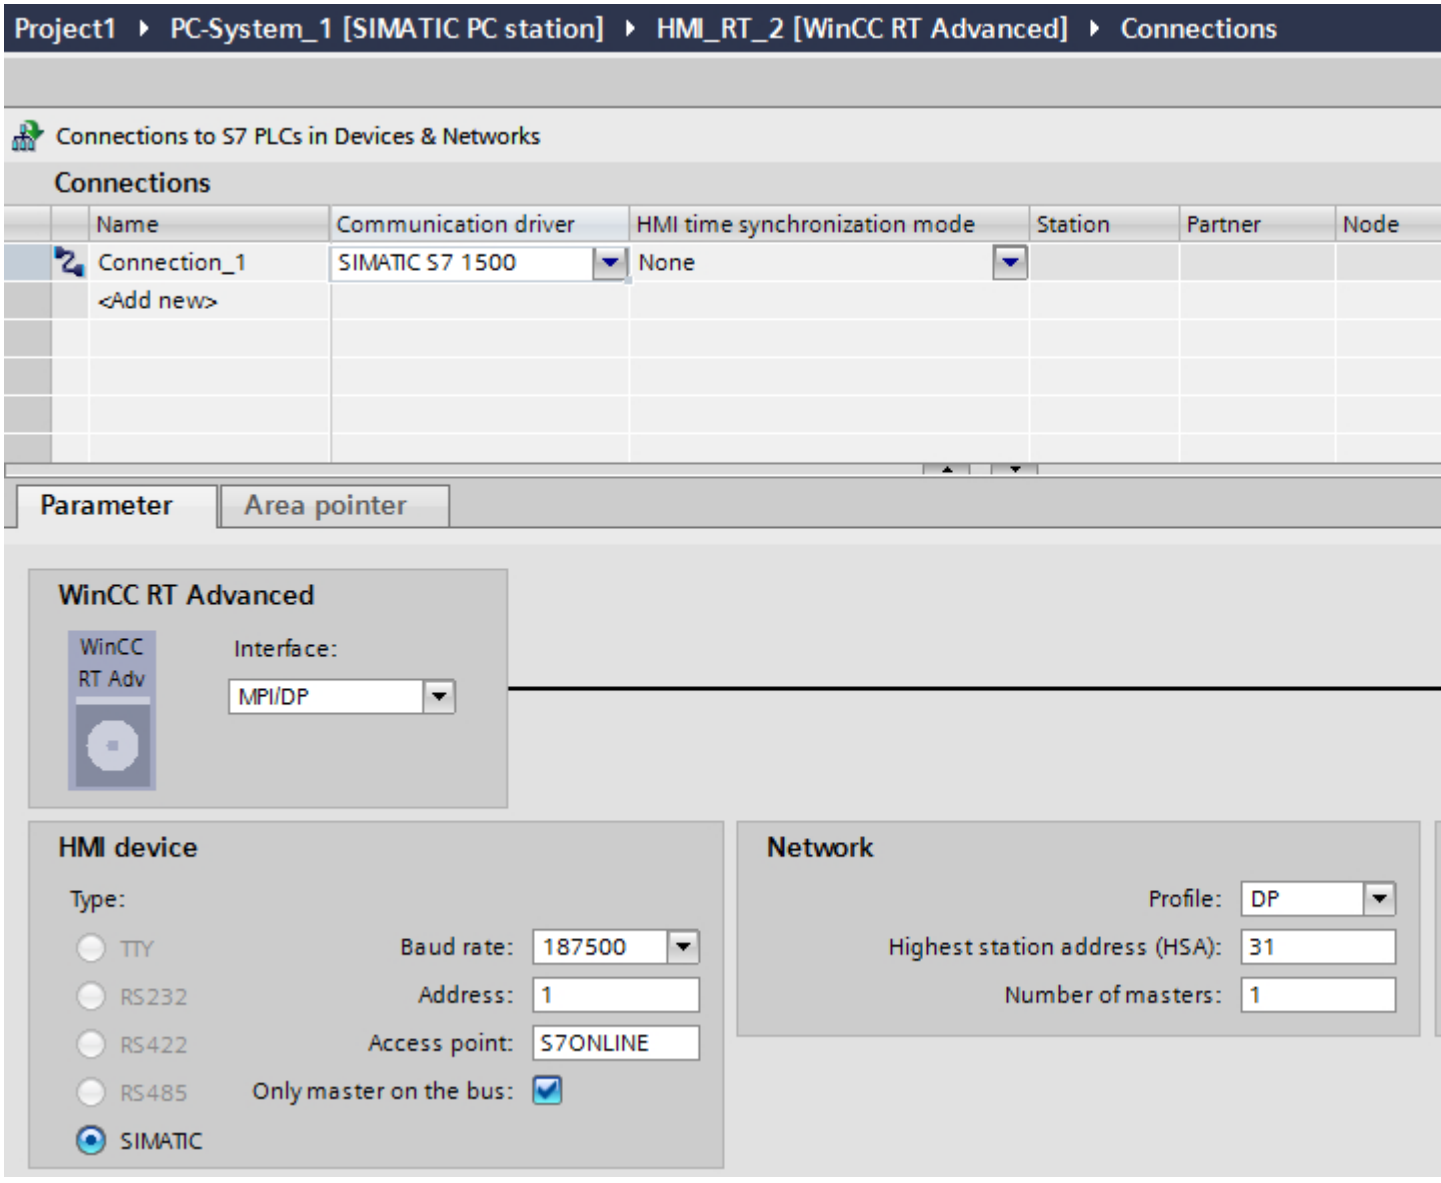
MPI/DP

Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- PROFIBUS



HMI device

- "Baud rate"
  Select the baud rate of the HMI device under "Baud rate".
- "Address"
  Enter the address of the HMI device under "Address".
- "Access point"
  Enter the logical device name under "Access point".

Controller

- "Address"
  Enter the address of the controller under "Address".
- "Access password"
  If you have configured the degree of protection "Complete protection" for the controller, enter the password for the controller under "Access password".

12.11.6.8 Configuring time synchronization

Time synchronization

Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and than at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

Time synchronization restrictions

Approved HMI devices

You can configure the time synchronization between a SIMATIC S7-1200 or SIMATIC S7-1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0
Multi Panel 177	Windows CE 5.0

Device	Operating system
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

Configuration restrictions

- If an HMI device has several connections to SIMATIC S7-1200 or SIMATIC S7-1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".
- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured.
  Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device.
  This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.
- Time synchronization with SIMATIC S7-1200 (V1.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1200 (V4.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1500 is not possible.

Configuring time synchronization for integrated connections

Introduction

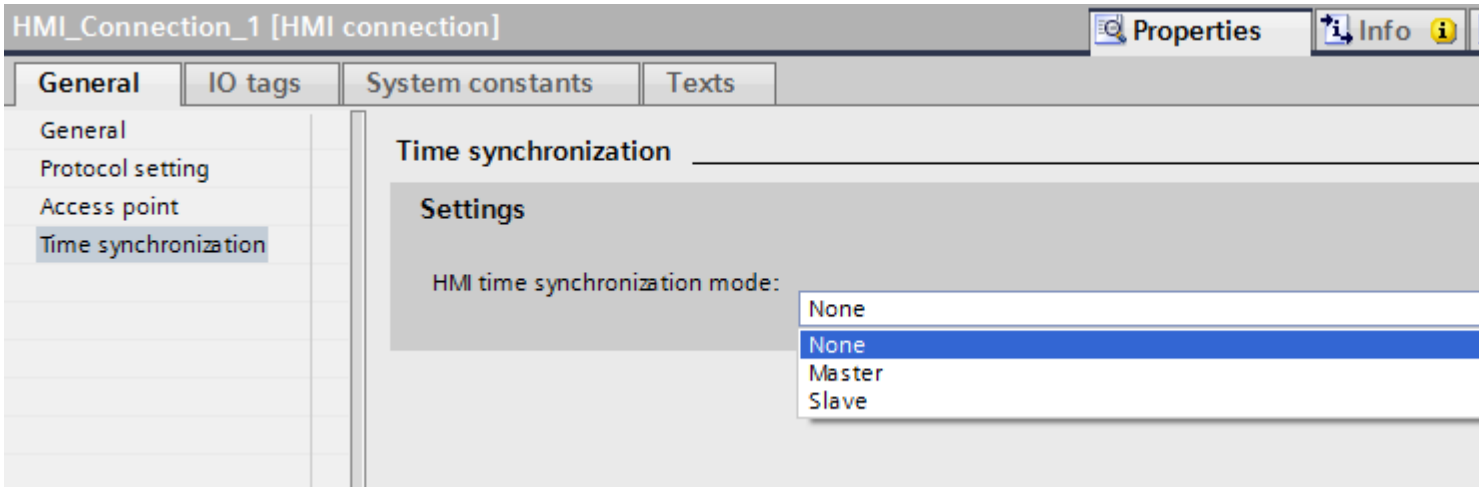
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 or SIMATIC S7 1500 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Configuring time synchronization for non-integrated connections

Introduction

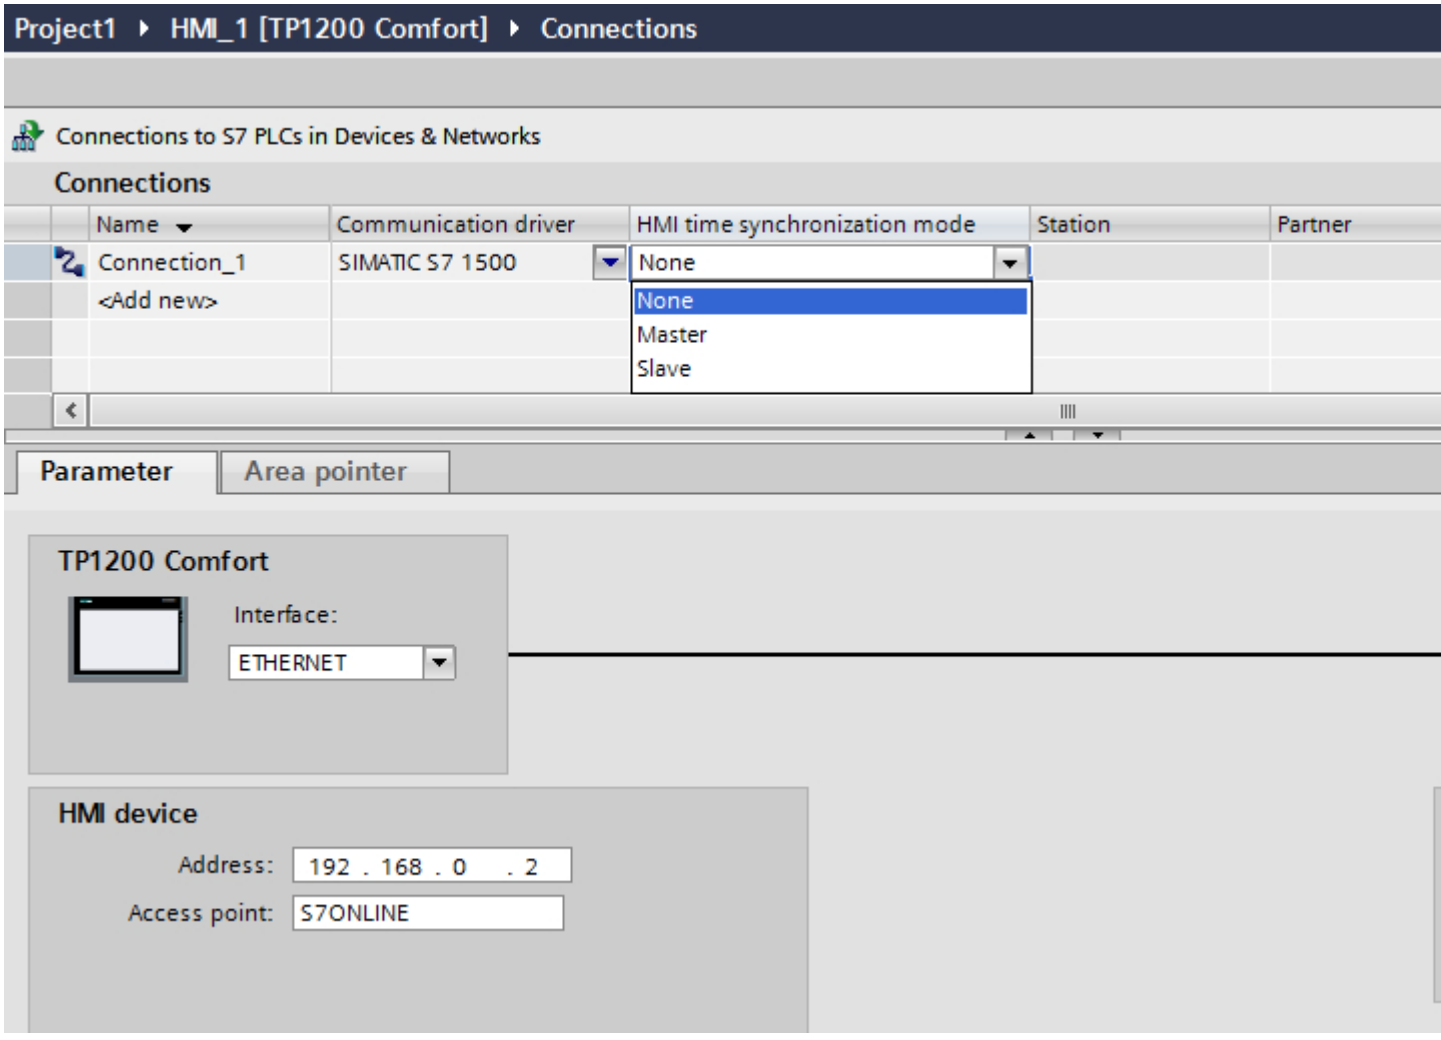
You configure time synchronization for a non-integrated connection in the "Connections" editor.

Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1500" PLC.
3. Select the following in the "HMI time synchronization mode" column:
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



12.11.7 Communicating with SIMATIC S7 1200

12.11.7.1 Communication with SIMATIC S7 1200

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 1200 PLC.

You can configure the following communication channels for the SIMATIC S7 1200 PLC:

- PROFINET
- PROFIBUS

HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 1200 in the "Devices & Networks" editor. If you have configured a HMI device with a serial port, you must configure a PROFIBUS-capable communication module to the SIMATIC S7 1200.

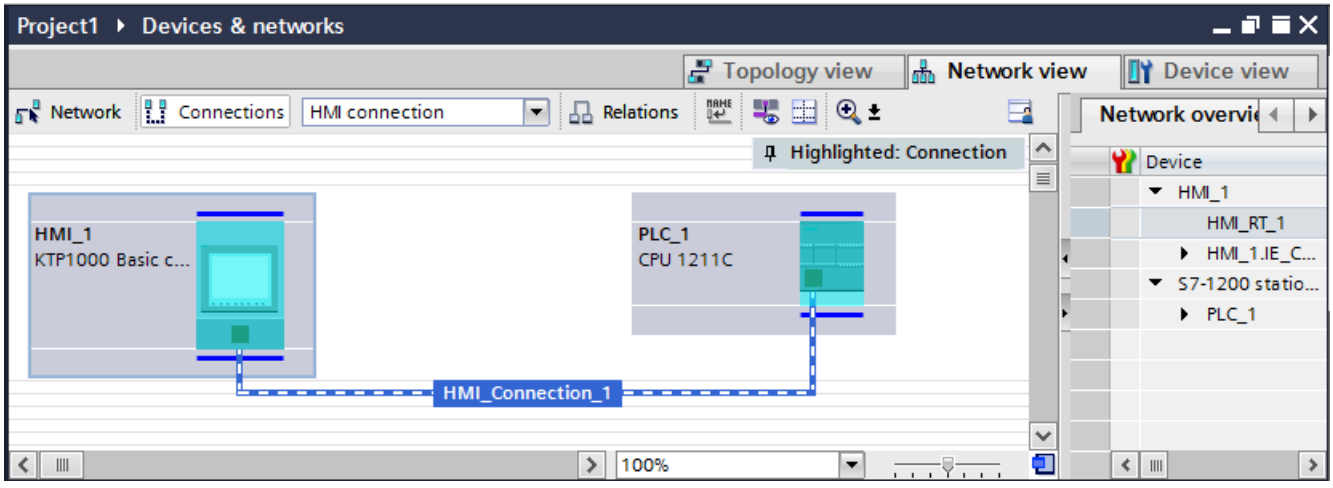
12.11.7.2 Communication via PROFINET

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 1200 into the project, you interconnect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

Requirements

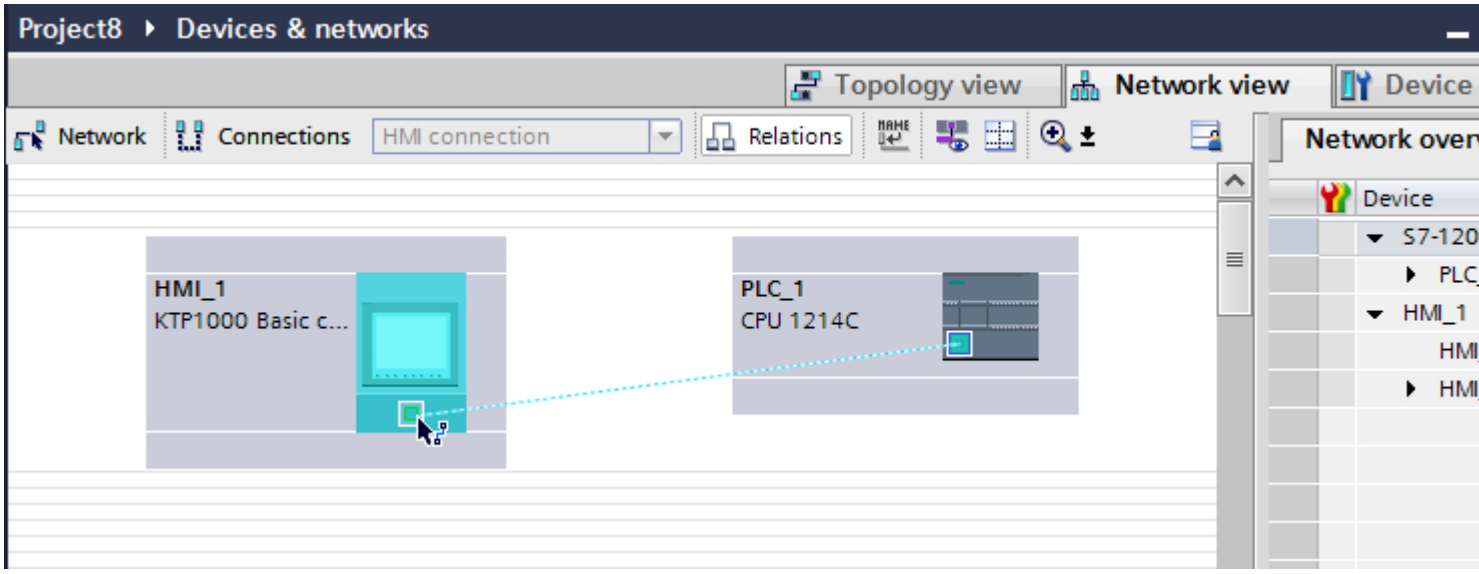
The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- HMI device with PROFINET or Ethernet interface

Procedure

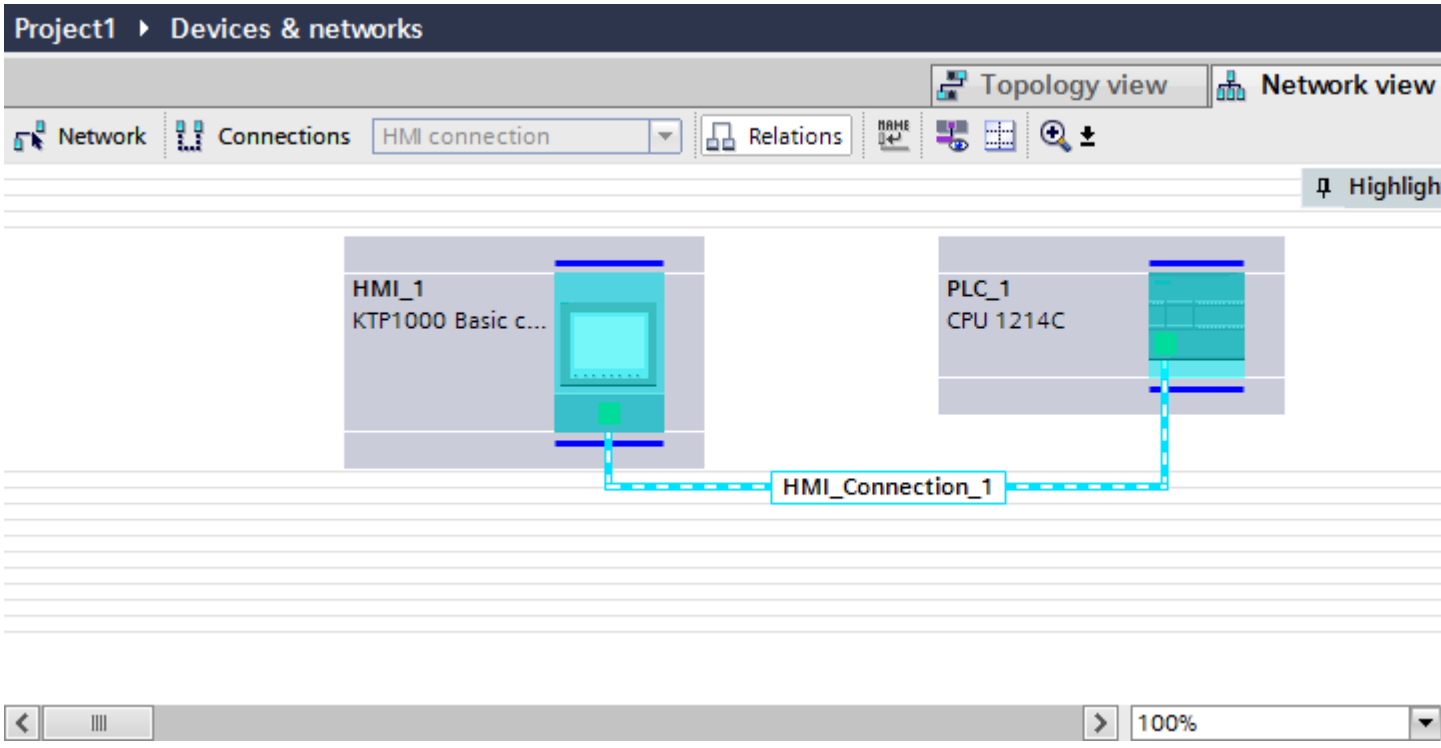
1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.



4. Click the connecting line.

5. Click "Highlight HMI connection" and select the HMI connection.



The connection is displayed graphically in the Inspector window.

6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 6175)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This section describes the communication between a WinCC Runtime and the SIMATIC S7 1200 PLC via PROFINET.

You can use the following WinCC Runtimes as an HMI device:

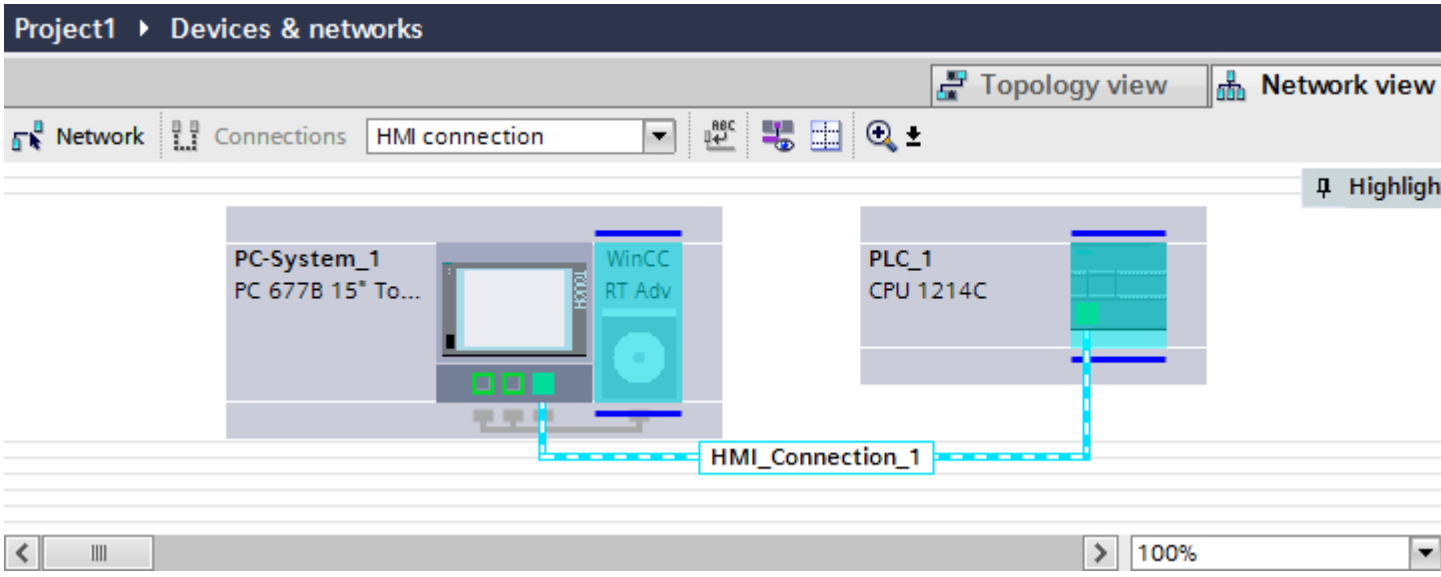
- WinCC RT Advanced

WinCC Runtime as HMI device

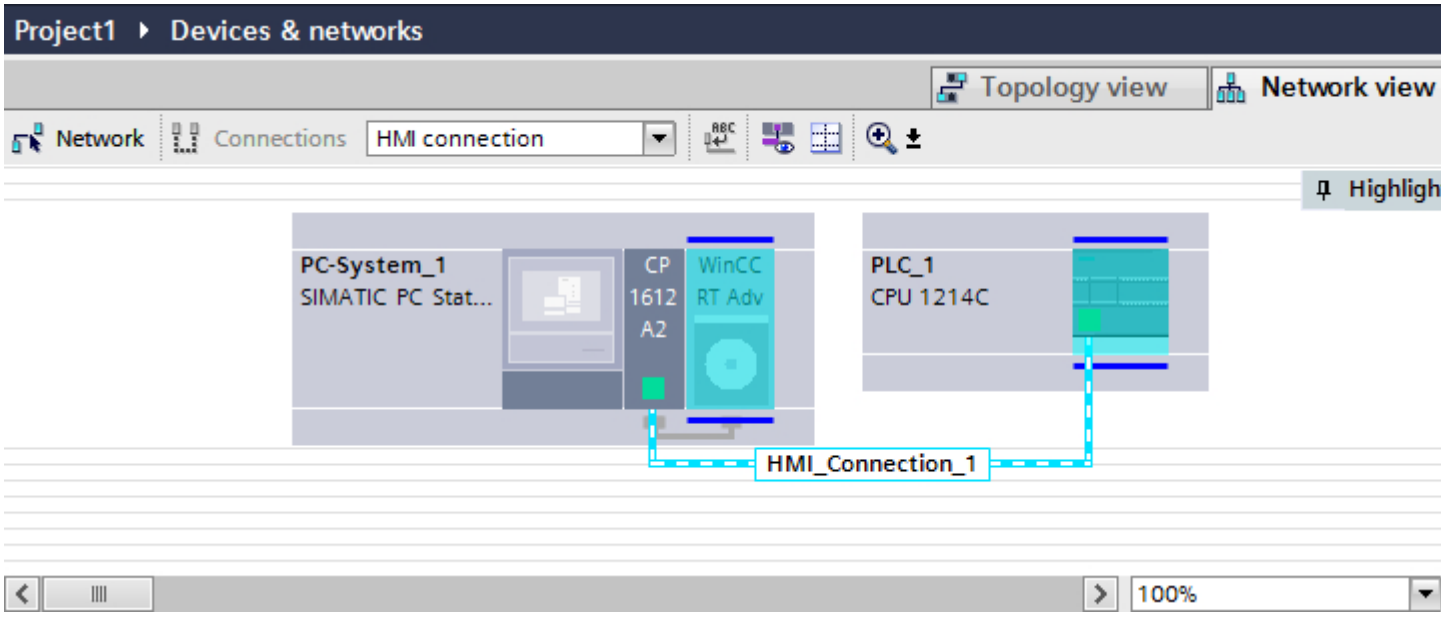
You configure the HMI connections between WinCC Runtime and SIMATIC S7 1200 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

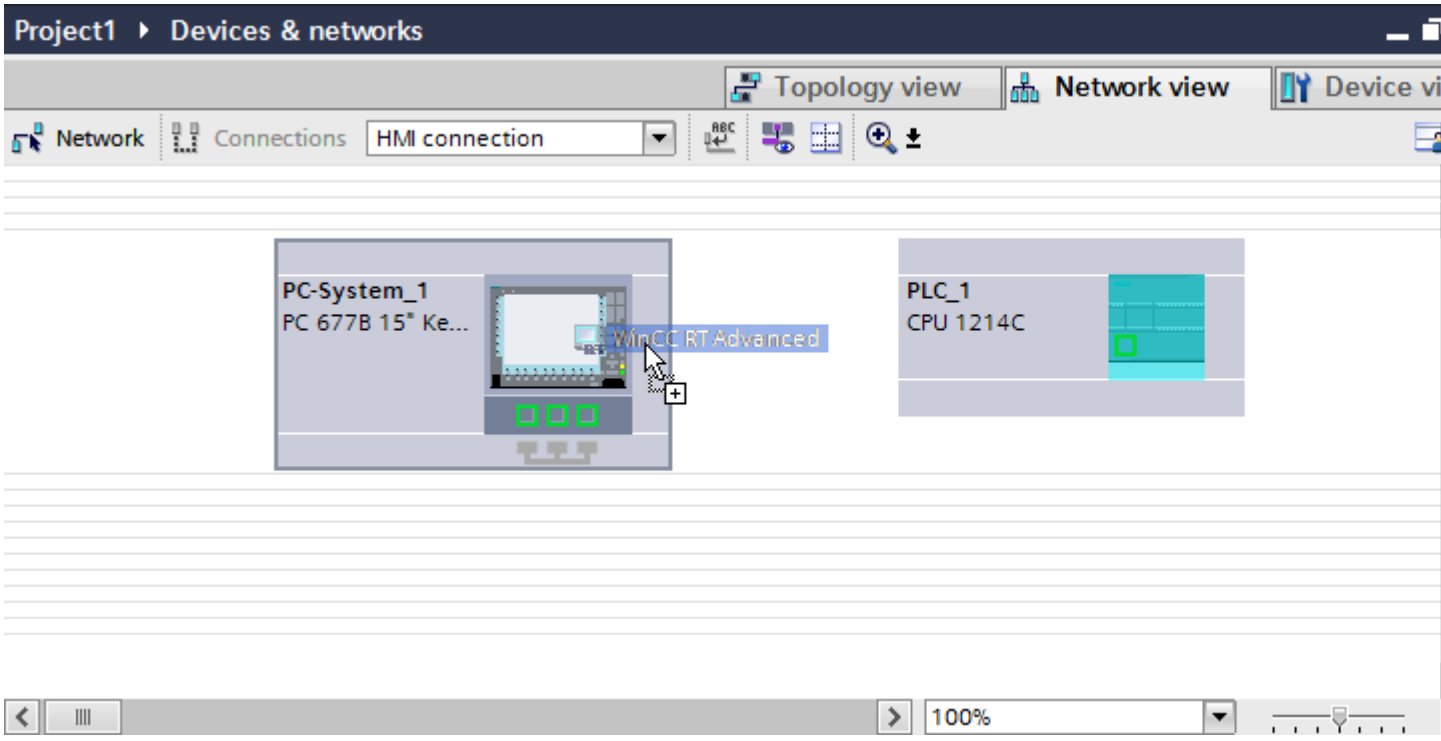
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- SIMATIC PC with PROFINET interface

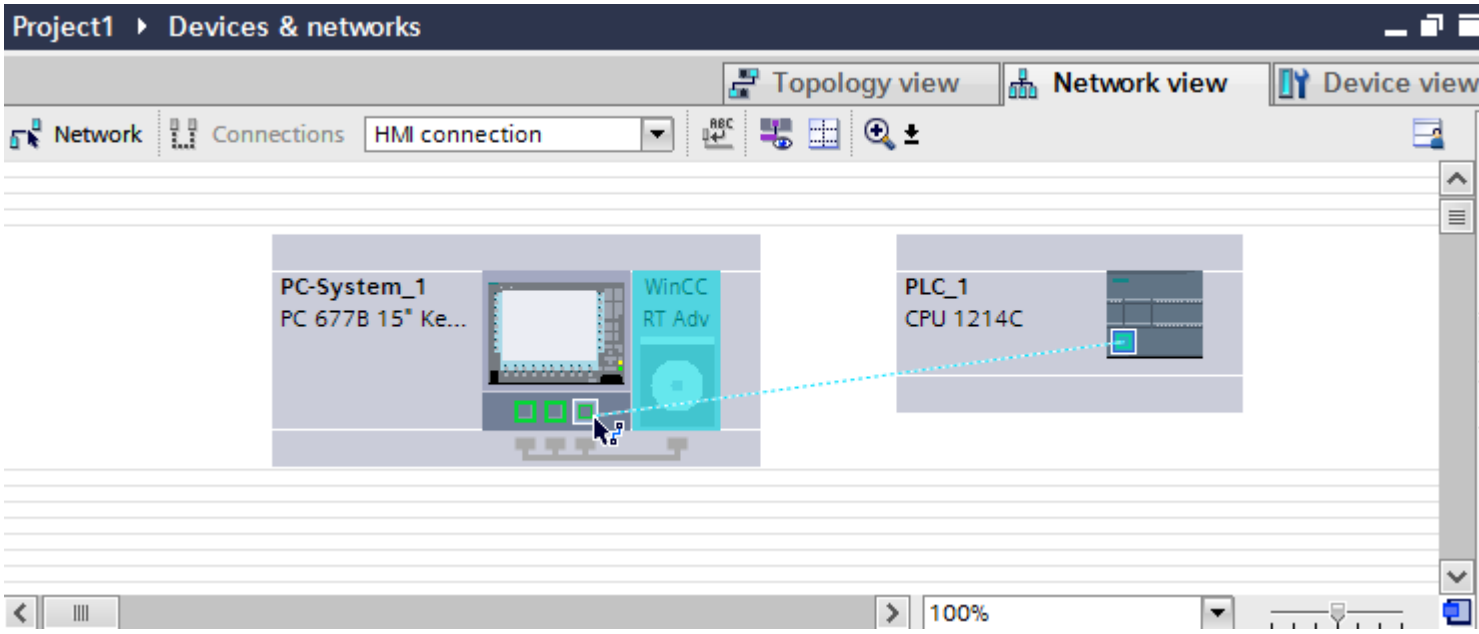
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the PC.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6175)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

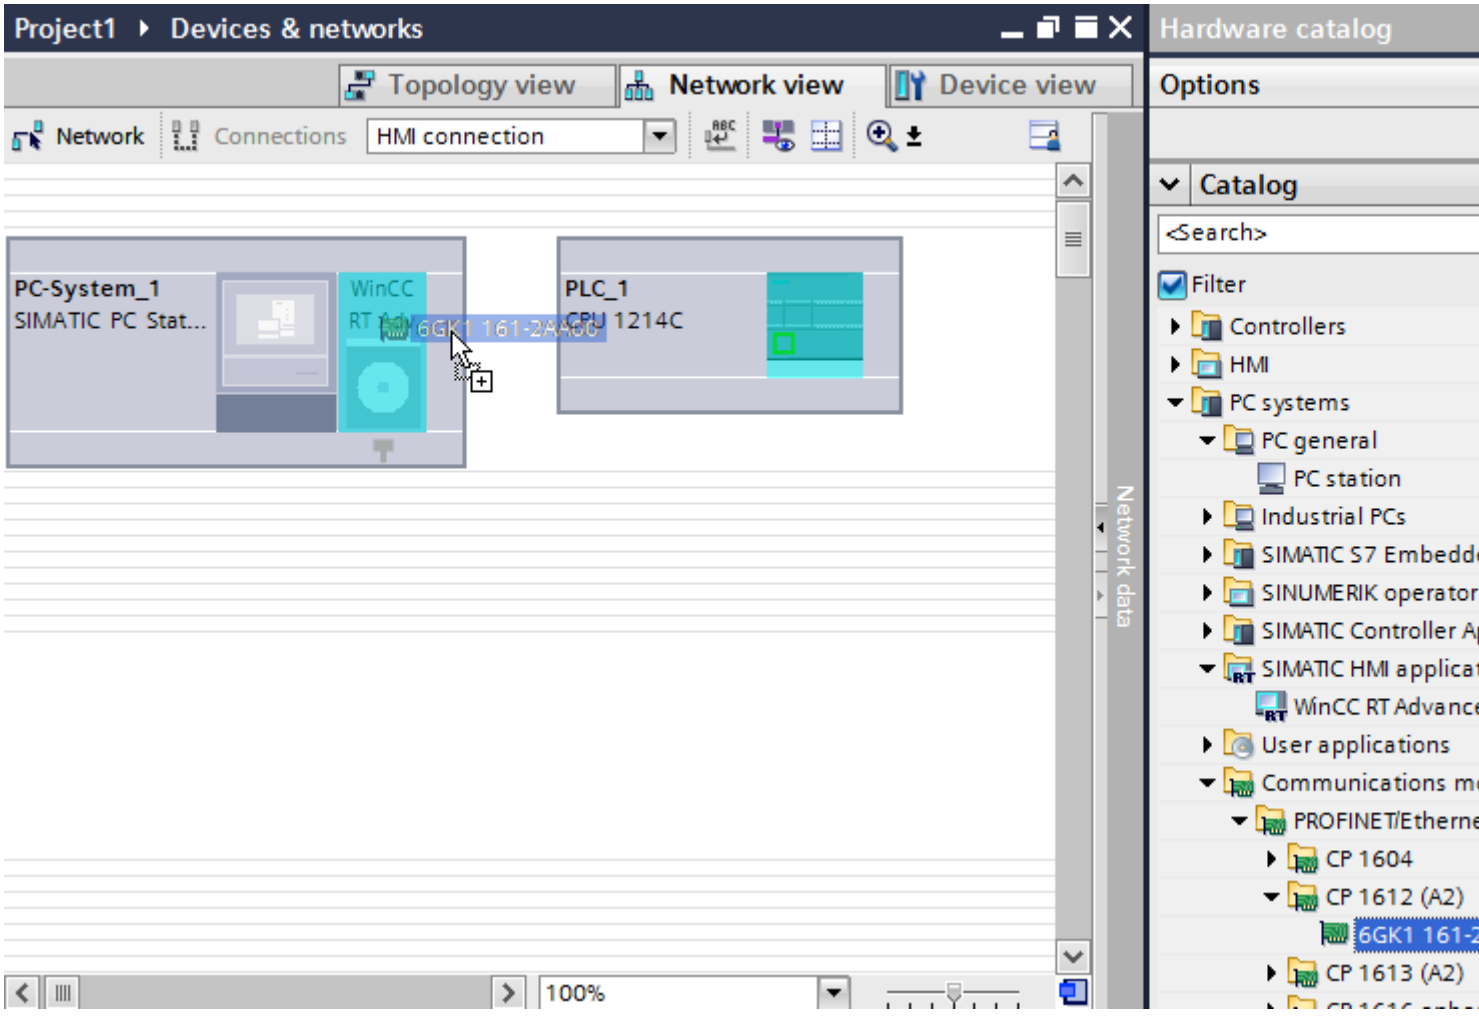
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- PC station with WinCC RT Advanced

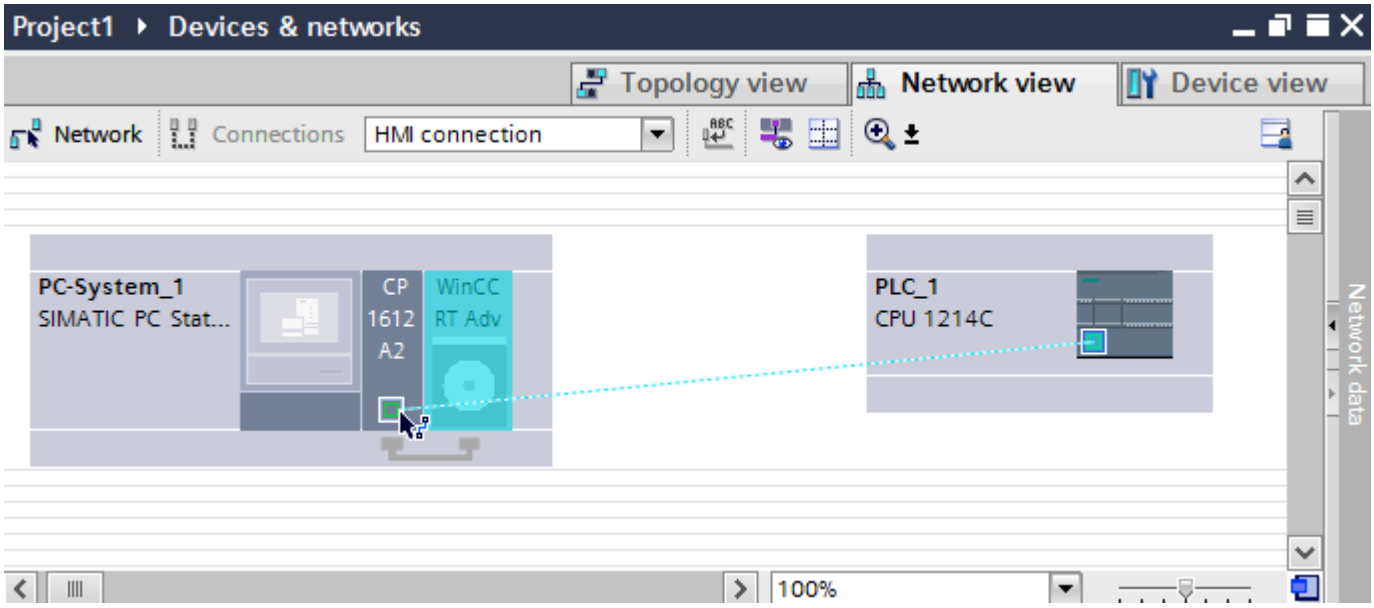
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6175)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

PROFINET parameters

PROFINET parameters for the HMI connection

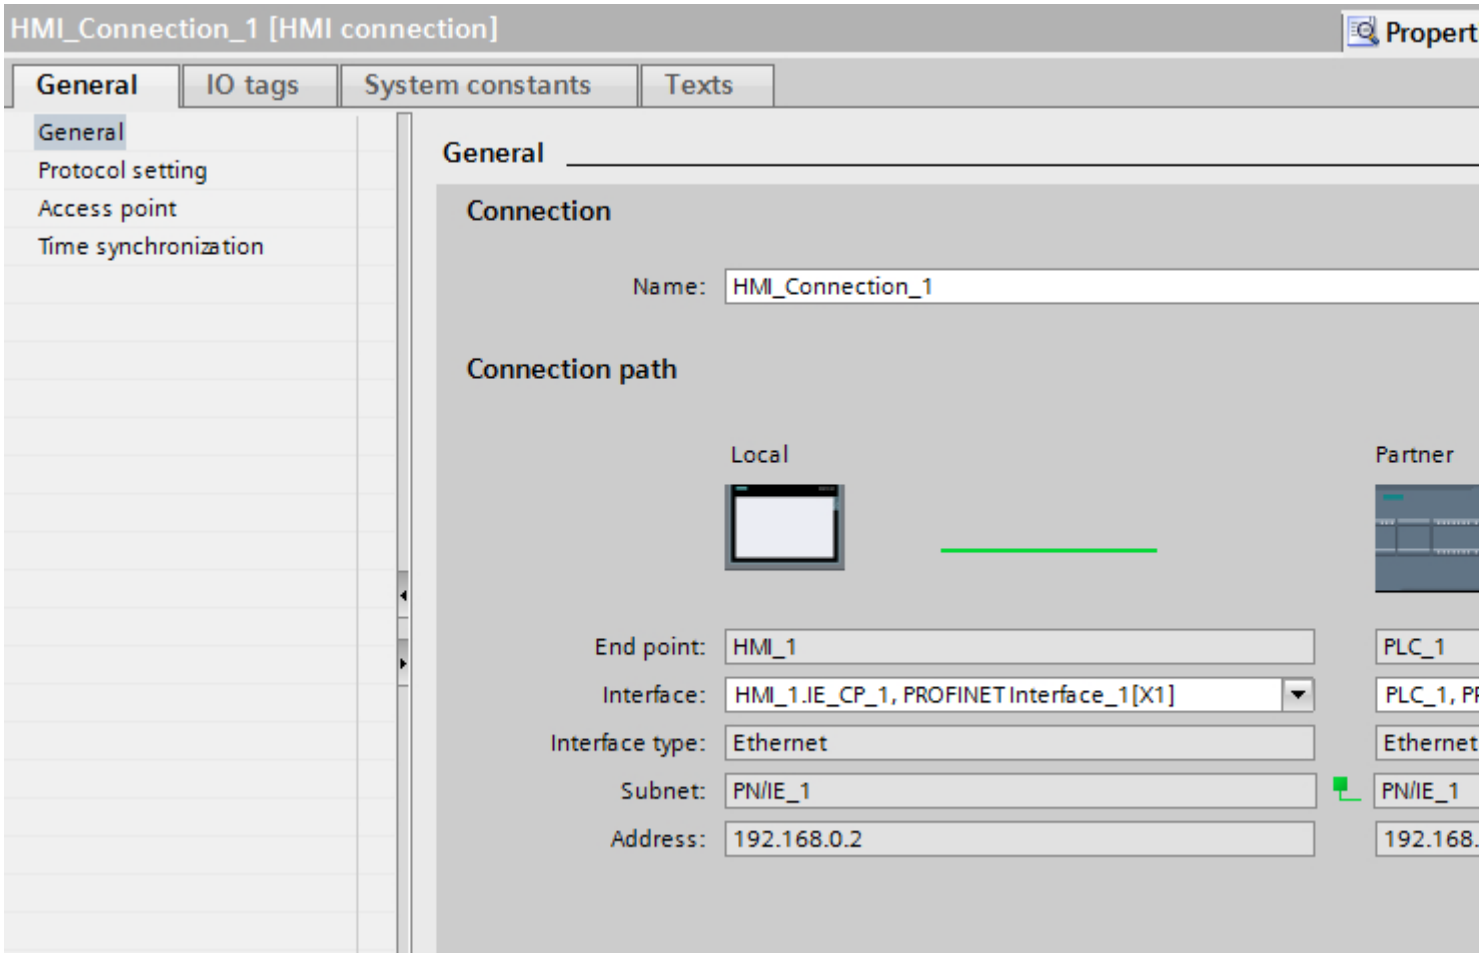
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and editing HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



Connection

The "Connection" area displays the HMI connection created for communication between the devices.

You can edit the name of the HMI connection in this area.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

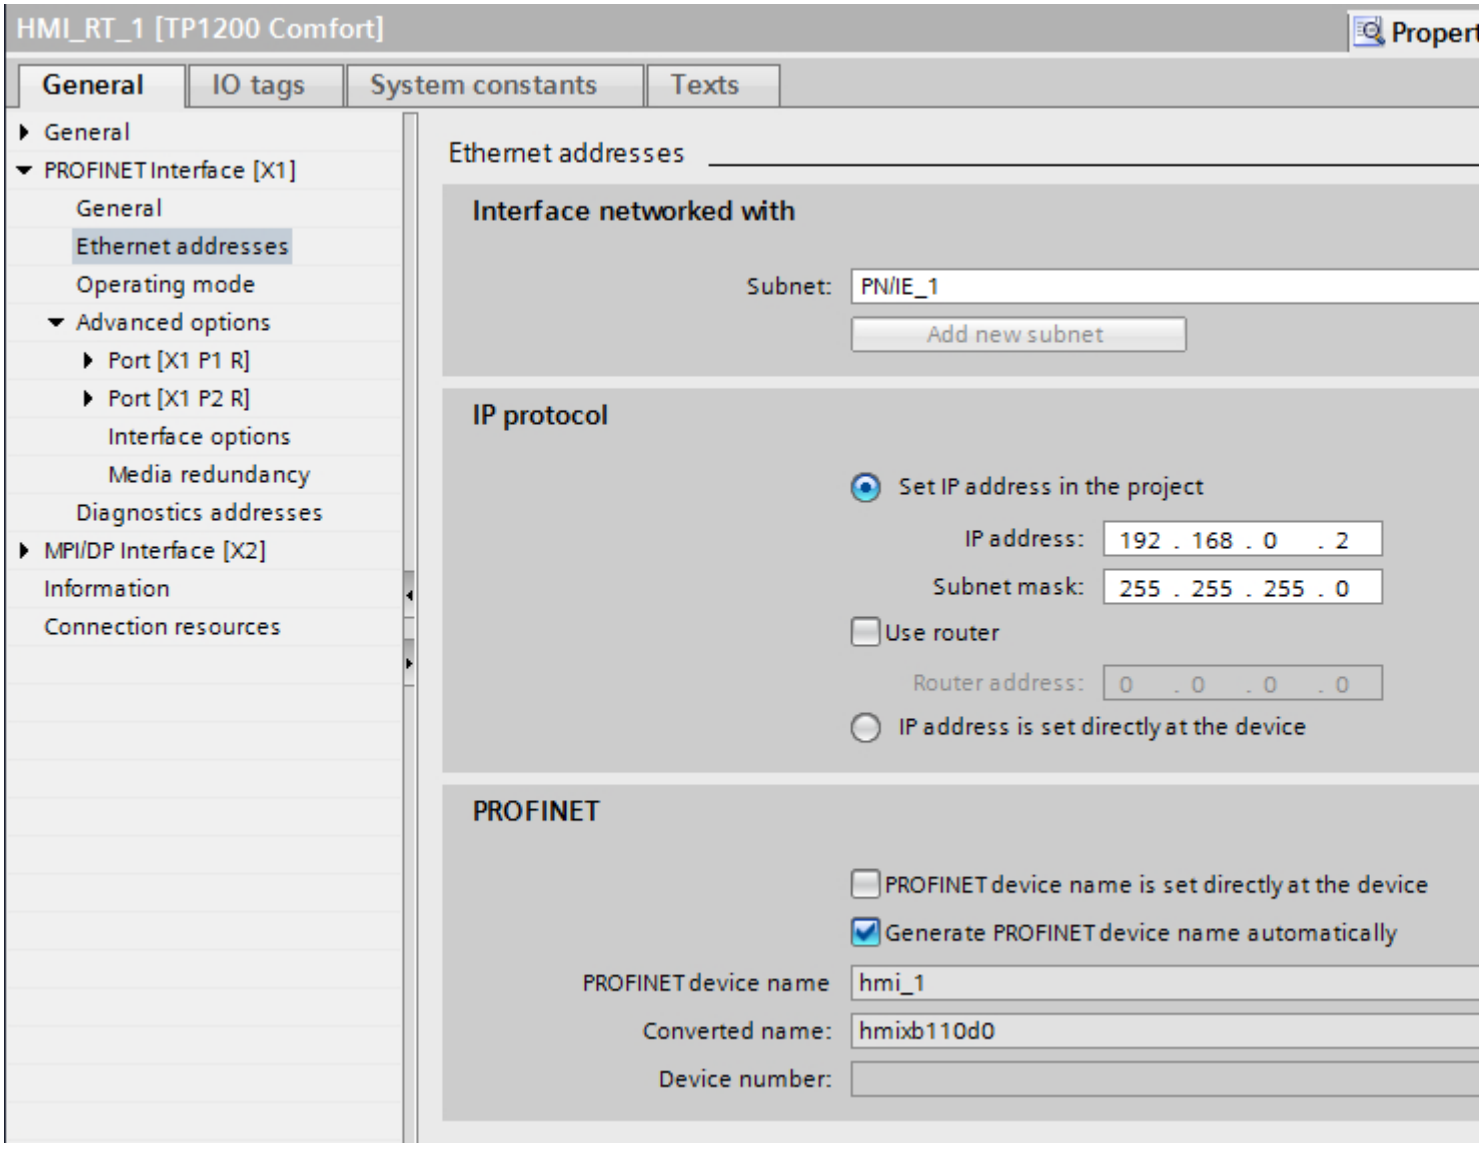
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - OP 77B
  - TP 177B color PN/DP
  - TP 177B mono DP
  - OP 177B color PN/DP
  - OP 177B mono DP
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP
  - TP 277 6"
  - OP 277 6"

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address using a different method"
  If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

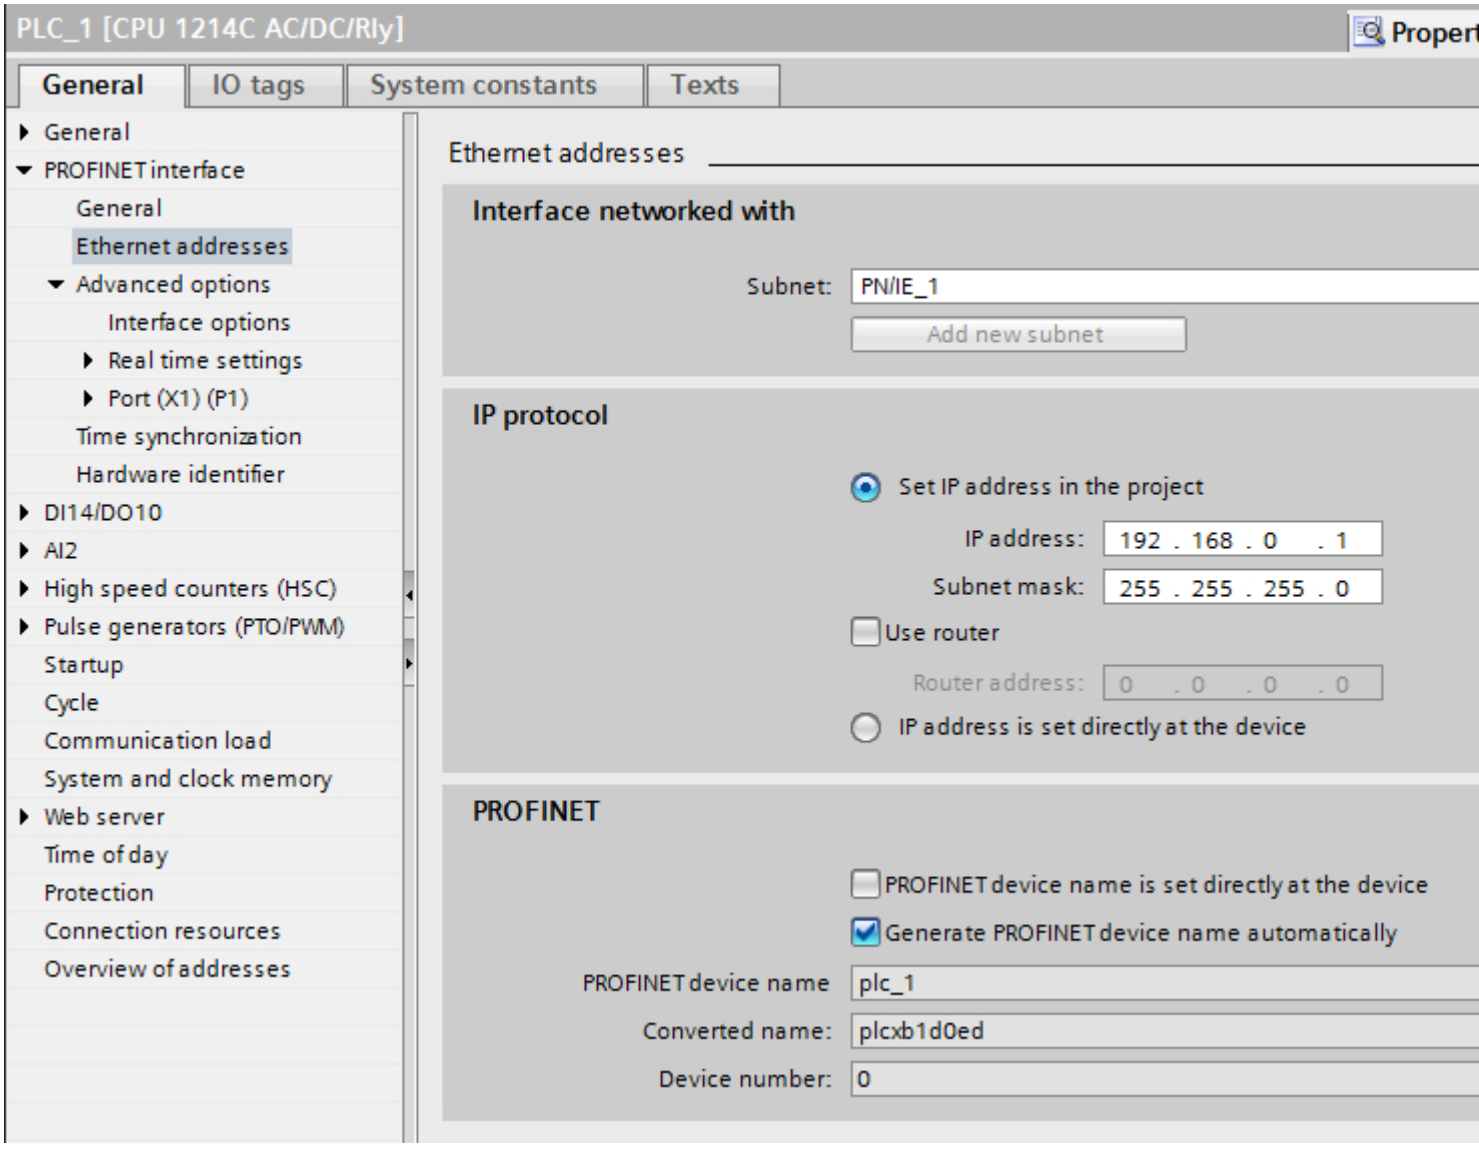
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Configuring Industrial Ethernet

Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

IP address

The IP parameters are visible if the communication-capable devices support the TCP/IP protocol.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of the following:

- The address of the (sub) net
- The address of the node (generally also called host or network node)

Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the node.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the node, thus 0.2.

It is generally true that:

- The network address results from AND linking the IP address and subnet mask.
- The node address results from AND NOT linking the IP address and subnet mask.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc). This is, however, not recommended because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of nodes they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (e.g. IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All nodes with addresses between 129.80.001.xxx and 129.80.127.xxx are on one subnet, all nodes with addresses between 129.80.128.xxx and 129.80.255.xxx are on another subnet.

Router

The job of the routers is to connect the subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, in this case you have to enter the address of the router for each node in the subnet.

The IP address of a node in the subnet and the address of the router may only differ at the points at which there is a "0" in the subnet mask.

Configuring time synchronization for integrated connections

Introduction

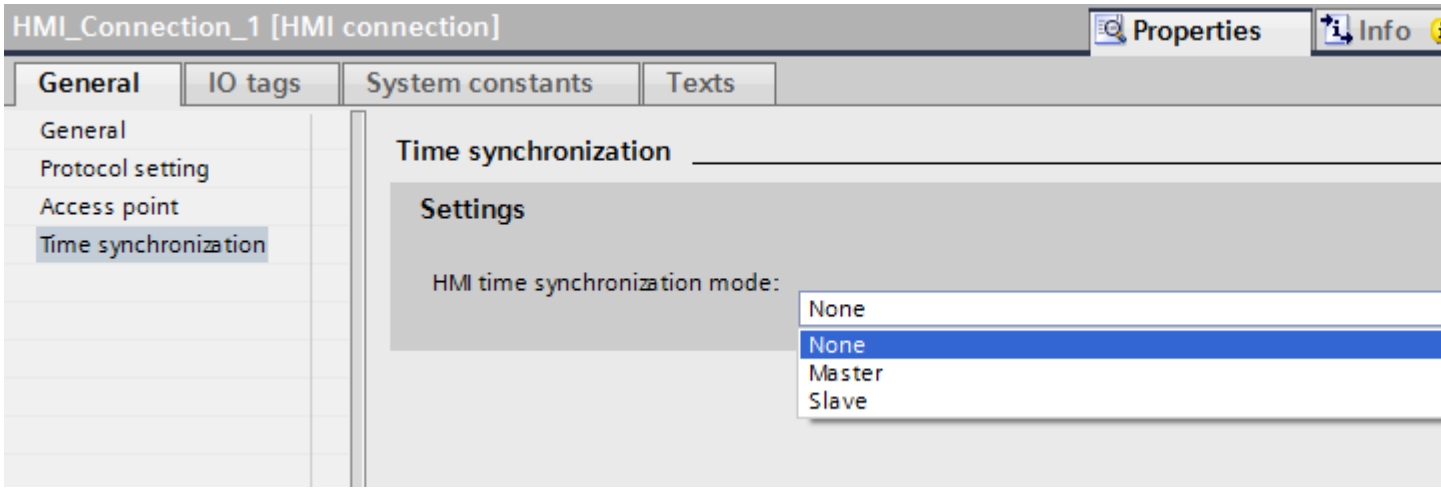
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Protection of communication

Security levels

If you want to protect the controller and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1200 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1200 controller, several aspects need to be considered when setting protection levels.

For additional information on this, see:

Setting options for the protection (FW as of V4) (Page 6184)

Setting options for the protection level (FW V1 to V3) (Page 6186)

Example

When configuring the controller, you select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU).

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Setting options for the protection (FW as of V4)

Protection level

The following section describes how to use the various access levels of the S7-1200 CPUs as of V4.

S7-1200 CPUs provide various access levels to limit the access to specific functions.

The parameters for the access levels are assigned in a table. The green checkmarks in the columns to the right of the respective access level specify which operations are possible

without knowing the password of this access level. If you want to use the functions of check boxes that are not selected, a password has to be entered.

Notice

Configuring an access level does not replace know-how protection

Configuring access levels prevents unauthorized changes to the CPU by restricting download privileges. However, blocks on the memory card are not write- or read-protected. Use know-how protection to protect the code of blocks on the memory card.

Default characteristics

The default access level is "Full access (no protection)". Every user can read and change the hardware configuration and the blocks. A password is not set and is also not required for online access.

The access levels in detail

With an S7-1200 CPU, you can configure the following access levels:

- Full access (no protection): The hardware configuration and the blocks can be read and changed by all users.
- Read access: With this access level, only read access to the hardware configuration and the blocks is possible without entering a password - meaning that you can load the hardware configuration and blocks into the programming device. In addition, HMI access and access to diagnostics data is possible.
  You cannot load blocks or a hardware configuration into the CPU without entering the password. Moreover, writing test functions and firmware updates are **not** possible without a password.
- HMI access: With this access level, only HMI access and access to diagnostics data is possible without entering the password.
  Without entering the password, you can neither load blocks and hardware configuration into the CPU, nor load blocks and hardware configuration from the CPU into the programming device. In addition, the following is **not** possible without a password: Writing test functions, changing the operating state (RUN/STOP) and firmware updates.
- No access (complete protection): When the CPU is completely protected, no read or write access to the hardware configuration and the blocks is possible. HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed).
  Authorization with the password again provides you full access to the CPU.

Behavior of a password-protected module during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was configured with read access and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights".

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

Setting options for the protection level (FW V1 to V3)

Protection level

The following section describes how to use the various protection levels of the S7-1200 CPUs V1 to V3.

Effects of the protection level setting

You can choose between the following protection levels:

- No protection: This corresponds to the default behavior. You cannot enter a password. Read and write access is always permitted.
- Write protection: Only read-only access is possible. You cannot change any data on the CPU and cannot load any blocks or a configuration. HMI access and communication between CPUs are excluded from the write protection. Assignment of a password is required to select this protection level.
- Write/read protection: No write or read access is possible in the "Accessible devices" area or in the project for devices that are switched online. Only the CPU type and the identification data can be displayed in the project tree under "Accessible devices". Display of online information or blocks under "Accessible devices", or in the project for devices interconnected online, is possible.
  HMI access and communication between CPUs are excluded from the write protection.
  Assignment of a password is required to select this protection level.

Behavior of a password-protected CPU during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was assigned write protection and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on with a password.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights". Access authorization will also expire when the project is closed.

Note

You can not restrict functions for process control, monitoring, and communications.

Some functions are still protected due to their use as online data. RUN/STOP in the "Online Tools" task card or "Set the time" in the diagnostics and online editor is therefore write-protected.

Access password for the HMI connection

Introduction

Secure access to a PLC by assigning a password.

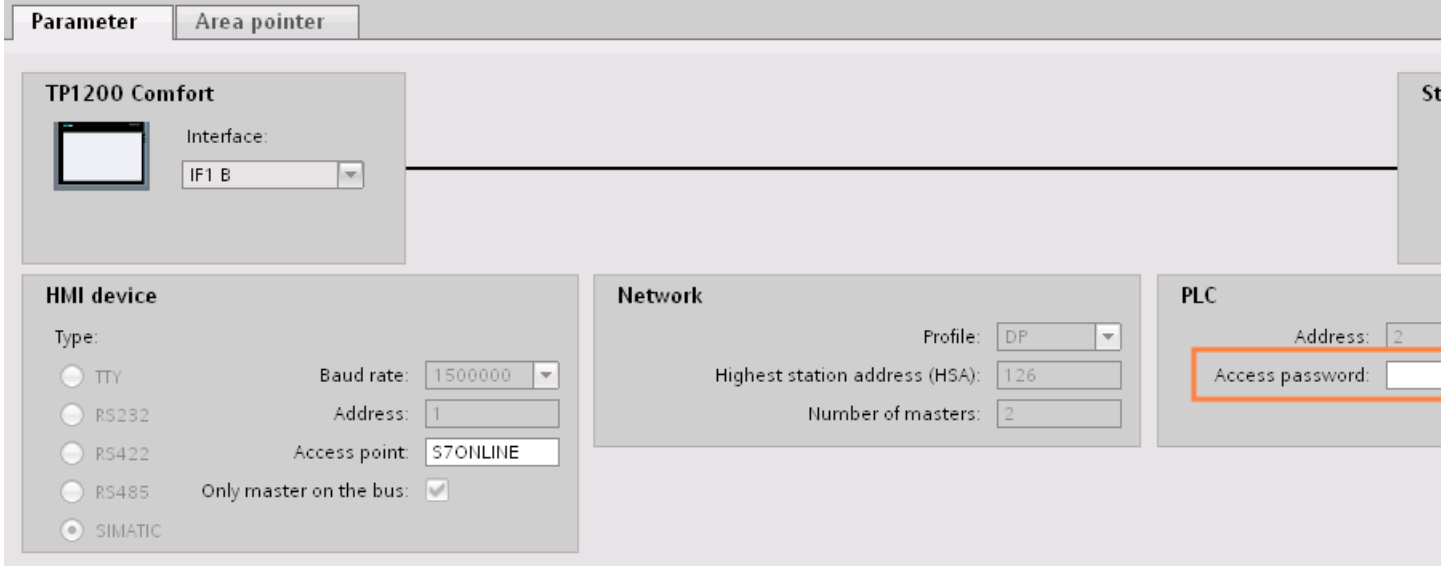
Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

Assigning password

Enter the "Access password" for the PLC in the "Connections" editor.



Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

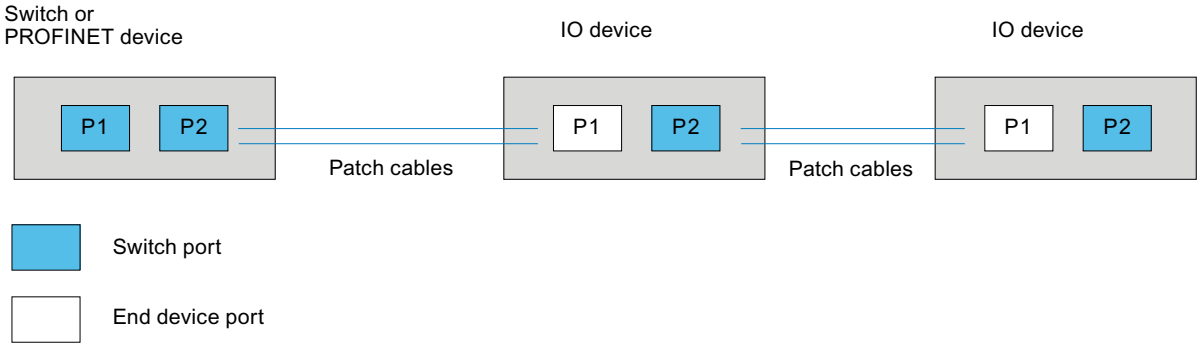
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"
  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"
  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.
  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

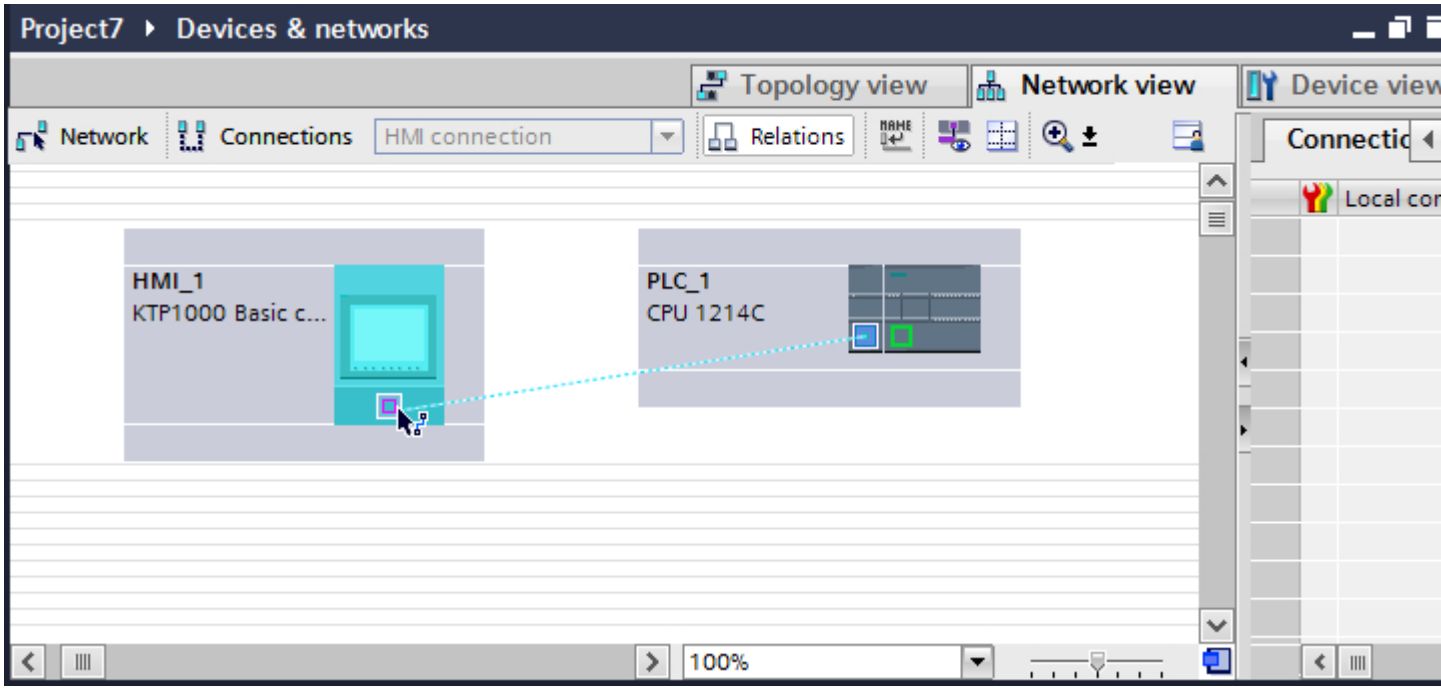
12.11.7.3 Communication via PROFIBUS

Configuring an HMI connection

Communication via PROFIBUS

HMI connections via PROFIBUS

If you want to connect a SIMATIC S7 1200 to a HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module to a slot of the controller first.



HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7-1200 via PROFIBUS in the "Devices & Networks" editor.

Requirements

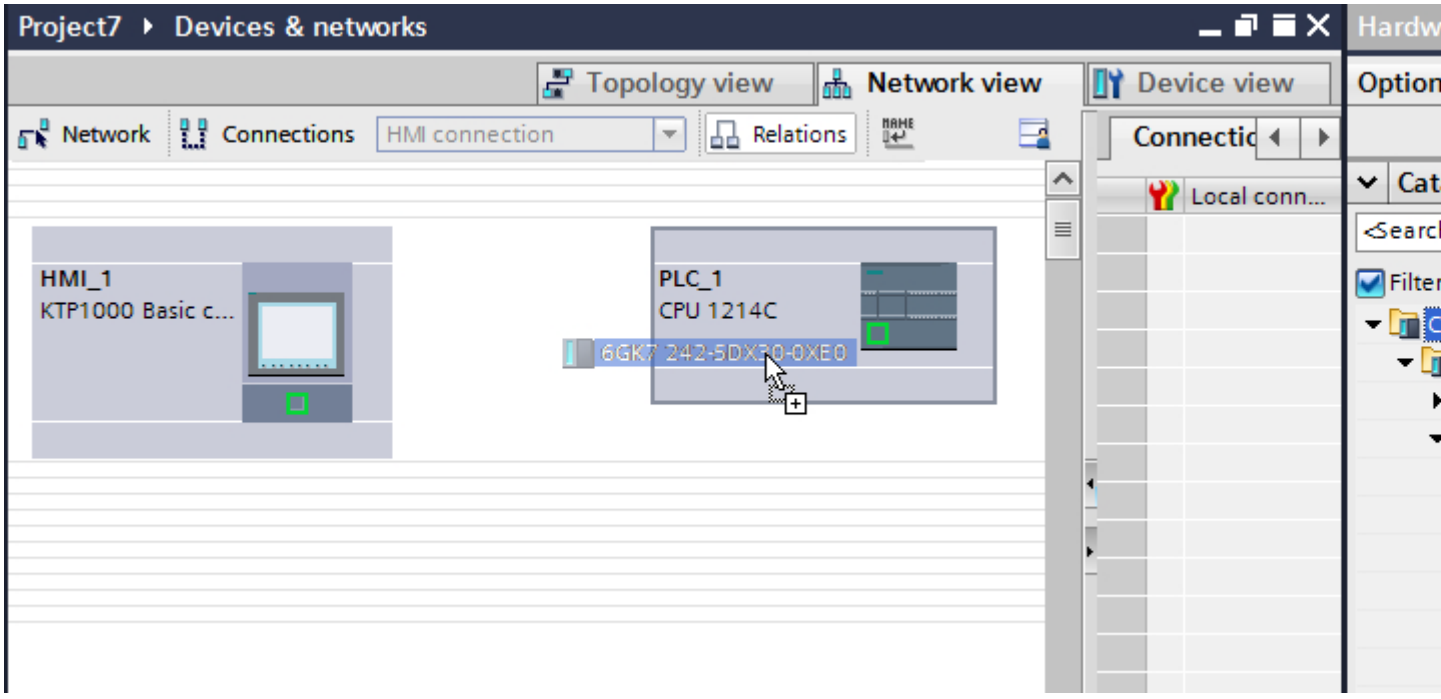
The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7-1200

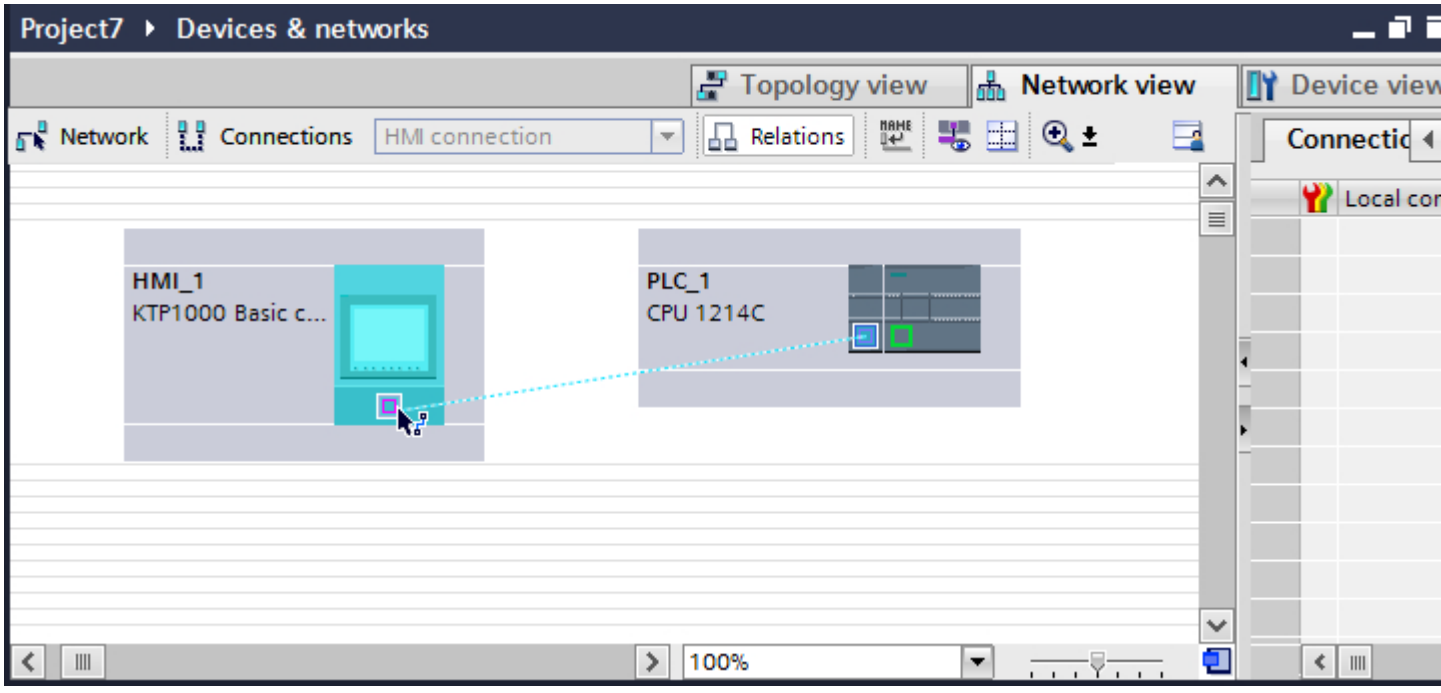
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button.
   The devices available for connection are highlighted in color.

3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.



4. Click the HMI device interface.
5. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > PROFIBUS address/ MPI address > Parameters".
6. Click the interface of the communication module and use a drag-and-drop operation to draw a connection to the HMI device.



7. Click the name of the connection.
   The connection is displayed graphically in the Inspector window.
8. Click "Highlight HMI connection" and select the HMI connection.
9. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the section "PROFIBUS parameters (Page 6202)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7-1200 via PROFIBUS.

Configuring an HMI connection

Communication via PROFIBUS

Communication via PROFIBUS

This section describes the communication between a WinCC Runtime and the SIMATIC S7 1200 PLC via PROFIBUS.

You can use the following WinCC Runtimes as an HMI device:

- WinCC RT Advanced

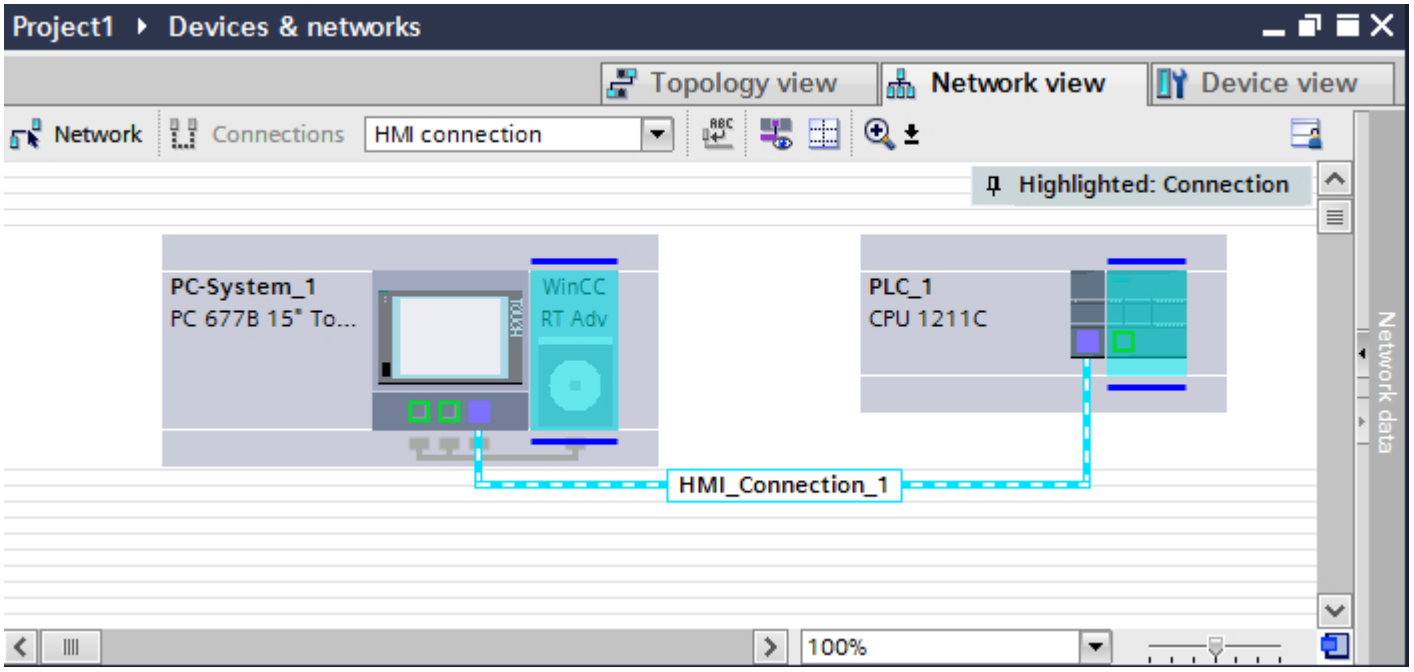
If you want to connect a SIMATIC S7 1200 to an HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module in a slot of the PLC.

WinCC Runtime as HMI device

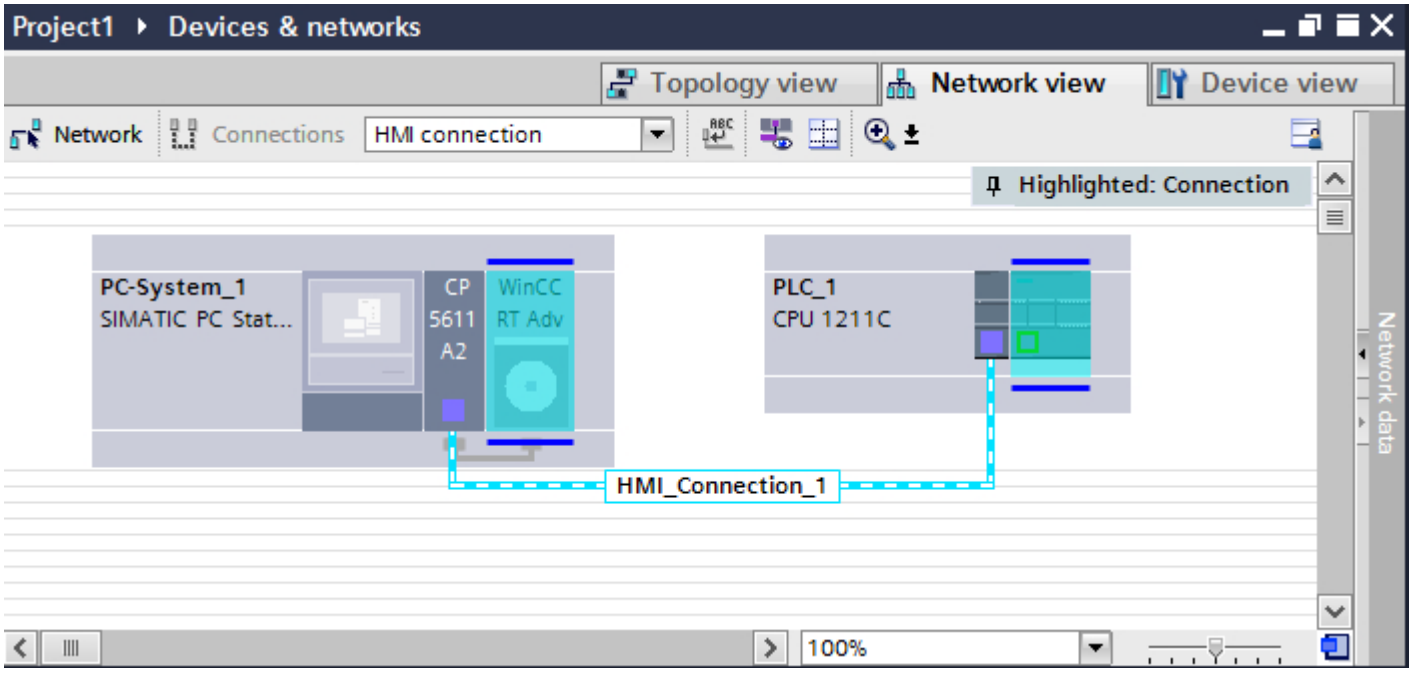
You configure the HMI connections between WinCC Runtime and SIMATIC S7 1200 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFIBUS in the "Devices & Networks" editor.

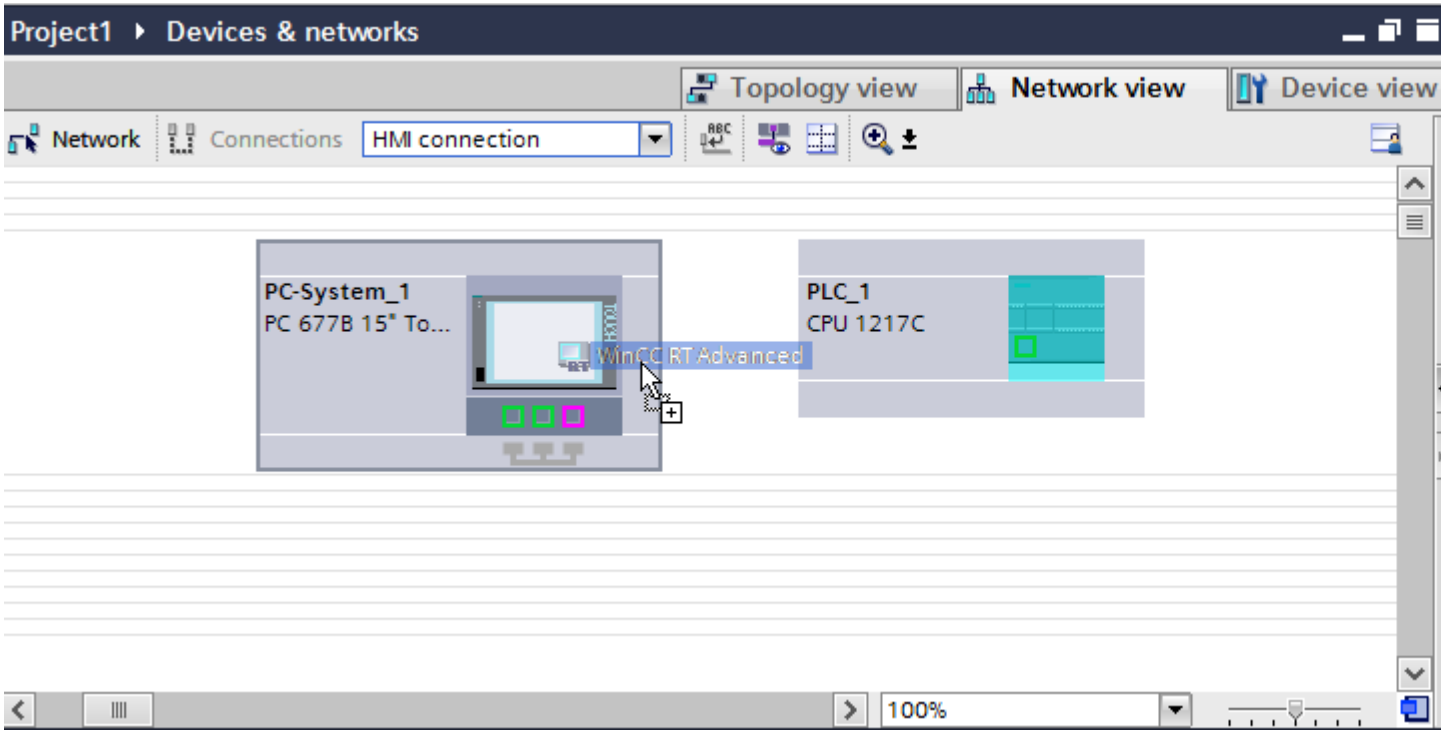
Requirements

The following communication partners are created in the "Devices & Networks" editor:

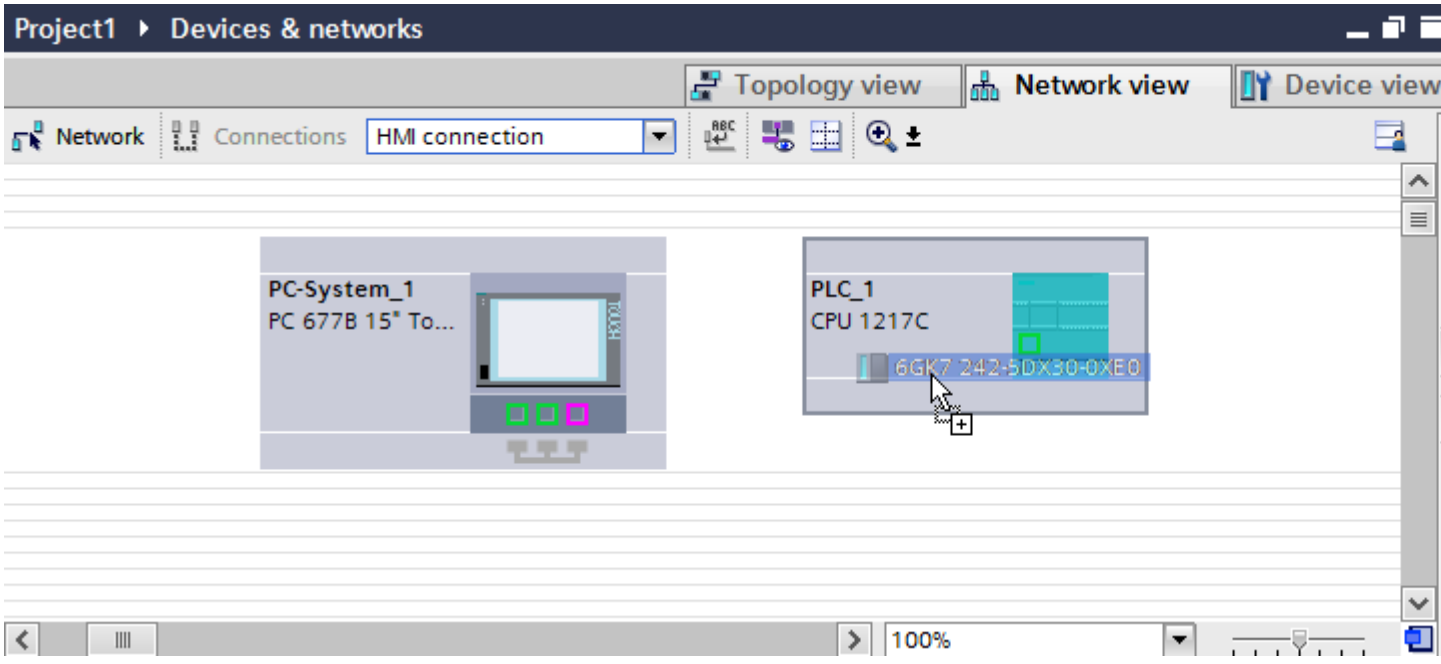
- SIMATIC S7 1200
- SIMATIC PC with PROFIBUS interface

Procedure

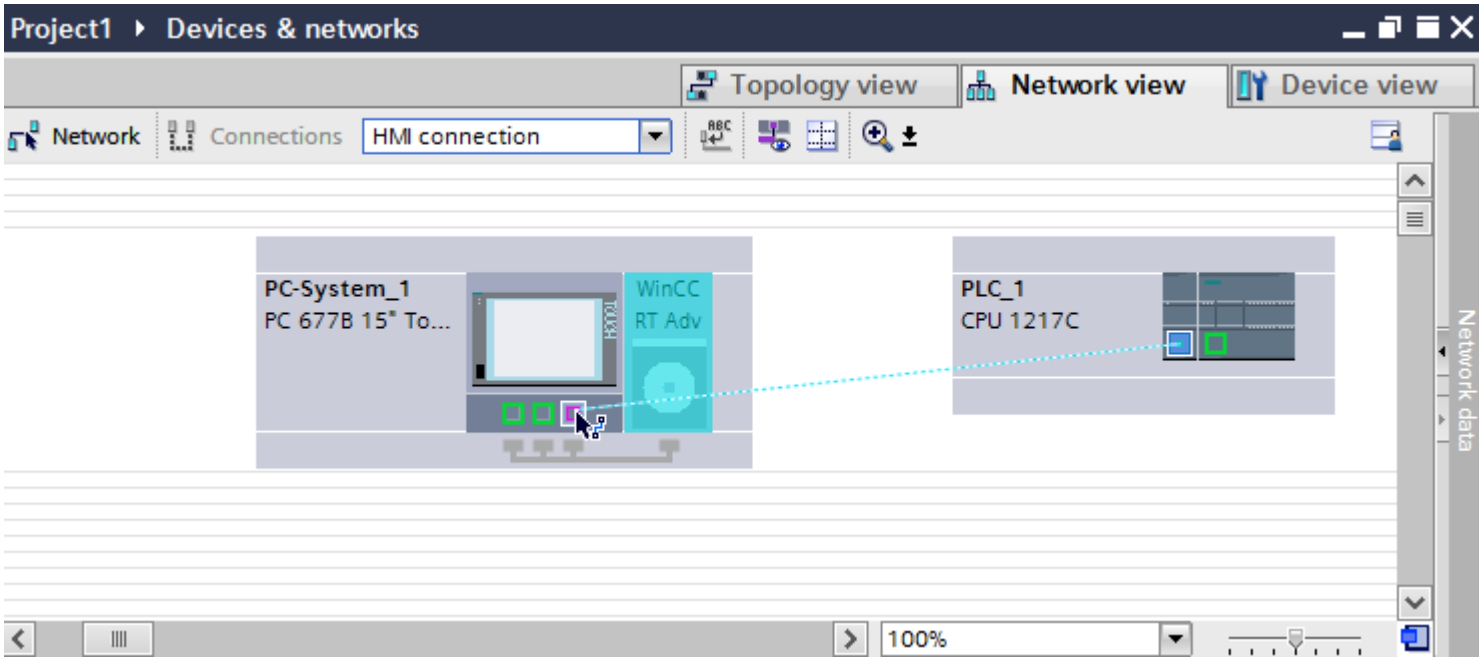
1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.



4. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
5. Click the PROFIBUS interface of the communication module and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6202)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 1200 via PROFIBUS.

Configuring an HMI connection via PROFIBUS with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFIBUS in the "Devices & Networks" editor.

Requirements

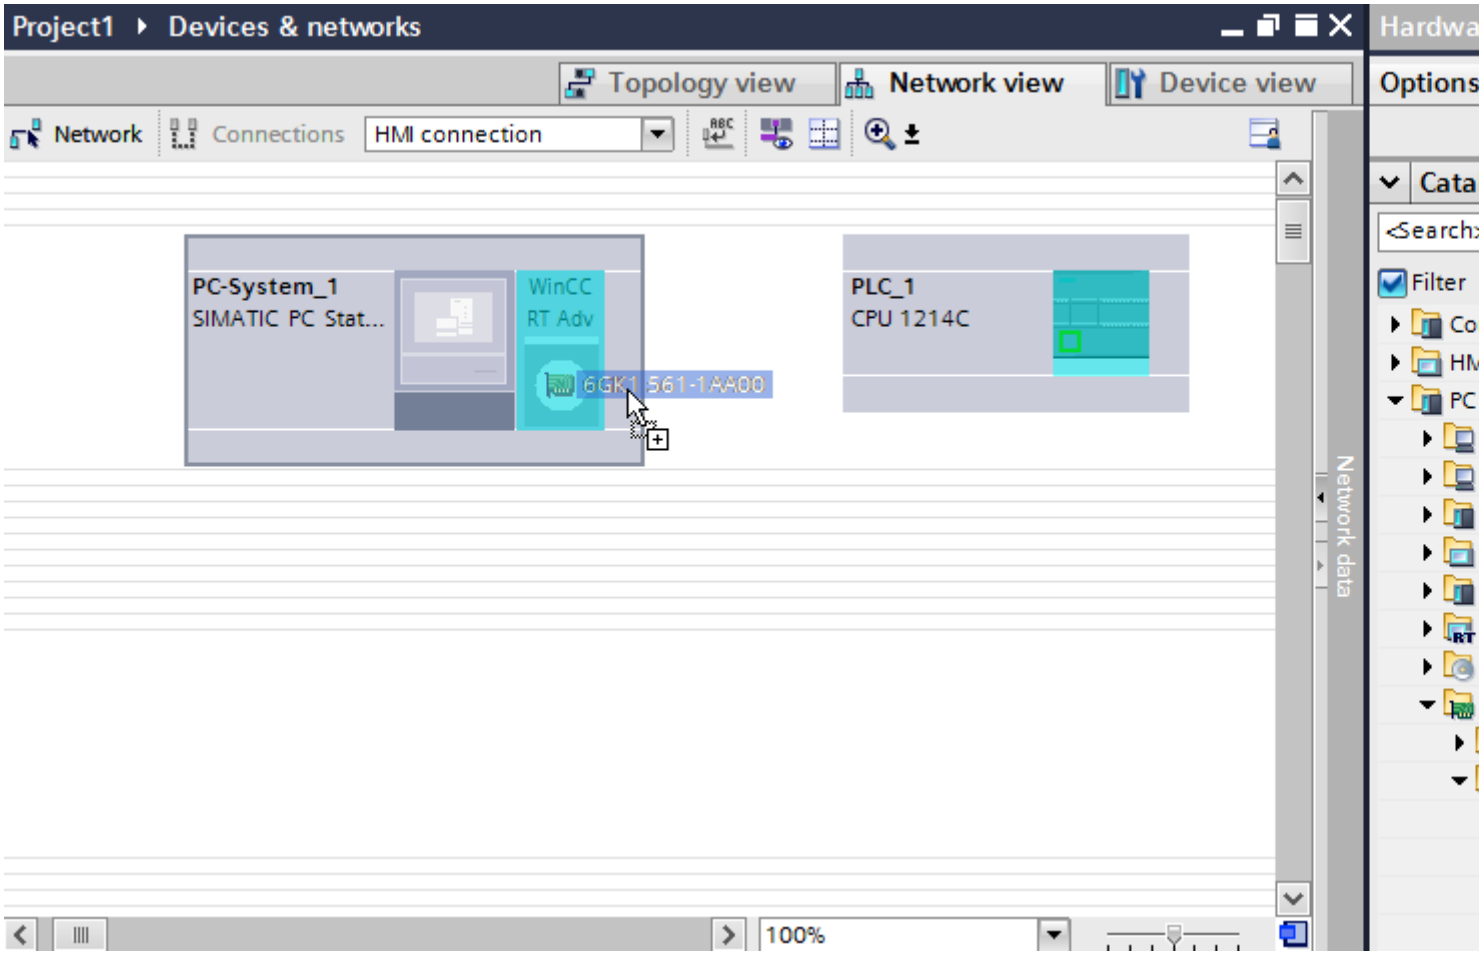
The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- PC station with WinCC RT Advanced

Procedure

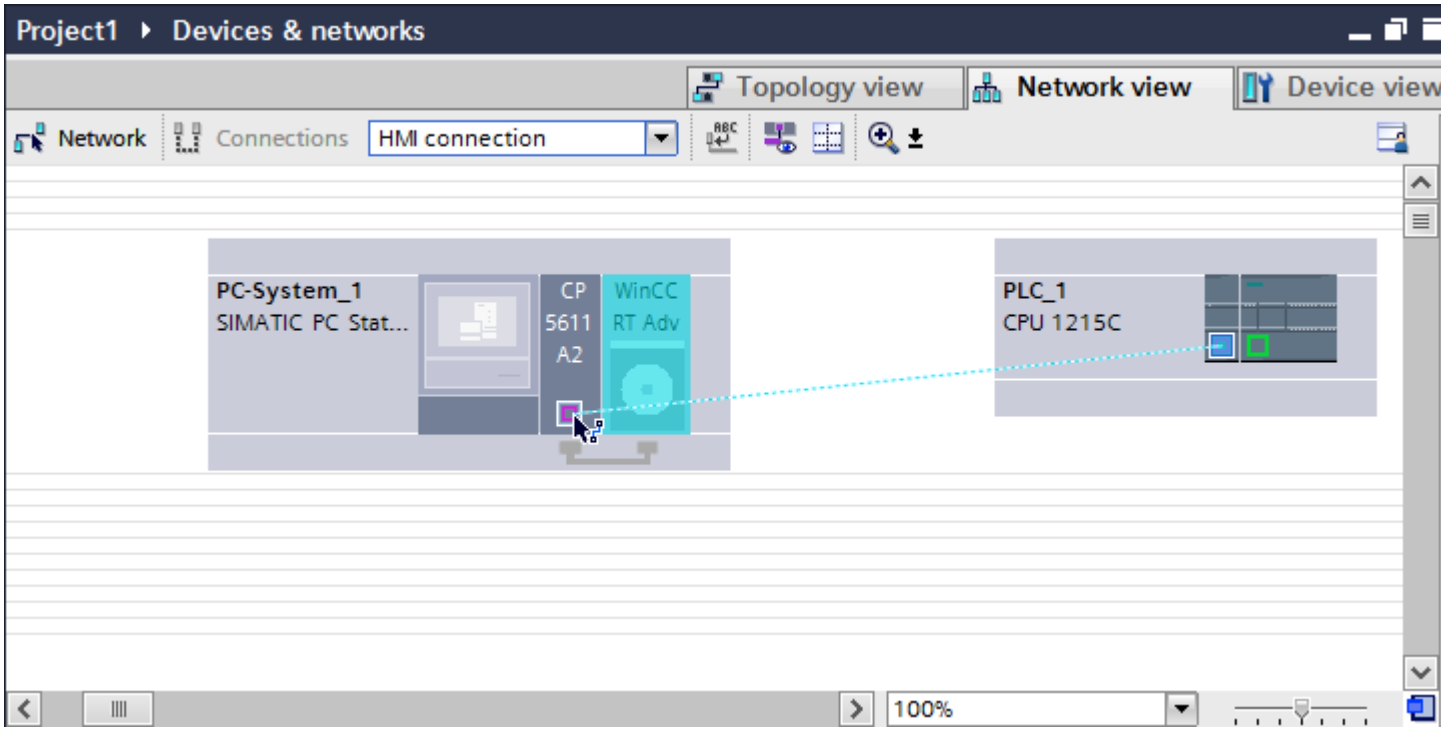
1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.

3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.



4. Click the "Connections" button and select "HMI connection" for the connection type. The devices available for connection are highlighted in color.

5. Click the PROFIBUS interface of the communication module and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6202)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 1200 via PROFIBUS.

PROFIBUS parameters

PROFIBUS parameters for the HMI connection

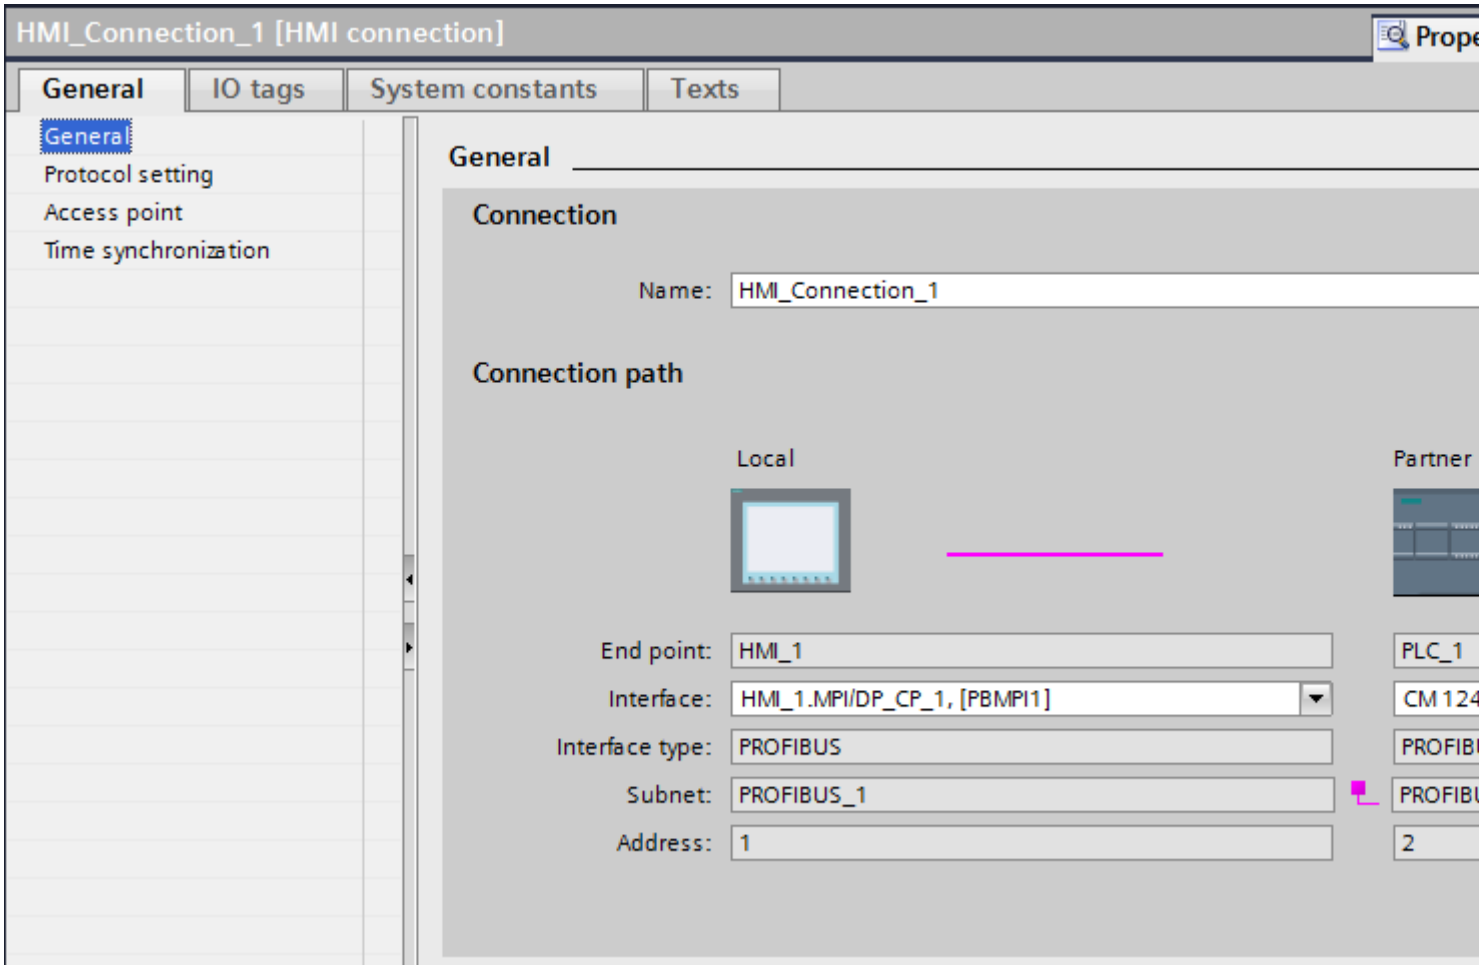
PROFIBUS parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and editing HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

The "Connection" area displays the HMI connection created for communication between the devices.

You can edit the name of the HMI connection in this area.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"

Displays the selected interface type. This area cannot be edited.

- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the PROFIBUS address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

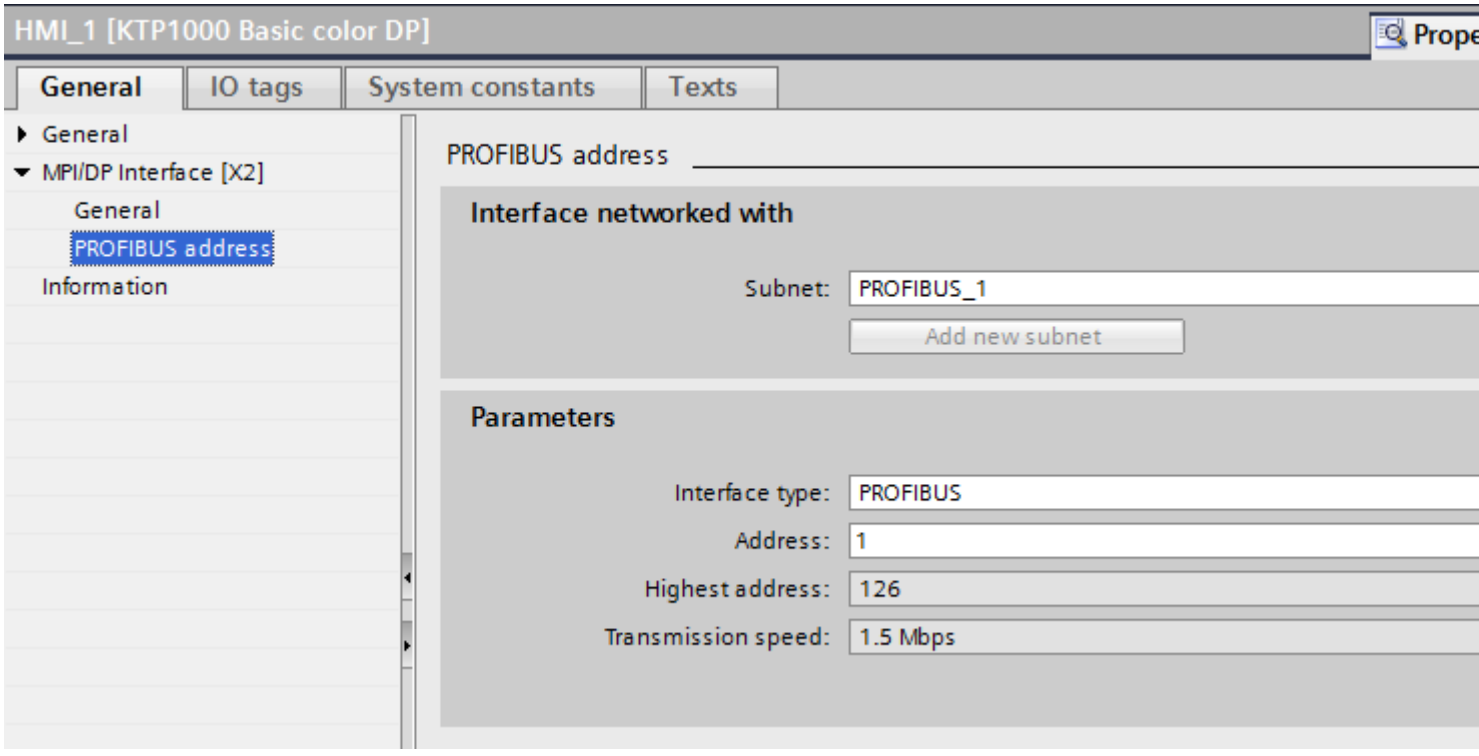
PROFIBUS parameters for the HMI device

PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFIBUS parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

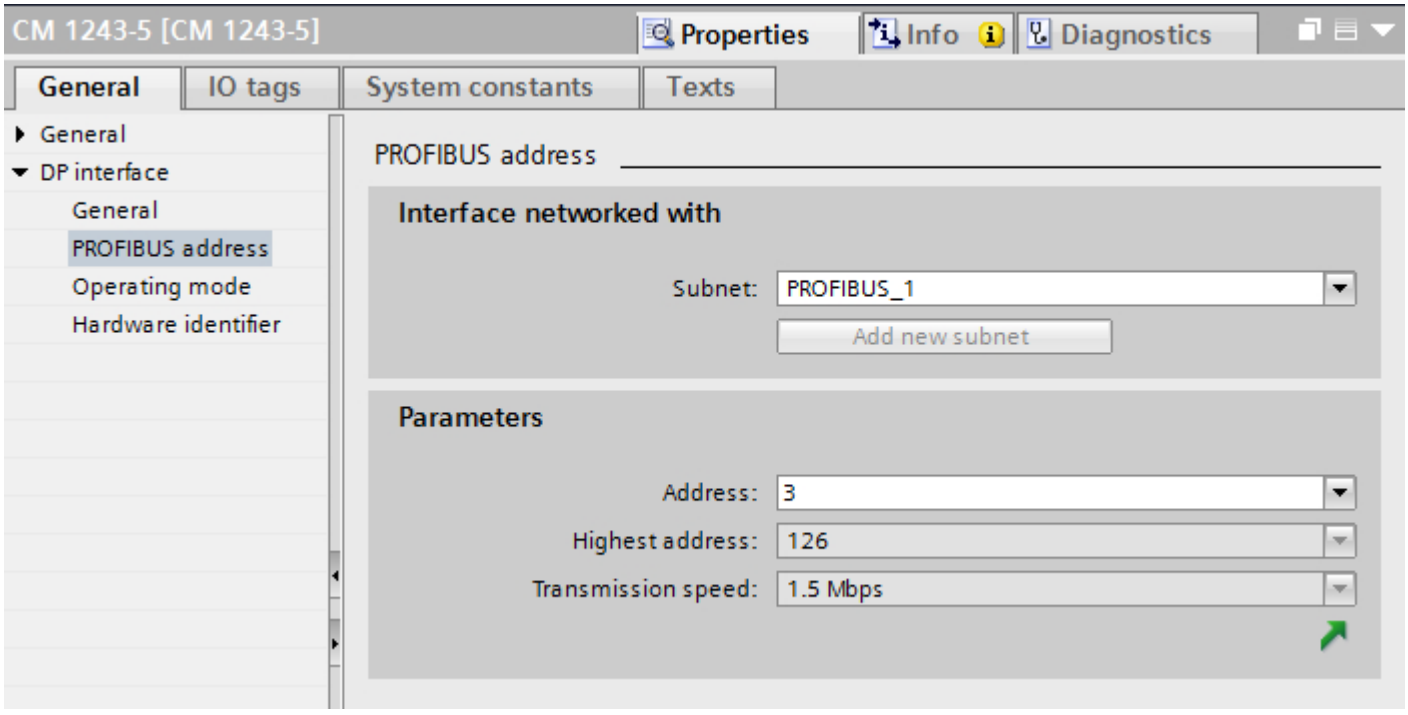
PROFIBUS parameters for the PLC

PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.

- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Bus profiles with PROFIBUS

Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values.

Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Standard	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Universal	9,6 19,2 93,75 187,5 500 1500

Meaning of profiles

Profile	Meaning
DP	Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices. This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.
Standard	Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.
Universal	Select the "Universal" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service. This includes the following devices for example: • CP 343-5 • PROFIBUS-FMS devices of other manufacturers As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.

Protection of communication

Security levels

If you want to protect the PLC and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1200 controller, several aspects need to be considered when setting protection levels. For additional information on this, see: Auto-Hotspot

Example

You select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU) when configuring it.

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Access password for the HMI connection

Introduction

Secure access to a PLC by assigning a password.

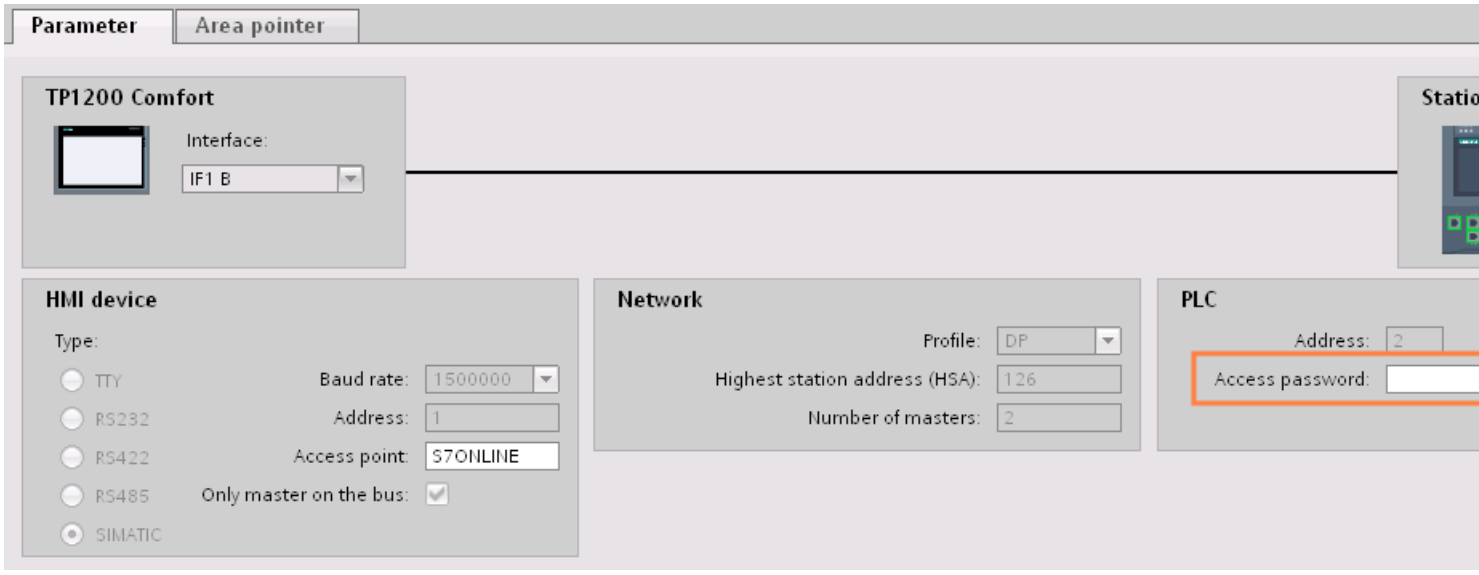
Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

Assigning password

Enter the "Access password" for the PLC in the "Connections" editor.



12.11.7.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 6044)

Area pointer "Date/time"

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Permitted data types

You can use the following data types when you configure the "Date/Time" area pointer:

- Int
- UInt
- Word
- DTL

Use of the "DTL" data type

Use of data type "DTL" with communication driver S7-1200.

A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

The "DTL" data type supports time information down to the nanosecond range. Because panels only support time information down to the millisecond, you may encounter the following restriction when using the area pointers:

For the transmission of time information from a panel to the controller, the smallest unit of time is 1 millisecond. The value range from microseconds to nanoseconds of the "DTL" data type is filled with zeros.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the date/time area pointer PLC to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Permitted data types

You can use the following data types when you configure the "Date/Time PLC" area pointer:

- DTL

Use of the "DTL" data type

Use of data type "DTL" with communication driver S7-1200. A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			

Byte	Component	Data type	Value range
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

The HMI devices do not support the use of nanoseconds. Values in the nanosecond range will be ignored during processing in Runtime.

The "DTL" data type supports time information down to the nanosecond range. Because panels only support time information down to the millisecond, you may encounter the following restriction when using the area pointers:

For the transmission of time information from a controller to a panel, the range from microseconds to nanoseconds is ignored. The time information is processed on the panel down to milliseconds.

Area pointer "Coordination"

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

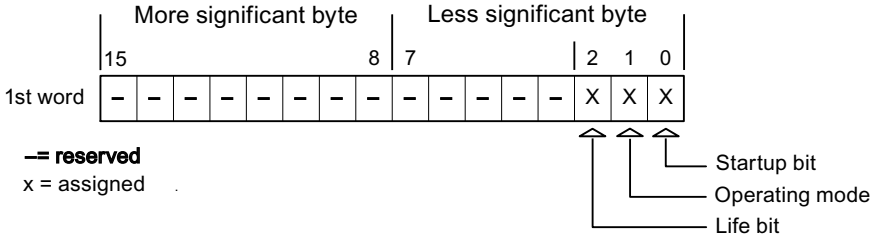
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

Processing in the PLC

For a simpler evaluation in the PLC program, use a Bool array for this area pointer when using the SIMATIC S7 1200 communication driver. You will have to map the complete 16-bit word of the area pointer. Configure a tag of the data type "Array [0 .. 15] of bool" for this purpose.

Permitted data types

You can use the following data types when you configure the "Coordination" area pointer.

- Word
- UInt
- Bool

Area pointer "Screen number"

Function

The HMI devices store information about the screen called up on the HMI device in the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. Certain reactions can be triggered in the PLC, such as the call of a different screen.

Use

Before the "Screen number" area pointer can be used, it must be set up and activated by selecting "Communication ▸ Area pointer". You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1. Word	Current screen type															
2. Word	Current screen number															
3. Word	Reserved															
4th word	Current field number															
5. Word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

Note

Device dependency

Permanent windows are not available on Basic Panels.

Permitted data types

You can use the following data types when you configure the "Screen number" area pointer.

- Word
- UInt

Area pointer "Project ID"

Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program.

A missing compatibility results in a corresponding alarm and Runtime will not be started.

Use

Note

HMI connections cannot be switched "online".

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- This is where you select the PLC tag or the tag array that you have configured as the data area for the area pointer.

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

Permitted data types

You can use the following data types when you configure the "Project ID" area pointer.

- Word
- UInt

Area pointer "Job mailbox"

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Set date (BCD-coded)**	

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Clear event buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Clear error alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Display selection**	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1)]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only devices supporting recipes
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.

Permitted data types

You can use the following data types when you configure the "Screen number" area pointer:

- Word
- UInt

"Data record" area pointer

"Data mailbox" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data mailbox

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a job mailbox, the data in the recipe view will be updated as well. Avoid operating the recipe view while job mailboxes for transfer of data records are being triggered. If you have already started editing a data record and a job mailbox is triggered for transfer of data records, then this job mailbox will be rejected.

Permitted data types

You can use the following data types when you configure the "Data record" area pointer.

- Word
- UInt

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. Use this mechanism to prevent uncontrolled overwriting of data in either direction of your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Connections ▸ Area pointer" editor.
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transfer is busy
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe display

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data mailbox and sets the data record number to 0.	Abort with system alarm.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data mailbox.	Abort with system alarm.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data mailboxes from the PLC to the HMI device. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox no. 70 transfers data mailboxes from the HMI device to the PLC. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device reads the values and stores the values in the data record specified in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed". • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the job from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The PLC program can now evaluate the transferred data. To allow further transfers, the PLC program must set the status word to 0 again.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	

Step	Action	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data mailbox.

Note

Availability for specific devices

Notes in the status bar of the recipe view are not available in Basic Panels.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 4270)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

See also

Trends (Page 4270)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

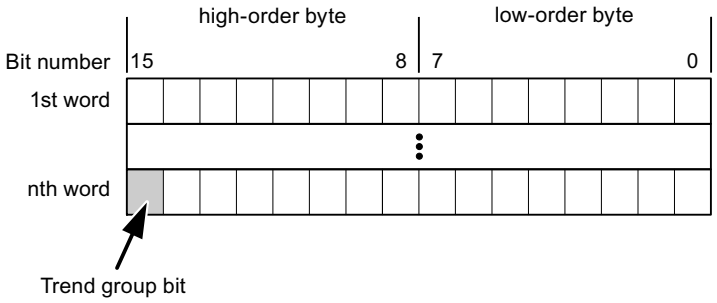
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 4293)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

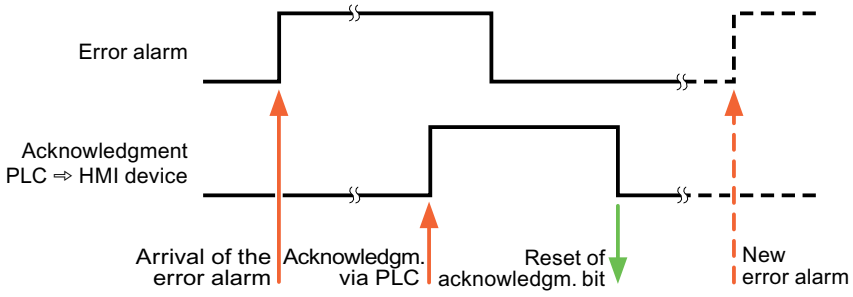
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

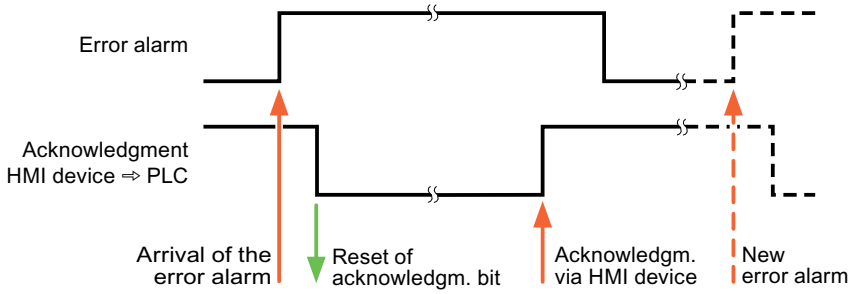
tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

12.11.7.5 Performance features of communication

S7-1200 device dependency

Communication with the SIMATIC S7-1200 controller

If you use devices from an earlier version of the TIA Portal with TIA Portal V13, it may not be possible to configure integrated connections to certain HMI devices.

STRING	(2+n) bytes, n = 0 to 254	
WSTRING	(4+2*n) bytes, n = 0 to 254	Basic Panels
	(4+2*n) bytes, n = 0 to 4094	Panels, RT Advanced
	(4+2*n) bytes, n = 0 to 65534	RT Professional
CHAR	1 byte	
Array of CHAR	--	
BYTE	1 byte	
WORD	2 bytes	
DWORD	4 bytes	
LDT	8 bytes	RT Professional
DATE_AND_TIME	8 bytes	RT Professional

12.11.7.6 Creating connections in the "Connections" editor

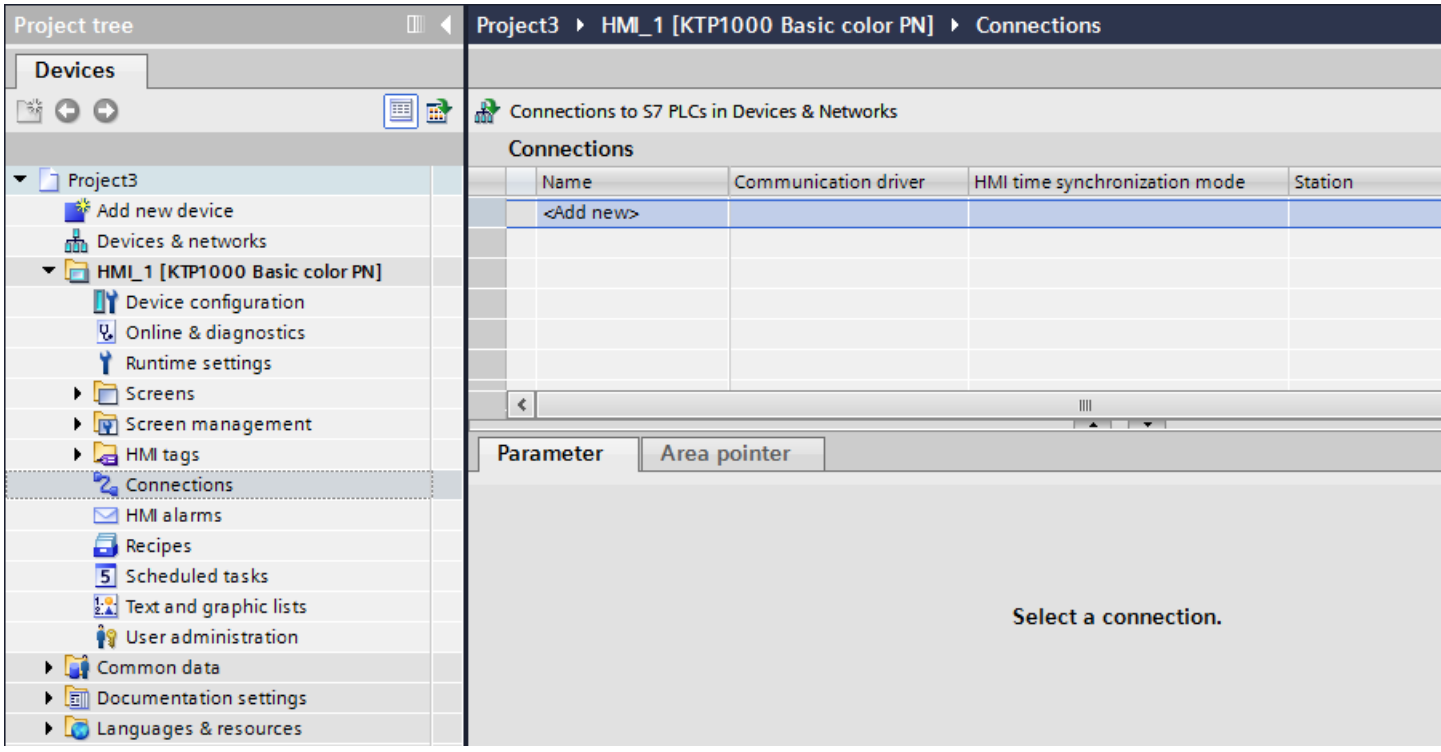
Creating a PROFINET connection

Requirements

- A project is open.
- An HMI device with a PROFINET interface has been created.

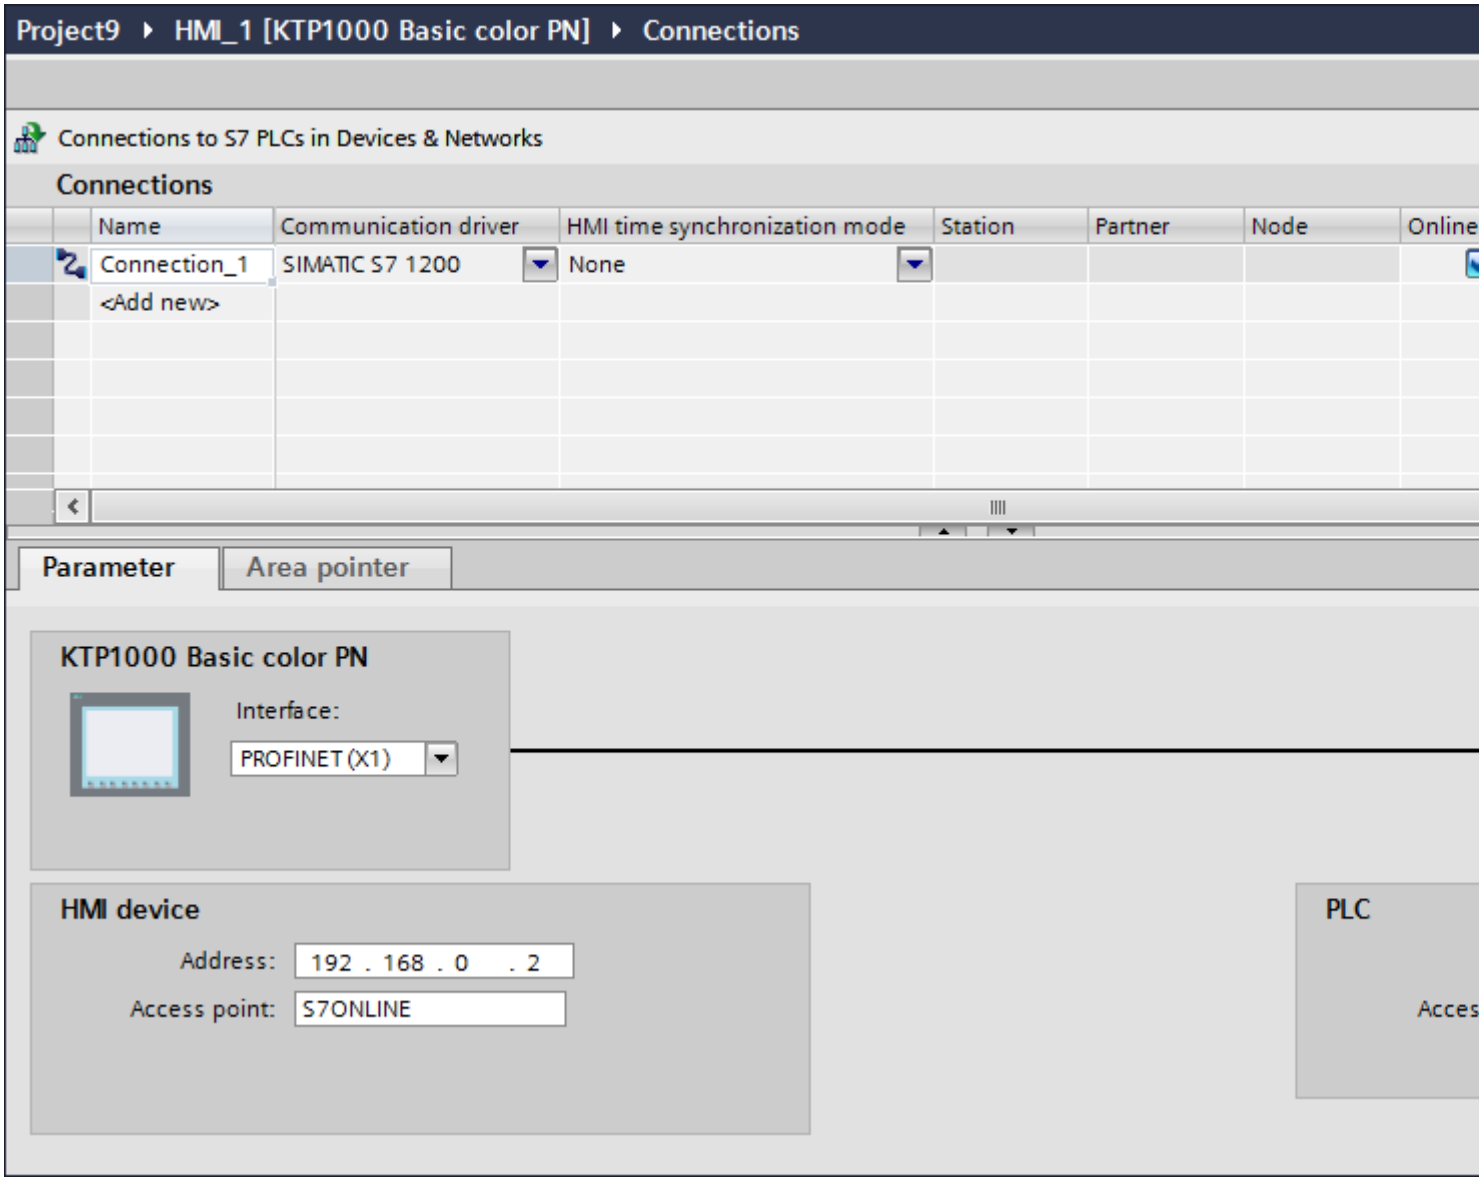
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. In the "Communication drivers" column, select the "SIMATIC S7 1200" driver.
4. Click the name of the connection.

5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".



6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

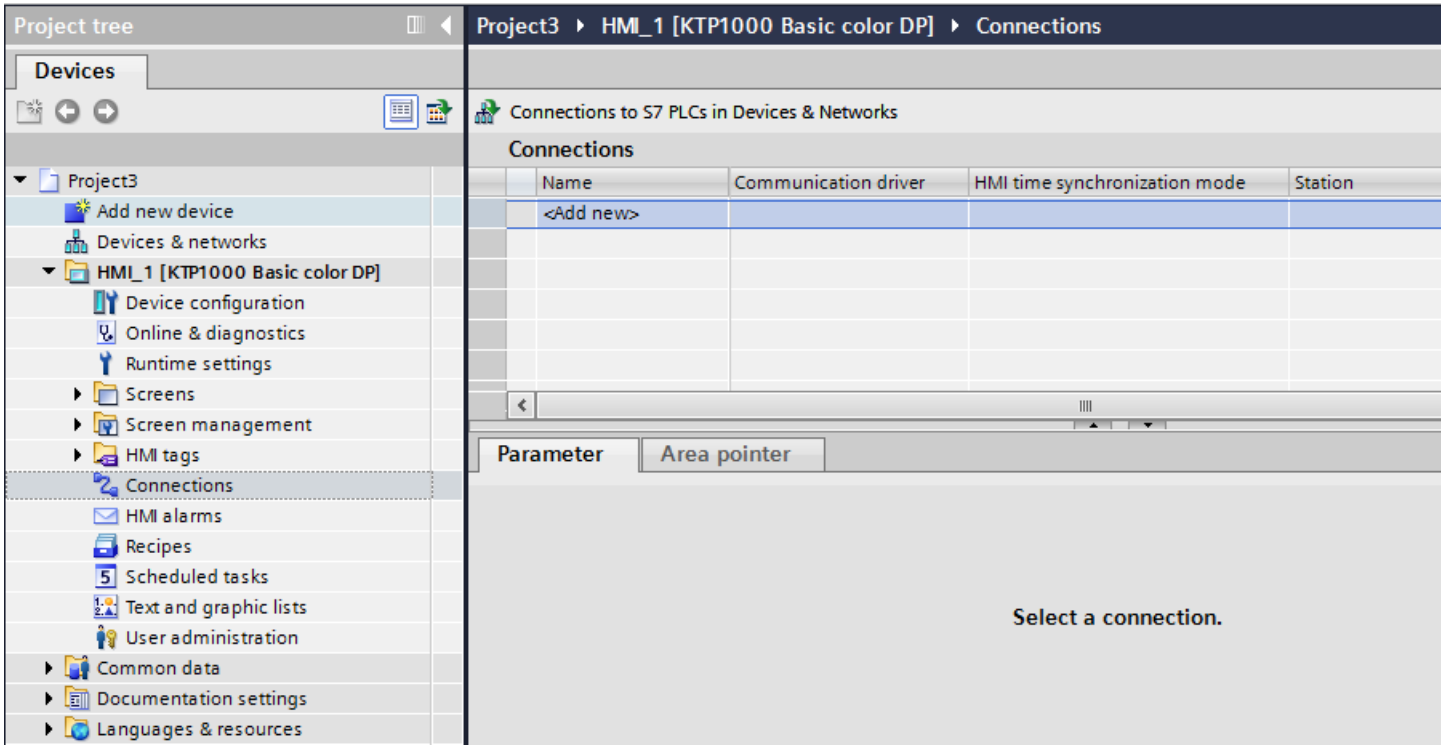
Creating a PROFIBUS DP connection

Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

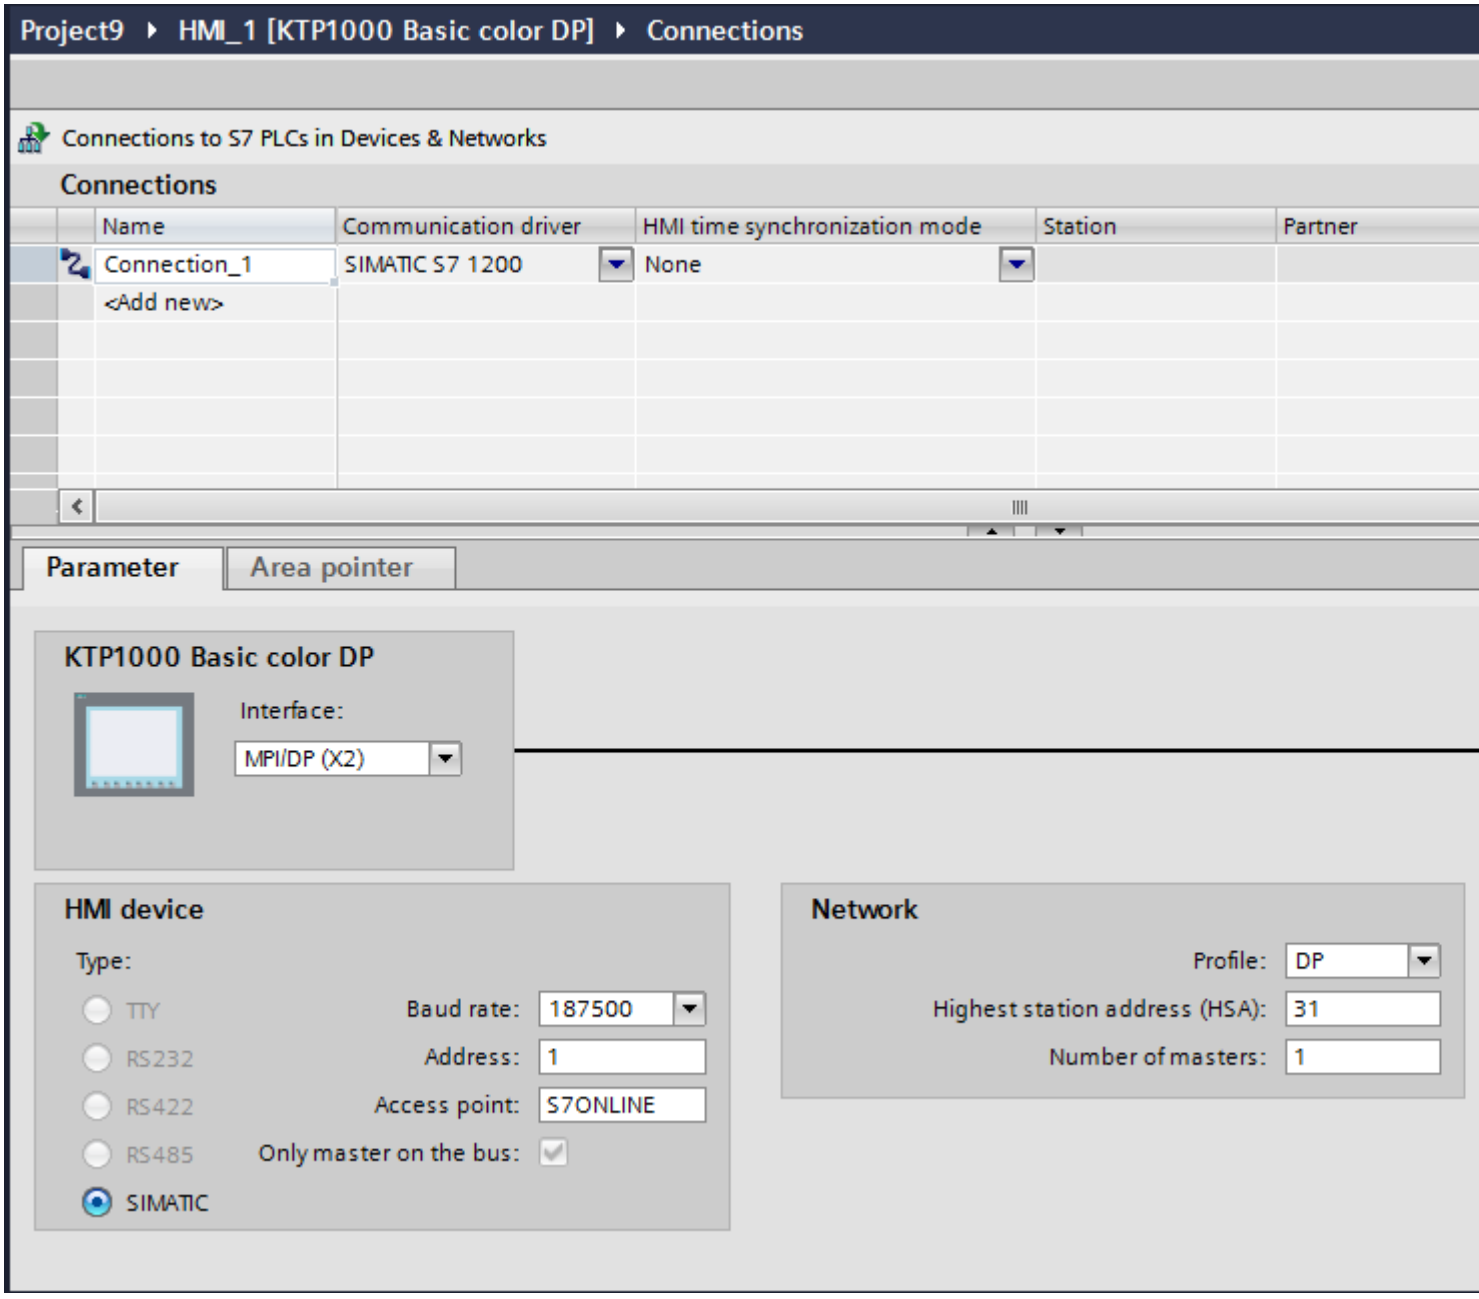
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. In the "Communication drivers" column, select the "SIMATIC S7 1200" driver.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters".

6. Select the "DP" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

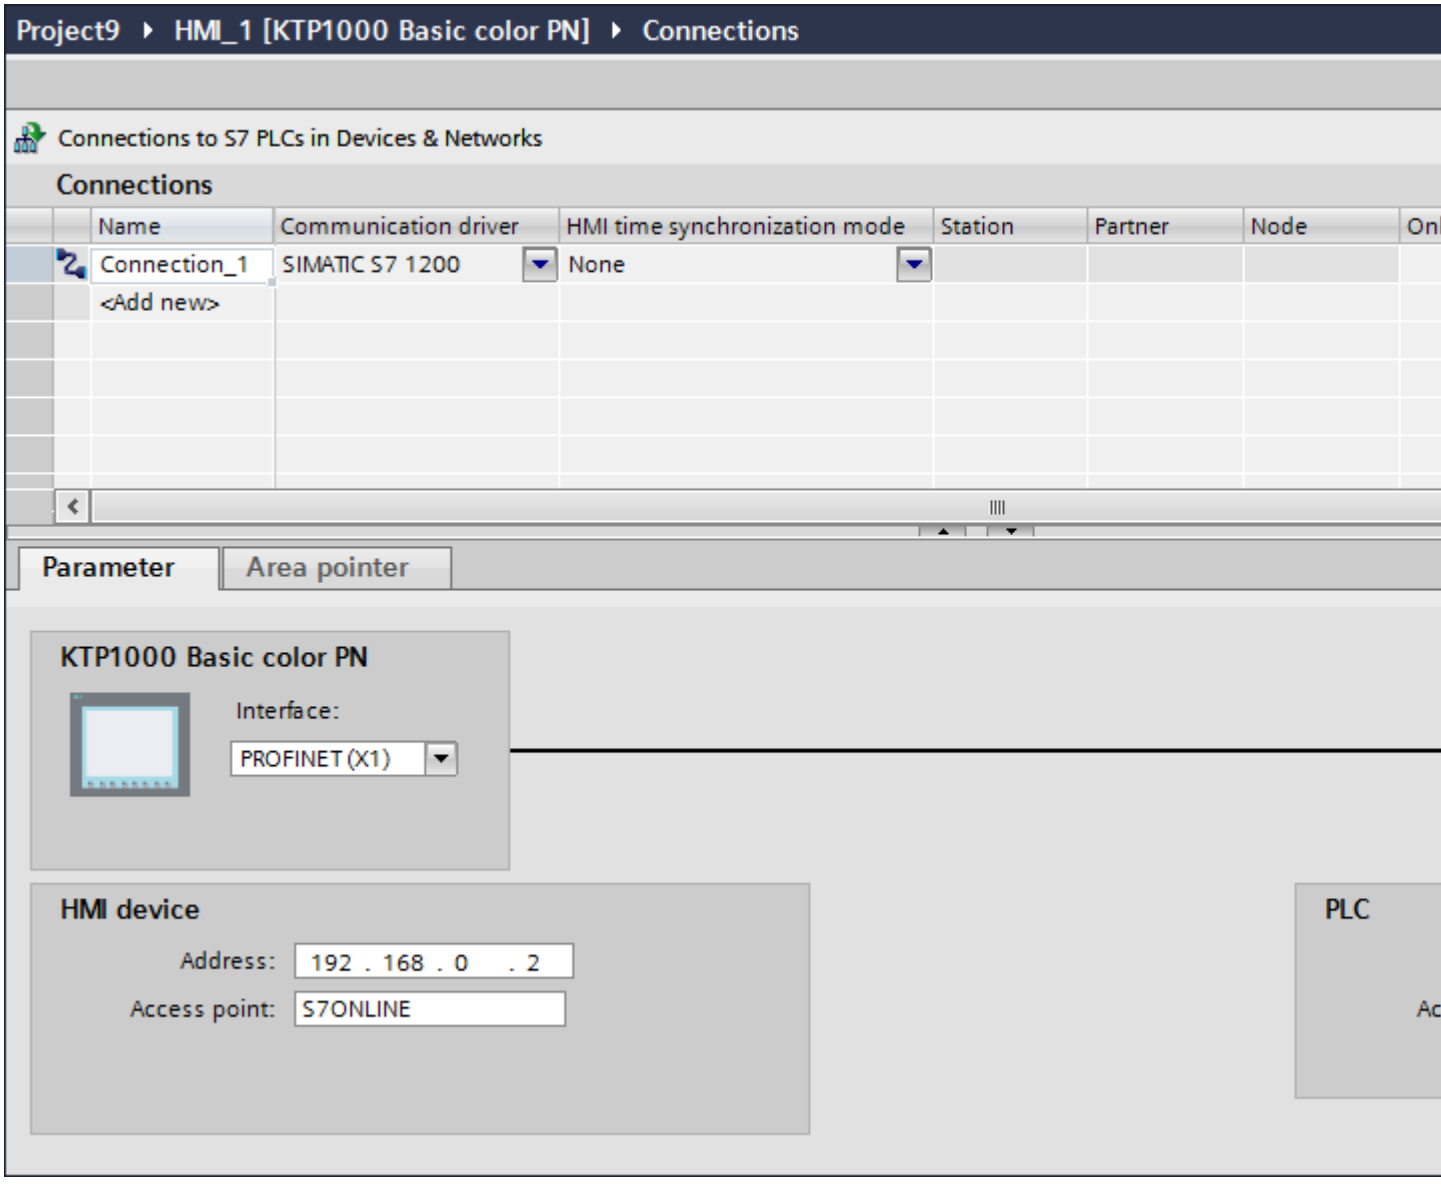
Parameters for the connection

Parameters for the connection (SIMATIC S7 1200)

Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"
- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

Note

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Only master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7-200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

  Note

  You only need a password if you have set "Complete protection" at the PLC.

  No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

12.11.7.7 Time synchronization

Time synchronization

Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and than at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

Time synchronization restrictions

Approved HMI devices

You can configure the time synchronization between a SIMATIC S7-1200 or SIMATIC S7-1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0
Multi Panel 177	Windows CE 5.0
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

Configuration restrictions

- If an HMI device has several connections to SIMATIC S7-1200 or SIMATIC S7-1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".

- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured.
  Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device.
  This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.
- Time synchronization with SIMATIC S7-1200 (V1.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1200 (V4.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1500 is not possible.

Configuring time synchronization for integrated connections

Introduction

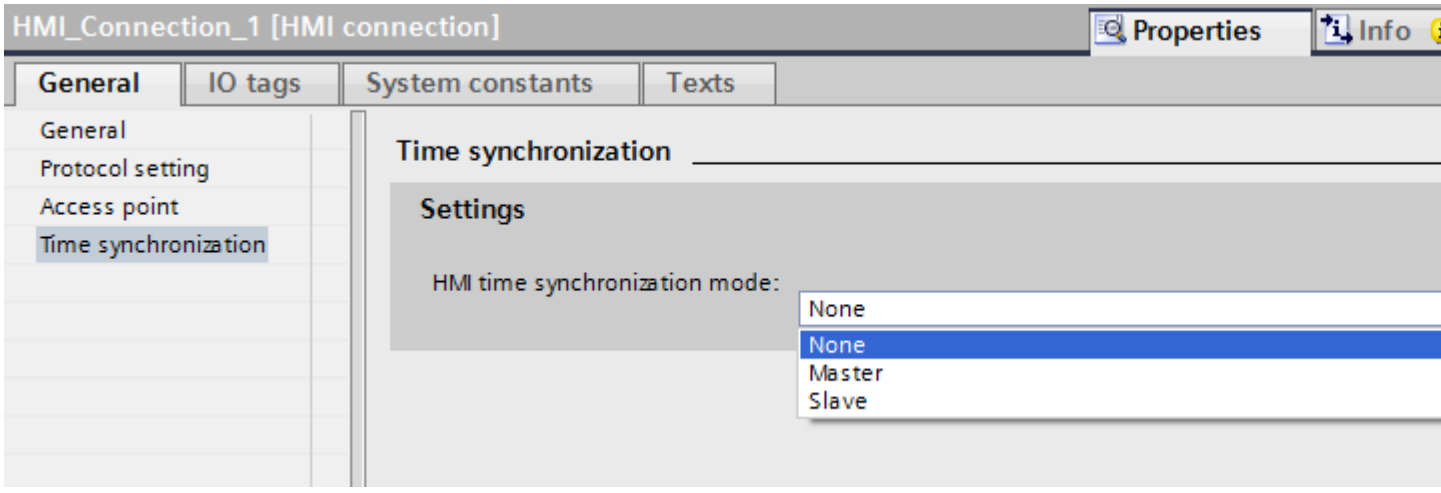
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Configuring time synchronization for non-integrated connections

Introduction

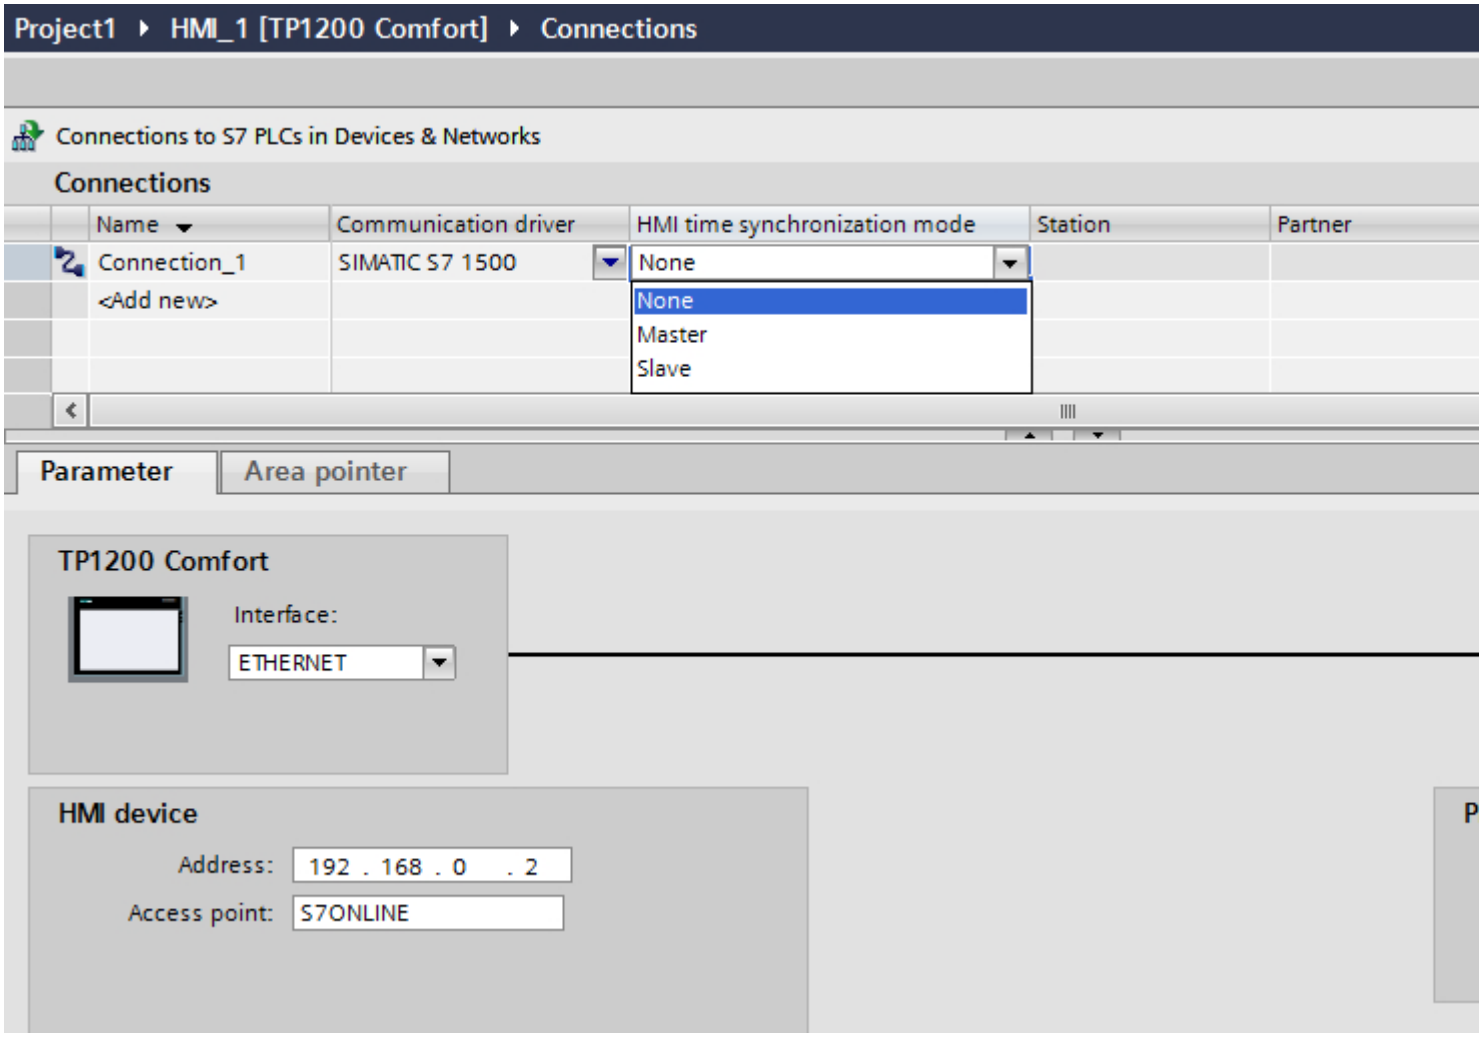
You configure time synchronization for a non-integrated connection in the "Connections" editor.

Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1200" PLC.
3. Select the following in the "HMI time synchronization mode" column:
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



12.11.8 Communicating with SIMATIC S7 300/400

12.11.8.1 Communication with SIMATIC S7 300/400

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 300 and S7 400 PLCs. These two PLCs will be referred to jointly as SIMATIC S7 300/400.

You can configure the following communication channels for the SIMATIC S7 300/400 PLC:

- PROFINET
- PROFIBUS
- MPI

HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 300/400 in the "Devices & Networks" editor.

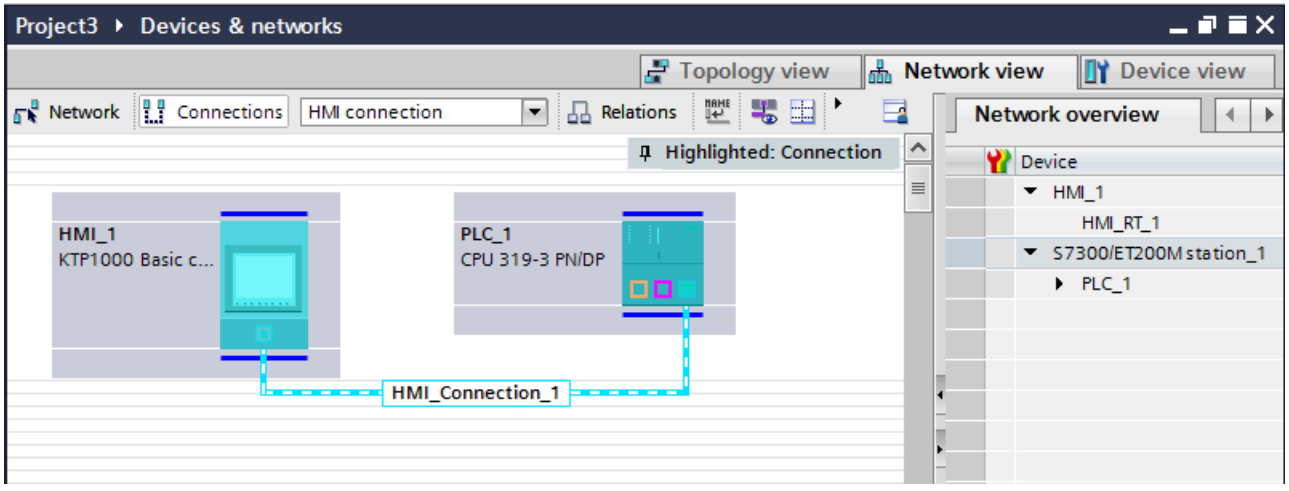
12.11.8.2 Communication via PROFINET

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

Requirements

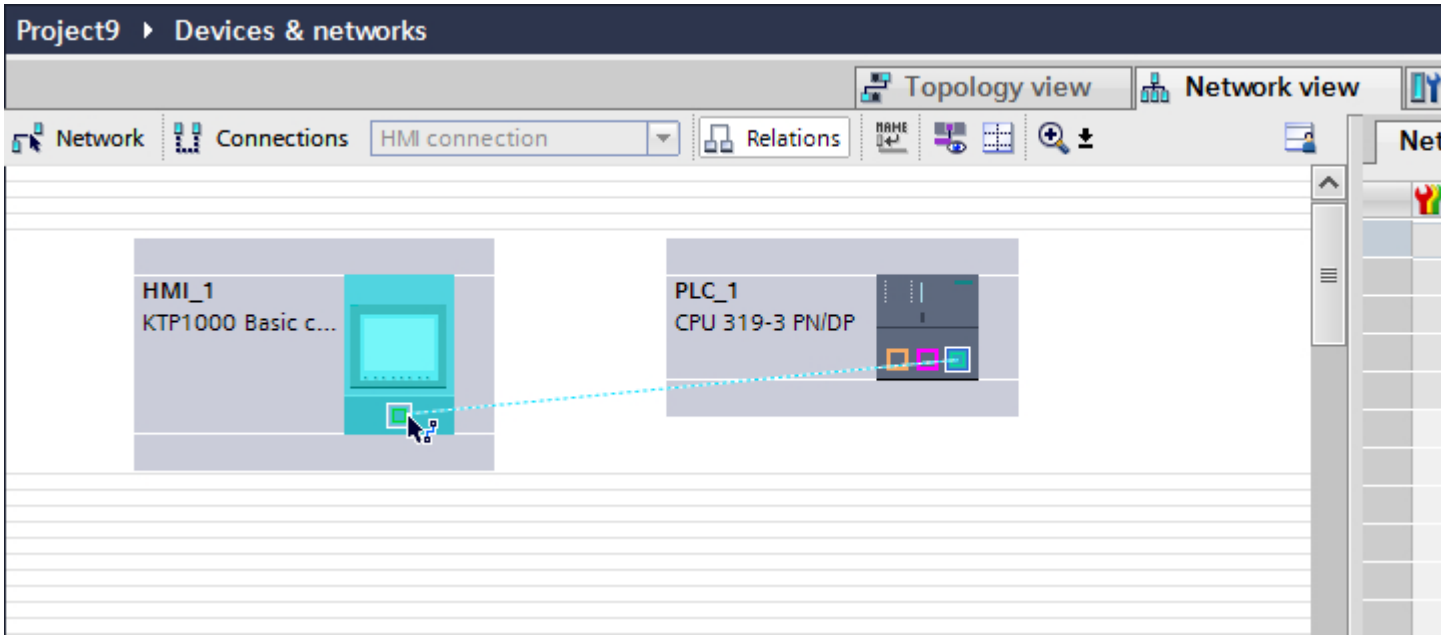
The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC S7 300/400 with PROFINET interface.

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.



4. Click the connecting line.
5. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6262)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via PROFINET.

You can use the following WinCC Runtimes as an HMI device:

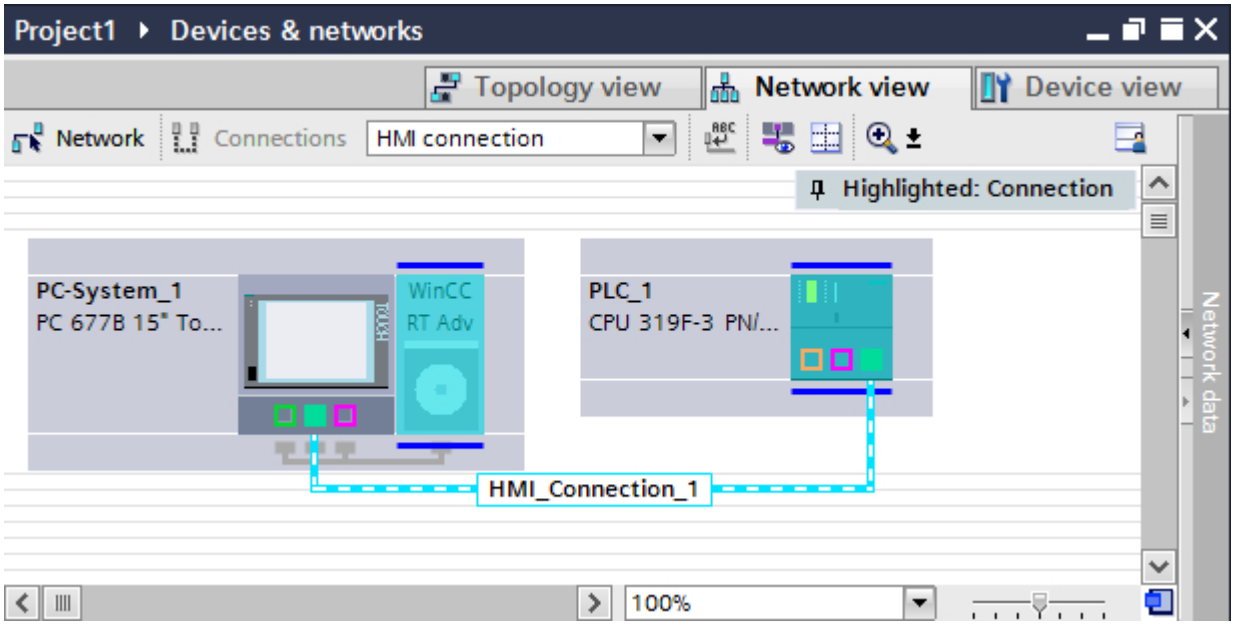
- WinCC RT Advanced

WinCC Runtime as HMI device

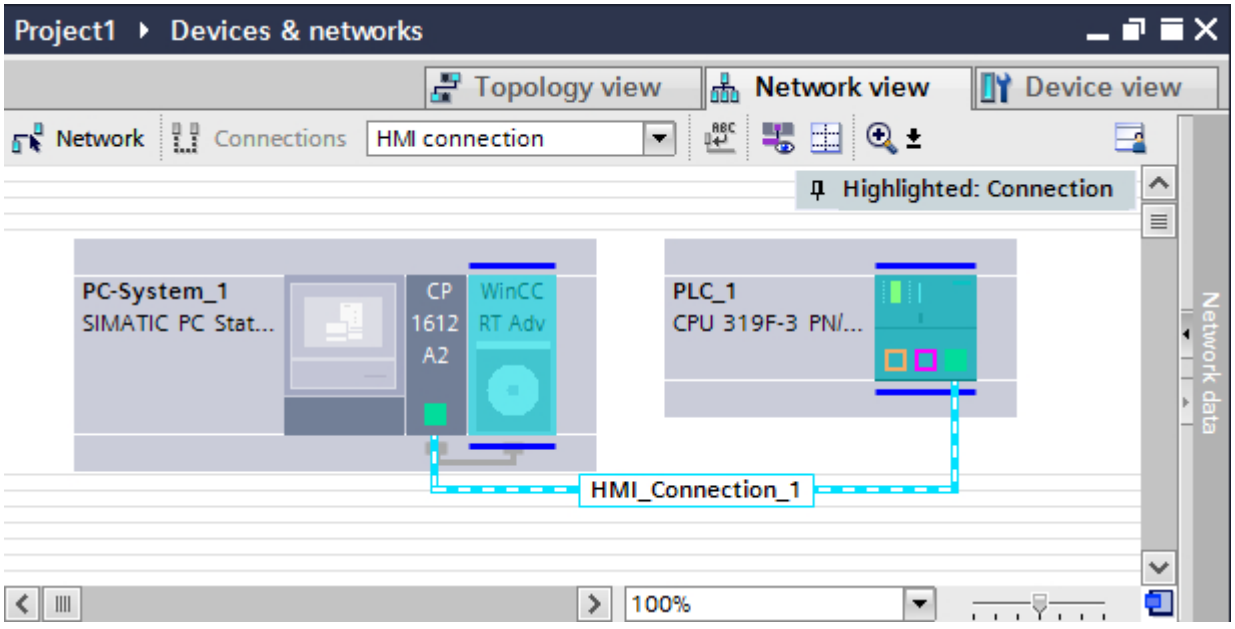
You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

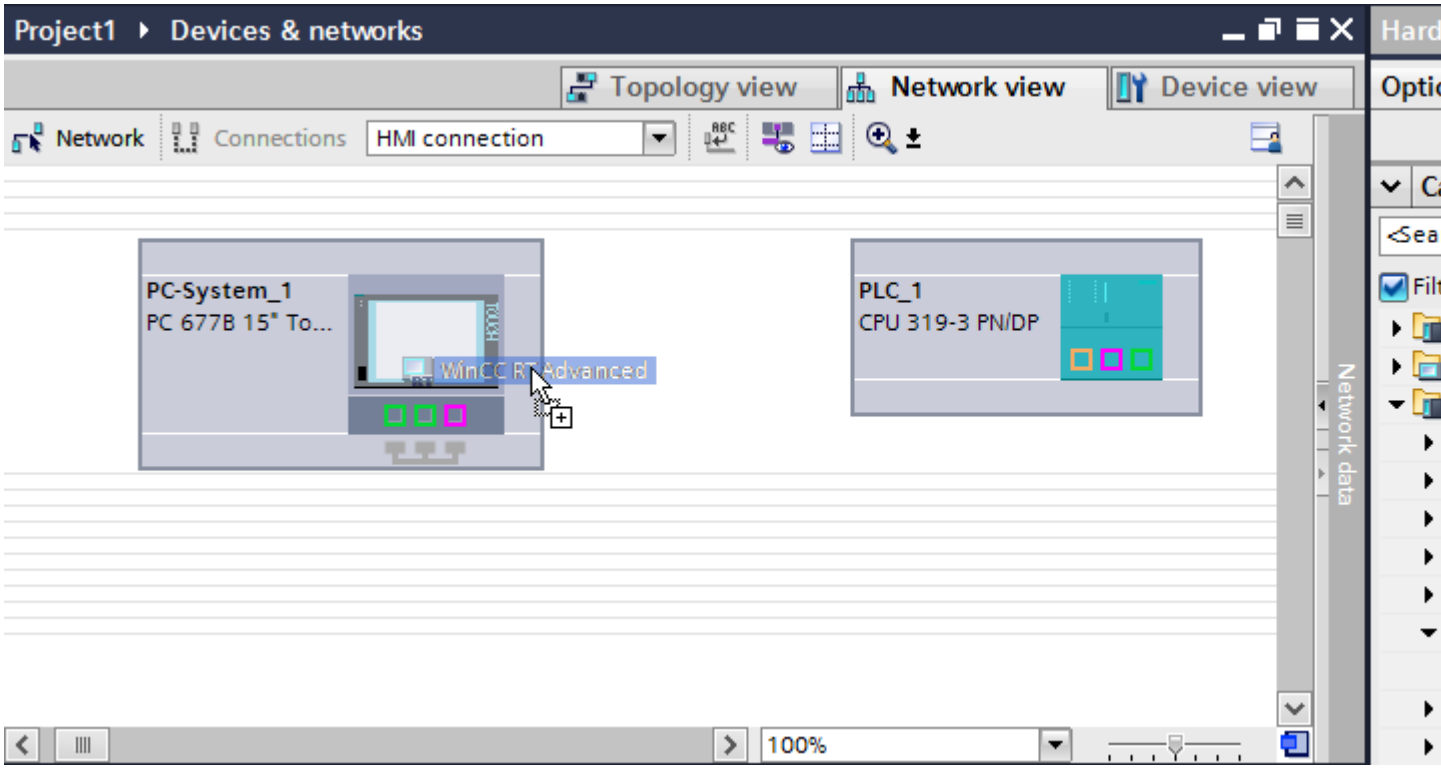
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with PROFINET interface
- SIMATIC PC with PROFINET interface

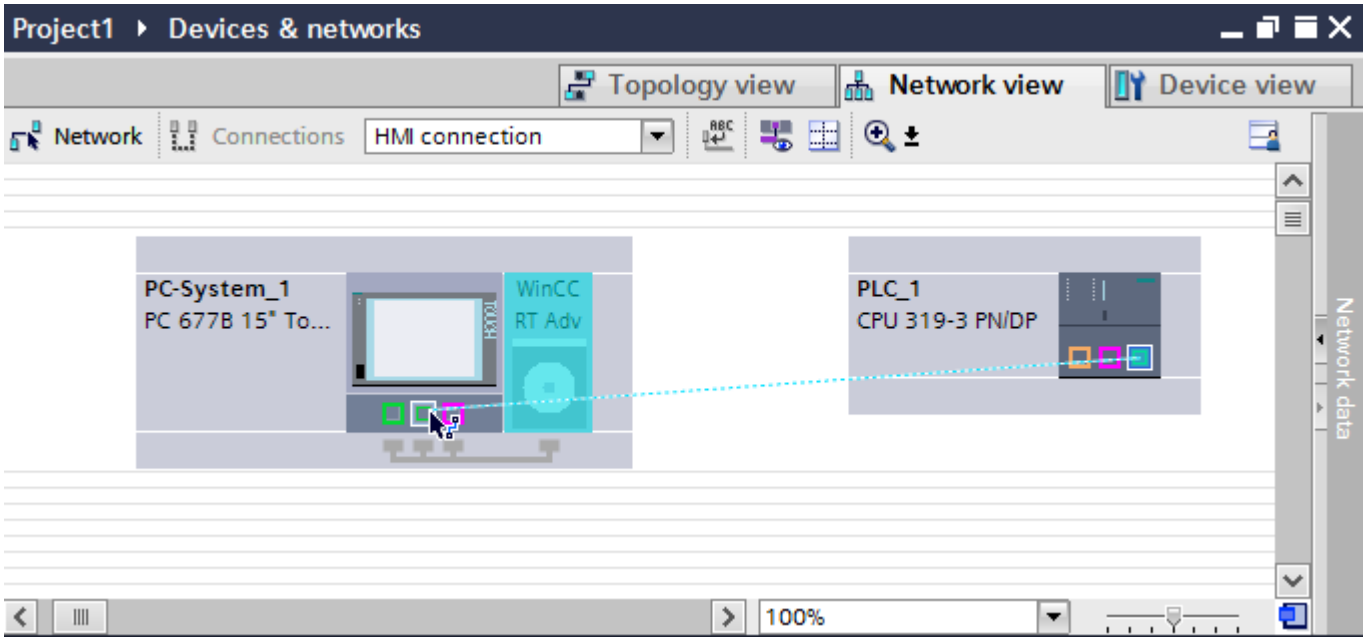
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the PC.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6262)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

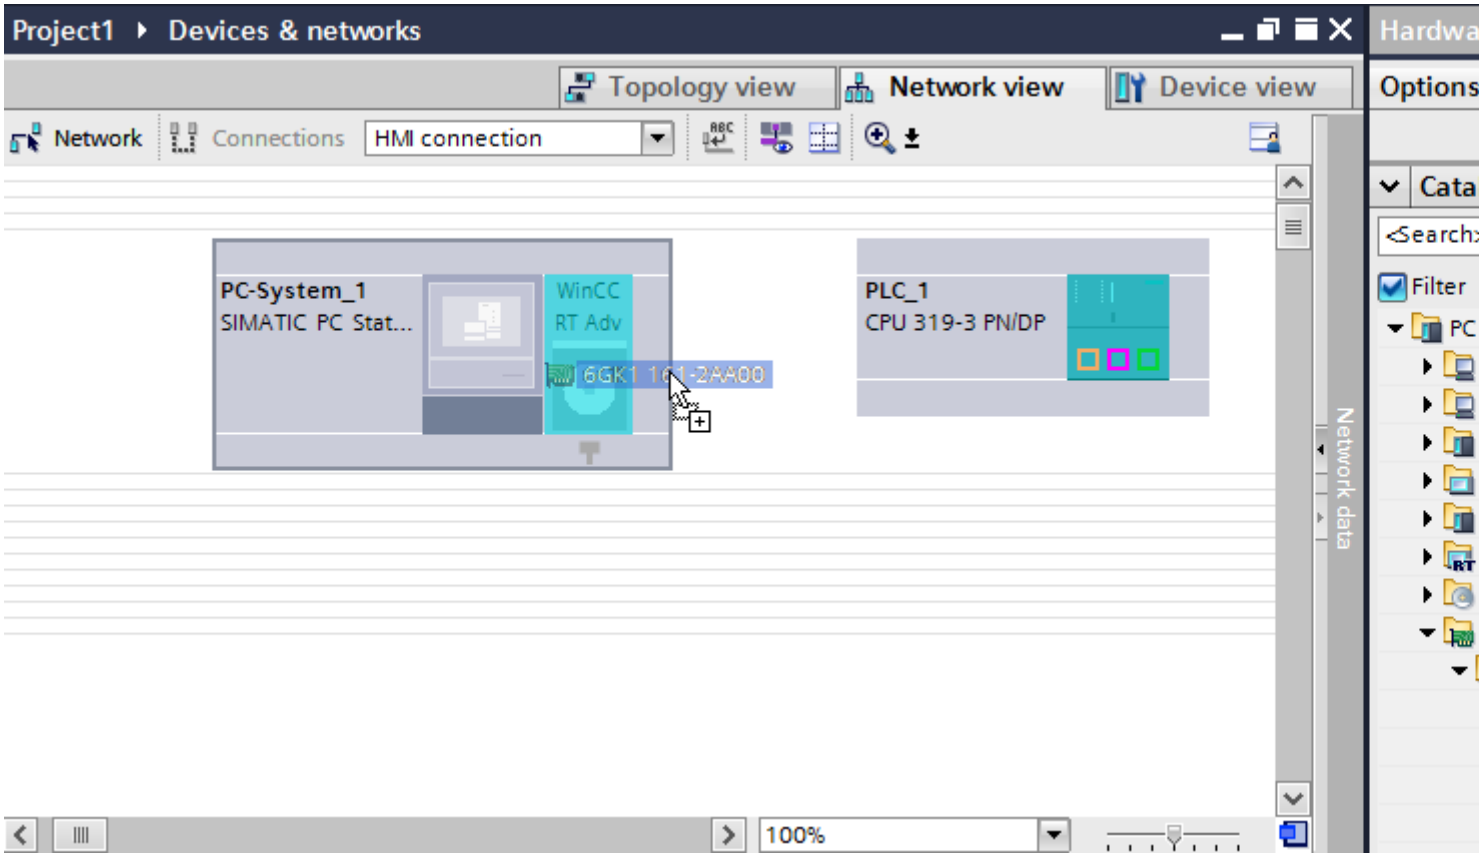
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with PROFINET interface
- PC station with WinCC RT Advanced

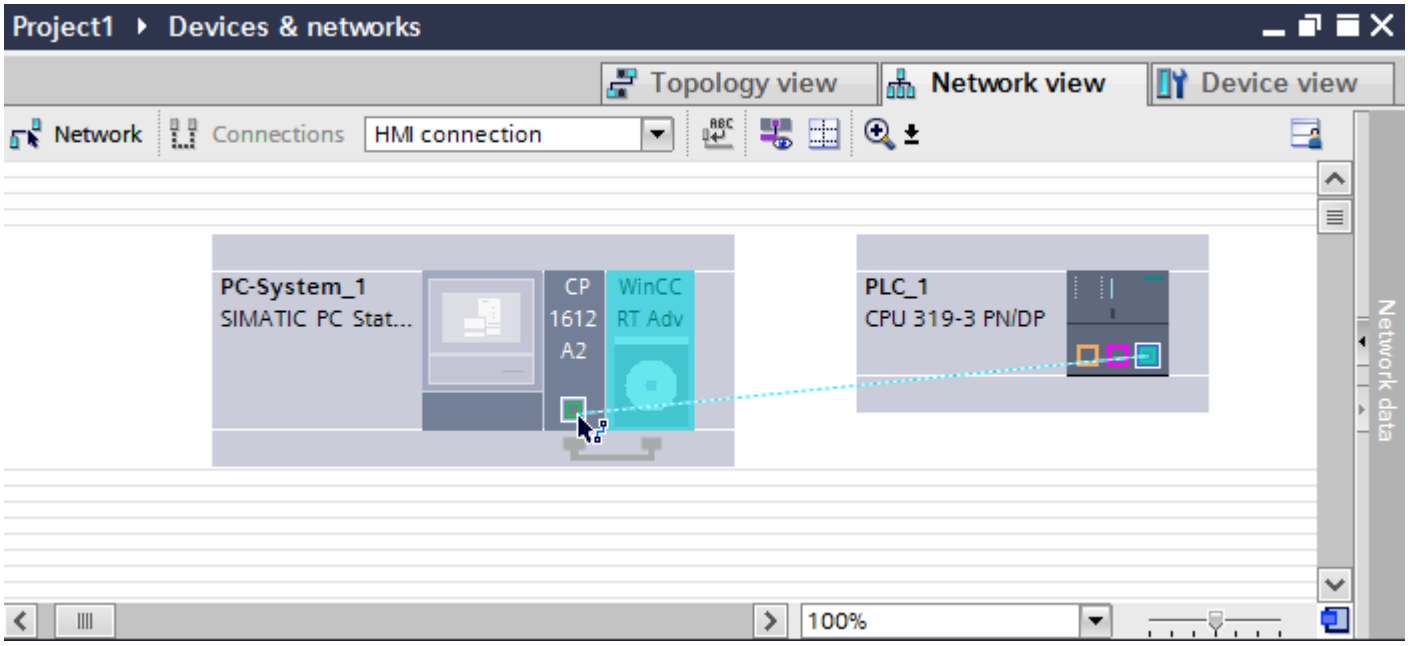
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.



5. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 6262)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

PROFINET parameters

PROFINET parameters for the HMI connection

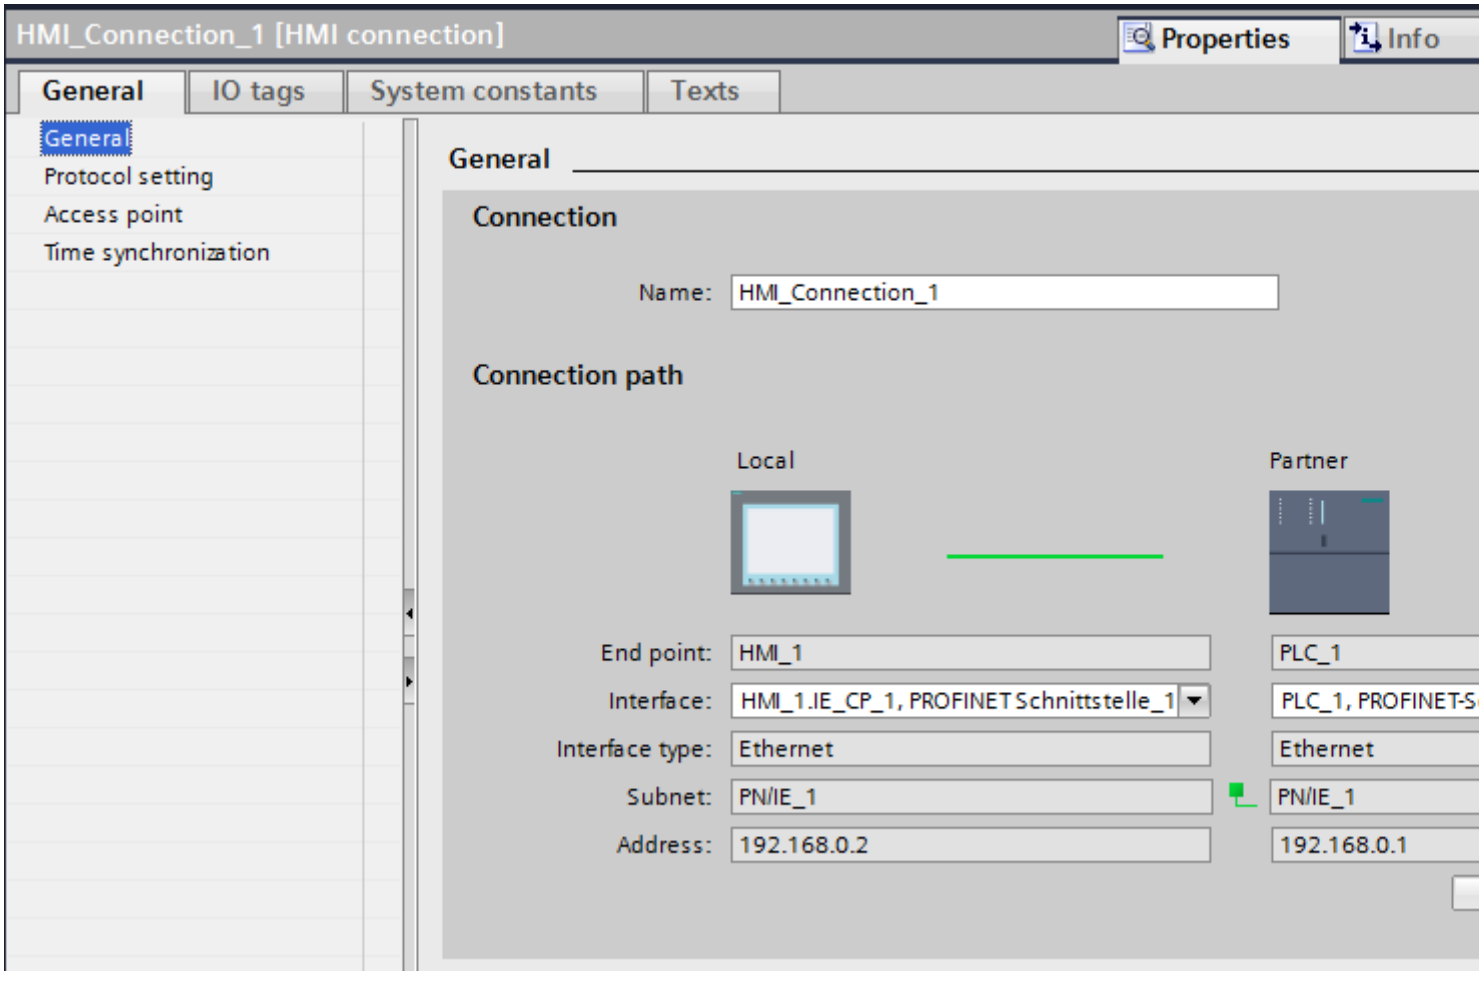
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Displays whether the devices are networked together.

 - displayed if the devices are networked together.

 - displayed if the devices are not networked together.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

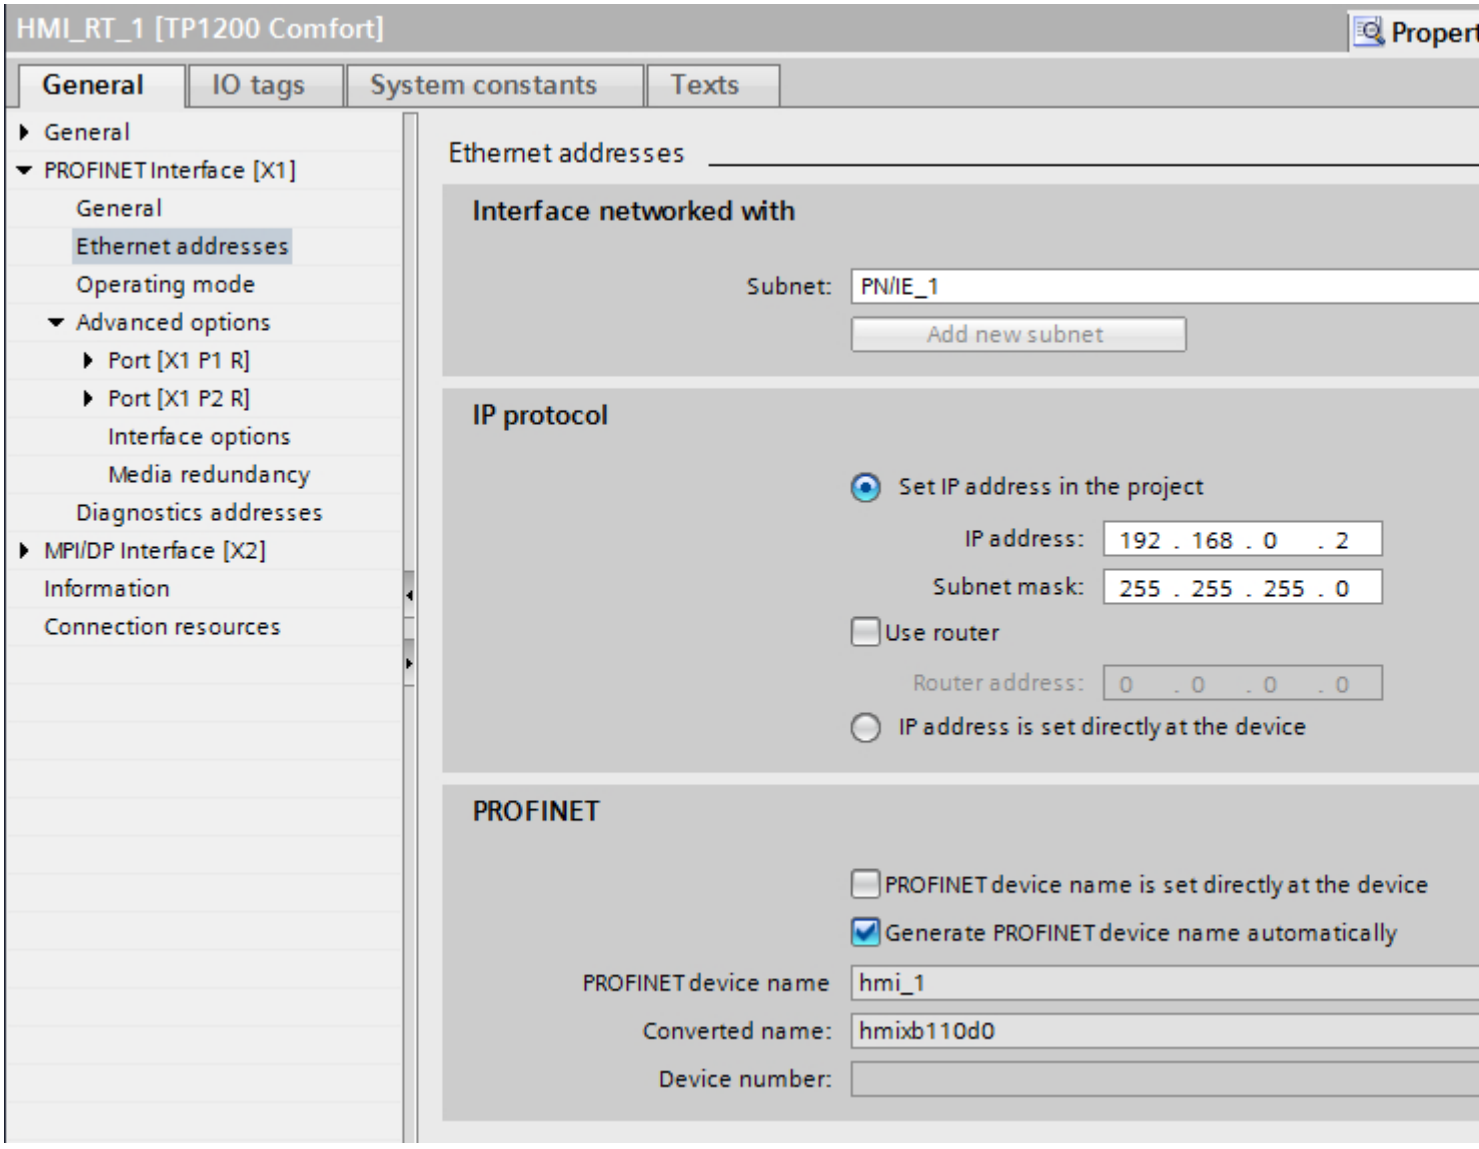
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - OP 77B
  - TP 177B color PN/DP
  - TP 177B mono DP
  - OP 177B color PN/DP
  - OP 177B mono DP
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP
  - TP 277 6"
  - OP 277 6"

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address using a different method"
  If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

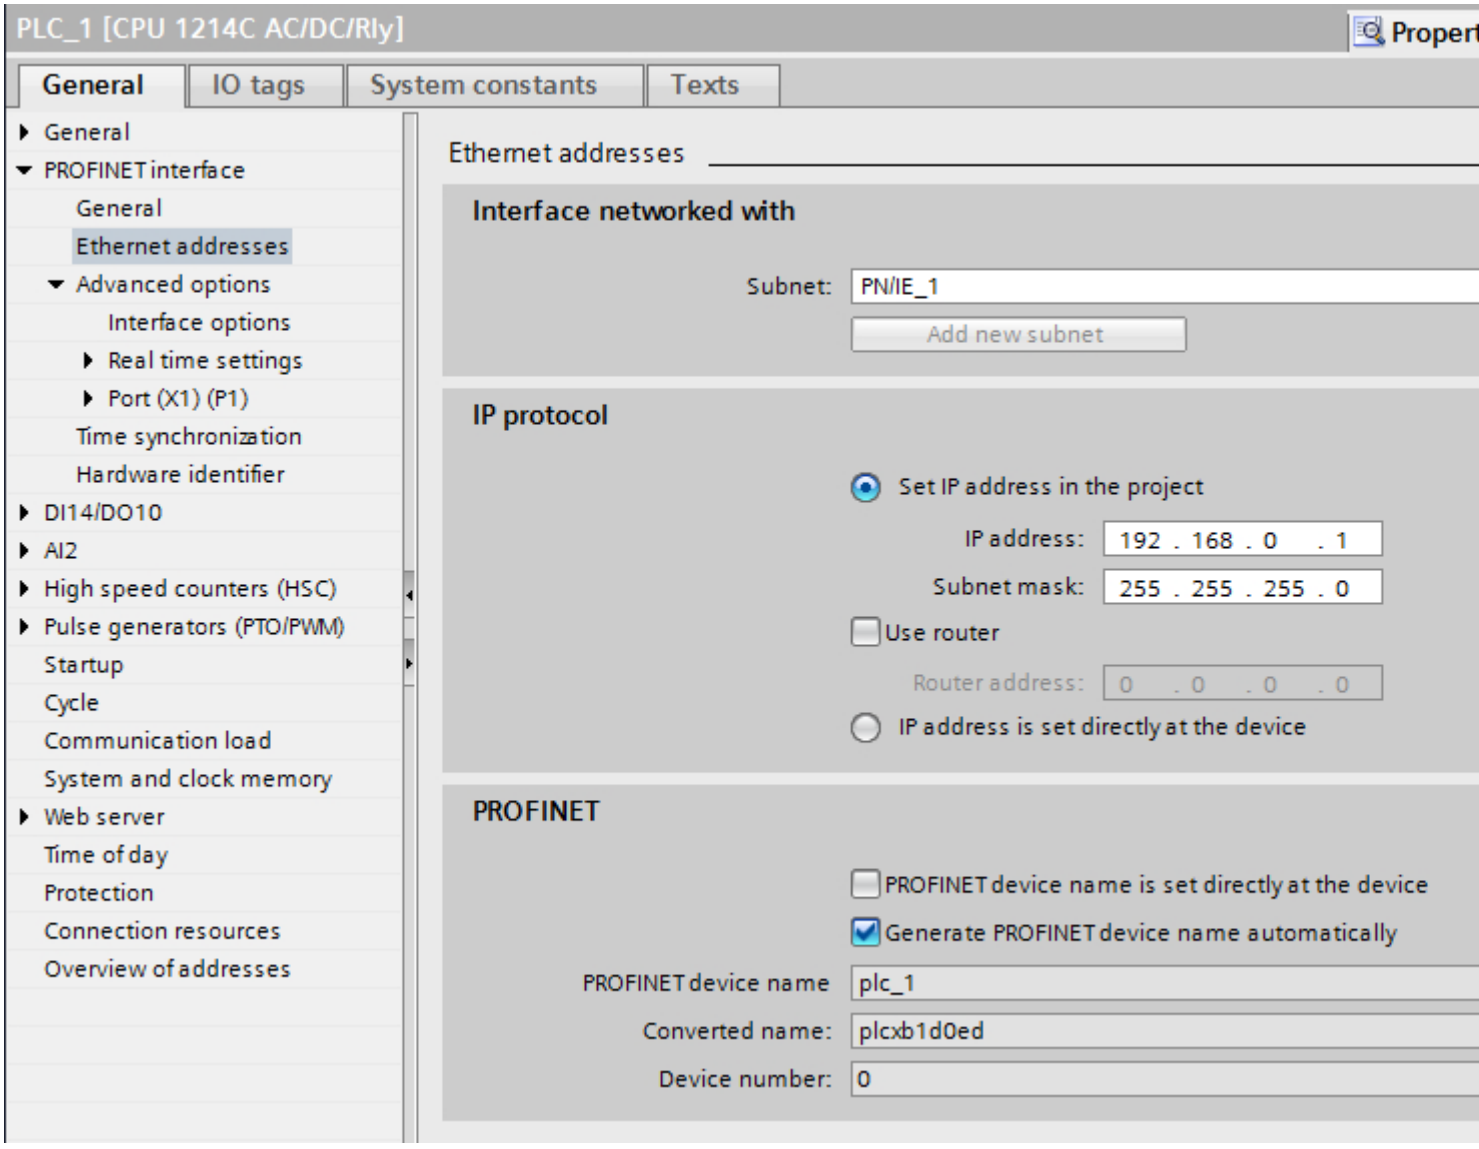
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Configuring Industrial Ethernet

Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

IP address

The IP parameters are visible if the communication-capable devices support the TCP/IP protocol.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of the following:

- The address of the (sub) net
- The address of the node (generally also called host or network node)

Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the node.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the node, thus 0.2.

It is generally true that:

- The network address results from AND linking the IP address and subnet mask.
- The node address results from AND NOT linking the IP address and subnet mask.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc). This is, however, not recommended because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of nodes they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (e.g. IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All nodes with addresses between 129.80.001.xxx and 129.80.127.xxx are on one subnet, all nodes with addresses between 129.80.128.xxx and 129.80.255.xxx are on another subnet.

Router

The job of the routers is to connect the subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, in this case you have to enter the address of the router for each node in the subnet.

The IP address of a node in the subnet and the address of the router may only differ at the points at which there is a "0" in the subnet mask.

Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

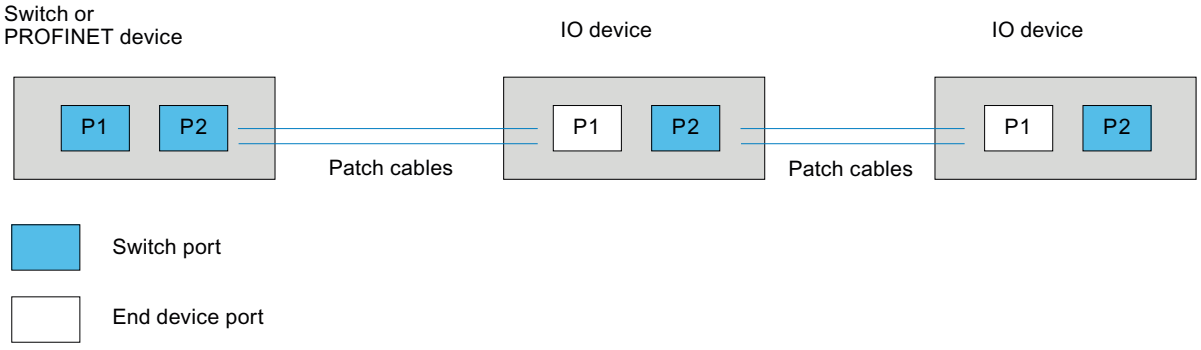
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"
  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"
  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.
  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

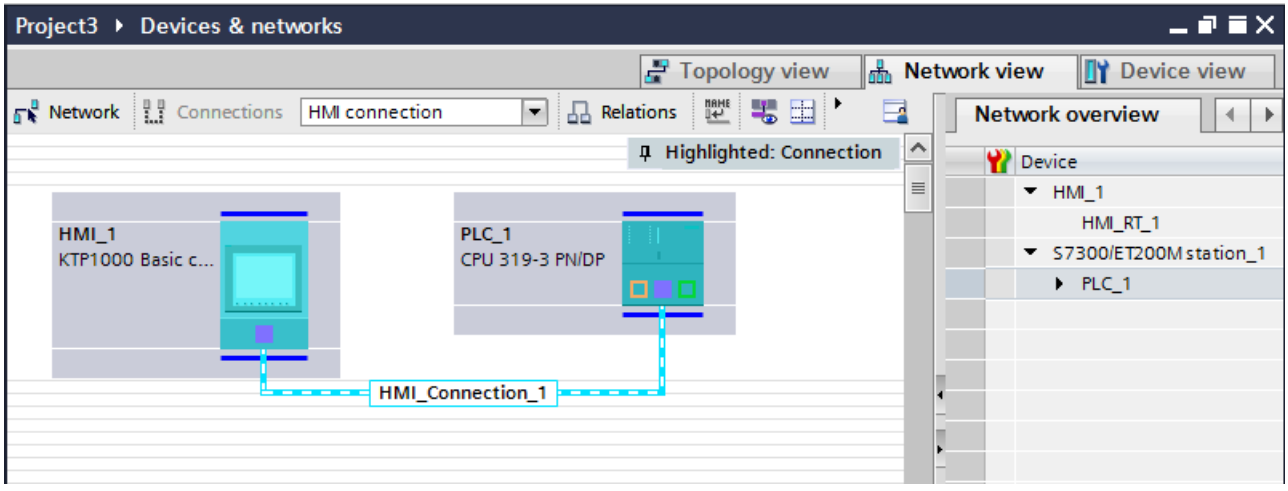
12.11.8.3 Communication via PROFIBUS

Configuring an HMI connection

Communication via PROFIBUS

HMI connections via PROFIBUS

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two PROFIBUS interfaces in the "Devices & Networks" editor.



HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

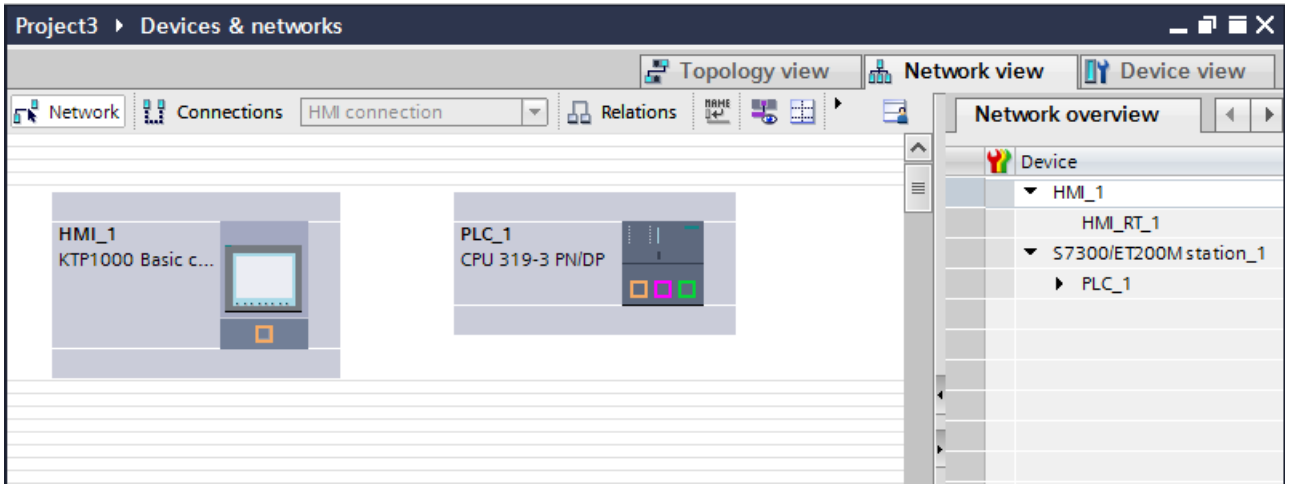
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7 300/400 with PROFIBUS interface

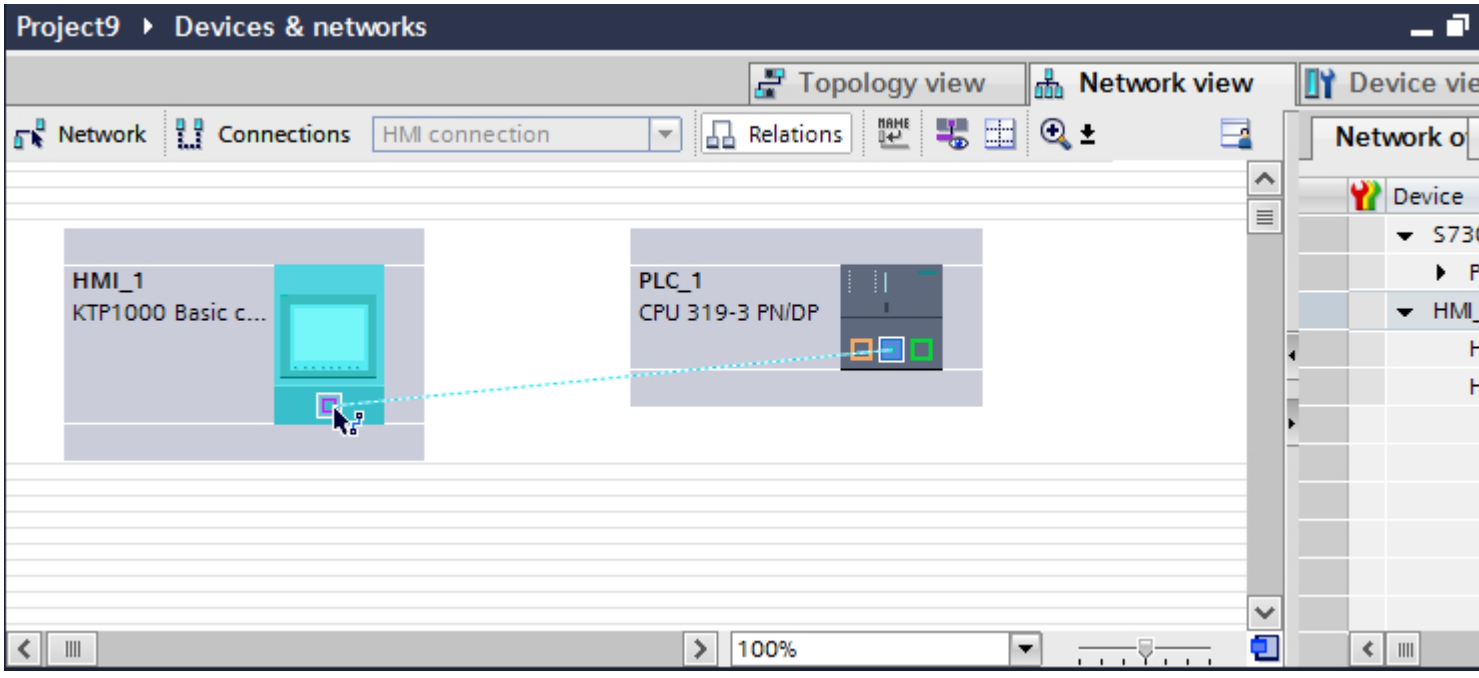
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.



2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Click the HMI device interface.
4. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > HMI MPIDP > Parameters".

5. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6282)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

Configuring an HMI connection

Communication via PROFIBUS

Communication via PROFIBUS

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via PROFIBUS.

You can use the following WinCC Runtimes as an HMI device:

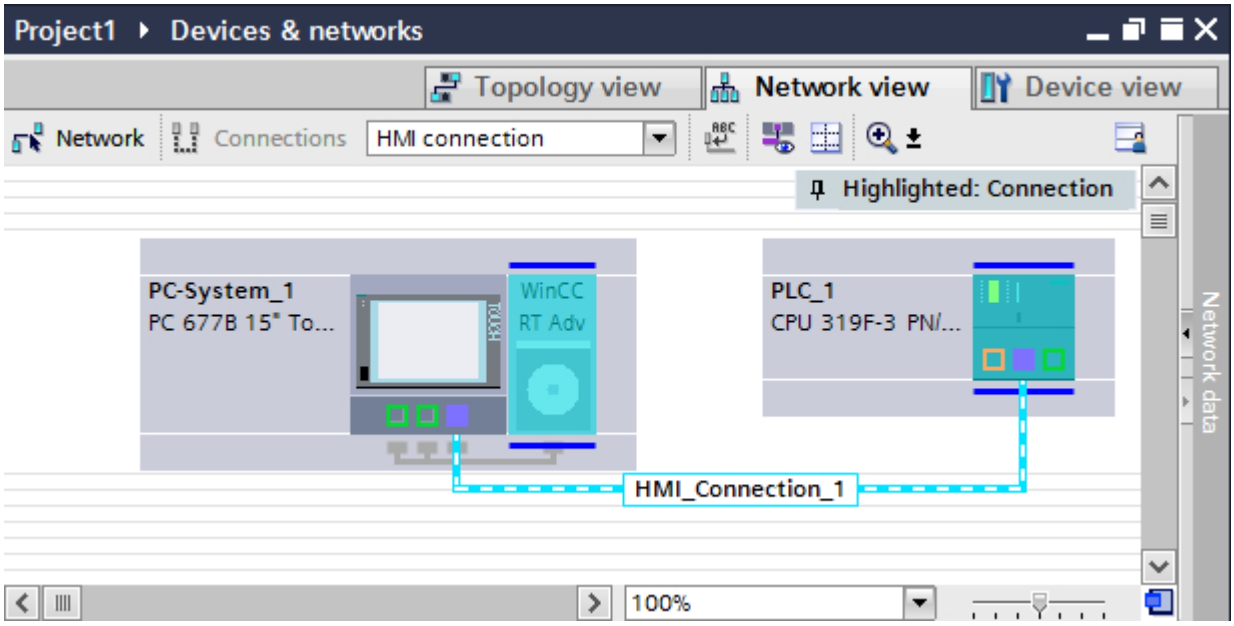
- WinCC RT Advanced
- WinCC RT Professional

WinCC Runtime as HMI device

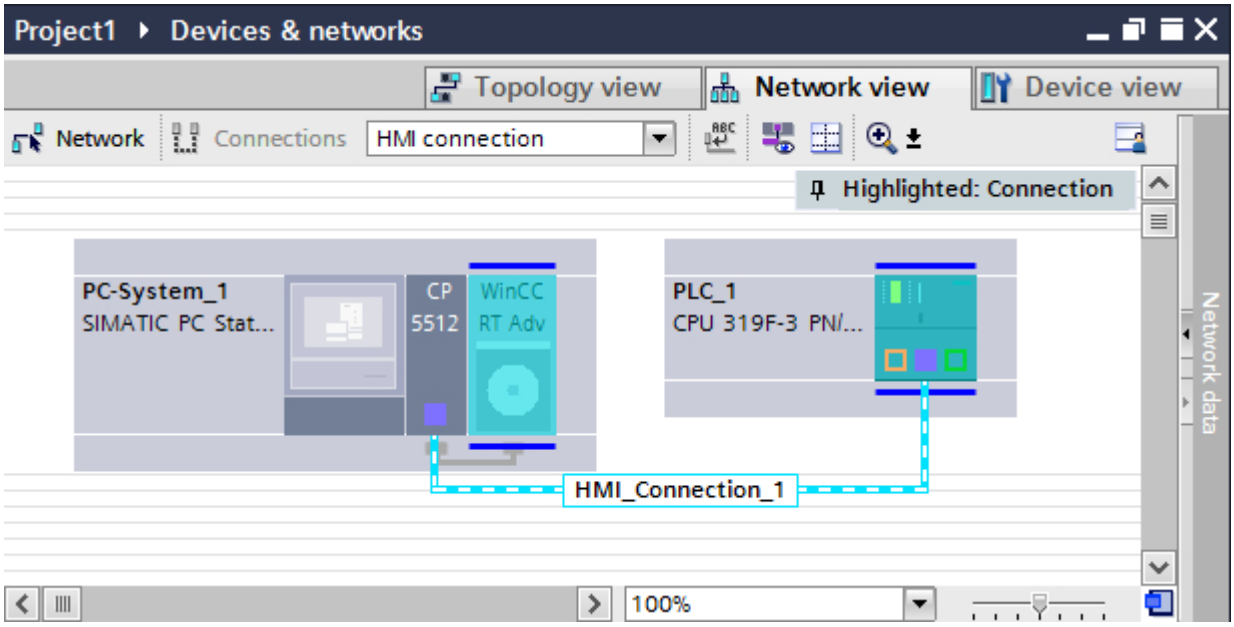
You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

Requirements

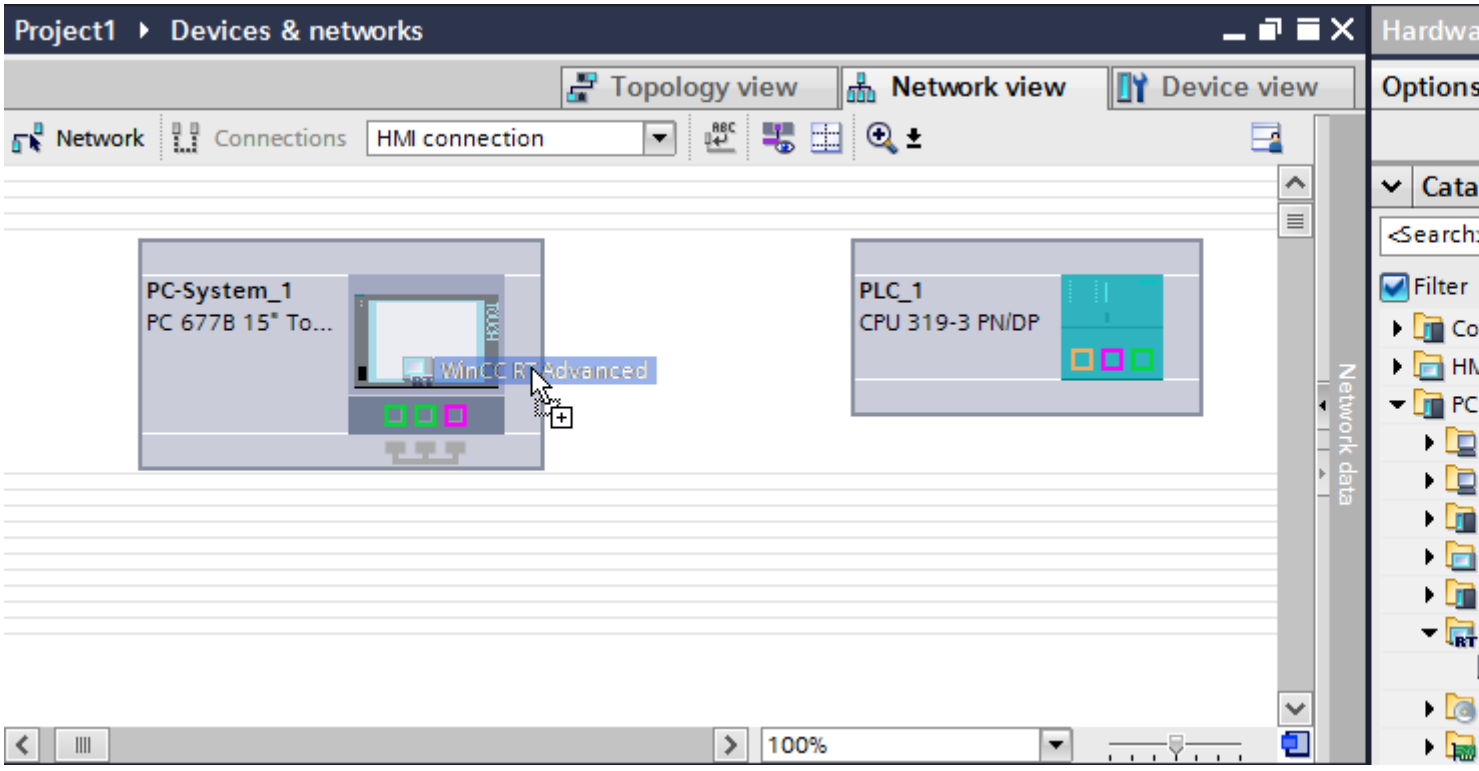
The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with PROFIBUS interface
- SIMATIC PC with PROFIBUS interface

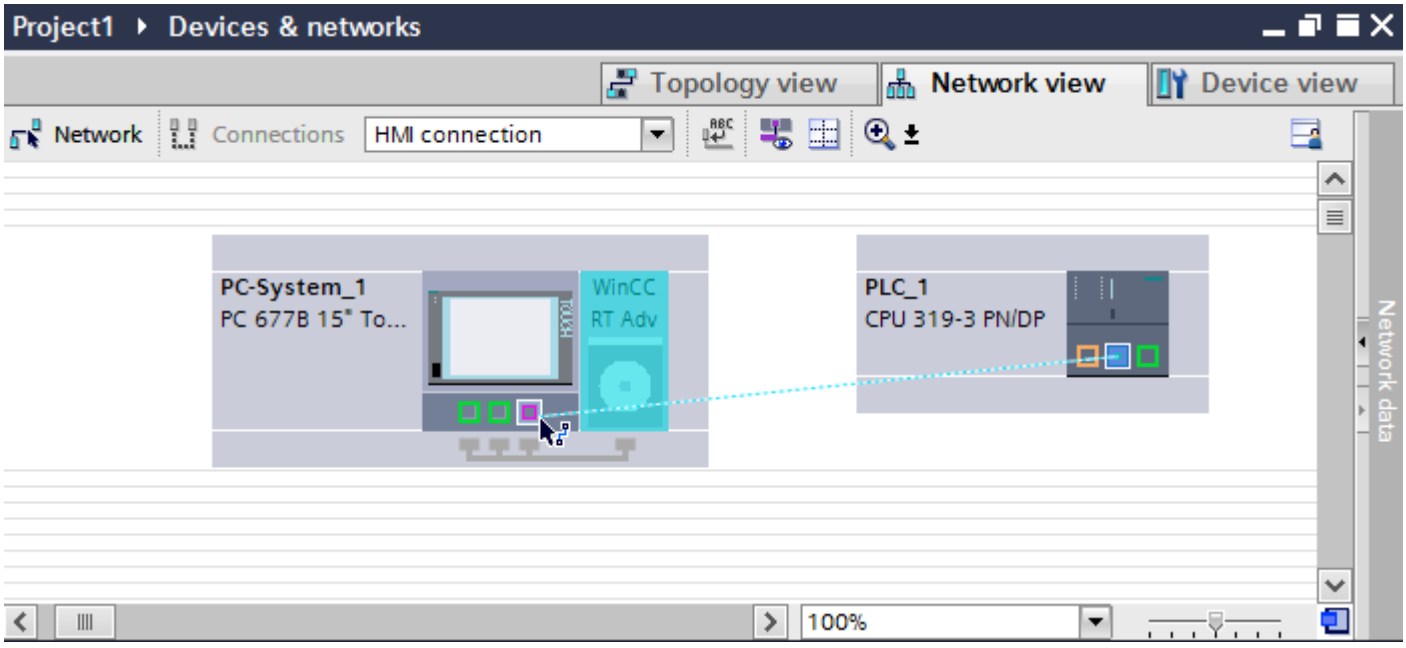
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Click the MPI interface of the PC and select "PROFIBUS" for the interface type in the Inspector window.

3. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



4. Click the "Connections" button and select "HMI connection" for the connection type. The devices available for connection are highlighted in color.
5. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6282)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

Configuring an HMI connection via PROFIBUS with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

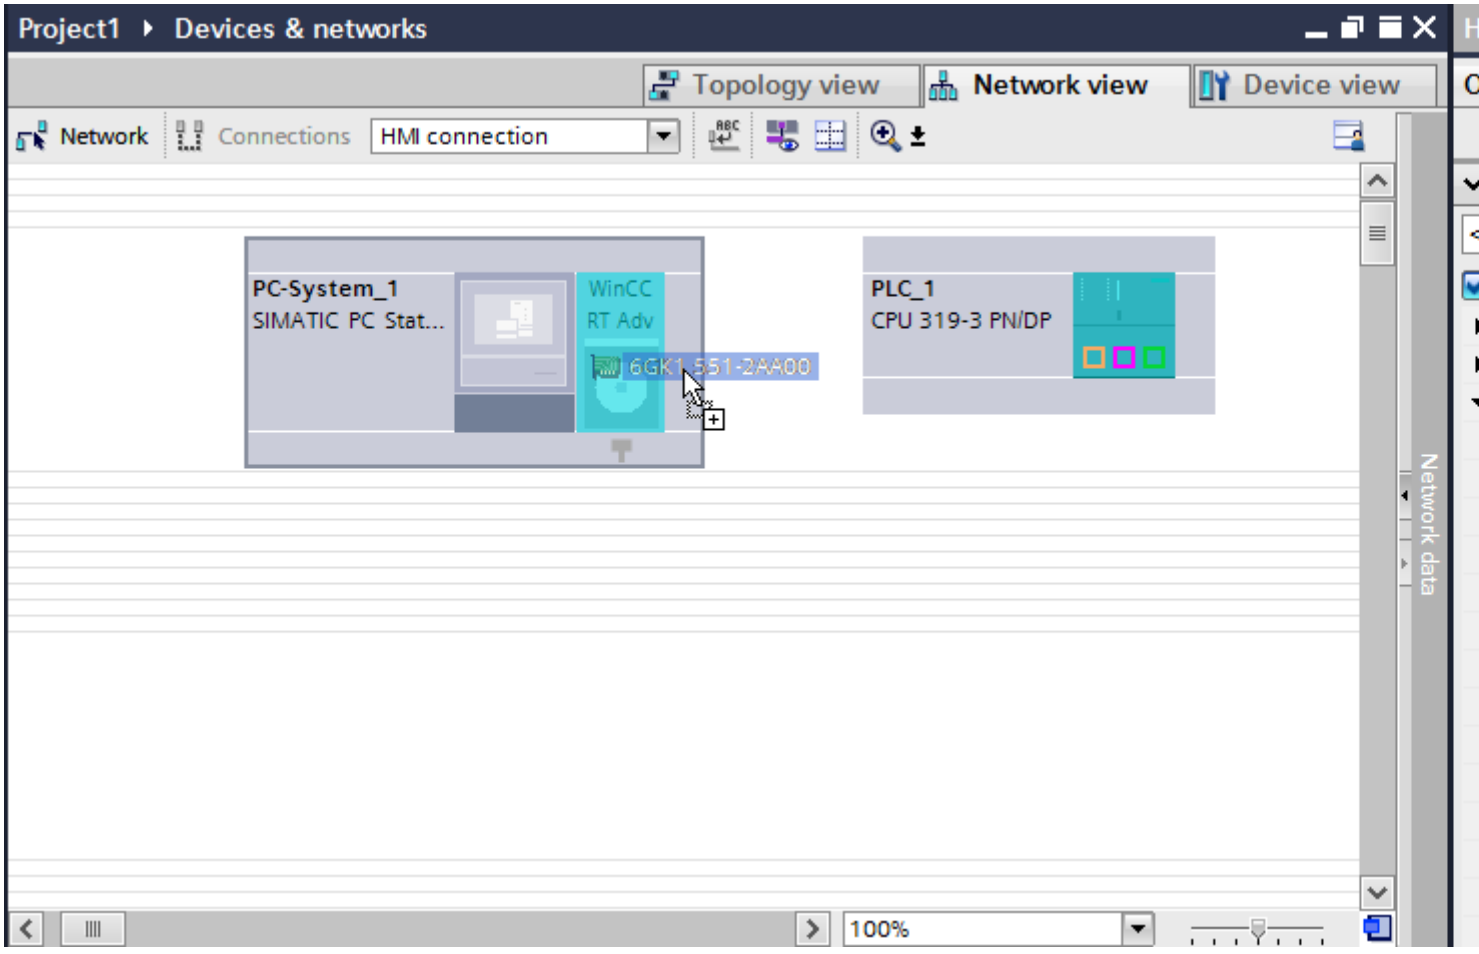
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400
- PC station with WinCC RT Advanced

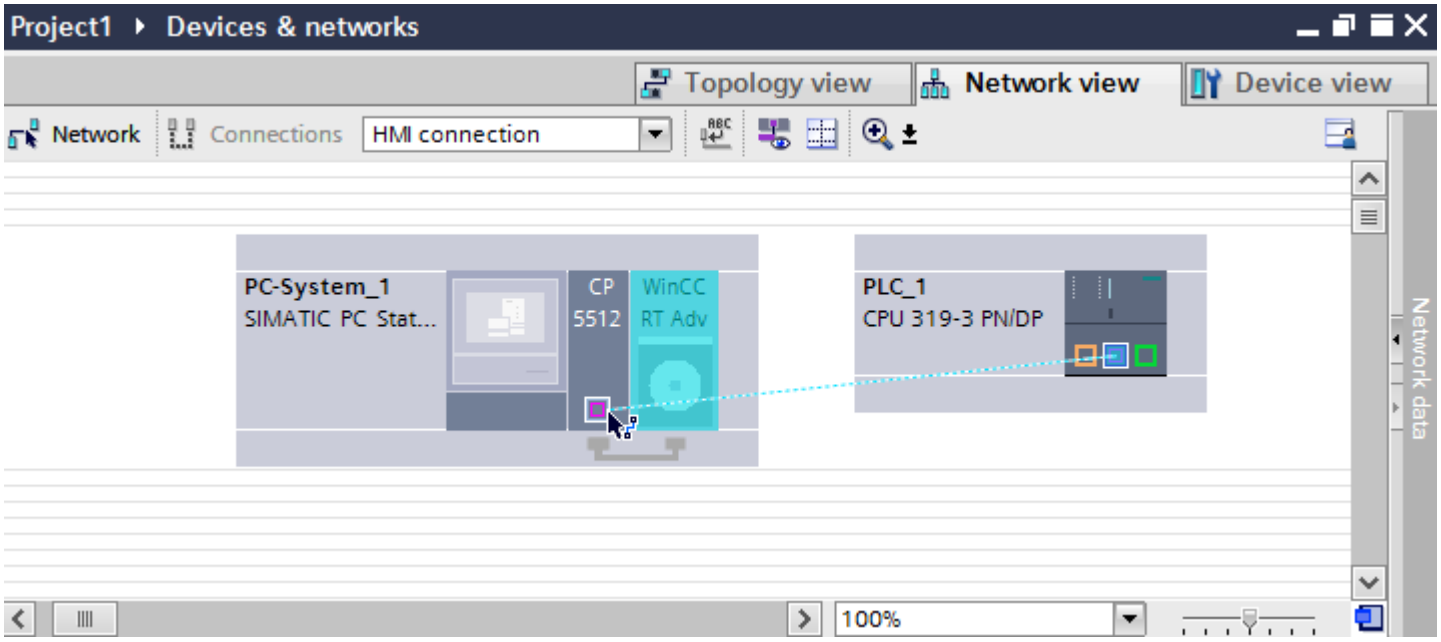
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 6282)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

PROFIBUS parameters

PROFIBUS parameters for the HMI connection

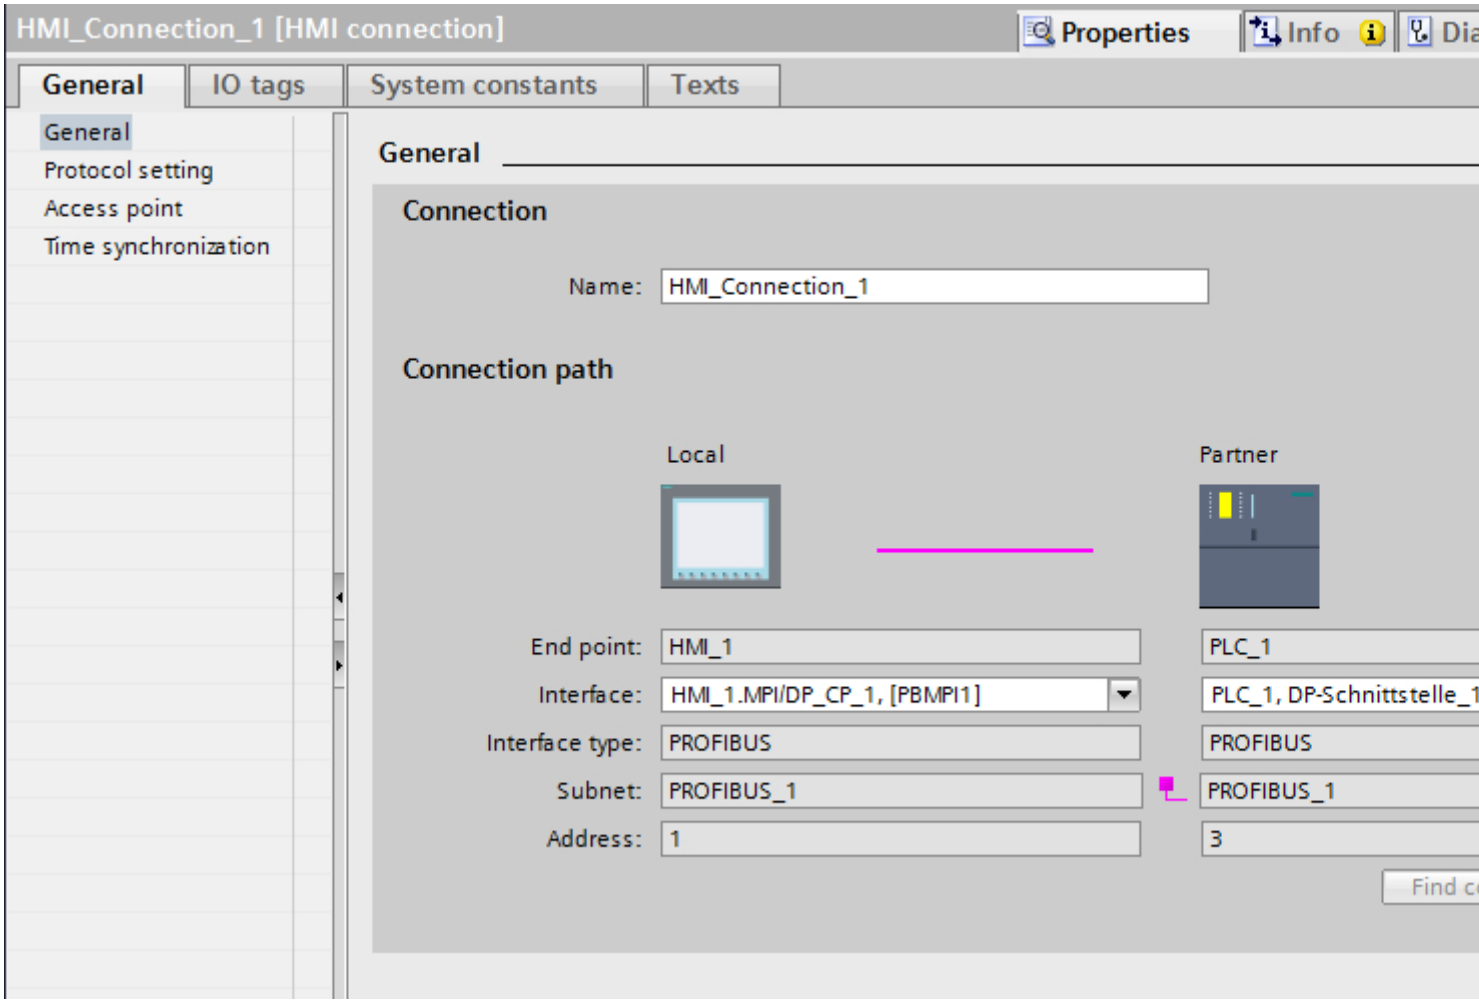
PROFIBUS parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Displays whether the devices are networked together.

 - displayed if the devices are networked together.

 - displayed if the devices are not networked together.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area is not editable.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area is not editable.
- "Subnet"
  Displays the selected subnet. This area is not editable.
- "Address"
  Displays the PROFIBUS address of the device. This area is not editable.
- "Find connection path" button
  Enables the subsequent specification of connections.

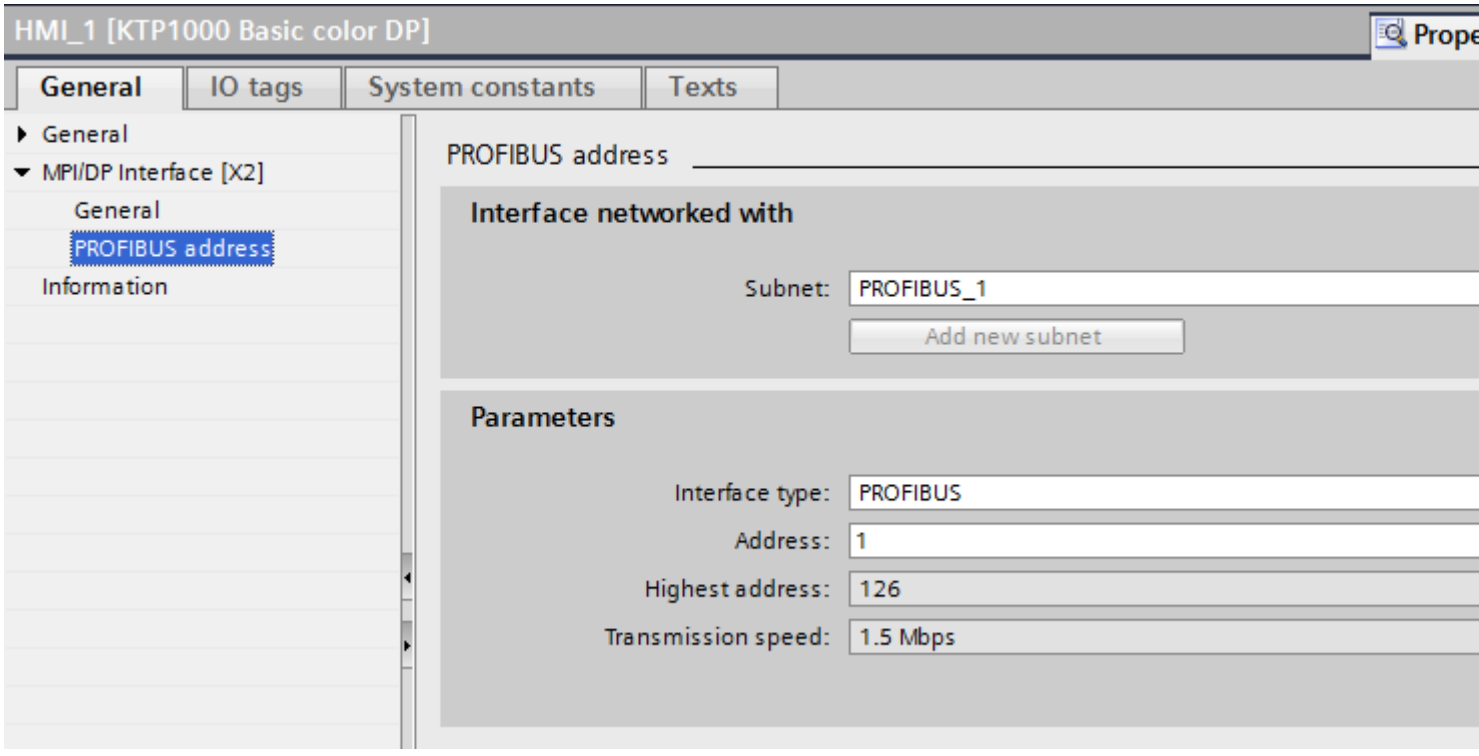
PROFIBUS parameters for the HMI device

PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

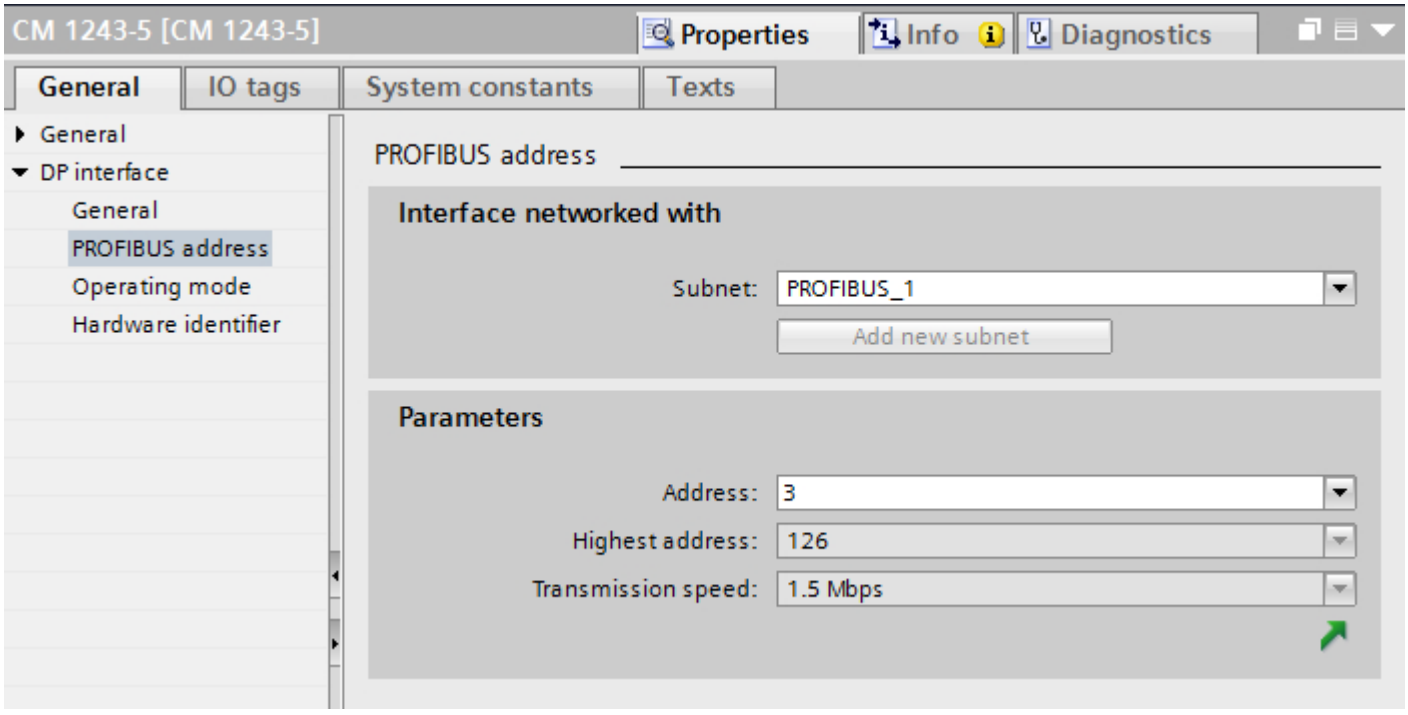
PROFIBUS parameters for the PLC

PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.

- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Bus profiles with PROFIBUS

Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values.

Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Standard	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Universal	9,6 19,2 93,75 187,5 500 1500

Meaning of profiles

Profile	Meaning
DP	Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices. This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.
Standard	Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.
Universal	Select the "Universal" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service. This includes the following devices for example: • CP 343-5 • PROFIBUS-FMS devices of other manufacturers As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.

12.11.8.4 Communication via MPI

Configuring an HMI connection

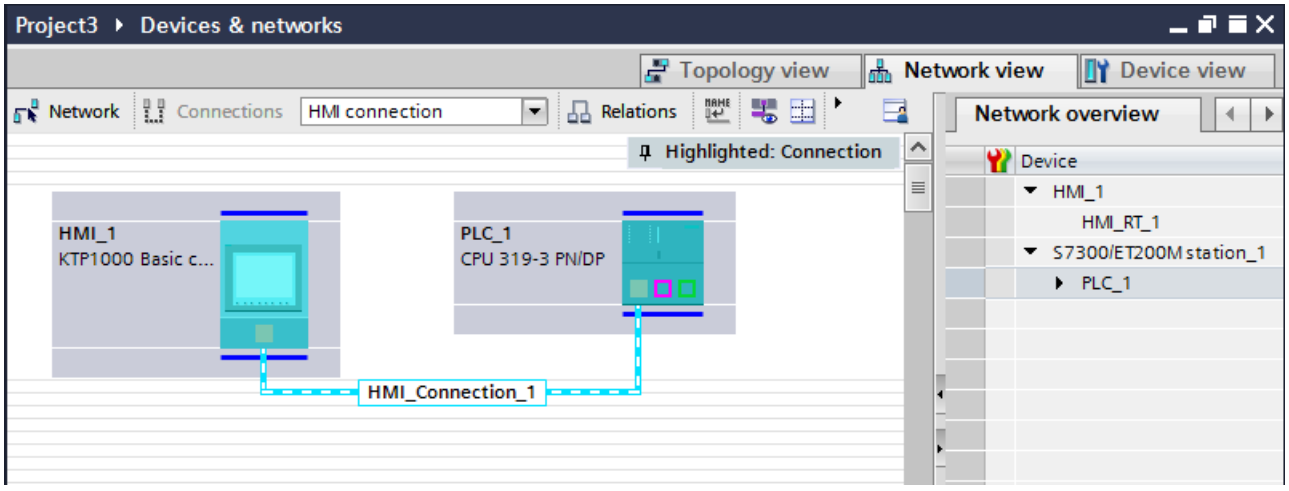
Communication via MPI

HMI connections via MPI

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two MPI interfaces in the "Devices & Networks" editor.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.



Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via MPI

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via MPI in the "Devices & Networks" editor.

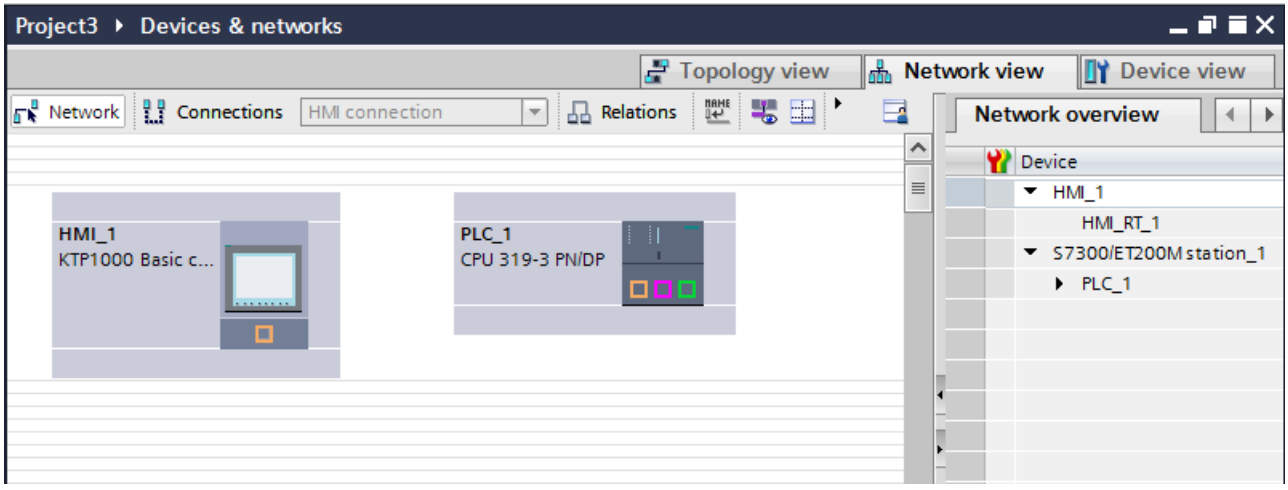
Requirements

The following communication partners are created in the "Devices & Networks" editor:

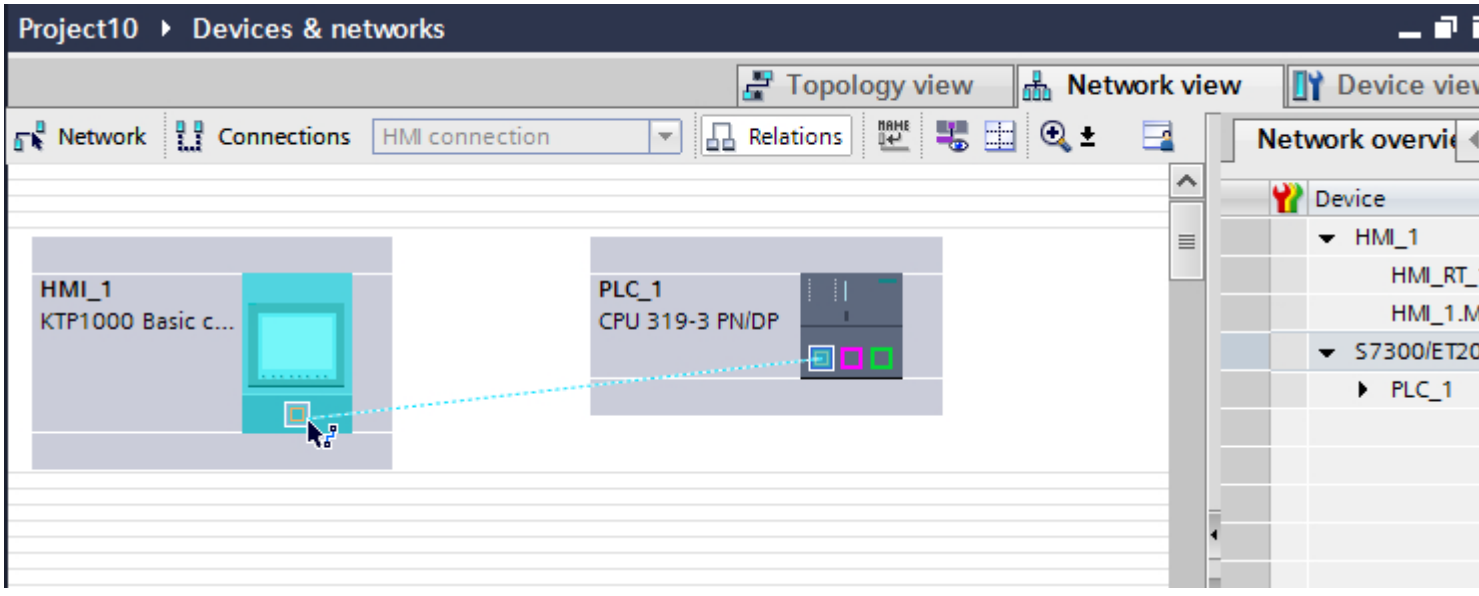
- HMI device with MPI/DP interface
- SIMATIC S7 300/400 with MPI/DP interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.



2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.



4. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
5. Click "Highlight HMI connection" and select the HMI connection.
6. Click the communication partners in the "Network view" and change the MPI parameters in the Inspector window according to the requirements of your project.
   See the chapter "MPI parameters (Page 6296)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. Use the table to monitor the connection parameters and change the connection partner. You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via MPI.

Configuring an HMI connection

Communication via MPI

Communication via MPI

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via MPI.

You can use the following WinCC Runtimes as an HMI device:

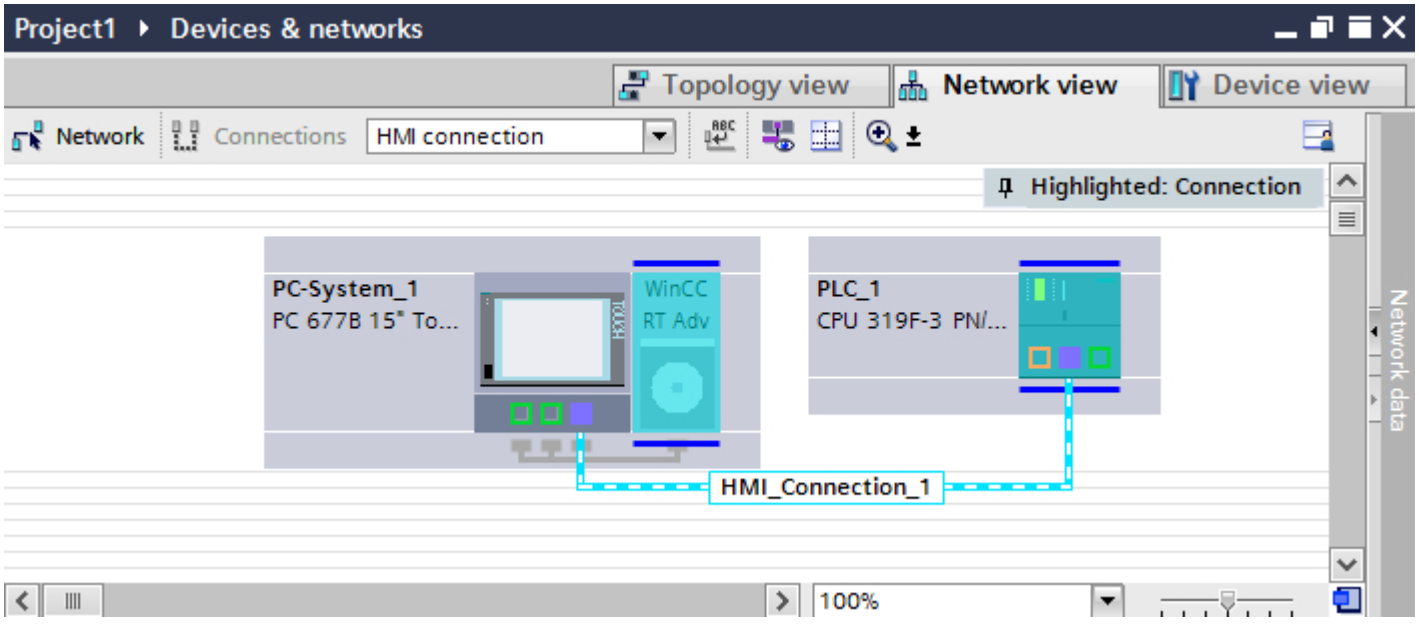
- WinCC RT Advanced

WinCC Runtime as HMI device

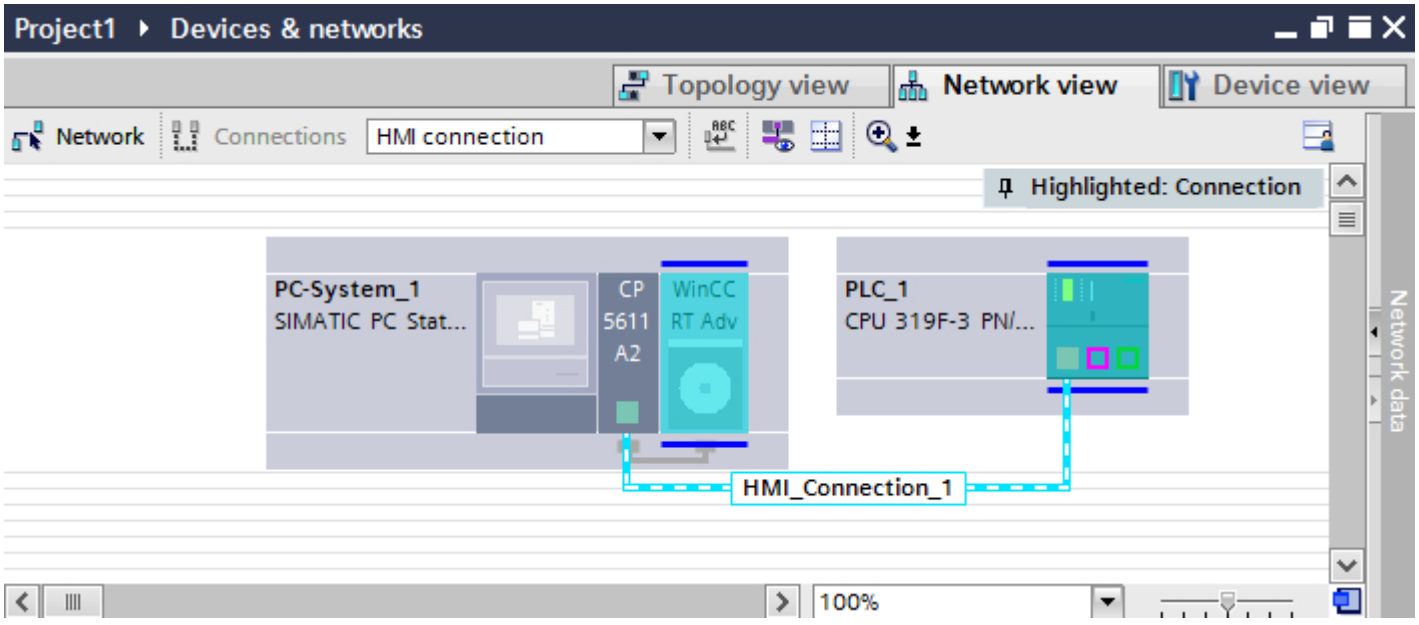
You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via MPI in the "Devices & Networks" editor.

Connection in the "Connections" editor

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via MPI.

Configuring an HMI connection via MPI with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via MPI in the "Devices & Networks" editor.

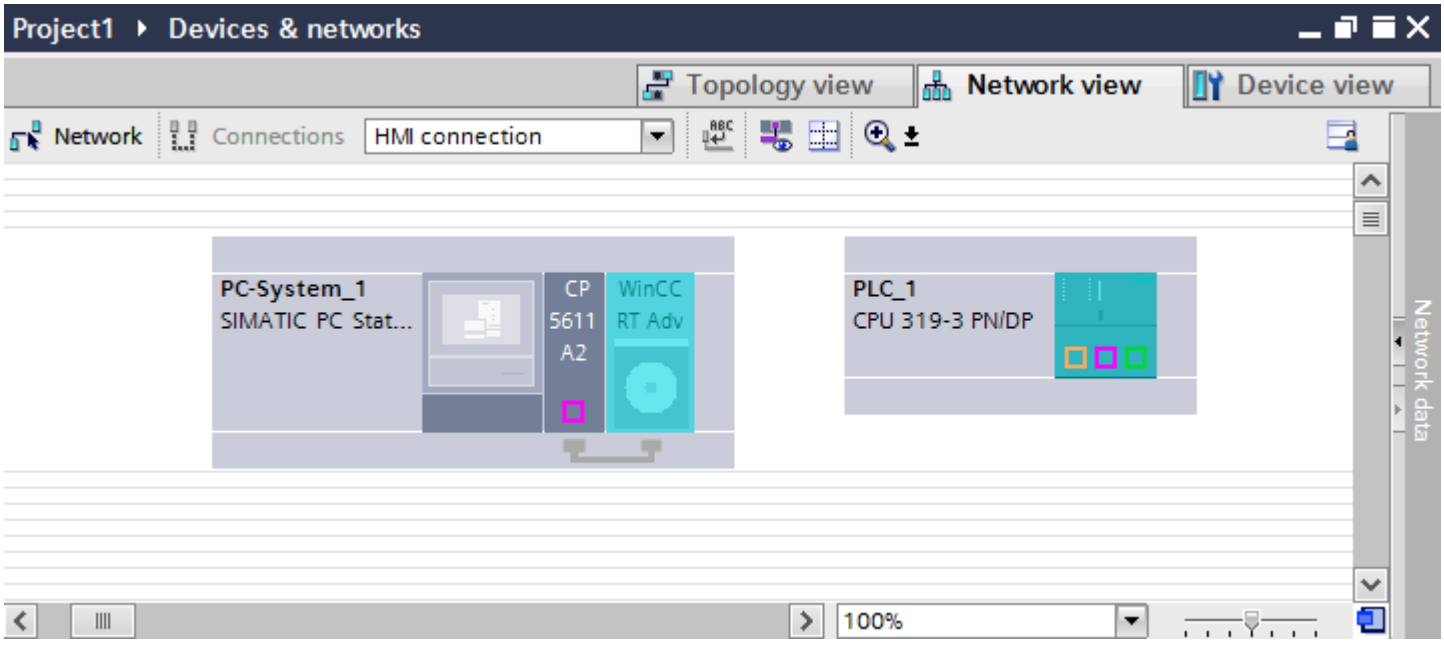
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with MPI interface
- PC station with WinCC RT Advanced

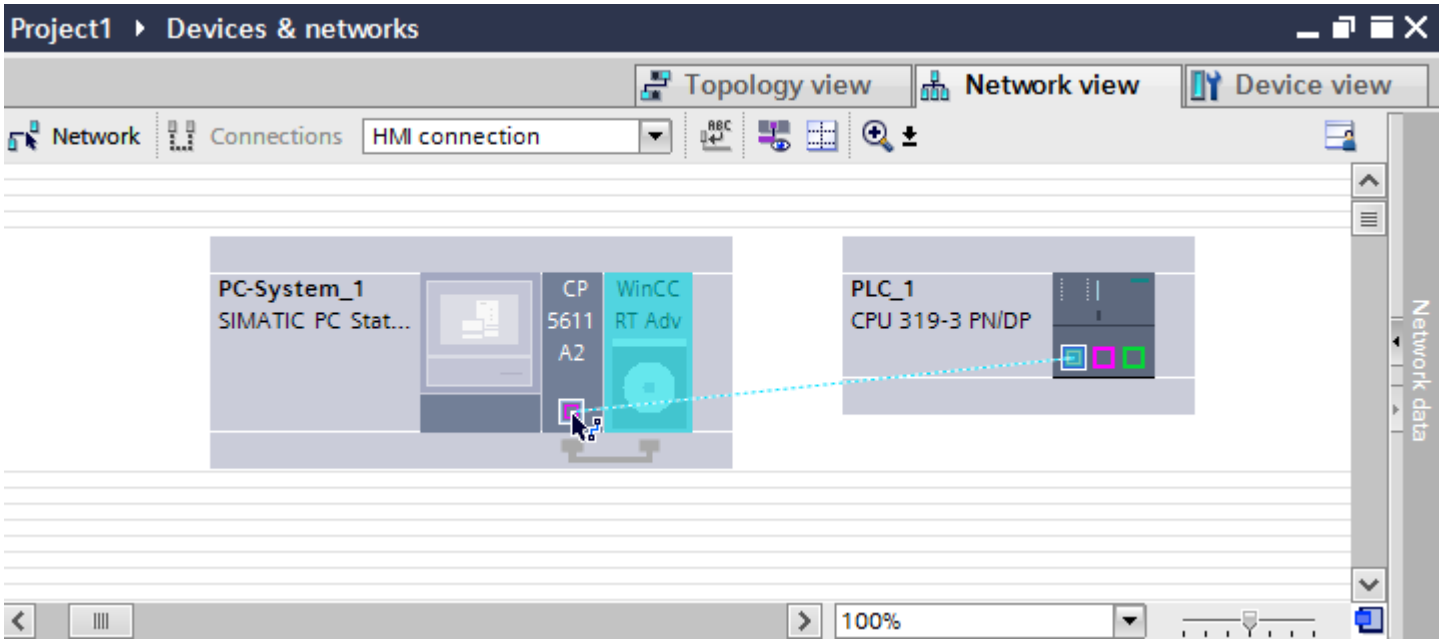
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the PROFIBUS interface of the communication processor and change the interface to "MPI".
4. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

5. Click the MPI interface of the PLC and use a drag-and-drop operation to draw a connection to the MPI interface of the communication processor.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the MPI parameters in the Inspector window according to the requirements of your project.
   See the chapter "MPI parameters (Page 6296)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via MPI.

MPI parameters

MPI parameters for the HMI connection

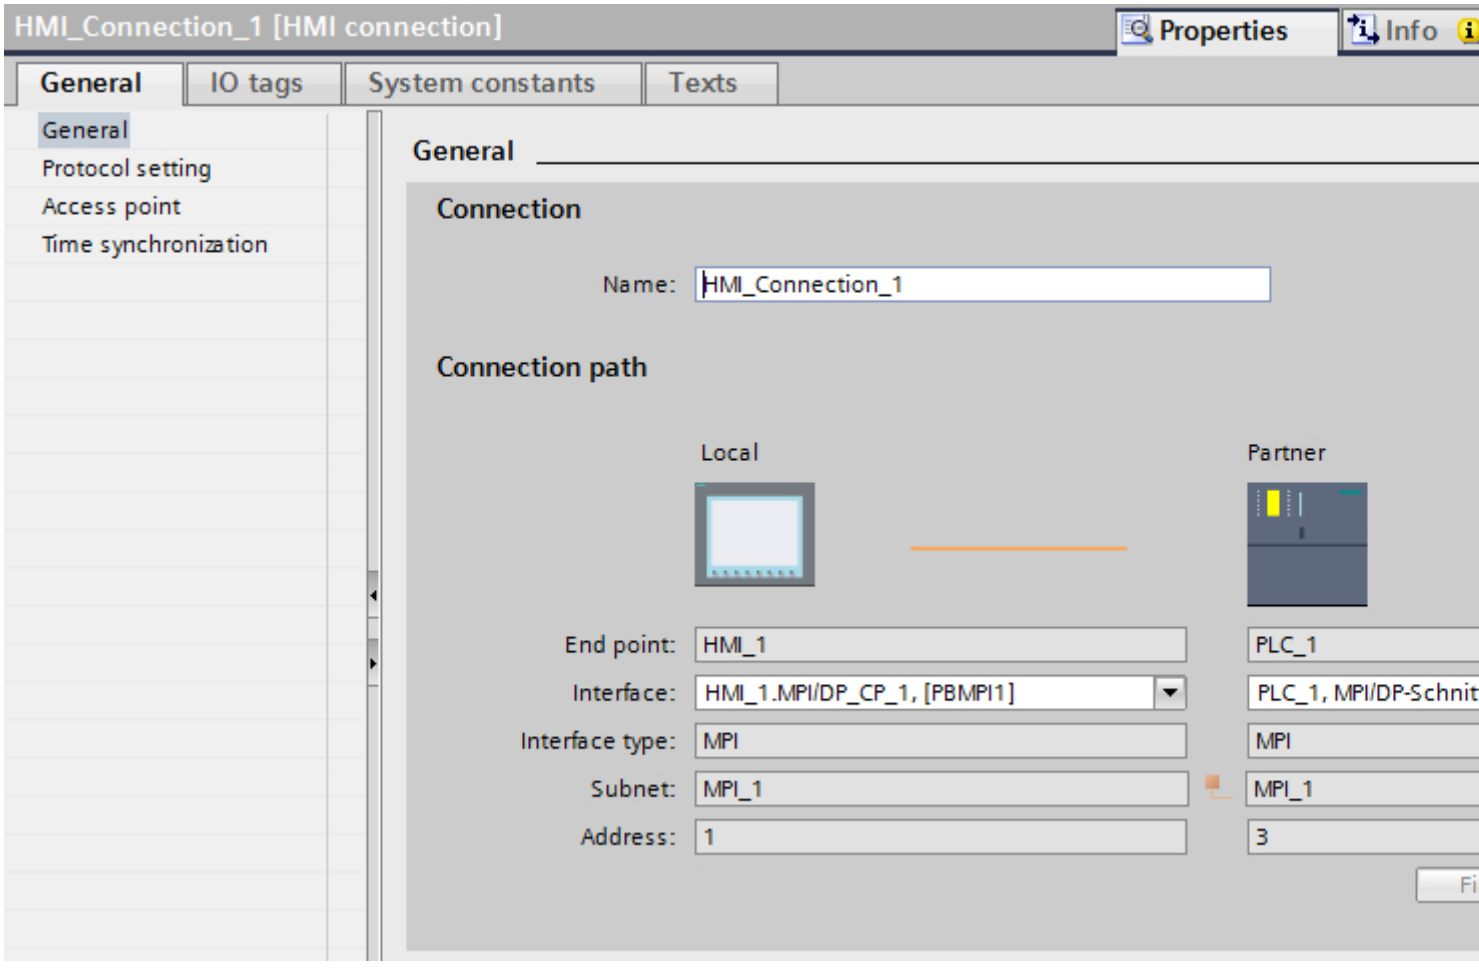
MPI parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Displays whether the devices are networked together.

 - displayed if the devices are networked together.

 - displayed if the devices are not networked together.

"Connection path"

The communication partners of the selected HMI connection and the associated MPI parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the name of the device. This area is not editable.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area is not editable.
- "Subnet"
  Displays the selected subnet. This area is not editable.
- "Address"
  Displays the MPI address of the device. This area is not editable.
- "Find connection path" button
  Enables the subsequent specification of connections.

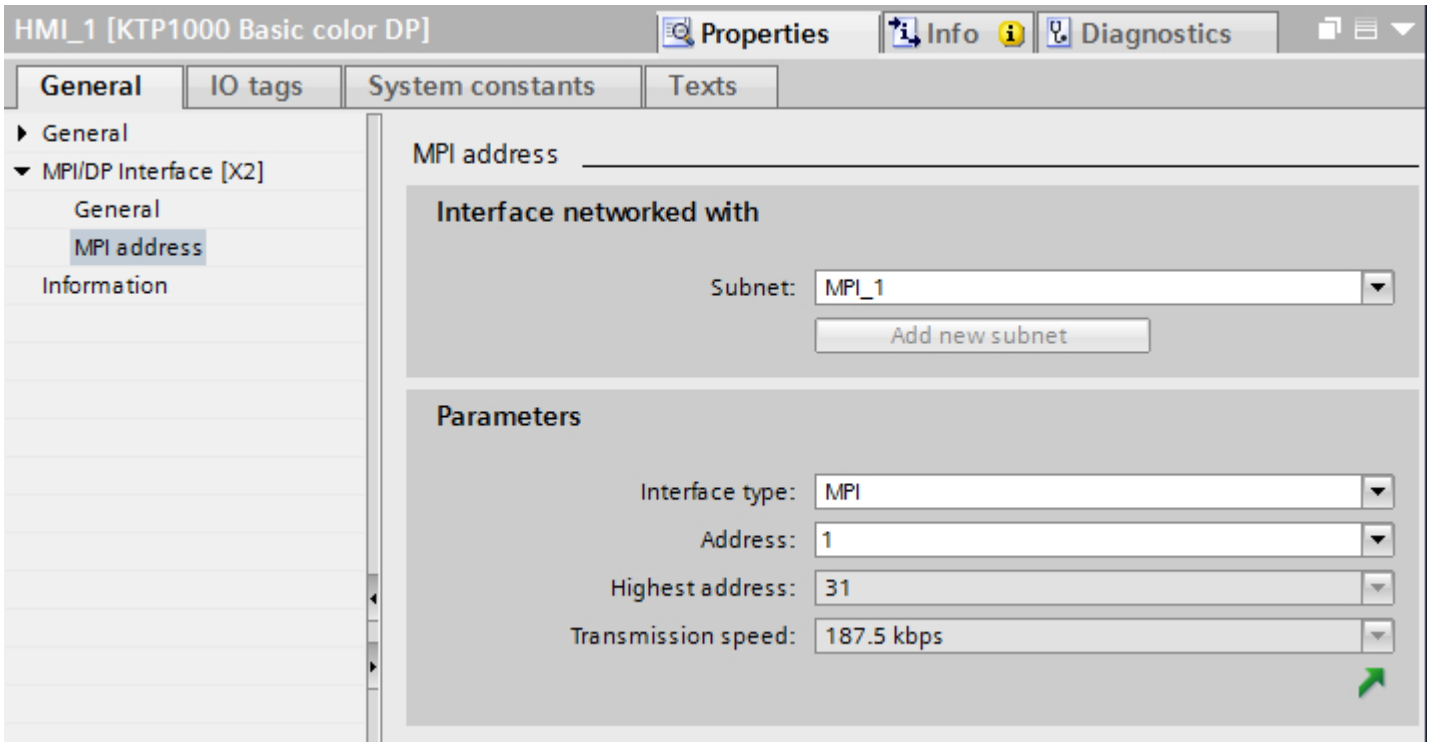
MPI parameters for the HMI device

MPI parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing MPI parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the MPI address of the HMI device in the "Address" area. The MPI address must be unique throughout the MPI network.
- "Highest address"
  The "Highest address" area displays the highest address of the MPI network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

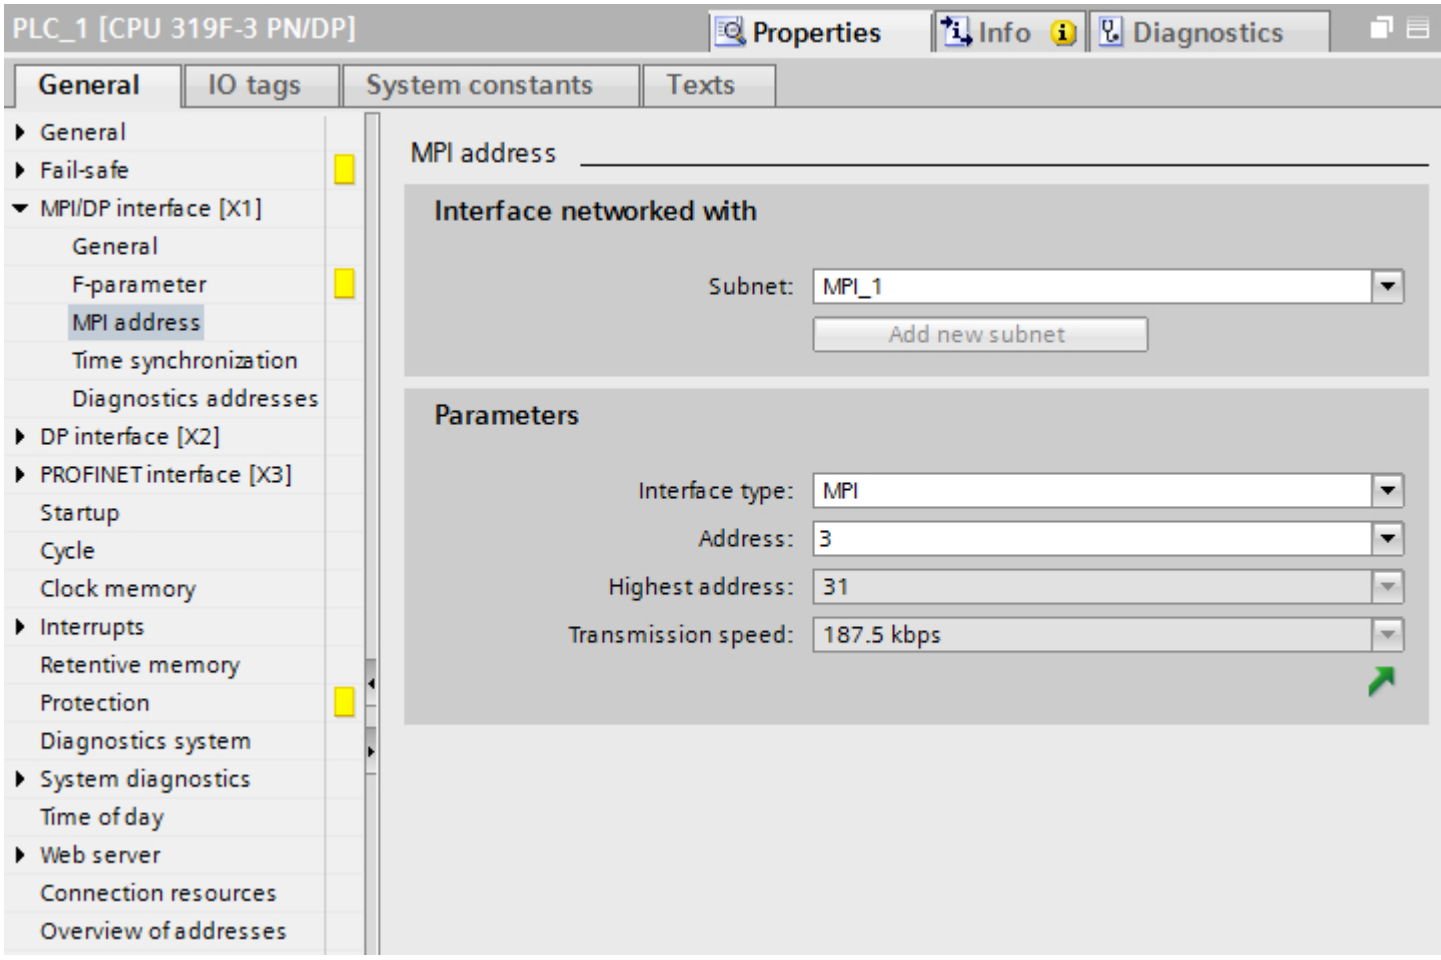
MPI parameters for the PLC

MPI parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the MPI address of the HMI device in the "Address" area. The MPI address must be unique throughout the MPI network.
- "Highest address"
  The "Highest address" area displays the highest address of the MPI network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Addressing of the PLC via MPI

Introduction

Each communication partner must be assigned an MPI network address.

Each S7 module which supports communication functions and is operated the SIMATIC S7-300/400 PLC is assigned a unique MPI address. Only one CPU may be used per rack.

Note

HMI devices cannot be operated with incorrect addressing

Always avoid redundant addressing on the MPI bus.

MPI address of the communication partner of a SIMATIC S7-300

When assigning addresses, you have to distinguish between communication partners with and without separate MPI address.

- If the communications partner has its own MPI address, you only need to define the MPI address.
- If the communication partners do not have a separate MPI address, specify the MPI address of the communications partner used for the connection. In addition, define the slot and rack of a communication partner without its own MPI address.

MPI address of the communication partner of a SIMATIC S7-400

Only S7 modules with an MPI connector are assigned an MPI address. Modules without an MPI connector are addressed indirectly:

- MPI address of the module to which the HMI is connected.
- The slot and the rack of the module with which the HMI device communicates.

12.11.8.5 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 6044)

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" or "40" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

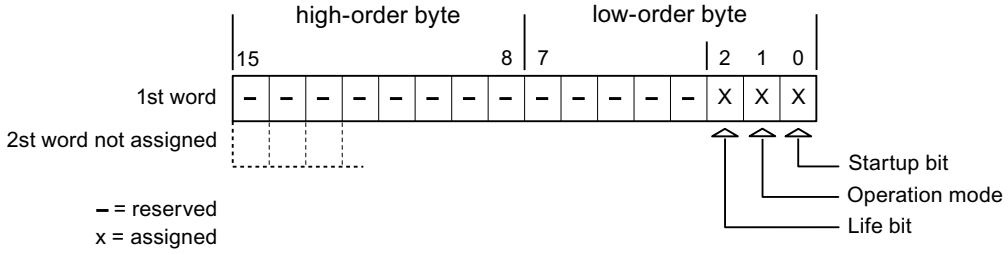
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Application

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

"Project ID" area pointer

Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

Use

Note

HMI connections cannot be switched "online".

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections" under "Address".

Connection failure

A connection failure to a device on which the "Project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "Project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the Engineering System.

"Job mailbox" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)** [3) 4)]	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-

No.	Function	
14	**Set time (BCD-coded)**	
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [2]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only for devices supporting recipes.
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.
[4]	The weekday is ignored when you configure the "Date/Time PLC" area pointer.

"Data record" area pointer

"Data record" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization via the data mailbox

Data records are always transferred directly, which means that the tag values are read straight from an address or written straight to an address configured for this tag without being redirected via an interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system alarm.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then, for example, process, edit, or save these values in the HMI device.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data mailbox free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe view

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data record.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxs No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	

Step	Action	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible
- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 4270)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

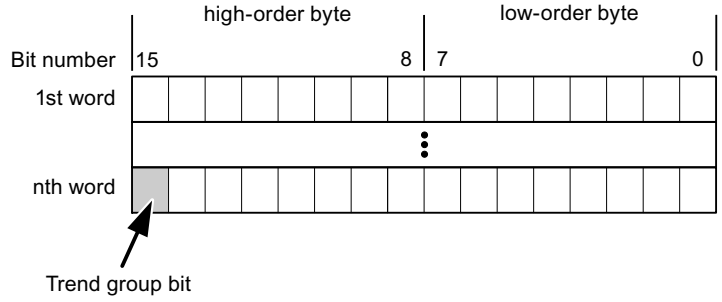
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 4293)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 300/400	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIME

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

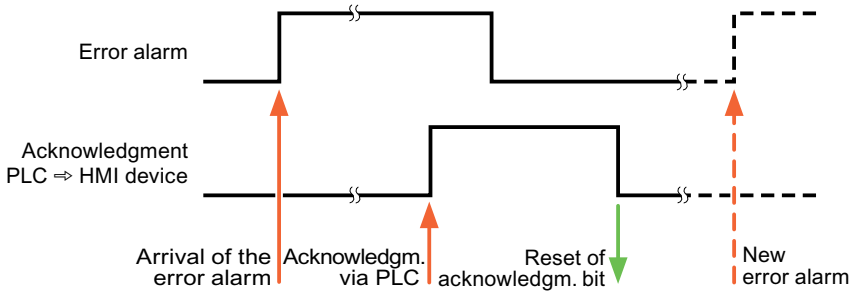
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

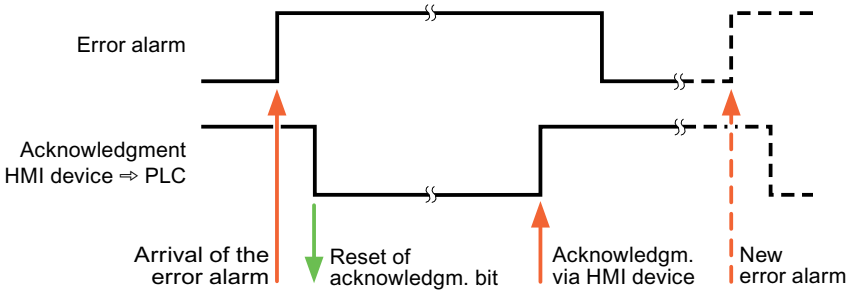
tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

12.11.8.6 Performance features of communication

S7-300/400 device dependency

Communication with the SIMATIC S7-300/400 controller

If you use devices from an earlier version of the TIA Portal with TIA Portal V13, it may not be possible to configure integrated connections to certain HMI devices.

DATE_AND_TIME	8 bytes
STRING	(2+n) bytes, n = 0 to 254

12.11.8.7 Creating connections in the "Connections" editor

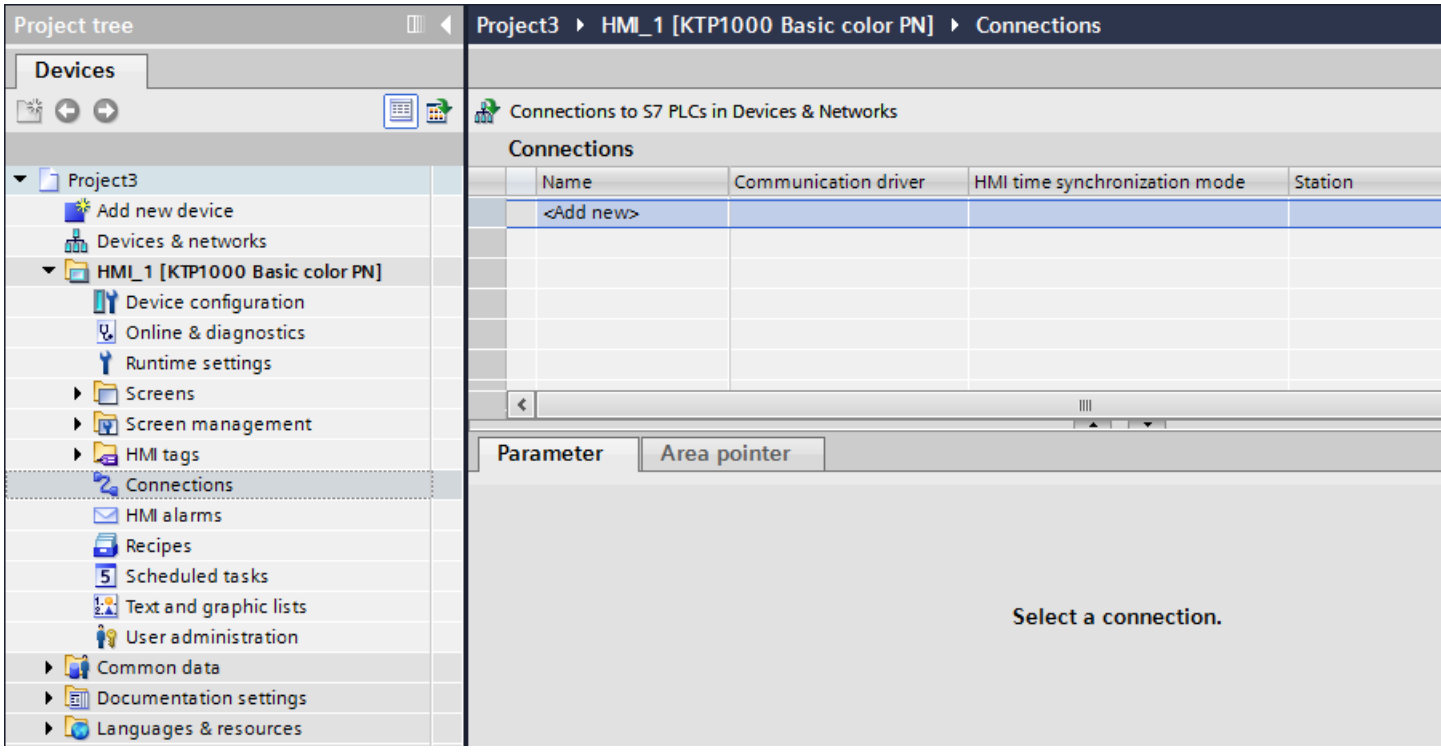
Creating a PROFINET connection

Requirements

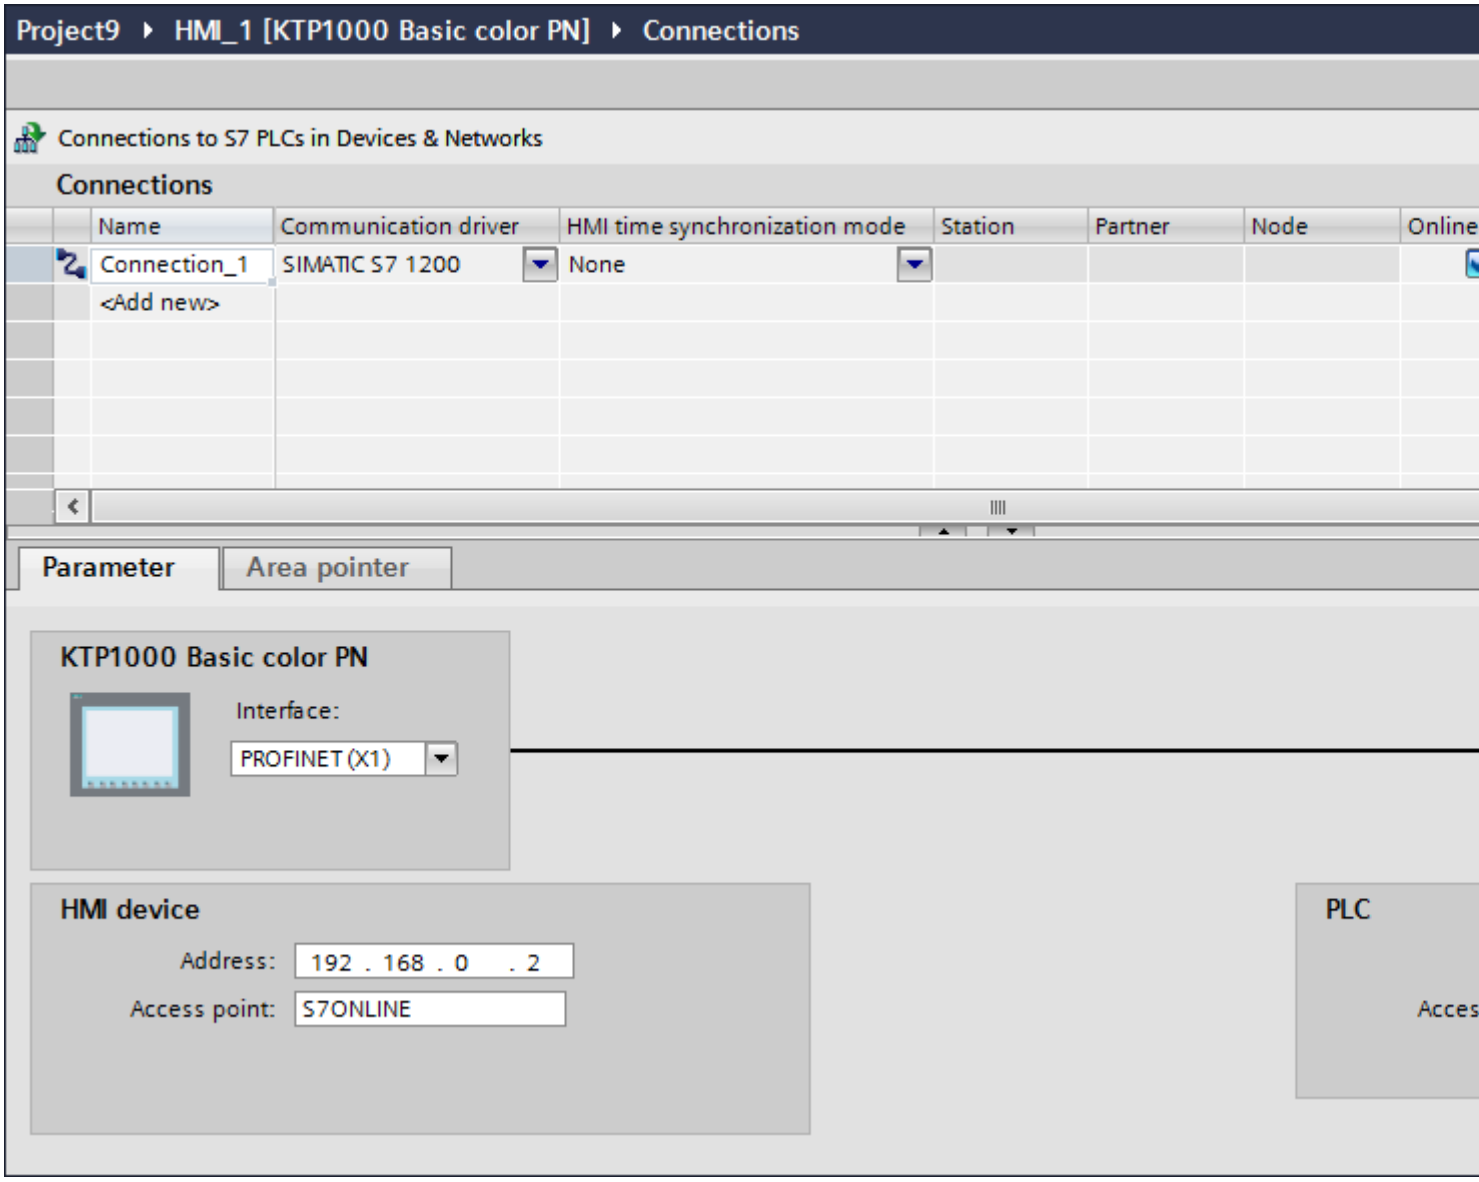
- A project is open.
- An HMI device with a PROFINET interface has been created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.



4. Click the name of the connection.
5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

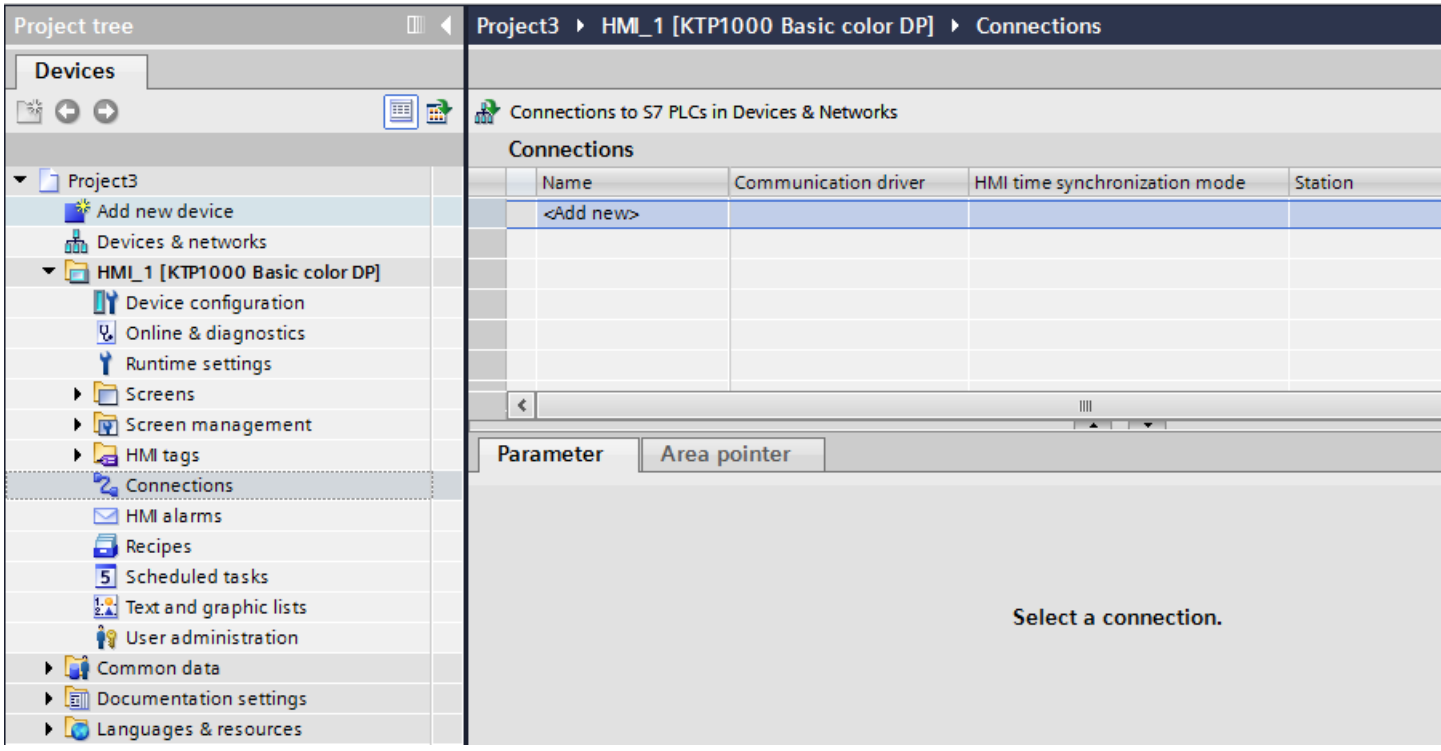
Creating a PROFIBUS connection

Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

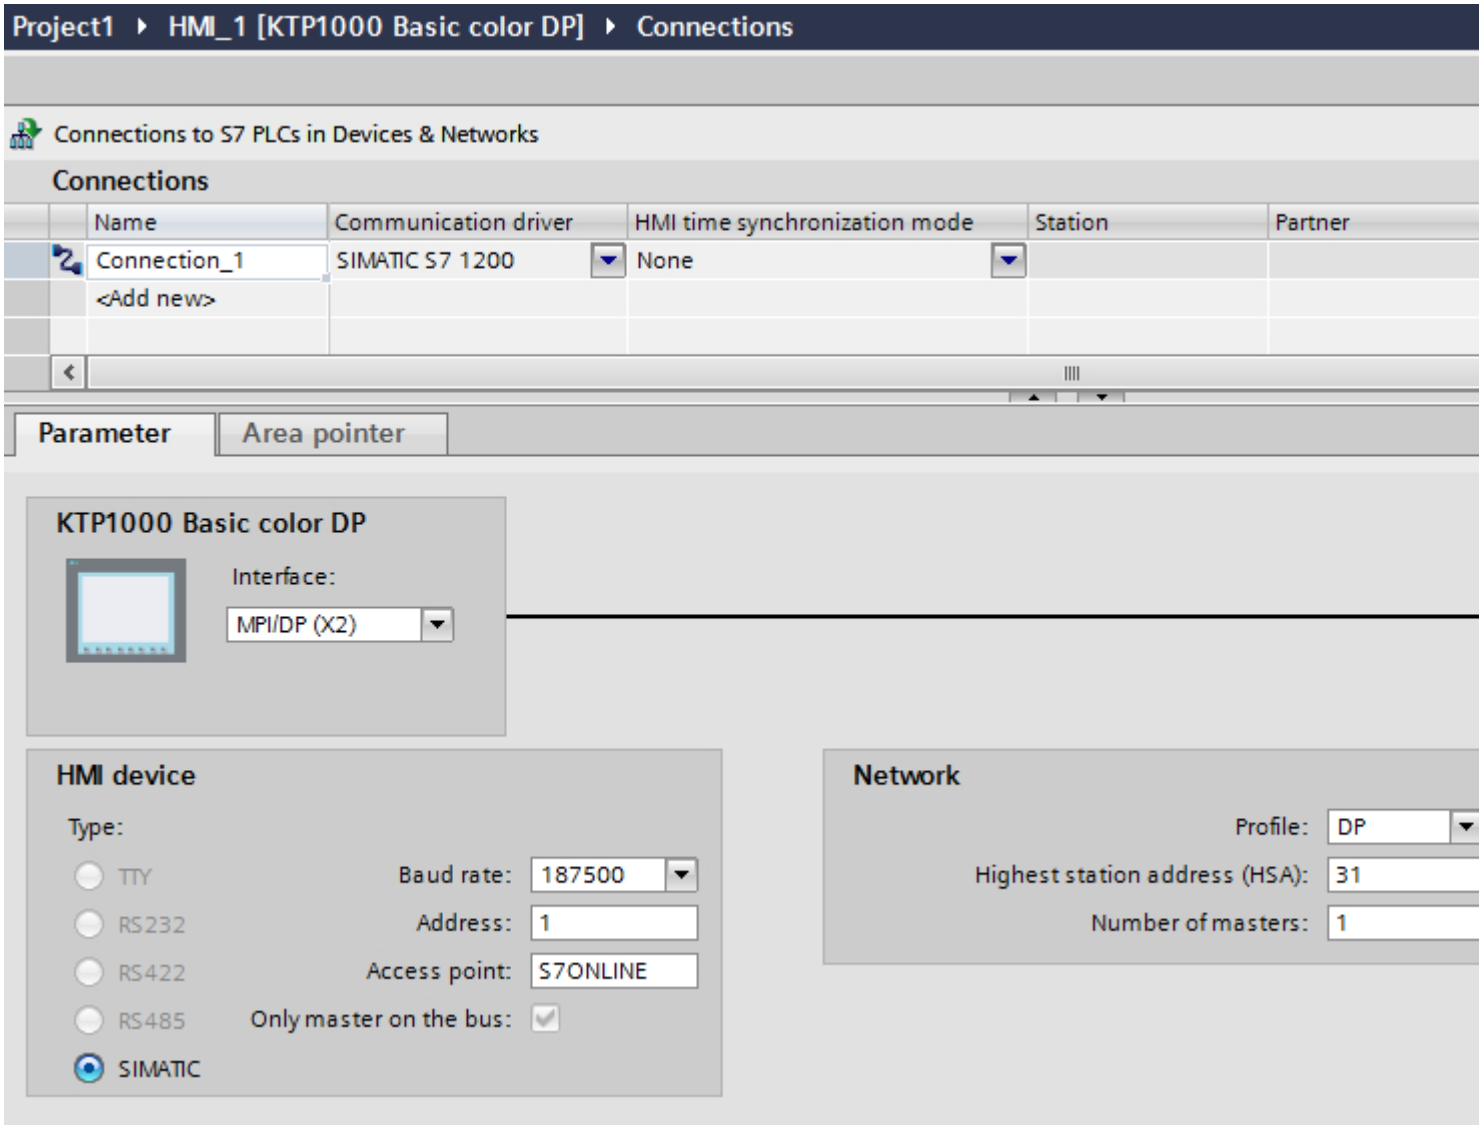
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters > Interface".

6. Select the "DP" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

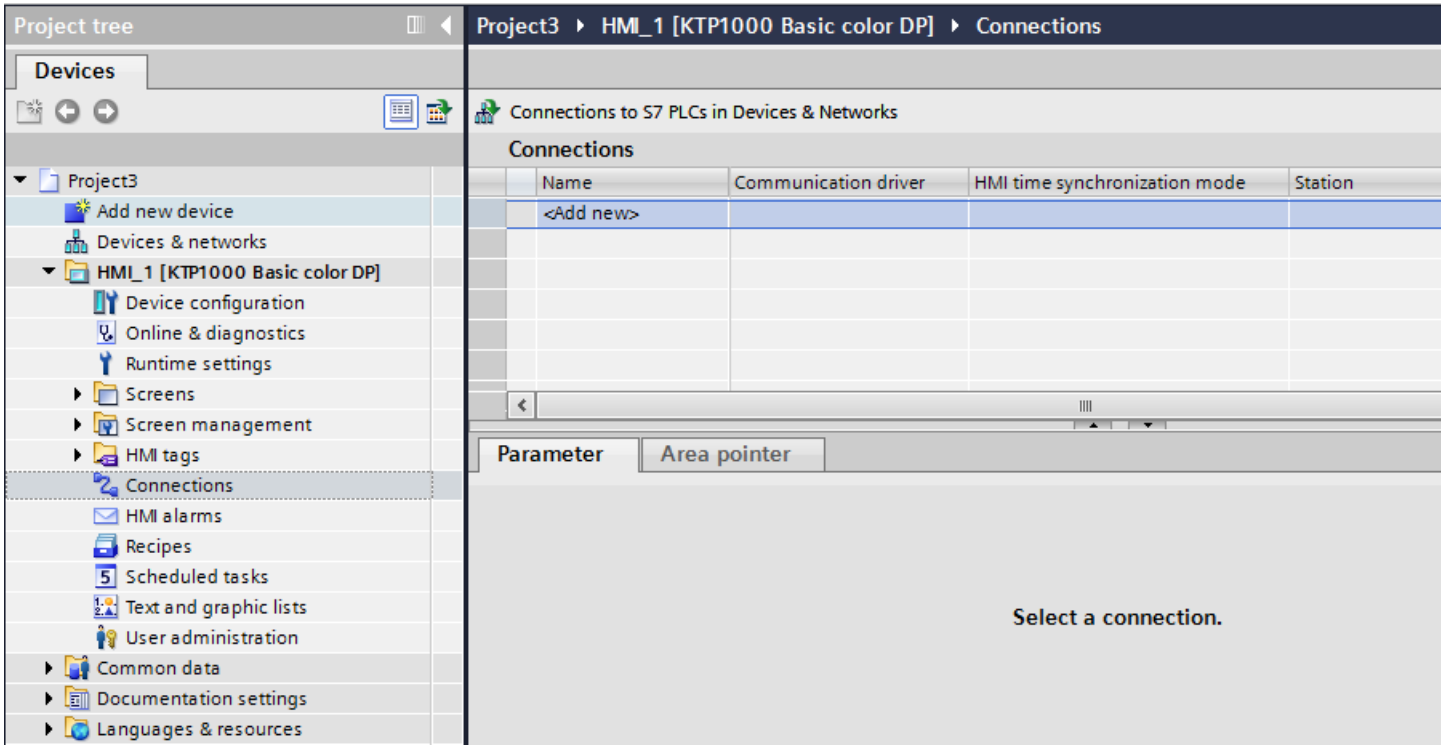
Creating an MPI connection

Requirements

- A project is open.
- An HMI device with an MPI interface has been created.

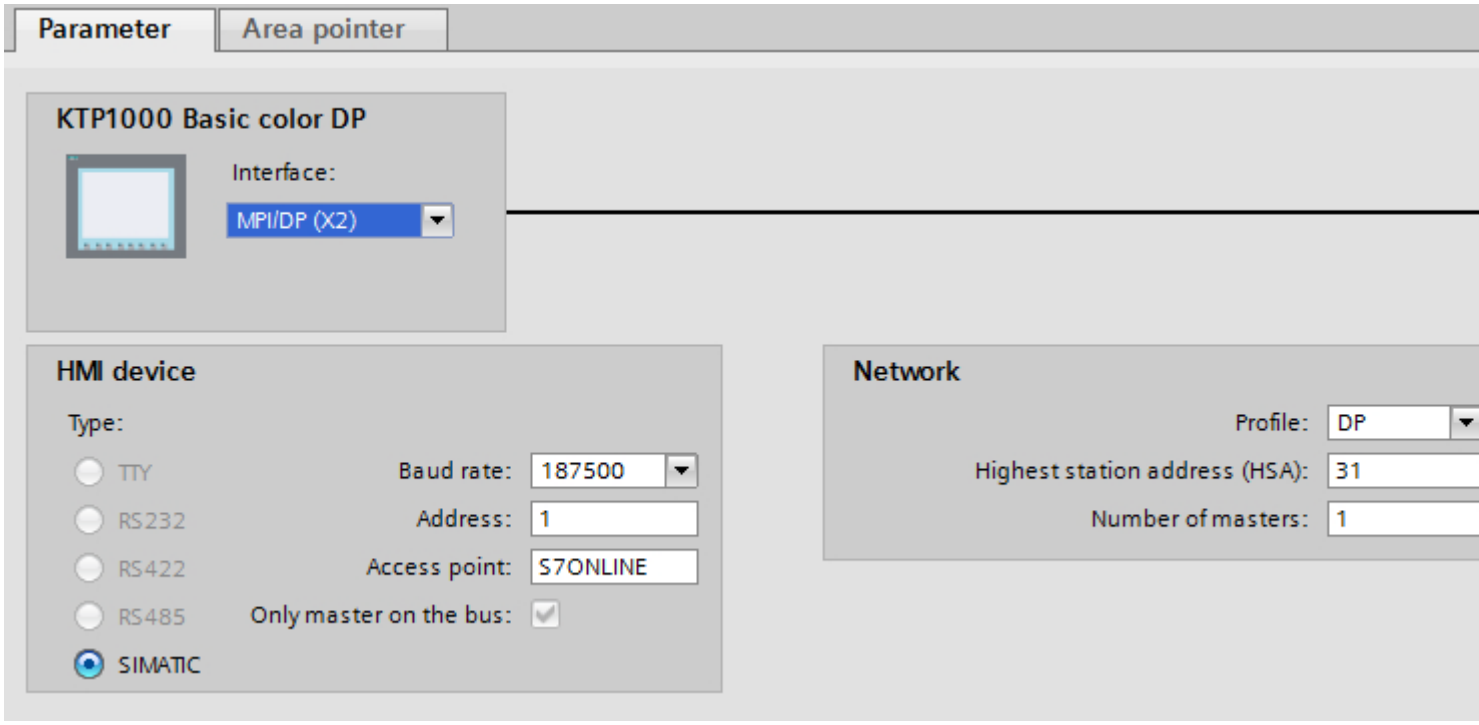
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters > Interface".

6. Select the "MPI" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

Parameters for the connection

Parameters for the connection (SIMATIC S7 300/400)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"
- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"
  Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"
  Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.
  Disable cyclic mode if you are operating several HMI devices in parallel.

PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7 200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200 PLCs.

MPI parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the MPI network.

- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  For "Address", you set the MPI address of the HMI device. The MPI address must be unique throughout the MPI network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.
  In S7 200, you must set an HMI device as the master.

Parameters for the network

Under "Network", you set the parameters for the MPI network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "MPI". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"
  This setting is not required for MPI.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the MPI address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic mode"
  When cyclic mode is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This improves system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200.

Cyclic operation

Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

12.11.9 Communicating with the SIMATIC S7-1500 Software Controller

12.11.9.1 Communication with SIMATIC S7-1500 Software Controller

Introduction

This section describes the communication between a HMI device and a SIMATIC S7-1500 Software Controller.

You can configure the following communication channels for the SIMATIC S7-1500 Software Controller :

- PROFINET

HMI connection for communication

You configure connections between the HMI device and SIMATIC S7-1500 Software Controller in the "Devices & Networks" editor.

12.11.9.2 Communication via PROFINET

Basics of HMI connections to an SIMATIC S7-1500 Software Controller

Introduction

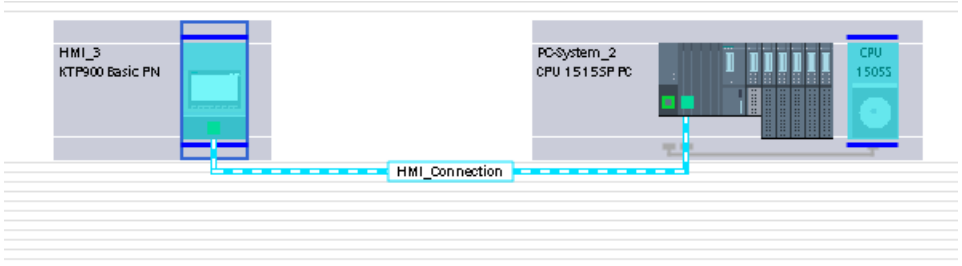
In a PC station, the SIMATIC S7-1500 Software Controller can support the following HMI connections depending on the network:

- Direct HMI connection
- Routed HMI connection to a PLC in another subnet

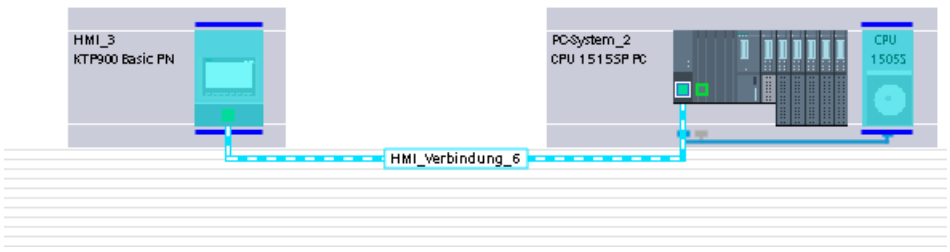
You can find additional information on networking a PC station with an SIMATIC S7-1500 Software Controller in the documentation for the SIMATIC S7-1500 Sofware Controller.

Direct HMI connection to an SIMATIC S7-1500 Software Controller

If a local interface is available on the PC station with the SIMATIC S7-1500 Software Controller, this interface is automatically assigned to the SIMATIC S7-1500 Software Controller when the HMI connection is established. An HMI connection created like this is a direct connection.

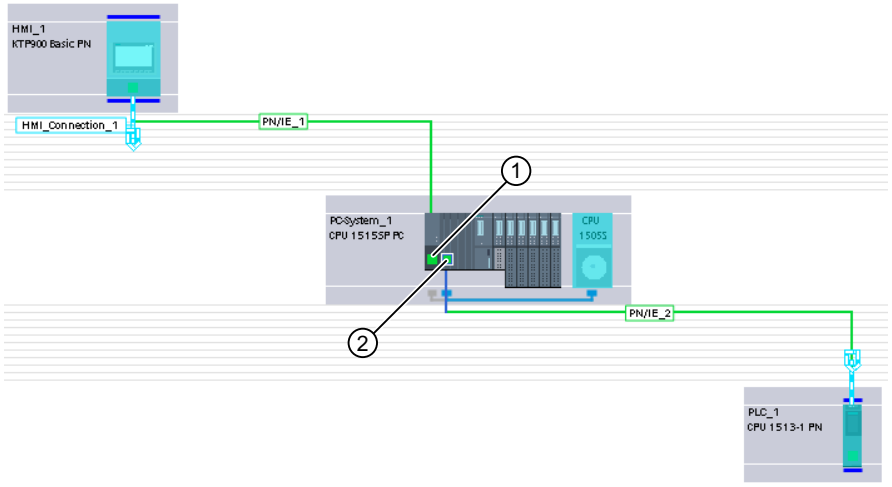


If an interface other than the local interface has been configured for communication on the PC station, the HMI connection is classified as a "routed connection". The HMI connection is, however, shown as a direct connection:



Routed HMI connection over an SIMATIC S7-1500 Software Controller

The SIMATIC S7-1500 Software Controller supports the routing functionality. The PC station must, however, have at least two PN/IE interfaces. The figure below shows the configuration of an HMI connection to an S7 CPU routed through the SIMATIC S7-1500 Software Controller.



① Local interface or interface retrofitted over a communication processor

Required settings under "Interface assignment":

- "PC station"

② "X1" local interface for process communication

Required settings under "Interface assignment":

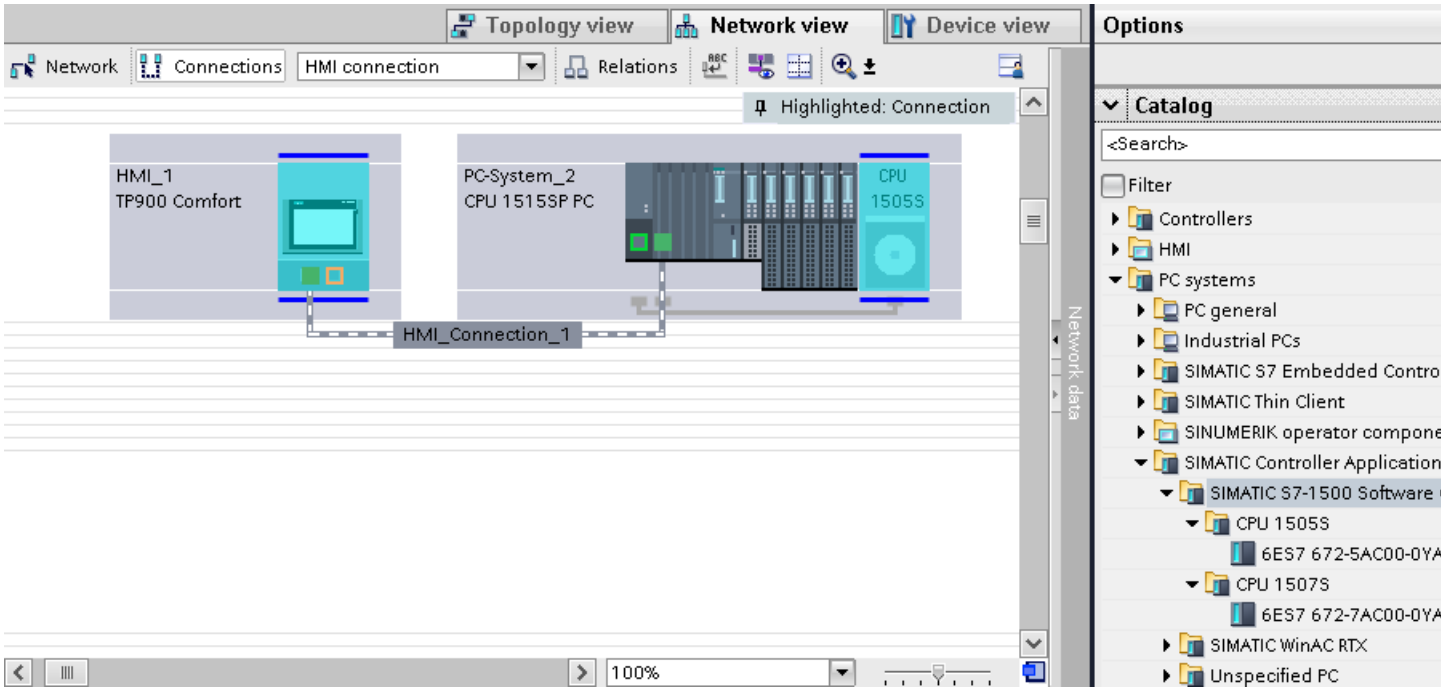
- "Software_PLC_1" (set automatically)

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7-1500 Software Controller in the project, connect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to a single SIMATIC S7-1500 Software Controller and multiple SIMATIC S7-1500 Software Controller to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure a HMI connection between HMI devices and a SIMATIC S7-1500 Software Controller via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

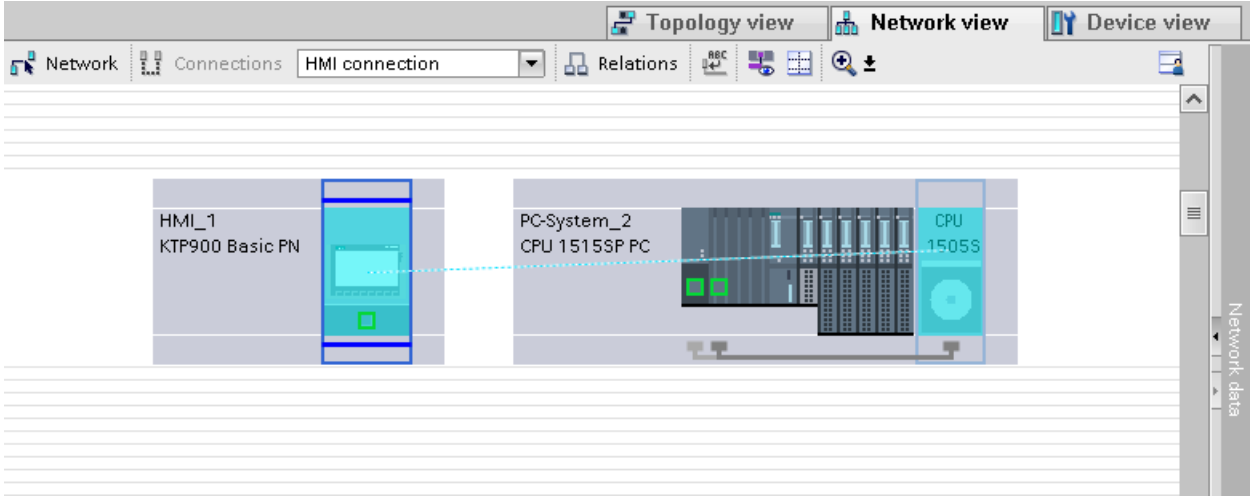
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC S7-1500 Software Controller on PC system with PROFINET interface.

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
3. Click the HMI device and use a drag-and-drop operation to draw a connection to the SIMATIC S7-1500 Software Controller.



4. Click the connecting line.

5. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the section "PROFINET parameters (Page 6350)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7-1500 Software Controller. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This section describes communication over PROFINET between a WinCC Runtime and an SIMATIC S7-1500 Software Controller.

You can use the following WinCC Runtimes as an HMI device:

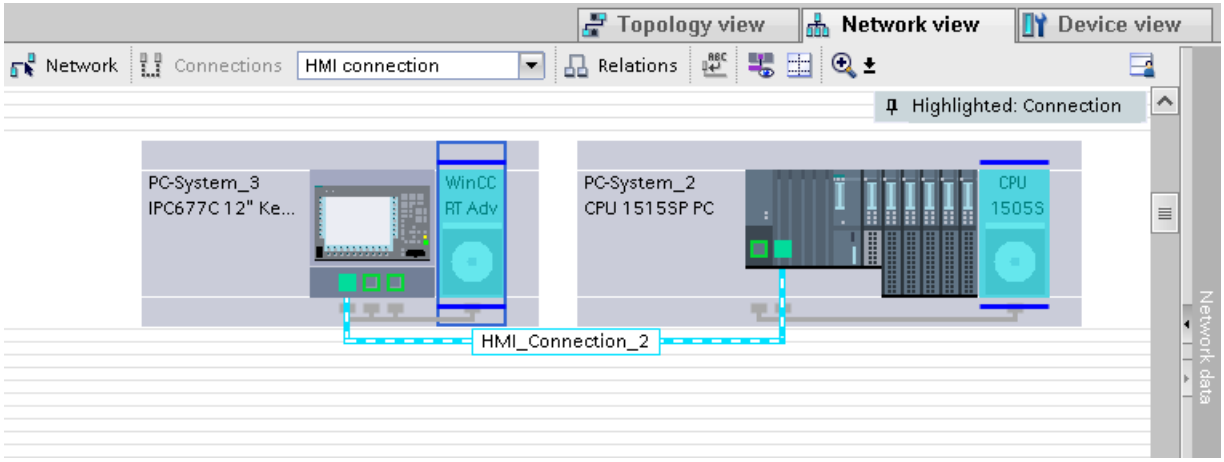
- WinCC RT Advanced
- WinCC RT Professional

WinCC Runtime as HMI device

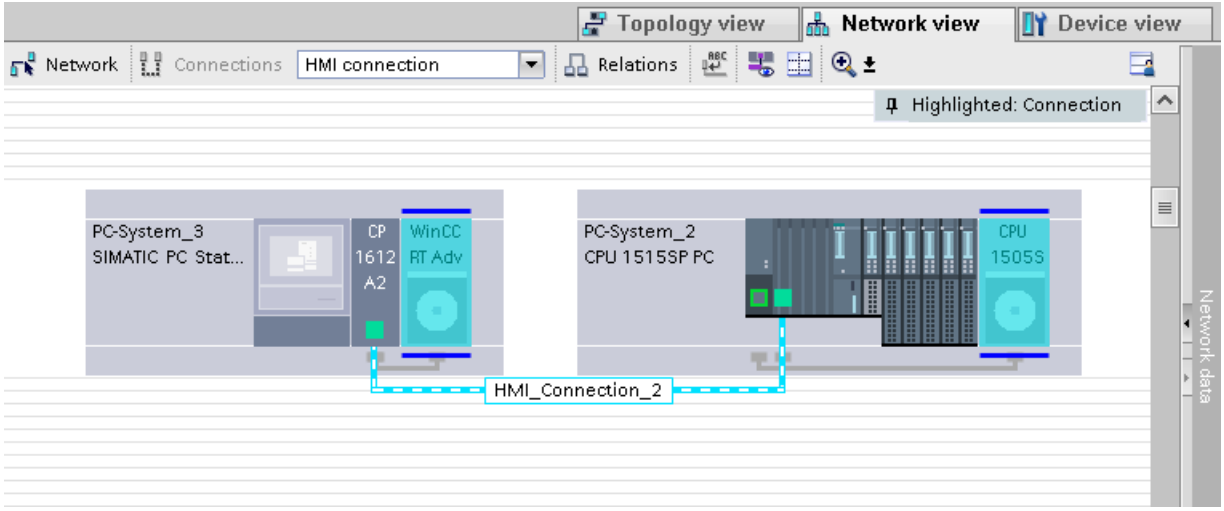
Configure the HMI connections between a WinCC Runtime and an SIMATIC S7-1500 Software Controller in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to a single SIMATIC S7-1500 Software Controller and multiple SIMATIC S7-1500 Software Controller to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection between an HMI device and a SIMATIC S7-1500 Software Controller via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

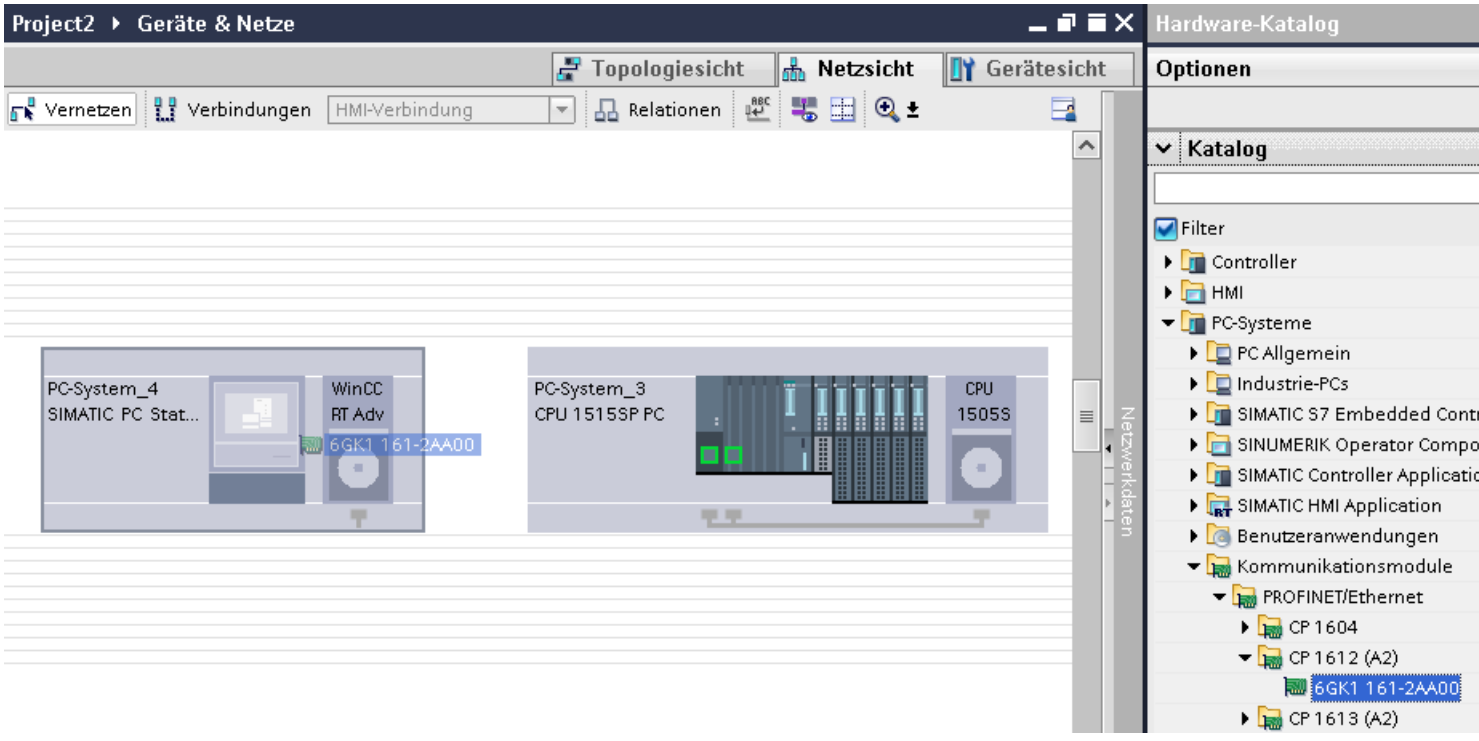
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- PC station with an SIMATIC S7-1500 Software Controller with PROFINET interface
- PC station with a "WinCC Runtime" application

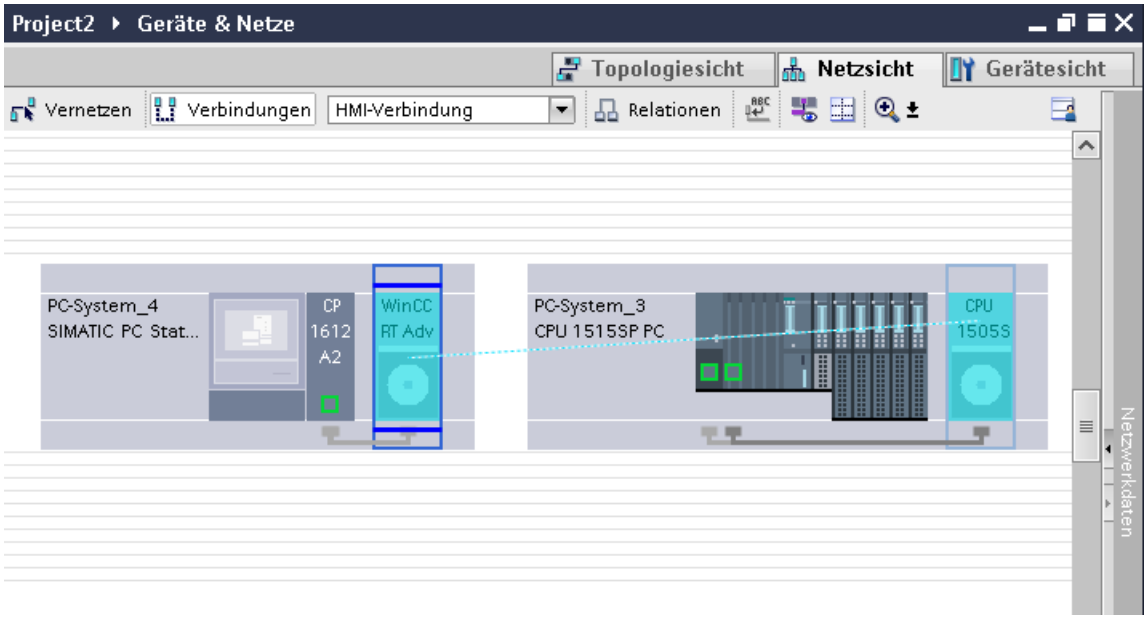
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click on WinCC Runtime in the PC station and create a connection to the SIMATIC S7-1500 Software Controller with drag-and-drop.



5. Click on the connected interface in the PC station and select the "PC station" entry under "Interface assignment" in the Inspector window.
6. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the section "PROFINET parameters (Page 6350)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7-1500 Software Controller. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection between an HMI device and a SIMATIC S7-1500 Software Controller via PROFINET or Ethernet in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

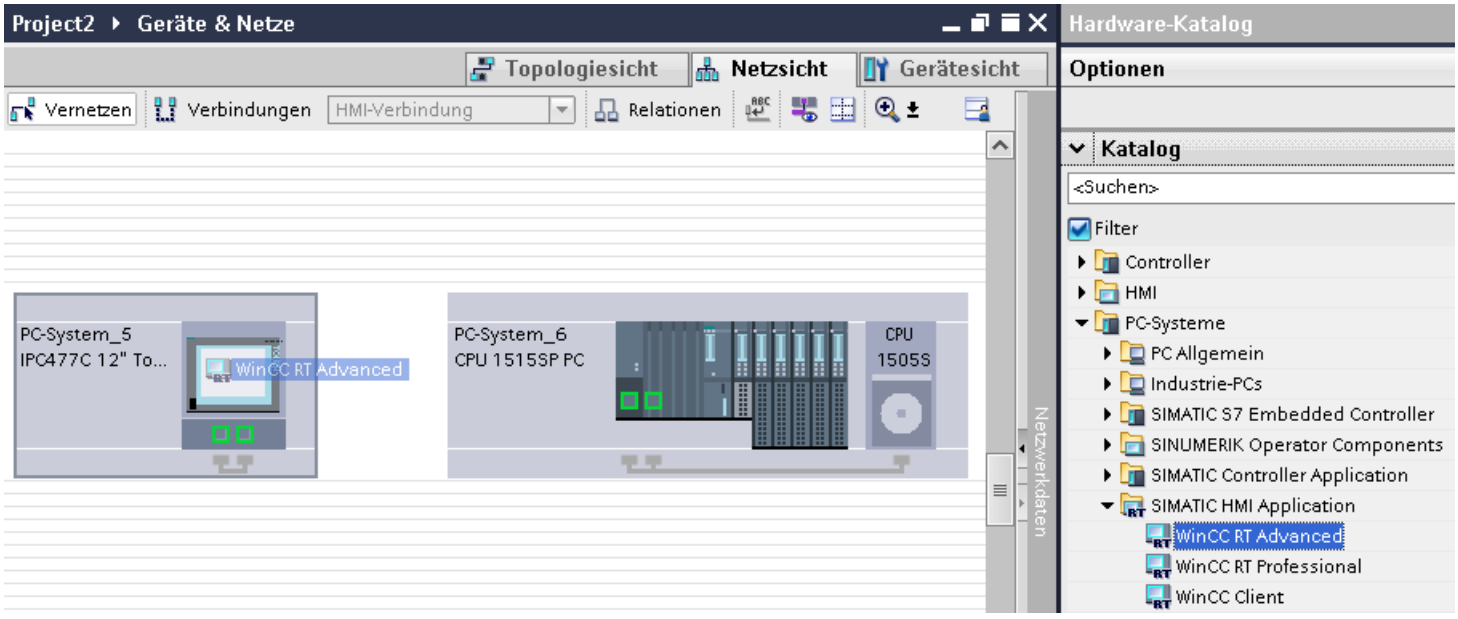
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- PC station with an SIMATIC S7-1500 Software Controller with PROFINET interface
- SIMATIC PC with PROFINET interface

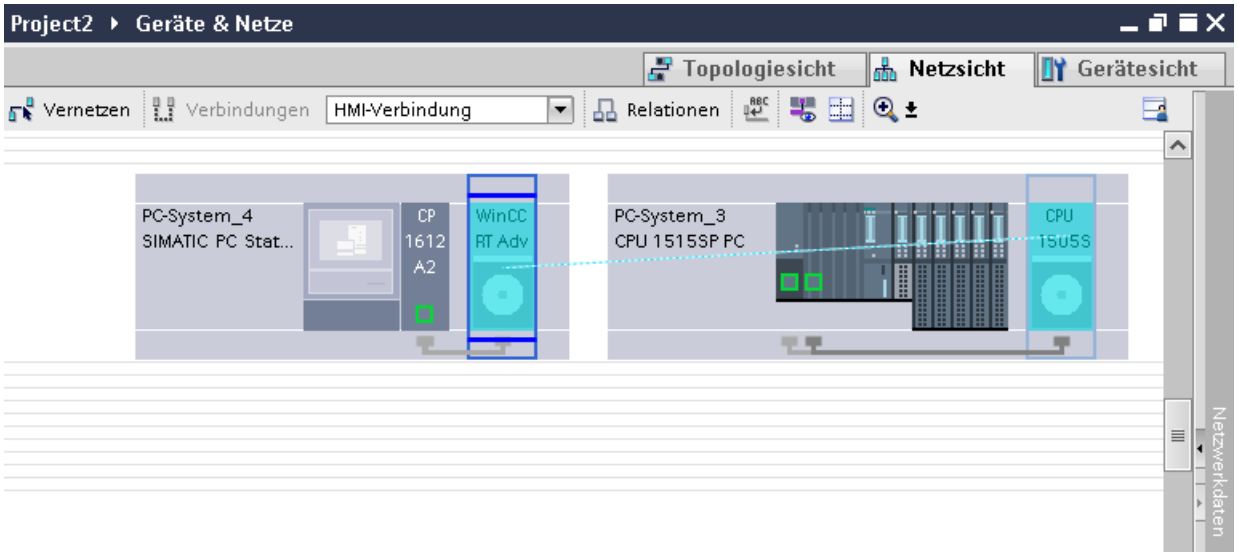
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click on WinCC Runtime in the PC station and create a connection to the SIMATIC S7-1500 Software Controller with drag-and-drop.



5. Click on the connected interface in the PC station and select the "PC station" entry under "Interface assignment" in the Inspector window.
6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the section "PROFINET parameters (Page 6350)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7-1500 Software Controller. The IP address and subnet mask connection parameters are configured.

12.11.9.3 PROFINET parameters

PROFINET parameters for the HMI connection

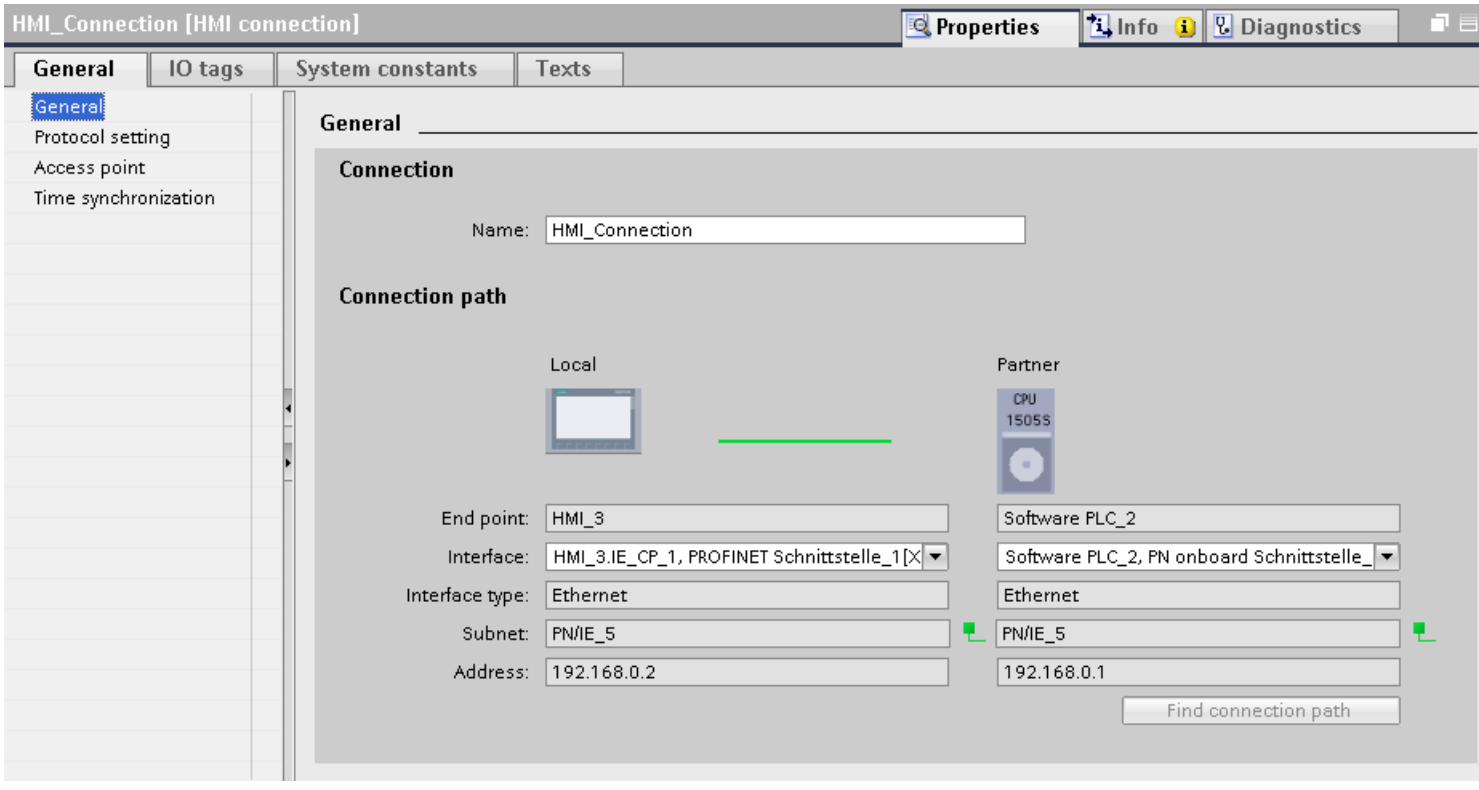
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Shows the name of the HMI connection.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

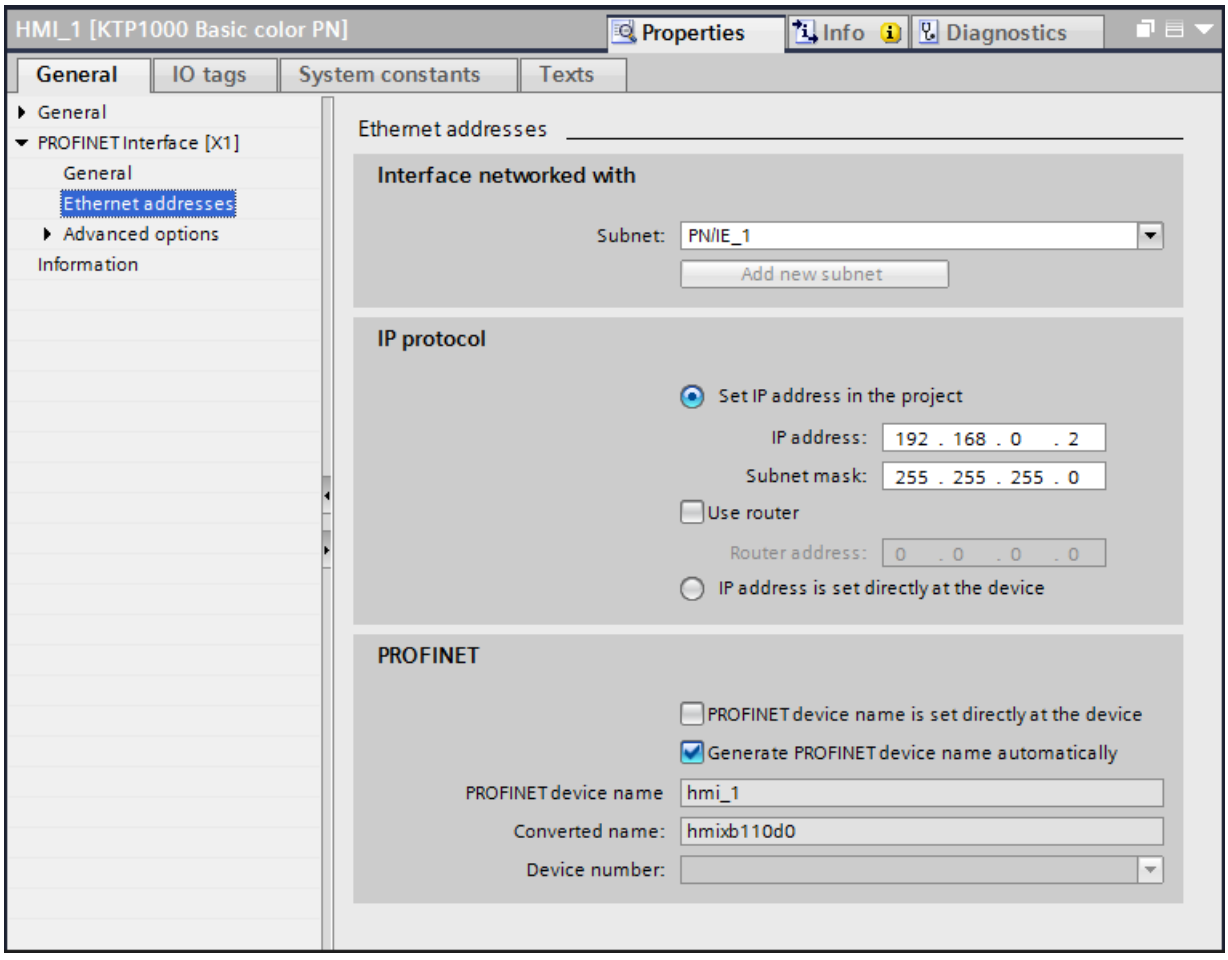
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - OP 77B
  - TP 177B color PN/DP
  - TP 177B mono DP
  - OP 177B color PN/DP
  - OP 177B mono DP
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP
  - TP 277 6"
  - OP 277 6"

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address using a different method"
  If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

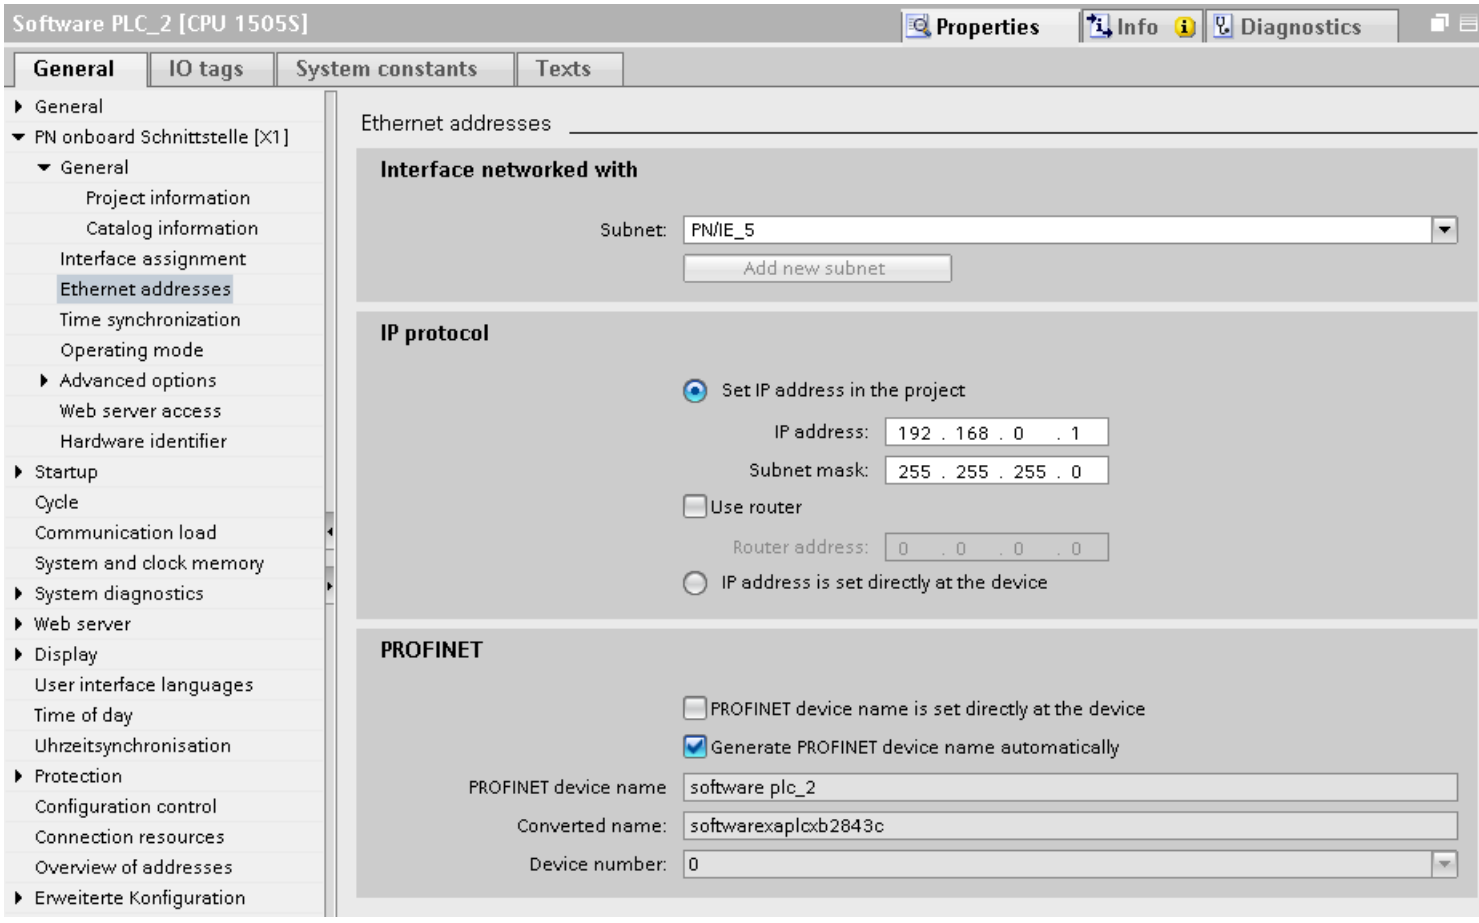
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Protection of communication

Security levels

If you want to protect the PLC and HMI device communication, you can assign protection levels for the communication.

For an SIMATIC S7-1500 Software Controller, you can enter multiple passwords to set up different access rights for different user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

Example

You select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU) when configuring it.

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Access password for the HMI connection

Introduction

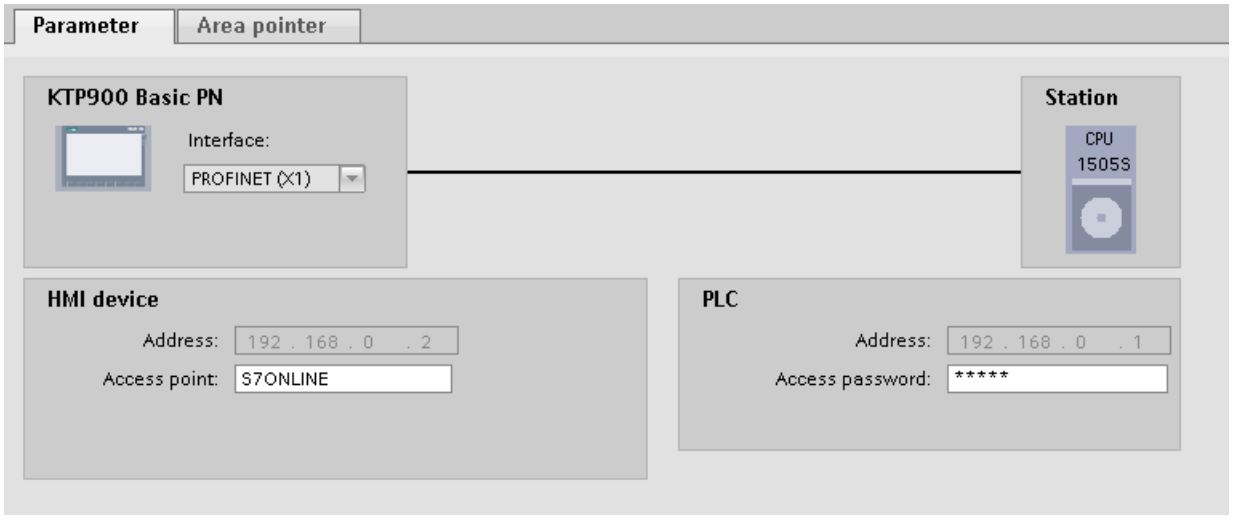
Communication with a PLC with the"Complete protection" protection level is protected by a password. The password is stored in the properties of the PLC.

Enter the password from the PLC in the "Access password" area.

Communication to the PLC is denied if an incorrect password or no password is entered.

Entering the access password

Enter the access password for the HMI connection in the "Connections" editor.



12.11.9.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Auto-Hotspot

Restrictions

You can only configure the following data types for communication with SIMATIC S7 1500 for data exchange using area pointers:

- UInt and array of UInt
- Word and array of Word
- Int and array of Int
- "Array[0..15] of Bool" for area pointer "Coordination"
- Date_And_Time
- DTL and LDT

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" or "40" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Using data types

The data types "Date_And_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE_AND_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE_AND_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 1)	Reserved			Reserved		
n+5 1)	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Using data types

The data types "Date_And_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE_AND_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE_AND_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

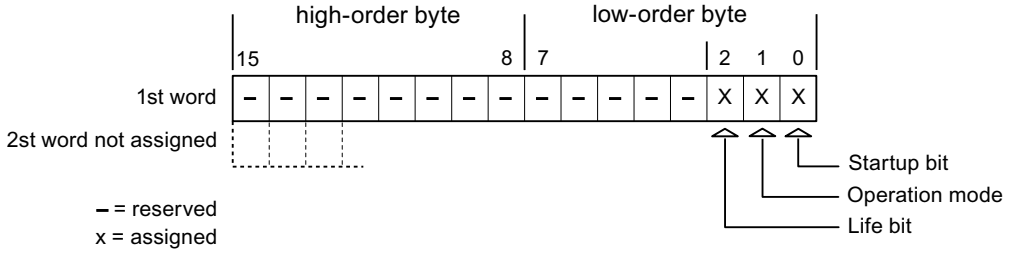
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

"Project ID" area pointer

Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

Use

Note

HMI connections cannot be switched "online".

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections" under "Address".

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

"Job mailbox" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	

Word	Most significant byte	Least significant byte
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)** [3) 4)]	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	

No.	Function	
14	**Set time (BCD-coded)**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [2]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only for devices supporting recipes.
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.
[4]	The weekday is ignored when you configure the "Date/Time PLC" area pointer.

"Data record" area pointer

"Data record" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization via the data mailbox

Data records are always transferred directly, which means that the tag values are read straight from an address or written straight to an address configured for this tag without being redirected via an interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system alarm.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then, for example, process, edit, or save these values in the HMI device.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data mailbox free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe view

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data record.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of a transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxs No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

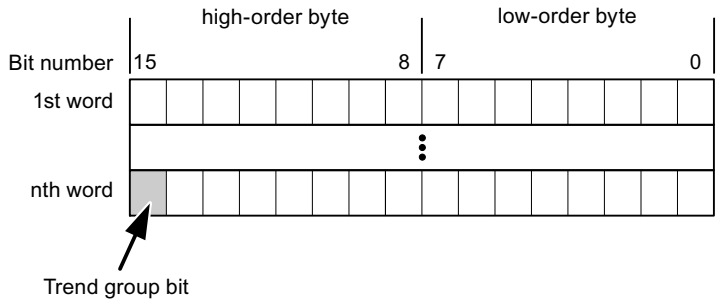
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Auto-Hotspot

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

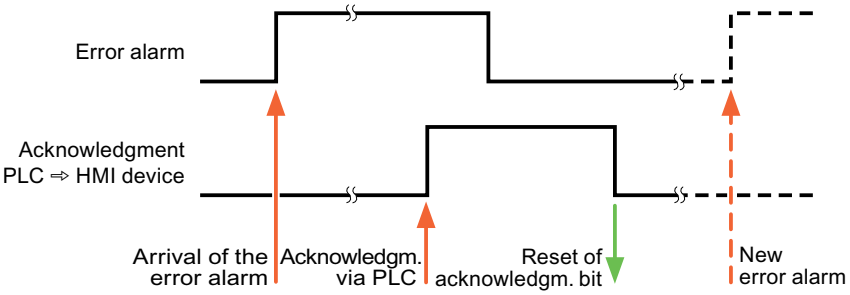
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

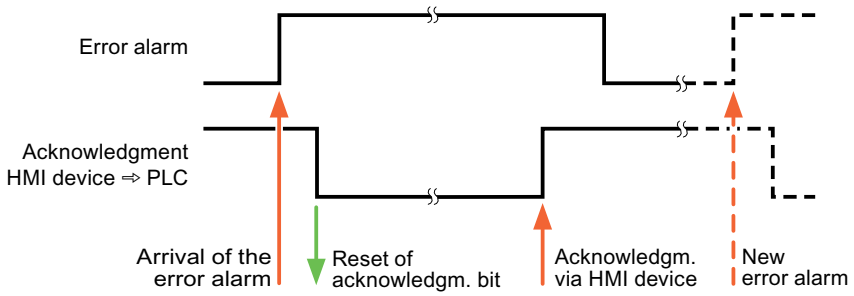
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

12.11.9.5 Performance features of communication

Device dependencies of the SIMATIC S7-1500 software controller

Device dependency

If you use devices from an earlier version of the TIA Portal with TIA Portal V13, it may not be possible to configure connections to certain HMI devices.

ULINT	8 bytes
USINT	1 byte

12.11.9.6 Configuring connections in the "Connections" editor

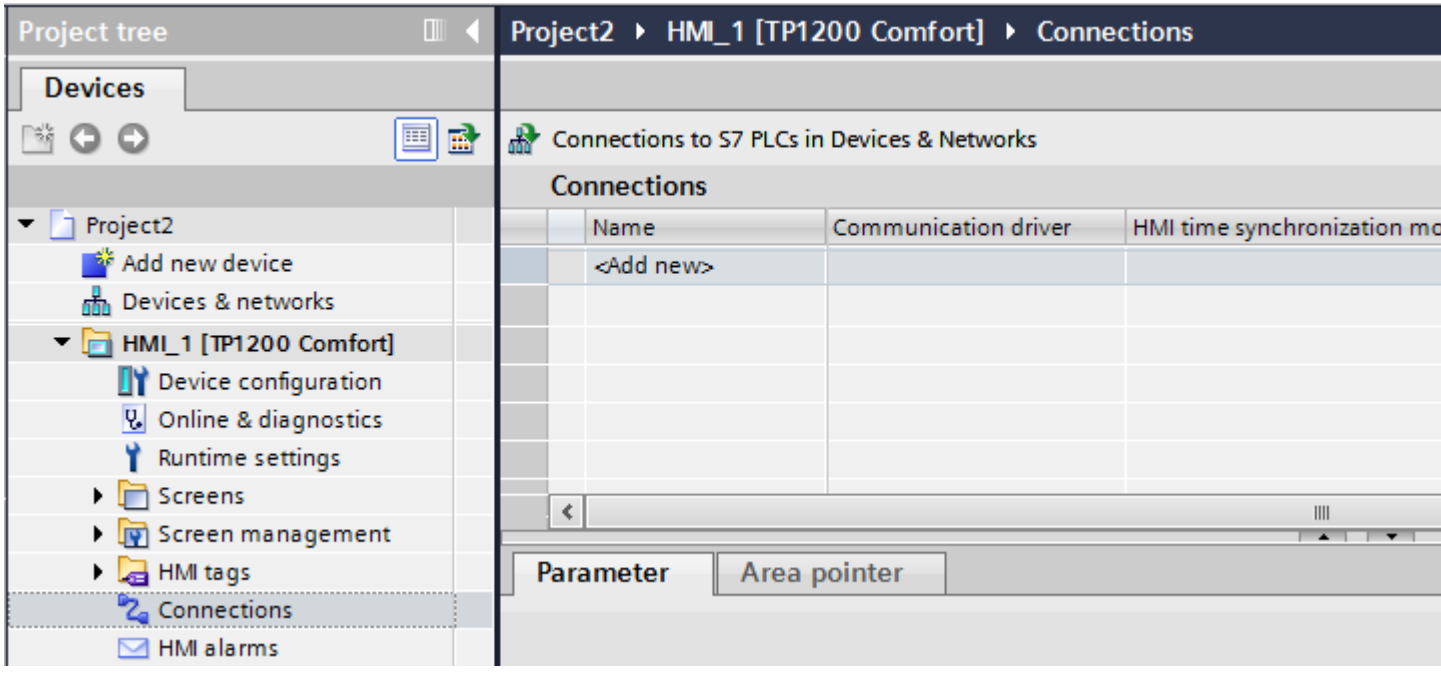
Creating a PROFINET connection

Requirements

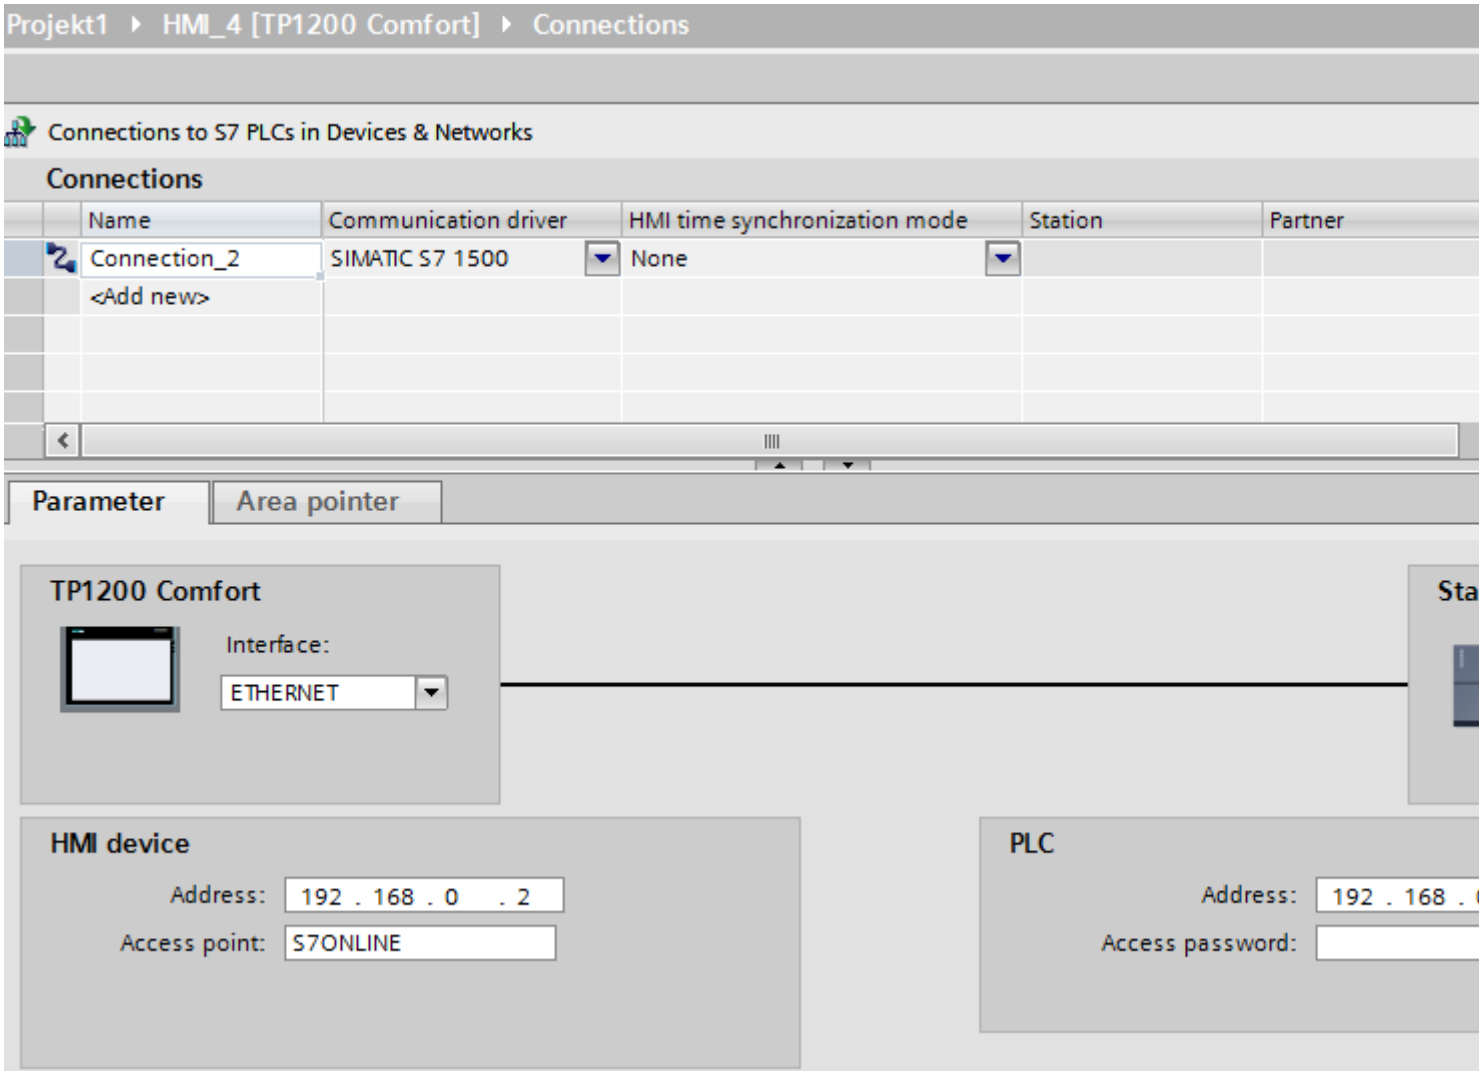
- A project is open.
- An HMI device with a PROFINET interface has been created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.



4. Click the name of the connection.
5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

12.11.9.7 Configuring connections in the "Connections" editor

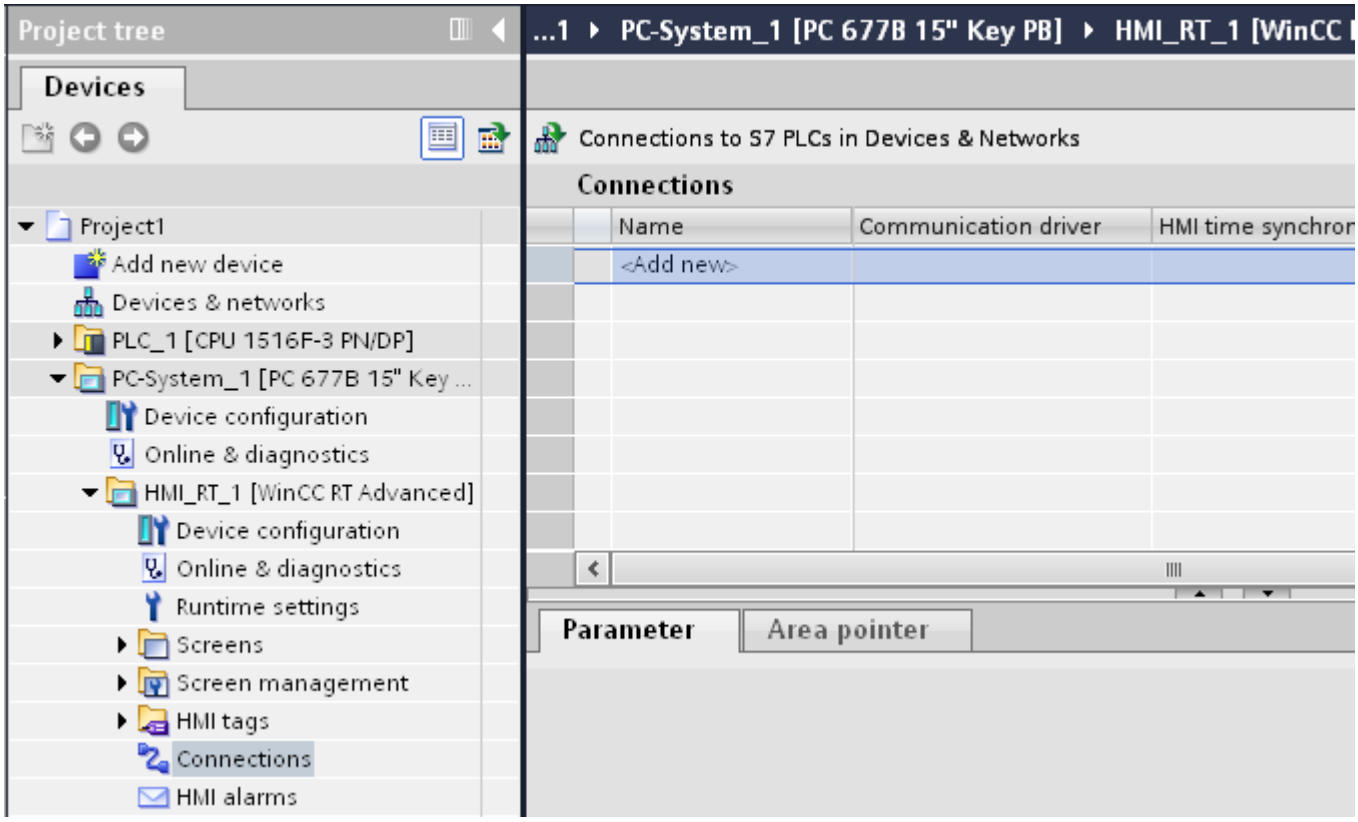
Creating a connection

Requirements

- A project is open.
- WinCC RT Advanced is created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select an interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the parameters for the connection in the Inspector window.

Interfaces

Select one of the following interfaces in the Inspector window under "Parameters > WinCC RT Advanced > Interfaces".:

- Industrial Ethernet
- MPI
- PROFIBUS

For additional information on the parameters of the interfaces see:

Auto-Hotspot

Connection parameters

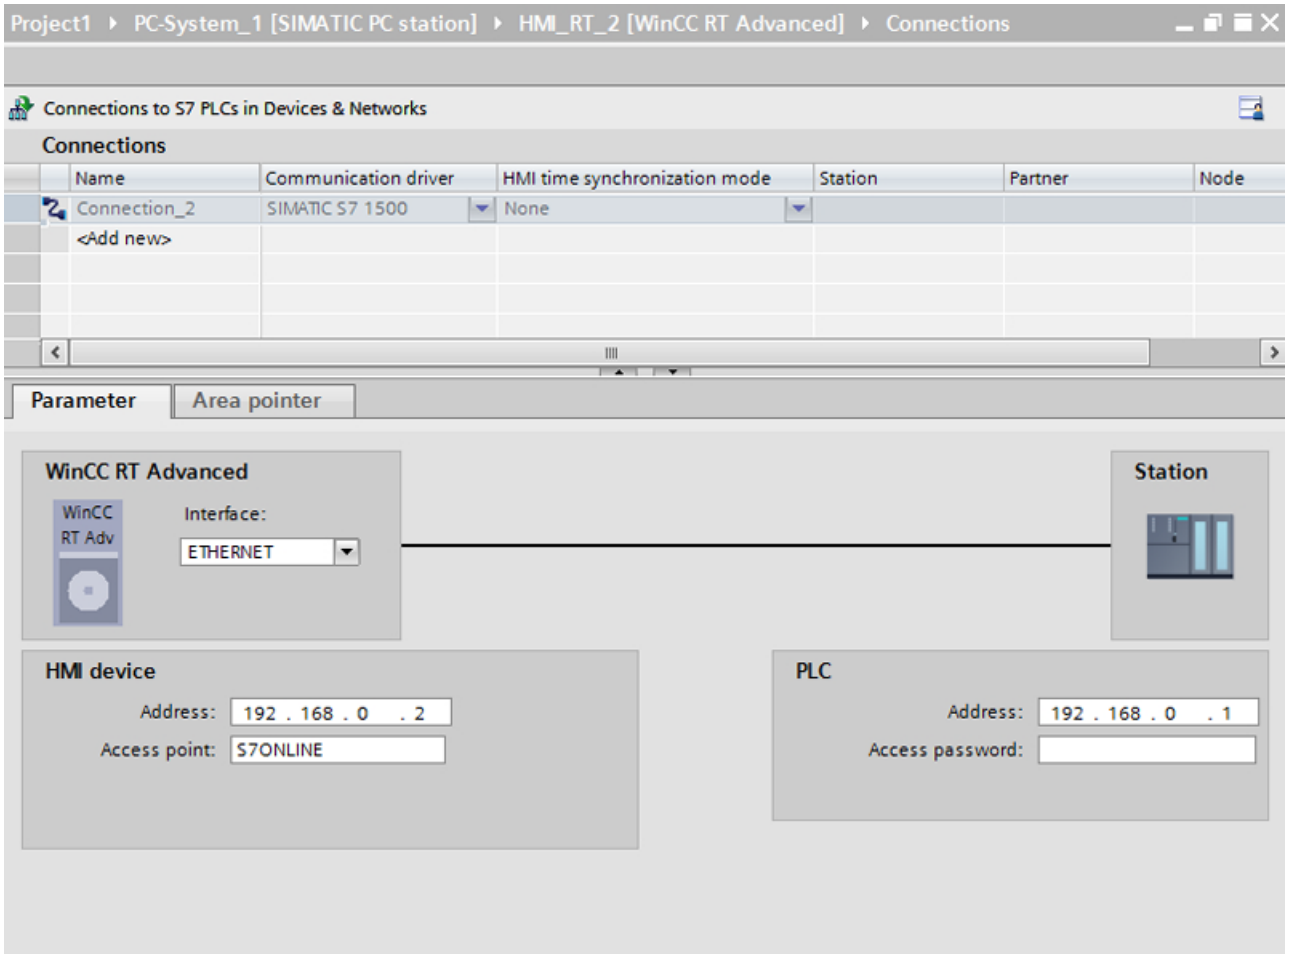
ETHERNET

Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- TCP/IP



HMI device

- "Address"
  Enter the IP address of the HMI device under "Address".
- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Controller

- "Address"
  Enter the IP address of the controller under "Address".
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the controller.

Note

You only need a password if you have set the "Complete protection" protection level at the controller.

No connection to the controller is established if the "Complete protection" protection level is stored on the controller and you do not enter a password.

12.11.9.8 Configuring time synchronization

Time synchronization

Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and than at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

Time synchronization restrictions

Approved HMI devices

You can configure the time synchronization between a SIMATIC S7-1200 or SIMATIC S7-1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0

Device	Operating system
Multi Panel 177	Windows CE 5.0
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

Configuration restrictions

- If an HMI device has several connections to SIMATIC S7-1200 or SIMATIC S7-1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".
- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured.
  Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device.
  This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.
- Time synchronization with SIMATIC S7-1200 (V1.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1200 (V4.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1500 is not possible.

Configuring time synchronization for integrated connections

Introduction

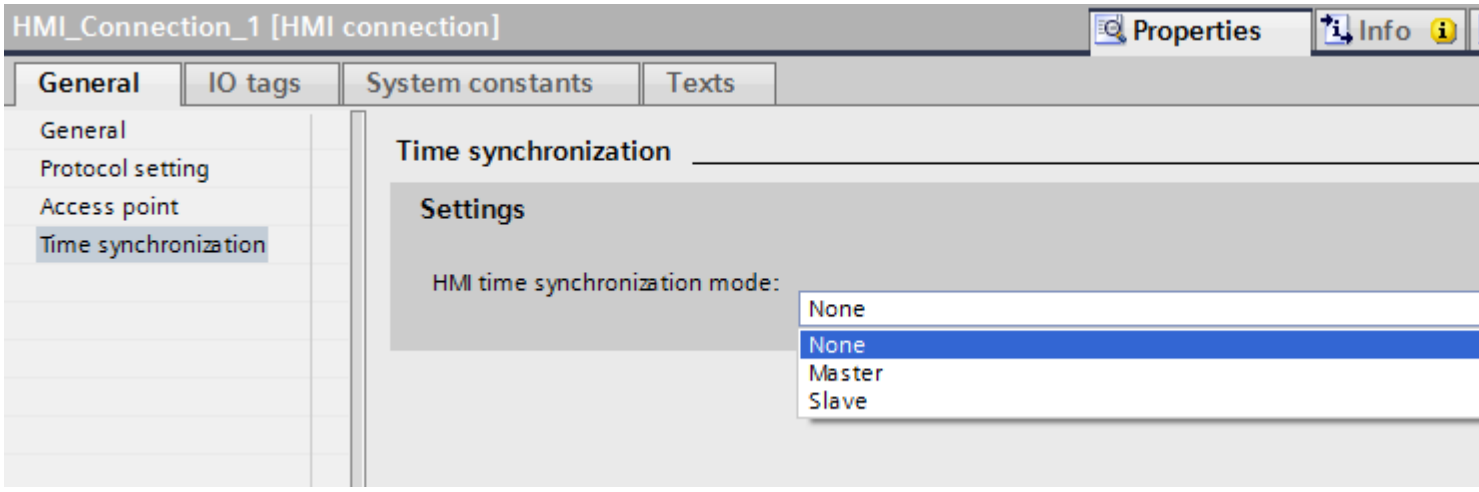
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 or SIMATIC S7 1500 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Configuring time synchronization for non-integrated connections

Introduction

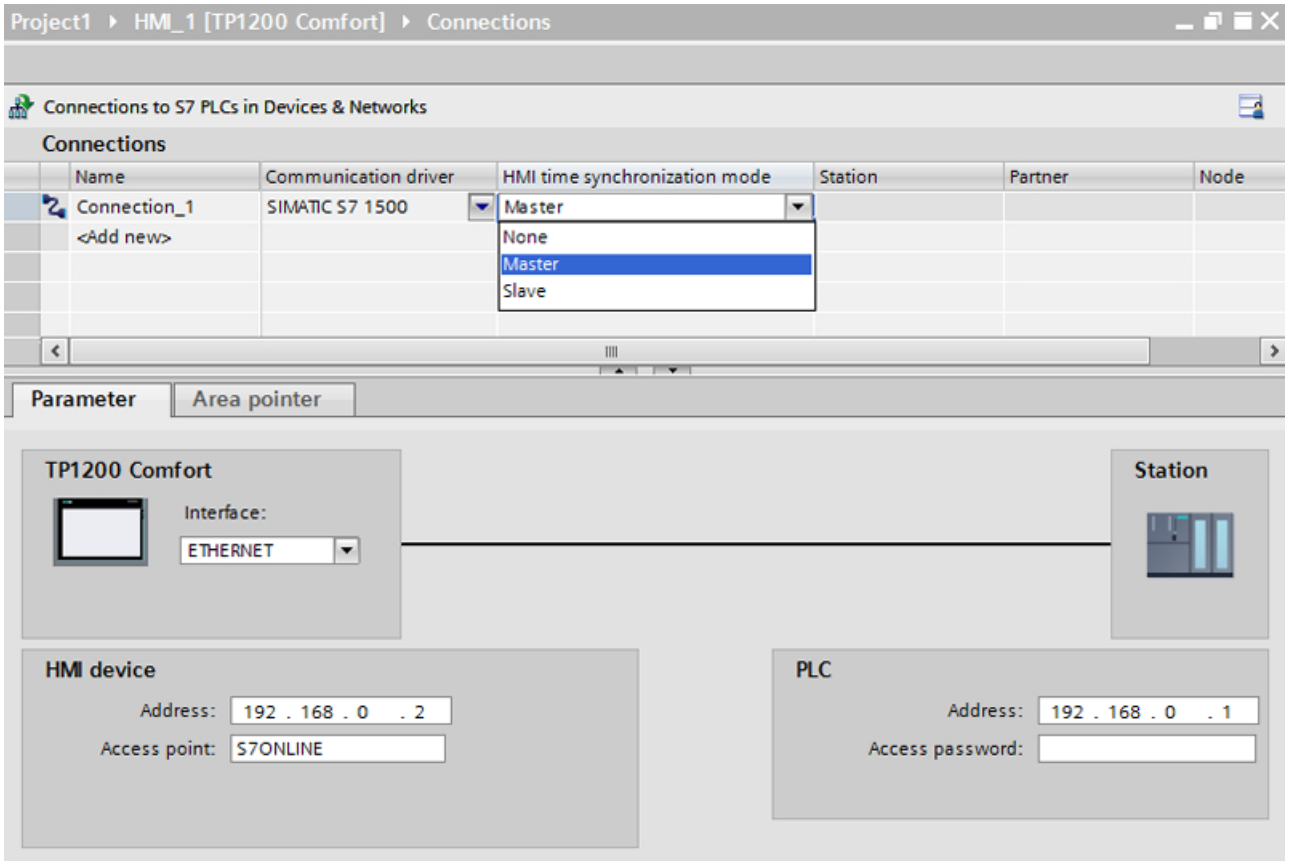
You configure time synchronization for a non-integrated connection in the "Connections" editor.

Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1200" PLC.
3. Select the following in the "HMI time synchronization mode" column:
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



12.11.10 Communicating with SIMATIC ET 200 CPU

12.11.10.1 Communication with SIMATIC ET 200 CPU

Introduction

This section describes the communication between an HMI device and the SIMATIC ET 200 CPU controller.

You can configure the following communication channels for the SIMATIC ET 200 CPU:

- PROFINET
- PROFIBUS

HMI connection for communication

Configure connections between the HMI device and a SIMATIC ET 200 CPU in the "Devices & Networks" editor. If you have configured a HMI device with a serial port, you must configure a PROFIBUS-capable communication module to the ET 200 CPU.

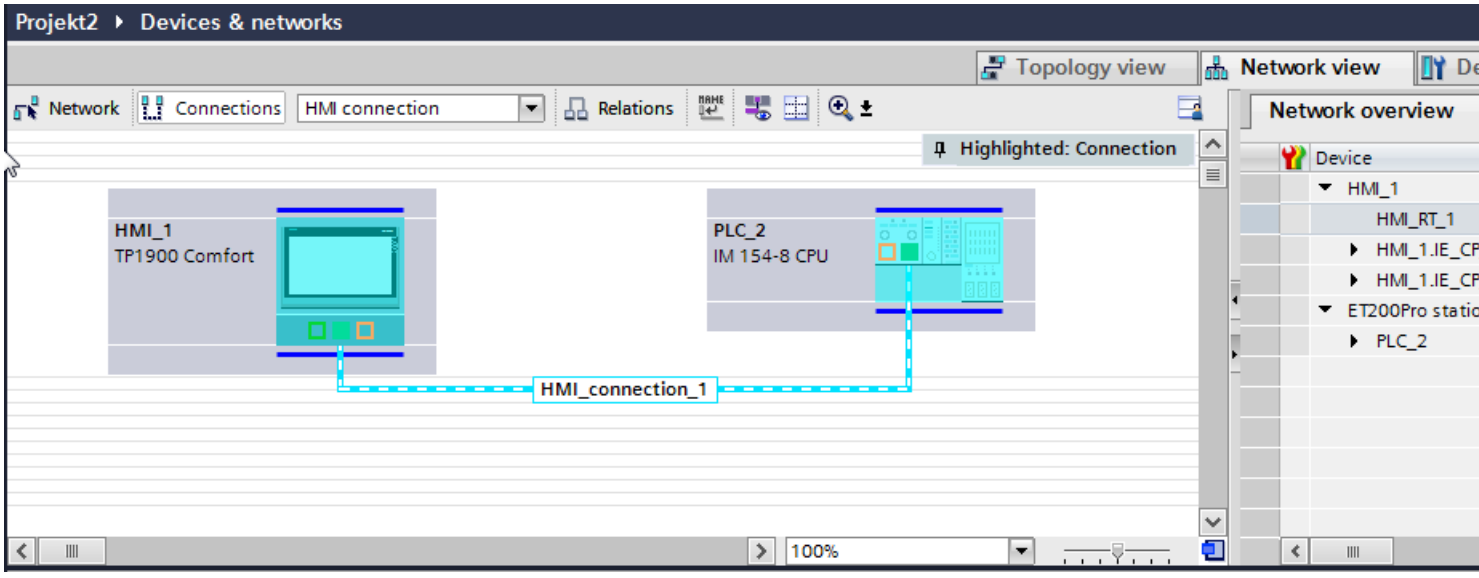
12.11.10.2 Communication via PROFINET

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC ET 200 CPU into the project, you interconnect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to a single SIMATIC ET 200 CPU and multiple SIMATIC ET 200 CPU to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure an HMI connection over PROFINET or Ethernet between HMI devices and a SIMATIC ET 200 CPU in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

Requirements

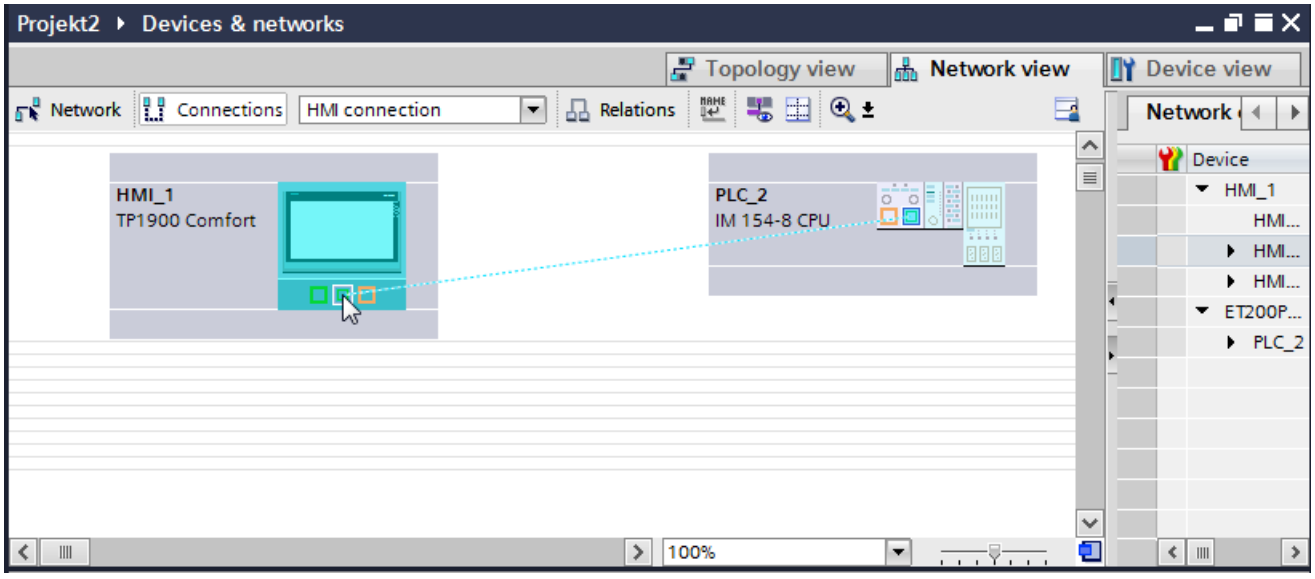
The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC ET 200 CPU with PROFINET interface.

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.



4. Click the connecting line.
5. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the section "PROFINET parameters (Page 6401)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC ET 200 CPU. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This section describes communication over PROFINET between a WinCC Runtime and the SIMATIC ET 200 CPU.

You can use the following WinCC Runtimes as an HMI device:

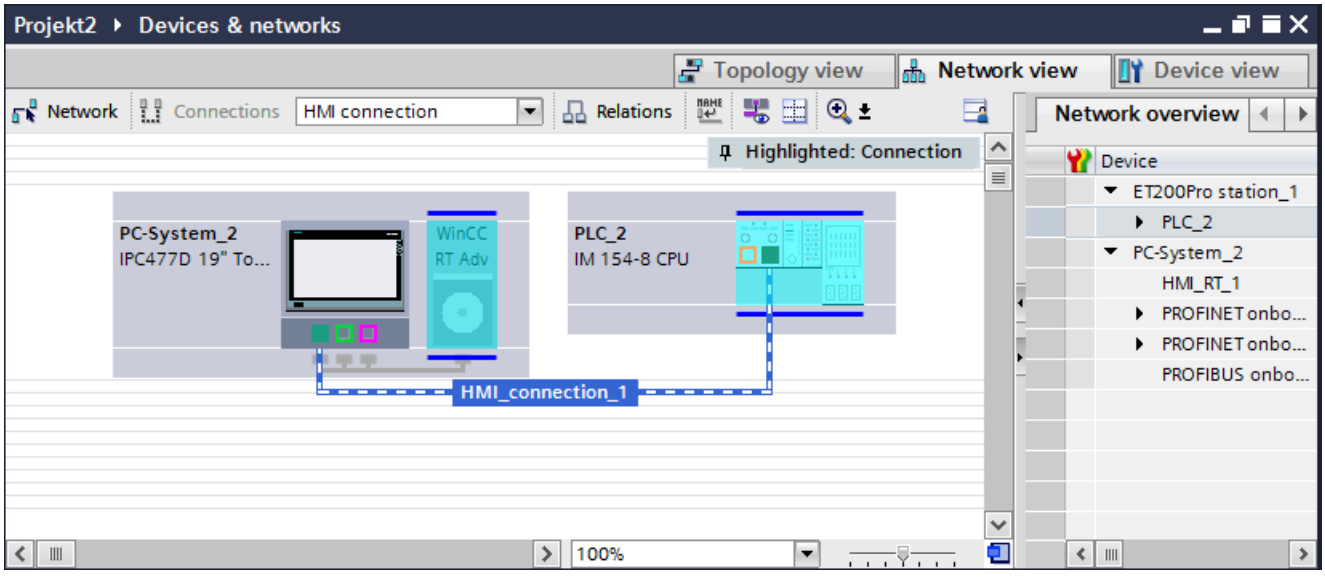
- WinCC RT Advanced
- WinCC RT Professional

WinCC Runtime as HMI device

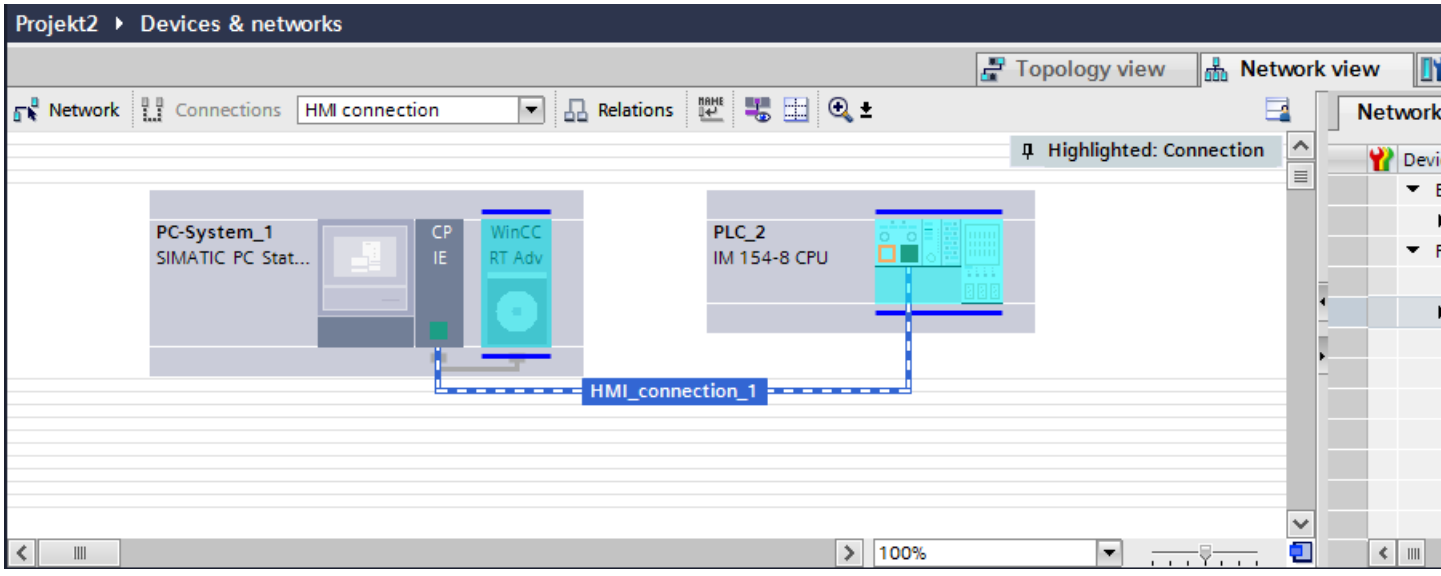
You configure the HMI connections between a WinCC Runtime and SIMATIC ET 200 CPU in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to a single SIMATIC ET 200 CPU and multiple SIMATIC ET 200 CPU to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection over PROFINET or Ethernet between a HMI device and a SIMATIC ET 200 CPU in the "Devices & Networks" editor.

Caution
Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

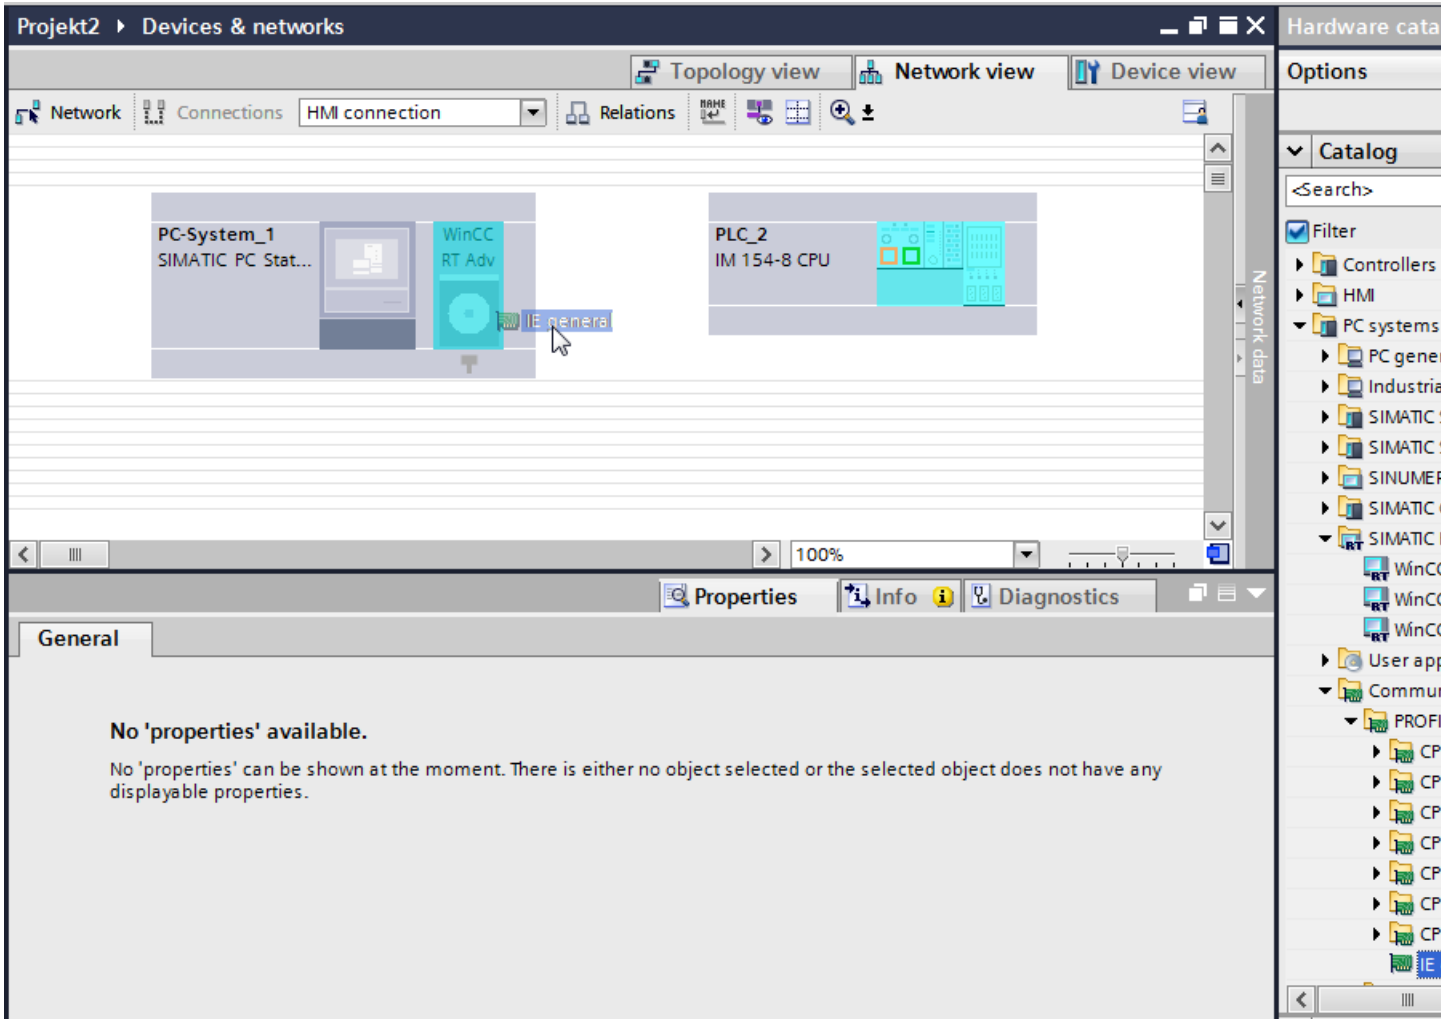
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC ET 200 CPU with PROFINET interface
- PC station with a "WinCC Runtime" application

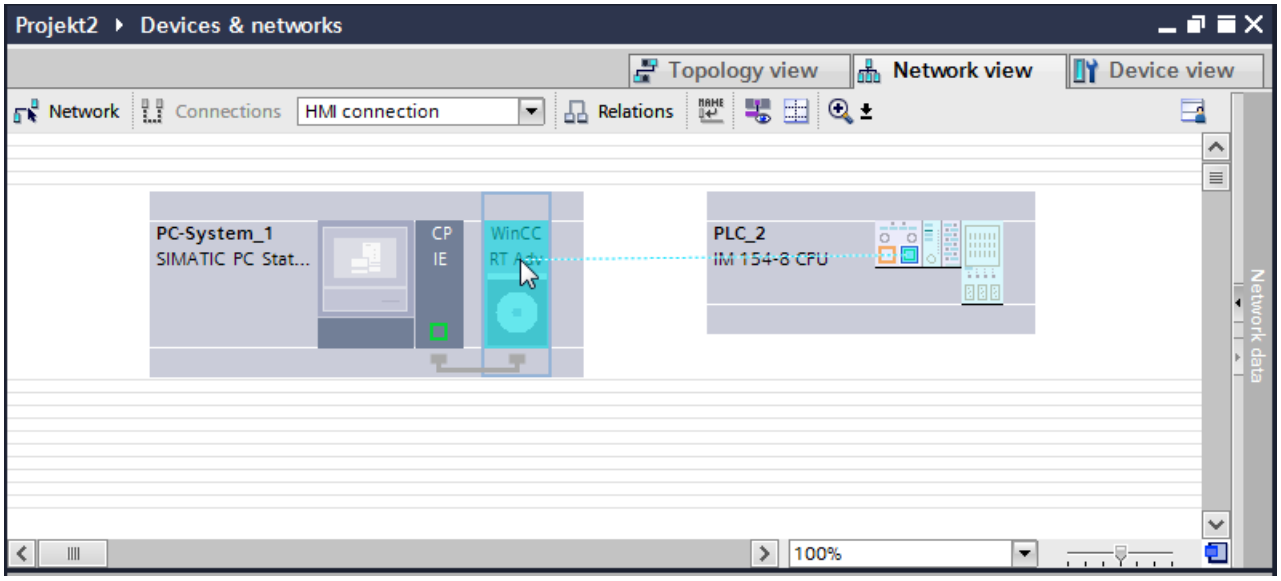
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.



5. Click the connected interface on the PC station and select the entry "PC station" under "Interface assignment" in the Inspector window.
6. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the section "PROFINET parameters (Page 6401)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC ET 200 CPU. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection over PROFINET or Ethernet between a HMI device and SIMATIC ET 200 CPU in the "Devices & Networks" editor.

Caution

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

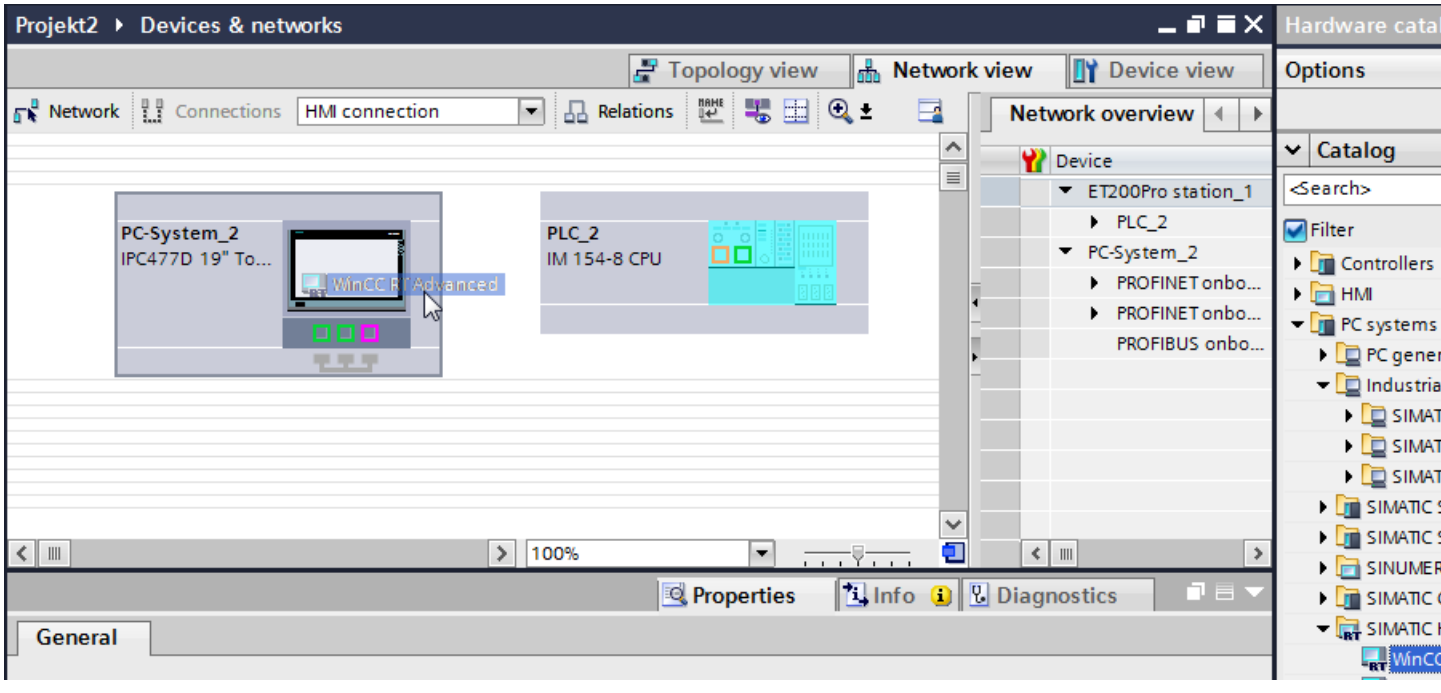
Requirements

The following communication partners are created in the "Devices & Networks" editor:

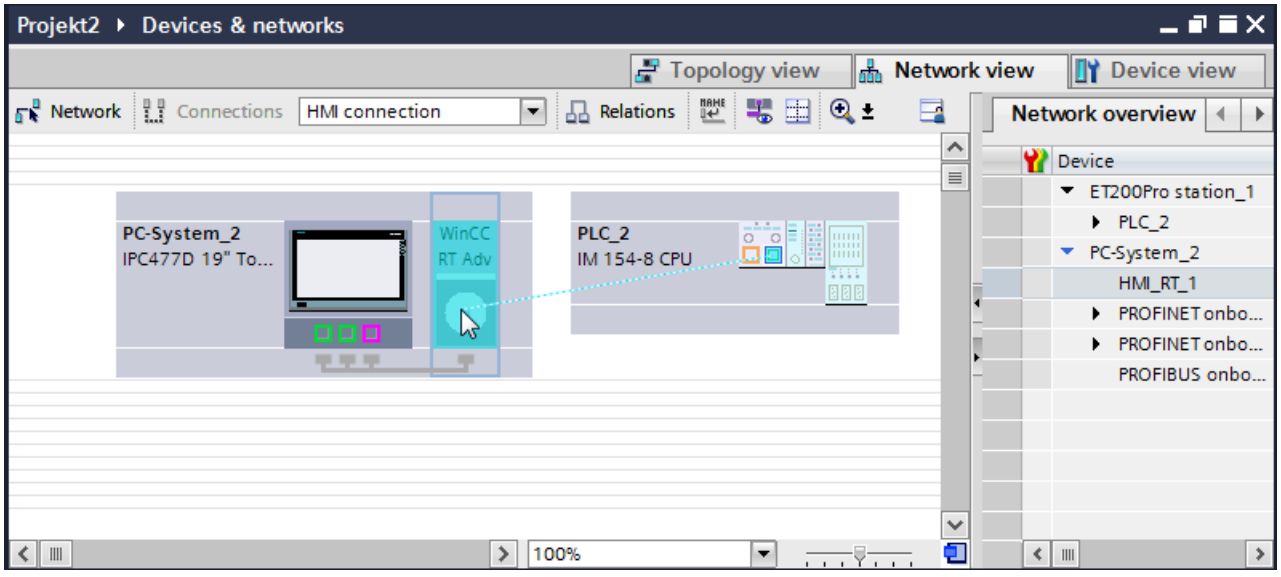
- SIMATIC ET 200 CPU with PROFINET interface
- SIMATIC PC with PROFINET interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the PC.



5. Click the connected interface on the PC station and select the entry "PC station" under "Interface assignment" in the Inspector window.
6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the section "PROFINET parameters (Page 6401)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC ET 200 CPU.

The IP address and subnet mask connection parameters are configured.

PROFINET parameters

PROFINET parameters for the HMI connection

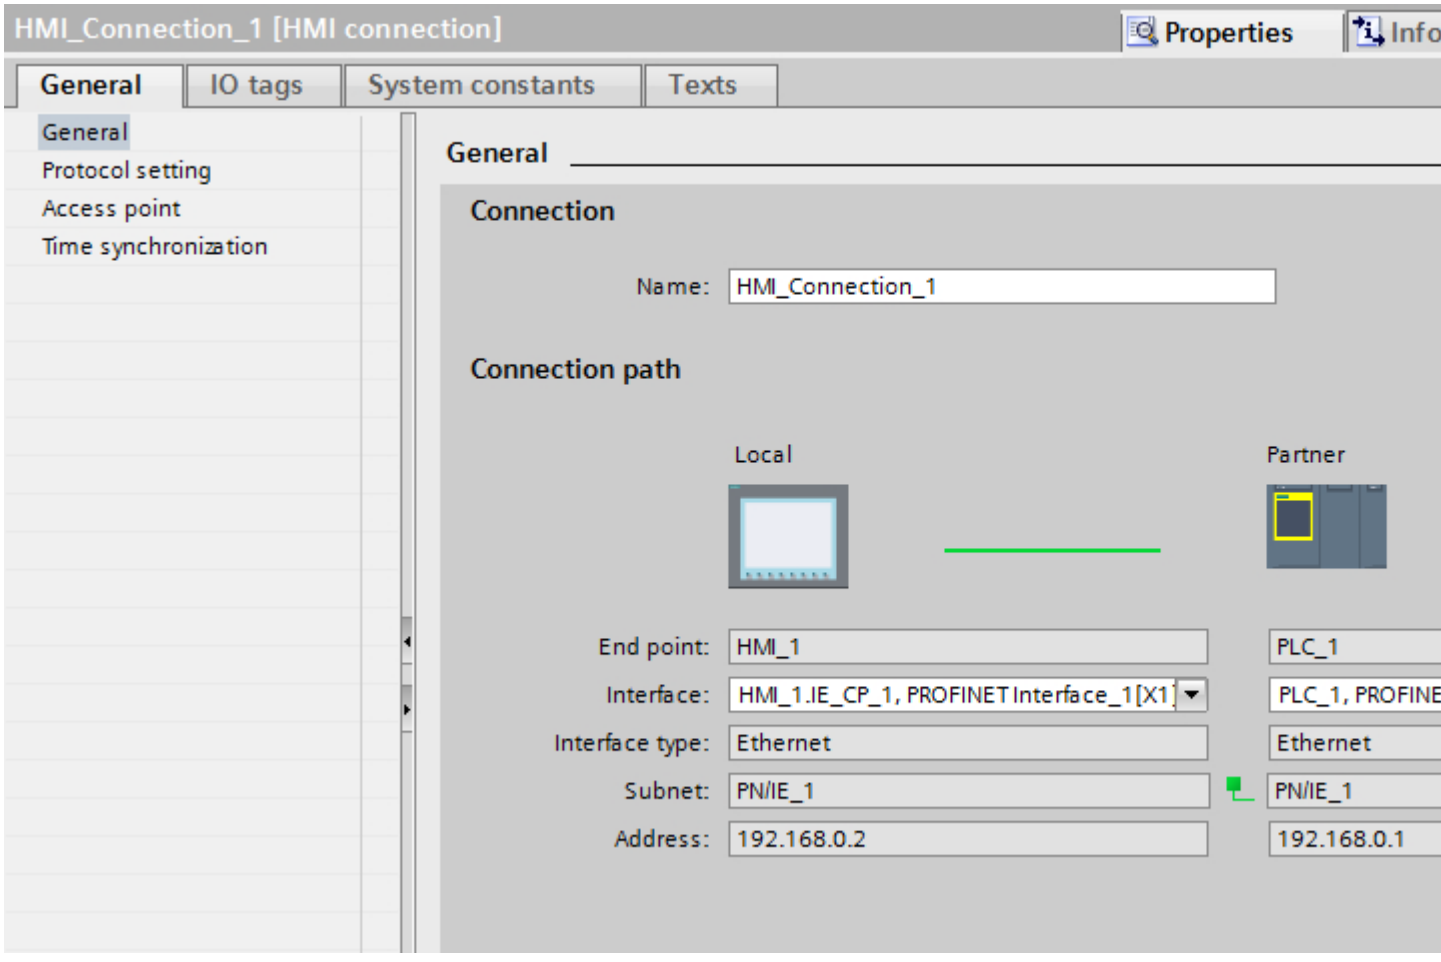
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Shows the name of the HMI connection.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

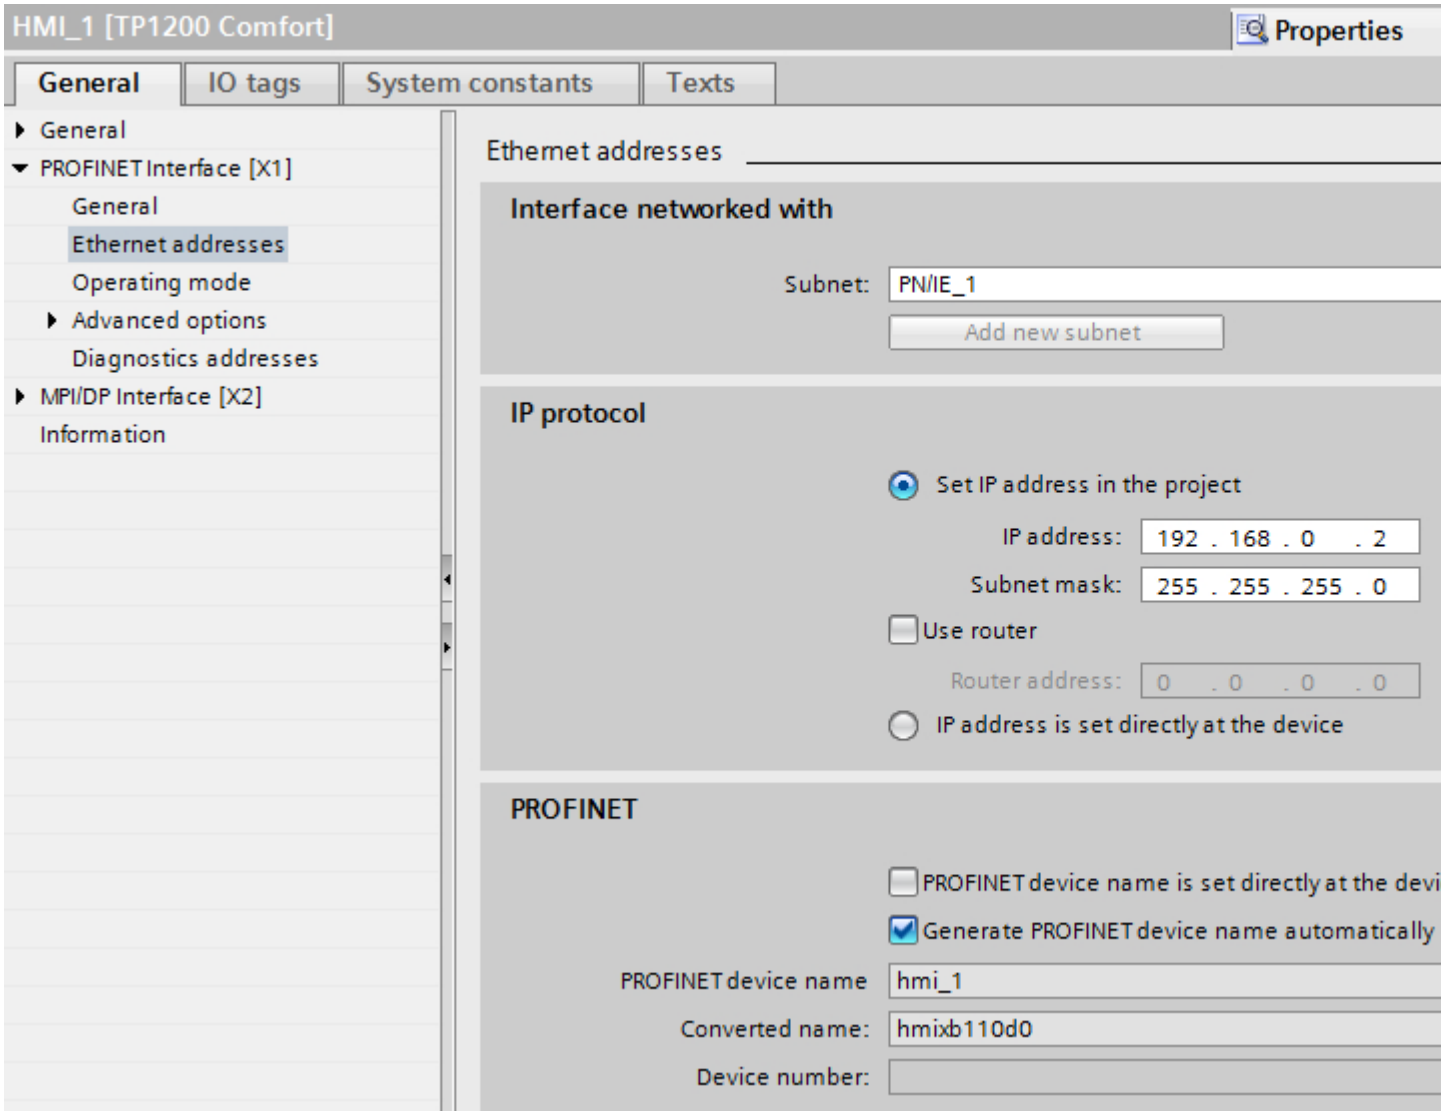
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address directly on the device"
  If the "Set IP address on the device" function is enabled, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

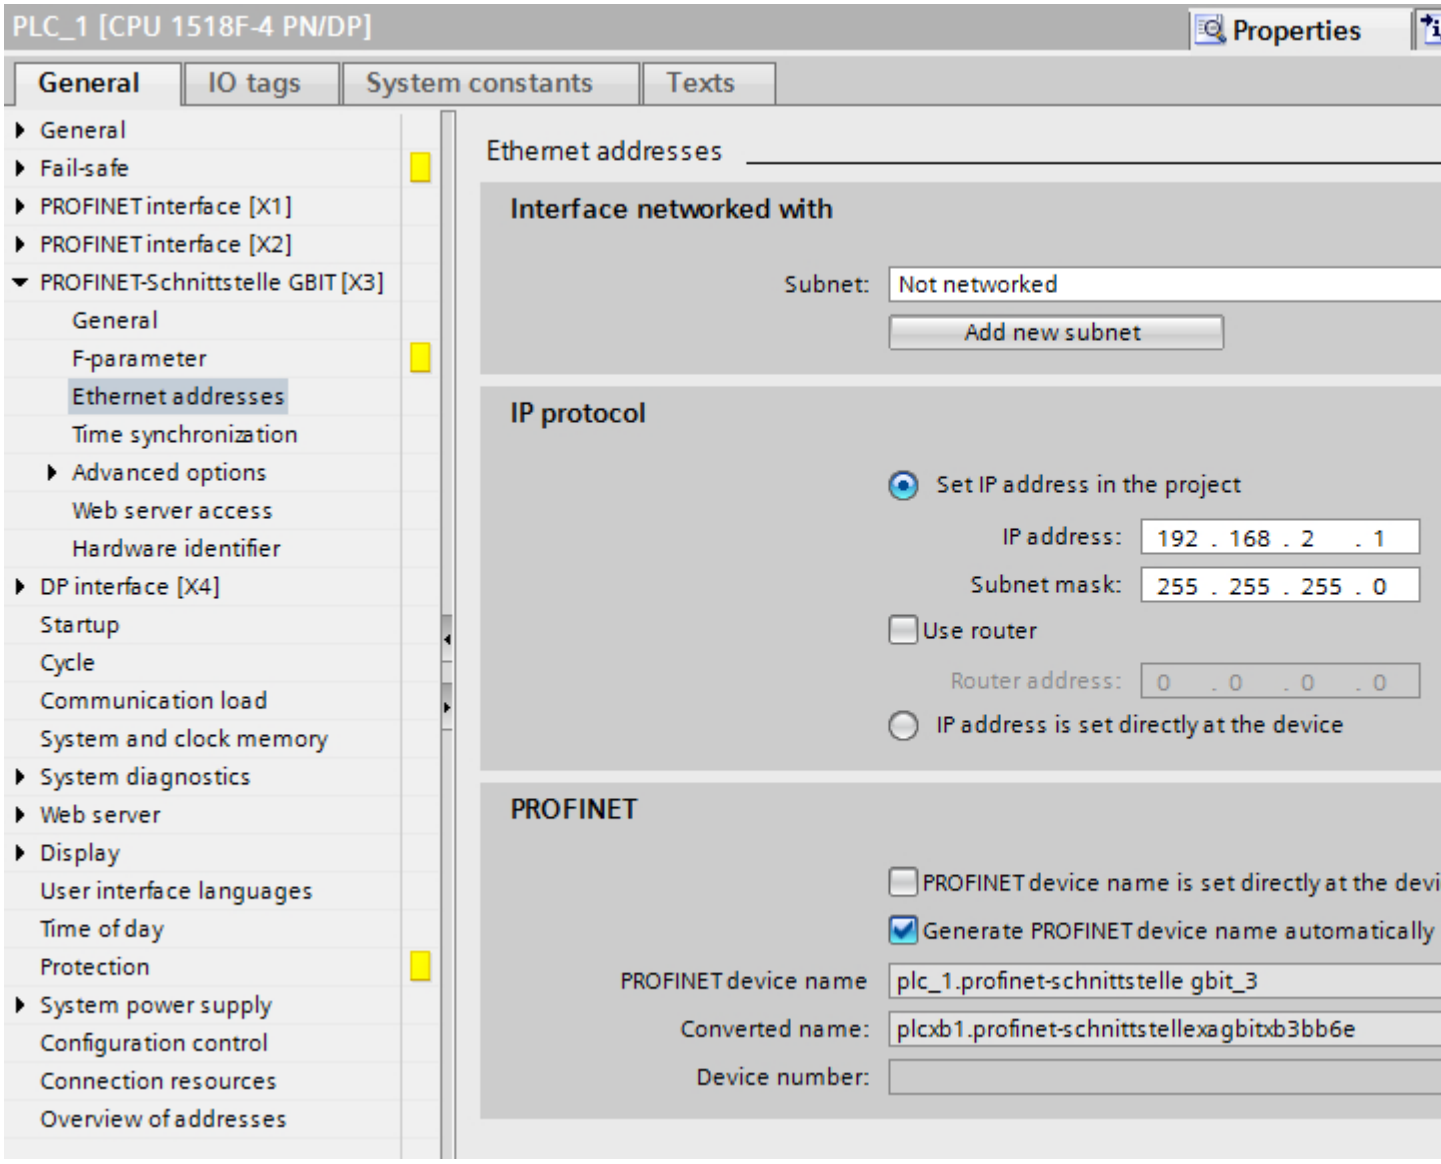
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

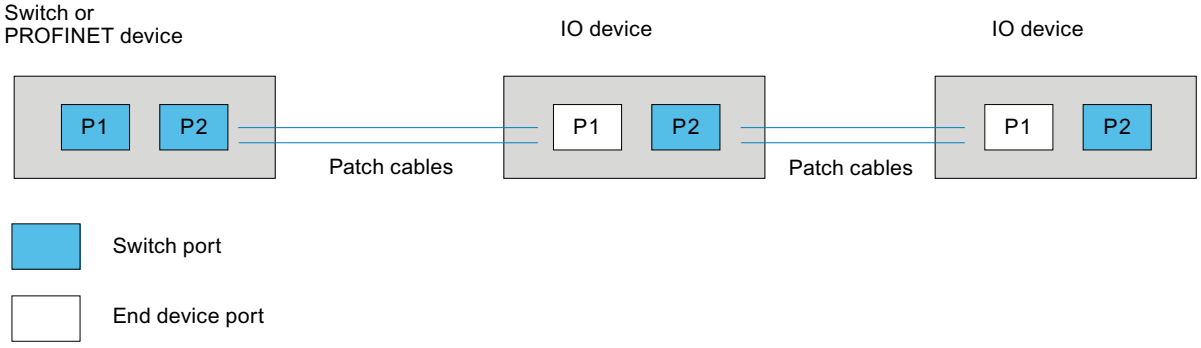
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"
  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"
  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.
  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

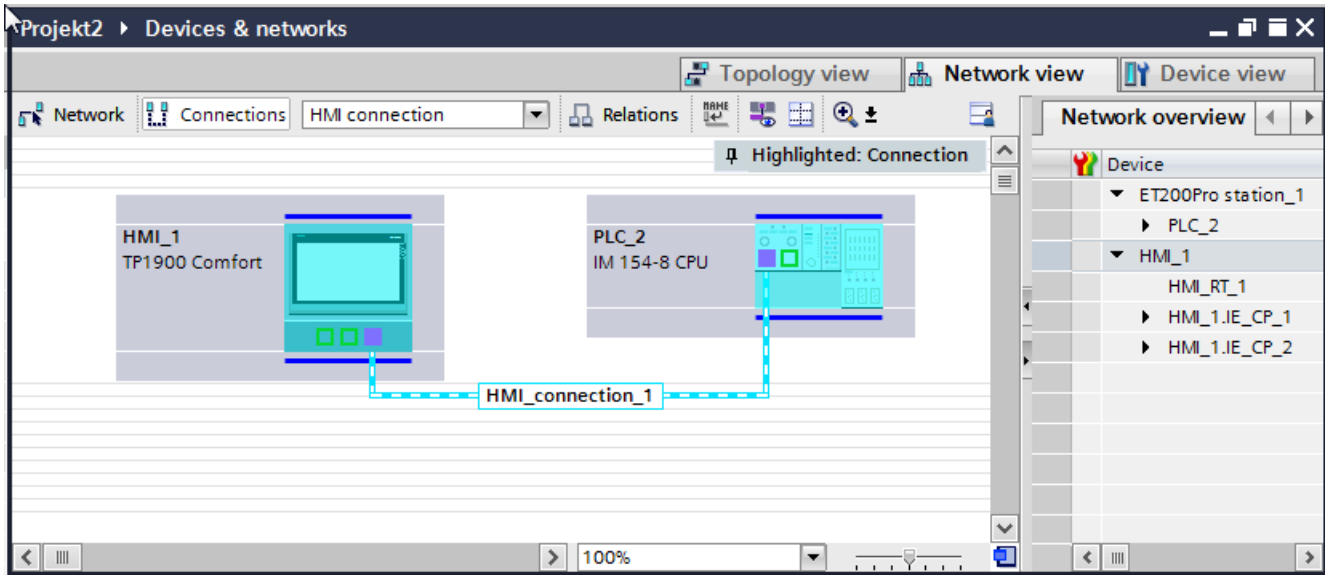
12.11.10.3 Communication via PROFIBUS

Configuring an HMI connection

Communication via PROFIBUS

HMI connections via PROFIBUS

If you want to connect a SIMATIC ET 200 CPU to a HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module to a slot of the controller first.



HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS

Introduction

You configure an HMI connection between HMI devices and a SIMATIC ET 200 CPU via PROFIBUS in the "Devices & Networks" editor.

Requirements

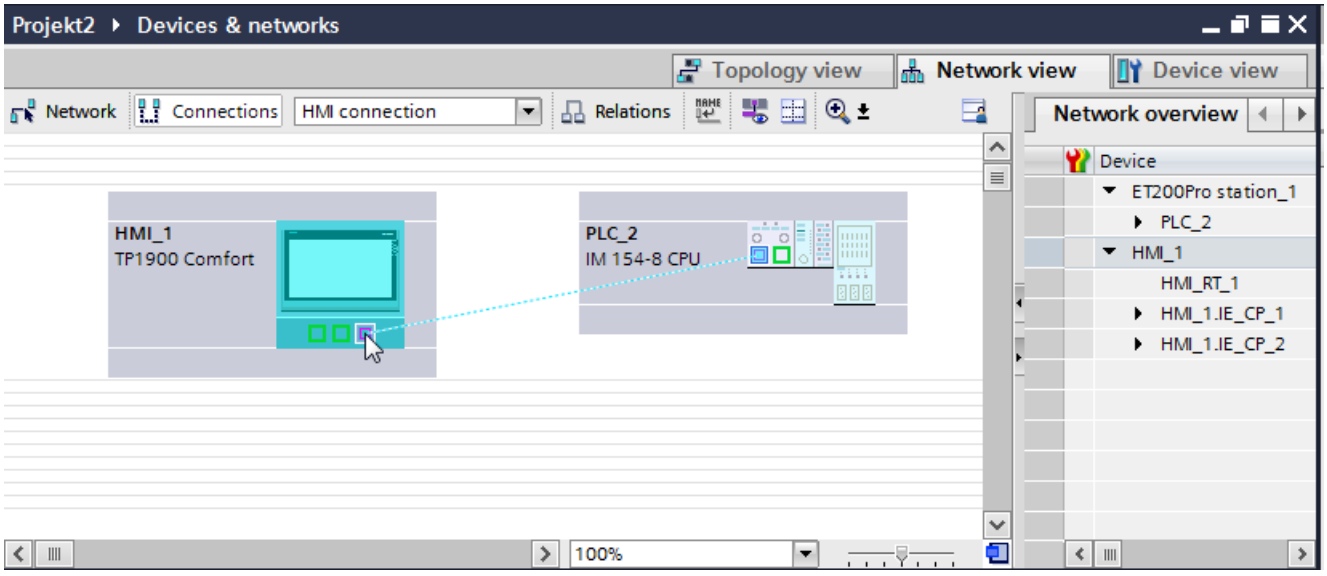
The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC ET 200 CPU

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Click the HMI device interface.
4. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > PROFIBUS address/ MPI address > Parameters".

5. Click the interface of the CPU and use a drag-and-drop operation to draw a connection to the HMI device.



6. Click the name of the connection.
   The connection is displayed graphically in the Inspector window.
7. Click "Highlight HMI connection" and select the HMI connection.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the section "PROFIBUS parameters (Page 6417)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC ET 200 CPU via PROFIBUS.

Configuring an HMI connection

Communication via PROFIBUS

Communication via PROFIBUS

This section describes the communication between a WinCC Runtime and the SIMATIC ET 200 CPU controller via PROFIBUS.

You can use the following WinCC Runtimes as an HMI device:

- WinCC RT Advanced
- WinCC RT Professional

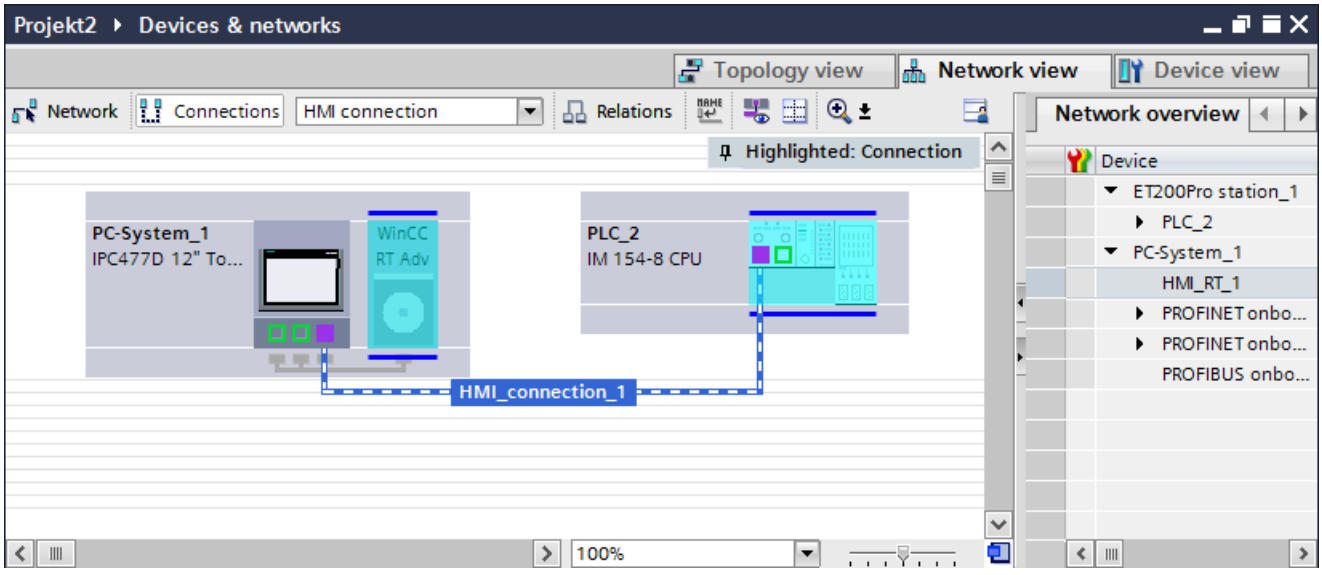
If you want to connect a SIMATIC ET 200 CPU to a HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module to a slot of the controller.

WinCC Runtime as HMI device

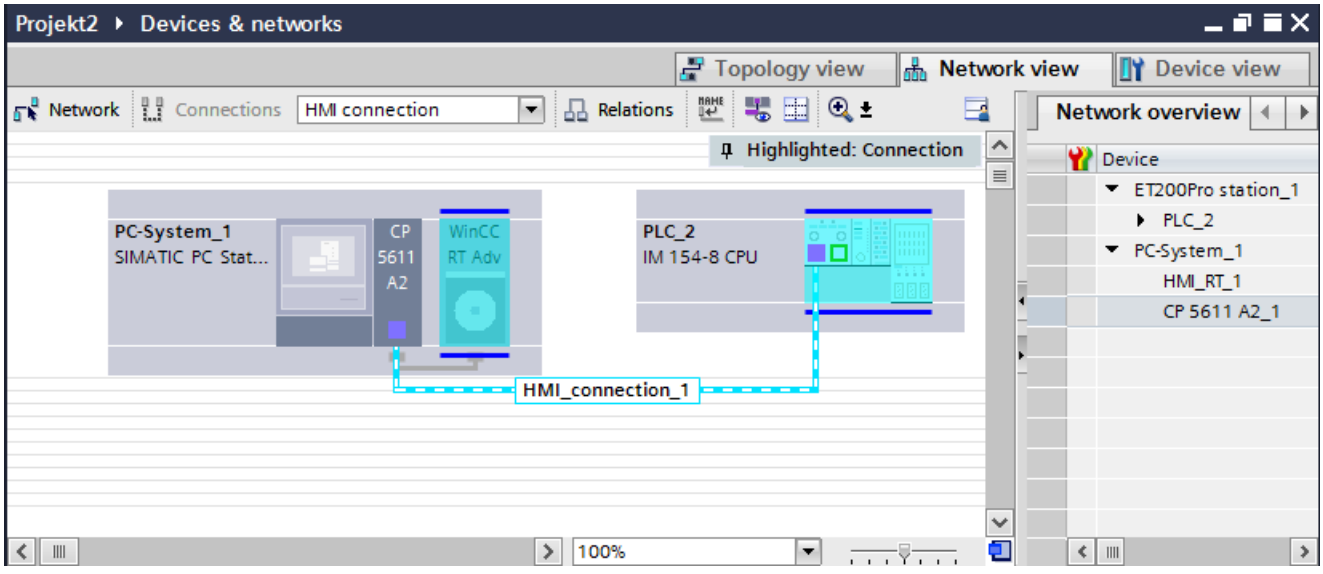
Configure the HMI connections between WinCC Runtime and SIMATIC ET 200 CPU in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to a single SIMATIC ET 200 CPU and multiple SIMATIC ET 200 CPU to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC ET 200 CPU via PROFIBUS in the "Devices & Networks" editor.

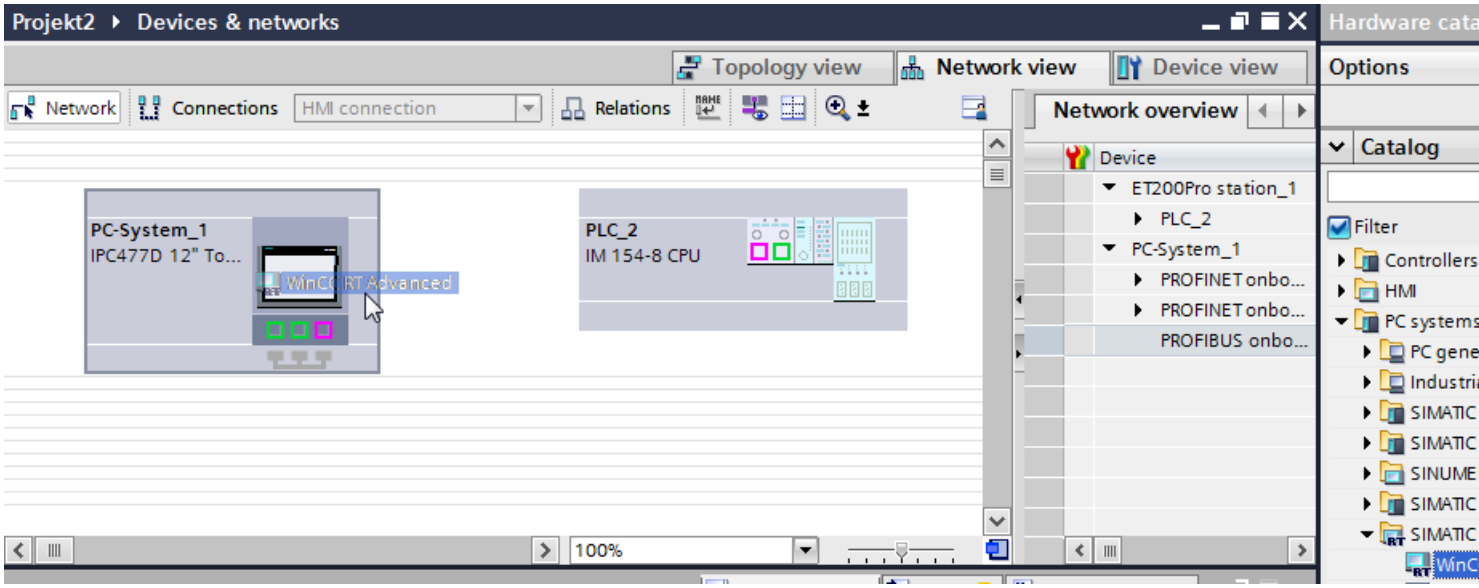
Requirements

The following communication partners are created in the "Devices & Networks" editor:

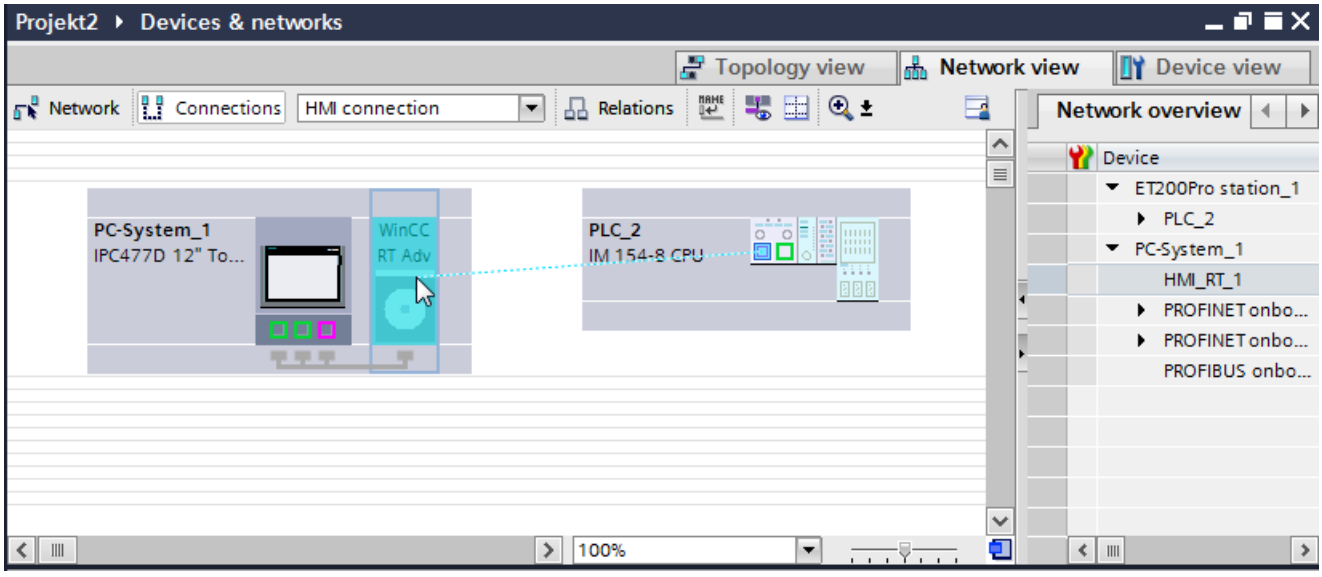
- SIMATIC ET 200 CPU
- SIMATIC PC with PROFIBUS interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
4. Click the PROFIBUS interface of the CPU and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the section "PROFIBUS parameters (Page 6417)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab.

You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC ET 200 CPU via PROFIBUS.

Configuring an HMI connection via PROFIBUS with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC ET 200 CPU via PROFIBUS in the "Devices & Networks" editor.

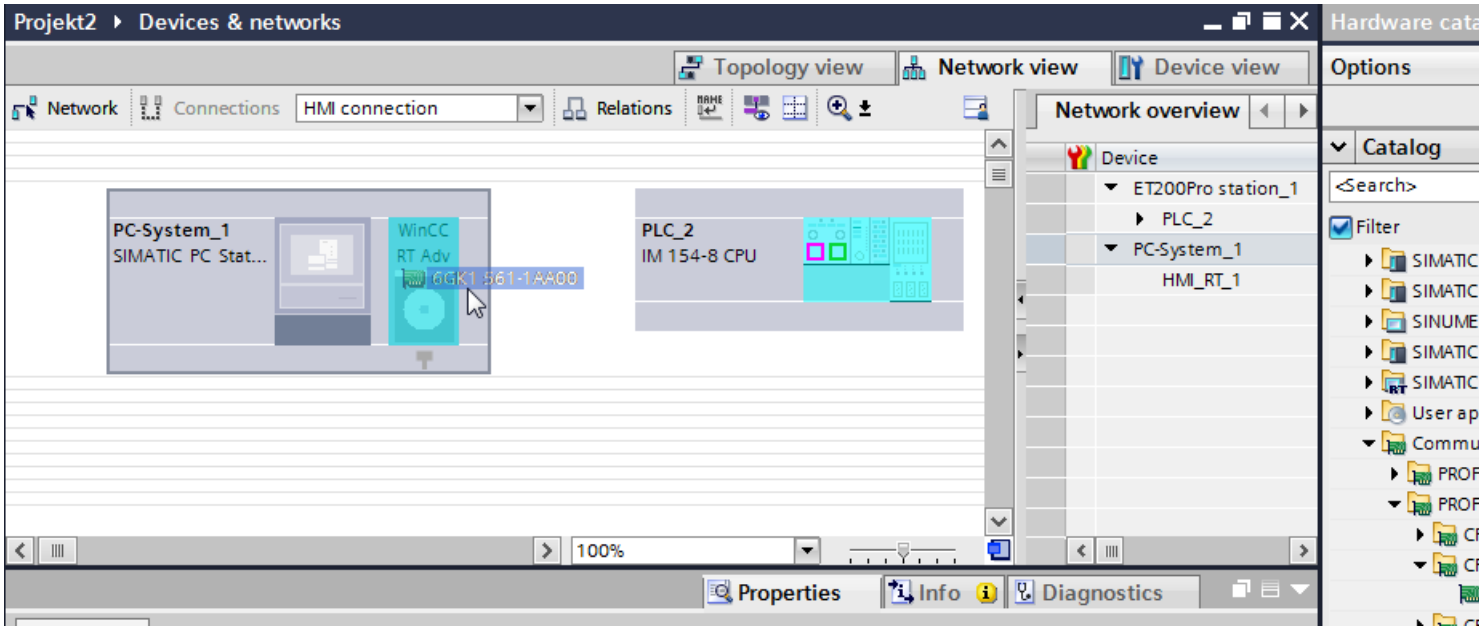
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC ET 200 CPU
- PC station with a WinCC RT Advanced or WinCC RT Professional

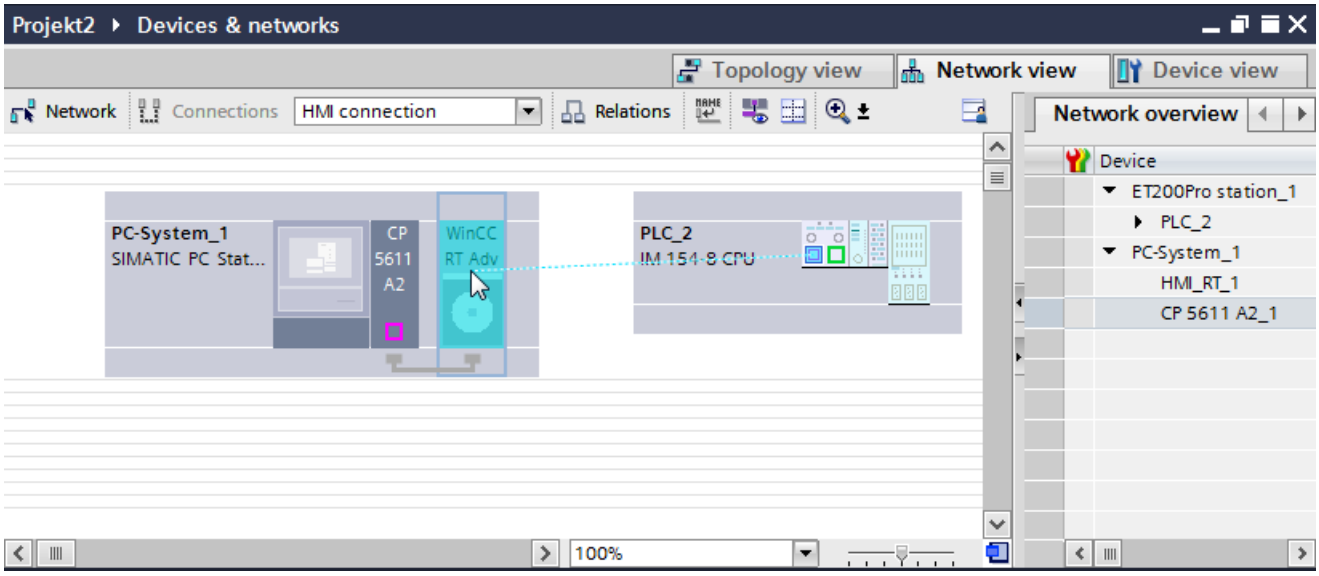
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.
3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.



4. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

5. Click the PROFIBUS interface of the communication module and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the section "PROFIBUS parameters (Page 6417)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab.

You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC ET 200 CPU via PROFIBUS.

PROFIBUS parameters

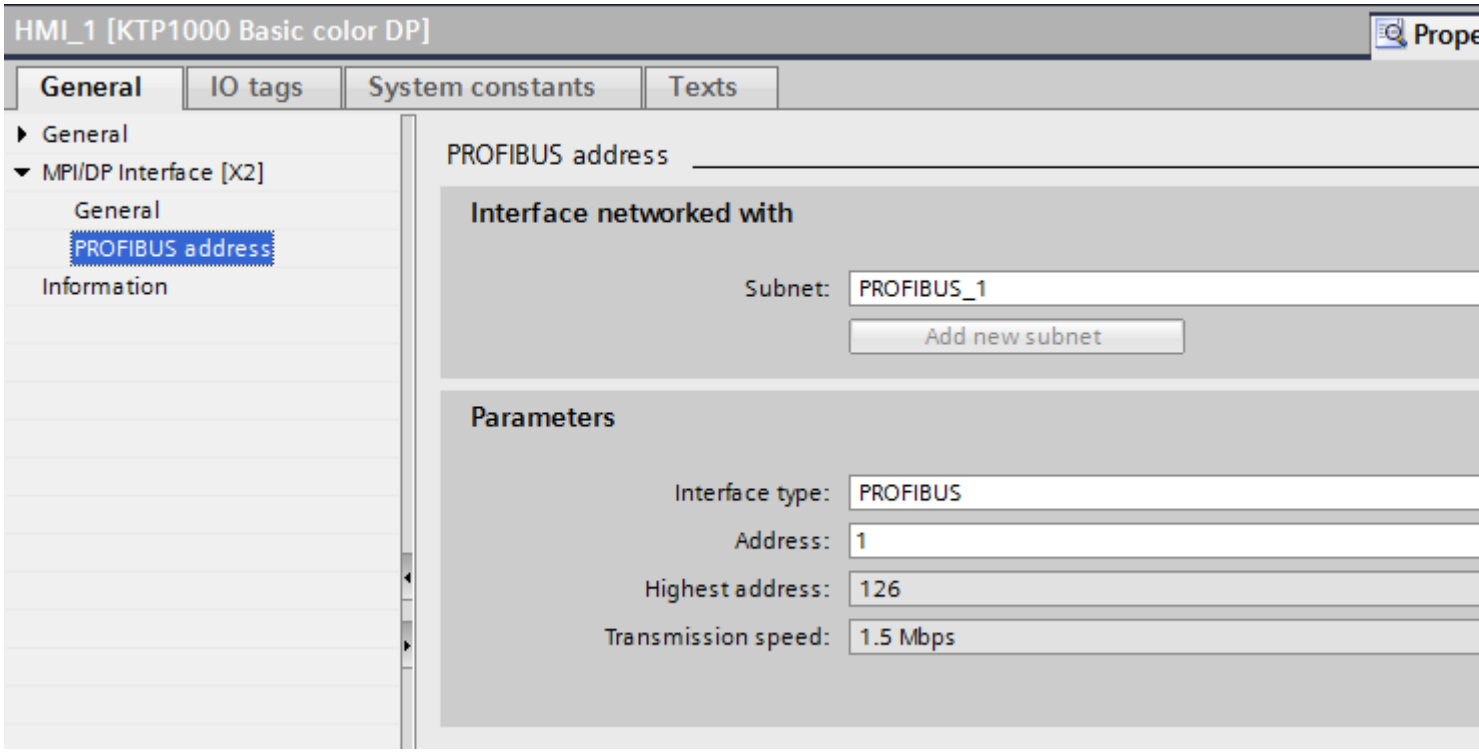
PROFIBUS parameters for the HMI device

PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFIBUS parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

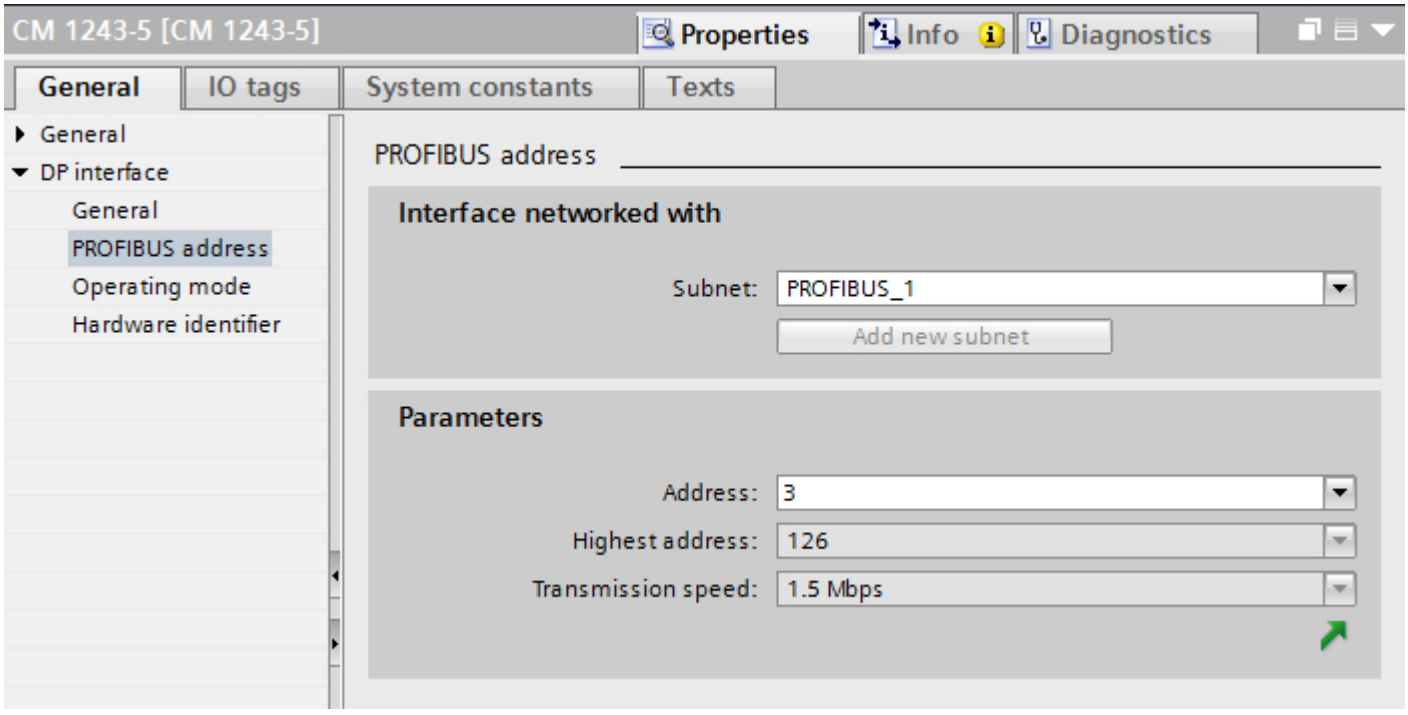
PROFIBUS parameters for the PLC

PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.

- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

PROFIBUS parameters for the HMI connection

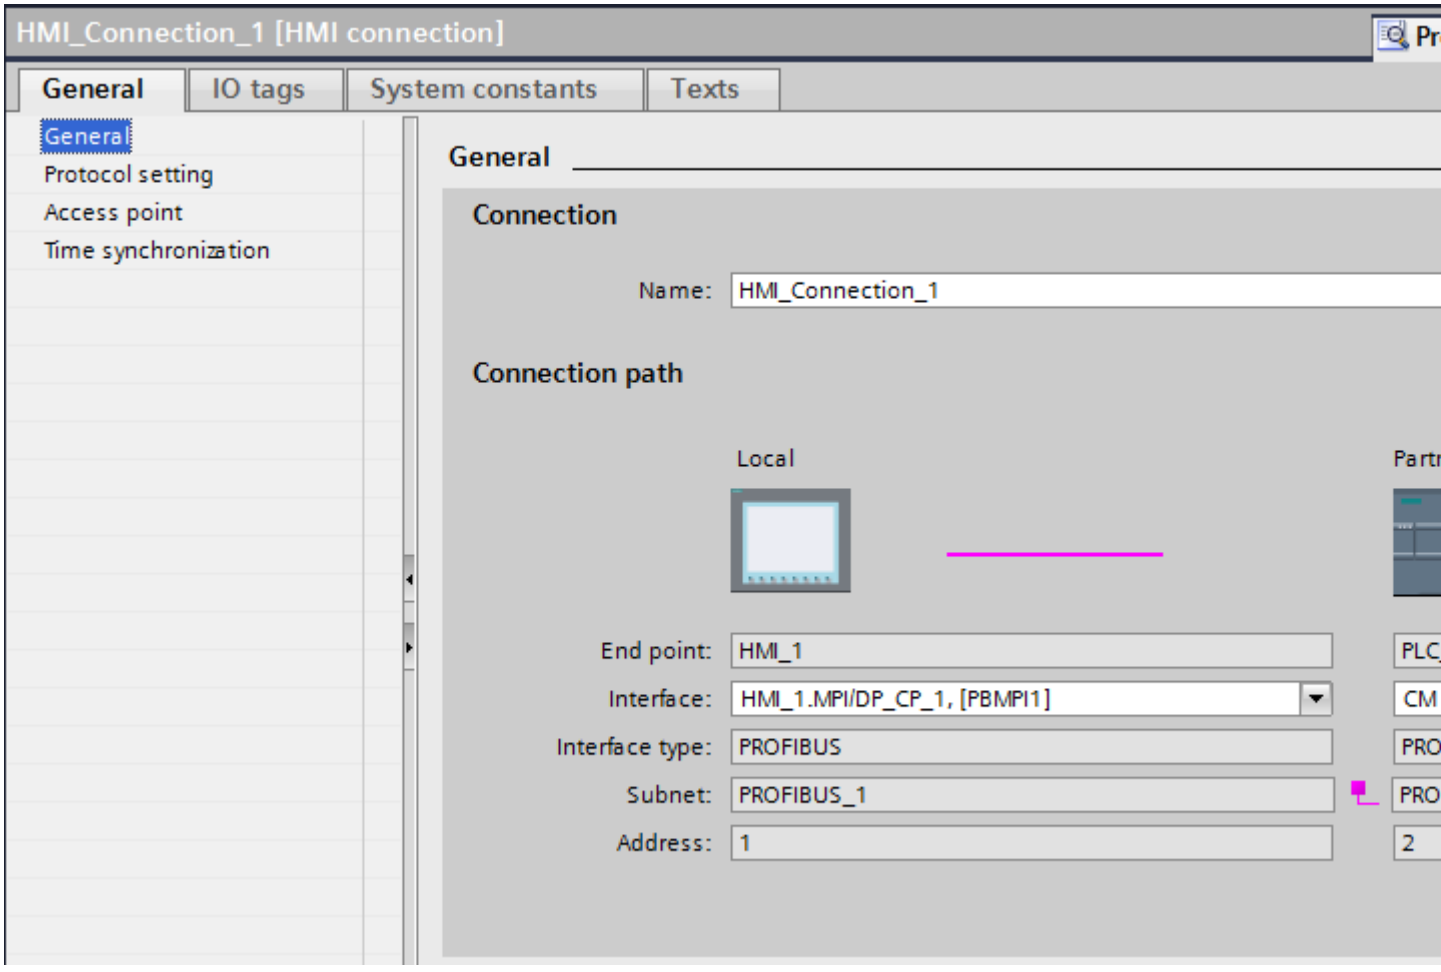
PROFIBUS parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and editing HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

The "Connection" area displays the HMI connection created for communication between the devices.

You can edit the name of the HMI connection in this area.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"

Displays the selected interface type. This area cannot be edited.

- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the PROFIBUS address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

12.11.10.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Auto-Hotspot

Area pointer "Date/time"

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Permitted data types

You can use the following data types when you configure the "Date/Time" area pointer:

- Int
- UInt
- Word
- DTL

Use of the "DTL" data type

Use of data type "DTL" with communication driver S7-1200.

A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

The "DTL" data type supports time information down to the nanosecond range. Because panels only support time information down to the millisecond, you may encounter the following restriction when using the area pointers:

For the transmission of time information from a panel to the controller, the smallest unit of time is 1 millisecond. The value range from microseconds to nanoseconds of the "DTL" data type is filled with zeros.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the date/time area pointer PLC to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Permitted data types

You can use the following data types when you configure the "Date/Time PLC" area pointer:

- DTL

Use of the "DTL" data type

Use of data type "DTL" with communication driver S7-1200. A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			

Byte	Component	Data type	Value range
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

The HMI devices do not support the use of nanoseconds. Values in the nanosecond range will be ignored during processing in Runtime.

The "DTL" data type supports time information down to the nanosecond range. Because panels only support time information down to the millisecond, you may encounter the following restriction when using the area pointers:

For the transmission of time information from a controller to a panel, the range from microseconds to nanoseconds is ignored. The time information is processed on the panel down to milliseconds.

Area pointer "Coordination"

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

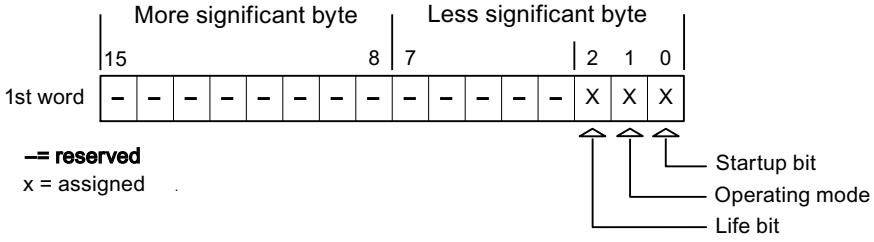
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

Processing in the PLC

For a simpler evaluation in the PLC program, use a Bool array for this area pointer when using the SIMATIC S7 1200 communication driver. You will have to map the complete 16-bit word of the area pointer. Configure a tag of the data type "Array [0 .. 15] of bool" for this purpose.

Permitted data types

You can use the following data types when you configure the "Coordination" area pointer.

- Word
- UInt
- Bool

Area pointer "Screen number"

Function

The HMI devices store information about the screen called up on the HMI device in the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. Certain reactions can be triggered in the PLC, such as the call of a different screen.

Use

Before the "Screen number" area pointer can be used, it must be set up and activated by selecting "Communication ▸ Area pointer". You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1. Word	Current screen type															
2. Word	Current screen number															
3. Word	Reserved															
4th word	Current field number															
5. Word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

Note

Device dependency

Permanent windows are not available on Basic Panels.

Permitted data types

You can use the following data types when you configure the "Screen number" area pointer.

- Word
- UInt

Area pointer "Project ID"

Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program.

A missing compatibility results in a corresponding alarm and Runtime will not be started.

Use

Note

HMI connections cannot be switched "online".

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- This is where you select the PLC tag or the tag array that you have configured as the data area for the area pointer.

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

Permitted data types

You can use the following data types when you configure the "Project ID" area pointer.

- Word
- UInt

Area pointer "Job mailbox"

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Set date (BCD-coded)**	

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Clear event buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Clear error alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Display selection**	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1)]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only devices supporting recipes
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.

Permitted data types

You can use the following data types when you configure the "Screen number" area pointer:

- Word
- UInt

"Data record" area pointer

"Data mailbox" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data mailbox

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a job mailbox, the data in the recipe view will be updated as well. Avoid operating the recipe view while job mailboxes for transfer of data records are being triggered. If you have already started editing a data record and a job mailbox is triggered for transfer of data records, then this job mailbox will be rejected.

Permitted data types

You can use the following data types when you configure the "Data record" area pointer.

- Word
- UInt

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. Use this mechanism to prevent uncontrolled overwriting of data in either direction of your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Connections ▸ Area pointer" editor.
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transfer is busy
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe display

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data mailbox and sets the data record number to 0.	Abort with system alarm.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data mailbox.	Abort with system alarm.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data mailboxes from the PLC to the HMI device. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox no. 70 transfers data mailboxes from the HMI device to the PLC. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device reads the values and stores the values in the data record specified in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed". • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the job from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The PLC program can now evaluate the transferred data. To allow further transfers, the PLC program must set the status word to 0 again.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	

Step	Action	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data mailbox.

Note

Availability for specific devices

Notes in the status bar of the recipe view are not available in Basic Panels.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

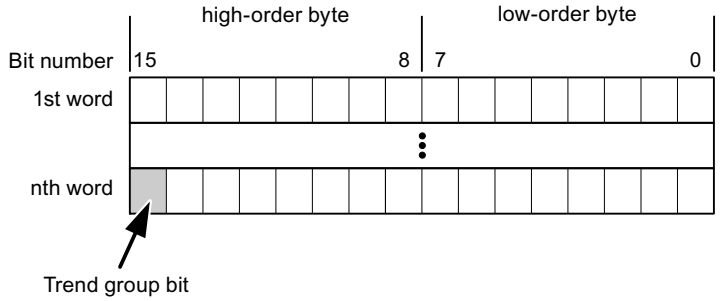
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Auto-Hotspot

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

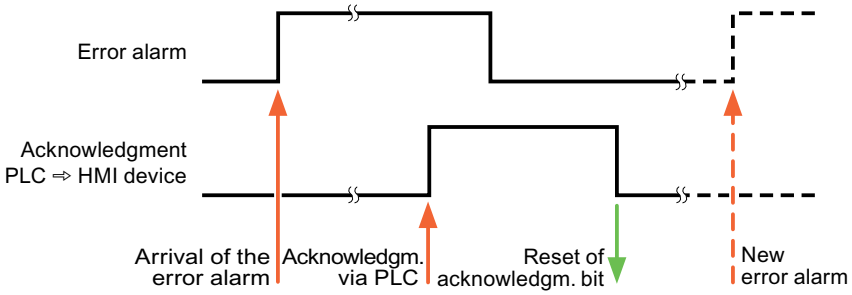
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

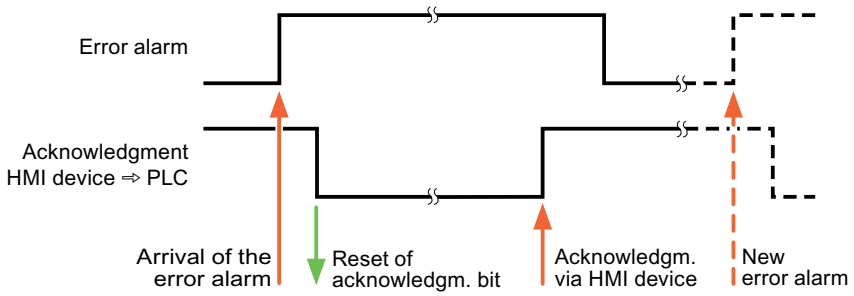
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

DTL	8 bytes
LDT	8 bytes

12.11.10.6 Configuring connections in the "Connections" editor

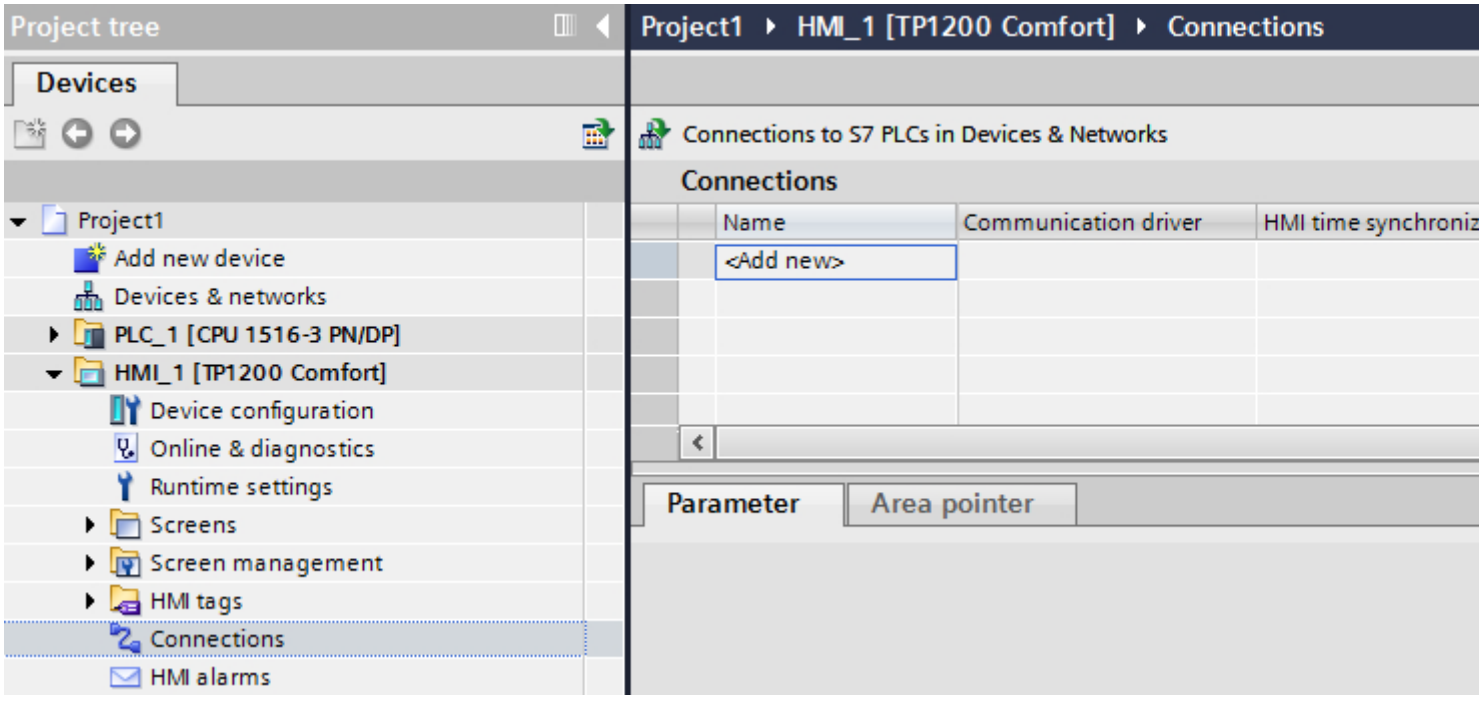
Creating a PROFINET connection

Requirements

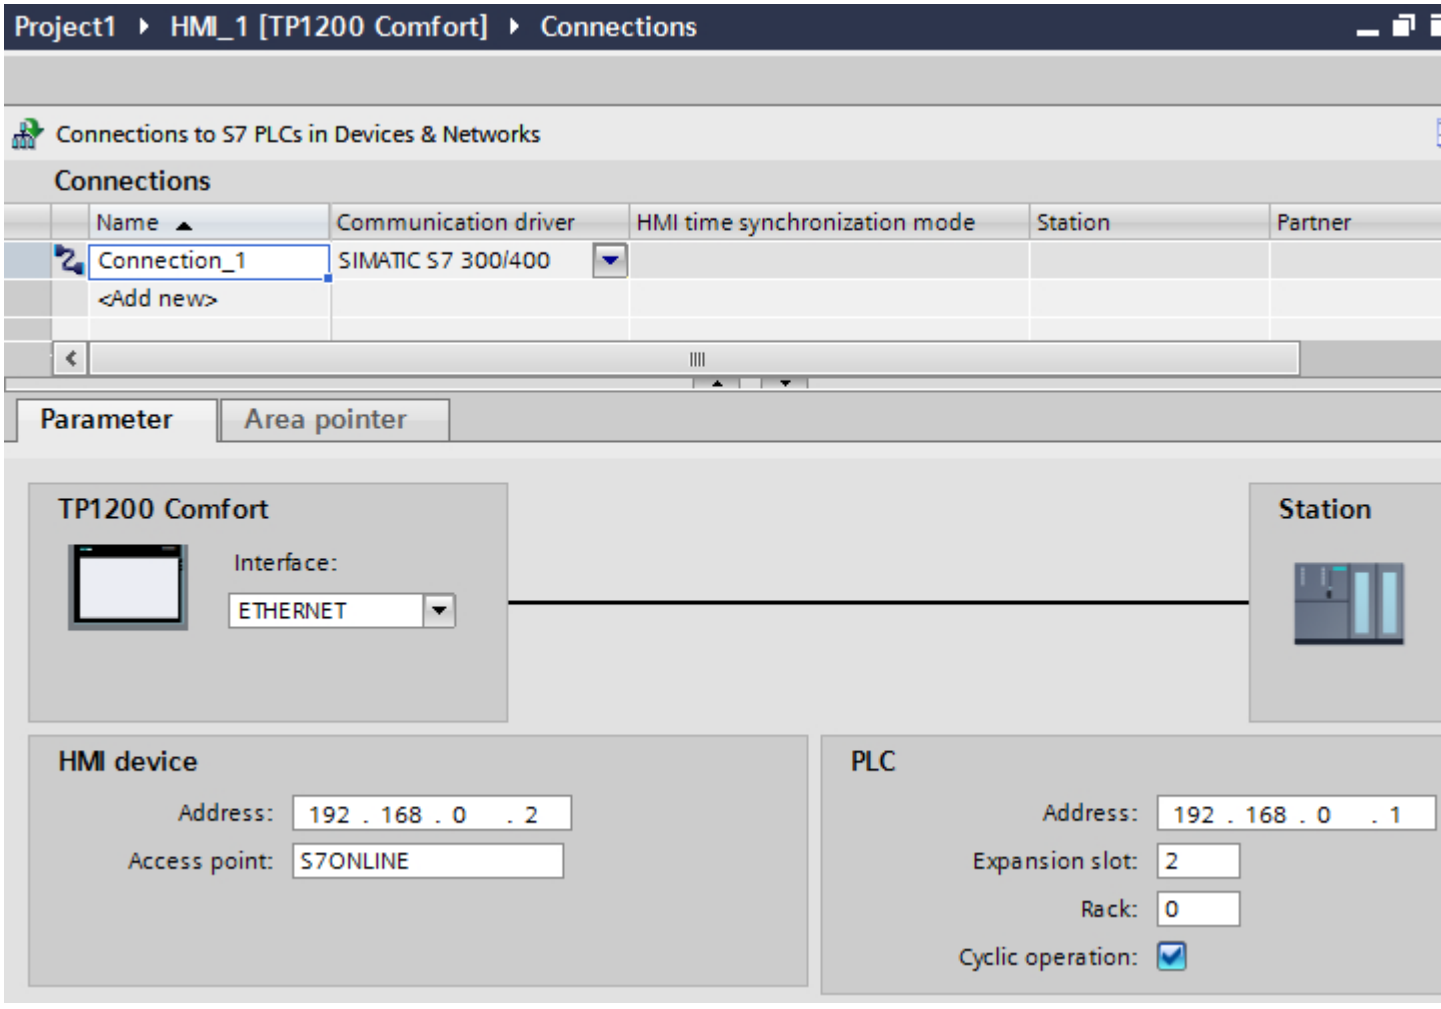
- A project is open.
- An HMI device with a PROFINET interface has been created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.



4. Click the name of the connection.
5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

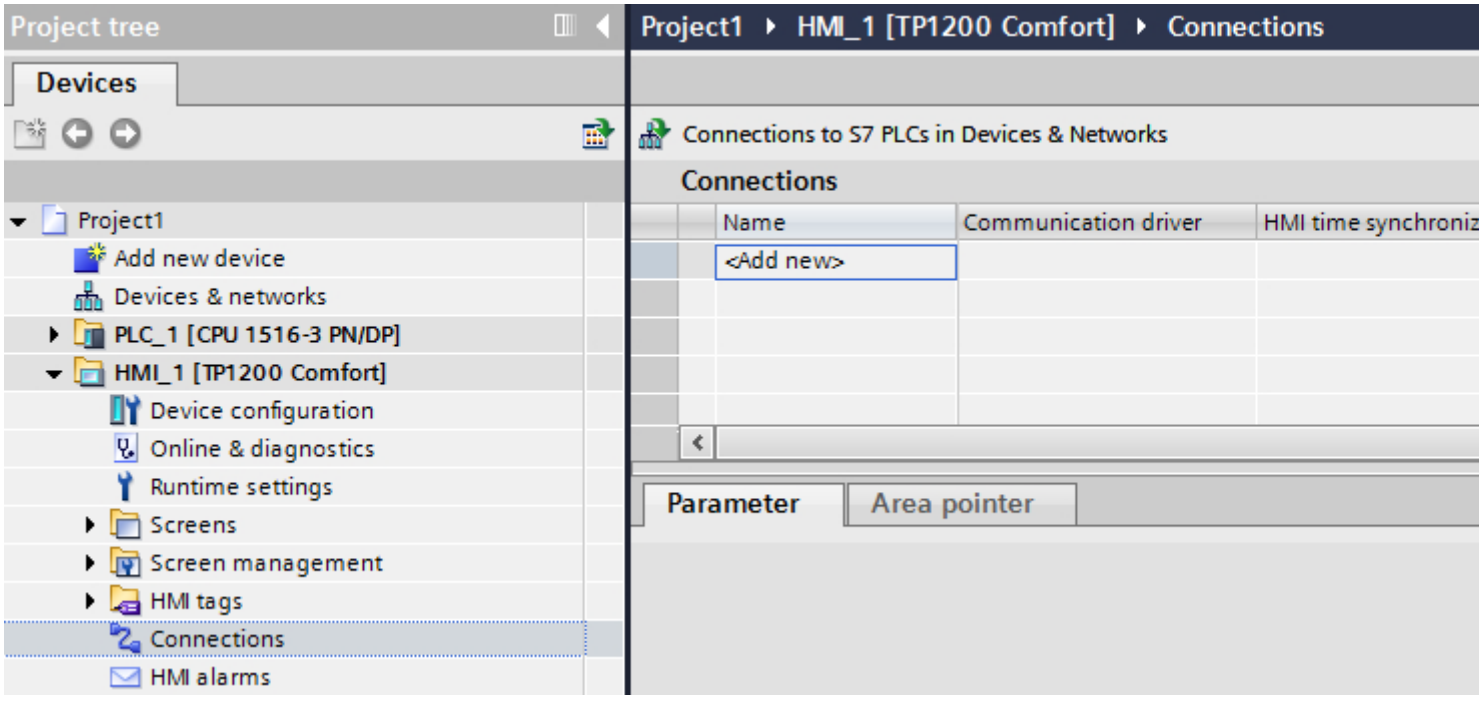
Creating a PROFIBUS connection

Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

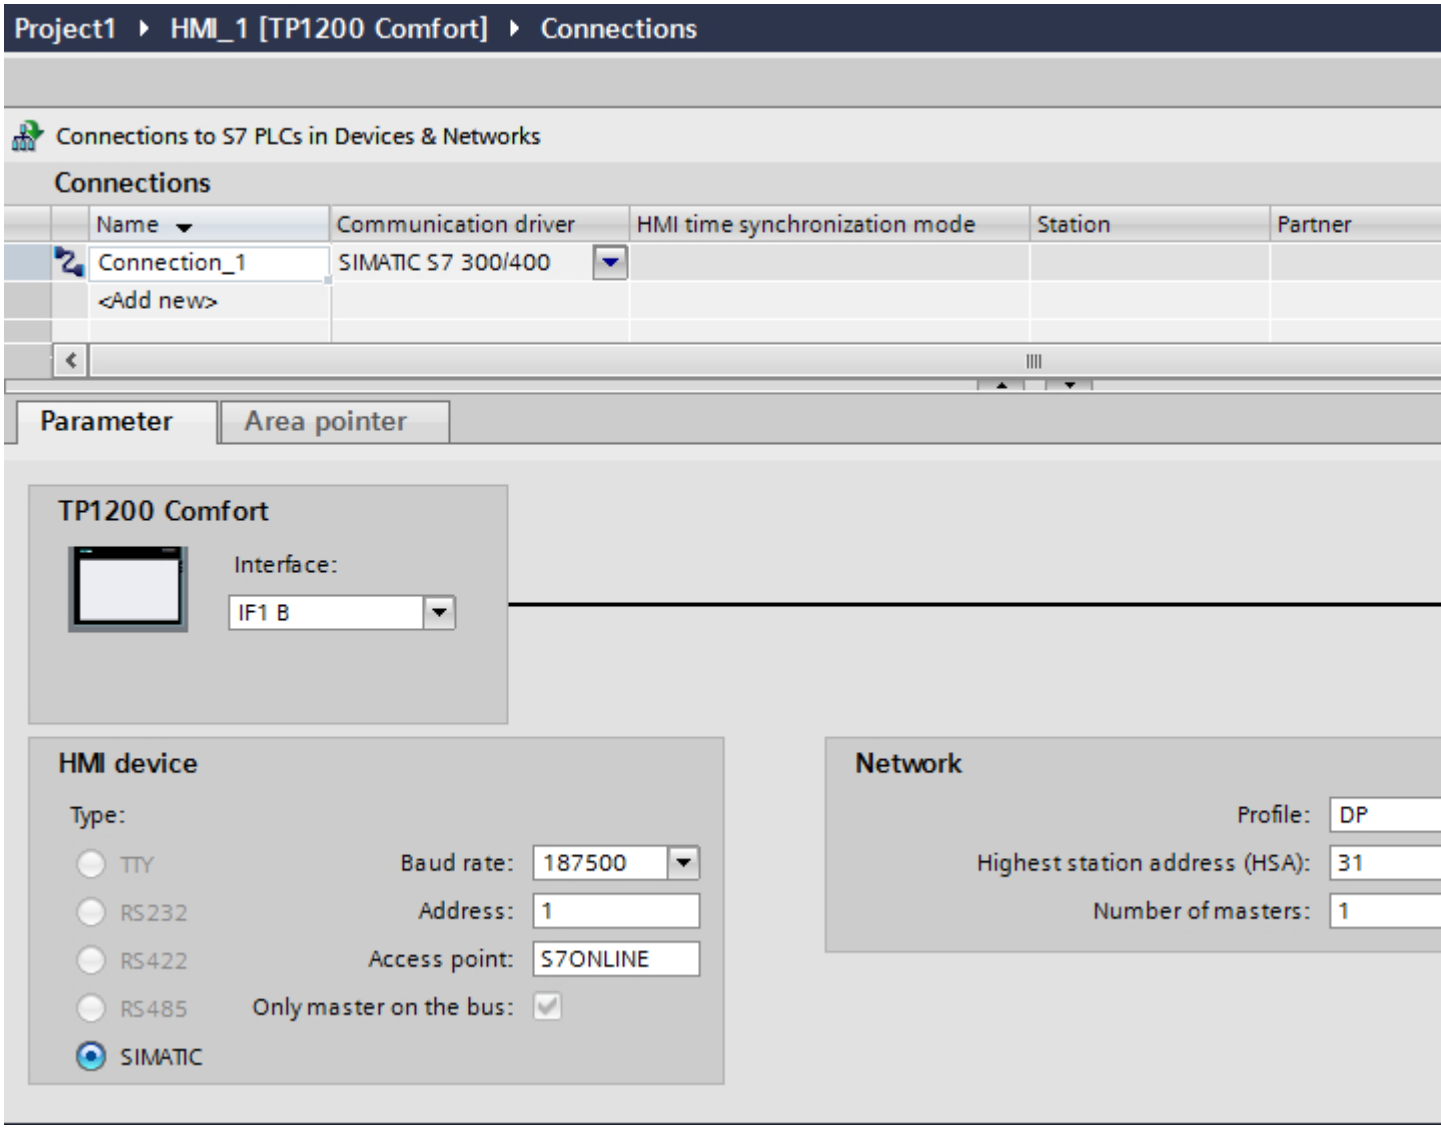
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "IF 1 B" interface from "Parameters > interface" in the Inspector window.

6. Select the "DP" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

Connection parameters

PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Only master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7-200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

  Note

  You only need a password if you have set "Complete protection" at the PLC.

  No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"

- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

Note

You only need a password if you have set "Complete protection" at the PLC.

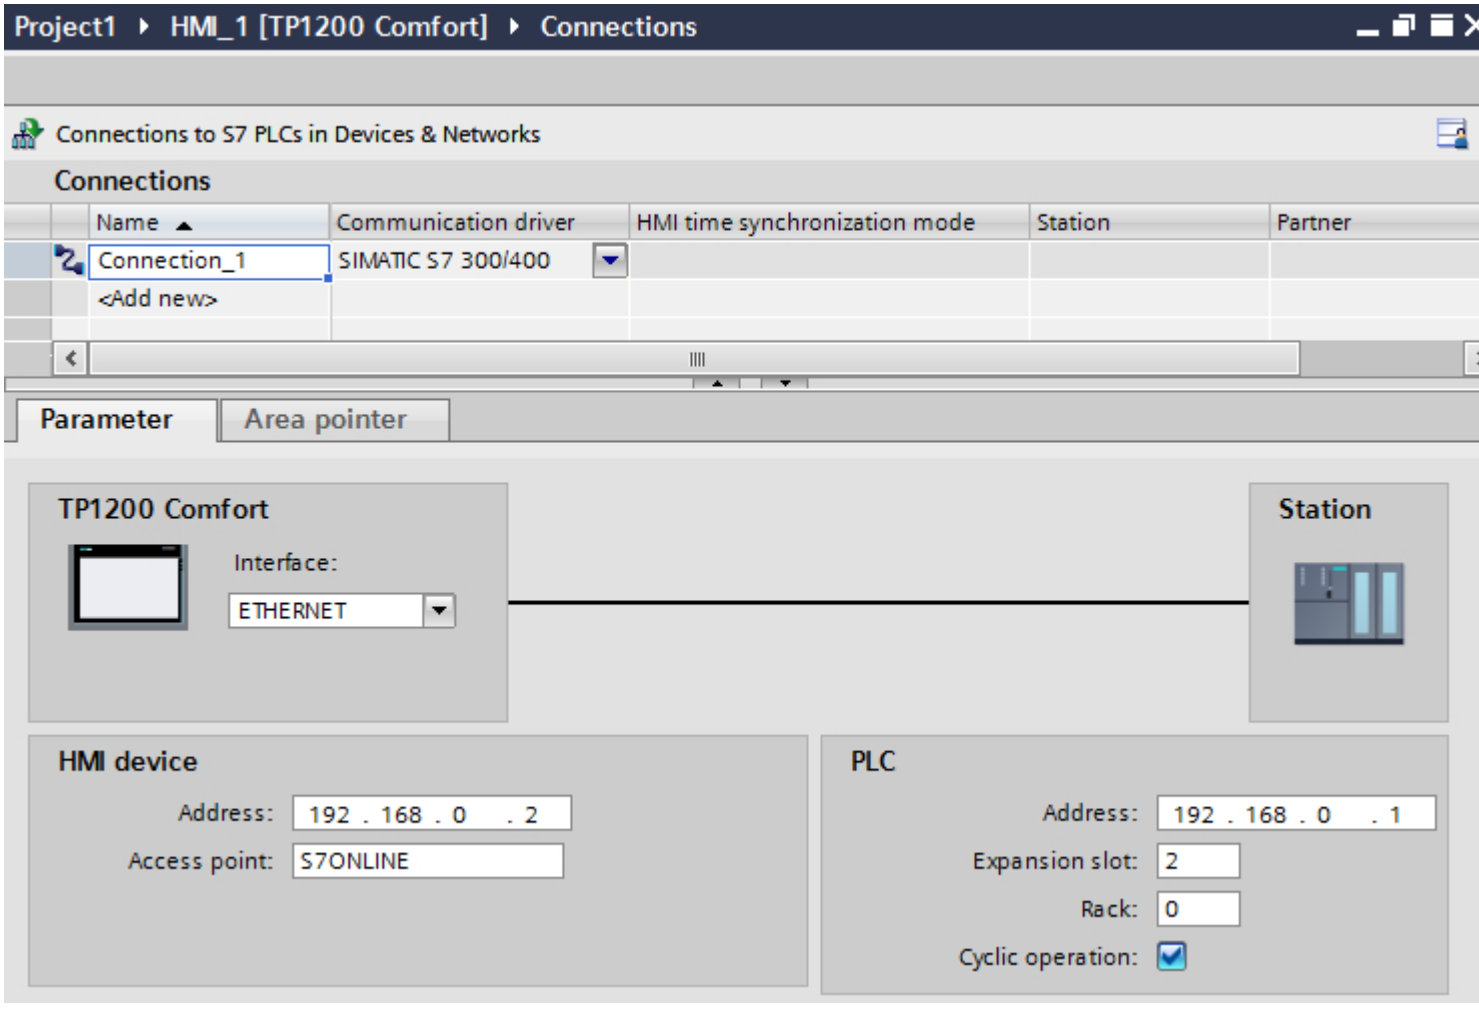
No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

Parameters for the connection (SIMATIC S7 1500)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



12.11.10.7 Configuring connections in the "Connections" editor

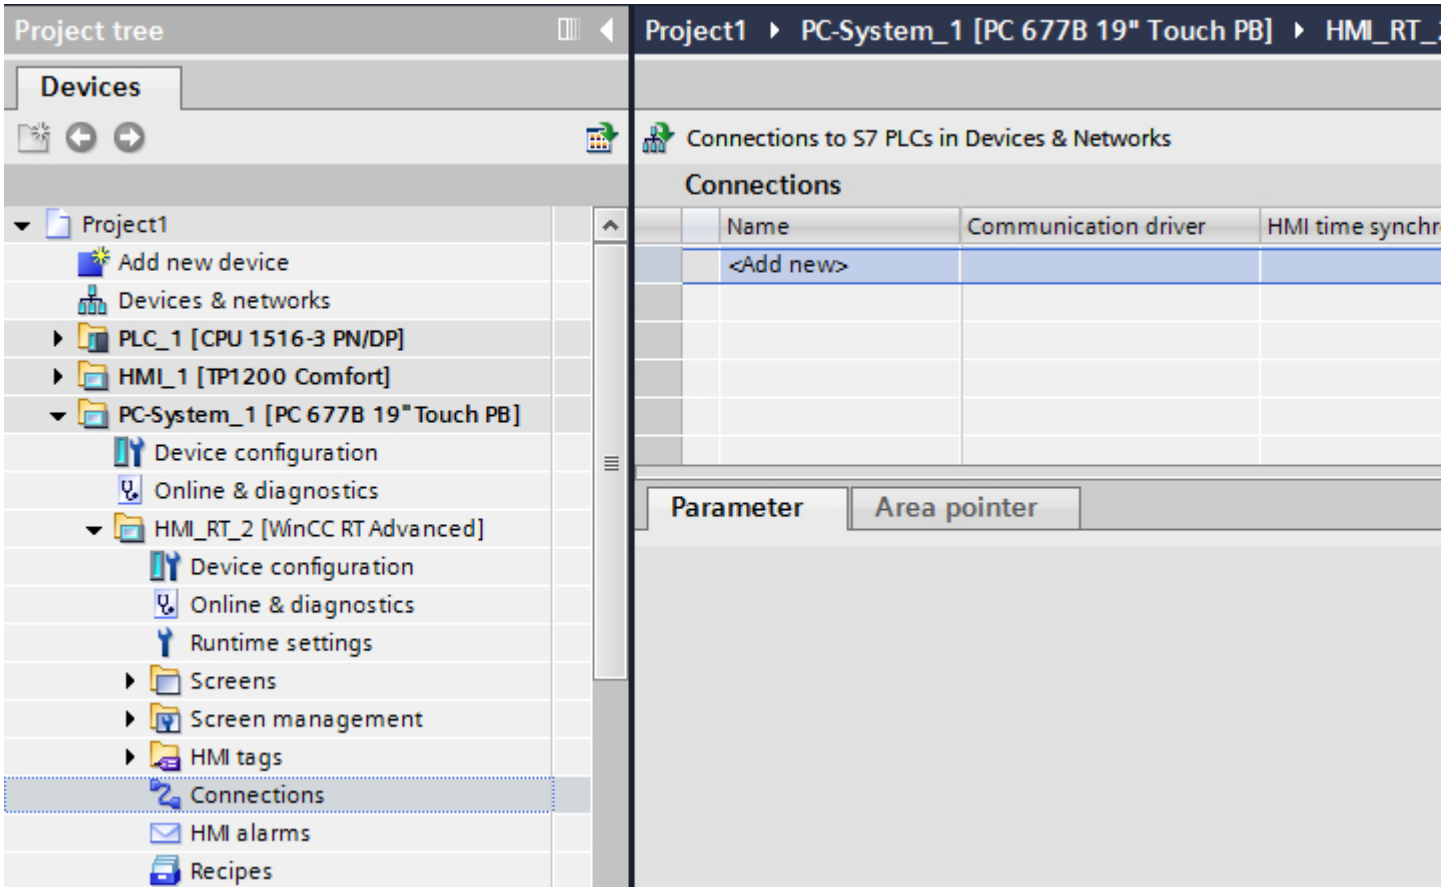
Creating a connection

Requirements

- A project is open.
- WinCC RT Advanced is created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select an interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the parameters for the connection in the Inspector window.

Interfaces

Select one of the following interfaces in the Inspector window under "Parameters > WinCC RT Advanced > Interfaces".:

- Industrial Ethernet
- MPI
- PROFIBUS

For additional information on the parameters of the interfaces see:

Auto-Hotspot

Connection parameters

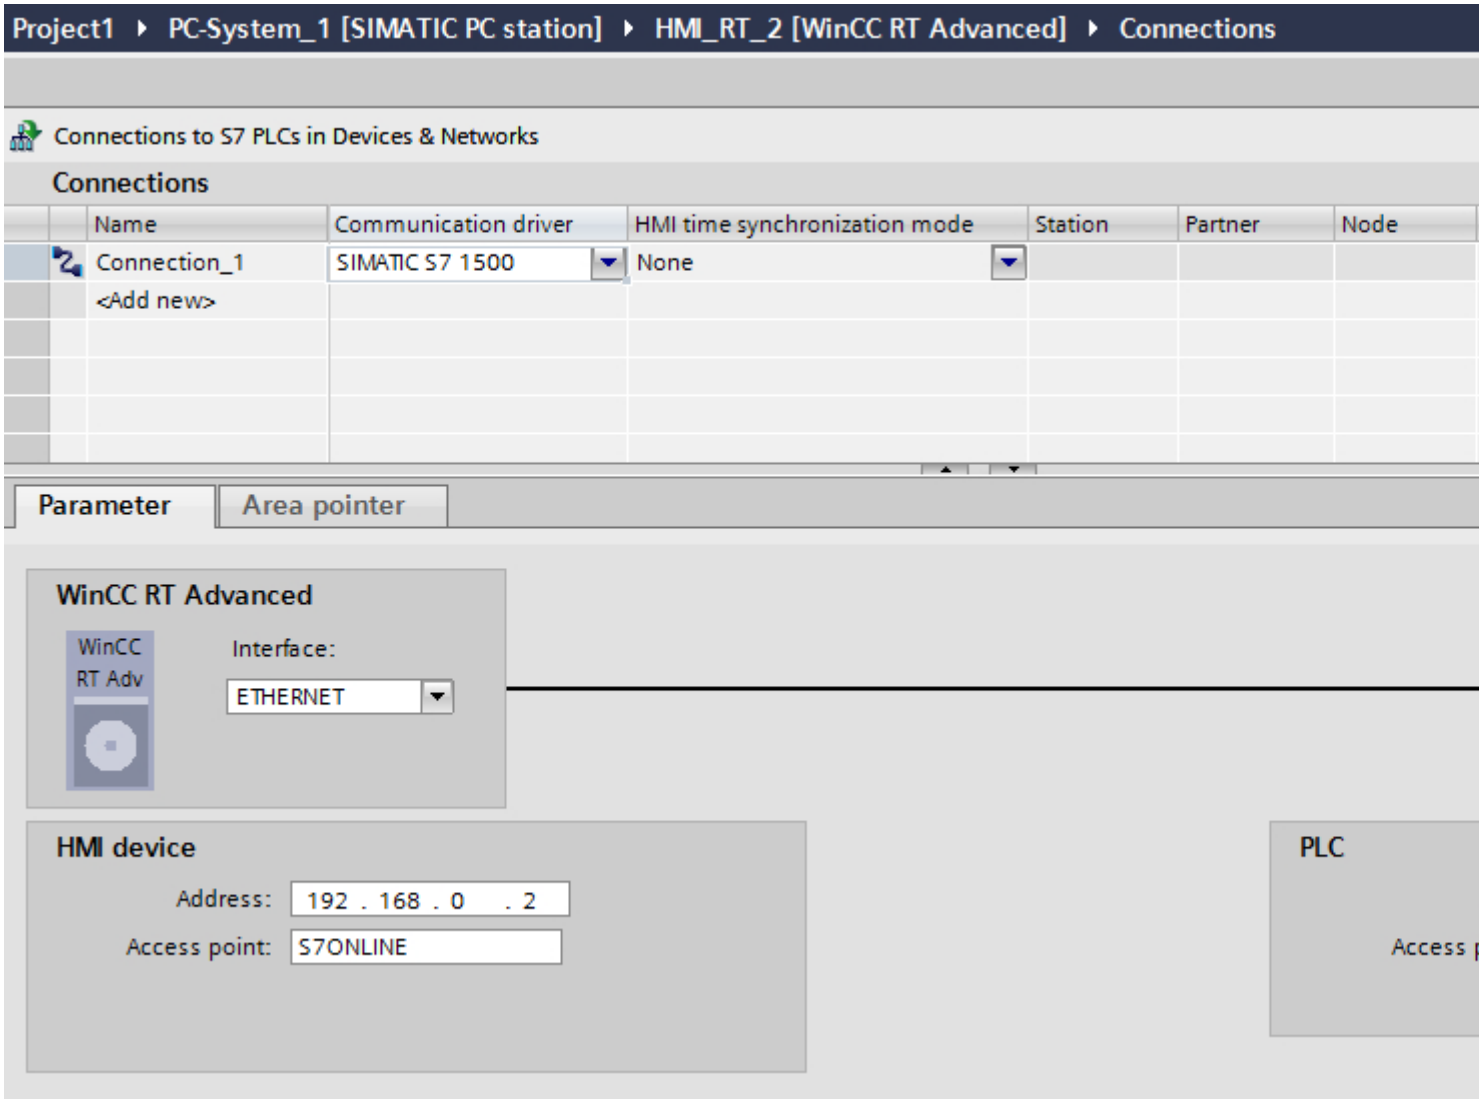
ETHERNET

Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- TCP/IP



HMI device

- "Address"
  Enter the IP address of the HMI device under "Address".
- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Controller

- "Address"
  Enter the IP address of the controller under "Address".
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the controller.

Note

You only need a password if you have set the "Complete protection" protection level at the controller.

No connection to the controller is established if the "Complete protection" protection level is stored on the controller and you do not enter a password.

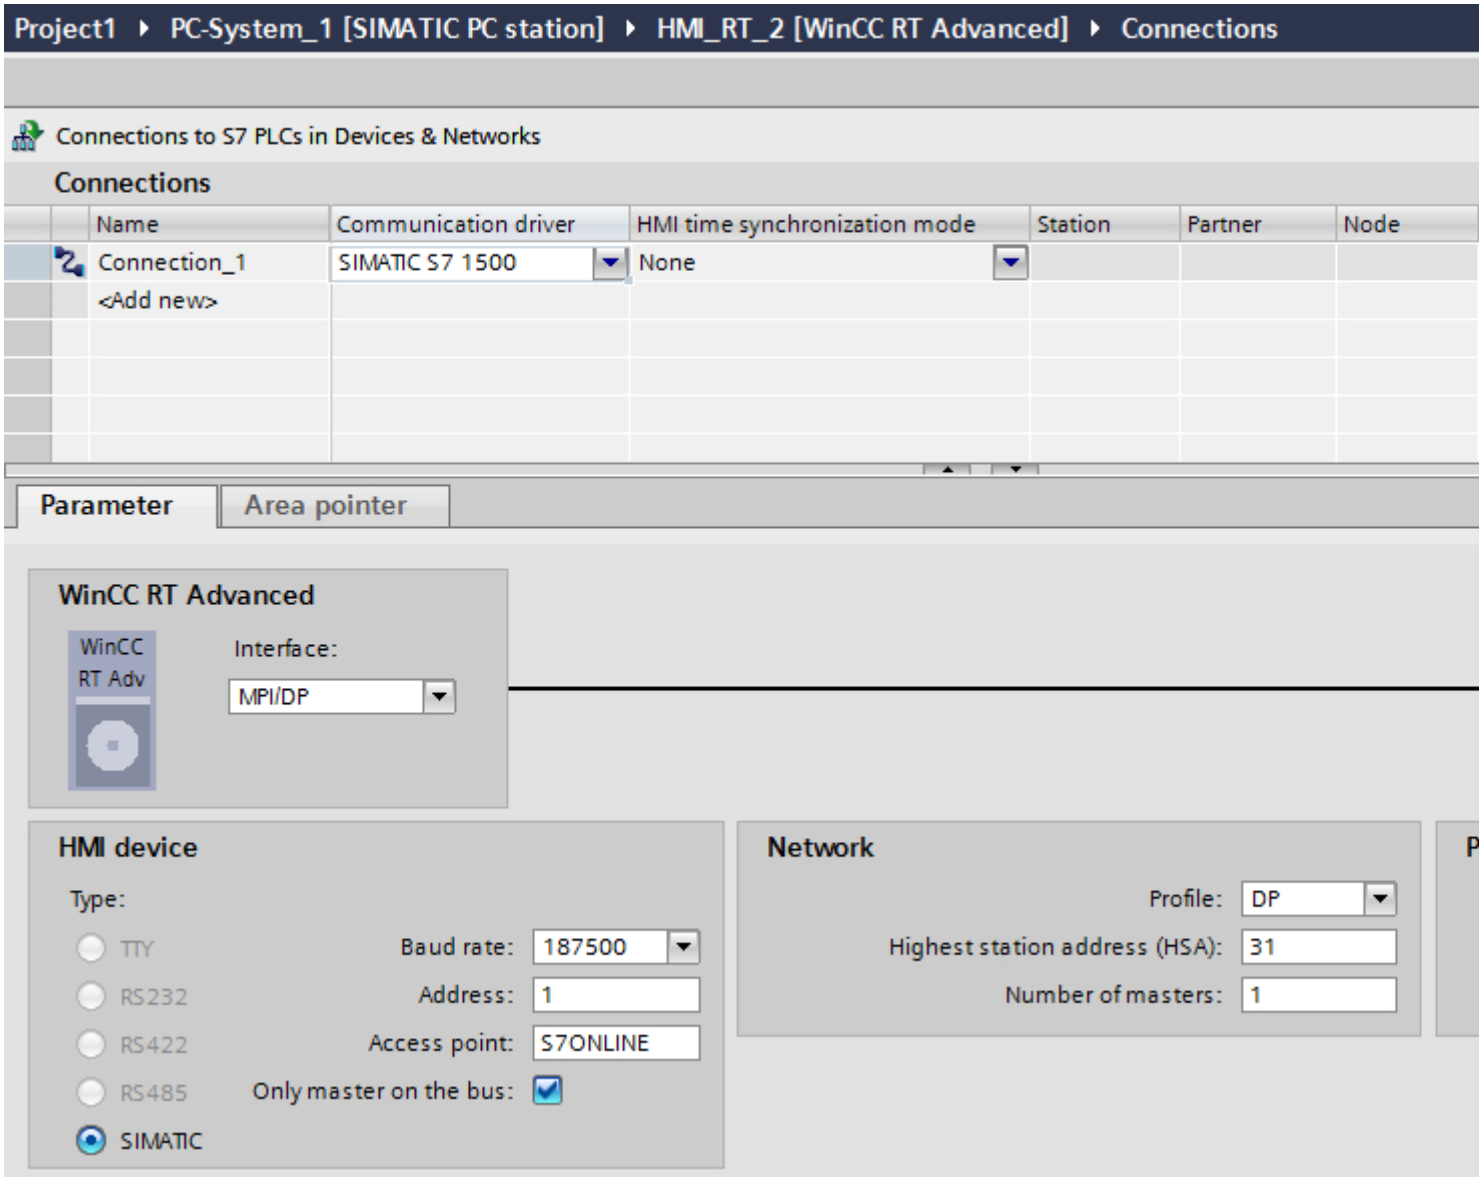
MPI/DP

Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- PROFIBUS



HMI device

- "Baud rate"
  Select the baud rate of the HMI device under "Baud rate".
- "Address"
  Enter the address of the HMI device under "Address".
- "Access point"
  Enter the logical device name under "Access point".

Controller

- "Address"
  Enter the address of the controller under "Address".
- "Access password"
  If you have configured the degree of protection "Complete protection" for the controller, enter the password for the controller under "Access password".

12.11.10.8 Configuring time synchronization

Time synchronization

Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and than at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

Time synchronization restrictions

Approved HMI devices

You can configure the time synchronization between a SIMATIC S7-1200 or SIMATIC S7-1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0
Multi Panel 177	Windows CE 5.0

Device	Operating system
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

Configuration restrictions

- If an HMI device has several connections to SIMATIC S7-1200 or SIMATIC S7-1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".
- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured.
  Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device.
  This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.
- Time synchronization with SIMATIC S7-1200 (V1.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1200 (V4.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1500 is not possible.

Configuring time synchronization for integrated connections

Introduction

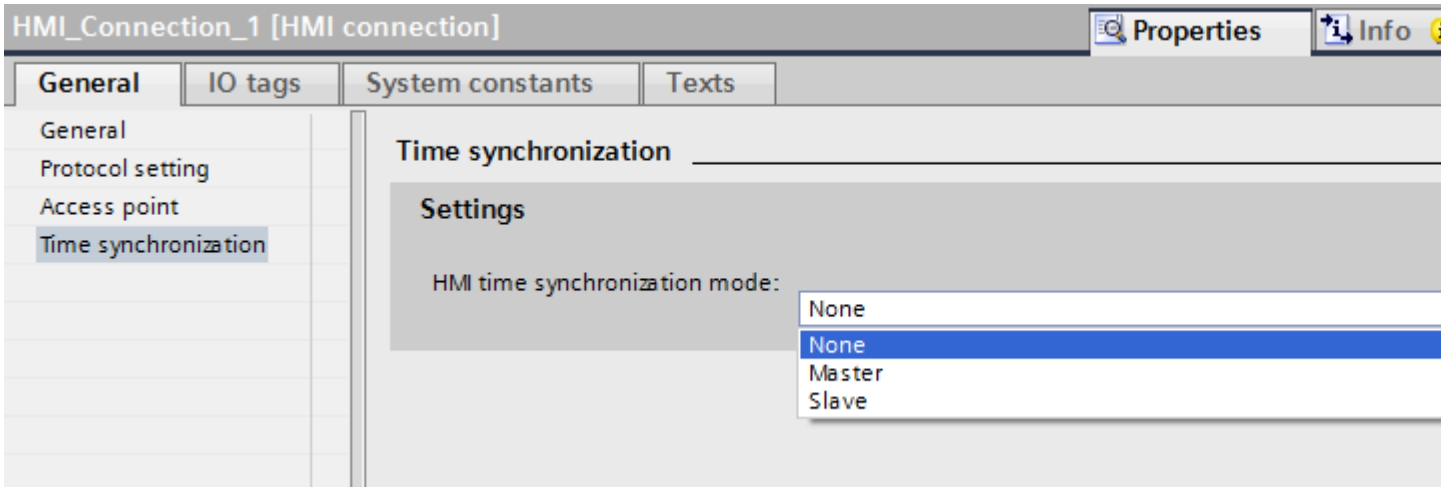
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 or SIMATIC S7 1500 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Configuring time synchronization for non-integrated connections

Introduction

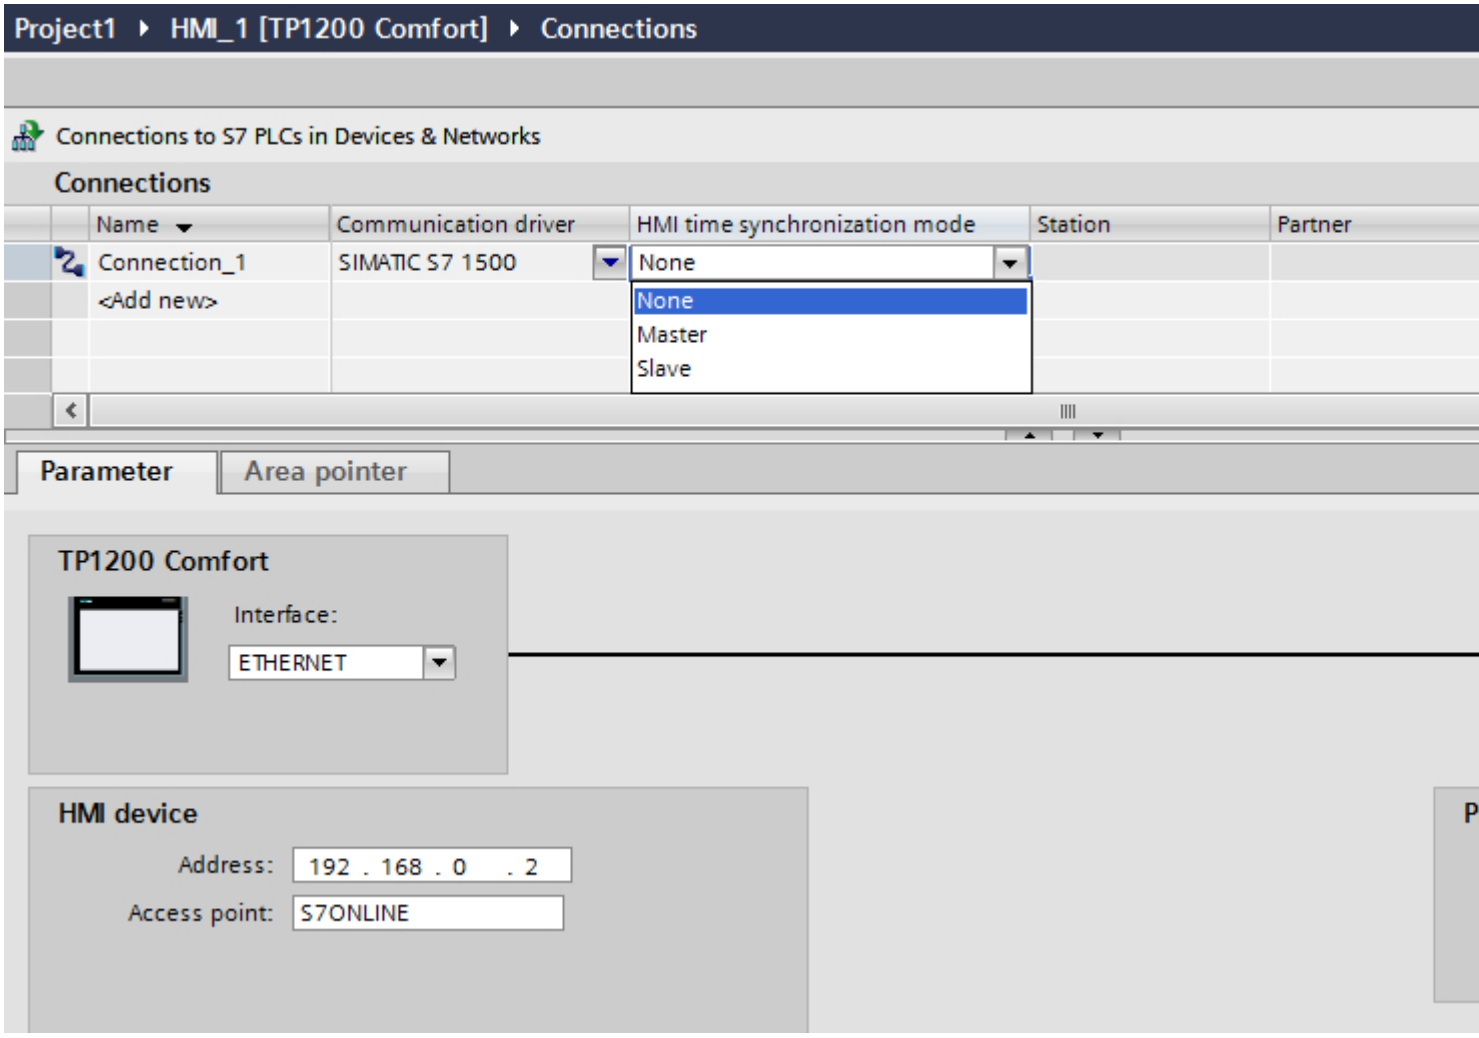
You configure time synchronization for a non-integrated connection in the "Connections" editor.

Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1500" PLC.
3. Select the following in the "HMI time synchronization mode" column:
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



12.11.11 Communicating with SIMATIC S7 200

12.11.11.1 Communication with SIMATIC S7 200

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 200 PLC.

You can configure the following communication channels for the SIMATIC S7 200 PLC:

- PROFINET and Ethernet
- PROFIBUS
- MPI
- PPI

HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 200 in the "Connections" editor of the HMI device.

12.11.11.2 Creating a connection to SIMATIC S7 200

Introduction

You configure a connection to the SIMATIC S7 200 PLC in the "Connections" editor of the HMI device. The interfaces are named differently depending on the HMI device.

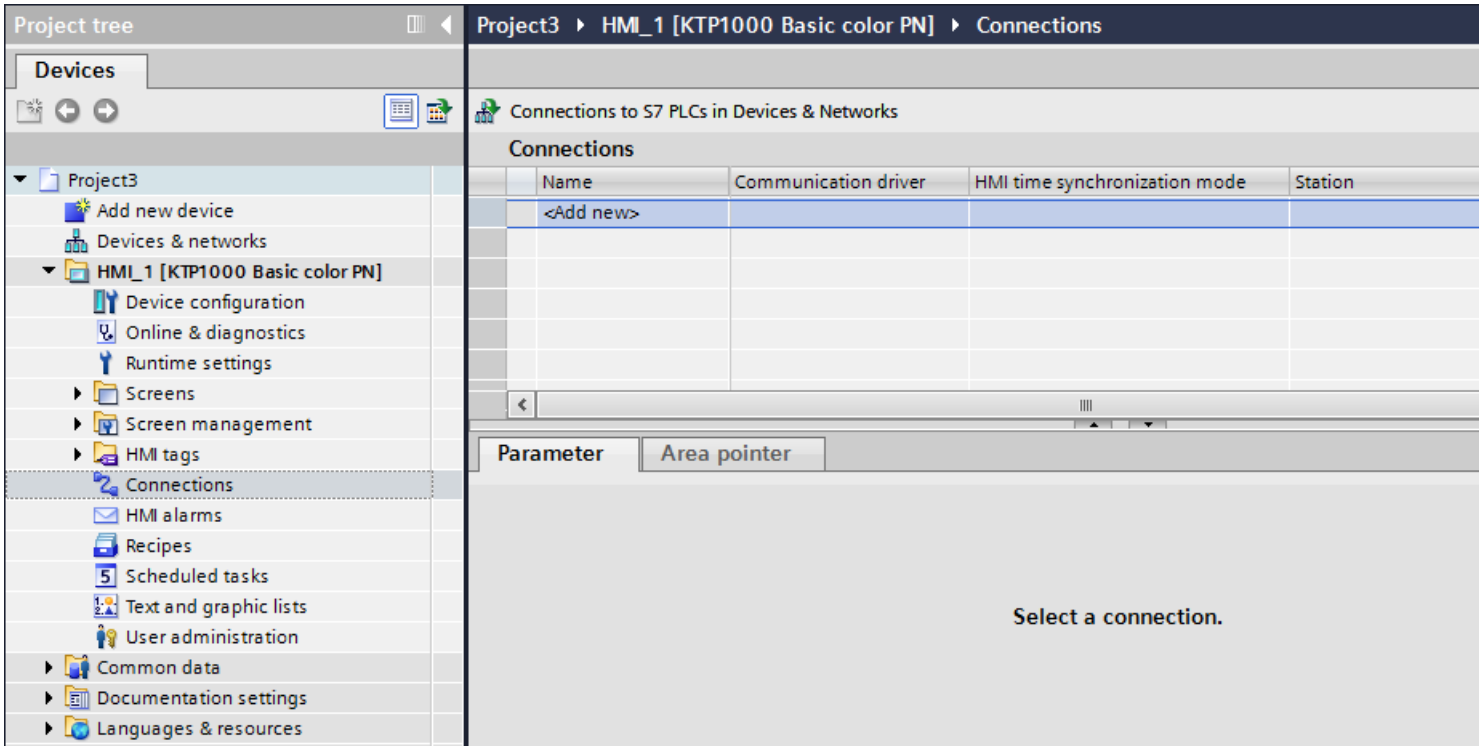
Requirements

- A project is open.
- An HMI device has been created.

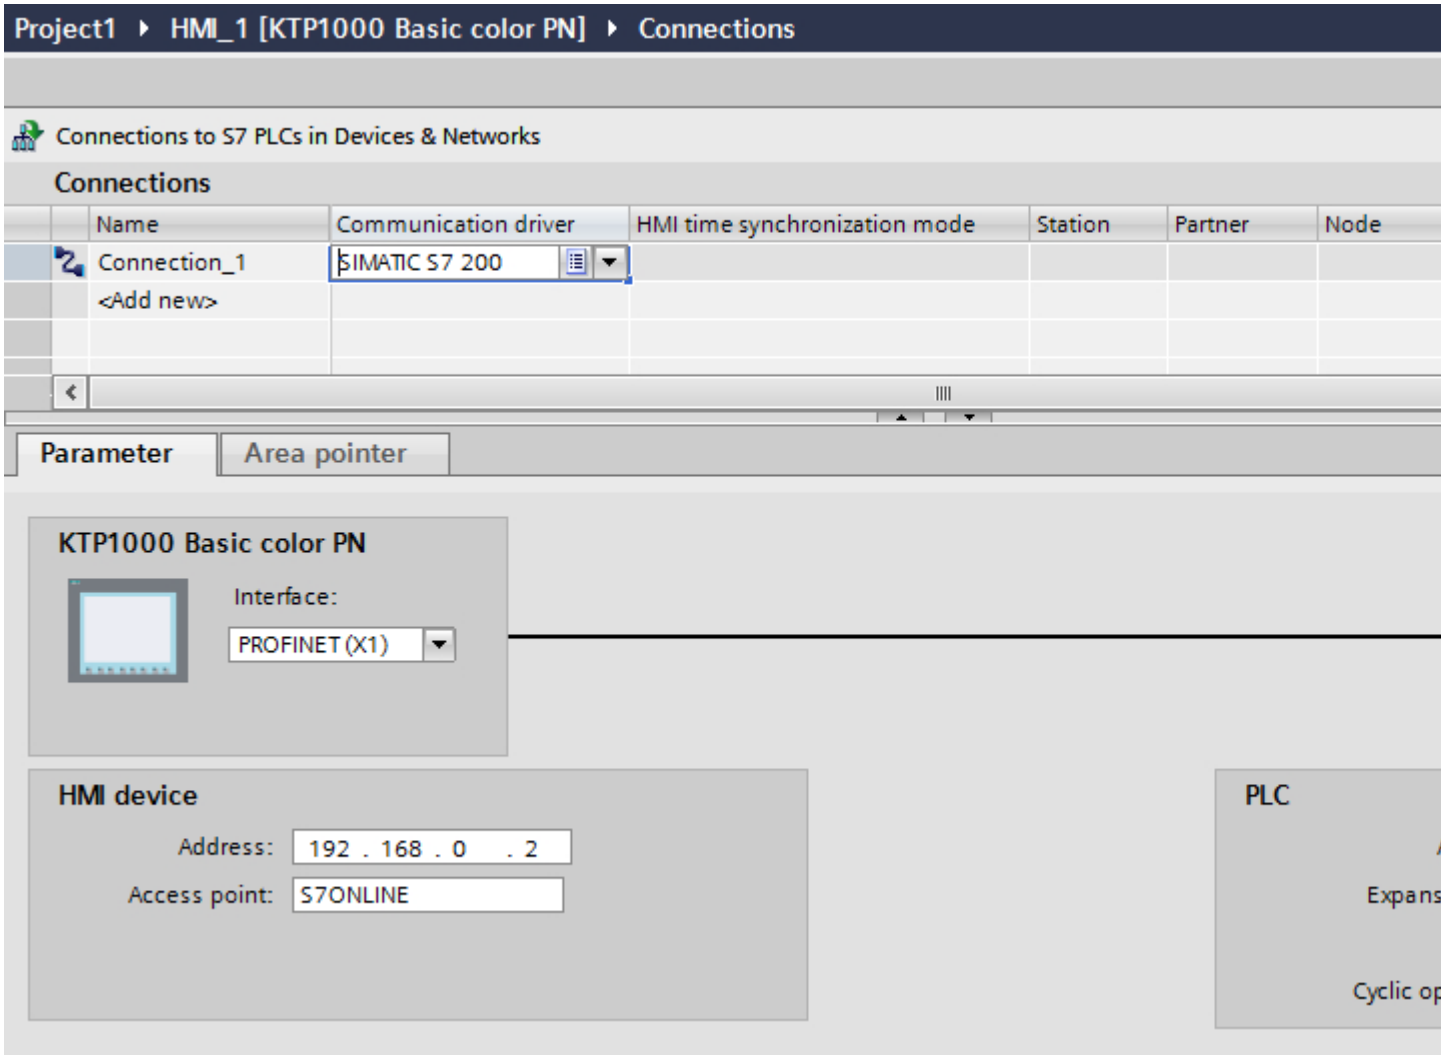
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "SIMATIC S7 200" driver.
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".



See the chapter "Parameters for the connection (Page 6471)" for additional details.

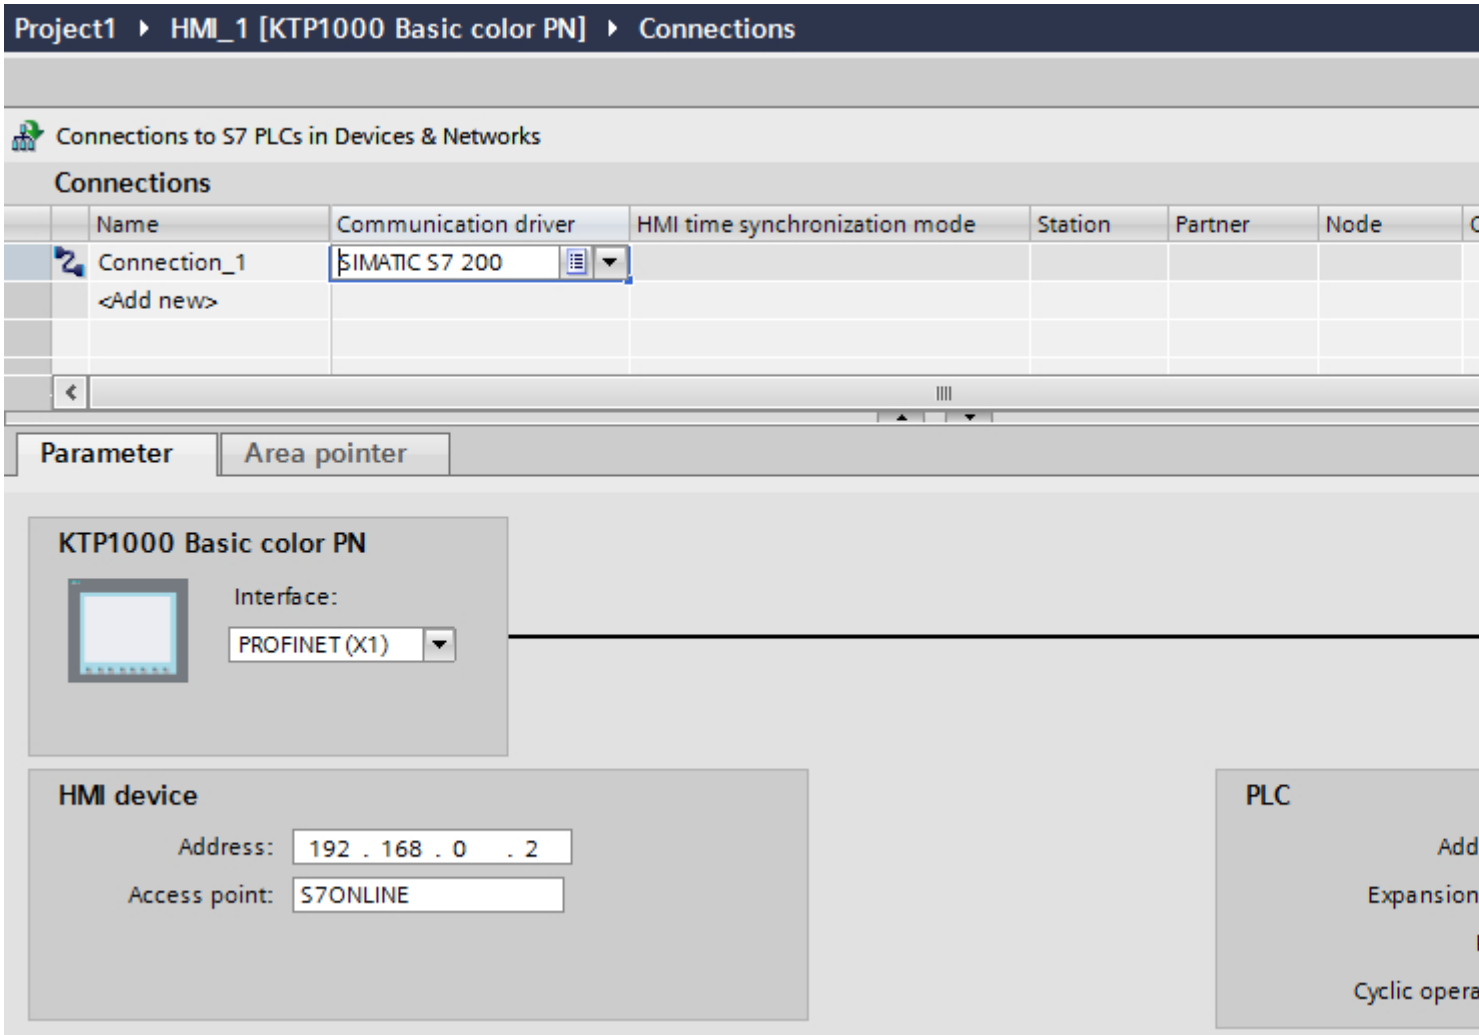
12.11.11.3 Parameters for the connection

Parameters for the connection (SIMATIC S7 200)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"
- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"
  Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"
  Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.
  Disable cyclic mode if you are operating several HMI devices in parallel.

PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7 200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200 PLCs.

MPI parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the MPI network.

- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  For "Address", you set the MPI address of the HMI device. The MPI address must be unique throughout the MPI network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.
  In S7 200, you must set an HMI device as the master.

Parameters for the network

Under "Network", you set the parameters for the MPI network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "MPI". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"
  This setting is not required for MPI.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the MPI address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic mode"
  When cyclic mode is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This improves system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200.

PPI parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PP network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  For "Address", you set the PPI address of the HMI device. The PPI address must be unique throughout the PPI network.
- "Access point"
  For "Access point", you set the access point via which the communication partner is reached.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.
  In S7 200, you must set an HMI device as the master.

Parameters for the network

Under "Network", you set the parameters for the network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "PPI". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"
  Set the number of the master on the network to "1".

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PPI address of the S7 module to which the HMI device is connected.
- "Cyclic operation"
  This parameter is not required for communication via PPI.

Cyclic operation

Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

12.11.11.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 6044)

See also

Data exchange using area pointers (Page 6039)

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Application

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

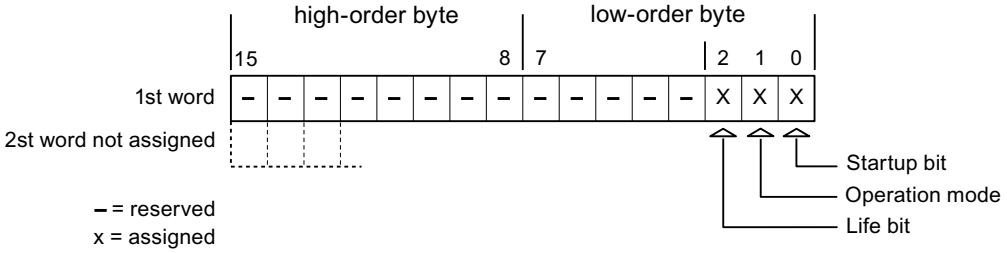
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

"Project ID" area pointer

Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

Use

Note

HMI connections cannot be switched "online".

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections" under "Address".

Connection failure

A connection failure to a device on which the "Project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "Project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the Engineering System.

"Job mailbox" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)** [3]	

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: Weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(In the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [2]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only devices supporting recipes
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.

"Data record" area pointer

"Data record" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data record

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system event.

Sequence of a transfer started by the operator in the recipe view

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data mailbox.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized in the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by the HMI device or by the PLC.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	

Step	Action	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC using job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the job from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of faults

The section below shows possible causes of errors which lead to a data record transfer being terminated with errors:

- Tag address not set up on the PLC
- Overwriting data records not possible
- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system events
- Triggered by function
  Output of system events
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data mailbox.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the Inspector window the "Coordinated transfer of data records" option under "General > Synchronization > Settings".

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 4270)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

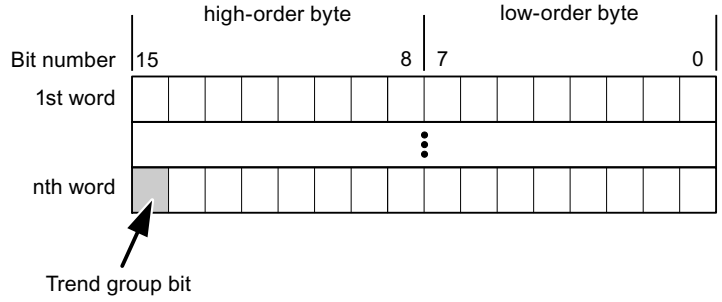
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 4293)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

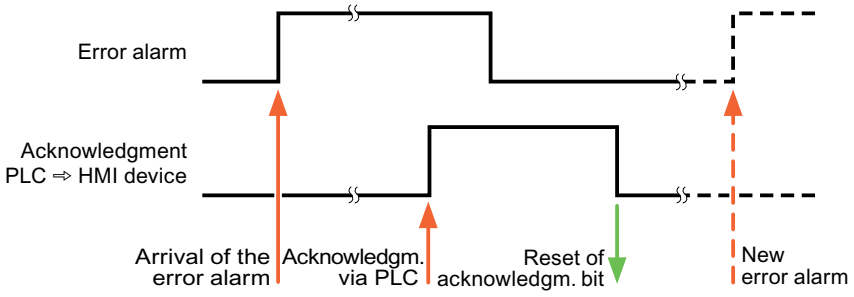
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

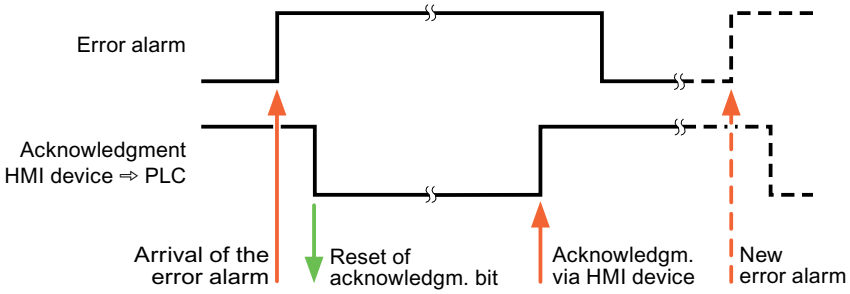
tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Runtime V11.0

HMI devices	SIMATIC S7-200
WinCC RT Advanced	Yes

Runtime V12.0

HMI devices	SIMATIC S7-200
WinCC RT Advanced	Yes

Runtime V13.0

HMI devices	SIMATIC S7-200
WinCC RT Advanced	Yes

Permitted data types for SIMATIC S7 200

Permitted data types for connections with SIMATIC S7 200

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Length
Bool	1 bit
Byte	1 byte
Char	1 byte
Word	2 bytes
Int	2 bytes
DWord	4 bytes

Data type	Length
DInt	4 bytes
Real	4 bytes
StringChar	--
Timer	2 bytes
Array	--

Note

Disconnection with a PPI network

If you are using arrays in the configuration, an array size of approximately 1000 bytes may cause an interruption of the connection.

Use smaller arrays in your configuration.

12.11.12 Communicating with SIMATIC LOGO!

12.11.12.1 Communication with SIMATIC LOGO!

Introduction

This section describes the communication between an HMI device and the SIMATIC LOGO! controller.

You can configure the following communication channels for the SIMATIC LOGO! controller:

- PROFINET
- Ethernet

HMI connection for communication

You configure connections between the HMI device and SIMATIC LOGO! in the "Connections" editor of the HMI device.

Data exchange

Data exchange with the SIMATIC LOGO! control system is possible by means of tags.

Data cannot be exchanged using area pointers.

12.11.12.2 Creating a connection to SIMATIC LOGO!

Introduction

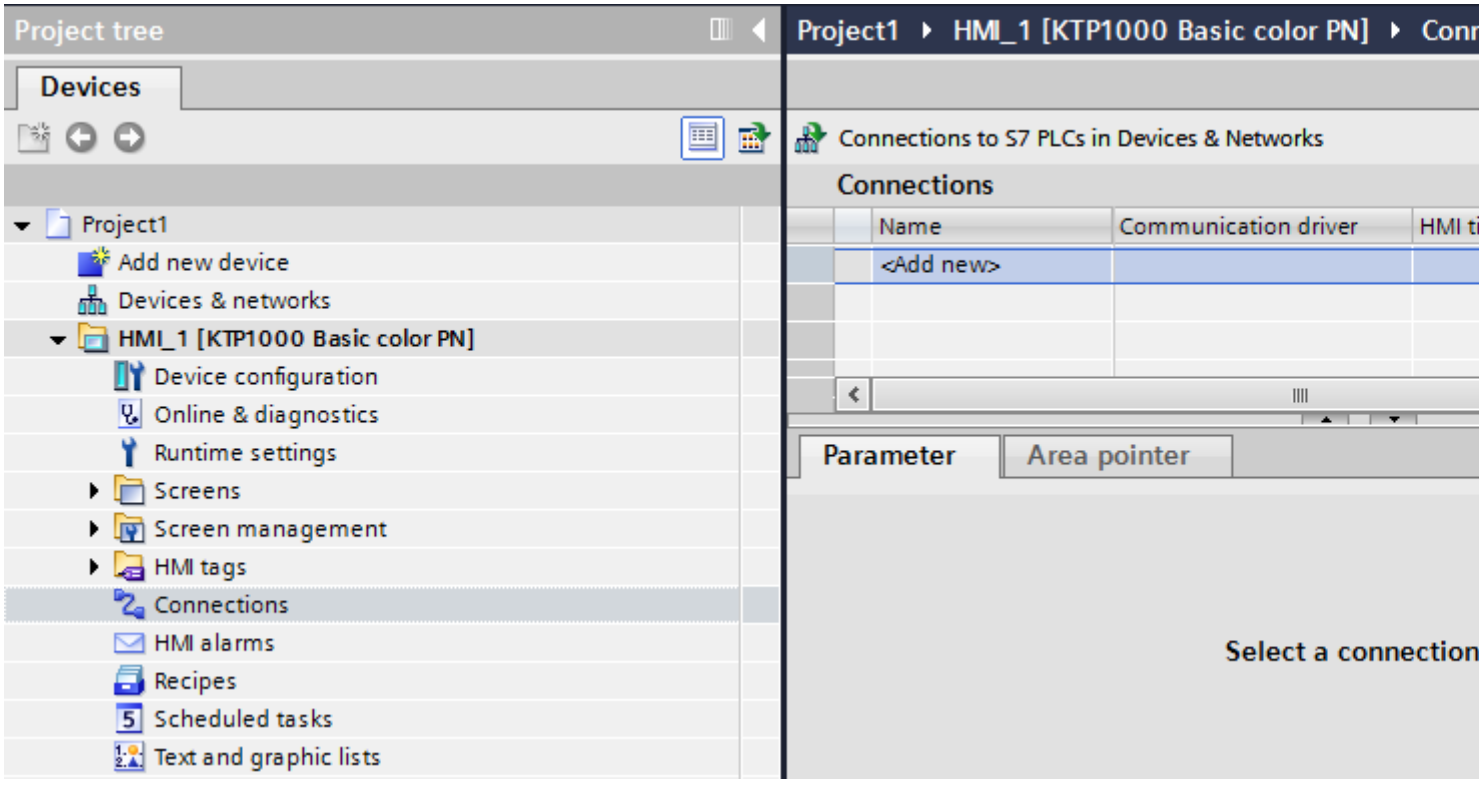
You configure a connection to the SIMATIC LOGO! controller in the "Connections" editor of the HMI device. The interfaces are named differently depending on the HMI device.

Requirements

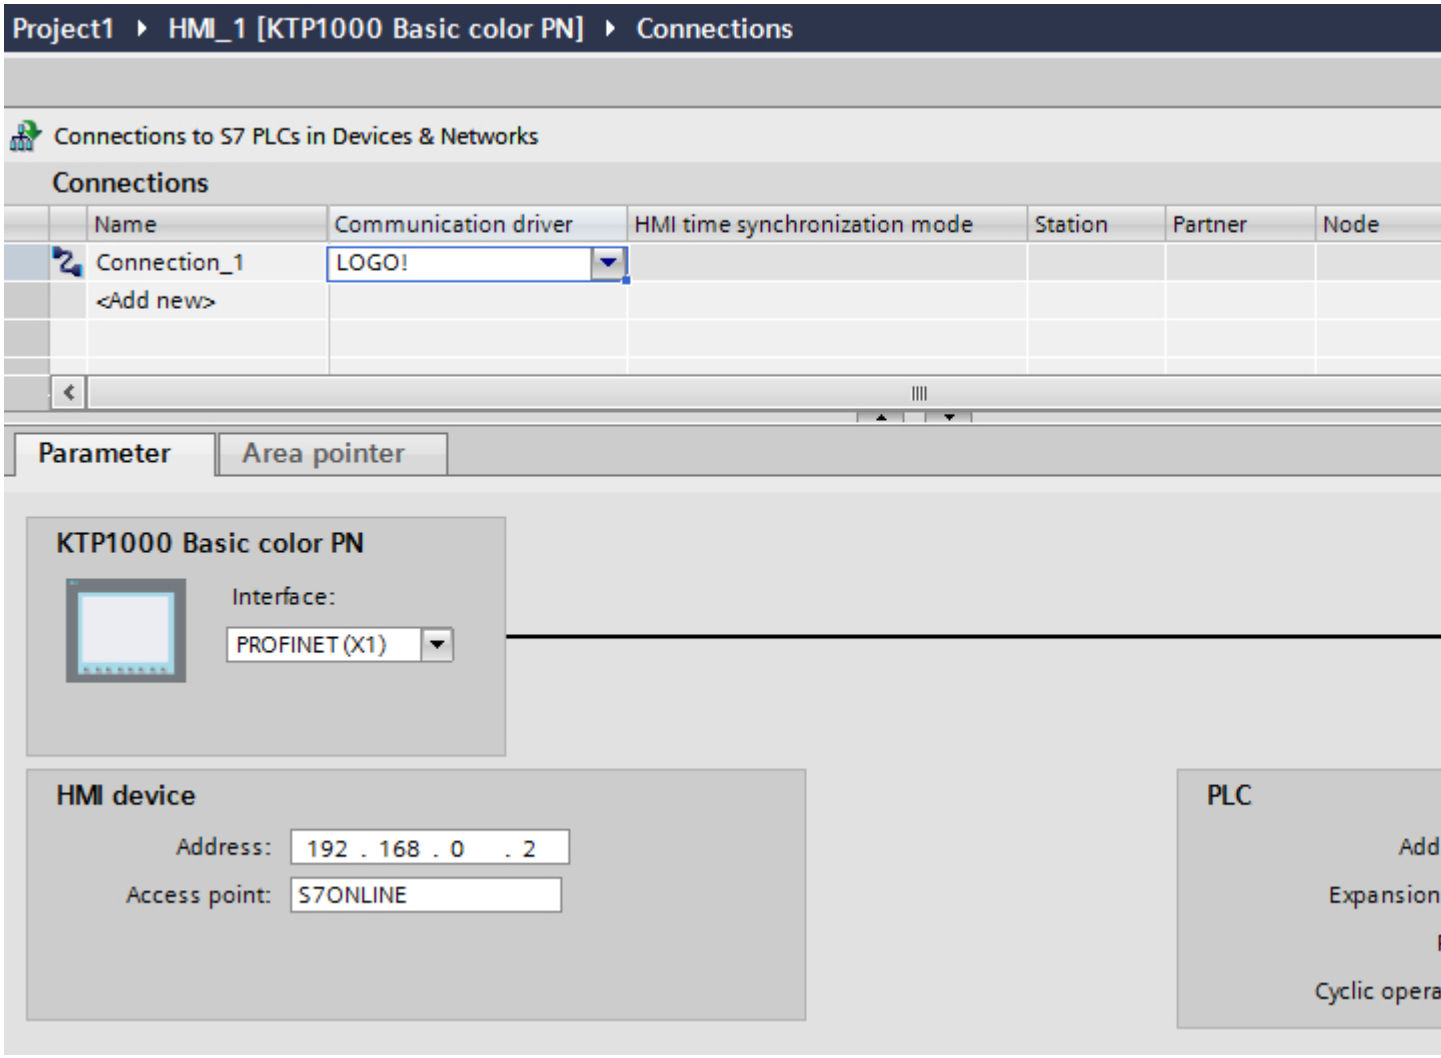
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "SIMATIC LOGO!" driver.
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".



See the chapter "Connection parameters (Page 6505)" for additional details.

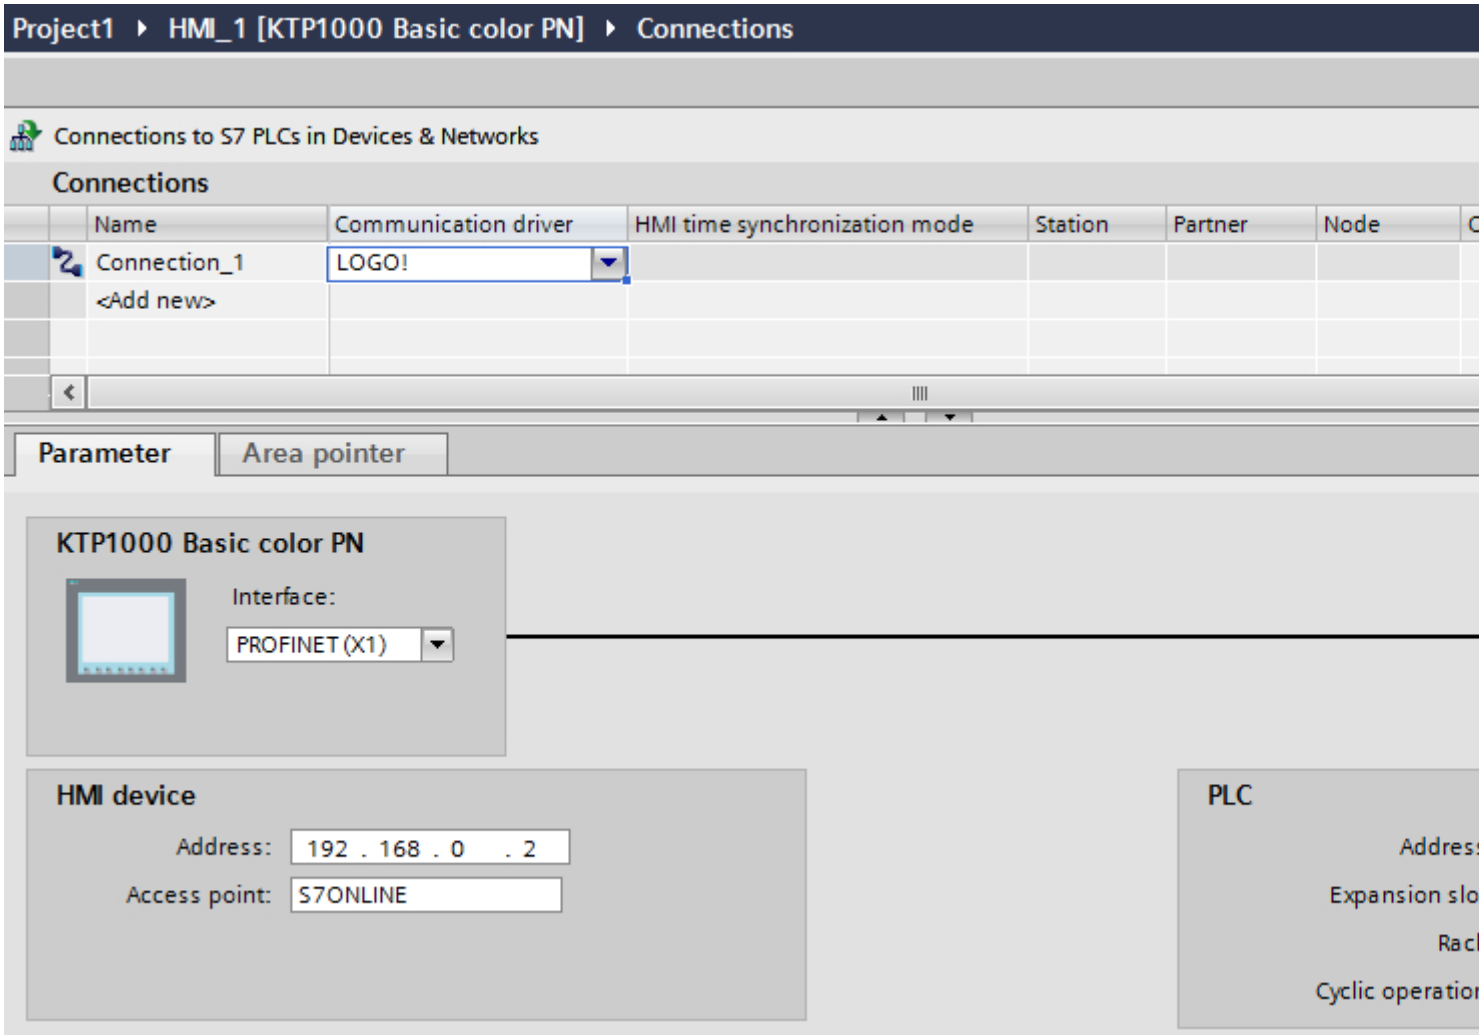
12.11.12.3 Connection parameters

Connection parameters

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"
- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"
  Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"
  Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.
  Disable cyclic mode if you are operating several HMI devices in parallel.

Cyclic operation

Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

12.11.12.4 Data exchange

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

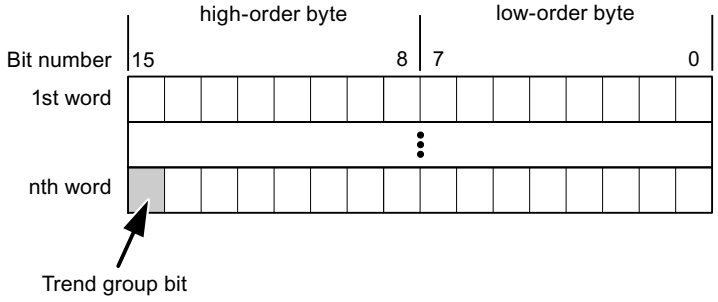
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Auto-Hotspot

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

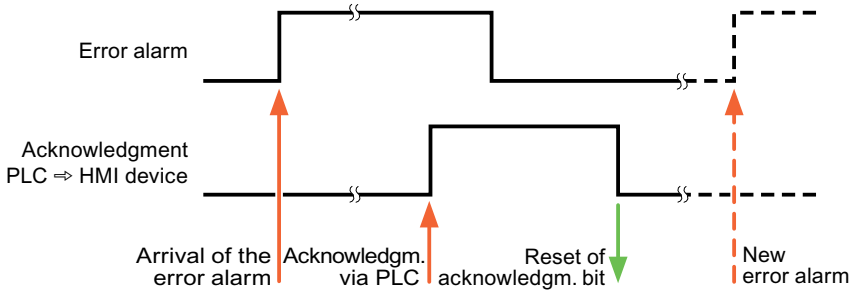
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

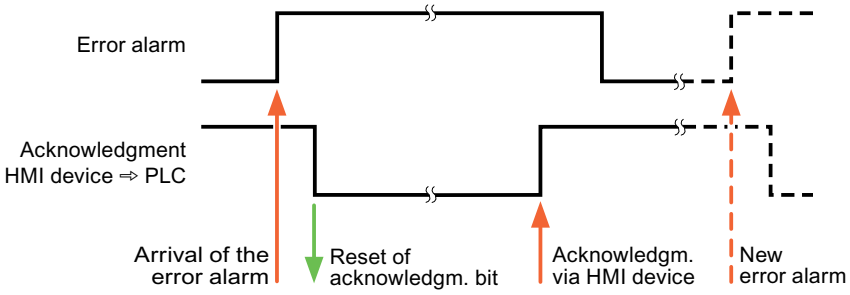
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



12.11.12.5 Performance features of communication

SIMATIC LOGO! device dependency

SIMATIC LOGO! device dependency

If you use devices from an earlier version of the TIA Portal with TIA Portal V13, it may not be possible to configure integrated connections to certain HMI devices.

12.11.13 Configuring direct keys

12.11.13.1 Direct keys

Introduction

In addition to their standard use, the F, K and S keys of an HMI device with key operation can be used as direct keys.

With HMI devices with touch operation, you configure the system function "Direct key" to a button

You can configure the following direct keys:

- PROFINET connection: PROFINET IO direct keys
- PROFIBUS connection: PROFIBUS DP direct keys

Operating mode of HMI devices with direct keys

Before accessing the PLC from the HMI device using the direct keys you have to change the operating mode of the HMI device.

12.11.13.2 Changing the operating mode of the HMI device

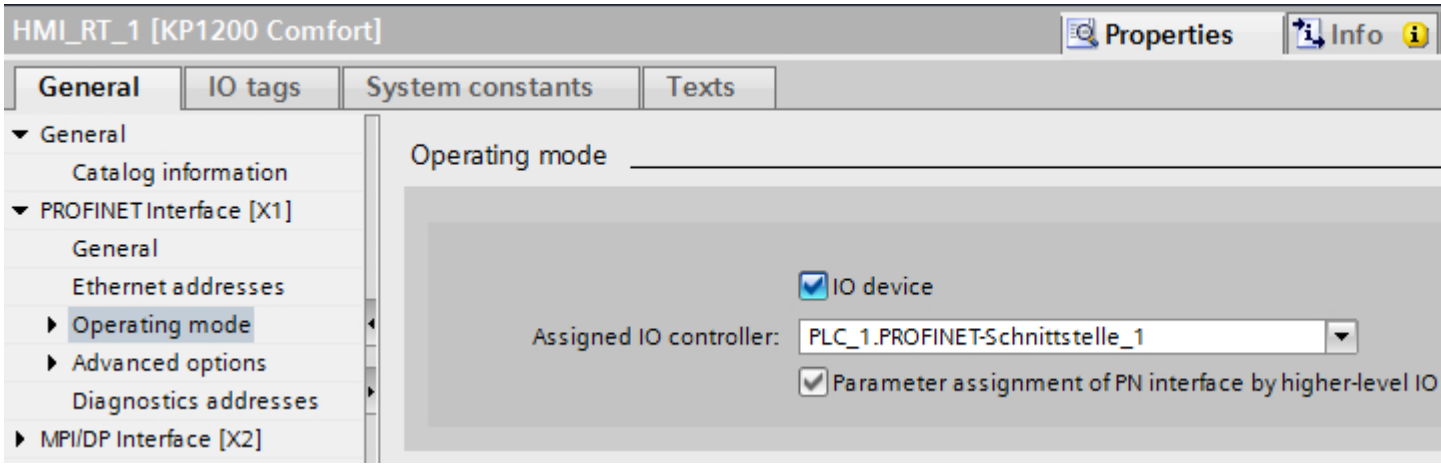
Changing the operating mode for a PROFINET connection

Requirements

The HMI device is networked with a PLC via PROFINET.

Procedure

1. Click the PROFINET interface of the HMI device in the "Devices & Networks" editor.
2. Click "Operating mode" under "Properties > General" in the Inspector window.
3. Select the function "IO device" in the "Operating mode" area.
4. Select the PLC which is networked with the HMI device under "Assigned IO controller".



Changing the operating mode for a PROFIBUS connection

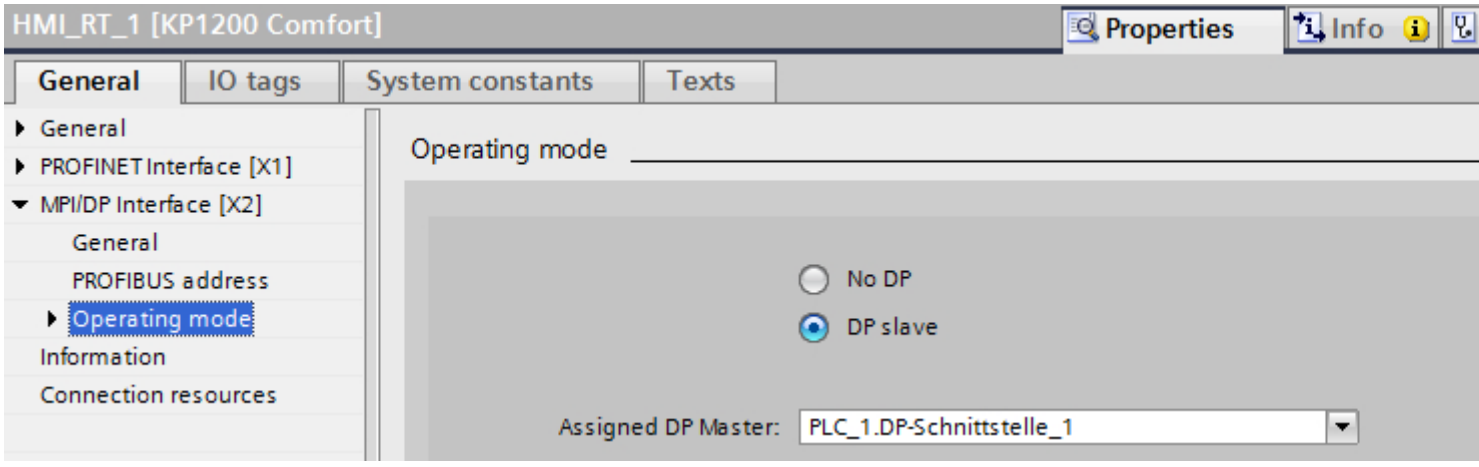
Requirements

The HMI device is networked with a PLC via PROFIBUS.

Procedure

1. Click the PROFIBUS interface of the HMI device in the "Devices & Networks" editor.
2. Click "Operating mode" under "Properties > General" in the Inspector window.

3. Select the function "DP slave" in the "Operating mode" area.
4. Select the PLC which is networked with the HMI device under "Assigned DP master".



12.11.13.3 Configuring direct keys

Configuring direct keys for an HMI device with touch operation

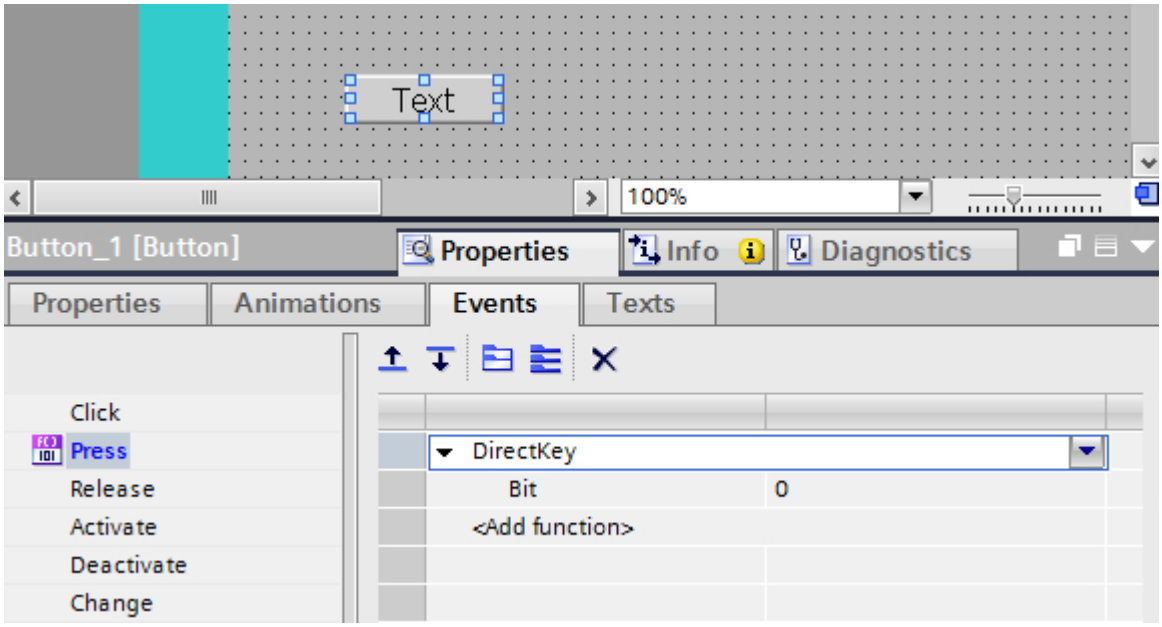
Requirements

- An HMI device with key operation has been created.
- You have created an LED tag.

Procedure

1. Create a new screen.
2. Drag-and-drop a button from the "Tools" task card into the screen.
3. Click the button.
4. In the Inspector window, click "Properties > Events > Press".
5. Click "<Add function>".

6. Select the "Direct key" system function.



7. Under "Bit" enter the correct bit number.
   The correct bit number depends on the HMI device and the input and output assignments on the HMI device.

Assignment of inputs and outputs

The exact assignment of inputs and outputs can be found under:

- PROFINET IO direct keys: Assignment of inputs and outputs (Page 6525)
- PROFIBUS DP direct keys: Assignment of inputs and outputs (Page 6543)

12.11.13.4 PROFINET IO direct keys

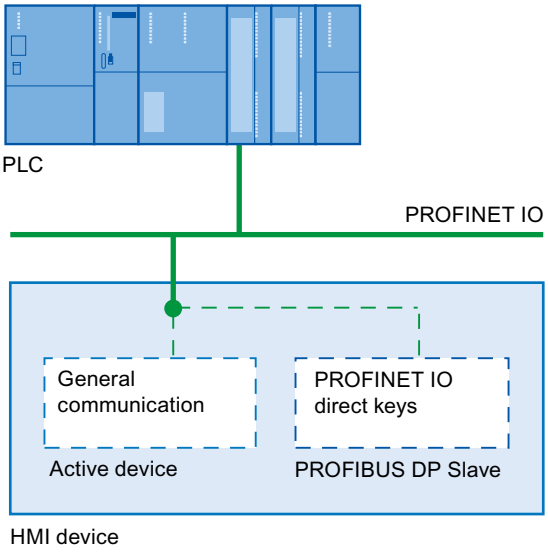
PROFINET IO direct keys

PROFINET IO direct keys

You configure the HMI device created in WinCC as an active communication partner in the automation network.

For the PROFINET IO direct keys, the HMI device can also be configured as a slave in the PROFINET IO network.

The following figure shows the basic configuration based on an automation network with an HMI device and a PLC.



Mode of operation of the PROFINET IO direct keys

The cycle time of the Ethernet bus can be set between 8 ms and 512 ms.

Thus, the reaction time of the PROFINET IO direct keys can also be determined. For a typical configuration with a cycle time of 64 ms, the response time of the PROFINET IO direct keys is < 100 ms.

A response time of < 100 ms to the CPU is usually ensured when using the PROFINET IO direct keys. This time can be exceeded significantly in the following cases:

- Complex functions run in the background, e.g. transmitting recipes, printing reports.
- At the same time, multiple connections can be maintained to the CPU.

HMI devices for the configuration of PROFINET IO direct keys

HMI devices

You can configure PROFINET IO direct keys with the following HMI devices:

Restrictions for PROFINET IO direct keys

Note

Direct keys are still active when the HMI device is in "offline" mode.

Note

If an external application such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the function "DirectKeyScreenNumber" is no longer set and the keys or buttons with the configured function "DirectKey" no longer trigger the associated bit in the PLC.

Restrictions

- It is not permitted to operate PROFIBUS IO direct keys and PROFINET DP direct keys simultaneously.
- Establish the following via the "PROFINET IO enabled" option in the control panel of the HMI device:
  - Option disabled = PROFIBUS DP direct keys enabled
  - Option enabled = PROFINET IO direct keys enabled
- If communication is enabled with PROFINET IO, you are not permitted to use the serial interface.
- You can operate direct keys only on local HMI devices. On the Sm@rtClient it is possible to operate the key / button for the direct key. However, No bit is set in the I/O area of the CPU.
- Direct keys which are assigned to a button are only triggered through touch operation. Triggering with a mouse click, for example with a connected USB mouse, is not possible.
- With touch operation, direct keys are triggered independent of any configured password protection.
- The buttons used as direct keys on HMI devices with touch screen functionality may not be modified as follows by means of scripting:
  - Moving
  - Resizing
  - Hiding
  - Disabling for operation
- The LEDs are addressed either via the PROFINET IO direct keys or the HMI Runtime application. Avoid concurrent addressing via the PROFINET IO direct keys and the HMI Runtime application. The LEDs "ACK", "A-Z l", "A-Z r" and "HELP" are reserved for system functions and cannot be configured. It is not advisable to control the "ACK", "A-Z l", "A-Z r" and "HELP" LEDs by means of PROFINET IO direct key functionality.

Inputs and outputs of HMI devices

Assignment of inputs and outputs

Assigning the inputs/outputs

The keys or buttons of the device are assigning bytes in the input area. The LEDs are assigning bytes in the output area. The number of bytes used depends on the HMI device.

The touch panels do not have any permanently assigned keys. They only have user-configurable buttons. Via the "DirectKey system function you can assign a bit to a button in the input area. The counting direction of the bit in the input direction is from right to left. In contrast to the operator panels which have permanently assigned keys, the touch panel buttons can be assigned freely.

Assigning direct keys to screen numbers (only for touch devices)

If a PROFINET IO direct key is using the same bit for different functions in different screens, the SIMATIC PLC must differentiate between the respective functionality by means of the screen number. You can use the "DirectKeyScreenNumber" system function to avoid the delayed updating of the screen number following a screen change.

Using the "DirectKeyScreenNumber"system function you can set within the input area any number of bits in order to identify the screen and simultaneously transfer the direct key bits to the PLC. This ensures unambiguous allocation of a control bit to screen number at all times.

KTP700 Mobile, KTP900 Mobile

Evaluating operator controls as direct keys

You can configure the operator controls of the HMI device as direct keys. The states of the following operator controls are available directly in the I/O area of the PLC:

- The switching state of the function keys
- The switching state of the key-operated switch
- The switching state of the illuminated pushbuttons

Byte assignment

The following table shows the assignment of the keys (inputs) and LEDs (outputs) to the bytes in the PLC process image. For more information, see your plant documentation.

- KTP700 Mobile and KTP700F Mobile

Direct key bit

LED bit							
7	6	5	4	3	2	1	0
F8	F7	F6	F5	F4	F3	F2	F1
T2	T1					F10	F9

F Bit for function key
S Bit for key-operated switch
T1 Bit for left illuminated pushbutton
T2 Bit for right illuminated pushbutton

The bytes "n+2" to "n+5" contain the direct key bits for the touch buttons.

Bit coding

The following tables show the bit coding for function keys, key-operated switch and illuminated pushbutton:

- Bit coding of function keys

State	F1 to F8 or F10
Not pressed	0
Pressed	1

- Bit coding of function key LEDs

State	F1 to F8 or F10
LED not illuminated	0
LED is illuminated	1

- Bit coding of key-operated switch

State	S1	S0	Key position
Position 0	0	0	In middle position
Position I	0	1	Turned in clockwise direction up to stop
Position II	1	0	Turned counter-clockwise up to stop

- Bit coding of illuminated pushbuttons

State	K1	K2
Not pressed	0	0
Pressed	1	1

- Bit coding of illuminated pushbutton LEDs

State	K1	K2
Off	0	0
On permanently	1	1

Controlling the LEDs of the function keys by means of system functions

F1 to F8 or F10 to LEDs are integrated in the function keys of the HMI device. The connected controller can control the integrated LEDs. The LED signals the operator that he should use the corresponding function key while the project is running.

The following table shows the possible states of the LEDs and the corresponding entries in bit n+1 and bit n of the LED tags:

Bit n + 1	Bit n	LED status
0	0	Off
0	1	Flashing quickly
1	0	Flashing slowly
1	1	ON, continuous

12.11.13.5 PROFIBUS DP direct keys

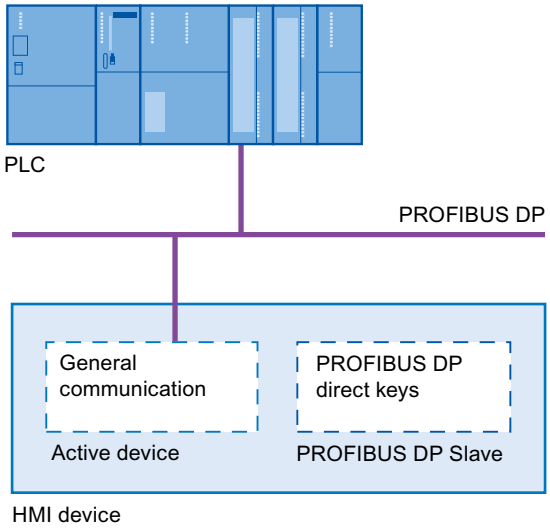
PROFIBUS DP direct keys

PROFIBUS DP direct keys

You configure the HMI device created in WinCC as an active communication partner in the automation network.

For the PROFIBUS DP direct keys, also configure the HMI device as a slave in the PROFIBUS DP network.

The following figure shows the basic configuration based on an automation network with an HMI device and a PLC.



Mode of operation of the PROFIBUS DP direct keys

With PROFIBUS DP direct keys, when the key or button is pressed, a bit is set in the I/O area of the CPU.

The cycle time of the PROFIBUS DP bus is calculated from the total of all configured inputs and outputs.

The number of configured inputs and outputs can influence the reaction time of the PROFIBUS DP direct key. For a typical configuration the response time of the PROFIBUS DP direct key is < 100 ms.

HMI devices for the configuration of PROFIBUS DP direct keys

HMI devices

You can configure PROFIBUS DP direct keys with the following HMI devices:

HMI device class	HMI device
Panel	OP 77B
	OP 177B
	OP 277 6"
	TP 177B 4"
	TP 177B 6"
	TP 277 6"
Mobile Panel	Mobile Panel 177 DP
	Mobile Panel 277 8"
	Mobile Panel 277 10"

HMI device class	HMI device
Multi Panel	Multi Panel 177 6" Touch
	Multi Panel 277 Key
	Multi Panel 277 Touch
	Multi Panel 377 Key
	Multi Panel 377 Touch
Comfort Panel	KTP400 Comfort
	KP400 Comfort
	KP700 Comfort
	TP700 Comfort
	KP900 Comfort
	TP900 Comfort
	KP1200 Comfort
	TP1200 Comfort
	KP1500 Comfort
	TP1500 Comfort
	TP1900 Comfort
	TP2200 Comfort

Restrictions for PROFIBUS DP direct keys

Note

If an external application such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the function "DirectKeyScreenNumber" is no longer set and the keys or buttons with the configured function "DirectKey" no longer trigger the associated bit in the PLC.

Restrictions

- It is not possible to operate PROFIBUS DP direct keys and PROFINET IO direct keys simultaneously.
  Establish the following via the "PROFINET IO enabled" option in the control panel of the HMI device:
  - Option disabled = PROFIBUS DP direct keys enabled
  - Option enabled = PROFINET IO direct keys enabled
- You can operate direct keys only on local HMI devices. On the Sm@rtClient it is possible to operate the key / button for the direct key. However, No bit is set in the I/O area of the CPU.

- The buttons used as direct keys on HMI devices with touch screen functionality may not be modified as follows by means of scripting:
  - Moving
  - Resizing
  - Hiding
  - Disabling for operation
- The LEDs are addressed either via the PROFIBUS DP direct keys or the HMI Runtime application. Avoid concurrent addressing via the PROFIBUS DP direct keys and the HMI Runtime application. The LEDs "ACK", "A-Z l", "A-Z r" and "HELP" are reserved for system functions and cannot be configured. We do not recommend addressing the LEDs "ACK", "A-Z l", "A-Z r" and "HELP" with the PROFIBUS DP direct keys.
- The PROFIBUS direct keys on an HMI device are triggered independent of any configured password protection.

Inputs and outputs of HMI devices

Assignment of inputs and outputs

Assigning the inputs/outputs

The keys or buttons of the device are assigning bytes in the input area. The LEDs occupy bytes in the DP output area. The following table shows the number of bytes used in the various HMI devices. The precise assignment is shown in the following screens.

The touch panels do not have any permanently assigned keys. They only have user-configurable buttons. Via the direct keys function you can assign to a button a bit in the input area. The counting direction of the bit in the input direction is from right to left. In contrast to the operator panels which have permanently assigned keys, the touch panel buttons can be assigned freely. For more detailed information, refer to the "WinCC flexible - Configuring WinCC Windows-based Systems" user manual.

Assigning direct keys to screen numbers (only for touch devices)

If a PROFIBUS DP direct key is using the same bit for different functions in different screens, the S7 must differentiate between the respective functionality by means of the screen number. To combat the delayed updating of the screen number in the PLC after a change of screen you use the "DirectKeyScreenNumber" screen function.

Using the "DirectKeyScreenNumber" you can set within the input area any number of bits in order to identify the screen and simultaneously transfer the direct key bits to the PLC. This ensures unambiguous allocation of a control bit to screen number at all times.

12.11.14 Communication via SIMATIC HMI HTTP

12.11.14.1 Basic information on SIMATIC HMI HTTP

Introduction

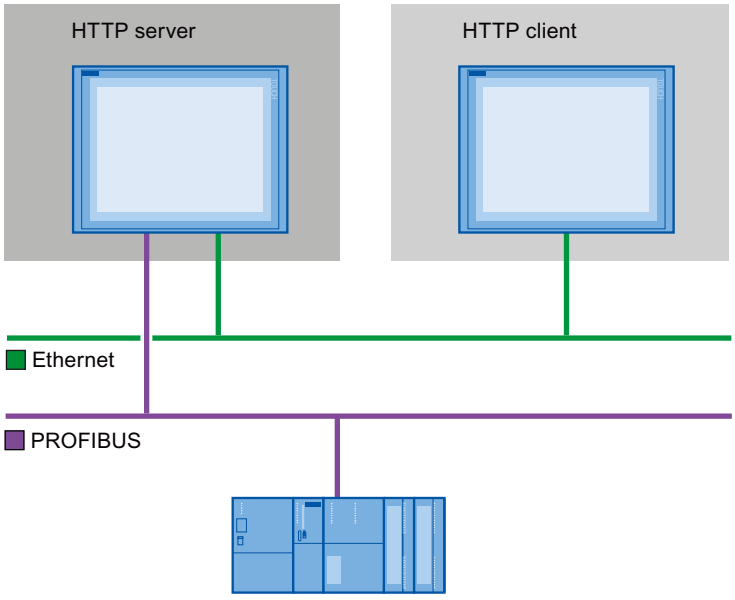
You use the SIMATIC HMI HTTP Protocol for data exchange between HMI devices.

The SIMATIC HMI HTTP Protocol is not suited for exchange of bulk data.

Data exchange occurs according to the Request-Response method. The HTTP client sends its request to the HTTP server, which processes it and returns a response.

A device can be configured as an HTTP client and HTTP server simultaneously.

The client and server establish a connection via the Ethernet interface for data exchange.



HTTP components

The components of the SIMATIC HMI HTTP Protocol are transferred to the HMI device in "Load to device".

HTTP components are:

- HTTP server
- HTTP client

If you use a Standard-PC or SIMATIC IPC, you must install WinCC RT Advanced or WinCC RT Professional first.

SMTP protocol

The SMTP protocol is not a requirement for communication via SIMATIC HMI HTTP Protocol .

HTTP / HTTPS

TheSIMATIC HMI HTTP Protocol offers two standards:

- HTTP
  Is implemented in local networks for a fast, uncoded transfer of uncritical data.
- HTTPS
  Enables a reliable HTTP connection between devices. Initially there is an exchange of secret keys. Then, in a further step, the respective public keys can be securely exchanged in the form of digital certificates. The public keys are used to encode the utility data in order to guarantee a bug-proof communication.

Note

Due to the encryption, the HTTPS protocol has a lower transmission performance than the HTTP protocol.

Caution

End users are responsible for the security of their own networks.

12.11.14.2 Configuring a connection via SIMATIC HMI HTTP

Configuring a connection via SIMATIC HMI HTTP

Communication between HMI devices via SIMATIC HMI HTTP protocol

Several steps are needed to configure communication between HMI devices via the SIMATIC HMI HTTP protocol:

1. Configure HMI device as a server.
2. Configure HMI device as a client.
3. Assign tag parameters in the client.
4. Commission connection.

Access to tags via SIMATIC HMI HTTP protocol

If access to tags via the SIMATIC HMI HTTP protocol is to be enabled, these tags must be defined for the relevant HMI devices and interconnected.

Configuring an HMI device as a server

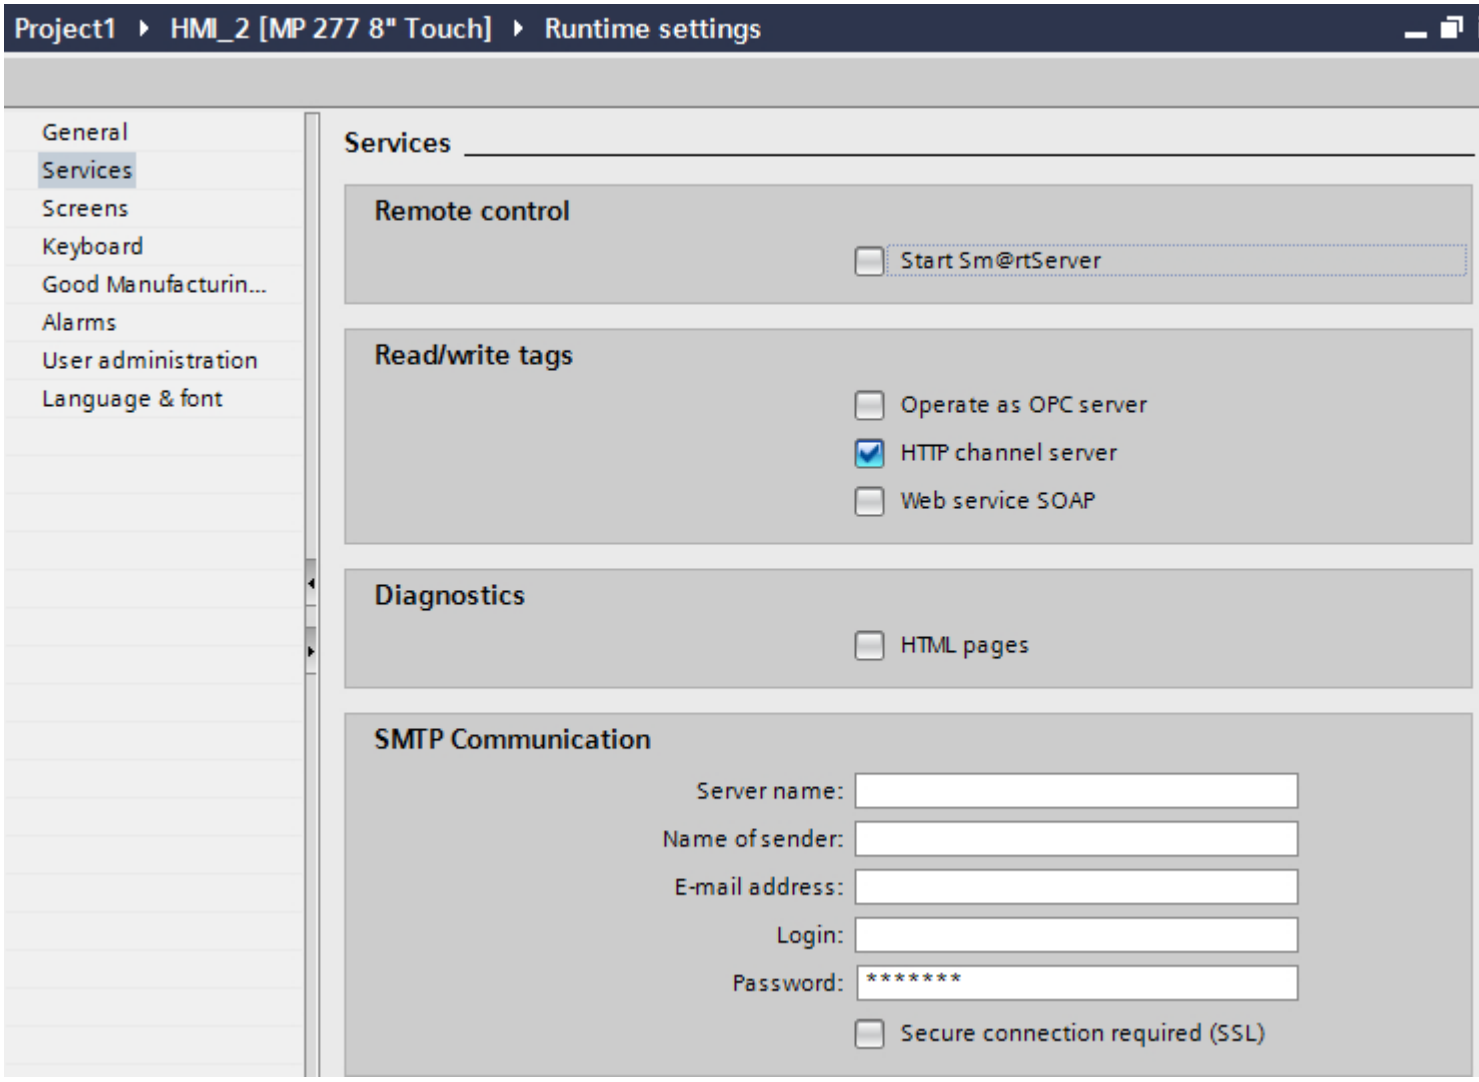
Configuring a server

Requirements

- The HTTP communication channel must be set in the Control Panel of the HMI device.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click "Runtime settings".
   The "Runtime settings" editor opens.
3. Click "Services".
4. Select the "HTTP channel server" option.



If you use the SMTP protocol, you assign the following values under "SMTP settings" according to your project specifications:

- Server name
- Login
- Password

Result

The HMI device has been configured as a server.

Tags in the server

Tags used

The client can use the HTTP protocol for read and write access to tags configured on the server in runtime. This means that it is not necessary to configure additional tags for an HTTP communication.

However, the following aspects must be taken into account to ensure correct data exchange:

- The data type of the server tags must match the data type in the client.
- The tag name configured in the HTTP server must be identical to the name of the address tag of the HTTP client.

Configuring an HMI device as a client

Configuring a client

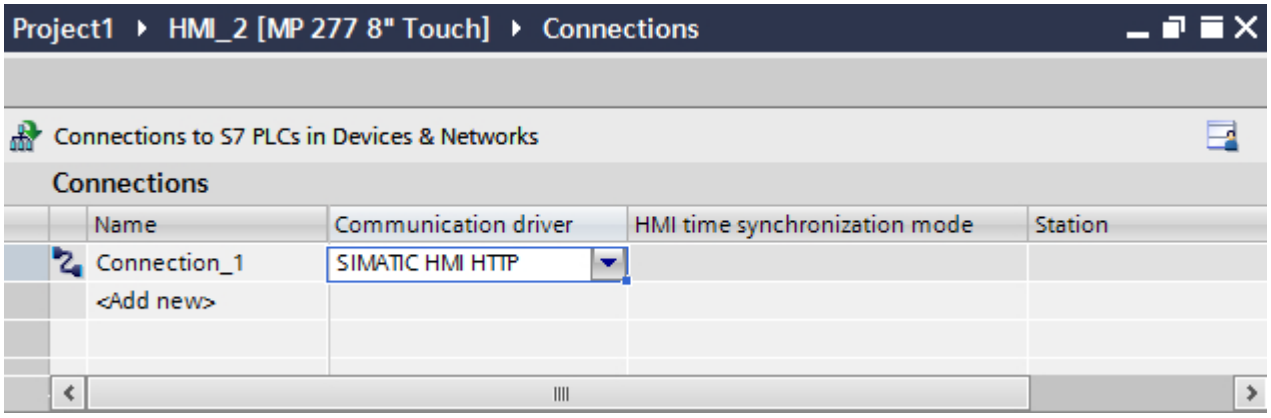
Requirements

- The HTTP communication channel must be set in the Control Panel of the HMI device.
- An HMI device has been configured as a server.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.

4. In the "Communication drivers" column, select the "SIMATIC HMI HTTP Protocol" driver.



5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".
6. Set the parameters in the Property window.
   See "Setting parameters for the client" for more information about the parameters.

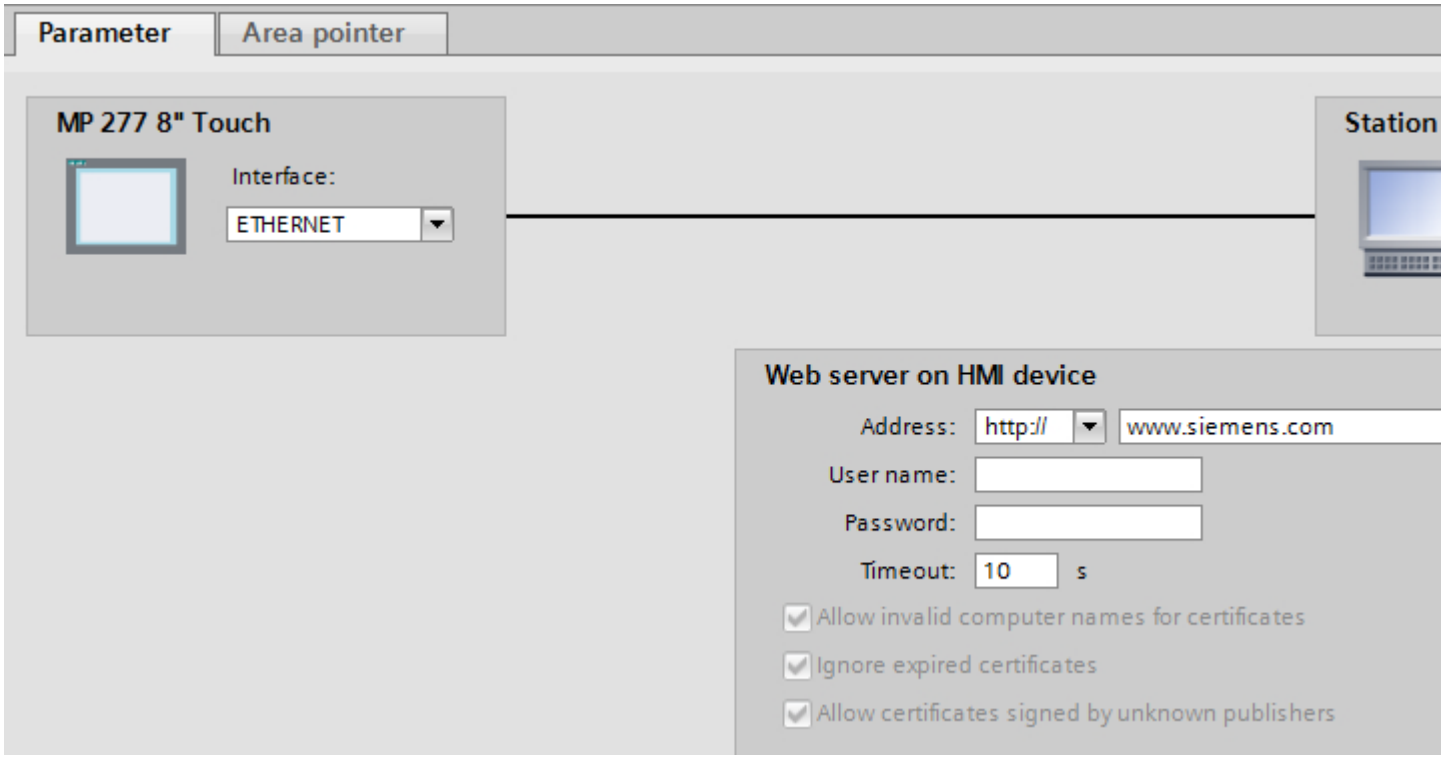
Setting parameters for the client

Requirements

- Connection has been created via SIMATIC HMI HTTP protocol.
- "Connections" editor is open.

Procedure

1. Select "Ethernet" in the Inspector window under "Parameters > Interface".
2. Select protocol http:// or https://.
3. Enter the name of the server or its IP address.



User name and password

If the "Authentication required" check box was selected in the server in the "Control Panel > WinCC Internet Settings > Web Server" dialog, a user name and password must be entered here in the client.

Timeout

Assign a time after which a connection break is recognized.

HTTPS protocol

If the HTTPS protocol is selected, with the following settings you can establish how the HTTPS client should check the properties of the server certificate and how it should react in the event of error:

- "Allow invalid computer names for certificates"
- "Allow expired certificates"
- "Allow certificates signed by unknown publishers"

Reading out an IP address

If the server has already been commissioned, you can read out the IP address on the server as well:

- For Panel
  Click "Start > Programs > Command Prompt" on the server and enter the "ipconfig" command using the screen keyboard. The IP address is displayed after pressing <Ret>.
- For PC / Panel PC
  Click "Start > Run" on the server, enter "Cmd", and press <Ret>: The command interpreter is displayed. Enter the "ipconfig" command. The IP address is displayed after pressing <Ret>.

Assigning tag parameters in the client

Assigning tag parameters in the client

Introduction

In order to be able to access tags on the server, they must be configured in the client as tag addresses.

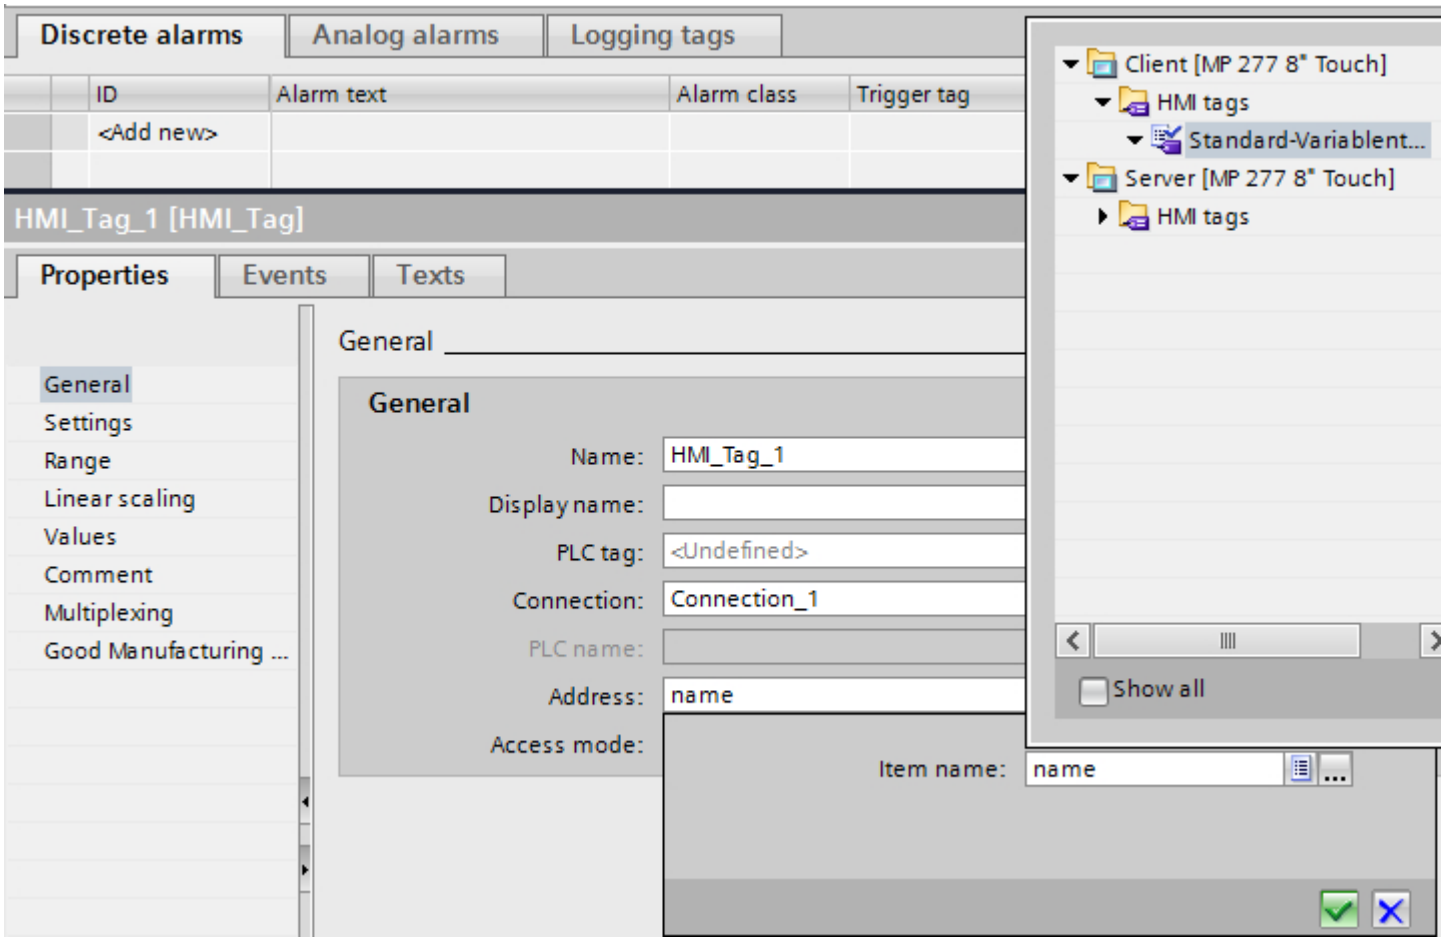
Requirements

- Tags have been created in the "HMI tags" editor of the server.

Procedure

1. Double-click the client under "Devices" in the project tree.
2. Double-click "HMI tags".
3. Create a new tag.
4. Select a data type.

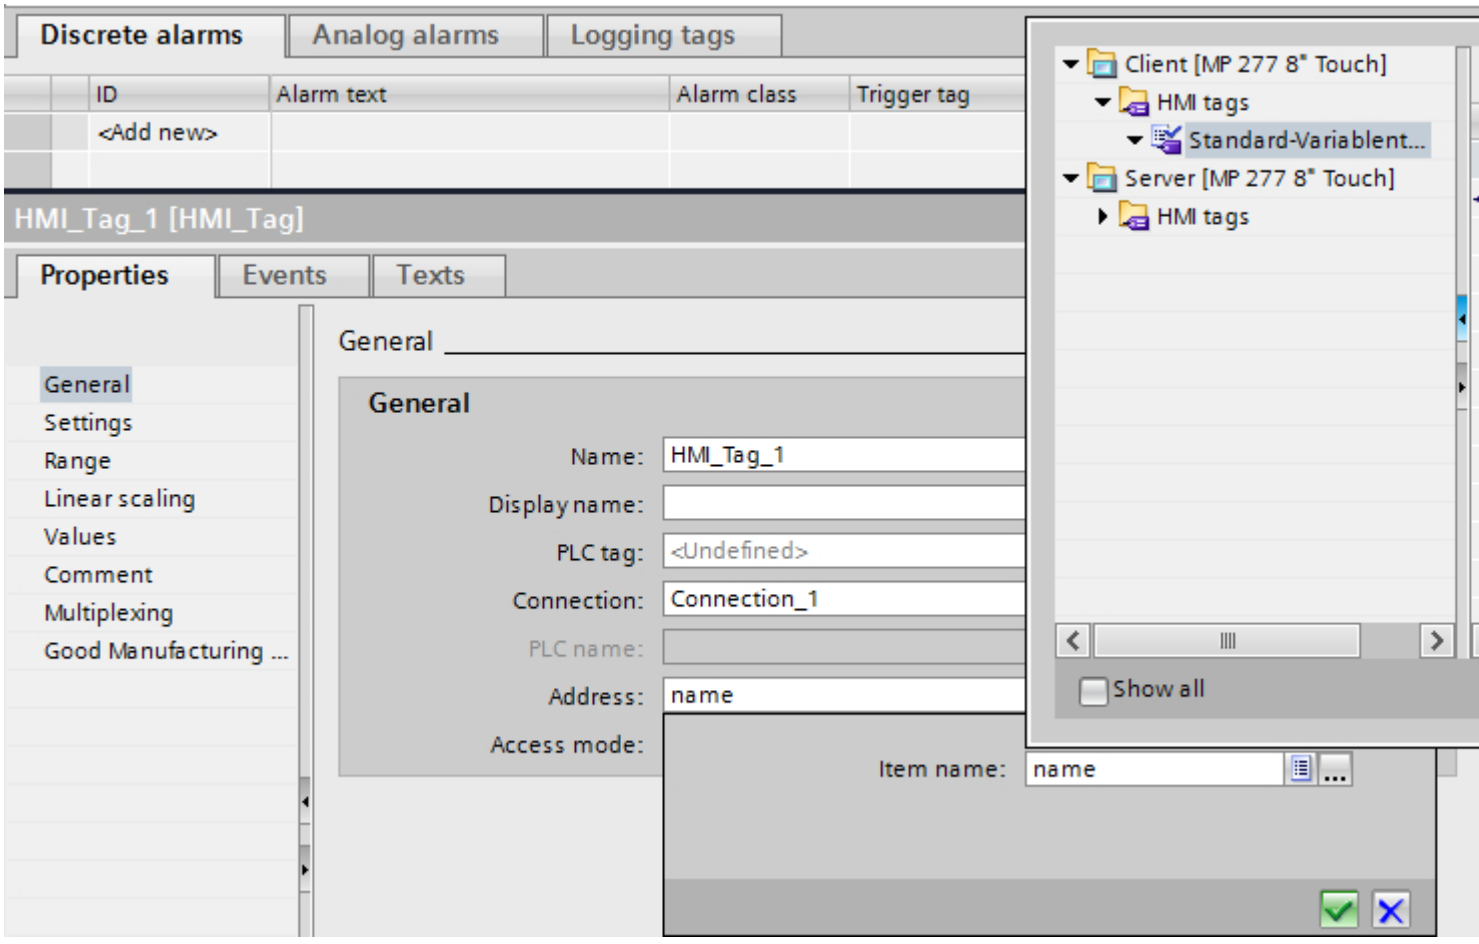
5. Open the selection dialog in the "Addresses" column.



6. Define the parameters in the working area:
   See "Parameters for the client tags" for more information about the parameters.

Parameters for the tags of the client

Parameters for the tags



Data type

- The client does not check the data type. Therefore, pay attention that the data type selected here matches the data type of the tags on the server.
- Array tags are not permitted.

Addressing

If the server and client are not within the same project, note the following:

- Enter the exact name of the tag that is to be communicated with on the server.

Commissioning a connection

Setting the server's Internet Settings

Introduction

To commission an HTTP/HTTPS connection, the WinCC Internet Settings must be set up in the Control Panel of both the server and client, in addition to the configuration in WinCC.

The name and number of tabs contained in the "WinCC Internet Settings" dialog depend on the software installed.

Only the required tabs with the MP 277 HMI device as an example are shown below.

WinCC Internet Settings, Proxy tab

The valid network settings are specified by the network administrator.

Make the following settings:

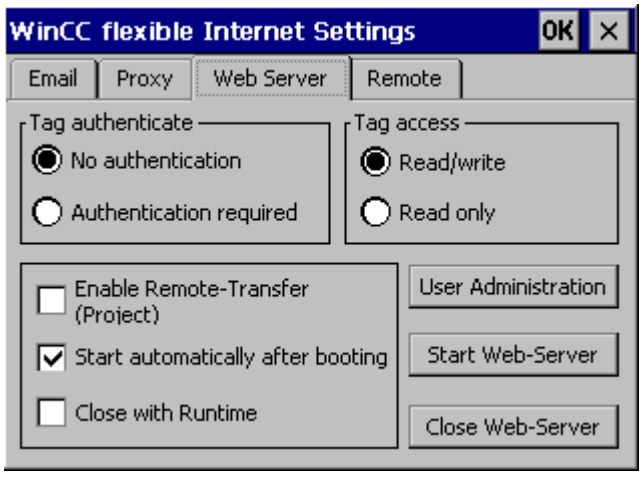
- Internet settings for HMI devices with Windows CE
  In this case, there are several options for calling the Control Panel:
  - In the startup phase, click on the "Control Panel" button in the Windows CE Loader menu.
  - Select "Start > Settings > Control Panel" in the toolbar.
  - During normal operation, pressing the key combination <CTRL + ESC> opens the toolbar. Start the Control Panel by selecting "Start > Settings > Control Panel".
  - Using the RT function "OpenControlPanel"

  The language in the Windows CE based devices is always English.

WinCC Internet Settings, Web Server tab

Settings for using the integrated Web Server are made in this tab.

The "Web Server" tab is only available in the WinCC Internet Settings if the Web Server is installed on the HMI device.

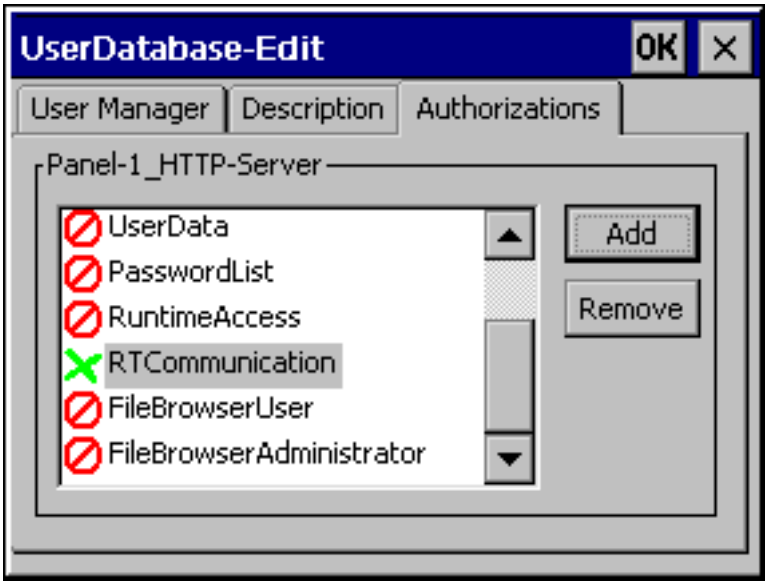


- Tag authenticate
  Controls authorization for tag access:
  - "No authentication": Authorization (user name password) is not required for access.
  - "Authentication required": Authorization (user name password) is required for access. The user name and password for the client are specified during configuration.
- Tag access
  Controls access to tags:
  - "Read/write": Tags can be read and rewritten.
  - "Read only": Tags can only be read.
- Group for defining operational performance
  The following check boxes are not selected in conjunction with tag exchange via the HTTP/ HTTPS protocol:
  - Enable remote transfer (project)
    Select this check box to enable an HTTP transfer from the configuration computer to the HMI device.
  - Start automatically after booting
    Specifies when the HTTP server should be started:
    Enabled: The HTTP server starts immediately after the HMI device is booted, irrespective of the runtime software
    Disabled: The HTTP server starts at the same time as the runtime software.
  - Close with Runtime
    Enabling this check box causes the HTTP server to be closed at the same time as the runtime software.

- User Administration
  This button opens the "UserDatabase-Edit" dialog box.

  In the "User Manager" tab of this dialog box, you can select, delete, or create a new user. The "Description" and "Authorizations" tabs always apply to the user currently selected. (This example dialog box shows a user with the name 'Panel-1_HTTP-Server'.)

- User Manager
  If a user name and password have been entered for the HTTP server under "Connections" in your WinCC project, the same user name and password must be specified on the server.
- Description
  Enables input of a user description.
- Authorizations
  The newly set up user must be assigned the authorizations for "RT Communication on the "Authorizations" tab control.



Establishing an HTTP connection

Introduction

To establish an HTTP connection, you must perform the following actions:

- In the "Connections" editor of WinCC, configure the connection as an "https://" protocol type and define how the HTTPS client should verify the properties of the server certificate and respond to errors.
- Install a valid certificate on the HTTPS client.
  Certificates are necessary for server authentication. Using certificates you can ensure that the server with which the connection is to be developed is actually the server for which it is outputting.

Principle of an HTTPS connection

After runtime start, the HTTPS client establishes a connection to the HTTPS server. The HTTPS server presents its certificate, which the client verifies for authenticity. The session code that can only be read by the HTTPS server is then transmitted. The session code is now available on both sides and enables a symmetrical data encryption.

Note

The certificate contains the current time. The current time can lead to problems if the time zones of the server and client are different. For example, a certificate generated on a server with an Asian time zone only becomes valid on a client with European time zone in the future (8 hours).

Preparation for installing a certificate on the client

With the first HTTPS client access, the HTTPS server generates the certificate itself and then saves it in the "Cert.cer" memory. The file is stored in the following directory:

- On a PC/panel PC (with Windows XP) in the directory "..\\Siemens\Automation\WinCC Runtime Advanced\SystemRoot\SSL"
- On Windows CE-based devices in the directory "Flash\Simatic\SystemRoot\SSL"
  The certificate must be stored on the HTTPS client on a storage medium from which it can be launched with a double click.

Server	Client	Possible file transfer
with Windows XP (PC, Panel PC)	with Windows XP (PC, Panel PC)	• Disk • USB stick • LAN (Ethernet) • Internet Explorer (via TCP/IP, if Service is already running)
With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	with Windows XP (PC, Panel PC)	• Memory card • ActiveSync (serial)
with Windows XP (PC, Panel PC)	With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	
With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	• Memory card

Installing a certificate on a client with Windows XP

Insert the storage medium on which you have saved the "Cert.cer" file into the HTTPS client or open the directory in which the file is located. Double click on the file and follow the instructions in the Windows dialog.

Tip: The Internet Explorer provides an easy way to install a certificate. Connect to this device via HTTPS (e.g.: https://<my device>). The browser establishes if a certificate has not yet been imported. In this case, the browser asks if you want to install the certificate. Any errors in the certificate will be displayed.

Installing a certificate on a client with Windows CE

Insert the memory card on which you have saved the converted "Cert.cer" file into the HTTPS client. WinCC provides the "InstallCert.exe" tool for importing certificates with Windows CE.

You can implement the installation as follows:

- In Explorer:
  Double click the "Cert.cer" file to install the certificate.
- At the command prompt:
  Enter "InstallCert /[command parameter] [filename]".
  - command parameters:
    /r parameter must be specified because the certificate used in WinCC Runtime is a root certificate.
    A root certificate is the main certificate and is used to verify the authenticity of all other certificates transferred.
  - filename
    You must specify the certificate file with its complete path (e.g. "\Storage Card\Cert.cer")

A status alarm is output when you completed the installation. Runtime has to be restarted after the installation of a certificate on Windows CE- HMI devices with HTTPS clients. It is necessary to restart Runtime so that an HTTPS connection can be established.

The file "Cert.cer" cannot be opened.

The "Cert.cer" file generated at the HTTPS server cannot be opened on HMI devices based on Windows CE 5.0 by double-clicking the client.

1. Open the Control Panel.
2. Select "Certificates > My Certificates."
3. Click the "Import" button.
   A dialog box opens.
4. Select the "From a File" menu in the file browser and select the "Cert.cer" file.

12.11.14.3 Performance features of communication

Permitted data types

Permitted data types

When configuring tags, the data types listed below can be used.

Data type in the SIMATIC HMI HTTP protocol	Length	Sign	Range of values
Bool	0	No	true (-1) or false (0)
SInt	1 Byte	Yes	-128 to 127
USint	1 Byte	No	0 to 255
Int	2 Byte	Yes	-32768 to 32767
UInt	2 Byte	No	0 to 65535

Data type in the SIMATIC HMI HTTP protocol	Length	Sign	Range of values
DInt	4 Byte	Yes	-2,147,483,648 to 2,147,483,647
UDInt	4 Byte	No	0 to 4,294,967,295
Real	4 Byte	Yes	-3.402823E38 to -1.401298E-45 for negative values and 1.401298E-45 to 3.402823E38 for positive values
LReal	8 Byte	Yes	-1.79769313486231E308 to -4.94065645841247E-324 for negative values and 4.94065645841247E-324 to 1.79769313486232E308 for positive values
String	1 to 255 byte	——	
DateTime	8 Byte	——	1.1.1970 00:00:00 up to 31.12.2037 23:59:59

Note

Data types for third-party PLCs

Data types in third-party PLCs may differ from those in WinCC.

Note the the tag definition of the third-party PLC for the correct assignment.

Note

It is not possible to access array tags from an HTTP client.

Multiplex tags are not supported by the HTTP protocol. If you need a multiplex tag, you must configure it on the HTTP client. You will have to create the tags for the multiplex list on the server and the client and then connect them. You will then add these tags to the multiplex list on the client.

Address multiplex tags are not supported by the HTTP protocol.

12.11.15 Communication via OPC

12.11.15.1 Communication via OPC

Introduction

This section describes the communication between an HMI device and a device via OPC.

In this case, the HMI device is the OPC client and the device is the OPC server.

For more detailed information on OPC and on configuring OPC servers, refer to Section "OPC (Page 7155)".

12.11.15.2 Configuring a connection via OPC

Introduction

You configure a connection to a device via OPC in the "Connections" editor of the HMI device.

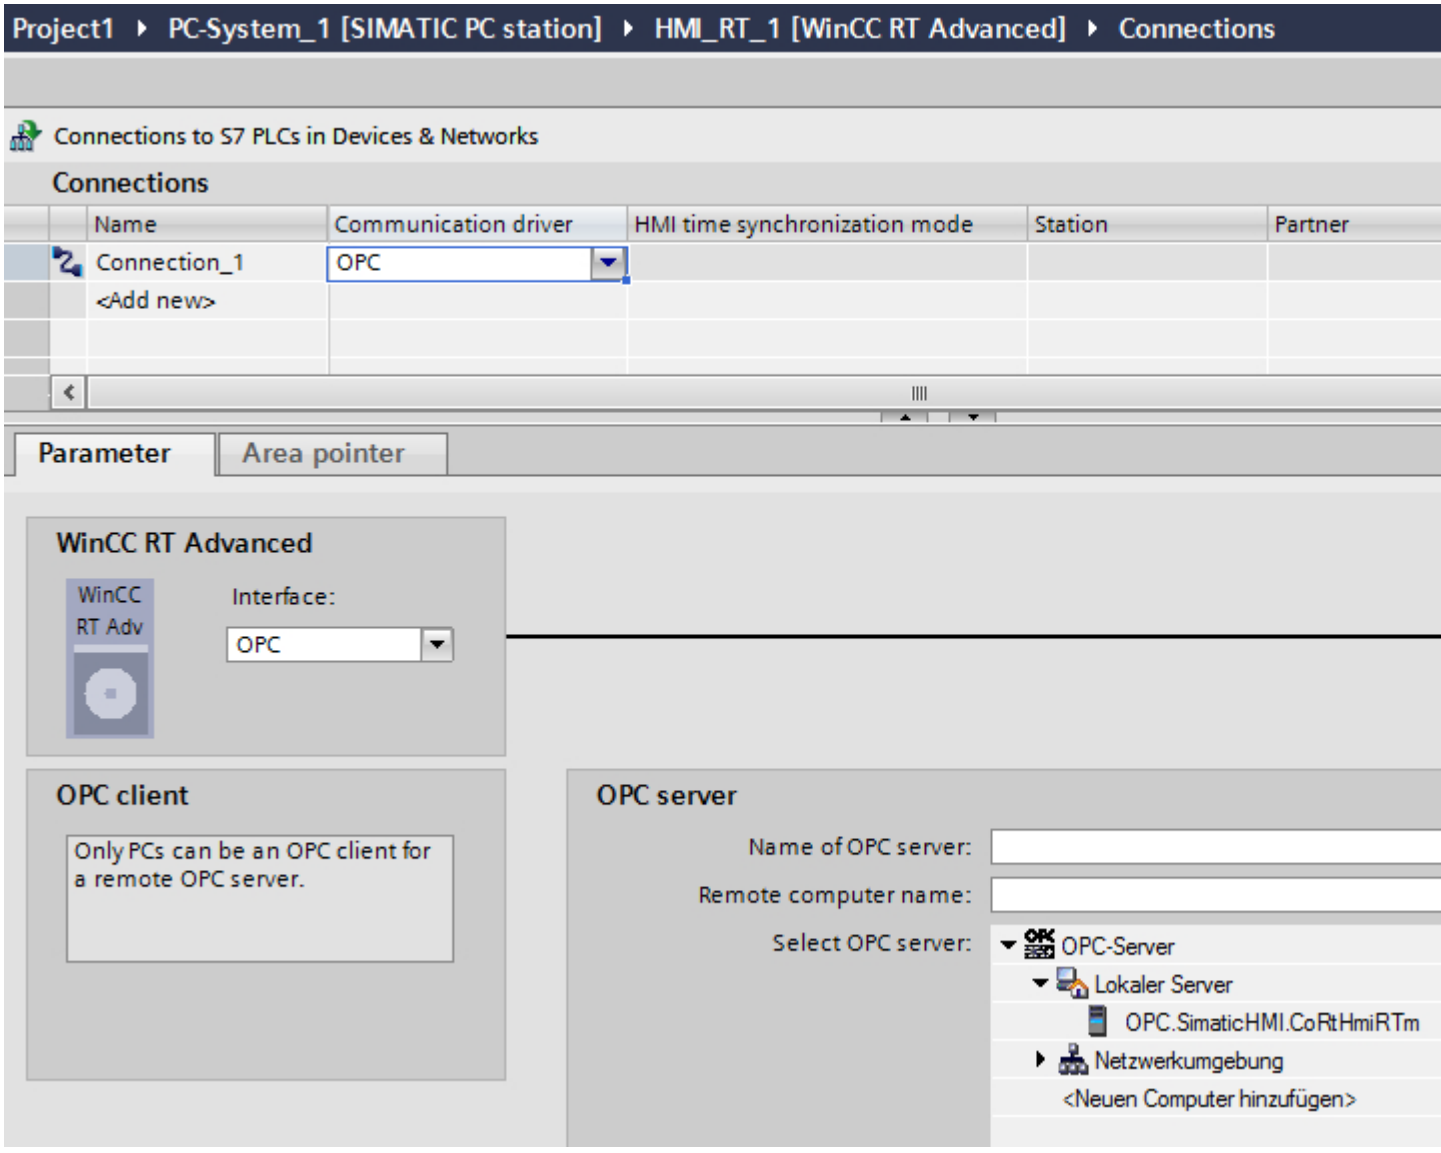
Requirements

- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.
4. In the "Communication drivers" column, select the "OPC" driver.

5. Select the "OPC" interface for the HMI device under "Parameters > Interface".



6. Select an OPC server from the tree view under "Parameters > OPC servers".
   The OPC server is entered in the "Name of OPC server" field.

12.11.15.3 Performance features of communication

Permitted data types for OPC DA

Permitted data types for connections with OPC DA

12.11.16 Communication via routing

12.11.16.1 Communication via routing

Introduction

If all stations in an automation system are not connected to the same subnet, these stations cannot be accessed directly online.

A connection between partners in different subnets is only possible via routing.

You configure the routing settings with the properties of the interfaces.

Communication from connection partners in various different subnets can be routed via the following links:

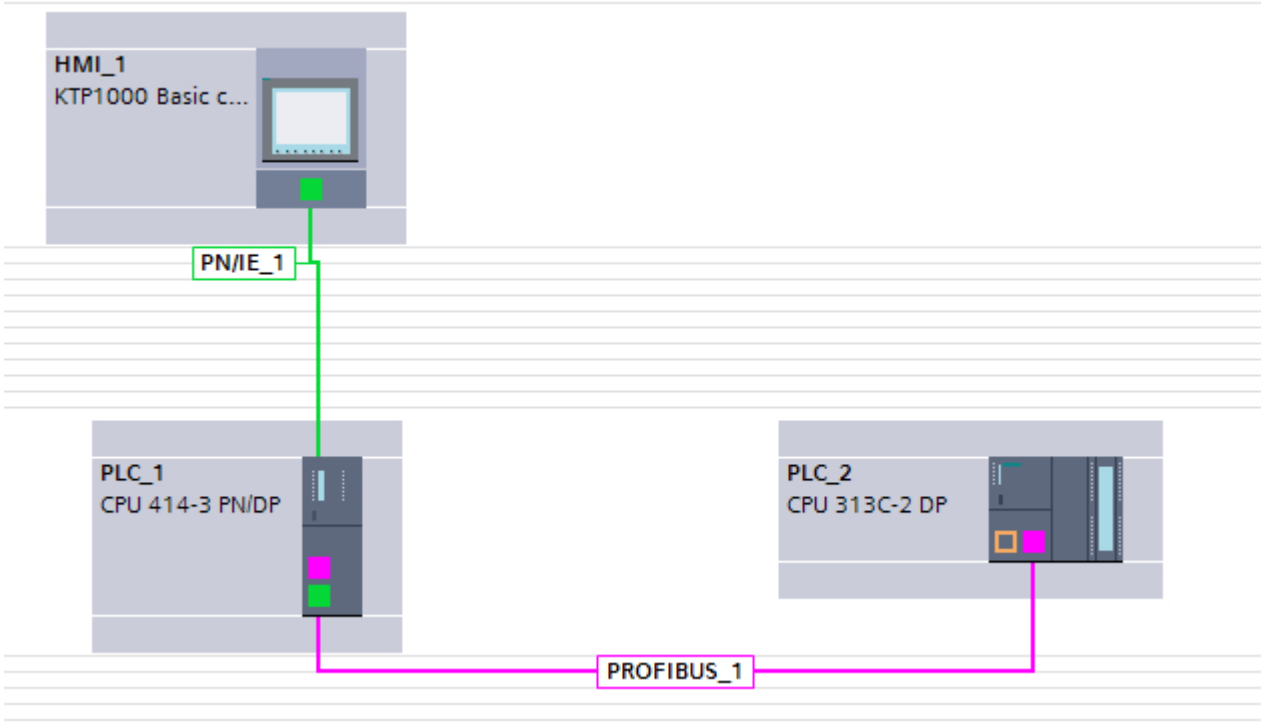
- PROFINET
- PROFIBUS
- MPI

Requirements for routing

To establish a connection to these devices, a router must be interposed. In this case, a SIMATIC station can also act as a router if it has appropriate interfaces with the different subnets.

Modules with communication capability (CPUs or CPs) used to establish gateways between the subnetworks must have routing capability.

A connection between partners in different subnets is only possible with IP routing. The routing settings can be edited in the corresponding interface properties.



Routing path

The routing path is determined in Runtime by the system and cannot be influenced by the user. During configuration, it is not possible to generate information about a faulty connection.

HMI devices as routers

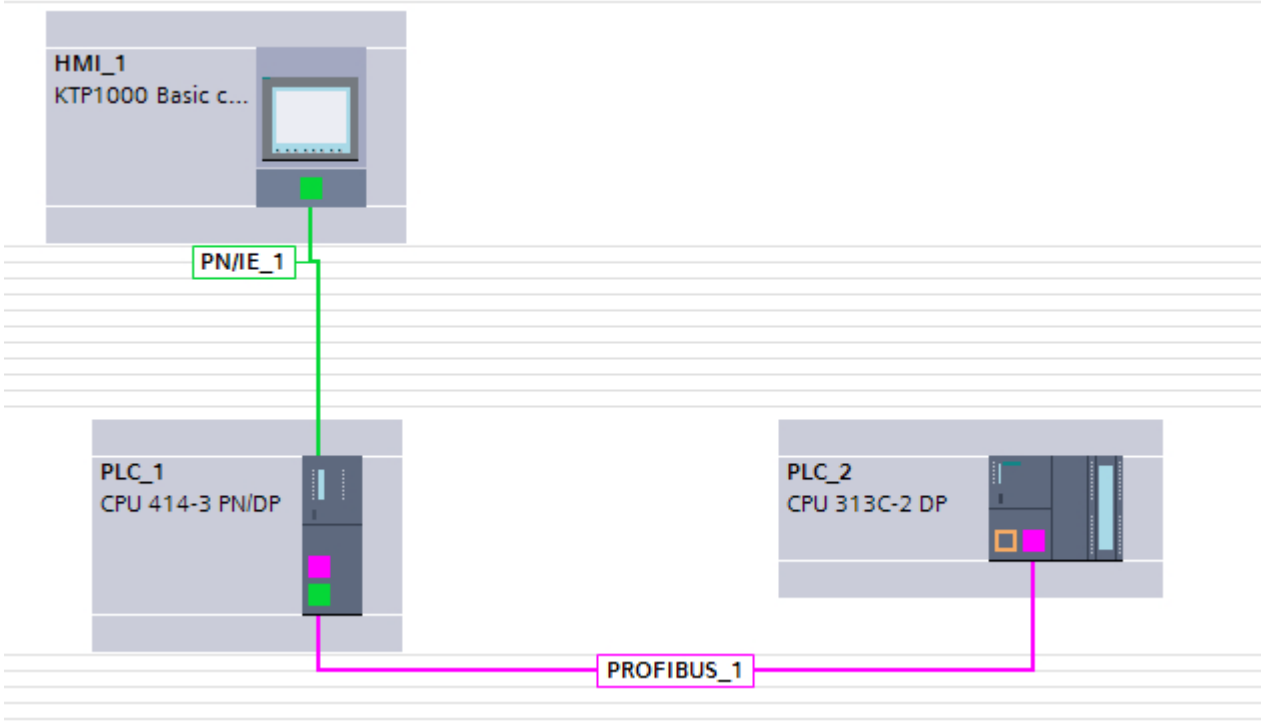
Only SIMATIC PCs or PC stations can be used as a router.

All other HMI devices from the "HMI" area cannot be used as a router.

12.11.16.2 Example for communication via routing

Communication via routing

Illustration of a hardware configuration with a routing connection



In the figure above, a routing connection has been established between an HMI device and the SIMATIC S7-300 controller.

The SIMATIC S7-400 automation device serves as a router.

A routing connection can be made directly in integrated projects. The communication partners are connected in the "Devices and Networks" editor.

You configure the parameters of the connection and interface in the Inspector window.

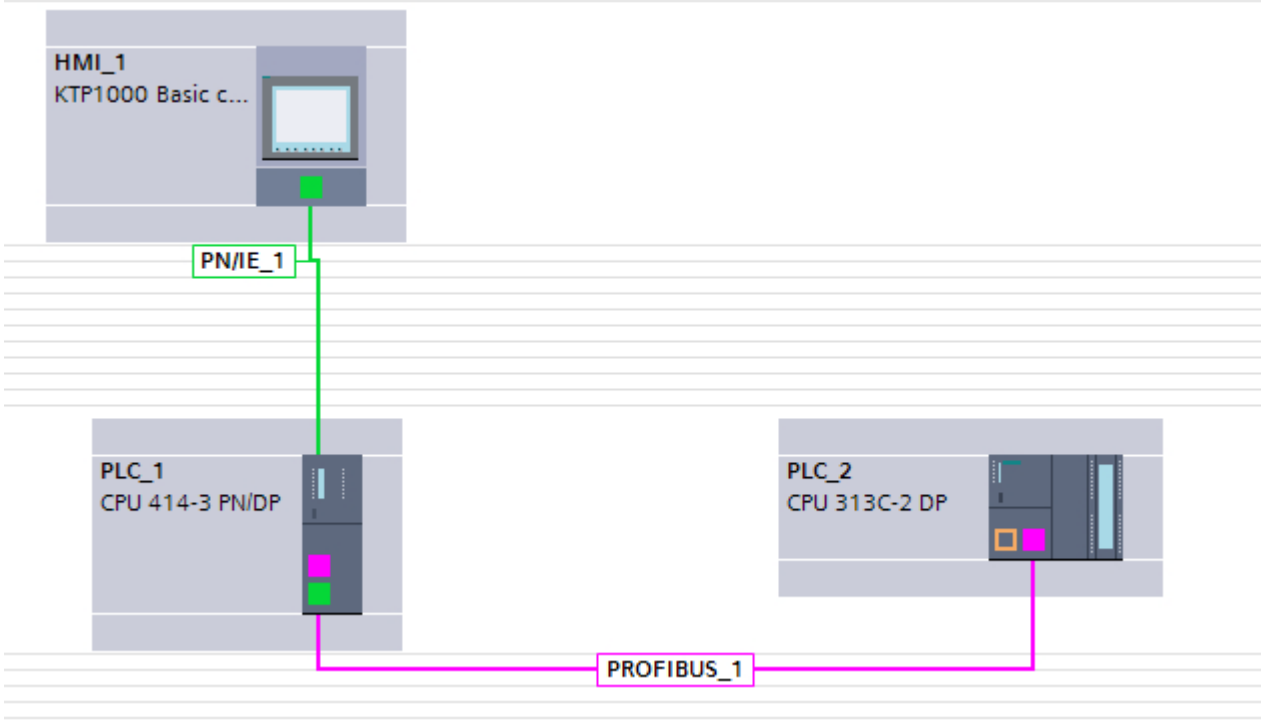
12.11.16.3 Configuring communication via routing

Introduction

The following configuration describes a network for the following communication partners:

- KTP1000 Basic PN
- SIMATIC S7-400 with PROFINET and PROFIBUS interface
- SIMATIC S7-300 with PROFIBUS interface



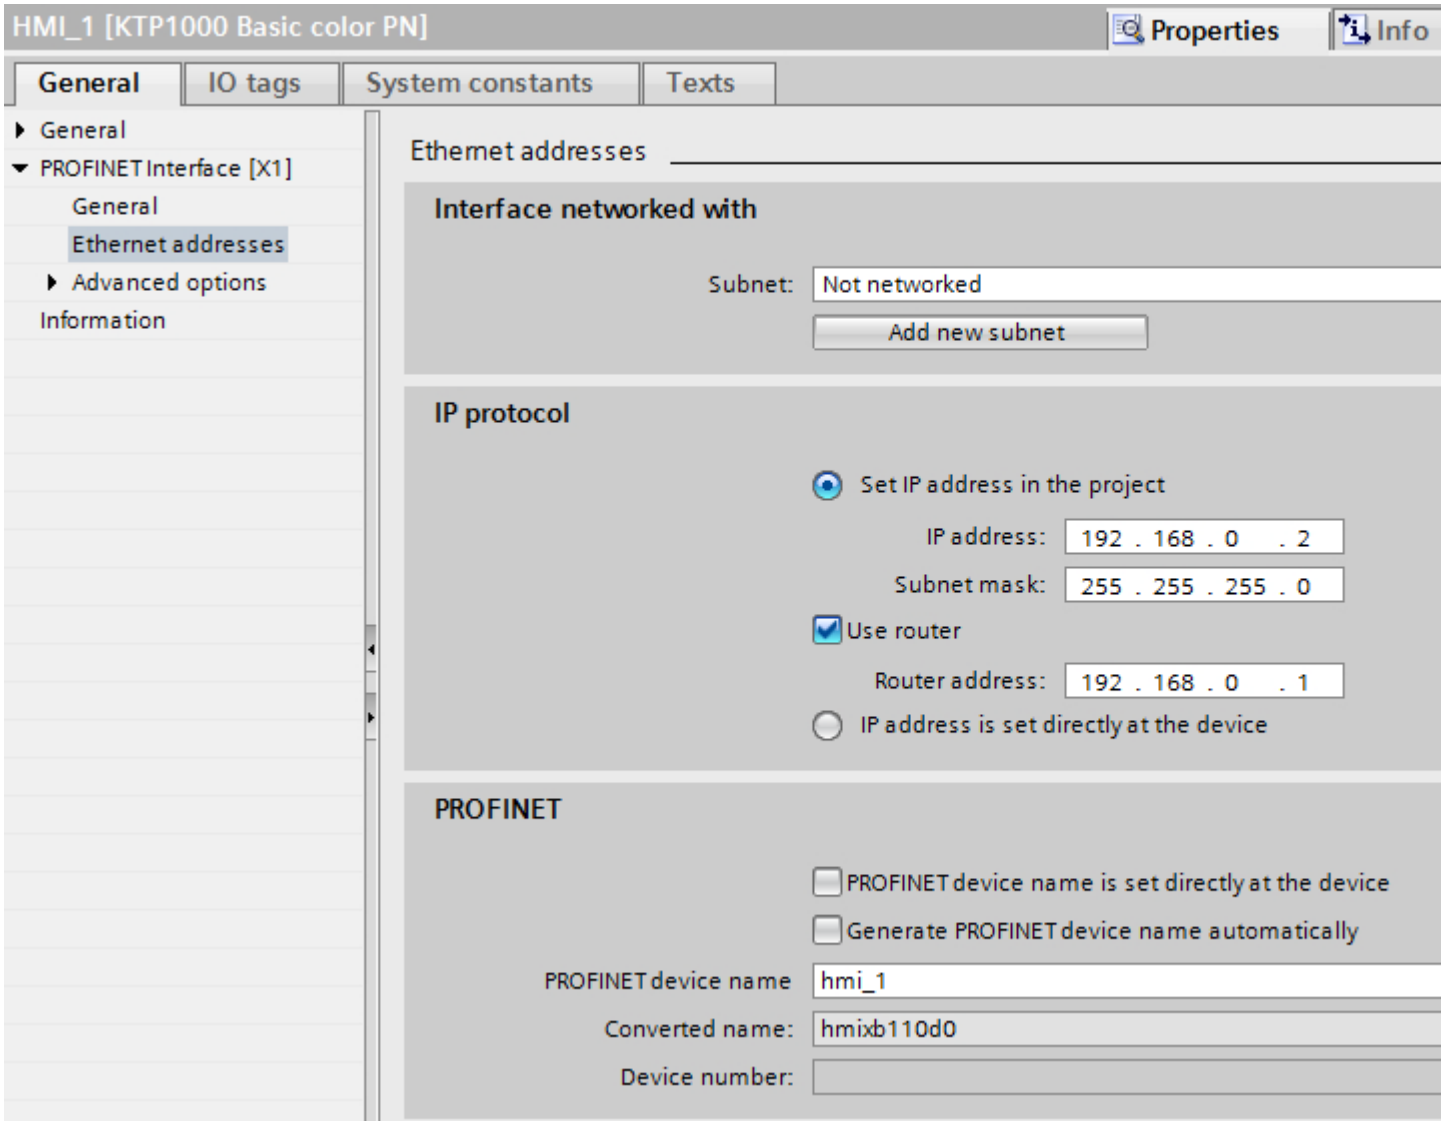
Requirements

- KTP1000 Basic PN is connected via PROFINET to the SIMATIC S7-400.
- SIMATIC S7-400 is connected via PROFIBUS to the SIMATIC S7-300.

Procedure

1. Click on the PROFINET interface of the HMI device.
2. In the Inspector window, click "Properties > General > Ethernet addresses".

3. Click "Use router" in the "IP protocol" area.
4. Enter the IP address of the router in the "Router address" field.



12.11.17 PROFINET IO and IRT

12.11.17.1 PROFINET IO

What is PROFINET IO?

PROFINET IO

PROFINET is an Ethernet-based automation standard of PROFIBUS Nutzerorganisation e.V. (PNO) which defines a manufacturer-neutral communication, automation and engineering model.

Objective

The objective of PROFINET is:

- Integrated communication via field bus and Ethernet
- Open, distributed automation
- Use of open standards

Architecture

The PROFIBUS User Organisation e.V. (PNO) has designated the following aspects for PROFINET architecture:

- Communication between controllers as components within distributed systems.
- Communication between field devices, such as I/O devices and drives.

Implementation by Siemens

The demand for "Communication between controllers as components within distributed systems" is implemented by "Component Based Automation" (CBA). Component Based Automation is used to create a distributed automation solution based on prefabricated components and partial solutions.

The demand for "Communication between field devices" is implemented by Siemens with "PROFINET IO". Just as with PROFIBUS DP, the complete configuration and programming of the components involved is possible using the Totally Integrated Automation Portal.

The following sections deal with the configuration of communication between field devices using PROFINET IO.

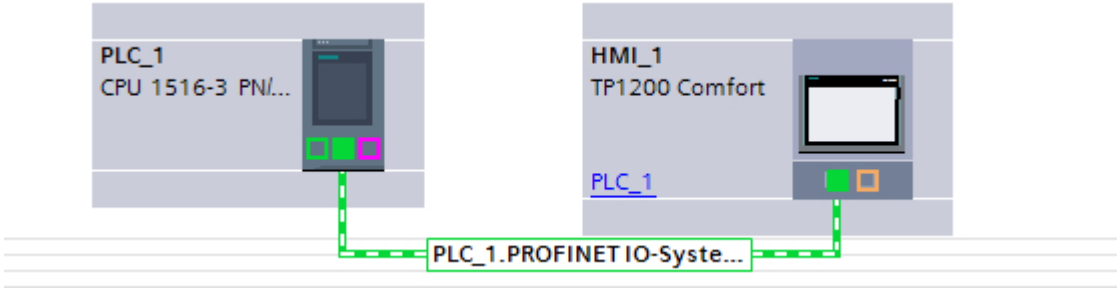
PROFINET IO systems

PROFINET IO system

A PROFINET IO system is comprised of a PROFINET IO controller and its assigned PROFINET IO devices.

- A PROFINET IO controller is a PLC that controls the automation task.
  Example: SIMATIC S7 1500 PLC
- A PROFINET IO device is a device that is controlled by an IO controller.
  Examples: HMI device TP 1200 Comfort, a head module of the distributed IO family ET 200S

As soon as you connect an IO controller to an IO device, a controller-device link is established.



12.11.17.2 IRT communication

Overview of RT classes

RT classes in PROFINET IO

PROFINET IO is a scalable, real-time communication system based on Ethernet technology. The scalable approach is reflected in several real-time classes:

- **RT:** Transmission of data in prioritized, non-isochronous Ethernet frames. The required bandwidth is within the free bandwidth area for TCP/IP communication.
- **IRT:** Isochronous transmission of data with high stability for time-critical applications (for example, motion control). The required bandwidth is from the area of bandwidth reserved for cyclic data.

Device dependency

Depending on the device, not all real-time classes are supported.

You can find further information on device dependency here: Performance characteristics of PROFINET IO and IRT (Page 6592)

Introduction: Isochronous Realtime Ethernet

Introduction: Isochronous Realtime Ethernet

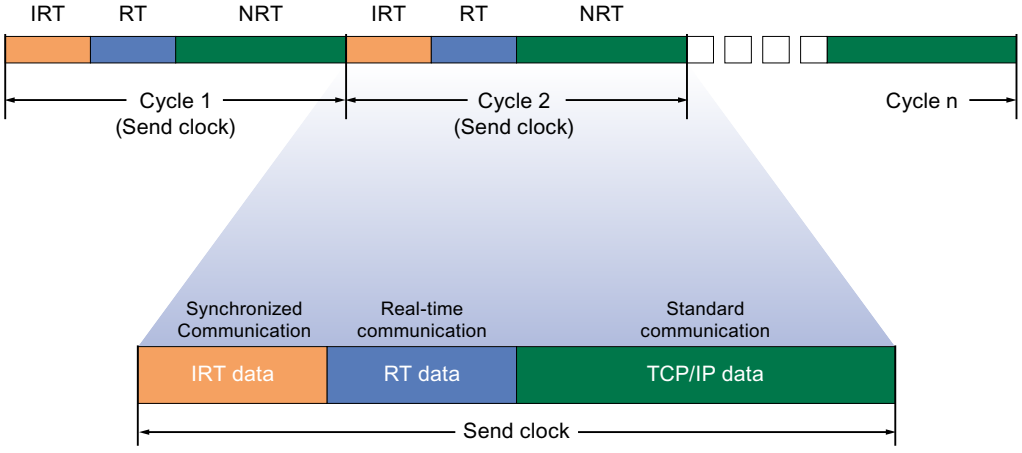
IRT is a transmission method by which PROFINET devices are synchronized with very high accuracy.

A sync master specifies the clock to which sync slaves are synchronized. An IO controller or an IO device can have the role of sync master.

Sync master and sync slaves are always devices in a sync domain. Bandwidth is reserved within the sync domain for IRT communication. Real-time and non-real-time communication (TCP/IP communication) is possible outside of the reserved bandwidth.

Time ranges of communication cycles

The communication cycle is divided into three time ranges, which are represented in the following chart:



- IRT data (synchronized communication)
  This area can be reserved in specific steps, depending on the send clock. Within this time range the IRT data is transmitted.
- RT data (real-time communication)
  In this time range the cyclic RT date is transmitted. RT data has a higher priority than "normal" TCP/IP data. TCP/IP data or Ethernet frames can have a priority between 1 and 7. RT data has a priority of 6.
- TCP/IP data (standard communication)
  Standard communication (TCP/IP, etc.) is transmitted in the remaining interval of the communication cycle.

Applications of IRT

PROFINET with IRT is especially suited for:

- High performance and deterministics for large quantity structures with regard to user data communications (productive data)
- High performance even with many devices in the line topology with regard to user data communications (productive data).
- Parallel transmission of production and TCP/IP data over wire, and securing the forwarding of production data when data volume is high by reserving transmission bandwidth.

Basic procedures for configuring IRT

Basic procedures for configuring IRT

If you want to upgrade equipment with PROFINET IO to IRT, follow these three steps:

1. Configure the PROFINET IO device. The PROFINET device must support IRT.
2. Set which device acts as the sync master and synchronizes the other devices. For this you must configure a sync domain with a sync master and at least one sync slave.
3. Download the configuration to all involved devices.

You can find further information on IRT configuration here: Auto-Hotspot

Creating PROFINET IO configuration for IRT

As a prerequisite for IRT configuration, there must be an existing PROFINET IO configuration, i.e., one or more stations must be configured with an IO controller and IO devices.

You can read which components are suitable for IRT communication in the task card "Information", once you have selected the corresponding components in the hardware catalog.

The requirements for functioning IRT communication are met simply by configuring a PROFINET IO system with components that support IRT.

Sync domain

Sync domain

A sync domain is required for synchronization of PROFINET IO devices. The sync domain assures that all devices belonging to it communicate synchronously.

Prerequisite for IRT communication is a synchronization cycle to distribute a common time base for all PROFINET devices in a sync domain. With this base synchronization, a synchronous transmission cycle of PROFINET devices within a sync domain is achieved. The sync master (usually an IO controller) generates the common synchronization clock and specifies the time basis on which all other sync slaves (usually IO devices) are synchronized.

If the sync master fails, the communication between the IRT devices reverts to RT communication.

Background processes during configuration of an IO system

If you configure an IO controller and network it with an Ethernet subnet, it will automatically be added to the default sync domain of the Ethernet subnet. The default sync domain is always available. The IO controller operates unsynchronized.

If you assign an additional IO device to the IO system of the IO controller, the IO device automatically assigns the IO controller's sync domain.

12.11.17.3 Configuring the HMI device as IO device

Introduction

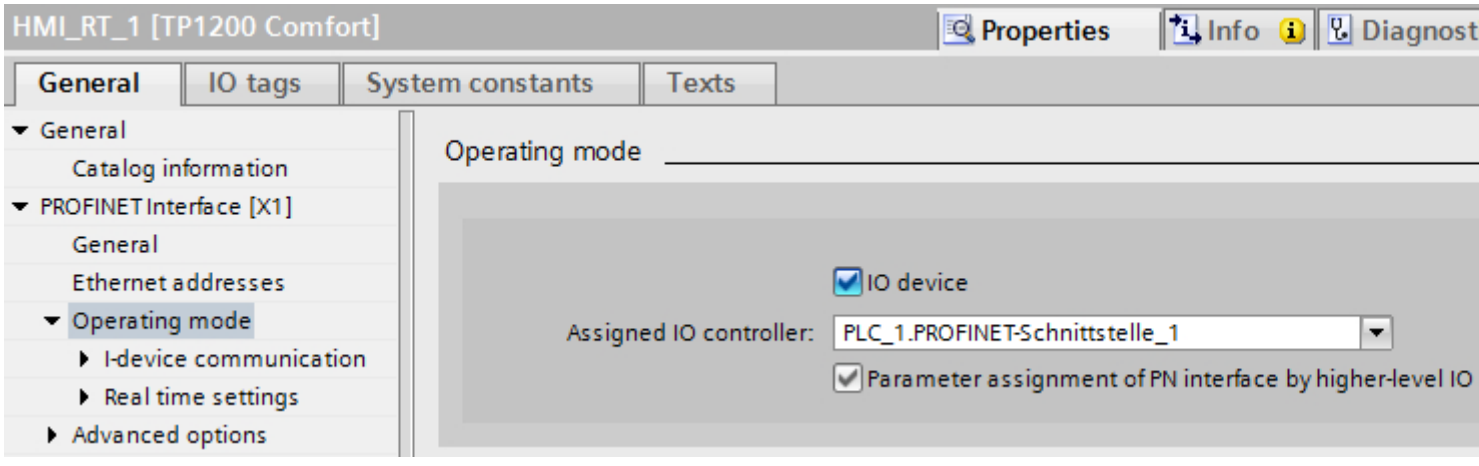
An IO controller and at least one PROFINET IO device are necessary for a PROFINET IO system.

Requirements

- A SIMATIC S7 1200 or SIMATIC S7 1500 PLC has been created.
- An HMI device from the Comfort Panels device family has been created.
- The "Devices & Networks" editor is open.

Procedure

1. You network the PLC with the HMI device:
2. Click the HMI device in the "Devices & Networks" editor.
3. In the inspector window, you select the following:
   "General > PROFINET Interface (X1) > Operating mode"
4. Select the "IO device".



5. You assign the parameters required for your PROFINET IO system
   You can find further information on the parameters for PROFINET IO systems here:
   Parameters for PROFINET IO and IRT (Page 6589)

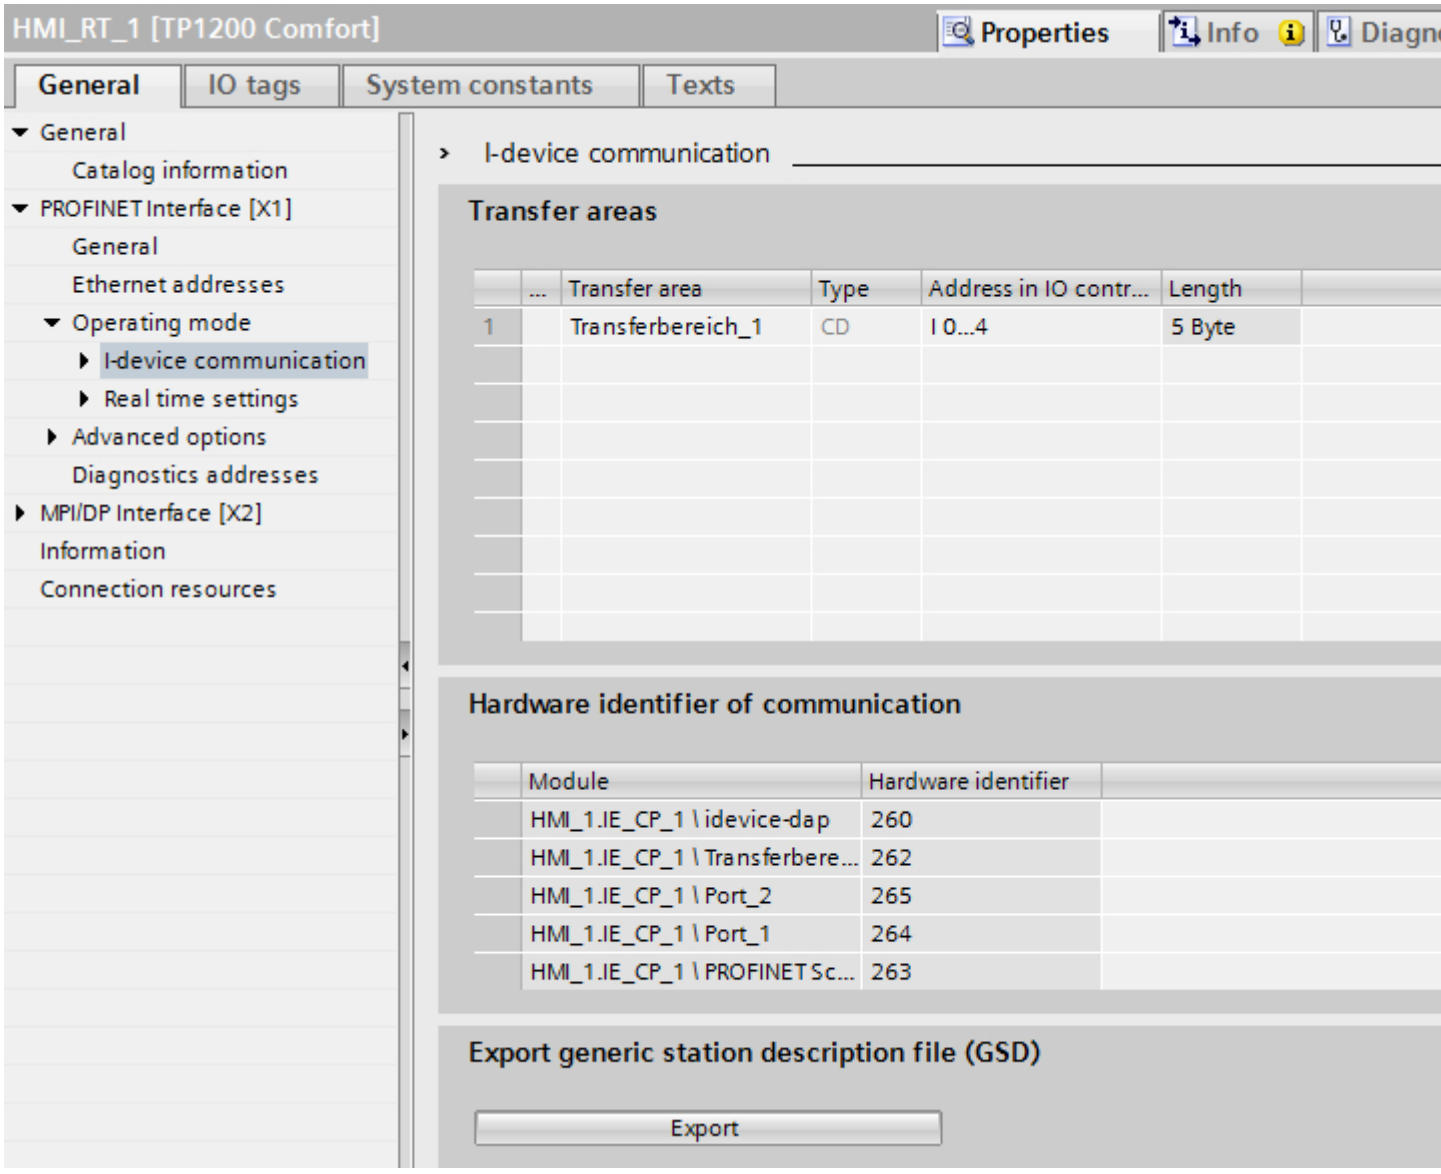
12.11.17.4 Parameters for PROFINET IO and IRT

I-device communication

I-device

The "I-device" functionality (intelligent IO device) of a CPU allows data to be exchanged with an IO controller and therefore to use the CPU, for example, as an intelligent preprocessing unit of subprocesses. The I-device is linked as an IO device to a "higher-level" IO controller.

Parameters for I-device communication



- Transfer areas
  Display transfer areas of the I-device communication
- Diagnostics address of communication
  Display of diagnostic data of the IO device

Configuring an I-device with a GSD file

If you use an I-device in another project, or if the I-device is used in another engineering system, then configure the higher-level IO controller and the I-device as described above.

However, click on the "Export" button after configuring the transfer areas in order to create a GSD file from the I-device. This GSD file represents the configured I-device in other projects.

The "Export" button is found in the "I-device communication" section of the inspector window.

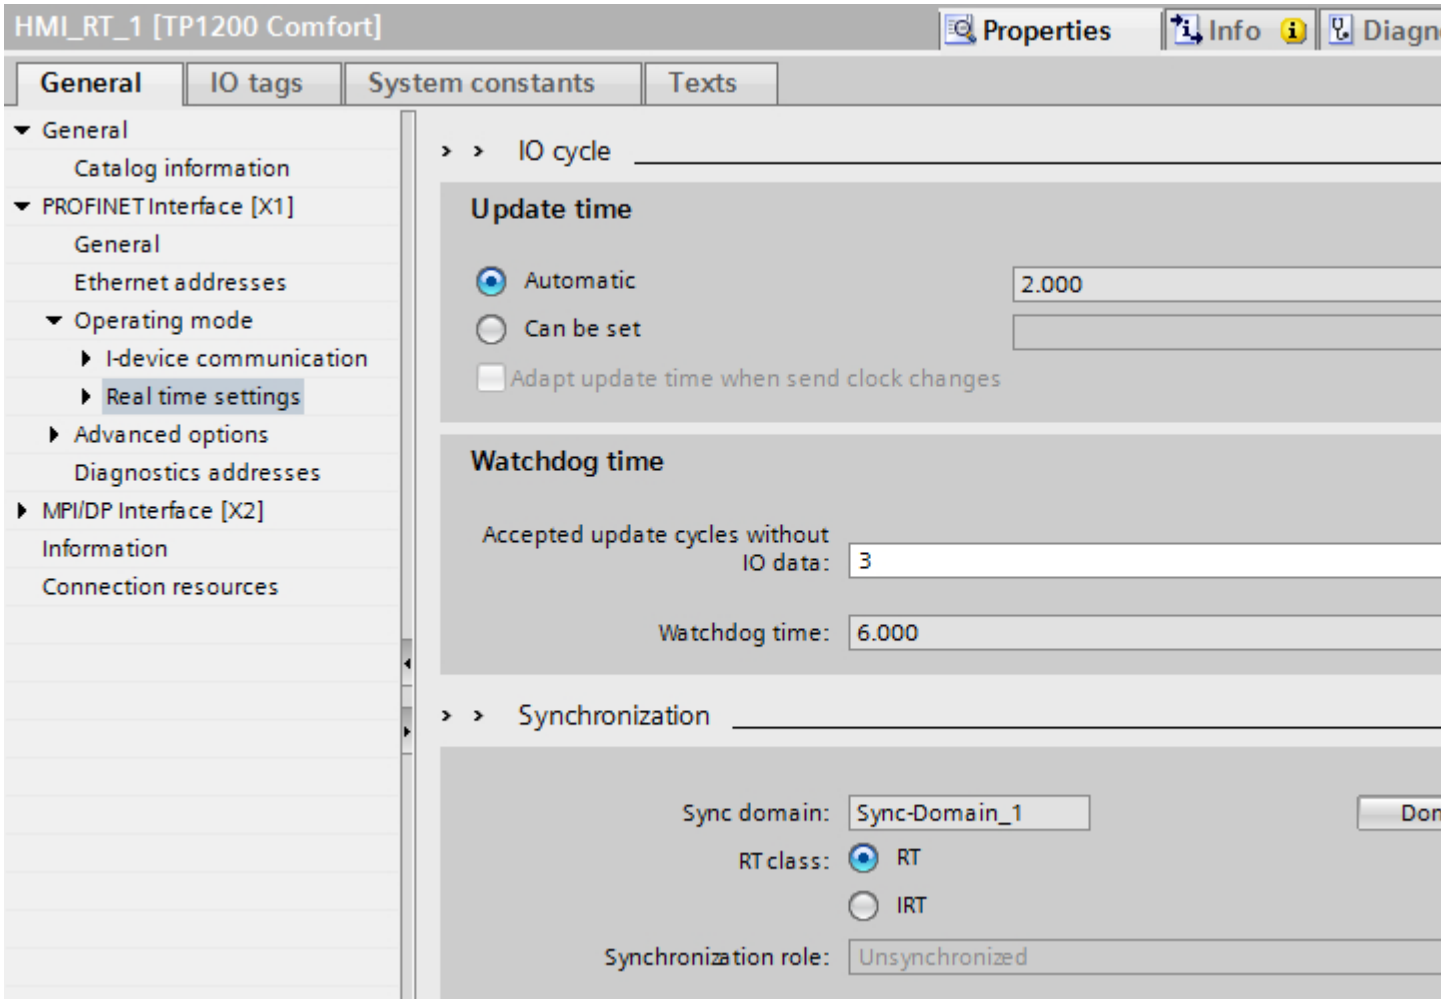
The hardware configuration is compiled and the export dialog opened.

Assign a name for the I-device proxy as well as a description in the fields provided. Click the "Export" button to complete your process.

Finally, import the GSD file, for example, into another project.

Real-time settings

Parameters for real-time settings



- Update time
  - Display of update time used in network.
  - Selection of update times available in network.
- Watchdog time
  - Selection of available update cycles.
  - Display of watchdog time used in network.
- Synchronization
  - Display of sync domain used
  - Selection of RT class.
  - Selection of role in the sync domain.

12.11.17.5 Performance characteristics of PROFINET IO and IRT

Configuration of PROFINET and IRT

Setting up PROFINET with IRT

Keep in mind the following rules for the set up and operation of a PROFINET IO system in IRT operation. They serve to insure an optimal operation of your PROFINET IO system.

- When using IRT, you must configure the topology. This will enable exact calculation of the update time, bandwidth, and additional parameters.
- If you would like to use multiple sync domains, configure a sync domain boundary for the port which is currently connected to the PROFINET device of another sync domain.
- In a sync domain you can only configure one sync master at a time.
- A PROFINET IO system may only be part of a single sync domain.
- If you configure a PROFINET device in a sync domain and want to synchronize with IRT, the PROFINET devices concerned must support IRT communication.
- Wherever possible, use the same PROFINET device as the PROFINET IO controller and sync master.
- If only some of the PROFINET devices in a PROFINET IO system are synchronized, please keep in mind the following: PROFINET devices which are not part of IRT communication are placed outside of the sync domain.

Device dependency

IRT communication

The following HMI devices support IRT communication:

- TP700 Comfort and KP700 Comfort
- TP900 Comfort and KP900 Comfort
- TP1200 Comfort and KP1200 Comfort
- TP1500 Comfort and KP1500 Comfort
- TP1900 Comfort
- TP2200 Comfort

The following connection boxes for Mobile Panels support IRT communication:

- Connection Box Advanced

Communication options

The following configuration options are available for Comfort Panels:

- Comfort Panel with PROFINET Basis functionality without PROFINET IO
- Comfort Panel with PROFINET RT in an RT network networked with an RT controller
- Comfort Panel with PROFINET RT as end point in an IRT network networked with an RT controller
- Comfort Panel with PROFINET IRT in an IRT network networked with an IRT controller

The following configuration options are available for Mobile Panels:

- Mobile Panel with PROFINET Basis functionality without PROFINET IO
- Mobile Panel with PROFINET IO as IO device in a PROFINET network connected to an IO controller
- Mobile Panel with PROFINET basic funtionality or with PROFINET IO as the terminal point in a IRT network (via Connection Box Advanced)

12.11.18 Media redundancy

12.11.18.1 Restrictions with media redundancy

Diagnostic interrupts

If you have activated "Diagnostic interrupts", diagnostic interrupts pertaining to "Media redundancy" are only processed by PROFINET-compatible devices and displayed on the "IO Controller".

If you do not use a PROFINET-compatible device, the "Diagnostic interrupts" selection does not have any function.

Diagnostic interrupts are only detected by the IO controller. There is no separate diagnostic interrupts for HMI devices that are detected and displayed by HMI devices.

12.11.18.2 Media redundancy

Media redundancy options

To increase the network availability of an industrial Ethernet network with optical or electrical line topology, the following options are available:

- Meshing networks
- Parallel switching of transmission modes
- Consolidation of a line topology to a ring topology

Media redundancy in ring topologies

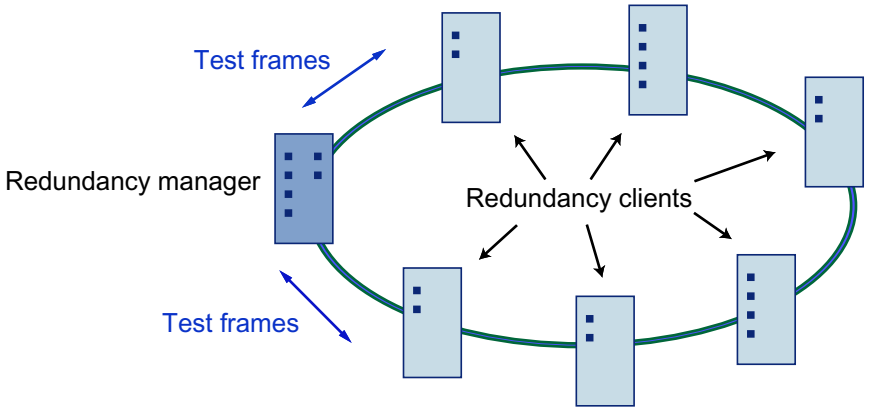
Devices in ring topologies can be the external switches and/or integrated switches of communication modules.

To set up a ring topology with media redundancy you must join both free ends of a line-shaped network topology to one device.

Consolidation of a line topology to a ring takes place over 2 ports (ring ports) in a device in the ring.

This device is the redundancy manager. All other devices in the ring are the redundancy clients.

The following figure shows the ring type interconnection:



The two ring ports in a device are the ports which create the connection to both of its neighboring devices in a ring topology.

The selection and set up of the ring ports takes place during configuration of the respective device.

Download the configuration in the individual devices before physically connecting the ring.

Functions of media redundancy in a ring topology

If a part of the ring is disconnected, then the data paths between the individual devices is automatically reconfigured. After the reconfiguration the devices are once again accessible in the newly created topology.

In the redundancy manager, 2 ring ports will be separated from each other during interruption-free network operation, so that no data frames circulate.

The ring topology is a line when viewed from the standpoint of data transfer. The redundancy manager monitors the ring topology. To do so it sends a test frame not only from ring port 1 but also from ring port 2. The test frame passes through the ring in both directions until it arrives at the other ring port on the redundancy manager.

An interruption in the ring can occur from connection failure between two devices or device failure in the ring.

If the redundancy manager's test telegram does not reach the other ring port because of interruption in the ring, the redundancy manager connects via both ports.

With this alternate route a functioning connection is again created among all remaining devices in a line-shaped topology.

The time between ring interruption and re-establishment of a functional line topology is called the reconfiguration time.

As soon as the interruption is eliminated, the original transmission route is again created, both ring ports in the redundancy manager are separated from each other, and the redundancy clients are notified of the change.

The redundancy clients then use the new route to the other devices.

If the redundancy manager fails, then the ring is changed to a functional line.

12.11.18.3 Media Redundancy Protocol (MRP)

Media Redundancy Protocol (MRP)

The MRP process works in conformity with Media Redundancy Protocol (MRP), which is specified in IEC 61158 Type 10 "PROFINET".

The reconfiguration time following an interruption of the ring amounts to a maximum of 0.2 seconds.

Requirements for trouble-free operation

Requirements for trouble-free operation with media redundancy process MRP are:

- MRP is supported in ring topologies of up to 50 devices. Exceeding the device limit can lead to data traffic failure.
- All devices must be connected to each other via their ring ports.
- "MRP" must be activated on all devices in the ring.
- The connection settings (transfer medium / duplex) must be set to full duplex and for at least 100 Mbit/s for all ring ports. Otherwise data traffic failure can occur.
- In STEP 7 configuration in the properties dialog for all ports in the ring, set the connection in the register "Options" to "Automatic settings".

HMI devices for media redundancy

The following HMI devices support "Media Redundancy":

- KP700 Comfort
- TP700 Comfort
- KP900 Comfort
- TP900 Comfort
- KP1200 Comfort
- TP1200 Comfort
- KP1500 Comfort

- TP1500 Comfort
- TP1900 Comfort
- TP2200 Comfort

Connection boxes for Mobile Panels for media redundancy

The following connection boxes for Mobile Panels support "media redundancy":

- Connection Box Standard
- Connection Box Advanced

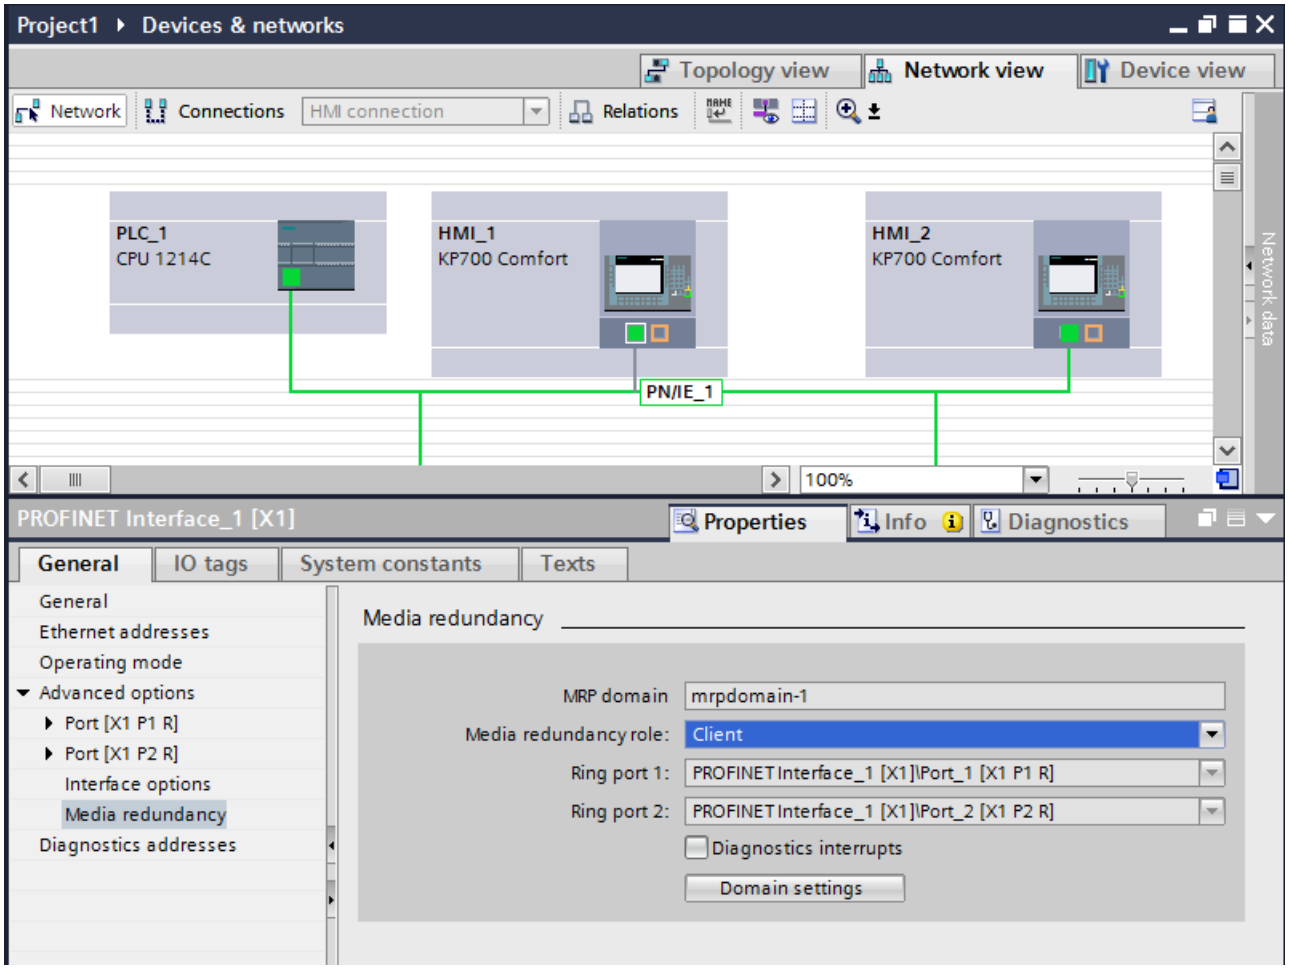
12.11.18.4 Configuring media redundancy for HMI devices

Requirements

- The participating components must support "media redundancy".
- IRT communication is not configured
- One device on the network must be configured as "Redundancy manager".
- A ring topology is set up by means of port interconnections.

Procedure

1. Click on the PROFINET interface of an HMI device.
2. Select "General > Advanced settings > Media redundancy" in the properties.
3. Select "Client" in the "Media redundancy role" area.

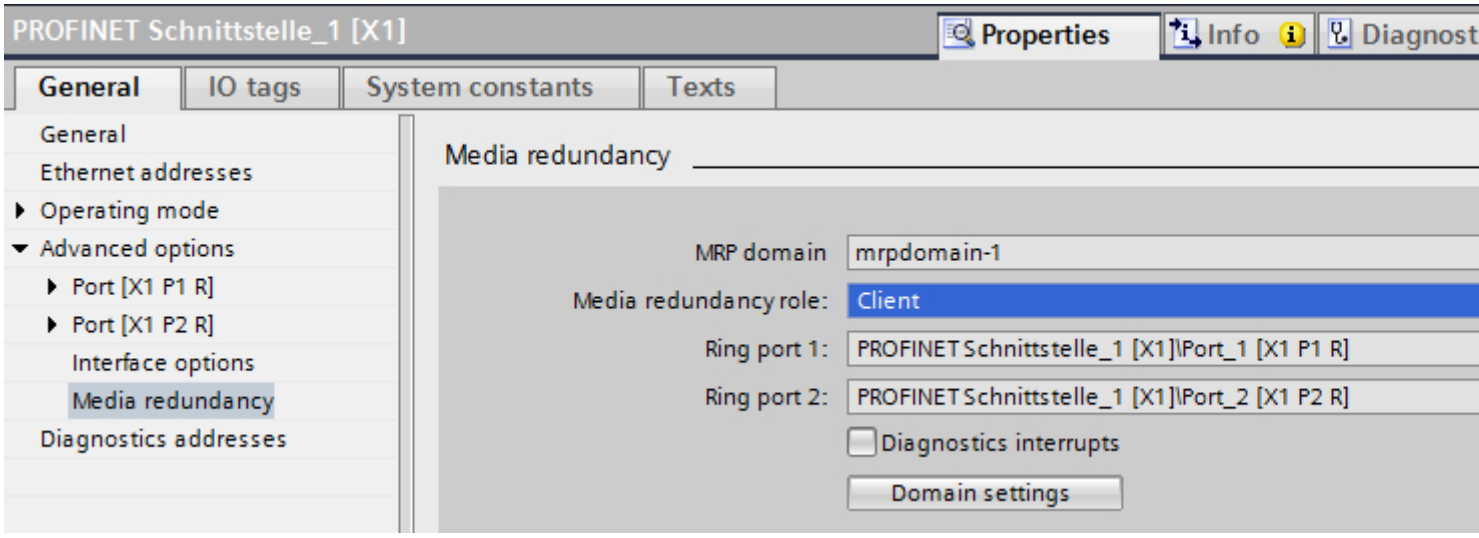


Result

The HMI device is now operating as client on the MRP network.

The default ring ports will automatically be displayed in the subjacent fields.

12.11.18.5 Parameters for media redundancy



MRP domain

This area displays the MRP domain.

You can rename the MRP domain in the "Domain settings" dialog.

Domain settings

Click "Domain settings" to open the "Domain settings" editor.

You also manage the MRP domains in the MRP domain area of the "Domain settings" editor.

Media redundancy role

Assign the role of the HMI device in the "Media redundancy role" area.

You have the following options:

- Client
  The HIM device is operated as "Client" in an MRP domain.
- Not a node of the ring
  The HIM device is not operated within an MRP domain.

Ring port 1 and Ring port 2

Display of available ring ports

Diagnostic interrupts

The following diagnostic interrupts can be generated if "Diagnostic interrupts" is activated:

- Wiring or port error
  Diagnostics interrupts will be generated for the following errors in the ring ports:
  - A neighbor of the ring port does not support MRP
  - A ring port is connected to a non-ring port

12.11.18.6 Managing MRP domains

You can monitor and adjust the media redundancy settings centrally.

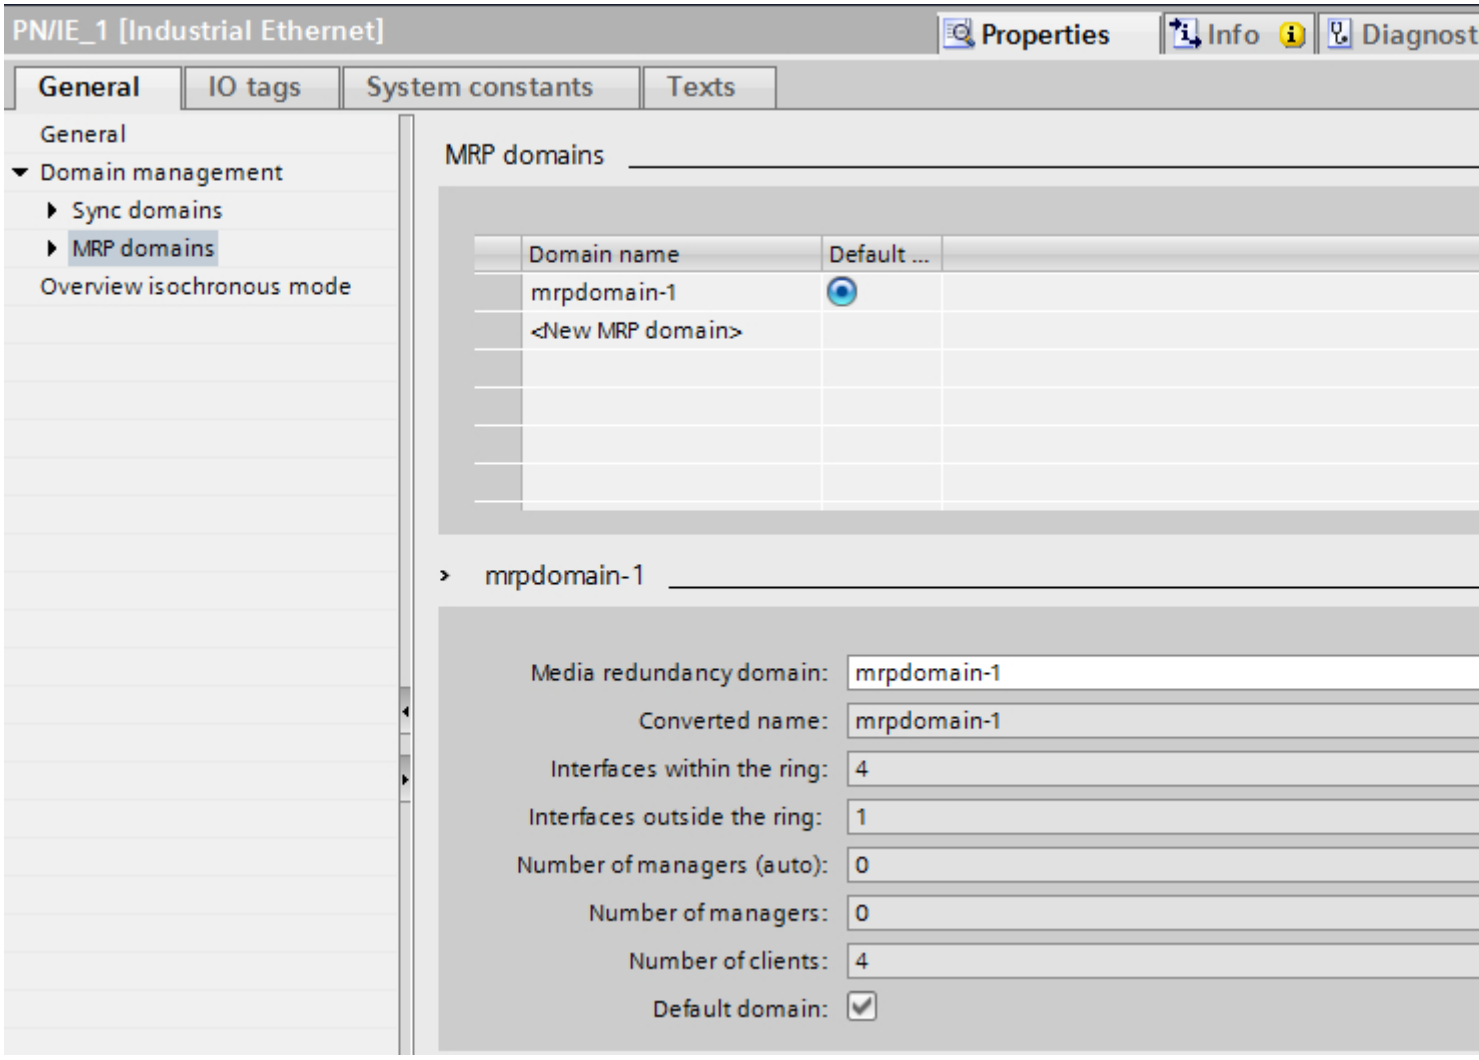
Requirements

The devices are configured and networked.

Procedure

1. Select the PROFINET interface of the HMI device.
2. Select the "Advanced options > Media redundancy" area in the Inspector window.

3. Click the "Domain settings" button.
4. Navigate to the "Domain management > MRP domains" area in the Inspector window.



MRP domains

You can specify the default MRP domain in the "MRP domains" area.

You can rename all domains and check the redundancy roles and ring ports.

For each MRP domain, you receive an overview of how many PROFINET interfaces are interconnected in the ring, how many PROFINET interfaces are located outside the ring, and the number of redundancy managers and redundancy clients.

You can have the devices in the ring, including device name, associated MRP domain, media redundancy role, and utilized ring ports, displayed in groups:

- IO systems
  The list shows you all configured devices of the selected IO system.
- Rings
  The list shows you all ring interconnections of the selected IO system. The identified rings are numbered consecutively. If all devices of this ring belong to one MRP domain, this is also displayed.
- MRP domain
  The list shows you the existing MRP domains of the selected IO system.

12.11.19 Communication with other PLCs

12.11.19.1 Communication with other PLCs

Introduction

Communication with other PLCs is communication with PLCs that are not in the SIMATIC family.

These PLCs have proprietary protocols for data exchange. The protocols are configured as communication drivers in WinCC.

Communication drivers

The following communication drivers are supported in WinCC and are already installed:

- Allen-Bradley
  - Allen-Bradley EtherNet/IP
  - Allen-Bradley DF1
- Mitsubishi
  - Mitsubishi MC TCP/IP
  - Mitsubishi FX
- Modicon Modbus
  - Modicon Modbus TCP/IP
  - Modicon Modbus RTU
- Omron
  - Omron Host Link

Communication drivers in WinCC RT Professional

The following communication drivers are supported for RT Professional:

- Allen-Bradley
  - Allen-Bradley EtherNet/IP
- Mitsubishi
  - Mitsubishi MC TCP/IP
- Modicon Modbus
  - Modicon Modbus TCP

Connections between HMI devices and other PLCs

You configure the connections between HMI devices and other PLCs in the "Connections" editor of the HMI device. These connections are non-integrated connections.

12.11.19.2 Distinctive features when configuring

Distinctive features for data exchange

Distinctive features apply when configuring connections to other PLCs, compared to configuring integrated connections.

Note the following distinctive features when configuring:

- Addressing of tags
- Permitted data types
- Distinctive features when configuring area pointers
- Distinctive features when configuring alarms
- Distinctive features when configuring trends

For more detailed information on distinctive features when configuring, refer to Section "Data exchange" of the respective communication driver.

12.11.19.3 Parallel communication

Parallel communication of communication drivers

The following table shows an overview of which communication drivers you can use simultaneously on one HMI device.

Note

Parallel communication is not approved for Basic Panels.

Parallel communication over Ethernet interfaces

The approved combinations can be operated via the same Ethernet interface. Several Ethernet interfaces are not required.

Parallel communication only concerns the Ethernet-based communication drivers.

	Allen-Bradley Ether-Net/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCPIP	OPC (DA/ XML DA)	OPC UA (DA)	SIMATIC LOGO !	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC HTTP protocol	Sinumerik NC
Allen-Bradley Ether-Net/IP	--	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Mitsubishi MC TCP/IP	No	--	No	Yes	Yes	No	No	No	No	No	Yes	No
Modicon Modbus TCPIP	No	No	--	Yes	Yes	No	No	No	No	No	Yes	No

	Allen-Bradley EtherNet/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCPIP	OPC (DA/ XML DA)	OPC UA (DA)	SIMATIC LOGO!	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC HTTP protocol	Sinumerik NC
SIMATIC HTTP protocol	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--	Yes
Sinumerik NC	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--

Parallel communication over serial interfaces

The following applies for parallel communication over serial interfaces:

- One communication driver per interface.
- One interface per communication driver.

12.11.19.4 Communication drivers

Allen-Bradley

Allen-Bradley communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Allen-Bradley communication drivers.

The following communication drivers are supported:

- Allen-Bradley EtherNet/IP
- Allen-Bradley DF1

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Allen-Bradley EtherNet/IP

Configuring a connection via Allen-Bradley EtherNet/IP

Introduction

You configure a connection to a PLC with an Allen-Bradley EtherNet/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

Example: PROFINET interface corresponds to the Ethernet interface

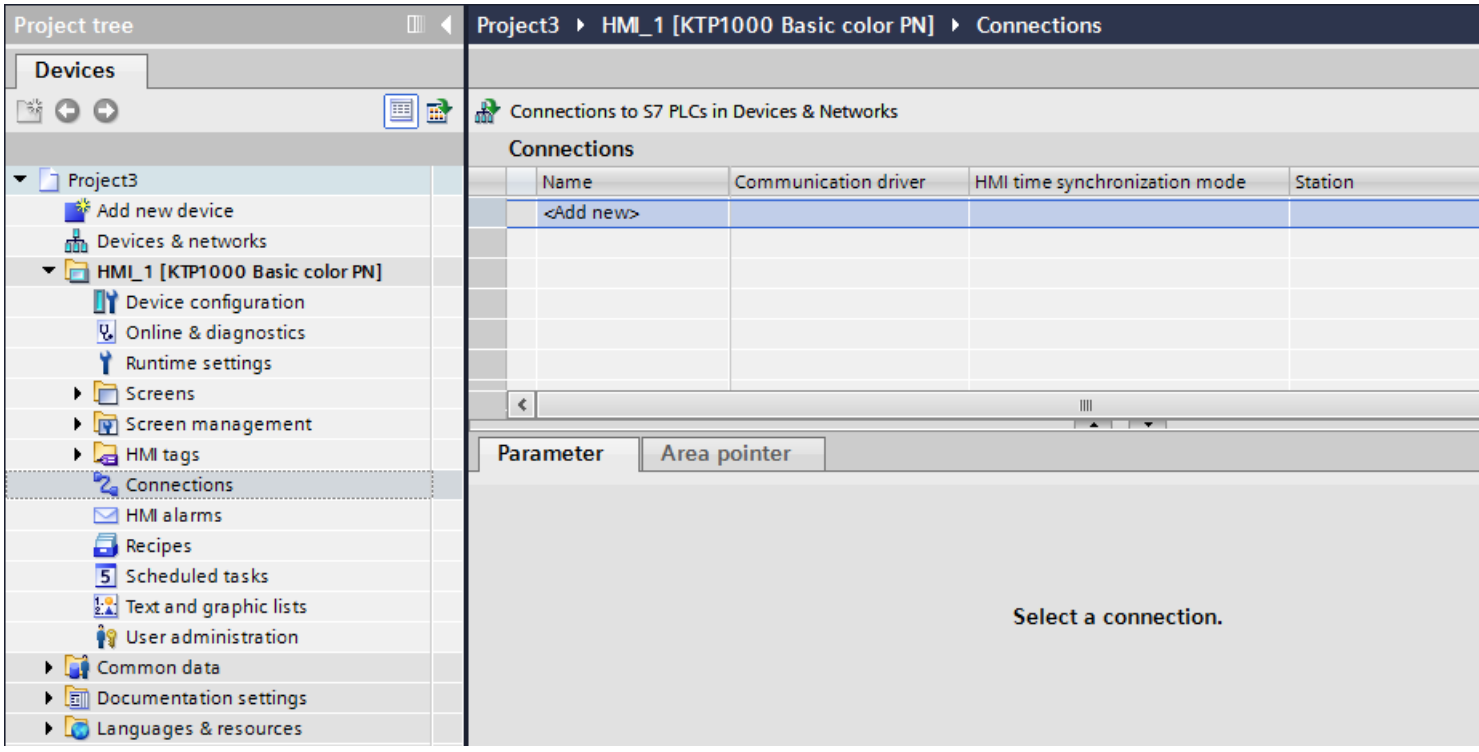
Requirements

- A project is open.
- An HMI device has been created.

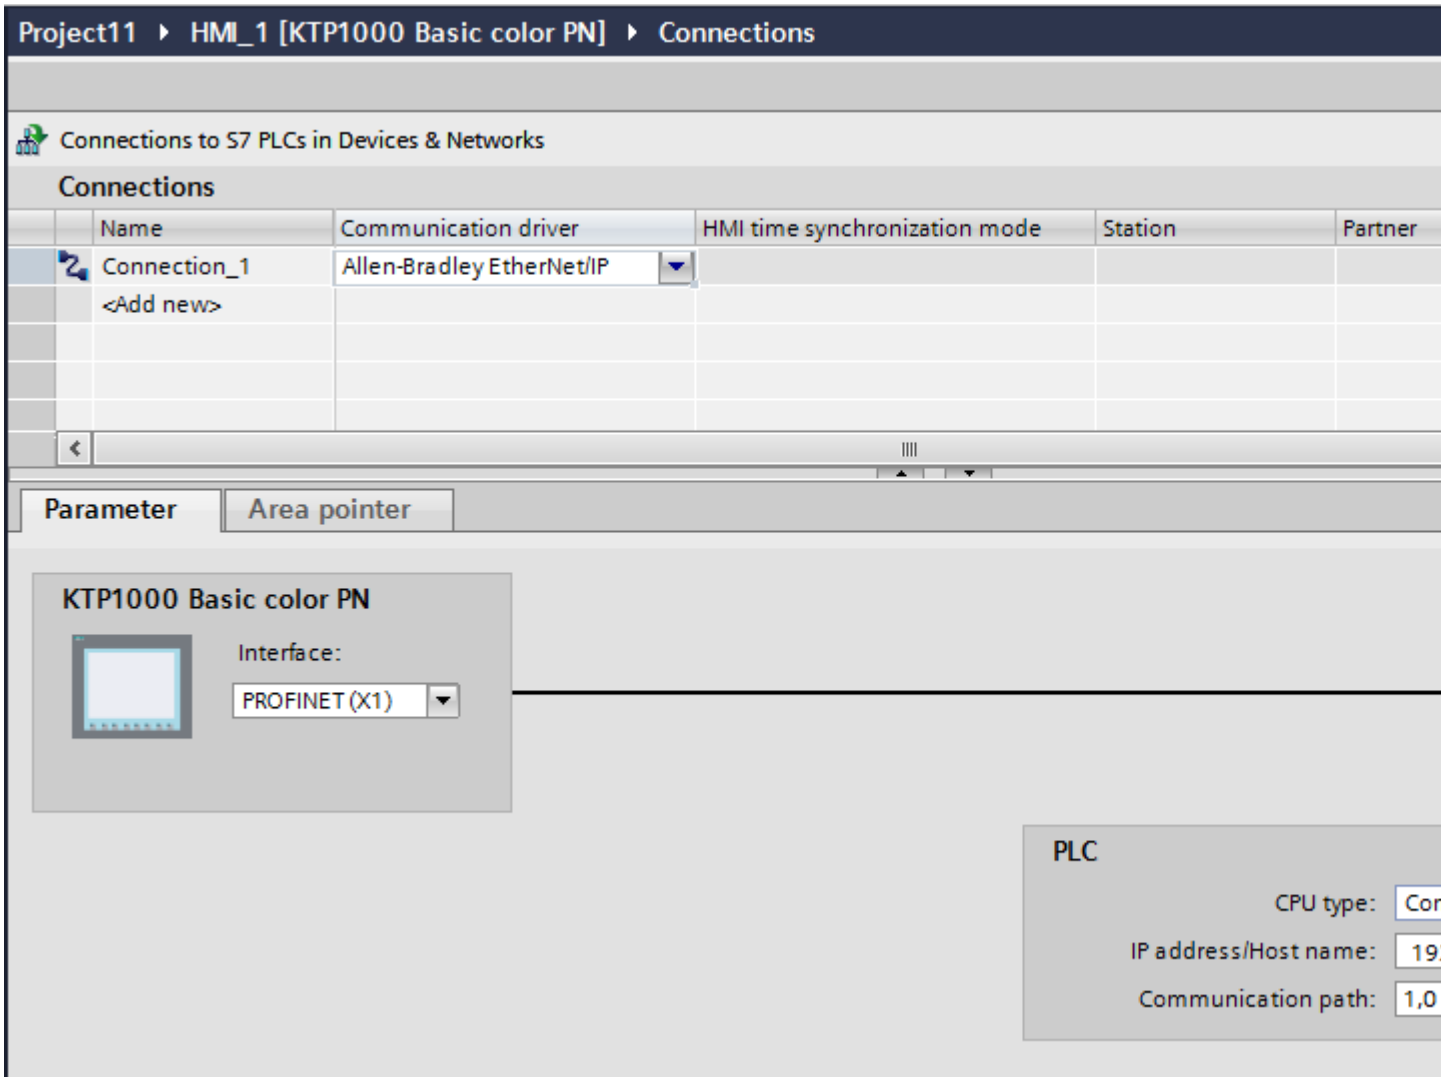
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Allen-Bradley EtherNet/IP" driver.



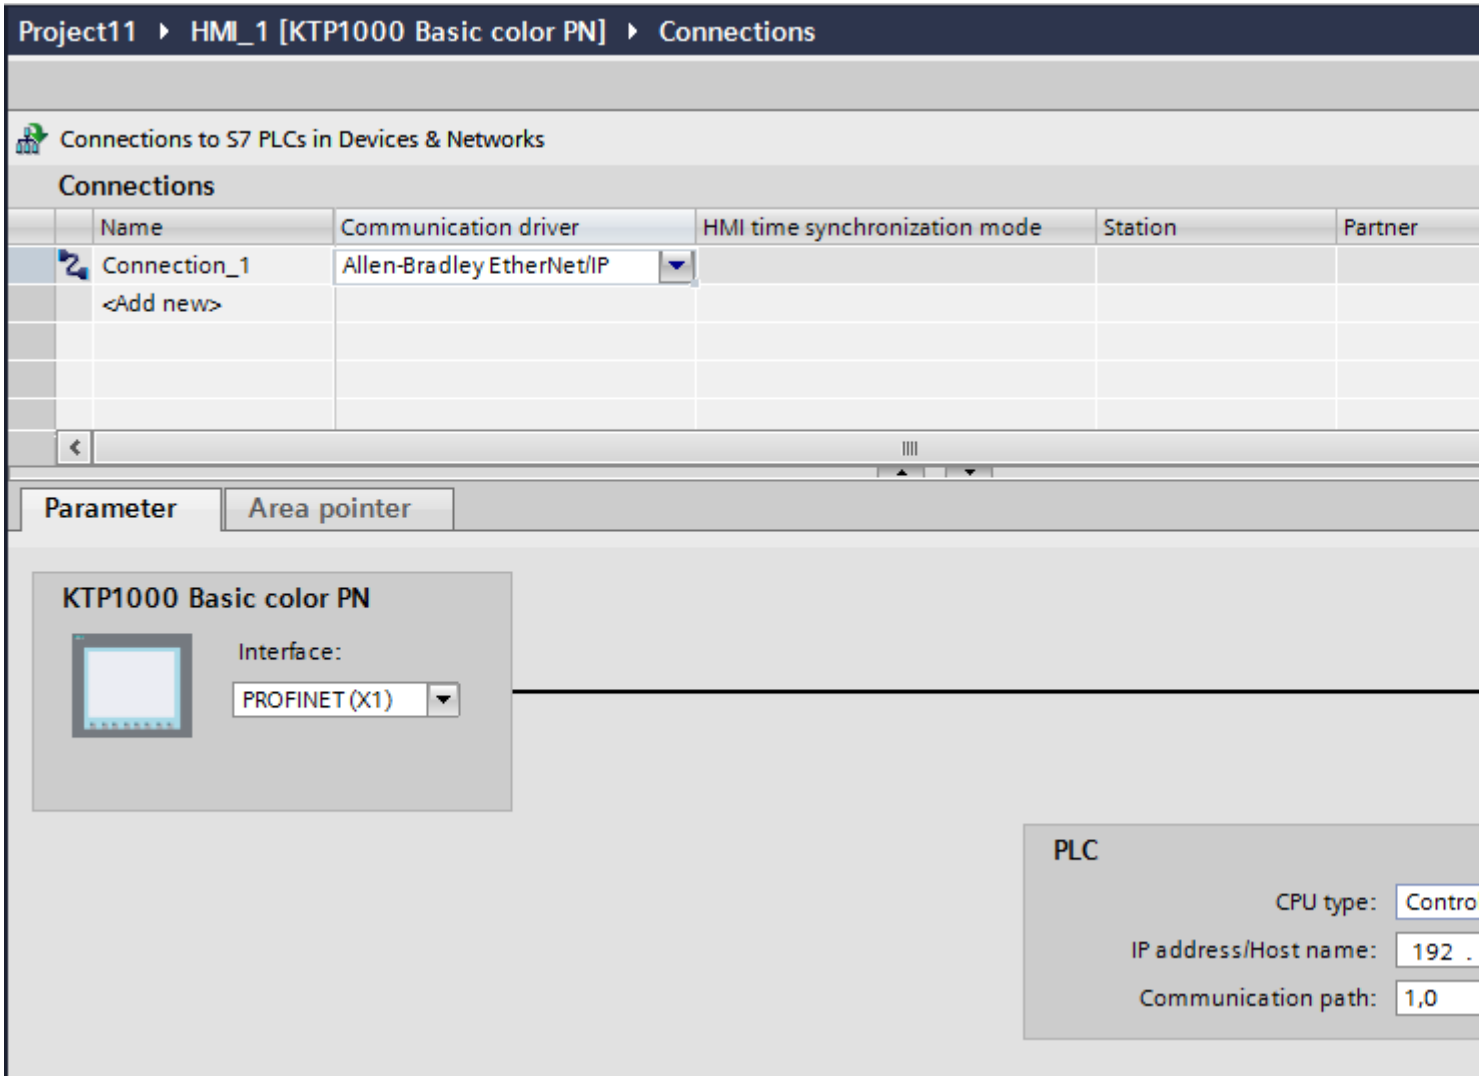
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Allen-Bradley EtherNet/IP)

Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "PLC" area is available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device upon subsequent loading.

Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

To set up the IP address of the HMI device:

1. Click on the HMI device.
2. Open the "Device configuration" editor.
3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:
   "General > PROFINET interface > Ethernet addresses"

Parameters for the PLC

- CPU type
  For "CPU type", set the CPU type of the PLC used.
- IP address
  Set the IP address or host name of the Ethernet/IP module of the PLC. Only the IP address can be used on a Basic Panel.
- Communication path
  Set the CIP path from the Ethernet module to the PLC. This establishes a logical connection between the Ethernet module and PLC, even if both devices are located in different CIP networks.
  For additional information see: Examples: Communication path

Connecting HMI device to PLC

Connections via Allen-Bradley EtherNet/IP

Connection

The HMI device can be connected to the Allen-Bradley PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to an Allen-Bradley PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Communication types

Approved communication types with Allen-Bradley EtherNet/IP

The following communication types are system-tested and approved:

- Point-to-point connection to the approved PLCs
- Multipoint connection from a HMI device (Allen-Bradley Ethernet/IP-Client) with up to 4 PLCs with the respectively approved PLCs. CPU types can be mixed.

Connection

Connection with the following PLCs is approved with Allen-Bradley EtherNet/IP:

- CPU type: "ControlLogix, Compact Logix"
  - ControlLogix
    556x(1756-L6x) with Ethernet module 1756-ENBT
  - Guard Logix-System ControlLogix
    556xS(1756-L6xS) with Ethernet module 1756-ENBT
  - CompactLogix
  - 533xE(1769-L3xE) with Ethernet interface onboard
  - 532xE(1769-L2xE) with Ethernet interface onboard
  - 534x (1768-L4x) with Ethernet module 1768-ENBT
- CPU type: "SLC, MicroLogix"
  - MicroLogix 1100 (with Ethernet interface onboard)
  - MicroLogix 1400 (with Ethernet interface onboard)
  - SLC 5/05 (with Ethernet interface onboard)

Performance features of communication

Permitted data types for Allen-Bradley EtherNet/IP

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

CPU type: ControlLogix, CompactLogix

Data type	Length
Bool	1 bit
DInt	4 bytes
Int	2 bytes
Real	4 bytes
SInt	1 byte
String	1 to 82 characters
UDInt	4 bytes
UInt	2 bytes
USInt	1 byte

Permitted data types arrays

Address	Permitted data types
Array	SInt, USInt, Int, UInt, DInt, UDInt, Real
Individual bits from the basic data types of the PLC SInt, USInt, Int, UInt, DInt, UDInt	Bool*

* Any changed value of certain defined bits is written back to the PLC. There is no check to determine whether any other bits have changed. The PLC (or other PLCs) may only read access the value.

CPU type: SLC, MicroLogix

Data type	Operand type	Length
ASCII	A	0 to 80 characters
Bool	N, R, C, T, B, S, I, O	1 bit
DInt	N	4 bytes
Int	N, R, C, T, S	2 bytes
Real	N, F	4 bytes
String	ST	1 to 82 characters
UDInt	N	4 bytes
UInt	N, R, C, T, B, I, O	2 bytes

Permitted data types arrays

Address	Permitted data types
Array	Int, UInt, DInt, UDInt, Real

Distinctive features for connections with Allen-Bradley Ethernet/IP

With the communication driver Allen Bradley Ethernet/IP and the CPU type SLC, MicroLogix, you can only use array tags for discrete alarms and trends.

Note

I/O modules with 8 or 16 ports occupy one data word on the PLC.

I/O modules with 24 or 32 ports occupy two data words.

The HMI device does not output an error message if using non-existent bits.

You should always make sure that I/O modules with 8 or 24 ports only occupy the bits that are actually assigned to a port.

Supported CPU types for Allen-Bradley EtherNet/IP

CPU types

The following CPU types are supported for configuring the Allen-Bradley EtherNet/IP communication driver.

- CompactLogix
  - 1769-L2xE with Ethernet interface onboard
  - 1769-L3xE with Ethernet interface onboard
  - 1768-L4x with Ethernet module 1768-ENBT
- ControlLogix
  - 1756-L6x with Ethernet module 1756-ENBT
- GuardLogix
  - 1756-L61S with Ethernet module 1756-ENBT
  - 1756-L62S with Ethernet module 1756-ENBT
  - 1756-L63S with Ethernet module 1756-ENBT
- MicroLogix
  - MicroLogix 1100 / 1400
- SLC50x
  - SLC5/05

Addressing in the C.Logix CPU type

Addressing

Addressing

A tag is uniquely referenced in WinCC by means of an address in the PLC. The address must correspond with the tag name in the PLC. The tag address is defined by a string with a length of up to 128 characters.

Using characters for addressing

Valid characters for tag addressing:

- Letters (a to z, A to Z)
- Numbers (0 to 9)
- Underscore (_)

The tag address consists of tag name and other character strings used to specify the tag in the PLC.

Tag name properties:

- The tag name may begin but not end with an underscore character.
- Strings with successive underscore and space characters are invalid.
- The address may not exceed a length of 128 characters.

Note

The characters reserved for tag addressing may not be used in program/tag names or at any other address instance.

The reserved characters are listed below:

Reserved character	Function
.	Element delimiter
:	Definition of a program tag
,	Delimiter for addressing multi-dimensional arrays
/	Reserved for bit addressing.
[ ]	Addressing of array elements or arrays

PLC and program tags

The Allen-Bradley EtherNet/IP communication driver supports addressing of PLC tags (global project tags) and/or program tags (global program tags).

A program tag is declared based on the program name in the PLC and actual tag name which are delimited by colon. PLC tags are simply addressed by their name.

Note

Addressing errors

Addressing errors occur when the tag name and data type are inconsistent.

Note that the tag name defined in the address field in WinCC must match the tag name in the PLC. Make sure that the data types of tags in WinCC match the data types in the PLC.

Note

Module-specific tags, e.g. for data on input and output modules, cannot be addressed directly. Instead, use an alias tag in the PLC.

Example: Local:3:O. Data cannot be addressed in WinCC.

If the alias "MyOut" is defined for Local:3:O in the PLC, you can address with WinCC via MyOut.Data.

Addressing syntax

Notation of addresses

The tables below define the notation for the individual addressing options for Allen-Bradley EtherNet/IP.

Table 12-155 Access to arrays, basic data types and structure elements

Data types	Type	Address
Basic data types	PLC tag	Tag name
	Program tag	Programname:tagname
Arrays	PLC tag	Array tag
	Program tag	Program name: array tag
Bits	PLC tag	Tagname/bitnumber
	Program tag	Programname:tagname/bitnumber
Structure elements	PLC tag	Structure tag. Structure element
	Program tag	Program name: structure tag. structure element

Note

Bit addressing with the data types Bool, Real and String is not permitted and will cause an addressing fault.

Description of the syntax

Syntax description:

```
 (Programname:)tagname([x(,y)(,z)]){.tagname([x(,y)(,z)])}(/
bitnumber)
```

- The "( )" defines an optional, single instance of an expression.
- The "{ }" defines an optional expression with multiple single instances.

The address string length may not exceed 128 characters.

Addressing types

Arrays

An array is a data structure that includes a number of data of the same type. WinCC only supports one-dimensional arrays.

In the address column of the tag editor, enter the array name possibly by specifying a start element. The length is defined in the Array Elements input box of the tag editor. If array limits in the PLC are exceeded (due to faulty indexing), addressing errors result.

These arrays must be declared in the PLC as controller or program tags.

Two- or three-dimensional arrays in the PLC can only be addressed in WinCC if these can be mapped area-wise onto one-dimensional arrays .

Note

During all read accesses and all write accesses, all array elements of a tag are always read or written, respectively. The contents of an array tag which is interconnected with a PLC are always transferred whenever there is a change. The HMI device and the PLC cannot concurrently write data to the same array tag for this reason. Instead of writing data only to a single element, the program writes the entire array to the PLC.

Array elements

Elements of one-dimensional, two-dimensional and three-dimensional arrays in the PLC are indexed by setting an index and the corresponding notation in the tag editor. Array addressing starts at element "0", with arrays of all basic types being valid for element addressing. Read/ write operations are only carried out at the addressed element, and not for the entire array.

Bits and bit tags

Bit access is allowed to all basic data types with the exception of Bool, Real and String. Bit addressing is also allowed at array/structure elements. The Bool data type is set in WinCC when bits and bit tags in the basic data types are addressed.

Single-digit bit numbers are addressed with "/x" or "/0x" (x = bit number). Bit numbers are defined by up to two digits.

Note

With the "Bool" data type in the data types SInt, Int and DInt, after changing the specified bit the complete tag is then written in the PLC again. In the meantime, no check is made as to whether other bits in the tag have since changed. Therefore, the PLC may have only read access to the specified tag.

Structures

User-defined data types are created by means of structures. These structures group tags of different data types. Structures may consist of basic types, arrays and of other structures. In WinCC, only structure elements are addressed and not entire structures.

Structure elements

Structure elements are addressed by means of the name of the structure and of the required structure element. This addressing is separated by point. In addition to basic data types, the structure elements may represent arrays or other structures. Only one-dimensional arrays may be used as a structure element.

Note

The nesting depth of structures is only limited by the maximum length of 128 characters for the address.

Address multiplexing

Address multiplexing

Address multiplexing is possible with the CompactLogix, ControlLogix CPU type.

Address multiplexing requires two tags:

- "Tag_1" of data type "String"; contains a logical address such as "HMI:Robot5.Block5" as value.
  The value may change to a second valid address, for example, "HMI:Robot4.Block3".
- "Tag_2" is a tag in which the "Allen-Bradley EtherNet/IP" communication driver is set up as a connection.
  Enter a valid name of an HMI_tag in square brackets as the address.
  - e.g.: "[Tag_1]"
  - The tag must be of the String data type.
  - The square brackets indicate address multiplexing.
  - The address is derived from the actual value in "Tag_1".

  Note

  You can only multiplex entire Allen-Bradley EtherNet/IP addresses. Multiplexing of address elements is not possible. "HMI:Robot[Tag_1].Block5" is an invalid address.

  You can optionally click the arrow right icon in the "Address" column. Replace the "Constant" with the "Multiplex" entry by clicking the arrow on the left edge of the next address dialog box. Now the tag selection list only returns tags of data type "String".

  You can also configure a function triggered by a "change of value" event for multiplexed tags.

Examples for addressing

Example of a table for addressing

The table below defines the basic variants for addressing PLC tags. Other addressing variants are possible by means of combination.

Type	Type	Address
General	PLC tag	Tag name
	Program tag	Program:tagname
Array	Access to an element of a 2-dimensional array	Arraytag[Dim1,Dim2]
	Element of structure array (1-dimensional)	Arraytag[Dim1].structureelement
	Bit in element basic type array (2-dimensional)	Arraytag[Dim1,Dim2]/Bit
Structure	Array in structure	Structuretag.arraytag
	Bit in the element of an array in the substructure	Structuretag.structure2.arraytag [element]/ bit

Note

Program tags are addressed by leading the address with the program name derived from the PLC with colon delimiter.

Example: Programname:arraytag[Dim1,Dim2]

Access to array elements

Type	Address
PLC tag	Arraytag[Dim1]
	Arraytag[Dim1,Dim2]
	Arraytag[Dim1,Dim2,Dim3]
Program tag	Programname:arraytag[Dim1]
	Programname:arraytag[Dim1,Dim2]
	Programname:arraytag[Dim1,Dim2,Dim3]

Examples: Communication path

Example 1:

Connection with a PLC in the same Allen-Bradley rack.

1,0

Number	Meaning
1	Stands for a backplane connection.
0	Stands for a CPU slot number.

Example 2:

Connection with a PLC in remote Allen-Bradley racks. Two Allen-Bradley racks are networked on Ethernet.

1,2,2,190.130.3.101,1,5

Number	Meaning
1	Backplane connection
2	Stands for the CPU slot number of the second Ethernet module.
2	Stands for an Ethernet connection.
190.130.3.101	IP address of a remote AB rack on the network – in particular the third Ethernet module
1	Backplane connection
5	Slot number of the CPU

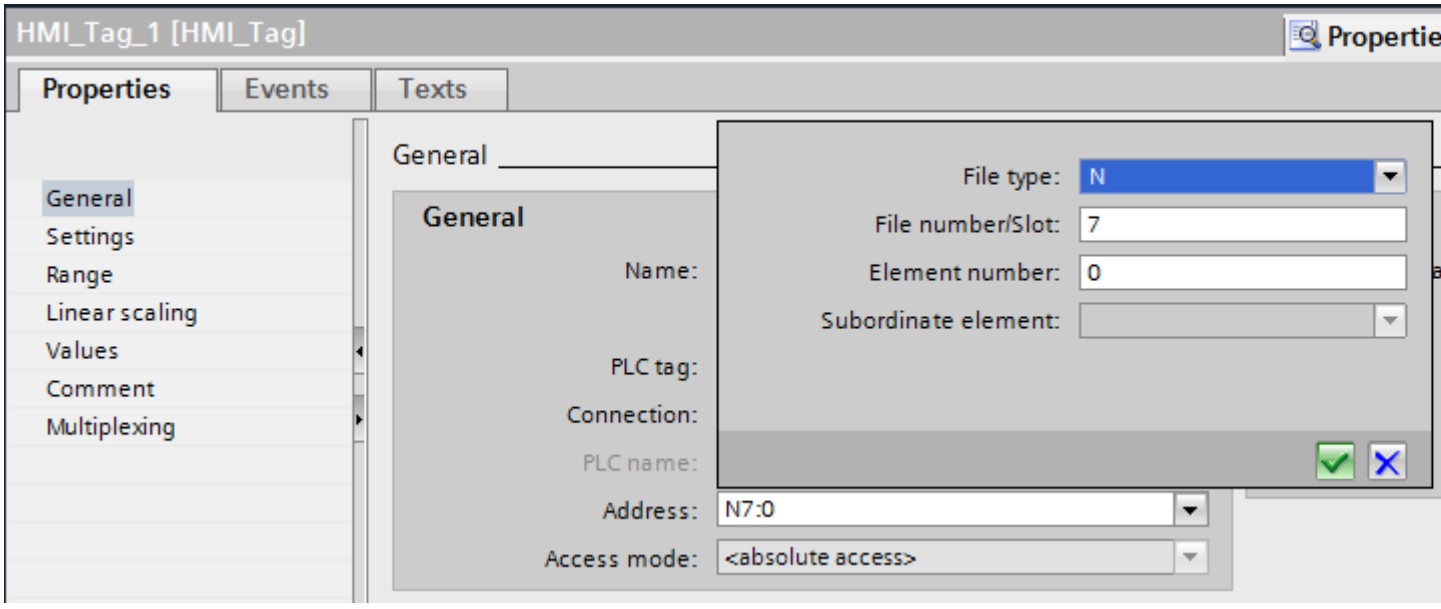
Addressing in the SLC, MicroLogix CPU type

Addressing

The addressing in the SLC, MicroLogix CPU type is entered in the following order:

- Operand type
- File number
- Element number

- Child element
- Bit number



The address then appears in the following format without spaces:

- File type file number : Element number . Child element
- e.g. T10:2.ACC

Operand type

You have the following options under operand type:

- I
- O
- S
- B
- C
- T
- R
- F
- N
- ST
- A

File number

Select the number between two limits under file number:

- Low limit
- High limit

The limit values depend on the selected operand type.

Child element

You can select a child element when you have selected one of the following operand types:

- R
- C
- T

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Note

If running the CompactLogix PLC with firmware earlier than version 18, you will possibly have to restart the HMI device following the transfer of the PLC program.

You could also terminate the connection before transferring the PLC program and set up the connection again after having completed the transfer of the PLC program.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Allen-Bradley DF1

Configuring a connection via Allen-Bradley DF1

Introduction

You configure a connection to a PLC with an Allen-Bradley DF1 communication driver in the "Connections" editor of the HMI device.

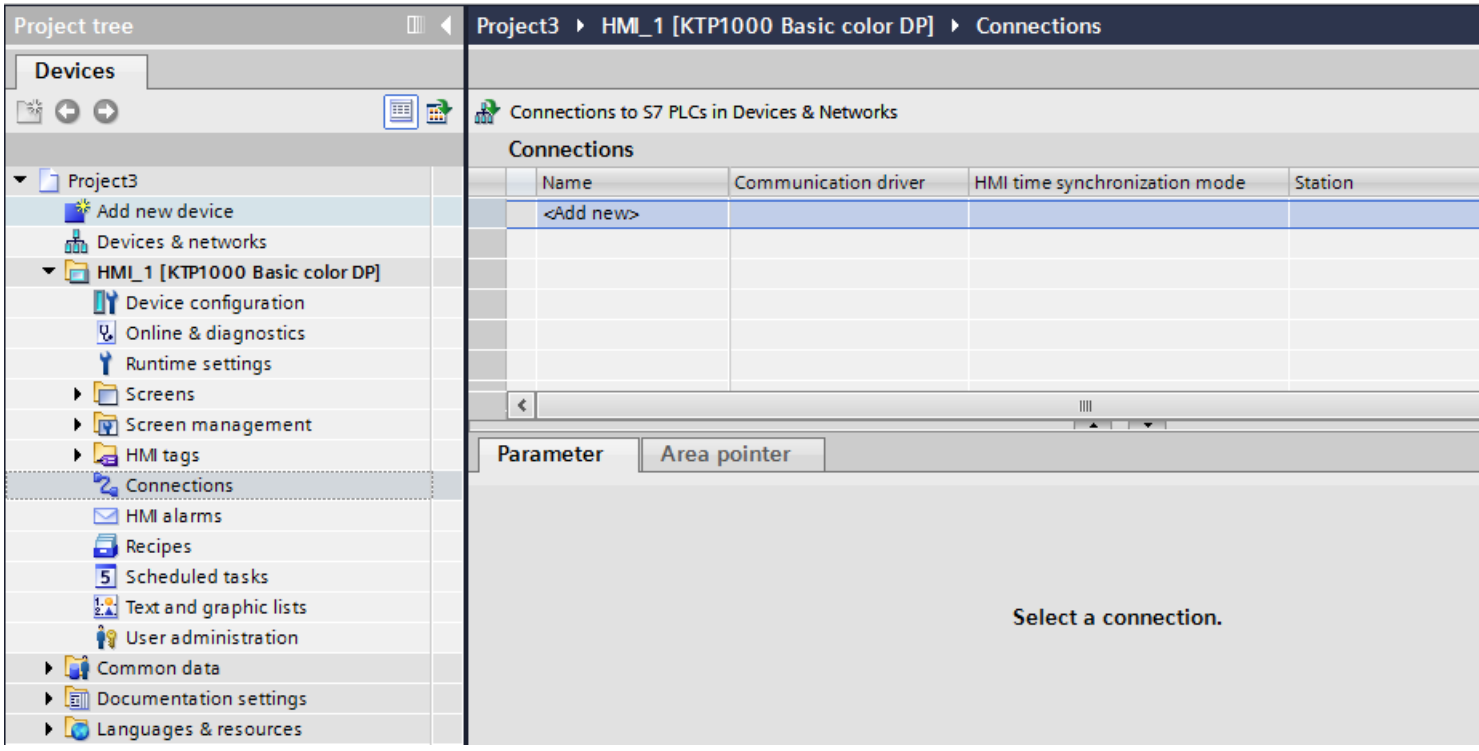
The interfaces are named differently depending on the HMI device.

Requirements

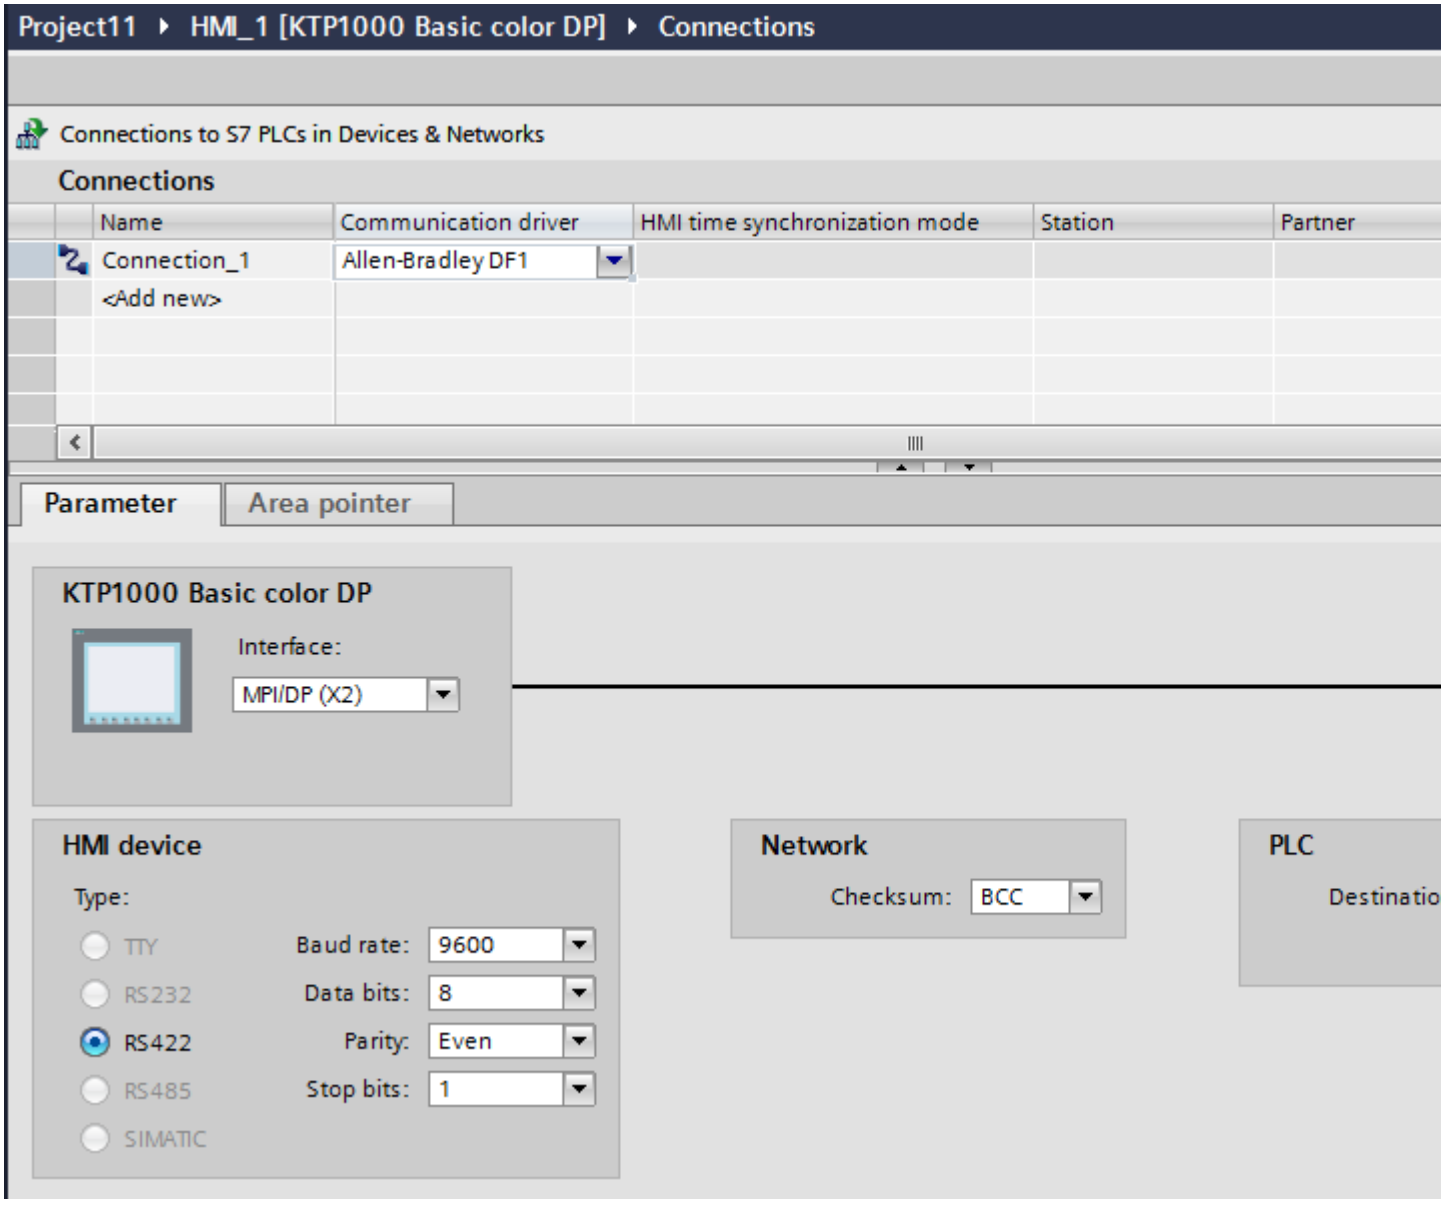
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Allen-Bradley DF1" driver.



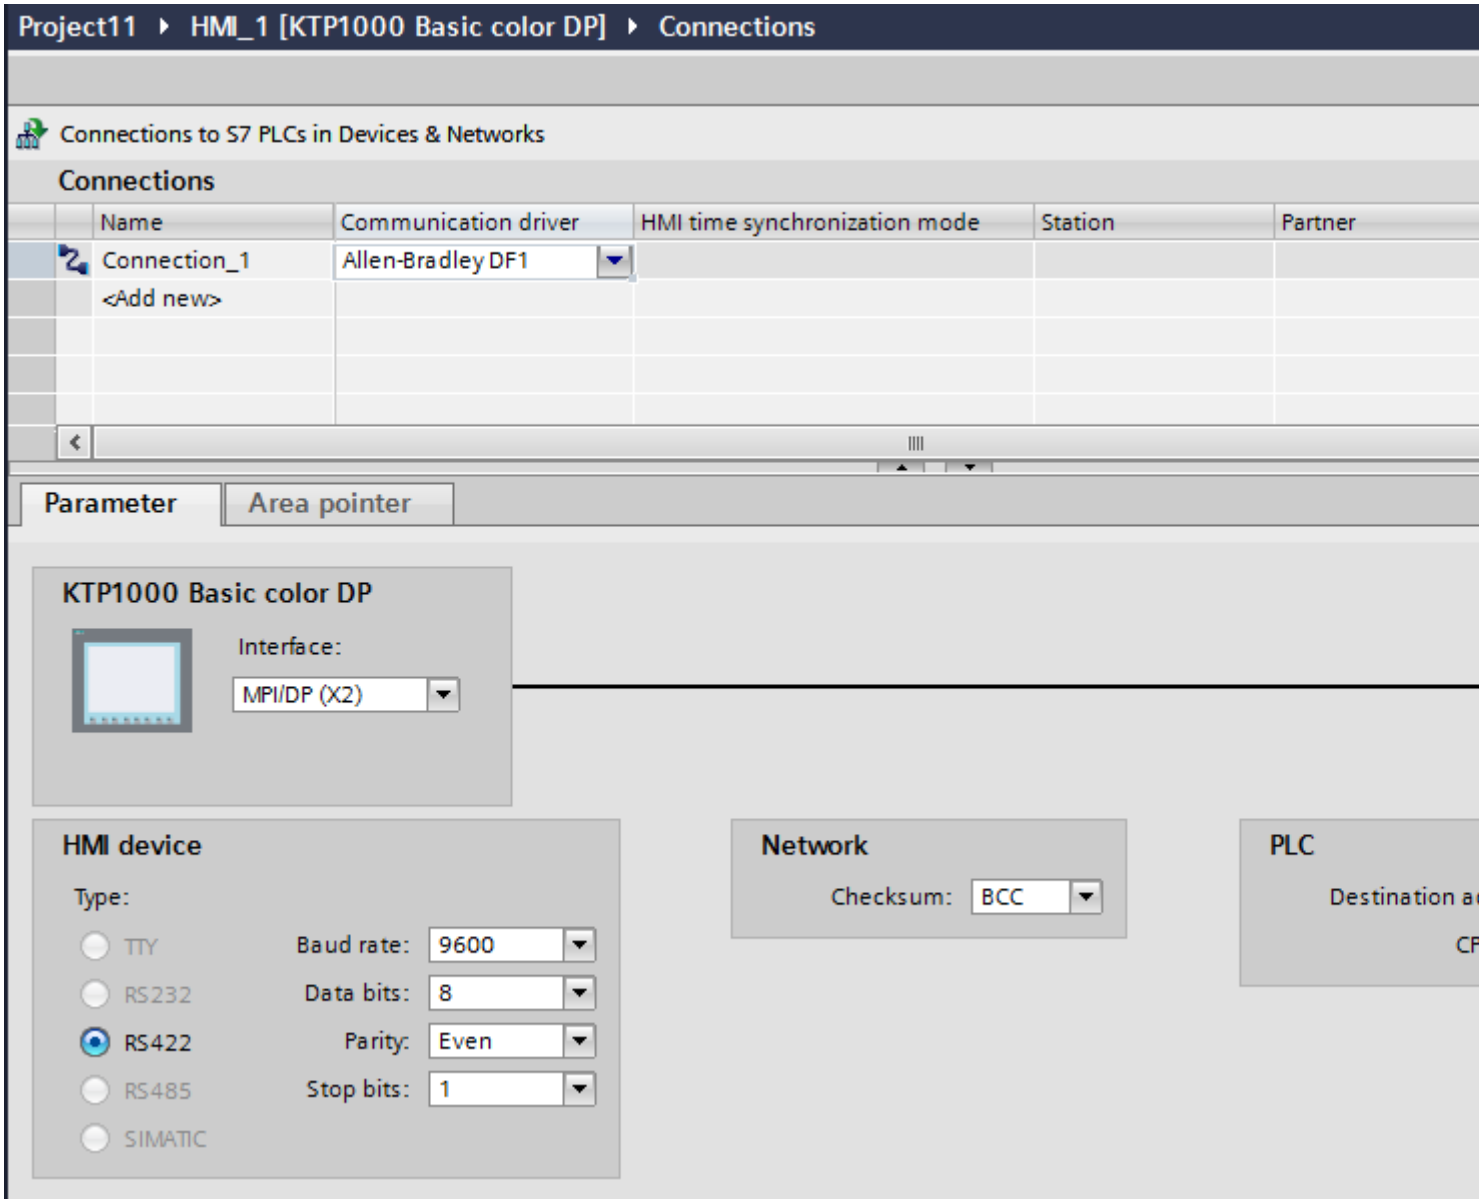
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Allen-Bradley DF1)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

- Interface
  Under "Interface", you select the interface of the HMI device to which the PLC is connected. For additional information, refer to the device manual for the HMI device.
- Type
  Specifies the physical connection used.

  Note

  If you are using the IF1B interface, you must also reconnect the RS-485 receive data and the RTS signal to the rear of the HMI devices via 4 DIP switches.

- Baud rate
  For "Baud rate", select the transmission speed between the HMI device and PLC.
- Data bits
  For "Data bits", you can choose between "7 bits" and "8 bits".
- Parity
  For "Parity", you can choose from "None", "Even", and "Odd".
- Stop bits
  For "Stop bits", you can choose between 1 and 2 bits.

Parameters for the network

- Checksum
  For "Checksum", choose the method for determining the error code: "BCC" or "CRC".

Parameters for the PLC

- Destination address
  For "Destination address", choose the PLC address. If there is a point-to-point DF1 connection, you set the address "0".
- CPU type
  For "CPU type", set the CPU type of the PLC used.

  Note

  Assign the DF1 FULL-DUPLEX driver in the CPU as follows: "NO HANDSHAKING" for "Control Line" and "AUTO-DETECT" for "Embedded Responses".

Connecting HMI device to PLC

Connections via Allen-Bradley DF1

Connection

The connection is established when you have matched the parameters of the PLC and the HMI device. Special blocks for the connection are not required in the PLC.

Note

Rockwell offers a variety of communication adapters for integrating "DF1 devices" for the DH485, DH, and DH+ networks. Of these connections, the direct connection and the connection via KF2 and KF3 module are approved. None of the other connections have been system-tested by SIEMENS AG and are therefore not approved.

Communication partners for Allen-Bradley DF1

Connectable PLCs

The communication drivers listed below support Allen-Bradley PLCs: :

PLC	DF1 (point-to-point) RS-232	DF1 (point-to-point) RS-422	DF1 (multipoint) over KF2 module to DH+ LAN RS-232/RS-422	DF1 (multipoint) over KF3 module to DH485 LAN RS-232
SLC500	–	–	–	X
SLC501	–	–	–	X
SLC502	–	–	–	X
SLC503	X	–	–	X
SLC504	X	–	X	X
SLC505	X	–	–	X
MicroLogix	X	–	–	X
PLC-5 [1)]	X	X	X	–

[1)] Processors released for PLC-5: PLC-5/11, PLC-5/20, PLC-5/30, PLC-5/40, PLC-5/60, and PLC-5/80.

Communication types

PLCs with Allen-Bradley DF1 communication driver

The communication between the HMI device and the following Allen Bradley PLCs is described in this section:

- SLC500
- SLC501
- SLC502
- SLC503
- SLC504
- SLC505
- PLC5
- MicroLogix

In these PLCs the connection is made by the PLC-internal protocols Allen Bradley DF1, Allen Bradley DH485 and Allen Bradley DH+.

The Allen-Bradley DF1 communication driver is used here, the protocol of which is converted into one of the other two PLC-internal protocols in multipoint communication with the communication modules KF2 (Allen Bradley DH+) and KF3(Allen Bradley DH485).

Enabled types of communication with Allen-Bradley DF1

The following communication types are system-tested and enabled:

- HMI (Allen Bradley DF1)
  Point-to-point connection
- HMI (Allen Bradley DF1)
  Via KF2 module to Allen Bradley DH+ (communication with up to 4 PLCs)
- HMI (Allen Bradley DF1)
  Via KF3 module to Allen Bradley DH485 (communication with up to 4 PLCs)

Connectable PLCs

The Allen Bradley DF1 communication driver is available for the following Allen-Bradley PLCs:

PLC	DF1 (point-to-point) RS 232	DF1 (point-to-point) RS 422	DF1 (multipoint) via KF2 module to DH+ LAN RS 232/RS 422	DF1 (multipoint) via KF3 module to DH485 LAN RS 232 [2]
SLC500	–	–	–	X
SLC501	–	–	–	X
SLC502	–	–	–	X
SLC503	X [2]	–	–	X

PLC	DF1 (point-to-point) RS 232	DF1 (point-to-point) RS 422	DF1 (multipoint) via KF2 module to DH+ LAN RS 232/RS 422	DF1 (multipoint) via KF3 module to DH485 LAN RS 232 [2]
SLC504	X [2]	–	X	X
SLC505	X [2]	–	–	X
MicroLogix	X [2]	–	–	X
PLC-5 [1]	X	X	X	–

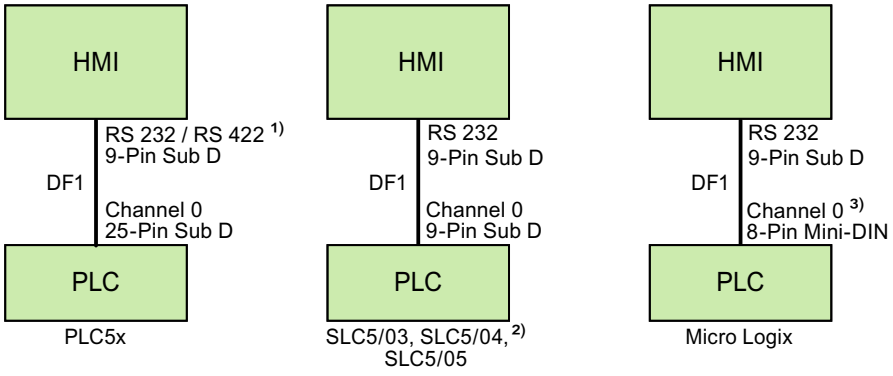
1) Only the following processors are approved for PLC-5: PLC-5/11, PLC-5/20, PLC-5/30, PLC-5/40, PLC-5/60 und PLC-5/80.

2) For HMI devices which only have an RS 422/485 interface and the communication partner is an RS 232 interface, the RS 422/232 converter is tested and approved.
Order number: 6AV6 671-8XE00-0AX0

DF1 protocol with multi-point connection

Point-to-point connection with DF1 protocol

Only point-to-point connections can be established with the DF1 protocol.



1) Only RS 232 is possible for Panel PC and PC.

2) A point-to-point connection to the SLC500, SLC501, and SLC502 PLCs via DF1 is not possible.

3) For MicroLogix ML1500 LRP, Channel 1 (9-pin Sub D) is also possible.

Connecting cable

HMI panel interface used	For connection to PLC5x	For connection to SLC5/03, SLC5/04, SLC5/05	For connection to MicroLogix
RS 232 9-pin	Allen-Bradley cable 1784-CP10	Allen-Bradley cable 1747-CP3	Allen-Bradley cable 1761-CBL-PM02
RS 422 9-pin	Connecting cable 9-pin Sub D RS 422	—	—

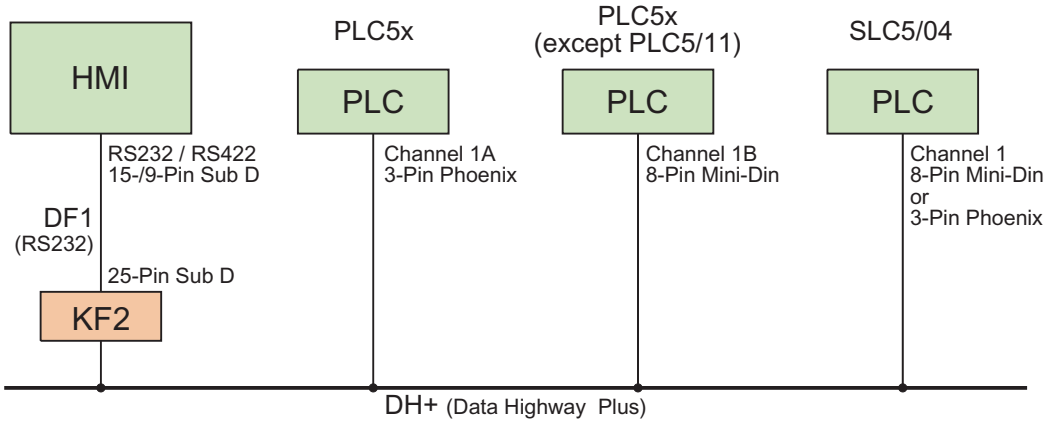
Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

DF1 protocol with multi-point connection via KF2 module

DF1 protocol with multi-point connection via KF2 module to DH+ LAN

The use of a KF2 protocol interface module enables a connection to be made to PLCs in the DH+ LAN (Data Highway Plus Local Area Network).



Connecting cable

HMI panel interface used	For connection to KF2 interface module
RS 232 9-pin	Allen-Bradley cable 1784-CP10 and 25-pin socket/socket adapter
RS 422 9-pin	9-pin Sub D RS 422 connecting cable and 25-pin female/female adapter

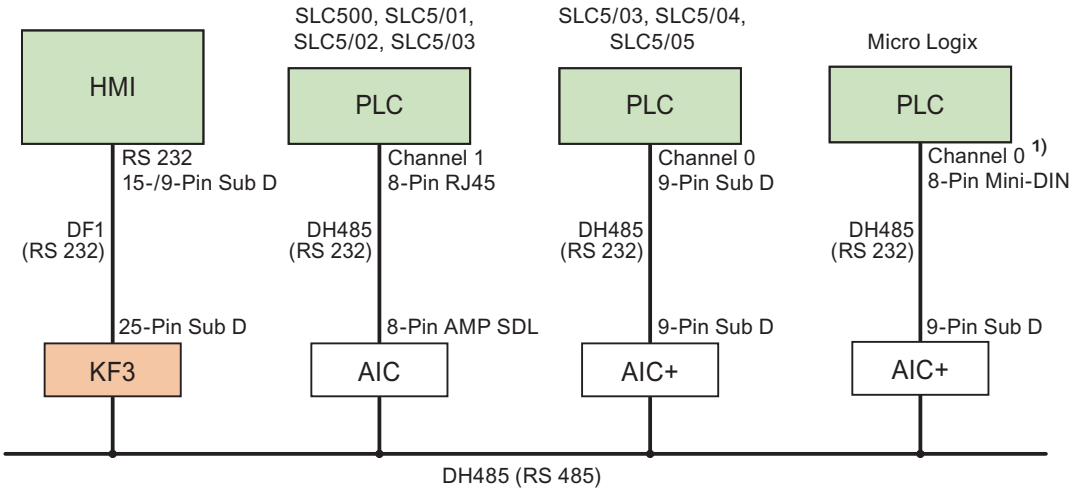
Refer to the Allen-Bradley documentation for the cable connection from the PLCs to the DH+ data bus.

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

DF1 protocol with multi-point connection via KF3 module

DF1 protocol with multi-point connection via KF3 module to DH485 LAN



1) For MicroLogix ML1500 LRP, Channel 1 (9-pin Sub D) is also possible.

Connecting cable

HMI panel interface used	For connection to KF3 interface module
RS 232 9-pin	Allen-Bradley cable 1784-CP10 and 25-pin socket/socket adapter

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

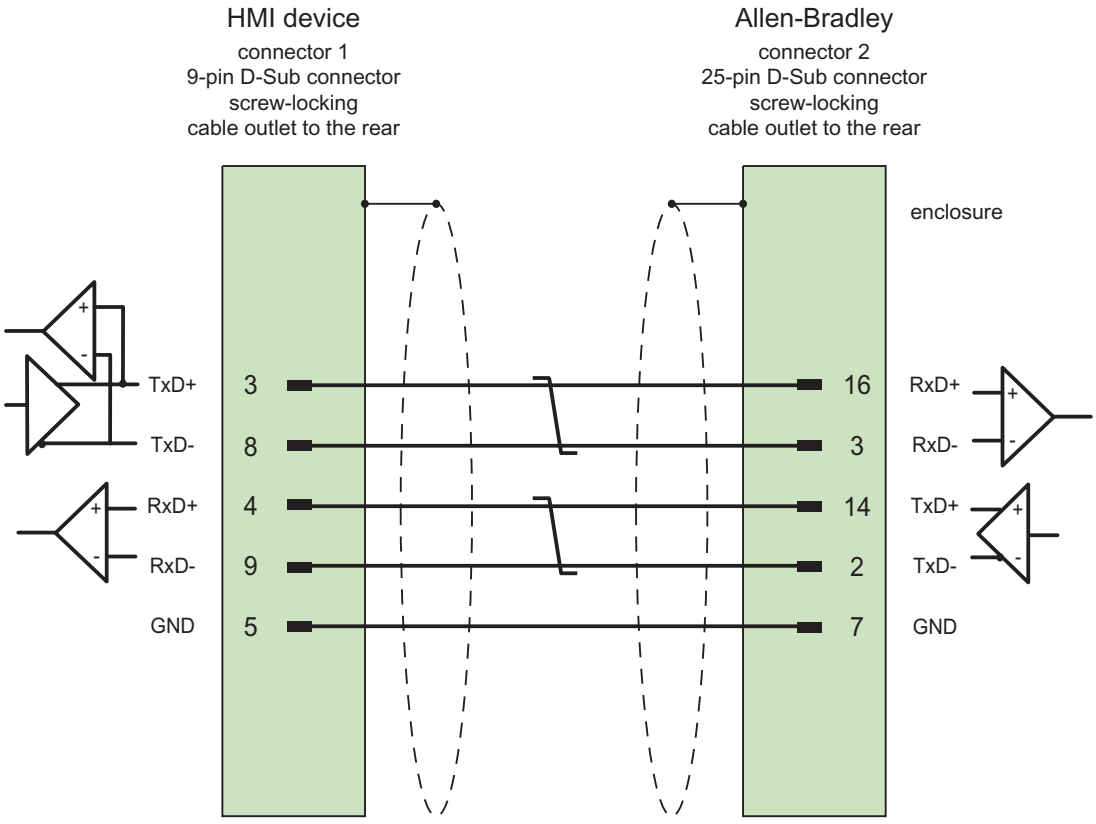
Connecting cables for Allen-Bradley DF1

Connecting cable 9-pin Sub D RS 422 for Allen-Bradley

Connecting cable 9-pin Sub D RS 422

For interconnecting the HMI device (RS 422, 9-pin sub D) - PLC5x, KF2, KF3

You require an additional 25-pin, female / female adapter (gender changer) for interconnections with KF2 and KF3.



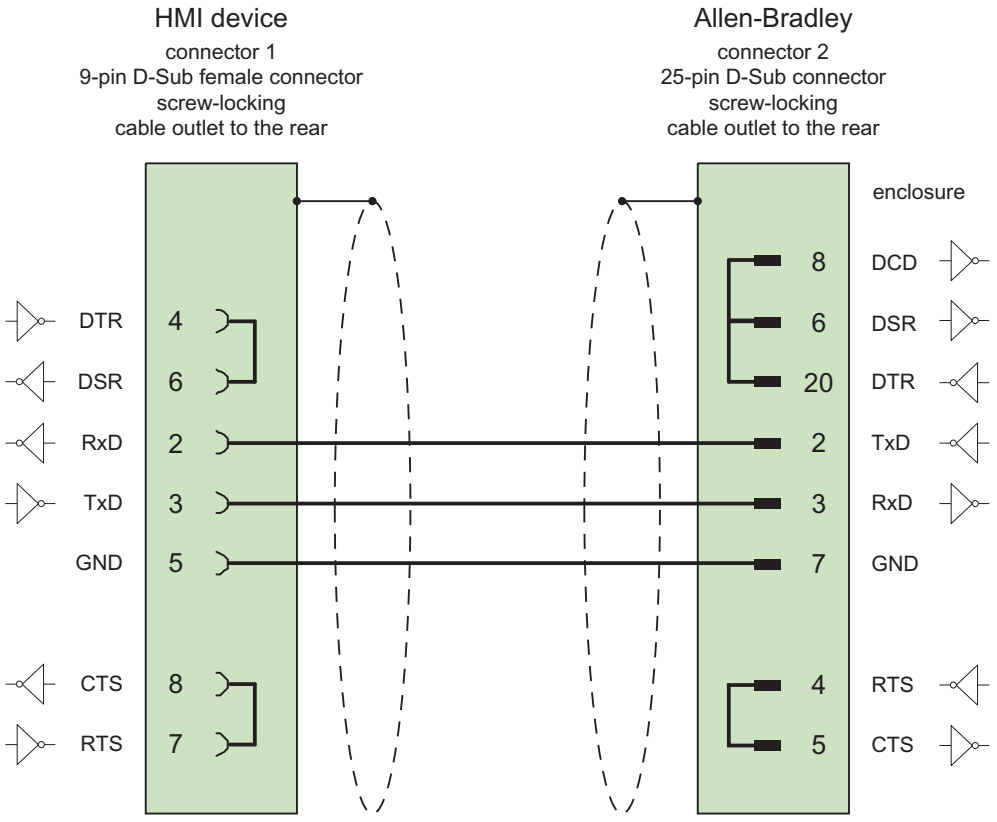
Shield with large-area contact to housing at both ends, interconnected shield contacts
Cable: 3 x 2 x 0.14 mm^2, shielded,
max. length 60 m

Connecting cable 1784-CP10, RS 232, for Allen-Bradley

Allen-Bradley cable 1784-CP10

For interconnecting the HMI device (RS 232, 9-pin sub D) - PLC5x, KF2, KF3

You require an additional 25-pin, female / female adapter (gender changer) for interconnections with KF2 and KF3.



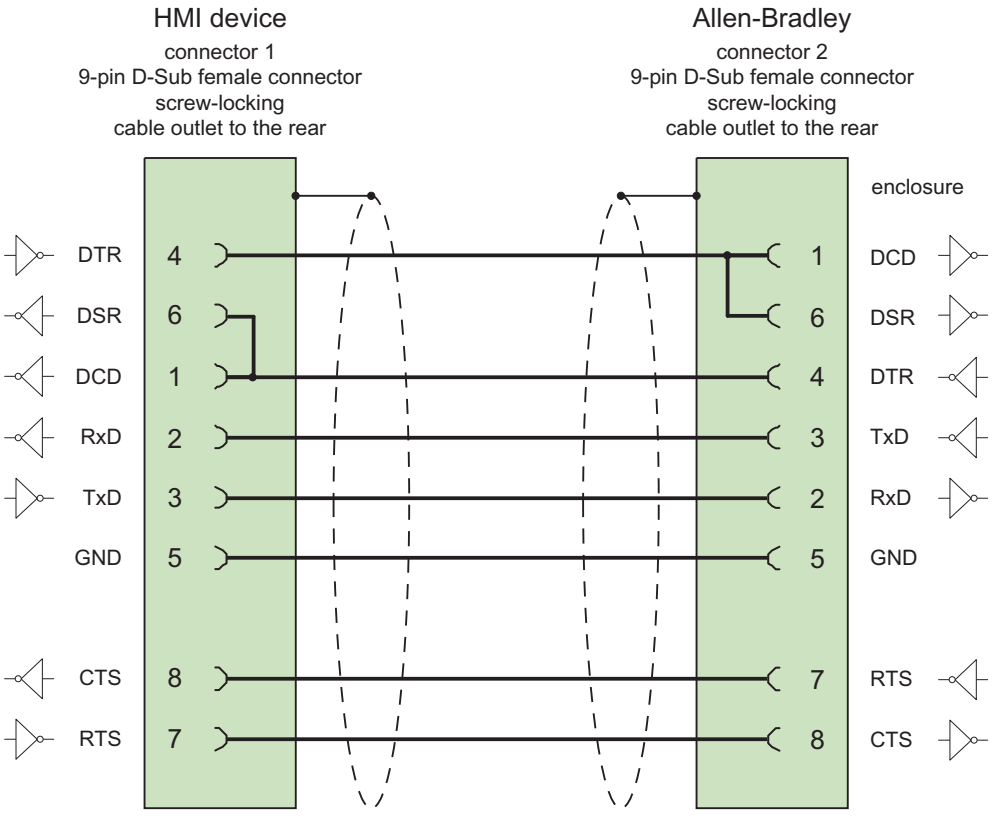
Screen connected with housing over large area on both sides

max. length 15 m

Connecting cable 1747-CP3, RS-232, for Allen-Bradley

Allen-Bradley cable 1747-CP3

For interconnecting the HMI device (RS 232, 9-pin sub D) - SLC503, SLC504, SLC505 (Channel 0), AIC+



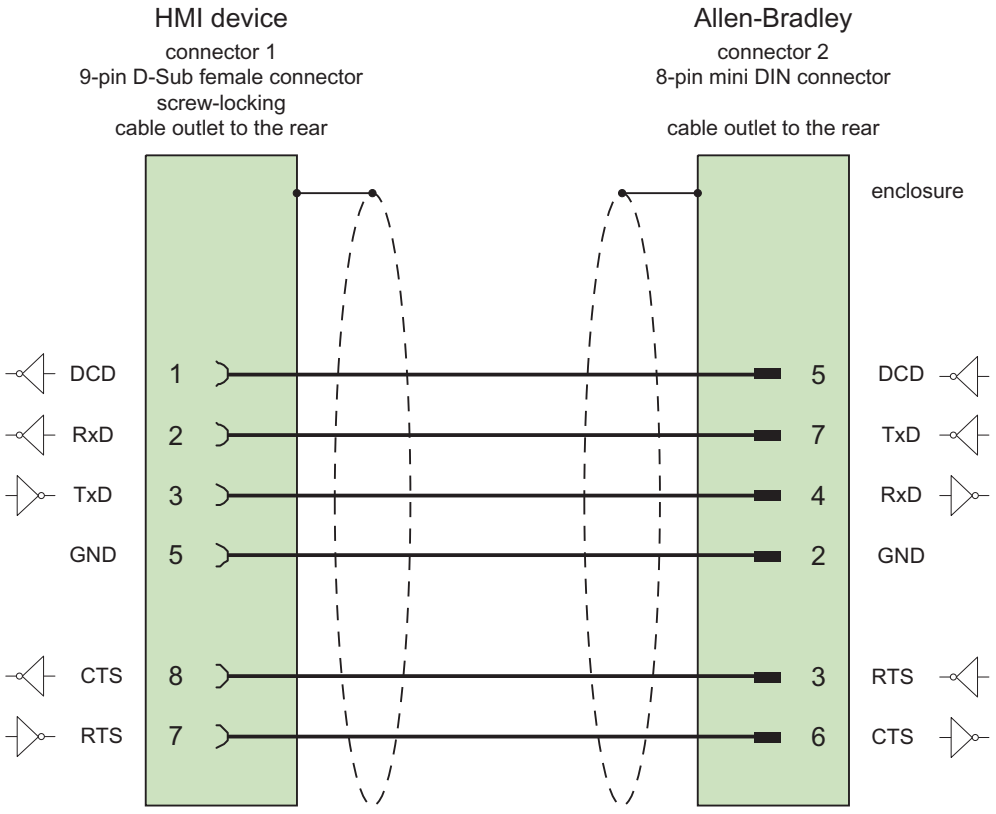
Screen connected with housing over large area on both sides

max. length 3 m

Connecting cable 1761-CBL-PM02, RS-232, for Allen-Bradley

Allen-Bradley cable 1761-CBL-PM02

For interconnecting the HMI device (RS 232, 9-pin sub D) - Micro Logix, AIC+



Screen connected with housing over large area on both sides

max. length 15 m

Performance features of communication

Permitted data types for Allen-Bradley DF1

Permitted data types for Allen-Bradley DF1

The table lists the user data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
ASCII	A [1)]	1 to 80 characters
Bool	N, R, C, T, B, S, I, O	1 bit
Int	N, R, C, T, S	2 bytes
DInt	N	4 bytes
UInt	N, R, C, T, B, I, O	2 bytes
UDInt	N	4 bytes
Real	N, F [1)]	4 bytes

[1] Selectable depending on the selected CPU type.

Abbreviations

In WinCC, formats of the data types are abbreviated as follows:

- UNSIGNED INT = UInt
- UNSIGNED LONG = UDInt
- SIGNED INT = Int
- SIGNED LONG = DInt

Distinctive features for connections with Allen-Bradley DF1

With Allen Bradley DF1, array tags may only be used for discrete alarms and trends.

Note

I/O modules with 8 or 16 ports occupy one data word on the PLC.

I/O modules with 24 or 32 ports occupy two data words.

The HMI device does not output an error message if using non-existent bits.

You should always make sure that I/O modules with 8 or 24 ports only occupy the bits that are actually assigned to a port.

Supported CPU types for Allen-Bradley DF1

CPU types

The following CPU types are supported for configuring the Allen-Bradley DF1 communication driver.

- SLC
  - SLC500
  - SLC501
  - SLC502
  - SLC503
  - SLC504
  - SLC505
- MicroLogix
  - MicroLogix 1x00
  - MicroLogix 1100 / 1400
- PLC 5
  - PLC-5/11
  - PLC-5/20
  - PLC-5/40
  - PLC-5/60
  - PLC-5/80

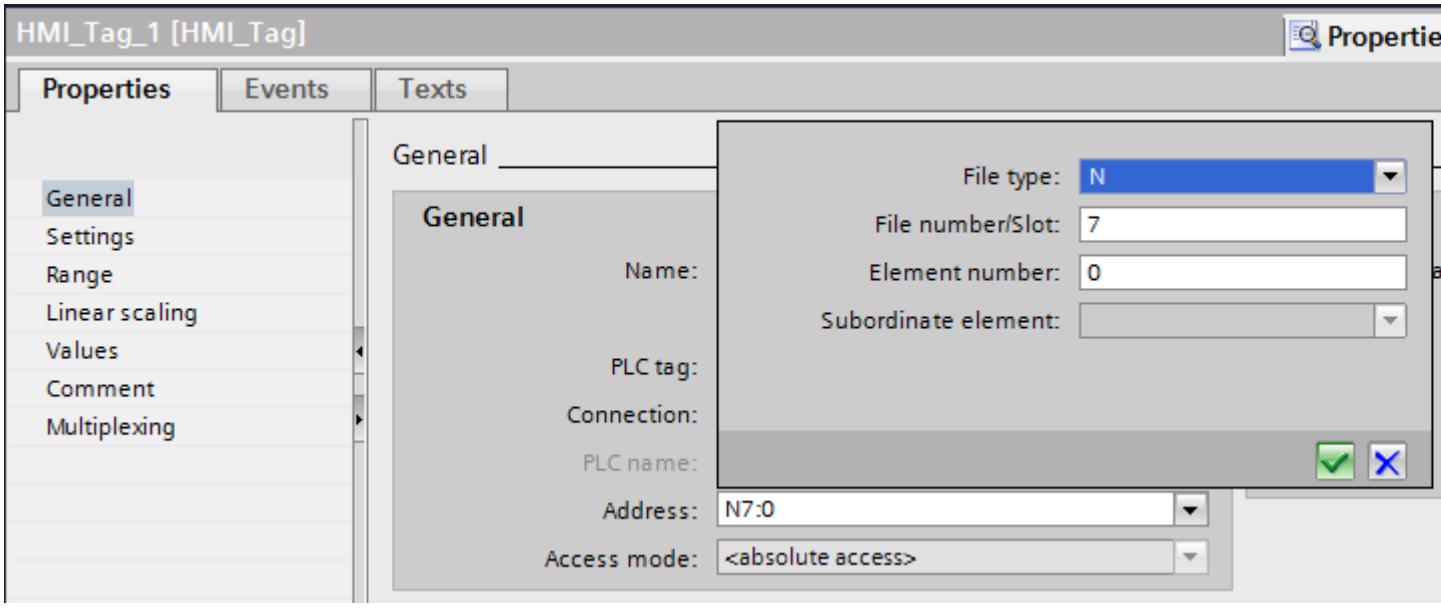
Addressing

Addressing

The addressing is entered in the following order in the Allen-Bradley DF1 communication driver:

- Operand type
- File number
- Element number

- Child element
- Bit number



The address then appears in the following format without spaces:

- File type file number : Element number . Child element
- e.g. T8:2.ACC

Operand type

You have the following options under operand type:

- I
- O
- S
- B
- T
- C
- R
- N
- A
- D only for PLC5 CPU type

File number

Select the number between two limits under file number:

- Low limit
- High limit

The limit values depend on the selected file type.

Child element

You can select a child element when you have selected one of the following data types:

- R
- C
- T

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Allen-Bradley

Area pointers for connections using an Allen-Bradley communication driver

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

Distinctive features for connections via Allen-Bradley EtherNet/IP

You can configure the following area pointers

Area pointer	Allen-Bradley EtherNet/IP	Allen-Bradley DF1
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

Restrictions Allen-Bradley Ethernet/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
ControlLogix,CompactLogix	Int, UInt	--
SLC, MicroLogix	Int, UInt	N, B

Restrictions Allen-Bradley DF1

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
MicroLogix	--	N, O, I, B
SLC50x	--	N, O, I, B
PLC5	--	N, O, I, B

See also

Data exchange using area pointers (Page 6730)

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 4270)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

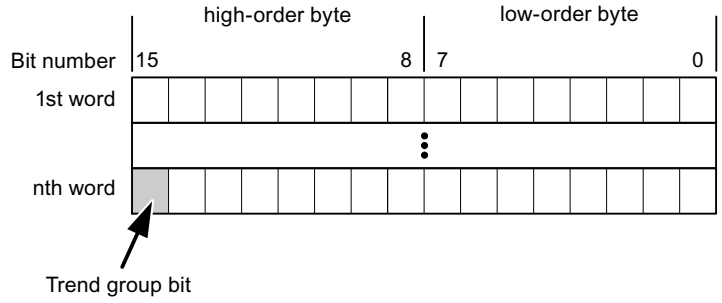
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Restrictions to the trend control

For Allen-Bradley DF1 communication drivers

Tags of the following operand types are permitted:

- "N"
- "O"
- "I"
- "S"
- "B"

Permitted data types:

- "UInt"
- "Int"

Note

The "Array" data type is only available for the trend type "Bit-triggered buffer". The data type "Array" cannot be selected for the "Bit-triggered real time", "Cyclic real time" or "Data log" trend types.

Individual array elements cannot be selected as data type.

You assign a bit to a trend during configuration. This sets a defined bit assignment for all trend areas.

For Allen-Bradley EtherNet/IP communication drivers

Tags of data type "Int" or an array tag of data type "Int" are permitted. You assign a bit to a trend during configuration. This sets a defined bit assignment for all trend areas.

ControlLogix and CompactLogix

The following data types are possible for tags for the ControlLogix and CompactLogix CPU types:

- "UInt"
- "Int"

SLC and MicroLogix

The following operand types are permitted for tags of the SLC and MicroLogix CPU types:

- "N"
- "O"
- "I"
- "S"
- "B"

Permitted data types:

- "UInt"
- "Int"

Note

The "Array" data type is only available for the trend type "Bit-triggered buffer". The data type "Array" cannot be selected for the "Bit-triggered real time", "Cyclic real time" or "Data log" trend types.

Individual array elements cannot be selected as data type.

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 4293)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Restrictions

Only tags whose "File type" is "N", "O", "I", "S" and "B" are allowed for use as a "trigger tag" for discrete alarms. These tags are only valid for the data types "Int" and "UInt".

Data types

For connections with an Allen-Bradley communication driver, the following data types are supported:

Communication drivers	PLC	Permitted data types	
		Discrete alarms	Analog alarms
Allen-Bradley DF1	SLC500, SLC501, SLC502, SLC503, SLC504, SLC505, PLC5, MicroLogix	Int, UInt	Int, UInt, Long, ULong, Real
Allen-Bradley EtherNet/IP	ControlLogix, Compact-Logix, SLC, Micrologix	Int, UInt	SInt, USInt, Int, UInt, DInt, UDInt, Real

How the bit positions are counted

For connections with an Allen-Bradley communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In Allen-Bradley PLCs	15							8	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

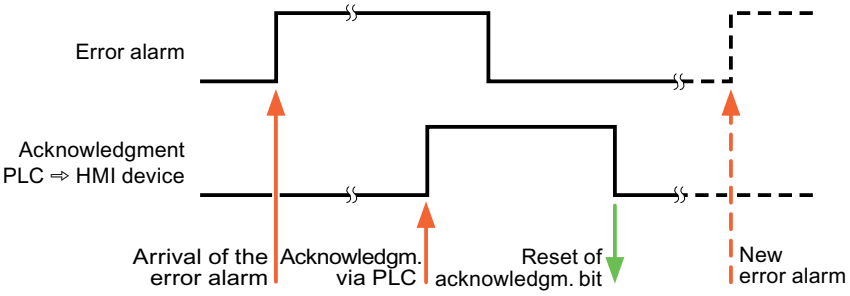
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

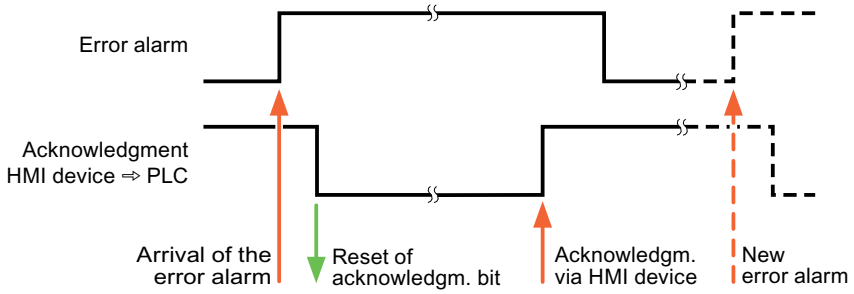
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Mitsubishi

Mitsubishi communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Mitsubishi communication drivers.

The following communication drivers are supported:

- Mitsubishi MC TCP/IP
- Mitsubishi FX

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Mitsubishi MC TCP/IP

Configuring a connection via Mitsubishi MC TCP/IP

Introduction

You configure a connection to a PLC with a Mitsubishi MC TCPI/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

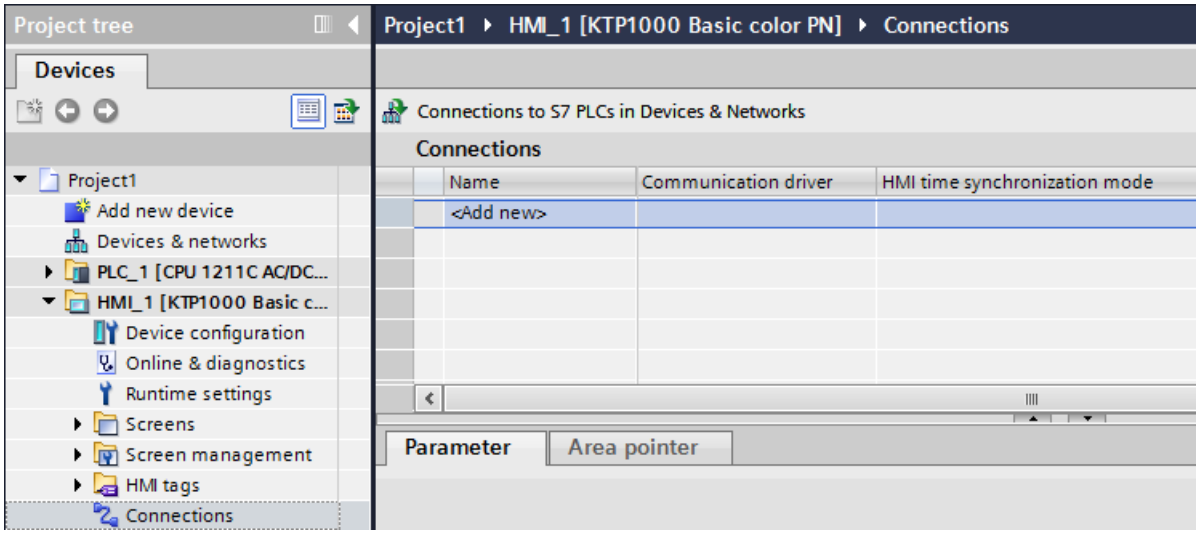
Example: PROFINET interface corresponds to the Ethernet interface

Requirements

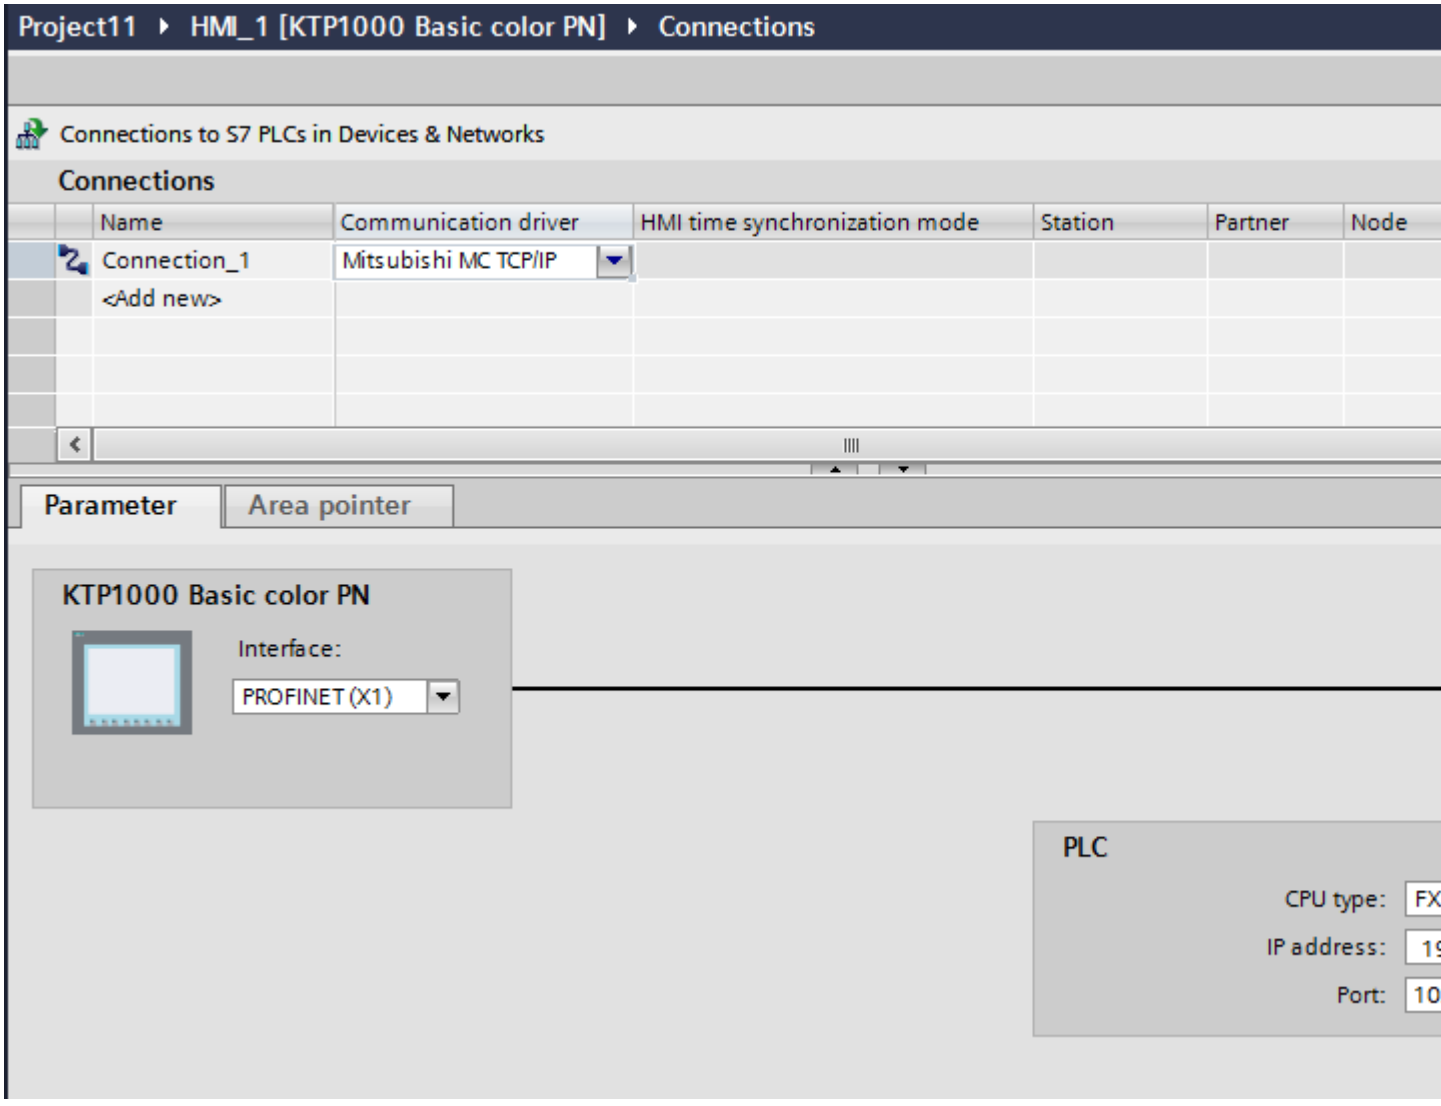
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Mitsubishi MC TCPI/IP" driver.



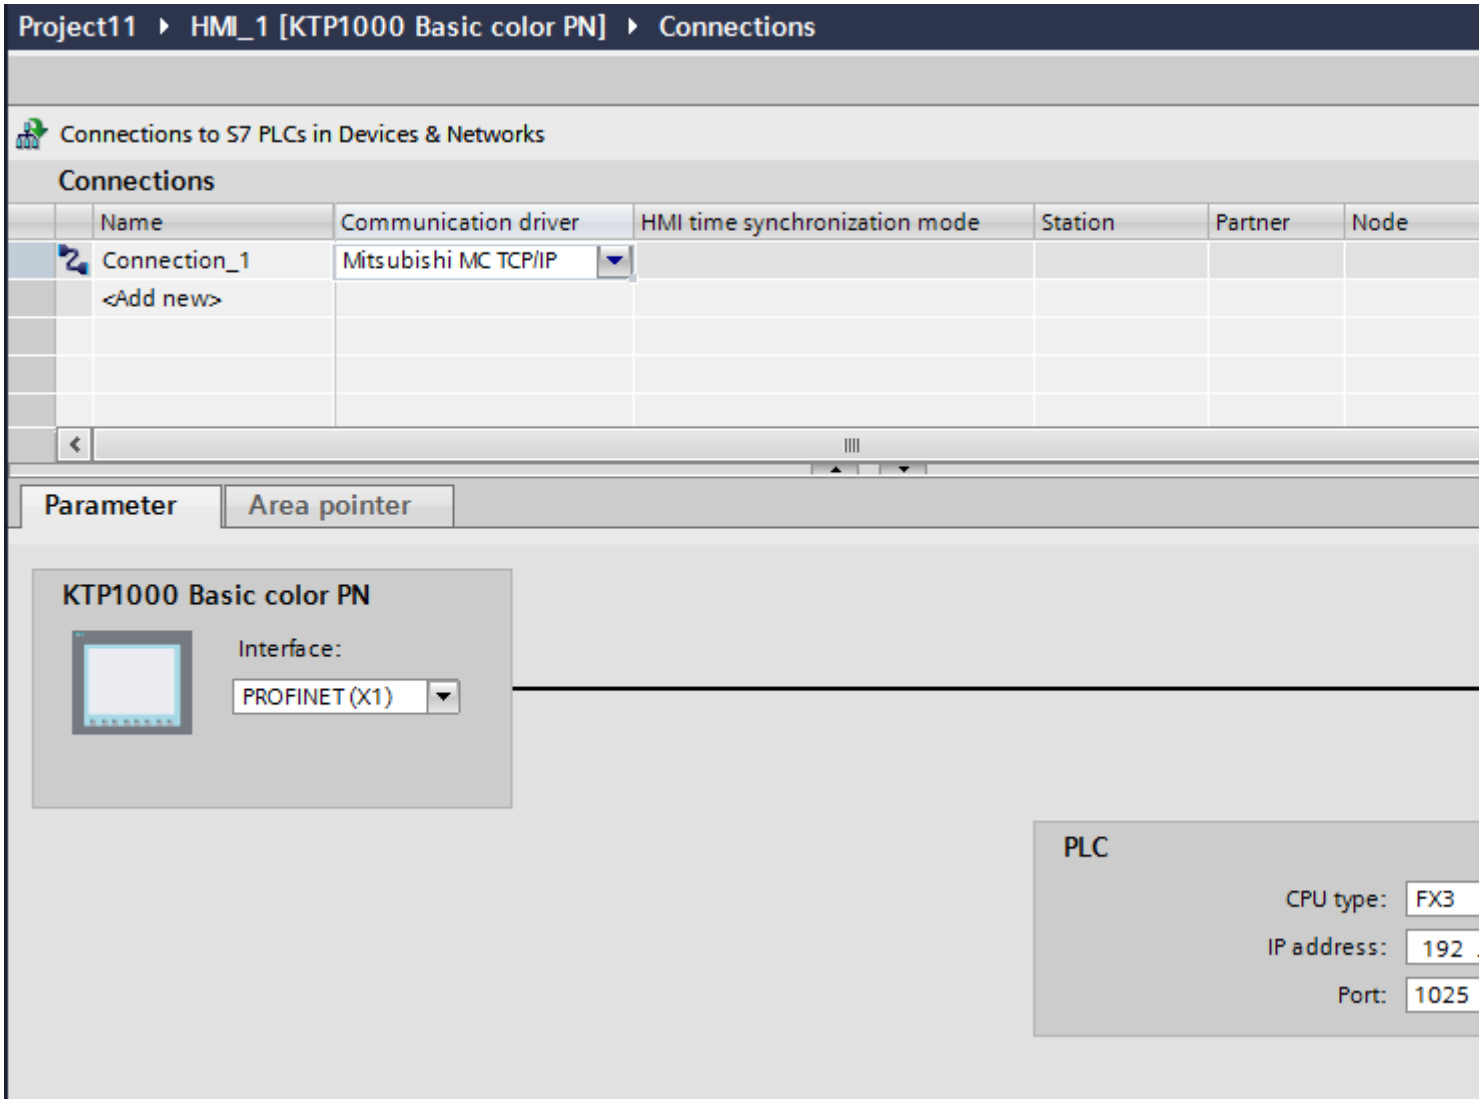
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Mitsubishi MC TCP/IP)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device during project transfer.

Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

To set up the IP address of the HMI device:

1. Click on the HMI device.
2. Open the "Device configuration" editor.
3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:
   "General > PROFINET interface > Ethernet addresses"

Parameters for the PLC

- CPU type
  For "CPU type", you set the type of PLC to which the HMI device is connected.
  The following settings are possible:
  –FX3
  –Q
  If you select the FX3 CPU type, the Mitsubishi MC protocol "1E" is used and "3E" for the "Q" CPU type.
  The "Binary code" protocol variant is always used.

  Note

  If the CPU type is changed for a configured connection, tags with the following properties must be revised:

  - Operands that do not exist for the new CPU type, such as "W", "B", "F".
  - Inputs and outputs with different addressing (hexadecimal/octal)
  - Addresses greater than the valid address area of the new CPU type

- IP address
  Set the IP address or host name of the Ethernet/IP module of the PLC. Only the IP address can be used on a Basic Panel.
- Port
  Set the port number of the module of the PLC.

Connecting HMI device to PLC

Connections via Mitsubishi MC TCP/IP

Connection

The HMI device can be connected to the Mitsubishi PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to a Mitsubishi PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Connect the HMI device to one or several Q-series and/or FX3 PLCs. Connect the HMI device via the following interfaces:

- Communication interface OnBoard
- Approved communication module suitable for the PLC

Note

Timeout response with TCP/IP (Ethernet)

Due to the use of the TCP/IP protocol, the breakdown of a connection is detected at the earliest after approximately one minute. Communication failure cannot be reliably detected if no tags are requested, for example, no output tags in the current screen.

Configure area pointer coordination for each PLC. This setting ensures that a communication failure is recognized after approximately two minutes, even in the aforementioned scenario.

Communication types

Approved communication types

- Only applies for Mitsubishi FX(PG protocol):
  The point-to-point connection from a HMI device to an approved Mitsubishi FX–CPU via Mitsubishi FX is system-tested and approved by Siemens AG.
- Only applies for Mitsubishi MC TCP/IP:
  The following communication types are system-tested and approved:
  - Point-to-point connection to the approved PLCs
  - Multipoint connection from a HMI device with up to 4 PLCs with the respectively approved PLCs. CPU types (FX3 and Q) can be mixed.

Note

The HMI device is a client and the PLC must operate as a server.

Connectable PLCs

Connections can be implemented for the following Mitsubishi PLCs:

PLC	Mitsubishi FX (PG protocol)	Mitsubishi MC TCP/IP
MELSEC FX1n, FX2n	Yes	No
MELSEC FX3U, FX3UC, FX3G with communication module FX3U-ENET	No	Yes
MELSEC System Q • Q-series with the communication module QJ71E71-100 • QnUDEH CPU with Ethernet interface onboard	No	Yes

Parameterization of the communications modules

FX3 PLCs

Procedure

1. Start the FX-Configurator.
2. Select the module.
3. Assign the following settings in the "Operational settings" dialog:
   - Communication data code:
     Binary code
   - Initial timing:
     Always wait for OPEN
   - IP address:
     IP address
   - Send frame setting:
     Ethernet(V2.0)
   - TCP Existence confirmation setting:
     Use the Ping

4. Assign the following settings in the "Open Settings" dialog:
   - Protocol:
     TCP
   - Open system:
     Unpassive
   - Fixed buffer:
     Receive
   - Fixed buffer communication procedure:
     Procedure exist(MC)
   - Pairing open
     Disable
   - Existence confirmation
     No confirm
   - Host station Port No. (DEC)
     Port number

   Note

   The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

   You must specify port numbers in decimal values.

5. Confirm the default settings of the other dialog boxes.

The network no. and station no. parameters are not relevant for the connection and can be chosen as required.

Q PLCs

Procedure

1. Click "Edit network parameters".
2. Select the network type:
   - Ethernet
     The network number and the group / station number are not evaluated and can be freely assigned

3. Assign the following settings in the "Operational settings" dialog:
   - Communication data code:
     Binary code
   - Initial timing:
     Always wait for OPEN
   - IP address:
     IP address
   - Send frame setting:
     Ethernet(V2.0)
   - Enable write operations during RUN
4. Assign the following settings in the "Open settings" dialog:
   - Protocol:
     TCP
   - Open system:
     Unpassive
   - Pairing open
     Disable
   - Existence confirmation
     No confirm
   - Host station Port No. (HEX)
     Port-Nummer

   Note

   The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

   You must specify port numbers in hexadecimal values.

Internal Ethernet port of the Q0xUDEH CPU

Procedure

1. Assign the following settings in the "Internal Ethernet Port" dialog:
   - IP address:
     IP address
   - Communication data code:
     Binary code
   - Enable online changes
2. Assign the following settings in the "Open settings" dialog:
   - Protocol:
     TCP
   - Open system:
     MC-Protocol
   - Host station Port No. (HEX)
     Port number

   Note

   The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

Performance features of communication

Permitted data types for Mitsubishi MC TCPI/IP

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
4-bit block	M, X, Y, B, F	1 byte
8-bit block	M, X, Y B, F	1 byte
12-bit block	M, X, Y B, F	2 bytes
16-bit block	M, X, Y B, F	2 bytes
20-bit block	M, X, Y B, F	4 bytes
24-bit block	M, X, Y B, F	4 bytes
28-bit block	M, X, Y B, F	4 bytes
32-bit block	M, X, Y B, F	4 bytes
Bool	M, D, X, Y B, F	1-bit
DInt	D, W	4 bytes

Data type	Operand type	Length
DWord	D, C, W	4 bytes
Int	D, W	2 bytes
Real 1)	D, W	4 bytes
String 1)	D	1 to 80 characters
Word	D, T, C, W	2 bytes

1) The "String" and "Real" data types are not available for all CPUs.
2) Operand types B, F and W are only available for CPU type "Q".

Note

Note the following for write accesses:

Tags can only be written if "Enable online changes" or "Enable write operations during RUN" was selected when parameterizing the Mitsubishi communication modules.

For data type "Bool" in operand type "D", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

Note

Array elements in I/O fields cannot be used in communication with a Mitsubishi PLC.

Supported CPU types for Mitsubishi MC TCP/IP

CPU types

The following CPU types are supported for configuring the Mitsubishi MC TCP/IP communication driver.

- FX3 series
  - FX 3G / FX 3G with communication modul FX3U-ENET
  - FX 3U / FX 3U with communication modul FX3U-ENET
  - FX 3UC / FX 3UC with communication modul FX3U-ENET
- Q series
  - Q-Series with QJ71E71-100 communication module
- iQ series / QnUD
  - QnUDEHCPU with built in ethernet module

Addresses for Mitsubishi MC TCP/IP

Address areas for connections via Mitsubishi MC TCP/IP

The address area boundaries differ for the different series; refer to the Mitsubishi Computerlink manuals for this information.

Examples of address area boundaries dependent on the CPU and communication format:

Name	Operand type	Max. address FX3	Max. address Q-Series
Output/Input	Y/X	Octal X/Y 0 - 777	HEX X/Y 0 - 7FF
Bit memory	M	M0 - M3071 and M8000 - M8255	M/L/S 0 - 8191
Data register	D	D0 - 7999 D8000 - D8255	D0 - 8191 D9000 - D9255 becomes SD1000 - SD1255
Counter	C	C0 - 255	C0 - 1023
Timer	T	T0 - 255	T0 - 2047
Link register	W	--	Hex: W0 - FFF
Link flag	B	--	Hex: B0 - FFF
Error flag	F	--	F0 - 2047

Address areas for Mitsubishi MC TCP/IP

FX3

Address areas	Data types														
	Bool	Int	Word	DInt	DWord	Real	String	4-bit block	8-bit block	12-bit block	16-bit block	20-bit block	24-bit block	28-bit block	32-bit block
M	M0 - M9999	--	--	--	--	--	--	M0 - M9996	M0 - M9992	M0 - M9988	M0 - M9984	M0 - M9980	M0 - M9976	M0 - M9972	M0 - M9968
D	D0.0 - D9999.15	D0 - D9999	D0 - D9999	D0 - D9999	D0 - D9999	D0 - D9999	D0 - D9999	--	--	--	--	--	--	--	--

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Mitsubishi FX

Configuring a connection via Mitsubishi FX

Introduction

You configure a connection to a PLC with a Mitsubishi FX communication driver in the "Connections" editor of the HMI device.

The Mitsubishi FX protocol is also referred to as the Mitsubishi PG protocol.

The interfaces are named differently depending on the HMI device.

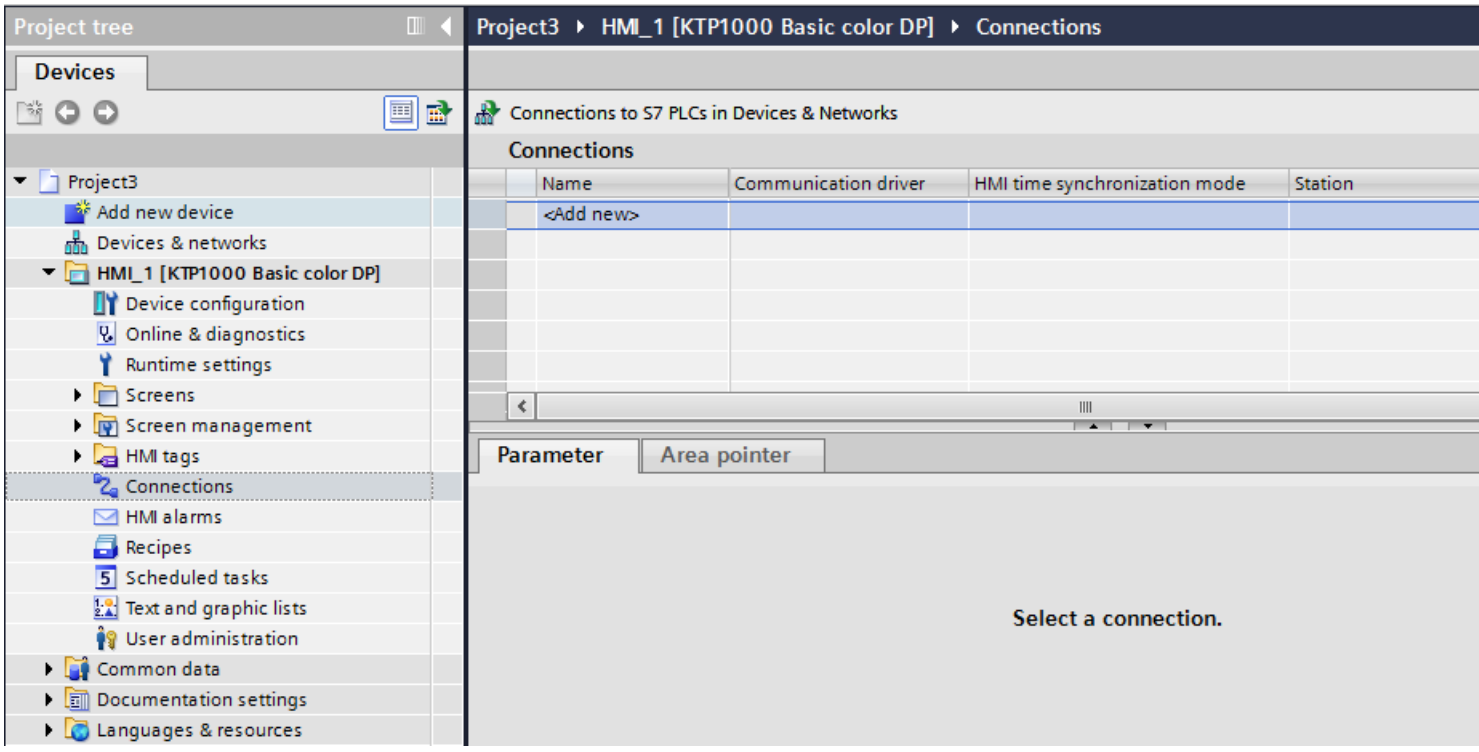
Requirements

- A project is open.
- An HMI device has been created.

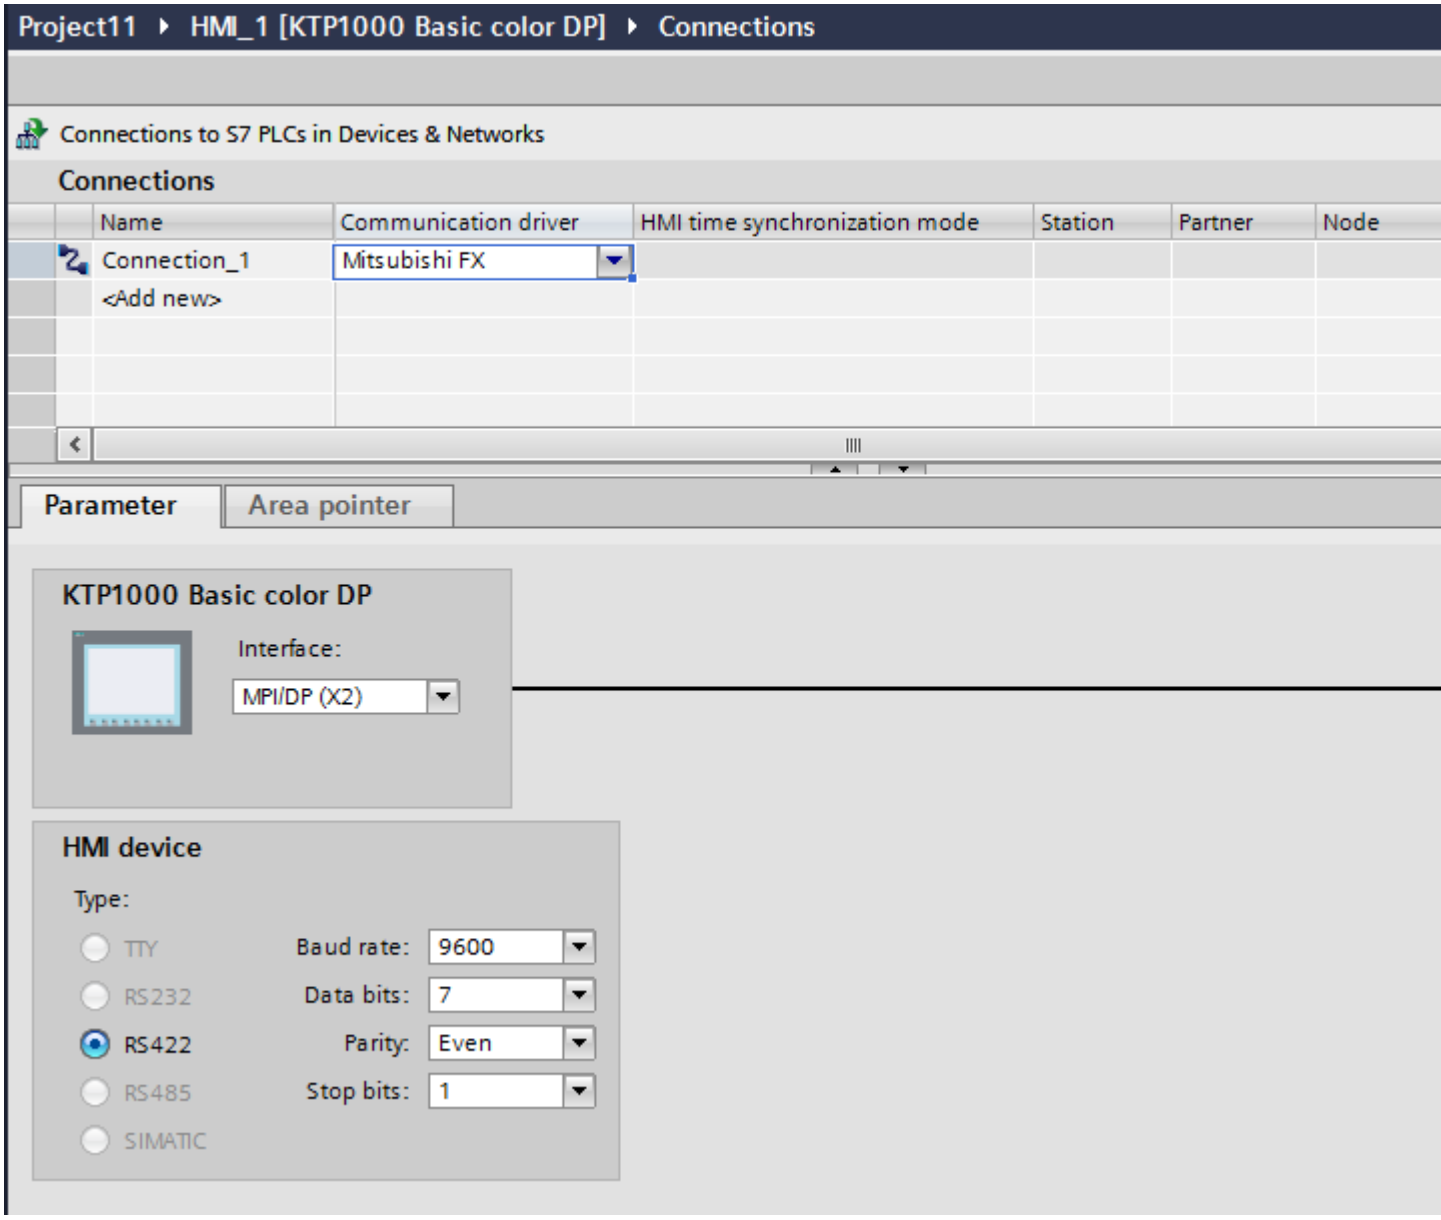
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Mitsubishi FX" driver.



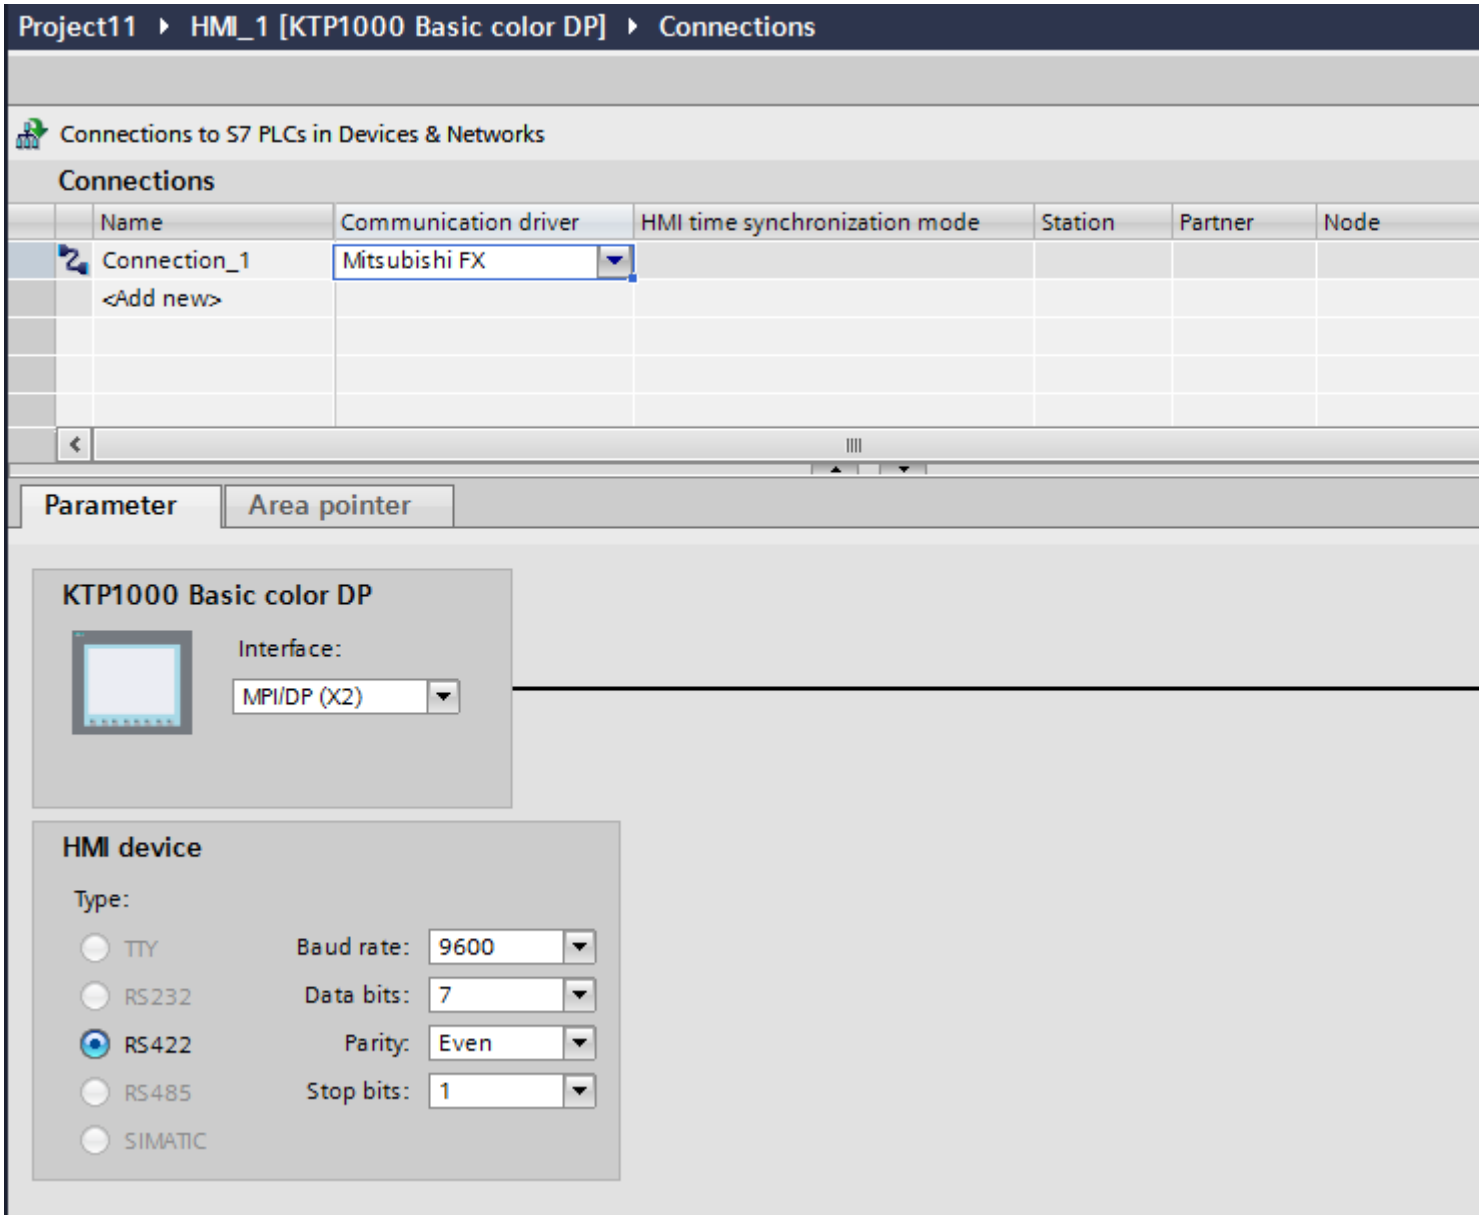
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Mitsubishi FX)

Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- "Type"
  Specifies the physical connection used.

Note

If you use the IF1B interface, you must switch over the RS422 receive data and the RTS signal additionally by 4 DIL-switches on the back of the HMI device.

Parameters for the PLC

- Baud rate: For "Baud rate", select the transmission speed between the HMI device and PLC. Select the baud rate "9600".
- Data bits: Under "Data bits", select "7 bits".
- Parity: Under "Parity", select "Even".
- Stop bits: Under "Stop bits", select "1 bit".

Connecting HMI device to PLC

Connections via Mitsubishi FX

Connection

Connect the HMI device to the programming interface of the CPU (RS 422) (see documentation of the PLC).

The connection between the HMI device and the Mitsubishi PLC is basically restricted to setting the interface parameters. Special blocks for the connection are not required in the PLC.

Connecting cable

The following connecting cables are available to connect the HMI device to the PLC.

Interface to HMI device or adapter	Mitsubishi Electric PLC via FX protocol
	FX1n, Fx2n, Mini DIN, 8–pin
RS 232, 9-pin	Mitsubishi SC-09 [1]
RS 422, 9-pin	Connecting cable RS422-2P

[1] Since the Mitsubishi PLCs communicate via RS 422 as a standard, the Mitsubishi programming cable SC–09 with integrated RS 422/RS 232 adaptor is necessary for connecting a HMI device via RS 232.

Note

Applies only to RS 232:

Cable length is restricted to 0.32 m.

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Mitsubishi FX".

Communication types

Approved communication types

- Only applies for Mitsubishi FX(PG protocol):
  The point-to-point connection from a HMI device to an approved Mitsubishi FX–CPU via Mitsubishi FX (PG protocol := protocol for access to the program and memory elements of the FX series PC CPU version V1.21 and after) is system-tested and approved by Siemens AG.
- Only applies for Mitsubishi MC TCP/IP:
  The following communication types are system-tested and approved:
  - Point-to-point connection to the approved PLCs
  - Multipoint connection from a HMI device with up to 4 PLCs with the respectively approved PLCs. CPU types (FX3 and Q) can be mixed.

    Note

    The HMI device is a client and the PLC must operate as a server.

Connectable PLCs

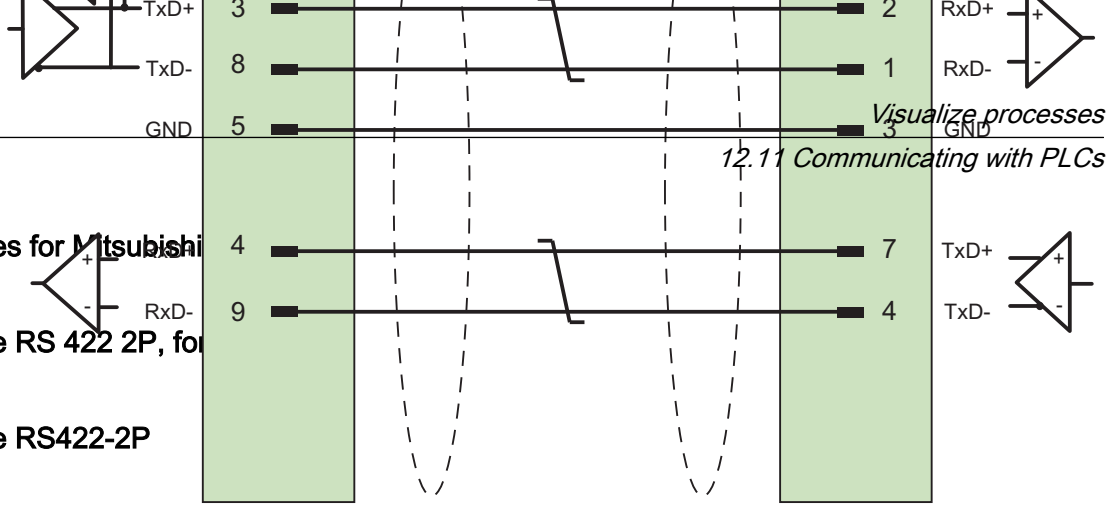
Connections can be implemented for the following Mitsubishi PLCs:

	Mitsubishi FX (PG protocol)	Mitsubishi MC TCP/IP
PLC		
MELSEC FX1n, FX2n	Yes	No
MELSEC FX3U, FX3UC, FX3G with communication module FX3U-ENET	No	Yes
MELSEC System Q • Q-series with the communication module QJ71E71-100 • QnUDEH CPU with Ethernet interface onboard	No	Yes

Connecting cables for Mitsubishi

Connecting cable RS 422 2P, for

Connecting cable RS422-2P



Shield with large-area contact to housing at both ends
Cable: 3 x 2 x 0.14 mm², shielded,
max. length 500 m

Performance features of communication

Permitted data types for Mitsubishi FX

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
4-bit block	M, X, Y	1 byte
8-bit block	M, X, Y	1 byte
12-bit block	M, X, Y	2 bytes
16-bit block	M, X, Y	2 bytes
20-bit block	M, X, Y	4 bytes
24-bit block	M, X, Y	4 bytes
28-bit block	M, X, Y	4 bytes
32-bit block	M, X, Y	4 bytes
Bool	D, M, X, Y	1-bit
DWord	D, C-32 bit	4 bytes
Real	D	4 bytes
String	D	1 to 50 characters
Word	D, T, C-16 bit	2 bytes

Note

Note the following for write accesses:

For data type "Bool" in operand type "D", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

Note

Array elements in I/O fields cannot be used in communication with a Mitsubishi PLC.

Supported CPU types for Mitsubishi FX

CPU types

The following CPU types are supported for configuring the Mitsubishi FX communication driver.

- FX1 series
  - FX1n
- FX2 series
  - FX2n

Configurable address areas for Mitsubishi FX

Permitted address areas

The following address areas can be configured for the "Mitsubishi FX" communication driver

X	Input	Octal 0- 377
Y	Output	Octal 0- 377
M	Bit memory	0...9999
D	Data register	0...999
C	Counter	0...199
T	Timer	0...25

Address areas for Mitsubishi FX

FX1n and FX2n

Address areas	Data types												
	Bool	Word	DWord	Real	String	4-bit block	8-bit block	12-bit block	16-bit block	20-bit block	24-bit block	28-bit block	32-bit block
M	M0 - M9999					M0 - M9996	M0 - M9992	M0 - M9988	M0 - M9984	M0 - M9980	M0 - M9976	M0 - M9972	M0 - M9968
D	D0.0 - D999.15	D0 - D999	D0 - D998	D0 - D998	D0 - D998								
T		T0 - T255											

Address areas	Data types												
	Bool	Word	DWord	Real	String	4-bit block	8-bit block	12-bit block	16-bit block	20-bit block	24-bit block	28-bit block	32-bit block
C-16-Bit		C-16-Bit 0 - C-16-Bit 199											
C-32-Bit			C-32-Bit 200 - C-32-Bit 255										
X	X0 - X255					X0 - X252	X0 - X248	X0 - X244	X0 - X240	X0 - X236	X0 - X232	X0 - X228	X0 - X224
Y	Y0 - X255					Y0 - Y252	Y0 - Y248	Y0 - Y244	Y0 - Y240	Y0 - Y236	Y0 - Y232	Y0 - Y228	Y0 - Y224

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Mitsubishi

Area pointers for connections via Mitsubishi communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

Special considerations for connections via Mitsubishi communication drivers

You can configure the following area pointers

Area pointers	Mitsubishi MC TCP/IP	Mitsubishi FX
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

Restrictions for Mitsubishi FX and MC TCP/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	Operand type
FX/FX3	Int, Word	D
Q	Int, Word	D

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

See also

Displaying tags with Runtime Advanced and Panels (Page 4270)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

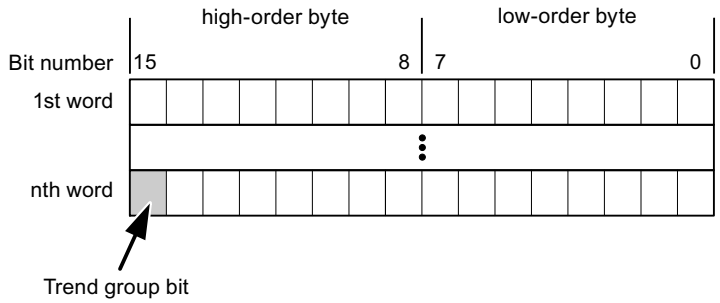
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Restrictions to the trend control

Data types for Mitsubishi MC TCPI/IP

For trend control you can create tags and array tags of the operand type "D" with the data type "Word" or "Int".

Data types for Mitsubishi FX

For trend control you can create tags and array tags of the operand type "D" with the data type "Word".

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 4293)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a Mitsubishi communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
FX1n, FX2n, FX3 series, Q-Series, iQ-Series	Word, Int [1)]	4-bit block, 8-bit block, 12-bit block, 16-bit block, 20-bit block, 24-bit block, 28-bit block, 32-bit block, Word, DWord, Int [1)], DInt [1)], Real,
[1)] Not for Mitsubishi FX communication driver		

How the bit positions are counted

For connections with a Mitsubishi communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In Mitsubishi PLCs	15							8	7							0
In WinCC you configure:	15							8	7							0

Restrictions on alarms

- Mitsubishi MC TCP/IP
  Only tags of operand type "D" and data types "Word" and "Int" are permitted as trigger tags for discrete alarms. You can use array tags (operand type: "D"; data types: "ARRAY [x..y] of Word" or "ARRAY [x..y] of Int") for discrete alarms.
- Mitsubishi FX
  Only tags of operand type "D" and data type "Word" are permitted as trigger tags for discrete alarms. You can use array tags (operand type "D"; data type "ARRAY [x..y] of Word") for discrete alarms."

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

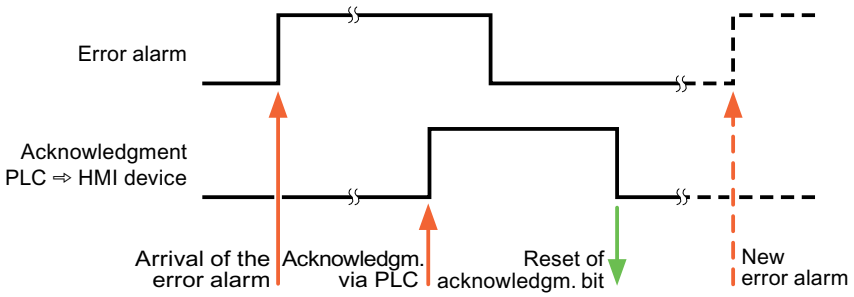
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

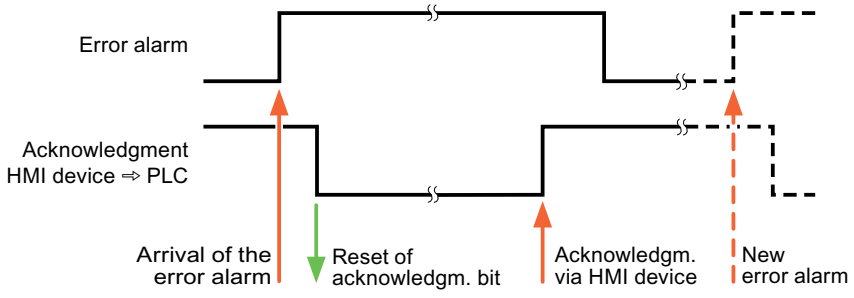
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Modicon Modbus

Modicon Modbus communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Modicon Modbus communication drivers.

The following communication drivers are supported:

- Modicon Modbus TCP/IP
- Modicon Modbus RTU

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Modicon Modbus TCP/IP

Configuring a connection via Modicon Modbus TCP/IP

Introduction

You configure a connection to one of the PLCs with Modicon Modbus TCP/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

Example: PROFINET interface corresponds to the Ethernet interface

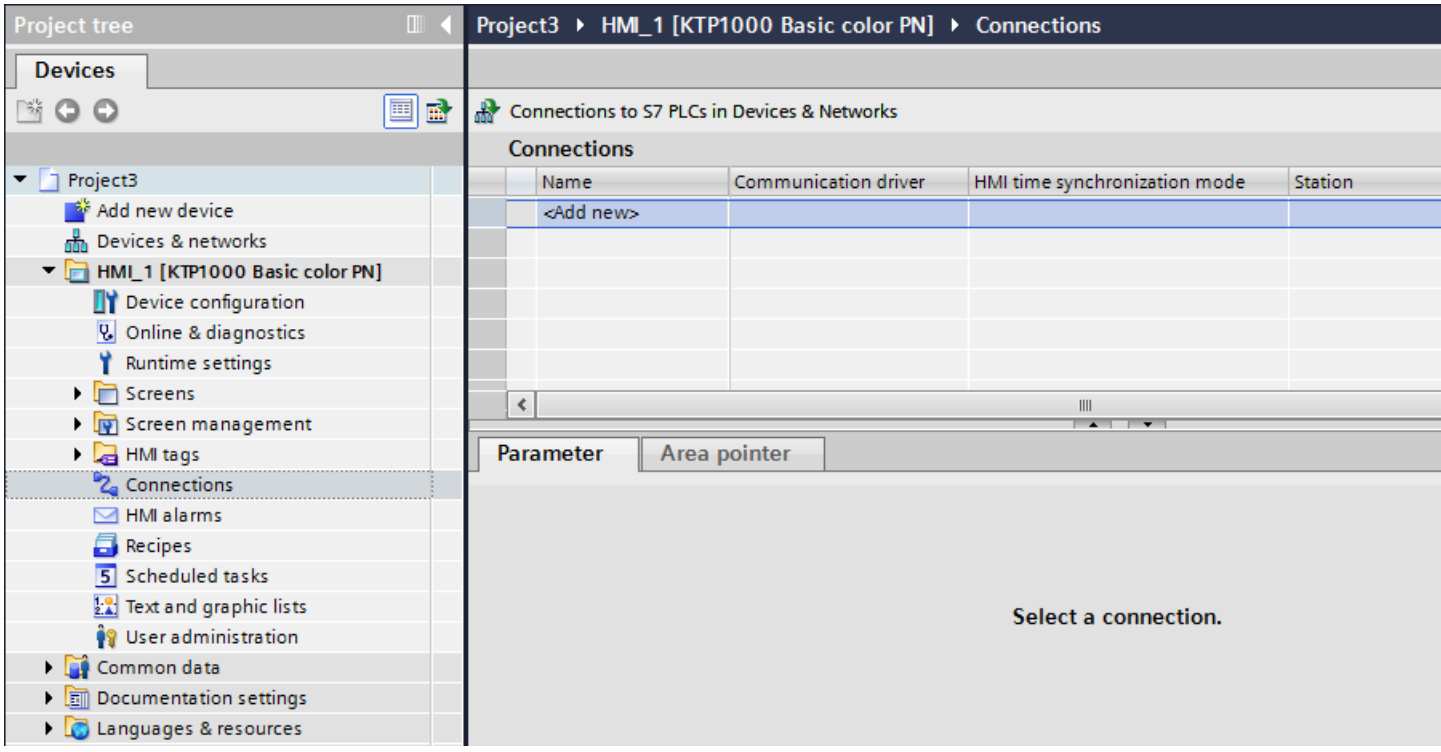
Requirements

- A project is open.
- An HMI device has been created.

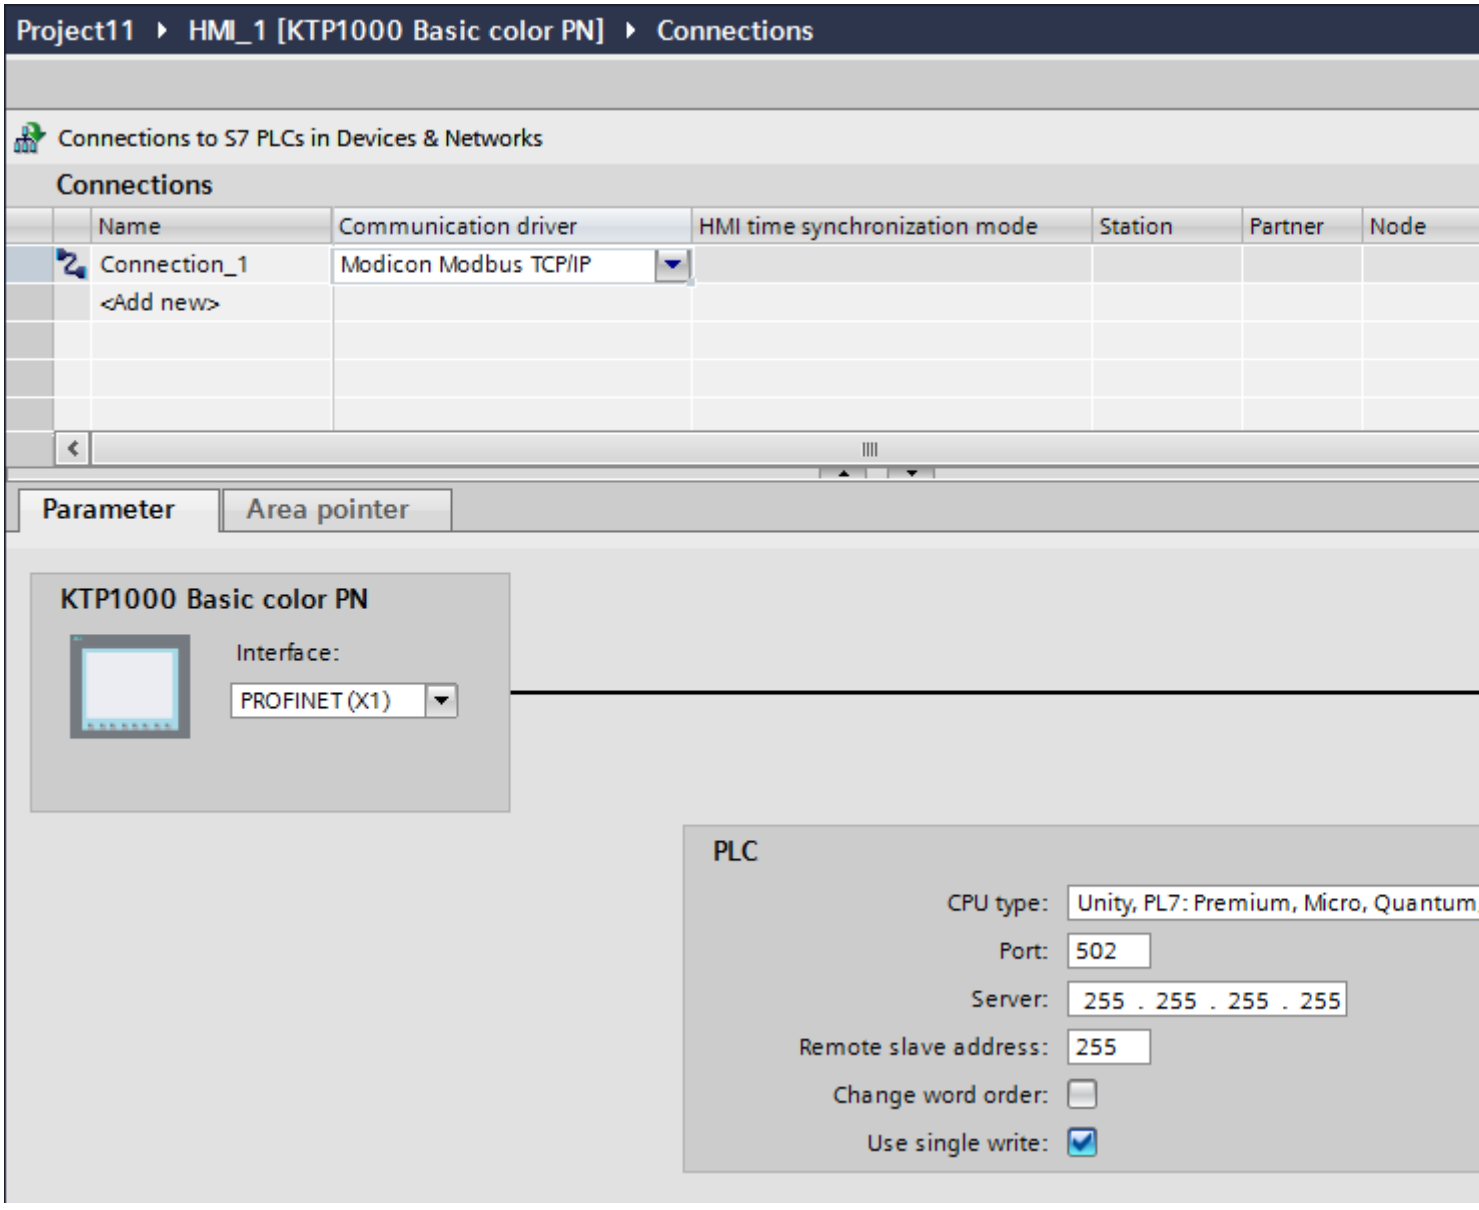
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. Select the "Modicon Modbus TCP" driver in the "Communication driver" column.



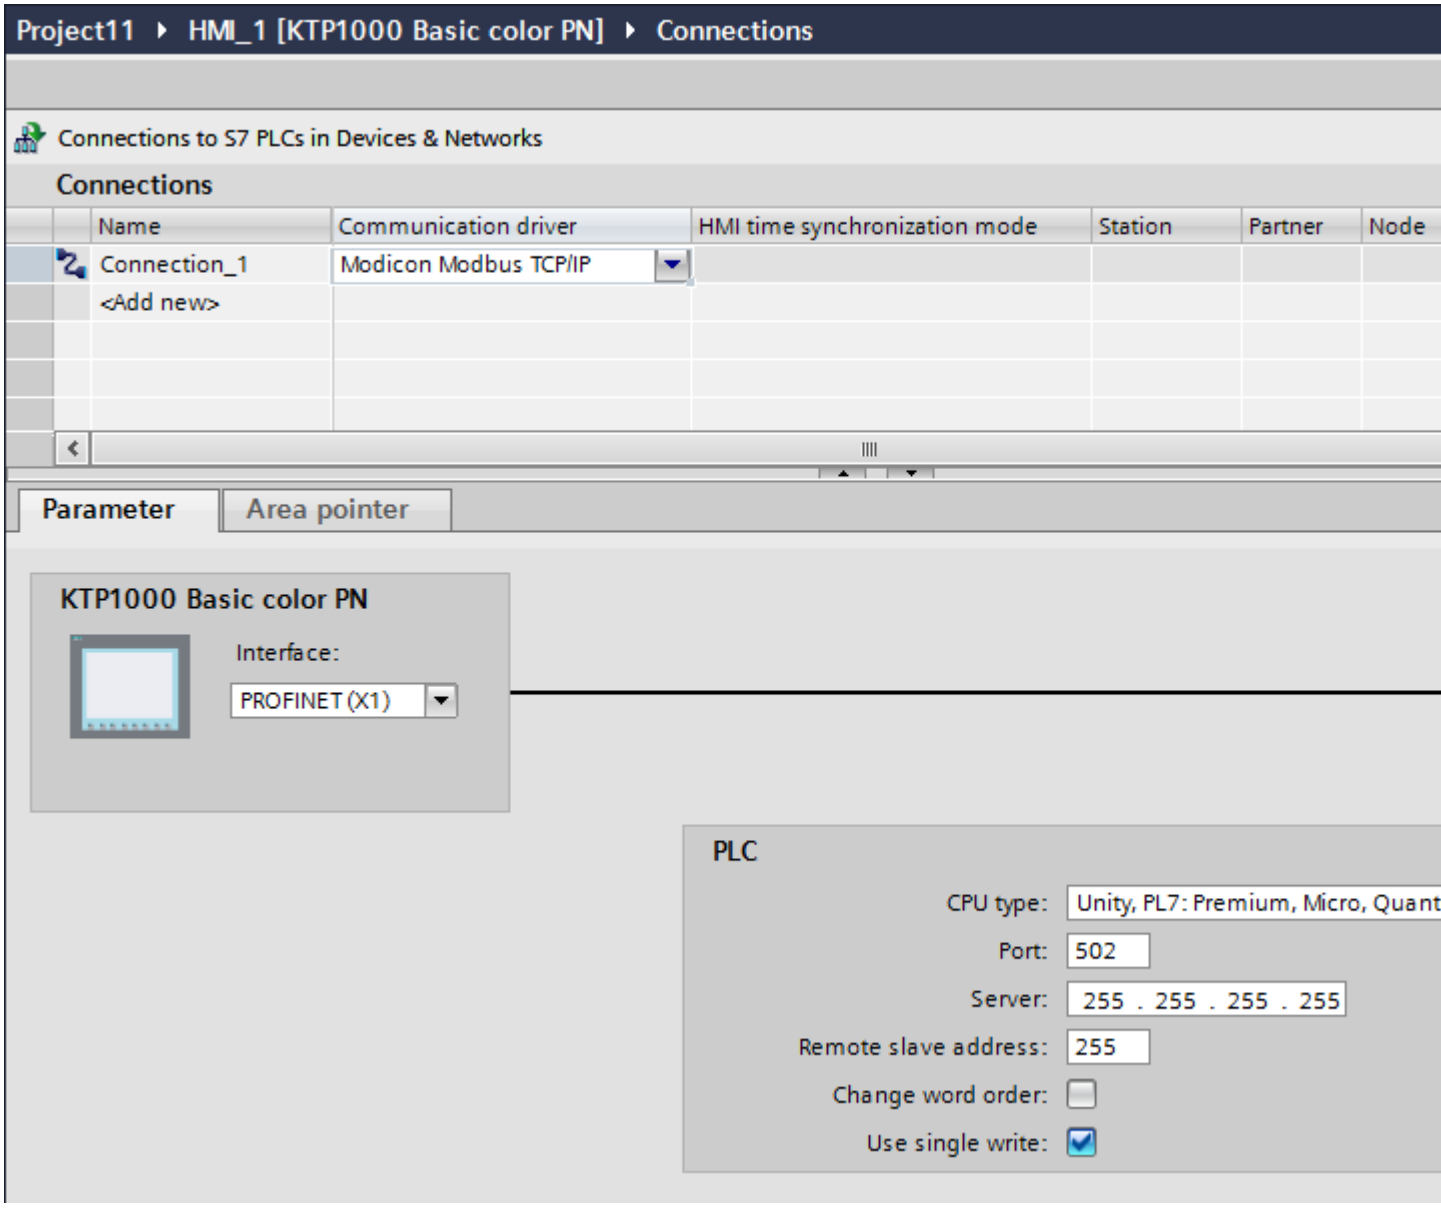
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Modicon Modbus TCP/IP)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device during project transfer.

Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

To set up the IP address of the HMI device:

1. Click the HMI device.
2. Open the "Device configuration" editor.
3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:
   "General > PROFINET interface > Ethernet addresses"

Parameters for the PLC

- "CPU type"
  For "CPU type", you set the Modicon PLC to which the HMI device is connected.
- "Port"
  For "Port", you set the port that is used for the TCP/IP connection. The port used by the Modicon PLCs is 502.
- "Server"
  You set the IP address or host name of the PLC under "Server". Only the IP address can be used on a Basic Panel.
- "Distributed slave address"
  For "Distributed slave address", set the slave address of the remote PLC, but only if a bridge is used.
  If a bridge is not used, the default value "255" (or "0") must be retained.

- "Change word order"
  The "Change word order " parameter only affects the word order of the 32-bit values display. The setting pertains to the data types Double, Double+/-, and Float. The byte order cannot be changed.
  - "Change word order" not activated
    The most significant byte is sent first.
    For double words, the least significant word is sent before the most significant word.
    This setting has been system-tested for all approved PLCs.
  - "Change word order" activated
    The most significant byte is sent first.
    For double words, the most significant word is sent before the least significant word.

    Note

    This setting must be used for the SIEMENS SENTRON PAC3200 and PAC4200 multi-function meters and can be used for PLCs of other manufacturers.

- "Use single write"
  If you deselect this function, only function codes 15H and 16H are used for writing into the PLC.
  If this function remains selected, the function codes 05H, 06H, 15H, and 16H are used.

Connecting HMI device to PLC

Connections via Modicon Modbus TCP/IP

Connection

The HMI device can be connected to the Modicon Modbus PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to a Modicon Modbus PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Note

Timeout response with TCP/IP (Ethernet)

Due to the use of the TCP/IP protocol, the breakdown of a connection is detected at the earliest after approximately one minute. Communication failure cannot be reliably detected if no tags are requested, for example, no output tags in the current screen.

Configure area pointer coordination for each PLC. This setting ensures that a communication failure is recognized after approximately two minutes, even in the aforementioned scenario.

Communication types

Approved communication types

The following communication types are system-tested and approved:

- Point-to-point coupling:
- Multiple point coupling of a HMI device (Modbus TCP/IP Client) with up to 4 PLCs, each with different couplings. CPU types can be mixed.
  The following couplings are possible:
  - Coupling the Ethernet CPU interface of the TSX Unity Quantum.
  - Coupling via the communication modules for Ethernet 140 NOE 771 01 for the TSX Quantum and TSX Unity Quantum series
  - Coupling via the Ethernet interface of the 171 CCC 980 30 CPU adapter of the Momentum series
  - Coupling the Ethernet CPU interface of the TSX Unity Premium.
  - Coupling via the Ethernet TCP/IP connect module TSX ETY 110 for the TSX Premium and TSX Unity Premium series
  - Coupling via the Ethernet TCP/IP connect module TSX ETY 410 for the Micro series
  - Coupling via the Ethernet TCP/IP Modbus Plus Bridge 174 CEV 200 40 to the Modbus Plus interface of the Compact, the TSX Quantum and the TSX Unity Quantum series

Via the TCP/IP Modbus Plus Bridge, 174 CEV 200 40, the PLCs can be accessed at their Remote Slave Address via the Ethernet interface of this bridge.

Note

Integration of the HMI device in a Modbus network via a bridge is not possible. The HMI device is the Modbus master.

Restrictions

The coupling of the HMI device to PLCs of other manufacturers who offer a Modbus TCP/IP interface is not system-tested and thus, not enabled.

However, if another PLC is to be used, observe the following instructions:

- Use the following CPU types, because these operate without address offset and in the usual bit count manner.
  - Unity, PL7: Premium, Micro, Quantum, M340
- The following function codes are used for the respective data areas:

Reading function codes		Address range	
01	ReadCoilStatus	0x / %M	DIGITAL_OUT
02	ReadInputStatus	1x / %I	DIGITAL_IN
03	ReadHoldingRegisters	4x / %MW	USERDATA

Reading function codes		Address range	
04	ReadInputRegisters	3x / %IW	ANALOG_IN
20 (14Hex)	ReadGeneralReference	6x / –	EXTENDEDMEMORY (not for all CPUs)

Writing function codes		Address range	
06 [1]	PresetSingleRegister	4x / %MW	USERDATA Single
16 (10Hex)	PresetMultipleRegisters	4x / %MW	USERDATA Multiple
05 [1]	ForceSingleCoil	0x / %M	DIGITAL_OUT with BIT
15 (0FHex)	ForceMultipleCoils	0x / %M	DIGITAL_OUT with 16 BIT GROUP
21 (15Hex)	WriteGeneralReference	6x / –	EXTENDEDMEMORY (not for all CPUs)

[1] Select use with "Use single write".

Connectable PLCs

Connections can be implemented for the following Modicon Modbus PLCs:

Modicon Modbus PLC	Supported protocol	
Modicon Modbus RTU [2]	Modicon Modbus TCP/IP	
TSX Compact	x	x [1]
TSX Quantum	x	x
Momentum	x	x
Premium	-	x
Micro	-	x
M340 20x0 (without 2010)	-	x

[1] Only via Ethernet TCP/IP Modbus Plus Bridge

[2] Communication via RS 232 is tested and enabled for the PLC. In the HMIs that only have a RS 422/485 interface, the RS 422/232 converter with the order number 6AV6 671-8XE00-0AX0 was tested and enabled.

Performance features of communication

Permissible data types for Modicon Modbus TCP/IP

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Note

If you change the Modicon Modbus RTU communication driver to Modicon Modbus TCP/IP, the string in the "String" data type may be different.

Permitted data types for CPU type "Unity, PLC: Premium, Micro, Quantum M340"

Data type	Operand type	Length
+/- Double	%MW	4 bytes
+/- Int	%MW, %IW	2 bytes
16-bit group	%MW, %I	2 bytes
ASCII	%MW	0 to 80 characters
Bit	%MW, %IW, %M, %I	1-bit
Double	%MW	4 bytes
Float	%MW	4 bytes
Int	%MW, %IW	2 bytes

Note

The ranges "%I" and "%IW" are not supported for the following CPU types:

- Premium
- Micro
- M340

Permitted data types for CPU type "Concept, ProWORX: Compact, Quantum, Momentum"

Data type	Operand type	Length
+/- Double	4x, 6x	4 bytes
+/- Int	3x, 4x, 6x	2 bytes
16-bit group	0x, 1x	2 bytes
ASCII	4x, 6x	0 to 80 characters
Bit	0x, 1x, 3x, 4x, 6x	1-bit
Double	4x, 6x	4 bytes

Data type	Operand type	Length
Float	4x, 6x	4 bytes
Int	3x, 4x, 6x	2 bytes

Bit counting method

The usual bit counting method "16 LSB - 1 MSB" in the following CPU types is only used in the "HMI tags" editor with the selected "Bit" data type:

- Concept, ProWORX: Compact, Quantum, Momentum

The following bit location assignment applies:

	Left byte								Right byte							
Counting with tags	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

Format for "Signed"

The placeholder "+/-" stands for the data types "Signed Int" and "Signed Double".

Supported CPU types for Modicon Modbus TCP/IP

CPU types

The following CPU types are supported for configuring the Modicon Modbus TCP/IP communication driver.

- Compact
- Momentum
- Quantum
  - Concept Quantum
  - Unity Quantum
- Micro
- Premium
- Modicon M340
  - 20x0 (except 2010)

Address areas for Modicon Modbus TCP/IP

Unity, PI7

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	DInt	+/- DInt	Float	ASCII
%1	%I0 - %I65535	%I65535 %I0 - %I65520	--	--	--	--	--	--
%M	%M0 - %M65535	%M65535 %M0 - %M65520	--	--	--	--	--	--
%IW	%IW0.0 - %IW65535.15	--	%IW0 - %IW65535	%IW0 - %IW65535	--	--	--	--
%MW	%MW0.0 - %MW65535.15	--	%MW0 - %MW65535	%MW0 - %MW65535	%MW0 - %MW65534	%MW0 - %MW65534	%MW0 - %MW65534	%MW0 - %MW65535

Concept, ProWORX

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	DInt	+/- DInt	Float	ASCII
0x	0x1 - 0x65535	0x1 - 0x65520	--	--	--	--	--	--
1x	1x100001 - 1x165535	1x100001 - 1x165520	--	--	--	--	--	--
3x	3x300001.1 - 3x365535.16	--	3x300001 - 3x365535	3x300001 - 3x365535	--	--	--	--
4x	4x400001.1 - 4x465535.16	--	4x400001 - 4x465535	4x400001 - 4x465535	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465535
6x	6x60000.1:1 - 6x69999.16:10	--	6x60000:1 - 6x69999:10	6x60000:1 - 6x69999:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69999:10

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Modicon Modbus RTU

Configuring a connection via Modicon Modbus RTU

Introduction

You configure a connection to a PLC with a Modicon Modbus RTU communication driver in the "Connections" editor of the HMI device.

The interfaces are named differently depending on the HMI device.

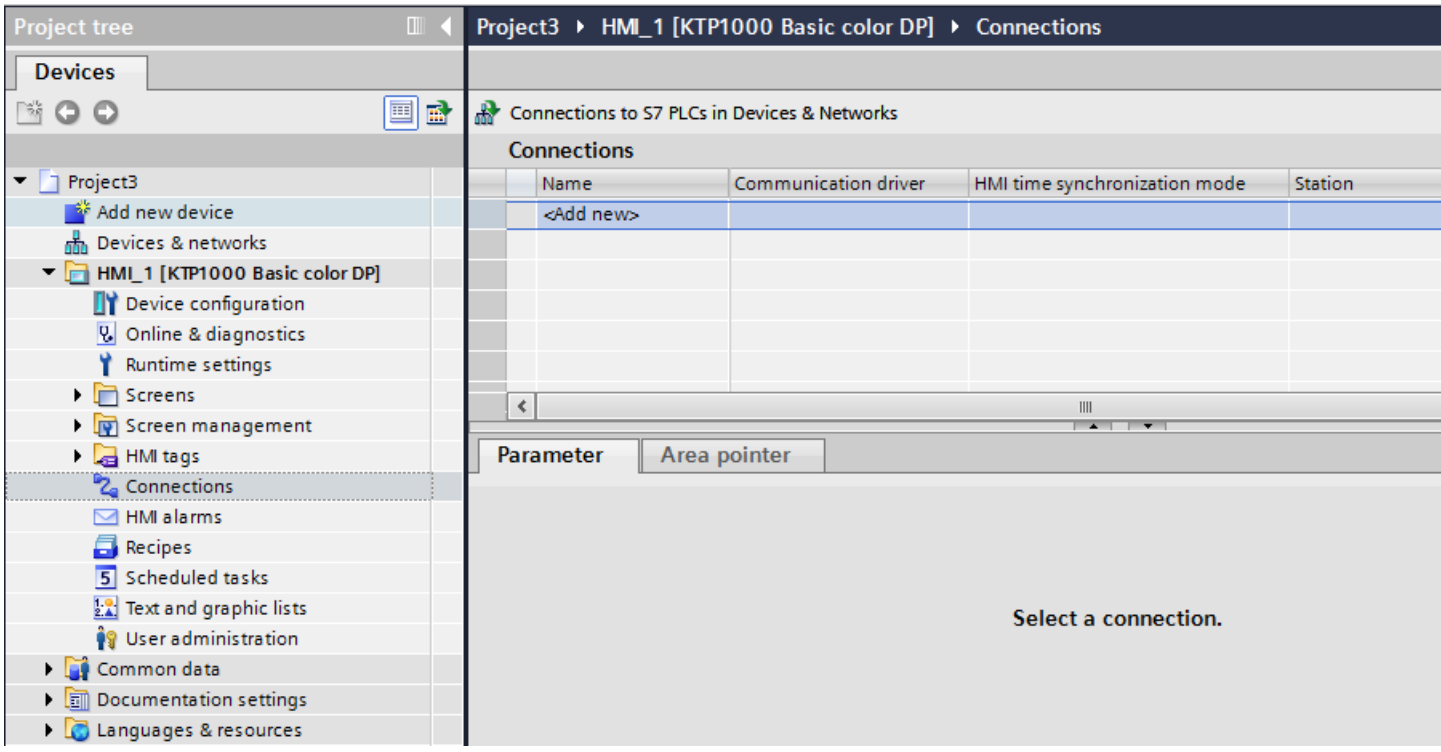
Requirements

- A project is open.
- An HMI device has been created.

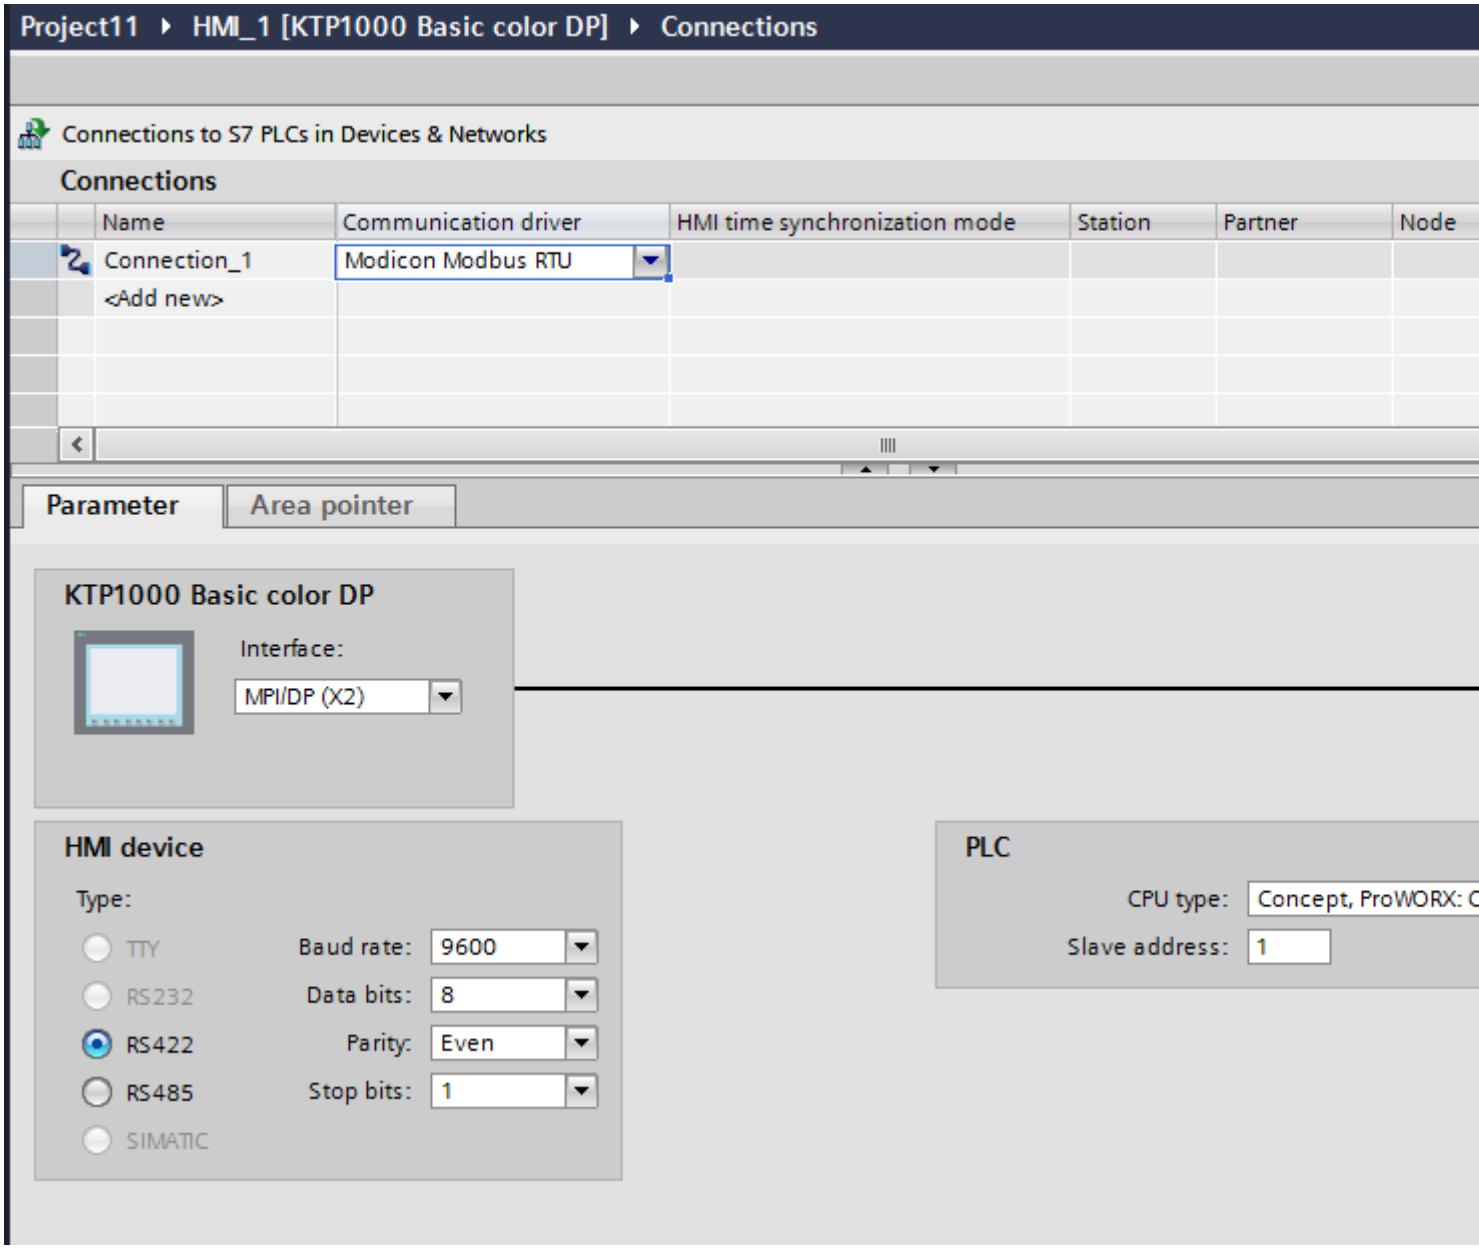
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Modicon Modbus RTU" driver.



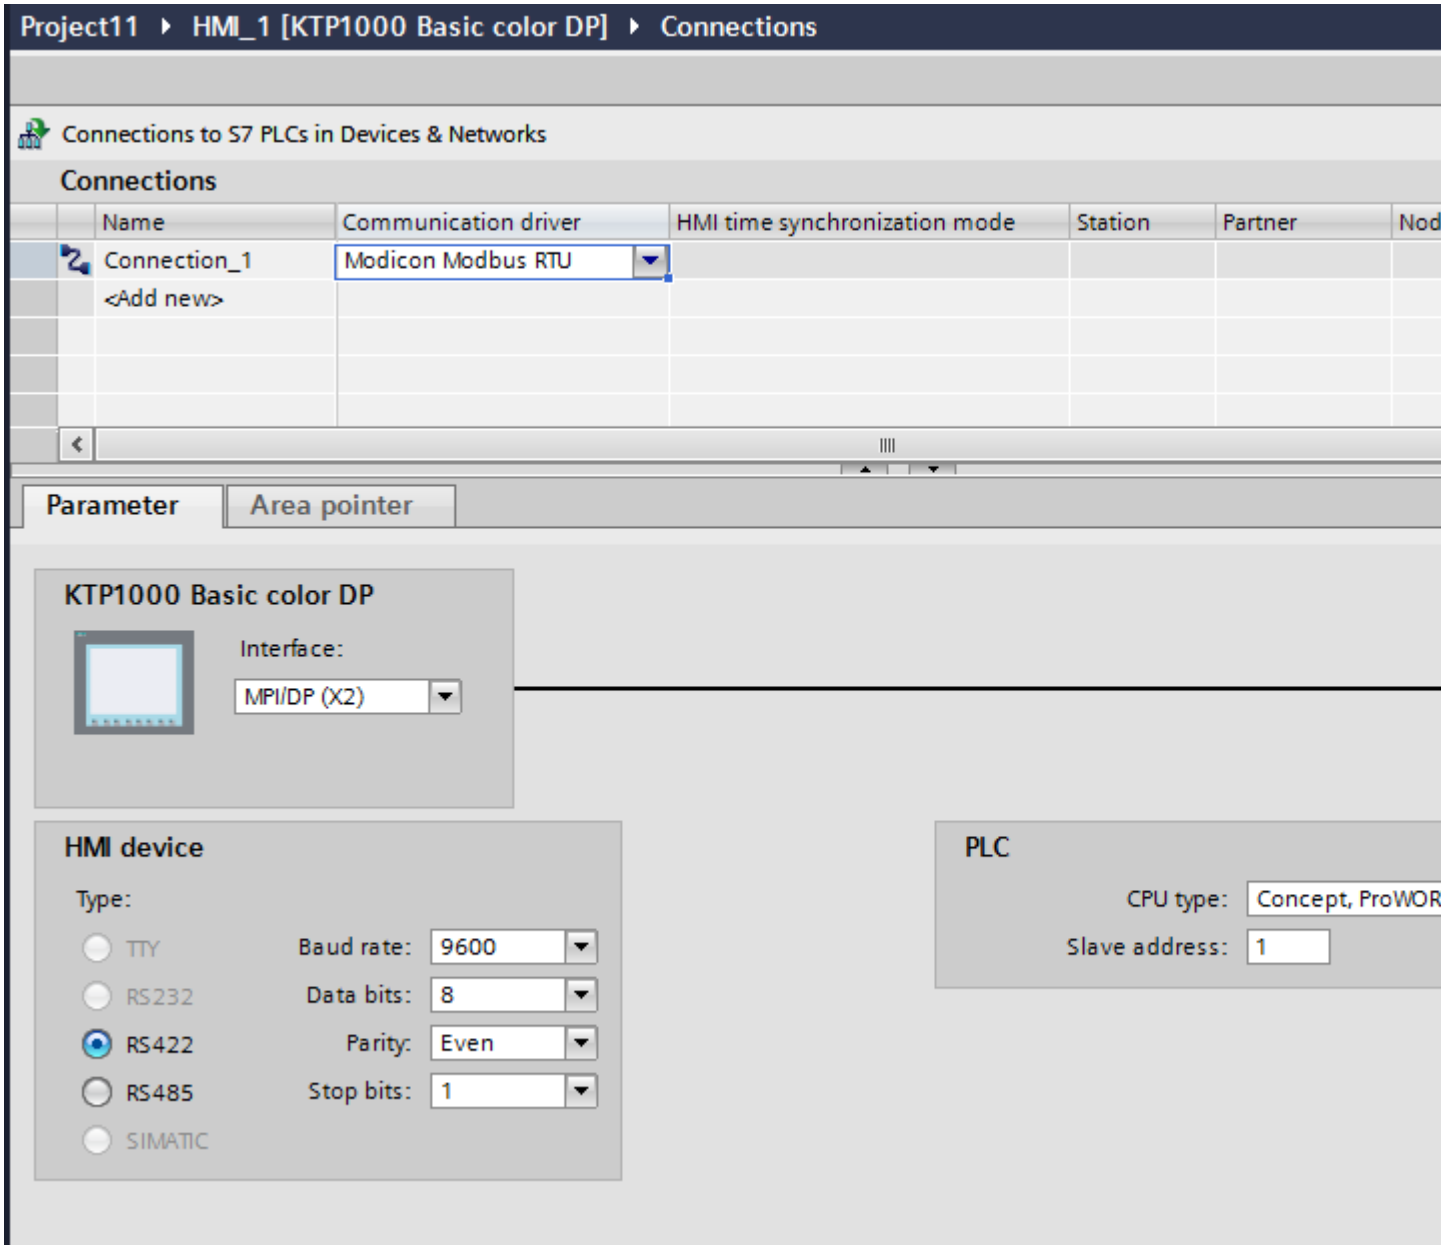
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Modicon Modbus RTU)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- Type
  Only RS 232 is system-tested.
  No warranty is given for RS 485.

  Note

  RS 422 is only approved in combination with the RS 422-RS 232 converter.

  Order number: 6AV6 671-8XE00-0AX0

  Note

  If you use the IF1B interface, you must switch over the RS422 receive data additionally by 4 DIL-switches on the back of the HMI device.

- Baud rate
  For "Baud rate", select the transmission speed between the HMI device and Modicon PLC.
  A baud rate of 19200 or 9600 can be selected for the communication.
  A baud rate of 4800 can be selected for certain HMI devices.
- Data bits
  For "Data bits", only the value "8" can be selected.
- Parity
  For "Parity", you can choose from "None", "Even", and "Odd".
- Stop bits
  For "Stop bits", you can choose between 1 and 2 bits.

Parameters for the PLC

- CPU type
  For "CPU type", you set the Modicon PLC to which the HMI device is connected.
  You can select the following CPUs:
  – Concept, ProWORX: Compact, Quantum
- Slave address
  Under "Slave address" you set which slave address the CPU has.

Connecting HMI device to PLC

Connections via Modicon Modbus RTU

Connection

Connect the HMI device to the Modicon Modbus RTU interface of the Modicon Modbus RTU slave.

The connection of the HMI device to Modicon is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Connection cable

The following connecting cables are available to connect the HMI device to Modicon Modbus.

Interface to the HMI device	Modicon PLC		
	directly via Modbus interface (RS232) 9-pin Sub D male connector	Via MB Bridge (RS 232)	directly via Modbus interface (RS232) 8-pin RJ45 connector
RS 232, 9-pin	PP1	PP1	PP2

The cable pin assignments can be found in Section "Connecting cables for Modicon Modbus RTU".

Communication types

Approved communication types

The following communication types are system-tested and approved:

- Ppoint-to-point connection only via the RS-232 interface.
- Multipoint connection from a HMI device (Modbus-Master) with up to 4 PLCs: The HMI device must be connected with a Modbus Plus Bridge or a Compact, Momentum CPU or TSX Quantum CPU which is configured as a Modbus Plus Bridge.
- You connect the other PLCs via the Modbus Plus connection on the first PLC. The PLCs can be reached under their address via the bridge functionality of the first PLC.

  Note

  It is not possible to integrate the HMI device into a Modbus network because the HMI device is Modbus-Master.

- Integration of the HMI device into a Modbus Plus network via the "bridge mode" of the Compact, Momentum or Quantum (logical point-to-point communication of the HMI device with a Compact, Momentum or Quantum).

Restrictions

The connection of the HMI device to PLCs of other manufacturers which offer a Modicon Modbus interface is not system-tested and therefore not approved.

If you use another PLC nevertheless, observe the following information:

- These drivers only work for tags with the bit counting method typical for Modicon PLCs from left (bit1 = most significant bit) to right (bit16 = least significant bit in data type INT).
- The address offset displayed in the configuring is subtracted at protocol level in the message frame. E.g. in Holding Register 4x the offset "40001". The configured address "40006" therefore becomes address "5" in the message frame. The address (e.g. "5") transferred in the message frame is transformed to the PLC-specific address range in the different Non-Modicon PLCs.
- A reply message frame without "ExceptionCode" is expected within 500 ms.
- The following function codes are used for the respective data areas:

Reading function codes		Address range	
01	ReadCoilStatus	0x	DIGITAL_OUT
02	ReadInputStatus	1x	DIGITAL_IN
03	ReadHoldingRegisters	4x	USERDATA
04	ReadInputRegisters	3x	ANALOG_IN
20 (14Hex)	ReadGeneralReference	6x	EXTENDEDMEMORY (not for all CPUs)

Writing function codes		Address range	
06	PresetSingleRegister	4x	USERDATA Single
16 (10Hex)	PresetMultipleRegisters	4x	USERDATA Multiple
05	ForceSingleCoil	0x	DIGITAL_OUT with data type Bit
15 (0FHex)	ForceMultipleCoils	0x	DIGITAL_OUT with data type 16 bit group
21 (15Hex)	WriteGeneralReference	6x	EXTENDEDMEMORY (not for all CPUs)

Connectable PLCs

Connections can be implemented for the following Modicon Modbus PLCs:

Modicon Modbus PLC	Supported protocol	
Modicon Modbus RTU [2]	Modicon Modbus TCP/IP	
TSX Compact	x	x [1]
TSX Quantum	x	x
Momentum	x	x
Premium	-	x
Micro	-	x
M340 20x0 (without 2010)	-	x

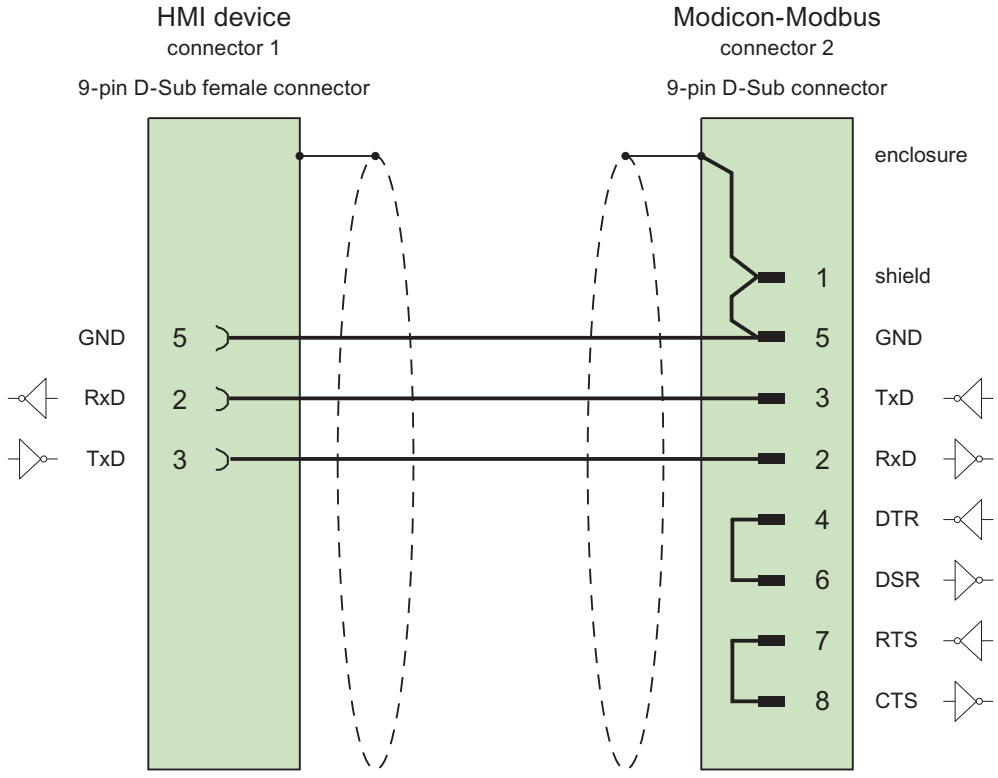
1) Only via Ethernet TCP/IP-Modbus Plus Bridge

2) Communication via RS 232 is tested and enabled for the PLC. In the HMI devices which only have an RS 422/485 interface, the RS 422/232 converter with the order number 6AV6 671-8XE00-0AX0 was tested and approved.

Connecting cables for Modicon Modbus RTU

Connecting cable PP1, RS-232, for Modicon

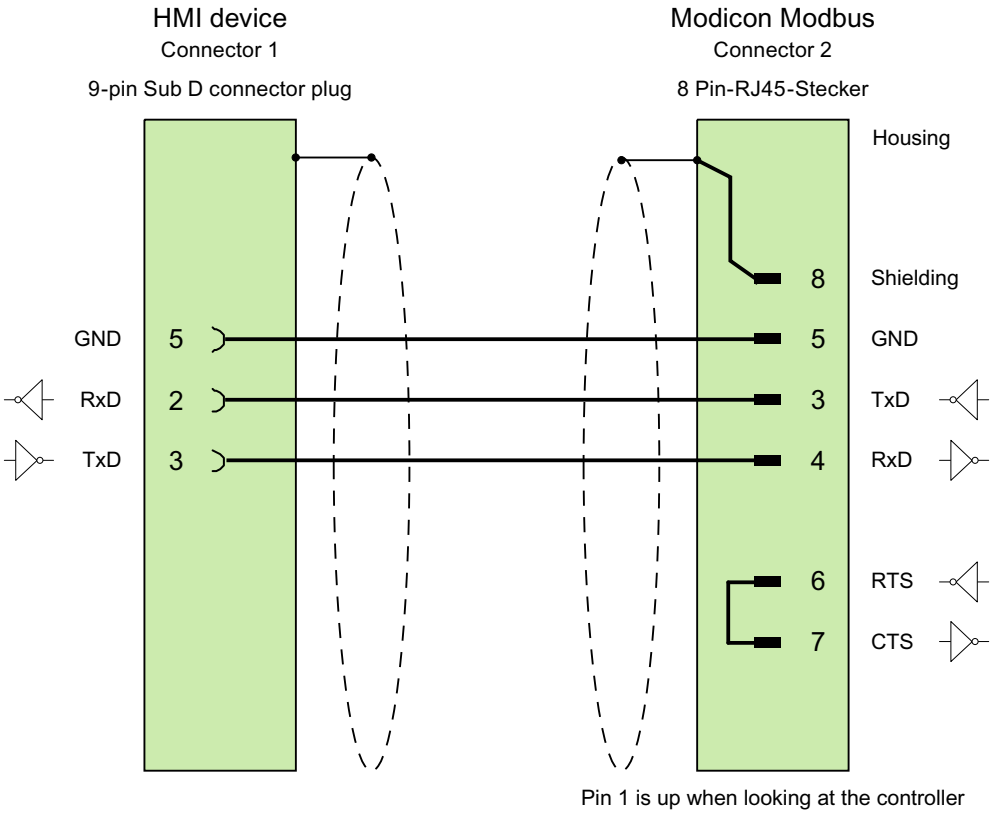
Point-to-point cable 1: PLC > PC ...



Cables: 3 x 0.14 mm^2, shielded,
max. length 15 m

Connecting cable PP2, RS-232, for Modicon

Point-to-point cable 2: PLC (TSX Compact) > PC...



Cables: 3 x 0.14 mm^2, shielded,
max. length 15 m

Performance features of communication

Permitted data types for Modicon Modbus RTU

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
+/- Double	4x, 6x	4 bytes
+/- Int	3x, 4x, 6x	2 bytes
16-bit group	0x, 1x	2 bytes
ASCII	4x, 6x	0 to 80 characters
Bit [1)]	0x, 1x, 3x, 4x, 6x	1-bit
Double	4x, 6x	4 bytes
Float	4x, 6x	4 bytes
Int	3x, 4x, 6x	2 bytes

1) Note the following for write accesses:

For data type "Bit" with the operand types "4x" and "6x", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

The usual bit counting method (16 LSB - 1 MSB) in the following CPU types is only used in the "HMI tags" editor with the selected "Bit" data type:

- Concept ProWORX: Compact, Quantum

The following bit location assignment applies:

	Left byte								Right byte							
Counting with tags	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

Format for "Signed"

The placeholder "+/-" stands for the data types "Signed Int" and "Signed Double".

Supported CPU types for Modicon Modbus RTU

CPU types

The following CPU types are supported in the configuration of the Modicon Modbus RTU communication driver.

- Compact
- Momentum
- Quantum

Address areas for Modicon Modbus RTU

Concept, ProWORX

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	DInt	+/- DInt	Float	ASCII
0x	0x1 - 0x65535	0x1 - 0x65520	--	--	--	--	--	--
1x	1x100001 - 1x165535	1x100001 - 1x165520	--	--	--	--	--	--
3x	3x300001.1 - 3x365535.16	--	3x300001 - 3x365535	3x300001 - 3x365535	--	--	--	--
4x	4x400001.1 - 4x465535.16	--	4x400001 - 4x465535	4x400001 - 4x465535	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465535
6x	6x60000.1:1 - 6x69999.16:10	--	6x60000:1 - 6x69999:10	6x60000:1 - 6x69999:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69999:10

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Modicon Modbus

Area pointers for connections via Modicon Modbus communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

Special considerations for connections via Modicon communication drivers

You can configure the following area pointers

Area pointers	Modicon Modbus TCP/IP	Modicon Modbus RTU
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

Restrictions Modicon Modbus TCP/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
Concept, ProWORX: Compact, Quantum, Momentum	+/- Int, Int	4x, 6x
Unity, PL7: Premium, Micro, Quantum, M340	+/- Int, Int	%MW

Modicon Modbus RTU restrictions

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
Concept, ProWORX: Compact, Quantum, Momentum	+/- Int, Int	4x, 6x

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 4270)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

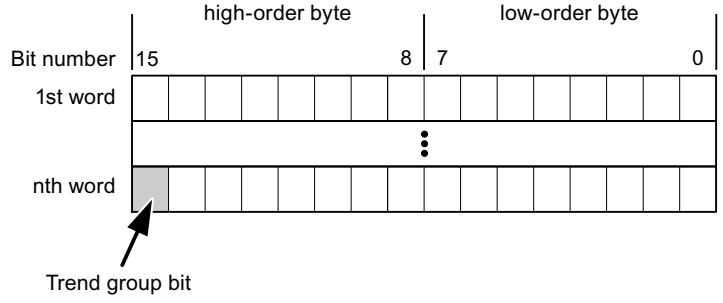
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trend control

Modicon Modbus TCP/IP

Tags of the following operand types are permitted for CPU type "Concept, ProWORX: Compact, Quantum, Momentum".

- "4x"
- "6x"

Tags of the following operand types are permitted for CPU type "Unity, PL7: Premium, Micro, Quantum, M340".

- "%MW"

The tags for trend control must have data type "Int" or "+/- Int" or be an array tag with data type "Int" or "+/-Int".

You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

Modicon Modbus RTU

Tags of the following operand types are permitted for CPU type "Concept, ProWORX: Compact, Quantum".

- "4x"
- "6x"

The tags for trend control must have data type "Int" or "+/- Int" or be an array tag with data type "Int" or "+/-Int".

You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 4293)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a Modicon Modbus communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
All Modicon series	Int, +/-Int	16 Bit Group, Int, +/-Int, Double, +/-Double, Float

Arrays and array tags cannot be used for discrete alarms.

How the bit positions are counted

For connections with a Modicon Modbus communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In WinCC you configure:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

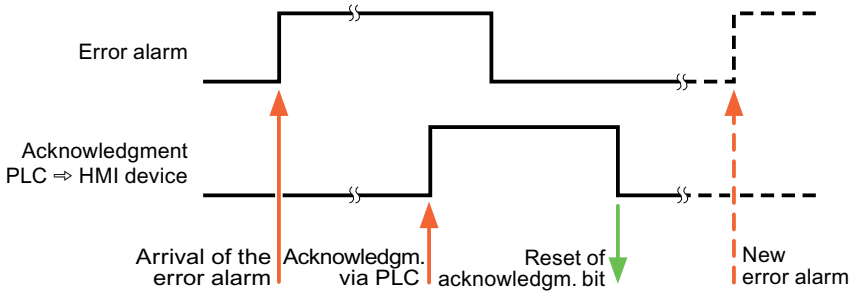
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

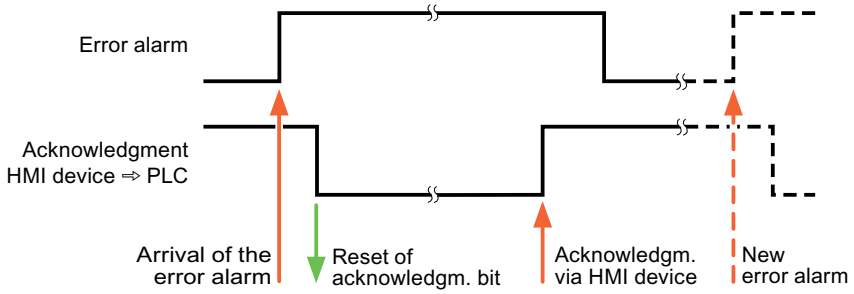
tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Omron

Omron communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Omron communication drivers.

The following communication drivers are supported:

- Omron Host Link

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Omron Host Link

Configuring a connection via Omron Host Link

Introduction

You configure a connection to a PLC with an Omron Host Link communication driver in the "Connections" editor of the HMI device.

Note

Connection with Omron Host Link

A connection will not automatically be established when runtime is started if you have configured a connection via Omron.

A tag which is in the valid PLC memory area must be configured in the runtime start screen.

The connection will otherwise only be established once a corresponding screen has been selected.

This tag will be accessed when runtime is started and a connection will then be established.

The interfaces are named differently depending on the HMI device.

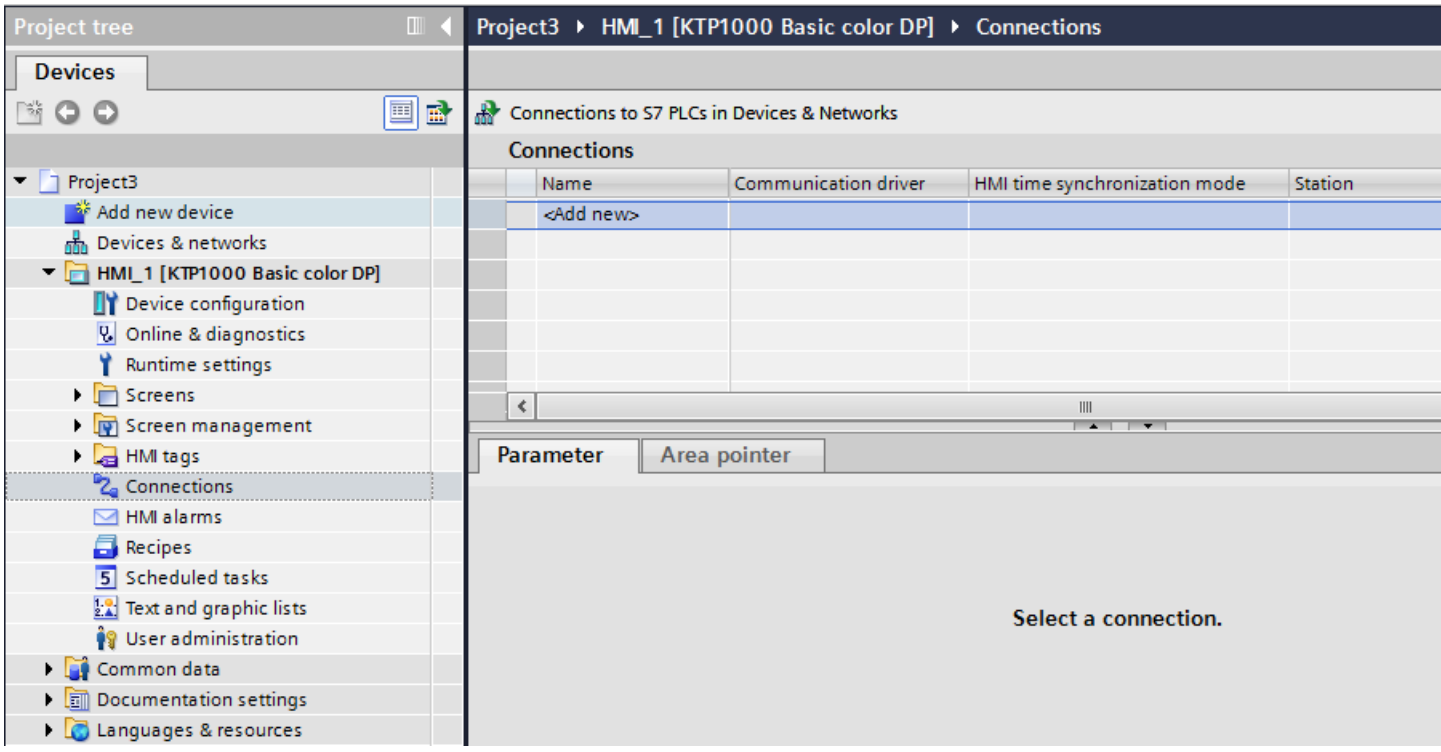
Requirements

- A project is open.
- An HMI device has been created.

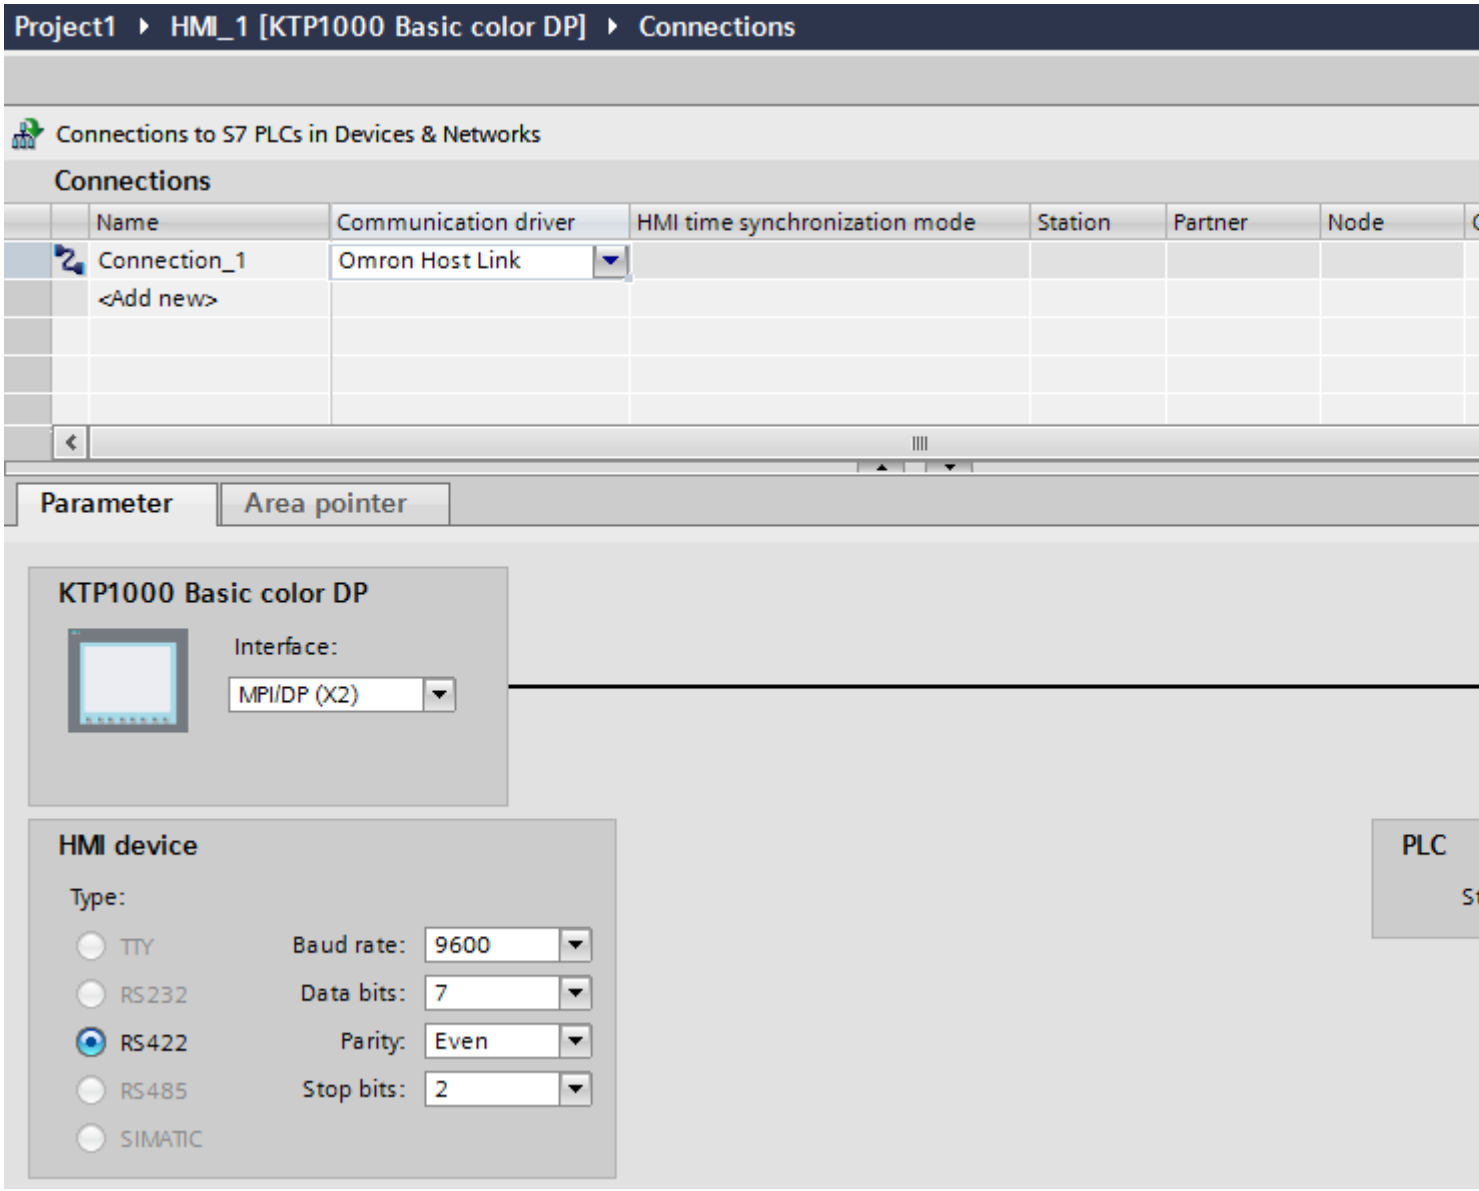
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. Select the "Omron Host Link" driver in the "Communication driver" column.



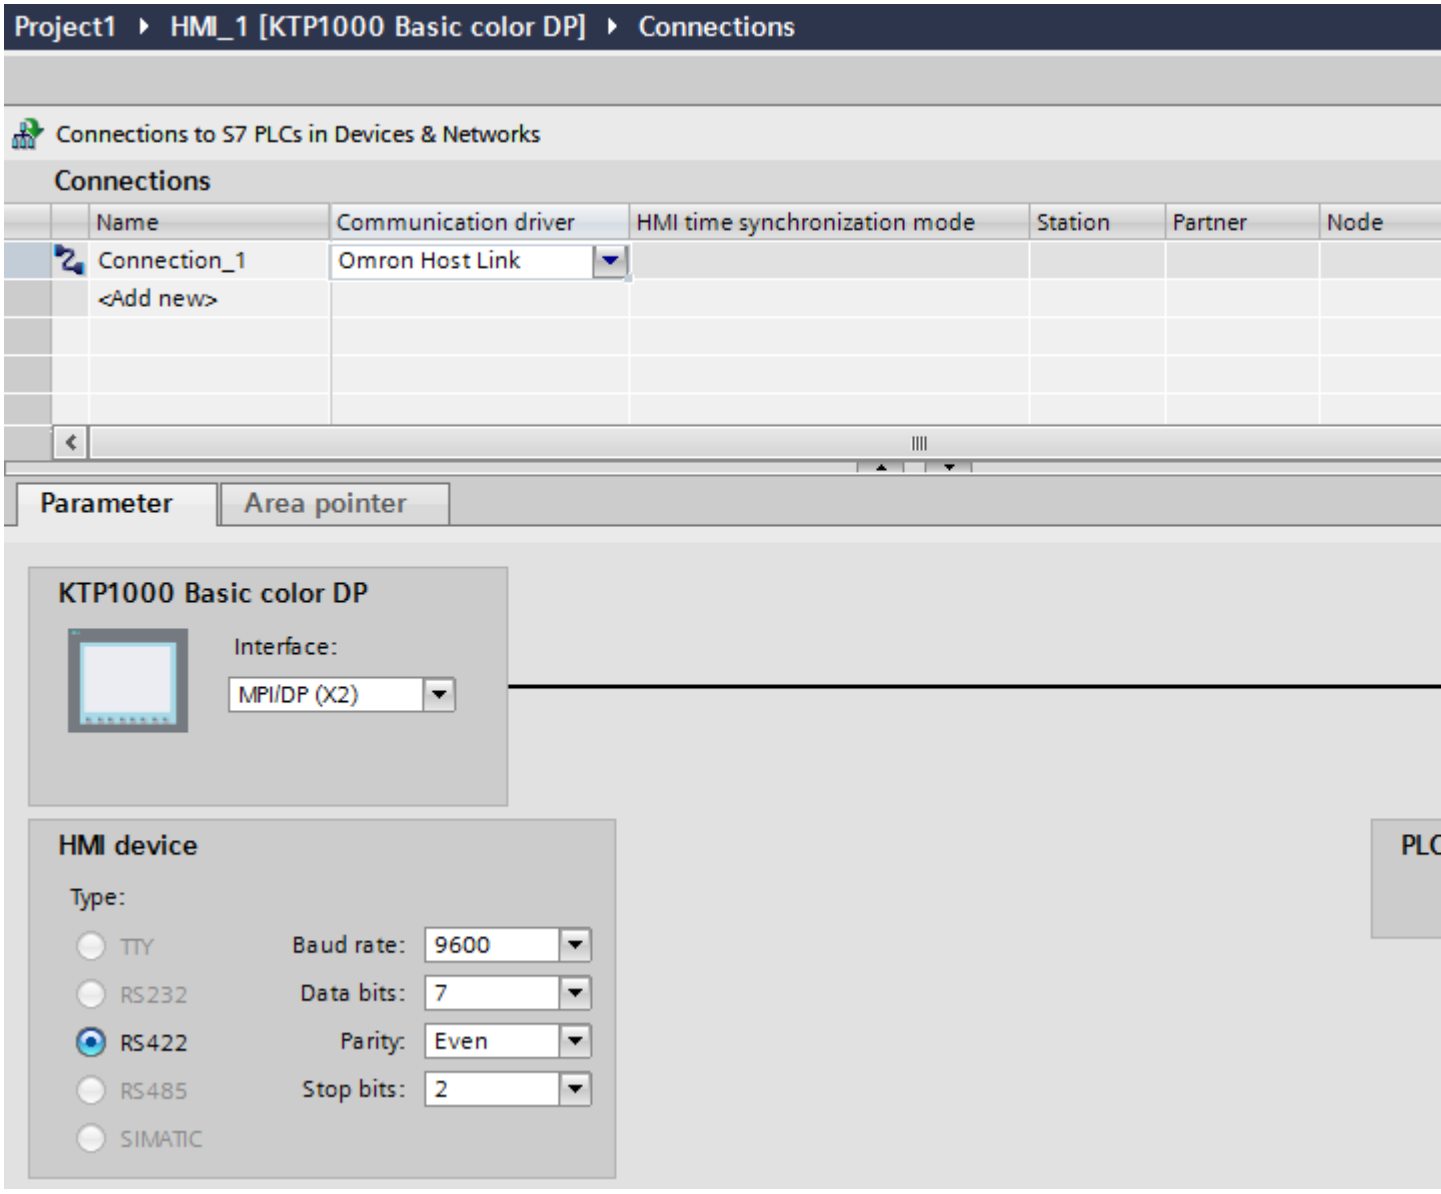
5. Select all necessary connection parameters for the interface in the inspector window under "Parameters".

Parameters for the connection (Omron Hostlink)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- Type
  Specifies the physical connection used.
- Baud rate
  For "Baud rate", you set the transmission speed of the HMI device to OMRON. A baud rate of 19200 or 9600 can be selected for the communication.
- Data bits
  For "Data bits", you can choose between "7 bits" and "8 bits".
- Parity
  For "Parity", you can choose from "None", "Even", and "Odd".
- Stop bits
  For "Stop bits", you can choose between 1 and 2 bits.

Parameters for the PLC

- Station address
  For "Station address", set the station number of the connected PLC.

Connecting HMI device to PLC

Connections via Omron Host Link

Connection

The connection of the HMI device to an OMRON PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Connection cable

The following connecting cables are available to connect the HMI device to an Omron PLC.

Interface to the HMI device	Omron PLC			
	RS232, 9-pin	RS232 I/O port	RS422, 9-pin	RS422, terminals/ pins
RS232, 9-pin	PP1	Programming cable (standard cable of Omron)	—	—
RS232 via converter	—	—	—	Multi-point cable 1
RS422, 9-pin	—	—	PP2	Multi-point cable 2

Refer to the relevant device manual to determine which HMI device interface is to be used.

Communication types

Approved communication types

The connection from a HMI device to an OMRON-CPU with the Omron Host Link protocol via RS232 and via RS 422 is system-tested and approved by Siemens AG.

This concerns the following CPU types:

- CP1x (CP1L, CP1H, CP1E)
- CJ1x (CJ1M, CJ1H, CJ1G)
- CJ2H
- CS1x (CS1G, CS1H, CS1D)
- CPM2C

Note

Only the following CPU types have been tested and released for Basic Panels, TP 177A and OP 77A:

- CP1x (CP1L, CP1H, CP1E)
- CJ1x (CJ1M, CJ1H, CJ1G)

Multipoint connection

A multipoint connection to the up to 4 approved OMRON PLCs in a RS422-four-wire connection can be implemented with communication modules on the PLCs and is system-tested and approved by Siemens AG.

Note

The HMI device can only be operated as a master. Exactly one master is possible in the RS422-four-wire-Multidrop connection.

Connecting cables for Omron Host Link

Connecting cable MP1, RS-232, over converter, for Omron

Performance features of communication

Permissible data types for Omron Host Link

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
Bool	I/O, HR, AR, LR, DM, T/C bit, CPU status	1-bit
Byte	CPU type	1 byte
DInt	HR, AR, LR, DM	4 bytes
Int	I/O, HR, AR, LR, DM, T/C Val	2 bytes
Real	HR, DM	4 bytes
String	HR, AR, LR, DM	0 to 80 characters
UDInt	HR, AR, LR, DM	4 bytes
UInt	I/O, HR, AR, LR, DM, T/C Val	2 bytes

Note

Read and write operations of all data areas in the OMRON PLC can only be reliably carried out in "STOP" or "MONITOR" mode.

"I/O" refers either to the IR/SR area or the CIO area depending on the PLC series. The operand types "LR", "HR" and "AR" are not available in all PLC series.

Note

Note the following for write accesses:

For the "Bool" data type with the operand types "I/O", "HR", "AR", "LR" and "DM", the entire word is written back into the PLC when the specified bit is changed. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

Operand type old PLC	Operand type CS and CJ PLC
CPU Status	CPU Status
I/O	CIO
HR	H Range 0-511
AR	A
LR	n/a 1)
DM	D
T/C	T/C
CPU type	CPU type

1) You do not get an error message when you read or write the LR area in the following PLCs
- CS
- CJ
- CP

Supported CPU types for Omron Host Link

CPU types

The following CPU types are supported in the configuration of the Omron Host Link communication driver.

- CP1
  - CP1L
  - CP1H
  - CP1E
- CJ1
  - CJ1M
  - CJ1H
  - CJ1G

- CJ2
  - CJ2H
- CS1
  - CS1G
  - CS1H
  - CS1D
- CPM
  - CPM2C

Addressing in Omron Host Link

Addressing of PLCs in Omron Host Link

In PLCs of the series CS, CP and CJ, the timers 0-4095 are addressed with T/C 0-2047.

The counters 0-4095 must be addressed with an offset of 2048 (T/C 2048-4095 correspond to the counters 0-2047). Counters and timers with addresses > 2047 cannot be addressed via Host Link.

Counters and timers with addresses > 2047 cannot be addressed via Host Link.

Example:

If you want to address counter C20, you must address T/C 20+2048 = T/C 2068.

Address areas for Omron Hostlink

Omron

Address areas	Data types							
	Bool	Byte	UInt	Int	UDInt	DInt	Real	String
I/O	I/O 0.0 - I/O 9999.15	--	I/O 0 - I/O 9999	I/O 0 - I/O 9999	--	--	--	--
HR	HR 0.0 - HR 9999.15		HR 0 - HR 9999	HR 0 - HR 9999	HR 0 - HR 9998	HR 0 - HR 9998	HR 0 - HR 9999	HR 0 - HR 9999
AR	AR 0.0 - AR 9999.15		AR 0 - AR 9999	AR 0 - AR 9999	AR 0 - AR 9998	AR 0 - AR 9998		AR 0 - AR 9999
LR	LR 0.0 - LR 9999.15		LR 0 - LR 9999	LR 0 - LR 9999	LR 0 - LR 9998	LR 0 - LR 9998		LR 0 - LR 9999
DM	DM 0.0 - DM 9999.15		DM 0 - DM 9999	DM 0 - DM 9999	DM 0 - DM 9998	DM 0 - DM 9998	DM 0 - DM 9999	DM 0 - DM 9999
T/C Bit	T/C Bit 0 - T/C Bit 4095							

Address areas	Data types							
	Bool	Byte	UInt	Int	UDInt	DInt	Real	String
T/C Val			T/C Val 0 - T/C Val 4095	T/C Val 0 - T/C Val 4095				
CPU Status	RUN, MONITOR							
CPU type		CPU type						

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.

- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Omron

Area pointers in connections via Omron communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section:

"Data exchange using area pointers".

Special features of connections via Omron Host Link

Area pointers can only be created in the following "File types": "DM", "I/O", "HR", "AR", and "LR".

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 4270)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

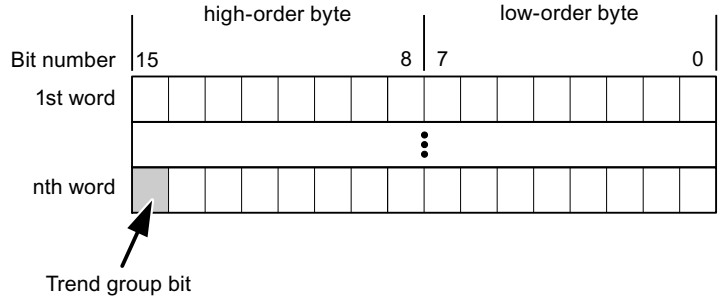
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Restrictions to the trend control

For Omron Host Link communication drivers

Tags of "Operand type" "DM", "I/O", "HR", "AR" or "LR" are permitted.

They must be data type "UInt", "Int" or an array tag of data type "UInt", "Int". You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 4293)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with an Omron communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
CP1, CJ1, CJ2, CS1, CPM	Uint, int	UInt, Int, UDInt, DInt

How the bit positions are counted

For connections with an Omron communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In Omron PLCs	15							8	7							0
In WinCC you configure:	15							8	7							0

Only tags for the "DM", "I/O", "HR", "AR", and "LR" file types are allowed for use as a trigger tag for discrete alarms.

Configuring discrete alarms

Use arrays for discrete alarms and append each individual alarm to one bit of the array tags themselves and not to the individual subelements.

Only tags for the "DM", "I/O", "HR", "AR", LR" areas and the "Int" and "UInt" file types are permitted for discrete alarms and arrays.

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

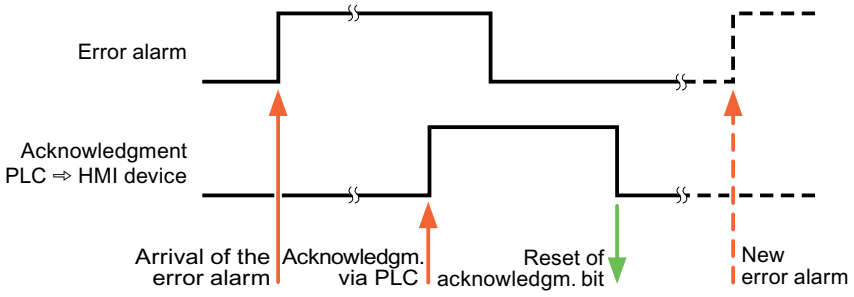
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

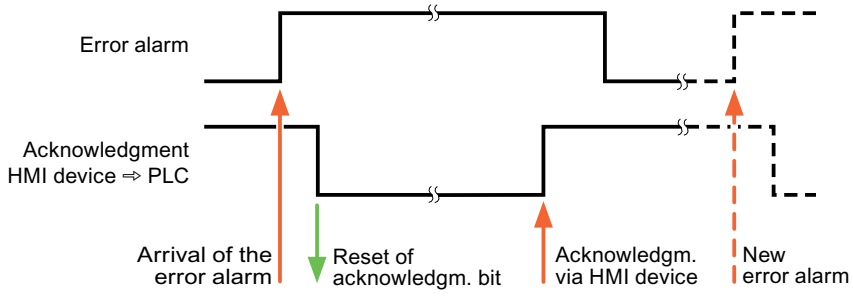
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Communication Service Packages

CSP_1

Parallel communication

Parallel communication of communication drivers

The following table shows an overview of which communication drivers you can use simultaneously on one HMI device.

Note

Parallel communication is not approved for Basic Panels.

Parallel communication over Ethernet interfaces

The approved combinations can be operated via the same Ethernet interface. Several Ethernet interfaces are not required.

Parallel communication only concerns the Ethernet-based communication drivers.

12.11.19.5 Data exchange using area pointers

General information on area pointers

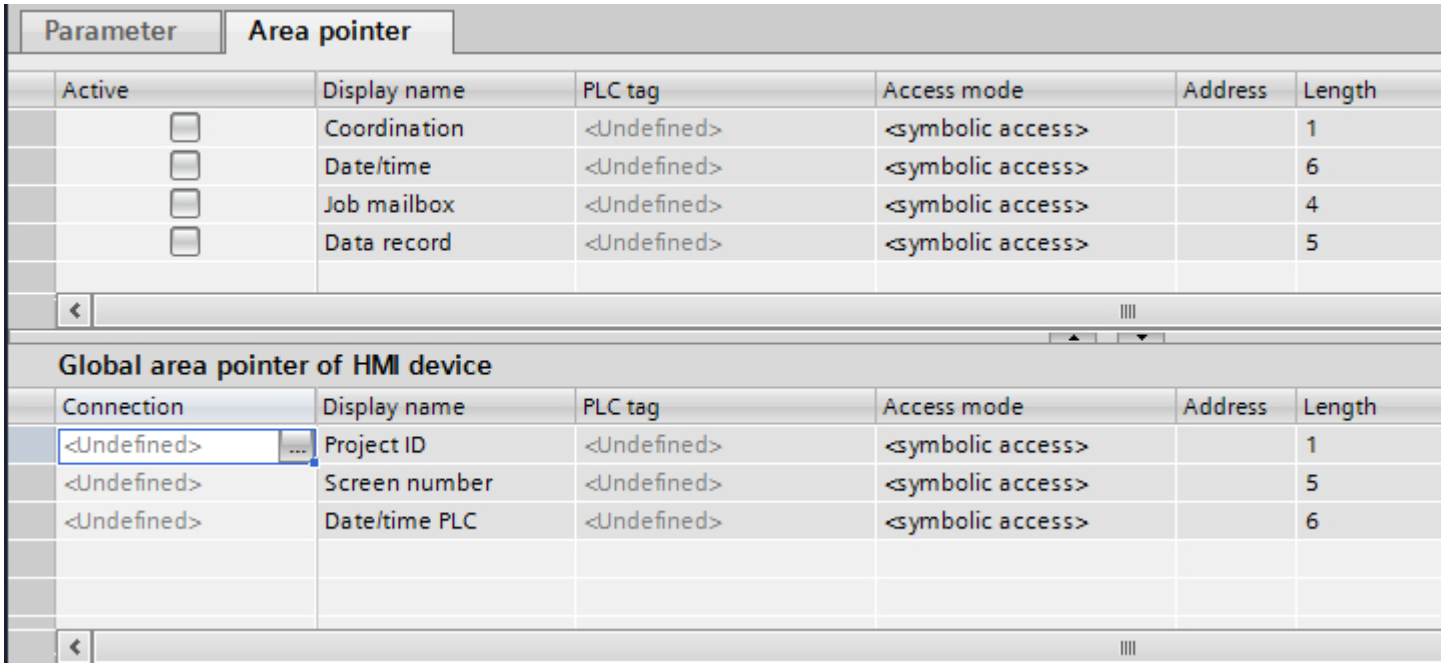
Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use the area pointer, you enable it in "Connections ▸ Area pointers". You then assign the area pointer parameters.



- Active
  Enables the area pointer.
- Pointer name
  Name of the area pointer specified by WinCC.
- PLC tag
  Here you select the PLC tag or the tag array that you have configured as the data area for the area pointer.
- Address
  No address is entered into this field because of the symbolic access.
- Length
  WinCC specifies the length of the area pointer.
- Acquisition cycle
  You specify the acquisition cycle in this field for area pointers that are read by the HMI device. Note that a very short acquisition time may have a negative impact on HMI device performance.
- Comment
  Enter a comment, for example, to describe the purpose of the area pointer.

Accessing data areas

Accessing data areas

The following table shows how HMI devices and PLCs access individual data areas for read (R) or write (W) operations.

Data area	Required for	HMI device	PLC
Screen number	Evaluation by the PLC in order to determine the active screen.	W	R
Data record	Transfer of data records with synchronization	R/W	R/W
Date/time	Transfer of the date and time from the HMI device to the PLC	W	R
Date/time PLC	Transfer of the date and time from the PLC to the HMI device	R	W
Coordination	Requesting the HMI device status in the PLC program	W	R
Project ID	Runtime checks for consistency between the WinCC project ID and the project in the PLC	R	W
Job mailbox	Triggering of HMI device functions by the PLC program	R/W	R/W

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1. word	Current screen type															
2. word	Current screen number															
3. word	Reserved															
4th word	Current field number															
5. word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

The date/time data area has the following structure:

Data word	Left byte								Right byte								
	15							8	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute if your process can handle it.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The "Date/time PLC" data area has the following structure:

Data word	Left byte			Right byte		
	15	. . . . .	8	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functionality:

- Detecting the startup of the HMI device in the control program
- detection in the control program of the current HMI device operating mode
- detection in the control program of the HMI devices ready to communicate state

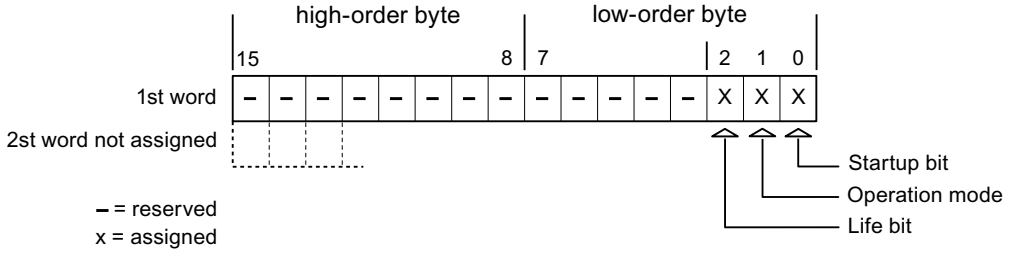
The "Coordination" area pointer has a length of one word.

Use

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program may not make changes to the coordination area for this reason.

Assignment of bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The state of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not the connection to the HMI device is still up by querying this bit in the control program.

"Project ID" area pointer

Function

You can check whether the HMI device is connected to the correct PLC at the start of Runtime. This check is important when operating with several HMI devices.

The HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of configuration data with the control program. If discrepancy is detected, a system event is displayed on the HMI device and Runtime is stopped.

Application

To use this area pointer, set up the following during the configuration:

- Define the version of configuration. Possible values between 1 and 255.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections".

Connection failure

A connection failure to a device on which the "Project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following prerequisites:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

"PLC job" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Left byte	Right byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

Note

Please note that not all HMI devices support job mailboxes.

No.	Function	
14	**Setting the time (BCD coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)**	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-

No.	Function	
14	**Setting the time (BCD coded)**	
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs in order to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tags**	
	Causes the HMI device to read the current value of the tags•from the PLC whose update ID matches the value transferred in parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [1]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Read data record from PLC**	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Write data record to PLC**	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1] OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.

"Data record" area pointer

"Data mailbox" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data record

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system event.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transferring.
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe display

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data record.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a PLC job

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data record.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data record.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data record.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data record.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

12.11.20 Special features of WinAC MP

12.11.20.1 WinAC MP basics

WinAC MP basics

WinAC MP is a software package for HMI devices. WinAC MP integrates a software PLC compatible with SIMATIC S7 in WinCC Runtime.

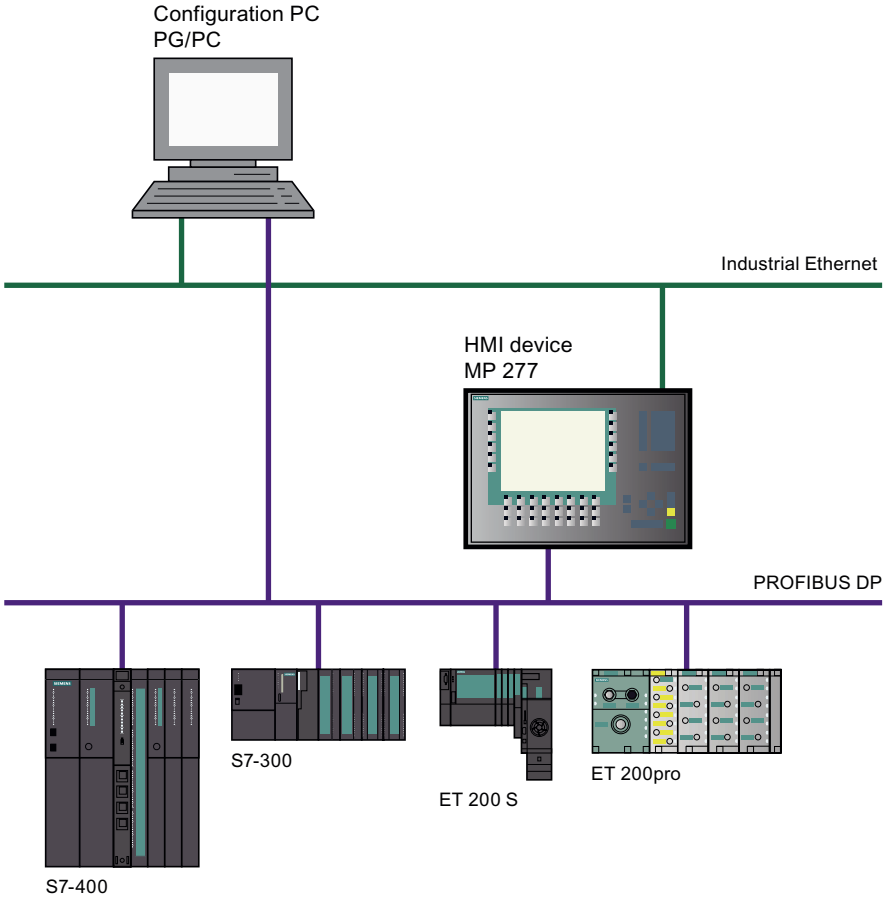
Using WinAC MP you can execute STEP 7 programs on the HMI device.

The common use of WinAC MP and WinCC provides process control and visualization on one HMI device.

The communications driver for WinAC MP supports the following protocols for controlling the process components:

- Industrial Ethernet
- PROFIBUS DP

The following screen shows the principal connection of the process components on the PROFIBUS DP example.



If you wish to control your process using an HMI device and WinAC MP, then you must install WinAC MP on your configuration PC. Then transfer WinAC MP and the project to your HMI device.

Note

Notes about instructions

The following describes how to install WinAC MP and transfer WinAC MP to an HMI device.

To transfer a STEP 7 project with a WinAC MP controller to an HMI device, you require experience with STEP 7.

12.11.20.2 Communication options with WinAC MP

Definition of "routing"

If there are stations in an automation system that are not connected to the same bus, these stations cannot be accessed directly online. To establish a connection to these devices, a router must be included between them.

An MP x77 HMI device with WinAC MP can function as the router. As a router, it connects the Ethernet and PROFIBUS networks.

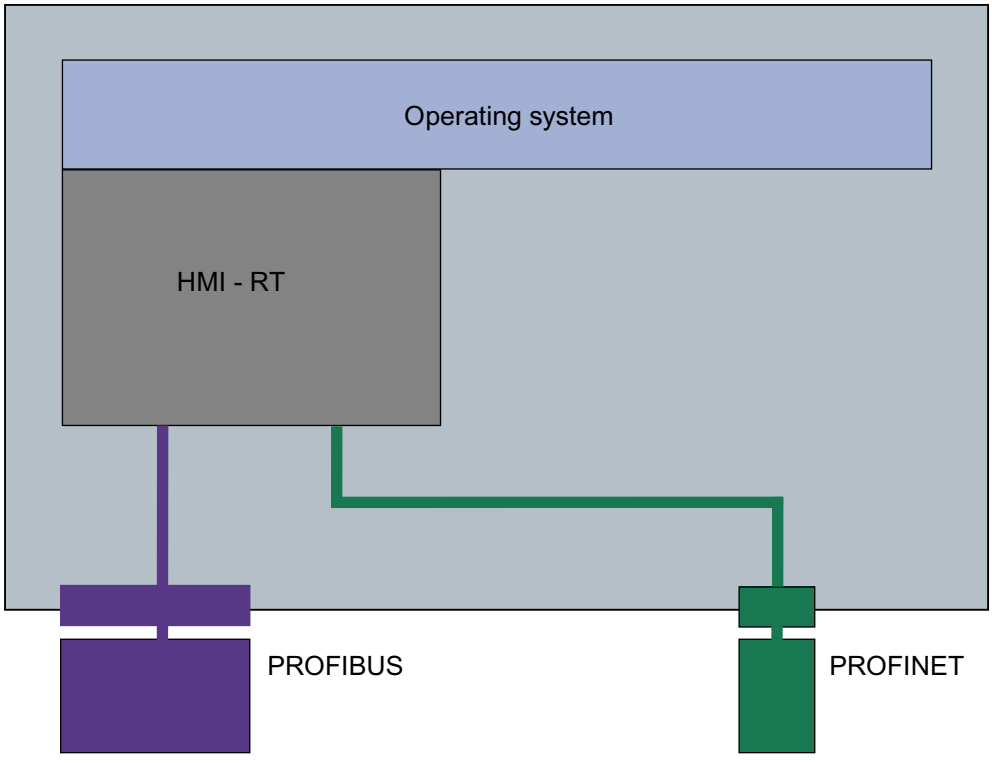
You can use routing, for example, to do the following:

- Download STEP 7 user programs
- Download a hardware configuration
- Execute testing and diagnostics functions

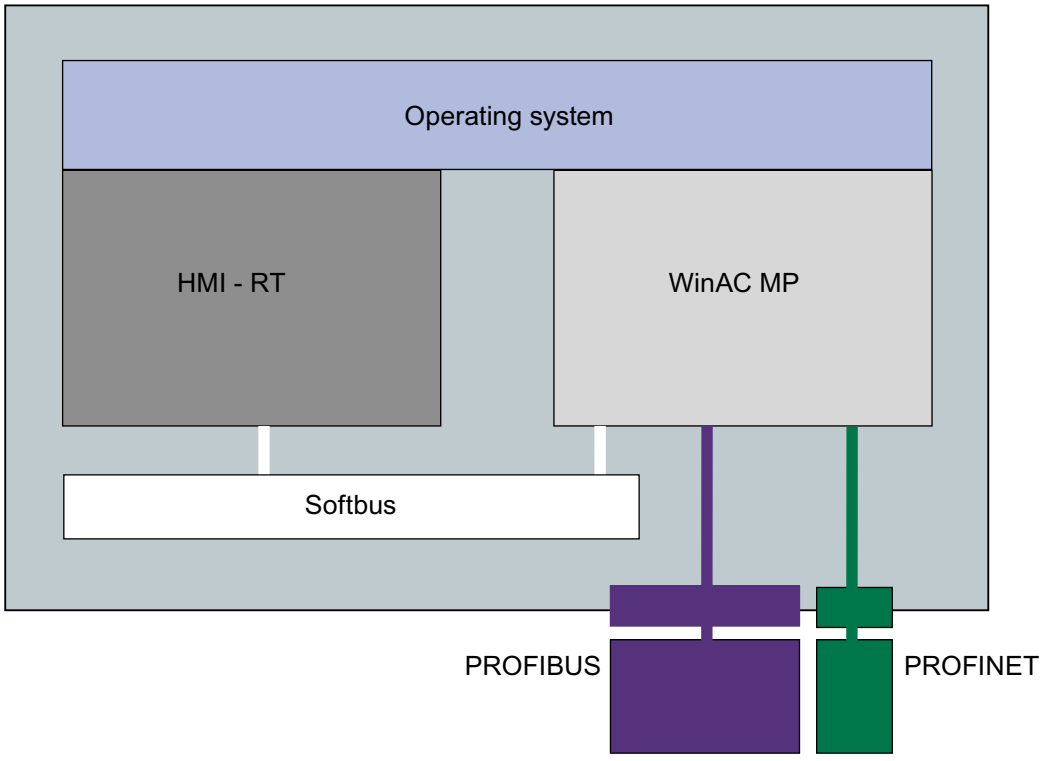
Definition of "Softbus"

Virtual bus that allows data exchange between WinCC Runtime and WinAC MP. This bus is also installed when you install WinCC . After installing WinAC MP, S7 connections from WinCC Runtime to external stations on PROFIBUS or Ethernet are routed over Softbus.

Prior to installation of WinAC MP (without Softbus)



After installation of WinAC MP (with Softbus)



Routing from Ethernet to PROFIBUS DP with WinAC MP

With STEP 7 on Industrial Ethernet, you can access all nodes on PROFIBUS DP from the HMI device. With WinCC, you can access the HMI device but not the nodes connected over PROFIBUS DP.

If the configuration PC is not connected directly to PROFIBUS DP, the nodes on PROFIBUS can nevertheless be reached because the MP x77 HMI device serves as a router.

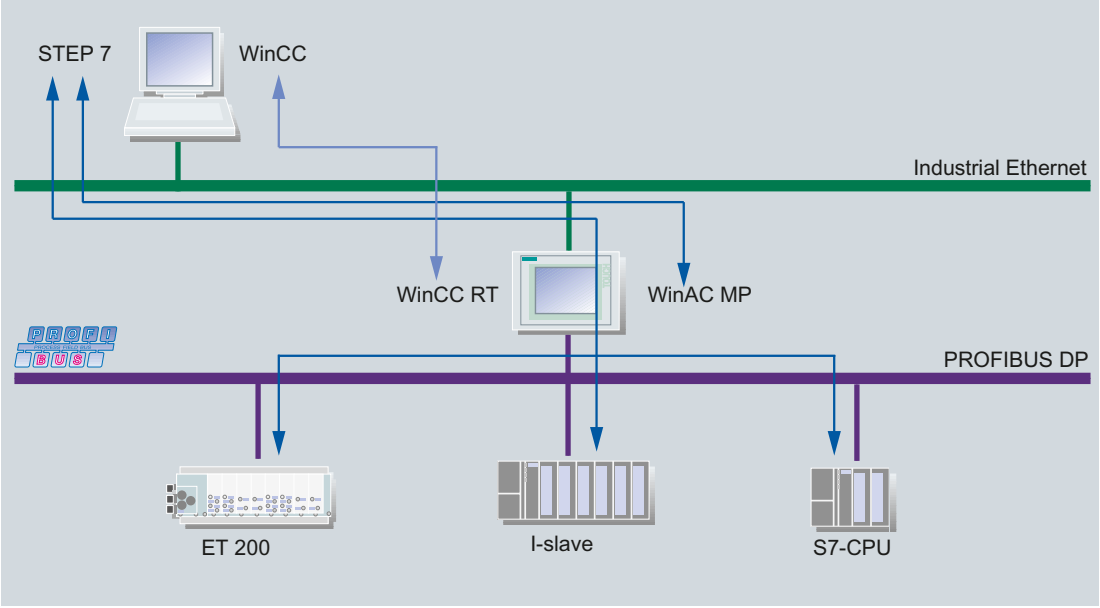


Figure 12-6 Routing from Ethernet to PROFIBUS DP with WinAC MP

Routing from PROFIBUS DP to Ethernet with WinAC MP

With STEP 7 on PROFIBUS DP, you can access all nodes on Industrial Ethernet from the HMI device. With WinCC on PROFIBUS DP, you have access to the HMI device and to OPs connected over PROFIBUS DP.

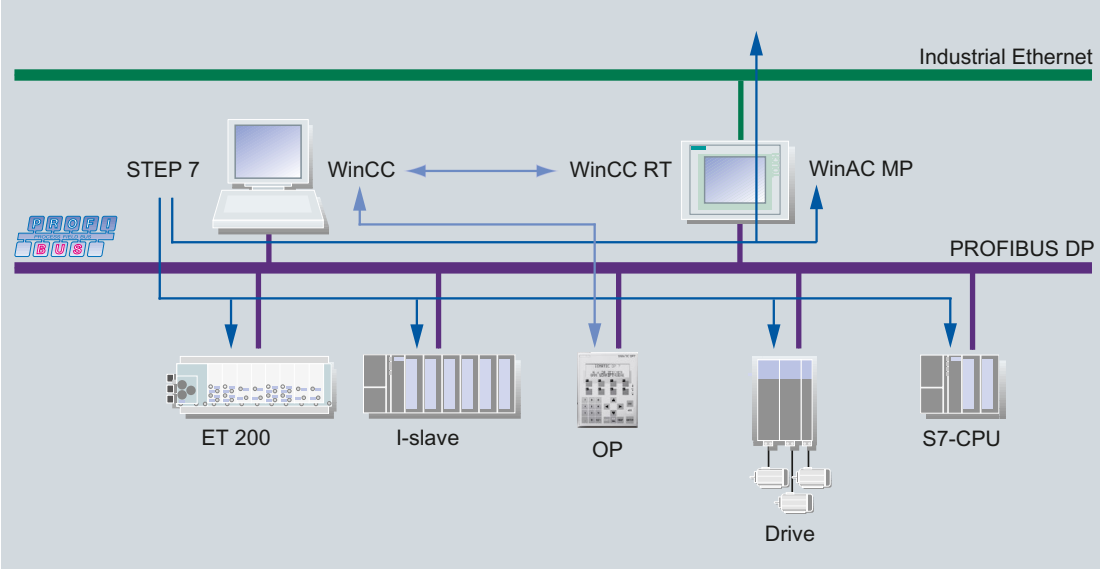

Figure 12-7 Routing with WinAC MP over PROFIBUS

Visualization over WinAC MP

Visualization over the HMI device between Industrial Ethernet and PROFIBUS DP is possible with WinCC.

It is not necessary to program the communication links. A PC serves as the visualization platform.

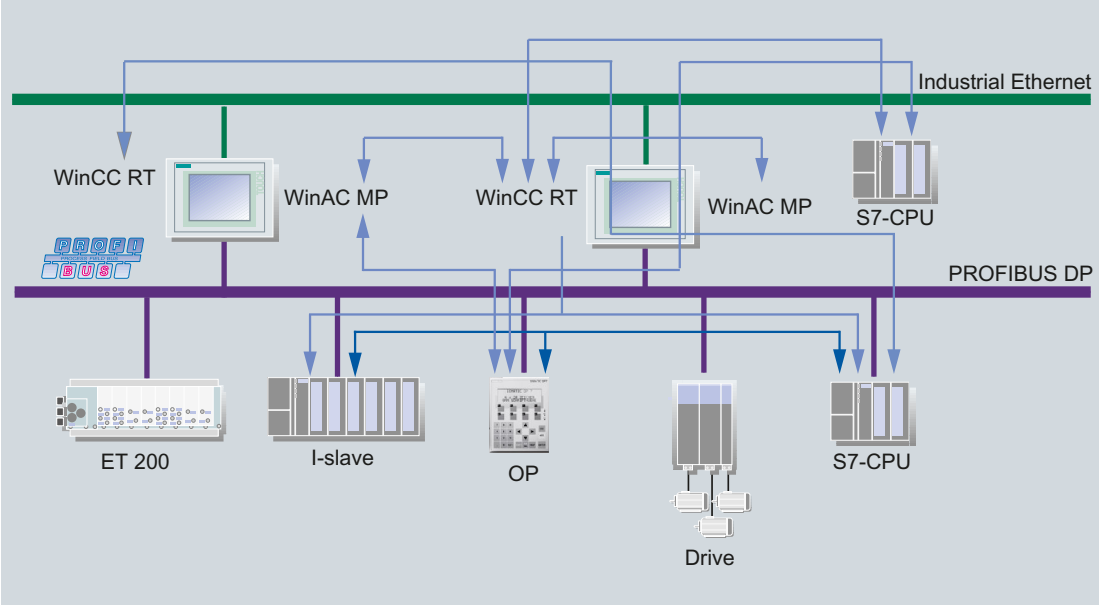

Figure 12-8 Visualization over WinAC MP

CPU-CPU communication over WinAC MP

CPU-CPU communication is possible with the HMI device.

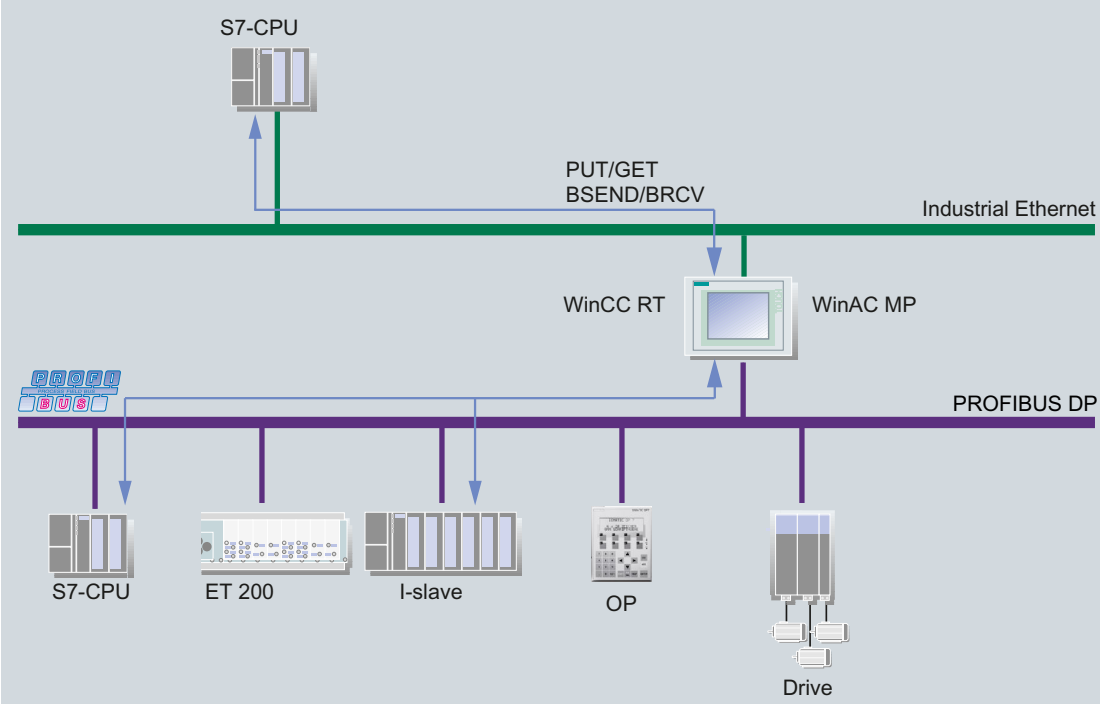

Figure 12-9 CPU-CPU communication over WinAC MP

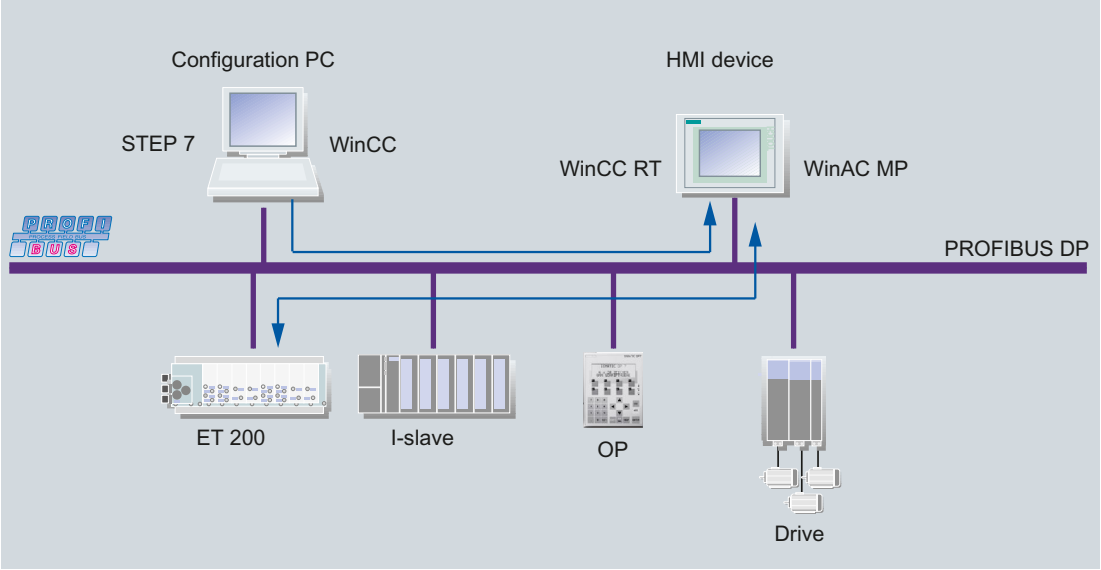
12.11.20.3 Standard procedure for communication with WinAC MP

Overview

The section below shows how to configure WinAC MP in a SIMATIC HMI station using a configuration PC on which STEP 7 and WinCC are installed.

The configuration PC and WinAC MP in a SIMATIC HMI station are interconnected via PROFIBUS DP. Configuration via Ethernet is also possible. A description of the procedure can be found in the "WinAC MP" manual.

You can integrate DP slaves for WinAC MP in the STEP 7 project.



Procedure

The basic steps are as follows:

1. Configure WinAC MP in STEP 7.
2. Create a connection between WinAC MP and WinCC Runtime.
3. In STEP 7, download the configuration to WinAC MP.
4. Configure (visualization) HMI objects with WinCC .
5. Download the (visualization) configuration (for example, visualization with histogram) from WinCC to the HMI device.

12.11.20.4 Configuring the WinAC MP communications driver

Requirements for the use of WinAC MP

Requirements

In order to use WinAC MP in the process control, you must perform the installation and development steps on your configuration PC. Transfer the necessary components to the HMI device.

Basic procedure

The following steps are described in more detail in the following:

1. Check that your system meets the system requirements:
   - STEP 7 and the authorization are installed on the configuration PC.
   - WinCC and the authorization are installed on the configuration PC.
     WinCC Runtime and ProSave were installed along with WinCC.
2. When WinCC is installed, the WinAC MP option is also automatically installed. Authorization of the WinAC MP is carried out via separate licenses.
   The following components are installed alongside WinAC MP:
   - WinAC MP Runtime files
   - WinAC MP system library
3. Develop a STEP 7 project for controlling your process with WinAC MP on the HMI device.
4. Develop a WinCC project for operating and visualizing your controller.
5. Connect the process components via the PROFIBUS network and configure the hardware.
6. Transfer the WinAC MP Runtime files from the configuration PC to the HMI device.
   Use ProSave for this.
7. Transfer the WinAC MP authorization from its storage location to the HMI device.
   Use the Automation License Manager for this.
8. Transfer the STEP 7 project to the HMI device.
9. Transfer WinCC Runtime and the WinCC project to the HMI device.
   To do this, use the "Transfer" function.

Changing the device type

Introduction

There are different ways to create a SIMATIC HMI-station with an HMI device and a configured WinAC MP controller.

Procedure 1

Create an HMI device in a SIMATIC HMI-station in the device and network view. Then add the corresponding variant of WinAC MP.

The advantage of this procedure is that you can choose the device type (MP 177, MP 277 or MP 377) and the design of the device type (monitor size and touch or key) directly on selection in the hardware catalog.

Procedure 2

Insert the desired variant of WinAC MP directly in the device and network view.

This procedure creates, by default, the largest touch design of the selected HMI device in the device and network view.

Changing the device type

Select a device. You can change the device type using the shortcut menu command "Change device". When the device type MP277 is changed to MP377 and MP 177 or vice versa with a configured WinAC MP controller in a SIMATIC HMI station, the WinAC MP controller is automatically moved to the storage location of the non slotted modules. It can therefore not be used in the new HMI device. If the the device type is changed, the WinAC MP-configuration must be created again.

Connecting the configuration PC and HMI device

Procedure for creating a connection via Ethernet or PROFIBUS DP

Basic procedure

WinAC MP supports the communication between the configuration PC and the HMI device via the following connections:

- Industrial Ethernet
- PROFIBUS DP
- USB

To achieve successful communication, follow these steps:

1. Connect the configuration PC to the HMI device.
2. Make the parameter settings for data transfer on the control panel.
3. Make the parameter settings for data transfer on the configuration PC.
4. Set the communications parameters in ProSave.
   With ProSave you can load the WinAC MP Runtime files in the HMI device. Therefore, you must set the communication parameters both in ProSave as well as on the HMI device.
5. Set the communications parameters in WinCC.
   Use WinCC to download your project to the HMI device using the "Download" function.

Establishing a connection over Ethernet

Connect the configuration PC to the HMI device (Ethernet)

In order to communicate via an Ethernet network you can either use a direct connection or a networked connection.

To connect a configuration PC to an HMI device via Ethernet, follow these steps:

1. Connect the interfaces of the configuration PC and the HMI device with an Ethernet cable.

Note

Use a crossover cable to create a direct connection between the configuration PC and the HMI device.

To connect the configuration PC and the HMI device to an Ethernet (LAN) use a 1 to 1 cable with RJ45 connector.

The interface to be used on the HMI device can be established from the operating instructions of your HMI device.

Configuring the transmission settings in the Control Panel (Ethernet)

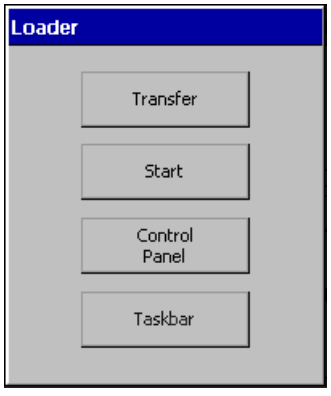
Requirements

The configuration PC and HMI device are connected to each other over an Ethernet cable.

Setting up an IP address on the control panel

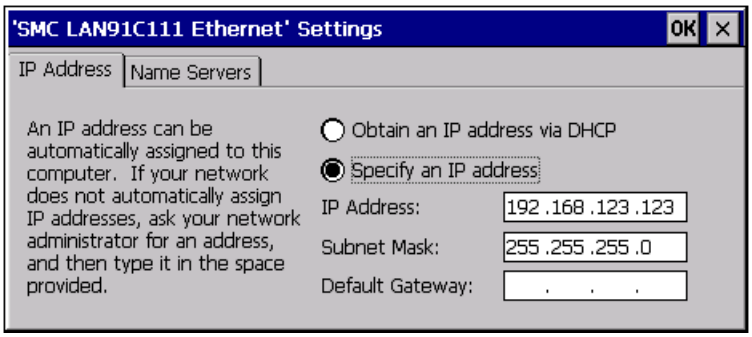
The set up the IP address on the control panel, follow these steps:

1. Switch on the HMI device.
   Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Select "Control Panel".



3. Double click on the "Network and Dial-up Connection" symbol.
4. Double-click on the LAN connection.
5. Select the "IP Adress" tab.

6. Select "Specify an IP address".

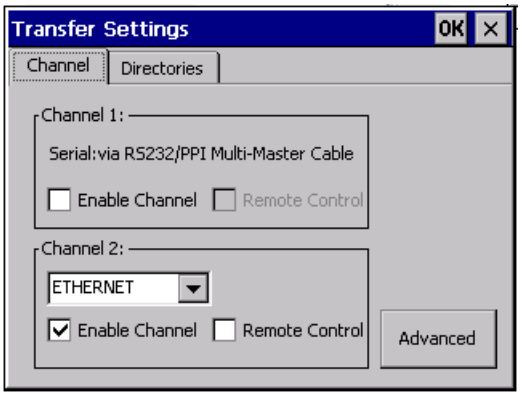


7. Enter the IP address and the subnet mask that you were given by your network administrator.
8. Confirm your entries with "OK".

Entering transfer settings

To make the data transfer settings, follow these steps:

1. In the control panel, double click on the "Transfer" symbol.
2. Select the "Channel" tab.
3. Select the "Ethernet" option in the "Channel 2" area.
4. Enable "Enable Channel" and confirm your entries.



5. Click "OK" and end the dialog "Transfer Settings".

The transmission settings are configured on the configuration PC

Requirement

- The configuration PC and HMI device are connected to each other over an Ethernet cable
- The data transfer settings have been made on the control panel

Procedure

To make the data transfer settings on the configuration PC, follow these steps:

1. Open the network settings of your PC.
2. Select the "Internet Protocol (TCP/IP)".
3. Enable the "General" tab.
4. Select the "Use the following IP address" check box in the protocol properties.
5. Enter an "IP address".
6. Enter a "subnetwork mask".
7. Confirm your entries.

Note

The IP addresses of the configuration PC and the HMI device must not be the same.

The subnet mask must be the same for the configuration PC and the HMI device.

Set the communication parameters (Ethernet)

Requirement

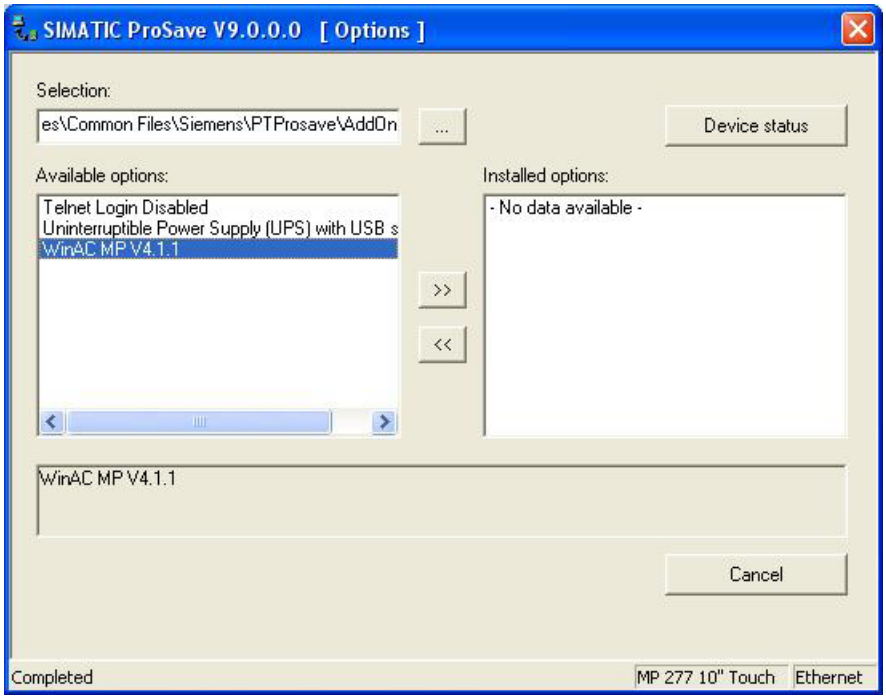
- The configuration PC and HMI device are connected to each other over an Ethernet cable
- The data transfer settings have been made on the control panel
- The data transfer settings have been made on the configuration PC

Procedure

To make the communications parameter settings in ProSave, follow these steps:

1. Make the transfer settings first.
2. To do this, select the desired component in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "Options" command from the "Online > HMI device maintenance" menu to start ProSave .

5. Select an element under "Available options".
6. Click ">>".



Setting the communication parameters in WinCC (Ethernet)

Requirement

- The configuration PC and HMI device are connected to each other over an Ethernet cable.
- The data transfer settings have been made on the control panel.
- The data transfer settings have been made on the configuration PC.

Procedure

To make the connection settings in WinCC, follow these steps:

1. Open the transfer settings.
2. Select the desired HMI device in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.

4. Select the "Ethernet" mode.
5. Specify the IP address or the computer name of the HMI device.
6. Switch the HMI device to "transfer" mode.
7. Transfer the WinCC project to the HMI device.

Warning

Death, serious bodily harm and / or damage to property from unexpected process or machine behavior.

If you use DHCP it is not guaranteed that every time the same IP address will be issued if a node is switched on.

Nodes could lose the connection in the Industrial Ethernet or be connected with incorrect nodes. Always enter a static IP address for the HMI device. Contact your network administrator for address allocations.

Establishing a connection via PROFIBUS DP

Connect the configuration PC to the HMI device (PROFIBUS DP)

1. Connect the interfaces from the configuration PC and the HMI device with an PROFIBUS DP cable.

Note

To communicate via an PROFIBUS DP network you must create a direct connection.

Check if your configuration PC has a suitable interface for connection to the PROFIBUS DP.

If this interface is missing, you must perform the following steps:

- Build a card into the configuration PC, e.g. CP 5611 for desktop PCs.
- Install the respective drivers.

Configuring the transmission settings in the Control Panel (PROFIBUS DP)

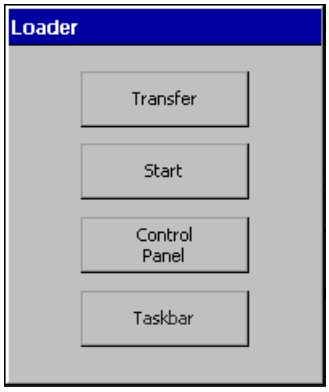
Requirement

- The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.

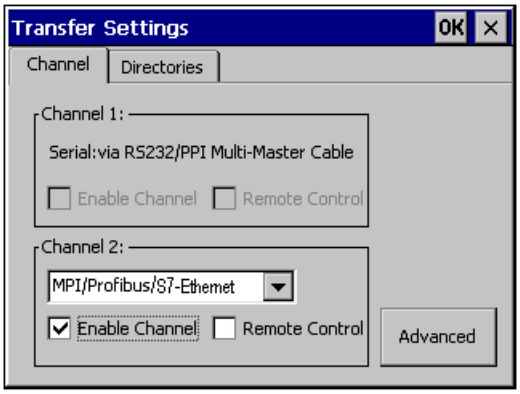
Procedure

Perform the following steps on the HMI device:

1. Switch on the HMI device.
   Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Select "Control Panel".



3. Double click on "Transfer".
4. Select the "MPI/PROFIBUS" option from the "Channel 2" selection list under the "Channel" tab.
5. Select "Enable Channel".



6. Confirm with "OK".
7. "Transfer Settings" End the dialog.

Setting the communication parameters in ProSave (PROFIBUS DP)

Requirement

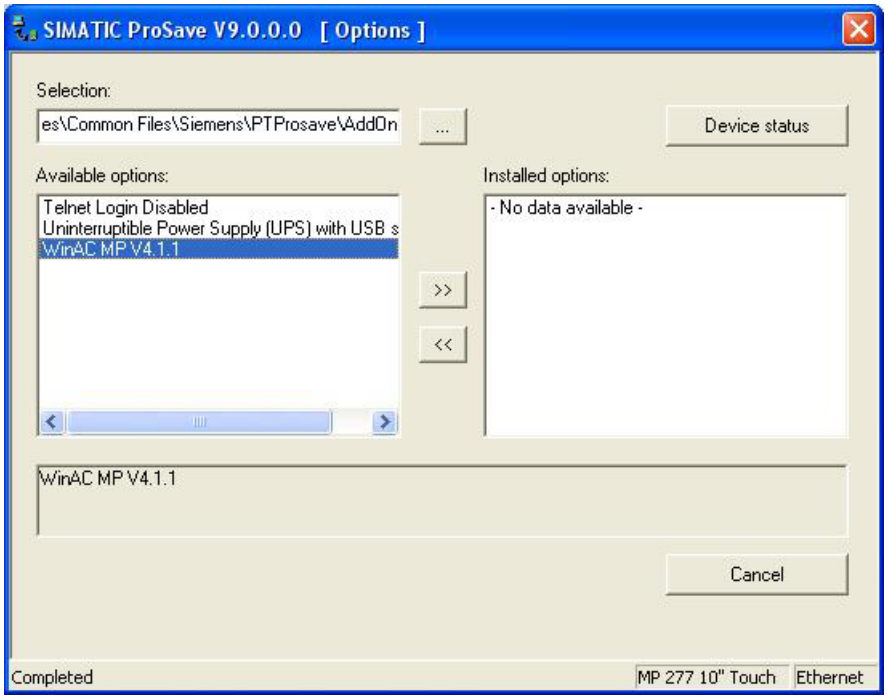
The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.

The data transfer settings have been made on the control panel.

Procedure

To make the communications parameter settings in ProSave, follow these steps:

1. Make the transfer settings first.
2. To do this, select the desired component in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "Options" command from the "Online > HMI device maintenance" menu to start ProSave .
5. Select an element under "Available options".
6. Click ">>".



Set the communication parameters in WinCC (PROFIBUS DP)

Requirement

- The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.
- The data transfer settings have been made on the control panel.

Procedure

To make the connection settings in WinCC, follow these steps:

1. Open the transfer settings.
2. Select the desired HMI device in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "MPI / PROFIBUS DP" mode.
5. Specify the PROFIBUS address that is assigned to the HMI device.
   The PROFIBUS address is the station address and corresponds to the address configured for the WinAC MP controller.
6. Switch the HMI device to "transfer" mode.
7. Transfer the WinCC project to the HMI device.

Note

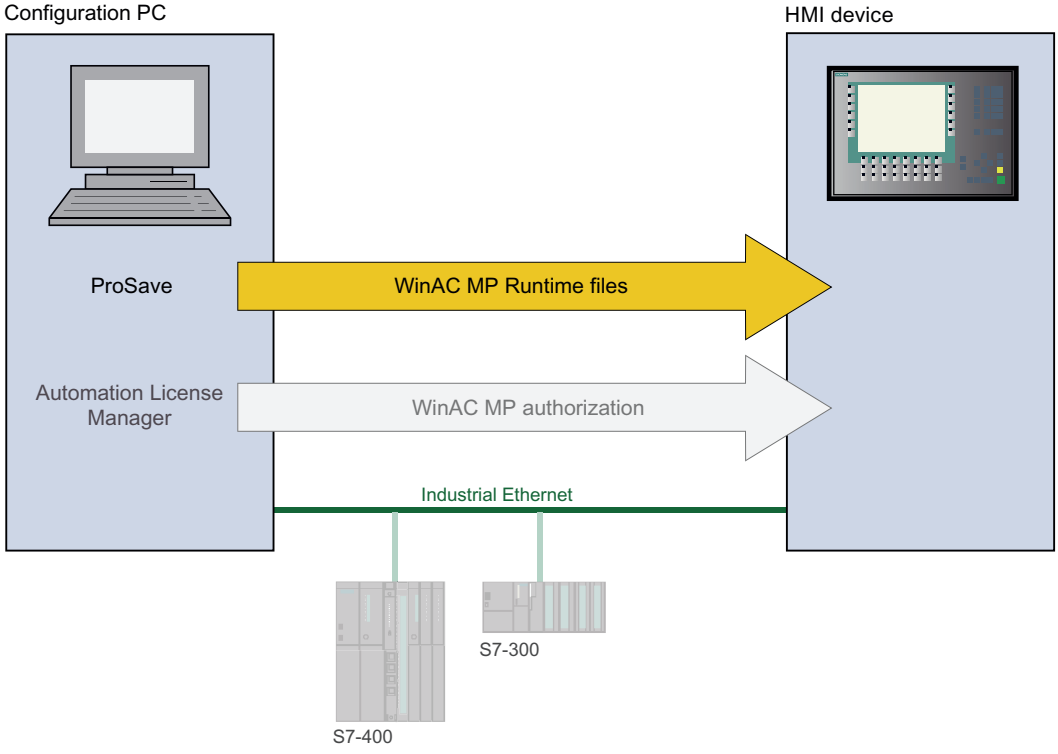
For PROFIBUS DP transmission the WinAC MP control must be started on the HMI device.

12.11.20.5 Transferring WinAC MP to the HMI device

Procedure for transferring WinAC MP

Introduction

If you want to execute WinAC MP on the HMI device you must transfer the WinAC MP Runtime files from the configuration PC to the HMI device. For the transfer there must be a data connection between the configuration PC and the HMI device. The following screen shows the arrangement using example Industrial Ethernet.



Basic procedure

To transfer WinAC MP Runtime files to an HMI device, follow these steps:

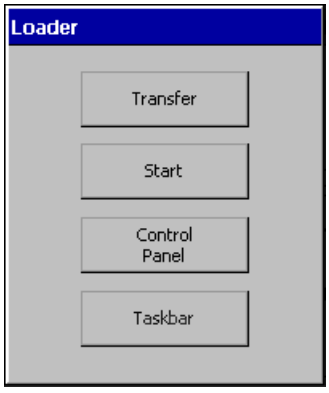
1. Setting up the HMI device.
2. Configure the ProSave on the configuration PC.
3. Start transfer.

Switch the HMI device to transfer mode

Procedure

For the transfer of data you must switch the HMI device to "Transfer":

1. Switch on the HMI device.
   Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Click on the "Transfer" button.
   The dialog window displays the message "Connecting to host ...".



Configuring ProSave on the configuration PC

Requirement

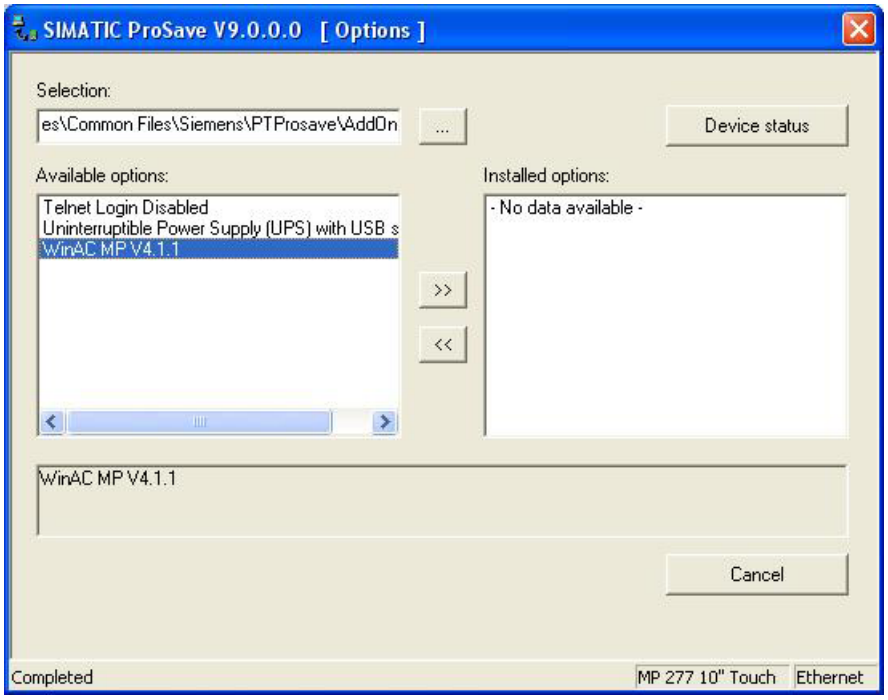
The HMI device was switched to transfer mode.

Procedure

To set up a configuration PC to transfer WinAC MP, proceed as follows:

1. Start ProSave.
2. Select the "General" tab.
3. Select the device type of your HMI device.
4. Select the "Ethernet" connection type.

5. Specify the IP address or the computer name of the HMI device.
6. Start the transfer of WinAC MP.



Start transfer

Requirement

- The HMI device was switched to transfer mode.
- ProSave is set up on the configuration PC.

Procedure

To start the transfer of WinAC MP files, follow these steps:

1. Open the "Options" tab in transfer mode and click the "Device status" button. If no error message is shown then the communication connection is valid.

   Note

   If there is a communication error, then you must check the following circumstances:

   • The HMI device must be in Transfer mode.

   • Check the cable connections for a correct and firm connection.

   • The settings in ProSave and on the HMI device must be correctly defined for the connection.

2. In the "Options" tab, select "WinAC MP" below "Available options".

3. To transfer WinAC MP to the HMI device, click the >> button.

   ProSave then starts to load the software of the WinAC MP control to the HMI device. While the files are being transferred the configuration PC shows the progress of the transfer. The following messages are displayed on the HMI device in the "Transfer" dialog box:

   – Progress of the file receipt on the HMI device.
   – Unzip data in the Flash file system.
   – Save data in the Flash file system.

   At the end of the transfer, a message confirms a successful transfer.

4. When transfer is complete, you will be asked to restart the device. Restart the device.

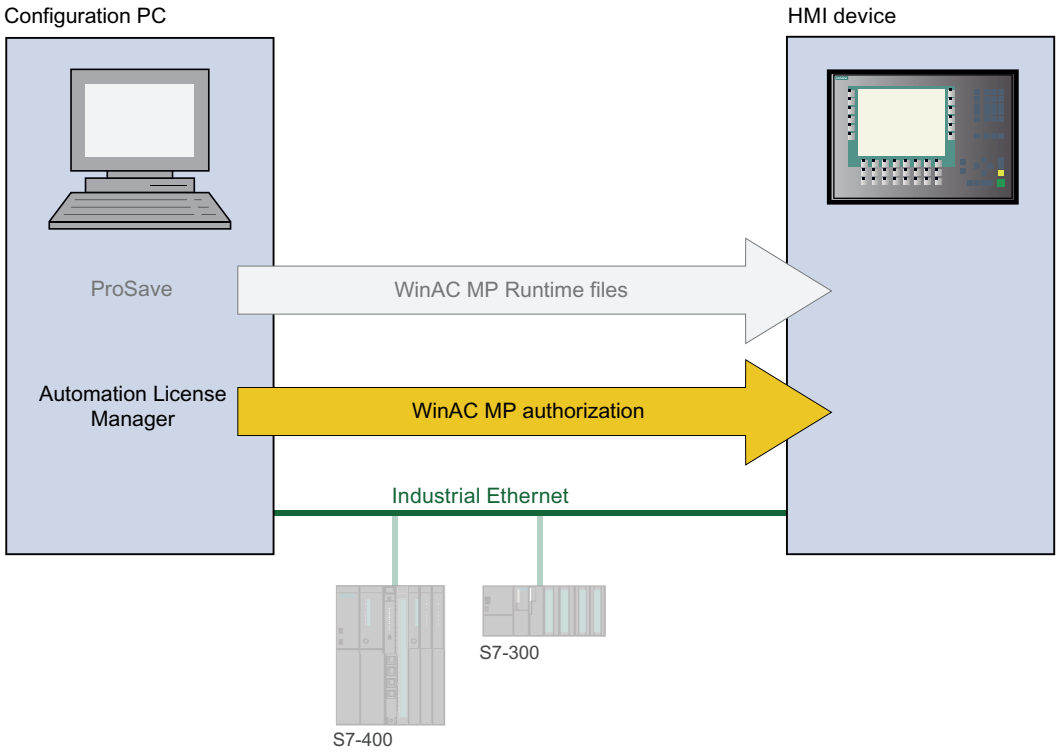
Result

The WinAC MP control is now installed on the HMI device. Now, transfer the authorization for WinAC MP to the HMI device.

12.11.20.6 Transferring authorization to the HMI device

Introduction

You need a license key to operate WinAC MP. The license key is transferred with the Automation License Manager to the HMI device.



Requirements

The storage location of the license key can be called from the configuration PC.

Procedure

To transfer the WinAC MP authorization to an HMI device, follow these steps:

1. Select the "Authorize/License" command from the "Online > Device maintenance" menu to start WinAC MP authorization.
   Automation License Manager is launched.
2. Select the "Connect HMI device" menu command.
3. Select the device type of the HMI device.
4. Select the type of connection and set the parameters for the connection.
   The connection to the HMI device is established. The connected HMI device is displayed.
5. Select the source drive.

6. Drag one or more license keys to the HMI device.
   The license keys are then transferred to the HMI device.
7. Close the Automation License Manager after a successful transfer.

12.11.20.7 WinAC MP system library

Screens from the system library

The screens from the system library are optimized for a 6' display with a resolution of 320 x 240. If you use a display of a different size, you can adapt the screens for your display in WinCC.

Standard screens and tags

The WinAC MP-system library offers you the standard screens "WinAC_MP_Home" and "WinAC_MP_Tuning" and the tags "WinAC_MP_Tags". To use the standard screens, move them to the "Screens" folder in the project tree.

In addition to the standard screens, the tags must be copied separately. To do this, drag "WinAC_MP_Tags" from the WinAC MP-system library to the "HMI_Tags" folder in the project tree.

12.12 Using global functions

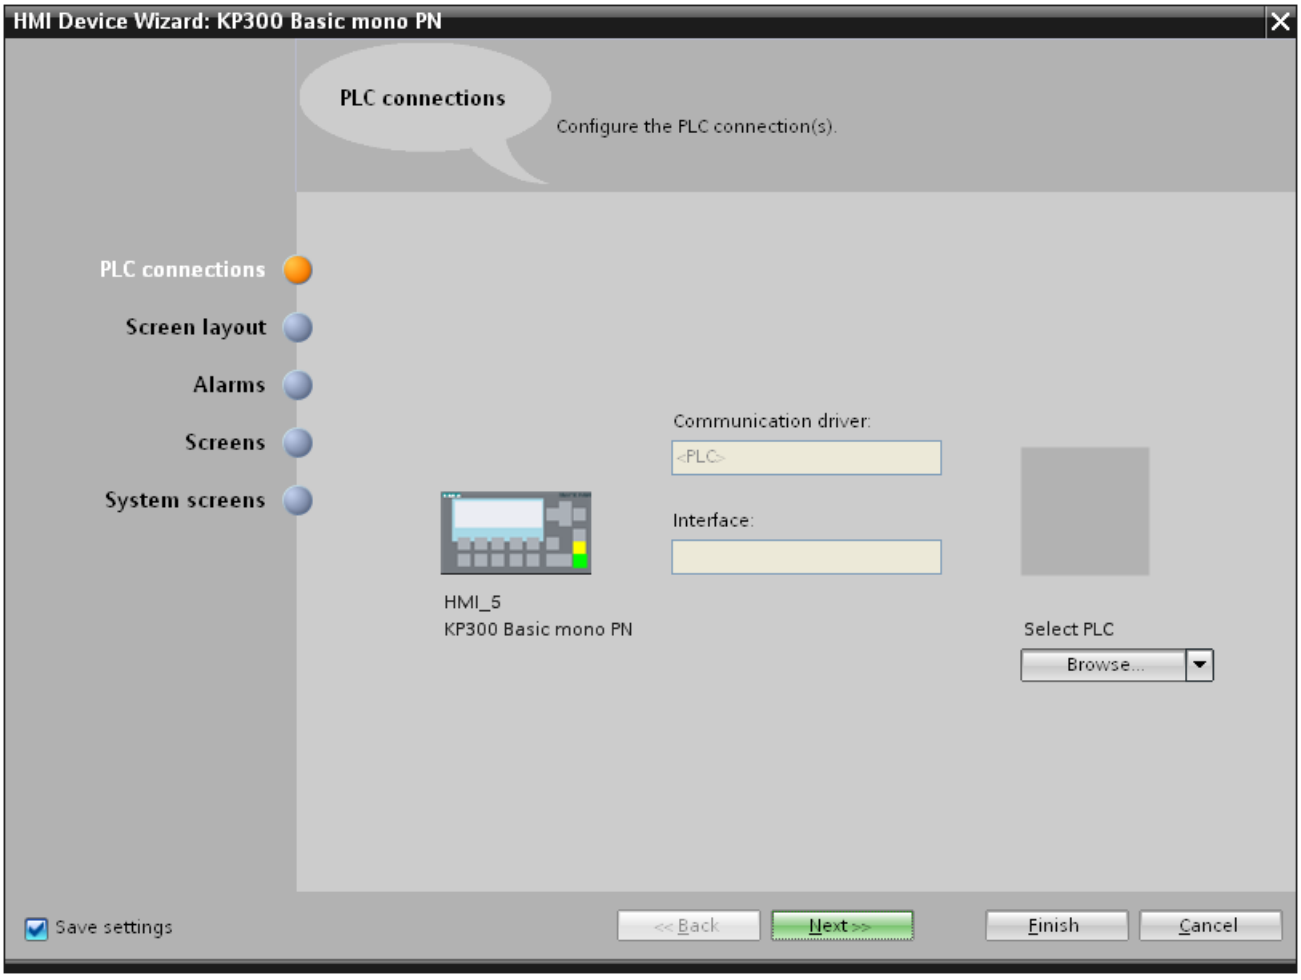
12.12.1 HMI device wizard basics

Introduction

The HMI device wizard will automatically start when you create a new HMI device in your project.

HMI device wizard

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.



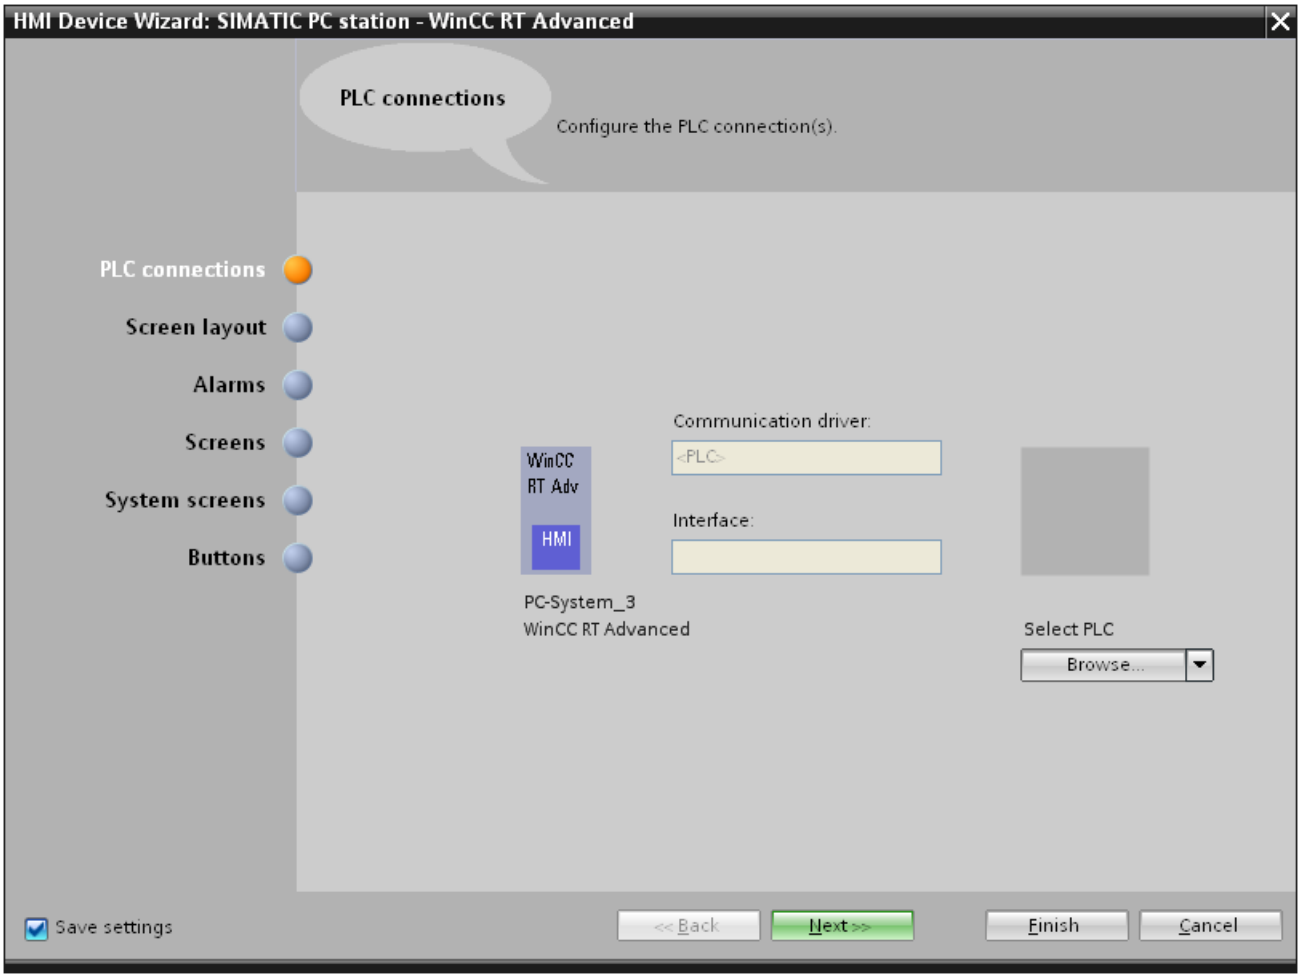
See also

HMI device wizard basics (Page 6770)

12.12.2 HMI device wizard basics

Introduction

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.



Opening the HMI device wizard

1. Add a new device to your project, for example, RT Advanced.
2. Click on the device in the project tree.
3. Select "Start the HMI device wizard" in the shortcut menu. The "HMI device wizard" opens.

Note

If you make changes after adding the device, such as adding a new screen, the HMI device wizard will not open again.

Note

When you create a device with a color display using the HMI device wizard, the graphics of the navigation buttons may be displayed in black and white. This error only occurs, however, if the new device is created with the same name as a device with a monochrome display which has been deleted in the meantime.

You can avoid this error by always deleting the associated graphics in the Graphics collection whenever you delete a device from the project.

HMI device wizard basics (Page 6766)

12.12.3 Working with libraries

12.12.3.1 Basics on libraries

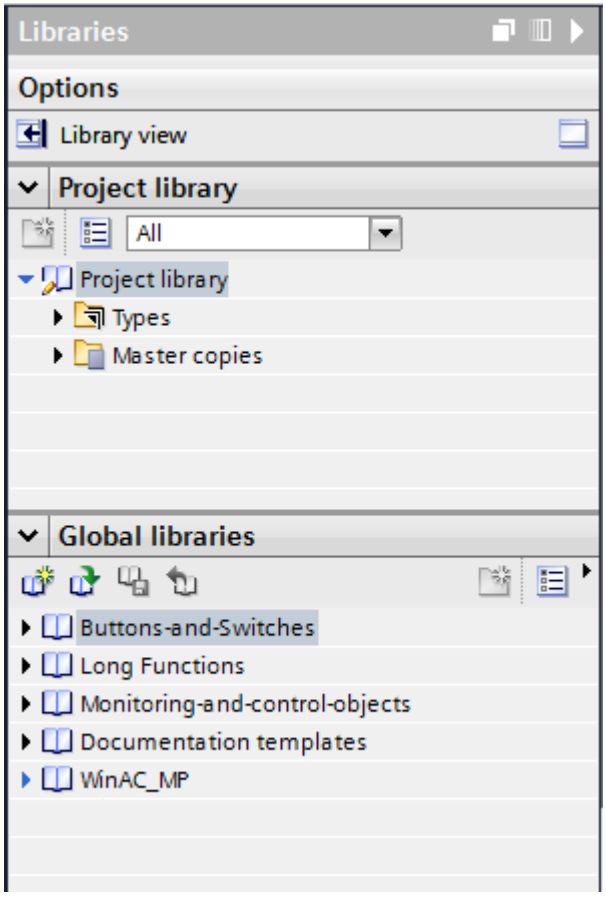
Introduction

Store all objects you need frequently in the libraries. An object that is stored in the library only has to be configured once. It can then be used repeatedly as often as required. Library objects extend the number of available screen objects and increase the effectiveness during configuration through the multiple usage of ready-to-use objects.

Your WinCC software package is supplied with comprehensive libraries that contain, for example, "Motor" or "Valve" objects. You may, however, define your own library objects.

You manage libraries in the "Libraries" task card or library view. The following libraries are available:

- Project library
- Global libraries



Note

There is a symbol library in the "Tools" task card in the "Graphics" palette.

Project library

There is one library for each project. Objects of the project library are stored alongside with the project data and are available only for the project in which the library was created. If the project is moved to another PC, any project library created in it is also moved.

To use the library object of the project library in other objects, move or copy the object into a global library.

Global libraries

A global library is saved independently of the project data in its own file with the extension *.al12.

A project can access several global libraries. A global library may be used concurrently in several projects.

When a library object is changed by a project, this library will be changed in all projects in which these libraries are open.

Library objects

A library can contain all WinCC objects. Examples:

- Complete HMI device
- Screens
- Display and control objects including tags and functions
- Graphics
- Tags
- Alarms
- Text and graphics lists
- Faceplates
- User data types

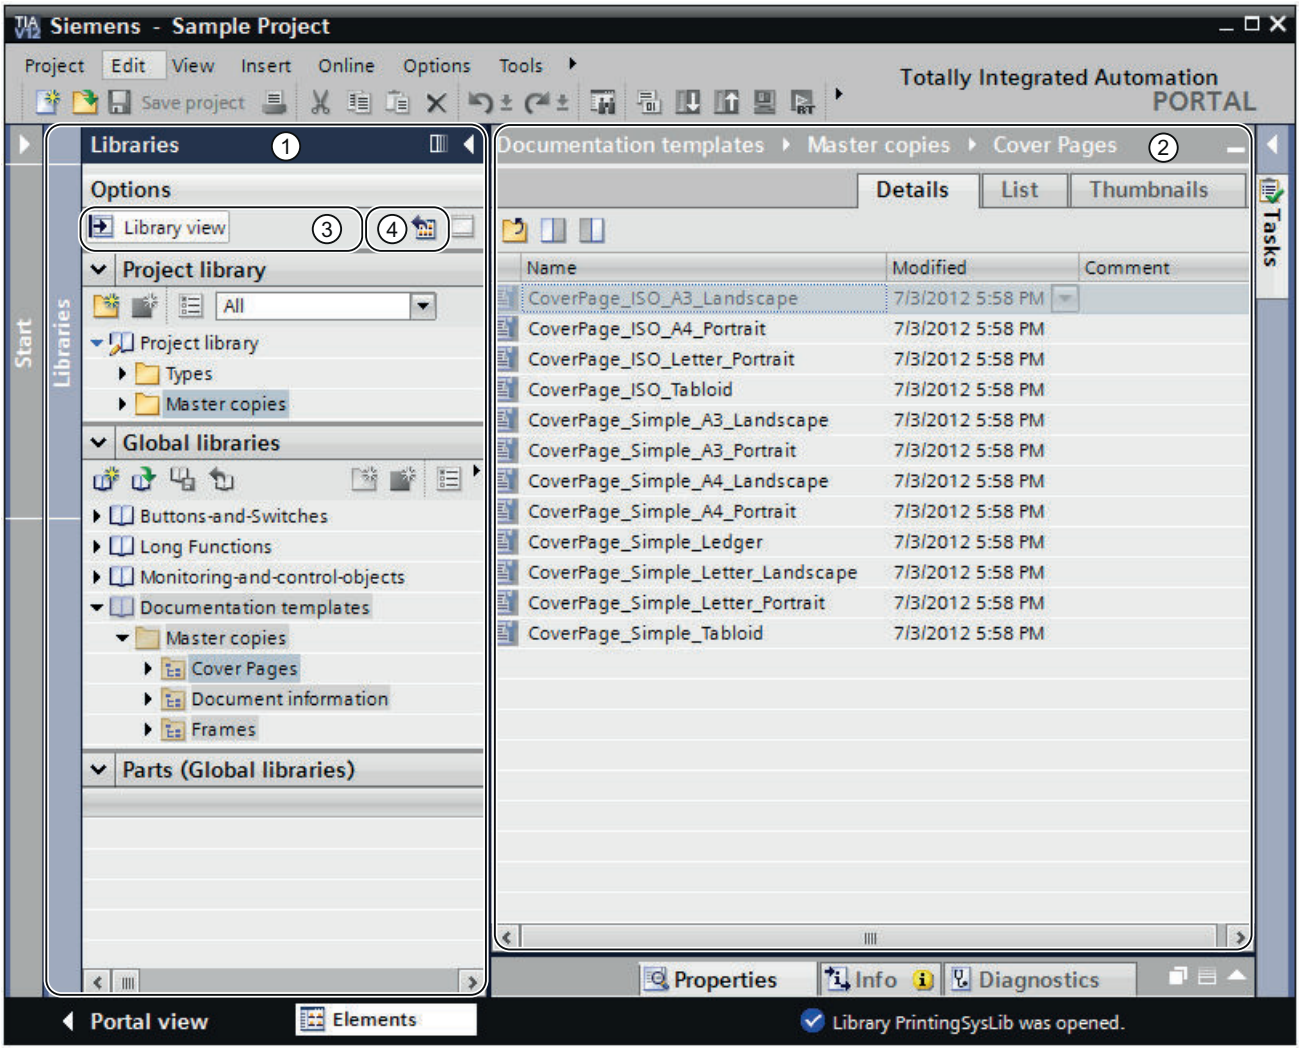
12.12.3.2 Overview of the library view

Function of the library view

The library view combines the functionality of the "Libraries" task card and the overview window. In the library view, the elements of a library are displayed in various views. In the details view, for example, you see additional properties of the individual elements. You can also edit and version the types in the library view.

Layout of the library view

The following figure shows the components of the library view:



1	Library tree
2	Library overview
3	"Library view" button
4	"Open or close library overview" button

Library tree

The library tree is similar to the "Libraries" task card, apart from a few minor differences. In contrast to the task card, there is no "Elements" palette, because the elements are displayed in the library overview. In addition, you can close the library view in the library tree, or open and close the library overview.

Library overview

The library overview corresponds to the overview window and displays the elements of the currently selected object in the library tree. You can display the elements in three different views. You can also perform the following actions in the library overview, for example:

- Copying elements
- Moving elements
- Versioning types
- Editing faceplates and HMI user data types
- Editing type instances

12.12.3.3 Master copies and types

Introduction

Both the "Project library" and the "Global library" contain the two folders "Master copies" and "Types". You can create or use the library objects either as a master copy or a type.

Master copies

Use master copies to create independent copies of the library object.

Types

Create instances of objects of the "Types" folder and use these in your project. The instances are bound to their respective type.

Administration of the library objects

You can copy and move library objects to another library. You can only copy master copies to the "Master copies" folder or any sub-folder of "Master copies". You can also only insert types in the "Types" folder or any sub-folder of "Types".

See also

Basics on libraries (Page 6769)

State of type versions (Page 6791)

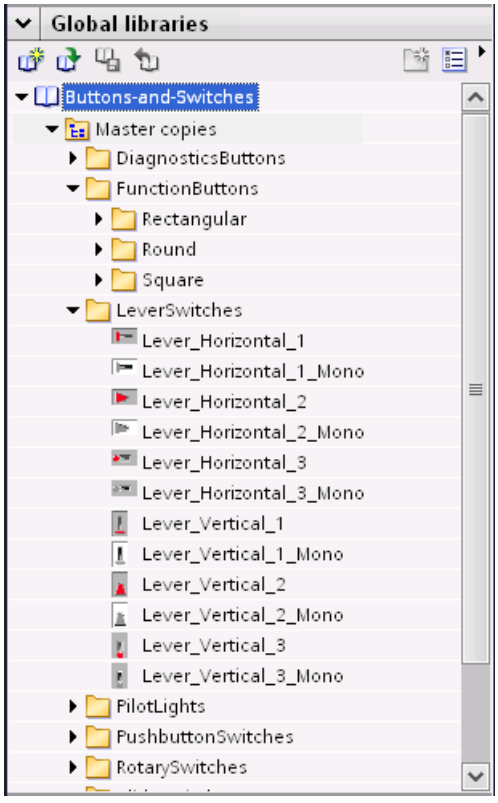
12.12.3.4 Libraries in WinCC

Introduction

The WinCC software package includes extensive libraries. Sorted by topic into folders, they contain preassembled graphic objects which you can use in screens for operation and monitoring of your plant.

Global library "Buttons and Switches"

The libraries "Buttons and Switches" offer a wide selection of buttons and switches.



The folders divide switches and buttons into categories. The "DiagnosticsButtons" folder contains the object "System diagnostics indicator", for example. You use the "System diagnostics indicator" object for system diagnostics in your plant.

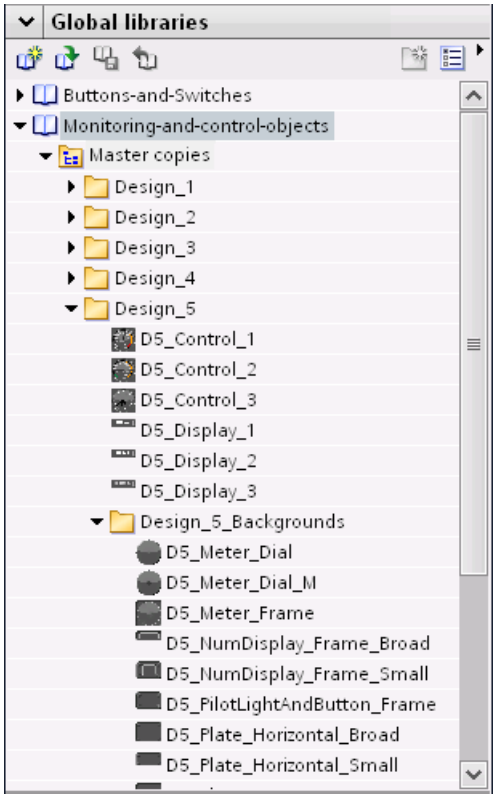
Note

You can only use the objects in the "DiagnosticsButtons" folder on Comfort Panels.

You cannot use objects which have "Switch" in the object name or in the associated folder name in Runtime Professional.

Global library "Monitoring and Control objects"

The "Monitoring and Control objects" library offers more complex display and operating objects in several designs and corresponding control lights, buttons and switches.



In addition, graphics views for the designs are stored in the "Design_Backgrounds" folder; they can be used as object backgrounds for the custom extension of the scope of the library.

Note

You cannot use objects which have "Switch" in the object name in Runtime Professional. The same applies for the object "D5_Display_3" with the date/time field it contains.

12.12.3.5 Managing libraries

Overview of the library management

Function of the library management

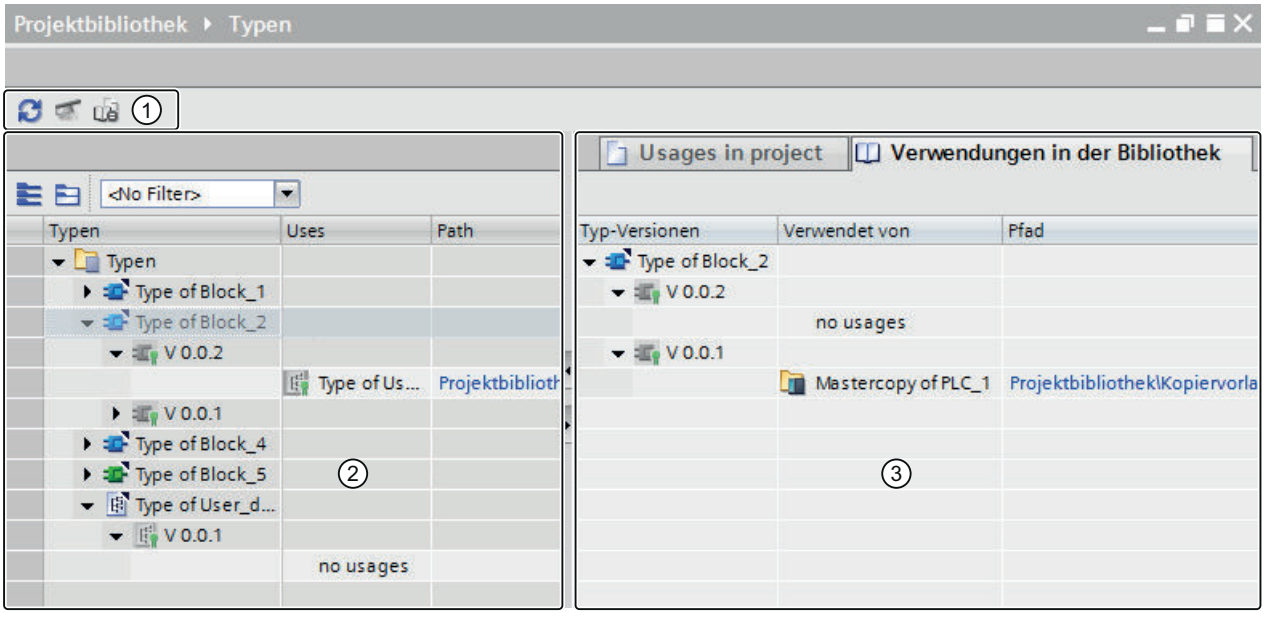
Master copies and types with dependencies to other library elements are subject to some functional restrictions. They can, for example, not be deleted as long as dependencies still exist. This prevents other library elements from becoming useless. The library management is used to identify the dependencies and to create an overview of the work progress.

The library management offers the following functions:

- Display of the correlations of types and master copies
  If a type is referenced in other types or master copies, the correlations are displayed in the library management. You will also be able to see which library elements reference a type or a master copy.
- Display of points of use of types in the project
- Display all types that include a version with the "In testing" or "In progress" status

Layout of the library management

The following figure shows the components of the library management:



① Toolbar of the library management
② "Types" area
③ "Uses" area

Toolbar of the library management

You can perform the following tasks in the toolbar of the library management:

- Update view
  If the project was changed, you can update the view of the library management.
- Clean up library
  You can clean up the project library and global libraries. By cleaning up a library, you delete all types and type versions that are not linked to an instance in the project.
- Harmonize project
  By harmonizing a project, you adapt the names and the path structures of type uses in the project to the corresponding names and path structures of the types within a library.

"Types" area

The "Types" area displays the contents of the folder that you have selected in the library view. You can open or close all types by using the buttons in the toolbar of the "Types" area. You can also use the "Filter" drop-down list to filter the view and display all types with the "In testing" or "In progress" status only. For each type, the types that it references are displayed.

"Uses" area

The "Uses" area gives you an overview of the points of use of the selected types and master copies. The "Uses" area is divided into two tabs:

- "Uses in the project" tab
  The "Uses in the project" tab is used to show the instances of type versions and their respective point of use in the project. When you select an instance, you can show the cross references of the instance in the project in the Inspector window.
- "Uses in the library" tab
  The "Uses in the library" tab is used to show all points within the library at which a type or a master copy is used.

Opening library management

Procedure

To open the library management, follow these steps:

1. Open the library view.
2. Select a type or any folder that contains types.
3. Select the "Library management" command from the shortcut menu.

Result

The library management opens and the types are displayed with their versions.

Filtering types in the library management

Introduction

A filter function in the library management enables you to limit the displayed types. The following filters are available:

- Display all types that include a version with "in progress" status
- Display all types that have no instances in the project
- Display all types that have more than one version
- Display all released types

Requirement

At least one type has been created.

Filtering for all types with "in progress" status

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder. The library management opens.
3. Select "Pending changes" from the "Filter" drop-down list. The "Types" area only displays types that have the "in progress" status.

Filtering for all types that have no instances in the project

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder. The library management opens.
3. Select "No instances in project" from the "Filter" drop-down list. The "Types" area only displays types that have the "in progress" status.

Filtering for types with multiple versions

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder. The library management opens.
3. Select "Multiple versions" from the "Filter" drop-down list.
4. The "Types" area only displays types that have more than one version.

Filtering for all released types

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder.
   The library management opens.
3. Select "Released types" from the "Filter" drop-down list.
   The "Types" area only displays types that have released versions.

Opening library management (Page 6777)

Creating a faceplate type (Page 4062)

Creating a global library

Introduction

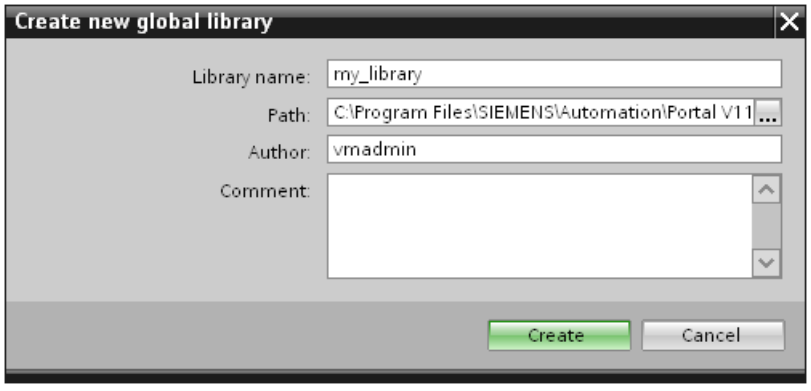
In the libraries you store the configured objects that you want to use several times in your configuration. To use objects in several projects, create a global library.

Requirement

- A project is open.
- The "Libraries" task card is displayed or the "Library view" is open.

Procedure

1. Click the icon under "Global library".
   The "Create new global library" dialog opens.



2. Enter a name.
3. Select the path where the new library is to be stored.
4. Click "Create".

Result

The new library is shown in the "Global libraries" palette. The global library contains the "Types", "Master copies" and "Common data" folders. Under the "Common data" you can find reports for the global library.

A folder with the name of the global library is created in the file system at the storage location of the global library. This actual library file is given the file name extension ".al12".

See also

Basics on libraries (Page 6769)

Saving a global library

Introduction

A global library is stored in a separate file on your hard disk drive. The file contains the objects of the global library including the referenced objects. E.g. the reference of a tag which was configured on an I/O field is also saved in the library.

WinCC prompts you to save the global libraries when you close WinCC or your project without saving. You also can store the global library during configuration, without storing the entire project.

Requirement

- You have opened a project which contains at least one library.
- displayed or the library view is open.
- .

Procedure

1. 
you want to save.
2. Click the icon in the "Global library" palette.

You can alternatively select the "Save Library" command in the shortcut menu.

If you want to store the global library in a different folder, select "Save as" in the shortcut menu. Select the path in which you want to store the new library and enter a file name.

Result

The global libraries are saved under their current file name or a file name you have specified.

See also

Basics on libraries (Page 6769)

Opening a global library

Introduction

In WinCC, the global libraries are stored in separate files. You can use a global library in every project.

Requirement

- You have saved a global library.
- A project is open.
- The "Libraries" task card is displayed or the library view is open.

Procedure

1. Click the  icon in the "Global library" palette.
   The "Open global library" dialog box is displayed.
2. Select the path in which the library is stored.
3. Click "Open".

Note

To have the access to a global library from multiple projects, open the global library read-only. As soon as a global library is not opened read-only, access from other projects is blocked.

Result

WinCC displays the opened global library in the "Global library" palette.

See also

Basics on libraries (Page 6769)

Displaying logs of global libraries

Logs listing all changes made to the global library are created when global libraries are updated. The logs are stored together with the global library and are always available once you have opened the global library.

Procedure

To open the logs of a global library, follow these steps:

1. Open the global library in the "Libraries" task card or in the library view.
2. Open "Common data > Logs" in the lower-level folder.
3. Double-click the required log.
   The log opens in the work area.

Updating a project with the contents of a library

Introduction

After you have edited several types in the project library, update all instances in the project to the most recent version of the types from the project library.

Requirement

The "Libraries" task card or the library view is open.

Procedure

1. Select the project library.
2. Select "Update > Project" from the shortcut menu. A dialog opens.
3. Select either the entire project or individual devices for the update.
4. Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.

Result

All instances of the types are updated in the project to the most recent version of the selected types in the project library.

You can find a log of the update process in the project tree under "Common data".

Updating a library with the contents of another library

The following options are available for updating libraries:

- Updating a global library with types from another global library
- Updating the project library with types from a global library

Each of the following elements can be selected as source for the update:

- An entire library
- Individual folders within a library
- Individual types

Requirement

To update a global library, open the library with write rights.

Requirement

The "Libraries" task card or the library view is open.

Procedure

To update a library with the contents of a different library, follow these steps:

1. Select the entire library or a folder within the library or individual types.
2. Right-click the source and select the "Update > Library" command from the shortcut menu. The "Update library" dialog box opens.
3. Select the type of library you want to update:
   - Select "Update the project library" to update the project library with types from a global library.
   - Select "Update a global library" if you want to update a global library.
4. Optional: Select the global library you want to update from the drop-down list.
5. Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
6. Click "OK" to confirm.

Result

- Types not yet available in the target library are supplemented there with all their versions. More recent versions are added to the types that already exist in the target library.
  If a more recent version of a type already exists in the target library, the latest version is nevertheless copied and automatically assigned a newer version number.
- A log listing all performed changes to the target library is created for the update process.
  If you have updated the project library, you can find the log in the project tree under "Common data > Logs".
  If you have updated a global library, you can find the log in the "Common data > Logs" folder in the level below the global library.

12.12.3.6 Managing objects in a library

Displaying library objects

Introduction

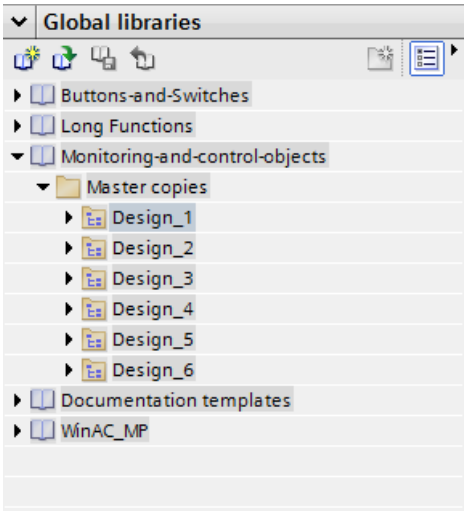
The libraries are displayed as file folders in the corresponding palette. The elements contained in the library are displayed in the file folder and in the "Elements" palette.

Requirement

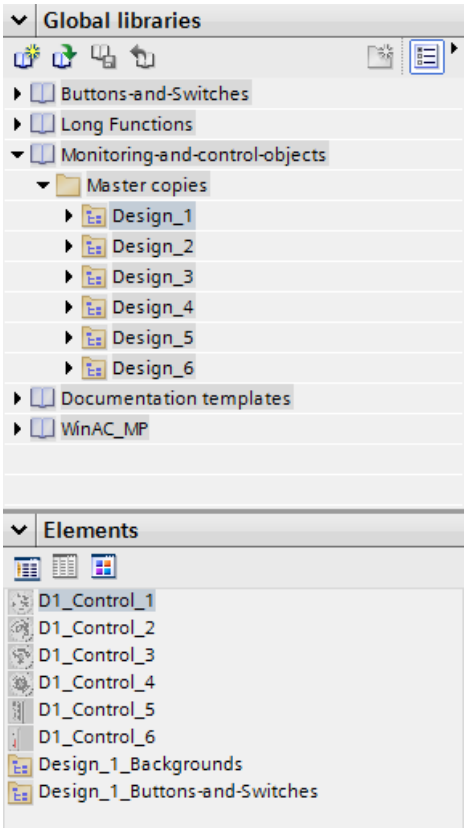
- At least one library object has been created in a library.
- The "Libraries" task card is opened.

Procedure

1. Select the library in the corresponding palette whose library objects you want to display.



2. Click .
The contained library objects are displayed in the "Elements" palette.



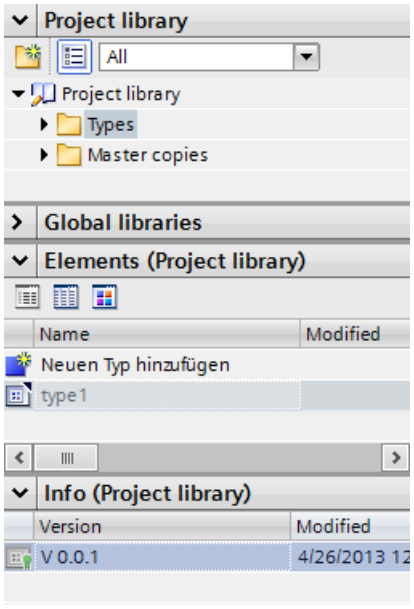
3. Click one of the following icons:

Icon	Description
	Element view in detailed mode
	Element view in list mode
	Element view in overview mode with icons

When several objects are assigned to the library with a multiple selection, only one of the objects is shown in the "Elements" palette. The individual components of this element are displayed in the "Parts" palette.

Show parts of the library objects

1. Select the library in the corresponding palette from which you want to view the components of an element.
2. Click  .
3. The contained library objects are displayed in the "Elements" palette.
4. Select the element.
   The "Parts" palette shows the objects of which the element consists.



Result

The library objects are displayed in accordance with the configuration. The components of the faceplates are displayed.

Basics on libraries (Page 6769)

Storing an object in a library

Introduction

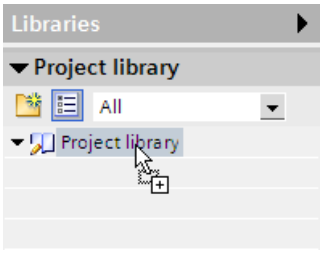
You can store all of WinCC objects, such as screens, tags, graphic objects or alarms in your libraries. You can use drag-and-drop to move the corresponding object from the work area, project window or detail view to the library. In a library you have divided into categories, you can directly add objects to a specific category.

Requirement

- The "Screens" editor is open.
- A screen object has been created in the work area of the screen.
- The created libraries are displayed.

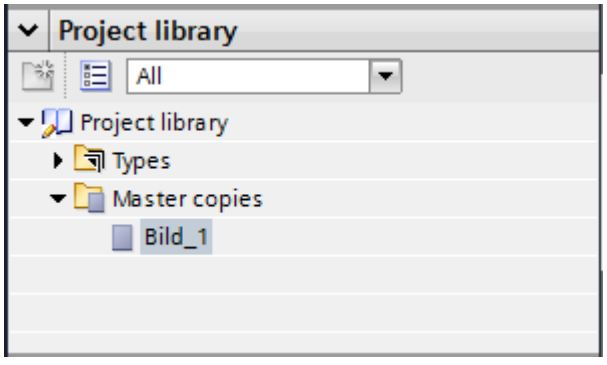
Procedure

1. Select the object in the work area of the "Screens" editor.
2. Drag-and-drop the object from the work area to the desired library.
   The mouse pointer is transformed into a crosshair with an appended object icon.



Result

The object is saved to the library for further use in multiple instances of your configuration.



See also

Basics on libraries (Page 6769)

Inserting a library object

Introduction

The system always assigns the inserted library object a name which consists of the name of the object type and of a consecutive number.

If the inserted object already exists, you have the option of replacing the object or of saving it under a new name.

You cannot insert library objects that are not supported by the HMI device.

Note

If you insert a screen with interconnected template from the library, the template will also be inserted. Any existing matching template is not used.

Requirement

- The "Libraries" task card is opened.
- The editor in which you want to insert the library object is open.

Procedure

1. Select a library object from the library.
2. Drag-and-drop the library object to the position in the work area where you want to insert the object.
   The library object is inserted.

Result

If the object was contained in the "Copy templates" folder, you have inserted an independent copy of the library object in the editor.

If the object was contained in the "Types" folder, you have inserted an instance of the library object in the editor.

See also

Basics on libraries (Page 6769)

12.12.3.7 Using types and their versions

State of type versions

Introduction

Depending on the point of use, the version of a type has different statuses.

Released version

The "released version" status is available for all types, regardless of the point of use.

If you want to edit a released version, you must first create a new test version or an "in progress" version.

Released type versions of scripts and screens can be opened and viewed at their instance.

"In progress" version

The "in progress" status is possible for the following types:

- Faceplates
- User data
- Styles
- Style sheets

When you create a new type or a new version of a released type, the type is assigned the status "in progress".

Types with the "in progress" status can be edited in the library view without the need for a reference to an instance in the project. Upon release, the compatibility of the type is tested by a consistency check.

"In testing" version

Only versions of scripts and HMI screens have the "in testing" status.

When you create a new version of a type, the type is assigned the status "in testing".

A version with "in testing" status is linked to an instance in the project. You can set only one version to "in testing" for each type at a given time.

A version in testing may only be linked to a single instance in the project. Therefore, it is not possible to copy an instance to the clipboard, to duplicate it or to create an additional type from the instance as long as it has "in testing" status.

See also

Generating a script as a type (Page 6792)

Generating a screen as a type (Page 6792)

Creating a faceplate type (Page 4062)

Create a new version of a type (Page 6794)

Master copies and types (Page 6773)

Generating a script as a type

Requirement

- A project is open.
- An HMI device has been created and opened.
- The project tree is open.
- The "Libraries" task card is opened.

Procedure

1. Open the "Scripts" editor in the project tree.
2. Create a new script.
3. Select the script in the project tree.
4. Drag-and-drop the script into a library in the "Libraries" task card. A dialog opens.
5. Enter a name.
6. Enter a comment.

Result

You have created a type version of a script in the library. The created type is stored as a released version in the library. An instance of the type is used in the project.

To change the script create a new version of the script.

See also

State of type versions (Page 6789)

Generating a screen as a type

Requirement

A project is open.

An HMI device has been created and opened.

The project tree is open.

The "Libraries" task card is opened.

Procedure

1. Open the "Screens" editor in the project tree.
2. Create a new screen.
3. Select the screen in the project tree.
4. Drag-and-drop the screen into a library in the "Libraries" task card. A dialog opens.
5. Enter a name.
6. Enter a comment.

Result

You have created a type of a screen in the library.

The created type is stored as a released version in the library. An instance of the type is used in the project.

To change the screen create a new version of the screen.

See also

State of type versions (Page 6789)

Generating a style as a type

Introduction

To define a new style, add a new type in the project library.

Adding a new style

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library. A dialog opens.
3. Select "HMI style".

Result

The new style is created and displayed under its selected name in the project library. The HMI style type is assigned the status "in progress" and the version 0.0.1.

Creating a style sheet as a type

Introduction

To define a new style sheet, add a new type in the project library.

Adding a new style sheet

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library. A dialog opens.
3. Select "HMI style sheet".
4. Assign a meaningful name to the style sheet.
5. Select the style sheet category from the list.

Result

The new style sheet is created and displayed under its selected name in the project library.

The HMI style sheet type is assigned the status "in progress" and the version 0.0.1.

Create a new version of a type

Principle

If you create a new version of a type, the point of use of the type determines the status of the newly created version.

Requirement

The "Libraries" task card is opened.

A type has been created and released.

Procedure

1. Select the released type.
2. Select "Edit type" in the shortcut menu.

Result for types of faceplates, user data, and styles

A new version of the type is created.

The version has the status "in progress". The library view opens.

Result for types of scripts and screens

A dialog opens.

After you have selected the settings in the dialog, the version is set to the status "in testing". The instance used in the project is set to the status "in testing". The library view opens.

State of type versions (Page 6789)

12.12.4 Importing and exporting project data

12.12.4.1 Importing and exporting project data

Introduction

WinCC gives you the option of exchanging project data between the projects or copying them to external applications.

Exporting and importing between projects

You can export the following project data from a project and import them into another project.

- Recipe data records
- Alarms
- Tags
- Text lists
- Project texts

Exporting and importing reduces the workload. Instead of creating new data records, you use data already created in previous projects.

Editing the export file

The following file formats are available for export and import depending on the editor:

- *.xlsx for alarms, tags, project texts and text lists
- *.csv for recipe data records

You can edit the import file in Excel, for example.

XLSX file format

XLSX format is a file format for Excel tables based on the Open XML format. XLSX files are optimized for Microsoft Excel 2007.

You can sort the columns as required in the XLSX file.

CSV file format

CSV stands for Comma Separated Value. In this format, the columns of the table that contain the names and the value of the entry are separated by semicolons. Each table row terminates with a line break. You can also open the CSV file for editing in Excel.

Importing project data

When project data is imported, the objects in the project are created.

The syntax of the import file is checked during import. The accuracy of the values imported and dependencies between the imported values are not checked.

Any errors found in the imported data are reported when the project is compiled.

Copying in Excel format

In all spreadsheet editors you can copy the content in Excel format into the buffer of your PC. Then you insert the project data in Excel format directly into any application outside the TIA Portal. To this purpose you use the corresponding command in the shortcut menu of the work area:

- If you select the command in the shortcut menu of the line header, the complete line is copied into the buffer.
- If you select the command in the shortcut menu of a cell, only the cell content is copied into the buffer.
- If you select several lines and select the command, all marked data are always copied into the buffer.

This data exchange is only possible as an export.

12.12.4.2 Import and export of recipes

Exporting recipes

Introduction

WinCC features an export function for exporting data records from recipes.

Requirements

- The WinCC project for the export is open.
- Recipes have been created in a project.
- The "Recipes" editor is open.

Exporting recipes

1. In the "Recipes" editor, select the recipe with the data records you want to export.
2. Click .
   The "Export" dialog box opens.

   The selected recipe is shown under "Recipe selection".
3. Under "Content selection", specify if all or only selected data records are to be exported.
4. Under "File selection", specify the file in which the recipe data is to be stored.
5. Specify the list separator and decimal separator under "Data separation".
6. Click "Export."
   The export will start.

Result

The exported data has been written to a CSV file. The CSV file will be stored in the specified directory.

Importing recipes

Introduction

Recipes are identified by their name. The recipe name must therefore be unique. Open the import file in a simple text editor to check that it has the correct data structure.

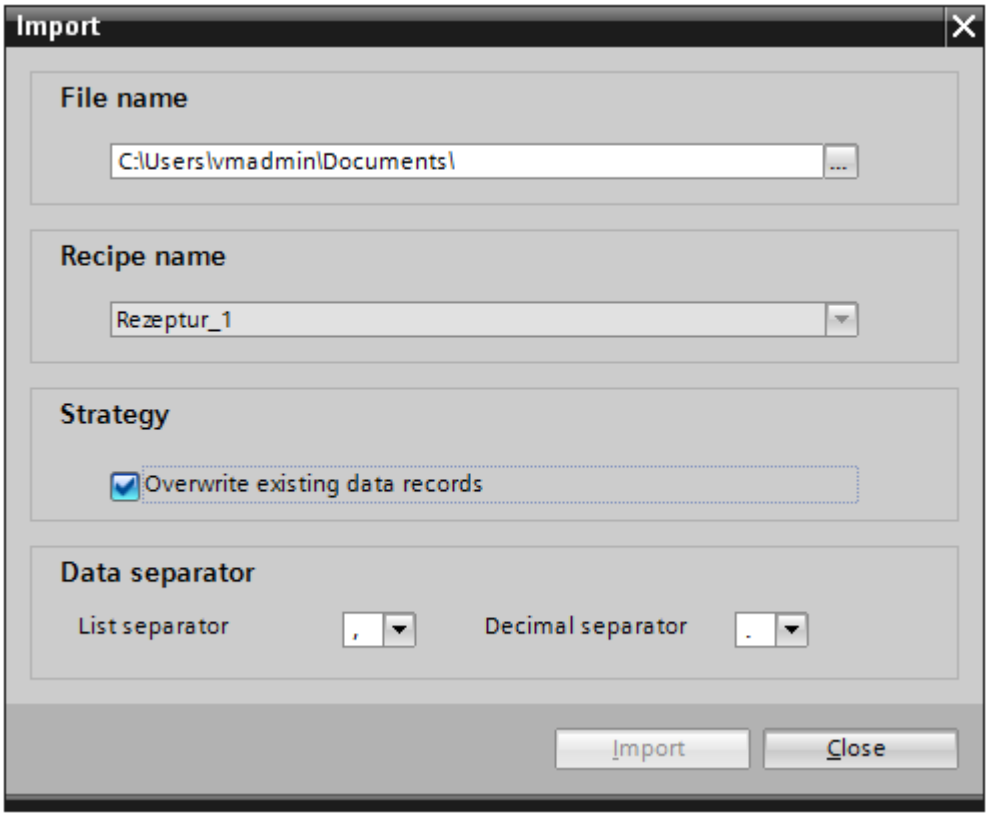
Specify whether or not existing data records should be overwritten by records with the same name during the import.

Requirements

- A CSV file containing at least one recipe has been created.
- The WinCC project for the import is open.
- The "Recipes" editor is open with at least one recipe.

Importing a recipe

1. In the "Recipes" editor, select the recipe with the data records you want to import.
2. Click  .
   The "Import" dialog box opens.



The selected recipe is shown under "Recipe selection".

3. Select the file you want to import under "File selection".
4. Under "Strategy", specify if existing data records should be overwritten by records of the same name.
5. Under "Data separation", select the list separator and the decimal separator to use in the CSV file.
6. Click "Import".
   The import will start.

Result

The data records are created in the selected recipe. Depending on the setting for "Strategy", existing data records are overwritten by records with the same name from the CSV file.

Existing data records with the same name will also be imported from the CSV file if you deactivate the "Overwrite existing data records" option.

Format of recipe data

Introduction

This section describes the required format of the file for the import of recipes. The file containing the data of the recipes must be available in "*.csv" format. :

Structure of recipe data

The structure of the import file is fixed. The following example shows the structure of a recipe containing two recipe elements, each with two data records:

```
List separator=<List separator>Decimal symbol=<Decimal
separator><List separator><Line break>
<Name of the recipe><List separator><List separator><Line break>
LANGID_<ID of the language><List separator>
<Display name, recipe element 1><List separator>
<Display name, recipe element 2><Line break>
<Number recipe><List separator>
<Recipe data record number 1><List separator>
<Recipe data record number 2><Line break>
<Tag recipe element 1><List separator>
<Recipe data record 1 value 1><List separator>
<Recipe data record 2 value 1><Line break>
<Tag recipe element 2><List separator>
<Recipe data record 1 value 2><List separator>
<Recipe data record 2 value 2><Line break>
```

ID of the language

Use the "Windows language ID" in decimal notation, e.g. "1033" for English. Additional information is available in the documentation for the Windows operating system.

12.12.4.3 Importing and exporting alarms

Exporting alarms

Introduction

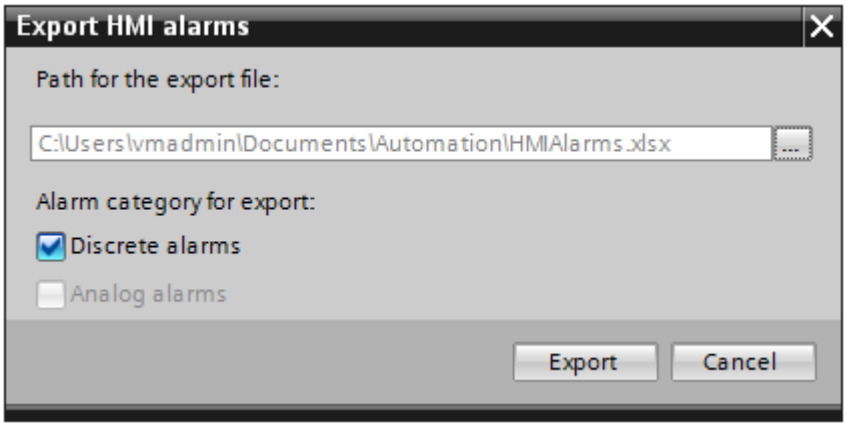
WinCC has an export function for alarms.

Requirements

- The WinCC project for the export is open.
- Alarms have been created in the project.
- The "HMI alarms" editor is open.

Exporting alarms

1. Click the  button in "Discrete alarms" or "Analog alarms".
   The "Export" dialog box opens.



2. Click the "..." button and specify in which file the data are saved.
3. Specify whether you want to export "Disrete alarms" or "Analog alarms".
4. Click "Export". The export will start.

Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

See also

Importing alarms (Page 6801)

Format of the analog alarm data (Page 6802)

Format of the discrete alarm data (Page 6805)

Importing alarms

Introduction

Alarms are identified by their alarm number. The alarm numbers must be unique in the analog and discrete alarm types. Alarms with redundant alarm numbers will be overwritten. An alarm without an existing alarm number is created.

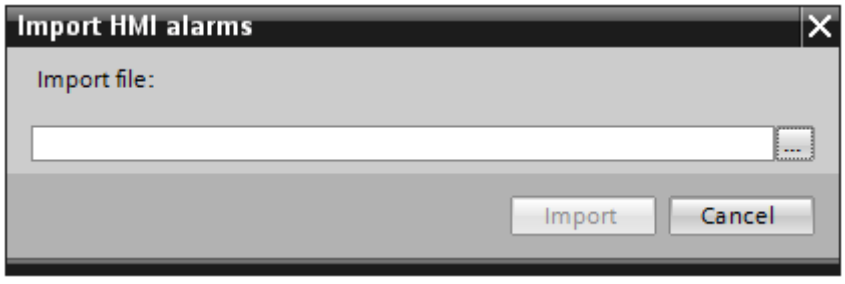
Any empty list entries for existing alarms contained in an xlsx file will be ignored for the purposes of the import. The entries of the existing alarms remain active and will not be replaced by empty ones.

Requirements

- An xlsx file with alarms has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.
- The "HMI alarms" editor is open.

Importing alarms

1. Click the button in "Discrete alarms" or "Analog alarms". The "Import" dialog box opens.



2. Click the "..." button and select the file that you want to import.
3. Click on the "Import" button. The import will start. A progress bar indicates the progress of the import operation.

Result

The corresponding alarms including alarm texts are created in WinCC on the basis of the import data. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign a trigger tag of an incorrect type, such as string, to an alarm. An error will be reported during compilation.

See also

Exporting alarms (Page 6798)

Format of the discrete alarm data (Page 6805)

Format of the analog alarm data

Introduction

This chapter describes the required format of the file for the import of analog alarms. The file containing the analog alarm data must be in "*.xlsx" format.

Structure of the alarm data

The import file in Microsoft Excel consists of a number of worksheets:

- Analog alarms(Analog alarms)
- Limits (Limits)

Each alarm is assigned a separate row in the import file. The import file with the analog alarms must be formatted as follows:

Example of the worksheet "Analog alarms"

	A	B	C	D	E
1	ID	Name	Event text [en-US], Alarm text	FieldInfo [Alarm text]	Class
2	1	Analog_alarm_1	AA1 Error-AC with maximum text length: abcdefghijklmnopqrstuvwxyz		Errors
3	2	Analog_alarm_2	AA2 Warning-AC this text should be bold		Warnings
4	3	Analog_alarm_3	AA3 SDm-AC this text should be italic		SDm
5	4	Analog_alarm_4	AA4 SDo-AC <u>this text should be underlined</u>		SDo
6	5	Analog_alarm_5	AA5 SystemAcknowledgement-AC <blink>this text should be flashing<		System_Ackn
7	25	Analog_alarm_25	Internal AA23 switchDT: Deadband mode in case of violation - value HL		AADT-Interna
8	26	Analog_alarm_26	Internal AA23 switchDT: Deadband mode in case of violation - percent		AADT-Interna
9	31	Analog_alarm_31	Internal AA23 switchDT: Low limit violation static		AADT-Interna
10	32	Analog_alarm_32	Internal AA23 switchDT: High limit violation static		AADT-Interna
11	33	Analog_alarm_33	Internal AA23 switchDT: Low limit violation dynamic		AADT-Interna
12	34	Analog_alarm_34	Internal AA23 switchDT: High limit violation dynamic		AADT-Interna
13	35	Analog_alarm_35	Internal AA23 switchDT: delay 3 seconds High limit violation		AADT-Interna
14	42	Analog_alarm_40	Internal AA23 switchDT: delay 3 seconds Low limit violation LLV		AADT-Interna
15	23	Analog_alarm_41	AA23 DT in event text: <field ref="0" /> Bool, <field ref="1" /> Byte, <fi	<ref id = 0; type = AlarmTag; T	ACAT
16	24	Analog_alarm_42	AA24 DT in event text: <field ref="0" /> Timer, <field ref="1" /> Counte	<ref id = 0; type = AlarmTag; T	ACAT

Table 12-156 Meaning of the entries

List entry	Meaning
ID	The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Name	Name of the analog alarm
Event text [de-DE], Alarm text	Displays the alarm text. The field designation contains a language ID. Alarm texts must be assigned a language ID for import. An expression with a reference ID will be added to the alarm text if the text has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign dynamic parameters to alarm texts.
FeldInfo	Specifies whether the alarm text contains dynamic parameters. The settings are separated by a semicolon ";". Example of dynamic parameters: Tag: <ref id = 0; type = AlarmTag; Tag = Tag1; DisplayType = Decimal; Length = 5;> Text list: <ref id = 1; type = CommonTextList; TextList = Textlist1; Tag = tag 2; Length = 5;>
Class	The class of an alarm determines whether or not the alarm must be acknowledged. It can also be used to determine how the alarm appears when it is displayed on the HMI device. The alarm class also determines whether and where the corresponding alarm will be logged.
Group	Indicates the allocation to an alarm group. If an alarm belongs to a group with other alarms, it can be acknowledged together with these alarms of the same group in a single operation.
Trigger tag	Specifies the tag monitored for limit value violation.
Delay time value	Specifies the delay time. The alarm is not triggered until the duration of the limit value violation equals the specified delay time.

List entry	Meaning
Delay time unit	Specifies the time unit for the delay.
Report	Enables reporting of the specific alarm on a printer. True or "1" = Reporting enabled. False or "0" = Reporting disabled. Reporting must also be globally enabled in the project.
Info text [de-DE], Info text	The tooltip is an optional property of an alarm. Tooltips can contain additional information about the alarm. A tooltip will be displayed in a separate window on the HMI device when the operator presses the <HELP> key. The field designation contains a language ID.

Example of the worksheet "Limits"

	A	B	C	D	E	F	G
1	Alarm ID	Limit type	Limit value	Limit mode	Deadband mo	Deadband valu	Deadband in percent
2	1	Constant	0	Upper limit	Off	0	False
3	2	Constant	1	Upper limit	Off	0	False
4	3	Constant	2	Upper limit	Off	0	False
5	4	Constant	3	Upper limit	Off	0	False
6	5	Constant	4	Upper limit	Off	0	False
7	25	Constant	50	Upper limit	On both	5	False
8	26	Constant	50	Upper limit	On both	10	True
9	31	Constant	50	Lower limit	Off	0	False
10	32	Constant	50	Upper limit	Off	0	False
11	33	Tag	AASDTdyn	Lower limit	Off	0	False
12	34	Tag	AASDT1dyn	Upper limit	Off	0	False
13	35	Constant	50	Upper limit	Off	0	False
14	36	Constant	50	Lower limit	On both	5	False

Table 12-157 Meaning of the entries

List entry	Meaning
Alarm ID	Alarm number The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Limit mode	Trigger mode Indicates the method used for monitoring the limit value.
Limit type	Specifies the limit that will be monitored. Both a tag and a constant can be used as limit value.
Limit value	Limit value Indicates the tag or constant monitored for limit violation.

List entry	Meaning
Deadband mode	Hysteresis mode Specifies whether and in which cases hysteresis will be used. For "Outgoing" For "Incoming" For "Incoming" and "Outgoing"
Deadband in percent	0 = The value specified for "Hysteresis" is considered to be absolute. 1 = The value specified for "Hysteresis" is referred to as a percentage of the limit value.
Deadband mode	Hysteresis Specifies a constant as a value of the hysteresis.

Note

"No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing alarm of the same name.

Exporting alarms (Page 6798)

Format of the discrete alarm data (Page 6805)

Format of the discrete alarm data

Introduction

This chapter describes the required format of the file for the import of discrete alarms. The file containing the discrete alarm data must be in "*.xlsx" format.

Structure of the alarm data

The import file in Microsoft Excel consists of the worksheets "Discrete alarms" (discrete alarms). Each alarm is assigned a separate row in the import file. Structure of the import file containing the discrete alarms:

Example of the worksheet "Discrete alarms"

	A	B	C	D	E	F
1	ID	Name	Event text [en-US], Alarm text	FieldInfo [Alarm text]	Class	Trigger t
2	1	Discrete_alarm_1	DA1 Error-AC with maximum text length: abcdefghijklmnopqrstuvwxyz äöü\na		Errors	HMI_AC
3	2	Discrete_alarm_2	DA2 Warning-AC this text should be bold		Warnings	HMI_AC
4	3	Discrete_alarm_3	DA3 SDm-AC this text should be italic		SDm	HMI_AC
5	4	Discrete_alarm_4	DA4 SDo-AC <u>this text should be underlined</u>		SDo	HMI_AC
6	5	Discrete_alarm_5	DA5 SystemAcknowledgement-AC <blink>this text should be flashing</blink>		System_Ackn	HMI_AC
7	6	Discrete_alarm_6	DA6 SystemNoAcknowledgement-AC mixed test: Bold, Italic, <l		System_No_A	HMI_AC
8	7	Discrete_alarm_7	DA7 DT in event text: <field ref="0" /> Integer, <field ref="1" /> Real, <field re	<ref id = 0; type = AlarmTag; Tag = Pl	ACAT	HMI_Tri
9	8	Discrete_alarm_8	DA8 DT in event text: <field ref="0" /> S5Time, <field ref="1" /> Timer, <field r	<ref id = 0; type = AlarmTag; Tag = Pl	ACAT	HMI_Tri
10	11	Discrete_alarm_9	DA11 DT in event text: <field ref="0" /> Int, <field ref="1" /> Real, <field ref="2	<ref id = 0; type = AlarmTag; Tag = In	ACAT	HMI_Tri
11	12	Discrete_alarm_10	DA12 DT in event text: <field ref="0" /> UDInt, <field ref="1" /> UInt;	<ref id = 0; type = AlarmTag; Tag = U	ACAT	HMI_Tri
12	13	Discrete_alarm_11	DA13 Textformat: Integer: <field ref="0" /> decimal, <field ref="1" /> binary, <	<ref id = 0; type = AlarmTag; Tag = H	ACAT	HMI_TF

Table 12-158 Meaning of the entries

List entry	Meaning
ID	The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Name	Name of the analog alarm
Event text [de-DE], Alarm text	Displays the alarm text. The field designation contains a language ID. For import, a language ID must be assigned to alarm text. An expression with a reference ID will be added to the alarm text if the text has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign dynamic parameters to alarm texts.
FeldInfo	Specifies whether the alarm text contains dynamic parameters. The settings are separated by a semicolon ";". Example of dynamic parameters: Tag: <ref id = 0; type = AlarmTag; Tag = Tag1; DisplayType = Decimal; Length = 5;> Text list: <ref id = 1; type = CommonTextList; TextList = Textlist1; Tag = tag 2; Length = 5;>
Class	The class of an alarm determines whether or not the alarm must be acknowledged. It can also be used to determine how the alarm appears when it is displayed on the HMI device. The alarm class also determines whether and where the corresponding alarm will be logged.
Group	Indicates the allocation to an alarm group. If an alarm belongs to a group with other alarms, it can be acknowledged together with these alarms of the same group in a single operation.
Trigger tag	Specifies the tag containing the bit that triggers the alarm.
Trigger bit	Specifies the number of the bit that triggers the alarm.
Acknowledge tag	Specifies the tag containing the bit that is set by the operator upon acknowledgment. Only available if the selected alarm class requires alarm acknowledgment.
Acknowledgment bit	Specifies the number of the bit that is set when the operator acknowledges the alarm.
PLC acknowledgement tag	Specifies the tag containing the bit that acknowledges the alarm of the control program. Only available if the selected alarm class requires alarm acknowledgment.

List entry	Meaning
PLC acknowledgment bit	Specifies the number of the bit that acknowledges the alarm of the control program.
Delay time value	Specifies the delay time. The alarm is not triggered until the duration of the limit value violation equals the specified delay time.
Delay time unit	Specifies the time unit for the delay.
Report	Enables reporting of the specific alarm on a printer. True or "1" = Reporting enabled. False or "0" = Reporting disabled. Reporting must also be globally enabled in the project.
Info text [de-DE], Info text	The tooltip is an optional property of an alarm. Tooltips can contain additional information about the alarm. A tooltip will be displayed in a separate window on the HMI device when the operator presses the <HELP> key. The field designation contains a language ID.

Note

"No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing alarm of the same name.

Format of the analog alarm data (Page 6800)

Importing alarms (Page 6799)

12.12.4.4 Importing and exporting tags

Exporting tags

Introduction

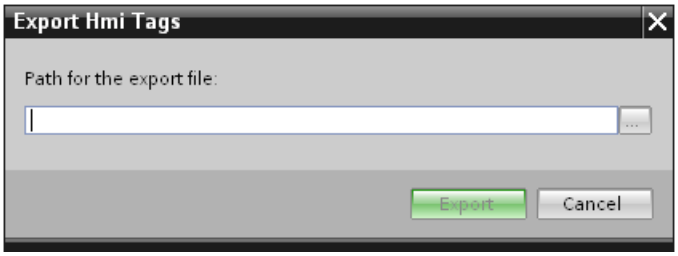
WinCC has an export function for tags.

Requirements

- The WinCC project for the export is open.
- Tags have been created in the project.
- The "HMI tags" editor is open.

Exporting tags

1. Click on the button in the "HMI Tags" tab.
   The "Export" dialog box opens.



2. Click the "..." button and specify in which file the data are saved.
3. Click "Export". The export will start.

Note

The version number of the xlsx file with the exported tags depends on the TIA Portal version. If the xlsx file was exported from a project in WinCC V13 SP1, it has the version number 1.2. If the xlsx file was exported from a project prior to WinCC V13 SP1, it has the version number 1.1.

Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

See also

Importing tags (WinCC V13 SP1 or higher) (Page 6808)

Format of the tag data (Page 6811)

Importing tags (WinCC V13 SP1 or higher)

Introduction

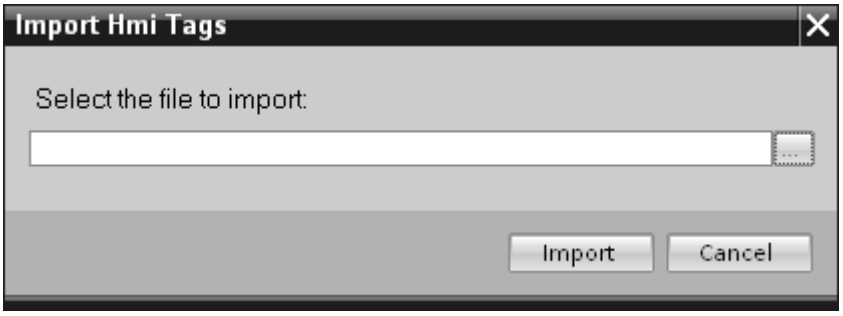
Tags are identified by the tag name. An existing tag is overwritten with the data from the xlsx file if the tag name already exists in the project. A new tag is created if the tag does not yet exist.

Requirements

- An xlsx file with tags has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.

Importing tags

1. Click "HMI tags" in the project navigation.
2. Double-click "Show all tags". The "HMI tags" editor opens.
3. Click the  button. The "Import" dialog box opens.



4. Click the "..." button and select the file that you want to import.
5. Click on the "Import" button. The import will start.

Result

The relevant tags have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign a tag a trigger tag of the wrong type, for example, string. An error will be reported during compilation.

Exporting tags (Page 6805)

Format of the tag data (Page 6811)

Importing tags (prior to WinCC V13 SP1)

Introduction

Tags are identified by the tag name. An existing tag is overwritten with the data from the xlsx file if the tag name already exists in the project. A new tag is created if the tag does not yet exist.

The version number of the xlsx file depends on the TIA Portal version. If the xlsx file was exported from a project in WinCC V13 SP1, it has the version number 1.2. If the xlsx file was exported from a project prior to WinCC V13 SP1, it has the version number 1.1.

To import files with the version number 1.2 into a project that was created prior to WinCC V13 SP1, you must prepare the files.

Requirements

- An xlsx file with tags has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.

Preparing files for the import

1. Open the corresponding file in Microsoft Excel.
2. Select "File > Properties > Advanced properties".
   The "Properties" dialog is opened.
3. Switch to the "Fit to size" task card.
4. Select "TIA_Version" in the "Properties" area.
5. Change the value in the column from "1.2" to "1.1".
6. Click the "Change" button.
7. Click "OK".
8. Delete the right column "Synchronization" in the file.
9. Save the file.

Importing tags

1. Click "HMI tags" in the project navigation.
2. Double-click "Show all tags". The "HMI tags" editor opens.
3. Click the button. The "Import" dialog box opens.
4. Click the "..." button and select the file that you want to import.
5. Click on the "Import" button. The import will start.

Result

The relevant tags have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign a tag a trigger tag of the wrong type, for example, string. An error will be reported during compilation.

Format of the tag data

Introduction

This section describes the format required for the file with tag data used for imports. The tag data file must be in "*.xlsx" format.

Tag data structure

The import file in Microsoft Excel consists of a number of worksheets:

- HMI Tags (HMI tags)
- Multiplexing (multiplex tags)

Each tag is on a separate line in the import file. The import file with the tag data must have the following format:

Example of the worksheet "HMI Tags"

	A	B	C	D	E	F	G	H
1	Name	Path	Connection	PLC tag	DataType	Length	Address	Access Me
2	HMI_Int	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
3	Mux_Tag_1	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
4	Mux_Tag_2	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
5	Mux_11	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
6	Mux_21	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
7	Mux_13	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
8	Mux_12	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
9	Mux_23	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
10	Mux_22	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
11	Mux_Tag_1_Index	Internal Tags	<No Value>	<No Value>	UInt	2	<No Value>	<No Value
12	Mux_Tag_12	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
13	Mux_Tag_11	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
14	Mux_Tag_13	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
15	HMI_UDInt	Internal Tags	<No Value>	<No Value>	UDInt	4	<No Value>	<No Value
16	Gauge_Process	Default tag table	<No Value>	<No Value>	Int	2	<No Value>	<No Value
17	Button_Tag_4	Default tag table	<No Value>	<No Value>	Int	2	<No Value>	<No Value
18	HMI_USInt	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
19	Data_block_2_PLC_DateTime_2	Default tag table	HMI_connection_1	Data_block_2.PLC_I	Date_And_Time	8	%DB28.DBX598.(	<absolute

Table 12-159 Meaning of the entries

List entry	Meaning
Name	Indicates the configured name of an HMI tag.
Path	Specifies which folders in the project tree contain the tag. The folder structure is represented by "\" : "FolderName1\FolderName2\TagName".
PLC Tag	Indicates whether the tag is linked to a PLC tag.
Connection	Indicates the name of the connection to the PLC.
Data type	Specifies the data type of a tag. The data types allowed depend on the communication driver being used. See the "Communication" section of the documentation for additional information on the data types permitted for the various communication drivers.
Length	Specifies the length of the tag. This entry is only useful for data types with a dynamic length such as strings; it is left empty for all other data types.
Address	Specifies the tag address in the PLC. The tag address must exactly match the one used in WinCC, for example, "%DB1.DBW0". The tag address is empty for internal tags.
Multiplexing	Specifies whether multiplexing is used.
Index tag	Shows the name of the index tag for multiplexing. In Runtime, the system first reads the value of the index tag. It then accesses the tag in the corresponding place in the tag list.
StartValue	Specifies the start value of a tag.
ID tag	The update ID updates the value of a tag with the aid of a function or a PLC job. The update ID must be unique within an HMI device.
Coding	Shows the coding method.

List entry	Meaning
DiplayName [de_DE]	Shows the display name of an HMI tag. The field designation contains a language ID. The field designation contains a language ID. Display names must be assigned a language ID for import. Texts are imported to the corresponding project language.
Acquisition mode	Specifies the tag acquisition mode.
Acquisition cycle	Specifies the tag acquisition cycle. The acquisition cycle must correspond exactly to the one used in WinCC. The value is not language-dependent and should therefore be the same in every language. The default value is "1 s". The acquisition cycle is undefined if the tag acquisition mode is "on demand". User-defined acquisition cycles must be created beforehand as the file will otherwise not be imported.
High High Limit type	Indicates whether the limit value "High high" is monitored by a constant, a tag or not at all.
High High Limit	Displays the limit value "High High".
High Limit type	Indicates whether the limit value "High" is monitored by a constant, a tag or not at all.
High Limit	Displays the limit value "High".
Low Limit type	Indicates whether the limit value "Low" is monitored by a constant, a tag or not at all.
Low Limit	Displays the limit value "Low".
Low Low Limit type	Indicates whether the limit value "Low Low" is monitored by a constant, a tag or not at all.
Low Low Limit	Displays the limit value "Low Low".
Linear scaling	Indicates whether linear scaling is enabled. This entry can only be used for external tags.
End value PLC	Specifies the end value of the PLC tag.
Start value PLC	Specifies the start value of the PLC tag.
End value HMI	Specifies the end value of the HMI tag.
Start value HMI	Specifies the start value of the HMI tag.

Example of the worksheet "Multiplexing"

	A	B	C
1	HMI Tag name	Multiplex Tag	Index
2	Mux_Tag_1	Mux_11	0
3	Mux_Tag_1	Mux_12	1
4	Mux_Tag_1	Mux_13	2
5	Mux_Tag_2	Mux_21	0
6	Mux_Tag_2	Mux_22	1
7	Mux_Tag_2	Mux_23	2
8	Mux_Tag_12	HMI_Array_Mux2	-1
9	Mux_Tag_11	HMI_Array_Mux1	-1
10	Mux_Tag_13	HMI_Array_Mux3	-1

Table 12-160 Meaning of the entries

List entry	Meaning
Name	Indicates the configured name of an HMI tag which uses indirect addressing. The HMI tag must be available in the "HMI Tags" worksheet.
Index	Shows the value which governs which tag is selected.
Multiplex Tag	Displays the tag from the tag list corresponding to the index value.

Note

"No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing tag of the same name.

Importing tags (WinCC V13 SP1 or higher) (Page 6806)

12.12.4.5 Importing and exporting text lists

Exporting text lists

Introduction

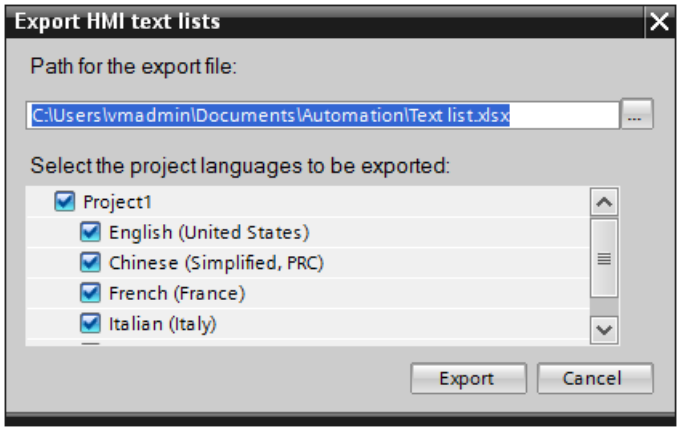
WinCC has an export function for text lists.

Requirements

- The WinCC project for the export is open.
- Text lists have been created in the project.
- The "Text & graphics lists" editor is open.

Exporting text lists

1. Click on the button in the "TextLists" tab.
   The "Export" dialog box opens.



2. Click the "..." button and specify in which file the data are saved.
3. By default, texts are exported in all defined project languages.
   If you do not want to export specific languages, disable the unnecessary languages in the dialog.
4. Click "Export". The export will start.

Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

Importing text lists

Introduction

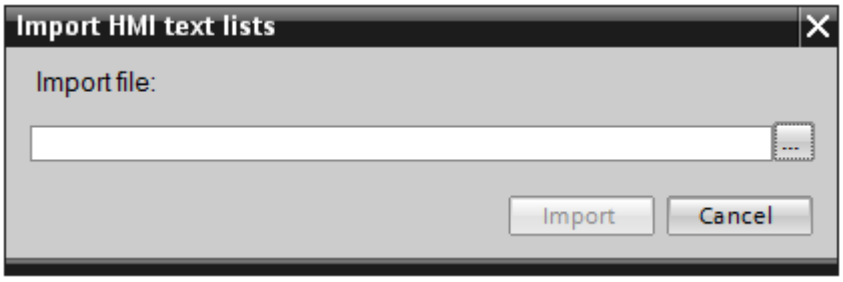
You then import text lists from an xlsx file to WinCC.

Requirements

- An xlsx file with text lists has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.
- The "Text & graphics lists" editor is open.

Importing text lists

1. Click on the button in the "Text lists" tab.
   The "Import" dialog box opens.



2. Select the file you want to import under "File selection".
3. Click on the "Import" button. The import will start.

Result

You have now imported the text lists. The relevant text lists have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Format of text list data

Introduction

This section describes the format required for the file with the text lists used for imports. The text list data file must be in "*.xlsx" format.

Tag data structure

The import file in Microsoft Excel consists of two worksheets:

- TextList (Text lists)
- TextListEntry (Text list entry)

Each text list is assigned a separate line in the import file. The import file containing the data must be structured as follows:

Example of the worksheet "TextList"

	A	B	C
1	Name	ListRange	Comment
2	TLValue/Range	Decimal	
3	TLBit	Bit	
4	TLBitnumber	Binary	
5	TLall_1	Decimal	
6	TLall_2	Decimal	

Table 12-161 Meaning of the entries

List entry	Meaning
Name	Shows the name of the text list.
ListRange	Shows the text list range: Number = Bit number (0-31) Range = value/range (...-...) Bit = Bit (0;1)
Comment	Any comments on the text list. You can use up to 500 characters

Example of the worksheet "TextListEntry"

	A	B	C	D	E	F
1	Name	Parent	DefaultEntry	Value	Text	FieldInfos
2	Text_list_entry_1	TLValue/Range	TRUE	0 - 1	Default entry TLValue/Range ->	
3	Text_list_entry_2	TLValue/Range		2 - 3	TLValue/Range = 2-3 ->	
4	Text_list_entry_3	TLValue/Range		1	TLValue Range - single value = 1 ->	
5	Text_list_entry_1	TLBit		0	TLBit = 0 ->	
6	Text_list_entry_2	TLBit		1	TLBit = 1 ->	
7	Text_list_entry_1	TLBitnumber	TRUE	0	Default entry TLBitnumber; ->	
8	Text_list_entry_2	TLBitnumber		0	TLBitnumber - Bitnumber 0 is set ->	
9	Text_list_entry_3	TLBitnumber		1	TLBitnumber - Bitnumber 1 is set ->	
10	Text_list_entry_4	TLBitnumber		2	TLBitnumber - Bitnumber 2 is set ->	
11	Text_list_entry_5	TLBitnumber		3	TLBitnumber - Bitnumber 3 is set ->	
12	Text_list_entry_1	TL1	TRUE	0 - 1	Default entry TL1	
13	Text_list_entry_2	TL1		1 - 3	TL1 Value between 1 - 3 ->	
14	Text_list_entry_3	TL1		4 - 6	TL1 Value between 4 - 6 ->	
15	Text_list_entry_4	TL1		7	TL1 Single value = 7 ->	
16	Text_list_entry_1	TL2	TRUE	0 - 1	<field ref="0" /> ->	<ref id = 0; type = CommonTextList; TextList = TL1; Tag = HMI_TL1control; Leng
17	Text_list_entry_2	TL2		1	TL2 Single value = 1 ->	
18	Text_list_entry_3	TL2		2 - 3	TL2 Range between 2 - 3 ->	
19	Text_list_entry_1	TLMultilined	TRUE	0 - 1	Default entry TLMultilined; last row	
20	Text_list_entry_2	TLMultilined		0 - 3	TLMultilined Value between 0-3\nwith test of"\n"	
21	Text_list_entry_1	TLall_1	TRUE	0 - 1	Default entry TLall_1	
22	Text_list_entry_1	TLall_2	TRUE	0 - 1	Default entry TLall_2	

Table 12-162 Meaning of the entries

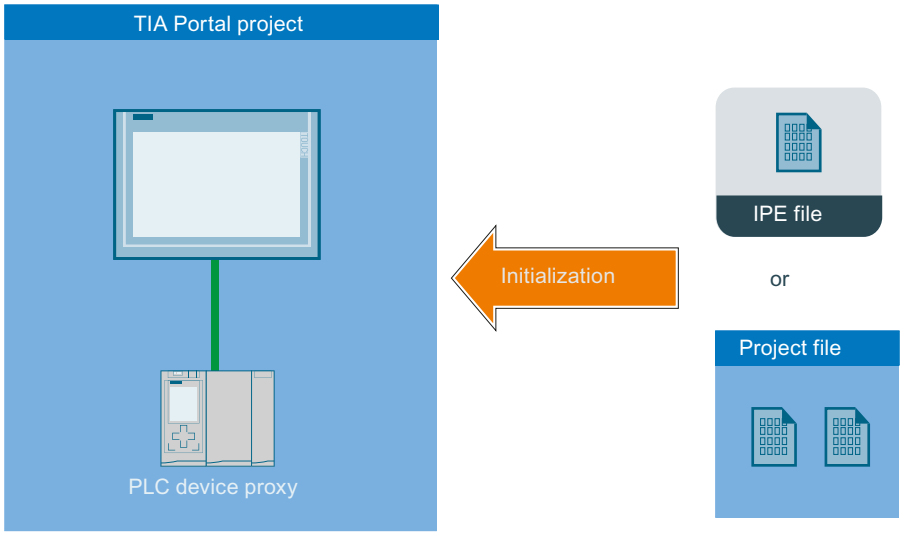
List entry	Meaning
Name	Shows the name of the text list entry.
Parent	Specifies the name of the corresponding text list.
DefaultEntry	Indicates whether the text list entry is a default entry. The default entry is always displayed when the tag has an undefined value.
Value	Specifies the tag integer values or value ranges which are assigned to the text entries in the text list.
Text	Shows the text list entry. The field designation contains a language ID. Text list entries must be assigned a language ID for import. An expression with a reference ID will be added to the text if the text list entry has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign the dynamic parameter to a text list entry.
FeldInfo	Specifies whether the text list contains dynamic parameters. The settings are separated by a semicolon ";". Example of dynamic parameters: Tag: <ref id = 0; type = CommonTagDisplayFormat; Tag = tag 1; DisplayType = Decimal; DisplayFormat = 9;> Text list: <ref id = 1; type = CommonTextList; TextList = Textliste_1; Tag = tag 2; Length = 5;> PLC tag: <ref id = 0; type = CommonControlTagDisplayFormat; DisplayType = Decimal; DisplayFormat = 9;>

12.12.5 Exchanging controller data from other projects

Inter-project engineering

You can use the IPE (Inter Project Engineering) function to read in controller data from other TIA Portal projects and use it for configuring.

IPE enables you to transfer and merge the HMI configuration and PLC programming communication into various TIA Portal projects.



You can find more information and notes on configuration under: Basics of Inter Project Engineering (IPE)

12.12.6 Using cross-references

12.12.6.1 General information about cross references

Introduction

The cross-reference list provides an overview of the use of objects within the project.

Uses of cross-references

The cross-reference list offers you the following advantages:

- When creating and changing a program, you retain an overview of the objects, tags, and alarms etc. you have used.
- From the cross-references, you can jump directly to the object location of use.
- You can learn the following when debugging:
  - The objects used in a specific screen.
  - The alarms and recipes shown in a specific display.
  - The tags used in a specific alarm or object.
- As part of the project documentation, the cross-references provide a comprehensive overview of all object, alarms, recipes, tags and screens.

12.12.6.2 Displaying the cross-reference list

Introduction

Details on the use of objects can be found in the cross-reference list. You can show cross-references for HMI devices, folders and all editors in the project tree. The detail view also lets you select individual objects of the editors.

Requirement

You have created a project.

Several objects have been created.

Procedure

1. Select the required entry in the project tree or detail view.
2. Select "Cross-references" in the shortcut menu. The cross-reference list is opened in the work area.
3. Open the "Used by" tab to display where the objects shown in the cross-reference list are used.
4. Open the "Used" tab to view the users of the objects displayed in the cross-reference list.
5. You can sort the entries in the "Object" column in ascending or descending order by clicking on the corresponding column header.
6. To go to the location of use for a specific object, click on the displayed link.

Result

The cross-reference list for the selected object is displayed in the work area.

12.12.6.3 Structure of the cross-reference list

Views of the cross-reference list

There are two views of the cross-reference list. The difference between the two views is in the objects displayed in the first column:

- Used by:
  Display of the referenced objects. Here, you can see where the object is used.
- Used:
  Display of the referencing objects. The users of the object are shown here.

The assigned tool tips provide additional information about each object.

Structure of the cross-reference list

Column	Content/meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Numbers	Number of uses
Location of use	Each location of use, for example, an object or event
Property	Function of the referenced objects, for example, tag for data record or process value
Connected to	PLC tag with which the object is connected.
Type	Type of object
Path	Path of object

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

Settings in the cross-reference list

You can make the following settings using the icons in the toolbar for the cross-reference list:

- Update cross-reference list
  Updates the current cross-reference list.
- Making settings for the cross-reference list
  Here, you specify whether all used, all unused, all defined or all undefined objects will be displayed. If the "Undefined objects" option is enabled, references to previously deleted objects are also displayed.
- Collapse entries
  Reduces the entries in the current cross-reference list by closing the lower-level objects.
- Expand entries
  Expands the entries in the current cross-reference list by opening the low-level objects.

Sorting in the cross-reference list

You can sort the entries in the "Object" column in ascending or descending order. Click on the column header to do this.

12.12.6.4 Displaying cross-references in the Inspector window

Introduction

The Inspector window displays cross-reference information about a selected object in the "Info > Cross-references" tab. The Inspector window displays the cross-reference information in tabular format.

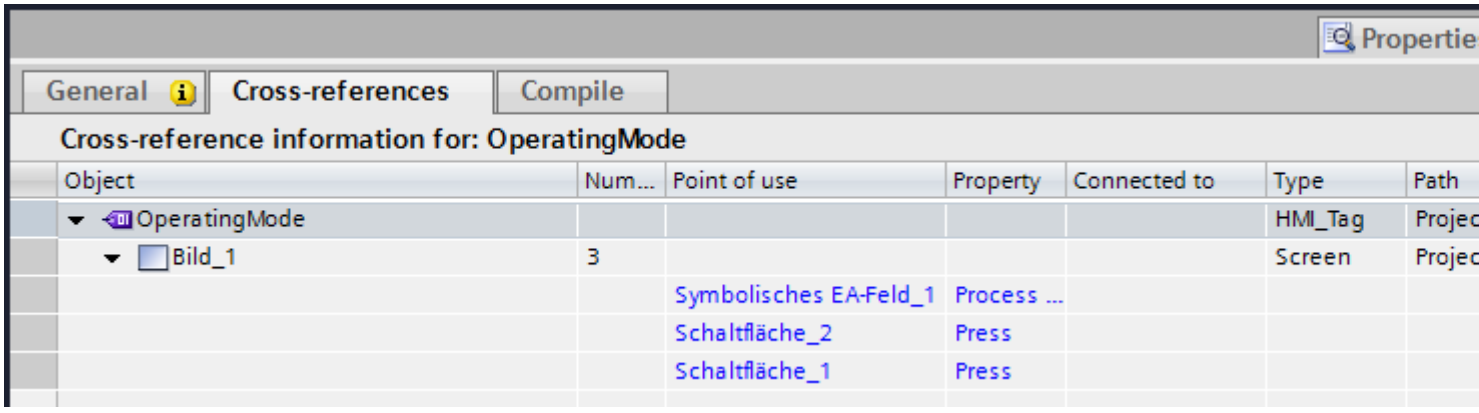
All included elements and their use in the cross-reference list are displayed for structured tags, user data types and instances of a PLC data type.

Requirement

- You have created a project.
- Several objects have been created.

Procedure

1. Select an object in a screen or a tabular editor.
2. Select "Cross-reference information" in the shortcut menu. The cross-references are opened in the Inspector window.



Result

The instances where and the other objects by which the selected object is being used are displayed.

The table below shows the additional information listed in the "About > Cross-reference" tab:

Column	Meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Numbers	Number of uses
Location of use	Each location of use, for example an object or event
Property	Function of the referenced objects, for example tag for data record or process value
Connected to	PLC tag with which the object is connected.
Type	Type of object
Path	Path of object

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

12.12.6.5 Rewiring tags in the screens

Introduction

You can change the references of tags in the properties of screen objects using the "Change object references" dialog.

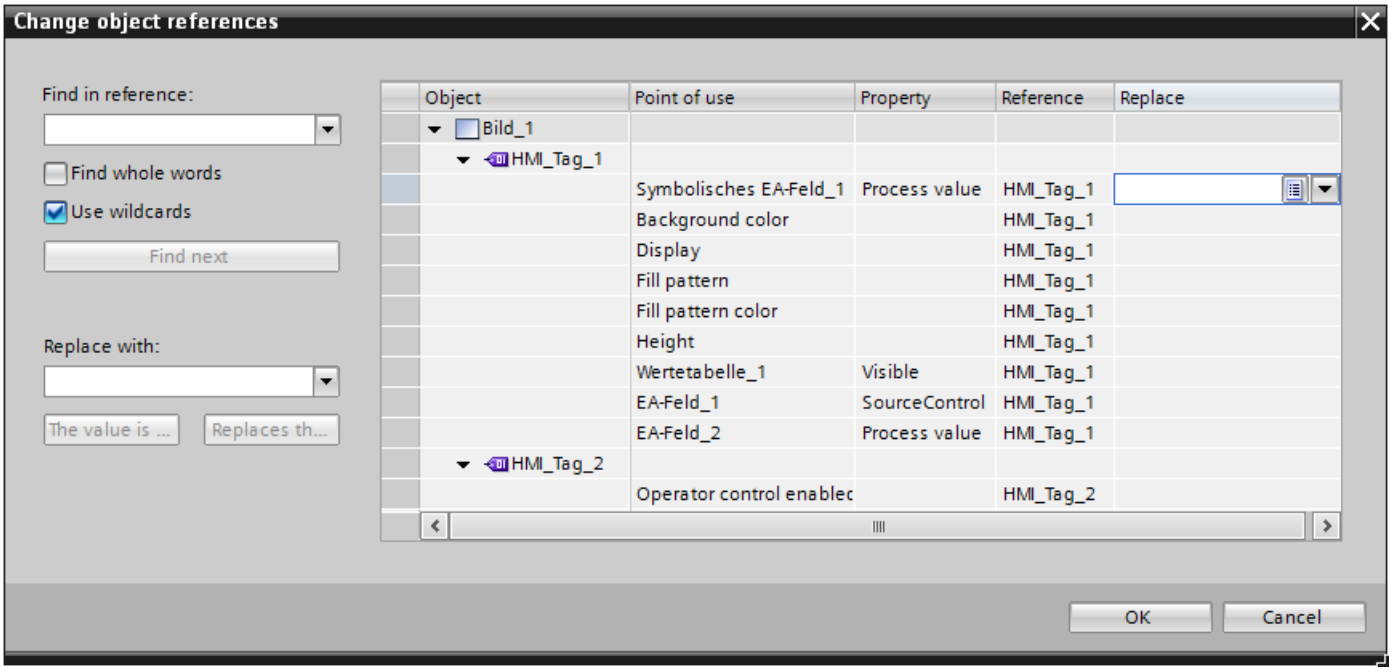
This function lets you to replace a large number of tags in various screen objects.

You search for and replace individual or multiple characters in the tag names.

You can open the "Change object references" dialog with the command in the shortcut menu. You can open the dialog for one or more screen objects or a screen.

How to replace a tag

1. Select the objects in the screen that contains a tag that you want to change.
2. Select the "Change object references" command in the shortcut menu or in the "Edit" menu. The "Change object references" dialog opens. You can see the selected screen objects and the tags used in the "Object" column.



3. Enter the name or part of the name you want to find in the "Find in reference" input box.
4. Start the search with the "Find next" button. If a reference is found, it is highlighted in the "Reference" column.
   Another click on the "Find next" button continues the search process until the list has been completely searched.
   After this, the search process starts again from the top of the list.
5. Enter the name or part of the name you want to replace for the found name in the "Replace with" input box.

6. Click the "Replace" button to replace the selected tag.
   All references found are replaced by clicking the "Replace all" button. In this way, you can replace a large number of references with another
   reference.
7. To select a tag from the list of all tags created in the project, click on the button in the "Replace" column.
8. To select a tag from the object list or to create a new tag, click on the button in the "Replace" column.
9. Confirm your entry with "OK".

The rewiring of the tags is applied in the project.

Additional options for searching

You can narrow down your search by enabling the following options:

- Use wildcards
  Enter * for any number of characters. Example: You want to search for all tags starting with "HMI". Enter "HMI*" in the search key box.
  Enter ? for an individual character.
- Find whole words
  To search only for full names, enable the "Find whole words" option.

Replacing arrays and user-defined tags

Variables whose names contain special characters . [ ] are shown in quotes.

Array type tags and tags of user-defined data types (UDT) contain special characters to separate tags from their elements. However, they are not shown in quotation marks. To replace an array or a UDT with an HMI tag with special characters, enter the name of the HMI tag in quotation marks in the "Replace" input box. If you type the name without quotation marks, a reference to a non-existent array or UDT is created instead of a reference to the desired HMI tag with special characters.

Correcting entries

If an incorrect entry is made in the "Replace with" input box, the existing references can be replaced by references to non-existent tags.

If you detect an incorrect entry before confirming with "OK", you can correct the error. To do this, select the "Replace" column and press the "Remove" button. Any incorrect entries in the "Reference" column are deleted.

If you confirm the dialog with "OK", the affected properties of the screen objects are marked in red. Non-existent tags are highlighted in red in the "Change cross references" dialog.

If the new tag does not yet exist, you must subsequently create the tag.

12.12.7 Managing languages

12.12.7.1 Languages in WinCC

User interface language and project languages

A distinction is drawn between two different language levels in WinCC:

- User interface language
  During configuration, the text in the WinCC menus and dialogs is displayed in the user interface language. The user interface language also affects the labeling of operating elements, the parameters of the system functions, the online help, etc.
- Project languages
  Project languages are all languages in which a project will later be used. Project languages are used to create a project in multiple languages.

The two language levels are completely independent of one another. For example, you can create English projects at any time using a German user interface and vice versa.

Project languages

The following languages are differentiated within the project languages:

- Reference language
  The reference language is the language that you use to configure the project initially. During configuration, you select one of the project languages as the reference language. You use the reference language as a template for translations. All of the texts for the project are first created in the reference language and then translated. While you are translating the texts, you can have them displayed simultaneously in the reference language.
- Editing language
  You produce translations of the texts in the editing language.
  Once you have created your project in the reference language, you can translate the texts into the remaining project languages. Select a project language respectively as an edit language and edit the texts for the appropriate language variant. You can change the editing language at any time.

  Note

  When switching the project languages, the assignment to the keys on the keyboard also changes. For some languages (for example, Spanish), the operating system does not allow you to switch to the corresponding keyboard assignment. In this case, the keyboard assignment is switched to English.

- Runtime languages
  Runtime languages are those project languages that are transferred to the HMI device. You decide which project languages to transfer to the HMI device depending on your project requirements.
  You must provide appropriate controls so that the operator can switch between languages in runtime.

Language settings in the operating system (Page 6826)

Operating system settings for Asian languages (Page 6826)

12.12.7.2 Language settings in the operating system

Introduction

The configuration PC operating system settings influence WinCC language management in the following areas:

- Selection of project languages
- Regional format of dates, times, currency, and numbers
- Displaying ASCII characters

Project language selection

A language is not available as a project language unless it is installed in the operating system.

Regional format of dates, times, currency, and numbers

WinCC specifies a fixed date and time format in the Date - Time field for the selected project language and runtime language.

In order for dates, times, and numbers to be presented correctly in the selected editing language, this language must be set in the Regional Options in the Control Panel.

Displaying ASCII characters

With text output fields, the display of ASCII characters as of 128 depends on the set language and the operating system being used.

If the same special characters are to be displayed on different PCs, the PCs must use the same operating system and regional settings.

See also

Languages in WinCC (Page 6823)

Operating system settings for Asian languages (Page 6826)

12.12.7.3 Operating system settings for Asian languages

Settings on Western operating systems

If you want to enter Asian characters, you must activate the support for this language in the operating system.

The Input Method Editor (IME) is available in Windows for configuring Asian texts. Without this editor, you can display Asian text but not edit it. For more information on the Input Method Editor, refer to the documentation for Windows. To enter Asian characters when configuring, switch to the Asian entry method in the "Input Method Editor".

Switch the operating system to the appropriate language to have language-specific project texts, such as alarm texts, displayed in the simulator in Asian characters.

Settings on Asian operating systems

If you are configuring on an Asian operating system, you must switch to the English default input language to enter ASCII characters, for example, for object names. As the English default input language is included in the basic installation of the operating system, you do not need to install an additional input locale.

Enable language support

1. Open the system controller.
2. Select "Regional and Language Options".
3. On the "Languages" tab, activate the check box "Install files for East Asian languages".
4. Then click on "Details" under "Text Services and Input Languages". The dialog "Text Services and Input Languages" is opened.
5. On the "Settings" tab add the required default input language under the "Installed Services".
6. Select the language of the operating system in the "Language for non-Unicode programs" area in the "Advanced" tab.

See also

Languages in WinCC (Page 6823)

Language settings in the operating system (Page 6824)

12.12.7.4 Setting project languages

Selecting the user interface language

Introduction

The user interface language is used for displaying menu entries, title bars, infotexts, dialog texts and other designations in the WinCC user interface.

You can switch between the installed user interface languages during configuration. The labeling of the operating elements remains in the language you set when you added the object even if you change the user interface language.

Procedure

1. Select "Options > Settings" in the menu.
   The "Settings" dialog box is opened.
2. Select the desired user interface language under "General > General settings".

Result

WinCC will use the selected language as user interface language.

See also

Enable project languages (Page 6828)

Selecting the reference language and editing language (Page 6829)

Languages in WinCC (Page 6823)

Enable project languages

Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language.

Enable project languages

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The lower-level elements will be displayed.
2. Double-click on "Project languages".
   The possible project languages will be displayed in the working area.
3. Enable the relevant project languages.

Note

Copying multilingual objects

The copies of multilingual objects to a different project only include text objects in the project languages which are activated in the target project. Activate all project languages in the target project to include the corresponding text objects when transferring the copy.

Disabling project languages

1. Disable the languages which are not relevant for the project.

Notice

If you disable a project language, all text and graphic objects you have already created in this language will be deleted from the current project.

Selecting the user interface language (Page 6825)

Selecting the reference language and editing language (Page 6829)

Selecting the reference language and editing language

Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language. You can change the editing language at any time.

Requirements

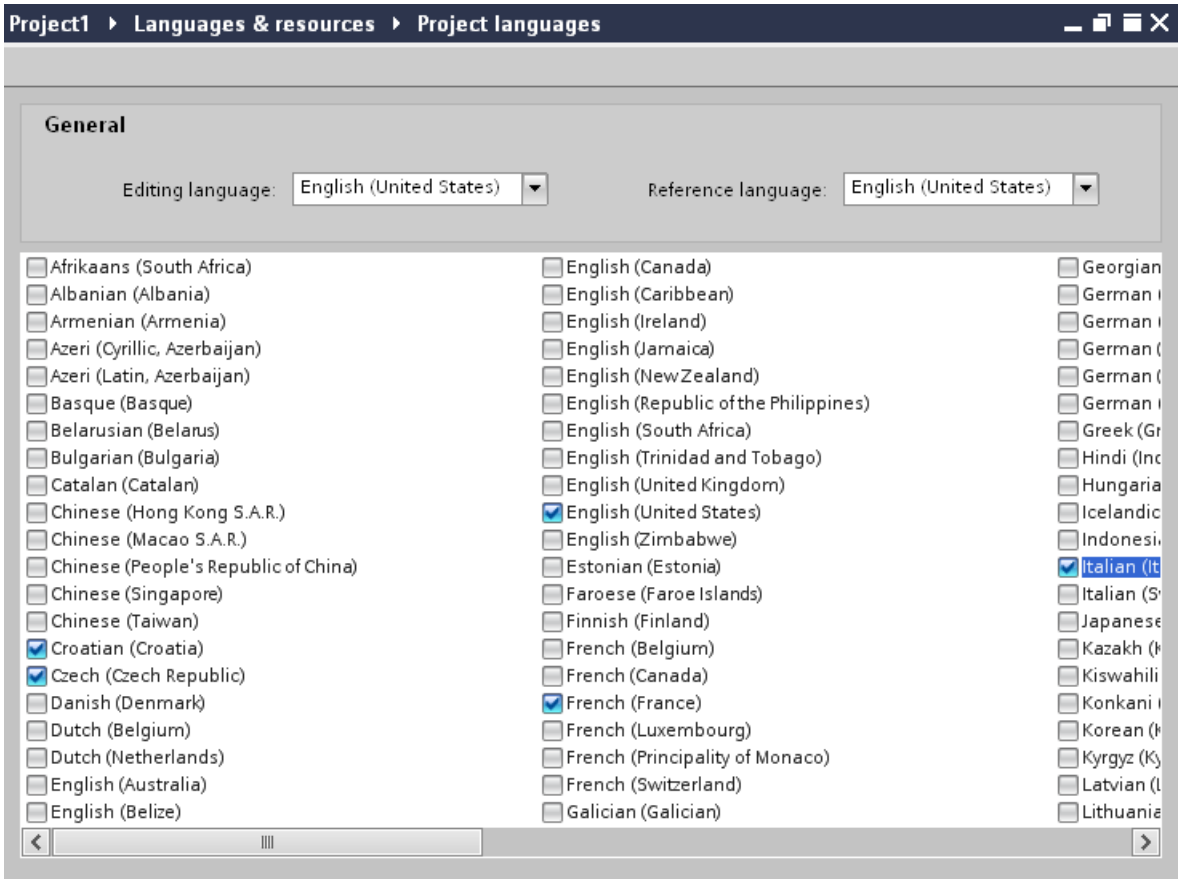
The "Project languages" editor is open.

Several project languages have been activated.

Selecting the reference language and editing language

1. Click the arrow in the drop-down list in the "General > Editing language" section.
2. Click on the required language in the drop-down list, for example, German.
3. Click on the arrow in the drop-down list in the "General > Reference language" section.
4. Click on the required language in the drop-down list, for example, English.

The language selection is displayed in the list box.



Result

You have now selected the editing and reference languages.

If you change the editing language, all future text input will be stored in the new editing language.

12.12.7.5 Creating one project in multiple languages

Working with multiple languages

Multilingual configuration in WinCC

You can configure your projects in multiple languages using WinCC. There are various grounds for creating a project in multiple languages:

- You would like to use a project in more than one country.
  You create the project in multiple languages but when the HMI device is commissioned, only the language spoken by the operators at the respective site will be transferred to the HMI device.
- The operators of a system speak a range of different languages.
  Example: An HMI device is used in China, but the service personnel understand only English.

Translating project texts

With WinCC, you can enter project texts directly in several languages in various different editors, for example, in the "Project texts" editor. WinCC also allows you to export and import your configuration for translation purposes. This is particularly advantageous if you configure projects containing a large amount of text and want to have it translated.

Language management and translation in WinCC

The following editors are used to manage languages and translate texts in WinCC:

Editor	Short description
Project languages	Selection of project languages, editing language and reference language.
Languages and fonts	Management of runtime languages and fonts used on the HMI device.
Project texts	Central management of configured texts in all project languages.
Graphics	Graphic library for managing graphics and their language-specific versions.

Translating texts using reference texts (Page 6834)

Exporting project texts (Page 6835)

Importing project texts (Page 6837)

Project text basics

Texts in different languages in the project

Texts that are output on display devices during processing are typically entered in the language in which the automation solution is programmed. Comments and the names of objects are also entered in this language.

If operators do not understand this language, they require a translation of all operator-relevant texts into a language they understand. You can therefore translate all the texts into any language. In this way, you can ensure that anyone who is subsequently confronted with the texts in the project sees the texts in his/her language of choice.

User texts and system texts

In the interests of clarity, a distinction is drawn between user texts and system texts:

- User texts are texts created by the user.
- System texts are texts created automatically and which are a product of configuration in the project.

The project texts are managed in the project text editor. This can be found in the project tree under "Languages & Resources > Project texts".

Examples of multilingual project texts

You can, for example, manage the following types of text in more than one language:

- Display texts
- Alarm texts
- Comments in tables
- Labels of screen objects
- Text lists

Translating texts

There are two ways of translating texts.

- Translating texts directly
  You can enter the translations for the individual project languages directly in the "Project texts" editor.
- Translating texts using reference texts
  You can change the editing language for shorter texts. You can enter the new texts in the editing language while the texts of the reference language are displayed.

See also

Working with multiple languages (Page 6829)

Translating texts directly (Page 6833)

Translating texts using reference texts (Page 6834)

Exporting project texts (Page 6835)

Importing project texts (Page 6837)

Translating texts directly

Translating texts

If you use several languages in your project, you can translate individual texts directly. As soon as you change the language of the software user interface, the translated texts are available in the selected language.

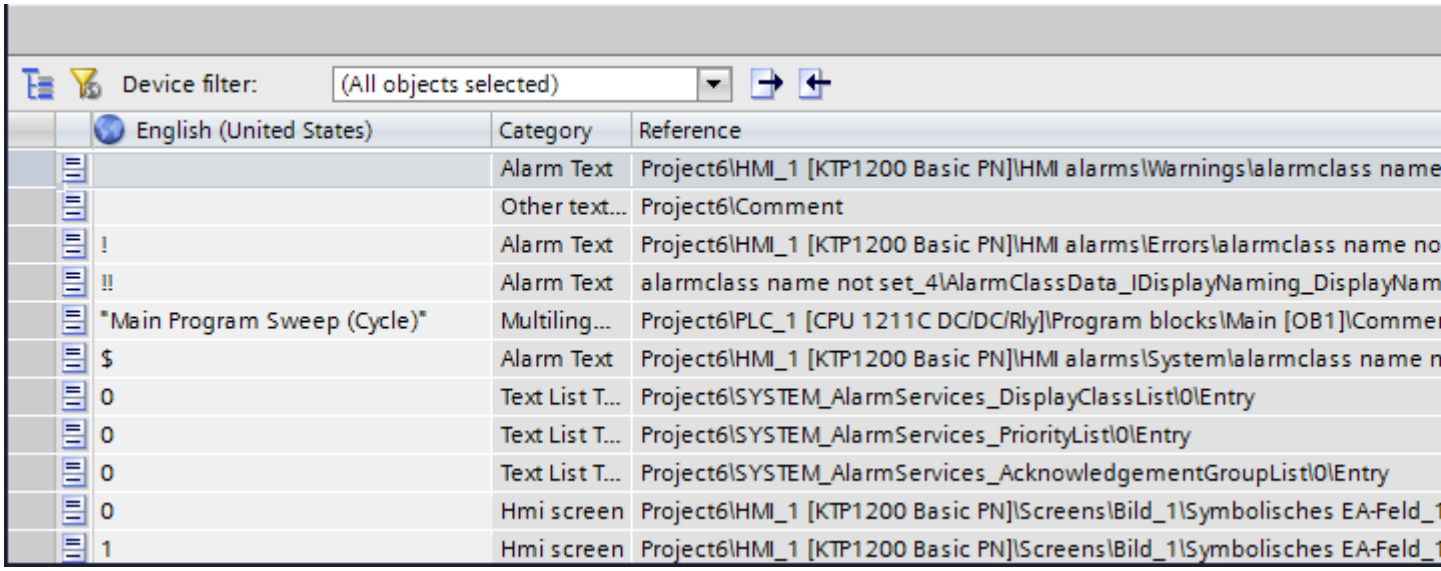
Requirements

- You are in the project view.
- A project is open.
- You have selected at least two further project languages.

Procedure

Proceed as follows to translate individual texts:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The elements below this are displayed.
2. Double-click on "Project texts".
   A list with the texts in the project is displayed in the work area. There is a separate column for each project language.



3. To group identical texts and translate them simultaneously, click on the "" button in the toolbar.

4. To hide texts that do not have a translation, click on the button in the toolbar.
5. Click on an empty column and enter the translation.

Result

You have translated individual texts in the "Project texts" editor. The texts will then be displayed in the runtime language.

See also

Working with multiple languages (Page 6829)

Exporting project texts (Page 6835)

Project text basics (Page 6830)

Importing project texts (Page 6837)

Translating texts using reference texts

Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for this language, the input boxes are empty or filled with default values.

If you enter text again in an input field, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

Requirement

There is at least one translation into a different project language for an input field.

Procedure

To display the translation of an input cell in a reference language, follow these steps:

1. Select "Tasks > Languages & resources" in the task card.
2. Select a reference language from the "Reference language" drop-down list.

Result

The reference language is preset. If you click in a text block, translations that already exist in other project languages are shown in the "Tasks > Reference text" task card.

See also

Working with multiple languages (Page 6829)

Project text basics (Page 6830)

Exporting project texts (Page 6835)

Importing project texts (Page 6837)

Exporting project texts

Project texts are exported for translation. Texts are exported to Office Open XML files ending in ".xlsx". These files can be edited in Microsoft Excel, for example.

You can exchange the file with the translators and import it back to the project as soon as it has been translated.

Requirements

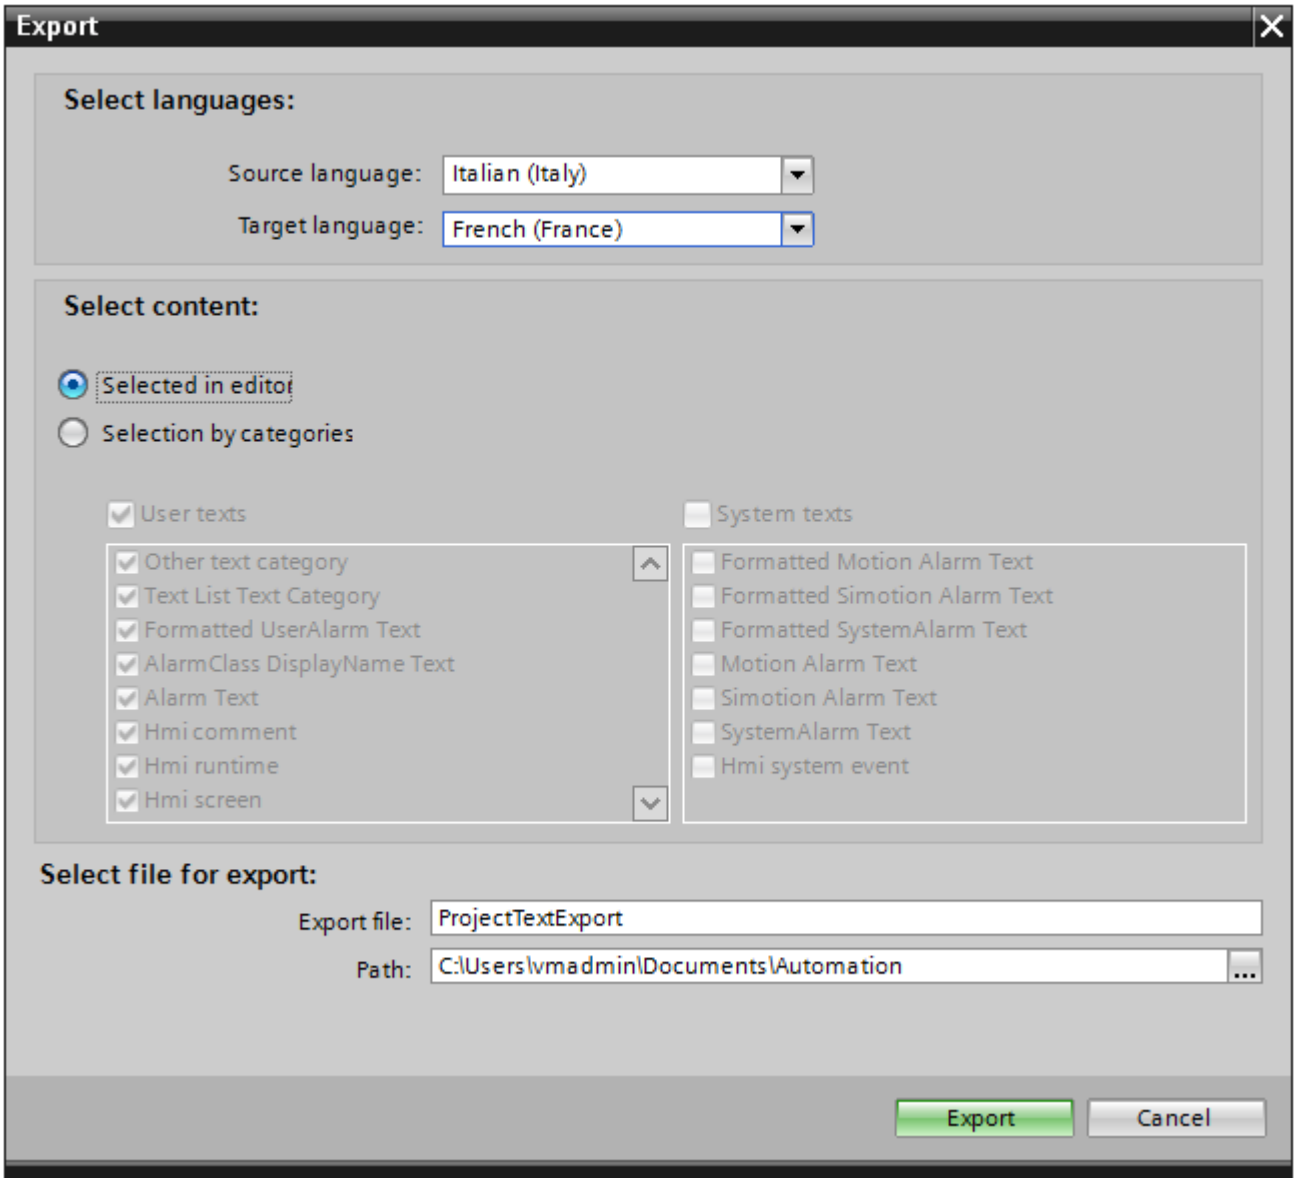
- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

Exporting project texts

To export individual project texts, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The child elements are displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Select the texts you want to export.

4. Click on the button. The "Export" dialog opens.



5. From the "Source language" drop-down list, select the language from which you wish to translate, for example Italian.
6. From the "Target language" drop-down list, select the language into which the texts are to be translated, for example, French.
7. Enter a file path and a file name for the export file in the "Export file" input field.
8. Click "Export".

Result

The texts selected in the "Project texts" editor are written to an xlsx file. The xlsx file will be stored in the specified folder.

You can alternatively select and export all project texts from categories. Select "User texts" or "System texts" in the "Export" dialog in line with the type of texts you wish to export. In this case, export can additionally be limited by categories.

Note

Project texts in library objects cannot be exported.

See also

Project text basics (Page 6830)

Translating texts directly (Page 6831)

Translating texts using reference texts (Page 6832)

Importing project texts (Page 6837)

Importing project texts

Edit the xlsx file or send it to a translator. Import the texts once they have been translated. The foreign languages will be imported to the relevant object in the project.

Requirements

- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

Importing project texts

To import a project text file, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The lower-level elements will be displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Click on the  button. The "Import" dialog opens.
4. Select the path and file name of the import file from the "Import file" field.
5. Activate the "Import source language" check box if you have made changes to the source language in the export file and would like to overwrite the entries in the project with the changes.
6. Click on "Import".

Result

You have imported the project texts.

12.12.7.6 Using language-specific graphics

"Graphics" editor

Introduction

You use the "Graphics" editor to manage the configured graphic objects in different language versions. Multilingual projects sometimes also require language-specific versions of the graphics, for example, if

- the graphics contain text;
- cultural aspects play a role in the graphics.

Opening the "Graphics" editor

Double-click on "Languages and resources" in the project tree.

Work area

The work area displays all configured graphic objects in a table. There is a separate column in the table for each project language. Each column in the table contains the versions of the graphics for one particular language.

In addition, you can specify a default graphic for each graphic to be displayed whenever a language-specific graphic for a project language does not exist.

Preview

The preview shows you how the graphics will look on various devices.

See also

Storing an external image in the graphics library (Page 6840)

Storing an image in the graphics library (Page 6839)

Languages in WinCC (Page 6823)

Storing an image in the graphics library

Introduction

You use the "Graphics" editor to import graphics you want to use in screens in the "Screens" editor. It also allows you to manage language-specific versions of graphics. A preview shows the graphic displays on various HMI devices.

Requirement

- The language-dependent versions of a graphic are available.
- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.

Inserting graphics

1. Click "Add" in the "Graphics library" table. A dialog box opens.
2. Select the required graphic file.
3. Click "Open" in the dialog box.
   The graphic will be imported to the project and displayed in all cells in this row in the "Graphics" editor.
4. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
5. Select "Add graphic" from the shortcut menu. A dialog box opens.
6. Select the desired graphic file and click "Open."
   The language-dependent version is inserted in the table in place of the reference language graphic.
7. Then, in the "Default graphic" column, import a graphic to be displayed in runtime for those languages for which there is no language-specific graphic.

You can also drag&drop a graphic from Windows Explorer to the relevant position in the "Graphics library" table.

Displaying graphics in the HMI device preview

1. Click on a graphic in the table.
2. Select the required HMI device under "Properties > Graphics settings > Device preview" in the Inspector window.
   The graphic will then be displayed as it will appear in runtime on the selected HMI device.

Result

The graphics added are available in the "Graphics" editor. The graphic assigned to the respective editing language will be displayed during editing. The default screen will be displayed in all editing languages for which no screen has been imported.

The screens assigned to the respective runtime language are displayed during runtime. The default screen is displayed in all runtime languages for which a screen has not been imported.

Note

If you disable a project language, all of the graphic objects you have already created in this language will be deleted from the current project.

See also

"Graphics" editor (Page 6836)

Storing an external image in the graphics library

Introduction

To display graphics that have been created in an external graphics program in your screens, you will first have to store these graphics in the graphics browser of the WinCC project.

Requirement

- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.
- There is a graphic in the "Graphics" editor.

Creating and adding a new graphic as an OLE object

1. Click "Add" in the "Graphics library" table. A dialog box opens.
2. Navigate to the folder in which the graphic is stored.
3. Click "Open" in the dialog box.
   The graphic will be imported to the project and displayed in all cells in this row in the "Graphics" editor.
4. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
5. Select "Insert object" from the shortcut menu. The "Insert object" dialog box opens.

   Note

   In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

6. Select "Insert object > Create new" and an object type in the dialog.

7. Click "OK." The associated graphic program is opened.
8. Close the graphics program once you have created the graphic.
   The graphic will be stored in the graphic programming software standard format and added to the graphic browser.

Inserting created graphics in WinCC

1. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
2. Select "Insert object" from the shortcut menu. The "Insert object" dialog box opens.

   Note

   In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

3. From the "Insert object" dialog box, select "Create from file."
4. Click the "Browse" button.
5. Navigate to the created graphic and select it.

   Note

   To import graphics files, note the following size restrictions:

   *.bmp, *.tif, *.emf, *.wmf ≤4 MB

   *.jpg, *.jpeg, *.ico, *.gif "*≤1 MB

Result

The OLE objects added are available in the "Graphics" editor.

Versions of the graphics for the current editing language are displayed in the "Screens" editor. The default graphic is displayed in all editing languages for which no screen has been imported.

The graphic is displayed in runtime in the set runtime language. The default graphic is displayed in all runtime languages for which no graphic has been imported.

You can double-click OLE objects in your library to open them for editing in the corresponding graphic editor.

12.12.7.7 Languages in Runtime

Languages in Runtime

Using multiple runtime languages

You can decide which project languages are to be used in runtime on a particular HMI device. The number of runtime languages that can be available at one time on the HMI device depends on the device. To enable the operator to switch between languages during runtime, you must configure a corresponding operator control.

When runtime starts, the project is displayed according to the most recent language setting. When runtime starts the first time, the language with the lowest number in the "Order for language setting" is displayed.

Setting runtime languages during configuration

In the "Languages and Fonts" editor you can specifiy:

- The project languages to be available as runtime languages for the respective HMI device.
- The order in which the languages are to be switched.

See also

Methods for language switching (Page 6842)

Enabling the runtime language (Page 6843)

Setting the runtime language order for language switching (Page 6845)

Setting the default font for a runtime language (Page 6846)

Selecting the log language (Page 6847)

Languages in WinCC (Page 6823)

Methods for language switching

Introduction

You need to configure language switching if you want to have multiple runtime languages available on the HMI device. This is necessary to enable the operator to switch between the various Runtime languages.

Methods for language switching

You can configure the following methods for language switching:

- Direct language selection
  Each language is set by means of a separate button. In this case, you create a button for each Runtime language.
- Language switching
  The operator switches the languages using a button.

Regardless of the method used, the button names must be translated into each of the languages used. You can also configure an output field that displays the current language setting.

See also

Languages in Runtime (Page 6840)

Selecting the log language (Page 6847)

Enabling the runtime language (Page 6843)

Setting the runtime language order for language switching (Page 6845)

Setting the default font for a runtime language (Page 6846)

Enabling the runtime language

Introduction

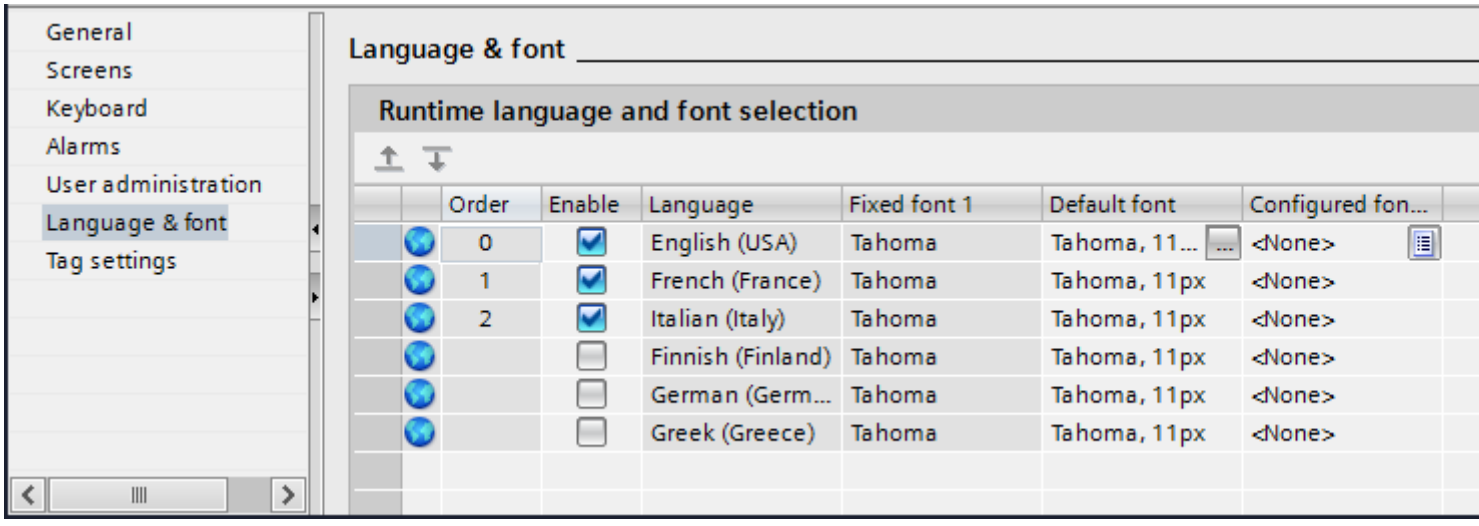
The "Language & Font" editor shows all project languages available in the project. Here you select which project languages are to be available as runtime languages on the HMI device.

Requirements

Multiple languages have been selected in the "Project languages" editor.

Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Select the following languages:
   - English
   - French
   - Italian



Result

You have now set three runtime languages. A number is automatically assigned to each language in the "Order" column. The enabled runtime languages are transferred with the compiled project to the HMI device.

If the number of languages selected exceeds the number that can be transferred to the HMI device, the table background changes color.

See also

Languages in Runtime (Page 6840)

Selecting the log language (Page 6847)

Setting the runtime language order for language switching (Page 6845)

Methods for language switching (Page 6840)

Setting the runtime language order for language switching

Introduction

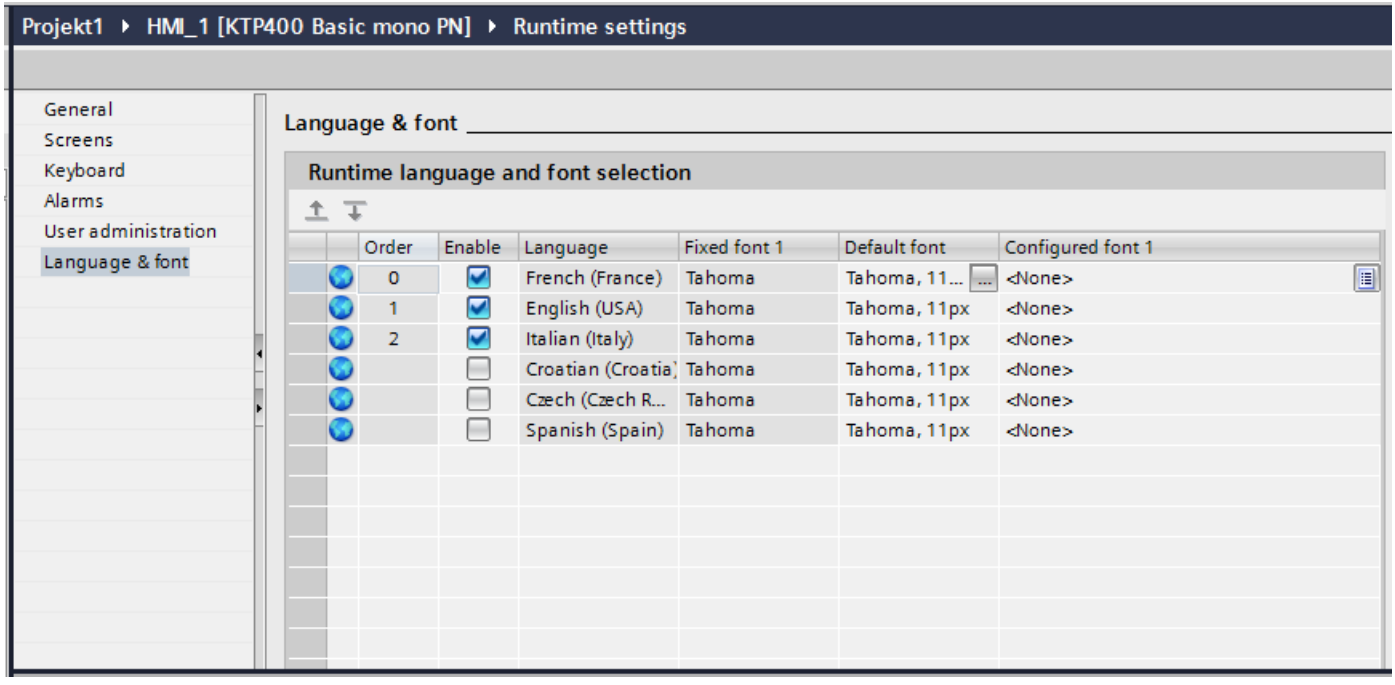
You specify the language order for Runtime language switching. The first time Runtime starts, the project is displayed in the language with the lowest number in the "Order" column.

Requirements

- Multiple languages have been enabled in the "Project languages" editor.
- The "Language & Font" editor is open and three Runtime languages have been set in the following order:
  1. English
  2. Italian
  3. French

Procedure

1. Select the runtime language "English".
2. Click the button. The runtime language "English" is moved down a place. The number will automatically be changed to "1" in the "Order" column.



Result

You have changed the order of Runtime languages. The first time runtime starts, the project will be displayed in the language with the lowest number. If the language is switched, this will happen in numerical order.

See also

Languages in Runtime (Page 6840)

Selecting the log language (Page 6847)

Enabling the runtime language (Page 6841)

Setting the default font for a runtime language (Page 6846)

Methods for language switching (Page 6840)

Setting the default font for a runtime language

Introduction

You can specify the font used to display the texts for each runtime language on the HMI device in the "Language & Font" editor. The default font is used in all texts, such as dialog texts, for which you cannot define a specific font.

WinCC offers only fonts supported by the HMI device.

Requirements

- Multiple languages have been enabled in the "Project languages" editor.
- Three runtime languages have been enabled in the "Language & Font" editor.
  1. Chinese
  2. German
  3. French

Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font". The table shows the runtime languages and fonts set.
3. Click in the "French" row in the "Default font" column.
4. Select the font to be used by default if a font cannot be selected for a given text.

Result

The project texts for the runtime language "French" are displayed on the HMI device in the selected font.

These fonts are transferred to the HMI device during a transfer operation.

The default font is also used for the representation of dialogs in the operating system of the HMI device. Select a smaller font as default if the full length of the dialog texts or headers is not displayed.

Languages in Runtime (Page 6840)

Selecting the log language (Page 6847)

Setting the runtime language order for language switching (Page 6843)

Methods for language switching (Page 6840)

Standardizing font for all languages

Introduction

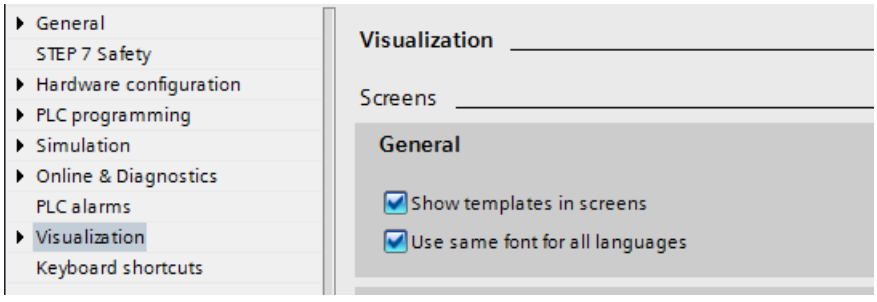
You can standardize the font for all project languages during configuration with the "Use same font for all languages" option.

Requirement

- Multiple languages have been selected in the "Project languages" editor.
- Multiple languages have been selected in the "Language & font" editor.
- The same font is defined for the selected runtime languages under "Configured font".

Procedure

1. In the "Options > Settings > Visualization > General" menu, select the "Use same font for all languages" option.



Result

You have enabled the option "Use same font for all languages". If you change the font of an object in one language during configuration, this font will be applied to all active languages.

Selecting the log language

Introduction

In the "Runtime settings > General" editor, select the language to be used for writing to logs in runtime.

Requirements

- The languages used in your project are activated in the "Project languages" editor, for example "German" and "English" .

Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Activate the runtime languages, for example, "German" and "English".
4. Specify the "order":
   - 1 German
   - 2 English
5. Click on "Runtime settings > General".
6. Select "German" for "Logs > Log language".

Result

After loading, the project will start in the runtime language "German". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

See also

Languages in Runtime (Page 6840)

Setting the default font for a runtime language (Page 6844)

Setting the runtime language order for language switching (Page 6843)

Methods for language switching (Page 6840)

Enabling the runtime language (Page 6841)

Specific features of Asian and Eastern languages in Runtime

Introduction

Note the following special considerations for the operation in Runtime of projects for Asian languages.

Note

During configuration, only use the Asian fonts that your configuration computer supports.

Memory requirement for Asian character sets

The memory requirement is greater when using Asian languages. Therefore look out for corresponding error messages when compiling the project.

Font size for Asian character sets

Use at least a font size of 10 points to display the text of projects created for Asian languages in Runtime. Asian characters will become illegible if smaller font sizes are used. This also applies to the default font in the Runtime settings under "Language & font".

Text field length for Asian languages

Make allowances for an appropriate length of the text fields when working on multilingual projects with Asian languages. Field contents may be partially hidden, depending on the font and the font size.

1. Open the "Properties > Appearance" text box in the Inspector window.
2. Under "Fit to size", disable the "Auto-size" option.
3. Verify the proper display in Runtime.

12.12.7.8 Example of multilingual configuration

Example: Configuring a button for language switching

Introduction

In this example, you configure a button that can be used to toggle between multiple runtime languages during runtime.

Requirements

- You have completed the "Configuring a button in multiple languages" example.
- The "Screen_1" screen is open.
- The button on the screen has been selected.

Procedure

1. In the Inspector window, select "Properties > Events > Press".
2. Click on "Add function" in the table.
3. Select the "SetLanguage" system function and the "Switch" setting.

Result

You have assigned the button the function "SetLanguage". Pressing the button during runtime will switch the runtime language. The runtime languages are switched in the order specified by the number sequence in the "Languages and fonts" editor.

See also

Example: Configuring a button in multiple languages (Page 6850)

Example: Configuring a button for language switching for each runtime language (Page 6851)

Languages in WinCC (Page 6823)

Example: Configuring a button in multiple languages

Introduction

In this example, you configure a "Sprache umschalten" button in German and "Switch language" button in English.

Requirements

- The languages "German" and "English" have been enabled in the "Project languages" editor.
- German has been set as editing and reference language.
- You have created and opened the "Screen_1" screen.
- The Inspector window is open.

Procedure

1. Drag-and-drop a button from the "Tools" task card into the screen.
   The button will be added to the screen.
2. In the Inspector window, open "Properties > Properties > General".
3. Enter the text ""Sprache umschalten" under "Text > off".
4. Press <Enter> to confirm. The button is named.
5. Open the "Tasks" task card.
6. Select "English" under "Languages & Resources > Editing language".
7. Enter the label "Switch Language" under "Properties > Properties > General > Text > Off" in the Inspector window.

Result

The button name is configured in German and English language. The button name corresponding with the current Runtime language is shown in Runtime.

See also

Example: Configuring a button for language switching (Page 6847)

Example: Configuring a button for language switching for each runtime language (Page 6851)

Example: Configuring a button for language switching for each runtime language

Introduction

In this example, you configure a "Sprache umschalten" button in German and "Switch language" button in English.

Requirements

- The following languages have been enabled in the "Project languages" editor
  - German
  - English
  - Italian
- All languages have been set as runtime languages in the "Runtime settings > Language & Font" editor.
- You have created and opened the "Screen_1" screen.
- Three buttons have been created on the screen:
  - Button_1 labelled "Deutsch"
  - Button_2 labelled "English"
  - Button_3 labelled "Italiano"
- The Inspector window is open.

Procedure

1. Select "Button_1".
2. In the Inspector window, select "Properties > Events > Press".
3. Click on <Add function> in the table.
4. Select the "SetLanguage" system function.
5. Click on the "Switch" field.
6. Click on the button.
7. Select "Runtime language". The field will be highlighted in red.
8. Select "German" from the drop-down list.
9. Repeat steps 1 - 8 for the other two buttons and select the corresponding runtime language.

Result

You have configured three buttons for switching language in runtime. Each button will switch to a different runtime language. For example, clicking on the "English" button during runtime will switch the runtime language to English.

12.12.8 Replacing devices

12.12.8.1 Basics

Introduction

You can use existing configurations for new devices and optimize these configurations with little manual effort.

All data configured by you is retained in the configuration data. This means you do not need to copy individual objects of one device and paste them to another.

Principle

The following applies when you replace devices:

- Only functions supported by the new device are available. Only configuration data supported by the new device are displayed.
  This affects
  - recipes,
  - objects available on the screens,
  - available system functions,
  - available communication logs, etc.
- The number of supported objects, such as screens or tags, may be limited on the new device. If the existing objects exceed the limitations on the new device, the objects are displayed in full. The objects are, however, highlighted in color in the individual editors. An error is generated when the project data is compiled.
  Manual post processing is required when switching to a device with fewer features.
  Example: Limited number of connections
  All connections will be highlighted in color as invalid if fewer connections are supported on the new device than have been configured. Delete any excess connections.

Note

If you replace a Panel and select a PC Station as your new device, for example, WinCC Runtime Advanced will automatically be moved below the PC Station in the project tree.

12.12.8.2 Device-specific functions

Device-specific functions

Functions dependent on the device

Functions dependent on the device are implemented as follows:

- Colors
  The color is changed automatically when you switch from a device with full color display to one with a smaller color range.
  If you change the color manually and then change back again to a device with a larger range of colors, the reduced range of colors will be retained.
- Fonts
  Any configured font not available on a device will be replaced by a similar one or by the configured default font. The default font depends on the device selected.
- Character sets with different font sizes
  Avoid using too many different font sizes when configuring the following devices:
  - OP 73
  - OP 77A
  - TP 177A

  A character set is downloaded to the device for each font size. Check the Inspector window during compilation to see how much of the device memory is being used by the character sets.

- Font size
  Use small Windows fonts to display the text on devices. If you use large Windows fonts, then, depending on the size of the display, the text will not be displayed in full.
  Using font sizes of 28 pixels or more for the OP 77A and TP 177A devices will affect device performance.
  The character scope is much greater for Asian languages. The use of different font sizes therefore has serious implications on the memory requirements of all devices.
  Use the same font type for all large characters throughout the project to ensure effective and efficient configuration.
- Screens and screen objects
  If the new device supports a different resolution than the previous device when you replace a device, there are several ways to adjust the screens.
  Adjust the size of the screens to the new device in the menu under "Options > Settings > Visualization > Fit to size screen".

See also

Example: Replacing devices (Page 6865)

Basics (Page 6850)

Key assignment when replacing devices

Introduction

The devices available each have different function keys. The functions configured for these keys will be mapped to the available function keys of the new device if the device is replaced.

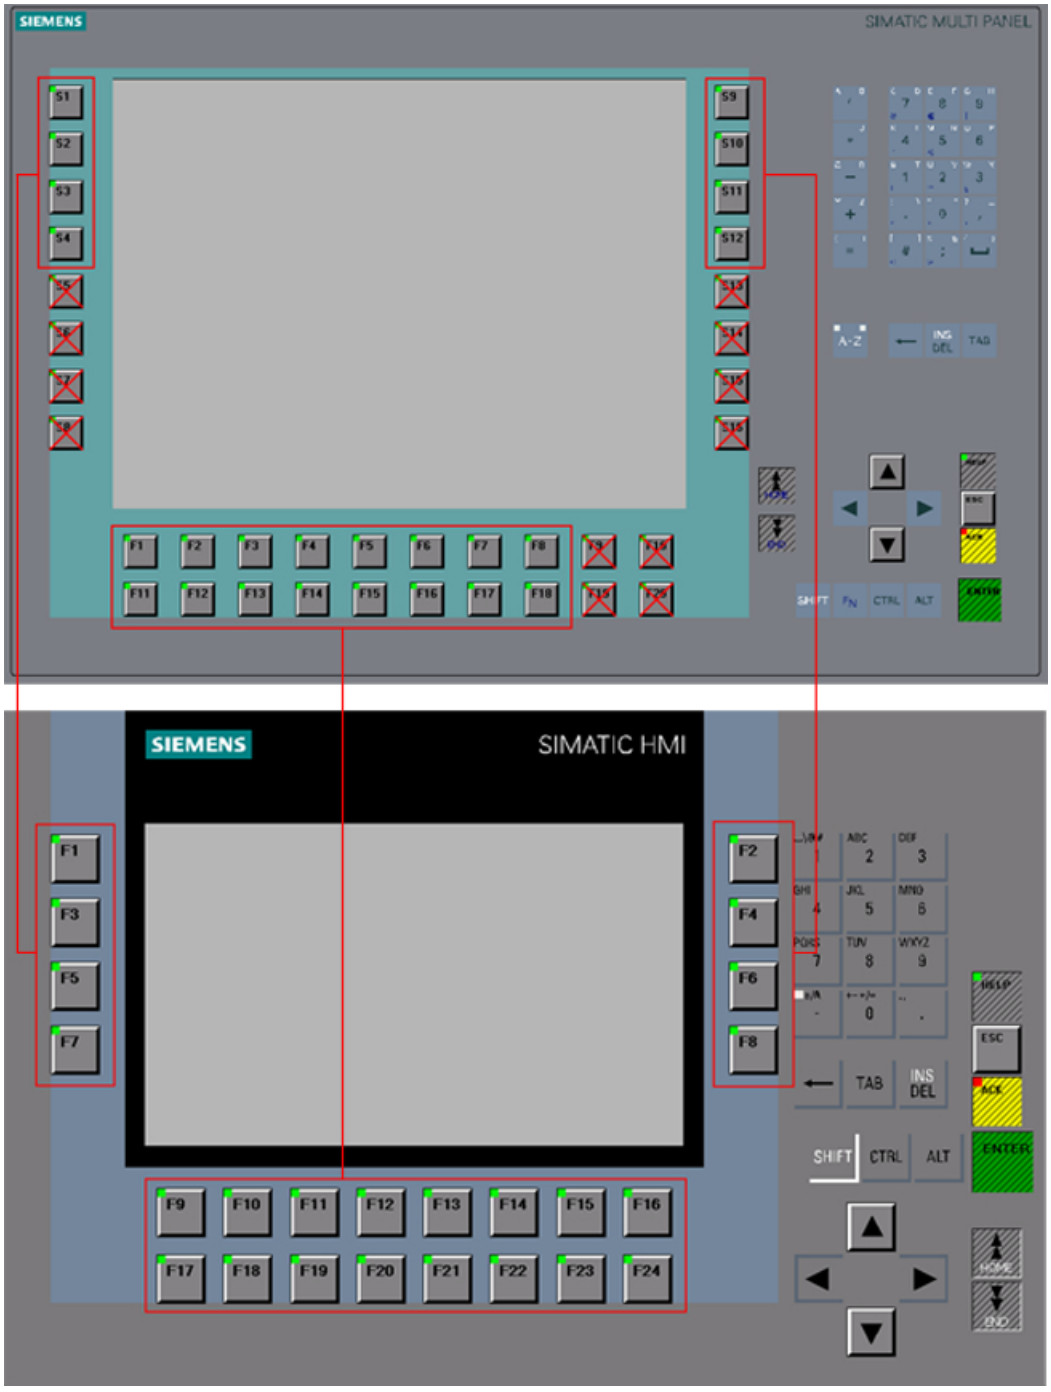
Function key mapping

The function keys to the left and right of the display are mapped from top to bottom to the new device. If the new device has fewer keys, the keys it does not have are not mapped. The function keys below the display are mapped from left to right to the new device. If the new device has fewer keys, the keys it does not have are not mapped.

Example: Exchange MP 377 with KP700 Comfort

You have configured a function on key S3 on the MP 377. This function is triggered by F5 if the panel is replaced with an KP700 Comfort.

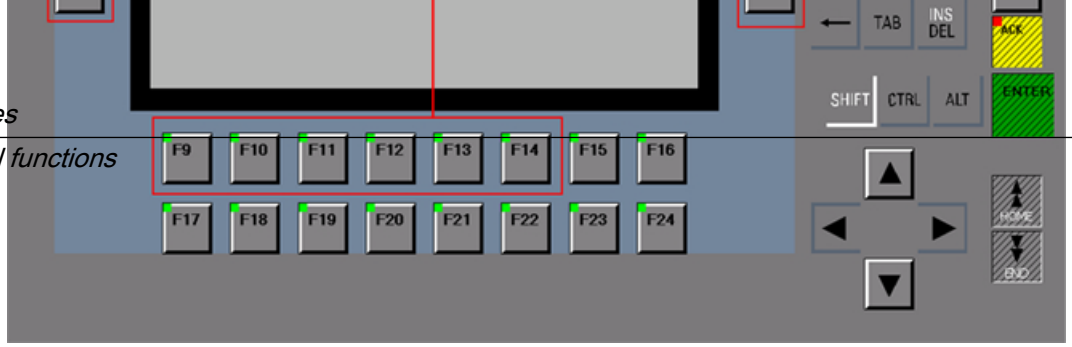
If you use the S8 key on an MP 377, this function is no longer available when the panel is replaced with a KP700 Comfort.



Mapping K-keys

K-keys are only mapped to the same K-keys in the new device, e.g. K5 to K5.

If the new device has no K keys, configurations for the K keys are lost.



Mapping of control keys and cursor keys

The following keys are mapped only to the same keys of the new device:

- HELP
- ESC
- ACK
- ENTER
- PAGE UP
- PAGE DOWN
- CURSOR UP
- CURSOR DOWN

Exception

"HELP" is triggered by "SHIFT+ ESC" on OP 73.

Key assignment when replacing devices (Page 6856)

Basics (Page 6850)

Screen adjustment options (Page 6858)

Key assignment when replacing devices

Introduction

The devices available each have different function keys. The functions configured for these keys will be mapped to the available function keys of the new device if the device is replaced.

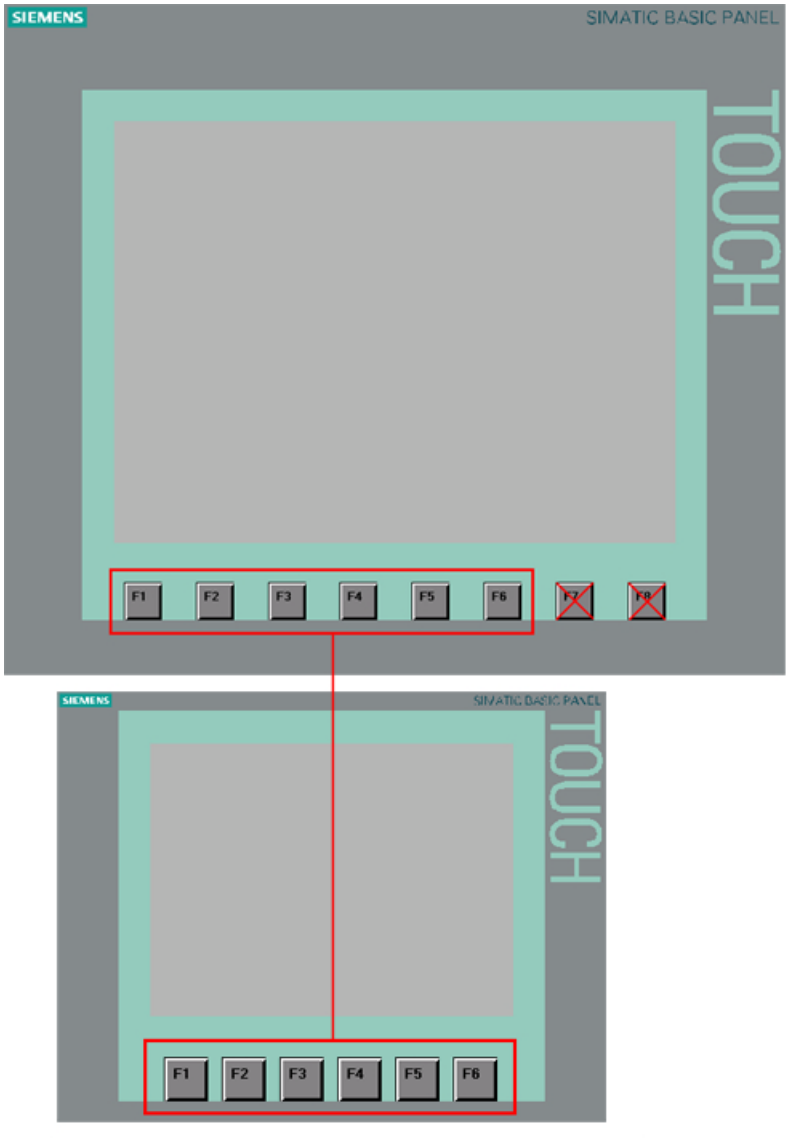
Function key mapping

The function keys below the display are mapped from left to right to the new device. If the new device has fewer keys, the keys it does not have are not mapped.

Example: Replacing a KTP1000 Basic with a KTP600 Basic

You have configured a function for F2 in KTP1000 Basic. This function is triggered by F2 following replacement with a KTP600 Basic.

If you have used F7 in a KTP1000 Basic, this function will no longer be available if the panel is replaced with a KTP600 Basic.



Mapping of control keys and cursor keys

The following keys are mapped only to the same keys of the new device:

- HELP
- ESC
- ACK

- ENTER
- PAGE UP
- PAGE DOWN
- CURSOR UP
- CURSOR DOWN

12.12.8.3 Adjusting screens to the new device

Screen adjustment options

Introduction

Select fit to size for screens before you replace a device. Fit to size is particularly important when switching devices with different display resolutions.

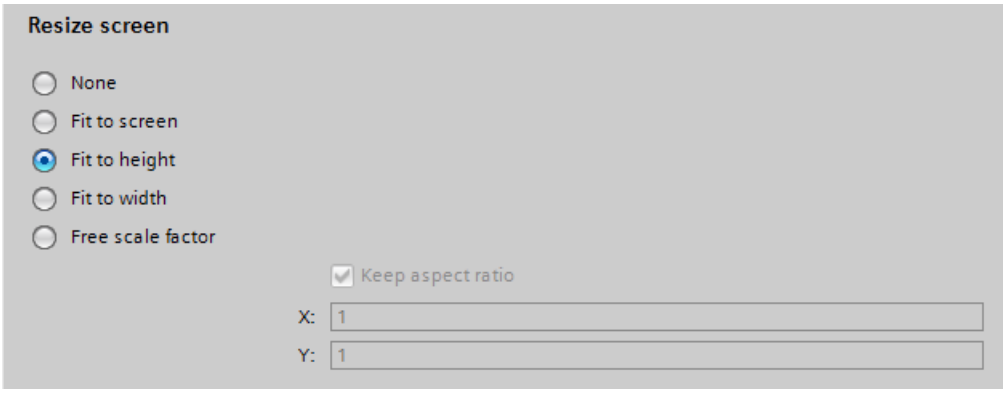
Object adjustment to content can be prevented for objects such as graphic views or text fields.

Note

The objects are distorted if you replace a device with a landscape format display with a device with a portrait format display. The difference in display format can, for example, result in object labels being cut off and content not being fitted to the object. You must therefore adjust the screens to the new device once you have replaced devices.

Screen adjustment when replacing devices

Adjust the size of the screens to the new device in the menu under "Tools > Settings > Visualization > Resize screen".



Select one of the following settings.

None (default setting)

The screens are not scaled. The objects in the screen retain their position and size. Use this setting as first test for checking of a possible exchange result because there are no rounding losses during forth and back exchange.

This option may result in objects being outside the configurable area if the display of the new device is smaller than the old one.

Fit to screen

The position and object size are adjusted to the new display size. Resizing takes place along the x-axis and the y-axis. Graphics and font size are adjusted accordingly.

Fit to height

The aspect ratio is maintained and the screens are adjusted to the height of the new device.

Use this option when you are replacing a device with display format 4:3, for example, with a device with widescreen.

Fit to width

The aspect ratio is maintained and the screens are adjusted to the width of the new device.

Use this option when you are replacing a device with widescreen, for example, with a device with display format 4:3.

Free scale factor

You select a free scale factor for screen adjustment. You can specify a factor for the x-axis and the y-axis.

Using a free scale factor of < 1 may distort the objects. Object labels may, for example, be cut off and the content may not be fitted to the object.

You must therefore adjust the screens to the new device once you have replaced devices.

Note

The aspect ratio is not adjusted for objects with a fixed aspect ratio, for example, gauge, circle. The objects are displayed on the new device with the same aspect ratio as prior to the replacement of the device.

See also

Example: Adjusting screens (Page 6864)

Specifying the position of screen objects (Page 6863)

Fit objects to contents (Page 6860)

Basics (Page 6850)

Key assignment when replacing devices (Page 6852)

Fit objects to contents

Introduction

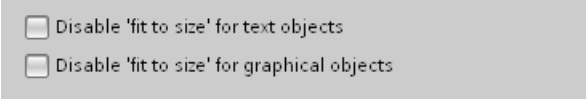
For some objects, you can specify fit to respective content in the Inspector window, for example:

- Text field: fit to text content
- I/O field: fit to text content
- Symbolic I/O field: fit to text content or to text list
- Graphic view: fit to included graphic

Fit to size for text and graphic objects

Disable automatic fit to size of the individual objects in the menu under "Options > Settings > Visualization > Resize screen and screen objects > Fit to content". This results in scaling of the objects as specified under "Options > Settings > Visualization > Resize screen and screen objects".

Select the objects which are not automatically fitted to size.



- If "Disable 'fit to size' for text objects" is activated, automatic fit to size is ignored in the text object properties.
  If you have activated "Fit screen to window height", the text field along with the other objects is scaled in accordance with the height of the new device.
- If "Disable 'fit to size' for graphic objects" is activated, automatic fit to size is ignored in the graphic object properties.
  If you have activated "Fit screen to window width", the graphics view along with the other objects is scaled in accordance with the width of the new device.

Note

The settings have no effect on screen objects whose size cannot be changed, such as alarm indicators or screen objects with a fixed aspect ratio.

"Disable 'fit to size' for text objects" and "Disable 'fit to size' for graphic objects" have no effect if:

- You have activated "Resize screen and screen objects > None".

- You have activated "Fit screen to window width and height" and the new device has the same resolution as the current device.

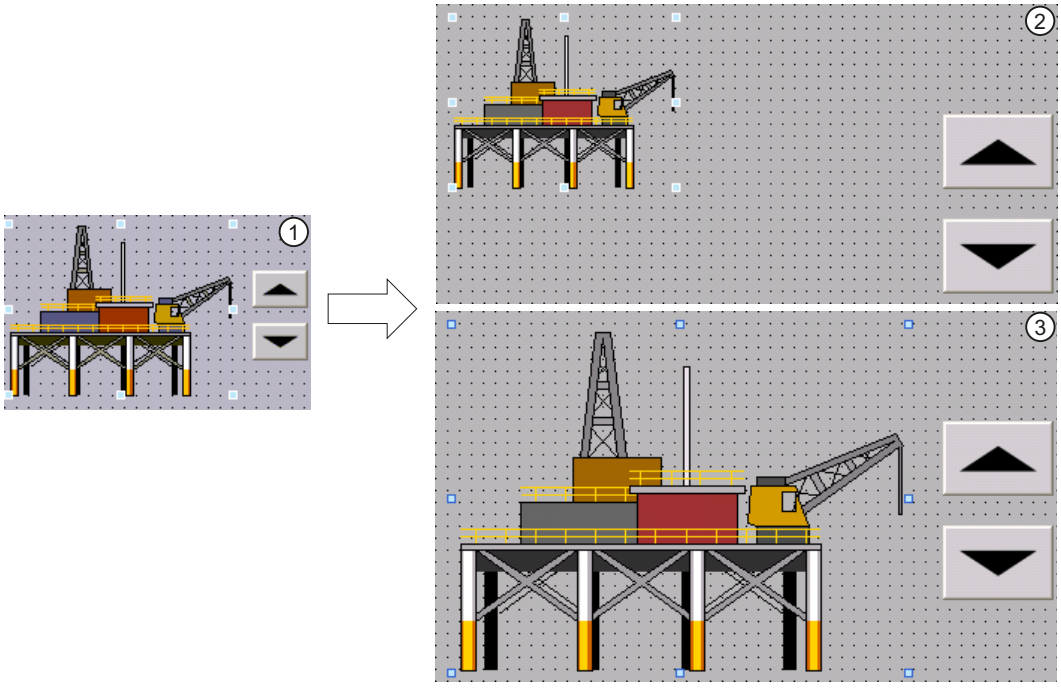
- You have activated "Fit screen to window height" and the new device has the same resolution as the current device.

- You have activated "Fit screen to window width" and the new device has the same resolution as the current device.

- You have selected "Resize screen and screen objects > None" and position "Top left" which means an adaptation is not necessary.

Example

The figure below shows the effects of automatic sizing using a graphic object with two buttons aligned as an example:



① Initial situation:

- Two buttons are aligned on a graphic object.
- The option "Fit object size to graphic" or "Adjust object size to graphic" is activated in the object properties of the graphic object under "Display > Sizing".

② Option 1: The original properties of the graphic object are to be maintained after switching the HMI device.

- Deactivate the option "Disable 'fit to size' for graphical objects" in the settings under "Size adaptation of objects".

Effect: The graphic object retains its original size after switching the HMI device. The alignment to the buttons is lost.

③ Option 2: The graphic object is to be placed relative to the new screen resolution after switching the HMI device.

- Activate the option "Disable 'fit to size' for graphical objects" in the settings under "Size adaptation of objects".

The option "Fit graphic to object size" is activated automatically in the object properties of the graphic object. The two buttons are properly aligned on the graphic object even after switching the HMI device.

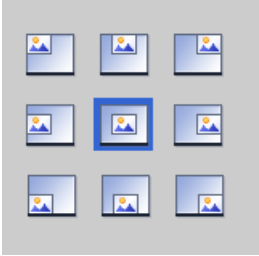
Screen adjustment options (Page 6856)

Example: Adjusting screens (Page 6864)

Specifying the position of screen objects

Introduction

There are various ways to adjust the position of screen objects to the new device.



Select position

Adjust the position of the screen objects to the new device in the menu under "Options > Settings > Visualization > Fit to size screen > Select position".

Example

The following option aligns the objects with the top left edge.

The following object centers the objects in the middle of the screen.

12.12.8.4 Example: Replacing devices

Example: Procedures overview

Introduction

In the following example you replace a TP177 B 6" PN/DP with a TP700 Comfort.

Procedures overview

The procedure when replacing a device is as follows:

1. Adjust screens to the new device
2. Replacing devices

Example: Adjusting screens

Introduction

Adapt the screen before you replace a device. Screen adaptation is required as the display formats are different.

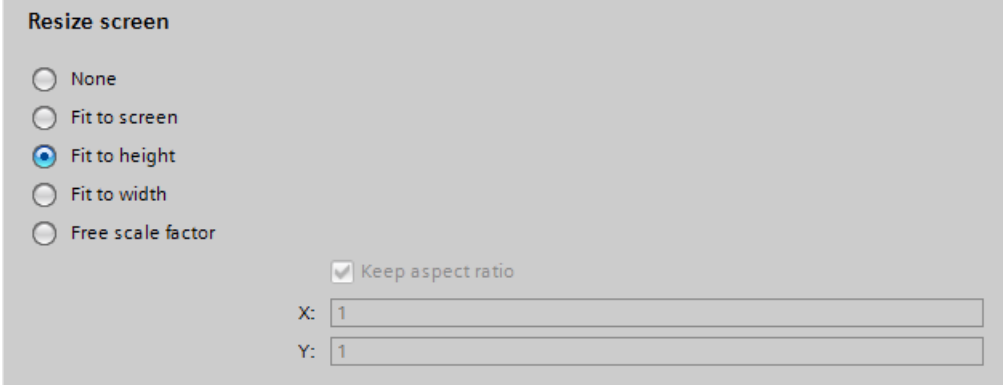
The TP 177B format is 320 x 240 pixels while the format of the TP700 Comfort is 800 x 480 pixels.

Requirements

- A project is open.
- The TP 177B 6" PN/DP device is used in the project.

Adjusting screens

1. Open the "Options > Settings" menu.
2. Click on "Visualization > Resize screen".
3. Activate "Fit to height".



4. Select "Disable fit to size for text objects".
5. Select "Disable fit to size for graphical objects".

Result

You have carried out screen adjustment in preparation for replacing devices.

See also

Example: Replacing devices (Page 6865)

Screen adjustment options (Page 6856)

Specifying the position of screen objects (Page 6861)

Fit objects to contents (Page 6858)

Example: Procedures overview (Page 6861)

Example: Replacing devices

Introduction

The following example shows you how to replace a device.

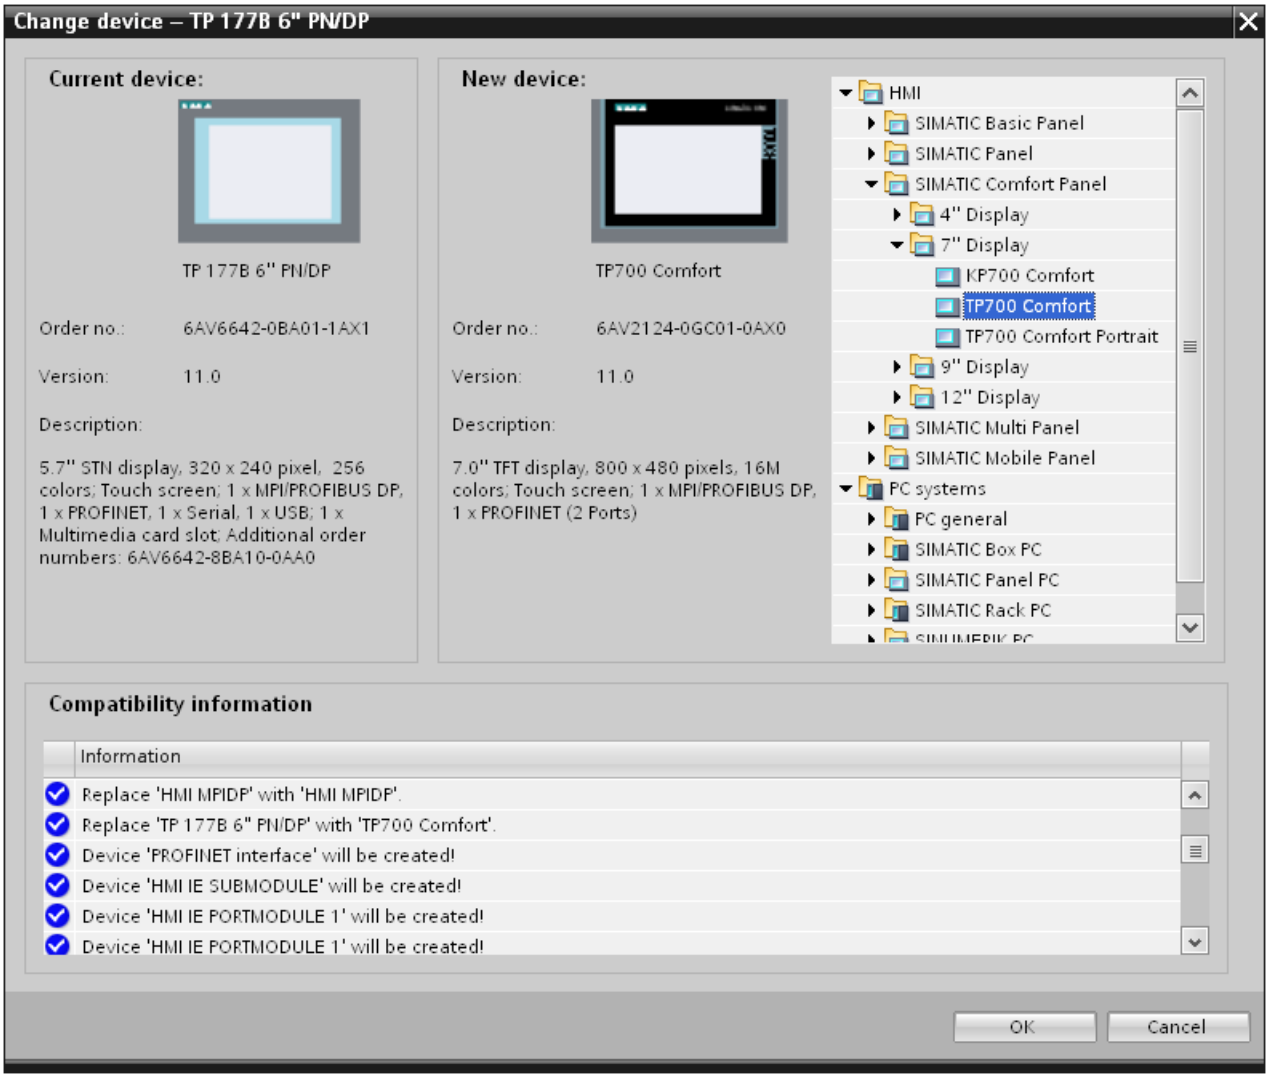
Requirements

- A project has been created and opened.
- The TP 177B 6" PN/DP device is used in the project.

Procedure

1. Double-click on "Devices & Networks" in the project navigation. The editor opens.
2. Click on the "TP 177B" device.
3. Select "Change Device/Version" in the device shortcut menu. A dialog opens.
4. Select the TP700 Comfort device.

5. Select the matching image for the HMI device version that suits your configuration under "Version".
   When you change the image, the new image is automatically transferred to the target system with the next download. All runtime files are deleted during this step.
   Details of hardware differences can be found in the "Compatibility information".



6. Click "OK". Device replacement is started.

Result

You have replaced the TP 177B device used in the project. You now use the TP700 Comfort device.

12.12.9 Copying between devices and editors

12.12.9.1 Basics

Basics

Copying and pasting within an HMI device

You can copy and paste objects, such as display objects, within an HMI device. If the object is already created in the editor, when the object name is inserted a number is automatically attached, in accordance with the following principle:

- "<Object_name>_1" is renamed to "<Object_name>_2".
- "<Object_name>_2" is renamed to "<Object_name>_3".

Copying and pasting between HMI devices

You can also copy and paste between HMI devices. If an object with the same name already exists, you have the following options:

Note

Exception to this basic rule

Copying and pasting of an alarm class that has been generated from project-wide alarm class is handled differently than with this basic rule. When the copied alarm class already exists in the target HMI device within the same project, the "Paste" command is not performed.

Copying user-defined folders

You can create user-defined folders for editors, for example, for HMI tags, screens, etc.

You can copy user-defined folders and paste them into another HMI device. The objects contained in a user-defined folder may exceed the limitations applying to the other HMI device, such as the number of supported screens. After they have been pasted, all the objects are displayed. An error is displayed when the project data is compiled.

System folders cannot be copied.

See also

Unsupported objects and functionalities (Page 6869)

Copy and paste options (Page 6868)

Copy and paste options

Copy and paste options

Copy and pasting individual objects simplifies configuration.

WinCC offers a number of options for copying and pasting objects.

Shortcut menu

To copy and paste objects using the shortcut menu, proceed as follows:

1. Select an object, for example a button.
2. Select "Copy" in the shortcut menu.
3. Move the mouse cursor to the place on the screen where you want to paste the button.
4. Select "Paste" in the shortcut menu.
   The button will be pasted together with all properties already defined.

Drag&drop

To drag-and-drop objects, proceed as follows:

1. Click on "Screens > Start" in the project tree of a device.
2. Drag-and-drop the "Start" screen into the "Screens" folder of another device.
3. A dialog will appear if the second device already contains a screen with the same name.
4. Choose whether to replace or rename the existing screen.

See also

Basics (Page 6865)

Unsupported objects and functionalities

Introduction

When an object is copied, all its properties and settings are transferred to the target HMI device.

Unsupported objects

Objects that are not supported in the target HMI device cannot be pasted.

Note

When you copy a screen containing objects which are not supported by the destination HMI device, the objects remain in the background. When you copy the screen again and the new device supports the objects, they are displayed again.

Invalid objects

The following objects become invalid once they have been pasted into the target HMI device:

- Referenced objects that do not exist in the target HMI device.
- Objects with settings that are not supported in the target HMI device.
- System functions that were configured for objects and that are not supported in the target HMI device.

Invalid objects are highlighted by a color coding. Select a supported object or create a new one. If you retain an invalid object, an error will be displayed when the project data is compiled.

Colors and fonts

Colors and fonts are supported to varying degrees by HMI devices. When unsupported colors and fonts are pasted, they are replaced by supported colors and fonts. When you paste the same object back into the source HMI device, the original settings become active again.

See also

Basics (Page 6865)

12.12.9.2 Copying and pasting

Copying screens

Introduction

You copy one or more screens from the "Screens" folder and paste them into the "Screens" folder of another device.

Type and size of the displays

In the case of HMI devices with keys, the available keys are displayed automatically in the screen. When a screen is copied between HMI devices, the keys are either displayed or hidden; functions configured for function keys are not transferred.

If there is less space for the screen in the target HMI device than in the source HMI device, you can adjust the size of and the spacing between existing objects.

Automatic fit to size for objects

1. Select "Options > Settings > Visualization > Resize screen and screen objects" in the menu.
2. Activate, for example, "Fit to height".

Copying recipes within an HMI device (Page 6870)

Copying objects with linked objects (Page 6871)

Linked objects copied automatically (Page 6872)

Linked objects copied automatically (Page 6872)

Drag & drop from the details view (Page 6873)

Copying recipes within an HMI device

"Recipes" Editor

You can copy recipes, recipe elements and recipe data records within each table. You copy a recipe element to another recipe.

Only WinCC Runtime Professional: You can copy a recipe view element to another recipe view. If a recipe view element of the same name already exists, a conflict dialog is displayed. You can select whether to replace or rename the recipe element. You can copy recipe elements to the first empty row of the "Recipe views" editor, "Elements" tab.

You can copy a recipe data record to another recipe, if the other recipe contains the same number of recipe elements. If the data types differ, the value will be copied to the target data record but it is assigned an error flag.

"Tags" editor

You can drag-and-drop a tag to a recipe element in the "Tag" column. The tag is linked to the recipe element. If a tag is already linked, an error message will be generated.

"Screens" editor

If you drag-and-drop a recipe to a screen, a new recipe display will be created and linked to the recipe.

See also

Copying screens (Page 6868)

Copying objects with linked objects

Introduction

An object is linked to another object in the following situations, for example:

- You specify a tag for an alarm as a trigger tag.
  The alarm is the object. The tag is the linked object.
- You specify a connection for an external tag.
  The tag is the object. The connection is the linked object.

The object is always fully inserted during copying and pasting. Whether or not the linked object is pasted depends on the command used to insert it.

Simple pasting

The linked object is not copied. The linked object is transferred and handled as follows in the target HMI device:

- If an object with the same name exists, the existing object with its settings is used.
- If no object with the same name exists, the name of the object will be displayed. The object becomes invalid.

For some objects, linked objects are pasted automatically during simple pasting.

Extended pasting

Select the "Extended paste" command in the shortcut menu to paste the linked objects as well. If objects of the same name exist in the target HMI device, you need to decide whether or not to overwrite each of these objects.

Drag & drop from the details view

Introduction

You can improve configuration efficiency with just a few simple measures. Below are a few examples of efficient configuration.

Pasting objects to a screen from the details view

You can drag objects in the details view from various different editors to other editors.

Pasting a symbolic I/O field

1. Open a screen.
2. Click on the "Text and graphics lists" editor in the project tree. All existing text and graphics lists will be shown in the details view.
3. Click on a text list, for example, "Textlist1" in the Details view.
4. Drag-and-drop a text list from the Details view to a screen. A symbolic I/O field has been created and connected to the text list "Textlist1".

Pasting a graphic I/O field

1. Open a screen.
2. Click on the "Text and graphics lists" editor in the project tree. All existing text and graphics lists will be shown in the details view.
3. Click on a graphics list in the Details view, for example "Graficlist1".
4. Drag-and-drop a graphics list from the Details view to a screen. A graphic I/O field has been created and connected to the graphics list "Graficlist1".

Pasting an I/O field

1. Open a screen.
2. Click on the "HMI tags" editor in the project tree. All existing HMI tags will be shown in the Details view.
3. Click on an HMI tag in the Details view, for example "Tag1".
4. Drag-and-drop the HMI tag from the Details view to a screen. An I/O field has been created and connected to the HMI tag "Tag1".

Copying screens (Page 6868)

12.12.9.3 Copying between different RT and ES versions

Introduction

You can copy and paste project data such as screens, objects or tags between projects with different WinCC versions.

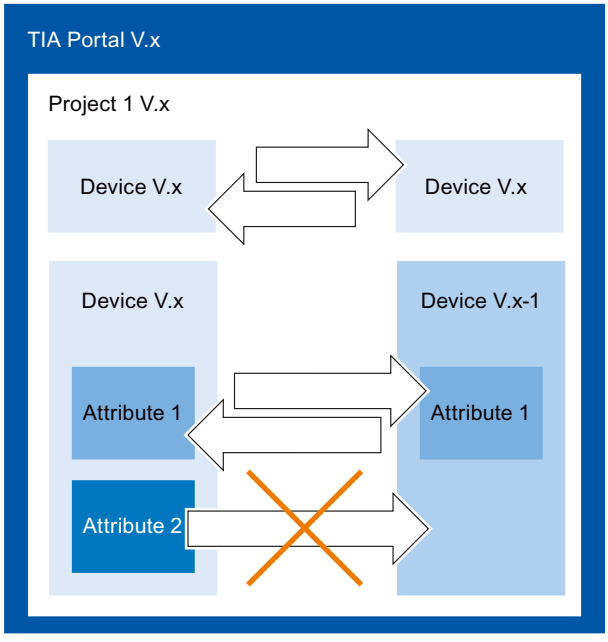
All configurations that are supported in the target version are retained when you copy data between projects of different WinCC versions. Configurations that are not supported by the target version are marked as invalid with a color code.

Copy of control between HMI devices from different device versions

WinCC supports all configurations of a previous WinCC version.

The following applies when copying within different ES versions:

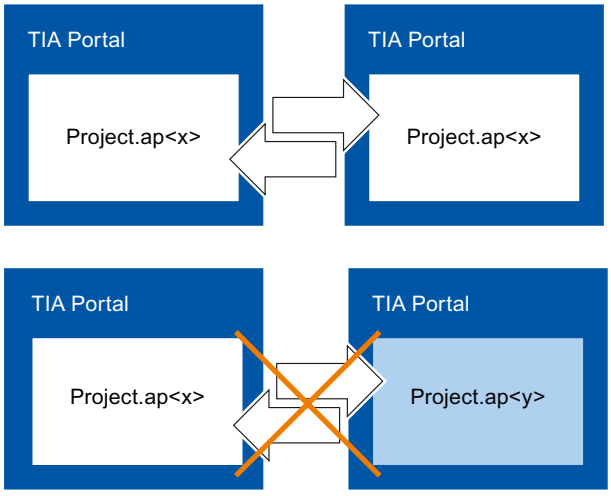
- All the configurations that are also supported in the respective RT version are retained.
- Default settings are defined for configurations that are only supported in the WinCC version of the target project.
- Configurations that are not supported by the respective RT version are marked by color as invalid or are not displayed.
  All properties and settings originally defined in the source HMI device are reactivated when you copy an object back to the source HMI device unchanged.



- The HMI device must be valid for the current Runtime version.

Copying between different ES versions

To copy between two TIA projects, open a second instance of the TIA Portal. You can only copy between projects that have the same ES version. The ES version of a project is indicated by the file extension *.ap<version_number>.



12.12.10 Using WinCC version compatibility

12.12.10.1 Basics on version compatibility

Introduction

Edit existing projects as follows with WinCC:

- You edit, compile and download existing projects with the range of functions of the previous version of WinCC. You can continue to edit these projects afterwards with the previous version of WinCC.
- You upgrade existing projects and use the functions of the current WinCC version.

Note

WinCC functions

While editing a project of a previous WinCC version, you can only access the functions and HMI devices of this previous WinCC version.

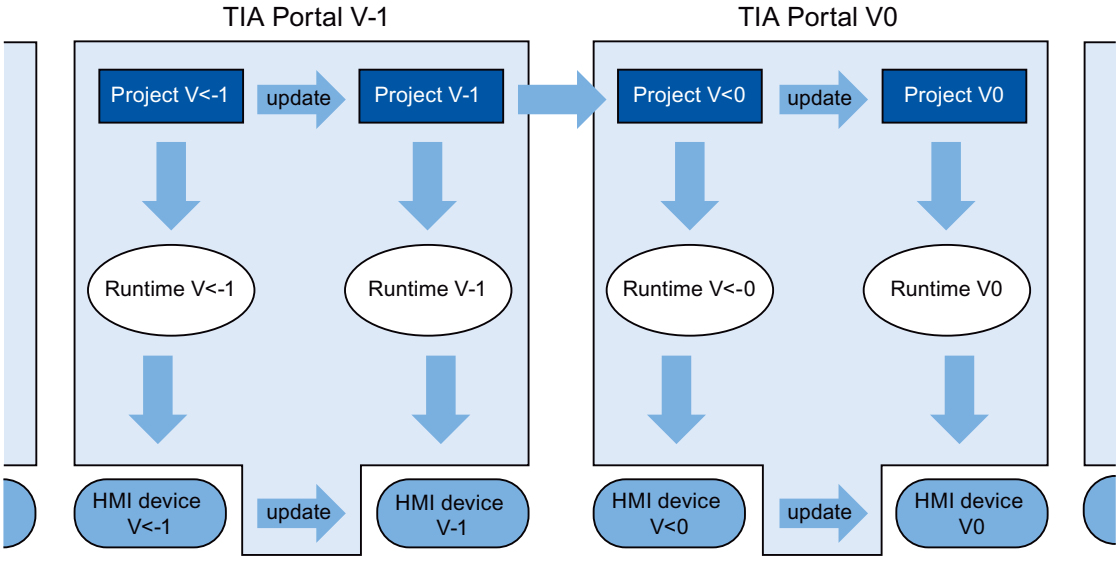
Versions in WinCC

In WinCC, you work with different version types:

- WinCC version
  The WinCC version installed on the configuration PC, for example, WinCC V12.
- Project version
  Projects are created using the WinCC version that is installed on the configuration PC. While you are editing a WinCC project from a previous version in the current WinCC version, the version ID is displayed behind the project name in the project tree.
- Runtime version
  You can configure HMI devices with different runtime versions in WinCC. You specify the runtime version once for an HMI device. The device version must match the Runtime version.
- Device versions
  Depending on the used HMI device, the image is a combination of the operating system and / or runtime software. For each HMI device, WinCC provides various images which can be loaded onto the HMI device, if necessary, according to the configuration. The device version corresponds to a specific image. The device version must match the configuration.

Compatibility of WinCC versions, Runtime versions and device versions

The figure below shows the interaction of the versions in the TIA Portal:



Creating projects

After you create a new project in WinCC, open and edit it in the WinCC version in which you created it.

Saving

To save a project of a predecessor WinCC version in this version again, save it in the usual way. If you manually upgrade the project to your WinCC version, please note that you will no longer be able to open the project in the previous WinCC version.

To save a project of the previous WinCC version in the current version, upgrade the project to your WinCC version. You can then no longer edit the project with a previous version of WinCC.

Compiling, simulating and loading

If you are using a project of a previous WinCC version, you can use your current version to generate Runtime data for this previous version. This also allows you to load HMI devices that are no longer compatible with your WinCC version.

Copying within projects with different WinCC versions

If objects and configurations are also available in the target version, copy these as required via the clipboard or using drag-and-drop.

Opening, editing and saving projects of a previous WinCC version

You can open and edit projects of previous WinCC versions as required. In doing so, you only utilize the functions of the previous WinCC version. Once you have completed editing, you can once again save and edit the project in the previous WinCC version.

Compiling, downloading and simulating projects of a previous WinCC version

You can compile, download and simulate projects of previous WinCC versions as required. Your current WinCC version will provide the Runtimes and device versions for the corresponding WinCC version.

See also

Editing projects of a previous WinCC version (Page 6878)

Upgrading projects (Page 6879)

Changing between device versions (Page 6881)

Changing the device version (Page 6882)

12.12.10.2 Editing projects of a previous WinCC version

Introduction

WinCC provides the option of editing projects of a previous WinCC version. While editing a project of a previous WinCC version, you can only access the functions of this version. In order to use the functions of your current WinCC version for this project, upgrade the project to your WinCC version.

Note

If you upgrade a project to your WinCC version, please note that you will no longer be able to open and edit the project in the previous WinCC version.

Requirement

- A project of a previous WinCC version has been created.
- The current WinCC version is installed on the configuration PC.

Procedure

Proceed as follows to edit a project of a previous WinCC version:

1. Open the project.
2. Edit the project using the functions of the previous WinCC version.
3. Save the project.
4. Compile the project.
5. Download and simulate the project.
6. You can open the project in the previous WinCC version for further editing, if required.

Result

The modified project data can be edited further on a different configuration PC with the previous WinCC version for further processing. The Runtime project was generated and downloaded in the corresponding Runtime version.

See also

Basics on version compatibility (Page 6873)

12.12.10.3 Upgrading projects

Introduction

If the project version is older than the WinCC version, the version ID is displayed in the project navigation. Your WinCC version also contains the previous version that you can use to edit projects as required. In order to use the functions and options of your WinCC version in a project, upgrade the project to your WinCC version. Then change your device or Runtime version(s) to match the new project version.

Note

WinCC version compatibility

If you upgrade a project to your WinCC version, please note that you will no longer be able to edit the project with the previous version.

Requirements

- The project version is a predecessor of your WinCC version.
- You have write access to your project drive.
- The project drive provides sufficient storage capacity for another project of this size.

Procedure

Proceed as follows to upgrade a project to your WinCC version:

1. Select the project in the project navigation.
2. Select the "Upgrade project" command from the shortcut menu of the project.
   A dialog opens.
3. Click "Confirm".
   The project closes and the progress bar is displayed.

An alarm is output when the project has been upgraded.

Result

- The project has been saved on the project drive in the previous WinCC version and with the corresponding file extension.
- The project is displayed on the project drive in the current WinCC version and with the corresponding file extension.
- The project is displayed without a WinCC version ID in the project navigation.

To make use of the functions of the new WinCC version, change your device or Runtime version(s) in accordance with the new project version in the next step.

See also

Basics on version compatibility (Page 6873)

12.12.10.4 Upgrading a global library

Introduction

In order to process objects of a global library in a project, the global library must be available in the product version of the project. You can upgrade each global library from an older product version to the current product version. You are prompted accordingly when you open the global library.

Requirements

- The version of the global library is a predecessor of your WinCC version.
- You have write access to your project drive.
- All types in the library have been released.

Note

Upgrading a user library

If you want to use a user library from an earlier version of WinCC, you must upgrade it. Make sure that all types of the library have been released. The library being upgraded cannot contain a type with the "in progress" status.

Procedure

Proceed as follows to upgrade a global library from TIA Portal V12.x or lower:

1. Open the global library.
   The "Upgrade global library" dialog box opens.
2. Click "OK".

A copy of the global library is created and upgraded. The copy of the global library receives the name extension "_V13". The global library opens.

Result

The global library is stored with the appropriate file extension.

See also

Basics on version compatibility (Page 6873)

Managing libraries
(Page 6776)

12.12.10.5 Changing between device versions

Selection of the device version

When you configure a new HMI device, WinCC automatically selects the latest version of the device.

If you want to use a device version other than the one set in WinCC, transfer an image to the HMI device. WinCC provides the images required for the supported HMI devices.

Information on the device versions used in WinCC is available in the FAQs on the Internet, entry ID 21742389.

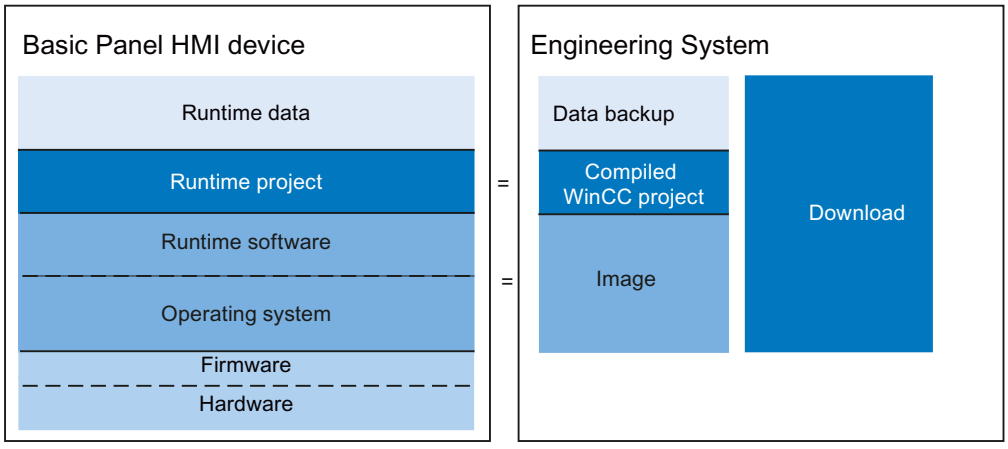
Notice

Changing the device version deletes all data on the HMI device.

Data is deleted on the target system if you change the device version. For this reason, you should save existing Runtime data before changing the device version.

HMI device configuration

The following figure shows the software components of an HMI device:



See also

Basics on version compatibility (Page 6873)

Updating the operating system (Page 6996)

Changing the device version (Page 6882)

12.12.10.6 Changing the device version

Introduction

Depending on the required Runtime version, select the suitable device version for your configuration.

Note

Selection of device versions

The selection of available devices versions depends on the version of the project.

Requirements

- A project has been created and opened.
- The project contains an HMI device.

Procedure

To change the device version, follow these steps:

1. Double-click on "Devices & Networks" in the project tree.
   The editor opens.
2. Select the required HMI device from the device view.
3. Select "Change Device/Version" in the device shortcut menu of the HMI device.
   A dialog opens.
4. Select the required HMI device.
5. Select the required device version under "Version".
6. Confirm your selection with "OK".

Result

You have changed the device version in the WinCC project.

Notice

Changing the device version deletes all data on the HMI device.

All data is deleted from the HMI device when you change the device version and compile/ download the project. You should therefore backup your Runtime data prior to the download.

See also

Basics on version compatibility (Page 6873)

Changing between device versions (Page 6879)

12.12.11 Viewing memory card data

12.12.11.1 Basics

Introduction

WinCC provides you with the possibility of viewing data stored on your memory card. The function supports the use of memory cards of the HMI device and of the CPU.

You have the following options:

Viewing a backup (Page 6883)

Renaming and deleting backups (Page 6885)

12.12.11.2 Working with backups

Viewing a backup

Introduction

The backup of a Basic Panel that is stored on a memory card can also be viewed in the TIA Portal.

Requirements

- WinCC is installed.
- A memory card with a backup is available.
- The card reader is connected to the configuration PC.
- The project view is open.

Backup on the memory card in the card reader

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.
   The "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder
5. Click the backup to open the shortcut menu.
6. Select "Properties".

Backup on the memory card of the PLC

Proceed as follows if the backup is stored on the memory card of the PLC:

1. Connect the PLC with the configuration PC.
2. Click on the PLC in the project navigation.
3. Select "Connect online" from the shortcut menu.
   A connection to the PLC is established.
   Once the PLC is connected, the "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder.

   Note

   Accessing a password-protected PLC

   When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

   You need at least read access rights in order to view the data that is stored on the memory card.

5. Click the backup to open the shortcut menu.
6. Select "Properties".

Result

The backup properties are displayed in a separate dialog.

Renaming and deleting backups

Introduction

You can rename and delete backups from a memory card in the project navigation of the TIA Portal.

Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
  The PLC is connected online with the configuration PC.
- A memory card with a backup is available.
- The project view is open.
- The backup is displayed in the project navigation.

Note

Accessing a password-protected PLC

When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

You need write access rights to rename or delete memory card data.

Procedure

1. Click on the backup in the project navigation.
2. Open the shortcut menu.

3. Select "Rename" to rename the file.
4. Enter a new name.
5. Select "Delete" to delete the file.

Result

The backup file is now renamed or deleted.

12.12.11.3 Working with HMI device images

Viewing HMI device images

Introduction

The HMI device image of a Comfort Panel that is stored on a memory card can be viewed in the TIA Portal.

Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
- A memory card with the HMI device image is available.
- The project view is open.

Procedure

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.
   The "Online Card Data" dialog is displayed.
4. Open the "Online Card Data" folder.
   The available images of the HMI device are displayed in additional folders.
5. Click the required HMI device image.
6. Select "Properties" in the shortcut menu.

Result

The properties of the HMI device image are displayed in a separate dialog.
