SIMATIC

WinCC Advanced V13.0 SP1

System Manual

Online help printout

12/2014

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

Danger
indicates that death or severe personal injury **will** result if proper precautions are not taken.

Warning
indicates that death or severe personal injury **may** result if proper precautions are not taken.

Caution
indicates that minor personal injury can result if proper precautions are not taken.

Notice
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

Warning
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

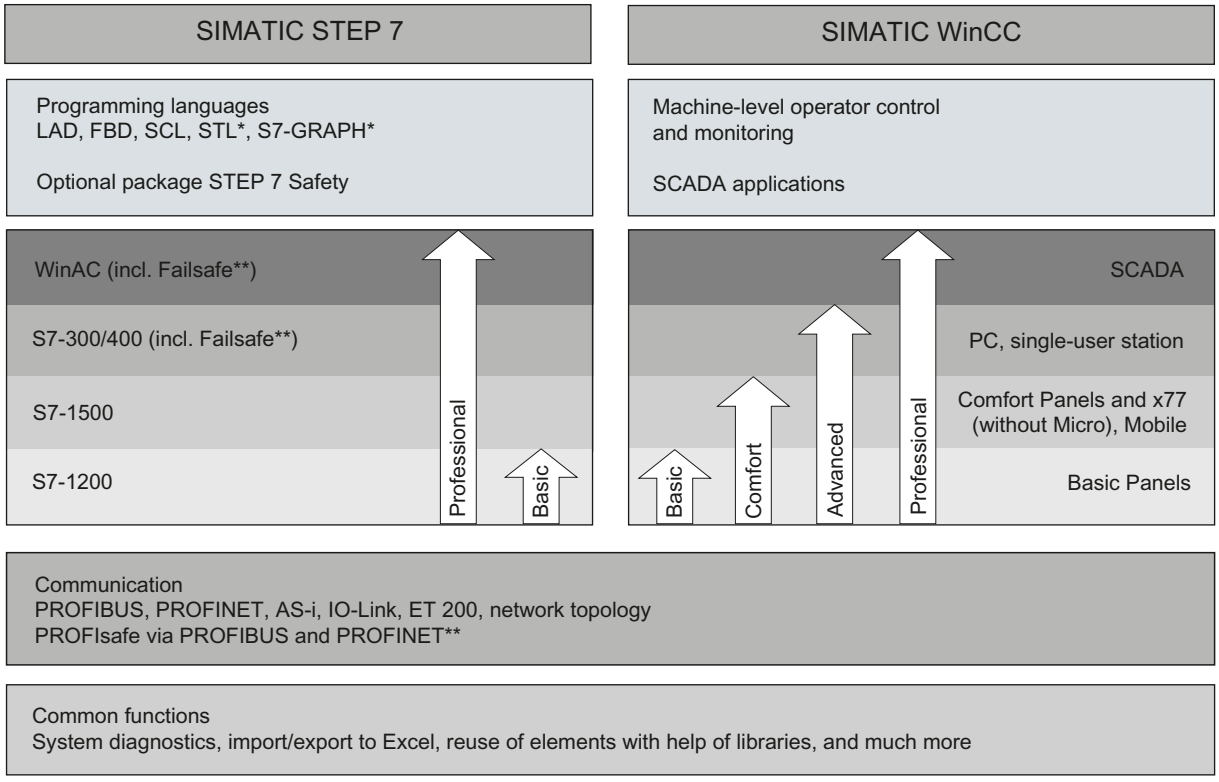
System overview of STEP 7 and WinCC

1

1.1 Scaling of STEP 7 and WinCC in the TIA Portal

Scope of performance of the products

The following graphic shows the scope of performance of the individual products of STEP 7 and WinCC:



* Only with STEP 7 Professional for S7-300/400/WinAC and S7-1500
** With installed optional package "STEP 7 Safety Advanced"

STEP 7

STEP 7 (TIA Portal) is the engineering software for configuring the SIMATIC S7-1200, S7-1500, S7-300/400 and WinAC controller families. STEP 7 (TIA Portal) is available in two editions, depending on the configurable controller families:

- STEP 7 Basic for configuring the S7-1200
- STEP 7 Professional for configuring S7-1200, S7-1500, S7-300/400 and WinAC

WinCC

WinCC (TIA Portal) is an engineering software for configuring SIMATIC Panels, SIMATIC Industrial PCs, and Standard PCs with the WinCC Runtime Advanced or the SCADA System WinCC Runtime Professional visualization software.

WinCC (TIA Portal) is available in four editions, depending on the configurable operator control systems:

- WinCC Basic for configuring Basic Panels
  WinCC Basic is included with every STEP 7 Basic and STEP 7 Professional product.
- WinCC Comfort for configuring all panels (including Comfort Panels, Mobile Panels)
- WinCC Advanced for configuring all panels and PCs with the WinCC Runtime Advanced visualization software
  WinCC Runtime Advanced is a visualization software for PC-based single-station systems. WinCC Runtime Advanced can be purchased with licenses for 128, 512, 2k, 4k as well as 8k PowerTags (tags with a process interface).
- WinCC Professional for configuring panels and PCs with WinCC Runtime Advanced or SCADA System WinCC Runtime Professional. WinCC Professional is available in the following editions: WinCC Professional for 512 and 4096 PowerTags as well as "WinCC Professional max. PowerTags".
  WinCC Runtime Professional is a SCADA system for structuring a configuration ranging from single-station systems to multi-station systems including standard clients or web clients. WinCC Runtime Professional can be purchased with licenses for 128, 512, 2k, 4k, 8k, and 64k PowerTags (tags with a process interface).

With WinCC (TIA Portal), it is also possible to configure a SINUMERIK PC with WinCC Runtime Advanced or WinCC Runtime Professional and HMI devices with SINUMERIK HMI Pro sl RT or SINUMERIK Operate WinCC RT Basic.

1.2 Options for STEP 7 Engineering System

Additional STEP 7 products

For applications with increased safety requirements, STEP 7 Professional can be supplemented with the STEP 7 Safety Advanced option.

When using the STEP 7 Safety Advanced option, you can configure failsafe I/O and program safety programs for F-CPUs in LAD and FBD.

1.3 Options for WinCC Engineering and Runtime systems

SIMATIC Panels as well as WinCC Runtime Advanced and WinCC Runtime Professional contain all essential functions for operator control and monitoring of machines or plants. Additional options allow you to extend the functionality in some cases to increase the range of available tasks.

Options for Comfort Panels, Mobile Panels, Multi Panels

The following possible extensions are available for Comfort Panels, Mobile Panels, and Multi Panels:

- WinCC SmartServer (remote operation)
- WinCC Audit (audit trail and electronic signature for regulated applications)

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

Options for WinCC Runtime Advanced

The following possible extensions are available for WinCC Runtime Advanced:

- WinCC SmartServer (remote operation)
- WinCC Recipes (recipe system)
- WinCC Logging (logging of process values and alarms)
- WinCC Audit (audit trail for regulated applications)
- WinCC ControlDevelopment (extension by means of customer-specific controls)

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

Options for WinCC Runtime Professional

The following possible extensions are available for WinCC Runtime Professional:

- WinCC Client (standard client for structuring multi-station systems)
- WinCC Server (supplements WinCC Runtime to include server functionality)
- WinCC Recipes (recipe system, formerly WinCC /UserArchives)
- WinCC WebNavigator (Web-based operator control and monitoring)
- WinCC DataMonitor (display and evaluation of process states and historical data)
- WinCC ControlDevelopment (extension by means of customer-specific controls)

Note

In contrast to WinCC V7, functions from the WinCC /OPC-Server and WinCC / ConnectivityPack options are incorporated into the basic functionality. Likewise, the basic functionality includes the Runtime API from WinCC /ODK.

What's new in WinCC Advanced? 2

2.1 What's new in WinCC V13 SP1?

New features in WinCC Advanced V13 SP1

You can find all important new features in WinCC Advanced V13 SP1 here:

Topic	New features in the TIA Portal
HMI devices	You can now configure the following new HMI devices: • Mobile Panels: KTP700 Mobile and KTP900 Mobile The following HMI devices have been extended in terms of their functionality: • Basic Panels 2nd Generation
Configuring screen	The following editors for creating HMI screens have been extended: • "Design" editor • "Styles" editor The following screen objects can now be configured: • "Slide-in screen" • "Pop-up screen" • "PDF view" • "Camera view" You can search for and replace colors within HMI screens.
Working with tags	Synchronization of HMI tags and PLC tags of data type "UDT". The range of data types for Panels and Runtime Advanced has been expanded.
Exchanging data with Inter Project Engineering (IPE)	The exchange of controller data using proxy devices has been extended.
Automating projects with scripts	You can automate projects with scripts using the "Openness" option. Install the "Openness" option using the DVD: "Support/Siemens_TIA_Openness_V13_SP1.exe"

What's new in STEP 7 Basic? 3

3.1 What's new in STEP 7 Basic?

New features in the TIA Portal

You can find all important new features in TIA Portal V13 SP1 here:

Topic	New features in the TIA Portal
Installation	The new virus scanner 360 Safety Guard is supported.
Migrating projects and programs	You can find many new examples of effective programming of S7-1200/1500 in the programming recommendations. (Page 224)
Editing projects	Information, warnings and errors can be hidden in the Inspector window. (Page 324) The creation of user-defined documentation is possible. (Page 361) Function extensions in libraries: • Types can be changed in the project view. (Page 501) • Drag-and-drop is also possible for multiple selection of objects.
Editing devices and networks	Devices can be compared at module level in the offline/offline comparison. (Page 579) HW system constants have unique names. The server module (6ES7 193-6PA00-0AA0) of the ET 200SP is automatically inserted after a compilation Installed GSD/GSDML files can be removed. The selection of partners for direct data exchange has been simplified. Device numbers are displayed in the network overview. PROFINET device names can be assigned easily. You can simply zoom in on the device and network views. Configuration control is available for S7-1200 as of FW4.1.

Topic	New features in the TIA Portal
Programming the PLC	New functions are available for controlling tags in data blocks. WCHAR and WSTRING data types are available. (Page 1936) Global constants cannot be used as ARRAY limits. New VARIANT instructions for creating generic user programs are available in all languages. (Page 260) The following instructions are also available for the S7-1200 CPU. As an example, the instructions in LAD are listed here: • EQ_Type (Page 2292) • NE_Type (Page 2294) • EQ_ElemType (Page 2295) • NE_ElemType (Page 2296) • IS_NULL (Page 2297) • NOT_NULL (Page 2298) • IS_ARRAY (Page 2299) • MOVE_BLK_VARIANT (Page 2346) • VariantGet (Page 2367) • VariantPut (Page 2368) • CountOfElements (Page 2369) Specifically in STL and SCL, the following VARIANT instructions are also available for the S7-1200 CPU: • VARIANT_TO_DB_ANY (Page 2890) • DB_ANY_TO_VARIANT (Page 2892) New extended instructions: • GetInstancePath (Page 3060) • GetSymbolPath (Page 3057) • ReconfigIOSystem (Page 3113) PLC data types (UDT) can be expanded in the PLC tag table A search is available in the "Instructions" task card. During a block call, the called block can be replaced with another block.
Using technology functions	A new PID controller "PID_Temp" for temperature processes is available. High-precision input/output with time-based IO is available. Position-controlled axis is available.
Using online and diagnostics functions	Scalable options for online backup of devices are available. (Page 7597) Preferred interfaces for the online connection can be saved as default in the settings. To establish an online connection to devices in an external subnet, you can assign an alternative IP address to the device.

Topic	New features in the TIA Portal
Using Team Engineering	Developing function extensions for HMI and PLC in parallel with Inter Project Engineering: • MPI is supported • H systems are supported
Support packages	The "Openness" option package with API functions and XML format for the import/export of project data is available for installation in the "Support" folder on the DVD. PLCSIM is also available for the S7-1200 CPU.

Readme

4

4.1 Notes on the TIA Portal

4.1.1 General notes

The information in this readme file supersedes statements made in other documents.

Read the following notes carefully because they include important information for installation and use. Read these notes prior to installation.

Display of Asian characters in the TIA Portal

Due to a change in behavior in Microsoft Windows, it may occur that texts are not displayed correctly in the TIA Portal when a Chinese TIA Portal is installed on another Asian operating system (e.g. Korean). To view the texts in TIA Portal correctly, open the Windows Control Panel and select "English" under "Language for non-Unicode programs". Note, however, that this may cause display problems in other programs.

Installing new .Net versions or .Net service packs

- Close the TIA Portal before installing a new .Net version or a new .Net service pack on your programming device/PC.
- Restart the TIA Portal only after successful installation of the new .Net version or the new .Net service pack.

Notes on handling

- If a project in the list of projects last used is located on a network drive that is not connected, you may experience delays when opening the "Project" menu.
- When you insert a CPU, you may need to wait for some time if the project editor is open at the same time. This generally takes longer when you insert the first CPU in a newly created project. To be able to continue working more quickly, you should close the project editor before inserting a CPU.
- The alarm "Application is not responding" may appear in Windows 7 with functions that take a long time to run (loading the CPU for example). If this occurs, wait until the function has correctly finished.
- If you have installed a Microsoft mouse with IntelliPoint, you may find that it superimposes components over the buttons of the title bar. If this is the case, uninstall the IntelliPoint software from Microsoft.
- Enabling the "Virtual Desktop" options with NVIDIA graphics cards can cause problems. In this case, disable the "nView virtual desktop manager" of your NVIDIA graphics driver.

Using the TIA Portal via a remote desktop

In principle, it is possible to use the TIA Portal via a remote desktop connection. During configuration, you should, however, avoid disconnecting the connection to the desktop client. In rare cases, this can lead to the software user interface being blocked.

If you experience this blockage, follow these steps on the desktop client.

1. Open the Windows Task-Manager and close the "rdpclip.exe" process.
2. Type in "rdpclip.exe" in the command prompt to restart the process.

Note that the current content of the clipboard will be lost. You can, however, then continue configuration as usual. To be on the safe side, you should restart the TIA Portal at the next opportunity.

Migration of projects with the TIA Portal

After the migration of hardware configurations and program blocks from earlier automation solutions, first check the functionality of the migrated project before you use it in productive operation.

Working with automatically synchronized network drives

Automatic synchronization after a network interruption can result in current (local) project data being stored as a "backup" on the network drive through user interactions. This could cause outdated project data to be loaded from the network drive when opening the project. For this reason, we do not recommend that you store TIA Portal projects on synchronized network drives.

If, however, you do work on synchronized drives, you can continue working locally in the event of a network interruption. In this case, you must always ensure that the TIA Portal application is closed while data is synchronized. The synchronization itself must be implemented in such a way that the current (local) project data replaces the project data on the network drive.

Entry of decimal places

With certain Windows language settings, it may occur that the entry of values with a comma as decimal place is not recognized (entering "1,23" leads to an error). Instead, use the international format ("1.23").

Information on the TIA Portal in online support

Overview of the most important technical information and solutions for the TIA Portal in the Siemens Industry online support.

Internet link: TIA Portal in Siemens Industry online support (www.siemens.com/industry/onlinesupport/tiaportal)

All information on service and support in the Siemens Industry online support:

Internet link: Service and support in Siemens Industry online support (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002)

Here, you can also subscribe to the newsletter that provides you with latest information relating to your products.

Starting the TIA Portal

When you start the TIA Portal, Windows attempts to update the Certificate Revocation List (CRL) of "windowsupdate.com".

If no Internet access is available and there are multiple DNS servers, a timeout may occur and delay the start of the TIA Portal.

4.1.2 Notes on libraries

Contents

Information that could not be included in the online help and important information about product characteristics.

Comparing library elements

If master copies and types have the same name, the corresponding objects in the project are overwritten when the action "Copy" is used. Please note that this takes place without a prompt. The same behavior occurs when the name of the master copy is different to the name of the type, but an object within the master copy has the same name as the type.

4.1.3 Notes on memory cards

Contents

Information that could not be included in the online help and important information about product characteristics.

Notes on SIMATIC memory cards

The SIMATIC memory cards have been formatted and set up by Siemens for use with S7-1200 and S7-1500 modules. This format must not be overwritten; otherwise, the card will no longer be accepted by the modules. Formatting with Windows tools is therefore not permitted.

Behavior in case of open force job

Note that an active force job is retained even after you have loaded a new project to the SIMATIC memory card. This means you should first delete the active force job before you remove a SIMATIC memory card from the CPU and before you overwrite the card in the PC with a new project. If you use a SIMATIC memory card with unknown content, you should format the SIMATIC memory card before the next download.

Access protection for memory cards in USB card readers

By improving the security mechanisms for online access and engineering of S7-1500 CPUs, the data storage on memory cards has been changed. For this reason, this version of STEP 7 cannot evaluate the passwords of the configured protection level when reading project data from memory cards that is accessed via a USB card reader. The changed behavior affects the memory cards for CPUs of the S7-1200/1500 series. Therefore, use physical safeguards to protect critical project data on memory cards for these devices.

Note

This restriction is not related to online access to devices or the know-how protection of program blocks.

4.1.4 Notes on the hardware configuration

Content

Information that could not be included in the online help and important information about product characteristics.

Subnet addressing for CP 1613 and CP 1623

CP 1613 and CP 1623 are communication modules with microprocessor. To ensure secure management of communication links, these are processed on the module. The protocol stack in your PC is used for diagnostic purposes (SNMP, DCP). To allow both protocol stacks (i.e. CP 1613/23 Firmware and CP 1613/23 NDIS access) access to the same partners, is recommended to place both stacks of a module in the same subnet.

Editing a device IP address

Do not use the address range from 192.168.x.241 to 192.168.x.250 when editing a device IP address. If necessary, this address range is automatically assigned by the system to a programming device. Depending on the subnet mask, this applies also for all network classes.

Drivers for the CP 5512 communications processor

The drivers for the CP 5512 are no longer included in this software version. If you want to use the CP 5512, the following needs to be installed prior to the installation of this software:

http://support.automation.siemens.com/WW/view/78453460 (http://support.automation.siemens.com/WW/view/en/78453460)

Please note that the CP 5512 can be used with a maximum of Windows 7 32-bit. As of Windows 8 or with 64-bit operating systems, the CP 5512 is not compatible.

Note

Since 2009, the functional successor the USB 2.0 module CP 5711 has been available.

4.1.5 Notes on instructions

Contents

Information that could not be included in the online help and important information about product characteristics.

Instructions not valid for all CPU firmware versions

The firmware version of your CPU determines the following:

- Whether a specific instruction is available for this CPU:
  - If you select CPU 1211C DC/DC/DC with firmware version V1.0, for example, the extended instruction "T_COMBINE" will not be available to you. It is grayed out in the "Instructions" task card.
  - However, if you select CPU 1211C DC/DC/DC with firmware version V3.0, the extended instruction "T_COMBINE" will be available to you in versions V1.1 and V1.2.
- Which versions of the instruction are available. You can select the different versions in the "Version" column of the "Instructions" task card.

4.1.6 Notes on online and diagnostics

Contents

Information that could not be included in the online help and important information about product characteristics.

Display of interfaces via online access

If the Ethernet interfaces for online access are not displayed sporadically, install hotfix KB2588507 (for Microsoft Windows) from the Microsoft Support website.

Internet link: http://support.microsoft.com/kb/2588507 (http://support.microsoft.com/kb/2588507/en-us)

Online operation in hibernate mode

We recommend that you do not use the two options "Hibernate" and "Sleep" in online operation; if you do, communication problems could occur. If necessary, adapt the computer's energy options.

4.2 WinCC Comfort/Advanced

4.2.1 Security information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Any third-party products that may be in use must also be taken into account. For more information about industrial security, visit

http://www.siemens.com/industrialsecurity (http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx)

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit

http://support.automation.siemens.com (http://support.automation.siemens.com)

Passwords

Various passwords are set by default in WinCC. For security reasons, you should change these passwords.

- On HMI devices with version V11 or V12, the password "100" is preset for the Sm@rtServer and for the integrated Web server. A default password is not preset for HMI devices with version V13.
- For the user "Administrator", the default password is "administrator".

Integrated Web server

It is always possible on a PC to access HTML pages in Runtime, even though the option"HTML pages" is disabled. Setup always installs the standard pages of the Web Server on the PC. Assign an administrator password to prevent unauthorized access to the pages.

Communication via Ethernet

In Ethernet-based communication, end users themselves are responsible for the security of their data network. The proper functioning of the device cannot be guaranteed in all circumstances; targeted attacks, for example, can lead to overload of the device.

Ending Runtime automatically

If automatic transfer is enabled on the HMI device and a transfer is started on the configuration PC, the running project is automatically stopped on the HMI device. The HMI device then switches autonomously to "Transfer" mode. Transfer mode may cause undesired reactions in the system.

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode. To block access to the transfer settings and thus avoid unauthorized changes, assign a password in the Control Panel.

Use of SSL 3.0

For security reasons, the use of the protocol SSL 3.0 is not recommended. The use of the protocol SSL 3.0 is disabled by default on Comfort Panels. If you nevertheless wish to activate the use of SSL 3.0, select the option "Use SSL 3.0" in Internet Explorer or in "Start Center > Settings" under "Internet options > Advanced".

For RT Advanced, the use of SSL 3.0 can be disabled in Internet Explorer or in the Control Panel under "Internet Options > Advanced" by deactivating the "Use SSL 3.0" option.

Network settings

The following tables show the network settings of each product which you need in order to analyze the network security and for the configuration of external firewalls:

WinCC Advanced (without simulation)					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
ALM	4410*	TCP	Inbound, Outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
HMI Load	1033	TCP	Outbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
HMI Load	2308	TCP	Outbound	HMI Load (RT Advanced)	This service is used to transmit images and configuration data to panels.
* Default port that can be changed by user configuration					

WinCC Simulation for Basic Panels					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
HMI Load	1033	TCP	Inbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.

WinCC Simulation for Basic Panels					
EtherNet/IP	44818	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
	2222	UDP	Inbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Modbus TCP	502	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
RFC 1006	102	TCP	Outbound	S7 channel	Communication with the S7 controller via Ethernet/PROFINET
Mitsubishi MC	5002	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.

WinCC Simulation for Panels and Runtime Advanced					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
DCP	---	Ethernet	Outbound	PROFINET	The DCP protocol (Discovery and basic Configuration Protocol) is used by PROFINET and provides the basic functionality for locating and configuring PROFINET devices.
LLDP	---	Ethernet	Inbound, Outbound	PROFINET	The LLDP protocol (Link Layer Discover Protocol) is used by PROFINET for topology detection.
SMTP	25	TCP	Outbound	SMTP Communication	This service is used by WinCC Runtime Advanced to send e-mails.
HTTP	80*	TCP	Inbound	Sm@rtServer	The Web server is only available when Sm@rtService is activated. The used port may differ depending on automatically selected settings.
RFC 1006	102	TCP	Outbound	S7 channel	Communication with the S7 controller via Ethernet/PROFINET
NTP	123	UDP	Outbound	Time synchronization	The NTP protocol (Network Time Protocol) is used for time synchronization in IP-based networks.
SNMP	161	UDP	Outbound	PROFINET	The SNMP client functionality is used by STEP 7 to read status information from PROFINET devices.
HMI Load	2308	TCP	Outbound	HMI Load (RT Advanced)	This service is used to transmit images and configuration data to panels.
HTTPS	443*	TCP	Inbound	Sm@rtServer	The Web server with HTTPS protocol is only available when Sm@rtService is activated. The used port may differ depending on automatically selected settings.
VNC server	5900*	TCP	Inbound	Sm@rtServer	This service is only available when Sm@rtService is activated.
	5800*	TCP	Inbound	Sm@rtServer	This service is only available when Sm@rtService is activated.
VNC client	5500	TCP	Outbound	Sm@rtServer	This service is only available when Sm@rtService is activated.
* Default port that can be changed by user configuration					

PROFINET protocols for Panels and Runtime Advanced					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
DCP	---	Ethernet	Outbound	Lifelist, PROFINET Discovery and configuration	The DCP protocol (Discovery and basic Configuration Protocol) is used by PROFINET and provides the basic functionality for locating and configuring PROFINET devices.
LLDP	---	Ethernet	Inbound, Outbound	PROFINET Link Layer Discovery protocol	The LLDP protocol (Link Layer Discover Protocol) is used by PROFINET for topology detection.
MRP	---	Ethernet	Outbound	PROFINET medium redundancy	The MRP protocol (Medium redundancy protocol) enables control of redundant transmission paths using a ring topology.
PROFINET IO Data	---	Ethernet	Inbound, Outbound	PROFINET Cyclic IO data transfer	Cyclic data exchange is used by panels for direct keys and LEDs.
NARE	---	Ethernet	Inbound, Outbound	Name Address Resolution	This protocol is used to resolve network names and assign IP addresses.
PROFINET Context Manager	34964	UDP	Inbound, Outbound	PROFINET connection less RPC	The PROFINET Context Manager provides an endpoint mapper in order to establish an application relation (PROFINET AR).

Communication connections for Panels and WinCC Runtime Advanced					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
Telnet	23	TCP	Inbound	Telnet	This service can be used for maintenance.
SMTP	**	TCP	Outbound	SendEMail	This service is used by Windows CE / PC Runtime to send e-mails.
HTTP	80*	TCP	Inbound	Hypertext Transfer Protocol	The HTTP protocol is used for communication with the internal Web server.
RFC 1006	**	TCP	Outbound	S7 channel	Communication with the S7 controller via Ethernet/PROFINET.
HMI Load	102	TCP	Inbound	Transfer	This service is used to transmit images, Runtime, and configuration data to the panel via PN/IE
NTP	**	UDP	Outbound	Time synchronization	The NTP protocol (Network Time Protocol) is used for time synchronization in IP-based networks.
DCOM***	135	TCP	Inbound	OPC server	This service is a component of the Microsoft Windows operating system. Communication via OPC (DA) is based on DCOM. Therefore, this service is required to initialize OPC (DA) connections.

Communication connections for Panels and WinCC Runtime Advanced					
DCOM***	**	TCP	Outbound	OPC server	The communication via OPC (DA) is based on DCOM and uses unspecified ports assigned by the system. This should be taken into consideration when using OPC (DA) and creating rules for the firewall.
NetBIOS over TCP/IP	**	UDP	Outbound	With the use of Remote File Share	Register / log on to a remote server.
NetBIOS over TCP/IP	**	UDP	Outbound	With the use of Remote File Share	Register / log on to a remote server.
SNMP	161	UDP	Inbound	Simple Network Management Protocol	The SNMP client functionality is used by STEP 7 to read status information from PROFINET devices.
HTTPS	443*	TCP	Inbound	Secure Hypertext Transfer Protocol	The HTTP protocol is used for communication with the panel-internal Web server via Secure Socket Layer (SSL).
Modbus TCP	**	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
Mitsubishi MC	**	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.
Printing	**	TCP	Outbound	Printing	Printing on the control panel (via Ethernet).
HMI Load	2308	TCP	Inbound	Transfer	This service is used to transmit images and configuration data to panels. On Comfort Panels, this service is replaced by DeviceManager and SCS in V13 and higher. This service is used to transmit configuration data to WinCC Runtime Advanced.
HMI Load	50523	TCP	Inbound	Transfer	This port is used if port 2308 is not available. This service is used to transmit images and configuration data to panels. On Comfort Panels, this service is replaced by DeviceManager and SCS in V13 and higher. This service is used to transmit configuration data to WinCC Runtime Advanced.
ALM	4410*	TCP	Inbound, Outbound	Application License Manager	This service of RT Advanced makes available the complete functionalities for software licenses and is used by the Automation License Manager.
OPC UA	4870*	TCP	Inbound	OPC UA server	This service is required for communication via OPC UA.
HMI Load	5001	TCP	Inbound	Device Manager	This service is used to transmit images and Runtime to panels.
HMI Load	5002	TCP	Inbound	SCS (System Configuration Server)	This service is used to transmit configuration data to panels.
VNC client	5500	TCP	Inbound	Sm@rtServer	Reverse VNC server connection. Receive mode is set for the VNC client.
VNC server	5800*	TCP	Inbound	Sm@rtServer	VNC server connection HTTP
	5900*	TCP	Inbound	Sm@rtServer	VNC server connection

Communication connections for Panels and WinCC Runtime Advanced					
SIMATIC Logon	**	TCP	Outbound	UMAC (User Management to the Access Control)	Register / log on to a remote server.
Allen Bradley Ethernet IP	**	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Reserved	49152 ... 65535	TCP/UDP	Outbound		Dynamic port range is used, for example, to connect to the remote file sharing.
* Default port that can be changed by user configuration ** Port is assigned automatically. *** Supported by WinCC Runtime Advanced only.					

4.2.2 News

News about the TIA Portal

You can learn about the latest news about various topic areas of the TIA Portal in Siemens Industry Online Support.

All news concerning WinCC can be found here: News (http://support.automation.siemens.com/WW/view/en/88360672)

4.2.3 Notes on use

Contents

Information that could no longer be included in the online help and important information about product features.

Working with standard user rights

If you are working with standard user rights in Windows 7, "User Account Control (UAC)" must not be disabled. The "User Account Control" is enabled in Windows 7 by default.

For more information on the "User Account Control", refer to the online help for Windows 7.

On-screen keyboard

Once you have opened the TIA Portal, you can no longer call the on-screen keyboard.

To call the on-screen keyboard in Windows, use the following command: “Start > All Programs > Accessories > Ease of Access > On-screen keyboard”.

Copying HMI devices with HMI connections

If you copy an HMI device with HMI connections to a PLC, the HMI connection in the new HMI device is not automatically connected to an existing PLC with the same name. This applies to copying within a project as well as copying across projects.

To access the PLC tag via HMI tag in the new HMI device, you have to complete the configuration of the HMI connection immediately after copying. Proceed as follows:

1. Open the "Devices & Networks" editor.
2. Connect the new HMI device to the desired network.
3. Open the connection table.
4. Select the HMI connection of the new HMI device.
5. Select the desired PLC under "Partner".

If you compile the new HMI device or connect additional PLC tags in between copying the HMI device and completing the connection, there may be some instances in which an additional HMI connection to the same PLC is created. This is especially true if you connect HMI tags with DB array elements.

Device replacement

After an HMI device has been replaced, you should check the appearance of the configured screens. Changing the size of the display may result in changes to the position and appearance of screen objects, e.g. recipe view and alarm view.

Device replacement - communication

If an HMI device is replaced, error messages of the type "... are not supported in the new configuration. and will therefore be removed" may be generated. These alarms refer to configured connections of the device and are triggered, for example, if the HMI devices have a different number of interfaces. These connections are marked red after a device replacement. If you would like to continue to use these connections, you have change the configuration of the connection. Proceed as follows:

1. Open the "Devices and Networks" editor.
2. Click "Network" in the toolbar of the network view.
3. Network the interface of the HMI device with the interface of the CPU.
4. Click in the table area of the network view on the "Connections" table.
5. Select the connection marked red.
6. Enter the new interface under "Properties > General > Interface" in the Inspector window.

Specifying the time of modification in the overview window

The times of modification displayed in the overview window only refer to changes to the object itself. Changes to subordinate objects, e.g. screen objects in a screen, do not cause the time of the last change to the screen to change in the overview window.

HMI device wizard

When you create a device with a color display using the HMI device wizard, the graphics of the navigation buttons may be displayed in black and white. This error only occurs, however, if the new device is created with the same name as a device with a monochrome display which has been deleted in the meantime.

You can avoid this error by always deleting the associated graphics in the Graphics collection whenever you delete a device from the project.

Objects with object references in the project library

Two copying methods can be used in WinCC flexible.

- With "simple copy" a WinCC flexible screen including an IO field, for example is copied. Only the object name of a tag configured on the IO field is copied, as this is a reference.
- With "copy", a screen, an IO field contained there and a tag configured on the IO field together with its properties are copied.

These two methods can also be used for storing an object in a library. Project libraries and the objects contained there are migrated during migration and can be used in WinCC.

In WinCC, however, only one copying method is available. With regard to tags, it functions like "simple copy" in WinCC flexible. With regard to graphics, graphics lists and text lists, it functions like "copy" in WinCC flexible.

If you stored objects with references to tags in a library in WinCC flexible, you must reconfigure the referenced objects when using them in WinCC.

Reports with Asian character sets on Windows CE devices

If Asian characters sets are displayed in an illegible manner in a report on a Windows CE device, you must change the character sets for the objects in the report. it is sufficient to change to a different character set and then reset the original character set.

Installation sequence for Startdrive

When you install Startdrive on a PC, adhere to the following installation sequence:

- Install STEP 7 V13.0.
- Install Startdrive.

Compatibility with V12

Empty projects are installed in the installation directory under ..\Portal V13\SampleProjects to allow the TIA Portal to be opened in compatibility mode:

- V12.0.1.4 project with the name "TIA_Portal_Project_V12.0.1.4.ap12", so that TIA Portal V13 SP1 can be opened in V12 compatibility mode
- V13.0.0.3 project with the name "TIA_Portal_Project_V13.0.0.3.ap13", so that TIA Portal V13 SP1 can be opened in V13 compatibility mode

This project must be copied to a local directory with full access before it can be used. For more information on this, refer to FAQ ID 66027369.

File browser on a Windows 8 PC with touch screen

You can only operate the file browser dialog with a mouse, keyboard or on-screen keyboard (without using the touch function) on a Windows 8 PC with touch screen. We recommend using the file browser dialog of the Windows operating system with the help of a script on a touch screen PC with Windows 8.

Making characters available for HMI tags of the type WString/WChar

In tags of the type WString or WChar, you specify strings that can be displayed with specific fonts.

WinCC Runtime Advanced supports all fonts that are installed on the configuration PC. If you want to use a different font, install it on the configuration PC.

The fonts Courier New and Tahoma are installed by default on the HMI device. Tahoma supports the display of characters in all languages except Chinese, Korean and Japanese.

You can download the following fonts to the HMI device with the additional ProSave options:

- SimSun for the input of strings in Chinese (PRC), Chinese (Singapore), English, German, Italian, French and Spanish.
- Gulim for the input of strings in Korean.
- MS PGothic for the input of strings in Japanese.

If you download any other font to the HMI device, only the characters used in tags are retained during compilation. Unused characters are removed when the project is compiled.

To use fonts that are not installed on an HMI device, provide the characters as configured texts in a screen:

1. Create a new screen.
2. Insert a text box.
3. In the properties of the text box, set a font that contains characters that you wish to use later.
4. Insert the characters of the font that you wish to use later into the text box.

After the project is compiled, you can use the characters configured in the text in HMI tags of the type WString/WChar.

4.2.4 Migration

Contents

Information that could no longer be included in the online help and important information about product features.

Project languages in WinCC

WinCC V13 does not support all project languages that were available in WinCC flexible, such as Arabic. If you receive an empty project as the result of your migration, you may want to check the set editing language. Do not set the project languages that are not supported as editing language in the source project. Proceed as follows:

1. Open the project with WinCC flexible.
2. Change the editing language to English, for example.
3. Save the project.
4. Restart the migration.

Migrating an integrated project with ProTool objects

The "PROTOOL option package(s) missing in STEP 7" error message output during migration of a WinCC flexible project that is integrated in STEP 7 indicates that WinCC flexible 2008 SP3 is installed on your system. Moreover, the project still contains objects that were configured using ProTool. Do not open the project with WinCC flexible 2008 SP3! Proceed as follows to migrate the project:

1. Copy the project to a computer on which WinCC flexible 2008 SP2 and STEP 7 are installed.
2. Open the project in the SIMATIC Manager.
3. Remove all ProTool objects from the project.
4. Execute the "Save as" command in the "File" menu.
5. Enable the option "With reorganization" in the "Save project as" dialog.
6. Click OK.
7. Copy the project back to the original computer.
8. Restart the migration.

Migrating a WinCC V7 project: Border line of rectangles

In a WinCC V7 project, you have configured a rectangle with the settings "Line weight = 1" and "Draw insider border = yes".

You then migrate the WinCC V7 project to WinCC V13. To have the rectangle displayed correctly, follow these steps.

1. Open the Inspector window of the rectangle.
2. Open the property list.
3. Disable "Widen border line inwards".

Progress bar

As long as the progress bar still shows a value of 100%, the software is still busy running remaining tasks such as the closing of references. The software will not respond to user input while this status is given.

Open a project created with WinCC V11

When you open a V11 project with a WinCC V13 version, it is no longer be possible to open this project with an older version afterwards.

Managing third-party ActiveX controls

The migration also supports third-party ActiveX controls. However, the controls must be registered in the operating system. If an ActiveX control is not registered, migration is canceled.

If you save a project with the migration tool and perform the migration yourself on another PC, the controls must also be registered on this PC.

Migrating integrated projects with alarm views

An alarm view is enabled with all alarm classes in an integrated project. The alarm classes are disabled during migration of the project.
Once the migration of the project is completed, check the settings in the alarm view.
Enable the require alarm classes in the Inspector window of the alarm view if needed under "Properties > General".

Migrating more extensive projects from WinCC V7

We recommend the use of a 64-bit operating system for the migration of more extensive projects from WinCC V7.

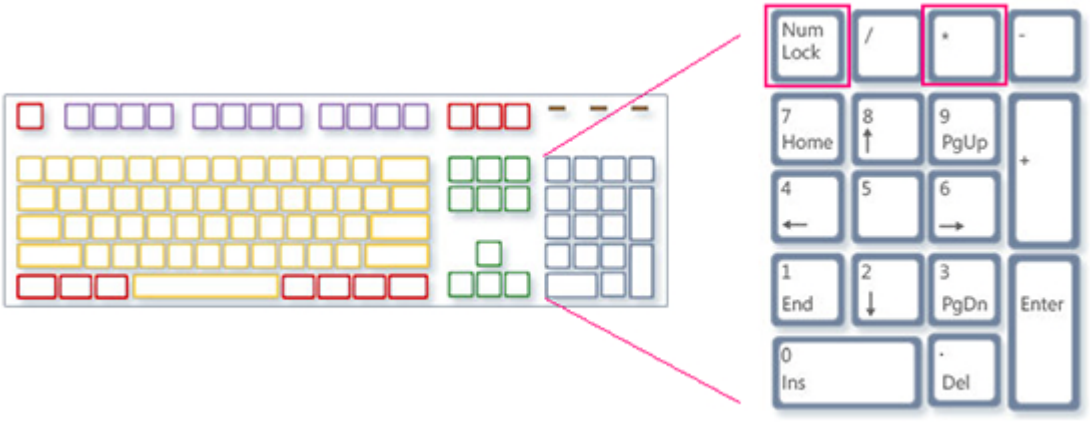
To use the migration tool on a computer with a 64-bit operating system for large projects, start the tool via the command line with the parameter 64-bit, as in the following example:
C:\Program Files (x86)\SIEMENS\Automation\MIGTOOL_V13\Bin
\Siemens.Automation.MigrationApplication.exe 64bit

Migrating projects from WinCC V7

In TIA Portal V13, you can continue to use projects from WinCC V7.2 after migration. Projects from earlier WinCC versions cannot be migrated directly to WinCC TIA Portal version V13. If you wish to continue using such projects in TIA Portal V13, you must first migrate them to the WinCC V7.2 Classic page. To do so, use WinCC V7.2 with the latest update.

Migration log

As of TIA Portal V13.0 alarms are sorted into a tree structure in the migration log. This means all alarms that are part of a specific subsystem are stored in one folder. The result is an increase in the number of folders in the tree structure. Press the shortcut <NUM+ X> to expand the currently selected folder and all subfolders in one single step.



Restrictions for user-specific project data

1. Folders and files you have created in the WinCC V7.2 project directory are not copied to the new project directory during the migration. You must adapt all scripts that access such directories and files after the migration.
2. C standard functions of WinCC V7 are not migrated. If you have made changes to the C standard functions in the WinCC V7 project, you must apply these changes manually to the TIA Portal after the migration.

Migration of texts in Spanish (international sorting) and Spanish (traditional sorting)

If the WinCC V7 project includes texts in Spanish (traditional sorting), these texts are migrated as Spanish (Spain) in WinCC V13.

If the WinCC V7 project includes texts in Spanish (international sorting), these texts are migrated as Spanish (Spain) in WinCC V13.

If the WinCC V7 project includes texts in Spanish (international sorting) as well as Spanish (traditional sorting), only the texts from Spanish (traditional sorting) are migrated as Spanish (Spain) in WinCC V13. The texts from Spanish (international sorting) are not taken into consideration.

Object support during migration (Page 172)

Object support during migration

4.2.5 Engineering System

4.2.5.1 Screens and Screen Objects

Contents

Information that could no longer be included in the online help and important information about product features.

Screen objects after HMI device replacement

If you upgrade a device to the new HMI device versions, you should check the screens contained in the project. Because of the new appearance and improved operability, texts of symbolic I/O fields may not be completely legible and may be concealed by operator controls.

Copying display objects between two projects or two devices

In Project_1 configure an alarm window in the Global Screen, for example. You copy the alarm window and paste it in the Global Screen in Project_2.

The enabled alarm classes are partly not enabled in the alarm window after pasting.

This behavior applies to the following display objects:

- Alarm window
- Alarm indicator
- Alarm view

Display of the cross-references in the Inspector window

The Inspector window displays objects used by a screen object in the "About > Cross-reference" tab.

A screen is open and an object selected. You are using an HMI tag at the object as process tag.

The object and the linked HMI tag are displayed in the cross-references. All locations of use of the object and the HMI tags are listed.

If the HMI tag is interconnected with a PLC tag or a DB tag, the locations of use of the interconnected PLC tag or DB tag are displayed.

Event names in case of alarms in the "Info" tab of the Inspector window

In some alarms of the Inspector window the event names in the "Info" tab will deviate from the names in the "Properties" tab.

Name in the "Properties" tab of the Inspector window	Name in the "Info" tab of the Inspector window
Cleared	ClearScreen
Loaded	GenerateScreen
Enable	Activate
Change	Change
When a dialog is opened	ONMODALBEGIN
When a dialog is closed	ONMODALEND
User change	PASSWORD
Screen change	SCREEN
Disable	Deactivate
Press	Press
Outgoing	Going
Incoming	Coming
Limit "high limit error" violated	AboveUpperLimit
Limit "low limit error" violated	BelowLowerLimit
Click	Click
Loop-in alarm	LoopInAlarm
Release	Release
Alarm buffer overflow	OVERFLOW
Acknowledge	Acknowledgement
Runtime stop	Shutdown
Press key	KeyDown
Release key	KeyUp
Toggle ON	SwitchOn
Toggle OFF	SwitchOff
Value change	Change value

Faceplates

Faceplates cannot be rotated or mirrored.

Tab sequence in screens with faceplates

If you have configured a tab sequence in screens with faceplates in WinCC V12 or WinCC V12 SP1, you should check the tab sequence of these screens in WinCC V13. The tab sequence may have been changed in both the screen and the faceplate.

Tag prefix of a screen window in WinCC Runtime Professional

The objects of the "Controls" palette do not support the tag prefix that can be configured for a screen window.

I/O field with "decimal" display format and format pattern without "s" prefix

You have linked a process tag to an I/O field. The I/O field is assigned the "decimal" display format.

You may select a signed or an unsigned display format.

A "Format pattern" setting without "s", e.g., "999" has the following effects:

1. You cannot set negative values using the I/O field in Runtime.
2. If the tag assumes a negative value, the I/O field generates a two's complement and a corrupted positive value is output.

Trend view on Basic Panels

The trend view buttons are not displayed on Basic Panels. You can operate the trend view using the function keys of the HMI device that are assigned corresponding system functions.

Grouping of screen objects

When you group screen objects in WinCC, performance problems can arise in WinCC in the case of large nesting depths.

ActiveX and .NET controls

ActiveX and .NET controls are always positioned in the foreground in runtime.

The configuration of ActiveX and .NET controls on levels is not supported.

Use of bitmaps as icons

In Windows 8 and Windows 8.1, the use of bitmaps with a size of 48x48 pixels and a color depth of 32 bits as icons is not supported.

Border line of rectangles

In a WinCC V7 project, you have configured a rectangle with the settings "Line weight = 1" and "Draw insider border = yes".

You then migrate the WinCC V7 project to WinCC V12. To have the rectangle displayed correctly, follow these steps.

1. Open the Inspector window of the rectangle.
2. Open the property list.
3. Disable "Widen border line inwards".

Border line of “Graphic I/O field" object

In WinCC V13, the dynamization of the border line of the "Graphic I/O field" object in "Two states" mode has no effect during runtime.

Dynamization of instances of a faceplate type in a group

You are using the instance of a faceplate type in an object group. The properties of the instance are also displayed as properties of the group. Any dynamization with tags, scripts or animations of the group is not displayed in Runtime.

Preview in screen window

You use your own designs with shadows for screen objects. The screen objects can be displayed in a screen window.
The shadows of the screen objects are not displayed in the preview of the screen window. The response occurs only in the engineering system. It is displayed correctly in Runtime.

Assigning graphics to a softkey

A graphic can only be assigned to a softkey if the bottom edge of the permanent window does not conceal the area of the softkey graphic.

Renaming a PLC in Runtime

If a PLC is connected to the PLC code viewer in WinCC Professional and Runtime is running, changing the name of the PLC during runtime will trigger a error. Do not change the PLC name, the IP address, or other properties of the HMI connection during runtime.

Panels and RT Advanced with device version V13: many visually different screen objects

The use of screen objects with very many visually different properties (e.g., very many different styles) can reduce the performance of the user interface in Runtime and can increase the amount of available memory space used. Avoid using, for example, very many different corner radii: 0 pixel, 1 pixel, 2 pixels, 3 pixels, etc.

The use of many differently sized “Gauge” objects can have the same effect. Avoid “Gauge” of height 48 pixels, 49 pixels, 51 pixels, etc. Instead, use sizes such as: 50 pixels, 70 pixels, 100 pixels.

Dynamization of grouped objects

For groupings with multiple nestings (group in group, faceplate in group, group in faceplate, etc.), only the events of the outermost group and the innermost objects can be used for dynamization with system functions. System functions that are configured at events of the lower-level group or lower-level faceplate are not executed.

Number of characters in text fields, lists and alarm texts

The number of available characters in the text of a screen object is dynamic and depends on the HMI device and the memory format. Control instructions and formatting are taken into consideration when entering text data and the maximum number of characters is reduced accordingly.

Transparency in WinCC V13

Transparent graphics can be displayed without any problems in Runtime. This is true for all Comfort Panels and WinCC Runtime Advanced with version 13.0.0.0.
To use the transparency in a graphic view or in a graphic I/O field, the "Fill pattern" property must be set to "Transparent" and the property "Use transparent color" must be disabled.

If the property "Use transparent color" is enabled in a device with version 13.0.0.0, the transparency of the graphic is lost and the transparent pixels are displayed in black. We recommend that you check the "Use transparent color" property at the points of use of transparent graphics after upgrading existing projects to device version 13.0.0.0. If the graphics are not displayed correctly, disable this property.

Addressing tags in the "PLC code display" object

The "PLC code display" object only supports symbolic addressing of tags. If the operand is not addressed symbolically, the network with the operands cannot be displayed and an error message is generated.

Characters that can be used in the property name of the screen blocks with RT Professional

Note the following rules when entering property names of the faceplates:

- The name must start with a letter.
- The name can contain alphanumeric characters and the underscore.
- The name may not contain more than 255 characters.
- Do not use any UNICODE characters (for example, Chinese characters).

Playing videos on Comfort Panels

You can play video sequences on Comfort Panels in the "Media Player" screen object. You can find more detailed information on playing videos on the Internet under: http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/62101921) (entry ID 62101921)

Selecting the transfer protocol for the camera view

To display the screens of a network camera in the camera view, define the transfer protocol in the properties of the screen object. Select the TCP or UDP transfer protocol depending on your network and the type of network camera you are using. In most cases, a TCP connection has reliable synchronization with the camera view.

Displaying SIMOTION PLC websites in the HTML browser

If the SIMOTION PLC websites are not displayed correctly in the HTML browser, insert "/basic" after the website URL to display the websites in basic mode.

Using the optional "CamControls" from older TIA Portal versions

If you want to continue using the control "CamControl" from older versions of TIA Portal configurations in TIA Portal V13 SP1 or newer, we highly recommend an update of the TIA Portal project version and HMI device version to V13 SP1.

Basic Panels: Animation of object groups

Basic Panels as of device version V13 SP1 support animation of object groups that consist of individual screen objects. Animation of nested groups is not supported, however.

RT Professional: Copying screen objects with linked user data types

After copying a screen object from a screen that uses a user data type to a screen that does not use a user data type, the tag references in the target screen are shown with the prefix "@NOP::". These tag references do not function during runtime if the target screen is to be shown in a screen window. If you want the tag references to function, interconnect the target screen temporarily to a user data type. The interconnection of the target screen to the user data type can then be deleted afterwards.

RT Professional: User data types linked to screen objects in faceplates

If a faceplate uses an element of a user data type and a faceplate is created from this screen object, all tag references in the faceplate are shown as "@NOP::". The tag references function during runtime despite this, however. For the tag references to be shown correctly, no element of a user data type should be used when creating a faceplate from an existing screen object.

Display differences between the configuration and the display on the HMI device

The display of the text configured in a screen object may be different on the HMI device due to the display configuration. If you are using the options for automatic size adjustment in the configuration, check the display on your HMI device in every language.

If texts that were configured with the "Fit object to contents" option cannot be displayed in full, they are reduced slightly on the HMI device. If this reduction leads to a distorted display of texts, disable the "Fit object to contents" option and expand the text with additional blanks. Optionally, you can increase the width of the object or use a shorter formulation for the text.

RT Professional: S7-GRAPH overview

If the name of the S7-GRAPH data block that is interconnected at an S7-GRAPH overview contains a period, the control does not work during runtime.

Migration and configuration of ActiveX controls

Changes to properties of ActiveX controls are only saved if the control synchronizes the OCXState property correctly in the case of changes.

For controls such as "Microsoft Date and Time Picker Control" that do not synchronize the OCXState property correctly, the changes are discarded after the screen is closed, during compilation or after the migration.

Exporting and importing function keys

Function keys are synchronized during the import. If a function key is created in the global screen and the key is empty in the screen, the corresponding function key will use the global definition in all screens.

If you want to disable the global use of function keys after the import, define empty keys in the screens and import the screen types in the following order: Global screen, templates, screens.

If you want to ensure when exporting the screens that the global definition of a function key is not used by the template or by the global screen, create an empty function key in the screen. Select the required function key in the screen, then enable the "Use global assignment" property and disable it again.

4.2.5.2 Tags and connections

Contents

Information that could not be included in the online help and important information about product features.

Display of deleted array elements at location of use of HMI tags

The locations of use of HMI tags, such as the process value of IO fields, are usually indicated by the tag name. If the element of an array tag is used, then the tag name will be extended by the index of the array element indicated in brackets.

If a used tag is no longer included in the project, then the tag name will still be displayed at the location of use. The field will be displayed with a red background to indicate the missing tag. If a used array element or the array tag is no longer present, then only the index of the array element will be displayed in brackets. The tag name will not be displayed. The field is highlighted in red. You can no longer identify the name of the associated array tag based on the location of use in this instance.

If you do not know which array tag was linked to this location of use, then it may be necessary to link the array element once again.

If a tag or array tag was created based on a reference, then the selected reference will be closed automatically.

If an HMI tag is connected with an array element of a PLC tag and the PLC tag does no longer exist in the project, then the same behavior will take place in the "HMI tags" editor.

Array tags as list entry of multiplex tags

You can use the array tags of the Char data type just like the tags of the String data type.

The use of an array tag of the Char data type as list entry of a multiplex tag in the "HMI tags" editor is not supported.

Multiplexing tags on a Basic Panel

If you multiplex a tag with an external tag on a Basic Panel, the address is read from the PLC in runtime during the first read cycle. The value of the address read is not available until the second read cycle.

Runtime Advanced and Panels: Importing array elements and structure elements

Array tags and structure tags are always imported in full with all elements. The elements of the array tags and structure tags are not filled further during import.

A new tag is created if the name of a tag corresponds to the name of an array or structure element in the import file.

Example:

The import file contains an array tag called "Otto" with 10 array elements. The array elements are then called Otto[1], Otto[2], for example.

If the import file contains a tag named "Otto[1]", the first element of the array tag will not be filled. Instead, a new tag will be created in the engineering system.

Local ID of HMI connections

You cannot edit the "Local ID" value in the HMI connection properties. You need the local ID, for example, for communication by way of AR_SEND. To enable usage of the "Local ID" for communication, proceed as follows:

1. Open the network view in the "Devices & Networks" editor.
2. Click "Connections".
3. Select an S7 connection.
4. Select the "Add new connection" command in the shortcut menu of the PLC.
5. Click on the interface.
6. Specify the "Local ID (hex)".
7. Click "Add" and then "Close".
8. Select "Properties > General" from the partner area of the Inspector window and enter the IP address of the HMI device for the new connection.
9. Configure the necessary raw data tags for communication in the HMI device.

Tags with the DTL data type

Tags that use the "DTL" data type element by element, can only be used as read-only.

Tag names in faceplates

Use of the "." or "@" character in names of tags in faceplate types is not permitted. Do not use these special characters in the tag names in faceplates.

RT Professional: Tags with symbolic addressing and "Char Array" data type

Tags with symbolic addressing and the "Char Array" data type are not released for communication of RT Professional and SIMATIC S7-1200 V3.

Array elements in WinCC

If you have connected an HMI tag with an array from a STEP 7 data block which does not start with a low limit of 0, the array elements are mapped in WinCC to the low limit of 0.

To ensure that you do not have to rethink between the STEP 7 indices and the WinCC indices when accessing the individual array elements, the low limits of arrays should also start at 0 in STEP 7.

Duration of the initialization of historical data

Initialization of the archives on some storage media can take up to 5 minutes. The successful completion of initialization is confirmed by a system message once it has been completed. If there a lack of any storage medium for archiving when Runtime starts, the appearance of the system message can also take up to 5 minutes.

4.2.5.3 Alarm system and alarm displays

Contents

Information that could not be included in the online help and important information about product properties.

Displaying special characters in alarm texts

When configuring alarm texts, a fixed character set is used in the Engineering System. This character set allows you to use numerous special characters in alarm texts.

Language-dependent fonts are used in runtime to display the texts, for example MS PGothic, SimSun. The fonts used in runtime do not support all special characters. As a result, some special characters are not displayed in runtime.

Use of multiplex tags in output boxes with alarm texts

It is also possible to use multiplex tags in the output boxes of alarm texts in the engineering system. During runtime, this leads to an incorrect display of the alarm, because the use of multiplex tags is not supported by the basic panels.

Parameters in user alarms

Contrary to the information in the online help, it is not possible to configure parameters for user alarms.
The menu command "Properties > Properties > Alarm parameters" is not available in the Inspector window.

Tags in alarm texts of Runtime Advanced

Tags of data type WChar or WString cannot be displayed in the alarm view in Runtime Advanced.

Boolean tags in alarm logs

Bool type tags are recognized as 0 and -1 in the alarm log. If you use a text list that is controlled by a tag of the type Bool in an alarm log, then add the entry for the value -1 to the corresponding text list.

Duration of the initialization of historical data

Initialization of the archives on some storage media can take up to 5 minutes. The successful completion of initialization is confirmed by a system message once it has been completed. If there a lack of any storage medium for archiving when Runtime starts, the appearance of the system message can also take up to 5 minutes.

Printing alarms in Runtime

In WinCC, only ASCII characters are supported when printing alarms directly in Runtime.

4.2.5.4 System functions and scripts

Contents

Information that could no longer be included in the online help and important information about product features.

Runtime error on startup on TP 277 and OP 277

At the start of the runtime on a TP 277 or OP 277, the error "Global unknown error with VBScript: 'Expected statement' in script ..." can be reported.

This error is triggered on devices with the Windows CE 3.0 operating system by user functions of the following type:

```
Sub VBFunction_1()
With HmiRuntime.Screens("Screen_1").ScreenItems("Button_1")
    .backcolor = vbred
    .visible = not .visible
End With
End Sub
```

If the error occurs, you need to re-program the user function as follows:

```
Sub VBFunction_1()
    HmiRuntime.Screens("Screen_1").ScreenItems("Button_1").backcolor = vbred
    HmiRuntime.Screens("Screen_1").ScreenItems("Button_1").visible = not .visible
End Sub
```

Hiding warnings for scripts

Enable "Runtime settings > General > Settings > Also start with faulty scripts".

As a result, Runtime is started irrespective of faulty scripts. In addition, script warnings will not be displayed during a complete compilation

Graphics in faceplates

You have added a graphic view in a faceplate and defined the "Graphic" property as the interface of the faceplate. The "Graphic" property can be made dynamic using the interface of the faceplate instance.
Use the following notation to address the graphic property via a script: "..\\..\\Graphic name".

Scripts for service projects

Since no interactive user is usually logged in service projects, C scripts and VB scripts lead to problems in the following cases:

- When the scripts require interaction, for example, operator input.
- When the scripts show message boxes.

There is no common data area for C scripting in service mode. Thus, for example, no global C variables can be exchanged between the "Scheduled tasks" and "Screens".

Find and Replace in local scripts in WinCC Professional

Use the "Find and Replace" function to find and replace texts within editors. It is not possible to use Find and Replace in local scripts.

System functions in local scripts

System functions can be converted into local C scripts or VB scripts.

If a WString type tag is used in a SetTag system function that was converted into a C script, an error message is generated in the Global Script diagnostics window when the function is executed. The message does not affect the execution of the function.

This concerns the following SetTag functions:

- SetTagWithOperatorEvent
- SetTagIndirect
- SetTagByTagIndirect
- SetTagIndirectByTagIndirect
- SetTagByProperty
- SetTagIndirectByProperty

Properties no longer used in Comfort Panels and RT Advanced

In WinCC V13, many new visual properties have been introduced and many existing properties have been harmonized.

In the course of revision of the object properties, some properties that could be used in VB scripts in earlier versions of WinCC are no longer supported for use in WinCC V13. Scripts that use properties that are no longer supported remain valid, but the relevant calls within the scripts have no function. These limitations pertain exclusively to Comfort Panels and RT Advanced in device version V13.0.

The following table shows the properties of screen objects that are no longer being used:

Property	Screen object
BorderBrightColor3D	Slider
BorderColor	Text field, I/O field, symbolic I/O field, date/time field
BorderInnerWidth3D	Slider
BorderOuterWidth3D	Slider
BorderShadeColor3D	Slider
BorderStyle3D	Text field, I/O field, button, symbolic I/O field, graphic I/O field, date/time field, bar, switch
BorderWidth	Text field, symbolic I/O field
CenterColor	Gauge
DialColor	Gauge
EdgeStyle	Text field, I/O field

System function "ChangeConnection"

Contrary to the description in the online help, the system function "ChangeConnection" is released for the following devices:

- SIMATIC S7-300/400
- SIMATIC S7-NC
- SIMOTION

The system function "ChangeConnection" is not released for SIMATIC S7-1200.

System function "SetPropertyByProperty"

If you change the background color of a gauge in a VBScript or CScript file with the "BackgroundColor" property, these changes are applied in Runtime for the dial color of the gauge. To change the background color of a gauge in a script file, use the "FrameColor" property.

Note

The "FrameColor" property is not displayed in the Script Editor via IntelliSense, but is accepted during compilation of the project.

Script parameters in C-scripting

The following labels are already assigned to the "char*" data type in runtime and must not therefore be used in C-scripting as internal tags or script parameters:

- "Object"
- "Property"
- "Tag"
- "Picture".

System function "EstablishPROFIsafe"

Contrary to the description in the online help, the system function "EstablishPROFIsafe" is not available.

RT Advanced: System function "ShiftAndMask"

If you are using the "ShiftAndMask" system function and the device version of the target HMI device is changed after configuration (e.g.,"13.1.0" to "13.0.0" or vice versa), you must check and test the parameters of this system function.

You can use the "Char" and "Word" data types for the "Source tag" and "Target tag" parameters as of the device version 13.1.0.

In the device versions before 13.1.0, these parameters must be assigned other data types:

- Use "SInt" instead of "Char"
- Use "Int" instead of "Word"

Otherwise, undesirable effects may occur, for example, incorrect or unexpected behavior of the configured system functions.

4.2.5.5 Reports

Contents

Information that could not be included in the online help and important information about product features.

Displaying controls in protocols

A project with WinCC V11 SP2 with Update 4 or earlier is upgraded to WinCC V13.

In this process, it may happen that archive data is not displayed in controls for protocols.

The following controls are affected:

- f(t) trend view
- f(x) trend view
- Table view

Remedial measures for f(t) trend view and f(x) trend view

1. In the control, select "Properties > Properties > General > Display > Online".
2. Recompile your project.
3. Load the project onto your HMI device.

Remedial measures for Table view:

1. In the control, select "Properties > Properties > General > Upon opening screen > Start update".
2. Recompile your project.
3. Load the project onto your HMI device.

4.2.5.6 Recipes

Contents

Information that could not be included in the online help and important information about product features.

Arrays in recipe elements

If you have configured both an array as well as the elements of this array for recipe elements of a recipe, the loading of data records aborts with the following error message: "290055: Import of data records aborted with error"

Use either the array or just the array elements for recipe elements of a single recipe.

4.2.5.7 User administration

Contents

Information that could no longer be included in the online help and important information about product features.

Encrypted connection with SIMATIC Logon V1.5 SP3

Secure encrypted communication between SIMATIC Logon and HMI operator devices is supported as of SIMATIC Logon version V1.5 SP3 and the HMI device version V13 SP1 for Comfort Panels, KTP Mobile Panels and RT Advanced.

HMI devices with a version V13 or earlier can only make an non-secure / non-encrypted connection to a SIMATIC Logon server.

Authentication and certificate management in SIMATIC Logon

If you want to use a secure encrypted connection, the first time a connection is made the SIMATIC Logon certificate is compared with the local certificate of the HMI device. Only when the comparison has been successfully performed can a secure encrypted connection be successfully established.

When you make a connection the first time, the compared certificate is stored under "SimaticLogon\rejected". If you trust the certificate of the server, copy the stored certificate into the local certificate store directory.

The certificate store is located in the following path:

- On the PC under "C:\Program Files\Siemens\CoRtHmiRtm\SimaticLogon\certs"
- On HMI panels under "\flash\simatic\SimaticLogon\certs"

Dynamic logon

In Runtime Professional, an automatic log-off time does not affect users that log on via a logon tag.

4.2.5.8 Communication

Contents

Information that could no longer be included in the online help and important information about product features.

Connection interruptions with Mitsubishi PLCs

After multiple connection interruptions, a situation may arise where all the connection resources of the Mitsubishi PLC are in use and the connection can no longer be established. It is recommended to check these connection resources in the PLC program of the PLC and also to enable them again.

Limited number of possible HMI connections

An error message is displayed during compilation of a device indicating that the configuration of the HMI connection in the "Devices & Networks" editor is invalid. The reason may be that the maximum number of possible connections of the HMI device or PLC has been exceeded.

Check the maximum number of available connections. Consult the device manuals of the devices you are using.

Communication by means of routing with S7 300/400

Communication of connection partners in different subnets is possible via routing with the following connections: PROFINET, PROFIBUS, MPI.

Use of PROFINET IO with panel HMI devices

When using PROFINET IO to connect the direct keys and LEDs of HMI devices to the PLC, you can define an offset for the address area of the inputs and outputs during configuration in HW Config.

The following restriction applies when a PROFINET IO-capable S7-400 CPU is used with one of the HMI devices listed below:

The offset for the start of the address area of the inputs must not be greater than the offset for the start of the address area of the outputs.

The restriction applies to the following HMI devices:

- OP 177B
- OP 277
- Mobile Panel 177

For the configuration of the address parameters, open the PLC with the S7-400 CPU in HW Config. Select the HMI device connected via PROFINET IO in the station window of HW Config. A table with the properties of the HMI device is displayed at the bottom of the station window in the detail view. Select the line containing the addresses of the HMI device in the table and open the object properties using the shortcut menu.

Enable the "Addresses" tab in the "Object properties" dialog. Configure the offset for the inputs under "Inputs > Start". Configure the offset for the outputs under "Outputs > Start".

Exceeding value ranges with Mitsubishi MC and Mitsubishi FX

With some data types, the Mitsubishi MC and Mitsubishi FX communication drivers do not check whether the value of a recipe tag exceeds the value range of the PLC tags. The data types affected are:

- 4-bit block
- 12-bit block
- 20-bit block
- 24-bit block
- 28-bit block

Coordination area pointer in an OPC connection

In principle, the coordination area pointer can be used eight times in an OPC connection. If you have configured an OPC connection and you automatically create another OPC connection using "Add", the coordination area pointer is only displayed once in the newly created connection. In this case, you should change the communication driver of the connection. If you then set OPC again as the communication driver, the coordination area pointer can again be used eight times.

RT Advanced communication via Station Manager (SIMATIC NET) with an S7-1200

For communication of a SIMATIC S7-1200 with a PC with WinCC RT Advanced via a router, the following restrictions apply to the PC:

- Windows 7: Only with installed SIMATIC NET 8.1
- Windows XP: Communication via Station Manager (SIMATIC NET) is not supported

These restrictions also apply if you are using WinAC MP or Station Manager. Connections with the help of the Station Manager of Runtime Advanced are always treated as routed connections.

Communication between S7-1200 and a multi panel

Communication between an S7-1200 and a multi panel with the "WinAC MP" option installed via ProSave is not possible. The HMI devices affected are:

- SIMATIC MP 177 6" Touch
- SIMATIC MP 277 8" Touch
- SIMATIC MP 277 8" Key
- SIMATIC MP 277 10" Touch
- SIMATIC MP 277 10" Key
- SIMATIC MP 377 12" Touch

- SIMATIC MP 377 12" Key
- SIMATIC MP 377 15" Touch
- SIMATIC MP 377 19" Touch

HMI connections in WinCC V13

HMI connections to SIMATIC S7-1200 PLCs with firmware versions earlier than V2.0 are not possible in WinCC V13.

Connections via PROFIBUS DP

When a connection between a PLC and an HMI device via PROFIBUS DP is interrupted and then re-established, sporadically all other PROFIBUS DP connections in the communication network are interrupted and re-established.

De-energize the disconnected station before reconnecting it.

"Set the IP suite (address) of the PLC in the Control Panel" with SIMATIC S7-1200 V1

The function "Set the IP suite (address) of the PLC in the Control Panel" has not been approved for the following PLCs:

- SIMATIC S7-1200 V1

Switching a connection

A connection may be interrupted when it is switched from an HMI device to a SIMATIC S7-300/400, to a SIMATIC S7-1500 or to a SIMATIC S7-1200 PLC.

Note the following settings in the SIMATIC S7-1500 or SIMATIC S7-1200 controllers:

- Absolute addressing of tags
- The "Disable PUT-GET communication" option must be selected
- The "Complete protection" protection level may not be set

RT Advanced in the Station Manager

If RT Advanced and WinAC RTX use the same communication processor of a PC, HMI communication with SIMATIC S7-1200 and SIMATIC S7-1500 is not possible.

Raw data communication in redundant projects

Simatic.NET, Named Connections and various communication blocks, such as BSEND/BRCV, for example, can only be used to a limited extent in a redundantly configured PC station because the connection parameters for the redundant partner server cannot be configured.

Non-integrated connection to a SIMATIC S7-1500 software controller

A non-integrated connection between an HMI device and a SIMATIC S7-1500 software controller is not supported in WinCC.

Transfer areas of the operating mode IO device and DP slave of the HMI devices

If you have activated the operating mode "IO device" or "DP slave" for HMI devices, no transfer areas should be added or deleted in the properties of the HMI device. If you have inadvertently deleted or added a transfer area, disconnect and reconnect the controller.

4.2.6 System-wide functions

Contents

Information that could no longer be included in the online help and important information about product features.

Using system diagnostics in the device proxy

To use the system diagnostics function in an IPE device proxy, for example, a system diagnostics view, insert the PLC alarms as content of a device proxy.

Importing and exporting project texts

In WinCC, you only import the previously exported project texts into the same project. Importing into a different project is not supported.

Initialize device proxy with data from a V13 project

You cannot initialize a device proxy with data from a V13 project in a project with the version V13 SP1.
Upgrade the V13 source project to version V13 SP1 to initialize the device proxy in the target project with the data from the source project.

4.2.7 Compiling and loading

Contents

Information that could no longer be included in the online help and important information about product features.

Compiling and loading

If internal errors or warnings occur during compiling, compile the complete project using the command "Compile > Software (rebuild all)" in the shortcut menu of the HMI device.

Before you start productive operation with your project, compile the entire project using the "Compile > Software (rebuild all)" command from the shortcut menu of the HMI device.

If you are using HMI tags that are connected to the control tags in your project, compile all modified blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

Settings for update of operating system

If you select the command "Online > HMI device maintenance > Update operating system" from WinCC, you cannot change the settings such as the type of PG/PC interface or baud rate. The settings used during the last download are always used.

To make changes to the settings, open the "Extended download to device" dialog using the "Online > Extended download to device" command and change the settings. When you click the "Load" button the changed settings are saved.

Alternatively, you can perform an update of the operating system with changed settings with ProSave. You start ProSave via the Windows Start menu "Siemens Automation > Options and Tools > HMI Tools > SIMATIC ProSave".

Incorrect installation of ProSave

If you receive an error message during installation of ProSave when loading data to a target device or maintenance of an HMI device, then you cannot remedy this error using the repair function of setup. Remove ProSave via the Control Panel. Then start setup and install the "ProSave" component again.

Checking the address parameters

During compilation of an HMI device in the project tree with the command "Compile > Software" in the shortcut menu, the address parameters of the HMI device, such as the IP address, will not be checked. If you want to ensure that the address parameters are checked as well, you will have to compile the HMI device using the "Compile" button in the "Devices & Networks" editor of the toolbar.

Error message when downloading data to the PLC

A panel and a PLC are connected and communicating with other.

If a tag is accessed while downloading data from the panel to the PLC, an error message is displayed on the panel.

Delayed reaction in the "Extended download to device" dialog

If the settings in the "Extended download to device" dialog for "Type of the PG/PC interface" and "PG/PC interface" do not match the settings on the HMI device, this can result in the application not responding for up to a minute.

Extended download with an S7-1200 and a Comfort Panel

An S7-1200 PLC and a Comfort Panel are located in the same physical network as the PG/PC. You open the "Extended download to device" dialog for the Comfort Panel.

If you enable the option "Show all accessible devices", it may occur that the application stops responding.

OP77A, OP73, TP177A: Loading projects

When loading a project to an HMI device, it can happen that Runtime is not automatically ended, even though "Remote Transfers" is activated in the Panel.

If this happens, stop Runtime and manually set the transfer mode on the HMI device.

Loading a SIMATIC HMI application to a PC station

The following circumstances can lead to an error message during the first load of a SIMATIC PC station:

- A SIMATIC HMI application is configured in a PC station in the project
  - WinCC Runtime Advanced
  - WinCC Runtime Professional
  - WinCC Standby
  - or WinCC Client
- The property "S7RTM is installed" is activated.

Before you load a SIMATIC PC station for the first time, select the configured device HMI_RT (WinCC...) in the project tree. Open the "Extended download to device" dialog and select the appropriate interface and parameter settings. Click "Load".

You then load the PC station as normal.

Project transfer via USB

If you have connected more than one HMI device via USB to your configuration PC, project transfer is only possible to the last connected device.

Opening project files

When you run "HmiIRTm.exe", a dialog opens asking if you want to open the project file (.fwc).

The following options are available to you:

- "Yes": A dialog opens allowing you to select a project file (.fwc).
- "No": The dialog closes.

Tag simulator in WinCC Professional does not start

If the tag simulator does not start in WinCC Professional, it may be because the fm20.dll file has not been installed in the system yet. The fm20.dll file cannot be distributed and must be installed as part of a Microsoft application:
http://support.microsoft.com (http://support.microsoft.com/default.aspx?scid=kb;EN-US;224305)

You have the following two options for installing the fm20.dll file:

- Install an application, such as Microsoft Office 97, on the destination system. The installation routine also installs the fm20.dll file.
- You can also download and install the Microsoft ActiveX Control Pad free of charge. The fm20.dll file is also installed in this case. Additional information on the ActiveX Control Pad is available on the Microsoft Developer Network website:
http://msdn.microsoft.com/en-us/library/ms968493.aspx (http://msdn.microsoft.com/en-us/library/ms968493.aspx)

Error message when PLC is loaded with a newer version of the TIA Portal

PLC code display shows the current program status of PLC programs.

An error message is output if the PLC code display from an older version of WinCC accesses a program on the PLC loaded with a new version. Make sure that the PLC and the HMI are loaded with the same version of the TIA Portal.

Comfort panels as of device version 13.0: Backing up data while loading projects

If the transfer is interrupted for Comfort Panels with a device version 13.0 or higher, WinCC automatically ensures that no data is lost and that existing data is only deleted on the HMI device after complete transmission.

Loading projects to a file

The "Load project to file" functionality is only available in Runtime Advanced devices with version V13 or older.

Displaying characters in transfer alarms

If characters are not displayed correctly in the transfer alarms during transfers to HMI devices with the device version V12 or older, please check the region and language settings in Windows. Set the corresponding language under "Language for non-Unicode programs".

4.2.8 Runtime

4.2.8.1 Notes on operation in Runtime

Contents

Information that could no longer be included in the online help and important information about product features.

Focus in Runtime

If you have configured a low-contrast combination of focus color and border color in a V12 project, the focus may no longer be identifiable after changing the HMI device version in Runtime. Change one of the two colors.

Language behavior - Layout of on-screen keyboard

The layout of the on-screen keyboard is not switched when the runtime language changes.

Tag values exceed the maximum length

You enter a character string in a string tag via an I/O field. If the character string exceeds the configured number of tags, the character string will be shortened to the configured length.

Empty alarm texts

Runtime is running with a project. The project is saved on a network drive.

In the event of interruptions to the network drive connection, Runtime may attempt to load alarm texts from the network drive.

In the event of disconnection, the alarm window or the alarm view remains empty.

To avoid this, copy the project to a local drive before the starting the project in Runtime.

Complete download in Service mode

If you need to perform a "complete download" to the OS in Service mode from the engineering station, Runtime automatically stops and then starts again.

The project is then no longer in Service mode.

In this state, the power supply is interrupted and WinCC Runtime no longer starts automatically on the OS.

Remedy:

1. Switch the project manually to Service mode after you have performed the "complete download".
2. Close the project manually.

3. Enable Service mode.
4. Start Runtime again using the surrogate icon in the taskbar.

Slow reaction of SmartServer

The following programs may start and respond very slowly under Windows 7 and Windows 2008 servers:

- HMI TouchInputPC
- SmartServer: <Ctrl+Alt+Del> shortcut in the logon dialog

The delay is caused by the callback for the Internet certificate validation.

Remedy:

You can find the following files
on the product DVD under:
Support\Windows7\CRL_Check or CD_RT\ Support\Windows7\CRL_Check\:

- DisableCRLCheck_LocalSystem.cmd
- DisableCRLCheck_CurrentUser.cmd

1. Run the "DisableCRLCheck_LocalSystem.cmd" file with administrator rights. Select the command "Run as administrator" from the shortcut menu of the file.
2. Reboot the PC.

If the problem persists, follow these steps:

1. Double-click the file and run the "DisableCRLCheck_CurrentUser.cmd" file with user rights.
2. Reboot the PC.

Note

The callback for the certificate validation is disabled for all users or PCs. To restore the original state, perform the following files:

- RestoreDefaults_LocalSystem.cmd
- RestoreDefaults_CurrentUser.cmd

You can find the files in the following directory of the product DVD:

- Support\Windows7\CRL_Check or CD_RT\Support\Windows7\CRL_Check\

Starting Runtime

Only WinCC Runtime V13 can be started in TIA Portal V13. WinCC Runtime V11.02, V12 or V13 can be simulated in TIA Portal V13.

Avoiding corrupt files during power failure

If a power failure occurs in Windows systems while the WinCC system is active, files may be corrupt or destroyed. Operation with the NTFS file system provides better security.

Secure, continuous operation is only ensured by using an uninterruptible power supply (UPS).

Blocking task switching on Windows 7 and Windows 8.x

To use the "Block task switching" option on a Runtime PC, disable the Aero theme in Windows 7 and Windows 8.x. To disable the Aero theme, right-click on the Desktop and select "Personalize". In the "Personalization" menu, select the designs "Windows Basic" or "Windows - Classic".

4.2.8.2 Notes on operation of panels in Runtime

Contents

Information that could no longer be included in the online help and important information about product features.

License transfer via S7USB

You always need to run WinCC to transfer a license to a panel via S7USB.

Transferring licenses to a panel on 64-bit operating systems

If you are running a 64-bit operating system and the "Edit > Connect target systems > Connect HMI device" menu command is not available in Automation License Manager, open command line input and run the following command with administrator rights:

"%WINDIR%\system32\RegSvr32.exe" "%CommonProgramFiles%\siemens\AlmPanelPlugin\ALMPanelParam.dll"

Using the mouse wheel in Runtime

The use of the mouse wheel in Runtime is not supported on all panels.

Basic Panels, OP73, OP77A and TP177A: Displaying texts in runtime

The default font selected in the "Runtime settings > Languages & font" editor has an effect on the display of texts in runtime.

Text entries may be truncated if you selected an unfavorable font size or style.

This setting possibly has an effect on the following text entries:

- Tooltips
- long alarm text
- text in the dialogs

Basic Panels: Connections to S7-1200 and S7-1500 with Backup/Restore

If you use the "Backup/Restore" function, a maximum of two connections from Basic Panels to the controllers are possible at any given time.

- SIMATIC S7-1200
- SIMATIC S7-1500

Basic Panels: Backup on the memory card of the PLC

Create the backup file "A.psb" on the memory card of the PLC. An error, for example a connection break, occurs when creating the backup.
This will create a corrupt file on the memory card of the PLC. Such a file has "~$" as prefix. Delete the file with the prefix "~$" if you want to save a backup again under the same name "A.psb".

Basic Panels: Panel Data Storage and S7-1500F

The "Panel Data Storage" PDS function cannot be used on Basic Panels in conjunction with S7-1500F when the password for the protection level "Full access incl. fail-safe" is used.

"Panel Data Storage" function on Basic Panels

The "Panel Data Storage" (PDS) function provided by Basic Panels is only supported by SIMATIC S7-1200 as of firmware V4.0 and SIMATIC S7-1500. For the PDS function, the panel must be connected directly with the CPU and must not be connected via the CP.

4.2.8.3 Notes on operation of Runtime Advanced

Contents

Information that could not be included in the online help and important information about product features.

Authorization for starting Runtime

On a computer running the 32-bit version of Windows 7, WinCC Runtime Professional or WinCC Runtime Advanced can only be started when a user is a member of the automatically created group, "Siemens TIA Engineer".

.Net-Controls in Runtime

If you have incorporated a .Net Control in your project as "Specific .Net-Control", you have to copy the files belonging to these controls to the installation directory of WinCC Runtime, e.g. "C:\ProgramFiles\Siemens\Automation\WinCC RT Advanced". Otherwise, the control cannot be loaded in Runtime.

Starting Runtime

Only WinCC Runtime V13 can be started in TIA Portal V13. WinCC Runtime V11.02, V12 or V13 can be simulated in TIA Portal V13.

Disabling automatic checking for software updates

If the Engineering System is installed together with Runtime on a PC, the operator gets notifications above software updates. For the system to run reliably on a multi-user system, the same software version must be installed on all PCs.

It is possible to disable the automatic checking for software updates and to thus improve performance.

To disable the automatic checking for software updates, go to "Settings > General > Software updates" and clear the "Check daily for updates" check box.

4.2.9 HMI devices

4.2.9.1 Notes on HMI devices

Contents

Information that could no longer be included in the online help and important information about product features.

If the PC goes into standby or hibernate mode while the transfer is in progress, the panel status after interruption of the transfer is not defined.

Multi-key operation

Unintentional actions can be triggered by multi-key operation:

- When you are using a key device, you cannot press more than two function keys at the same time.
- When you are using a touch device, a standard PC or a panel PC, you can only press one function key or button at the same time.

TS Adapter with Ethernet interface

If an HMI device is connected via Ethernet and a TS adapter, it can not be reset to factory settings.

Simulation of the Basic Panels

Use an output field in an alarm text to output an external tag. The content of the output field will always be displayed with "0" during simulation.

Simulation with real PLC connection

The access point used by the simulation is independent from the settings of the engineering system and can only be altered in the Control Panel with the "Setting PG/PC Interface" tool. If the PLC connection is terminated right after the start of the simulation with alarm 140001, you should check the access point used by the simulation with "Setting PG/PC Interface".

1. Double-click "Setting PG/PC Interface" in the Control Panel. A dialog opens.
2. Select" "S7ONLINE" in the "Access point of application" field as standard for HMI.
3. Select the interface in the "Interface Parameter Assignment Used" area.
4. Exit the dialog "Setting PG/PC Interface" with OK

Loading of projects without recipe data records

You are using recipes in a project. You transfer the project to a Basic Panel without recipe data records.

You may encounter inconsistencies if you have altered the structure of the recipe in the engineering system and the device already held recipe data records.

Check the consistency of the data records in this case. The device will not issue a note for all structural changes.

Floating point numbers on MP 277, MP 377, TP 177B 4" and CP4

Only floating point numbers in the range from 10^{-293} ... 10^{+307} are displayed correctly on the HMI devices MP 277, MP 377, TP 177B 4" and CP4. If the tag value is outside this range, it is displayed as 0.

Mobile Panels V2

If you use Mobile Panels V2 in a project, it is not possible to open the project with WinCC V11 SP1. This affects projects with the following devices:

- Mobile Panel 277F IWLAN (RFID Tag)
- Mobile Panel 277F IWLAN V2
- Mobile Panel 277 IWLAN V2

"Zone ID/Connection point ID" tag of a Mobile Panel 277 IWLAN V2

The tag used for the "Zone ID/Connection point ID" must be of data type INT for Mobile Panel 277 IWLAN V2 devices. Adapt this data type if necessary when migrating a project.

HMI devices with operating system Windows CE 5.0 or higher

Owing to a modified client-server communication security setting, the time difference between the HMI device (client) and PC (server) must not exceed 1 day. If you back up recipe data from the HMI device on a network drive, for example, make sure that the time is set correctly on the PC (server) and the HMI device (client).

HMI devices with high communication load

S7 Diagnostics should be enabled if a Panel is assigned many connections to PLCs or other HMI devices. Otherwise, you will risk overload on the Panel.

Device replacement in the engineering system

In the engineering system, you replace a device with configured LED keys with a device without LED keys. Runtime start fails after you have transferred the project data to the device.

For this reason, delete the LED key configuration before you replace the device.

Restrictions for the HMI device, MP 377 15" Touch daylight readable

The following functions are not supported in WinCC V12 for the MP 377 15" Touch daylight readable HMI device:

- Option: Sm@rtServer
- System function: SetAndGetBrightness
- Direct keys

Upgrading Basic Panels to WinCC V13

Before you upgrade Basic Panels from version V12 to version V13, transfer the image of the V12 SP2 Update 5 or higher to the devices.
In the "SIMATIC ProSave [OS Update]" dialog, select the setting "Reset to factory settings".

In this way, you always start a functional update of the image.

Affected devices:

- KP300 Basic mono PN
- KP400 Basic color PN
- KTP400 Basic color PN

Connection switch in the Control Panel with Basic Panels

If you use the "Override protected connection information" function, the following restriction applies:

You cannot perform a connection switch in the Control Panel of a Basic Panel from a PLC without a protection level to a PLC with a "Complete protection" level.

2nd generation Basic Panels: Choosing a USB port

If you are not using a USB hub, select the USB port USB_X60.1 as storage path.

KTP400F Mobile

KTP400F Mobile is available as Hardware Support Package (HSP) for version V13 SP1.

Mobile Panels 277F IWLAN (RFID Tag): F_DB_STATES

The block F_DB_STATES is no longer delivered with WinCC V13 SP1. The block F_DB_STATES serves only for data exchange. You can configure a block to replicate the function of the F_DB_STATES, however. Note the description of the F_DB_STATES in the operating instructions of your HMI device or in the information system.

F_FB_KTP_Mobile and F_FB_KTP_RNG

The fail-safe function blocks F_FB_KTP_Mobile and F_FB_KTP_RNG are not contained in the software WinCC V13 SP1. The function blocks will be part of the WinCC V13 SP1 Update for the Mobile Panels 2nd generation.

Mobile Panels 277F IWLAN

Mobile Panels 277F IWLAN are not released for use with CPUs of the type S7-1500F with WinCC V13 SP1.

Mobile Panels 277F IWLAN are not released for use with CPs in connection with CPUs of the type S7-400F with WinCC V13 SP1.

Affected MLFBs: 6AV6645-0EB01-0AX1, 6AV6645-0EC01-0AX1, 6AV6645-0EF01-0AX1, 6AV6645-0GB01-0AX1, 6AV6645-0GC01-0AX1, 6AV6645-0GF01-0AX1.

4.3 STEP 7 Basic

4.3.1 Security information

Upgrades and updates

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit

http://www.siemens.com/industrialsecurity (http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx)

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit

http://support.automation.siemens.com (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002)

Network settings

The following tables show the network settings of each product you need to analyze the network security and to configure external firewalls:

STEP 7 Basic					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
ALM	4410*	TCP	Inbound/outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
RFC 1006	102	TCP	Outbound	S7 communication	Communication to the S7 controller via Ethernet/PROFINET for programming and diagnostic purposes.
DCP	---	Ethernet	Outbound	PROFINET	The DCP protocol (Discovery and Basic Configuration Protocol) is used by PROFINET and provides the basic functionality for locating and configuring PROFINET devices.
SNMP	161	UDP	Outbound	PROFINET	The SNMP client functionality is used by STEP 7 to read status information from PROFINET devices.
* Default port that can be changed by user configuration					

WinCC ES Basic (without simulation)					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
ALM	4410*	TCP	Inbound/outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
HMI Load	1033	TCP	Outbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
* Default port that can be changed by user configuration					

Simulation RT Basic					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
HMI Load	1033	TCP	Inbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.

Simulation RT Basic					
Ethernet/ IP	44818	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
	2222	UDP	Inbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Modbus TCP	502	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
RFC 1006	102	TCP	Outbound	S7 channel	Communication to the S7 controller via Ethernet/PROFINET
Mitsubishi MC	5002	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.

4.3.2 Notes on use

Content

Information that could not be included in the online help and important information about product characteristics.

Online operation

The simultaneous online operation of STEP 7 V5.5 or earlier and STEP 7 Basic V13 has not been approved.

Simultaneous online connections on an S7-1200 CPU

It is not possible to establish an online connection from multiple instances of the TIA Portal simultaneously to the same S7-1200 CPU.

Removing/inserting the memory card

After removing or inserting a memory card, always perform a memory reset on the CPU in order to restore the CPU to a functional condition.

Removing and inserting Ethernet modules

If Ethernet modules are removed and re-inserted during operation, you must boot the PC; otherwise, the "Accessible devices" functionality in STEP 7 or NCM PC will not display all devices. While the PC boots, Ethernet modules must be activated.

Loading project data with TIA Portal V12 and V13 (S7-1200)

If you load the project data of an S7-1200 CPU with the TIA Portal V13, you can no longer use TIA Portal V12 to access this data. To do this, first restore the factory settings of the CPU. Read the additional information on this in the online help under "How to reset a CPU to factory settings".

Using project data of distributed IO-Link master modules from TIA Portal V12 in V13

The following procedure applies if you are using distributed IO-Link master modules in TIA Portal V12 that are not GSD devices and were configured with PCT: To continue using your project data from TIA Portal V12.0 in TIA Portal V13.0, you have to export them to PCT before you upgrade the project. After the upgrade, you must import the project data once again using the PCT.

Compatibility

The device configuration and program of an S7-1200 CPU must always be configured with the same STEP 7 version. Usually, the TIA Portal makes sure that no version conflicts occur by outputting appropriate notifications during loading to the device.

This automatic verification is not possible with S7-1200 CPUs with firmware version V1.x. In this case, users themselves must ensure that no version conflicts occur.

4.3.3.2 Use of modules on the S7-1200

Content

Information that could not be included in the online help and important information about product characteristics.

Use of modules on the S7-1200

The modules listed below are not supported on the S7-1200.

Family	Module	Order number
S7-300 FMs	SM 338	6ES7 338-4BC01-0AB0
	FM 350-1	6ES7 350-1AH03-0AE0
	FM 350-2	6ES7 350-2AH00-0AE0, 6ES7 350-2AH01-0AE0
	FM 351	6ES7 351-1AH01-0AE0, 6ES7 351-1AH02-0AE0
	FM 352	6ES7 352-1AH02-0AE0
	FM 355 S	6ES7 355-1VH10-0AE0
	FM 355 C	6ES7 355-0VH10-0AE0
	FM 355-2 C	6ES7 355-2CH00-0AE0
	FM 355-2 S	6ES7 355-2SH00-0AE0
S7-300 PtP-CP	CP 340	6ES7 340-1AH02-0AE0, 6ES7 340-1BH02-0AE0, 6ES7 340-1CH02-0AE0
	CP 341	6ES7 341-1AH01-0AE0, 6ES7 341-1AH02-0AE0, 6ES7 341-1BH01-0AE0, 6ES7 341-1BH02-0AE0, 6ES7 341-1CH01-0AE0, 6ES7 341-1CH02-0AE0
Network component	Diagnostics repeater	6ES7 972-0AB01-0XA0
ET 200S	1 Count 24 V	6ES7 138-4DA04-0AB0
	1 Count 5 V	6ES7 138-4DE02-0AB0
	1 Step 5 V	6ES7 138-4DC00-0AB0, 6ES7 138-4DC01-0AB0
	2 pulses	6ES7 138-4DD00-0AB0, 6ES7 138-4DD01-0AB0
	1 SI	6ES7 138-4DF01-0AB0

	1 SSI	6ES7 138-4DB02-0AB0, 6ES7 138-4DB03-0AB0
	1 Pos Universal	6ES7 138-4DL00-0AB0
	SIWAREX	7MH4910-0AA01, 7MH4912-0AA01, 7MH4920-0AA01
ET 200M	SIWAREX	7MH4 900-2AA01, 7MH4 900-3AA01, 7MH4 950-1AA01, 7MH4 950-2AA01

Loading S7-1200 module comments to the PG/PC

In central configurations with S7-1200, comments of modules, submodules and signal boards are not loaded. With CPs/CMs, only the comments of the IE interface or DP interface are loaded. In distributed configurations with ET 200SP or ET 200MP, only the comment of the channels is loaded from the I/O modules.

4.3.3.3 Replacing ET 200S positioning modules

Contents

Information that could not be included in the online help and important information about product characteristics.

Replacing ET 200S positioning modules

This information relates to the positioning module "1 Step 5V" (6ES7 138-4DC00-0AB0) from a project which was created with TIA Portal V11.0. When replacing these modules from the TIA Portal V11.0 with a new version of these modules, the parameter settings are reset to the default values.

This is the case with one of the following procedures:

- Replace the positioning module 6ES7 138-4DC00-0AB0 with its successor module 6ES7 138-4DC01-0AB0 by means of a device exchange.
- Updating the module version using the appropriate button in the device properties in the Inspector window.

4.3.3.4 CP 343-2 on SIMATIC S7 Embedded Controller EC31-RTX

Contents

Information that could not be included in the online help and important information about product characteristics.

CP 343-2 on SIMATIC S7 Embedded Controller EC31-RTX

The module AS-Interface CP 343-2 (article no.: 6GK7 343-2AH01) can be inserted in an expansion rack of the SIMATIC S7 Embedded Controller EC31-RTX (article no.: 6ES7 677-1DDxx-0BB0), but the CP 343-2 cannot be operated with the EC31-RTX.

4.3.3.5 F-CM AS-i Safety ST for ET 200SP

Content

Information that could not be included in the online help and important information about product characteristics.

F-CM AS-i Safety ST (3RK7 136-6SC00-0BC1) from HSP0070

When using an F-CM AS-i Safety ST (3RK7 136-6SC00-0BC1) using HSP0070 in TIA Portal V13.0, after updating to Service Pack 1, the HSP0070 (F-CM AS-i Safety ST) must be updated to version V2.0. This is necessary to allow use of the module in TIA Portal V13 Service Pack 1.

4.3.3.6 S7 routing via IE/PB Link

Content

Information that could not be included in the online help and important information about product characteristics.

S7 routing via IE/PB Link

In the following situations, no routing via the IE/PB Link PN IO is possible:

- S7 routing between two CPUs of the S7-1500
- S7 routing of PG connections to CPUs of the S7-1200/1500
- S7 routing of HMI connections to CPUs of the S7-1200/1500

This behavior relates to the IE/PB Link with firmware version V2.1 (6GK1 411-5AB00).

4.3.3.7 Notes on online and diagnostics

Contents

Information that could not be included in the online help and important information about product characteristics.

Hardware detection followed by online connection

When the "Online > Hardware detection" command is performed for an unspecified CPU, the online configuration is not loaded from the CPU. If you do not load the configuration resulting from the hardware detection to the CPU, the device and network views will always show a difference between the offline and online configurations. It will appear that there are different configurations in the online and diagnostic views, although the MLFBs are identical in the actual CPU and the offline CPU.

4.3.3.8 Network components

S7-1200 telecontrol CPs Load, TeleService, project number, station number

Changing the project number or station number for the entire STEP 7 project

If you change the project number or the station number in the "CP identification" parameter group for a telecontrol CP, this parameter is changed for all CPs in the STEP 7 project.

Copying Security modules

Copying stations with activated Security functions to another project without activated Security functions is forbidden and can lead to serious inconsistencies.

Mobile wireless CPs: Download / TeleService

The following behavior applies to all mobile wireless CPs:

- CP 1242-7 (6GK7 242-7KX30-0XE0)
- CP 1242-7 GPRS V2 (6GK7 242-7KX31-0XE0)

- CP 1243-7 LTE-EU (6GK7 243-7KX30-0XE0)
- CP 1243-7 LTE-USA (6GK7 243-7SX30-0XE0)

Connection resources for TeleService

The TeleService function occupies a connection resource on the engineering station.

The function download to device or upload from device during a TeleService session occupies a second connection resource on the engineering station.

Download to device

Only use the "Download to device" function with the mobile wireless CP via a TeleService connection as follows:

1. Select the CP in STEP 7.
2. Select the "Online" > "Download to device" menu.
3. In the "Extended download" dialog that appears, select the TeleService interface.
4. Download the project data from the "Extended download" dialog.

Upload from device

The "Upload from device" function via a TeleService connection is supported by the mobile wireless CPs with the following TeleService server applications:

- TeleControl Server Basic as of version V3
- TeleService Gateway as of version V3

Security modules

Migration of projects with Ethernet CPs and activated security functions

In STEP 7 V5.5 projects that contain Industrial Ethernet CPs with activated security functions, the security settings are disabled during migration to STEP 7 Professional.

If necessary, follow these steps after the migration:

1. Activate the security functionality.
2. Configure the required security settings.

Migration of IP access protection lists when activating the security functions

An active IP access protection list is converted to firewall rules when security functions are activated. These rules are visible in advanced firewall mode and can be adjusted there. The advanced firewall mode is activated automatically.

Copying Security modules

Copying stations with activated Security functions to another project without activated Security functions is forbidden and can lead to serious inconsistencies.

Security online diagnostics of S7 CPs

Security online diagnostics of a CP with security capability is only possible if the online connection is established directly via the CP. If the online connection was established by STEP 7 via the CPU to the station, with the "Connect online" button on the security diagnostics page "Security" > "Status" of the security CP you can establish a direct connection to the CP to run security online diagnostics. As an alternative, you can also terminate the online connection to the CPU and enter the IP address of the CP in the "Station address" input box under the entry "Online access" in online diagnostics.

IKE mode

When negotiating the key in phase 1 the IKE mode "Main" should be preferred. This mode normally provides a reliable procedure compared with the "Aggressive" mode. One reason for using the "Aggressive" setting is when you have VPN groups with different pre-shared keys since only one pre-shared key is supported with the "Main" setting.

The IKE "Aggressive" mode should not be used in conjunction with certificates. In the IKE "Aggressive" mode, only use pre-shared keys.

The SOFTNET Security Client only supports the IKE "Main" mode.

A security module must not be used in VPN groups that use different IKE modes.

Downloading configuration data to an S7-300/400 via a VPN tunnel

When you download configuration data via the gigabit interface of a CP x43-1 Advanced to an S7-300/S7-400 station, the path via which the download takes place is stored in the project. If the project is then downloaded via a VPN tunnel established between a SCALANCE S module and the CP x43-1 Advanced, the download fails due to the changed path.

To download via the VPN tunnel, follow the steps below:

1. Using the "Go online" button, connect the engineering station to the gigabit interface of the CP x43-1 Advanced.
2. Disconnect the online connection to the CP x43-1 Advanced.
3. Download the project to the station via the gigabit interface of the CP x43-1 Advanced.

VPN tunnel establishment with 1200/1500 CPs capable of VPN

The establishment of VPN tunnel connections by 1200/1500 CPs capable of VPN with the authentication method "pre-shared key" is only possible if the VPN connection partner is also a 1200/1500 CP capable of VPN. The establishment of VPN tunnel connections by a 1200/1500 CP capable of VPN to all other VPN connection partners is only possible with the "certificate" authentication method.

Media converters

When you migrate a project, you need to reconfigure the media converters.

4.3.4 Programming a PLC

4.3.4.1 General notes on PLC programming

Content

Information that could not be included in the online help and important information about product characteristics.

Information about network security

For communications access between the TIA Portal and CPU or between HMI (except for HMI access using "GET/PUT communication") and CPU, there are integrated security functions. These provide greater protection from manipulation and higher access protection. To protect against unauthorized network access to a CPU with standardized communications access such as "GET/PUT", "TSEND/TRCV", "Modbus", "FETCH/WRITE", you should also take suitable additional measures (e.g. cell protection concept).

Renumbering PLC data types

For better performance, the S7 CPUs process PLC data types with numbers. The user is not aware of these numbers, because the system processes the numbers independently. This means number conflicts are automatically resolved. When using know-how protected blocks that use PLC data types, it may be useful to set up your own numbering system (recommended > 5000) because the automatic resolution of numbering conflicts may result in a password prompt (compilation required).

To renumber the default number of a PLC data type, follow these steps:

1. Open the project library in the "Libraries" task card.
2. Drag the compilable PLC data type to the "Types" folder.
   The "Add type" dialog opens.
3. Enter the properties of the new type.
4. Click "OK" to confirm.
5. Right-click the PLC data type.
   The shortcut menu opens.
6. Select "Edit type" in the shortcut menu.
7. Open the "PLC programming" task card once again.
   The extension "in testing" is now added to the name of the PLC data type.
8. Right-click the PLC data type.
   The shortcut menu opens.
9. Select "Properties" in the shortcut menu.
10. Change the number of the PLC data type in the "General" section.
11. Select "Release version" from the shortcut menu of the library.

The PLC data type now has the new number and can be used. The assigned number is retained even if the type of the PLC data type is revoked.

Generating external sources from blocks

When generating external sources from blocks, the changes made directly in the block interface to the default values of PLC data types are not exported to the sources. This means these values are not available when the sources are imported once again. The default values are applied instead. To prevent this loss of data for the modified default values, the changes must be made directly in the PLC data type and not in the block interface. In this case, the changes are also exported when generating external sources.

Indirect indexing of ARRAY components of data type bit string in SCL

In TIA Portal V13, you can address the components of an ARRAY for a CPU of the S7-1200 series in SCL with a tag of the data type BYTE, WORD or DWORD as index in addition to a tag of the integer data type if the IEC check is not set.

Explicit data type conversion in SCL

As of TIA Portal V13, the string is displayed with a leading sign during explicit data type conversion of SINT/INT/DINT/LINT_TO_STRING or WSTRING in SCL and transferred aligned to the left.

The result is an incompatibility with TIA Portal V12 SP1, in which the string was transferred aligned to the right during conversion.

Start value behavior during "Upload from device"

The start values that you have changed with the instruction "WRIT_DBL: Write to data block in the load memory" will be lost during execution of the action "Upload from device".

Online/offline differences in the project tree (S7-1200 FW V2.0 and V2.1)

If you use the instruction "WRIT_DBL: Write to data block in the load memory" to change a data block, the resulting difference between online and offline block is initially not displayed correctly by the symbols in the project tree. The difference is only shown when you terminate an online connection and then go back online.

Loading inconsistent programs to a device

In TIA Portal, it is not possible to download inconsistent programs to a device without a consistency check. During the loading process, all blocks of the program are implicitly checked and are compiled again in the event of inconsistencies. If, however, there are programs on your CPU which were loaded with earlier versions of STEP 7, these programs could demonstrate inconsistencies.

In this case, note the following:

If you load an inconsistent program from a device, you will not be able to load the program unchanged to the device afterwards, because a consistency check always takes place during the loading process and existing inconsistencies are corrected.

Process image of PTO/PWM outputs

Do not use PTO/PWM outputs in the process image (for example, for access in the user program, for online functions or in HMI). The update rate of the process image is much slower than the rate of the signal changes. The display in the process image therefore does not reflect the signal flow.

Monitoring blocks in LAD and FBD

If the start of the current path is outside the visible range, it may not be possible to determine the input value. In this case, the current path is shown grayed out.

Avoid using PLC data types generated by the system in libraries

Some instructions generate their own PLC data types during instancing which are saved in the "PLC data types" project folder. However, you should not use these system-generated PLC data types in any library, because they may be recreated by the system at any time and may result in an unfavorable system behavior.

Using global data blocks in assignments

It is not possible to assign the contents of a global data block to a structurally identical data block, e.g. using a move box.

4.3.4.2 Compatibility of PLC programs from V12 SP1 or V13

Content

Information that could not be included in the online help and important information about product characteristics.

Compatibility

You can continue to use in V13 SP1 all programs that were created with TIA Portal V12 SP1 or V13. However, because improvements were made to the compiler and errors corrected there in V13 SP1, it can occur in rare cases that the program reacts differently after the upgrade or that you have to adjust the program code manually. These cases are described in detail below.

In addition, you have the option of editing the project in compatibility mode. Compatibility mode is available for projects that were created with TIA Portal V12 SP1 and V13.

You can find additional information on the compatibility under "Compatibility of projects".

Instruction "S_CONV: Convert character string"

Der EN/ENO mechanism behaves differently in TIA Portal V13 SP1 than in TIA Portal V13.

In version V13, the ENO enable output returns the signal state "0" in case of error, even if you have deactivated the ENO enable output. If you have switched an additional instruction to the EN enable output, this is then not executed.

In version V13 SP1, the ENO enable output returns the signal state "1" in case of error, if you have deactivated the ENO enable output. If you have switched an additional instruction to the EN enable output, this is then executed as expected.

Instruction "MUX: Multiplex" (SCL)

Up to and including TIA Portal V13, the value of the tag at the input parameter was output unchanged as a function value, even if the K parameter had a negative integer. This behavior has changed in TIA Portal V13 SP1.

In TIA Portal V13 SP1, if you use the BOOL, STRING, DT or DTL data types at the input parameters of the MUX instruction and the K parameter is a negative integer, the value of the tag is changed.

Instruction "DEMUX: Demultiplex" (SCL)

Up to and including TIA Portal V13, no value was output at the OUTELSE output parameter if the value of the K parameter was < 0. In contrast, the value of the IN input parameter was output at the OUTELSE output parameter if the value of the K parameter was > available outputs. This behavior has changed in TIA Portal V13 SP1.

In the TIA Portal V13 SP1, if you specify at the K parameter a value that is outside the available outputs (K < 0 or K > available outputs), then the value of the IN input parameter is output at the OUTELSE output parameter.

Function values (Return)

As of TIA Portal V13 SP1, more stringent syntax rules apply to function call:

It is checked that the function value (Return) is written in any case, even if multiple possible program paths can be run through in the function. Therefore, there is no longer any risk that the function values will accidentally not be written during runtime.

However, you may possibly receive syntax errors in functions during compiling, which it was still possible to compile without errors in V13. In such cases change the program code so that the function valve is written in all possible program paths.

Example:

SCL

```
IF #MyIn1 = #MyIn2 THEN
   #Block_3 := #MyIn1 + 1;
END_IF;
```

In this example, the function value of "Block_3" is not written if the condition of the IF instruction is not fulfilled. The function value then contains an undefined value.

SCL

```
#Block_3 := #MyIn1;
IF #MyIn1 = #MyIn2 THEN
   #Block_3 := #MyIn1 + 1;
END_IF;
```

In this example the function valve of "Block_3" is definitely written in the program, since "MyIn1" is set as default before the IF loop is completed.

Comparing the hardware data types HW_IO and HW_DEVICE

As of TIA Portal V13 SP1, there is a stricter syntax rule that is valid for the comparison of the data types HW_IO and HW_DEVICE:

Up until and including TIA Portal V13 it was possible to compare the data types HW_IO and HW_DEVICE directly with each other.

If you want to compare these data types in TIA Portal V13 SP1 you have to first create a tag of the data type HW_ANY in the section "Temp" for the block interface and then copy the LADDR (from data type HW_DEVICE) to the tag. It is then possible to compare HW_ANY and HW_IO.

EN/ENO mechanism for STRING conversion

Conversion	Description
Strg_TO_Chars: Convert character string to Array of CHAR	The ENO enable output returns the signal state "0" even if you have deactivated the ENO enable output: • For an invalid character at the CHARS parameter • For an invalid ARRAY index at the PCHARS parameter • If the sum of the PCHARS and STRG parameters exceeds the length of the target ARRAY.
Chars_TO_Strg: Convert Array of CHAR to character string	The ENO enable output returns the signal state "0" even if you have deactivated the ENO enable output: • If the sum of the PCHARS and CNT parameters exceeds the length of the source ARRAY.

4.3.4.3 Instructions

Content

Information that could not be included in the online help and important information about product characteristics.

Instruction "TRCV_C: Receive data via Ethernet"

Contrary to the information provided in the online help, the communication connection is terminated immediately, and not after sending data, when the CONT parameter is set to the value "0".

Instruction "T_CONFIG: Configure interface"

The CPU is restarted after you have executed the "Configure interface" instruction in order to change an IP parameter. The CPU goes to STOP mode, a warm restart is carried out and the CPU starts up again (RUN mode). Make sure that the control process is in a secure operating mode after the CPU has been restarted following execution of the "Configure interface" instruction. Uncontrolled operation can result in serious material damage or personal injury due to malfunctions or programming errors, for example. Non-retentive data could be lost.

Parameters ERROR and STATUS

ERROR	STATUS (DW#16#..)	ERR_LOC	Explanation
0	00000000	0	After the instruction has been executed successfully, the STATUS parameter "00000000" does not return any value.

Instruction "DataLogCreate: Create data log"

In addition to the values described in the online help, the RET_VAL parameter can also adopt the following values:

Error code (W#16#...)	Explanation
8B24	Invalid assignment at parameter HEADER (for example, bit memory used as memory area).
8C24	Invalid assignment at parameter DATA (for example, bit memory used as memory area).

Instruction "DPSYC_Fr: Synchronize DP slaves / Freeze inputs"

In addition to the values described in the online help, the RET_VAL parameter can also have the following value:

Error code (W#16#...)	Explanation
80A4	Communication on central PROFIBUS disrupted.

Instruction "Get_IM_Data: Reading identification and maintenance data"

The explanation for the values of the RET_VAL parameter described in the online help has been changed as follows:

Error code (W#16#...)	Explanation
80B1	No valid data available. (The I&M data is either not supported by the (sub)module or you have not configured I&M data for this device.)

Instruction "T_RESET: Resetting the connection"

In addition to the values described in the online help, the STATUS parameter can also have the following value:

Error code (W#16#...)	Explanation
7000	No job processing active.

Instruction "TCON: Establish communication connection"

In addition to the values described in the online help, the STATUS parameter can also have the following value:

Error code (W#16#...)	Explanation
80A1	The specified connection or the port is already being used.

Instruction "RD_ADDR: Determine the IO addresses from the hardware identifier"

Output of the IO addresses with packed addresses of an ET200

With packed addresses of an ET200. the first module of the pack group returns all addresses. For the other modules, the following is output with the PIADDR and PQADDR parameters:

- With PROFINET as address "0".
- With PROFIBUS as address "0". The error code 16#8090 (the hardware identifier of the module at the LADDR parameter is invalid.) is also output.

For the number of bytes of the inputs and outputs (parameters PICOUNT and PQCOUNT), "0" is output in each case.

Instruction "RD_LGADR: Determine the IO addresses from the hardware identifier"

Output of the IO addresses with packed addresses of an ET200

With packed addresses of an ET200. the first module of the pack group returns all addresses. For the other modules, the following is output with the PEADDR and PAADDR parameters:

- With PROFINET as address "0".
- With PROFIBUS as address "0". The error code 16#8090 (the hardware identifier of the module at the LADDR parameter is invalid.) is also output.

For the number of bytes of the inputs and outputs (parameters PECOUNT and PACOUNT), "0" is output in each case.

Notes on the use of "RecipeExport" and "RecipeImport"

- The instructions RecipeExport and RecipeImport are not suitable for applications in which special protection is necessary for the recipe data. For higher protection of the data use the recipe functions of HMI.
- The data block with the recipe data exported with RecipeExport can be located in work or load memory. If the data block is both in work memory as well as in load memory, the values from work memory are used.
- You can use different separators for the separators of the row values in the recipe. Note that if you open the CSV file with the exported recipe data, for example in Excel, commas can be replaced by periods and vice versa. The reason for this is that different languages use different decimal separators. This can have effect when importing CSV files. The following convention applies for RecipeImport; the first detected possible separator is assumed to be the separator for all values of a table row.
  - Example 1: If a semicolon is detected as the first separator, during import it is assumed that the semicolon is used as the separator for all further values. As the decimal separator with a value of the type REAL, a comma is then used.
  - Example 2: If a comma is detected as the first separator, during import it is assumed that the comma is used as the separator for all further values. As the decimal separator with a value of the type REAL, a period is then used.

  If the recipe data record contains a character string, make use that the character string does not contain the separator you are using. With character strings, also make sure that they do not contain any control characters that specify a line break (with ASCII: LF, CR LF, CR).
  Note: Spaces and tabs cannot be used as separators. The lead to error code 80B2 during import.

Notes on the use of data logs

Data logs are stored as a CSV file and can be opened using the Web server, for example in Excel. If you use character strings within a data log, make sure that you do not use any characters in the character strings that are also used as the separator for the row elements of the CSV file.

Instructions STRG_VAL and VAL_STRG

The instructions STRG_VAL and VAL_STRG are also available in the SCL programming language in V13 SP1 in contrast to the restriction in the online help.

Passing parameters to asynchronous executable blocks

Code blocks (FBs/FCs) and data blocks (DBs) can be created with different access types ("standard" and "optimized"). In code blocks, you can call any instructions. Many instructions (e.g. "WRIT_DBL" and "READ_DBL") are executed asynchronously. These blocks cannot be supplied with tags from TEMP because the data must not be changed during execution.

Ensure that you do not use these instructions in programs in which code blocks of different access types are called reciprocally. This could cause the following to occur:

- A structure from a standard data block is directly or indirectly passed to an optimized code block, which forwards this structure directly or indirectly to one of the blocks mentioned above.
- The reverse scenario, whereby a structure from an optimized code block is directly or indirectly passed to a standard data block, which forwards this structure directly or indirectly to one of the blocks mentioned above.

Otherwise a hidden copy of the passed data is created in TEMP, which leads to the asynchronous blocks returning a negative acknowledgment.

4.3.4.4 Testing the user program

Testing with the watch table

Content

Information that could not be included in the online help and important information about product characteristics.

Multiple access to the same CPU

Access to a CPU from a PG/PC is permitted only when a TIA Portal is open. Multiple access to the same CPU is not permitted and can lead to errors.

Loading data blocks during an active control job

Note

Loading changed data blocks during an active control job can result in unforeseen operating states. The control job continues to control the specified address, although the address assignment may have changed in the data block. Complete active control jobs before loading data blocks.

Testing programs converted from older STEP 7 versions

To monitor and test a program converted from an older STEP 7 version, you first need to compile and download the program with the current STEP 7 version.

4.3.5 Inter Project Engineering (IPE)

4.3.5.1 Notes on IPE

Contents

Information that could not be included in the online help and important information about product characteristics.

Comment box of the device proxy

Contrary to the description in the information system for the TIA Portal V13, with the "Inter Project Engineering" functionality, the comment field for a device proxy cannot be edited.

Restricted functionality

In the TIA-Portal V13, the "S7 GRAPH overview" and "PLC code display" functionality cannot be used in conjunction with the IPE device proxy.

Using system diagnostics in the device proxy

To use the "system diagnostics" function in an IPE device proxy, for example, a system diagnostics view, insert the PLC alarms as content of a device proxy.

4.3.6 Technological functions

4.3.6.1 Notes on technological functions

S7-1200 Motion Control - MC_Home

The motion control instruction "MC_Home" has been extended with the absolute value encoder adjustment:

- **Absolute encoder adjustment (relative)**
  MC_Home.Mode = 6
  The current position is shifted by the value of the parameter "MC_Home.Position".
  The calculated absolute value offset is stored retentively in the CPU.
  (<Axis name>.StatusSensor.AbsEncoderOffset)
- **Absolute encoder adjustment (absolute)**
  MC_Home.Mode = 7
  The current position is set to the value of the parameter "MC_Home.Position".
  The calculated absolute value offset is stored retentively in the CPU.
  (<Axis name>.StatusSensor.AbsEncoderOffset)

S7-1200 Motion Control - MC_WriteParam

Motion control instruction "MC_WriteParam" for drive connection via PROFIdrive/analog output:

Contrary to the statements in the online help, you cannot write parameters with "MC_WriteParam" which require a restart of the technology object.

S7-1200 Motion Control - MC_ChangeDynamic

You can only use the motion control instruction "MC_ChangeDynamic" for drive connection via PTO (Pulse Train Output).

S7-1200 Motion Control - Application cycle MC-Servo [OB91]

To avoid disruptions in the program execution on the CPU, set the application cycle depending on the number of used axes as follows:

Application cycle = number of axes x 2 ms

Number of axes	Application cycle
1	2 ms
2	4 ms
4	8 ms
8	16 ms

The SINAMICS G120 drive updates the drive process image every 4 ms. To improve control, set the application cycle of the MC-Servo [OB91] to 4 ms or to a multiple of 4 ms.

S7-1200 Motion Control - Overflow MC-Servo [OB91]

Contrary to the online help, the CPU does not go into STOP at overflow of the MC-Servo [OB91].

If necessary, you can set the CPU to STOP at overflow of MC-Servo [OB91] via a time-error OB (OB80).

S7-1200 Motion Control - Process image partition "OB Servo PIP"

For optimal control of all I/O modules (e.g. hardware limit switches) used by Motion Control, assign them to the process image partition "OB Servo PIP". The assignment causes the I/O modules to be processed simultaneously with the technology object.

A high-speed counter (HSC) used by Motion Control is automatically assigned to the process image partition "OB Servo PIP".

S7-1200 Motion Control - Renaming technology objects

In order to assure the consistency of your project, after you rename the technology objects, download the project to the CPU while it is in STOP. A name change includes when you delete a technology object and create a new technology object with a new name and data block number of the deleted technology object.

S7-1200 Motion Control - ErrorIDs and ErrorInfos

The ErrorInfo 16#003D is also displayed if a drive with an analog drive connection has turned off.

The ErrorInfo 16#002C has been supplemented for the ErrorID 16#820A:

ErrorID	ErrorInfo	Description	Solution
16#820A		**It is not possible to restart the axis**	
	16#0013	The axis is enabled in the user program	Disable the axis with the "MC_Power" instruction; restart again
	16#0027	The axis is currently being operated in "Manual control" (axis control panel)	Exit "Manual control"; restart again
	16#002C	The axis is not disabled.	Disable the axis; restart the command
	16#0047	The technology object is not ready for restart.	Download the project again.
	16#0048	Condition for restart of the technology object is not satisfied.	Disable the technology object.

PtP module with CM 1243-5 PROFIBUS Master

You have to make the following settings in the instance DB for the instructions when using the PtP-Module CM PtP RS232 BA, CM PtP RS422/485 BA, CM PtP RS232 HF, CM PtP RS422/485 HF and CM PtP with a CM 1243-5 PROFIBUS Master with firmware ≤ V1.3.4:

- **Send_P2P**
  max_record_len = 240
- **Modbus_Master**
  Send_P2P.max_record_len = 240
- **Modbus_Slave**
  Send_P2P.max_record_len = 240

Installation 5

5.1 Notes on the installation

Contents

Information that could not be included in the online help and important information about product characteristics.

Automated Installation

A description of automated installation is available on the product DVD in the directory "Documents\Readme\<Language directory>".

Use of the same versions of TIA Portal products during installation

When installing different TIA Portal products, make sure that you use the same versions of service packs and updates for the installation. For example, if you have installed SP1 for STEP 7 V13, you must also install SP1 for WinCC V13. The service packs and updates must be installed for all products at the same time. Do not start the TIA Portal until all products have been upgraded.

You can download the service packs from the Internet under Siemens Industry online support (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002).

Target directory of the installation

Do not use any UNICODE characters (for example, Chinese characters) in the installation path.

Use of antivirus programs

During the installation, read and write access to already installed files is necessary. Some antivirus programs block this access. We therefore recommend that you disable antivirus programs during installation of the TIA Portal and enable them again afterwards.

Compatibility with V12 SP1 and V13

Empty projects from previous versions are installed in the installation directory under .. \<INSTALLDIR>\Sample Projects to allow the current TIA Portal to be opened in compatibility mode. These projects must be copied to a local directory with full access before they can be used. For more information on this, refer to FAQ ID 82169157.

FAQs on the TIA Portal

FAQs on the TIA Portal are available under FAQs (http://support.automation.siemens.com/WW/view/en/28919804/133000).

5.2 System requirements for installation

5.2.1 Notes on licenses

Availability of licenses

The licenses for the products of the TIA Portal are usually supplied on an installation data medium and transferred automatically by the Automation Licence Manager during the installation process of the TIA Portal.

Before you uninstall the TIA Portal, you must transfer and back up the licenses still required. Use the Automation License Manager for this purpose.

Provision of the Automation License Manager

The Automation License Manager is supplied on the installation data medium and is transferred automatically during the installation process.

If you uninstall the TIA Portal, the Automation License Manager remains installed on your system.

Working with the Automation License Manager

The Automation License Manager is a product of Siemens AG, which is used for handling license keys (technical representatives of licenses).

Software products that require license keys for operation, such as the TIA Portal, register the need for license keys automatically with the Automation License Manager . If the Automation License Manager finds a valid license key for this software, the software can be used according to the license usage terms associated with this license key.

Note

For additional information on how to manage your licenses with the Automation License Manager , refer to the documentation supplied with the Automation License Manager .

Displaying the installed software (Page 142)
Modifying or updating installed products (Page 143)
Repairing installed products (Page 144)
Starting to uninstall (Page 146)
Installation log (Page 136)

5.2.2 Notes on the system requirements

System requirements for individual products

The system requirements may differ depending on the products you want to install. You should therefore check the individual system requirements of your products.

If you want to install several products, make sure that your system meets the demands of the product with the highest requirements.

Displaying PDF files

To be able to read the supplied PDF files, you require a PDF reader that is compatible with PDF 1.7 e.g. Adobe (R) Reader version 9.

Displaying the Welcome Tour

You need the Adobe (R) Flash Player Version 9 or higher to start the Welcome Tour for the TIA Portal.

Starting to uninstall (Page 146)

5.2.3 System requirements STEP 7 Basic

5.2.3.1 Licensing of STEP 7

Introduction

You require a License Key to license the following STEP 7 editions:

- STEP 7 Basic
- STEP 7 Professional

You can install the corresponding License Key when you are installing STEP 7 or transfer it using the Automation License Manager after the installation has been completed.

Licenses for STEP 7

The following licenses with the corresponding license keys are available:

- STEP 7 Basic
- STEP 7 Professional
- STEP 7 Professional Combo

Validity of license keys for older versions of STEP 7

With a valid License Key for V13.x of STEP 7 Professional and STEP 7 Professional Combo, you can also operate older versions of STEP 7 without restrictions. The following table provides more detailed information about this:

Edition	License	Valid for
STEP 7 Basic V13.x	STEP 7 Basic	• STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x • STEP 7 Basic V10.5
STEP 7 Professional V13.x	STEP 7 Professional	• STEP 7 Professional V13.x • STEP 7 Professional V12.x • STEP 7 Professional V11.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x • STEP 7 Basic V10.5
STEP 7 Professional V13.x	STEP 7 Professional Combo	• STEP 7 Professional V13.x • STEP 7 Professional V12.x • STEP 7 Professional V11.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x • STEP 7 Basic V10.5 • STEP 7 V5.5 • STEP 7 V5.4 • STEP 7 Professional 2010 • STEP 7 Professional 2006

Starting without a valid license key

If you start an edition of STEP 7 without a valid License Key , the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a Trial License. However, this license is valid for a limited period only and expires after 21 days.

When the Trial License expires, the following scenarios can occur:

- STEP 7 has never been licensed on the PC in question:
  - Operations requiring a license can no longer be performed in STEP 7.
- STEP 7 was already licensed on the PC in question:
  - A window requiring acknowledgment presents an alert for non-licensed mode every 10 minutes and for every action requiring a license.

License requirements for simulation

You do not require additional licenses when you use the menu command "Online > Simulation" to start the simulation in STEP 7.

If the following conditions are met, the appropriate licenses for the edition of STEP 7 you have installed are also required for the simulation.

- The engineering station is connected to a PLC.
- The connection to the PLC is configured and active.

See also

Handling licenses and license keys (Page 116)

5.2.3.2 Handling licenses and license keys

Introduction

In each case, you require a valid License Key to use STEP 7 Basic and STEP 7 Professional.

Installing license keys

When you install STEP 7 Basic, the License Key is installed automatically during setup. When you install STEP 7 Professional you will be prompted at the end of the setup to transfer the license from the supplied storage medium to your PC.

If you want to install additional License Keys, you have to use the Automation License Manager to do this.

When you install a license, the associated license key is removed from the license key storage location.

Notice

Destruction of license keys by copying

It is not possible to copy a License Key. The copy protection prevents the license keys from being copied. If you attempt to copy a License Key this will be destroyed.

Uninstalling license keys

License keys are always uninstalled using the Automation License Manager. You uninstall a License Key in the following cases:

- When backing up data.
- If you no longer require the license.

You can then use a valid license on another PC or HMI device.

Data backup

When backing up data on the HMI device or creating a backup during device replacement, remove the License Keys on the HMI device. To do this, open the Automation License Manager and back up the uninstalled license key to another storage location.

Notice

Destruction of license keys on PCs

Start by removing all license keys in the following situations:

- Before you format the hard disk.
- Before you compress the hard disk.
- Before you restore the hard disk.
- Before you start an optimization program that moves fixed blocks.
- Before you install a new operating system.

Read the description of Automation License Manager ("Start > Siemens Automation > Documentation"). Observe all warnings and notices.

On PC-based HMI devices and on non-PC-based HMI devices where Automation License Manager is used, the license key storage location may contain multiple license keys. This capability means you can store multiple licenses of the same type at one location. Save all license keys of an HMI device to the same storage location.

Notice

Always keep the original storage location of the license keys.

Invalid license after time zone change

The installed license no longer functions in the following case.

- If you change the time zone on a PC as follows:
  From a time based on a complete hour to a time not based on a complete hour.
  Example: You change the time zone from GMT +3:00 to GMT +3:30.

To avoid this inconvenience, uninstall the license key using the Automation License Manager under the time zone setting that was set when the license key was installed.

This behavior does not apply to the Trial License.

Defective license

A license is defective in the following cases:

- If the license key is no longer accessible at the storage location.
- If the license key disappears during its transfer to the destination drive.

You can use the Automation License Manager to repair the defective license. To do this, use the "Restore" function or the "Restore wizard" of the Automation License Manager. To perform this restore operation you must contact Customer Support.

You can find more detailed information on the Internet: http://support.automation.siemens.com (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002)

Licensing of STEP 7 (Page 114)

5.2.3.3 Software and hardware requirements STEP 7

System requirements for installation

The following table shows the minimum software and hardware requirements for installation of the "SIMATIC STEP 7 Basic" software package:

Hardware/software	Requirement
Processor	Intel® Celeron® Dual Core 2.2 GHz (Ivy/Sandy Bridge)
RAM	4 GB
Available hard disk space	8 GB
Operating systems *	**Windows 7 (32-bit)** • Windows 7 Home Premium SP1 • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 **Windows 7 (64-bit)** • Windows 7 Home Premium SP1 • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 **Windows 8.1 (64-bit)** • Windows 8.1 • Windows 8.1 Professional • Windows 8.1 Enterprise **Windows Server (64-bit)** • Windows Server 2012 R2 StdE (full installation)
Screen resolution	15.6" wide screen display (1024 x 768)

* For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft homepage.

Recommended software and hardware requirements

The following table shows the recommended software and hardware for the operation of STEP 7.

Hardware/software	Requirement
Computer	From SIMATIC FIELD PG M4 PREMIUM (or similar PC)
Processor	From Intel® Core™ i5-3320M 3.3 GHz
RAM	8 GB or more
Hard disk	300 GB SSD
Monitor	15.6" Wide Screen Display (1920 x 1080)
Operating systems *	**Windows 7 (64-bit)** • Windows 7 Home Premium SP1 • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 **Windows 8.1 (64-bit)** • Windows 8.1 • Windows 8.1 Professional • Windows 8.1 Enterprise **Windows Server (64-bit)** • Windows Server 2012 R2 StdE (full installation)

* For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft homepage

Supported virtualization platforms

You can install the "SIMATIC STEP 7 Basic" software package on a virtual machine. For this purpose, use one of the following virtualization platforms in the specified version or a newer version:

- VMware vSphere Hypervisor (ESXi) 5.5 as of Update 2
- VMware Workstation 10
- VMware Player 6.0
- Microsoft Windows Server 2012 R2 Hyper-V

These virtualization platforms can use the following operating systems as host operating system:

- Windows 7 Professional/Ultimate/Enterprise (64-bit)
- Windows Server 2008 R2 (64-bit)
- Windows Server 2012 R2 (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)

You can use the following host operating systems to install "SIMATIC STEP 7 Basic" within the selected virtualization platform:

- Windows 7 Professional/Ultimate/Enterprise (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)

Note

- The same hardware requirements apply to the host operating system as for the respective TIA products.
- The plant operator must ensure that sufficient system resources are available for the host operating systems.
- The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.
- When you use Microsoft Hyper-V, accessible stations cannot be displayed.

Supported security programs

The following security programs are compatible with "SIMATIC STEP 7 Basic":

- Antivirus programs:
  - Symantec Endpoint Protection 12.1
  - Trend Micro Office Scan Corporate Edition 10.6
  - McAfee VirusScan Enterprise 8.8
  - Kaspersky Anti-Virus 2014
  - Windows Defender (as of Windows 8.1)
  - Safety Guard 360
- Encryption software:
  - Microsoft Bitlocker
- Host-based Intrusion Detection System:
  - McAfee Application Control 6.0

5.2.4 System requirement for WinCC Advanced

5.2.4.1 Software and hardware requirements

Introduction

Specific requirements for the operating system and software configuration must be met for the installation.

Note

WinCC is generally authorized for use in a domain or workgroup.

However, be aware that domain group policies and restrictions of the domain may hinder the installation. In this happens, remove the computer from the domain prior to installing Microsoft Message Queuing, Microsoft SQL Server and WinCC. Log onto the computer in question locally with administrative rights. Then perform the installation. After successful installation, you can enter the WinCC computer back into the domain. If the domain group policies and restrictions of the domain do not impede the installation, the computer need not be removed from the domain during the installation.

Be aware that domain group policies and restrictions of the domain may also hinder operation. If you cannot avoid these restrictions, run the WinCC computer in a workgroup.

Consult with the domain administrator if needed.

Installation requirements

The following table shows the minimum software and hardware requirements that have to be met for the installation of the "SIMATIC WinCC Comfort/Advanced" software package:

Hardware/software	Requirement
Processor type	Intel® Celeron® Dual Core 2.2 GHz (Ivy/Sandy Bridge)
RAM	4 GB
Free hard disk space	8 GB

Hardware/software	Requirement
Operating systems *	**Windows 7 (32 bit)** • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 **Windows 7 (64 bit)** • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 **Windows 8 (64 bit)** • Windows 8.1 Professional • Windows 8.1 Enterprise **Windows Server (64 bit)** • Windows Server 2008 R2 Standard Edition SP1 • Windows Server 2012 R2 Standard Edition
Screen resolution	1024 x 768
Network	Ethernet 10 Mbps or faster
Optical drive	DVD-ROM
Software	Microsoft .Net Framework 4.5

* For additional information on the operating systems, refer to the Microsoft Windows help or the Microsoft homepage.

Simultaneously opening multiple instances of WinCC on a configuration PC can also increase the hardware capacity required.

Note

"Aero Glass Style" of Microsoft Windows 7

A powerful graphics card is required for "Aero Glass Style". It requires DirectX9 capabilities and 128 MB of dedicated graphics memory.

The performance of the architecture of the graphics system can significantly influence the performance of WinCC.

Recommended hardware

The following table shows the recommended hardware for the operation of SIMATIC WinCC.

Hardware	Requirement
Computer	SIMATIC FIELD PG M4 PREMIUM or higher (or comparable PC)
Processor	Intel® Core™ i5-3320M 3.3 GHz or higher
RAM	8 GB or more
Hard disk	300 GB SSD
Monitor	15.6" Wide Screen Display (1024 x 768)
Optical drive	DL MULTISTANDARD DVD RW

Supported virtualization platforms

You can install the "SIMATIC WinCC Comfort/Advanced" software package on a virtual machine. To do this, use one of the following virtualization platforms:

- VMware vSphere Hypervisor (ESXi) 5.5 (as from Update 2)
- VMware Workstation 10
- VMware Player 6
- Microsoft Windows Server 2012 R2 Hyper-V

The following operating systems can serve as a host operating system for these virtualization platforms:

- Windows 7 Professional / Ultimate / Enterprise (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)
- Windows Server 2008 R2 (64-bit)
- Windows Server 2012 R2 (64-bit)

You can use the following guest operating systems to install "SIMATIC WinCC Comfort/ Advanced" on the selected virtualization platform:

- Windows 7 Professional / Ultimate / Enterprise (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)

Note

- The same hardware requirements apply to the guest operating system as to the respective TIA products.
- The plant operator must provide sufficient system resources for the guest operating systems.
- The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.

Supported security programs

The following security programs are compatible with "SIMATIC WinCC Comfort/Advanced".

- Virus scanners:
  - Symantec Endpoint Protection 12.1
  - Trend Micro Office Scan Corporate Edition 10.6
  - McAfee VirusScan Enterprise 8.8
  - Kaspersky Anti-Virus 2014
  - Windows Defender (Windows 8.1 and higher)
- Encryption software:
  - Microsoft Bitlocker
- Host-based Intrusion Detection System:
  - McAfee Application Control 6.0

Installing Microsoft .Net Framework

The software requires .Net Framework 4.5; it is automatically installed and activated.

You will be prompted to install the required .Net Framework version if this cannot be performed by the software package installation. A restart may be necessary after installation of .Net Framework.

Online help for Windows 7 / Windows Server 2008

Windows 7 and Windows Server 2008 no longer support all online help formats by default. These online help formats are used in WinCC in the following cases:

- Calling WinCC Direct Help
- Calling the WinCC Information System from the WinCC editors or via the Direct Help links

The following component is installed during the installation of WinCC to allow you to continue to call the WinCC Direct Help:

- Microsoft Help Engine

You can also call the WinCC Information System under Windows 7 and Windows Server 2008 from the Windows Start menu or from the installation folder.

To call the WinCC Information System from the WinCC editors or via the Direct Help links, some changes have to be made to the operating system. You can find more information on this in the section "More information for advanced users" of Microsoft Support article "917607": http://support.microsoft.com/kb/917607 (http://support.microsoft.com/kb/917607)

Security settings during installation

When you install WinCC V13, security settings are changed in your operating system.

The security settings in question are listed during the installation.

You must confirm the changes to the security settings.

If you make changes to your operating system after the installation, the changes to the security settings made by the installation of the TIA Portal could be changed.

You can restore the changes to the security settings made by the installation of the TIA Portal: "Start > All Programs > Siemens Automation > Security Controller > Restore settings".

SQL instance of WinCC V13

If you have installed a WinCC V11 product and you wish to install WinCC V13, you must uninstall the WinCC instance of SQL Server 2005 before the installation.

A new WinCC SQL 2008 instance is installed with the installation of WinCC V13.

Options for WinCC Engineering and Runtime systems (Page 126)

Licensing of WinCC Engineering System (Page 128)

5.2.4.2 Parallel installation

Parallel installations in TIA Portal V13

You will be prevented from starting the TIA Portal if you perform a non-permitted parallel installation of STEP 7 and WinCC. The following parallel installations are permitted in the TIA Portal:

- STEP 7 V13 and WinCC V13

A dialog opens during installation to inform you of any inconsistencies in your parallel installation. The following parallel installations are permitted:

- WinCC V13 and RT Advanced V13
- WinCC V13 and RT Professional V13

The engineering system and Runtime must always be of the same version after an installation.

Parallel installation of WinCC V13 and other SIMATIC HMI products

Parallel installation of WinCC V13 and versions of WinCC flexible earlier than WinCC flexible 2008 SP1 is not allowed.

Parallel installation of WinCC V13 with versions of WinCC earlier than WinCC V7.0 SP2 is not allowed. Parallel installation of WinCC V13 with WinCC V7.0 SP2 or WinCC V7.0 SP3 is not allowed for:

- WinCC V 13 Professional
- WinCC V 13 Runtime Professional

Parallel use

If the term "Combo" appears in the name or license key of the software after installation, the use of the following products/versions is permitted in accordance with paragraph 1.6 of the General Terms and Conditions (see also setup text):

- With license for "WinCC V13 Comfort Combo": WinCC flexible 2008 Standard
- With license for "WinCC V13 Advanced Combo": WinCC flexible 2008 Advanced

5.2.4.3 Add-ons

Options for WinCC Engineering and Runtime systems

SIMATIC Panels as well as WinCC Runtime Advanced and WinCC Runtime Professional contain all essential functions for operator control and monitoring of machines or plants. Additional add-ons allow you to extend the functionality in some cases to increase the range of available tasks.

Add-ons for Comfort Panels, Mobile Panels, Multi Panels

The following add-ons are available for Comfort Panels, Mobile Panels, and Multi Panels:

- WinCC SmartServer (remote operation)
- WinCC Audit (audit trail and electronic signature for regulated applications)

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess add-ons as well as the WinCC flexible /OPC Server add-on are incorporated into the basic functionality.

Add-ons for WinCC Runtime Advanced

The following add-ons are available for WinCC Runtime Advanced:

- WinCC Recipes (recipe system)
- WinCC Logging (logging of process values and alarms)
- WinCC SmartServer (remote operation)
- WinCC Audit (audit trail for regulated applications)

Note

For use of the WinCC SmartServer and WinCC Audit add-ons, one license each is required.

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess add-ons as well as the WinCC flexible /OPC Server add-on are incorporated into the basic functionality.

Add-ons for WinCC Runtime Professional

WinCC Runtime Professional contains the following components, which you can activate with a corresponding license:

- WinCC Server (supplements WinCC Runtime to include server functionality)
- WinCC Recipes (recipe system, formerly WinCC /UserArchives)
- WinCC Logging (logging system, previously WinCC/TagLogging)

You can select and install the following add-ons in the installation dialog:

- WinCC Client (standard client for building multiple-station systems)
- WinCC WebNavigator (Web-based operator control and monitoring)
- WinCC DataMonitor (display and evaluation of process states and historical data)

Note

To use the add-ons, one license each is required.

Note

In contrast to WinCC V7, functions from the WinCC / OPC Server add-on have been incorporated into the basic functionality. Likewise, the basic functionality includes the Runtime API from WinCC /ODK.

In addition to the Runtime add-ons, you can also expand WinCC Runtime Professional with customized controls. The WinCC ControlDevelopment add-on is required to develop controls.

See also

Software and hardware requirements (Page 121)

Installing and uninstalling options (Page 127)

Installing and uninstalling options

Introduction

Some add-ons are included in standard WinCC installation and are installed automatically.

During the installation of WinCC Engineering System, the following add-ons are available for you to select for installation:

- Simulation for WinCC Runtime Advanced

During the installation of WinCC Runtime Advanced, the following add-ons are available for you to select for installation:

- OPC XML Gateway
- WinCC Audit Viewer

Add-ons for non-PC-based HMI devices

The required Runtime add-ons are installed on the HMI device as follows:

- During the transfer of the project to the HMI device
  Add-ons that are no longer required are removed automatically.
- With ProSave

Procedure - activating add-ons

To activate an add-on for use, install the appropriate license key using the Automation License Manager.

In order to backup the license key of an add-on or use it on a different configuration PC or HMI device, you must uninstall this license key using the Automation License Manager.

Note

When no valid license key is installed on a PC with WinCC Runtime, Runtime runs in Demo mode.

See also

Options for WinCC Engineering and Runtime systems (Page 126)

5.2.4.4 Licenses and Powerpacks

Licensing of WinCC Engineering System

You require a license key for the following:

- WinCC Engineering System, for example, WinCC Professional
- Add-ons for WinCC Engineering System

You can transfer the license key for WinCC simultaneously with the WinCC installation. You transfer licenses for the WinCC add-ons after installation with the Automation License Manager.

Starting without a valid license key

If you start WinCC without a valid license, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a trial license. The trial license for Engineering editions WinCC Basic, Comfort/Advanced, and Professional expires after 21 days.

When the trial license has expired, the following scenarios may occur:

- WinCC was never licensed on the PC in question.
  - Operations requiring a license can no longer be performed in WinCC.
- WinCC was already licensed on the PC in question.
  - Non-licensed mode is indicated every 10 minutes and at every action requiring a license by a window, which you must acknowledge.

License requirements for simulation

When you want to start simulation in WinCC using the "Online > Simulation> With tag simulator" menu command, you do not need licenses for WinCC Runtime or for add-ons that require a license.

If the following conditions are met, you will need the appropriate licenses for WinCC Runtime and add-ons that require a license even for simulation:

- The engineering station is connected to a PLC.
- The connection to the PLC is configured and active.

You start the simulation with the "Online > Simulation > Start" menu command.

See also

Software and hardware requirements (Page 121)

Licensing WinCC Runtime on PC-based HMI devices (Page 129)

Licensing of HMI devices (Page 132)

Working with license keys (Page 132)

Powerpack (Page 135)

Installing a Powerpack (Page 136)

Licensing WinCC Runtime on PC-based HMI devices

With PC-based HMI devices, you require a license key for the following:

- WinCC Runtime with 128 tags, for example.
- WinCC add-ons

You can install the license key for WinCC Runtime during the installation of WinCC. You transfer licenses for the WinCC add-ons after installation with the Automation License Manager.

Note

Only the Certificate of License for WinCC Runtime V13 authorizes operation of WinCC Runtime V13 SP1.

The appropriate new license is required to license WinCC Runtime.

You can upgrade the runtime licenses of WinCC flexible 2008 and WinCC V7 with an upgrade to WinCC Runtime V13.

Productive operation of the software is only allowed with a valid Certificate of License that matches the version listed on it.

Non-licensed mode

WinCC Runtime and the Runtime add-ons can be used freely without license. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.

See also

Licensing of WinCC Engineering System (Page 128)

Validity of licensing for older versions of WinCC

Validity of license keys for older versions of WinCC

With a valid license key for WinCC Advanced V13.x, you can also operate older versions of WinCC without restrictions.

The following table provides more detailed information about this:

WinCC Engineering System

Edition	License	Validity
WinCC Basic V13.x	WinCC Basic	• WinCC Basic V11.0 SP2 • WinCC Basic V12.0 • WinCC Basic V13.0
WinCC Comfort/Advanced V13.x	WinCC Comfort	• WinCC Basic V11.0 SP2 • WinCC Comfort V10.5 • WinCC Comfort V11.0 • WinCC Basic, Comfort V12.0 • WinCC Basic, Comfort V13.0
	WinCC Comfort Combo	• WinCC flexible Compact, Standard >= 2005 • WinCC Basic V11.0 SP2 • WinCC Comfort V10.5 • WinCC Comfort V11.0 • WinCC Basic, Comfort V12.0 • WinCC Basic, Comfort V13.0
	WinCC Advanced	• WinCC Basic V11.0 SP2 • WinCC Comfort, Advanced V10.5 • WinCC Comfort, Advanced V11.0 • WinCC Basic, Comfort, Advanced V12.0 • WinCC Basic, Comfort, Advanced V13.0
	WinCC Advanced Combo	• WinCC flexible Compact, Standard, Advanced >= 2005 • WinCC Basic V11.0 SP2 • WinCC Comfort, Advanced V10.5 • WinCC Comfort, Advanced V11.0 • WinCC Basic, Comfort, Advanced V12.0 • WinCC Basic, Comfort, Advanced V13.0

WinCC Runtime Advanced

Edition	License	Validity
WinCC RT Advanced V13.x	WinCC RT Advanced (128) WinCC RT Advanced (512) WinCC RT Advanced (2048) WinCC RT Advanced (4096) WinCC RT Advanced (8192)	• WinCC RT Advanced V11.0 • WinCC RT Advanced V12.0 • WinCC RT Advanced V13.0

Validity of licenses for WinCC options

Generally, WinCC options have version-independent license keys. You can use WinCC options V13.x with V11 and V12 license keys and vice versa.

Licensing of HMI devices

Non-PC-based HMI devices are always equipped with Runtime licenses. A license key is not required for runtime operation.

A license may be required for an add-on for non-PC-based HMI devices. The license key of the respective license always activates one add-on for use.

License key

In order to license non-PC-based HMI devices with license keys, the "SIMATIC HMI License Manager Panel Plugin" add-on is needed.

WinCC Setup installs this add-on by default. You open the License Manager Panel Plugin in the Automation License Manager with the "Edit > Connect Target System > Connect HMI Device" menu command.

If WinCC is not installed, an installation of ProSave 7.2 or higher is required.

Note

Further information on license handling can be found in the Automation License Manager help.

Note

Verify that the current version of the operating system (or higher) is installed on the HMI device before you start licensing. If necessary, update the operating system using ProSave.

Non-licensed mode

Runtime add-ons can be used for a short time without restrictions without a valid license. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.

See also

Licensing of WinCC Engineering System (Page 128)

Working with license keys

Introduction

You transfer a license key to the HMI device in the following cases:

- To use the WinCC engineering system
- To operate WinCC Runtime
- To use add-ons for WinCC Runtime on PC-based HMI devices
- To use add-ons on non-PC-based HMI devices

You transfer a license key from the HMI device in the following cases:

- When backing up data
- If you no longer require the license

You can then use this license on another PC or HMI device.

When you transfer a license to an HMI device, the associated license key is removed from the license key storage location.

Note

A license key cannot be copied. The copy protection employed prevents the license keys from being copied.

Data backup

You transfer the license keys from the HMI device for data backup on the HMI device or as a backup for device replacement.

You use the Automation License Manager to back up license keys from an HMI device to the storage area of the license keys.

Notice

Destruction of license keys on non-PC-based HMI devices

License keys transferred as a result of backup/restore operations are destroyed in the case of the following HMI devices:

- 270 series
- 370 series

Carry out the following before beginning restoring:

- Use the Automation License Manager and ProSave to check whether license keys are on the HMI device.
- Transfer the license keys present from the HMI device
  After restoring has been carried out, transfer the license keys back to the HMI device.

Note

Destruction of license keys on PCs

Transfer all license keys to a storage location in the following cases:

- Before you format the hard disk
- Before you compress the hard disk
- Before you restore the hard disk
- Starting an optimization program that moves fixed blocks
- Installing a new operating system

Read the description of Automation License Manager ("Start > Simatic Automation > Documentation"). Observe all warnings and notices.

The license key storage location on PC-based HMI devices and on non-PC-based HMI devices where Automation License Manager is used may contain multiple license keys. This capability means you can store multiple licenses of the same type at one location. For the backup, use a single storage location for all license keys present on an HMI device.

Note

Always keep the original storage location of the license keys.

Invalid license after time zone change

The transferred license no longer functions in the following case.

- If you change the time zone on a WinCC PC as follows:
  - From a time based on a complete hour to a time not based on a complete hour. Example: You change the time zone from GMT +3:00 to GMT +3:30.

To work around this, transfer the license key from the HMI device with a time zone setting that was set when the license key was transferred to the HMI device.

Example:

You transferred the license key with a time zone setting based on a full hour. Then, also transfer the license key to a storage location with a time zone setting based on a full hour.

This behavior does not apply to the trial license.

Defective license

A license is defective in the following cases:

- If the license key is no longer accessible at the storage area.
- If the license key disappears during its transfer to the destination drive.

Note

Resetting of the system date to an earlier time causes all licenses to be become defective.

You can use the Automation License Manager to repair the defective license. Use the "Restore" function or the "Restore Wizard" of the Automation License Manager for this purpose. You must contact Customer Support in order to restore the license. For additional information see: http://support.automation.siemens.com (http://support.automation.siemens.com)

Note

The Runtime software can also be operated without errors if the license is missing or defective. The system alerts you at brief intervals that you are working in non-licensed mode.

Note

If you start the WinCC Engineering System without a valid license key, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a trial license. The trial license expires after 21 days.

When the trial license has expired, the following scenarios may occur:

- WinCC was never licensed on the PC in question.
  WinCC can no longer be started.
- WinCC was already licensed on the PC in question.
  WinCC can be started. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.

See also

Licensing of WinCC Engineering System (Page 128)

Powerpack

Introduction

The following upgrades are possible with a Powerpack:

- From a smaller to a larger edition of WinCC Engineering System
- To a runtime system with a larger tag volume

A Powerpack also includes a special license that you can use at any time to activate a higher level of WinCC for use.

Engineering system

You own WinCC Comfort, for example. You can use the "SIMATIC WinCC Advanced Powerpack WinCC Comfort -> WinCC Advanced V13" Powerpack to activate WinCC Advanced for use.

Runtime

You own WinCC Runtime Advanced with 128 tags, for example. You use the "SIMATIC WinCC Runtime Advanced Powerpack 128 PowerTags -> 512 PowerTags V13" Powerpack to increase the tag volume from 128 to 512 tags.

You own WinCC Runtime Advanced with 128 tags, for example. You use the "SIMATIC WinCC Runtime Professional Powerpack Runtime Advanced 128 PowerTags -> Runtime Professional 128 PowerTags V13" Powerpack to activate WinCC Runtime Professional with 128 tags for use.

See also

Licensing of WinCC Engineering System (Page 128)

Installing a Powerpack

Introduction

Install a Powerpack by transferring the corresponding license key. The Powerpack license key replaces the license key of an existing installation.

Requirement

- The conditions described in the "System requirements" section must be fulfilled.
- The license key for the license for which you have purchased a Powerpack is available on the PC.

Installing a Powerpack

1. Open the Automation License Manager.
2. Select the license key.
3. Select "License Key > Upgrade" in the menu.

Result

The Powerpack license key replaces the former license key. You cannot reverse this process.

See also

Licensing of WinCC Engineering System (Page 128)

5.3 Installation log

Function of the installation log

The progress during the following installation processes is logged in a file:

- Installing products
- Modifying or updating already installed products
- Repairing an existing installation
- Uninstalling products

If errors occur during the installation process or warnings are issued, these can be evaluated with the help of the log file. You can do this yourself or contact product support.

Installation logs storage location

The log file is the most recent file with the file extension ".log" and the name of which that starts with "SIA".

The location of the log file is stored in the environment variable "%autinstlog%". You can enter this environment variable in the address bar of Windows Explorer to open the folder with the log files. Alternatively, you can navigate to the corresponding directory by entering "CD %autinstlog%" in the command line.

The storage location is dependent on the operating system, e.g. "C:\ProgramData\Siemens\Automation\Logfiles\Setup" in English-language Windows.

Setup_Report (CAB file)

To make it easier to provide Product Support with all necessary files, an archive file that contains the installation log and all other required files is saved in CAB format. This log can be found at "%autinstlog%\Reports\Setup_report.cab". Send this CAB file to Product Support if you need assistance with installation. With this information, Product Support can determine whether the installation was executed properly. CAB files that were generated during earlier installation processes are saved with a date ID in the "Reports" directory.

Starting to uninstall (Page 146)

5.4 Starting installation

Introduction

Software packages are installed automatically by the setup program. The setup program starts once the installation medium has been inserted in the drive.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To install the software packages, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the product languages opens.
6. Select the languages for the product user interface, and click the "Next" button.

   Note

   "English" is always installed as the basic product language.

   The dialog for selecting the product configuration opens.
7. Select the products you want to install:
   - If you wish to install the program in a minimal configuration, click on the "Minimal" button.
   - If you wish to install the program in a typical configuration, click on the "Typical" button.
   - If you wish to personally select the products to be installed, click on the "User-defined" button. Then select the check boxes for the products you wish to install.
8. If you want to create a shortcut on the desktop, select the "Create desktop shortcut" check box.
9. Click the "Browse" button if you want to change the target directory for the installation. Note that the length of the installation path must not exceed 89 characters.
10. Click the "Next" button.
    The dialog for the license terms opens.
11. To continue the installation, read and accept all license agreements and click "Next".
    If changes to the security and permission settings are required in order to install the TIA Portal, the security settings dialog opens.
12. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.
    The next dialog displays an overview of the installation settings.
13. Check the selected installation settings. If you want to make any changes, click the "Back" button until you reach the point in the dialog where you want to make changes. Once you have completed the desired changes, return to the overview by clicking on "Next".

14. Click the "Install" button.
    Installation is started.

    Note

    If no license key is found during installation, you have the chance to transfer it to your PC. If you skip the license transfer, you can register it later with the Automation License Manager.

    Following installation, you will receive a message indicating whether the installation was successful.

15. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
16. If the computer does not reboot, click "Exit".

Result

The TIA Portal along with the products and licenses you have ordered and the Automation License Manager have been installed on your computer.

Starting to uninstall (Page 146)

5.5 Checking availability of updates and support packages and installing them

By default, the TIA Portal checks automatically if new software updates or support packages are available, for example, Hardware Support Packages (HSPs). The automatic search for updates takes place after each computer restart and then cyclically every 24 hours. You can also deactivate the automatic search at any time or reactivate it. You can also search for updates manually.

If updates are found, you can download and install them.

Note

Updates and support packages from TIA Portal V13 or higher are supported.

Deactivate or activate automatic search for software updates

To deactivate or reactivate the automatic search for software updates, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General > Software Updates" group in the area navigation.
3. Deselect the "Look for updates daily" check box if you want to deactivate the automatic search for software updates.
4. Select the "Look for updates daily" check box if you want to reactivate the automatic search for software updates.

Manually searching for software updates

If you want to search for software updates manually, follow these steps:

1. Click "Installed software" in the "Help" menu.
   The "Installed software" dialog opens.
2. Click "Look for updates".
   The "TIA Updater" opens and the available updates are displayed.

Or:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General > Software Updates" group in the area navigation.
3. Click "Search for updates now".
   The "TIA Updater" opens and the available updates are displayed.

Or:

1. Open the TIA Updater with "Start > All Programs > Siemens Automation > Automation Software Updater".
2. Click "Look for updates".
   The available updates are displayed.

Download and install software updates

To download and install available software updates and support packages, follow these steps:

1. If the TIA Updater is not displayed, open it in one of these ways:
   - If the automatic search has found updates, you receive a message in the information area of the Windows taskbar and the icon for the TIA Update is displayed in the information area. Click either the message or the icon to open the TIA Updater.
   - Click "Installed software" in the "Help" menu and then "Look for updates".
   - In the Windows Start menu, click "Start > All Programs > Siemens Automation > Automation Software Updater".
2. Click "Download" in the line of the update or support package that you want to install. The update or support package is downloaded. The associated "Install" button becomes active as soon as the download process has been completed.

   Note

   Please note the following:

   1. You can initiate multiple download processes simultaneously.
   2. You can log off or also shut down the computer while the download process is running. In such cases, the download process continues in the background as soon as you log on again.
   3. In some cases, a link to an external web page is displayed instead of the "Download" button. In this case, download the software update from this site and install it manually.

3. Close the TIA Portal if it is still open.
4. In the TIA Updater, click the "Install" button of the software package you want to install. The installation dialog appears.

   Note

   Please note the following:

   1. It is not possible to install multiple updates simultaneously.
   2. Do not log off during an installation and do not shut down the computer. This avoids inconsistent versions of the software on your computer.

5. Click "Next".
   The selected product is installed.

Alternative procedures for the installation of support packages

Another procedure is available for the installation of a support package. To do this, follow these steps:

1. Click "Support packages" in the "Options" menu of the TIA Portal.
   The "Detailed information" dialog opens. A table lists all support packages from the directory that you selected as the storage location for support packages in the settings.
2. If you want to install a support package that is not in the list, you have the following options:
   - If the support package is already on your computer, you can add it to the list by selecting "Add from file system".
   - If you add a support package from the "Service & Support" page on the Internet, first you download it by selecting "Download from the Internet". Then you can add it from the file system.
3. Select the support package that you want to install.
4. Click "Install".
5. Close and then restart the TIA Portal.

See also

Installation log (Page 136)

5.6 Displaying the installed software

You can find out which software is installed at any time. In addition, you can display more information on the installed software.

Procedure

To display an overview of the software installed, follow these steps:

1. Click "Installed software" in the "Help" menu.
   The "Installed software" dialog opens. You will see the installed software products in the dialog. Expand the entries to see which version is installed in each case.
2. If you would like to display additional information on the installed automation software, click the link on the "Detailed information about installed software" dialog.
   The "Detailed information" dialog opens.
3. Chose the topic you want more information about in the area navigation.

See also

Notes on the system requirements (Page 113)

Notes on licenses (Page 112)

Starting installation (Page 137)

5.7 Modifying or updating installed products

You have the option to modify installed products using the setup program or to update to a new version.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To modify or update installed products, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Modify/Upgrade" option button and click the "Next" button.
   The dialog for selecting the product languages opens.
7. Select the check boxes of the product languages that you want to install. You can remove previously installed product languages by clearing the corresponding check boxes.

   Note

   Note that the product language "English" cannot be removed.

8. Click the "Next" button.
   The dialog for selecting the product configuration opens.
9. Select the check boxes of the components that you want to install. You can remove previously installed components by clearing the corresponding check boxes.

10. Click the "Next" button.

Note

Note that you cannot change the target directory because the existing installation is being modified.

If changes to the security and permission settings are required in order to install the TIA Portal, the security settings dialog opens.

11. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.
The next dialog displays an overview of the installation settings.

12. Click the "Modify" button.
This starts the installation of the additional components.

Note

Following installation, you will receive a message indicating whether the existing installation was successfully changed.

13. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".

14. If the computer does not reboot, click "Exit".

Result

The existing installation has been modified on your computer.

Starting to uninstall (Page 146)

Installation log (Page 136)

5.8 Repairing installed products

You have the option to repair installed products by completely reinstalling them using the setup program.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To repair installed products, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Repair" option button, and click the "Next" button.
   The next dialog displays an overview of the installation settings.
7. Click the "Repair" button.
   This starts the repair of the existing installation.

   Note

   Following installation, you will receive a message indicating whether the existing installation was successfully repaired.

8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Result

The installed products have been reinstalled.

Installation log (Page 136)

5.9 Starting to uninstall

Introduction

Software packages are removed automatically by the setup program. Once started, the setup program guides you step-by-step through the entire removal procedure.

You have two options for removing:

- Removing selected components via the Control Panel
- Removing a product using the installation medium

Note

The Automation License Manager will not be removed automatically when you remove the software packages, because it is used for the administration of several license keys for products supplied by Siemens AG.

Removing selected components via the Control Panel

To remove selected software packages, follow these steps:

1. Open the Control Panel with "Start > Control Panel".
2. Click "Programs and Features".
   The "Uninstall or change a program" dialog opens.
3. Select the software package to be removed and click the "Uninstall" button.
   The dialog for selecting the setup language opens.
4. Select the language in which you want the dialogs of the setup program to be displayed and click "Next".
   The dialog for selecting the products you want to remove opens.
5. Select the check boxes for the products that you want to remove and click "Next".
   The next dialog displays an overview of the installation settings.
6. Check the list with the products to be removed. If you want to make any changes, click the "Back" button.
7. Click the "Uninstall" button.
   Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Removing a product using the installation medium

To remove all software packages, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Select the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click "Read product information" or "Read installation notes".
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Uninstall" option button and click the "Next" button.
   The next dialog displays an overview of the installation settings.
7. Click the "Uninstall" button.
   Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

5.10 Installing and uninstalling the migration tool

5.10.1 System requirements

System requirements for the migration tool

The following system requirements apply to the use of the migration tool:

- All products used to create the source project must be installed. The following products are supported:
  - STEP 7 V5.5 SP3
  - WinCC V7.2 with the latest updates
  - WinCC flexible 2008 SP3
  - Integrated projects from STEP 7 V5.5 and the WinCC products listed above
  - STEP 7 Distributed Safety V5.4
  - SINUMERIK STARTER and Startdrives
  - SIMOTION SCOUT V4.4
    You need the SCOUT Migration Tool PlugIn V4.4 to migrate SIMOTION SCOUT V4.4 projects.
- All optional packages needed to process the STEP 7 project are installed. For example, all HSPs for the devices used in the source project are required.

5.10.2 Installing the migration tool

Distribution of the migration tool

You can find the migration tool in the "Support" directory on the installation DVD of the TIA Portal. Alternatively, it is available for download from the Siemens Industry Online Support. For some products, (such as SIMATIC Failsafe or SIMOTION) additional plug-ins are required for the migration tool. These plug-ins can also be downloaded from the Siemens Industry Online Support or installed from the installation DVD of the specific products.

Normally, the migration tool is installed without the TIA Portal. Because the TIA Portal has its own integrated migration function, a separate installation of the migration tool is not necessary.

Procedure

To install the migration tool, proceed as follows:

1. Download the installation file from the Siemens Industry Online Support, or use the installation file from the "Support" directory of the installation DVD of the TIA Portal to perform the installation.
2. Run the installation file.
   The setup program for the migration tool will open.
3. First, select the language in which the setup should be displayed and click the "Next" button.
   The page for selecting the software language is displayed.
4. Since the migration tool is provided exclusively in English, you cannot choose any other language for the installation. Therefore, click "Next" to proceed to the next step.
   The page for selecting the product is displayed.
5. The migration tool consists solely of a software component. Therefore, the migration tool is already selected.
   To create a Desktop icon for starting the migration tool, select the check box "Create Desktop icon". Then click the "Next" button.
   The page for confirming the licensing terms is shown.
6. Click on an entry in the list of license terms to read the selected license term. If you agree with all license terms, select the check box "I accept the terms of the displayed license agreement". Then click the "Next" button.
   An overview of the installation is displayed.
7. Click the "Install" button.
   The installation is performed with the displayed settings.

5.10.3 Uninstalling the migration tool

The migration tool can be removed using the Control Panel.

Procedure

To remove the migration tool, follow these steps:

1. Open the Control Panel.
2. Double click on "Add or Remove Programs" in the Control Panel.
   The "Add or Remove Programs" dialog opens.
3. Select the entry for the migration tool in the "Add or Remove Programs" dialog, and click the "Remove" button.
   A security prompt appears.
4. Click the "Uninstall" button to confirm this prompt.
   The migration tool will be removed.

Migrating projects and programs

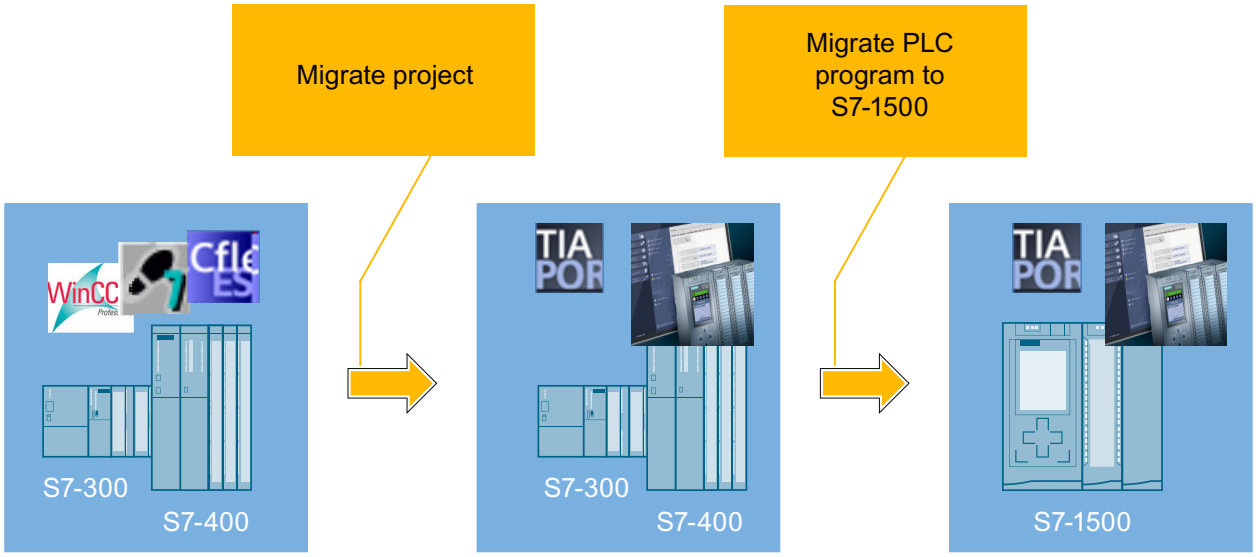
6

6.1 Overview of Migration Options

Migration paths

If you want to continue to use existing projects or programs with the latest version of the TIA Portal and the S7-1500, you have several options for migrating projects.

The following graphic provides an overview of the migration options:



Migrating projects to the TIA Portal

You use the "Migrate project" function to migrate projects that were created outside of the TIA Portal with STEP 7, WinCC, WinCC flexible, or SINUMERIK.

The result of the project migration is a TIA Portal project that you can use with your existing S7-300/400 series hardware and existing HMI devices.

Migrating PLC programs from S7-300/400 to S7-1500

To migrate a PLC program within the TIA Portal from an S7-300/400 series device to an S7-1500, you use the PLC migration.

The result of the PLC migration is an executable PLC program that is automatically adapted to the new system architecture of the S7-1500 as far as possible.

Optimizing PLC program for S7-1500

You also have the option to optimize your program for the S7-1500 by employing newly introduced programming methods. The optimization enables you to effectively use the higher performance, innovated memory technology and new features of the S7-1500 system.

Upgrading projects

You can also continue to use projects from previous versions of the TIA Portal. However, these projects do not need to be migrated. You upgrade projects from previous versions to the current version of the product or use projects from TIA Portal V12 SP1 in compatibility mode. You can find additional information on compatibility and upgrading projects in the section "Upgrading projects (Page 380)".

Note

Additional support for migration

You can find the latest information about migration in the Siemens Industry Online Support.

Migration of entire systems (http://support.automation.siemens.com/WW/view/en/83558085)

If you need further support, contact SIMATIC Customer Support.

6.2 Migrating projects to a TIA Portal project

6.2.1 Migration of projects with the TIA Portal

Migration of existing projects

You can migrate projects from earlier automation solutions to the TIA Portal. Each time you migrate, a new project is created for the migrated data with which you can then work. Any TIA Portal projects already open are closed first.

The migration is then displayed in the table of the project history. From there, you have access to the migration log that is created automatically for the migration.

Supported products for migration

Refer to the chapter "System overview STEP 7 and WinCC" to find out which products are available for the TIA Portal. All products listed there are generally supported by the TIA Portal during migration.

Any additional requirements that must be met depend on the initial products that were used and the currently installed products. For more information on the migration options for your products, you can, for example, refer to the Siemens Industry Online Support and the documentation of your software products.

See also: Scaling of STEP 7 and WinCC in the TIA Portal (Page 33)

Procedure during migration

The migration process is divided into the following basic steps:

1. Preparing the initial project
   If the software for editing the initial project is not installed or not fully installed on the programming device/PC with the TIA Portal, or if the initial project is an integrated project, you must first convert the initial project to a migration file. To do this, install the migration tool on a programming device/PC on which the required software for editing the initial project is installed. Then, use the migration tool to convert the initial project, and copy the file to the programming device/PC on which the TIA Portal is installed. You can omit this step if the initial project and its associated software are on the same programming device/PC as the TIA Portal, and if the initial project is not an integrated project.
2. Performing migration
   Perform the migration within the TIA Portal. For the migration, specify as source either the migration file which you created with the migration tool or the initial project when all required software has been installed.
3. Checking the migration log
   A migration log is created for each migration. It contains information about modified project parts. You can call the log under "Common data > Logs" in the project tree or in the project history. After completion of the migration, the migration log will be displayed in the TIA Portal. Check the log following completion of the migration.
   If the migration failed, an XML file is created as a log under "\Logs" in the project directory. You can use any XML editor to open this log and view the reasons why the migration failed.
4. Correcting the migrated project
   Because the configurations of the initial project may not always be completely compatible with the TIA Portal, all configurations may not be reproduced identically in the migrated project. You should therefore work through the points in the migration log systematically. If you have not included the hardware configuration in the migration, you also have to convert the unspecified devices to the appropriate hardware.

Including the hardware configuration in the migration

By default, only the software parts of the project are included in the migration. An unspecified device is generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You therefore convert the unspecified devices into suitable devices after the migration and recreate any network configurations and connections manually.

If you are certain that the hardware used in the initial project has a corresponding equivalent in the TIA Portal, you can include the hardware configuration in the migration. In this case, both the hardware configuration and the software are migrated. You can check with a tool (Page 154) to see which hardware components are supported.

See also

Display migration log (Page 160)

Scaling of STEP 7 and WinCC in the TIA Portal (Page 33)

6.2.2 Check migration readiness of hardware components

Introduction

Siemens offers a tool that can be used to check whether the hardware configuration used in an initial project is ready for migration to the TIA Portal.

Components integrated via GSD or GSDML files cannot be checked. For such modules, check manually in the TIA Portal whether the modules are available in the hardware catalog. If the modules are not available there, install the required GSD or GSDML files in the TIA Portal. You can obtain the required files from the manufacturer of the components.

In the result you can also see which software products and licenses have to be available on the programming device/PC with the installation of the TIA Portal to perform a migration. You can also see as of which firmware version the individual modules of the initial project are supported in TIA Portal. The result of the check can be output in a Microsoft Excel file or in PDF format.

Download

The tool for checking the migration readiness is available for download in the FAQs of the Siemens Industry Online Support under entry number 60162195 (http://support.automation.siemens.com/WW/view/en/60162195).

Source files for the check

To check readiness, you require one of the following source files which contains the article number of the hardware used in the initial project:

- .cfg file
  You can export the .cfg file from HW Config (STEP 7) with the menu command "Export as .cfg file" in the "Station" menu. The .cfg file contains all MLFBs of the devices used in the currently open station.
- Microsoft Excel file (in .xls file format)
  Regardless of the initial project used, you can create a Microsoft Excel list containing all MLFBs of the devices you want to migrate.
- File in .csv format
  The article numbers that are to be checked can also be saved to a .csv file instead of a Microsoft Excel list. To do this, use a standard text editor and enter the MLBs separated by comma and without space after the comma. Save the text file with the extension ".csv".

See also

Tool for checking migration readiness (http://support.automation.siemens.com/WW/view/en/60162195)

6.2.3 Preparing projects with the migration tool

6.2.3.1 Migrating projects with the migration tool

Preparation for migration

In many cases, a project that you wish to migrate will not be located on the same programming device/PC on which the latest version of the TIA Portal is installed. Therefore, the initial project must first be converted to a compatible format for the migration. The same applies to integrated projects.

After creation of the migration file, you copy the migration file to the programming device/PC on which the current version of the TIA Portal is installed. In the TIA Portal, you enter the migration file as the source for the migration and can create a project in the current file format of the TIA Portal.

Procedure for migration with the migration tool

The following steps are necessary to prepare a migration with the migration tool:

1. Install the migration tool on the programming device/PC where the source project is located. To do this, download the installation file from the Siemens Industry Online Support or install the migration tool from the setup DVD of the TIA Portal.
2. Start the migration tool, and use it to convert the source project to the migration file format with file extension ".am13".
   For this step, make sure that all software needed to process the source project is installed on the programming device/PC. This also includes all necessary service packs, hardware support packages and all expansion software that is needed to process the initial project. If individual products are not installed it may not be possible to perform the migration or the migration may be incomplete.
3. Copy the migration file to the target system on which a current version of the TIA Portal is installed.
   Note that the target system must have been installed with all software needed to configure the complete set of devices contained in the migration.
4. Perform the migration within the TIA Portal and specify the migration file with the extension ".am13" as the source.
5. Once migration is complete, check the migration log and systematically work through the information provided there for the newly created project. Read the information in the Inspector window with special care after the first compilation of the configuration.

Including the hardware configuration in the migration

By default, only the software parts of the project are included in the migration. An unspecified device is generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You therefore convert the unspecified devices into suitable devices after the migration and recreate any network configurations and connections manually.

If you are certain that the hardware used in the initial project has a corresponding equivalent in the TIA Portal, you can include the hardware configuration in the migration. In this case, both the hardware configuration and the software are migrated. You can check with a tool to see which modules are supported.

See also

Migration of projects with the TIA Portal (Page 152)

Migrating projects (Page 158)

Calling the migration tool (Page 157)

Creating a migration file (Page 157)

6.2.3.2 Calling the migration tool

Starting the migration tool

During the installation, a "Migration to TIA Portal V13" shortcut is created as standard in the Start menu under "Siemens Automation > Migration Tool". Click this shortcut.

Alternatively, you can call the migration tool directly in Windows Explorer. During the installation, the migration tool is saved by default in one of the following folders:

- On a 64-bit operating system:
  C:\Program Files (x86)\Siemens\Automation\MIGTOOL_V13\Bin
- On a 32-bit operating system:
  C:\Program Files\Siemens\Automation\MIGTOOL_V13\Bin

To start the migration tool, click the "Siemens.Automation.MigrationApplication.exe" file in one of the directories.

See also

Creating a migration file (Page 157)

6.2.3.3 Creating a migration file

The section below describes how you can use the migration tool to convert the initial project to a migration file that can be read by the TIA Portal. Following conversion, this file is transferred to the target system and migrated there.

You can specify whether the migration file should contain the entire project, including the complete hardware configuration and the associated software, or whether you want to migrate the software only.

Requirement

- The suitable, original software with a valid license is installed for all configurations used in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

Procedure

To create the migration file, proceed as follows:

1. Select the path of the source file for the migration in the "Storage Location (Path)" field.
2. Specify the project parts that are to be migrated:
   - Select the "Include HW and Network data during the migration" check box to migrate not only the software but also the complete hardware parts and the network configuration of the project.
   - Select the "Copy SCADA runtime data" check box if you also want to migrate the runtime data, such as alarm archives, tag archives and user archives, in addition to the data of the engineering system.
3. Select the path and the file name for the migration file in the "Intermediate file" field.
4. Click the "Migrate" button.

Result:

A migration file is created. You now copy this file to the target system and migrate this file in the TIA Portal.

See also

Migrating projects (Page 158)

Calling the migration tool (Page 157)

Migrating projects with the migration tool (Page 155)

6.2.4 Migrating projects

Requirement

- A converted file in the format ".am13" is already available or the original software with a valid license is installed for all configurations used in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

Read the additional information on the requirements in the help for the respective products installed.

Note

System hibernation during the migration

While a migration is running, the system should not be changed to the standby or hibernate mode. Otherwise the migration will be aborted.

Procedure

To migrate a project, follow these steps:

1. Select the "Migrate project" command in the "Project" menu.
   The "Migrate project" dialog opens.
2. Specify the path and the file name for the project to be migrated in the "Source path" field.
   Select either a project in the ".am13" migration format or in the format of the initial project.
3. To include the hardware configuration in the migration, select the "Include hardware configuration" check box.
   If you have selected a migration file that was created with the migration tool, the check box cannot be selected. In this case, you must specify if you wish to include the hardware configuration in the migration before the conversion with the migration tool .
4. Select the "Copy WinCC Runtime Professional data" check box, if you also want to migrate the runtime data, such as alarm archives, tag archives and user archives, in addition to the data of the engineering system.
   If you have selected a migration file that was created with the migration tool, the check box cannot be selected. In this case, you must specify if you wish to include the SCADA runtime data in the migration before the conversion with the migration tool .
5. Select a name for the new project in the "Project name" box.
6. Select a path in the "Target path" box where the new project is to be created.
7. Enter your name or the name of another person responsible for the project in the "Author" field.
8. Enter a comment in the "Comment" box, if you require one.
9. Click "Migrate".

Result

The initial project is converted and a message appears after conversion is complete. The newly created project is then opened in the project view, and the migration log is opened in the TIA Portal.

Even if the migration failed, a project directory is created and a migration log in the form of an XML file is generated in this directory. The completion message that appears after the migration contains a link to this XML file. Click the link to open the XML file. Alternatively, you can find the XML file in the project directory under "\Logs".

Post-editing integrated projects (Page 211)

Display migration log (Page 160)

Using logs (Page 376)

Migrating projects with the migration tool (Page 155)

Creating a migration file (Page 157)

6.2.5 Displaying the history of the migration

If a project was created by migration, the migration will be listed in the table of the project history. You can open the migration log in the table. The time of the migration is also shown.

Procedure

To display the migration in an overview table, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.
   The dialog with the properties of the project opens.
3. Select the "Project history" group in the area navigation.
   The overview table is displayed.

See also

Displaying properties of the project (Page 382)

6.2.6 Display migration log

A log is created for each successful migration. The log contains the following information:

- Migrated objects
- Modifications to objects made during migration
- Errors that occurred during migration
- In certain cases a link to more help with specific events.
  In this case, click the question mark to obtain more help.

Procedure

To display the log file of the migration, follow these steps:

1. Open the "Common data > Logs" folder in the project tree.
2. Double-click the desired log in the list.
   The contents of the log are displayed in the work area.

See also

Migration of projects with the TIA Portal (Page 152)

Using logs (Page 376)

6.2.7 Migrating WinCC flexible projects

6.2.7.1 Principles (WinCC flexible)

Migration (WinCC flexible)

Introduction

You can continue to use projects in WinCC from WinCC flexible. The following versions of WinCC flexible are supported:

- WinCC flexible 2008 SP2
- WinCC flexible 2008 SP3

The following sections describe the HMI devices that are supported and the required basic conditions for a successful migration.

Projects from ProTool Pro and earlier WinCC flexible versions cannot be migrated directly to WinCC. If you want to continue using such projects in WinCC, you have to migrate these to a supported version of WinCC flexible first and change the HMI device type.

If the project to be migrated contains components of a supported option package, the option package must be installed for successful migration to WinCC. If the option package is not installed, migration is canceled. This concerns the following option packages:

- SINUMERIK

The following option packages are not supported by the migration:

- ProAgent
- Open Platform Program - OPP

Compiling and loading a migrated project (WinCC flexible) (Page 166)

Supported HMI devices (Page 167)

Migration of connections (WinCC flexible) (Page 176)

Migration of tags (WinCC flexible) (Page 179)

Migration of runtime data (WinCC flexible) (Page 188)

Migration of integrated projects (WinCC flexible) (Page 191)

Migration principles (WinCC flexible)

Introduction

In the migration the project data are converted from a WinCC flexible project into the new data format of WinCC. The data will not be evaluated to see if they are consistent in the project you want to migrate. If errors or warnings are output in a source project during compilation, these will not be resolved as part of the migration. This means you should be able to compile the project without errors prior to migration. Note the scope of a project during migration. The features of WinCC apply for migration. For additional information refer to the online help in section "Process visualization > Performance features > Engineering System".

Unique object names

The objects are clearly identified by the folders in which they are contained in WinCC flexible. Screen objects in groups are clearly identified by the group name.

In WinCC, an object name must be unique within an HMI device. The name of screen objects must be unique within a screen.

The uniqueness of the name is verified during migration. If a name is not unique according to the new rule, the object in question will be renamed. A renamed object will receive the suffix "#Mign", where "n" stands for a sequential number.

Note

Changed OPC DA server name

If you have configured an OPC-DA server in the WinCC flexible project, the OPC-DA server is no longer available under the old name after migration.

In the migrated project, change the name of the OPC-DA server to the following value for the OPC clients concerned: "OPC.SimaticHMI.CoRtHmiRTm".

Points to note when renaming tags

If you have structured tags in folders in WinCC flexible, the name of the tag will be formed during migration from the folder name and the tag name. The names of the folders and tags are separated by the character \. The name of the tag after migration is then, for example: Plant1\Line3\Tag17.

If the name would otherwise be longer than 128 characters after migration, the name is formed by the character string #mig, a consecutive number, the character # and the tag name from WinCC flexible, for example #mig2#Tag17.

If you dynamically compose tag names in scripts, you must check the tags whose names were changed during migration with "#mig".

Affected objects

The following objects are renamed if necessary:

- Screens
- Faceplates
- Screen objects
- Graphics
- Recipes
- Structures
- Structural elements
- Alarm logs
- Tags
- Data logs
- Connections

Canceling migration

The migration is canceled in the following cases:

- If the project to be migrated is opened in the engineering system or in Runtime.
- If not enough memory space is available on the hard disk to create a copy for migration of the project.
- If the migration cannot address the project database due to problems with the installed SQL-Server.
- If the migration cannot address the project database due to missing user authorization.
- If you select the "*.hmi" file for the migration in an integrated project. You must select the "*.s7" file for the migration in an integrated project.
- If the project was created with a version not supported by the migration.

Saving the project in the migration format

You do not have to execute the migration of a WinCC flexible project completely on the PC on which the project is available. You can prepare the migration by saving the project in the migration format. The migration tool is available for saving a WinCC flexible project in the migration format. The migration tool exports the engineering data from the WinCC flexible project and saves the data in the migration format "*.AM13".

For the actual migration, copy the data in the migration format to a PC on which the TIA Portal is installed.

For more detailed information, please refer to the migration tool documentation.

Migrating projects from WinCC flexible

Introduction

When you migrate a project, data from a WinCC flexible project is loaded into a new project for WinCC. A new project is therefore created automatically for project migration. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

You should only migrate a project to a re-started TIA Portal.

Information on the migration of an integrated project can be found in the section Migration of integrated projects (WinCC flexible) (Page 191).

If you only want to save the project in migration format, you can use the migration tool. See Migration principles (WinCC flexible) (Page 162) for additional information.

Note

Further support for migration

You find current information on migration in the Siemens Industry Online Support:

Migration of visualization

If you need further assistance, please contact the SIMATIC Customer Support.

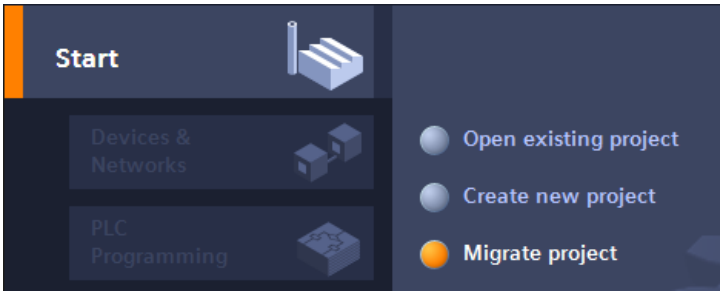
Requirement

- A project from WinCC flexible is available.
- The project is not open in WinCC flexible.

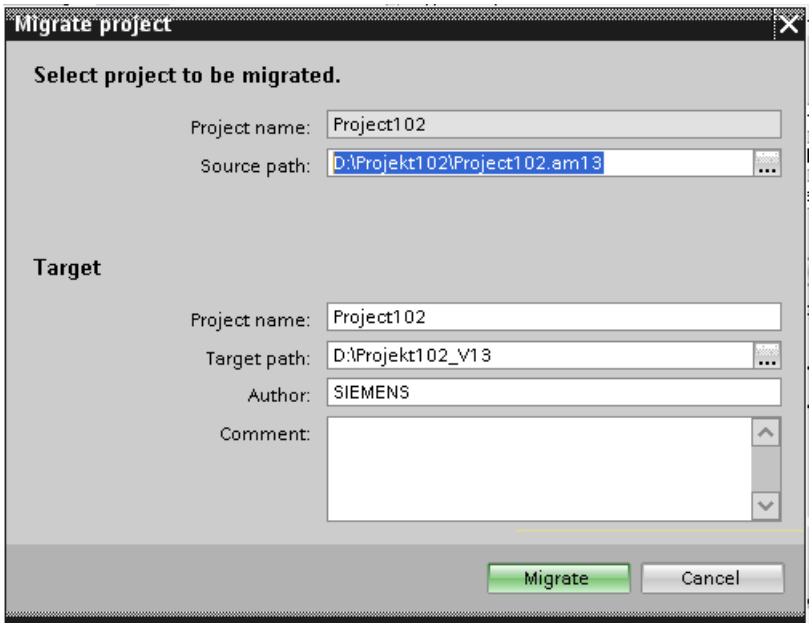
Procedure

Migrate a project in the Portal view as follows:

1. Select the action "Start > Migrate Project".



2. In the "Source path" box, navigate to the project you want to migrate.



3. Select the WinCC flexible project file "*.hmi" or "*.am13".
4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. Click "Migrate".
   A new project is created and migration of the data is started:
   - The Project view opens.
   - The progress of the migration is shown in a migration window.
   - Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
   - All information about the migration is saved in a log file.
   - The project is saved and a message displayed upon completion of the migration. The message contains a link that you can use to open the log file.

When migration is complete, you will find a newly created device for each migrated HMI device in the project tree. These devices contain the migrated data, such as screens, alarms and tags.

Opening the migration log at a later point in time

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log file as follows:

1. Open the "Common data > Logs" folder in the project tree. It contains the logs of all previously performed migrations.
2. Double-click the required migration log.
   The log is opened.

Migration principles (WinCC flexible) (Page 162)

Compiling and loading a migrated project (WinCC flexible)

Compiling a migrated project

Once you have successfully migrated a WinCC flexible project, you need to recompile it before loading it to the HMI device. The project will only compile successfully if it was capable of error-free compiling prior to migration.

If errors occur during compilation of the migrated project, they have to be eliminated.

Once compiling is successfully completed, load the project to the HMI device.

Settings for download to the HMI device

The settings for loading the HMI device are not included in the migration. Once you have migrated the project, you must configure the settings for loading.

Select the HMI device in the project tree and select "Loading in device > Software (complete loading)" from the shortcut menu.The dialog "Advanced Loading" is opened. Configure the required settings for the interface. Click the "Load" button. The project is recompiled and the dialog "Load preview" is opened.

Expand the "Overwrite" entry and verify the settings for the following options:

- Would you like to overwrite the existing user administration data from this device
- Would you like to overwrite the existing recipe data on HMI system

Configure the options as you want to use them in the project in the future. Subsequently, load the project to the HMI device.

HMI devices (WinCC flexible)

Supported HMI devices

Introduction

When migrating projects from WinCC flexible you must bear in mind that WinCC does not support all HMI devices. You have to distinguish between the following cases:

- HMI device is supported by WinCC.
  The project is migrated 1:1 and gets the same HMI device after migration as before migration.
- The HMI device is replaced by a compatible successor model.
  The project is migrated. The migration replaces the HMI device with a compatible successor model. See HMI device change as a result of migration (WinCC flexible) (Page 169) for additional information.
- HMI device is not supported.
  If your WinCC flexible project contains an HMI device that is not supported by WinCC, the migration process is cancelled. To migrate the project, you must change the HMI device in WinCC flexible to a HMI device type supported by WinCC.

The following HMI device types are supported both by WinCC flexible and WinCC:

Basic Panels

- KTP400 Basic mono PN
- KTP400 Basic mono PN Portrait
- KTP600 Basic DP
- KTP600 Basic DP Portrait
- KTP600 Basic PN
- KTP600 Basic PN Portrait
- KTP600 Basic mono PN
- KTP600 Basic mono PN Portrait
- KTP1000 Basic DP
- KTP1000 Basic PN
- TP1500 Basic PN

Mobile Panels

- Mobile Panel 177 6" DP
- Mobile Panel 177 6" PN
- Mobile Panel 277 8"
- Mobile Panel 277 8" IWLAN V2
- Mobile Panel 277F 8" IWLAN V2
- Mobile Panel 277F 8" IWLAN (RFID Tag)
- Mobile Panel 277 10"

Panels

- OP 015A Key
- TP 015A Touch+Key

HMI applications

- WinCC flexible Runtime

WinCC only supports the functions provided by these HMI device types.

Other functions which are not migrated because of the restricted device selection are documented in the following sections.

Adaptations before migration

If the HMI device was changed to an HMI device with a different screen size in the project to be migrated, you must recompile and save the project in WinCC flexible before the migration. The compilation process will adjust the size of the screens and screen elements.

Configuration change after HMI device change (WinCC flexible) (Page 172)

Migration of connections (WinCC flexible) (Page 176)

HMI device change as a result of migration (WinCC flexible)

Introduction

WinCC flexible supports some HMI devices which are discontinued in the future. These HMI devices are no longer supported by WinCC. When migrating a WinCC flexible project, an HMI device that is not supported is replaced by a compatible successor device.

Only the HMI device type is changed during the migration. HMI device-specific data are not changed by the migration.

Inconsistencies in the project may occur due to a change in the HMI device. In a project which was compilable before the migration, errors may occur in the project compilation after changing the HMI device. E.g. because the changed HMI device supports different memory media to the previous HMI device.

HMI device change by the migration

The following table provides information about which successors replace the HMI devices that are not supported.

HMI device change by the user

If a project contains an HMI device that is not supported by WinCC and no compatible successor model exists, the migration is cancelled. If you want to migrate the project, you must change the HMI device to WinCC yourself before the migration. Use an HMI device which is supported both by WinCC flexible and WinCC for this.

See also

Supported HMI devices (Page 167)

Configuration change after HMI device change (WinCC flexible)

Note

If you migrate a project with embedded screens, this can result in the project file becoming larger than the old project file.

HMI device replacement by the migration

If the migration makes an HMI device replacement, it replaces the existing HMI device with a compatible successor model. The successor models are further developed and therefore more efficient than their predecessors. The new models therefore support all the properties of their predecessors. Therefore only a little rework is to be expected on the project due to the HMI device replacement.

HMI device replacement by the user

if you change an HMI device yourself before the migration, you must ensure that the HMI device used supports all properties which are used in the project. Compile the project after the HMI device replacement in WinCC flexible. The project must be perfectly compilable before the migration. Then migrate the project to WinCC.

Supported HMI devices (Page 167)

Object support during migration

Introduction

When migrating projects from WinCC flexible, all configuration data involving an HMI device supported by WinCC will be migrated. Basically, all object types and functions that are available and can be mapped to the new project environment will be fully migrated.

Some global object types are not migrated, for example, dictionaries and global libraries.

Supported object types

The following object types are supported for migration:

- Animations
  Disabled animations are not migrated.
- Audit settings
- Audit reports
- Scheduler
- User administration

- Area pointers
- Faceplates
- Screens
- Screen template
- Data types
- Function lists
- Graphics lists
- Display and operating elements
  All display and operating elements that are available on the supported HMI devices are supported for migration.
- Alarms
- Alarm classes
- Alarm groups
- Project library
- Project languages
- Reports
- Recipes
- Runtime languages
- Runtime scripting
- Sm@rtAccess/Sm@rtService
- Structures
- System events
- System functions
- Texts
- Text lists
- Tags
- Connections
- Effective ranges
- Zones
- Cycles

Unsupported object types

The following object types are not supported by migration:

- Global libraries
- Dictionaries

- Project versions
- Change log

Mapping of the screen navigation

WinCC does not support the screen navigation from WinCC flexible. The data of the screen hierarchy from WinCC flexible are not migrated. To map the functionality of a screen navigation from WinCC flexible, the naivigation buttons are migrated to the button available in WinCC. The system functions migrated to the "ActivateScreen" system function are migrated to the "Click" event of the respective button. The following system functions used in WinCC flexible are not available for the screen navigation in WinCC:

- ActivateRootScreen
- ActivateLeftScreen
- ActivateRightScreen
- ActivateParentScreen
- ActivateFirstChildScreen

These system functions are migrated to the "ActivateScreen" system function. The "Screen name" parameter is taken from the data of the screen hierarchy. If one of the named system functions is called from a screen which is not contained in the screen hierarchy, the "ActivateScreen" function is created without parameters. You must configure the desired screen to this system function after the migration.

Tab sequence in pictures with faceplates

In pictures with faceplates, the tab sequence is changed in both the screen and the faceplate as a result of the migration.

Migration of the screen template

WinCC offers an extended concept for working with screen templates. WinCC offers a global screen and several templates for each device. During migration of a template from WinCC flexible, the objects contained there and the properties configured in the template are migrated to the extended concept of the screen templates of WinCC.

The following objects are migrated to the "global screen" of WinCC:

- Alarm window
- Alarm indicator
- Help indicator
- Function keys of HMI devices with function keys

All other objects and properties are migrated to a template of WinCC.

The connection of the objects and properties to the respective template is automatically adapted.

See also

Changes of values of object properties by the migration (WinCC flexible) (Page 175)

Changes of values of object properties by the migration (WinCC flexible)

Introduction

The standardization of object properties from WinCC V7 and WinCC flexible requires changes to the object properties during the migration process. The migration calculates the changes in such a way that the representation of the objects after migration is the same as prior to migration. Changes made during migration result in different units of measurements and values in the configuration for some object properties.

Migrating the font settings of an object

In WinCC V7 and WinCC flexible, the unit of measurement "point" is used to denote the size of the fonts used for an object. In WinCC, the unit of measurement "pixel" is used to denote the size of the fonts used for an object. During migration, the font size is converted accordingly to ensure that the representation of the font is the same size at zoom level 100%. The different units of measurement result in changes to the numerical values for the font sizes after migration.

Example:

Font style before migration	Font style after migration
Arial 10 points	Arial 13 pixels
Arial 16 points	Arial 21 pixels
Tahoma 10 points	Tahoma 13 pixels
Tahoma 16 points	Tahoma 21 pixels

Migration of object margins

In WinCC flexible, some objects permit the entry of values <0 and >127 for setup of the object margins for the configuration of the representation. In WinCC, the range of values for object margins is limited to values between 0 and 127. The migration changes values <0 to the value "0" and values >127 to the value "127".

Object support during migration (Page 172)

Connections (WinCC flexible)

Migration of connections (WinCC flexible)

Introduction

If you migrate a project in which a supported communication driver is used, this driver is used further in WinCC. Objects which communicate via this driver are migrated 1:1. No rework is necessary.

Not all communication drivers which are available in WinCC flexible are supported in WinCC. If an unsupported driver is used in the project to be migrated, there are two possible scenarios:

1. A compatible spare driver is available for the used driver.
2. No compatible spare driver is available for the used driver.

Compatible spare driver is available

If a driver is available in WinCC which addresses the used PLC or a comptaible PLC, the driver is automatically replaced during the migration.

You get an appropriate warning if the used driver is replaced.

In this case, check whether all the external tags and area pointers are valid after the migration by means of the migration report.

If the used driver is replaced, all the connection parameters are reset to the standard values. The CPU type is adapted to the appropriate PLC. The properties of the connected tags and area pointers are not changed.

Compatible spare driver is not available

If no driver is available in WinCC which addresses the used PLC or a compatible PLC, the configured connection is not migrated. All external tags which were connected to the PLC by this driver are converted into internal tags. External tag properties are lost in the conversion, e.g. the address in the PLC. All changes to the tags are recorded in the migration report.

You must reconnect the tags with the PLC after the migration and configuring of a connection.

You get an appropriate warning if the driver is not migrated.

Converting the communication driver

The following tables show the mapping of communication drivers from WinCC flexible to WinCC.

Supported communication drivers

WinCC flexible	WinCC
Allen Bradley DF1	Allen Bradley DF1
Mitsubishi FX	Mitsubishi FX

WinCC flexible	WinCC
Modicon MODBUS	Modicon MODBUS RTU
Modicon MODBUS TCP/IP	Modicon MODBUS TCP/IP
Omron Hostlink/Multilink	Omron HostLink
OPC	OPC
SIMATIC HMI HTTP Protocol	SIMATIC HMI HTTP Protocol
SIMATIC S7 200	SIMATIC S7 200
SIMATIC S7 300/400	SIMATIC S7 300/400

Compatible communication drivers

WinCC flexible	WinCC
Allen Bradley DH485	Allen Bradley DF1
Allen Bradley E/IP C.Logix	Allen Bradley EtherNet/IP
Mitsubishi Protocol 4	Mitsubishi MC TCP/IP

Not supported communication drivers

WinCC flexible	WinCC
GE Fanuc SNP	Not supported
ISAC	Not supported
LG GLOFA-GM	Not supported
SIMATIC 500/505 DP	Not supported
SIMATIC 500/505 serial	Not supported
SIMATIC S5 AS511	Not supported
SIMATIC S5 DP	Not supported
Telemecanique Uni-Telway	Not supported

Migration of tags (WinCC flexible) (Page 179)

Adapting configuration for non-migrated connection (WinCC flexible)

Introduction

If a connection cannot be migrated you have the following options:

- Change the configuration in WinCC flexible before the migration
- Change the configuration after the migration

Change a connection before the migration

If the communication driver selected for the connection is not supported by the migration, you must select a driver which is supported by the migration. The HMI device must also support the selected communication driver.

If no suitable driver is available for the used HMI device, you must use a suitable HMI device. Then adapt the configuration in WinCC flexible and recompile the project. Migrate the project after successful adaptation and compiling. The connection is then also migrated.

Changing a connection before the migration

If you migrate a WinCC flexible project in which the connection is not migrated, all external tags of this connection are mapped to internal tags. You receive an appropriate entry in the migration protocol for every tag concerned.

You must configure a new connection after the migration. For this connection you select a communication driver which supports the used HMI device. If no suitable driver is available for the used HMI device, you must use a suitable HMI device.

If you have configured the new connection, you must reconnect all tags which were mapped to internal tags before the migration. Open the migration report to make reconfiguration easier. Reconfigure the tags according to the log entry.

If the project contained area pointers, you must also reconfigure these. You will also find corresponding entries for the area pointers in the migration log.

See the section Migrating projects from WinCC flexible (Page 164) for further information about the migration log.

See also

Migrating projects from WinCC flexible (Page 164)

Migration of connections (WinCC flexible) (Page 176)

Migration of area pointers (WinCC flexible)

Introduction

The migration of area pointers depends on the used communication driver.

- If the used communication driver is supported by the migration, area pointers from WinCC flexible are taken over unchanged in the migration.
- if the used communication driver is not supported by the migration, area pointers are not migrated.

Migration of the area pointers

If the connection used by the area pointers is fully migrated, the area pointers are also fully migrated. The parameters of the area pointers are taken over unchanged.

If you replace the communication driver of the connection before the migration, check whether all the parameters of the area pointers are still valid after the migration.

If the connection used by the area pointer is not migrated, the area pointers are not migrated either. See Adapting configuration for non-migrated connection (WinCC flexible) (Page 178) for additional information.

See also

Adapting configuration for non-migrated connection (WinCC flexible) (Page 178)

Migration of connections (WinCC flexible) (Page 176)

Migration of tags (WinCC flexible)

Introduction

You need to make some special considerations when migrating tags. The following aspects should be distinguished:

- Migrating data types of tags
- Migrating internal tags
- Migrating external tags
- Tag names
- Tag limits

Migrating data types

WinCC features some other data types and uses different data type names than WinCC flexible. When migrating a relevant tag, the data type from WinCC flexible is mapped to the corresponding data type in WinCC. See Migration of data types (WinCC flexible) (Page 195) for additional information.

Migrating internal tags

Internal tags are always migrated completely. Only the data type names and tag names may change due to migration.

Migrating external tags

If the connection used by the external tags is migrated, the external tags are also fully migrated. The migration of external tags depends on whether the used communication driver is supported by the migration. See Migration of connections (WinCC flexible) (Page 176) for additional information.

If the connection used by the external tags is not migrated, the external tags are not migrated either. The external tags are then mapped to internal tags. You must configure a new connection and reconnect the tags with the tags of the PLC after the migration.

Migrating names of tags

In WinCC flexible, tags located in different folders can have the same name. In WinCC, the tag name must be unique on the configured HMI device. This means that tags with the same name from different folders will be renamed during migration. See Migration principles (WinCC flexible) (Page 162) for additional information.

Migration of alarm classes and alarm groups (WinCC flexible) (Page 181)

Migrating scripts (Page 184)

Migration of language-specific content (WinCC flexible) (Page 185)

Migration of libraries (WinCC flexible) (Page 187)

Migration of structures

The "StringChar" data type is not supported in HMI user data types in WinCC.

If you have used this data type in a structure in a WinCC flexible project, an invalid element is created by the migration in the HMI user data type.

After migration , you must re-work this user data type in WinCC and enable the user data type.

At the same time, check the offset of the following elements and any existing interconnections between a faceplate and the elements of the user data type. Adapt the elements if required.

Migration of logs

Storage location of logs

WinCC flexible allowed you to store logs in a database which was automatically set up upon WinCC flexible installation ("System-defined data source" setting). This option is not available in WinCC.

If you have used this setting in your WinCC flexible project, it will be changed to "User-defined name of data source" during migration. Before you can store logs in a database, you must configure an ODBC data source in the Windows control panel and configure the name of the user data source specified there as the "name of the data source" in the log in WinCC.

Migration of alarm classes and alarm groups (WinCC flexible)

Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Alarms
System	System
Warnings	Events

The names of the alarm classes can be changed as necessary after migration.

Migrating alarm groups

Migration will migrate only those alarm groups actually in use.

Alarm groups with an ID from 1-31 will be migrated 1:1.

A corresponding alarm group is created in WinCC for each alarm class in the system. These alarm groups created by the system are assigned IDs beginning with the number 32 and consecutively incremented. The 4 pre-defined message classes in every WinCC project are automatically given IDs 32-35 by their alarm groups. Additionally created alarm group and an additional ID is assigned to each user-defined alarm class. Therefore, the IDs for alarms groups with IDs > 31 may be changed after migration. This step also changes the assignment of the alarm group names to the IDs.

Example:

In the example, you can see the assignment of the IDs in WinCC for the migration.

Alarm groups	ID in WinCC flexible	ID in WinCC	
Alarm group 1-16	1-16	1-16	Default for alarm groups from system alarms
Alarm group 17-31	17-31	17-31	Custom alarm groups

Alarm groups	ID in WinCC flexible	ID in WinCC	
		32-35	Default in WinCC for alarm groups of pre-defined alarm classes.
Alarm group 32	32	36	Changed assignment of ID to alarm group in WinCC
Alarm group 33	33	37	Changed assignment of ID to alarm group in WinCC

Also note:

When migrating alarm groups that supposedly have the same group name, the migration adapts the name. This occurs, for example, when a group name contains a space at the end of the name. The migration deletes all existing spaces at the end of names. If two groups obtained the same group names due to this deletion, the migration adds the suffix "# Mign" to the group name of the following alarm groups, where "n" stands for a sequential number.

Example:

The following alarm groups exist in WinCC flexible:

"AlarmGroup_18"

"AlarmGroup_18 " - group name contains one space

"AlarmGroup_18 " - group name contains two spaces

"AlarmGroup_18" is the alarm group with the highest number.

Result after migration:

"AlarmGroup_18"

"AlarmGroup_18#Mig1"

"AlarmGroup_18#Mig1.1"

Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Errors
System	System
Warnings	Warnings

The names of the alarm classes can be changed as necessary after migration.

Display of ALARM_S messages and SIMATIC SFM messages

In WinCC flexible you can activate the display classes for ALARM_S messages in integrated projects. In WinCC flexible, you activate the display of SIMATIC SFM messages via a separate setting. The separate setting for activating the display of SIMATIC SFM messages is not required in WinCC. You control the display of SIMATIC SFM messages, and also the display of ALARM_S messages in WinCC only by activating the corresponding display class.

The changed concept may cause the display of messages to change following migration.

If all the display classes for ALARM_S messages are activated and the display of SIMATIC SFM messages is deactivated in the WinCC flexible project , ALARM_S messages and SIMATIC SFM messages are displayed following migration.

To ensure that only ALARM_S messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to deactivate this display class in WinCC.

If all the display classes for ALARM_S messages are deactivated and the display of SIMATIC SFM messages is activated in the WinCC flexible project , ALARM_S messages and SIMATIC SFM messages are not displayed following migration.

To ensure that only SIMATIC SFM messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to activate this display class in WinCC.

The display class is dependent on the settings in STEP 7. The default setting for SIMATIC SFM messages in Step 7 is the display class "0". To activate the display in WinCC, the display class "0" must be activated.

You activate the display class in WinCC in the Runtime settings of the respective HMI device in the "Messages" category.

Migrating scripts

Introduction

The migration supports VB-scripts which were created in WinCC flexible. For a VB-script to be migrated successfully it must be functionable in WinCC flexible first.

Note

Script errors

The most efficient way to locate scripting errors in the course of the initial test run after migration is to use an installed Script Debugger and the diagnostics controls.

Migration of a VB script

A script is analyzed in the migration and adapted to the system behavior of WinCC if necessary. The following is adapted:

- System functions which have changed their names are renamed.
  This concerns the following system functions:

Function name in WinCC flexible	Function name in WinCC
IncreaseValue	IncreaseTag
DecreaseValue	DecreaseTag
SetBrightness	SetAndGetBrightness
SetValue	SetTag

- The access to tags as parameters of system functions is adapted to the system behavior of WinCC. In WinCC scripts are no longer transfromed as in WinCC flexible. The scripts are executed directly as a source code. Therefore the stricter rules for the VBS syntax apply. A tag call is always migrated with inverted commas. If several parameter types are allowed for a system function, these are migrated with the keyword "SmartTags".
  Example 1:
  The value of the "temperature" tag should be incremented by the value "1".
  Valid expressions in WinCC flexible:
  IncreaseValue temperature, 1
  IncreaseValue "temperature", 1
  IncreaseValue SmartTags("temperature"), 1
  Valid expression in WinCC:
  IncreaseTag "temperature", 1
  Example 2:
  You use a system function on which several parameters are allowed. The value of the "temperature" tag should be incremented by the value of the "heatcontrol" tag.
  Valid expression for WinCC flexible:
  IncreaseValue "temperature", "heatcontrol"
  Valid expression for WinCC:
  IncreaseTag "temperature", SmartTags("heatcontrol")
- Objects renamed by the migration are also renamed in the script when using in a script. See the section Migration principles (WinCC flexible) for further information about the renaming objects. You only have to observe the following rules when renaming objects: If you address objects whose names are dynamically generated by the script with the help of a script, the object names in the script can not be automatically changed by the migration. In such a case, you have to correct the generation of the object names in the script after migration.

Migration of tags (WinCC flexible) (Page 179)

Migration of language-specific content (WinCC flexible)

Introduction

WinCC offers the same options for configuring projects in different languages as those available in WinCC flexible. All languages supported by WinCC are included in the migration of a project.

Migrating language-dependent content

The following language-dependent content is migrated:

- Project languages
- Project texts

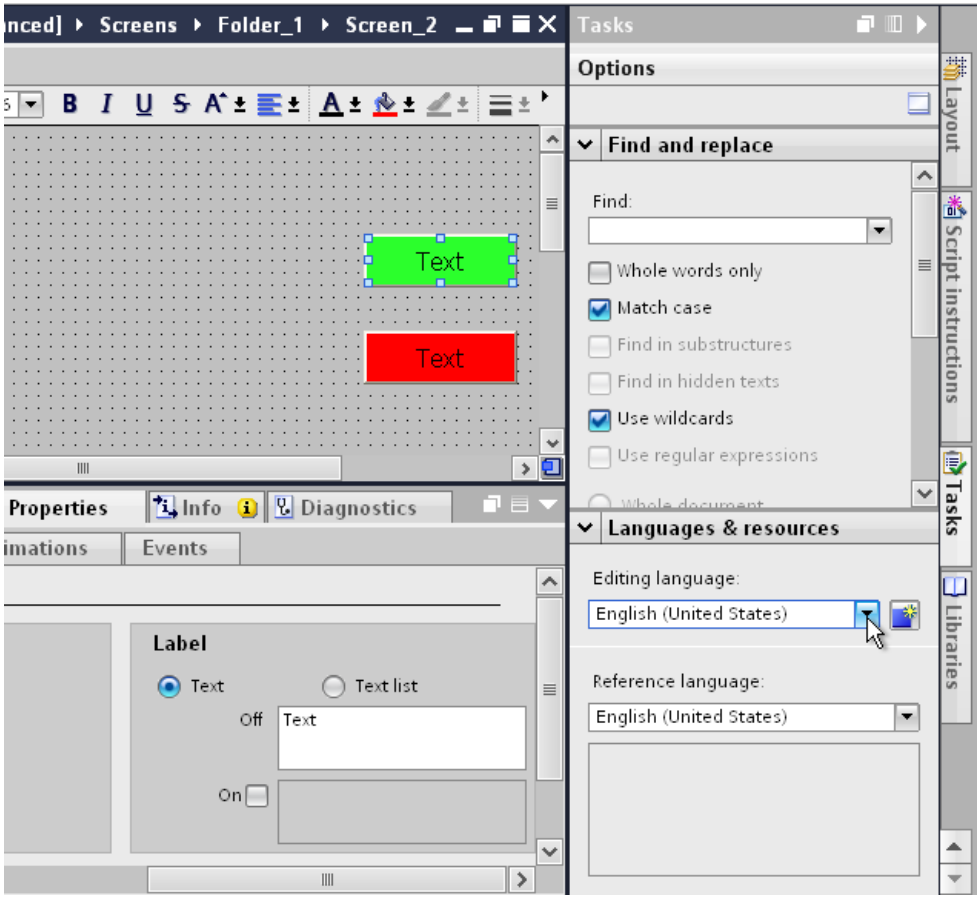
- Fonts for display in runtime
- Language-dependent graphics

You need to consider the following when migrating language-dependent content:

- The operating system on the PC performing the migration must support the project languages used in the project.
- The fonts used for runtime display must be installed on the PC performing the migration.
- Dictionaries are not supported by the migration.

Editiing language of integrated projects following migration

During migration of an integrated project, the project components to be migrated from STEP 7 and WinCC flexible also bring their respective settings for the editing language. In WinCC there is only one editing language for all project components. Migration activates for the mgrated project the editing language which was set in STEP 7 prior to migration. If this setting is not the same as the setting from WinCC flexible, the configured texts are no longer visible in WinCC. No text is displayed at the usage locations, or only the entry "Text" can be seen. To make the texts visible, you must change the editing language. Click the "Tasks" taskcard at the right-hand edge of the TIA portal and select the correct editing language in the "Language & Resources" area.



Unsupported languages

The migration of language-dependent content depends on whether or not WinCC supports the respective language.

If a project only contains project languages not supported by WinCC, the project will not be migrated.

If a project contains supported and unsupported project languages, only the supported languages will be migrated. The editing language and reference language are set to a supported language.

The following languages are not supported by WinCC:

- Arabic
- Hebrew
- Dhivehi
- Gujarati
- Kannada
- Tamil
- Telugu
- Urdu
- Punjabi
- Persian
- Syrian

Migration of tags (WinCC flexible) (Page 179)

Migration of libraries (WinCC flexible)

Introduction

You need to consider two different cases when migrating from libraries:

1. Migrating a project library
2. Migrating a global library

Migrating a project library

A project library is stored together with the project data in the project file. For this reason, a project library is migrated with the same restrictions as the project data.

Migrating a global library

Global libraries are not supported by the migration. The library objects used in the project will be migrated, however. The library objects are copied when used in the project and then no longer have a connection to the library.

To migrate a global library, you must copy or move the objects contained in the library to the project library. The objects are then included in the migration. In WinCC, you move the migrated objects to a new global library that is created. You can copy or move both individual objects or entire library categories.

Migration of tags (WinCC flexible) (Page 179)

6.2.7.3 Migrating runtime data (WinCC flexible)

Migration of runtime data (WinCC flexible)

Introduction

Only the configuration data are migrated by the migration when migrating a project. The runtime data are not affected. You need to update the runtime data following migration.

The runtime data consists of the following:

- Runtime project
  The runtime project contains the compiled project data.
- Recipe data and user administration
  The recipe data and user administration are data that can be changed in runtime.
- Log data
  The data of tag logs and alarm logs are acquired and logged in runtime.

Migrating recipe data and user administration

If the recipe data and user administration were changed in runtime, you need to back up this information from the HMI device before you load the migrated project.

Depending on the used HMI device, you have different options for saving the above data.

If the HMI device supports external memory media and the recipe data are saved there, the data remain on the memory medium. External memory media are for example StorageCard or a network drive. You use the data again after the migration. The user adminsitration is not saved on an external memory medium so you have to save these data, e.g. with ProSave.

If the recipe data are saved in the internal memory of the HMI device, save these data on an external memory medium. Use ProSave to save the recipe data. If you have already configured

appropriate system functions in your project, use the system functions. The following system functions are available for the recipe data:

- "ExportDataRecords" for the backup
- "ImportDataRecords" for the restore

You update the runtime project by compiling the project in WinCC again and loading it to the HMI device.

After you have loaded the migrated project on the HMI device, restore the recipe data and the user administration to the HMI device.

Migration (WinCC flexible) (Page 161)

Backing up recipe data and user administration (WinCC flexible) (Page 189)

Restoring recipe data and user administration (WinCC flexible) (Page 190)

Backing up recipe data and user administration (WinCC flexible)

Introduction

To continue using the recipe data and user administration in a migrated project, you first need to back up this data from the HMI device. Then load the data into the migrated WinCC project. Use ProSave to back up the data.

Requirement

- The WinCC flexible project is running on the HMI device in Runtime.
- The HMI device is connected to a PC on which ProSave is installed.

Procedure

Proceed as follows to back up the recipe data and user administration:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Backup" tab.
4. Select the "Recipes from the device memory" entry in the "Data type" box.
   Do not select "Complete backup" because otherwise you will not be able to select separately when restoring the recipe data.
5. Navigate to the desired location in the "Save as" box and click "Start Backup".
   The recipe data are saved.
6. Select "User administration" in the "Data type" box and click "Start Backup".
   The user administration is saved.

For additional information refer to the online help for ProSave.

Alternative procedure

ProSave is automatically installed with WinCC flexible. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

Alternatively, you can back up the recipe data and user administration via the ProSave integrated in WinCC flexible. Start WinCC flexible and select the menu command "Project > Transfer > Backup". Back up the recipe data and user administration as described in steps 4-6.

Migration of runtime data (WinCC flexible) (Page 188)

Restoring recipe data and user administration (WinCC flexible)

Introduction

To continue using saved recipe data and user administration after the migration, you first need to compile the migrated project and load it to the HMI device. You can then transfer the saved data to the HMI device. Use ProSave to restore the data.

Requirement

- The migrated project has been transferred to the HMI device and is running in runtime.
- The HMI device is connected to a PC on which ProSave is installed.

Procedure

Proceed as follows to load the saved recipe data and user administration to the HMI device:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Restore" tab.
4. Navigate to the location of the saved recipe data in the "Opening..." box and select the file.
5. Click "Start Restore".
   The recipe data will be transferred to the HMI device..
6. Repeat steps 4-5 to restore the user administration.
   The user administration will be transferred to the HMI device.

For additional information refer to the online help for ProSave.

Alternative procedure

ProSave is automatically installed with WinCC. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

You can also restore the recipe data and user administration via the ProSave integrated in WinCC. Start WinCC and select the menu command "Online > Device maintenance > Restore". Restore the recipe data and user administration as described in steps 4-6.

Migration of runtime data (WinCC flexible) (Page 188)

Backing up log data (WinCC flexible)

Introduction

If an HMI device supports external memory media and the log data are saved there, the data remain on the memory medium. External memory media are for example StorageCard or a network drive. If a log is saved on an external memory medium, the migrated project accesses this storage location again after the migration. In this case the log data must not be backed up.

Backing up log data

If you want to back up the log data externally before the migration, you have the following options:

- Backup with the "ArchiveLogFile".
  If you have already configured the "ArchiveLogFile" function in the WinCC flexible project, use this function to back up the data.
- Copy the log files by Copy&Paste with the Windows Explorer to an external memory medium or network drive.

Migration of runtime data (WinCC flexible) (Page 188)

6.2.7.4 Migrating integrated projects (WinCC flexible)

Migration of integrated projects (WinCC flexible)

Introduction

The controllers and HMI devices contained in a project integrated in STEP 7 are linked together by the configuration. The configuration data of WinCC flexible and STEP 7 are also connected. When an integrated project is migrated, the complete project will be migrated with components from WinCC flexible and STEP 7. The connections remain intact.

Note

It is advisable to compile and save an integrated project in WinCC flexible before you migrate it. You can be sure that the data in WinCC flexible and STEP 7 is synchronized if compilation was completed without errors.

Migrating an integrated project

When migrating an integrated project, the same requirements apply for the WinCC flexible component as those for the migration of a non-integrated WinCC flexible project. The objects and properties contained in the WinCC flexible component must be supported by WinCC, for example, the HMI device or the communication driver. The "Online" property must be activated on the configured connection. A connection with deactivated "Online" property is not migrated.

In addition to the requirements for the WinCC flexible component, there are also requirements for the STEP 7 component of the integrated project. The objects and properties contained in the STEP 7 V5.4 SP5 or V5.5 component must be supported in STEP 7. For detailed information, refer to the documentation for STEP 7.

To fully migrate an integrated project and then edit it, the following components must be installed on the PC performing the migration:

- STEP 7 V5.4 SP5 or STEP 7 V5.5
- WinCC flexible 2008 SP2 or WinCC flexible 2008 SP3
- STEP 7

If you only want to save the project in migration format, you can use the migration tool. See Migration principles (WinCC flexible) (Page 162) for additional information.

An integrated project is always fully migrated. If you only want to migrate the WinCC flexible project it contains, you need to separate it from the STEP 7 project before the migration. To separate the project from the integrated form, open the project in STEP 7 V5.4 SP5 or V5.5. Open the WinCC flexible project in the SIMATIC Manager. The project is opened with WinCC flexible. In WinCC flexible, select the menu command "Project > Copy project from STEP 7". WinCC flexible saves a non-integrated copy of the project.

Migration (WinCC flexible) (Page 161)

Migrating an integrated project (Page 193)

Migration principles (WinCC flexible) (Page 162)

Migrating an integrated project

Introduction

When migrating an integrated project, the components from both the WinCC flexible project and the STEP 7 project will be migrated. This means you need to select the project file with the file extension "*.s7p" for migration. During migration, the data is copied from the existing project and migrated to a new project. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

You should only migrate a project to a re-started TIA Portal.

If you only want to save the project in migration format, you can use the migration tool. For more information, refer to basics of migration (WinCC flexible).

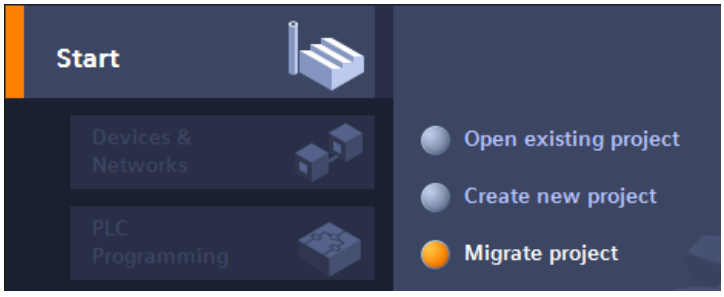
Requirement

- STEP 7 V5.4 SP5 or STEP 7 V5.5 and all option packages used are installed.
- STEP 7 and all option packages used are installed.
- The TIA Portal is restarted.
- No project is open in WinCC.
- An integrated project is available.
- The integrated project is not open.

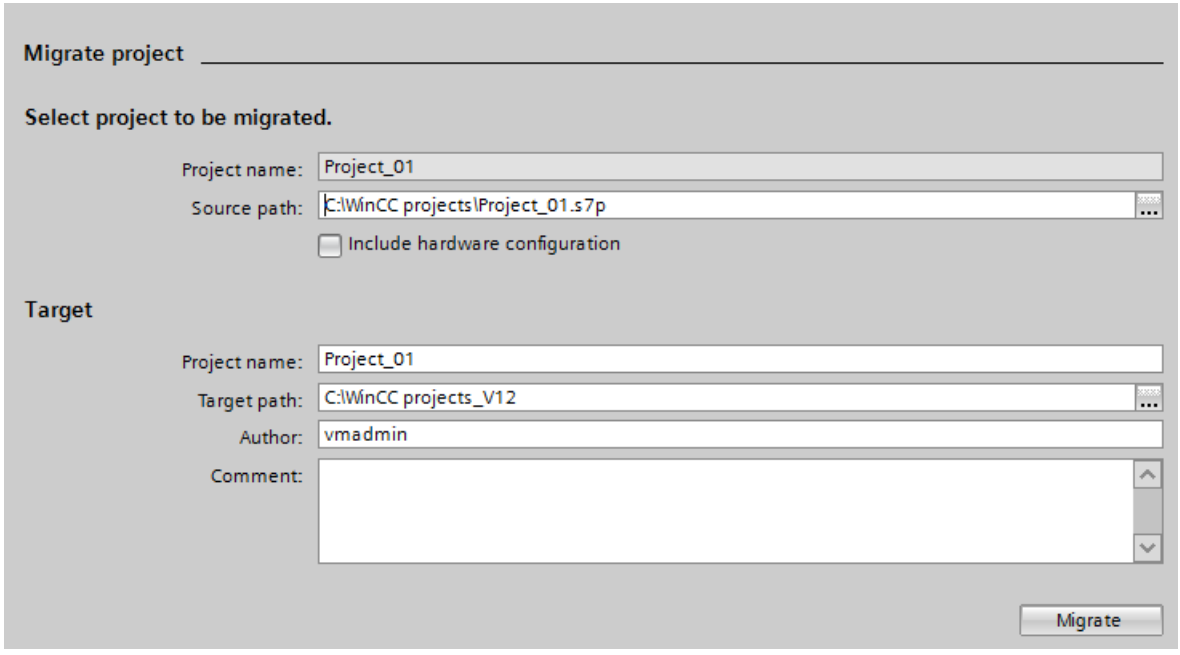
Procedure

To migrate an integrated project in the portal view, follow these steps:

1. Select the action "Start > Migrate Project".



2. In the "Source path" box, navigate to the project you want to migrate.



3. Select the "*.s7p" project file.
4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. To migrate the project with hardware configuration, activate "Include hardware configuration".

6. Click "Migrate".
   A new project is created and migration of the data is started:
   - The Project view opens.
   - The progress of the migration is shown in a migration window.
   - Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
   - All information about the migration is saved in a log file.
   - A message is displayed upon completion of the migration. The message contains a link that you can use to open the log file.
7. Once migration is completed, save the project.

Once the migration is complete, you will find a newly created device for each migrated HMI device and controller in the project tree. These devices include the migrated data.

Opening the migration log at a later point in time

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log file as follows:

1. Open "Common data > Logs" in the project navigation.
2. Double-click the log file. The migration log opens.

6.2.7.5 Reference (WinCC flexible)

Migration of data types (WinCC flexible)

Introduction

To harmonize the data types used by PLCs and HMI systems, some data types of the internal HMI tags are renamed. The naming takes place in accordance with IEC conventions. Because only the names change, there are no changes to the internal tags for the configuration.

The following table describes the mapping of the internal data types from WinCC flexible to the data types in WinCC.

Migrating internal data types

The internal data types are mapped as follows during migration:

Internal data types WinCC flexible	Internal data types WinCC
Bool	Bool
Char	SInt
Byte	USInt
Int	Int
UInt	UInt
Long	DInt
ULong	UDInt
Float	Real
Double	LReal
String	WString
DateTime	DateTime

Migrating external data types

Special considerations for some data types

There are special considerations to be made when migrating external tags that contain data types of a SIMATIC S7-300/400 PLC.

Mapping of the S7 data type "Char"

The S7 data type "Char" is a data type for mapping characters according to the specification. However, since this data type is often used for reading and writing numerical values, it is mapped in WinCC to the S7 data type "Byte". If this should be the case during migration, an alarm will appear in the output window.

If the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to the S7 data type "Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

If the S7 data type "Char" is used for mapping characters, you must change the configuration after migration. To represent characters, use the data type "String".

When an integrated project is migrated, the data type "Char" in WinCC is also migrated to the data type "Byte". With a connected PLC tag, the data type "Char" remains "Char". As a result of changing the data type of the HMI tag, symbolic addressing of the tags in question is not migrated. After migration. the tags are interconnected by absolute addresses and continue to work. If you want to restore symbolic addressing, you have to change the configuration accordingly after the migration.

Mapping an array of the S7 data type "Char"

An array of the S7 data type "Char" is mapped to an array of the data type "Byte" during migration.

If an array of the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to an array of the S7 data type "Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

Mapping of the S7 data type "Counter"

An external tag with the S7 data type "Counter" with counter address is mapped to the S7 data type "Counter". The address will be retained.

If an external tag with the S7 data type "Counter" addresses a data block or a bit memory address, it is is mapped to the S7 data type "Word". The address will be retained. The migration sets the coding to "SimaticBCDCounter".

The S7 data type "Counter" has a value range of 0-999. When supplied by the S7 data type "Word" the value range may be exceeded on the PLC side. Ensure that you are observing the value range.

Example:

WinCC flexible

Tag	S7 data type	Address	Comment
Counter_Actual_Value	Counter	C10	BCD coded counter value
Counter_Setpoint_Value	Counter	DB10.DBW200	BCD coded counter value
Counter_Setpoint_Value#2	Counter	MW20	BCD coded counter value

WinCC

Tag	S7 data type	Address	Coding	Comment
Counter_Actual_Value	Counter	%C10	<Standard>	BCD coded counter value
Counter_Setpoint_Value	Word	%DB10.%DBW200	SimaticBCDCounter	BCD coded counter value
Counter_Setpoint_Value#2	Word	%MW20	SimaticBCDCounter	BCD coded counter value

Mapping of the data type "StringChar"

In WinCC there is no corresponding data type to which the "StringChar" data type can be mapped. Mapping in WinCC depends on the property "Length" of the S7 data type.

A tag of the "StringChar" data type with the "Length" property > 1 is migrated to an array of the S7 data type "Char". The length of the array corresponds to the length of the originally configured data type "StringChar".

If the property "Length" = 1, the data type in WinCC is migrated to an array of the S7 data type "Char" with length = 1. The expression for an array with an element is "Array[0 ..0] of Char".

Mapping of the S7 data type "Timer"

An external tag with the S7 data type "Timer" with timer address is mapped to the S7 data type "Timer". The address will be retained.

If an external tag with the S7 data type "Timer" addresses a data block or a bit memory address, it is is mapped to the S7 data type "S5 Time". The address will be retained.

Example:

WinCC flexible

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	T10	BCD coded timer value
Timer_Setpoint_Value	Timer	DB10.DBW200	BCD coded timer value
Timer_Setpoint_Value#2	Timer	MW20	BCD coded timer value

WinCC

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	%T10	BCD coded timer value
Timer_Setpoint_Value	S5Time	%DB10.%DBW200	BCD coded timer value
Timer_Setpoint_Value#2	S5Time	%MW20	BCD coded timer value

Migrating data types of Telemecanique Uni-Telway (WinCC flexible)

Migrating data types Telemecanique Uni-Telway

The Telemecanique Uni-Telway communication driver is not supported by WinCC, the data types are mapped to the internal data types of WinCC. The data types of the Telemecanique Uni-Telway communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
+/-Int	Int
+/-Long	DInt
ASCII	WString
Bool	Bool
Float	Real
Int	UInt
Long	UDInt

6.2.8 Migrating integrated projects

6.2.8.1 Migrating an integrated project

Introduction

In integrated projects, you use SIMATIC controllers and WinCC components together in a project. When an integrated project is migrated, the complete project will be migrated with components from WinCC and STEP 7. Configured connections between control and visualization remain intact.

Migrating an integrated project

When migrating an integrated project, the same requirements apply for the STEP 7 component as those for migration of a non-integrated STEP 7 project. The objects and properties contained in the WinCC component must also be supported in WinCC (TIA Portal).

For an operating station (OS) to be migrated, it has to be located below a PC station and the WinCC application in the project tree of SIMATIC Manager. The following figure shows the assignment of the operating station within the initial project:

Additional migration requirements for integrated projects can be found in the documentation for WinCC.

Also note that the initial project must be compiled before the migration.

In order to fully migrate an integrated project, the following components must be installed on the programming device/PC for the migration:

- STEP 7 V5.4 SP5 or STEP 7 V5.5
- WinCC V7.2 with the latest update or WinCC flexible 2008 SP2 and SP3

To be able to fully post-edit an integrated project, the latest version of the following components must be installed on the PC for post-editing:

- STEP 7 Professional
- WinCC Basic, WinCC Comfort/Advanced or WinCC Professional, depending on the components used

Using the migration tool

It is necessary to use the migration tool under the following circumstances:

- The initial project is not located on the same programming device/PC as the installation of the TIA Portal.
- SCADA devices are included in the initial project. These can only be migrated with the migration tool.
- WinCC Professional V13 and STEP 7 with WinCC V7.2 cannot be installed on the same programming device/PC. Therefore, integrated projects with WinCC V7.2 parts must be prepared for migration using the migration tool.

Migration of the STEP 7 part of an integrated project

An integrated project is always fully migrated. Individual components cannot be migrated on their own. You can only migrate the included STEP 7 project alone, if you have previously deleted all HMI stations in the SIMATIC stations in the SIMATIC Manager and then recompiled the project in NetPro.

Alternatively, you can open the project in an installation of STEP 7 V5.4 SP5 or V5.5 without an installation of WinCC. Then, save the project again and select the "Reorganize" function during saving. The WinCC parts are then automatically removed when the copy is saved.

You can then migrate the STEP 7 project without the WinCC project.

Migration of an integrated project with the hardware configuration

In integrated projects, HMI devices are migrated even if the hardware configuration is not included in the migration. The STEP 7 part of the hardware configuration, including network configurations, and connections and interrupts, is migrated only if you include the hardware configuration in the migration. Otherwise, unspecified modules will be created for the STEP 7 devices and you will need to convert them into suitable modules after the migration.

HMI modules that are plugged into a PC station are converted to a separate Station during the migration. If you perform the migration without including the hardware configuration, the migrated project then contains a non-specified SIMATIC PC Station and a SIMATIC PC Station with the HMI devices. References to HMI devices are not imported during migration. When the hardware configuration is included, the migrated project contains two separate stations: the HMI Station and the PC Station.

Storage location of an integrated WinCC project

If you migrate an integrated project, the HMI part of it must be on the same PG/PC as the STEP 7 part of the project. If the HMI part is on a different PG, then only the STEP 7 part will be migrated.

Unsupported objects

The following components are not supported for migration:

- STEP 7 multiproject
  A STEP 7 multiproject cannot be migrated. Migration will be canceled.
- Central Archive Server - CAS
  If a CAS is part of an integrated project, then the migration will be carried out but the CAS data will not be migrated.

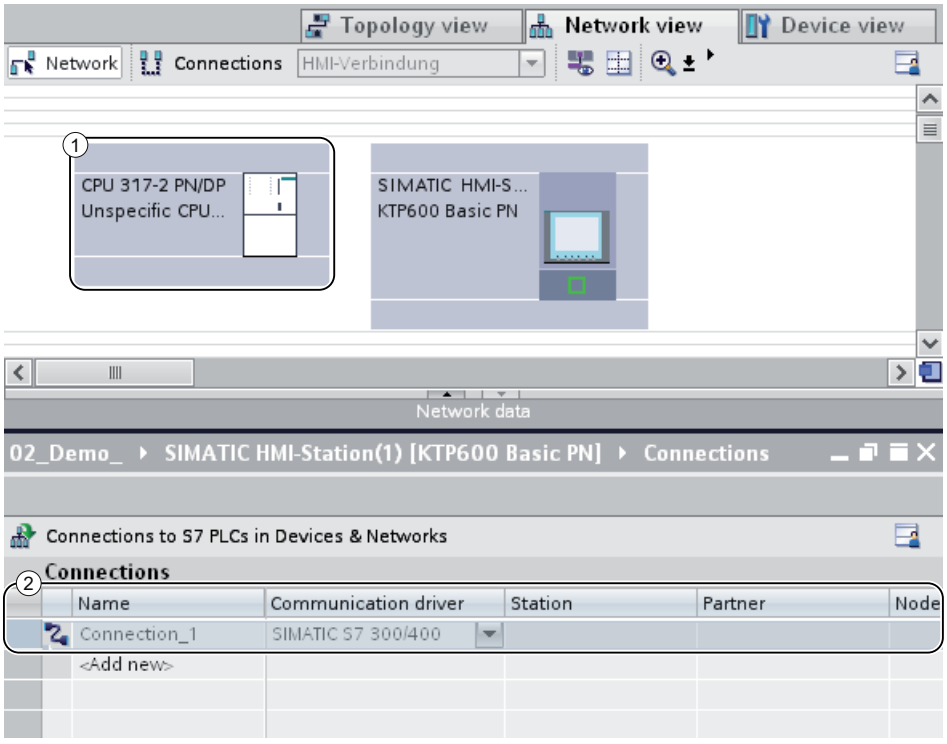
See also

Post-editing integrated projects (Page 211)

6.2.8.2 Post-editing integrated projects

If you have migrated an integrated project without hardware configuration, unspecified CPUs are used instead of the CPUs of the original project. Since no connection can exist between an unspecified CPU and an HMI device, connections from the source project are also imported only unspecified.

The following figure shows the state after a Migration without hardware configuration in an example project:



① The original CPU 317-2 PN/DP was replaced with an unspecified CPU during migration.

② The link between the CPU and HMI device is also unspecified and must be renewed.

Procedure

To continue to use an integrated project after the migration, follow these steps:

1. Convert the unspecified devices into suitable devices again.
2. Restore the integrated HMI connection between the HMI device and the PLC.
3. Connect all HMI tags to the newly created integrated connection.
4. Restore the connection between HMI tags and PLC tags.
5. Delete the non-integrated HMI connection.

In the following chapters a sample project is used to describe the individual steps in more detail.

See also

Converting unspecified CPUs into specified CPUs (Page 213)

Creating an integrated HMI connection (Page 214)

Re-linking HMI tags (Page 216)

Deleting an unspecified connection (Page 217)

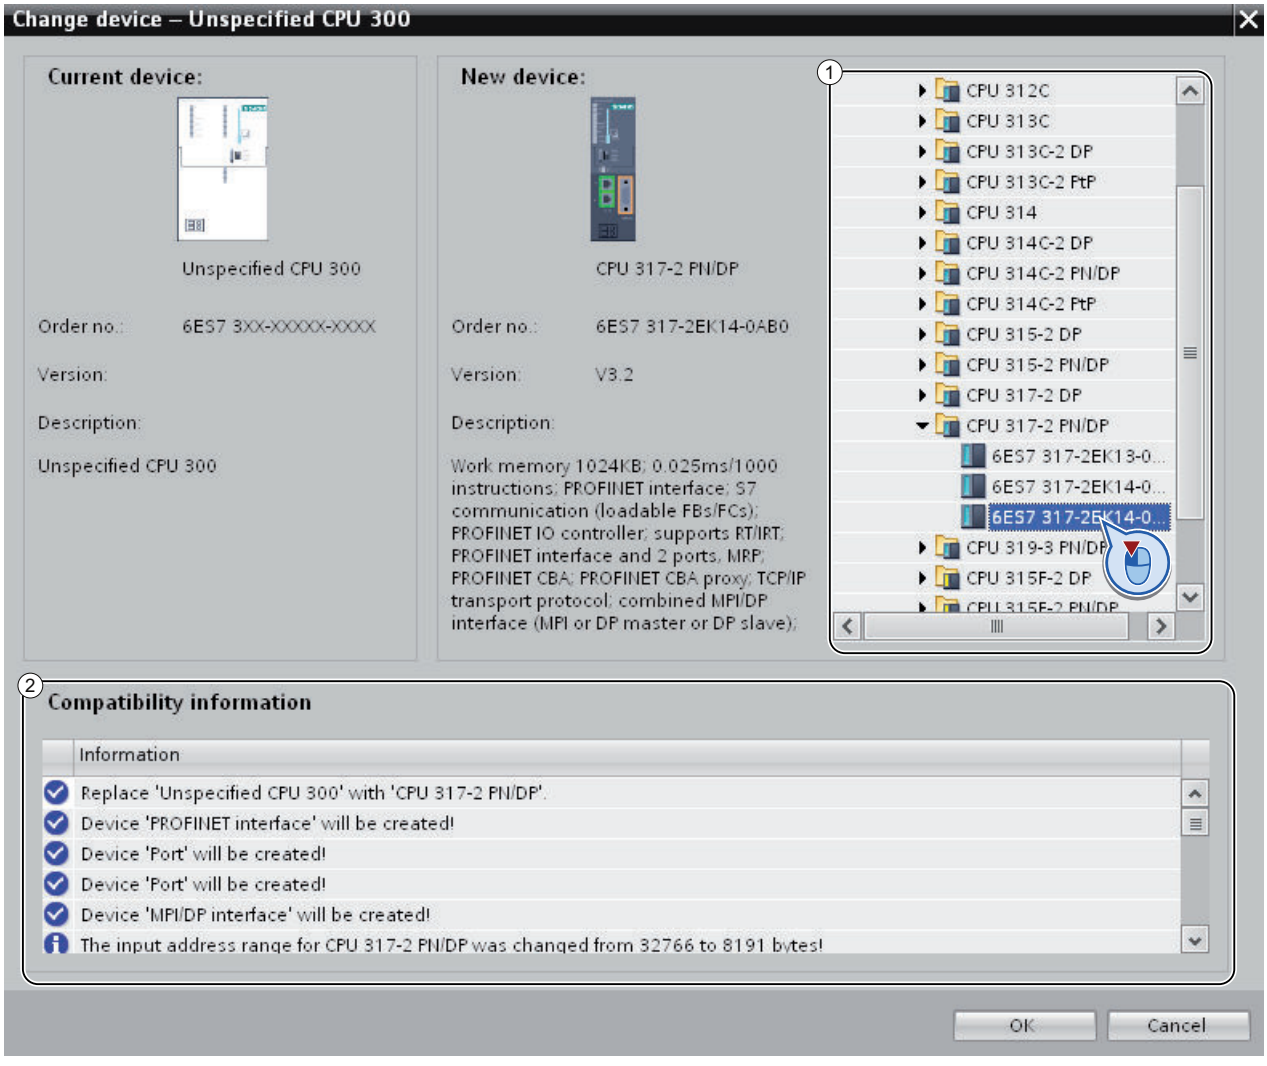
6.2.8.3 Converting unspecified CPUs into specified CPUs

The first step after the migration without hardware configuration is the conversion of the unspecified CPUs into specified CPUs. Unspecified CPUs are placeholders for certain CPUs from the hardware catalog that are not currently known. You can define general parameters and home the CPUs already in the user program. However, the project is not fully functional until the unspecified CPU has been specified.

Specifying a CPU using module replacement

To use module replacement to specify an unspecified CPU, follow these steps:

1. Select the unspecified CPU in the network or device view.
2. Select the "Replace device" command in the shortcut menu.
   The "Replace device" dialog opens.



3. Under "New device" in the tree structure, select the module with which you want to replace the unspecified CPU. (Area 1)
   "Compatibility information" provides you with information on the extent to which the selected CPU is compatible with the configuration in source project. (Area 2)
4. Click "OK".
5. Perform the above-described steps for all unspecified CPUs.

See also

Creating an integrated HMI connection (Page 214)

6.2.8.4 Creating an integrated HMI connection

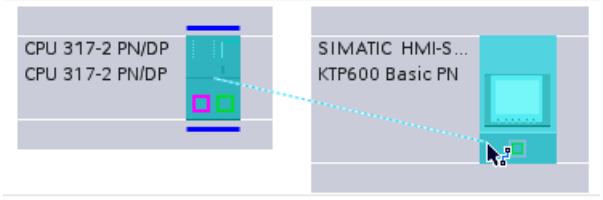
After you have specified the unspecified CPU, establish the connection to the HMI-device.

Procedure

To create a connection graphically, follow these steps:

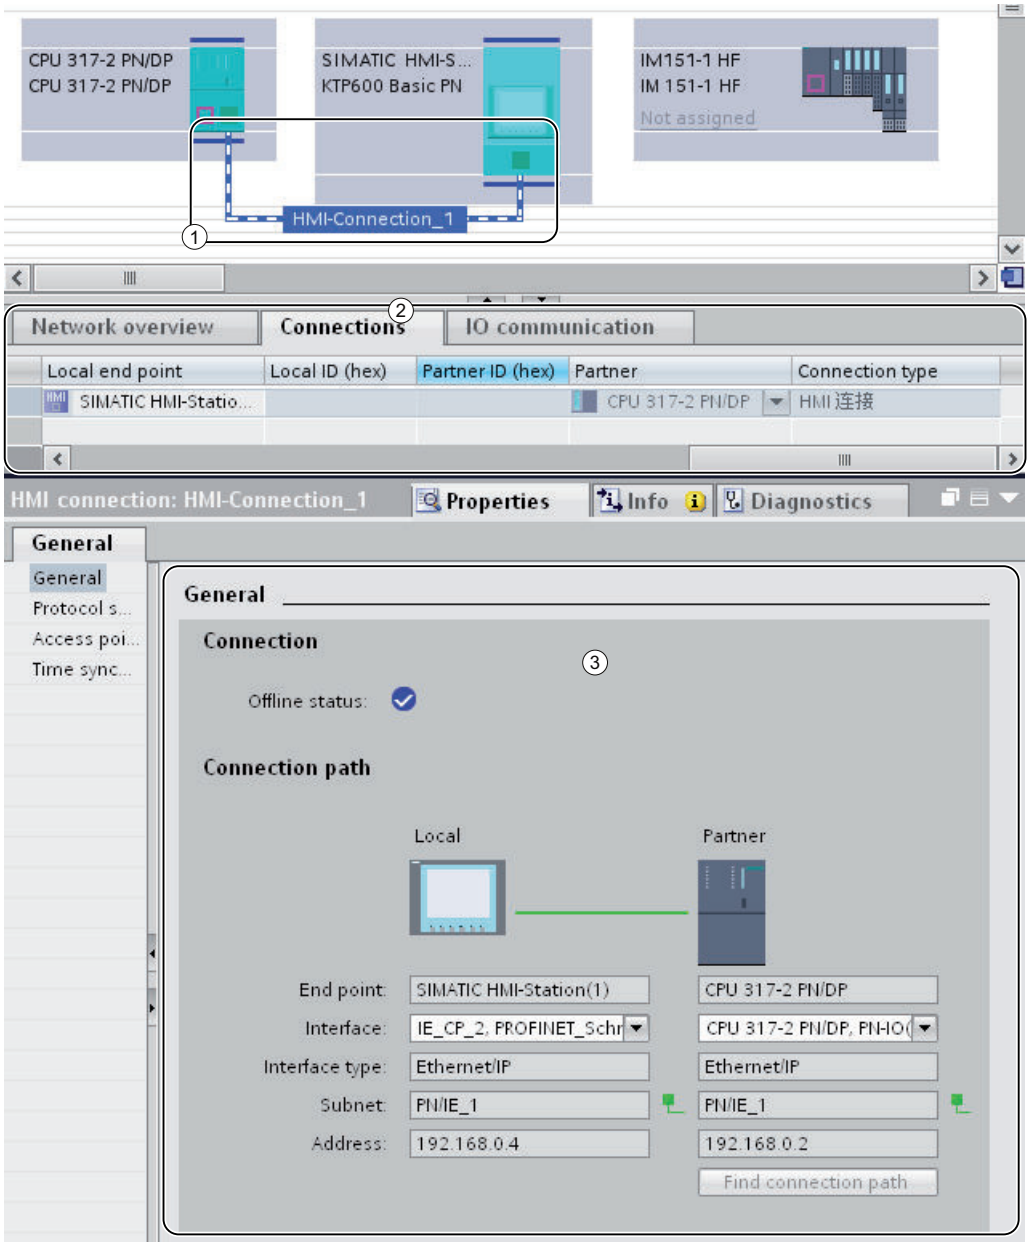
1. On the toolbar, click the "Connections" icon. This activates connection mode.

2. Select the connection type "HMI connection" in the adjacent drop-down list.
   The network view highlights in color all CPUs and HMI devices that can be used for an HMI connection.
3. You can now have the connection path automatically determined, or explicitly select a connection path via specific interfaces:
   - Allow connection path to be automatically determined
     Select the source CPU for a connection. Drag the mouse to the target components. Confirm the connection endpoint with another mouse click.
     Alternatively: While holding down the shift button, select the target components and with the right mouse button select the "Add new connection" command.
   - Selecting an explicit connection path from interface to interface
     Click on the subnet interface in the device for which you want to create a connection. Hold down the mouse button, drag the cursor to the relevant interface in the target device and then release the mouse button.



Result

The following figure shows the state after the integrated connection has been created:



① An integrated HMI connection is created and highlighted in the network view.
② The connection is shown in the connection table of the components.
③ The connection can be edited in the connection properties.

Re-linking HMI tags (Page 216)

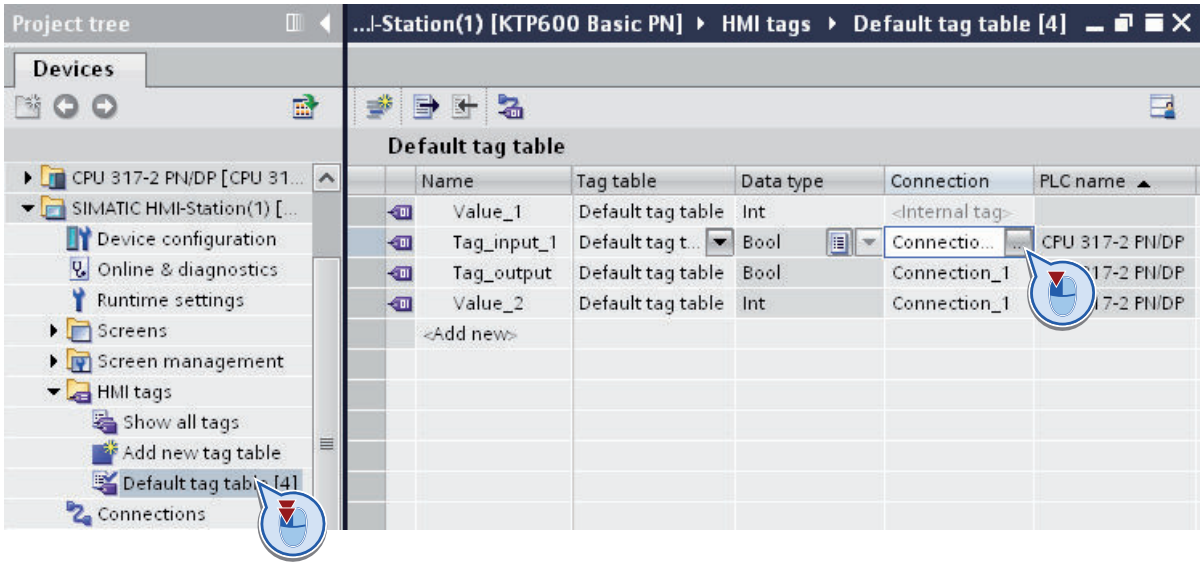
6.2.8.5 Re-linking HMI tags

When you have created a new HMI connection between the CPU and HMI device, you have to assign the existing HMI tags to the new connection. Perform the following steps for each line in the relevant tag table.

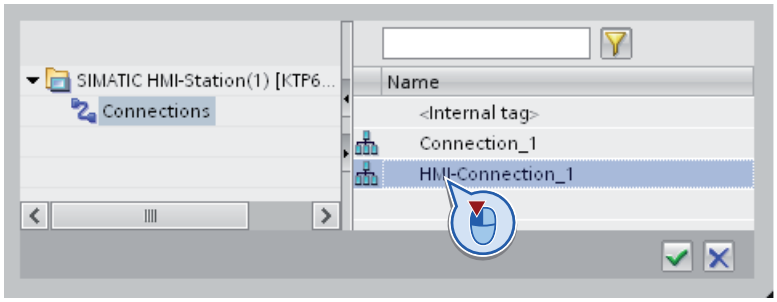
Procedure

To re-link HMI tags, follow these steps:

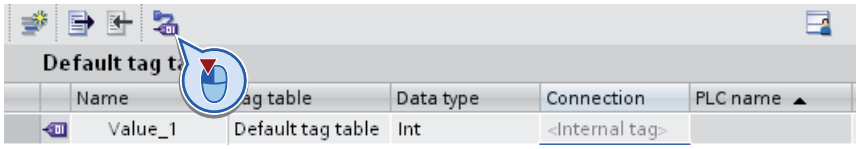
1. In the project tree, navigate to the HMI tags and double-click the relevant tag table to show this in the work area.
   The tag table opens.



2. Click the " ... " button in the "Connection" column.
   A dialog box for selecting the connection opens.
3. Select the newly established HMI connection.



4. Click the "✓" button to apply the selected connection.
5. On the toolbar, click the "Re-connect PLC tag" button.



See also

Deleting an unspecified connection (Page 217)

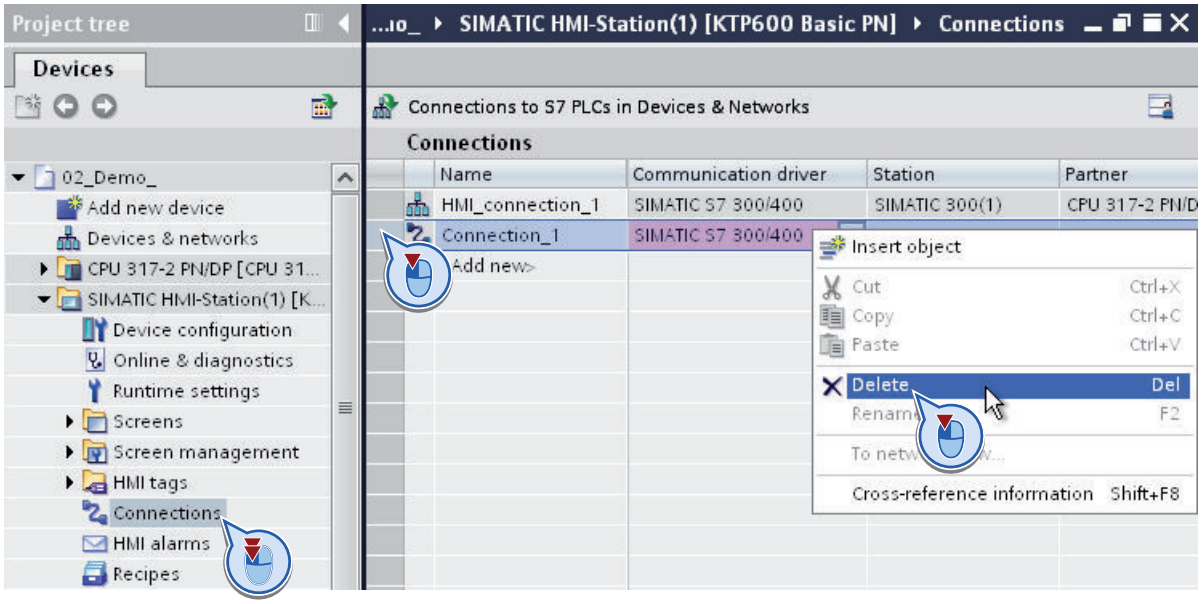
6.2.8.6 Deleting an unspecified connection

Finally, you can remove unspecified connections that still remain from the source project.

Procedure

To delete unspecified connections, follow these steps:

1. In the project tree, open the HMI device and double-click the "Connections" entry. The connection table opens.



2. Select the row with the old connection in the table.
3. Select the "Delete" command in the shortcut menu of the connection line.
4. Perform the above-described steps for all unspecified connections of the source project.

6.3 Migrating S7-1200 to firmware as of V4

6.3.1 Basic information on upgrading to V4

Introduction

If you have used a CPU with firmware version V3 in your project and want to upgrade to a CPU with firmware V4.0 or later, you can easily replace the device.

The TIA Portal offers the "Change device" function for this purpose. The project remains unchanged when the device is replaced. You can continue using the programs that you created with firmware version V3.

Rules

The following basic rules apply when replacing a device:

- Replacing a device is only possible if the project was created based on a CPU with firmware version V3.0. If your project was created based on firmware version V1.0 or V2.0, create a new CPU with firmware version V3.0 offline in the project, and copy your program to this CPU.
- It is not possible to replace a V4 CPU with a V3 CPU. If you want to continue using the existing V3 CPU, create a copy of this CPU before replacing the device.
- The program cannot be transferred to the new CPU via a memory card. Instead, use the "Change device" function, which is described in the following sections.

HMI panels

Configured HMI panels are treated differently during device replacement depending on the firmware version of the panel and the communication mode.

The following table shows the HMI connections that are supported with the migration:

Firmware version of the panel	PUT/GET communication	Migration to V4
V11 or later	No	S7-1200 does not support this configuration. Upgrade the firmware of the HMI panel to V12.0. Then compile and load the configuration.
V11 or later	Yes	S7-1200 supports this configuration. The connection is established automatically while you compile and load the project after replacing the device.
V12 or later	No	S7-1200 supports this configuration. The connection is established automatically while you compile and load the project after replacing the device.

During compilation of the program, you receive specific information on migrating the HMI panel.

Note

HMI TP 177B 4"

The HMI TP 177B 4" with firmware version V11.0.2 cannot be operated with S7-1200 V4. Replace the panel with a new device, if necessary.

S7-1200 expansion modules

If you are already using the following centrally plugged S7-1200 modules in your system, you must perform a firmware update for these modules in order to guarantee operation with S7-1200 V4.

- ASi - Master - CM 1243
- DP - Master - CM 1243-5
- WAN CP - CP1243-1

Newly shipped S7-1200 modules have the latest firmware installed ex works.

Protected blocks

Blocks equipped with know-how protection or copy protection cannot be converted to V4. If the project contains protected blocks, you must remove the protection prior to migration.

If these are supplied blocks and you do not know the password, ask your supplier either for the password or for a V4-compatible block.

Warning

Preventing personal injury and material damage

Changes are made to the program during device replacement in some cases. Therefore, thoroughly check the program in a test environment after replacing the device and before putting it in operation.

Note

Additional support

You can find the latest FAQs about migrating to S7-1200 V4 (http://support.automation.siemens.com/WW/view/en/82140966) in Siemens Industry Online Support.

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

Migrating to V4 (Page 220)

Special considerations after migrating to V4 (Page 221)

6.3.2 Migrating to V4

Requirement

- A CPU with firmware version V3 is available in the project.
- The project contains no protected blocks.

Procedure

Proceed as follows to replace a CPU:

1. Select the V3 CPU you want to replace.
2. Select the "Change device" command in the shortcut menu.
   The "Change device" dialog box appears.
3. Under "New device" in the tree structure, select the V4 CPU with which you want to replace your current V3 CPU.
4. Click "OK".
   The existing CPU is replaced by the new one.
5. Select the new CPU and select the "Compile > Hardware and software (only changes)" command in the shortcut menu.
   The device configuration and the user program are compiled again.
6. Optional: If necessary, apply know-how protection or copy protection to individual blocks in the program.
7. Select the new CPU and select the "Download to device > Hardware and software (only changes)" command in the shortcut menu.
   The device configuration and the user program are loaded into the new CPU.
   This completes the device replacement.

Warning

Preventing personal injury and material damage

Changes are made to the program during device replacement in some cases. Therefore, thoroughly check the program in a test environment after replacing the device and before putting it in operation.

Note

Additional support

You can find the latest FAQs about migrating to S7-1200 V4 (http://support.automation.siemens.com/WW/view/en/82140966) in Siemens Industry Online Support.

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

See also

Basic information on upgrading to V4 (Page 217)

Special considerations after migrating to V4 (Page 221)

6.3.3 Special considerations after migrating to V4

Functional changes in V4

S7-1200 V4 offers significantly enhanced functionality. The most important functional changes that you need to consider after migrating from V3 are described briefly below.

You can find more information on S7-1200 in the "SIMATIC S7-1200 Programmable controller" system manual.

See also:

TIA Portal in Siemens Industry Online Support (http://support.automation.siemens.com/WW/view/en/65601780)

Organization blocks

With S7-1200 V4, you can specifically set the interruptibility of each organization block used. When a device is replaced, all the organization blocks are configured as non-interruptible, to ensure that the executability of your V3 program remains unchanged. The OB priorities from the V3 program also remain unchanged. After migration, you can change the settings for priority and interruptibility as needed.

The behavior of diagnostic interrupts in V4 has changed as follows:

In V3, the start information always contained information on the triggering module, including the channel number. In V4, this information is only generated for a pending diagnostics event. If no diagnostic event is pending, for example, because the fault has already been corrected, only the triggering module is indicated.

Access levels

S7-1200 V4 offers an extended access level concept. The following table shows how the protection levels of the V3 firmware are indicated in V4:

V3 protection level	V4 access level	Meaning
No protection	Full access (no protection)	Unrestricted access without password protection.
Read-only	Read access	HMI access and unimpeded communication between CPUs without password protection. A password is required for changes (write access) in the CPU and for changing the operating mode of the CPU (RUN/STOP).
Write/read protection	HMI access	HMI access and unimpeded communication between CPUs without password protection. A password is required to read the data in the CPU, for changes (writing) in the CPU, and for changing the operating mode of the CPU (RUN/STOP).
-	No access (complete protection)	No access without password input. A password is required for HMI access, for reading the data in the CPU, for changing (writing) data in the CPU, and for changing the operating mode of the CPU (RUN/STOP).

Instruction libraries

After migration to S7-1200 V4, instructions from the libraries of the firmware version V3 are still available. This ensures that you can continue to use your program unchanged. In addition, S7-1200 V4 offers many new instructions which are also compatible with the instructions of the S7-1500.

You can find more information on the instruction libraries of S7-1200 in the "SIMATIC S7-1200 Programmable controller" system manual.

See also:

TIA Portal in Siemens Industry Online Support (http://support.automation.siemens.com/WW/view/en/65601780)

Motion Control

When a device is replaced, the Motion Control objects from the libraries of the firmware versions V1 and V2 are replaced with the corresponding objects from the V3 libraries. The objects from V3 libraries are compatible so that you can continue to use the programs unchanged.

The libraries of the S7-1200 V4 offer many new Motion Control functions, which are compatible with the functions of the S7-1500. If you want to use V4 libraries, select them on the "Instructions" task card after replacing the device.

You can find more information on the new Motion Control functions in the "SIMATIC S7-1200 Programmable controller" system manual.

See also:

TIA Portal in Siemens Industry Online Support (http://support.automation.siemens.com/WW/view/en/65601780)

Web server

The following settings for operation via a web server are transferred from the V3 CPU to the V4 CPU during device replacement:

- Activate web server on this module
- Permit access only with HTTPS

If you want to operate the V4 CPU via a web server, you need to set up user accounts with assigned user rights in the user management. Only the standard web pages are available to standard users without any additional rights.

Note

Additional support

You can find the latest FAQs about migrating to S7-1200 V4 (http://support.automation.siemens.com/WW/view/en/82140966) in Siemens Industry Online Support.

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

Communication via PUT/GET

Communication via PUT/GET is enabled after the device replacement. Note that the new integrated connection types offer a security standard higher than PUT/GET communication. If you do not use PUT/GET communication, you should disable it.

Migrating to V4 (Page 220)

6.4 Programming recommendations

6.4.1 The new S7-1500 CPU functions at a glance

Higher performance

The S7-1500 represents a CPU series that provides much higher performance than the CPUs of the S7-300/400 series. When programming with STEP 7 V5.x, you were probably used to working with programming methods such as absolute addressing to achieve higher performance from the CPU and leaner program code.

Due to the high performance that the S7-1500 provides, these programming methods are made obsolete.

In the paragraphs below we would like to introduce some new programming options of the S7-1500.

Universal symbolism

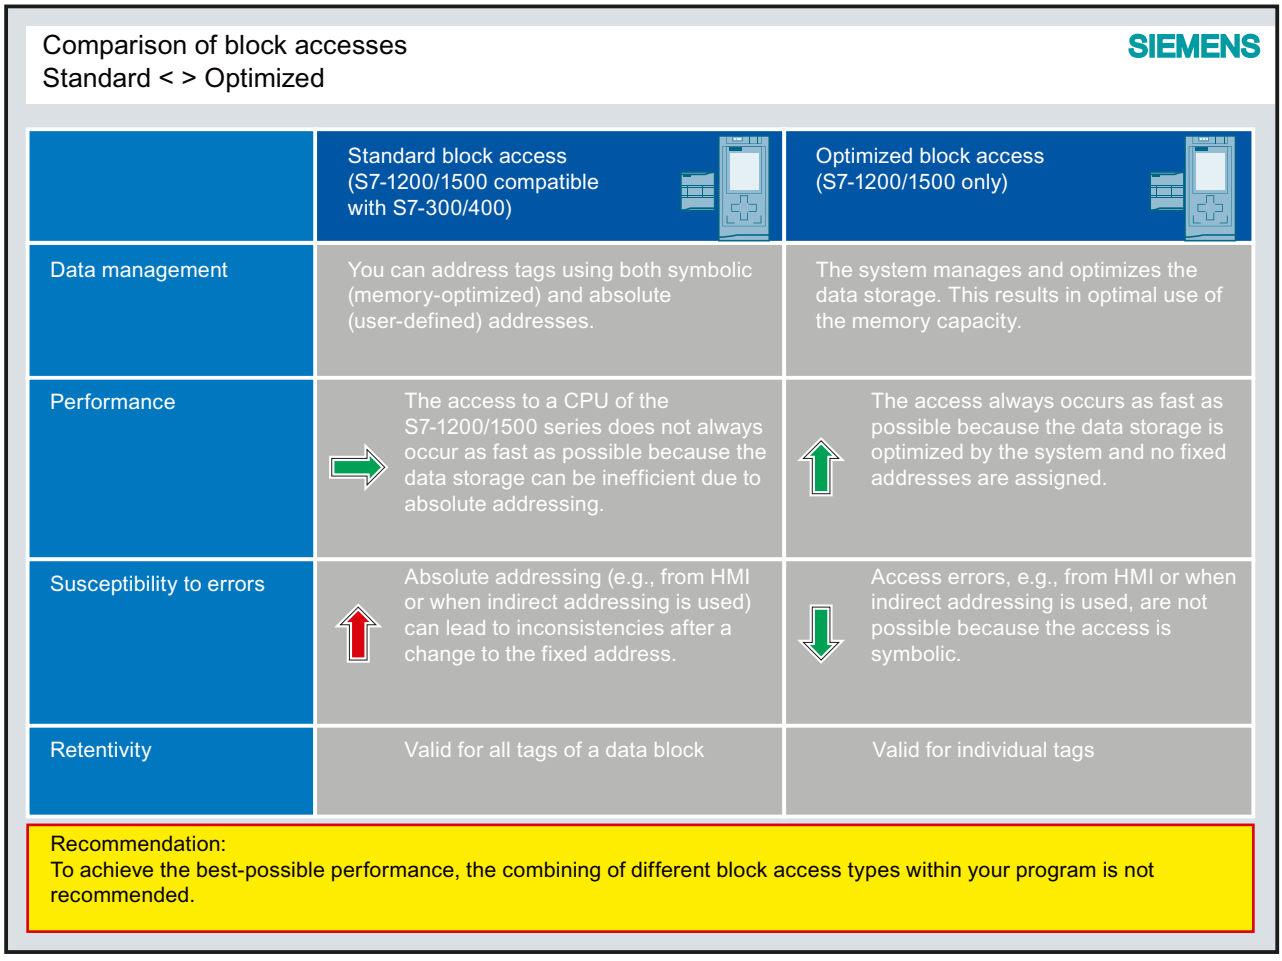
The S7-1500 allows you to use the symbolism throughout the entire project. Using the auto-complete function, you are given context-dependent support for programming with symbols within the programming editors. The data elements, for example those in a data block, are assigned only a symbolic name in the declaration but no fixed address within the data block. This allows you to fully exploit the high performance of the S7-1500 when accessing these data elements. The absolute addresses of operands need not be known and access errors are avoided.

Your program code will be clearer due to the symbolism and you have to comment less. All points of use are automatically updated when a correction is made to the symbolism.

An example of the use of universal symbols is available at: Symbolic addressing (Page 249)

Optimized block access

With optimized block access, the declared data elements are arranged automatically in the available memory area of the block in a way that makes optimal use of its capacity. The data is structured and saved in way that is optimal for the CPU used. The storage is left to the system. The data elements are assigned only a symbolic name in the declaration by which the tag within the block can be addressed. This allows you to increase the performance of the CPU. Access errors, from the HMI, for example, are not possible.



You can find additional information on blocks with optimized access under "See also".

New data types

The new data types LWORD, LINT, ULINT, LTIME, LTOD, LDT and the array (32-bit limit) offer much higher calculation accuracy when using mathematical functions. In the area of implicit and explicit data type conversion, you have more options in comparison to the CPUs of the S7-300/400 series.

You can find additional information on the new data types under "See also".

PLC data types

PLC data types (UDT) are data structures that you define and that can be used multiple times within the program. The structure of a PLC data type is made up of several components, each of which can contain different data types. You define the type of components in the declaration of the PLC data type.

You can use the PLC data type as a base data type for defining tags and as a template for creating global data blocks. If you later make changes to the PLC data type, the changes are automatically updated at all points of use.

You can also symbolically access individual elements of an array within a PLC data type.

You can find additional information on the new data types under "See also".

You can find an example for using PLC data types under: Using PLC data types (UDT) (Page 286)

Uniform instructions in all programming languages

You are provided with a uniform set of instructions in all programming languages (LAD, FBD, STL, SCL, and GRAPH).

Slice access

Slice access gives you the option of specifically addressing areas within declared tags. You can implement symbolic access to a single bit up to the level of the tag. The single bit is then addressed absolutely.

You can find additional information on slice access under "See also".

Indirect addressing

Indirect addressing offers you the option of addressing operands whose address is not calculated until runtime. All programming languages provide general methods for indirect addressing, for example, via POINTER. In the SCL programming language, you can also use PEEK and POKE instructions.

You can find additional information on indirect addressing under "See also".

Additional programming recommendations

You can find more information about programming recommendations and a programming guide in the Siemens Industry online support under:

- FAQs: Programming recommendations (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&Datakey=47071380&extranet=standard&groupid=4000002&viewreg=WW&nodeid0=29156492&objaction=csopen)
- Background and system descriptions in the Programming Guideline (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=100&lang=en&referer=%2fWW%2f&func=cslib.cssearch&nodeid0=4000024&viewreg=WW&siteid=csius&extranet=standard&groupid=4000002&objaction=cssearch&content=adsearch%2Fadsearch%2Easpx)

See also

PLC data types (Page 1954)

6.4.2 Flexibly using enable output ENO

Advantages

You can to detect runtime errors and avoid program termination using the EN/ENO mechanism for each instruction and block call. Overflow, for example, is reported via the ENO enable output for mathematical functions.

In STEP 7 TIA Portal, the ENO enable output is disabled by default in the programming languages LAD and FBD. If needed, you can activate the enable output and thereby deliberately target the instructions for which you want to have error evaluation.

This gives you the following advantages:

- The performance increases with ENO disabled.
- Runtime errors do not cause the CPU to go to STOP when ENO is enabled.

Procedure in STEP 7 TIA Portal

Proceed as follows to activate the EN/ENO mechanism of an instruction:

1. In your program, right-click the instruction at which you want to activate the EN/ENO mechanism.
2. Select the "Generate ENO" command from the shortcut menu.
   The ENO value is generated for the instruction. Other instructions are inserted with the enable output.

The tables below list the instructions for which ENO enable output can be disabled:

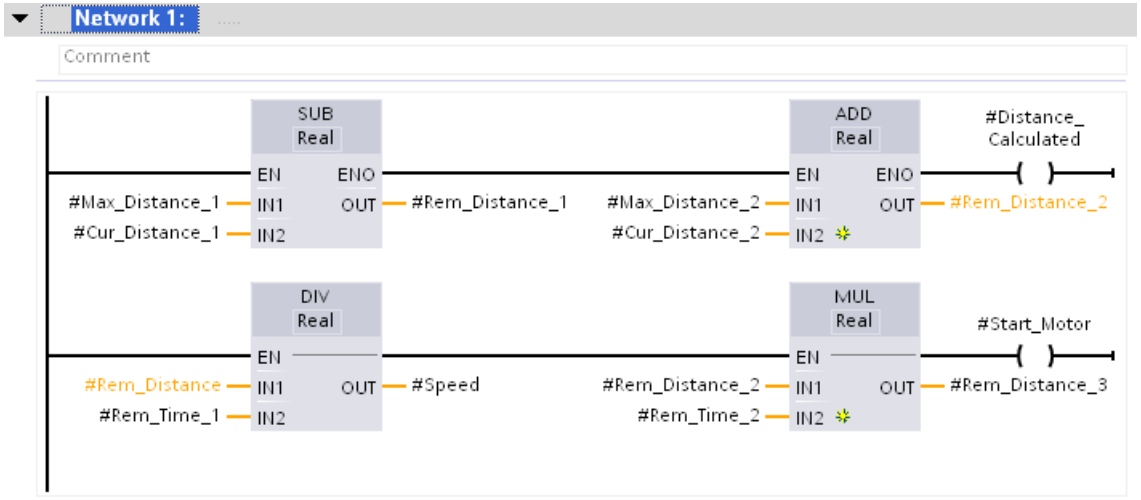
Basic instructions	
Math functions	ADD, SUB, MUL, DIV, MOD, INC, DEC, ABS, NEG, SQR, SQRT, LN, EXP, SIN, COS, TAN, ASIN, ACOS, ATAN, FRAC, EXPT, MIN, MAX, LIMIT, CALCULATE
Move operations	MOVE, SWAP, MOVE_BLK, UMOVE_BLK, FILL_BLK, UFILL_BLK, MOVE_BLK_VARIANT
Conversion operations	CONVERT, ROUND, CEIL, TRUNC, FLOOR, NORM_X, SCALE_X
Word logic operations	AND, OR, XOR, INV, DECO, ENCO
Shift and rotate	SHR, SHL, ROR, ROL

Extended instructions	
String + Char	CONCAT, LEFT, RIGHT, MID, DELETE, INSERT, REPLACE, FIND, LEN, S_CONV
Date and time	T_CONV

You can find additional information on the EN/ENO mechanism in each programming language under "See also".

Programming example

The following example shows you how to use instructions with the ENO enable output enabled and disabled:



If you have activated the ENO enable output, for example with the SUB instruction, all subsequent instructions are also applied with an activated enable output. If an arithmetic error occurs during the execution of the SUB instruction, the ADD instruction is not executed.

The ENO enable output is disabled for the DIV instruction in the second branch. If a runtime error occurs during execution, the MUL instruction is executed anyway.

6.4.3 Querying and fixing errors in the program code

Error handling in the TIA Portal

Various error scenarios can occur within the program code during runtime. These can involve, for example, an access error or an overflow in mathematical operations. If you do not catch such a runtime error using a program code sequence within your program, the CPU reacts as follows in the event of an error, depending on the model:

- CPU S7-1200:
  - The CPU remains in RUN mode and writes an entry to the diagnostics buffer.
- CPU S7-1500:
  - When a programming error occurs, the CPU goes to STOP mode and writes an entry to the diagnostics buffer.
  - With an I/O access error, the CPU remains in RUN mode and writes an entry to the diagnostics buffer.

To be able to respond appropriately to possible errors, in addition to global error handling (for example, the use of the organization blocks "Programming error OB" or "I/O access error OB"), we recommend that you implement local error handling in your program (for example, use an EN/ENO mechanism, the parameters RET_VAL, STATUS and ERROR, or the instructions "GET_ERROR"/"GET_ERR_ID").

Note

STL programming language

In STL, you use the BR bit of the status word instead of the EN/ENO mechanism.

Global error handling intervenes at the end of each program cycle, while local error handling is capable of intervening immediately after an error occurs.

Note

BR bit and EN/ENO mechanism as first indicator

A first indicator for an error can be either the BR bit of the status word or the ENO enable output. If these return signal state "0", there is an error in the execution of the instruction. Signal state "1" indicates that there is no error and no further error analysis is necessary.

Options for local error handling

The following options for local error handling of programming and access errors are available:

Error handling method	Validity	Explanation
EN/ENO mechanism	S7-1200/1500	You can use the ENO enable output to detect and handle runtime errors. Execution of subsequent instructions depends on the signal state of this parameter. You can avoid program crashes by using the EN/ENO mechanism. The block status is passed on in the form of a Boolean tag.
Output parameter RET_VAL	S7-1200/1500	Using the RET_VAL parameter as the return value of system functions (SFCs). you can display general error codes that may relate to any instruction or specific error codes that apply only to the instruction at hand. A maximum of one tag of the data type INT or WORD can be output. This error handling method is suitable for querying a communication error or incorrect data access, for example. You can find more information on the error codes in the Siemens Industry Online Support under the following FAQ ID: 770453 (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&groupid=4000002&extranet=standard&viewreg=WW&nodeid0=10805384&objaction=csopen)
Output parameters STATUS and ERROR	S7-1200/1500	Using the STATUS and ERROR parameters as return values of system function blocks (SFBs), you can query device-specific error information. The error information is output in a pre-defined structure.

Error handling method	Validity	Explanation
Instructions "GET_ERROR" and "GET_ERR_ID"	S7-1200/1500	The instructions give you the opportunity to obtain an error ID or detailed error information. You can use the error information for an access error, for example, to determine the parameter that caused the access error. In order for the instructions to output the required error information, they must be programmed in the user program for each individual block from which potential errors are to be evaluated. This option is ideal especially for custom libraries with error handling. If you work with the "GET_ERROR" or "GET_ERR_ID" instructions, no error OB is called and there is no entry in the diagnostics buffer. With this method of error handling, you actively intervene in the program sequence when an error occurs.
BR bit of the status word	S7-1200/1500	Using the BR bit of the status word, you can determine whether an error occurred when the instruction was executed. (BR bit = "0" => An error has occurred; BR bit = "1" => No error has occurred)

Warning

Output parameter RET_VAL

When errors occur in the supply of the input parameters during the execution of the instruction that contains the RET_VAL parameter, an invalid error code is output at the RET_VAL parameter and the output parameters of the instruction cannot be evaluated.

Example

The above-mentioned local error handling options can be programmed individually or in combination with one another. To ensure that each error scenario that can occur within your program is recognized, we recommend a combination of local error handling options, as shown in the example below.

For a more precise error analysis, in addition to the RET_VAL output parameter you can also use the instructions "GET_ERROR" or "GET_ERR_ID". These options provide you with error codes, the detailed explanations of which are available in the descriptions of the respective instructions.

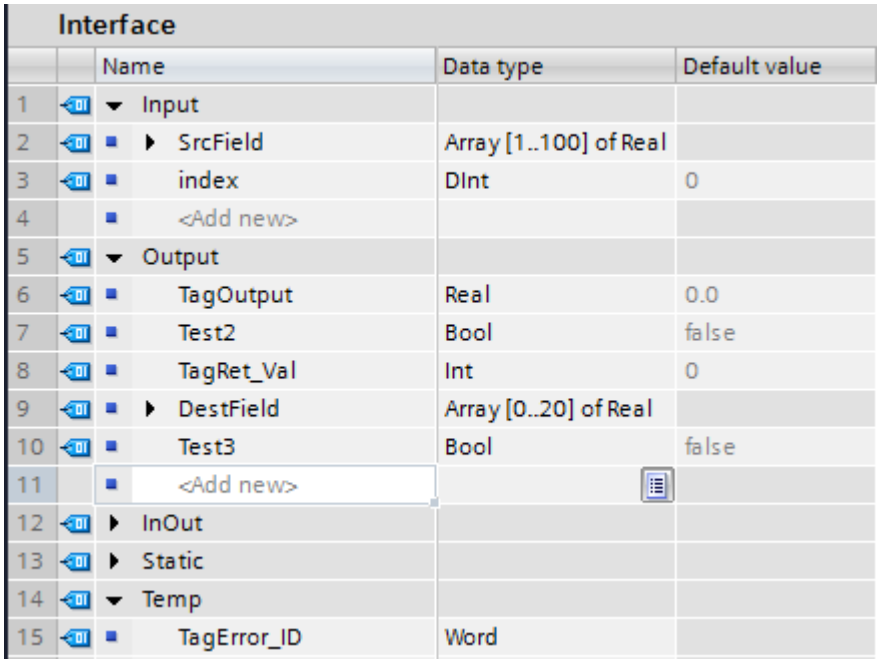
There are also error scenarios in which the RET_VAL output parameter does not output a valid error code. If an access error occurs while reading an input parameter, for example, the outputs of the instruction are no longer written, because the execution of the instruction is interrupted. In this case, we recommend that you integrate the two instructions "GET_ERROR" and "GET_ERR_ID" in your program because they provide reliable error information even when this type of error occurs.

Warning

Access error when reading an input parameter

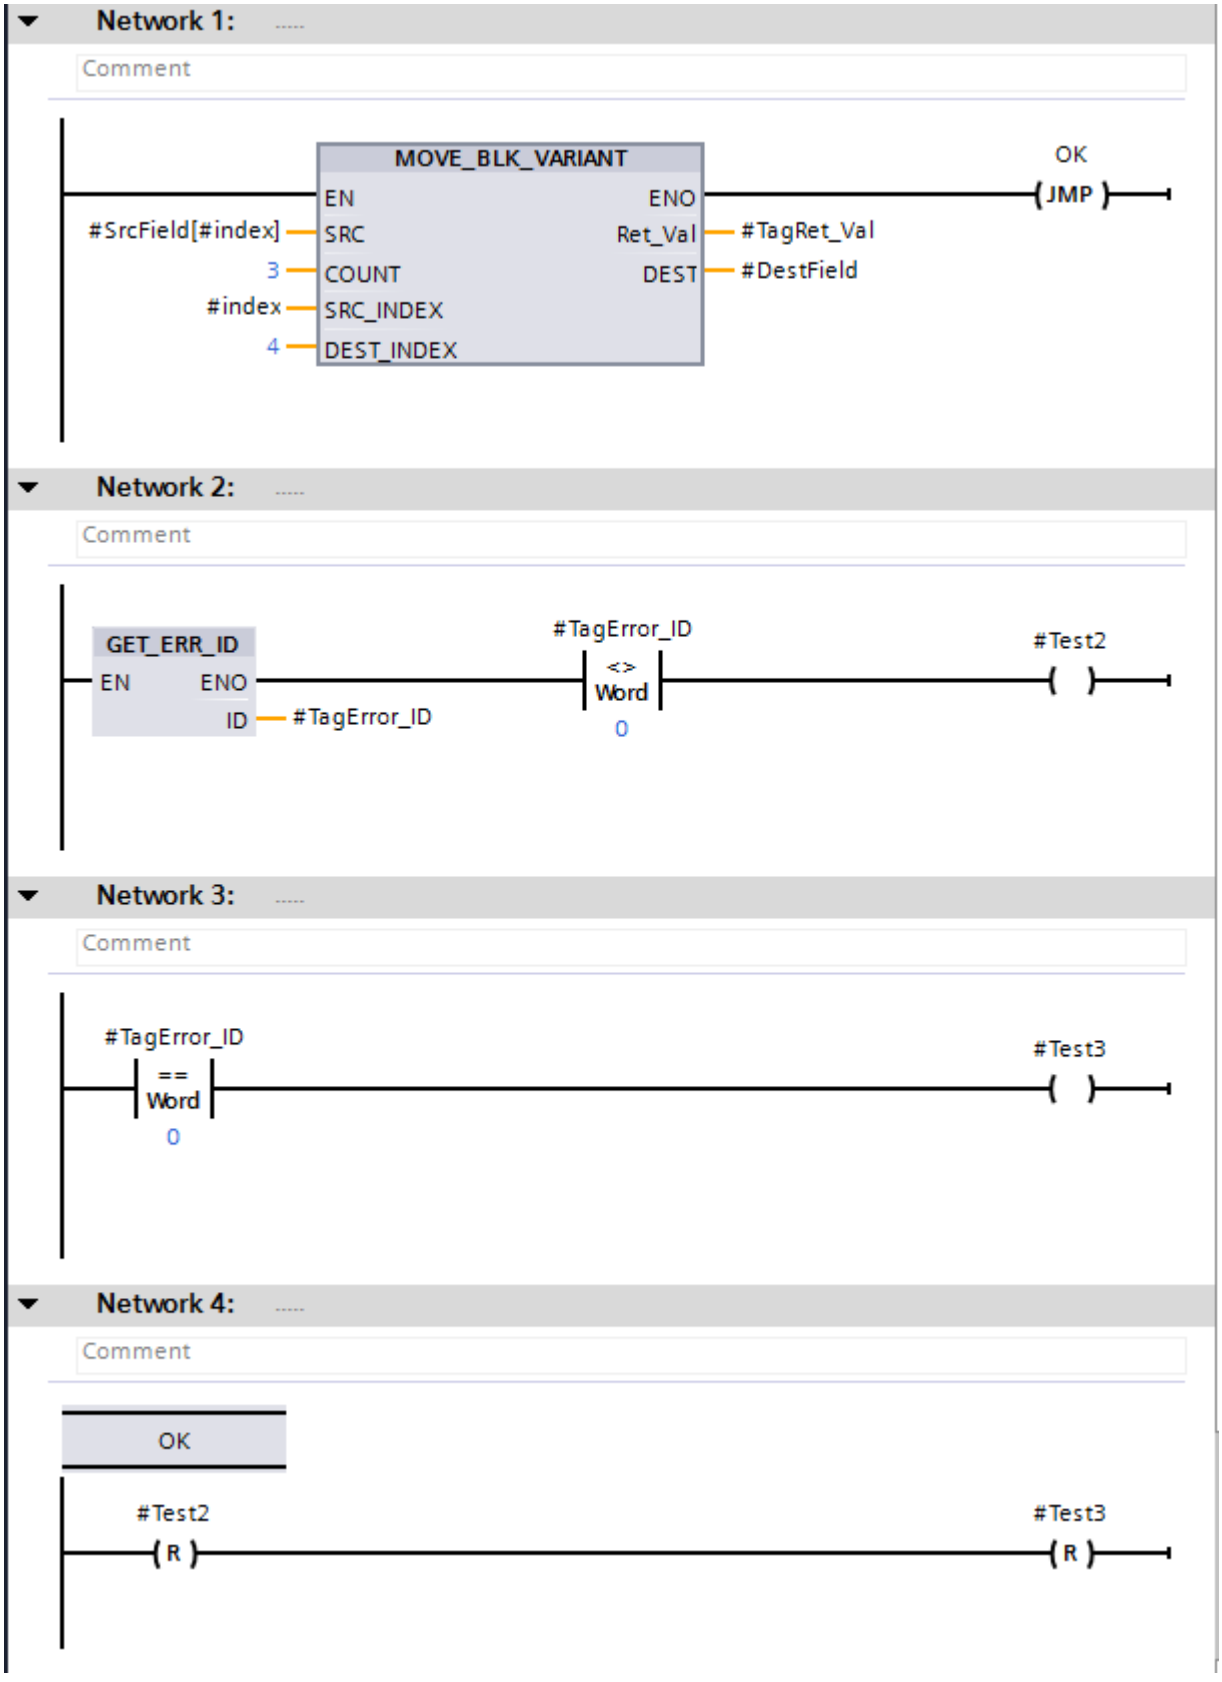
The RET_VAL parameter does not return a valid error code and no detailed error information is output to the diagnostics buffer.

The following example shows you how you can recognize an access error when reading an input parameter:



Interface

		Name	Data type	Default value
1		Input		
2		SrcField	Array [1..100] of Real	
3		index	DInt	0
4		<Add new>		
5		Output		
6		TagOutput	Real	0.0
7		Test2	Bool	false
8		TagRet_Val	Int	0
9		DestField	Array [0..20] of Real	
10		Test3	Bool	false
11		<Add new>		
12		InOut		
13		Static		
14		Temp		
15		TagError_ID	Word	



Network 1:
Comment
MOVE_BLK_VARIANT
EN
ENO
#SrcField[#index]
SRC
Ret_Val
#TagRet_Val
3
COUNT
DEST
#DestField
#index
SRC_INDEX
4
DEST_INDEX

#Test3
Network 4:
Comment
OK
#Test2
R
#Test3
R

In network 1, the instruction "MOVE_BLK_VARIANT": Move block" is called. The "SrcField" source area is accessed at the SRC parameter using a variable index. If no errors occur during the execution of the instruction, the ENO enable output returns signal state "1", and program execution jumps to network 4 and continues there.

If an access error occurs during the execution of the instruction, for example, due to the variable index, the instruction "GET_ERR_ID: Get error ID locally" in network 2 returns an error ID. The comparison of the error ID for "UNEQUALS" with the value "0" in network 2 returns the result #Test2 = TRUE. The comparison of the error ID for "EQUALS" with the value "0" in network 3 returns the result #Test3 = TRUE.

The #TagRet_Val operand at the RET_VAL output parameter returns no valid error code in this case.

Exceptions

There are some instructions, however, for which you cannot program the error handling as described in the example above. This includes the following instructions:

- Instructions which generally do not have an EN/ENO mechanism
- Instructions in which the ENO was disabled
- S_COMP and T_COMP
- PEEK, PEEK_BOOL, POKE, POKE_BOOL and POKE_BLK

The BR bit or the ENO enable output is set to TRUE in these instructions even if it may result in an access error.

The following example shows you how to program reliable error handling in the STL programming language:

		Name	Data type
1		Input	
2		StringArray	Array[0..10] of String
3		index	DInt
4		Output	
5		TagResult	Bool
6		InOut	
7		Static	
8		Temp	
9		TagError_ID	Word
10		Constant	

STL	**Explanation**
SET L 0 T #Tag_ErrorID	// The operand #Tag_ErrorID is initialized with "0".
CALL S_COMP	// The instruction is called.

STL	Explanation
String EQ	
IN1 := #StringArray.[#index]	// Variable access to the ARRAY component.
IN2 := 'STRING'	// The two values are compared with each other.
OUT := #TagResult	// If both values are identical, the operand #TagResult receives the signal state "1".
A BR	// The BR bit is queried.
CALL GET_ERR_ID	// The instruction is called.
RET_VAL := #Tag_ErrorID	// The instruction outputs an error code in the case of an access error.

Even if the RLO bit has signal state "1", the access error is detected. You can query the error code with the evaluation of the #Tag_ErrorID operand of the "GER_ERR_ID instruction: Get error ID locally".

Parameter STATUS (Page 3078)

6.4.4 Using MOVE instructions in STL

Possible applications

You can now program with MOVE instructions in STL on an S7-1500 CPU.

This gives you the following advantages:

- The program structure is easier to create.
- The performance of the CPU increases.

Programming in STEP 7 V5.x

In STEP 7 V5.x, you used the "BLKMOV: Move block" and "UBLKMOV: Move block uninterruptible" system functions to implement the MOVE functionality.

Procedure in STEP 7 TIA Portal

The following new MOVE instructions are available in STEP 7 TIA Portal:

- MOVE: Move value
- MOVE_BLK: Move block
- MOVE_BLK_VARIANT: Move block
- UMOVE_BLK: Move block uninterruptible

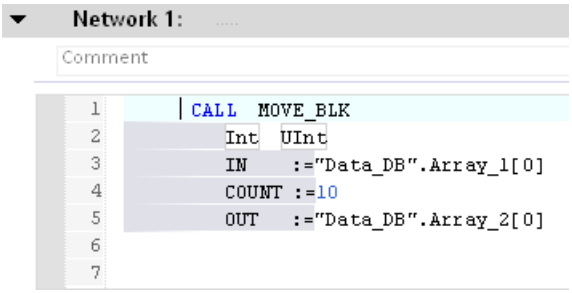
You can find additional information on the new MOVE instructions under "See also".

Programming example

The following example shows you how the "MOVE_BLK instruction works: Move block". An ARRAY block is copied into another ARRAY block:

Data_DB

	Name	Data type
1	Static	
2	Array_1	Array [0..10] of Int
3	Array_1[0]	Int
4	Array_1[1]	Int
5	Array_1[2]	Int
6	Array_1[3]	Int
7	Array_1[4]	Int
8	Array_1[5]	Int
9	Array_1[6]	Int
10	Array_1[7]	Int
11	Array_1[8]	Int
12	Array_1[9]	Int
13	Array_1[10]	Int
14	Array_2	Array [0..10] of Int
15	Array_2[0]	Int
16	Array_2[1]	Int
17	Array_2[2]	Int
18	Array_2[3]	Int
19	Array_2[4]	Int
20	Array_2[5]	Int
21	Array_2[6]	Int
22	Array_2[7]	Int
23	Array_2[8]	Int
24	Array_2[9]	Int
25	Array_2[10]	Int



Using the MOVE_BLK instruction, ten elements from "Array_1" of the "Data_DB" data block are copied into "Array_2" of the same data block.

6.4.5 Using IEC timers and counters

Advantages of IEC timers and counters

The universal use of IEC timers and counters makes your program code more efficient.

This gives you the following advantages:

- The blocks can be called multiple times with newly generated instance data blocks.
- The IEC counters have a large counting range.
- Compared to S5 timers, IEC timers have better performance and greater time accuracy.

Programming in STEP 7 V5.x

The S5 timers and counters in STEP 7 V5.x were addressed absolutely via a number. Due to this dependency on numbers, program blocks were not reusable with S5 timers and counters.

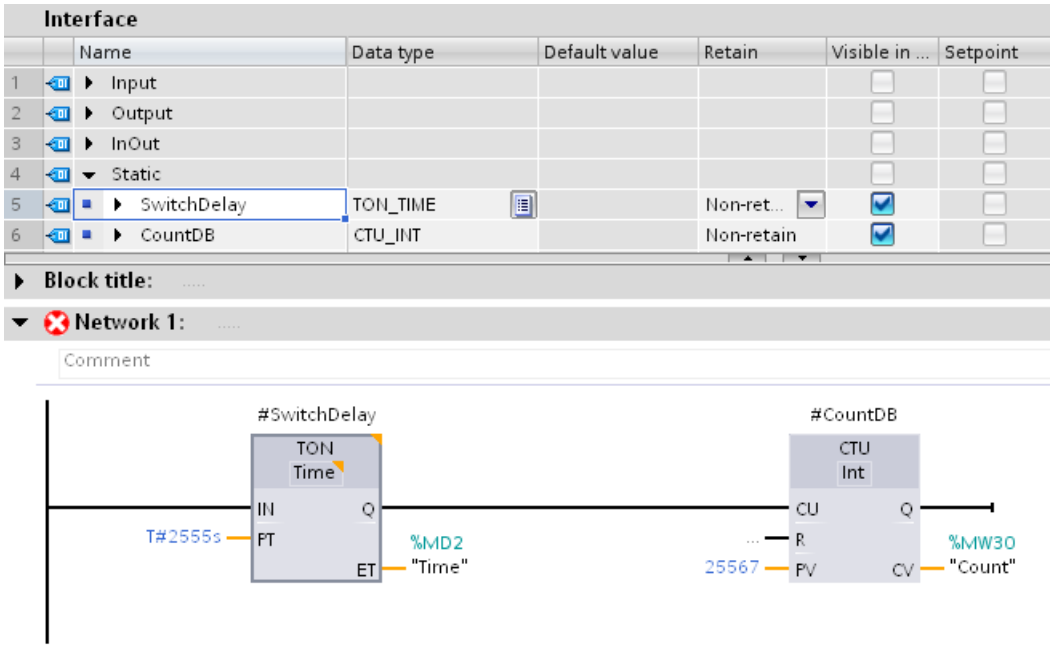
The value range of a timer was limited to 9990 seconds and that of a counter limited to a maximum of 999.

Procedure in STEP 7 TIA Portal

You declare IEC timers and counters in the program block where they are called or needed. The IEC timer is a structure of data type IEC_TIMER, IEC_LTIMER, or TON_TIME and TON_LTIME, for example, which you can also declare as a local tag in a block. The IEC counter is a structure of data type IEC_SCOUNTER, IEC_USCOUNTER, etc.

Programming examples in the TIA Portal

The following example shows you how to declare an IEC timer and IEC counter as a local tag:



The data of the TON IEC timer and the CTU IEC counter is stored as a local tag (multi-instance) in the block interface.

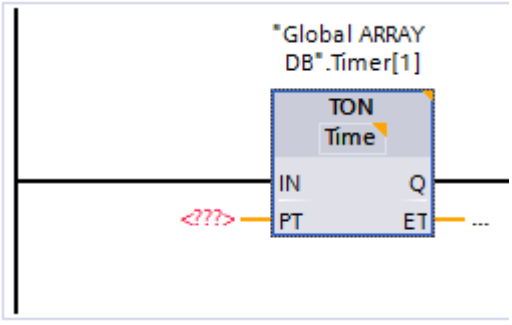
In the LAD and FBD programming languages, you also have the option of creating timers in a global data block and of using these as instances in your program code.

1. To do this, for example, create a global data block with an ARRAY of TON. The data type TON does not appear in the drop-down list, but can be entered manually:

Global ARRAY DB

		Name	Data type
1		Static	
2		Timer	Array[0..10] of TON
3		Timer[0]	TON
4		Timer[1]	TON
5		Timer[2]	TON
6		Timer[3]	TON
7		Timer[4]	TON
8		Timer[5]	TON
9		Timer[6]	TON
10		Timer[7]	TON
11		Timer[8]	TON
12		Timer[9]	TON
13		Timer[10]	TON

2. Create a LAD or FBD function block and drag the instruction "TON: Generate on-delay" to a network. Call the instance of timer TON as follows:



Call of a timer as multi-instance

If you want to use the IN parameter to start a timer as multi-instance, you must not initialize it beforehand in your program code. In this case, the timer called at the IN parameter does not recognize a positive signal edge and the timer is not started:

STL	Explanation
`Q "Tag_Output"`	`// When the "Tag_Output" output receives the signal state 1,`
`= #Timer_1.IN`	`// the IN parameter of the multi-instance timer #Timer_1 is initialized with a positive signal edge.`

STL	Explanation

CALL #Timer_1
???
IN := "Tag_Output"
PT := T#30s
Q := "Tag_4"
ET := "Tag_ElapsedTime"
	// When the multi-instance timer is now called and the IN parameter queried again, the timer is not started because there is no new positive signal edge.
	
	// Enter TIME as data type of the instruction.

This is why you must program the initialization of the multi-instance timer within the call.

STL	Explanation

CALL #Timer_1
???
IN := "Tag_Output"
PT := T#30s
Q := "Tag_4"
ET := "Tag_ElapsedTime"
	// The timer is called and started.
	
	// Enter TIME as data type of the instruction.

Timers (Page 1929)

6.4.6 Using ARRAY data blocks

Using an ARRAY data block (S7-1500)

ARRAY data blocks are global data blocks that consist exclusively of an ARRAY. A data block with a tag of the ARRAY data type is sufficient for most applications because access can be programmed intuitively with a tag of the ARRAY data type (for example, #myArray[#index]) and offer a better runtime performance than ARRAY data blocks. In certain scenarios, however, it is necessary to process ARRAYs with different lengths. The ARRAY data block is particularly suitable for these scenarios. ARRAY data blocks with different length can be processed by means of the following instructions:

- ReadFromArrayDB: Read from Array data block
- WriteToArrayDB: Write to array data block
- ReadFromArrayDBL: Read from array data block in load memory
- WriteToArrayDBL: Write to array data block in load memory

For more information about the instructions, refer to "Basic instructions > LAD/FBD/STL/SCL/GRAPH > Move operations > ARRAY DB".

When the program code is being written, it is not necessary to know which ARRAY data block is read or written or what size it is. As a result, you can program the block flexibly so that it can also be used for buffers of various length. It is also not necessary to know the data type of the ARRAY elements, as the function in the program code using the DB_ANY data type does not yet require this information. The data type VARIANT is used so that you can also be flexible

in specifying the value to be read or written. The ARRAY data block is transferred only during runtime in order to then access the values in the program block. The data type of the ARRAY elements and the data type of the value that is to be read or written are determined. You can determine the number of objects and the fill level of the ARRAY data block using the ARRAY elements.

Note

When you create an ARRAY data block, specify the data type and the number of ARRAY elements. The data type of the value which is to be written to the ARRAY data block, for example, must match the data type of the ARRAY elements of the data block. In each case, connect a source area (PLC data type) with a destination area (ARRAY data block).

The advantage of this procedure is that the program code can already be created before you know which ARRAY data block and which value will be processed.

Programming example

The following example shows you how to use an ARRAY data block:

Individual pieces of material are transported on a conveyor belt. These pieces of material pass a scanner which can read out the information that a piece of material carries with it. The information is read out and transmitted to a panel. Because the scanner and the panel have different clock cycles/speeds, the material information must be cached in each case.

In the following programming example, we show you how to program the program code for passing on material information. For this purpose, you use a PLC data type (UDT) and an ARRAY data block.

Procedure

Create the PLC data type "UDT_Queue". You use this PLC data type as an instance which can be accessed by both functions ("FC_Enqueue" and "FC_Dequeue"). This is important, for example, for accessing the tag #Queue.Used, as the function "FC_Enqueue" increments the tag by one and the function "FC_Dequeue" decrements the tag by one.

1. Double-click the "Add new data type" command in the "PLC data types" folder in the project tree.
   A new declaration table for creating a PLC data type will be created and opened.
2. Declare the following lines within the PLC data type:
   DB > Data type: DB_ANY
   Size > Data type: DINT
   Used > Data type: DINT
   ReadPos > Data type: DINT
   WritePos > Data type: DINT

UDT_Queue

	Name	Data type	Default value	Comment
1	DB	DB_ANY	0	
2	Size	DInt	0	
3	Used	DInt	0	
4	ReadPos	DInt	0	Pointer Reading Position
5	WritePos	DInt	0	Pointer Writing Position

Program the instruction "FC_Enqueue", which writes the values from a PLC data type into an ARRAY data block. The PLC data type and the ARRAY data block must be still unknown at this time, as the interfaces with the data types VARIANT and DB_ANY are programmed:

1. Create an SCL function and name it "FC_Enqueue".
2. Declare the block interface as follows:

FC_Enqueue

	Name	Data type	Comment
1	Input		
2	Value	Variant	
3	Output		
4	InOut		
5	Queue	"UDT_Queue"	
6	DB	DB_ANY	
7	Size	DInt	
8	Used	DInt	
9	ReadPos	DInt	Pointer Reading Position
10	WritePos	DInt	Pointer Writing Position
11	Temp		
12	Error	Int	
13	<Add new>		
14	Constant		
15	Return		
16	FC_Enqueue	Int	

3. Write the following program code:

```
IF #Queue.Used < #Queue.Size THEN // As long as there is enough space in the DB
                                  // the function keeps on writing.

    #Error := WriteToArrayDB(db := #Queue.DB, index := #Queue.WritePos, value := #Value);

    IF #Error = 0 THEN

        #Queue.Used := #Queue.Used + 1;
        #Queue.WritePos := #Queue.WritePos + 1;

        IF #Queue.WritePos >= #Queue.Size THEN // If this condition is fullfilled
                                               // the end of the DB is reached.
                                               // End of writing pointer.

            #Queue.WritePos := 0;

        END_IF;

    END_IF;

ELSE

    #Error := 4711; // The queue is full.

END_IF;
```

With this function, you check whether there is still space free in the data block. If so, write the value that is specified at the parameter value into the data block at the parameter db. With each new item of material information that is written, the tag #Queue.Used and the pointer tag #Queue.WritePos are incremented by one. As soon as the cursor reaches the end of the data block, it is reset to 0. If the data block is full, the error code #4711 is returned.

Program the instruction "FC_Dequeue", which reads the material information from an ARRAY data block and writes it into a PLC data type. The PLC data type and the ARRAY data block must be still unknown at this time, as the interfaces are programmed with the data types

VARIANT and DB_ANY. The material information can then be displayed on a panel, for example:

1. Create an SCL function and name it "FC_Dequeue".
2. Declare the block interface as follows:

FC_Dequeue

	Name	Data type	Comment
1	Input		
2	Output		
3	InOut		
4	Value	Variant	
5	Queue	"UDT_Queue"	
6	DB	DB_ANY	
7	Size	DInt	
8	Used	DInt	
9	ReadPos	DInt	Pointer Reading Position
10	WritePos	DInt	Pointer Writing Position
11	Temp		
12	Error	Int	
13	Constant		
14	Return		
15	FC_Dequeue	Int	

3. Write the following program code:

```
IF #Queue.Used > 0 THEN // As long as there is some information in the DB
                        // the function keeps on reading.

    #Error := ReadFromArrayDB(db := #Queue.DB, index := #Queue.ReadPos, value => #Value);

    IF #Error = 0 THEN

        #Queue.Used := #Queue.Used - 1;
        #Queue.ReadPos := #Queue.ReadPos + 1;

        IF #Queue.ReadPos >= #Queue.Size THEN // If this condition is fullfilled
                                              // the end of the DB is reached.
                                              // End of reading pointer.

            #Queue.ReadPos := 0;

        END_IF;

    END_IF;

ELSE

    #Error := 4712; // The queue is empty.

END_IF;
```

With this function, you check whether material information is available in the data block. If so, read the value to which the pointer #Queue.ReadPos points, and write it to the tag #Value. With each item of material information that is read, the tag #Queue.Used is decremented by one and the pointer tag #Queue.ReadPos is incremented by one. As soon as the cursor reaches the end of the data block, it is reset to 0. If the data block is empty, the error code #4712 is returned.

In order to be able to write or read data, you require a specific PLC data type and an ARRAY data block, each of which must have the same data type.

To do this, create the PLC data type "UDT_Material". The scanner writes the read-out material information into this PLC data type.

1. Double-click the "Add new data type" command in the "PLC data types" folder in the project tree.
   A new declaration table for creating a PLC data type will be created and opened.
2. Declare the following lines within the PLC data type:
   ArticleNumber > Data type: DINT
   ArticleName > Data type: STRING
   Amount > Data type: REAL
   Unit > Data type: STRING

UDT_Material

	Name	Data type
1	ArticleNumber	DInt
2	ArticleName	String
3	Amount	Real
4	Unit	String

Create the ARRAY data block "DB_MaterialBuffer". The material information from the PLC data type "UDT_Material" is sent to this ARRAY data block with the help of the function "FC_Enqueue".

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the name "DB_MaterialBuffer".
4. Select the type of the data block "ARRAY DB".
5. Select the PLC data type "UDT_Material" as ARRAY data type.
6. Specify "1000" as high ARRAY limit.
7. Click "OK".

DB_MaterialBuffer

	Name	Data type
1	DB_MaterialBuffer	Array[0..1000] of "UDT_Material"
2	DB_MaterialBuffer[0]	"UDT_Material"
3	ArticleNumber	DInt
4	ArticleName	String
5	Amount	Real
6	Unit	String
7	DB_MaterialBuffer[1]	"UDT_Material"
8	DB_MaterialBuffer[2]	"UDT_Material"
9	DB_MaterialBuffer[3]	"UDT_Material"
10	DB_MaterialBuffer[4]	"UDT_Material"
11	DB_MaterialBuffer[5]	"UDT_Material"

Create the start of the organization block (OB) "OB_MaterialQueue". In this organization block, you initialize the tags DB and Size.

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Organization block (OB)" button.
3. Specify the name "OB_MaterialQueue".
4. Select the type "Startup".
5. Select SCL as the language of the organization block.
6. Click "OK".
7. Write the following program code:

```
1  "DB_MaterialQueue".DB := "DB_MaterialBuffer";
2  "DB_MaterialQueue".Size := 1000;
3  "DB_MaterialQueue".Used := 0;
4  "DB_MaterialQueue".ReadPos := 0;
5  "DB_MaterialQueue".WritePos := 0;
```

   By assigning the data block, you connect the ARRAY data block "DB_MaterialBuffer" with the SCL functions "FC_Enqueue" and "FC_Dequeue". Enter the size of the ARRAY data block at the Size parameter. The start value of the Used parameter is "0". The first item of material information is thus written to the ARRAY element "0".

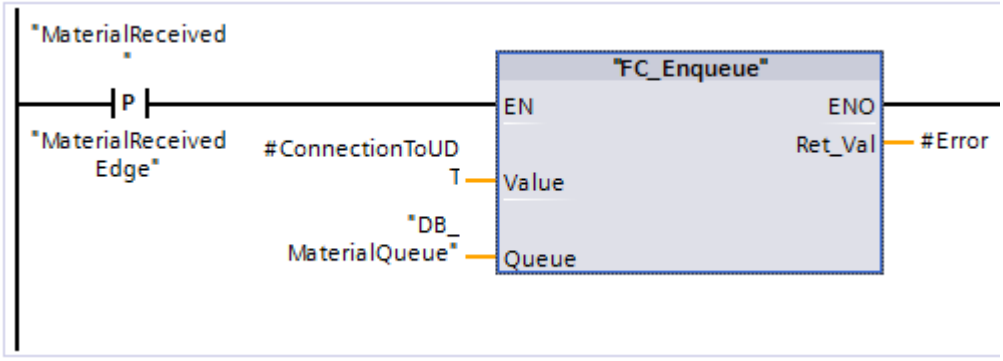
1. Select the folder "Program blocks" in the project tree and select the command "Compile > Software (only changes)" from the shortcut menu.
2. Declare the following tags in the "Default tag table":

Name	Data type	Address
MaterialReceived	Bool	%I0.0
MaterialReceivedEdge	Bool	%M0.0
MaterialDone	Bool	%I1.0
MaterialDoneEdge	Bool	%M0.1

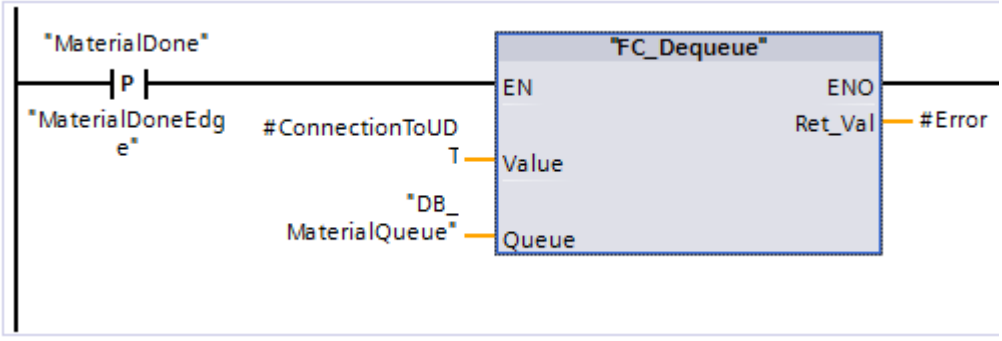
3. Call the SCL function "FC_Enqueue" within the function block in which the scanner reads out the material information.
4. Declare the tag "ConnectionToUDT" in the section "Temp" in the block interface and link this tag with the PLC data type "UDT_Material":

Temp	
ConnectionToUDT	"UDT_Material"
ArticleNumber	DInt
ArticleName	String
Amount	Real
Unit	String

5. Link the function call with the following tags and, at the enable input EN, create the signal edge "P: Scan operand for positive signal edge". Link the signal edge with the global tags from the default tag table:



6. Call the SCL function "FC_Dequeue"
7. Link the function call with the following tags and, at the enable input EN, create the signal edge "P: Scan operand for positive signal edge". Link the signal edge with the global tags from the default tag table:



Result

As soon as a positive signal edge occurs, material information is written to an ARRAY data block with the help of the instruction "WriteToArrayDB" and sent to the panel with the help of the instruction "ReadFromArrayDB".

6.4.7 Reliable addressing

6.4.7.1 Symbolic addressing

Advantages of symbolic addressing

The use of universally applied and meaningful symbols in the overall project makes the program code easier to read and understand.

This gives you the following advantages:

- You do not have to write detailed comments.
- Data access is faster.
- No errors occur when accessing data.
- You no longer have to work with absolute addresses.
- The assignment of the symbol to the memory address is monitored by STEP 7, which means all points of use are automatically updated when the name or the address of a tag changes.

Programming in STEP 7 V5.x

STEP 7 V5.x already gave you the option to write a program that is easier to read by using descriptive names for operands and blocks. You did this by assigning the symbolic operands to memory addresses and blocks in the symbol table. In order for a change in the symbolism to also have an affect on the program code in the program editor, you had to use the "Operand priority" property to specify whether the symbol or the absolute value had priority.

The use of symbolic addressing allowed you to create a program with greater clarity. However, in some cases, such as when programming with user-defined data types (UDT), this could impair performance.

You could increase the performance by ignoring the symbolism in the UDT and using absolute addressing. This made it necessary, however, to know the data storage. Changes to the UDT were not automatically updated. Using absolute addressing, you could also access parts of a tag and edit these. The disadvantage of exclusively absolute addressing, however, was that the program code became cluttered after a certain level and you had to insert additional comments for better orientation.

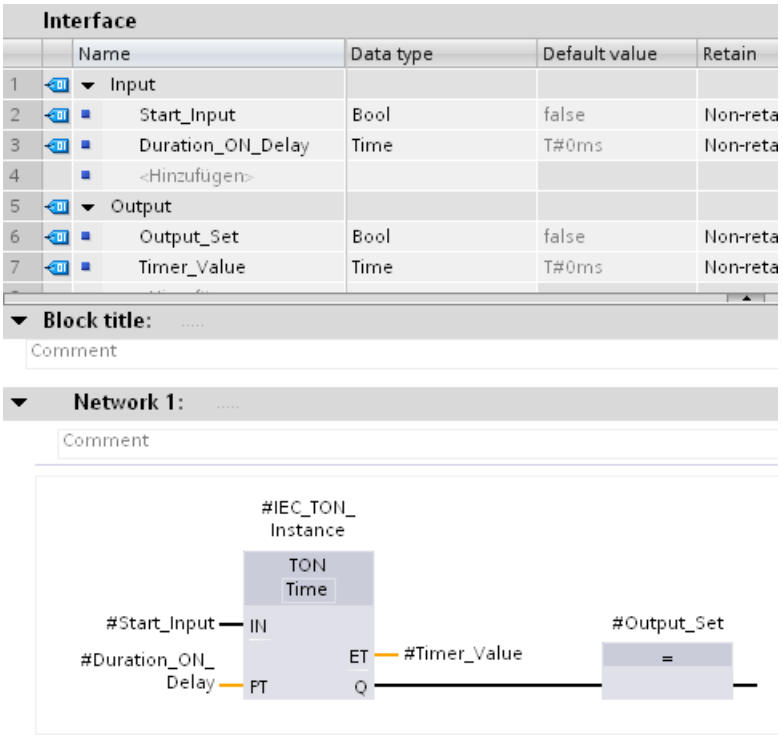
Procedure in STEP 7 TIA Portal

The S7-1500 CPU offers much higher performance than the S7-300/400 CPUs. To make full use of this high performance, we recommend that you enable optimized block access for all blocks and use symbolic addressing in the program code.

The program editor helps you work with symbols through context-sensitive input help, for example, auto-completion. Using it, you can easily access existing tags or instructions during programming.

Programming example

The following example shows you how to symbolically access individual elements:



You can use the tag names that you have defined in the block interface directly at the parameters of the TON instruction without knowing the absolute address of the tags.

6.4.7.2 Addressing with Slice access

Symbolically accessing tags of Bit string data type, bit by bit, byte by byte, word by word and double word by double word

You have the option to specifically address areas within declared tags. You can access areas of the 1-bit, 8-bit, 16-bit, or 32-bit width. The allocation of a memory area (e.g., BYTE or WORD) to a small memory area (e.g., BOOL) is also referred to as "Slice".

You can find additional information on the syntax of slice access under "See also".

Programming example

You can find a detailed example in the Siemens Industry Online Support under the following FAQ ID: 57374718 (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&Datakey=47071380&extranet=standard&groupid=4000002&viewreg=WW&nodeid0=29156492&objaction=csopen)

6.4.7.3 Indirect addressing of ARRAY elements

Implementing ARRAY access in TIA Portal with a variable index

It is advisable to use an ARRAY when you want to process assembled data of the same data type. For addressing ARRAY elements, you can specify either constants or tags of the integer data type as index. Integers with lengths of up to 32 bits are allowed here.

With indirect addressing using a tag, the index is only calculated during program runtime. You can, for example, use a different index for each cycle in program loops. You can also access an ARRAY within a PLC data type (UDT).

This gives you the following advantages:

- No addressing is necessary with address registers or with self-assembled pointers, for example, an ANY pointer.
- More flexibility within your program.
- The variable index is available in all STEP 7 programming languages.
- It uses the existing names of data blocks and ARRAY tags (symbolic addressing). This improves readability of the program code.
- The start address of the ARRAY does not have to be known.
- The program code is easier to create and the compiler generates optimized program code.

Procedure in STEP 7 V5.x

In STEP 7 V5.x, you had to use an address register with the help of a self-configured POINTER for indirect addressing of ARRAY elements. The following aspects had to be taken into consideration for this:

- The name of the ARRAY was not used. This reduced the readability of the program code and make additional comments necessary.
- The start address of the ARRAY had to be known to perform the addressing.

The SCL programming language already supported indirect addressing with variable index.

Programming example in STEP 7 V5.x

The "Data_classic" data block is required for the following STL example. To address an element of the "Quantities" ARRAY, the following commands must be used:

STL	Explanation
`OPN "Data_classic"`	`// The "Data_classic" data block is called.`
`L #index`	`// The value of the local tag #index is loaded into accumulator 1.`
`SLD 3`	`// Move bits 0 to 31 of accumulator 1 by 3 positions to the left.`
	`// Fill the now empty bit places with zeros.`
`LAR1`	`// Load address register 1 with contents of accumulator 1.`
`L DBW [AR1, P#10.0]`	`// Load the ARRAY element addressed with #index into accumulator 1.`
	`// P#10.0 = Start address of the array`

Programming example in STEP 7 TIA Portal

In the example below, you see the indirect addressing of an ARRAY element in STL in the TIA Portal.

Create a global data block for this purpose:

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the name "DB_Quantities".
4. Select the type of the data block "ARRAY DB".
5. Select the "DINT" data type as ARRAY data type.

6. Specify "10" as high ARRAY limit.
7. Click "OK".

DB_Quantities

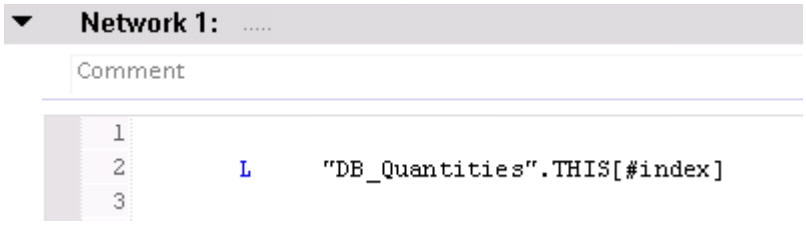
	Name	Data type
1	DB_Quantities	Array[0..10] of DInt
2	DB_Quantities[0]	DInt
3	DB_Quantities[1]	DInt
4	DB_Quantities[2]	DInt
5	DB_Quantities[3]	DInt
6	DB_Quantities[4]	DInt
7	DB_Quantities[5]	DInt
8	DB_Quantities[6]	DInt
9	DB_Quantities[7]	DInt
10	DB_Quantities[8]	DInt
11	DB_Quantities[9]	DInt
12	DB_Quantities[10]	DInt

1. Create a function block and name it "FB_Quantities".
2. Declare the block interface as follows:

FB_Quantities

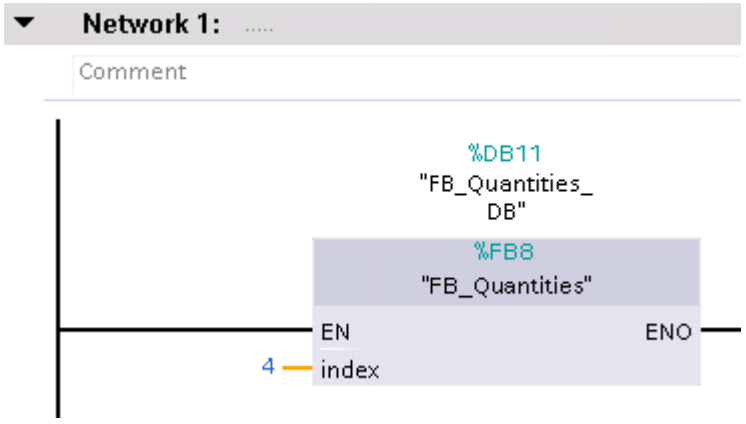
	Name	Data type
1	Input	
2	Output	
3	InOut	
4	Static	
5	Temp	
6	Index	Int
7	Constant	

3. Write the following program code:



You need just one more program line for addressing an ARRAY element in the TIA Portal. The value of the ARRAY element #index is loaded directly from the data block into accumulator 1.

4. Call the "FB_Quantities" function block in OB1 and assign it an index between 0 - 10:



Note the following to get the best performance:

- Declare tags that are used as an ARRAY index as an integer of less than or equal to 32 bits.
- Store intermediate results and ARRAY indexes in the temporary local data area.

Array (Page 1941)

6.4.7.4 Addressing tags indirectly

Implementing tag access with variable index

Using a variable index, you can access tags that have different data types and are located in different areas. For addressing, you can specify either constants or tags of the integer data type as index. Integers with lengths of up to 32 bits are allowed here.

With indirect addressing using a tag, the index is only calculated during program runtime. You can, for example, use a different index for each cycle in program loops.

This gives you the following advantages:

- No addressing is necessary with address registers or with self-assembled pointers, for example, an ANY pointer.
- More flexibility within your program.
- The variable index is available in all STEP 7 programming languages.
- The existing names of data blocks and tags are used (symbolic addressing). This improves readability of the program code.
- The start address does not need to be known.
- The program code is easier to create and the compiler generates optimized program code.

1. Programming example

In the example below, you use the index to access three tags from different memory areas.

Access list of the three tags, each of which is assigned to an index:

Index	Accessing tag	Memory area
1	Input_WORD_0	IW 0
2	"Processdata".Temperature	DB 1
3	Output_WORD_4	QW 4

Declare the following two tags in the "Default tag table":

Default tag table

		Name	Data type	Address
1		Input_WORD_0	Word	%IW0
2		Output_WORD_4	Word	%QW4

Create a global data block:

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the name "DB_Processdata".
4. Select "Global DB" as the type of the data block.
5. Click "OK".
6. Declare the data block element "Temperature":

DB_Processdata

		Name	Data type	Start value
1		Static		
2		Temperature	DInt	50

Declare indirect access using an index within a function.

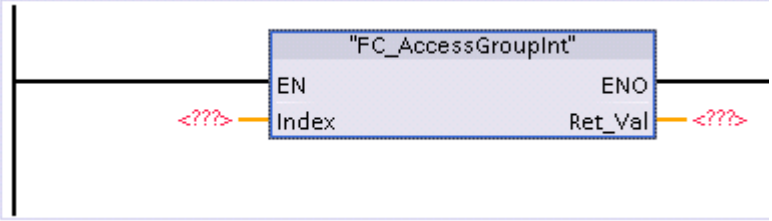
1. Create an SCL function and name it "FB_AccessGroupInt".
2. Declare the block interface as follows:

FC_AccessGroupInt		
	Name	Data type
1	Input	
2	Index	Int
3	Output	
4	InOut	
5	Temp	
6	Constant	
7	Return	
8	FC_AccessGroupInt	DInt

3. Write the following program code:

```
1
2  CASE #Index OF
3
4      1: // First case: "Input_WORD_0"
5          #FC_AccessGroupInt := "Input_WORD_0";
6      2: // Second case: "DB_Processdata".Temperature
7          #FC_AccessGroupInt := "DB_Processdata".Temperature;
8      3: // Third case: "Output_WORD_4"
9          #FC_AccessGroupInt := "Output_WORD_4";
10
11 END_CASE;
```

4. Call the "FC_AccessGroupInt" function in OB1:



Depending on which number (1, 2 or 3) you specify at the Index parameter, the first, second or third case of the "FC_AccessGroupInt" instruction is executed.

2. Programming example

In the example below, you use the index to access three different optimized data blocks.

Since all data blocks should contain the same tags, you can use a PLC data type (UDT) in this case.

1. To create a PLC data type, double-click the "Add new data type" command in the "PLC data types" folder in the project tree.
   A new declaration table for creating a PLC data type will be created and opened.
2. Rename the PLC data type to "UDT_SiloContents".
3. Declare the following lines within the PLC data type:
   MyBool > Data type: BOOL
   MyInt > Data type: INT
   MyWord > Data type: WORD

UDT_SiloContents

		Name	Data type
1	...	MyBool	Bool
2	...	MyInt	Int
3	...	MyWord	Word

Create three global data blocks.

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the names "DB_SiloWater", "DB_SiloSugar" and "DB_SiloMilk".

4. Select the data blocks "UDT_SiloContents" as the type of the data blocks.
5. Click "OK".

DB_SiloWater

		Name	Data type
1		Static	
2		MyBool	Bool
3		MyInt	Int
4		MyWord	Word

DB_SiloSugar

		Name	Data type
1		Static	
2		MyBool	Bool
3		MyInt	Int
4		MyWord	Word

DB_SiloMilk

		Name	Data type
1		Static	
2		MyBool	Bool
3		MyInt	Int
4		MyWord	Word

Create a function to read the values of the data block tags and to write these to a PLC data type.

1. Create an SCL function and name it "FC_AccessGroupSiloRead".
2. Declare the block interface as follows:

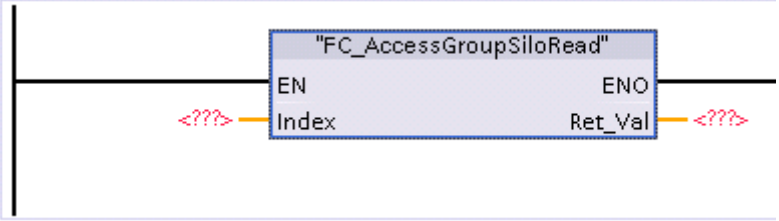
FC_AccessGroupSiloRead

		Name	Data type
1		Input	
2		Index	DInt
3		Output	
4		InOut	
5		Temp	
6		Constant	
7		Return	
8		FC_AccessGroupSiloRead	"UDT_SiloContents"

3. Write the following program code:

```
1
2  CASE #Index OF
3
4      1: // First case: "DB_SiloWater"
5          #FC_AccessGroupSiloRead := "DB_SiloWater";
6      2: // Second case: "DB_SiloSugar"
7          #FC_AccessGroupSiloRead := "DB_SiloSugar";
8      3: // Third case: "DB_SiloMilk"
9          #FC_AccessGroupSiloRead := "DB_SiloMilk";
10
11     ELSE // Optional case
12         #FC_AccessGroupSiloRead := "DB_SiloWater";
13
14 END_CASE;
```

4. Call the "FC_AccessGroupSiloRead" function in OB1:



Depending on which number (1, 2 or 3) you specify at the Index parameter, the first, second or third case of the "FC_AccessGroupSiloRead" instruction is executed.

Result

With this procedure, the programming is

- comprehensible, as you can use cross-reference lists
- reliable, as you use only the previously defined memory areas
- applicable to both standard and optimized data areas

6.4.8 Handling specific data types

6.4.8.1 Using the VARIANT data type

Overview of the VARIANT data type

Introduction

The VARIANT data type is a pointer or a reference to another data object. The data type VARIANT is typified, i.e., you can read out the data type of a referenced tag during program runtime.

Using the data type VARIANT, you can above all create generic, standardized function blocks (FB) or functions (FC) for various data types. Various instructions in all programming languages are available to you for this purpose. During the creation of the program, you can specify which data types the block should be able to process. The VARIANT data type supports you here by allowing the interconnection of any tags. You can then react accordingly to their data types in the block.

Each of the figures below shows you a section from the "Moving data" programming example. You can find the detailed program code under "See also".

Application cases for pointers with an S7-1200/1500 CPU as compared to S7-300/400

The following table provides you with an overview of the various applications for pointers on a CPU of the S7-300/400 series (ANY pointer) and their solution with a CPU of the S7-1200/1500 series.

In most applications, the use of a pointer is no longer required on a CPU of the S7-1200/1500 series. Instead, much simpler language resources are available.

It is only advisable to use the VARIANT data type for indirect addressing, when the data types are only determined during the program runtime.

What is the purpose of the ANY pointer?	Recommendations in the TIA Portal (S7-1200/ S7-1500)
Moving data of any source and destination data type in the program using the instruction "BLKMOV: Move block".	Definition of tags within a PLC data type. You can use the instructions "Serialize" and "Deserialize" to move the tags.
Initializing an ARRAY structure	Using the instruction "FILL_BLK: Fill block", you initialize or fill an ARRAY structure.
Moving ARRAY elements	Using the instruction "MOVE_BLK: Move block". you move the content of multiple elements of an ARRAY structure to another ARRAY structure.

What is the purpose of the ANY pointer?	Recommendations in the TIA Portal (S7-1200/ S7-1500)
Memory and performance optimization using structured data	Use the InOut section in the block interface to optimize memory and performance. You can find additional information in the "Programming Guideline for S7-1200/1500" under the following link Programming Guideline for S7-1200/1500 (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=4&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&groupid=4000002&extranet=standard&viewreg=WW&nodeid4=20229695&objaction=csopen)
Access to individual bits/bytes of a WORD	Use the "slice access" Additional information is available here: Example of a slice access (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&groupid=4000002&extranet=standard&viewreg=WW&nodeid0=29156492&objaction=csopen)
Determination of the length of structures or data blocks	Use an ARRAY and read its length using the instruction "CountofElements: Get number of ARRAY elements. The instruction only works in conjunction with the data type VARIANT.
Indirect addressing	You can use the VARIANT pointer for the indirect addressing of data types that will only be known during runtime. You can use the data type DB_ANY for indirect access to a data block.

Initializing the VARIANT data type

Initialize the VARIANT data type by assigning a specific tag to the VARIANT block parameter at the block call. This forms a reference to the address of the passed tag. To do this, create a block parameter of the VARIANT data type in the block interface. In the following example, these are the two block parameters SourceArray and DestinationArray in the section InOut.

FC_PartialArrayCopy

	Name	Data type
1	Input	
2	Count	UDInt
3	SourceIndex	DInt
4	DestinationIndex	DInt
5	Output	
6	InOut	
7	SourceArray	Variant
8	DestinationArray	Variant
9	Temp	
10	Error	Int
11	Constant	
12	<Add new>	
13	Return	
14	FC_PartialArrayCopy	Int

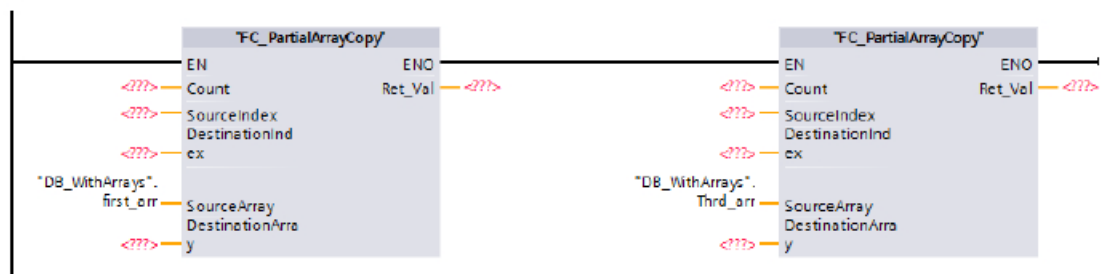
Note

Direct passing of a tag to a VARIANT tag is not possible, such as myVARIANT := #Variable

Passing various data types

In the following example, you see how the VARIANT block parameter can be initialized with different tags when a generic, standardized function is called multiple times:

The "FC_PartialArrayCopy" function is called twice. The VARIANT parameter SourceArray is interconnected with an ARRAY of "my_struct" with the left call. The VARIANT parameter SourceArray is interconnected with an ARRAY of REAL with the right call.



Reading out and checking data types

Various comparison instructions are available to you to read out the data type of a tag or an element and compare it with data types of other tags or elements.

In the figure below, you see the usage of multiple comparison instructions to check whether the elements of the ARRAYs have the same data type:

```
6  IF IS_ARRAY(#SourceArray) AND IS_ARRAY(#DestinationArray)
7      AND TypeOfElements(#SourceArray) = TypeOfElements(#DestinationArray) THEN
8      #Error := MOVE_BLK_VARIANT(COUNT := #Count, SRC := #SourceArray, SRC_INDEX := #SourceIndex,
9                                 DEST => #DestinationArray, DEST_INDEX := #DestinationIndex);
10 END_IF;
```

The MOVE_BLK_VARIANT instruction is only executed if the data types of the ARRAY elements are the same.

VARIANT instructions

VARIANT instructions

The following instructions for working with VARIANT are available to you in the TIA Portal:

Basic instructions		
Category	**Instruction**	**Description**
Comparator operations	EQ_Type	Compare data type for EQUAL with the data type of a tag
	NE_Type	Compare data type for UNEQUAL with the data type of a tag
	EQ_ElemType	Compare data type of an ARRAY element for EQUAL with the data type of a tag
	NE_ElemType	Compare data type of an ARRAY element for UNEQUAL with the data type of a tag
	IS_NULL	Query for EQUALS ZERO pointer
	NOT_NULL	Query for UNEQUALS ZERO pointer
	IS_ARRAY	Check for ARRAY
	TypeOf	Check data type of a VARIANT tag
	TypeOfElements	Check element data type of a VARIANT tag
	IS_ARRAY	Check for ARRAY

Basic instructions		
Category	**Instruction**	**Description**
Move operations	MOVE_BLK_VARIANT	Move block
	VariantGet	Read out VARIANT tag value
	VariantPut	Write VARIANT tag value
	CountOfElements	Get number of ARRAY elements
Conversion operations	VAR-IANT_TO_DB_ANY	Convert VARIANT to DB_ANY
	DB_ANY_TO_VARIANT	Convert DB_ANY to VARIANT

Note

Differences between MOVE, MOVE_BLK and MOVE_BLK_VARIANT

- You can use the "MOVE" instruction to copy complete structures.
- You can use the "MOVE_BLK" instruction to move parts of ARRAYs with known data type.
- The MOVE_BLK_VARIANT instruction is only required if you want to move parts of ARRAYs with a data type that is only known during program runtime.

You can find additional information on the individual instructions in the information system under "Basic instructions > Respective programming language".

You can also find additional instructions which also work with the VARIANT data type under the "Extended instructions".

VARIANT (Page 1951)

Indirect addressing with the VARIANT data type (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&groupid=4000002&extranet=standard&viewreg=WW&nodeid0=29156492&objaction=csopen)

Using VARIANT instructions

Introduction

In the following chapter, you will learn which application options you have with VARIANT instructions.

Evaluating data types of tags to which a VARIANT points

In the table below, you see which instructions are available to you to evaluate data types of tags to which a VARIANT points:

Function	Instruction	Description
To determine the data type	TypeOf(): Check data type of a VARIANT tag (This instruction is available only in SCL and only in conjunction with an IF instruction.)	You use this instruction to compare the data type to which a VARIANT tag points with the data type of any other tag. You can also make the comparison with a PLC data type.
	TypeOfElements(): Check element data type of a VARIANT tag (This instruction is available only in SCL and only in conjunction with an IF instruction.)	You use this instruction to compare the data type to which a VARIANT tag points with the data type of any other tag. You can also make the comparison with a PLC data type. If the data type of the VARIANT tag is an ARRAY, the data type of the ARRAY elements is compared.
	EQ_Type: Compare data type for EQUAL with the data type of a tag NE_Type: Compare data type for UNEQUAL with the data type of a tag	You use this instruction to compare the data type to which a VARIANT tag points with the data type of any other tag. You can also make the comparison with a PLC data type.
	EQ_ElemType: Compare element data type for EQUAL with the data type of a tag NE_ElemType: Compare element data type for UNEQUAL with the data type of a tag	You use this instruction to compare the data type to which a VARIANT tag points with the data type of any other tag. You can also make the comparison with a PLC data type. If the data type of the VARIANT tag is an ARRAY, the data type of the ARRAY elements is compared.
To evaluate ARRAY elements	IS_ARRAY: Check for ARRAY	You use this instruction to check whether the data type to which a VARIANT tag points is an ARRAY.
	CountOfElements: Get number of ARRAY elements	You use this instruction to read out how many ARRAY elements the tag has to which the VARIANT tag points.

You can find additional information on the individual instructions in the information system under "Basic instructions > Respective programming language".

Reading data to which a VARIANT points

To be able to use the data you must move this data to a tag as an intermediate step, as it cannot be processed directly.

Instruction	Description	Example		Result
		VARIANT points to	Destination data type	
VariantGet: Read out VARIANT tag value	You use this instruction to move the value of a single tag to another tag. The data types of both tags must match.	UDT_1	UDT_1	The instruction is executed
		REAL	REAL	
		DINT	DWORD	The instruction is not executed.

Assigning data to a VARIANT tag

You cannot use the instruction to initialize VARIANT tags. The VARIANT tags must therefore already be initialized when the data is returned to the tag. Do not use uninitialized temporary VARIANT tags.

Instruction	Description	Example		Result
		Source data type	VARIANT points to:	
VariantPut: Write VARIANT tag value	You use this instruction to move the value of a single tag to another tag. The data types of both tags must match.	UDT_1	UDT_1	The instruction is executed
		REAL	REAL	
		DINT	DWORD	The instruction will not be executed, as the data types are different.

Processing dynamic ARRAY structures

To evaluate ARRAY elements	TypeOfElements(): Check data type of an ARRAY element of a VARIANT tag (This instruction is available only in SCL and only in conjunction with an IF instruction.)	You use this instruction to compare the data type to which a VARIANT tag points with the data type of any other tag. You can also make the comparison with a PLC data type. If the data type of the VARIANT tag is an ARRAY, the data type of the ARRAY elements is compared.
	IS_ARRAY: Check for ARRAY	You use this instruction to check whether the data type to which a VARIANT tag points is an ARRAY.
	CountOfElements: Get number of ARRAY elements	You use this instruction to read out how many ARRAY elements the tag has to which the VARIANT tag points.
	MOVE_BLK_VARIANT: Move block	This instruction is used to move dynamic and type-safe (integrated type test) ARRAYs. You can freely select the limit values for the source and destination ARRAYs. The data types of ARRAY elements must match.

Note

Differences between MOVE, MOVE_BLK and MOVE_BLK_VARIANT

- You can use the "MOVE" instruction to copy complete structures.
- You can use the "MOVE_BLK" instruction to move parts of ARRAYs with known data type.
- The MOVE_BLK_VARIANT instruction is only required if you want to move parts of ARRAYs with a data type that is only known during program runtime.

Additional information on the use of the MOVE_BLK_VARIANT instruction can be found in the "Moving data" programming example.

See also

VARIANT (Page 1951)

Programming example: Moving data (Page 267)

Programming examples with VARIANT

Programming example: Moving data

Programming example

In this programming example, data values, which are collected for example during a production shift, are moved for further processing. The data is collected in an ARRAY. Using the "MOVE_BLK_VARIANT instruction: Move block", you can move either the entire ARRAY or only individual ARRAY elements dynamically and type-safe. You can freely select the ARRAY limits for the respective source and destination ARRAYs and these do not have to match. However, the data type of the data values that are to be moved must match. This instruction is available in all programming languages.

By using the VARIANT data type, you can use the created program code to move data for other production shifts as well, by specifying a different source and destination area at the block call.

Procedure

1. Create a function using the SCL programming language and give it the name "FC_PartialArrayCopy".
2. Declare the block interface as follows:

FC_PartialArrayCopy

	Name	Data type
1	Input	
2	Count	UDInt
3	SourceIndex	DInt
4	DestinationIndex	DInt
5	Output	
6	InOut	
7	SourceArray	Variant
8	DestinationArray	Variant
9	Temp	
10	Error	Int
11	Constant	
12	<Add new>	
13	Return	
14	FC_PartialArrayCopy	Int

3. Create the SCL program code as follows:
   You can find the program code below as template.

```
IF IS_ARRAY(#SourceArray) AND IS_ARRAY(#DestinationArray)
    AND TypeOfElements(#SourceArray) = TypeOfElements(#DestinationArray) THEN
    #Error := MOVE_BLK_VARIANT(COUNT := #Count, SRC := #SourceArray, SRC_INDEX := #SourceIndex,
                               DEST => #DestinationArray, DEST_INDEX := #DestinationIndex);
END_IF;
#FC_PartialArrayCopy := #Error;
```

4. Create the PLC data type "UDT_MyStruct":

UDT_MyStruct

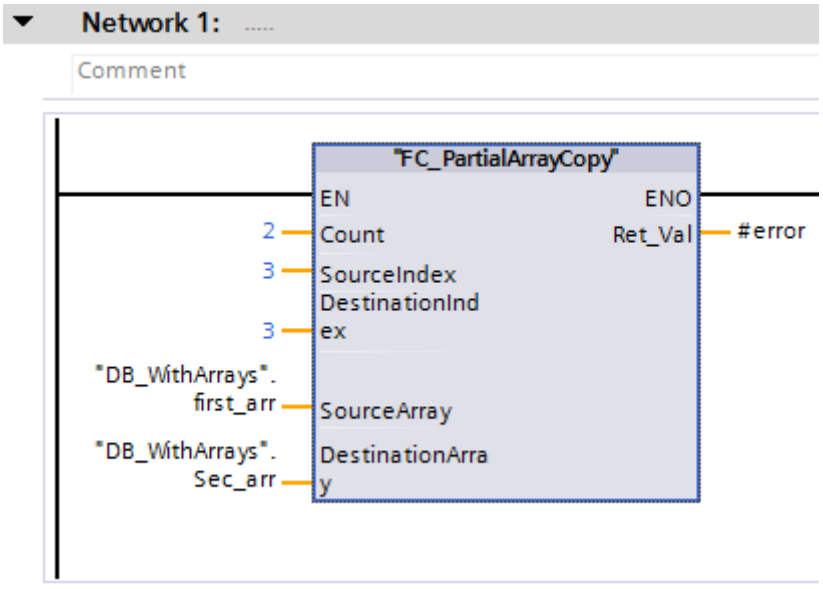
	Name	Data type	Default value
1	a	Bool	1
2	b	Bool	false
3	c	Bool	1
4	d	Bool	false
5	e	Bool	1
6	arr_int	Array[1..100] of Int	
7	f	Int	0
8	g	Real	0.0
9	h	LReal	0.0

5. Create the global data block "DB_WithArrays":

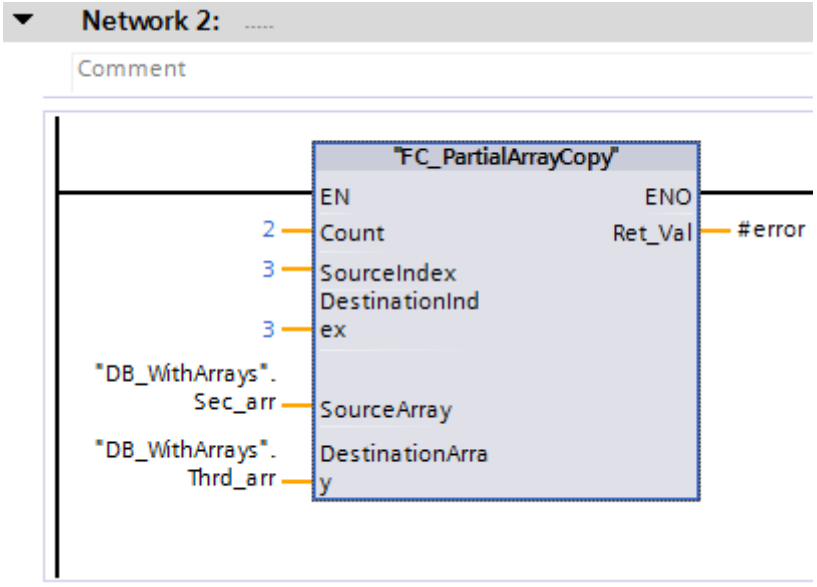
DB_WithArrays

	Name	Data type
1	Static	
2	first_arr	Array[0..100] of "UDT_MyStruct"
3	Sec_arr	Array[1..200] of "UDT_MyStruct"
4	Thrd_arr	Array[1..200] of Real
5	For_arr	Array[1..500] of Real

6. Call the "FC_PartialArrayCopy" function in an organization block, for example OB1, and initialize the parameters with the DB_WithArrays data block. Enter the named constants:



7. Instead of using the first two ARRAYs, which have the data type UDT_MyStruct, you can also use the third and fourth ARRAY, which have the data type REAL:



Result

As soon as the "FC_PartialArrayCopy" block is called in the program cycle, two data values, starting with the fourth element, are copied from the first ARRAY of the "DB_WithArrays" global data block to the second ARRAY of the data block. The copied data values are inserted in the second ARRAY, starting from the fourth element.

SCL program code for copying:

SCL

```
IF IS_ARRAY(#SourceArray) AND TypeOfElements(#SourceArray) =
TypeOfElements(#DestinationArray) THEN
#Error := MOVE_BLK_VARIANT(COUNT := #Count, SRC := #SourceArray, SRC_INDEX := #SourceIndex,
                           DEST => #DestinationArray, DEST_INDEX := #DestinationIndex);
END_IF;
#FC_PartialArrayCopy := #Error;
```

VARIANT (Page 1951)

Programming example: Programming queues (FIFO)

Programming example

In the following example, you program a ring buffer which consists of an ARRAY and is written and read according to the FIFO principle. The program code has a read-VARIANT pointer and a write-VARIANT pointer. Using the VARIANT instructions, you can program the program code robustly and ensure reliable copying or deleting.

Using the VARIANT data type, program sections can be influenced during runtime. The VARIANT pointer is a type-safe pointer, i.e. a type test is performed during runtime. For blocks that have been created with the block property "optimized", sub-functions that were previously programmed with an ANY pointer can now be resolved with a VARIANT pointer. The VARIANT data type is used to transfer structures to system function blocks.

Procedure

1. Create an SCL function block and name it "FIFOQueue".
2. Declare the block interface as follows:

Declaration	Parameters	Data type	Comment
Input	request	BOOL	The instruction is executed when a positive signal edge is detected at the "request" parameter.
	mode	BOOL	0 = The first entry in the ring buffer is returned. 1 = An entry is written at the last position in the ring buffer.
	initialValue	VARIANT	Value with which the ARRAY of the ring buffer is initialized.
Output	error	INT	Error information
InOut	item	VARIANT	The entry that is either returned from the ring buffer or written to the ring buffer.
	buffer	VARIANT	An ARRAY that is used as a ring buffer.
Static	edgeupm	BOOL	Edge memory bit in which the RLO of the previous query is saved.
	firstItemIndex	INT	Index of the oldest entry in the ring buffer
	nextEmptyItemIndex	INT	Index of the next free entry in the ring buffer
Temp	edgeup	BOOL	Result of edge evaluation
	internalError	INT	Error information
	newFirstItemIndex	INT	Variable index
	newNextEmptyItemIndex	INT	Variable index
	bufferSize	UDINT	Number of ARRAY elements in the ring buffer

3. Create the following program code in the "FIFOQueue" function block:

```
(* This program code section is only executed once after a positive signal
edge. If there is no change in the signal state of the result of logic
operation, the program processing of the "FIFOQueue" FB is terminated. *)
#edgeup := #request & NOT #edgeupm;
#edgeupm := #request;
IF NOT (#edgeup) THEN
   RETURN;
END_IF;
```

```
// ------Validation of whether all parameter inputs are valid.----
(* This program code section checks whether the ring buffer is an ARRAY. If
so, the number of the ARRAY elements is read out. If it is not an ARRAY,
the program execution is terminated at this point and the error code "-10"
is output. *)
IF NOT (IS_ARRAY(#buffer)) THEN
   #error := -10;
   RETURN;
ELSE
   #bufferSize := CountofElements(#buffer);
END_IF;

(* This program code section checks whether the data type of the ARRAY
elements matches the data type of the entry (tag #item). If the data types
do not match, the program execution is terminated at this point and the
error code "-11" is output. *)
IF NOT (TypeOf(#item) = TypeOfElements(#buffer)) THEN
   #error := -11;
   RETURN;
END_IF;

(* This program code section checks whether the initial value of the ring
buffer matches the entry (tag #item). If the data types do not match, the
program execution is terminated at this point and the error code "-12" is
output. *)
IF NOT (TypeOf(#item) = TypeOf(#initialValue)) THEN
   #error := -12;
   RETURN;
END_IF;

(* This program code section checks whether the variable indices are within
the ARRAY limits. If they are not, the program execution is terminated at
this point and either error code "-20" or "-21" is output depending on the
index. *)
IF (#nextEmptyItemIndex >= #bufferSize) THEN
   #error := -20;
   RETURN;
END_IF;
IF (#firstItemIndex >= #bufferSize) THEN
   #error := -21;
   RETURN;
END_IF;
```

```
//-----------Program code execution, depending on the Mode
parameter-------------
// The execution of the instructions depends on the signal state of the Mode
parameter.
IF #mode = 0 THEN

// If the Mode parameter has the signal state "0", the first entry from the
passed ring buffer is returned.
(* This program code section checks whether the ring buffer is empty. If
this is the case, program execution is terminated at this point and the
error code "-40" is output. *)
   IF (#firstItemIndex = -1) THEN
      #error := -40;
      RETURN;
   END_IF;

// This program code section returns the first entry of the ring buffer.
   #internalError := MOVE_BLK_VARIANT(SRC := #buffer,
                                      COUNT := 1,
                                      SRC_INDEX := #firstItemIndex,
                                      DEST_INDEX := 0,
                                      DEST => #item);

   IF (#internalError = 0) THEN
(* This program code section checks whether the ring buffer contains ARRAY
elements. If it does, the first entry is passed further on and the index is
incremented by 1. *)
      #internalError := MOVE_BLK_VARIANT(SRC := #initialValue,
                                         COUNT := 1,
                                         SRC_INDEX := 0,
                                         DEST_INDEX := #firstItemIndex,
                                         DEST => #buffer);

// This program code section calculates the new index of the first entry.
      #newFirstItemIndex := #firstItemIndex +1;
      #newFirstItemIndex := #newFirstItemIndex MOD #bufferSize;

// This program section checks whether the ring buffer is empty.
      IF (#nextEmptyItemIndex = #newFirstItemIndex) THEN
// If the ring buffer is empty, the index is set to 0.
         #firstItemIndex := -1;
         #nextEmptyItemIndex := 0;
      ELSE
// The index of the first entry is changed.
         #firstItemIndex := #newFirstItemIndex;
      END_IF;
```

```
   END_IF;
ELSE

// If the Mode parameter has the signal state "1", the entry is written to
the passed ring buffer.
(* This program code section checks whether the ring buffer is full. If this
is the case, program execution is terminated at this point and the error
code "-50" is output. *)
   IF (#nextEmptyItemIndex = #firstItemIndex) THEN
      #error := -50;
      RETURN;
   END_IF;

// This program code section writes the entry to the ring buffer.
   #internalError := MOVE_BLK_VARIANT(SRC := #item,
                                      COUNT := 1,
                                      SRC_INDEX := 0,
                                      DEST_INDEX := #nextEmptyItemIndex,
                                      DEST => #buffer);

   IF (#internalError = 0) THEN
// This program code section increments the index by 1 and calculates the
new empty entry index.
      #newNextEmptyItemIndex := #nextEmptyItemIndex +1;
      #newNextEmptyItemIndex := #newNextEmptyItemIndex MOD #bufferSize;
      #nextEmptyItemIndex := #newNextEmptyItemIndex;

(* This program code section checks which index the "#firstItemIndex" tag
has. If the number = -1, the ring buffer is initialized and the entry is
written to the ring buffer. Therefore, "0" must be assigned to the tag. *)
      IF (#firstItemIndex = -1) THEN
         #firstItemIndex := 0;
      END_IF;
   END_IF;
END_IF;

//-------------------------Local error handling-----------------------------
(* This program code section checks whether a local error has occurred. If
this is the case, program execution is terminated at this point and the
error code "-100" is output. *)
IF (#internalError > 0) THEN
   #error := -100;
   RETURN;
END_IF;
```

```
// If no error occurred during program execution, the error code "0" is
output.
#error := 0;
```

Result

Call the SCL function block at the position in your program at which the FIFO queue is to run.

6.4.8.2 Using the DB_ANY data type

Using the DB_ANY data type (S7-1200/1500)

The DB_ANY data type is used to identify any data block. For CPUs of the S7-1200/1500 series, you have the option of accessing a data block that is not yet available during programming. For this purpose, create a block parameter of the DB_ANY data type in the block interface of the accessing block. The data block name or a tag of data type DB_ANY which was previously assigned to the data block name is transferred to this parameter during runtime. You can symbolically process the content of a data block by means of the following instructions:

- VARIANT_TO_DB_ANY: Convert VARIANT to DB_ANY
- DB_ANY_TO_VARIANT: Convert DB_ANY to VARIANT

For more information about the instructions, refer to "Basic instructions > LAD/FBD/STL/SCL > Conversion operations > VARIANT".

The advantage of this procedure: You can create the program code before you know which data block will be processed.

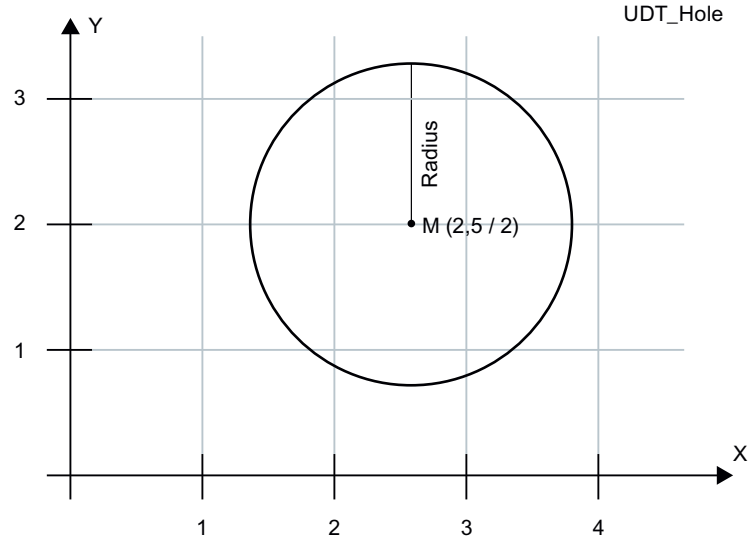
Programming example

The following example shows you how to use the DB_ANY data type:

A punching machine can punch out a variety of geometric shapes. The punching jobs are transferred to the machine and there are specific job data for each individual job. The job data differ in their job type as well as in their values.

Procedure - Creating the PLC data types

In the first job, a round hole is to be punched out of a piece of sheet metal. For the punching machine to be able to execute this job, it needs the center point coordinates and the radius of the hole. You can transfer these job data to the punching machine collectively in a PLC data type (UDT).

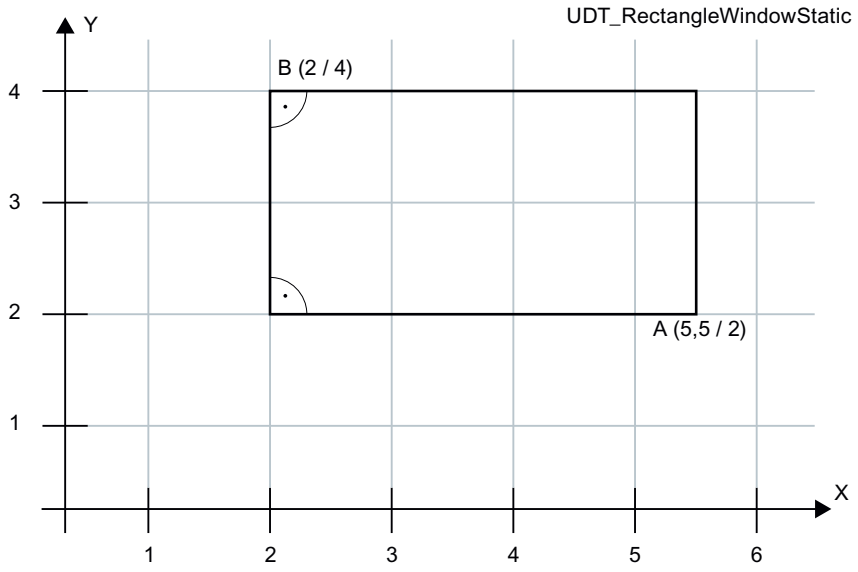


Create the PLC data type "UDT_Hole" to transfer the job data:

1. Double-click the "Add new data type" command in the "PLC data types" folder in the project tree.
   A new declaration table for creating a PLC data type will be created and opened.
2. Declare the following lines within the PLC data type:
   X-coordinate > REAL
   Y-coordinate > REAL
   Radius > REAL

UDT_Hole			
		Name	Data type
1		X-coordinate	Real
2		Y-coordinate	Real
3		Radius	Real

A rectangle is to be punched out of a piece of sheet metal in the second job. For this job, you need two coordinates which define the upper left-hand point and the bottom right-hand point of the rectangle. You can transfer these job data to the punching machine collectively in the PLC data type "UDT_RectangleWindowStatic".



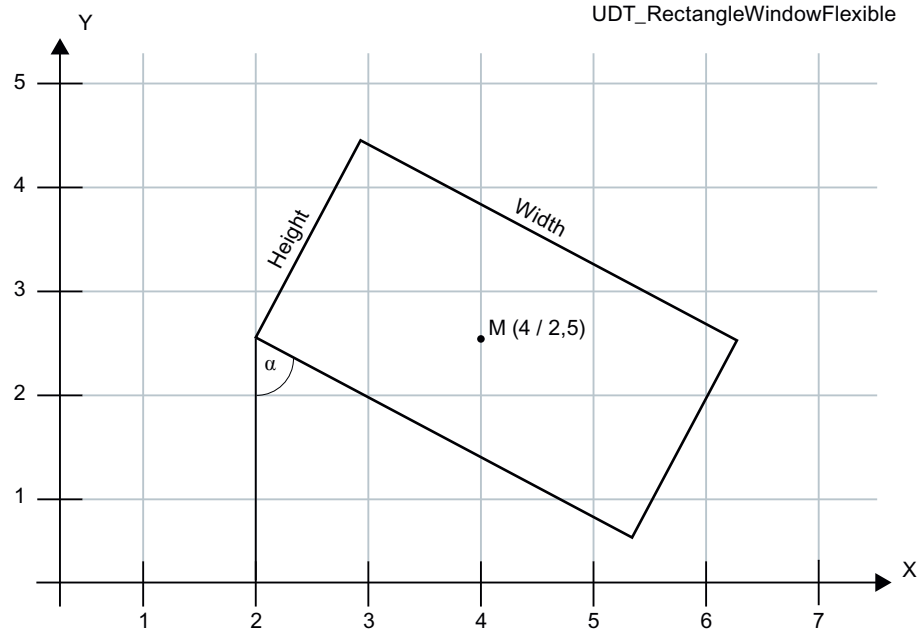
Create the PLC data type "UDT_RectangleWindowStatic":

1. Double-click the "Add new data type" command in the "PLC data types" folder in the project tree.
   A new declaration table for creating a PLC data type will be created and opened.
2. Declare the following lines within the PLC data type:
   X1-coordinate > REAL
   Y1-coordinate > REAL
   X2-coordinate > REAL
   Y2-coordinate > REAL

UDT_RectangleWindowStatic			
		Name	Data type
1		X1-coordinate	Real
2		Y1-coordinate	Real
3		X2-coordinate	Real
4		Y2-coordinate	Real

The job data of the "UDT_RectangleWindowStatic" can only be used to punch out rectangles whose edges are aligned parallel to the x and y axis.

If you want to punch out a rectangle with different alignment, i.e., not parallel to the x and y axis, you need an additional PLC data type. In it, you can specify the height and width, for example, as well as the alignment of the rectangle to the x axis by means of an angle.



Create the PLC data type "UDT_RectangleWindowFlexible":

1. Double-click the "Add new data type" command in the "PLC data types" folder in the project tree.
   A new declaration table for creating a PLC data type will be created and opened.
2. Declare the following lines within the PLC data type:
   X-coordinate > REAL
   Y-coordinate > REAL
   Height > REAL
   Width > REAL
   Angle > REAL

UDT_RectangleWindowFlexible			
		Name	Data type
1		X-coordinate	Real
2		Y-coordinate	Real
3		Height	Real
4		Width	Real
5		Angle	Real

The x and y coordinates specify the center of the rectangle.

Procedure - Creating the data blocks

In the next section, you will learn how to transfer simple geometric shapes whose job data you have defined in the PLC data types to the punching machine. The punch jobs are broken down into individual punches in the program code; these punches are then executed consecutively by the punching machine. The punching machine has a cross table on which a sheet metal has been firmly clamped. You can move a cross table along the x and/or y axis just as in a coordinate system. The cross table is moved by two motors. The tool has different dies to punch out shapes from the sheet metal, such as circles and rectangles of different sizes. The tool can also be rotated by up to 90 degrees to cut out rectangles at different alignments.

You now use the PLC data types to create a data block. The data block then includes the specific values, for example, for a hole.

Create the data block "DB_OrderHole":

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the name "DB_OrderHole".
4. Select "Global-DB" as the type of the data block.
5. Click "OK".

Create the following tag in the data block and enter the corresponding start values:

DB_OrderHole

	Name	Data type	Start value
1	Static		
2	Hole	"UDT_Hole"	
3	X-coordinate	Real	10.0
4	Y-coordinate	Real	900.0
5	Diameter	Real	4.0

To manufacture a specific sheet metal part such as the side panel of a control cabinet, for example, the necessary geometric shapes are loaded to the punching machine. For this purpose, you need to create another data block which includes a list of data blocks.

Create the data block "DB_OrderList":

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the name "DB_OrderList".
4. Select "Global-DB" as the type of the data block.
5. Click "OK".

Create the following job list in the data block:

DB_OrderList			
		Name	Data type
1		Static	
2		Order	Array[0..100] of DB_ANY
3		Order[0]	DB_ANY
4		Order[1]	DB_ANY
5		Order[2]	DB_ANY
6		Order[3]	DB_ANY
7		Order[4]	DB_ANY
8		Order[5]	DB_ANY
9		Order[6]	DB_ANY
10		Order[7]	DB_ANY
11		Order[8]	DB_ANY

Procedure - Creating the program code

The punching machine should now start processing the jobs. If it is already processing the jobs, it should get the next job from the job list and prepare it.

1. Create an SCL function block.
2. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
3. Click the "Function block (FB)" button.
4. Specify the name "FB_PickNextOrder".

5. Declare the block interface as follows:

FB_PickNextOrder

	Name	Data type
1	Input	
2	Output	
3	InOut	
4	Static	
5	OrderReady	Bool
6	OrderNo	DInt
7	Order	DB_ANY
8	Temp	
9	Error	Int

6. Write the following program code:

```
1
2 IF #OrderReady THEN
3     #Order := "DB_OrderList".Order[#OrderNo];
4     #OrderNo := #OrderNo + 1;
5     #OrderReady := false;
6 END_IF;
```

The next job on the list is prepared by breaking down the current punch job into individual punches. The punching machine must be able to recognize which punch job it is processing.

1. Create an SCL function.
2. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
3. Click the "Function (FC)" button.
4. Specify the name "FC_PrepareOrder".

5. Declare the block interface as follows:

FC_PrepareOrder

	Name	Data type
1	Input	
2	Order	DB_ANY
3	Output	
4	Error	Int
5	InOut	
6	Temp	
7	WindowFlexible	"UDT_RectangleWindowFlexible"
8	WindowStatic	"UDT_RectangleWindowStatic"
9	Hole	"UDT_Hole"
10	a	Variant
11	Constant	
12	Return	
13	FC_PrepareOrder	Void

6. Write the following program code. The calls of the three functions are not yet given a red underline because they still have to be created.

```
1
2  #a := DB_ANY_TO_VARIANT(in := #Order, err => #Error);
3
4 CASE TypeOf(#a) OF
5     UDT_Hole:
6         VariantGet(SRC := #a,
7                    DST => #Hole);
8         "FC_PrepareHole"(#Hole);
9         ;
10
11    UDT_RectangleWindowStatic:
12        VariantGet(SRC := #a,
13                   DST => #WindowStatic);
14        "FC_PrepareWindowStatic"(#WindowStatic);
15        ;
16
17    UDT_RectangleWindowFlexible:
18        VariantGet(SRC := #a,
19                   DST => #WindowFlexible);
20        "FC_PrepareRectangleWindow"(#WindowFlexible);
21        ;
22    ELSE
23        ;
24 END_CASE;
```

The "VariantGet" instruction copies the information from the #a tag to the #Hole tag.

In the following section, you create the functions "FC_PrepareHole" and "FC_PrepareWindowStatic".

A separate function is created for each job type. The punch jobs are broken down into individual punches here and collected in an ARRAY.

1. Create a PLC data type.
2. Double-click the "Add new data type" command under "PLC data types".
   A new PLC data type with the name "UserDataType_x" is created.
3. Rename the PLC data type to "UDT_Punch".
4. Declare the following lines within the PLC data type:
   Tool > DINT
   x > REAL
   y > REAL
   w > BOOL

UDT_Punch

	Name	Data type
1	Tool	DInt
2	x	Real
3	y	Real
4	w	Bool

5. Create the global data block "DB_PunchList":

DB_PunchList

	Name	Data type
1	Static	
2	Punch	Array[0..100] of "UDT_Punch"
3	Punch[0]	"UDT_Punch"
4	Punch[1]	"UDT_Punch"
5	Punch[2]	"UDT_Punch"
6	Punch[3]	"UDT_Punch"
7	Punch[4]	"UDT_Punch"
8	Punch[5]	"UDT_Punch"
9	Punch[6]	"UDT_Punch"
10	Punch[7]	"UDT_Punch"
11	Punch[8]	"UDT_Punch"

To prepare the punch job for a hole, create an SCL function and name it "FC_PrepareHole".

1. Declare the block interface as follows:

FC_PrepareHole

		Name	Data type
1		Input	
2		a	"UDT_Hole"
3		Output	
4		InOut	
5		Temp	
6		Constant	
7		Return	
8		FC_PrepareHole	Void

2. Write the following program code:

```
1
2  IF #a.Radius = 4.0 THEN
3      "DB_PunchList".Punch[0].Tool := 1;
4
5  ELSIF #a.Radius = 6.0 THEN
6      "DB_PunchList".Punch[0].Tool := 2;
7
8  ELSE
9      ;
10     "DB_PunchList".Punch[0].x := #a."X-coordinate";
11     "DB_PunchList".Punch[0].y := #a."Y-coordinate";
12
13 END_IF;
```

To prepare the punch job for a window, you need a function which combines four punch sequences into the punch job. Create an SCL function and name it "FC_PrepareWindowStatic".

1. Declare the block interface as follows:

FC_PrepareWindowStatic

	Name	Data type
1	Input	
2	a	"UDT_RectangleWindowStatic"
3	Output	
4	InOut	
5	Temp	
6	delta	Real
7	x	Real
8	x2	Real
9	y	Real
10	i	DInt
11	Constant	
12	Return	
13	FC_PrepareWindowStatic	Void

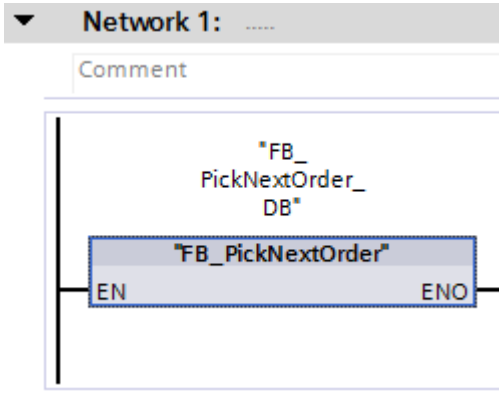
2. Write the following program code:

```
1
2  #delta := 6.0;  // Defined by tool 7
3  #i := 0;
4  #x := #a."X1-coordinate" + #delta;
5 WHILE #x < #a."X2-coordinate" - #delta  DO
6      "DB_PunchList".Punch[#i].Tool := 7;
7      "DB_PunchList".Punch[#i].x := #x;
8      "DB_PunchList".Punch[#i].y := #y + #delta;
9      "DB_PunchList".Punch[#i].w := 0; // Don't rotate
10     #x := #x + 2 * #delta;
11 END_WHILE;
12
13 #y := #a."Y1-coordinate" + #delta;
14 WHILE #y < #a."Y2-coordinate" - #delta DO
15     "DB_PunchList".Punch[#i].Tool := 7;
16     "DB_PunchList".Punch[#i].x := #x2 + #delta;
17     "DB_PunchList".Punch[#i].y := #y;
18     "DB_PunchList".Punch[#i].w := 0; // Don't rotate
19     #y := #y + 2 * #delta;
20 END_WHILE;
```

Call the SCL function block "FC_PrepareOrder" in the SCL function block "FB_PickNextOrder":

```
1
2  IF #OrderReady THEN
3      #Order := "DB_OrderList".Order[#OrderNo];
4      #OrderNo := #OrderNo + 1;
5      #OrderReady := false;
6      "FC_PrepareOrder"(Order:=#Order,
7                        Error=>#Error);
8
9  END_IF;
```

Then, call the "FB_PickNextOrder" in OB1:



Result

This example shows you how to use the instruction "DB_ANY_TO_VARIANT: Convert DB_ANY to VARIANT" to determine the PLC data type of a data block and how to select and execute a suitable function based on this.

6.4.8.3 Using PLC data types (UDT)

Using a PLC data type

PLC data types (UDT) are data structures that you define yourself and that can be used multiple times in the program. The structure can be composed of multiple elements of different data types. You define the data types of the individual elements during the declaration of a PLC data type.

PLC data types are frequently used if an assembled data record with various data types is required and these are to be processed from different points in the program. For example, these could be:

- Data records for material tracking
- Parameter sets for a motor setting
- Recipes

The use of PLC data types provides you with the following benefits:

- The elements of a PLC data type can also be addressed indirectly, which means the address is variable and is not calculated until during runtime.
- Tags based on a PLC data type inherit all properties of the PLC data type. When there is a change to the PLC data type, all tags based on this PLC data type are therefore adapted automatically.
- Using universal symbolism makes the program easier to read, because the names of the individual elements of a PLC data type are displayed in the program.
- Optimum utilization of the high performance of an S7-1500 CPU.
- The PLC data type can be passed as a complete structure for a block call.
- A simplified call interface due to a lower number of parameters to be supplied.

Procedure in STEP 7 V5.x

STEP 7 V5.x already gave you the option to create a data record as a structured tag using the STRUCT data type or a PLC data type (UDT). However, the performance was adversely affected by the use of symbolic addressing.

The declaration in the data blocks was mostly implemented as an anonymous structure. The blocks themselves were then programmed to pass the values of the structure as actual parameters and the calculated values were copied back into the structure. This enabled you to also pass the data block number and use absolute addressing in the block. The number of parameters that you had to supply was often very large. The actual data was stored in the data blocks and the calculated values were passed to other blocks. However, no symbolism was available when passing the data block tags.

Programming example in STEP 7 TIA Portal

You can assign both a formula parameter and an actual parameter to a PLC data type. This means that you no longer have to declare individual parameters. If a block has an input parameter that is based on a PLC data type, you must transfer a tag of the same PLC data type as actual parameter.

The following example shows the call and the parameter assignment of a function block (FB) with two formal parameters:

1. To create a PLC data type, double-click the "Add new data type" command in the "PLC data types" folder in the project tree.
   A new declaration table for creating a PLC data type will be created and opened.
2. Rename the PLC data type to "UDT_Material".
3. Declare the following lines within the PLC data type:
   ArticleNumber > Data type: DINT
   ArticleName > Data type: STRING
   Amount > Data type: REAL
   Unit > Data type: STRING

UDT_Material

		Name	Data type
1		ArticleNumber	DInt
2		ArticleName	String
3		Amount	Real
4		Unit	String

Use the PLC data type within a global data block. You can specify the PLC data type either directly as data type of the data block or within the data block as data type of a tag.

Create a global data block for this purpose:

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the name "DB_MaterialBuffer".
4. Select the type of the data block "ARRAY DB".
5. Select the PLC data type "UDT_Material" as ARRAY data type.

6. Specify "1000" as high ARRAY limit.
7. Click "OK".

DB_MaterialBuffer

	Name	Data type
1	DB_MaterialBuffer	Array[0..1000] of "UDT_Material"
2	DB_MaterialBuffer[0]	"UDT_Material"
3	ArticleNumber	DInt
4	ArticleName	String
5	Amount	Real
6	Unit	String
7	DB_MaterialBuffer[1]	"UDT_Material"
8	DB_MaterialBuffer[2]	"UDT_Material"
9	DB_MaterialBuffer[3]	"UDT_Material"
10	DB_MaterialBuffer[4]	"UDT_Material"
11	DB_MaterialBuffer[5]	"UDT_Material"

At the function block call, interconnect the formal parameters with tags from the global data block "DB_MaterialBuffer".

1. Create an SCL function block and name it "FB_Material".
2. Declare the block interface as follows:

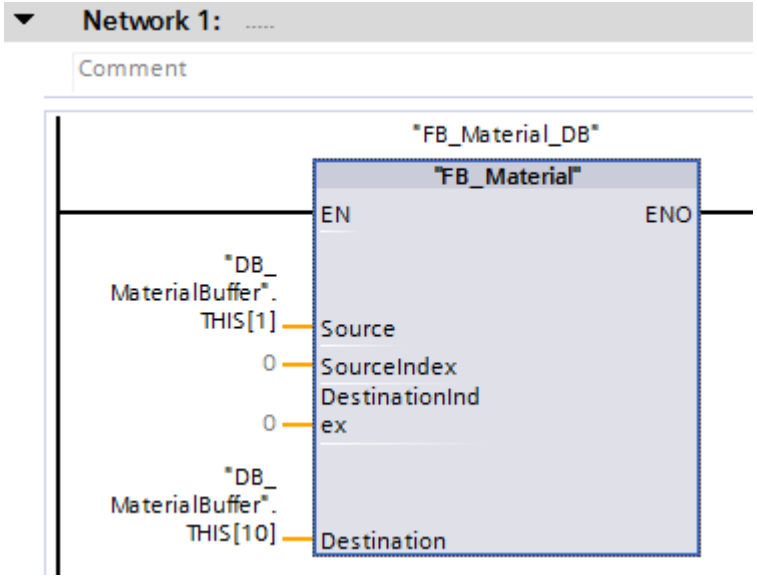
FB_Material

	Name	Data type
1	Input	
2	Source	Variant
3	SourceIndex	DInt
4	DestinationIndex	DInt
5	Output	
6	InOut	
7	Destination	Variant
8	Static	
9	Temp	
10	Result	Int
11	Constant	

3. Write the following program code:

```
1
2 #Result := MOVE_BLK_VARIANT(SRC:=#Source,
3                              COUNT:=3,
4                              SRC_INDEX:=#SourceIndex,
5                              DEST_INDEX:=#DestinationIndex,
6                              DEST=>#Destination);
```

4. Call the "FB_Material" function block in OB1 and interconnect the formal parameters with tags of the global data block "DB_MaterialBuffer":



The material data are moved within the global data block "DB_MaterialBuffer".

PLC data types (Page 1954)

6.4.8.4 Calculating with floating-point numbers (REAL and LREAL) in SCL

Representation of the accuracy of floating-point numbers

The data type REAL, for example, is specified and calculated in the program with an accuracy of 6 decimal places. For the calculation of floating-point numbers (REAL and LREAL), it should be noted that this accuracy applies in general to each individual step of the calculation.

The exponents are adjusted when floating-point numbers are added and subtracted. The base and the exponents are thus equal during the addition and subtraction and only the mantissas are added. For additional information on the structure of floating-point numbers, refer to "See also".

Programming example

In the following programming example, you are to perform a calculation in which two operands of the data type REAL are to be added and one is to be subtracted. In the next step of the calculation, the constant 1 is divided by the previous result. To do this, create a global data block in which you declare your operands and a function in which you program the calculation operations.

Calculation formulas

```
y = a + b - c
Z = 1/y
```

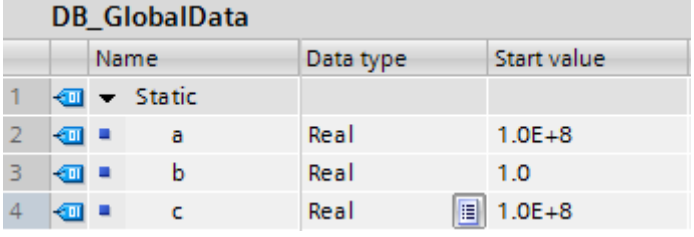
The operands are stored with the following values:

Operand	Value	REAL value
a	100 000 000	$1.000000*10^8$
b	1	$1.000000*10^0$
c	100 000 000	$1.000000*10^8$

Procedure

Create the data block "DB_GlobalData":

1. Double-click the "Add new block" command.
   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Specify the name "DB_GlobalData".
4. Select "Global DB" as the type of the data block.
5. Click "OK".
6. Create the following tags in the data block and enter the corresponding start values:



The start value of both tags is 100000000.0 and is converted into 1.0E+8 according to the data type REAL.

Create an SCL function and name it "FC_Calculate".

1. Declare the block interface as follows:

FC_Calculate		
	Name	Data type
1	Input	
2	Output	
3	InOut	
4	Temp	
5	z	Real
6	y	Real
7	Constant	
8	Return	
9	FC_Calculate	Void

2. Write the following formulas in your program code and establish an online connection to see the result:

SCL

```
#y := "DB_GlobalData".a + "DB_GlobalData".b - "DB_GlobalData".c;
#z := 1/#y;
```

#y	0.000000E+000
"Global data".a	1.000000E+008
"Global data".b	1.000000E+000
"Global data".c	1.000000E+008

As you can see, the result at the operand is #y = 0, even though the number 1 is actually expected as result.

The incorrect result comes about as follows:

1. In the first step of the calculation, the operands a + b are added. The REAL values of the two operands (a = $1.000000*10^8$ and b = $1.000000*10^0$) look as follows after the exponents have been adjusted:
   a = $1.000000*10^8$ and b = $0.00000001*10^8$. The last two places of the second number (operand b) are truncated, as they can no longer be represented due to the accuracy of 6 decimal places. Therefore, a 0 instead of a 1 is added to the operand.
2. In the second calculation step, the operand C is subtracted from the result of the preceding calculation step (intermediate result = $1.000000*10^8$ - c = $1.000000*10^8$ is $0.000000e^0$).
3. If you now calculate the operand z in the next calculation step, you try to divide by zero.

#z	16#7F800000
#y	0.000000E+000

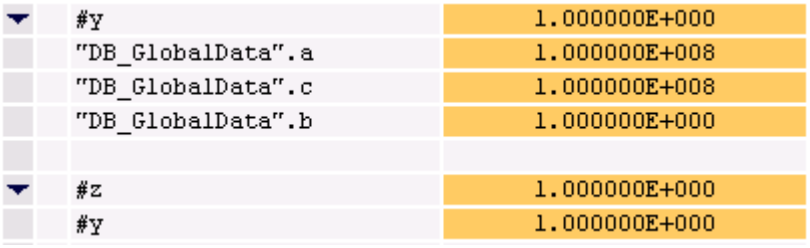
1. Possible solution

To work around such cases, you can simply adjust your calculation formula. Write the formula as follows instead:

Calculation formulas

```
y = a - c + b
Z = 1/y
```

Since the result 0.000000e^{0} is available in this case after the first calculation step (operand a - c), the addition of the REAL number in the second calculation step (intermediate result + b) leads to the correct result (y = 0.000000*10^{0}+ 1.000000*10^{0} = 1.000000*10^{0}).



▼	#y	1.000000E+000
	"DB_GlobalData".a	1.000000E+008
	"DB_GlobalData".c	1.000000E+008
	"DB_GlobalData".b	1.000000E+000
▼	#z	1.000000E+000
	#y	1.000000E+000

We recommend that you check how the calculation can be made most effectively before you program a calculation.

2. Possible solution

To calculate the above named formulas, use the LREAL data type instead of the REAL data type. Since the data type is processed with an accuracy of 15 decimal places, this problem does not even arise.

1. In the global data block "DB_GlobalData", create three new tags with the same values, each with the data type LREAL.

DB_GlobalData

	Name	Data type	Start value
1	Static		
2	a	Real	1.0E+8
3	a_LREAL	LReal	100000000.0
4	b	Real	1.0
5	b_LREAL	LReal	1.0
6	c	Real	1.0E+8
7	c_LREAL	LReal	100000000.0

2. In the block interface of the FC "FC_Calculate", also declare two new tags with the data type LREAL.

FC_Calculate

	Name	Data type
1	Input	
2	Output	
3	InOut	
4	Temp	
5	z_LREAL	LReal
6	z	Real
7	y_LREAL	LReal
8	y	Real
9	Constant	
10	Return	
11	FC_Calculate	Void

3. Use the new LREAL tags for the formulas in your program code and establish an online connection to see the result.

SCL

```
#y_LREAL := "DB_GlobalData".a_LREAL + "DB_GlobalData".b_LREAL -
"DB_GlobalData".c_LREAL;
#z_LREAL := 1/#y_LREAL;
```

▼	#y_LREAL	1.00000000000000E+000
	"DB_GlobalData".a_LREAL	1.00000000000000E+008
	"DB_GlobalData".b_LREAL	1.00000000000000E+000
	"DB_GlobalData".c_LREAL	1.00000000000000E+008
▼	#z_LREAL	1.00000000000000E+000
	#y_LREAL	1.00000000000000E+000

Invalid floating-point numbers (Page 1927)

6.4.8.5 Calculating with constants in SCL

Interpretation of typed and non-typed constants

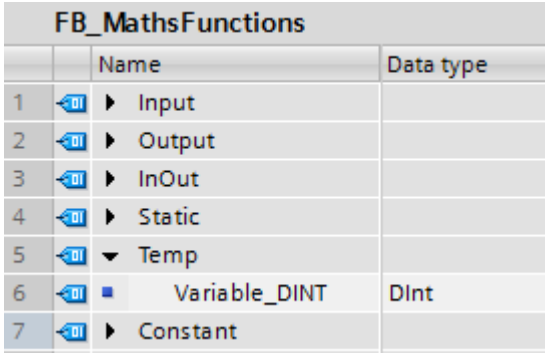
Constants are data with a fixed value that cannot change during program runtime. Constants can be read by various program elements during the execution of the program but cannot be overwritten. There are defined notations for the value of a constant, depending on the data type and data format. A distinction is made between the typed and non-typed notation.

We recommend that you do not mix typed and non-typed constants within mathematical functions as you may otherwise be faced with unwanted implicit conversions and thus end up with incorrect values.

Programming example

In the following programming example, you see a calculation operation with a typed and a non-typed constant.

1. Create an SCL function block and name it "FB_MathsFunctions".
2. Declare the "Variable_DINT" tag in the "Temp" section of the block interface.

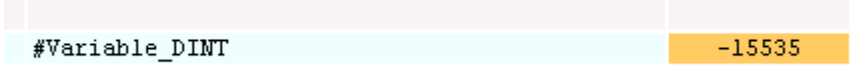


3. Write the following program code:
   Variable_DINT := INT#1 +50000;
   In this math operation, the typed constant INT#1 and the non-typed constant 50000 are to be added. The non-typed constant 50000 is underlined in yellow in the software to indicate that the constant value is outside the permitted range of the data type INT.

```
1
2  #Variable_DINT := INT#1 + 50000;
```

To see the result, go online.

1. Compile the SCL function block "FB_MathsFunctions" by right-clicking the command "Compile > Software (only changes)" to execute it.
2. Download the block with the command "Download to device > Software (only changes)".
3. Go online and monitor your block.



The data type of the typed constant defines the data type of the addition. This means that the addition is performed in the data type area INT. In the first step, the non-typed constant 50000 is implicitly converted into the data type INT. However, the conversion leads to a negative value (-15536). This value is then added to the typed constant (INT#1). The result is -15535. Since the tag to which the result of the addition is to be written is declared with the data type DINT, the number -15535 is implicitly converted into the data type DINT and written to the tag "Variable_DINT". However, the result remains negative.

1. Possible solution

One option for avoiding this undesired result is to type both constants. If you type both constants, the longer data type determines the calculation operation.

1. Write the following program code in the "FB_MathsFunctions" SCL function block:

```
3
4  #Variable_DINT := INT#1 + DINT#50000;
```

   In this calculation operation, the typed constant INT#1 and the typed constant DINT#50000 are to be added.

To see the result, go online.

1. Compile the SCL function block "FB_MathsFunctions" by right-clicking the command "Compile > Software (only changes)" to execute it.
2. Download the block with the command "Download to device > Software (only changes)".
3. Go online and monitor your block.

	#Variable_DINT	50001

   The constant INT#1 is converted into the DINT data type and the addition of the two constants is executed in the DINT data type area.

2. Possible solution

Another option for avoiding this undesired result is not to type both constants. If you do not type both constants, these are then interpreted as the widest possible data type on the current CPU. This means that on an S7-1500 series CPU, the two constants are interpreted as LINT data type.

1. Write the following program code in the "FB_MathsFunctions" SCL function block:

```
1
2  #Variable_DINT := 1 + 50000;
```

   In this calculation operation, the non-typed constant 1 and the non-typed constant 50000 are to be added.

To see the result, go online.

1. Compile the SCL function block "FB_MathsFunctions" by right-clicking the command "Compile > Software (only changes)" to execute it.
2. Download the block with the command "Download to device > Software (only changes)".
3. Go online and monitor your block.

The constants 1 and 50000 are interpreted as LINT data type and the result of the addition is again converted into the DINT data type.

7.1 Getting Started Documentation

Getting Started with the TIA Portal

The Getting Started documentation is available to help you begin using the TIA portal.

The Getting Started documentation contains instructions which show you, step-by-step how to create a project in the TIA portal and give you the chance to get a quick overview of all the possibilities the TIA portal offers you.

Contents

The Getting Started documents describe the creation of a single, continuous project for STEP 7 and WinCC that is extended with each chapter. You start with simple basic functions, and use more complex ones as you continue with the creation of the project.

In addition to the step-by-step instructions, the Getting Started documents also give you background information that explains the functions used and illustrate how they relate to each other.

Target audience

The Getting Started documents are intended for beginners, but are also useful for users migrating from a previous version of SIMATIC STEP 7 and WinCC.

Getting Started documentation

The documentation is available, free of charge at the Service&Support (https://support.automation.siemens.com) portal in PDF form.

You can download the documents here:

- STEP 7 Basic and WinCC Basic (as of TIA Portal V10.5) (http://support.automation.siemens.com/WW/view/en/40263542/0/en)
- STEP 7 Professional and WinCC Advanced (as of TIA Portal V11) (http://support.automation.siemens.com/WW/view/en/28919804/133300)

Multimedia Getting Started

A multimedia Getting Started is also available for the TIA Portal as of version 13.0.

The following link will take you to the home page of the Getting Started:

http://www.automation.siemens.com/salesmaterial-as/interactive-manuals/getting-started_simatic-s7-1500/_content/EN/content_en.html (http://www.automation.siemens.com/

salesmaterial-as/interactive-manuals/getting-started_simatic-s7-1500/_content/EN/content_en.html)

Introduction to the TIA Portal 8

8.1 User interface and operation

8.1.1 Starting, setting up, and exiting the TIA Portal

8.1.1.1 Starting and exiting the TIA Portal

Starting the TIA Portal

To start the TIA Portal, follow these steps:

1. In Windows, select "Start > All Programs > Siemens Automation > TIA Portal V13".
   The TIA Portal opens with the last settings used.

Exiting the TIA Portal

To exit the TIA Portal, follow these steps:

1. In the "Project" menu, select the "Exit" command.
   If the project contains any changes that have not been saved, you will be asked if you wish to save them.
   - Select "Yes" to save the changes in the current project and close the TIA Portal.
   - Select "No" to close the TIA Portal without saving the most recent changes in the project.
   - Select "Cancel" to cancel the closing procedure. The TIA Portal will remain open if you select this option.

8.1.1.2 Overview of the program settings

Overview

The following table shows the application settings that you can make:

Group	Setting	Description
General settings	User name	The user name of the user. The user name is stored in the project properties when a new project is created.
	User interface language	Language for the program interface
	Mnemonic	Specifies the mnemonics for programming: "German" uses the German mnemonics, for example, "E1.0". "International" uses international mnemonics, for example, "I1.0". For information on the differences in the mnemonics of the individual commands, refer to the description of the relevant programming language.
	Show list of recently used projects	Number of entries in the list of recently used projects in the "Project" menu
	Load most recent project during startup	The last opened project is opened automatically after the TIA Portal starts.
	Displaying truncated text in full	Texts which are truncated due to their length are displayed in a tooltip.
	Show tooltips (context-sensitive help is available)	Tooltips are displayed and you get context-sensitive help. If this function is disabled, you can open the tooltip with <F1>.
	Open cascade automatically in tooltips	After a brief time, the tooltips automatically expand to display a cascade containing additional help. If this option is cleared, the tooltips must be manually expanded.
Reset to default	All application settings	All changes that you made in the TIA Portal after installation are undone.
	Layout of the editors	Resets the complete layout of the application to the factory state.
	Show all alarm windows	All alarm windows whose appearance was manually suppressed are displayed again.
Start view	Most recent view	Starts the program in the last view that was used. This can be either the portal view or the project view.
	Portal view	Starts the TIA Portal in the portal view every time, irrespective of the last view you worked in.
	Project view	Starts the TIA Portal in the project view every time, irrespective of the last view you worked in.
View for objects in overview	Details	When several views are available, the detail view opens by default, for example, in the overview window.
	List	When several views are available, the list view opens by default, for example, in the overview window.
	Thumbnails	When several views are available, the symbol view opens by default, for example, in the overview window.

Group	Setting	Description
Storage settings	Recently used storage location	When a project is saved the first time, the most recently used file path is set by default.
	Default storage location	Enables the specification of file paths for: • Projects • Libraries • Configuration file for corporate libraries
Data exchange	Storage location for data import	Imported files are searched for at this storage path by default.
	Storage location for data export	This is the default storage path for the data export.
	Storage location for support packages	When support packages are downloaded, they are stored in the specified storage path and can be installed from there.
	Storage location for log files	Log files are stored at the location specified here.

8.1.1.3 Overview of the script and text editor settings

Overview

The following table shows the available settings for script and text editors:

Group	Setting	Description
Font	Font type and size	Sets the font type and size for the text in text editors.
Font colors	Color settings	You can choose the colors for individual text elements from the respective drop-down lists in the text editors. Optional settings are available for the following text elements: • Text • Keywords • Comments • Operands • Scripts • Standard functions • Instructions/system functions • Constant strings • Numeric constants • Constant tags • Tags • Object models • Formal parameters
	Reset to default	Resets all font colors in editors to their factory settings.
Tabs	Tab width	Sets the width of tabs.
	Use tabs	Enables the use of tabs.
	Use spaces	Specifies use of space characters instead of tabs.
Indent	None	Text entries are not automatically indented.
	Block	The lines or the selected paragraph are automatically indented.
	Smart	The lines or the selected paragraph are automatically indented. All unnecessary spaces are also removed.
View	Show white spaces	Shows control characters within a text.
STL (Statement List)	Font type and size	Sets the font type and size for STL program code.
SCL (Structured Control Language)	Show line numbers	Shows the row numbers in SCL programs.

Changing the settings (Page 306)

8.1.1.4 Overview of the print settings

Overview

The following table shows the available settings for printing:

Group	Setting	Description
General	Always print table data as pairs of values	Tables are printed as a list and not in tabular form. The corresponding values are listed for each column. Enable this option, for example, if you want to print a table that is too large for the print area.
Hardware configuration	Active graphic view	The graphics of network and device view are included in the printout.
	Active table	A table associated with an editor is included when printing with the editor.
PLC Programming	Zoom factor	Specifies the size in which blocks are to be printed out.
	With interface	The interfaces of blocks are included in the printout.
	With comments	Comments on blocks are included in the printout.
	With line numbers	The line numbers of the program code are printed for text-based programming languages.
Motion & Technology	Dialog display/graphic	The content of the editor is printed out as a graphic if the editor supports this.
	Table	The parameters of the technology objects are printed out in the form of a table.
HMI screens	Show tab order	In the printout you can specify the order in which the runtime objects can be selected with the TAB key.

Changing the settings (Page 306)

8.1.1.5 Overview of the online and diagnostic settings

Overview

The following table shows the settings that you can make for the online and diagnostic functions:

Group	Setting	Description
Preset connection path for online access	Type of the PG/PC interface	Specifies the type of the PG/PC interface that is used as the presetting in the dialogs for online access, e.g., in the "Go online" dialog.
	PG/PC interface	Specifies a particular PG/PC interface that is used as the presetting in the dialogs for online access, e.g., in the "Go online" dialog.
	Use preset connection path for online connection	Activates or deactivates the presettings for the PG/PC interface. If the check box is selected, the connection path specified in the settings is used as the presetting in the dialogs for online access.

Group	Setting	Description
Alarm display	Multiline	Displays the alarms in the Inspector window using multiple lines.
	Autoscroll	When a new alarm occurs, the display scrolls automatically to this alarm.
	Archive size	Maximum number of alarms that can be displayed in the Inspector window. If the set number of alarms is exceeded, older alarms are automatically deleted.

8.1.1.6 Changing the settings

Procedure

To change the settings, proceed as follows:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation to change the settings described in the previous sections. Or click on one of the other entries in area navigation to make settings for your installed products.
3. Change the settings.

Result

The change will be adopted immediately, there is no need to save it explicitly.

8.1.2 Layout of the user interface

8.1.2.1 Views

Views

Three different views are available for your automation project:

- The portal view is a task-oriented view of the project tasks.
- The project view is a view of the components of the project, as well as the relevant work areas and editors.
- The library view (Page 311) shows the elements of the project library and the open global libraries.

You can change over between the two views using a link.

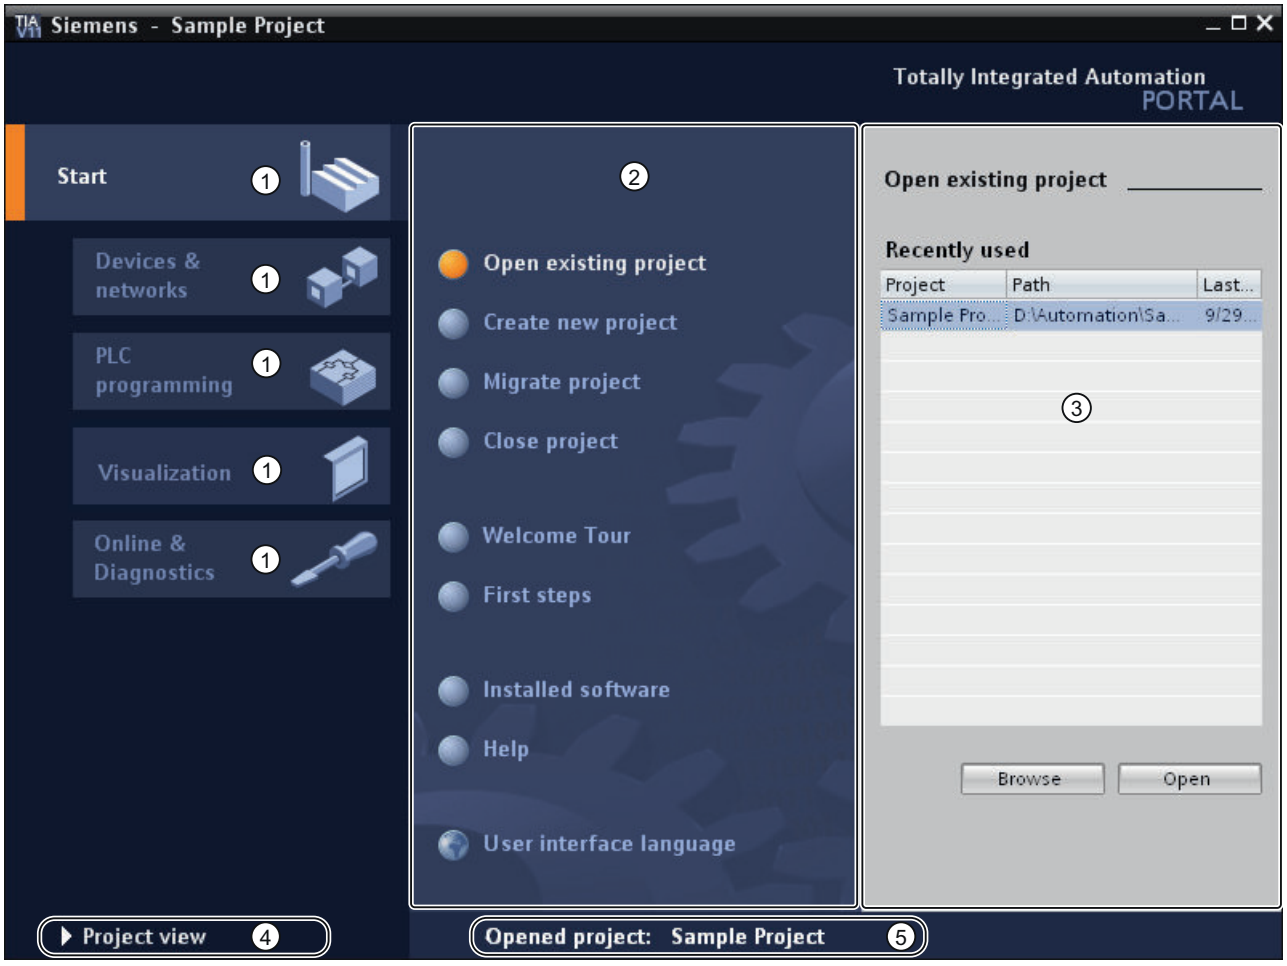
8.1.2.2 Portal view

Purpose of the portal view

The portal view provides you with a task-oriented view of the tools. Here, you can quickly decide what you want to do and call up the tool for the task in hand. If necessary, the view changes automatically to the project view (Page 309) for the selected task.

Layout of the portal view

The following figure shows an example of the components in the portal view:



① Portals for different tasks
② Actions for the selected portal
③ Selection panel for the selected action
④ Change to the project view
⑤ Display of the project that is currently open

Portals

The portals provide the basic functions for the individual task areas. The portals that are provided in the portal view depends on the products that have been installed.

Actions for the selected portal

Here, you will find the actions available to you in the portal you have selected. You can call up the help function in every portal on a context-sensitive basis.

Selection panel for the selected action

The selection panel is available in all portals. The content of the panel adapts to your current selection.

Change to the project view

You can use the "Project view" link to change to the project view.

Display of the project that is currently open

Here, you can obtain information about which project is currently open.

Inspector window (Page 324)

Basics on task cards (Page 326)

Details view (Page 330)

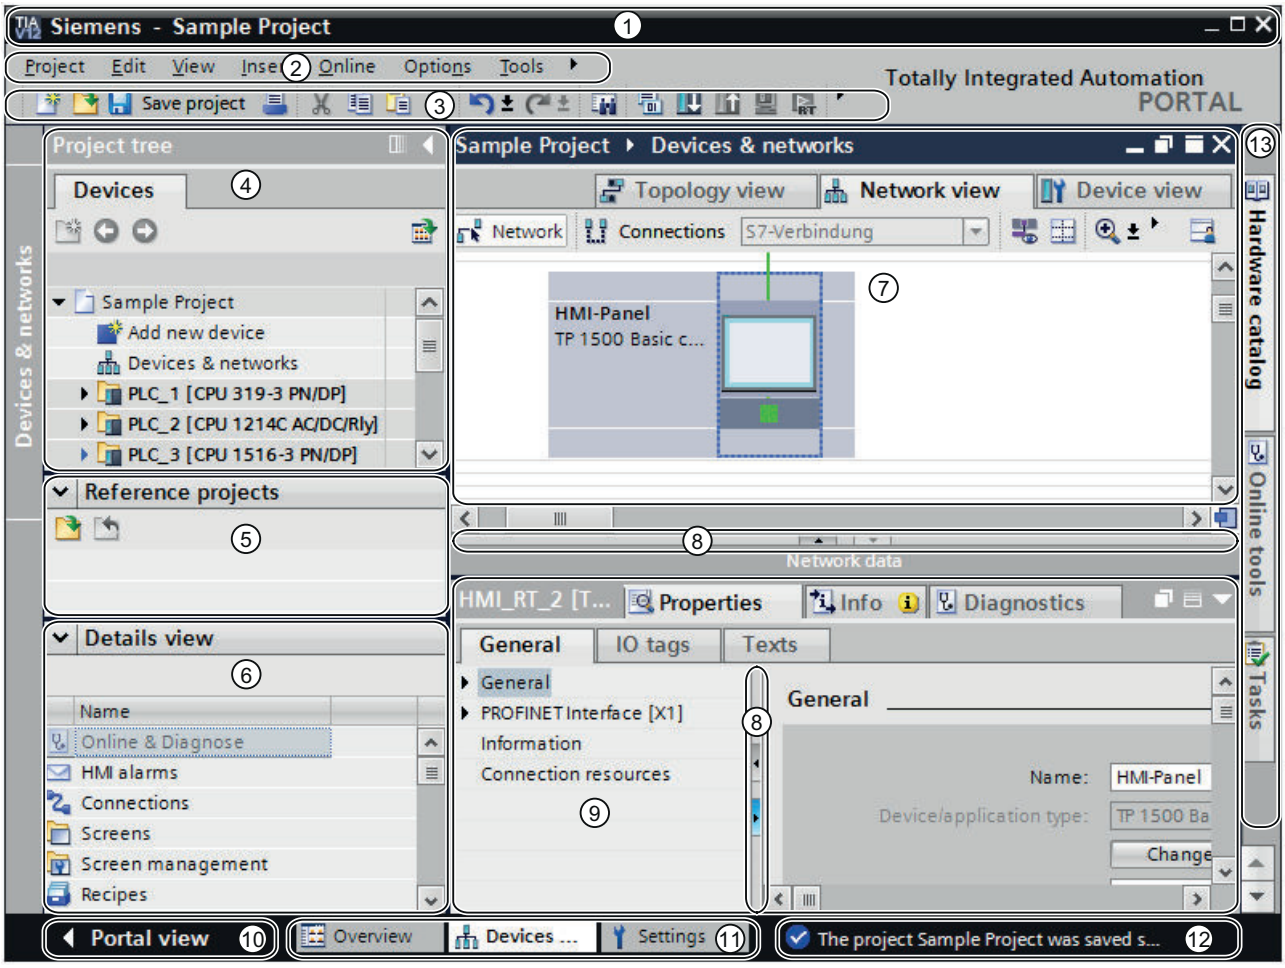
8.1.2.3 Project view

Purpose of the project view

The project view is a structured view of all components of the project.

Layout of the project view

The following figure shows an example of the components of the project view:



① Title bar
② Menu bar
③ Toolbar
④ Project tree (Page 312)
⑤ Reference projects (Page 328)
⑥ Details view (Page 330)
⑦ Work area (Page 326)
⑧ Dividers
⑨ Inspector window (Page 324)
⑩ Changing to the Portal view (Page 307)
⑪ Editor bar
⑫ Status bar with progress display
⑬ Task cards (Page 326)

Title bar

The name of the project is displayed in the title bar.

Menu bar

The menu bar contains all the commands that you require for your work.

Toolbar

The toolbar provides you with buttons for commands you will use frequently. This gives you faster access to these commands.

Dividers

Dividers separate individual components of the program interface. The arrows on the dividers allow you to display and hide the adjacent sections of the user interface.

Changing to the portal view

You can use the "Portal view" link to change to the portal view.

Editor bar

The Editor bar displays the open editors. If you have opened a lot of editors, they are shown grouped together. You can use the Editor bar to change quickly between the open elements.

Status bar with progress display

In the status bar, you will find the progress display for processes that are currently running in the background. This also includes a progress bar that shows the progress graphically. Hover the mouse pointer over the progress bar to display a tooltip providing additional information on the active background process. You can cancel the background processes by clicking the button next to the progress bar.

If no background processes are currently running, the status bar displays the last generated alarm.

See also

Basics of the work area (Page 316)

8.1.2.4 Library view

Function of the library view

The library view provides an overview of the elements in the project library and the open global libraries. You can switch to the library view using the "Libraries" task card.

See also: Overview of the library view (Page 475)

8.1.2.5 Project tree

Project tree

Function of the project tree

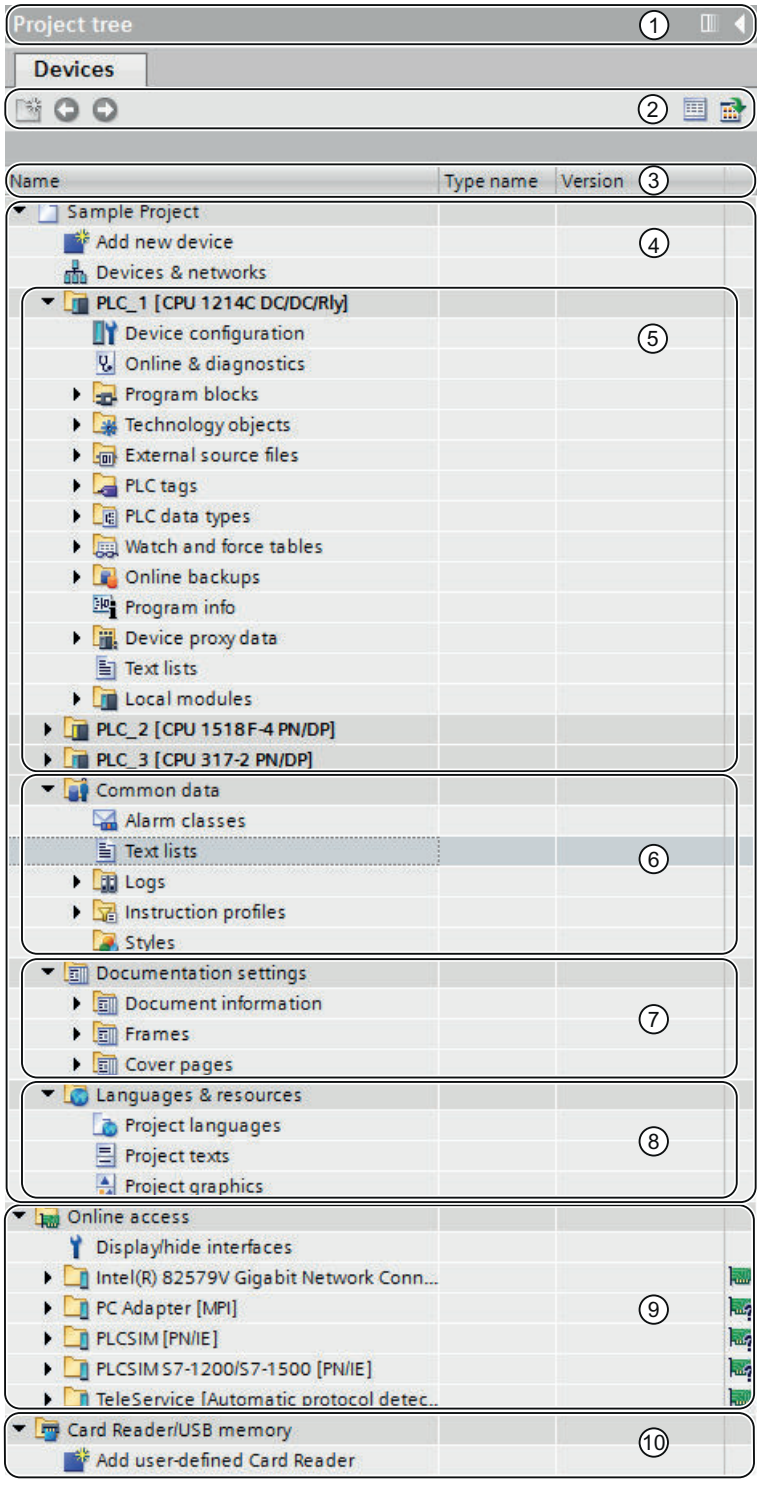
Using the project tree features gives you access to all components and project data. You can perform the following tasks in the project tree:

- Add new components
- Edit existing components
- Scan and modify the properties of existing components

You can select the objects of the project tree either with the mouse or via the keyboard by typing the first letter of the desired object. If more than one object begins with the same letter, the next lower object is selected. The project tree must be the focused user interface element in order for you to select an object with its initial letter.

Layout of project tree

The following figure shows an example of the project tree components:



① Title bar
② Toolbar
③ Table header
④ Project
⑤ Devices
⑥ Common data
⑦ Documentation settings
⑧ Languages & resources
⑨ Online access
⑩ Card Reader / USB memory

Title bar

The title bar of the project tree has a button for automatically and manually collapsing the project tree. Once it is collapsed manually, the button is "Reduced" to the left-hand margin. It changes from an arrow pointing left to one that is pointing right, and can now be used to reopen the project tree. You can use the "Collapse automatically" button collapse to project tree automatically when you do not need it.

See also: Maximizing and minimizing the work area (Page 318)

Toolbar

You can do the following tasks in the toolbar of the project tree:

- Create a new user folder; for example, in order to group blocks in the "Program blocks" folder.
- Navigate forward to the source of a link and back to the link itself.
  There are two buttons for links in the project tree. You can use these to navigate from the link to the source and back.
- Show an overview of the selected object in the work area.
  When the overview is displayed, the lower-level objects and actions of the elements in the project tree are hidden.

Table header

The "Name" column is shown by default. You can also show the columns "Type name" and "Version". If you are showing the additional columns, you see the name of the respective type as well as the version used for instances of types from the library.

Project

You will find all the objects and actions related to the project in the "Project" folder, e.g.:

- Devices
- Languages & resources
- Online access

Device

There is a separate folder for each device in the project, which has an internal project name. Objects and actions belonging to the device are arranged inside this folder.

Common data

This folder contains data that you can use across more than one device, such as common message classes, logs, scripts and text lists.

Documentation settings

In this folder, you can specify the layout for project documentation to be printed at a later point.

Languages & resources

You can determine the project languages and texts in this folder.

Online access

This folder contains all the interfaces of the programming device / PC, even if they are not used for communication with a module.

Card Reader / USB memory

This folder is used to manage all card readers an other USB storage media connected to the programming device / PC.

Showing and hiding columns (Page 316)

Showing and hiding columns

You can show additional columns in the project tree, if necessary. These additional columns show the name of the type associated with an instance as well as its version number.

Procedure

To show or hide additional table columns for the associated type and its version number, follow these steps:

1. Right-click on the table header of the project tree.
2. Select the "Show/Hide" command in the shortcut menu, and select the columns you want to display.
   The selected columns are displayed or hidden.

Project tree (Page 312)

8.1.2.6 Work area

Basics of the work area

Function of the work area

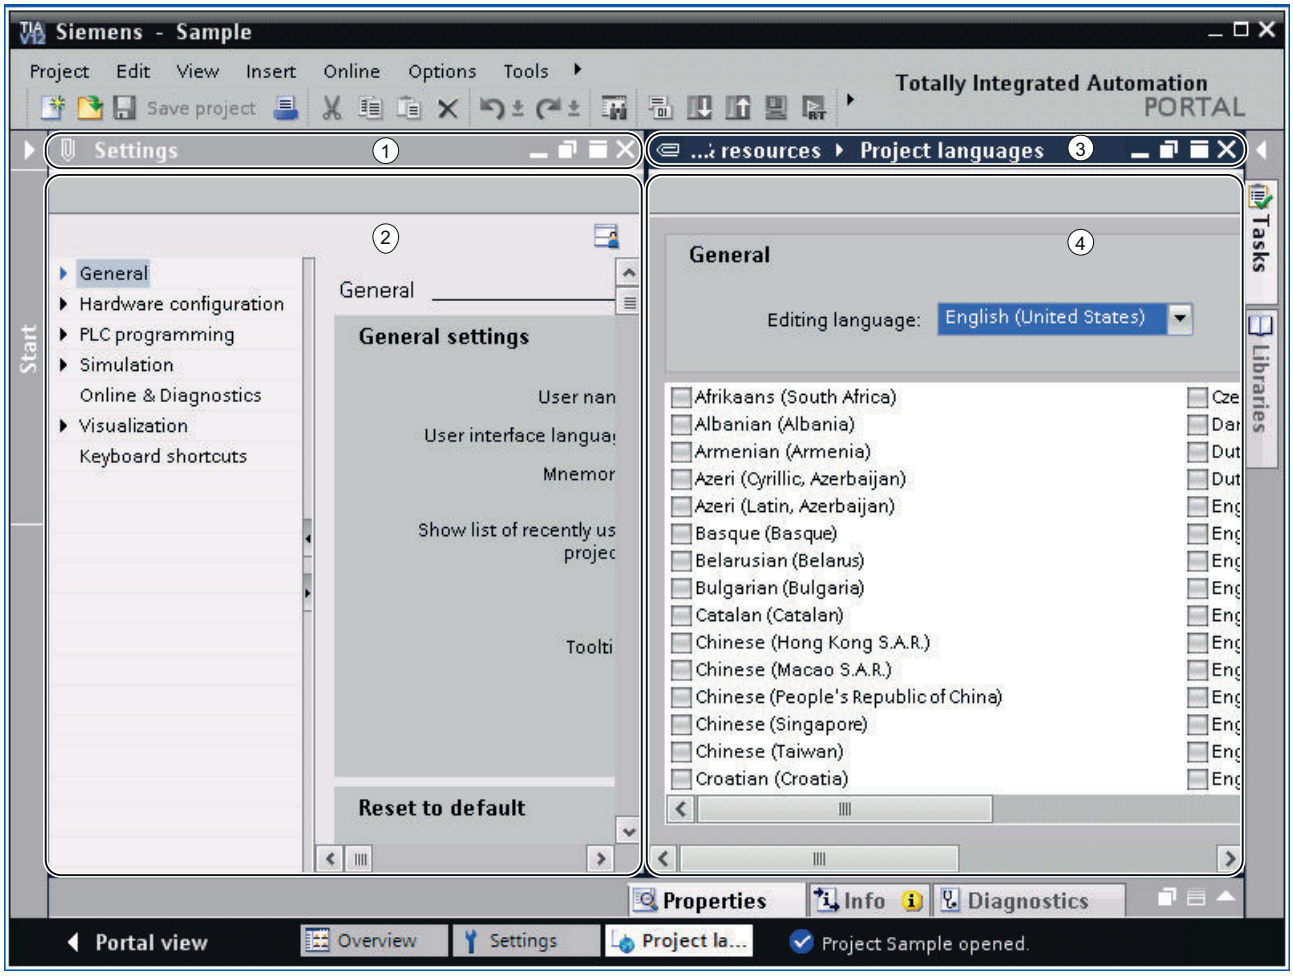
The objects that you can open for editing purposes are displayed in the work area. These objects include, for example:

- Editors and views
- Tables

You can open several objects. However, normally it is only possible to see one of these at a time in the work area. All other objects are displayed as tabs in the Editor bar. If, you would like to view two objects at the same time when performing certain tasks, you can tile the work area either horizontally or vertically or undock elements of the work area. If no objects are open, the work area will be empty.

Layout of the work area

The following figure shows an example of a vertically split work area:



① Title bar of left-hand editor
② Work area of left-hand editor
③ Title bar of right-hand editor
④ Work area of right-hand editor

See also

Using grouped elements of the work area (Page 321)

Minimizing and maximizing elements of the work area (Page 322)

Switching between the elements in the work area (Page 323)

Saving a layout of editors and tables (Page 337)

Save user interface layout (Page 335)

Maximizing and minimizing the work area

You have the option to adapt the work area to make it as large as possible. You can use the following function for this:

- Maximizing the work area
  You can close the task cards, project tree and inspector window with a single click. This increases the size of the work area. You can minimize the work area again at any time in order to return to the previous view.
- Collapsing task cards, project tree, and Inspector window automatically
  You can use the "Collapse automatically" option for the task cards, project tree, and Inspector window. This function causes these items to collapse automatically when you don't need them.

Maximizing and minimizing the work area

To maximize the work area, follow these steps:

1. Open an element such as an editor or a table.
   The element appears in the work area.
2. Click the "Maximize" button in the title bar of the element.
   The task cards, project tree and inspector window collapse, and the work area is shown with its maximum dimensions.

To minimize the work area again, follow these steps:

1. Click the "Embed" button in the title bar of the displayed element.
   This restores the view that existed before the work area was maximized. That is, if the task cards, project tree, or Inspector window were expanded before, they will be expanded again.

Collapsing task cards, project tree, and Inspector window automatically

To collapse the task cards automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the task cards.
   The task cards collapse when you click anywhere outside the task cards.
2. To use the task cards, click the collapsed task cards.
3. The task cards expand and are available for use. The "Collapse automatically" option remains enabled.

To collapse the project tree automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the project tree.
   The project tree collapses when you click anywhere outside the project tree.
2. To use the project tree, click the collapsed project tree.
   The project tree expands and is available for use. The "Collapse automatically" option remains enabled.

To collapse the Inspector window automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the Inspector window.
   The Inspector window collapses when you click anywhere outside the Inspector window.
2. To use the Inspector window, click the collapsed Inspector window.
   The Inspector window expands and is available for use. The "Collapse automatically" option remains enabled.

To disable the automatic collapse option, follow these steps:

1. Click "Expand permanently" again in the relevant window.
   The Collapse automatically" option is disabled, and the window remains expanded.

Switching between the elements in the work area (Page 323)

Saving a layout of editors and tables (Page 337)

Splitting the work area

You can split the work area vertically or horizontally.

Procedure

To split the work area vertically or horizontally, follow these steps:

1. In the "Window" menu, select the "Split editor space vertically" or "Split editor space horizontally" command.
   The element you have clicked and the next element in the Editor bar will be displayed either next to one another or one above the other.

Note

If no elements are open in the work area, the "Split editor space vertically" and "Split editor space horizontally" functions will not be available.

See also

Basics of the work area (Page 316)

Maximizing and minimizing the work area (Page 318)

Minimizing and maximizing elements of the work area (Page 322)

Switching between the elements in the work area (Page 323)

Saving a layout of editors and tables (Page 337)

Floating the work area elements

You can float work area elements in their own separate window:

- Editors
- Tables
- Setting windows
- Task cards
- Inspector window

You can embed floating elements again in the work area at any time.

Note

Properties of elements in a floating window

The properties of elements that you have selected in a floating window are only displayed in the Inspector window if the Inspector window is floating as well.

Floating the work area elements

To float work area elements, follow these steps:

1. Click the "Float" button in the title bar of the element.
   The element will be released from the work area and displayed in its own window. You can now place the window wherever you wish. If you have minimized the window, you can restore it via the editor bar.

Embedding elements in the work area

To embed elements in the work area again, follow these steps:

1. Click the "Embed" button in the title bar of the element.
   The element will appear in the work area again.

See also

Minimizing and maximizing elements of the work area (Page 322)

Switching between the elements in the work area (Page 323)

Saving a layout of editors and tables (Page 337)

Using grouped elements of the work area

If you open more than five elements of the same type, e.g., editors or tables, they are grouped in the editor bar. You can use these groups as follows:

- Displaying individual elements of a group
- Displaying all elements of a group in separate windows
- Embedding all displayed elements of a group in the work area
- Minimizing all displayed elements
- Closing all elements of a group

Displaying individual elements of a group

To display individual elements of a group, follow these steps:

1. In the editor bar, click the group containing the element you want to display.
   All list of all available elements of the group is displayed.
2. Click the element that you want to display.

Displaying all elements of a group in separate windows

To display all elements of a group in separate windows, follow these steps:

1. In the editor bar, right-click the group whose elements you want to display.
2. Select "Restore group" in the shortcut menu.
   All elements of the group are displayed in separate, overlapping windows. Move the windows in order to see the individual element, or choose an element via the group in the editor bar.

Embedding all displayed elements of a group in the work area

To embed all elements of a group displayed in separate windows in the work area again, follow these steps:

1. In the editor bar, right-click the group whose elements you want to embed.
2. Select "Embed group" in the shortcut menu.
   All elements of the group are embedded in the work area again.

Minimizing all displayed elements

To minimize all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to minimize.
2. Select "Minimize group" in the shortcut menu.
   All elements of the group are minimized. However, the minimized elements remain open and can be quickly maximized again via the group in the editor bar.

Closing all elements of a group

To close all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to close.
2. Select "Close group" in the shortcut menu.
   All elements of the group are closed. The group is removed.

Minimizing and maximizing elements of the work area

You can minimize the elements that are open in the work area, such as editors or tables, as needed. However, an element remains open even if it has been minimized, and can quickly be maximized again using the editor bar.

Minimizing elements in the work area

To minimize elements in the work area, follow these steps:

1. Click the "Minimize" button in the title bar of the element.
   The element is minimized, but can still be accessed via the editor bar.

To minimize all elements at the same time, follow these steps:

1. In the "Window" menu, select the "Minimize all" command.

Maximizing elements in the work area

To maximize elements in the work area again, follow these steps:

1. Click the required element in the editor bar.
   The element is maximized and appears in the work area.

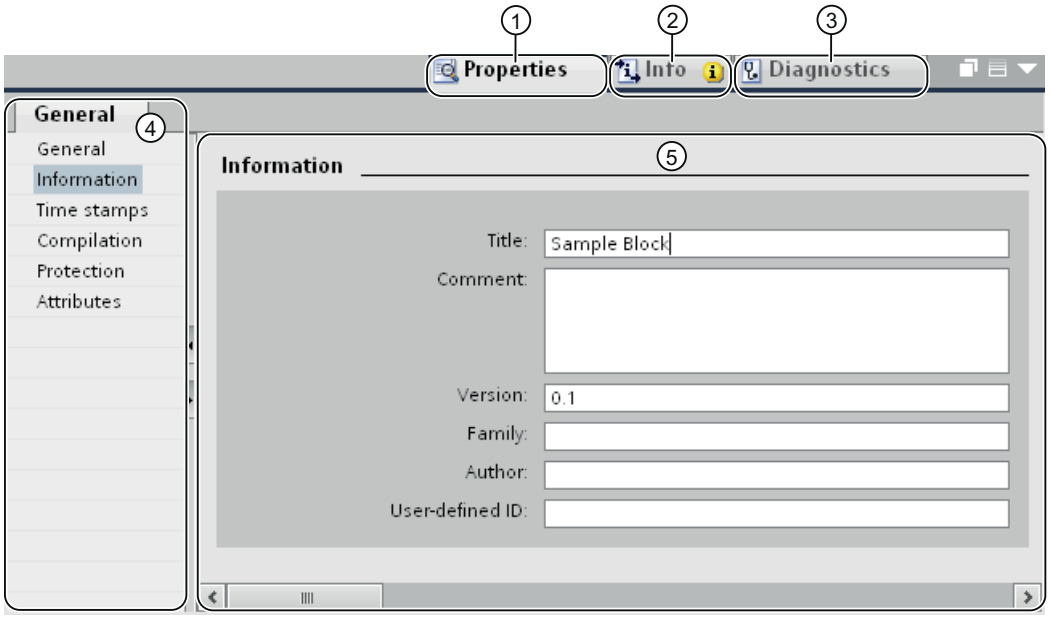
8.1.2.7 Inspector window

Function of the Inspector window

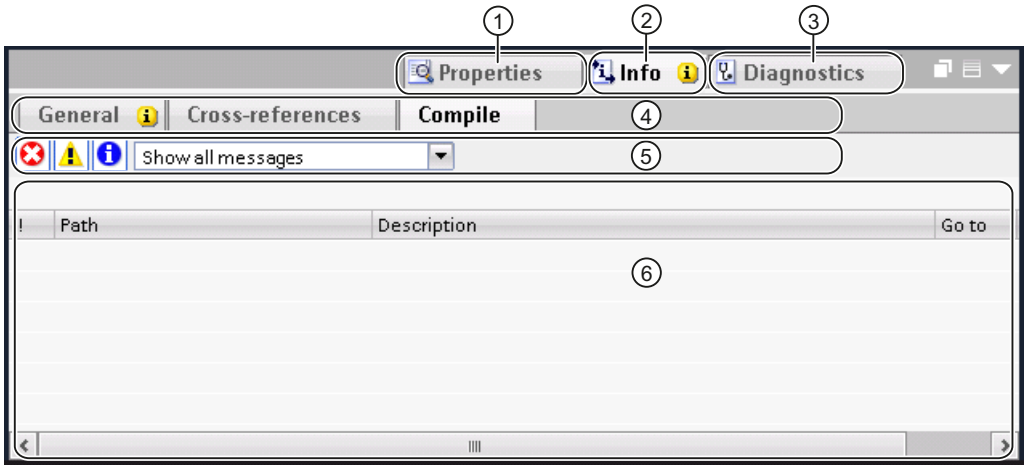
Additional information on an object selected or on actions executed are displayed in the inspector window.

Layout of the Inspector window

The following figures show the components of the Inspector window:



① "Properties" tab
② "Info" tab
③ "Diagnostics" tab
④ Area navigation within the "Properties" tab
⑤ Content of the "Properties" tab



① "Properties" tab
② "Info" tab
③ "Diagnostics" tab
④ Navigation through additional tabs within a tab (only available in the "Info" and "Diagnostics" tabs)
⑤ Toolbar (only available in the secondary "General" and "Compile" tabs of the "Info" tab)
⑥ Content of the "Compile" tab in the "Info" tab

"Properties" tab

This tab displays the properties of the object selected. You can change editable properties here.

"Info" tab

This tab displays additional information on the object selected, as well as alarms on the actions executed (such as compiling).

"Diagnostics" tab

This tab provides information on system diagnostics events, configured alarm events, and connection diagnostics.

Navigation within the tabs

You can use area navigation and the lower-level tabs to display the information you require within the tabs.

Toolbar

You can use the toolbar in the "General" and "Compile" tabs within the "Info" tab to specify which types of alarms are to be displayed. You can enable or disable the display for the following alarm types:

- Errors
- Warnings
- Information

8.1.2.8 Task cards

Basics on task cards

Function of task cards

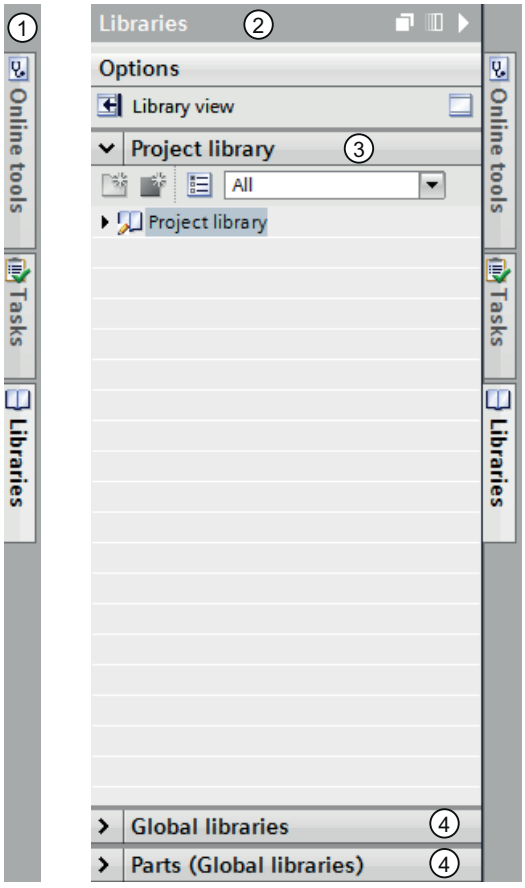
Depending on the edited or selected object, task cards that allow you perform additional actions are available. These actions include:

- Selecting objects from a library or from the hardware catalog
- Searching for and replacing objects in the project
- Dragging predefined objects to the work area

The task cards available can be found in a bar on the right-hand side of the screen. You can collapse and reopen them at any time. Which task cards are available depends on the products installed. More complex task cards are divided into panes that you can also collapse and reopen.

Layout of task cards

The following figure shows an example of the bar with the task cards:



① Task cards closed
② Task card open
③ Opened palette of a task card
④ Closed palette of a task card

Changing the pane mode

You can choose between two pane modes:

- Single pane mode:
  Only one pane is open at any given time. If you open another pane, the previously opened pane is closed automatically.
- Multi-pane mode:
  You can open several panes at the same time.

Procedure

To change the pane mode, follow these steps:

1. Click the "Change pane mode" button above the panes inside a task card.

See also

Basics on task cards (Page 326)

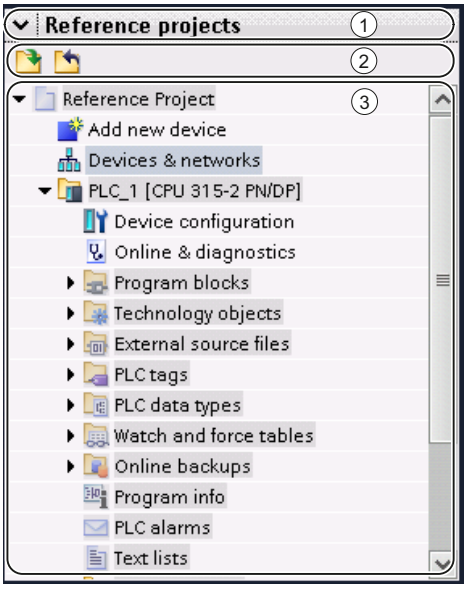
8.1.2.9 Reference projects

Function of reference projects

In the "Reference projects" palette, you can open other projects in addition to the current project. These reference projects are write-protected and cannot be edited. However, you can drag the objects of a reference project into your current project and further edit them there. You can also compare the objects of a reference project to the objects of your current project.

Layout of the "Reference projects" palette

The following figure shows the layout of the "Reference projects" palette:



① Title bar
② Toolbar
③ Opened reference projects

Title bar

The arrow for closing the palette is located in the title bar of the "Reference projects" palette. Once it is closed, the direction in which the arrow is pointing changes from downwards to right. It can now be used to reopen the palette.

Toolbar

The toolbar contains buttons for opening and closing reference projects.

Opened reference projects

Opened reference projects are displayed as read-only with their objects and their hierarchical structure.

8.1.2.10 Details view

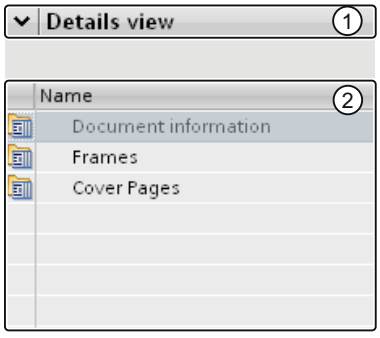
Purpose of the details view

The detail view shows certain content of the selected object is in the overview window or in the project tree. This might include text lists or tags.

The content of folders is not shown, however. To display the content of folders, use the project tree or the Inspector window.

Layout of the details view

The following figure shows an example of the details view:



① Title bar
② Content of the selected object

Title bar

The arrow for closing the details view is located in the title bar of the details view. After it has closed, the direction in which the arrow is pointing changes from left to right. It can now be used to reopen the details view.

Objects

The displayed content varies depending on the selected object. You can move the content of objects from the details view to the required location using drag-and-drop.

8.1.2.11 Overview window

Overview window

Functions of the Overview window

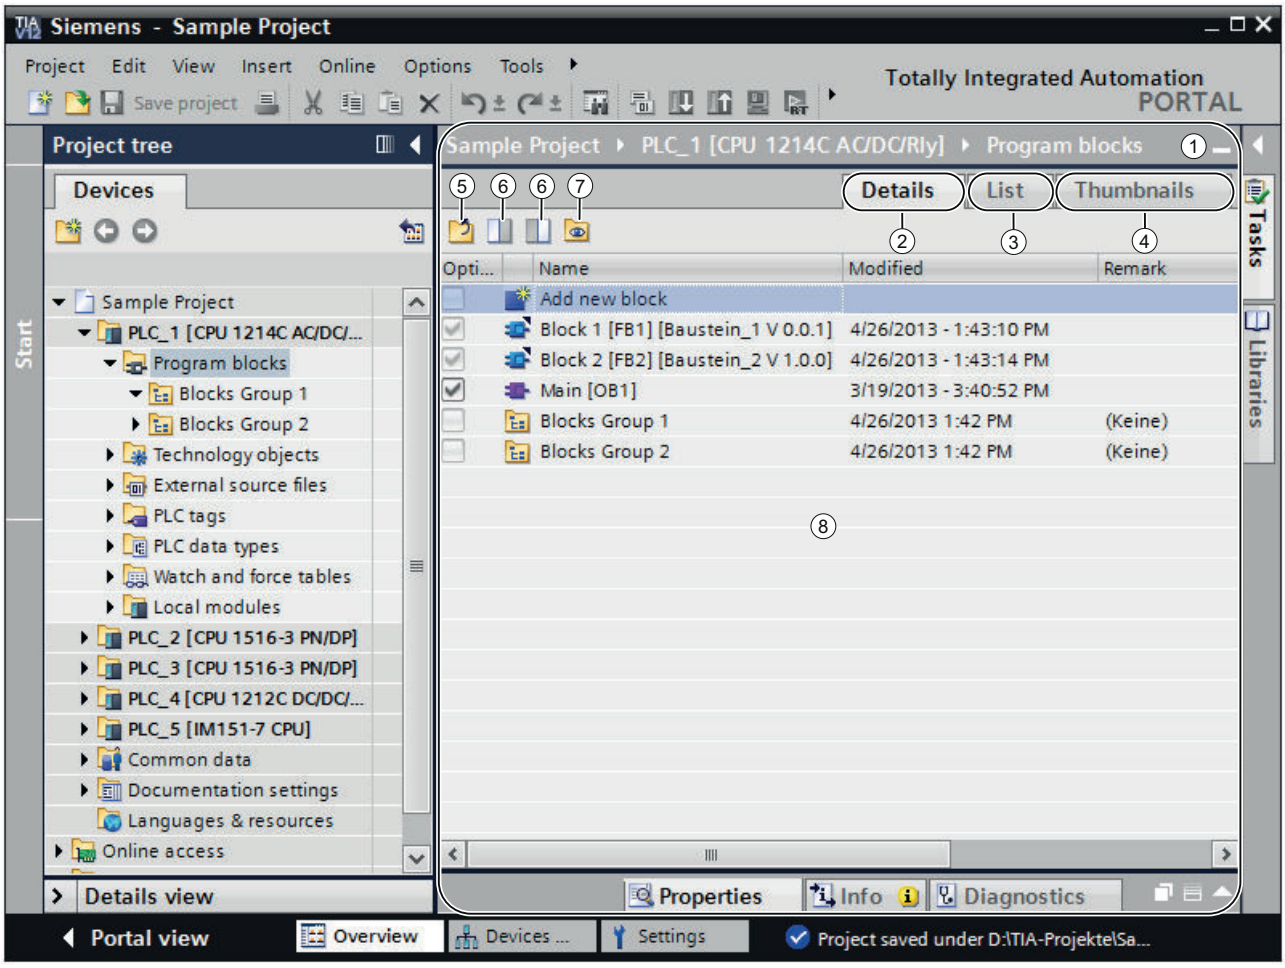
The Overview window supplements the project tree. The Overview window shows the contents of the folder currently selected in the project tree.

In addition, you can perform the following actions in the Overview window:

- Open objects
- Display and edit the properties of objects in the Inspector window
- Rename objects
- Call object-specific actions from the shortcut menu
- Compare objects side by side
- Perform various object operations, such as inserting objects from the library via drag-and-drop and moving, copying, pasting, and deleting objects

Layout of the Overview window

The following figure shows the components of the Overview window:



① Overview window
② Switch to the Details view
③ Switch to the List view
④ Switch to the Icon view
⑤ Move to higher level
⑥ Split the overview window in two. Either the right or left half of the overview window is synchronized. Clicking again cancels the split.
⑦ All elements within a selected folder are displayed even if these are located in lower-level groups. This option is only available in details view.
⑧ Contents of the object selected in the project tree.

Display forms of the Overview window

The content of the Overview window can be displayed as follows:

- Details view
  The objects are displayed in a list with additional information, such as the date of the last change.
- List view
  The objects are displayed in a simple list.
- Icon view
  The objects are displayed as icons according to category.

See also

Comparing objects in the overview window (Page 333)

Sorting the details view of the overview window (Page 334)

Overview of the library view (Page 475)

Comparing objects in the overview window

You can display the contents of two folders or objects side by side in the Overview window. The Overview window is split in half and you can display different contents on the left and right sides.

In addition, you can use a drag-and-drop operation to move objects between the split windows. Thus, for example, you can move contents from one window to the other.

Procedure

To split the Overview window in half or cancel the split, follow these steps:

1. In the toolbar, click on the "Synchronize left side" or "Synchronize right side" icon to split the overview window. Either the left or the right side of the overview window synchronized with the contents of the selected object in the project tree.
2. To cancel the split, click again on the previously selected icon.

See also

Overview window (Page 331)

Sorting the details view of the overview window

You have several options for adapting the display in the details view of the overview window:

- Adding additional columns
  Some columns are hidden by default to increase clarity. You can display hidden columns if needed. The columns available depend on the selected object.
- Display of folder contents in a flat hierarchy
  Folder contents can be displayed in a flat hierarchy. All the content is displayed at once even if it is located in different groups.
- Sorting the table columns
  You can sort individual columns of the table in ascending or descending order.

Showing or hiding columns

To show or hide additional table columns, follow these steps:

1. Right-click the title bar of the table.
2. Select the "Show/Hide" command in the shortcut menu, and select the columns you want to display.

Displaying folder contents in flat hierarchy

To display the content of a folder in a flat hierarchy, follow these steps:

1. Select the required folder in the project tree or in the library navigation of the library view.
2. Click the "Show subordinate elements" icon in the toolbar.
   All elements are displayed at once in the table even if they are located in subfolders.

Sorting a table in ascending or descending order

To sort the table by a column in ascending or descending order, follow the steps below:

1. Click the table header of a column if you want to sort the column in ascending order.
2. Click again on the same column of the table header to sort the column in descending order.
3. Click a third time on the table header of the same column to cancel the sorting.

8.1.2.12 User interface layout

Save user interface layout

Options for backing up the user interface layout

When you make a change to the user interface, this is retained even after a restart of the TIA Portal. A change to the user interface layout includes, for example, moving a window or adjusting the size of an editor.

In addition to the automatic saving of the user interface layout, you have the option of manually backing up specific layouts:

- Save the window layout
  You can save the layouts of the windows and editors of the TIA Portal manually and restore these at a later time. It is possible to call five window layouts using a key combination. Use this function, for example, if you are working with a notebook to which you connect an external monitor when necessary. You can create a window layout for mobile use on the notebook display and another layout for when you work at the office with an external monitor.
- Save the layout within editors
  With some editors, you can adjust the display. You can, for example, adjust the width of tables or show or hide individual table columns.

See also

Save window layout (Page 335)

Load window layout (Page 336)

Managing window layouts (Page 337)

Saving a layout of editors and tables (Page 337)

Resetting the user interface layout (Page 338)

Basics of the work area (Page 316)

Save window layout

You can save the current window layout in order to call it again in the same form at a later time.

Procedure

To save a window layout, follow these steps:

1. Arrange all windows in the way in which you want to save them.
2. In the "Window" menu, select the "Save window layout as" command.
   The "Save window layout" dialog box appears.
3. Enter a name for the window layout in the "Name" field.

4. Enter a description of the window layout in the "Description" field in order to be able to identify the window layout more easily later.
5. Click "Save".

Result

The new window layout is saved in the last position after the existing saved window layouts. The first five window layouts can be called using a key combination.

See also

Save user interface layout (Page 335)

Load window layout

If you have already saved a window layout, you can load this, allowing you to quickly adjust your work environment to the respective conditions. You can load the first five window layouts using quick access via the "Window" menu or via a key combination.

If you load a window layout and then make changes to the arrangement of the window, you can restore the originally saved window layout.

Using quick access to load window layouts 1 to 5

To load one of the first five saved window layouts, follow these steps:

1. In the "Window" menu, select a window layout or select the key combination <Alt+Shift+[1 ... 5]>.

Loading additional window layouts

To load a window layout that is not among the first five window layouts, follow these steps:

1. In the "Window" menu, select the "Additional window layouts" command.
   The "Manage window layouts" dialog box appears.
2. Select the desired window layout.
3. Click "OK".

Restore window layout

To go back to a saved window layout, follow these steps:

1. In the "Window" menu, select the "Restore window layout" command or select the key combination <Alt+Shift+0>.

See also

Save user interface layout (Page 335)

Managing window layouts

You can carry out the following actions with existing window layouts:

- Changing the order of window layouts
  The order of the window layouts is important, as the first five window layouts can be called directly via the "Window" menu and via a key combination.
- Select a window layout
  If a window layout is not one of the first five window layouts, you can call it using the "Manage window layouts" dialog box.
- Deleting window layouts

Procedure

To manage the existing window layouts, follow these steps:

1. In the "Window" menu, select the "Manage window layouts" command.
   The "Manage window layouts" dialog box appears.
2. Select the window layout which you want to modify.
3. Click the "Up" or "Down" symbol to move the window layout up or down.
4. Click the "Delete" symbol to delete the selected window layout.
5. Click "OK".
   The selected window layout is activated.

See also

Save user interface layout (Page 335)

Saving a layout of editors and tables

You have the option of adapting editors and tables to meet your requirements. For example, you can hide columns in tables that you don't need. You can then save your customized view.

Procedure

To save the layout of editors and tables in the work area, follow these steps:

1. Adapt the editor or table according to your requirements.
2. Click the "Remember Layout" button in the editor or table.

Result

The layout is saved. When you reopen the editor or table, this layout will be used.

Using grouped elements of the work area (Page 321)

Minimizing and maximizing elements of the work area (Page 322)

Switching between the elements in the work area (Page 323)

Save user interface layout (Page 335)

Resetting the user interface layout

Every change you make to the layout of the user interface is saved. The changes are thus available even after a restart of the TIA Portal. For example, if you change the height and width of a text editor or the division of a table, your changes are retained so that you don't have to re-customize elements every time.

In some cases, however, it may be helpful to restore the original layout settings; for example, if another user prefers a different arrangement of the user interface.

Procedure

To reset the user interface settings to the default, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation.
3. Click the "Reset to default" button under "Reset to default > Editor layout".

Result

The default settings for the user interface are restored.

8.1.3 Keyboard operation in the TIA Portal

8.1.3.1 Operation of the TIA Portal with the keyboard

You can navigate through the TIA Portal using the keyboard, for example if you do not have a mouse available at the given moment. Many functions are also accessible via keyboard shortcuts. You can find an overview of all keyboard shortcuts in the settings for the TIA Portal.

In the following sections, you will learn how to navigate in the TIA Portal using the keyboard, edit objects, and customize the TIA Portal to your needs.

See also

Displaying an overview of all keyboard shortcuts (Page 339)

8.1.3.2 Displaying an overview of all keyboard shortcuts

You can display an overview of all keyboard shortcuts.

Procedure

To display an overview of all available keyboard shortcuts, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The settings of the TIA Portal are displayed.
2. Open the "Keyboard shortcuts" entry in the area navigation.
   You can see an overview of all keyboard shortcuts, which are valid for the currently installed products.

8.1.3.3 Basic functions of the TIA Portal

Below, you will learn how you can use the basic functions of the TIA Portal using only your keyboard.

Using the basic functions of the TIA Portal with the keyboard

The following table shows how you can access basic functions of the TIA Portal with keyboard shortcuts:

Function	Keyboard shortcut	Menu command
Change between the project view and the portal view	<Alt+F7>	
Open the Help system If you need help on the TIA Portal, press <F1>.	<F1>	Help > Show help
Cancel the current action	<Esc>	
Find	<Ctrl+F>	
Replace an object You can replace found objects when searching in the editor.	<Ctrl+H>	

Function	Keyboard shortcut	Menu command
Find next If you have started a search in the editor, you can jump to the next hit with <F3>.	<F3>	
Print object	<Ctrl+P>	Project > Print
Run default action of the object	<Enter>	
Scroll horizontally to the right	<Ctrl+Arrow right>	
Scroll horizontally to the left	<Ctrl+Arrow left>	

Operating menus

The following table shows how you can navigate through menus using the keyboard:

Function	Keyboard shortcut
Start keyboard shortcuts in the menu You can access the menu using the <Alt> key and then continue to navigate with the arrow keys to scroll through the menu. Confirm your selection of the menu command with <Enter>.	<Alt>
Go directly to a specific menu You can go directly to an individual menu command by holding down the <Alt> key. There is an underlined letter for each menu command. Press the <Alt> key along with the underlined letter.	<Alt+underlined letter in respective menu>
Open shortcut menu of an object With the shortcut menu key (on Microsoft Windows compatible keyboards), you can open the shortcut menu of the selected object. Alternatively, you can use <Shift+F10> if you are not using a Microsoft Windows compatible keyboard. You can use the arrow keys to scroll through the shortcut menu and select a menu command with <Enter>.	<Shortcut menu key> Alternative: <Shift+F10>

Operating expandable elements

The following table shows how you can operate expandable elements using the keyboard:

Function	Keyboard shortcut
Expand a folder in a tree With <Arrow right>, for example, you expand a folder in the project tree.	<Arrow right>
Close a folder in a tree With <Arrow left>, for example, you collapse a folder in the project tree.	<Arrow left>
Open a drop-down list You can open drop-down lists with <F4> and then navigate with the arrow keys to scroll through the drop-down list. Finally, press the <Enter> key to confirm your selection.	<F4>
Open autocompletion	<Ctrl+Space> <Ctrl+I>
Show object selection	<Ctrl+J>

8.1.3.4 Using project-related functions

Editing a project

Function	Keyboard shortcuts	Menu command
Open a project	<Ctrl+O>	Project > Open
Close a project	<Ctrl+W>	Project > Close
Save a project	<Ctrl+S>	Project > Save
Save a project under a different name	<Ctrl+Shift+S>	Project > Save as
Delete a project	<Ctrl+E>	Project > Delete project
Print project	<Ctrl+P>	Project > Print
Undo last action	<Ctrl+Z>	Edit > Undo
Redo last action	<Ctrl+Y>	Edit > Redo

Calling up the help function

Function	Keyboard shortcuts	Menu command
Calling up the help function	<F1> or <Shift+F1>	Help > Show help

8.1.3.5 Arranging windows

Below, you will learn how to open and close individual windows of the TIA Portal and work with saved window layouts using the keyboard.

Opening and closing windows

The following table shows how you can open and close windows with keyboard shortcuts:

Function	Keyboard shortcut	Menu command
Open/close project tree	<Ctrl+1>	View > Project tree
Opening/closing the detailed view	<Ctrl+4>	View > Details view
Opening/closing the overview	<Ctrl+2>	View > Overview
Opening/closing a task card	<Ctrl+3>	View > Task card
Open libraries	<Ctrl+Shift+L>	
Open hardware catalog If you are in the device or network view, the hardware catalog opens.	<Ctrl+Shift+C>	
Open/close inspector window	<Ctrl+5>	View > Inspector window
Open the "Properties" tab in the inspector window	<Ctrl+6>	
Open the "Info" tab in the Inspector window	<Ctrl+7>	
Open the "Diagnostics" tab in the Inspector window	<Ctrl+8>	
Display or hide reference projects	<Ctrl+9>	

Function	Keyboard shortcut	Menu command
Display the on-screen keyboard You can display a keyboard on the screen, for example, to operate with a touch screen.	<Ctrl+Shift+K>	
Close all editors	<Ctrl+Shift+F4>	Window > Close all

Using saved window layouts

You can save individual window arrangements and restore them at a later point in time. The following table shows how you to access saved window layouts with keyboard shortcuts:

Function	Keyboard shortcut	Menu command
Restore active window layout If you use a saved window layout and have made changes to the program interface in the meantime, you can restore the original state of the active window layout with <Alt+Shift+0>.	<Shift+Alt+0>	Window > Restore window layout
Load window layout You can use <Alt+Shift+[number of the window layout]> to activate the first of the five saved window layouts.	<Shift+Alt+[Number of the window layout]>	Window > Window layout 1 to 5

8.1.3.6 Navigating through the program interface

The TIA Portal is divided into various user interface areas, for example, individual windows, toolbars, and editors. If you want to work with the keyboard within an interface area, you first have to place the focus on it. Below, you will learn how to place the focus on individual interface areas using the keyboard. You will also learn how to move within an interface area in the TIA Portal using the keyboard.

Switching between interface areas and editors

The following table shows how to move between individual interface areas of the TIA Portal:

Function	Keyboard shortcut
Move clockwise between the interface areas You can use the <F6> key to move clockwise between the individual interface areas of the TIA Portal. The interface area currently in focus is highlighted with a blue title bar. If you are in the project tree, for example, and press the <F6> key, you jump to the currently open editor. If you press <F6> again, the task cards are in focus. If you press <Shift+F6>, on the other hand, you move counterclockwise between the work areas.	<F6>
Move counterclockwise between the interface areas With <Shift+F6> you move counter-clockwise between the interface areas of the TIA Portal.	<Shift+F6>
Go to the next open editor With <Ctrl+Alt+Arrow right> you go to the next open editor. You can see the open editors in the editor toolbar.	<Ctrl+Alt+Arrow right> Alternative: <Ctrl+F6>
Go to the previous open editor With <Ctrl+Alt+Arrow left>, you go to the last opened editor.	<Ctrl+Alt+Arrow left> Alternative: <Ctrl+Shift+F6>

Function	Keyboard shortcut
Go to the next higher section of the interface area With <Shift+Esc>, you move to the next higher section of the program interface. If, for example, you have selected a device in the project tree and you press <Shift+Esc>, the entire project navigation is put into focus.	<Shift+Esc> Alternative: <Alt+Arrow up>
Go to the next lower section of the interface area With <Enter>, you place the focus on the next lower section of the program interface. For example, if you have just opened the properties of a device in the Inspector window in order to assign parameters to the device, press <Enter> to go one level deeper in the program interface. You can then navigate to the desired parameter using the Tab key.	<Enter> Alternative: <Alt+Arrow down>

Navigation within interface areas and editors

The following table shows how you can navigate within an interface area using the keyboard:

Function	Keyboard shortcut
Jump to the next element within an interface area You can use the Tab key to jump from one element to the next within a work area. If, for example, you have opened the properties of a device and want to jump from one field to the next, press the Tab key. Any changes you have made to the current text box are applied in this case.	<Tab>
Jump to the previous element within an interface area With <Shift+Tab>, you can jump to the previous element in a work area, for example, a previous text box. Any changes you have made to the current text box are applied in this case.	<Shift+Tab>
Jump to the higher-level element within an interface area With <Shift+Home> you can jump to the higher-level element of a work area, e.g., to the higher-level folder in the project tree.	<Shift+Home>
Move to the next tab within an interface area If an interface area is divided into separate tabs, you can move between the tabs with the shortcut keys <Ctrl+Tab>. If, for example, you are in the "Properties" tab of the Inspector window and you want to jump to the "Info" tab, press the shortcut keys <Ctrl+Tab>.	<Ctrl+Tab>
Go to the previous tab With <Ctrl+Shift+Tab>, you move to the most recently open tab within an interface area.	<Ctrl+Shift+Tab>
Jumping to the toolbar of an editor You can use the <Alt+F10> key to jump to the toolbar of an editor. For example, if you have opened the print preview and want to switch to the next page of the printout in the toolbar, press <Alt+F10>. Then, use the arrow keys to navigate to the appropriate icon in the toolbar and confirm the selection with <Enter>.	<Alt+F10>
Use arrows on the divider to display or hide user interface components The table in the work area can be minimized and maximized. First, navigate to the work area and use the Tab key to place the focus on one of the little arrows on the separator line above the table. The arrows have the focus as soon as they are highlighted in blue. Then, press the space bar to minimize or maximize the table.	<Space>

8.1.3.7 Customizing editors

Below, you will learn how to arrange editors using the keyboard. You will also learn how to select the display size and the area within a graphical editor.

Arranging and customizing editors

The following table shows how to arrange open editors above and below each other or side-by-side, and how to close an open editor:

Function	Keyboard shortcuts	Menu command
Close active editor	<Ctrl+F4>	
Split editor space vertically If, for example, you have opened the overview window and the network view and want to display them side-by-side, press the <F12> key.	<F12>	Window > Split editor space vertically
Split editor space horizontally You can display two open editors in the work area above and below each other.	<Ctrl+F12>	Window > Split editor space horizontally
Remove window split If you have displayed two editors in the work area horizontally or vertically in split mode, you can remove the split with <Alt+Shift +F12>.	<Alt+Shift+F12>	Window > Unsplit editor space

Customizing the display in an editor

The following table shows how you how to zoom in and out in graphical editors and how to move the area selection in an editor:

Function	Keyboard shortcuts
Zoom in step-by-step in an editor With <Ctrl> and the <Plus> key on the numeric keypad of the keyboard, you can zoom in on the display of the editor.	<Ctrl+Plus> Alternative: <Ctrl+mousewheel up>
Zoom out step-by-step in an editor Use the <Ctrl> and the <Minus> key on the numeric keypad of the keyboard to zoom out of the display of the editor.	<Ctrl+Minus> Alternative: <Ctrl+mousewheel down>
Set view in editor to 100% Press <Ctrl+0> to reset the current view in a graphical editor to 100%.	<Ctrl+0>
Move the area selection of the editor If you hold down the spacebar, you can move the displayed section of an editor using the mouse.	<Space>

8.1.3.8 Editing objects

Selecting objects

The following table shows how to select individual objects, for example, devices in the project tree:

Function	Keyboard shortcut	Menu command
Select an object located at the left, right, above or below	<Arrow keys>	
Jump to the first object within the current interface area The first object in the interface area currently in focus is selected. In the project tree, this would be the project node at the top, for example.	<Home>	
Jump to the last object within the current interface area The last object in the interface area currently in focus is selected, for example, the last item in the project tree.	<End>	
Select all objects in an area All objects in the work area currently in focus are selected.	<Ctrl+A>	Edit > Select all
Select multiple objects If you want to select several objects that are not located directly next to each other, you first have to move the focus (gray outline of an object) to the next desired object using <Ctrl+Arrow keys>. The current selection is maintained. Then, press the space bar to select the new focused object as well. Repeat this process until all desired objects are selected.	<Ctrl+Arrow keys> + <Space>	

Editing objects

The following table provides an overview of all the keyboard shortcuts required for editing objects:

Function	Keyboard shortcut	Menu command
Insert new object A new object is inserted depending on your current context. If, for example, you are in the device view, the "Add Device" dialog opens for creating a new device.	<Ctrl+N>	
Open object	<Enter>	
Rename an object	<F2>	Edit > Rename
Copy an object	<Ctrl+C> Alternative: <Ctrl+Ins>	Edit > Copy
Cut an object	<Ctrl+X> Alternative: <Shift+Del>	Edit > Cut
Paste an object	<Ctrl+V> Alternative: <Shift+Ins>	Edit > Paste
Delete an object	<Del>	Edit > Delete

Function	Keyboard shortcut	Menu command
Compile an object	<Ctrl+B>	Edit > Compile
Open properties of an object Many objects in the TIA Portal have editable properties. Press the shortcut keys <Alt+Enter> to display the properties of an object.	<Alt+Enter>	-

8.1.3.9 Text editing

Below, you will learn how to operate text editing functions using only the keyboard.

Editing text

The following table shows the basic editing functions for text:

Function	Keyboard shortcuts
Switch to insert or overwrite mode	<Insert>
Exit edit mode	<Esc>
Delete	<Del>
Delete characters	<Backspace>
Confirm entry in a text box and leave the text box	<Return>
Line break in a multiline text box In a multiline text box, hold down the <Shift> button to create a line break.	<Shift+Return>
Reset input in a text box If you are in an text box and press <Esc>, you exit the box and the changes are discarded.	<Esc>

Navigating within a text area

The following table shows how to navigate in a text area with the keyboard:

Function	Keyboard shortcuts
Jump to start of line	<Home>
Jump to end of line	<End>
Jump to start of text	<Ctrl+Home>
Jump to end of text	<Ctrl+End>
Jump to the previous page	<PgUp>
Jump to the next page	<PgDn>
Confirm entry in a text box and leave the text box	<Return>
Line break in a multiline text box	<Shift+Return>
Reset input in a text box If you are in an text box and press <Esc>, you exit the box and the changes are discarded.	<Esc>

Selecting text

The following table shows how to select text with the keyboard:

Function	Keyboard shortcuts
Expand selection to the word at the left or right The text or current text selection is marked up to the end of word. If you are at the beginning or end of a word, the previous or next word is selected.	<Ctrl+Shift+Arrow left or Arrow right>
Expand selection to beginning of line	<Shift+Home>
Expand selection to end of line	<Shift+End>
Expand selection to beginning of text The text is selected up to the beginning or the end.	<Ctrl+Shift+Home>
Expand selection to end of text The text is selected up to the beginning or the end.	<Ctrl+Shift+End>

8.1.3.10 Editing tables

Below, you will learn how to navigate with the keyboard in tables, edit individual fields, and select parts of tables.

General keyboard operation in tables

The following table shows how you can edit tables using only the keyboard:

Function	Keyboard shortcuts
Place a cell in edit mode	<F2> or <Return>
Confirm entry and exit edit mode	<Return>
Cancel editing and discard changes	<Esc>
Open drop-down list in a cell Open the drop-down list with <F4>. Use the arrow keys to select the desired entry and then confirm the selection with <Return>.	<F4>
Close drop-down list in a cell and discard changes	<Esc>

Navigate in tables

The following table shows how you can navigate within a table using the keyboard:

Function	Keyboard shortcuts
Go to the next cell	<Arrow keys>
Go to the next editable cell on the right	<Tab>
Go to the next editable cell on the left	<Shift+Tab>
Move a screen upwards	<PgUp>
Move a screen downwards	<PgDn>
Go to the first cell in the row	<Home>
Go to the last cell in the row	<End>
Go to the first cell in the table	<Ctrl+Home>

Function	Keyboard shortcuts
Go to the last cell in the table	<Ctrl+End>
Go to the top cell in the column	<Ctrl+Arrow up>
Go to the bottom cell in the column	<Ctrl+Arrow down>

Selecting areas in tables

The following table shows how you can select areas within a table using the keyboard:

Function	Keyboard shortcuts
Select column	<Ctrl+Space>
Select line	<Shift+Space>
Select all cells	<Ctrl+A>
Expand selection by one cell	<Shift+arrow keys>
Extend selection up one page	<Shift+PgUp>
Extend selection down one page	<Shift+PgDn>
Expand selection up to the first row	<Ctrl+Shift+Arrow up>
Expand selection down to the last row	<Ctrl+Shift+Arrow down>
Expand selection to the first cell in the row	<Ctrl+Shift+Arrow left>
Expand selection to the last cell in the row	<Ctrl+Shift+Arrow right>

8.1.3.11 Using online functions

Controlling online functions with the keyboard

The following table provides an overview of the shortcut keys that you can use for the online functions of the TIA Portal:

Function	Keyboard shortcut	Menu command
Establish an online connection	<Ctrl+K>	Online > Go online
Go offline	<Ctrl+M>	Online > Go offline
Download project data to the device	<Ctrl+L>	Online > Download to device
Show accessible devices This opens a dialog showing all devices that are connected to the PG/PC interface of the PG/PC.	<Ctrl+U>	Online > Show accessible devices
Start CPU The CPU is set to "RUN" mode. The CPU must be online for this.	<Ctrl+Shift+E>	Online > Start CPU
Stop CPU The CPU is set to "STOP" mode. The CPU must be online for this.	<Ctrl+Shift+Q>	Online > Stop CPU
Start simulation The hardware and software of the project can be tested in a simulated online environment, without the modules actually being online.	<Ctrl+Shift+X>	Online > Simulation > Start

8.1.3.12 Using the on-screen keyboard

Introduction

When working with the TIA Portal, you also have the Microsoft on-screen keyboard available.

Displaying the on-screen keyboard

To display the on-screen keyboard, follow these steps:

1. In the "View" menu, select the "Screen keyboard" command.

Exiting the on-screen keyboard

To exit the on-screen keyboard, follow these steps:

1. In the "File" menu of the on-screen keyboard, select the "Exit" command.

8.1.4 Special features specific to the operating system

8.1.4.1 Influence of user rights

Restrictions when user rights are limited

The software provides several functions that require direct access to the hardware of the programming device / PC and therefore also to the installed operating system. To make full use of the range of functions, the software must cooperate closely with the operating system. To ensure problem-free interaction, you should therefore be logged on to the operating system with adequate user rights.

In particular, you may not be able to use functions requiring an online connection or those that change the settings of interface cards if you work with limited user rights.

Recognizing restricted functions

You can recognize functions requiring special rights as follows:

- A shield icon is displayed beside the function.
  
  The function can be used but is regulated by the user account control.
- A box is grayed out and cannot be accessed.
  You require administrator privileges to access the box. In some operating system environments, you can obtain administrator privileges by entering an administrator password.

Note

A box being grayed out does not necessarily mean a lack of rights. You should also check the additional information in the tooltip cascades to find out the conditions for editing the box.

8.1.4.2 Expanding user rights

Counteracting restrictions due to user rights

Certain functions may not be available if you are not logged on to the operating system with adequate rights. You can counteract these restrictions in the following ways:

- Enabling of extended rights using Windows user account control
- Logging on to the operating system with administrator privileges
- Using temporary administrator rights

Enabling extended rights using the Windows user account control

To be able to use a function indicated by the shield icon of the Windows user account control, follow these steps:

1. Click on the box or button with the shield icon.
   The security prompt of the Windows user account control opens.
2. Follow the instructions of the Windows user account control and, when prompted enter an administrator password, if possible.

The function can now be used once without restrictions.

Logging on to the operating system with administrator privileges

To be able to use a function that is disabled due to lack of user rights, follow these steps:

1. Close the software.
2. Log off from the operating system.
3. Log on to the operating system with administrator privileges.
4. Restart the software.

Using temporary administrator rights

To obtain administrator privileges temporarily, follow these steps:

1. Click the "Change settings" button. You will find this button in dialogs that allow the temporary assignment of administrator privileges.
   An operating system dialog box for entering an administrator password opens.
2. Enter an administrator password.

The settings can be temporarily changed. When you call the dialog again, the procedure must be repeated.

Note

This function is not supported by all operating systems. If no "Change settings" button is present or the button is grayed out, you will need to log on to the operating system with administrator privileges instead.

8.2 Help on the information system

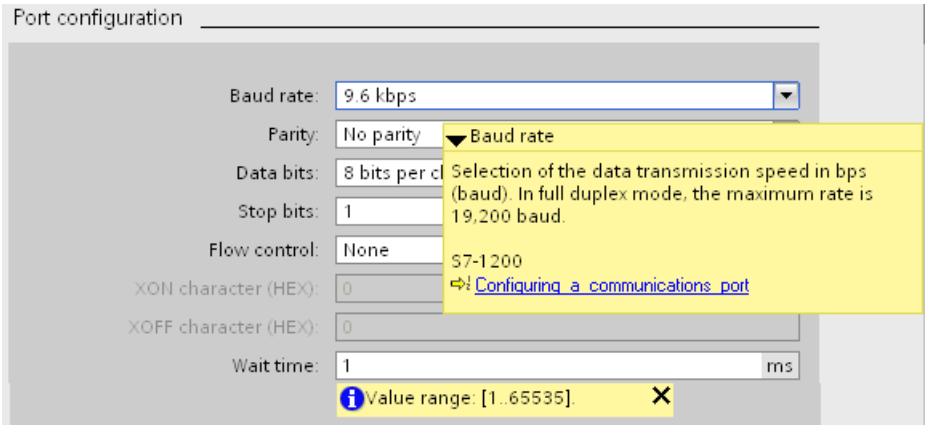
8.2.1 General remarks on the information system

Quick answers to your questions

A comprehensive help system is supplied with the TIA Portal for solving your tasks. It describes basic concepts, actions, and functions. While working with the program, you also receive the following support:

- Roll-out for correct inputs in dialog boxes
- Tooltips for information on elements of the user interface, for example text boxes, buttons and icons. Some of the tooltips are supplemented by cascades containing more precise information.
- Help on the current context, on menu commands for example when you click on the keys <F1> or <Shift+F1>.
- Help on alarms

The following figure shows an example of a cascading tooltip (top) and a roll-out (bottom):



Help

The supplied help system describes concepts, instructions and functions. It also contains reference information and examples. The help opens in a separate window.

A navigation pane appears on the left side of the help window. You can also hide the navigation pane to make room on the screen. The navigation pane provides you with the following functions:

- Table of contents
- Search in the index
- Full text search of the entire help
- Favorites

Identification of the topics in the help according to the type of information

The help topics are identified by different symbols depending on the type of information they contain.

Symbol	Information type	Explanation
	Operating instructions	Describes the steps to follow in order to carry out a particular task.
	Example	Contains a concrete example to explain the task.
	Factual information	Contains background information that you need to know to carry out a task.
	Reference	Contains comprehensive reference information to refer back to.

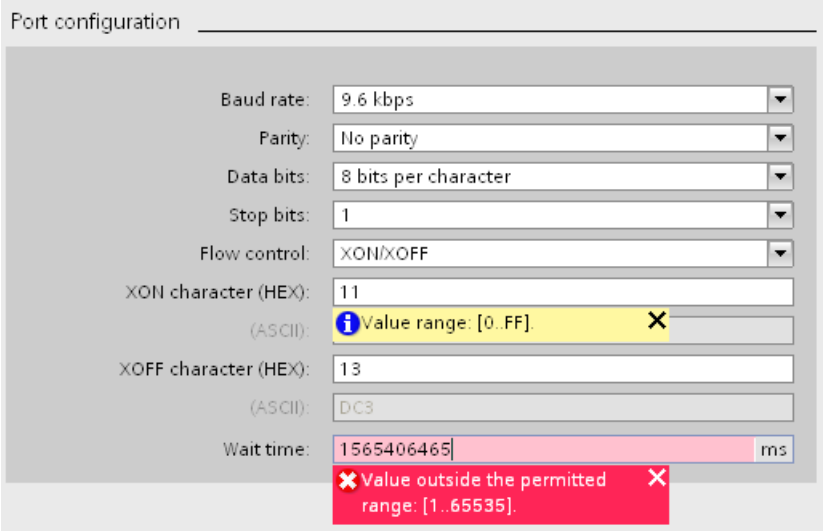
Identification of the topics in the help according to the target system

Depending on the products that are installed, the help system may contain sections that apply to specific devices only. To be able to recognize such sections at first glance, you will find a note in brackets in the table of contents. The search results in the full text search and in the index are marked in the same way if they only apply to a specific device.

Roll-out

Certain text boxes offer information that rolls out and helps you to enter valid parameters and values. The roll-out informs you about permitted value ranges and data types of the text boxes.

The following figure shows a roll-out (yellow) and a roll-out error message (red), which indicates an invalid value:



The roll-out is closed as soon as you exit the window or click on the "x" in the upper right-hand corner.

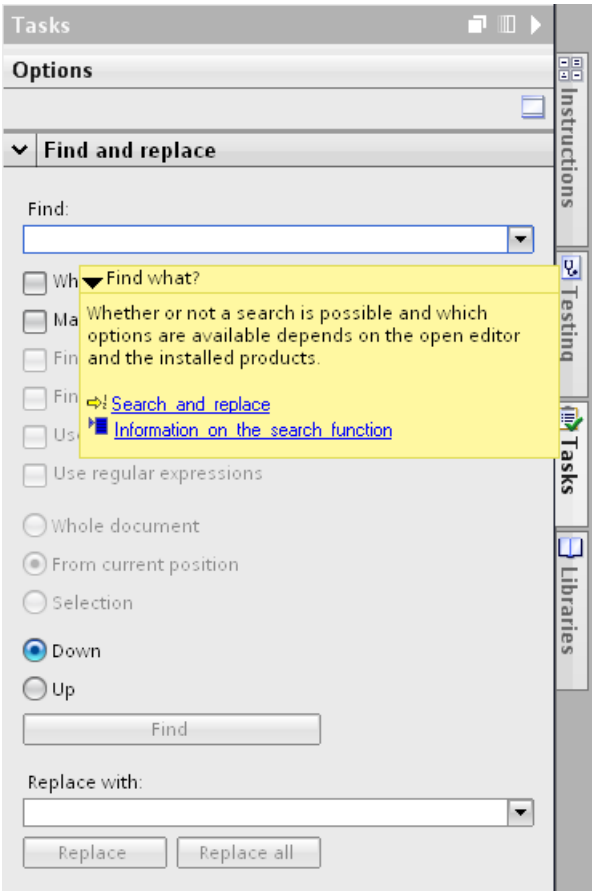
Tooltip

Interface elements offer you a tooltip for easier identification.

Tooltips, which have an arrow icon on the left, contain additional information in tooltip cascades. If you position the mouse pointer briefly over the tooltip or click the arrow icon, this information is displayed. The automatic display of tooltip cascades can be disabled.

If additional information is contained in the help system, a link to the corresponding help topic appears in the cascade. If you click on the link, the corresponding topic opens in help.

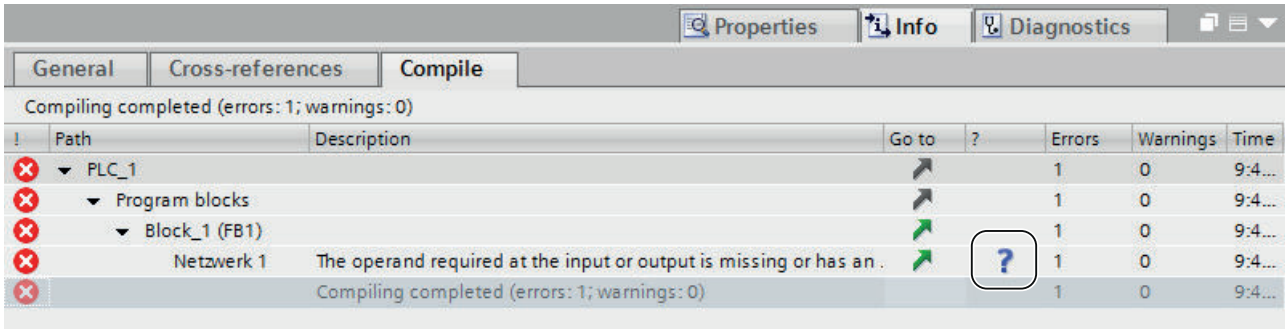
The following figure shows a tooltip with opened cascade:



Help on alarms

Numerous actions are accompanied by alarms in the Inspector window of the TIA Portal. The alarms give information about whether or not an action was successful. In addition, you see which changes have been made in the project. Further help is available for some alarms. If further help is available for an alarm, you access the help by clicking the question mark symbol.

The following figure shows the "Info" tab in the Inspector window with several alarms and a question mark symbol:



See also

Configuring the display of tooltips and tooltip cascades (Page 358)

Using user-defined documentation (Page 361)

8.2.2 Opening the Help system

You access the help via the menu, using links in the tooltip cascades, or with the <F1> key.

Procedure

To open the supplied help system, follow these steps:

1. In the "Help" menu, select the "Show help" command or press <F1> to display the help matching the current context.

Or:

1. Click on the link in a tooltip cascade to go directly to a point in the help system that contains more detailed information.

See also

Calling user-defined documentation (Page 370)

8.2.3 Searching the Help system for keywords

Searching for keywords in the help text

To search the help topics for predefined keywords, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.
   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Index" tab.
3. Enter the search term in the input box or select the search term from the list of key words.
4. Click "Display".

8.2.4 Full-text searches

Full-text searches

To search the entire text for specific words, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.
   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Search" tab.
3. Type in your search term in the text box.
4. Refine your search if necessary using additional criteria:
   - Select "Search previous results" to start an additional search operation of your last search results only.
   - Select "Search for similar words" to find words that differ only slightly from your search term.
   - Select "Search titles only" to obtain only results that contain your search term in the title. The contents of the Help topics are ignored during the search.
5. Click on the arrow button to the right of the search field to use logic operations. The following logic operations are available:
   - Combine two or more search terms using the "AND" operator to find only Help topics that contain all the search terms in the text.
   - Combine two or more search terms using the "OR" operator to find only Help topics that contain one or more of the search terms in the text.
   - Combine two or more search terms using the "NEAR" operator to find only Help topics that contain terms in close proximity to each other (eight words).
   - Precede a word with the "NOT" operator to exclude Help topics from the search that contain this word.
6. Click on "List topics" to start the search.
   The results are now listed with title, position and ranking. The "Position" column shows the section in which the Help topic found is located. Sorting according to ranking is based on the position of the Help topics found in the table of contents and based on the number of hits in the Help topics.

8.2.5 Using favorites

Using favorites

You can save individual help topics as favorites. This saves you searching for the help topic a second time.

Saving favorites:

To save a page as a favorite, follow these steps:

1. Open the help topic or the chapter you want to save as a favorite.
2. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.
   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
3. Open the "Favorites" tab.
4. Click the "Add" button.
   The help topic or chapter is saved as a favorite and is available the next time you open the help system.

Calling up favorites:

To call up a page from the favorites, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.
   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Favorites" tab.
3. Select the topic you want to open from the list.
4. Click the "Display" button.

Deleting favorites

To delete an entry from the favorites, proceed as follows:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.
   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Favorites" tab.
3. Select the topic you want to remove from the list.
4. Click the "Remove" button.

8.2.6 Printing help topics

Printing information

You can either print all the contents of the Help system or individual topics only.

Procedure

To select the topics you would like to print, follow these steps:

1. Click the "Display printing dialog" button.
   The table of contents opens in a separate window.
2. Select the check boxes for the folders and help topics to be printed in the "Print help topics" dialog.
3. Click the "Print" button to print the selected information.
   The "Print" dialog opens.
4. Select the printer on which you want print the help topics.
5. Click "Properties" if you want to make additional printer settings.
6. Confirm your entries with "OK".
   The help topics are printed out on the selected printer.

8.2.7 Configuring the display of tooltips and tooltip cascades

Configuration options for tooltips and tooltip cascade

You can customize the display of tooltips and tooltip cascades to suit your needs. You can make the following settings:

- Display or hide truncated text
  Sometimes texts may be too long for a text field. The texts are then fully displayed in a tooltip when you hover your mouse over the text field. You can enable or disable this function.
- Enable or disable tooltips
  Tooltips provide more detailed information about an element of the user interface. You can also have tooltips displayed in a cascade. If you disable the tooltips, the cascade with context-sensitive help is also no longer displayed. However, you have the option of manually displaying the tooltip for the currently active interface element by pressing <F1>.
- Enable or disable automatic opening of tooltip cascades
  By keeping the mouse pointer over a tooltip for a brief time, any available cascades are displayed automatically. You can enable or disable the automatic display of cascades. When automatic display is disabled, you must open the cascade manually if necessary. To do this, click on the arrow icon in the tooltip.

Procedure

To configure the display of tooltips and tooltip cascades, follow these steps:

1. Select the "Settings" command in the "Options" menu.
2. Select the "General" group in the area navigation.
3. Select or clear the individual check boxes in the "Tooltips" area to suit your needs. The "Open cascade automatically in tooltips" check box is only available if you have enabled the display of tooltips.

8.2.8 Safety Guidelines

Safety guidelines

This Help manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

Danger

indicates that death or severe personal injury will result if proper precautions are not taken.

Warning

indicates that death or severe personal injury may result if proper precautions are not taken.

Caution

with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

Notice

without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

Note

indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by qualified personnel. Within the context of the safety notes in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

Prescribed Usage

Note the following:

Warning

This device may only be used for the applications described in the catalog or the technical description and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens. Correct, reliable operation of the product requires proper transport, storage, positioning and assembly as well as careful operation and maintenance.

Trademarks

All names identified by ® are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

8.2.9 Assembling customized documentation

Customized documentation

In the Siemens Industry Online Support, you can assemble customized documentation that is tailored to your needs. All configurable manuals and operating instructions of the Siemens Industry Online Support are available to you for this purpose. You can select the parts that are of interest to you and combine them into in a library to form personal documentation. You can organize the documentation using folders in the library. The folders will later become the individual chapters of your custom documentation.

You can open your personal library here (https://www.automation.siemens.com/mdm/?guiLanguage=en).

Requirements

- The manuals or operating instructions used must be configurable. You can recognize configurable manuals by the suffix "configurable" in their name.
- To use all the functions, you have to register in the Siemens Industry Online Support and log on.

Documentation in different languages

You can change the language of the assembled documentation to German, French, Spanish, Italian and Chinese. This gives you the possibility, for example, to gather relevant information for a specific project and make it available to colleagues who speak other languages.

Export function in the documentation

You can perform an export at any part of your library in various formats (PDF, XML, RTF).

Help on creating documentation

You can find more help on creating and using custom documentation in the Siemens Industry Online Support (https://www.automation.siemens.com/mdm/_help/en/mdm_reference_manual_de-DE.htm).

8.3 Providing user-defined documentation

8.3.1 Using user-defined documentation

User-defined documentation for project or library contents

Over time, you create your own contents in a project or a library. Your own contents include, for example, blocks, tags or library types. While the functionality of the TIA Portal is described in the supplied help system, there is no help for the contents you have created yourself. You can create your own user-defined documentation to explain to other employees how your project works or how to use individual library types.

You can provide user-defined documentation in the available user interface languages. The default user interface languages in the TIA Portal are English, German, French, Spanish, Italian, and Chinese. You need to observe a few conventions when you create user-defined documentation so that the help matching an object can be opened.

You create the user-defined documentation either in one of the supported Office formats or as compiled HTML help in CHM format.

Possible areas for user-defined documentation

You can offer user-defined documentation in the following areas of the TIA Portal, for example:

- Project tree
- "Libraries" task card and library view
- Some editors, depending on the products installed, for example:
  - Program editor
    The programming languages LAD, FBD, STL, SCL and GRAPH are supported. Block calls also support the connection of user-defined documentation.
  - "Screens" editor
    Uses of screens and instances of HMI faceplates are supported in the "Screens" editor.

Directories for user-defined documentation

Save the user-defined documentation in one of the following directories:

- Project folder
  If you create user-defined documentation for objects within a project, save this help in the project folder. The user-defined documentation is also included when you pass on the project.
- Directory of a global library
  If you create user-defined documentation for objects within a global library, save the user-defined documentation in the directory of the global library. The user-defined documentation is also included when you pass on the global library.
- Central directory on the hard drive or a network drive
  You can store the user-defined documentation in a central directory on the hard disk or on a network drive. In this way, you have access to the user-defined documentation in each project or you use the documentation on a network drive together in the team. You specify the central file directory for the user-defined documentation using an XML file or in the settings of the TIA Portal.

Homepage for the user-defined documentation

You can create a separate homepage for each language version of the user-defined documentation. The homepage for the user-defined documentation can contain general help for a project or for a library. The homepage must be saved in the central storage directory for user-defined documentation.

Calling the user-defined documentation

If user-defined documentation is available for an object, you call it with the keyboard shortcut <Shift+F1>. The user-defined documentation is always opened with the standard program specified for the respective file format in Microsoft Windows.

Once you have pressed <Shift+F1>, certain directories are searched in a fixed order for user-defined documentation. The search order is given below:

1. Search in the central directory for user-defined documentation
   1.1 Search for a CHM file
   1.2 Search for documentation in other file formats
2. Search in the project or library directory
   2.1 Search for a CHM file
   2.2 Search for documentation in other file formats

The search is initially performed in the language directory for the currently set user interface language of the TIA Portal. If no help is contained in this language directory, the search for user-defined documentation is performed in the same order in the English language directory.

As soon as user-defined documentation is found in one location, the user-defined documentation is opened and the search is canceled. If no user-defined documentation is found in any of the directories, a search for a homepage for user-defined documentation is performed in the order presented above. The search for a homepage is again initially performed in the language directory for the currently set user interface language. If no homepage is found there, the English language directory is searched.

Call log

You can display a call log for the user-defined documentation for easier connection of the user-defined documentation. The alarms within the log indicate the directories in which documentation is searched for and whether the call of the user-defined documentation is successful. In addition, the file name that is expected for the file is indicated. This allows you to identify how you must name your documentation and the directories in which you must save the user-defined documentation. The call log has the same sequence as the one used to search for user-defined documentation or a homepage.

The log is displayed in the Inspector window in the "Info" tab. Before you can display the call log, you must first enable the call log in the settings of the TIA Portal or using an XML file.

See also

Conventions for the creation (Page 367)

Specifying settings with an XML file (Page 365)

Creating a homepage (Page 366)

Creating user-defined documentation (Page 371)

Calling user-defined documentation (Page 370)

General remarks on the information system (Page 351)

8.3.2 Specifying settings in the TIA Portal

You specify the following settings for user-defined documentation in the settings of the TIA Portal:

- Display call log in the Inspector window
  A log of the call of user-defined documentation is displayed on the 'Info > General' tab of the Inspector window. The log helps you to adhere to the conventions for calling user-defined documentation.
- Search for user-defined documentation in a central file directory
  You can save user-defined documentation in a directory outside the current project directory in order, for example, to make documentation available across projects.
- Central directory for user-defined documentation
  You store cross-project documentation in the central file directory for user-defined documentation.

Note

XML configuration file takes precedence over the settings of the TIA Portal

If you use an XML configuration file and have specified settings for user-defined documentation there, the settings in the XML file take precedence. As soon as you refresh the XML configuration file or restart the TIA Portal, the settings from the XML file are applied. The settings that you have made in the TIA Portal lose their validity.

Procedure

To specify a central storage location for user help, follow these steps:

1. Select the "Settings" command in the "Options" menu.
2. Open the "General > General" area.
3. Navigate to the "User documentation" section.
4. Select the "Display call log for user-defined documentation" check box in order to display a log of the call of the user-defined documentation in the Inspector window.
5. Select the "Search for user-defined documentation in a central directory" check box in order to store user-defined documentation in a cross-project directory.
6. Specify the path to where you save the cross-project documentation in the "Central directory for user-defined documentation" field.

See also

Specifying settings with an XML file (Page 365)

8.3.3 Specifying settings with an XML file

As an alternative to settings in the TIA Portal, you can make settings for the user-defined documentation in an XML file. The XML file is the same file you use for integrating corporate libraries.

If you use an XML configuration file and have specified settings for user-defined documentation there, the settings in the XML file take precedence. As soon as you refresh the XML configuration file or restart the TIA Portal, the settings from the XML file are applied. The settings that you have made in the TIA Portal lose their validity.

You can set the following options in the XML configuration file:

- Display call log in the Inspector window
  A log of the call of user-defined documentation is displayed on the 'Info > General' tab of the Inspector window. The log helps you to adhere to the conventions for calling user-defined documentation.
- Search for user-defined documentation in a central file directory
  You can save user-defined documentation in a directory outside the current project directory in order, for example, to make documentation available across projects.
- Central directory for user-defined documentation
  You store cross-project documentation in the central file directory for user-defined documentation.

Procedure

To specify settings for the user-defined documentation, follow these steps:

1. Create an XML file named "CorporateSettings.xml", if you are not yet using an XML configuration file for the integration of company libraries. If you are already using a configuration file, proceed with step 3.
   The configuration file must be saved with "UTF-8" coding.
2. Save the file in the following directory on your computer:
   C:\ProgramData\Siemens\Automation\Portal V13\CorporateSettings\
3. Enter the content listed below into the XML configuration file.
4. Adapt the attributes for display of the user-defined documentation. The meaning of the individual elements is available in the comments in the XML configuration file. Use the value "true" to activate a function. Use the value "false" to deactivate a function.

Content of the XML configuration file

The XML configuration file must have the following content:

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
 <Settings.Settings ID="0">
  <ObjectList>
   <Settings.General ID="1" AggregationName="General">
    <!-- Here you find the settings for global company libraries, if available. -->
    <ObjectList>
     <Settings.UserDocumentation ID="2" AggregationeName="UserDocumentation">
      <!-- In the following section, you specify the values for display of the user-defined
documentation. -->
      <AttributeList>
       <!-- Activates or deactivates the display of the access log. -->
       <DisplayLogInformation>
        <Value>true</Value>
       </DisplayLogInformation>
       <!-- Activates or deactivates the search for user-defined documentation in a central
directory. -->
       <EnableLookupFromCentralStorageLocation>
        <Value>true</Value>
       </EnableLookupFromCentralStorageLocation>
       <!-- Specifies the central directory for user-defined documentation. -->
       <CentralStorageLocation>
        <Value>D:\CorporateDocumentation\UserDocumentation\</Value>
       </CentralStorageLocation>
      </AttributeList>
     </Settings.UserDocumentation>
    </ObjectList>
   </Settings.General>
  </ObjectList>
 </Settings.Settings>
</Document>
```

Using user-defined documentation (Page 361)

Specifying settings in the TIA Portal (Page 364)

Calling user-defined documentation (Page 370)

Creating a homepage (Page 366)

Creating a configuration file for corporate libraries (Page 496)

8.3.4 Creating a homepage

You can design a homepage for user-defined documentation. The homepage can be an HTML page that you save either within a CHM or in the directory of the respective language. You can

also use other file formats approved for user-defined documentation. You design the homepage of the user-defined documentation outside the TIA Portal.

Procedure

To create a homepage, follow these steps:

1. Design a file in HTML format or in any other file format approved for user-defined help.
2. Name the file "Home".
3. Copy the file to the central directory for user-defined documentation on the hard disk or on a network drive:
   <Central directory for user-defined documentation>\<Folder for the respective language>
4. If the respective language folder does not exist yet, create the folder now.
   Alternative: If you are creating the homepage for a CHM file, place the homepage in the main directory of the CHM file.

Sample configuration for the homepage

Below you see the correct path for the following conditions:

- The user-defined documentation is in Spanish.
- The homepage is an HTML file.

The path for these conditions is as follows:

<Central directory for user-defined documentation>\es-ES\Home.html

See also

Specifying settings with an XML file (Page 365)

Using user-defined documentation (Page 361)

Conventions for the creation (Page 367)

Calling user-defined documentation (Page 370)

Displaying the call log (Page 371)

Creating user-defined documentation (Page 371)

8.3.5 Conventions for the creation

You must observe some conventions to ensure that user-defined documentation is called at the correct location:

- the user-defined documentation must be saved in the correct directory.
- The file name must be exactly the same as the object name in the TIA Portal.

To prevent malicious code from being executed on your computer, only file formats that are considered as relatively safe are permitted.

Supported file formats

Create the user-defined documentation in one of the following file formats:

- Microsoft Word (.docx)
- Microsoft Excel (.xslx)
- Microsoft PowerPoint (.pptx and .ppsx)
- HTML pages (.htm or .html)
- Microsoft XPS (.xps)
- Rich Text Format (.rtf)
- Text documents (.txt)
- Compiled HTML help (.chm)
- PDF documents (.pdf)

You save the homepage of the user-defined documentation in HTML format or save the homepage within a CHM file.

Notice

Infection of the computer with malicious code

If the user-defined documentation contains malicious code, it can infect your computer. Especially HTML pages and CHM files can contain malicious code.

Make sure that the user-defined documentation comes from a trustworthy source. You should also use the standard security measures, such as the use of a firewall and an up-to-date virus scanner.

Directories for user-defined documentation

Save the user-defined documentation in one of the following directories:

- Project folder:
  UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>
- Directory of a global library:
  UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>
- Central directory on the hard drive or a network drive:
  <Central directory for user-defined documentation>\<Folder for the respective language>
  \<Object category>\

The user-defined documentation must be located in the suitable subfolder for the respective language. The table below shows the respective language folders for the user languages installed as default:

Language	Subfolder
German	\de-DE
English	\en-US
Spanish	\es-ES
French	\fr-FR

Language	Subfolder
Italian	\it-IT
Chinese	\zh-CN

The language folder must contain a separate subfolder for each object category. Create the corresponding subfolders for objects for which you are providing user-defined documentation. Always use the English designation of the object category. The table below shows the English designations of the most important object categories in the TIA Portal:

Object category	English designation
HMI screens	Screens
Organization blocks (OB)	Organization Blocks
Function blocks (FBs)	Function Blocks
Functions (FCs)	Functions
Data blocks	Data Blocks
Types in the library	Library Types
Master copies in the library	Master Copies
The project node in the project tree	Projects
All types of folders in the project tree, in the project library or in global libraries	Folders
All types of links in the project tree, for example, "Add new block", "Add new device", etc.	ShortCut
Libraries in the "Libraries" task card or in the library view	Libraries

If you are not sure of the English designation for an object category, change the user interface language of the TIA Portal to English. Alternatively, open the user-defined documentation for an object with <Shift+F1> and check in the call log which designation is expected for the object category.

Permitted file names

The file name must be exactly the same as the object name in the TIA Portal.

There are, however, restrictions for file names under Microsoft Windows. The same restrictions apply to the file system used to format the hard drive. The file name may only include certain characters and must not exceed a specific length. The restrictions for file names differ depending on the Windows version and the file system used for the hard drive.

To ensure that the help call works, read up on possible restrictions in the Microsoft Windows documentation.

Special features of CHM files

You store CHM files directly in the respective language folder. The folder for the respective object category must be included in the actual CHM file. Within the compiled CHM file, the names of the individual HTML files must also be exactly the same as the object names in the TIA Portal.

Note

Opening CHM files on network drives

If CHM files are saved on a network drive, the CHM files are not displayed correctly in more recent versions of Microsoft Windows. This behavior is determined by the security guidelines of the operating system. All versions of Microsoft Windows as of Windows Server 2003 SP1 are affected.

You can bypass the security guidelines by changing the registry database in Microsoft Windows.

To not compromise the security of your computer, save the CHM files only locally on your computer and do not change the registry database.

See also

Using user-defined documentation (Page 361)

Creating a homepage (Page 366)

8.3.6 Calling user-defined documentation

The user-defined documentation is opened in the language that is currently set as the user interface language. If there is no user-defined documentation available in the currently set user interface language, the English version of the user-defined documentation opens. If no user-defined documentation exists, a homepage is searched for.

Requirement

You have already saved user-defined documentation or a homepage according to the conventions.

Procedure

To open the user-defined documentation, follow these steps:

1. Select the object for which you want to display the user-defined documentation.
2. Press <Shift+F1>.
   The suitable user-defined documentation or the homepage opens.

See also

Using user-defined documentation (Page 361)

Opening the Help system (Page 355)

Creating a homepage (Page 366)

Specifying settings with an XML file (Page 365)

Displaying the call log (Page 371)

8.3.7 Displaying the call log

Use the call log to check whether the user-defined documentation is connected correctly. The call log shows the directories in which the search is performed for user-defined documentation or a homepage. The call log also displays the names that the individual files must have in order to call the user-defined documentation.

Requirement

The call log is enabled in the settings of the TIA Portal or using an XML configuration file.

Procedure

To display the call log, follow these steps:

1. Open the "Info" tab in the Inspector window.
2. Open the "General" tab.
3. Select the object for which you want to call the help.
4. Press <Shift+F1>.
   If possible, the matching user-defined documentation or the homepage of the user-defined documentation is opened. In any case, you will be informed in the Inspector window about which user-defined documentation is opened. You may be shown the directories in which no user-defined documentation was found.

See also

Calling user-defined documentation (Page 370)

Creating a homepage (Page 366)

8.3.8 Creating user-defined documentation

You create user-defined documentation for individual elements within a project or global library outside the TIA Portal. You can create the user-defined documentation in all available user interface languages.

If you create the user-defined documentation as CHM file, the procedure for creating the help is somewhat different to the creation process for other file formats.

Note the information provided in chapter "Conventions for the creation (Page 367)".

Creating user-defined documentation as single file

To create user-defined documentation as a single file, follow these steps:

1. Create a file in a valid file format.
2. Name the file identically to the object for which you want to call the user-defined documentation.
   If you are offering help for a library type, for example, name the help file identical to the type.
3. Depending on whether you are creating the user-defined documentation for project contents or for contents of a global library, copy the file to one of the following storage locations:
   - project folder under "UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>"
   - Directory of a global library under "UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>"
   - Central directory on the hard drive or a network drive:
     <Central directory for user-defined documentation>\<Folder for the respective language>\<Object category>\

   If the respective language folder or the folder for the object category does not exist yet, create the required folders before copying the file.

Sample configuration for user-defined documentation

Below you see the correct path for the following conditions:

- The user-defined documentation is intended for a type in a global library.
- The user-defined documentation is in French.
- The type is called "commande de moteur".
- The user-defined documentation is supplied with the global library.
- The user-defined documentation is created in Microsoft PowerPoint format.

The path for these conditions is as follows:

<Folder of the global library>\UserFiles\UserDocumentation\fr-FR\Library Types\commande de moteur.pptx

Creating user-defined documentation as CHM file

To provide user-defined documentation in CHM format, follow these steps:

1. Create a folder in Windows Explorer for each object category for which you want to create user-defined documentation. Use the English designation for the object category.
2. Create an HTML file for each object for which you want to provide user-defined documentation. Name the HTML file identically to the object for which you want to call the user-defined documentation. If you want to provide user-defined documentation for a library type, for example, name the HTML file identically to the type.
3. Store the HTML files in the corresponding folders of the respective object category.
4. Use the Microsoft HTML Help Workshop to create the CHM. Use the prepared folder structure with the HTML files.
5. Copy the CHM file to one of the following storage locations:
   - Project folder under "UserFiles\UserDocumentation\<Folder for the respective language>"
   - Directory of a global library under "UserFiles\UserDocumentation\<Folder for the respective language>"
   - Central directory on the hard drive or a network drive:
     <Central directory for user-defined documentation>\<Folder for the respective language>

   If the respective language folder does not exist yet, create the language folder before you copy the CHM file.

Conventions for the creation (Page 367)

Editing projects

9

9.1 The basics of projects

Introduction

Projects are used to organize the storage of data and programs resulting from the creation of an automation solution. The data that makes up a project includes the following:

- Configuration data on the hardware structure and parameter assignment data for modules
- Project engineering data for communication over networks
- Project engineering data for the devices
- Logs for important events in the life cycle of the project

Project hierarchy

Data is stored in a project in the form of objects. Within the project, the objects are arranged in a tree structure (project hierarchy).

The project hierarchy is based on the devices and stations along with the configuration data and programs belonging to them.

Common data of the project and online access, for example, are also displayed in the project tree.

Saving projects (Page 383)

Closing projects (Page 384)

Removing projects (Page 384)

Deleting projects (Page 385)

9.2 Using logs

For some operations within the TIA Portal, logs are created automatically in the background. These logs document changes in the project. Logs are created automatically, for example, when you migrate projects and programs or when you update instances from the library.

Logs are displayed in the "Common data" folder in the project tree. They are stored together with the project in the project folder and can therefore be read independently of the programming device/PC used as soon as you have opened the project. The log can be filtered for errors, warnings, and information.

In addition to displaying them in the TIA Portal, logs can also be printed.

Displaying logs

To open a log, follow these steps:

1. Open the "Common data > Logs" folder in the project tree.
2. Double-click the desired log in the list.
   The contents of the log are displayed in the work area.
3. Optional: To show or hide a particular category of alarms, activate or deactivate the button for "Errors", "Warnings", or "Information" in the toolbar.

Deleting logs

To delete a log, follow these steps:

1. Select the log in the project tree.
2. Press <Del>.
   The selected log is deleted from the project directory and removed from the project tree.

9.3 Creating and managing projects

9.3.1 Creating a new project

Procedure

To create a new project, follow these steps:

1. Select the "New" command in the "Project" menu.
   The "Create a new project" dialog opens.
2. Enter your project name and path or accept the proposed settings.
3. Click the "Create" button.

Result

The new project is created and displayed in the project tree.

Closing projects (Page 384)
Removing projects (Page 384)
Deleting projects (Page 385)

9.3.2 Compatibility of projects

You can use the TIA Portal to open projects that were created with an older version of the TIA Portal or with a different installation package. In the following, you will learn what to consider in this case.

Opening projects from older product versions

The table below describes the behavior of the TIA Portal when opening projects from older product versions:

Product version of the TIA Portal (file extension of the respective version)	Behavior when opened with the current product version of the TIA Portal
V10.5 (.ap10) V11.x (.ap11)	The project is automatically upgraded to the latest product version when opened, following your confirmation. The upgraded project is a copy of the original project. The original project is retained unchanged.
V12 (.ap12)	You can select between the following options: • Upgrade project to product version V12 SP1 and open in compatibility mode • Upgrade project to the current product version and open The upgraded project is a copy of the original project in both cases. The original project is retained unchanged.
V12 SP1 (.ap12) V13 (.ap13)	You can select between the following options: • Open project in compatibility mode • Upgrade project to the current product version and open A copy of the original project is created when you upgrade the project. The original project is retained unchanged.

Compatibility mode

Compatibility mode is available for projects that were created with TIA Portal V12 SP1 and V13. If you open a project in the V12 SP1 or V13 project format and do not upgrade it, the project is in compatibility mode. The range of functions of the TIA Portal is limited to the range of functions of the earlier product version. The project remains backward compatible and can still be opened and edited with the earlier version of the TIA Portal.

Components supplied subsequently for the earlier product version as part of a Hardware Support Package (HSP) can be added to projects in compatibility mode. To continue working with the project in the earlier version of the TIA Portal, you simply need to install the Hardware Support Package as well.

Global libraries are always created in the most recent format and are not backwards compatible, even if the project is opened in compatibility mode.

You need to upgrade the project to use the full range of functions of the current version. By upgrading the project you convert it to the current project format. The full range of functions of the current version becomes available.

Backward compatibility with the current product version

Projects that have been saved with the current version of the TIA Portal are not backward compatible with older versions due to their enhanced functionality. Projects saved with TIA Portal V13 SP1 can only be opened with TIA Portal V13 SP1 or later.

Opening projects created with add-on products

The project you want to open may include data that were created with an optional software. The following cases may occur if you did not install the optional software:

- Software components which are not absolutely required are missing:
  A dialog appears listing the missing software components. After the project is opened, its properties are displayed. You now have the opportunity to install missing components. All the devices contained in the project are available even if you do not install the missing components. However, you can only work with the devices that are supported by the currently installed software.
  Devices which are not supported because software components are missing are identified by the following symbol in the project tree:
  
- Essential software components are missing:
  A dialog appears listing the missing software components. The essential software components are marked. The project can only be opened if you install the missing software components.

Removing projects (Page 384)

Deleting projects (Page 385)

Compatibility of global libraries (Page 484)

9.3.3 Opening projects

You can open all projects from the current version and earlier versions in the TIA Portal.

Projects from earlier versions of the TIA Portal may first have to be upgraded to a more recent project format. You are prompted to upgrade the project when you open it.

You recognize projects of the TIA Portal by their file name extension ".ap[version number]". Projects of TIA Portal V13 SP1 have the file name extension ".ap13".

Procedure

To open an existing project, follow these steps:

1. Select the "Open" command in the "Project" menu.
   The "Open project" dialog box opens and the list of most recently used projects is displayed.
2. Select a project from the list and click "Open".
3. If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder, and open the project file.
   Projects in the current project format are opened in the project view. If you have selected a project from an older version of the TIA Portal, the "Upgrade project" dialog opens. More information on upgrading the project can be found in chapter "Upgrading projects (Page 380)".

Closing projects (Page 384)

Removing projects (Page 384)

Deleting projects (Page 385)

Compiling project data (Page 393)

Opening a global library (Page 486)

9.3.4 Upgrading projects

Projects from older versions of the TIA Portal can be edited with the current version of the TIA Portal. Depending on the product version that was used to create the project, you either upgrade the project or open the project in compatibility mode. To find out which options you have depending on the product version of the project, go to chapter "Compatibility of projects (Page 377)".

When you open projects from older product versions, you are prompted to upgrade the project. You can manually upgrade projects that are already open in compatibility mode. After the project is upgraded to the current product version, it can no longer be opened in older versions of the TIA Portal. But the original project is still available. The upgraded project is saved as a copy and receives the name extension "_V13_SP1".

Upgrading projects from V11.x or lower

To upgrade a project from TIA Portal V11.x or earlier, follow these steps:

1. Open the project.
   The "Upgrade project" dialog box opens.
2. Click "OK".
3. Compile the hardware and software of all devices in the project.

Upgrading projects from V12

To upgrade a project from TIA Portal V12, follow these steps:

1. Open the project.
   The "Upgrade project" dialog box opens.
2. Select the target version for the upgrade:
   - Click "Yes" to upgrade the project to the current product version.
   - Click "No" to upgrade the project to product version V12 SP1 and to work in compatibility mode
3. Compile the hardware and software of all devices in the project.

Upgrading V12 SP1 and V13 projects or using them in compatibility mode

To upgrade a project from TIA Portal V12 SP1 or V13 or to use it in compatibility mode, follow these steps:

1. Open the project.
   The "Upgrade project" dialog box opens.
2. Select how you want to proceed with the project:
   - Click "Yes" to upgrade the project to the current product version.
   - Click "No" to use the project in compatibility mode.
3. Optional: If you have upgraded the project to the current product version, compile the hardware and software of all devices in the project.

Manually upgrading projects in compatibility mode to V13 SP1

For this procedure, a project must already be open in compatibility mode.

To manually upgrade a project in compatibility mode, follow these steps:

1. Select the "Upgrade" command in the "Project" menu.
   A security prompt appears.
2. Click "Yes" to confirm.
   The project is closed, and the upgraded project is opened.
3. Compile the hardware and software of all devices in the project.

Notes

Pay attention to the following notes after upgrading a project:

Note

Upgrading global libraries

Because global libraries are independent of projects, they are not upgraded automatically together with the project. If you want to continue using global libraries from older versions of the TIA Portal, you upgrade these global libraries as well. More information on upgrading global libraries can be found in the chapter "Compatibility of global libraries (Page 484)".

Note

Upgrading know-how-protected blocks

The block is only upgraded and loaded after it has been opened once with the password. This means you should open know-how-protected blocks once after upgrading the project to also upgrade the blocks. If you have protected numerous know-how-protected blocks with the same password, you can select and open all of them at once.

Compiling project data (Page 393)

9.3.5 Displaying properties of the project

You can display the properties of a project. Properties include the following:

- Metadata for the project
  This includes the following information: creation time, author, file path, project size, copyright, project languages, etc. Many of the properties can be changed.
- Project history
  The project history contains an overview with important events in the project life cycle. Here, for example, you can see the version of the TIA Portal used to create a project and whether it has been converted to another version in the meantime. If a project was created during a migration, for example, this is also indicated in the project history table with the date and time of the migration. If a log was created for an event, you can also call the log directly.
- Support packages in the project
  An overview of the add-on software needed to work with all devices in the project is displayed. In addition, installed GSD files are listed (device description files for other devices in the hardware catalog).
- Software products in the project
  You can display an overview of all installed software products needed for the project.

Procedure

To display the project properties, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.
   The dialog with the properties of the project opens.
3. Select the project properties in the area navigation that you want to have displayed.

Removing projects (Page 384)

Deleting projects (Page 385)

9.3.6 Saving projects

You can save the project at any time either under the same or a different name. You can even save a project when it still contains elements with errors.

Saving a project

To save a project, follow these steps:

1. Select the "Save" command in the "Project" menu.
   All changes to the project are saved under the current project name. If you are editing a project from an earlier version of the TIA Portal, the file extension of the project is also retained and you can continue to edit the project in the earlier version of the TIA Portal.

Project Save as

To save a project under another name, follow these steps:

1. Select the "Save as" command in the "Project" menu.
   The "Save current project as" dialog opens.
2. Select the project folder in the "Save in" box.
3. Enter the new project name in the "File name" box.
4. Confirm your entry with "Save".
   The project is saved under the new name and opened.

Note

Undoing actions

Keep in mind that you cannot undo actions once you have saved the project.

Removing projects (Page 384)

Deleting projects (Page 385)

9.3.7 Closing projects

Procedure

To close a project, follow these steps:

1. Select the "Close" command in the "Project" menu.
   If you have made changes to the project since the last time you saved it, a message is displayed.
2. Decide whether or not you want to save the changes.

Removing projects (Page 384)

Deleting projects (Page 385)

9.3.8 Removing projects

You can remove projects from the list of recently used projects. The project data is retained on the storage medium.

Procedure

To remove a project from the list of recently used projects, follow these steps:

1. Select the "Delete project" command in the "Project" menu.
   The "Delete project" dialog opens and includes the list of most recently used projects.
2. Select a project from the list.
3. Click the "Remove" button.
4. Click "Yes" to confirm the prompt in order to remove the project from the list.

Result

The project is no longer displayed in the list of recently used projects. If you open the project again, it will be added to the list again.

Deleting projects (Page 385)

9.3.9 Deleting projects

Note

When you delete a project, the entire project data is removed from the storage medium.

Requirement

The project you want to delete is not open.

Procedure

Follow the steps below to delete an existing project:

1. Select the "Delete project" command in the "Project" menu.
   The "Delete project" dialog opens and includes the list of most recently used projects.
2. Select a project from the list.
   If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder, and open the project file.
3. Click the "Delete" button.
4. Click "Yes" to confirm. This starts the deletion of the project.

Result

The entire project folder is deleted from the file system.

9.3.10 Archiving and retrieving projects

9.3.10.1 Working with project archives

Archiving and transferring projects

If you work for a long time with a project, large files may result, especially with extensive hardware configurations. Therefore, you may want to reduce the size of the project, for example, when you archive it to an external hard drive, or when you send it via e-mail and require a smaller file size.

Options for reducing the size of the project

There are two ways to reduce the size of the project:

- Creating a project archive
  TIA Portal project archives are compressed files, each containing an entire project including the entire folder structure of the project. Before the project directory is compressed into the archive file, all files are reduced to their essential components to further decrease the size of the project. Project archives are therefore well suited for sending via e-mail.
  Project archives have the file extension ".zap[version number of the TIA Portal]". Projects created with TIA Portal V13 SP1 have the file extension ". zap13".
  To open a project archive, retrieve the project archive. By retrieving it, the archive file with the included project files is extracted to the original project directory structure.
- Minimizing a project
  You can skip additional compression in an archive file, and instead create a copy of the project directory. The included files are reduced to the essential elements of the project. This minimizes the required storage space. The full functionality of the project is maintained and you can open the project as usual.
  A minimized project is especially well suited for archiving, for example, on an external medium.

See also

Retrieving compressed project (Page 389)

Creating compressed project archive (Page 387)

Minimizing project (Page 388)

9.3.10.2 Creating compressed project archive

You can reduce the required storage space of the currently open project by archiving the project in a compressed file.

Note

The most recently saved state of the project is used for archiving. Therefore, save the project before using the archiving function. This will ensure that your most recent changes are included in the archived project.

Procedure

To archive a project, follow these steps:

1. In the "Project" menu, select the "Archive > Compressed archive" command.
   The "Archive current project as..." dialog opens.
2. Select the directory in which you want to save the archive file.
3. Enter a file name in the "File name" box.
4. Click "Save".

Result

A compressed file with the extension ".zap13" is generated. Project archives of projects in compatibility mode for product version V12 SP1 receive the file extension ".zap12" and are backward compatible with TIA Portal V12 SP1. The archive file contains the complete project directory. The individual files of the project are also reduced to the essential components in order to save space.

See also

Working with project archives (Page 386)

Retrieving compressed project (Page 389)

Minimizing project (Page 388)

9.3.10.3 Minimizing project

You can reduce the required storage space of the currently open project by reducing the project files to their essential components. The "Minimize" function creates a copy of the original project directory.

Note

The most recently saved state of the project is used for minimizing. Therefore, save the project before using the minimizing function. This will ensure that your most recent changes are included in the project copy.

Procedure

To minimize a project to its essential components, follow these steps:

1. In the "Project" menu, select the "Archive > Minimize project" command.
   The "Minimize current project under..." dialog opens.
2. Select the directory in which you want to save the project copy.
3. Enter the name of the new project directory in the "Directory name" box.
4. Click "Save".

Result

A copy of the original project directory is created at the designated location. The files contained within it are reduced to their essential components in order to save space.

See also

Working with project archives (Page 386)

Creating compressed project archive (Page 387)

9.3.10.4 Retrieving compressed project

You extract project archives of the TIA Portal with the "Retrieve" function. This restores the project directory structure including all project files.

Requirement

No project is open.

Procedure

To extract a project archive, follow these steps:

1. Select the "Retrieve" command in the "Project" menu.
   The "Retrieve archived project" dialog opens.
2. Select the project archive.
3. Click "Open".
4. The "Find folder" dialog opens.
5. Select the target directory to which the archived project should be extracted.
6. Click "OK".

Result

The project is extracted to the selected directory and opened immediately. If you extract a project archive that includes a project from a product version earlier than V12 SP1, you may have to upgrade the project. You will automatically receive the corresponding prompt as soon as you open the project. The same rules apply that are described in the chapter "Compatibility of projects (Page 377)".

Upgrading projects (Page 380)

9.4 Using reference projects

9.4.1 Basics of reference projects

Introduction

You can open other projects as a reference in addition to the current project. You can use these reference projects as follows:

- You can drag individual objects from a reference project into the current project and then edit them.
- You can open specific objects, for example, code blocks from a reference project as read-only. But this is not possible for all elements.
- You can use an offline/offline comparison to compare devices of the reference project to devices from the current project.

Note that reference projects are read-only. You cannot change the objects of a reference project.

Projects that were created with an older version of the TIA Portal or with a different installation package can also be opened as reference projects. The same compatibility rules apply here as for normal opening of a project from an older version of the TIA Portal.

See also: Compatibility of projects (Page 377)

See also

Comparing reference projects (Page 391)

Opening and closing a reference project (Page 390)

Reference projects (Page 328)

9.4.2 Opening and closing a reference project

Opening a reference project

To open a reference project, follow these steps:

1. In the "Reference projects" palette of the project tree, click on "Open reference project" in the toolbar.
   The "Open reference project" dialog box opens.
2. Navigate to the desired project folder, and open the project file. TIA Portal V13.x projects have the extension ".ap13". Older projects of the TIA Portal have the extension ".ap[version number]".
3. Click "Open".
   The selected project is opened as a read-only reference project.

Closing a reference project

To close a reference project, follow these steps:

1. In the "Reference projects" palette of the project tree, select the reference project you want to close.
2. Click on "Close reference project" in the toolbar.
   The selected reference project is closed.

See also

Basics of reference projects (Page 390)

Comparing reference projects (Page 391)

Reference projects (Page 328)

9.4.3 Comparing reference projects

Introduction

You can compare devices from reference projects with devices from both the current project as well as from the same or another reference project or from a library.

Note

Please note the following:

- You cannot specify actions for the comparison objects, since the reference projects are write-protected.
- You can perform a detailed comparison for the comparison objects, if the type of comparison object generally allows a detailed comparison.
- When comparing reference projects, you can always switch between automatic and manual comparison.

Procedure

To compare the objects of a reference project to the device data of the current project, follow these steps:

1. In the project tree, select the device whose data you want to compare to the data of a reference project and which allows offline/offline comparison.
2. Select "Compare > Offline/Offline" from the shortcut menu.
   The compare editor opens with the selected device displayed in the left area.
3. Open the "Reference projects" palette in the project tree.

4. Select the device of a reference project that you want to compare to the device data from the current project.
5. Drag the device from the reference project into the right drop area of the compare editor. You can identify the status of the objects based on the symbols in the status and action area. When you select an object, the object's properties and the corresponding object of the associated device is clearly shown in the properties comparison.
   You can drag a library or other devices from a reference project from the current project into drop areas at any time and thus start a new comparison. It does not matter which device you drag into the drop area.

Using the compare editor (Page 405)

9.5 Editing project data

9.5.1 Compiling and loading project data

9.5.1.1 Compiling project data

General information on compiling project data

Compiling project data

During compilation, project data is converted so that it can be read by the device. Hardware configuration data and program data can be compiled separately or together. You can compile the project data for one or more target systems at the same time.

The following project data must be compiled prior to loading:

- Hardware project data, for example, configuration data of the devices or networks and connections
- Software project data, for example, program blocks or process screens

Note

While a device is being compiled, no additional compiling process can be started. Note in this regard that you can not only perform a compiling process manually, but you can also trigger it automatically for HMI devices.

Scope of the compilation

When you compile project data, you have the following options depending on the device involved:

- Hardware and software (only changes)
- Hardware (only changes)
- Hardware (rebuild completely)
- Software (only changes)
- Software (rebuild all blocks)
- Software (reset memory reserve)

See also

Compiling project data (Page 393)

Compiling project data

The following section describes the general procedure for compiling project data in the project tree. You will find details of how certain objects are compiled and any special points to note in the online help of the product.

Procedure

To compile project data, follow these steps:

1. In the project tree, select the devices whose project data you want to compile.
2. Select the option you require in "Compile" submenu of the shortcut menu.

   Note

   Note that the options available to you depend on the selected device.

   The project data is compiled. You can check whether or not the compilation was successful in the Inspector window with "Info > Compile".

See also

General information on compiling project data (Page 392)

9.5.1.2 Loading project data

General information on loading

Introduction

In order to set up your automation system, you need to load the project data you generated offline on the connected devices. This project data is generated, for example when configuring hardware, networks, and connections or when programming the user program or when creating recipes.

The first time you download, the entire project data is downloaded. During later loading operations, only changes are downloaded.

You can download the project data to devices and memory cards.

Note

While a device is being compiled, no additional download process can be started. Note in this regard that you can not only perform a compiling process manually, but you can also trigger it automatically for HMI devices.

Possible options for downloading

Depending on the object you want to download, you have the following options:

- Hardware and software (only changes)
  Both the hardware configuration and software are downloaded to the destination if differences exist between the online and offline versions.
- Hardware configuration
  Only the hardware configuration is downloaded to the destination.
- Software (only changes)
  Only the objects that differ online and offline are downloaded to the destination.
- Load PLC program to device and reset
  All the blocks are loaded to the destination and all values are reset to their initial state. Be aware that this also applies to retentive values.

You can also upload project data already contained in a device back to your project. You have the following options:

- Upload entire device as new station
  The hardware configuration of the device and the software on the device is uploaded to the project.
  All relevant data of the device is uploaded to the project.
- Upload software of a device
  Only the blocks and parameters from the device are uploaded to an existing CPU in the project.

In both cases, during loading all instances of library types are connected again with the corresponding version of the type in the project library. If no suitable type is yet available for

a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

Downloading with synchronization

In team engineering, it is possible for several users to work on one project with several engineering systems at the same time and to access one S7-1500 CPU. To ensure consistency within the shared project, it is necessary to synchronize the changed data prior to loading so that nothing gets overwritten unintentionally.

If differences are detected between the online and offline data management within the shared project that were caused by a different engineering system, automatic synchronization of the data to be loaded is offered when loading.

In this case, the "Synchronization" dialog displays the data to be synchronized with the current status (online-offline comparison) and the possible actions.

Use case	Recommendation	Synchronization
One or more blocks on the CPU (online) are more recent than in the engineering system (offline).	These blocks should be uploaded from the CPU to the engineering system before downloading.	Automatic synchronization is possible: The blocks in the engineering system are updated prior to loading.
One or more new blocks have been created and exist only on the CPU (online).	These blocks should be uploaded from the CPU to the engineering system before downloading.	Automatic synchronization is possible: The new blocks are added to the engineering system prior to the download.
One or more blocks on the CPU have been deleted.	The blocks should also be deleted prior to the download in the engineering system.	Automatic synchronization is not possible. The blocks deleted on the CPU should be manually deleted in the offline project in the engineering system.
One or more blocks on the CPU and in the engineering system are different. This is the case when a different user has changed blocks to which you have also made corrections and has already downloaded them to the CPU.	These blocks with competing changes must be adapted manually. You decide in this case which changes you are going to accept. If the blocks on the CPU are to be retained, you should adopt these blocks from the CPU in your engineering system before downloading to the CPU. If the blocks that you have changed are to be applied, you can continue with the download without synchronization.	Automatic synchronization is not possible: The affected blocks on the CPU or in the engineering system must be adapted manually. One of the existing block versions (online or offline) will be overwritten in the process.
There are differences in the hardware configuration on the CPU (online) and in the engineering system (offline).	Differences in the hardware configuration must be adapted manually. You decide in this case which hardware configuration you are going to accept. If the existing hardware configuration on the CPU is to be retained, you should adopt this in your engineering system prior to downloading. If you want to apply the hardware configuration you changed, you can continue downloading without synchronization.	Automatic synchronization is not possible: The hardware configuration must be adapted manually. One of the existing hardware configurations (online or offline) will be overwritten.

If required, you can use the "Force download to device" command to download blocks without synchronization.

See also

Downloading project data to a device (Page 396)

Downloading project data to a memory card (Page 397)

Uploading project data from a device (Page 399)

Downloading project data to a device

The following section describes the general procedure for downloading project data to a device. You will find details of how certain objects are downloaded and any special points to note in the online help of the product.

Requirement

- The project data is consistent.
- Each device to which you want to download is accessible via an online access.

Procedure

To download the project data to the selected devices, follow these steps:

1. Select one or more devices systems in the project tree.
2. Right-click on a selected element.
   The shortcut menu opens.
3. Select the option you require in the shortcut menu of the "Download to device" submenu.

   Note

   Note that the options available to you depend on the selected device.

   When necessary, the project data is compiled.

   – If you had previously established an online connection, the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.

   – If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interfaces via which you want to establish the online connection to the device. You have the option of showing all compatible devices by selecting the corresponding option and clicking the "Start search" command.
   See also: Auto-Hotspot

4. Check the messages in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.

Warning

Preventing personal injury and material damage

Performing the proposed actions while the plant is in operation can cause serious bodily injury and property damage in the event of malfunctions or program errors.

Make sure that no dangerous situations can arise before you start the actions.

As soon as loading becomes possible, the "Load" button is enabled.

5. Click the "Load" button.
   The loading operation is performed. If there is a need for synchronization, the system automatically displays the "Synchronization" dialog. This dialog displays messages and suggests actions that are required for the synchronization. You have the option of performing these actions or forcing the download without synchronization by clicking "Force download to device". If you have performed the suggested actions, you will be asked whether you want to continue with the download. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
6. Click the "Finish" button.

Result

The selected project data was downloaded to the devices.

See also

General information on loading (Page 394)

Downloading project data to a memory card (Page 397)

Uploading project data from a device (Page 399)

Downloading project data to a memory card

You have the option of downloading project data to a memory card. For CPUs of the S7-300/400 series you can also explicitly download the user program to a memory card inserted in the CPU.

To download project data to a memory card, you have the following options:

- Dragging project data to a memory card
- Writing project data to a memory card
- Downloading user program to a memory card that is inserted in a CPU of the S7-300/400 series

Requirement

A memory card is displayed.

See also: Accessing memory cards (Page 468)

Downloading project data to a memory card

To download project data to a memory card, follow these steps:

1. In the project tree, drag the project data you want to download to the memory card.
   If necessary, the project data is compiled. The "Load preview" dialog then opens. This dialog displays alarms and recommends actions needed for the loading operation.
2. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
3. Click the "Load" button.
   The loading operation is performed.

Or:

1. In the project tree, select the project data that you want to download.
2. To do this, right-click the selection and select the "Copy" command from the shortcut menu. You can also use the key combination <Ctrl+C>.
3. Right-click the memory card and select the "Paste" command from the shortcut menu. You can also use the key combination <Ctrl+V>.
   If necessary, the project data is compiled. The "Load preview" dialog then opens. This dialog displays alarms and recommends actions needed for the loading operation.
4. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
5. Click the "Load" button.
   The loading operation is performed.

Or:

1. In the project tree, select the project data that you want to download.
2. Select the "Card Reader/USB memory > Write to memory card" command in the "Project" menu.
   The "Select memory card" dialog opens.
3. Select a memory card that is compatible with the CPU.
   A button with a green check mark is activated at the bottom of the dialog.
4. Click the button with the green check mark.
   If necessary, the project data is compiled. The "Load preview" dialog then opens. This dialog displays alarms and recommends actions needed for the loading operation.
5. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
6. Click the "Load" button.
   The loading operation is performed.

Downloading the user program to a memory card in the CPU (S7-300/400 only)

To download the user program to a memory card in a CPU of the S7-300/400 series, follow the steps below:

1. Select a CPU of the S7-300/400 series in the project tree.
2. Select the "Download user program to memory card" command in the "Online" menu.
   The "Load preview" dialog opens. This dialog displays alarms and recommends actions needed for the loading operation.
3. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
4. Click the "Load" button.
   The loading operation is performed and the "Load results" dialog is displayed. This dialog displays alarms and suggests possible actions.
5. Check the alarms and select the actions in the "Action" column, if necessary.
6. Click the "Finish" button.

See also

General information on loading (Page 394)

Downloading project data to a device (Page 396)

Uploading project data from a device (Page 399)

Uploading project data from a device

The following section describes the general procedure for uploading project data from a device. Which project data you can upload from a device depends on the products installed.

You have the following options for uploading project data from a device to your project:

- Upload as new station
  With this option you upload existing project data of a device to your project as a new station.
- Upload project data of a device
  With this option you upload project data from the device to an existing CPU in the project. You will find the project data that can be loaded in the online help of the product.

In both cases, all instances of library types are connected again with the corresponding version of the type in the project library during loading. If no suitable type is yet available for a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

Requirement

- A project is open.
- The hardware configuration and software to be uploaded must be compatible with the TIA Portal. If the data on the device was created with a previous program version or with a different configuration software, please make sure they are compatible.

Uploading as a new station

To upload the complete device to your project, follow these steps:

1. Select the project name in the project tree.
2. Select "Upload device as new station (hardware and software)" in the "Online" menu.
   The "Upload device to PG/PC" dialog opens.
3. Select the type of interface you want to use for the uploading operation in the "Type of the PG/PC interface" drop-down list.
4. Select the interface to be used from the "PG/PC interface" drop-down list.
5. Click the "Configure interface" button to the right of the "PG/PC interface" drop-down list to adapt the settings for the selected interface.
   See also: Auto-Hotspot
6. Display all compatible devices by selecting the relevant option and clicking the "Start search" command. In the accessible devices table, select the device from which you want to upload project data.
7. Click on "Load".
   Depending on the selected device, a dialog appears in which you have to enter additional information, such as the position of the module rack.
   The project data of the device is uploaded to the project. You can edit it offline and then download it to the device again.

Uploading project data of a device

To upload only project data from one device to your project, follow these steps:

1. Establish an online connection to the device from which you want to download the project data.
   See also: Auto-Hotspot
2. Select the device in the project tree.
   The "Upload from device (software)" command in the "Online" menu is enabled.
3. Select the "Upload from device (software)" command in the "Online" menu.
   The "Upload preview" dialog box opens.
4. Check the alarms in the "Upload preview" dialog, and select the necessary actions in the "Action" column.
   As soon as uploading becomes possible, the "Upload from device" button is enabled.
5. Click the "Upload from device" button.
   The loading operation is performed.

See also

General information on loading (Page 394)

Downloading project data to a device (Page 396)

Downloading project data to a memory card (Page 397)

Loading project data from a memory card

You have the following options for uploading project data from a memory card to your project:

- Upload project data of the memory card as a new station
  With this option you upload the project data of a memory card to your project as a new station.
- Upload project data of the memory card to an existing device
  With this option you upload project data of a memory card to an existing device in your project. You will find the project data that can be loaded in the online help of the product.

In both cases, all instances of library types are connected again with the corresponding version of the type in the project library during loading. If no suitable type is yet available for a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

Requirement

- A project is open.
- The memory card is displayed.
  See also: Accessing memory cards (Page 468)
- The hardware configuration and software to be uploaded must be compatible with the TIA Portal. If the data on the memory card was created with a previous program version or with different configuration software, please make sure they are compatible.

Uploading project data as a new station

To upload project data from a memory card to your project, follow these steps:

1. In the project tree, select the project data you want to upload.
2. Select "Upload device as new station (hardware and software)" in the "Online" menu.

Or:

1. In the project tree, drag the memory card folder to the project.

Or:

1. Right-click on the memory card.
2. Select "Copy" in the shortcut menu.
3. Right-click on the project.
4. Select the "Paste" command in the shortcut menu.

Uploading project data to an existing device

To upload the project data of a memory card to an existing device, follow these steps:

1. In the project tree, drag the folder of the memory card to a device in the project or copy the memory card and paste the data into a device.
   The "Upload preview" dialog box opens.
2. Check the alarms in the "Upload preview" dialog, and select the necessary actions in the "Action" column.
   As soon as uploading becomes possible, the "Upload from device" button is enabled.
3. Click the "Upload from device" button.
   The loading operation is performed.

9.5.2 Comparing project data

9.5.2.1 Basics of project data comparison

Function

You can compare project data of the same type in order to determine possible differences. In principle, the following comparison methods are available:

- Online/offline comparison
  With this comparison method you can compare the software of objects of a device with the objects of a project. This is only possible when you establish an online connection to the device.
- Offline/offline comparison
  With this comparison method you can either compare the software or the hardware. When you compare the software, you can compare objects from projects or libraries. The hardware comparison is available for devices from the currently open project or from reference projects. You can decide for the software as well as the hardware comparison whether the comparison should be performed automatically for all objects or whether you want to compare individual objects manually.
- Detailed comparison
  For some objects, for example, blocks, you can also perform a detailed comparison in addition to the online/offline and offline/offline comparison. This involves opening the blocks to be compared beside each other and highlighting the differences.

A simple online/offline comparison is performed as soon as you establish an online connection. During this process, comparable objects in the project tree are marked with icons that represent the result of the comparison. You can also run a more comprehensive online/offline and offline/

offline comparison in the compare editor. When you compare software, you can also select actions for non-identical objects in the comparison.

Note

- Not all objects allow all types of comparison. Which comparison method you can use for which project data depends on the products installed.
- Compile your user program before you start a comparison or detailed comparison. After each change of the program during a comparison, repeat this step before you update the result of the comparison. This ensures that the comparison shows the current status.

Carrying out an online/offline comparison (Page 403)

Carrying out offline/offline comparisons (Page 404)

Using the compare editor (Page 405)

Running a detailed comparison (Page 412)

9.5.2.2 Carrying out an online/offline comparison

The online/offline comparison lets you compare objects of a device with objects of a project.

Requirement

The project tree is open.

Procedure

To perform an online/offline comparison, follow these steps:

1. Select a device in the project tree that allows online/offline comparison.
2. Select the "Compare > Offline/online" command in the shortcut menu.
3. If you have not already established an online connection to this device, the "Go online" dialog opens. In this case, set all the necessary parameters for the connection and click "Connect".
   The online connection is established and compare editor opens.

Result

All objects that exist online and offline are displayed. The symbols in the compare editor and in the project tree show you the status of the objects. In the compare editor, you can now define certain actions for the objects, depending on their status.

Basics of project data comparison (Page 402)

Carrying out offline/offline comparisons (Page 404)

Using the compare editor (Page 405)

Running a detailed comparison (Page 412)

9.5.2.3 Carrying out offline/offline comparisons

With offline/offline comparison you have the option to compare the project data of two devices. You can carry out a software as well as a hardware comparison. When you compare the software, you can compare objects from projects or libraries. The hardware comparison is available for devices from the currently open project or from reference projects. You can decide whether the comparison should be performed automatically for all objects or whether you want to compare individual objects manually.

You can drag any other device to the drop area at any time to perform further comparisons.

Requirement

The project tree is open.

Procedure

To perform an offline/offline comparison, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane.
   All existing objects of the selected devices are displayed depending on the settings of the compare editor in the "Software" tab and an automatic comparison is carried out. You can identify the status of the objects based on the symbols in the compare editor. You can define certain actions depending on the status of the objects. You can select an object in order to additionally display the property comparison for the object.
4. If you want to carry out a manual comparison, click on the button for switching between automatic and manual comparison in the status and action area. Then select the objects that you want to compare.
   The properties comparison is displayed. You can identify the status of the objects based on the symbols. You can define certain actions depending on the status of the objects.
5. If you want to carry out a hardware comparison, open the "Hardware" tab. You can once again carry out a manual comparison, if necessary. But you cannot specify any action.

Using the compare editor (Page 405)
Running a detailed comparison (Page 412)

9.5.2.4 Using the compare editor

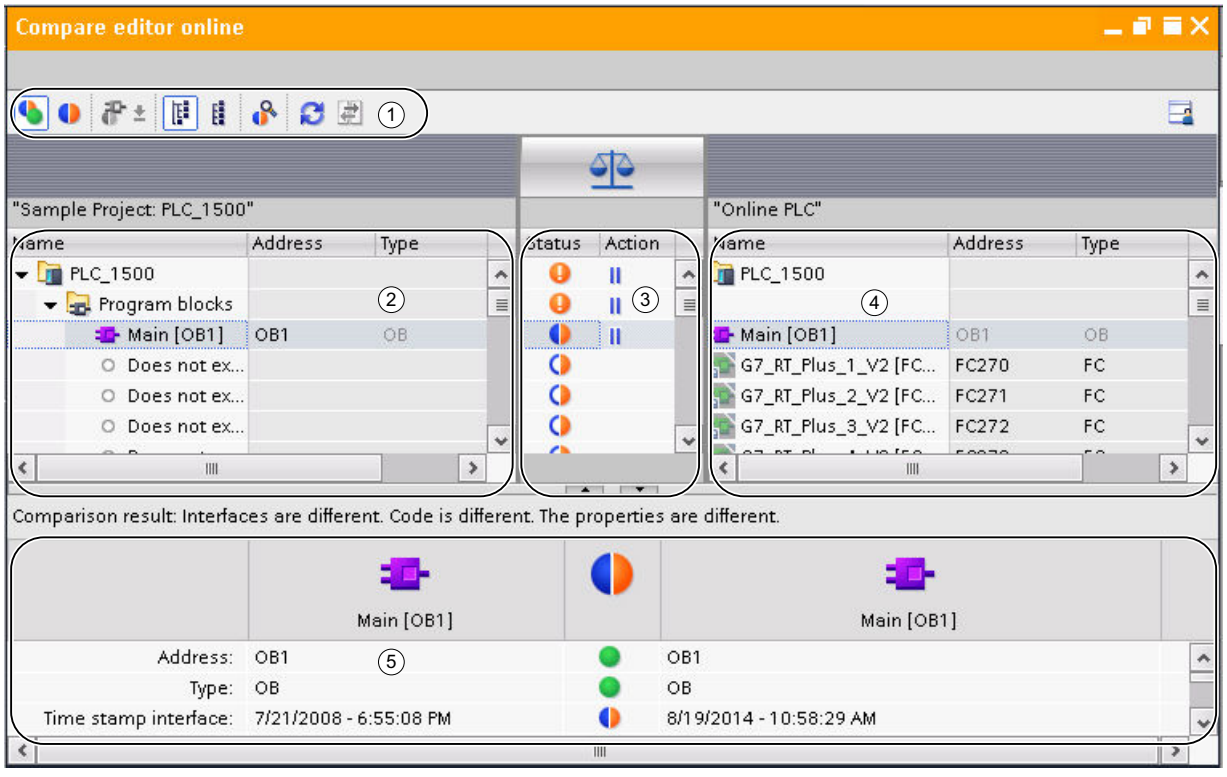
Overview of the compare editor

Function

The compare editor gives an overview of the results of a comparison in a table. The appearance varies slightly depending on whether it is an online/offline comparison or a hardware/software comparison.

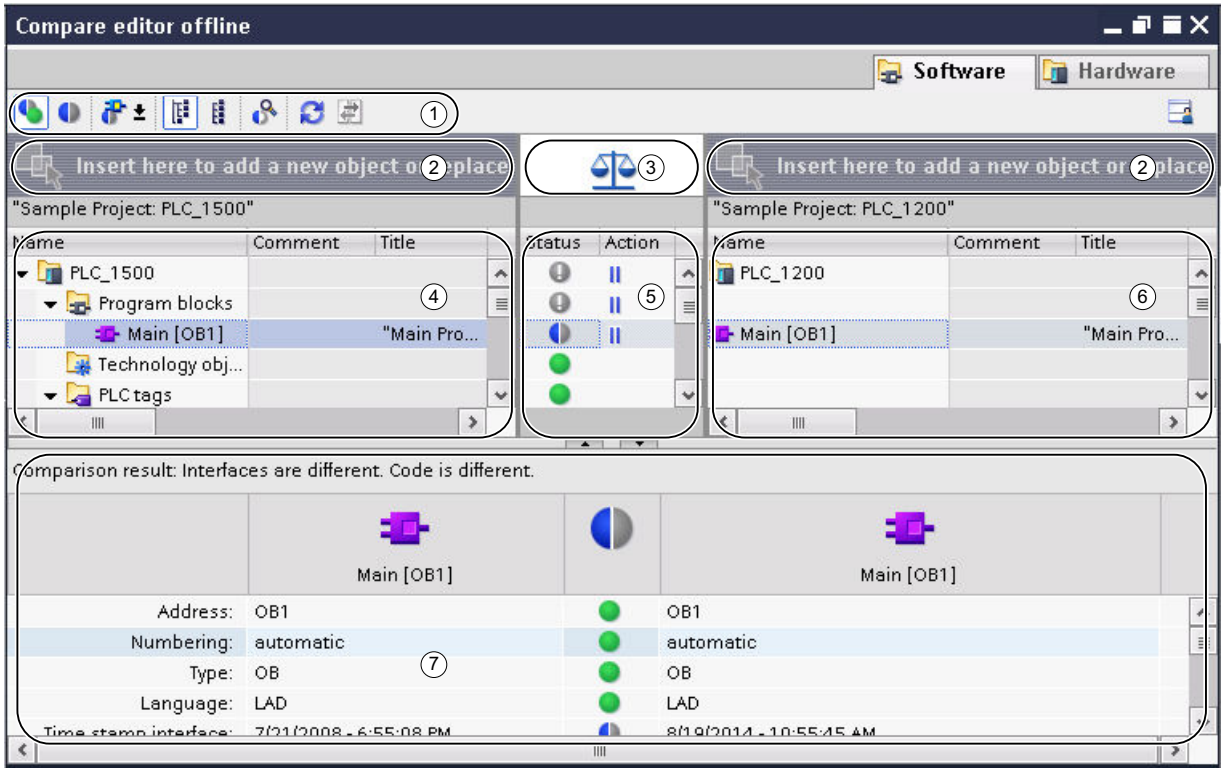
Layout of the compare editor

The following figure shows the layout of the compare editor for an online/offline comparison:



① Compare editor toolbar
③ Left comparison table
③ Status and action area
④ Right comparison table
⑤ Property comparison

The following figure shows the layout of the compare editor for an offline/offline comparison (software):



① Compare editor toolbar

② Drop areas

③ Button to toggle between automatic and manual comparison

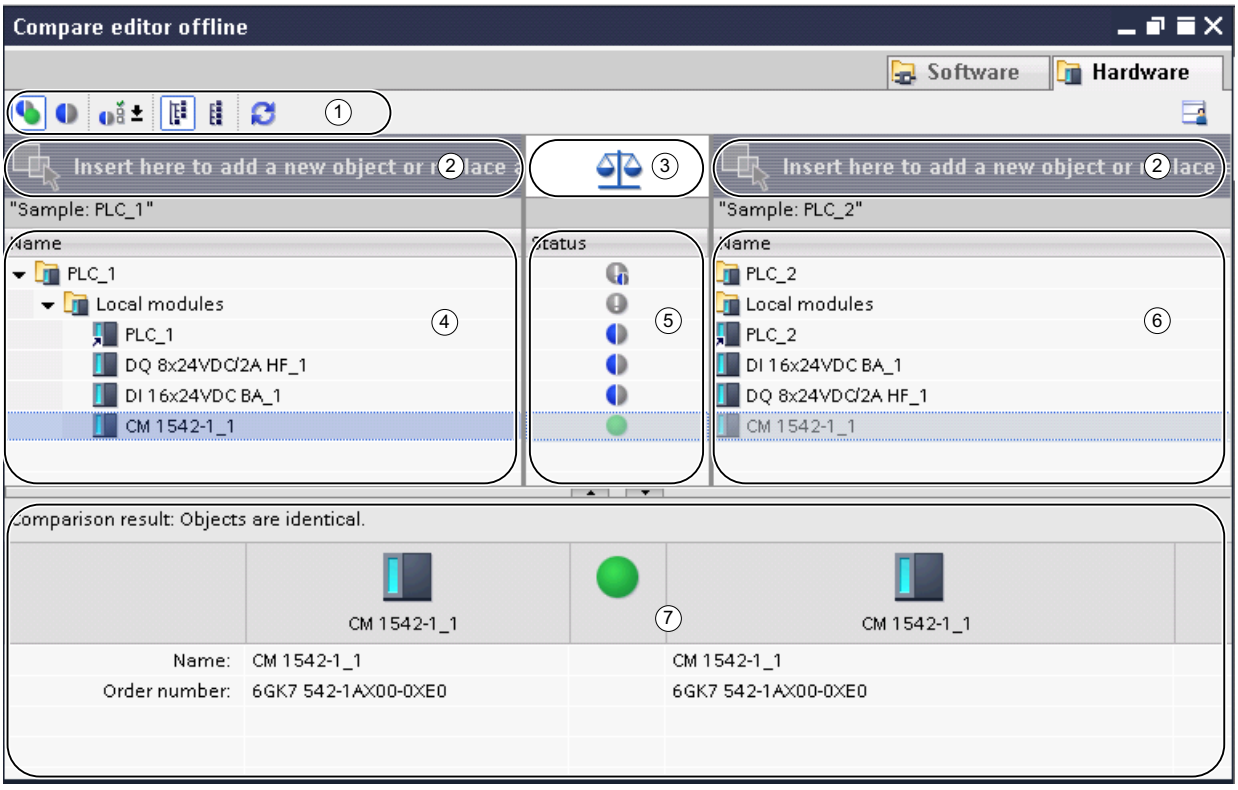
④ Left comparison table

⑤ Status and action area

④ Right comparison table

⑦ Property comparison

The following figure shows the layout of the compare editor for an offline/offline comparison (hardware):



① Compare editor toolbar

② Drop areas

③ Button to toggle between automatic and manual comparison

④ Left comparison table

⑤ Status area

④ Right comparison table

⑦ Property comparison

Compare editor toolbar

With the toolbar, you can access the following compare editor functions:

- Show identical and different objects
  You can show identical objects if you want to view the comparison in full.
- Show only objects with differences
  You can hide identical objects to make the comparison easier to follow.
- Show additional filters available (only online/offline comparison and offline/offline comparison for software)
  You can define which objects are to be compared.
- Display available assignment criteria (only offline/offline comparison for hardware)
  You can specify the criterion according to which the modules are to be assigned to each other for the comparison.

- Changing the view
  You can choose between a hierarchical and a flat view. In the hierarchical view, the devices are shown in their structure; in the flat view, the objects of the devices are listed without structure.
- Start detail comparison (only online/offline comparison and offline/offline comparison for software)
  You can start a detailed comparison for objects to show the individual differences. This function is, however, not available for every object.
- Refresh the view
  After you have modified objects, you can update the comparison results using this function.
- Execute actions (only online/offline comparison and offline/offline comparison for software)
  You can synchronize non-identical objects using specific actions.

Drop areas

In the case of an offline/offline comparison, you can drag the devices you want to compare into the drop areas. In the case of a software comparison, the devices to be compared can originate from the opened project, from reference projects, from the project library or from global libraries. However, note that you can only drop complete libraries into the right drop area. In the case of a hardware comparison, you can compare devices from the opened project or from reference projects.

Button to toggle between automatic and manual comparison

With an offline/offline comparison, you can switch between automatic and manual comparison. In the case of automatic comparison, the objects to be compared are assigned automatically to each other. In the case of a manual comparison, you can select the objects that are to be compared.

Comparison tables

Comparison tables show the objects of the devices being compared to one another.

The following table shows the meaning of the columns of the comparison table:

Column	Description
Name	Name of the compare object
Comment	Comment on the compare object
Title	Title of the compare object
Address	Address of the compare object
Numbering	Type of numbering for the comparison object
Type	Type of compare object
Language	Programming language set for the compare object.
Time stamp interface	Time of the last modification to the block interface
Time stamp code	Time of the last modification to the source code
Author	Name of the author of the compare object
Version	Version of the compare object

Column	Description
Family	Name of the object family
Load memory	Memory usage of the load memory of the compare object
Work memory	Memory usage of the work memory of the compare object
Modified on	Time of last modification
Optimized block access	Indicates whether "Optimized block access" is enabled for a block.
Signature	Signature of the compare object (SIMATIC Safety)
Interface signature	Signature of the block interface of the compare object (SIMATIC Safety)

Not all columns are available in every comparison type. For the hardware comparison, for example, the comparison tables contain only the "Name" column.

Not all columns are shown in the default setting. However, as in all table editors, you can show or hide the columns as required and sort according to individual columns.

Status and action area

The status and action area offers the following options:

- You can view the results of automatic comparison. The results are displayed with symbols.
- In an online/offline comparison and an offline/offline comparison for software, you can specify actions for non-identical objects.

Status and action symbols

The following table shows the comparison results symbols for an online/offline comparison:

Symbol	Description
	Folder contains objects whose online and offline versions differ
	Comparison results are not known
	Online and offline versions of the object are identical
	Online and offline versions of the object are different
	Object only exists offline
	Object only exists online

The following table shows the comparison results symbols for an offline/offline comparison:

Symbol	Description
	Reference program
	Version compared
	Folder contains objects of which the versions compared differ

Symbol	Description
	Results of the offline/offline comparison are not known
	The versions of the object compared are identical
	The versions of the object compared differ
	Object only exists in the reference program
	Object only exists in the version compared
	Hardware comparison only: Although the lower-level objects of the container are identical, there are differences between the containers themselves. Such a container may be a rack, for example.
	Hardware comparison only: The lower-level objects of the container are different. There are also differences between the containers. Such a container may be a rack, for example.

The following table shows the symbols for possible actions in a software comparison:

Symbol	Description
	No action
	Overwrite the object of the compared version with the object from the reference program
	Overwrite the object of the output program with the object from the compared version
	Different actions for the compare objects in the folder

Property comparison

The property comparison compares the properties of the selected compare objects. The result is displayed with symbols. Only the property comparison is made with a manual comparison so that the status and action area remains empty. With automatic comparison, you can perform the property comparison in addition to the comparison in the comparison tables.

Filtering the compare editor view (Page 411)

Updating the comparison results (Page 413)

Synchronizing non-identical objects (Page 414)

Show and hide table columns

In a software comparison, you can show or hide the columns of comparison tables as required.

Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. Select the "Show/Hide" command in the shortcut menu.
   The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.
5. In order to show or hide multiple columns, click "More" and select or clear the check boxes of the corresponding columns in the "Show/Hide" dialog.

Result

The columns in both the left and the right comparison table are shown or hidden.

Running a detailed comparison (Page 412)

Updating the comparison results (Page 413)

Synchronizing non-identical objects (Page 414)

Changing the view (Page 416)

Filtering the compare editor view

You can improve the clarity of the compare editor using the following filters:

- Hiding identical comparison objects
  You can hide comparison objects which have identical online/offline or offline/offline versions. Any such comparison objects you have hidden can also be shown again at any time.
- Displayed objects
  In an online/offline comparison or an offline/offline comparison for software, you can specify the objects for which the comparison results are to be shown.

Requirement

The compare editor is open.

Hiding identical comparison objects

To hide identical objects, follow these steps:

1. Click on the "Show only objects with differences" button in the toolbar.
   Only the elements that differ online and offline are displayed.

Showing identical comparison objects

To show identical objects again, follow these steps:

1. Click on the "Show identical and different objects" button in the toolbar.
   All elements will be displayed.

Selecting displayed objects

To select the objects for which comparison results should be displayed, follow these steps:

1. Perform an online/offline or an offline/offline comparison for software.
2. Click the arrow of the button "Show additional available filters" in the toolbar.
3. Select the required filter.

Show and hide table columns (Page 411)

Running a detailed comparison (Page 412)

Updating the comparison results (Page 413)

Synchronizing non-identical objects (Page 414)

Running a detailed comparison

Note

Not all objects allow a detailed comparison. The project data for which you can perform a detailed comparison depends on the products installed. A detailed comparison of the hardware components is not available for hardware comparison.

Procedure

Proceed as follows to perform a detailed comparison:

1. First, perform an online/offline or an offline/offline comparison for software.
   The compare editor opens.

   Note

   You can only perform a detailed comparison for objects that are listed in the left as well as the right comparison table.

2. In the compare editor, select the object for which you want to perform a detailed comparison.
3. Click the "Start detailed comparison" button in the toolbar.

Carrying out offline/offline comparisons (Page 404)

Overview of the compare editor (Page 405)

Show and hide table columns (Page 411)

Changing the view (Page 416)

Filtering the compare editor view (Page 411)

Updating the comparison results (Page 413)

Synchronizing non-identical objects (Page 414)

Updating the comparison results

As soon as you change an object, the comparison results are no longer valid and must be updated.

Note

For online/offline comparisons, you should note that changes in the device may result in the system automatically updating the comparison editor if objects in the comparison are affected by the change. This can have the following results:

- Some of the actions you have defined may become invalid, for example if the device no longer contains the object in question. Objects with such invalid actions will be highlighted so you can define new, valid actions.
- The selection you made before the automatic update may also be cancelled.

Requirement

The comparison editor is open.

Procedure

To update the comparison results, follow these steps:

1. Click the "Refresh view" button in the toolbar.
   The comparison results are updated.

Note

Please note that the "Refresh view" button will not be available while the comparison editor is loading or synchronizing content.

Changing the view (Page 416)

Filtering the compare editor view (Page 411)

Running a detailed comparison (Page 412)

Synchronizing non-identical objects (Page 414)

Synchronizing non-identical objects

Specifying actions

If you have performed a comparison, you can specify the actions to be performed for non-identical objects in the compare editor. You cannot select any actions for identical objects. Note that you cannot execute any actions during hardware comparison.

In the case of an online/offline comparison, only synchronization actions in one direction are permitted, in order to retain program consistency. Thus, for example, you can load multiple blocks to a device or from a device, but you cannot perform a combination of loading actions in one synchronization action. In this case, the first action you set in the compare editor determines the synchronization direction. For example, if you specify for a block that the offline block is to be loaded to the device, then the other objects can also only be loaded to the device via a synchronization action. To load objects from the device again, first select the "No action"

option. You can then specify the action settings again as required. Or, you can perform a new comparison.

Note

Please note the following CPU-specific aspects when defining actions:

- S7-300/400:
  - You can define actions for the "Program blocks" folder, for folders you have created yourself or for individual blocks.
  - Neither SCL nor GRAPH blocks can be loaded from the device to the offline project.
- S7-1200/1500:
  - You can define actions for the "Program blocks" folder, for folders you have created yourself or for individual blocks. If you have performed an online/offline comparison and select download to the device as action, a consistent download is executed. If you upload the object from the device to the project, however, you can also upload individual blocks.
  - SCL blocks cannot be loaded from the device to the offline project.

Requirement

The compare editor is open.

Procedure

To select an action for a non-identical object, follow these steps:

1. In the status and action area, click in the "Action" column on the cell of the object for which you want to define an action.
   The cell changes to a drop-down list.
2. Click on the drop-down list.
3. Select the action you want.
   The action set will be carried out for the object in question the next time synchronization is performed.
   If you have accidentally changed the action you had selected, you can undo the change before the next synchronization.
4. To restore the previously set action selection, right-click the action in the status and action area that you want to restore.
5. Select the "Restore last selection" command in the shortcut menu.

Filtering the compare editor view (Page 411)

Updating the comparison results (Page 413)

Synchronizing objects (Page 416)

Synchronizing objects

Synchronization executes the actions you have specified for non-identical objects. Note, however, that in the case of an online/offline comparison you can only perform actions in one direction in one synchronization action.

Requirement

- The compare editor is open.
- The desired actions have been selected.

Procedure

To synchronize objects, follow these steps:

1. Click the "Execute actions" button in the toolbar.

Result

The actions you specified for the objects are performed.

Show and hide table columns (Page 411)

Filtering the compare editor view (Page 411)

Updating the comparison results (Page 413)

Specifying actions (Page 414)

Changing the view

You can choose between a hierarchical and a flat view for the left comparison table. In the hierarchical view, the devices are shown in their structure; in the flat view, the objects of the devices are listed without structure. In the right comparison table, the objects are always displayed flat.

Setting the hierarchical view

To set the hierarchical view, follow these steps:

1. Click the "Display in hierarchical view" button in the toolbar of the compare editor.

Setting the flat view

To set the flat view, follow these steps:

1. Click the "Display in flat view" button in the toolbar of the compare editor.

9.5.3 Protecting project data

9.5.3.1 Protection concept for project data

Introduction

You can protect your project data from unauthorized access. These include, for example:

- Access protection for devices
- Copy and display protection of objects
- Restrictions for printouts of know-how-protected objects

For objects with know-how protection, this protection is also retained after the object is pasted into a library. Note that every protection mechanism is not available for all objects. How to protect specific objects is described in the online help of the product.

Revoking access rights for devices

If you want to execute a function that is password-protected by means of the device protection level, you are prompted to enter a password. When the password is entered correctly, you can execute the required function. The access right is retained on the device until you close the TIA Portal.

If you want to reactivate password protection while the TIA Portal is open, you can explicitly revoke the access rights for a device. As a result, certain functions for the protected device cannot be executed until the correct password is entered again. You specify the functions for which a password must be entered when you assign the device protection level.

See also

Printing project data (Page 436)

9.5.3.2 Revoking access rights for devices

Requirement

- A protection level has been set for the device.
- A protected function for the device has been enabled by entering the password.

Procedure

To revoke the access rights for the device, follow these steps:

1. Select the device for which you want to revoke access rights in the project tree.
2. Select the "Delete access rights" command in the "Online" menu.

Result

The access rights are revoked, and starting from now the user will be prompted to enter the password again to execute a password-protected function on the device. The function can only be executed if the correct password is entered.

If the device has an online connection, it will be disconnected.

See also

Protection concept for project data (Page 417)

9.5.4 Printing project contents

9.5.4.1 Printing project documentation

Documentation settings

Introduction

Once a project is created, the contents can be printed in an easy-to-read format. You may print the entire project or individual objects within the project. A well-structured printout is helpful when editing the project or performing service work. The printout can also be used for your customer presentations or as full system documentation.

You can prepare the project in the form of standardized circuit manuals and print it in a uniform layout. You can limit the scope of the printout. You have the option to print to the entire project, individual objects along with their properties, or a compact overview of the project. In addition, you can print the contents of an open editor.

Improving the printout with frames and cover pages

You can design the appearance of the printed pages according to your own requirements, for example, to add your own company logo or the corporate design of your company in the project documentation. You can create any number of design variants as frames and cover pages. The frames and cover pages are stored in the project tree under the item "Documentation settings" and are part of the project. You can insert placeholders for data from previously entered document information within the frames and cover pages. These will be filled automatically with the appropriate metadata during printing.

If you want to avoid designing your own template, there are ready-made frames and covers pages available. These include templates complying with the ISO standard for technical documentation.

Modular structure of a printout

An printout generally consists of the following components:

- Cover page (only when printing from the project tree)
- Table of contents (only when printing from the project tree)
- Name and path of an object within the project tree
- Object data

Printout of the cover page or the table of contents can be deactivated in the "Print" dialog.

See also

Creating frames (Page 425)

Creating a cover page (Page 425)

Editing cover pages and frames (Page 427)

Entering document information (Page 423)

Print function for module labels (Page 438)

Printout of project contents

Availability of print function

The following contents can be printed:

- An entire project in the project tree
- One or more project-related objects in the project tree
- Contents of an editor
- Tables
- Libraries
- Diagnostics view of the Inspector window

It is not possible to print in the following areas:

- Portal view
- Detailed view
- Overview window
- Compare editor
- All tabs of the Inspector window, except the diagnostics view
- All task cards, except the libraries
- Most of the dialogs
- Properties and devices of the programming device/PC not related to the project, for example online portals and connected card readers.

Scope of printout

To be able to print, at least one printable element has to be selected.

If a selected object is printed, all subordinate objects are also printed. For example, if a device is selected in the project tree, all of its data is also printed. If you select the entire project in the project tree for printing, all project contents are printed with the exception of the graphical views. These have to be printed separately. Items in the project tree that are not part of the project cannot be printed. For example, this includes online portals and connected card readers and USB memory devices.

When table contents are printed, all lines in the table in which a cell is selected are printed. In order to print one or more table columns, the desired columns must be selected. If no individual cells or columns are selected, the entire table is printed.

Limitations when printing

In general, it is possible to print all objects that can be visualized on the user interface. Conversely, this means that you cannot print objects that you do not have access to. If a printout fails, possible reasons may include the following:

- A valid license does not exist for displaying an object.
- There is no device description for an object.
- A software component needed to display an object is not installed.

See also

Printing project data (Page 436)

Changing the print settings

Changing the print settings

You can specify general print settings that are retained even after the TIA Portal is closed and re-opened. Some settings are dependent on the products installed. The following settings are possible in every case:

Always print table data as pairs of values

If this option is selected, tables are not printed in tabular format but rather as a pairs of key and value.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

Object A

Property 1: Value A1

Property 2: Value A2

Object B

Property 1: Value B1

Property 2: Value B2

Printing mask editors

- Always print data in tables
  All parameters of technology objects are printed in tabular format.
- Print mask graphics if possible
  If the utilized editor supports this function, the contents of the editor are not printed as a table but rather as a complete graphic as it appears on the screen.

Procedure

To change the print settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General" group.
3. Select the desired default settings in the "Print settings" area.
   The changes are applied immediately and are retained for all projects, even after the TIA Portal is closed.

Overview of the print settings (Page 305)

Specifying the print layout

Specifying the print layout

If you do not want to rely on ready-made print templates, you can specify your own cover page or your own layout for the individual pages. Your designs are saved together with the respective project.

Your designs for the cover page and your templates for the page layout can be found in the project tree under the "Documentation information" group. You will also find metadata on the project there under the entry "Document information". For subsequent print operations, you can customize the appearance of the printout in the "Print" dialog using the saved cover pages and page layout templates and the available metadata.

Designing the cover page

The cover page can be customized. You can insert a background graphic and provide placeholders for text on the page. The placeholders are automatically filled with data from a documentation information during printing.

Cover pages are located in the project tree under the "Documentation information > Cover pages" group.

Designing the content page

The regular pages of a printout can contain the following elements:

- Frame with static content, such as a company logo
- Placeholders for text, such as the name of the project, the page number, and the time the printout was started
  Several different values for the individual placeholders can be specified in the document information. Other values, such as the project name, are preassigned and are inserted automatically during printing.
- Footnote
  The footnote is always output below the content area.
- Content area
  You can specify an area where the printed content is to be embedded.

The design of the content pages is saved in Frames. The individual frames are located in the project tree under the "Documentation information > Frames" group.

Entering document information

You can enter metadata in the document information for every project. In addition, a print frame and a cover page are specified in the document information. You can create different information, if required, to enable you to quickly switch between different document information containing different information, frames, cover pages, page sizes, and page orientations when printing. For example, this is useful if you want to generate printouts in different languages and different document information is provided for each language.

In the documentation editor, you can specify placeholders on the cover page or in the frame of the regular pages. These placeholders can be automatically replaced with metadata from the documentation information during printing.

The various document information are therefore part of the printing function and specify the print layout and print content.

Procedure

To add metadata, follow these steps:

1. To create new document information, double-click "Add new document information" under "Documentation information > Document information" in the project tree.
   The new document information is created and opened immediately.
2. Enter a name for the set in the "Name" field.
3. Fill in the individual fields with the metadata for the project.

Managing cover pages and frames

Using cover pages and frames

Uses for cover pages

You can give your plant documentation printouts a professional appearance by adding a cover page. You can design your own cover page or use ready-made cover pages. Ready-made cover pages can be adapted and stored again as a template.

Cover pages can be saved in global libraries where they are available for use across projects.

Cover pages are designed for use as a right printed page only.

Uses of frames

You can embed the regular pages of your plant documentation inside a consistently uniform page frame. The frame can contain placeholders for project metadata, which is stored in the document information. It can also contain graphic elements that you design yourself.

You can create your own frames or rely on ready-made page frames. You can adapt a ready-made page frame and then store it again as a new frame.

Like cover pages, frames can be saved in global libraries where they are available for use across projects.

Frames are designed for use on right printed pages only.

Cover pages and templates in the project tree

Cover pages and frames associated with the project are stored in the project tree under the entry "Documentation information". There are separate folders here for frames and cover pages.

The following actions are available in the project tree for cover pages and frames.

- Creating your own subfolders
- Copying and pasting
- Inserting cover pages and frames from the "Documentation templates" system library
- Copying cover pages and templates to a global library

Cover pages and templates in libraries

The "Documentation templates" system library contains a few cover pages and templates that are available in every project. The cover pages and templates can be moved from there to the project tree using a drag-and-drop operation. You can then adapt the cover pages and templates in the project tree according to the requirements of your project.

Cover pages and templates can be moved from the project tree to a global library. Afterwards, these are available in every project.

Designing cover pages and frames (Page 427)

Using ready-made frames and cover pages (Page 426)

Creating frames

You can create any number of frames for each project. The frames are stored in the project tree below the "Documentation information > Frames" group. You can assign a frame to all document information. When you select document information for printing, its associated frame is used.

Procedure

To create a new frame, follow these steps:

1. Double-click the entry "Add new frame" below the "Documentation information > Frames" group in the project tree.
   The "Creating frames" dialog opens.
2. Enter a name for the frame in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

Result

A new frame is created. The frame is then opened automatically in the documentation editor where it can be edited.

Editing cover pages and frames (Page 427)

Creating a cover page (Page 425)

Creating a cover page

You can create any number of cover pages for the printout for each project. The cover pages are stored in the project tree below the the "Documentation information > Cover pages" group. You can assign a cover page to all document information. When you select specific document information for printing, its associated cover page is used.

Procedure

To create a new cover page, follow these steps:

1. Double-click the entry "Add new cover page" below the "Documentation information > Cover pages" group in the project tree.
   The "Add new cover page" dialog box opens.
2. Enter a name for the cover page in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

Result

A new cover page is created. The cover page is then opened automatically in the documentation editor where it can be edited.

Creating frames (Page 425)

Using ready-made frames and cover pages

The TIA Portal comes with some ready-made frames and cover pages. These can change according to your wishes.

Procedure

To create and edit the ready-made frames and cover pages, follow these steps:

1. Open the "Global libraries" pane in the "Libraries" task card.
2. In the "Templates" folder, open the "Cover Pages" or "Frames" folder.
3. Drag a cover page or a frame from one of the folders into the project tree and drop it into one of the following folders:
   - For frames: "Document information > Frames"
   - For cover pages: "Document information > Cover pages".

   The ready-made frame or cover page can now be used in the project.
4. Double-click on the new entry in the project tree click to edit the frame or the cover page.

Using cover pages and frames (Page 424)

Editing cover pages and frames (Page 427)

Designing cover pages and frames

Editing cover pages and frames

The documentation editor is a graphical editor which allows you to design frames and cover pages for your plant documentation. You can place images or text elements on the frame and the cover pages in the document editor. The text elements are either static or they are automatically filled during printing with the data from the document information that you have selected in the print dialog.

Procedure

To edit a cover page or a frame in the documentation editor, follow these steps:

1. In the project tree, double-click on the entry for an existing cover page or frame under the "Documentation information > Frames " or "Documentation information > Cover pages" group.
   The documentation editor opens.
2. Design the cover page or frame as desired.
3. Close the documentation editor.
   The changes to the cover page or frame are applied automatically.

See also

Creating a cover page (Page 425)

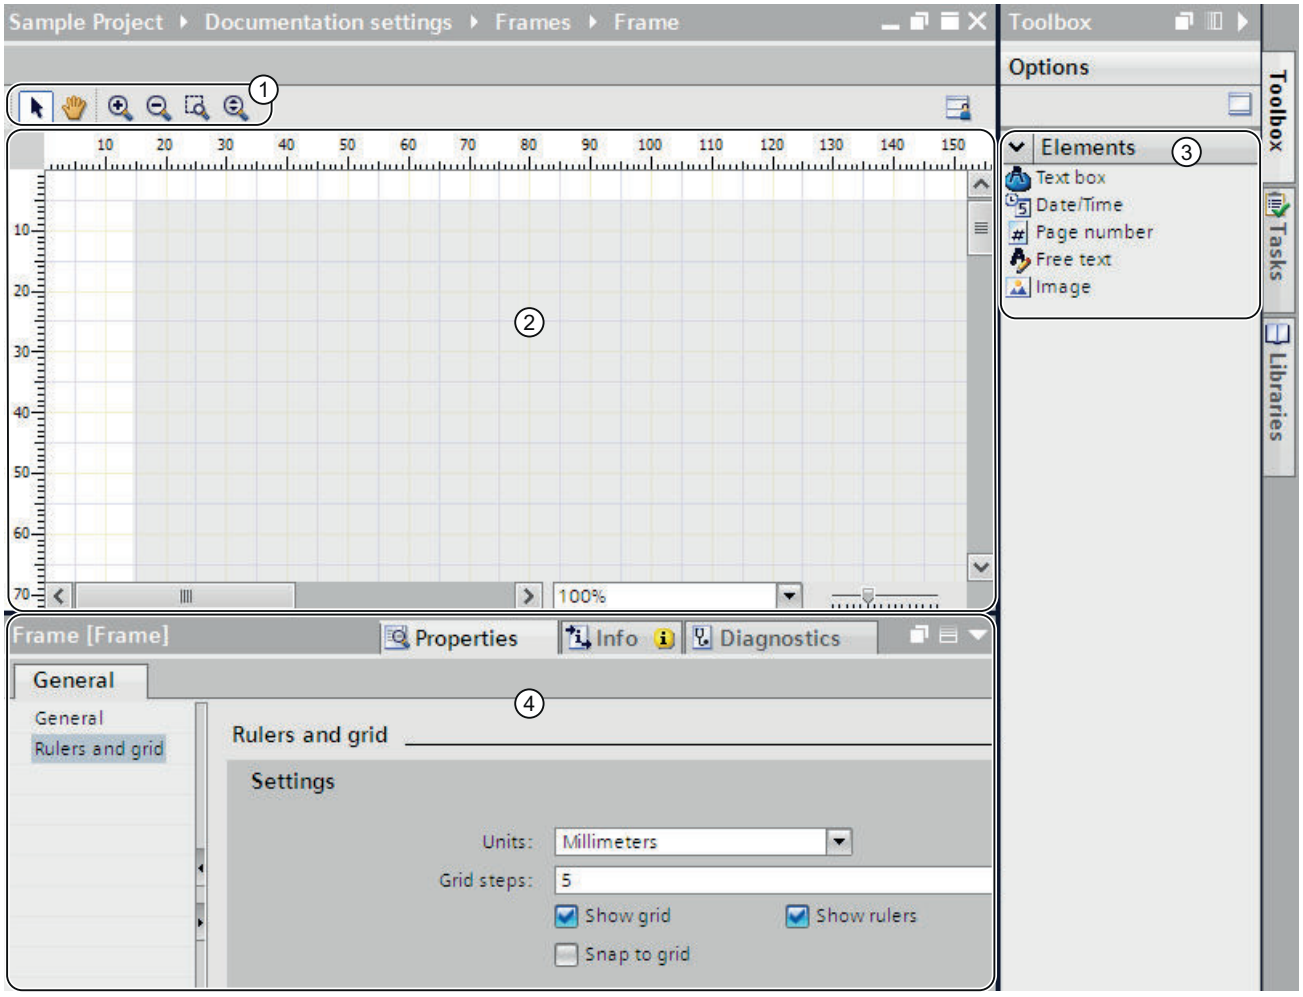
Creating frames (Page 425)

General operation of the documentation editor (Page 428)

General operation of the documentation editor

Components of the documentation editor

The following figure provides an overview of the components of the documentation editor:



① Toolbar

The toolbar provides the following tools (from left to right):

- Arrow tool
  Enables object selection.
- Navigation tool
  Allows shifting of the partial page.
- Zoom-in button
  Magnifies the page display incrementally.
- Zoom-out button
  Reduces the page display incrementally.
- Zoom with selection
  Adapts the page size to a selected work area.
- Dynamic zoom
  Adapts the page width to the work area.

② Work area

You can design the cover page or frame in the work area.

③ "Toolbox" task card

The "Toolbox" task card contains various types of placeholders that you can use on the cover sheet or frame. The placeholders can be placed in the work place using a drag-and-drop operation.

④ Properties in the Inspector window

You can display and modify the properties of the currently selected object in the "Properties" tab of the Inspector window. For example, you can modify the properties of the page, format text, specify the position of objects on the page, etc.

Operation in the documentation editor

The following basic functions are available in the documentation editor:

- Drag-and-drop functionality
  The documentation editor is a graphic editor. which means you can place objects anywhere with the mouse. An image of the page is displayed in the work area. This image corresponds to the ultimate print layout.
  If you want to select objects on the page in order to move them or modify their properties, the arrow tool must be activated in the toolbar.
- Zoom function
  You can use the zoom function to change the size of the page display. You have two options for changing the page size:
  - Via the buttons in the toolbar
    Select the "Zoom in" or "Zoom out" magnifying glass button in the toolbar of the documentation editor. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.
    To zoom in on a particular area, select the "Zoom with selection" tool and use the mouse to drag an outline around the area you want to focus on.
    To continuously zoom in or zoom out of the work area, use the "Dynamic zoom" tool. To magnify the page display, click anywhere on the work area, and then hold down the mouse button while dragging the mouse toward the top of the page. To reduce the page display, drag the mouse toward the bottom of the page.
  - Via the zoom bar
    You can also use the zoom bar (located in the bottom right corner of the work area) to change the display size. Select a percentage value from the drop-down list or enter a percentage value. Alternatively, you control the display size using the slider.
- Navigation over the page
  In addition to scrolling, you the option of changing the partial page with the navigation tool. To change the partial page with the navigation tool, select the Hand button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.

Using and adapting the positioning aids

You have various aids at your disposal to help you position elements on the page:

- Rulers
  Rulers are affixed to the page margins in the work area.
- Page grid
  A grid is placed underneath the page in the work area.

You can display, hide or adapt the positioning aids in the Inspector window under "Properties > Rulers and grid". You can make the following settings:

- Units:
  Specify the unit of measurement for the grid and the rulers.
- Grid steps:
  Specify the width of the grid.
- Show grid:
  Specify whether the grid is to be displayed or hidden.

- Snap to grid:
  Specify whether objects are to be aligned automatically to the grid. If the option is selected, the grid lines function like a "magnet".
- Show rulers:
  Specify whether the rulers are to be displayed.

Editing cover pages and frames (Page 427)

Specifying the print area (Page 431)

Inserting placeholders for metadata (Page 431)

Specifying the print area

An area within the frame is provided for the actual printed contents. The project data is then always inserted inside this defined and uniformly consistent area within the frame. You can adjust the size of the print area.

Requirement

A frame is open in the documentation editor.

Procedure

To define an area for the printed contents, follow these steps:

1. Click on the slightly darker area within the page display in the documentation editor to select the area for the print content.
   This opens the properties of the area to be printed in the Inspector window.
2. Enter the position of the print area on the X and Y axes in the Inspector window.
3. Specify the width and height of the print area in cm in the Inspector window.

Alternatively, you can change the width and position of the print area in the graphic display of the page. To do so, use the mouse to drag the margins of the print area until the desired size and position are achieved.

See also

Creating frames (Page 425)

General operation of the documentation editor (Page 428)

Inserting placeholders for metadata

You can provide placeholders on the cover page and in a frame. The placeholders are automatically filled with metadata from documentation information during printing, if they are placeholders for text. Alternatively, you can add non-modifiable data, such as free text or an image.

All elements are arranged in numbered Z-Orders. If objects overlap, you can determine in which sequence these are to be arranged.

Types of placeholders

The following types of placeholders are available to you:

- Text field
  The text field stands as a placeholder for a text element from a document information. In the properties of the text field, you set which text from a document information should be automatically inserted during printing.
- Field for date and time
  A date and time is inserted instead of the placeholder when printing. This can be the date of creation or the point in time when the last change was made to the project. In the properties of the Inspector window, you specify which date or time is printed.
- Page number
  The correct page number is automatically applied when printing.
- Free text
  You can enter freely selectable text in the properties of the text field. The text is static and is not influenced by the document information selected at the time of printing.
- Image
  Select the image file in the properties of the placeholder in the Inspector window. Images in the formats BMP, JPEG, PNG, EMF or GIF are possible.

Requirement

An cover page or frame is open in the documentation editor.

Procedure

To insert placeholders for metadata on the cover sheet or in a frame, follow these steps:

1. Drag a field from the "Toolbox > Elements" task card to the work area of the documentation editor.
   The placeholder is inserted. The placeholder properties are shown in the Inspector window and can be edited there.
2. Select the metadata to be inserted during printing from the "Text" drop-down list in the Inspector window under "Properties > General > Text box". Alternatively, you have the option of entering free text or selecting an image depending on the type of placeholder.
3. In the Inspector window under "Properties > General > Position and size", specify the position of the placeholder on the X and Y axis and enter the width and height of the text box in cm. You specify the sequence of the objects in the "Z-Order" field, if these overlap. The smaller the value, the further down an object is located.
4. In the Inspector window, go to "Properties > View" and select the font formatting and the orientation of the text as well as the alignment of the text. You cannot make this setting for images.

General operation of the documentation editor (Page 428)

Displaying print preview

Creating a print preview

Creating a print preview

You can create a preview of the printout. Document information can be chosen for this, in the same way as for the actual printout. In this way, you preview the selected frame and, if applicable, the cover sheet. The settings are retained for later printing.

Procedure

To create a print preview and to set the scope of the later printout, follow these steps:

1. Select the "Print preview" command in the "Project" menu.
   The "Print preview" dialog opens.
2. Select the frame layout you want to use for the printout.
   - In the "Document information" drop-down list, select the documentation information you want to use later for the printout.
   - Select the "Print cover page" check box to print the cover page, which is specified in the selected document information.
   - Select the "Print table of contents" check box to add a table of contents to the printout.

   The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.
3. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.
   - Choose "All" to print out the entire content of the editor.
   - Choose "Selection" to print only the objects currently selected in the editor.

4. Select the print scope under "Properties".
   - Choose "All" to print all configuration data of the selected objects.
   - Choose "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor that supports this function.
   - Choose "Compact" to print out an abbreviated version of the project data.
5. Click "Preview" to generate the preview.
   A print preview is created in the work area.

Note

Wait time for extensive documents

It can take several minutes to generate the print preview in the case of very extensive projects. You can continue working normally in the meantime on systems with adequate resources. The progress of the print preview is shown in the status bar.

See also

Operation within the print preview (Page 435)

Operation within the print preview

Functions within the print preview

The print preview shows an exact image of the subsequent printout. You can use the buttons in the toolbar to modify the print preview display. The following functions are available (from left to right):

- Navigation mode
  Allows shifting of the partial page.
  To change the partial page with the navigation tool, select the arrow button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.
- Zoom function
  - "Zoom in" and "Zoom out"
    Magnifies or reduces the page display.
    To zoom in or zoom out the display incrementally, select the corresponding button. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.
    To zoom in on a particular area, enable the "Zoom with selection" icon and use the mouse to drag an outline around the area you want to focus on.
    To zoom dynamically through the page, select the button "Zoom in / zoom out dynamically". With pressed mouse button, scroll down over the page to zoom in. Scroll up to zoom out.
  - Percentage value in the drop-down list
    Specifies the display size of the page in percent.
    Enter a percentage value or select a percentage value from the drop-down list. Alternatively, choose the "Fit to page" option from the drop-down list to adapt the page size to the work area. Or, choose "Fit to width" to adapt the page width to the work area.
- "Forward" and "Backward"
  Each change in the partial page, the page count, or the display size is saved in a history in the background. You can use the "Forward" or "Backward" button to return to the previous view or the next view.
- Page navigation
  - "First page"
    Jumps to the first page
  - "Previous page"
    Goes to the previous page.
  - "Page number" input field
    Shows the current page. To jump directly to a page, enter the page number of the page you want to view.
  - "Next page"
    Goes to the next page.
  - "Last page"
    Jumps to the last page.

See also

Creating a print preview (Page 433)

Printing project data

You have two options for printing out project data:

- Print immediately using default settings by means of the "Print" button in the toolbar.
  The button is only active if a printable object is selected.
- Printout with additional setting options with the "Project > Print" menu command.
  For example, you can choose a different printer or specific documentation information or you can specify whether a cover page and table of contents are to be printed. In addition, you can specify the print scope or display a print preview prior to printing.

Requirement

- At least one printer is configured.
- The objects to be printed are not protected.
  The print scope for protected objects is limited. Disable the know-how protection to print the objects in full.

Printing project data

To print out data from the current project or the entire project with additional setting options, follow these steps:

1. Select the entire project in the project tree in order to print out the entire project. To print only individual elements within a project, select them in the project tree.
2. Select the "Print" command in the "Project" menu.
   The "Print" dialog opens.
3. Select the printer in the "Name" box.
4. Click "Advanced" to modify the Windows printer settings.
5. Select the frame layout you want to use for the printout.
   - Select the documentation information in the "Document information" drop-down list.
     The frame stored in the document information is used for the printout. All placeholders within the chosen frame are filled with the metadata from the selected document information.
   - Select the "Print cover page" check box to print the cover page, which is stored in the selected document information.
   - Select the "Print table of contents" check box to add a table of contents to the printout.

   The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.

6. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.
   - Select "All" to print out the entire content of the editor.
   - Select "Selection" to print only the objects currently selected in the editor.
7. Select the print scope under "Properties".
   - Select "All" to print all configuration data of the selected objects.
   - Select "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor.
   - Select "Compact" to print out an abbreviated version of the project data.
8. Click "Preview" to generate a print preview in advance.
   A print preview is created in the work area.
9. Click "Print" to start the printout.

Note

Scope of the "Print" dialog

The options available in the "Print" dialog vary depending on the elements to be printed.

Result

The project data is prepared in the background for printing and then printed on the selected printer. The status bar shows the progress of the print operation. You can continue working normally while data is being prepared for printing.

The print results and any errors or warnings are listed in the Inspector window under "Info" at the conclusion of the print job.

Canceling a print job

To cancel an active print job, follow these steps:

1. Click the blue cross in the status bar next to the progress display for the printout.
   The printout is aborted.

Designing cover pages and frames (Page 427)

9.5.4.2 Printing module labels

Print function for module labels

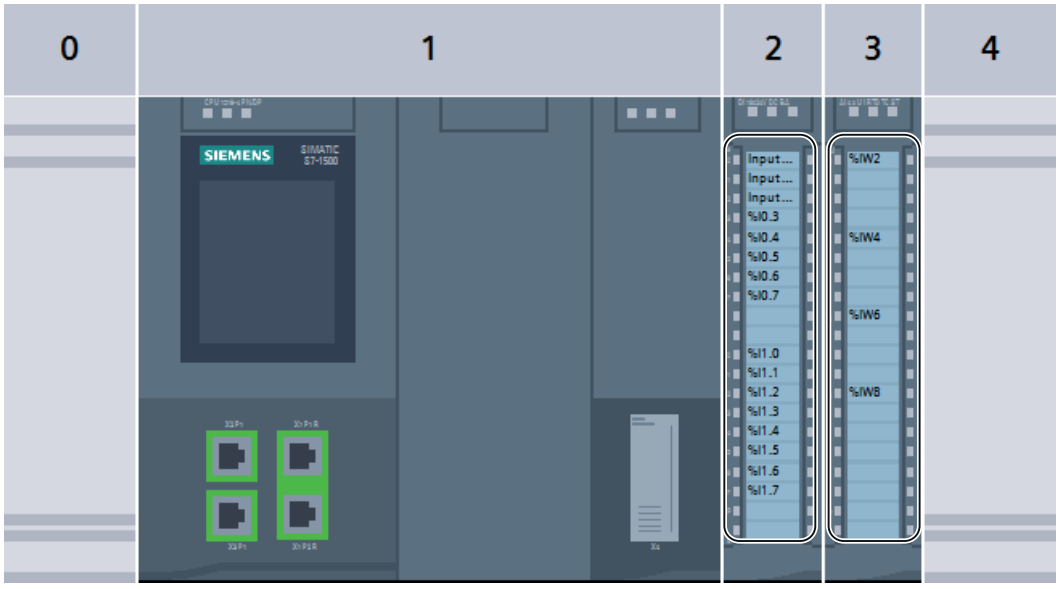
Printing of module labeling strips for hardware modules

You can print labeling strips for the modules in your project with the help of the TIA Portal. The labeling strips are custom-fit to each module and can contain the following printed information:

- Symbolic name of the input or output
- Absolute address of the input or output
- Symbolic name and additionally the absolute address of the input or output. The order of the information can be specified.

The modules are displayed graphically in the device view. If you set the zoom level in the device view to at least 200%, the labels for the individual modules will be visible. The printout on the labeling strip corresponds to the representation of the labeling in the device view.

The following figure shows an example of two modules in the device view on which the labeling of the inputs and outputs is visible:



Export and further editing as Microsoft Word file

The labeling strips are first exported as a Microsoft Word file (.docx) before they are printed. The file can be further edited with commonly available word processing programs such as Microsoft Word. The individual labeling strips are represented as a table in the .docx file.

The character spacing of the text within the table is adapted by default, so that texts are not truncated. If you want to prevent this from stretching or compressing the text too much, change the character spacing of the text in the table cell properties.

Printing the labeling data to an XML file

As an alternative to printing the labeling strips, you can print the addresses of the inputs and outputs of a module to an XML file. You can use the export to an XML file for devices for which no ready-made labeling strips are available. You can also use the export to an XML file to create labeling strips with another program. The program must be able to transform the data of the XML file into an input format that is suitable for the labeling system. The schema of the XML file is available in the section "XML schema of the export file (Page 442)".

Print media

You can print the labeling strips either on ready-made print sheets or on standard DIN A4 paper. You can separate the individual labeling strips from the ready-made print sheets and insert them in the designated labeling areas of your modules. If you print on standard paper, the individual labeling strips must be cut out. Cut marks are automatically included on the printout and serve as aids.

Because the paper feeds of printers differ slightly, the printout may be slightly offset on the paper. When the labeling strips are printed on ready-made sheets, printing that is accurate to the millimeter is important. Otherwise, the text will not be fit exactly inside the stamped area. In addition, if the printing is imprecise, the labeling of an input or output may no longer be congruent with the channel status displays of the module. To ensure precise printing, you can enter an offset value for your printer in the TIA Portal. For information on how to determine the proper offset value for your printer, refer to Chapter "Determining the print area offset (Page 445)".

See also

Exporting labeling data as XML (Page 441)

XML schema of the export file (Page 442)

Printing labels (Page 439)

Determining the print area offset (Page 445)

Documentation settings (Page 419)

Printing labels

You can print labeling strips for the modules in your project if provision has been made for attaching labels to the utilized modules. The labels are first exported to a Microsoft Word file (.docx). A separate .docx file is created for each module family (for example, for all selected S7-1500 modules). The labels are always printed from the word processing program.

Requirement

The following requirements apply to printing of labeling strips:

- The chosen modules must support the printing of labels. Otherwise, the data can only be output to an XML file.
- A word processing program that supports Microsoft Word DOCX files must be installed, e.g., Microsoft Word 2010 or later.
- You need the ready-made labels for your modules or commercially available DIN A4 paper.

Procedure

To print labeling strips for hardware modules, follow these steps:

1. In the project tree, select the modules for which you want to print labeling strips.
   - You can select one or more stations in order to print out labeling strips for all modules plugged into these stations.
   - Alternatively, select the desired modules below the stations in the "Local modules" folder.
2. Right-click one of the devices, and select the "Export labeling strips" command from the shortcut menu.
   The "Export labeling strips" dialog opens.
3. In the "Content of the labeling strip" area, select the data to be printed on the labeling strip:
   - Select "Symbolic name" in order to print the symbolic name of the input or output (corresponds to the contents of the "Name" column in the IO tag table).
   - Select "Absolute address" in order to print the absolute address of the input or output (corresponds to the contents of the "Address" column in the IO tag table).
   - Select "Absolute and symbolic address" or "Symbolic and absolute address" in order to print both addresses. Printing takes place according to the specified order.
4. In the "Export format" area, define how the labeling data will be output.
   - Select "Print on SIEMENS labeling sheet" if you are printing on a ready-made label sheet for your modules.
   - Select "Print on plain DIN A4 page" if you are printing on standard DIN A4 paper.
5. Select correction values for your printer in the "Offset print area", if required. The correction values are used for correct alignment of the print area. Correction values are only necessary if you are printing on ready-made labeling strips.
   - Enter a correction value, in millimeters, in the "Vertical offset" field. A negative value shifts the print area upward. A positive value shifts the print area downward.
   - Enter a correction value, in millimeters, in the "Horizontal offset" field. A negative value shifts the print area to the left. A positive value shifts the print area to the right.
6. In the "Path" field, select the path where the exported files will be stored.
7. Click the "Export" button to start the export.
   The export files are created.
8. Open the DOCX files with a conventional word processing program, such as Microsoft Word, and change the design of the labeling strips if necessary.

9. Print out the labeling strips from your word processing program. Use the paper that you specified in the Export dialog for this.
10. If you are using ready-made sheets, separate the labeling strips at the stamped lines provided for that purpose. When standard DIN A4 paper is used, you must cut out the labeling strips.

See also

Determining the print area offset (Page 445)

Exporting labeling data as XML (Page 441)

Exporting labeling data as XML

The TIA Portal supports a large number of different modules and can be continually expanded using Hardware Support Packages, for example. Ready-made labeling strips are not available for every supported module. However, you can still use the TIA Portal to label inputs and outputs of modules that are not supported. First, you export the absolute and symbolic addresses of the inputs and outputs to a standardized XML file. Then, you import the XML file to an external program for printing the labels. In this program, you prepare the data to suit your modules and print out the labels.

Procedure

To export labeling data for hardware modules as XML, follow these steps:

1. In the project tree or network view, select the modules for which you need labeling strips.
   - You can select one or more stations in order to export the input and output addresses of all modules plugged into these stations.
   - Alternatively, select the desired modules below the stations in the "Local modules" folder.
2. Right-click one of the devices and select the "Export module labeling strips" command from the shortcut menu.
   The "Export labeling strips" dialog opens.
3. In the "Export format" area, select the "Export to XML file" option.
4. In the "Path" field, select the path where the XML file will be stored.
5. Click the "Export" button to start the export to an XML file.
   The XML file is created with the name "<Project name>_IO_Channels.xml".

Example of an XML file

The following example shows an XML file that contains the labeling data for an S7-1500 CPU with a digital input module and an analog input module:

```
<?xml version="1.0" encoding="UTF-8"?>
<Stations>
  <!-- The CPU is specified first -->
  <Station Name="S71500/ET200MP-Station_1">
    <Rack Name="Rack_0"> <!-- Name of the rack -->
      <Module Name="Sample S7-1500" /> <!-- Name of the CPU -->
     <Module Name="DI 16x24VDC BA_1"> <!-- Name of the digital input
module -->
       <!-- The individual channels of the digital input module are
specified -->
        <IOChannel Number="0">
          <Address>%I0.0</Address>
          <Tag>Input Value 1</Tag> <!-- Symbolic address of input 0
-->
        </IOChannel>
        <IOChannel Number="1">
          <Address>%I0.1</Address>
          <Tag>Input Value 2</Tag>
        </IOChannel>
        <IOChannel Number="2">
          <Address>%I0.2</Address>
          <Tag>Input Value 3</Tag>
        </IOChannel>
        <!-- All other channels follow -->
      </Module>
      <Module Name="AI 4xU/I/RTD/TC ST_1"> <!-- Name of the analog
input module -->
        <!-- The individual channels of the analog input module are
specified -->
        <IOChannel Number="0">
          <Address>%IW2</Address>
          <Tag> <!-- Symbolic addresses are not specified for the
analog input module. -->
          </Tag>
        </IOChannel>
        <IOChannel Number="1">
          <Address>%IW4</Address>
          <Tag>
          </Tag>
        </IOChannel>
        <IOChannel Number="2">
          <Address>%IW6</Address>
          <Tag>
          </Tag>
        </IOChannel>
        <IOChannel Number="3">
          <Address>%IW8</Address>
          <Tag>
          </Tag>
```

```
        </IOChannel>
      </Module>
      <Module Name="Sample S7-1500" />
      <Module Name="DI 16x24VDC BA_1">
        <IOChannel Number="0">
          <Address>%I0.0</Address>
          <Tag>Input Value 1</Tag>
        </IOChannel>
        <IOChannel Number="1">
          <Address>%I0.1</Address>
          <Tag>Input Value 2</Tag>
        </IOChannel>
        <IOChannel Number="2">
          <Address>%I0.2</Address>
          <Tag>Input Value 3</Tag>
        </IOChannel>
        <!-- All other channels follow -->
      </Module>
      <Module Name="AI 4xU/I/RTD/TC ST_1">
        <IOChannel Number="0">
          <Address>%IW2</Address>
          <Tag>
          </Tag>
        </IOChannel>
        <IOChannel Number="1">
          <Address>%IW4</Address>
          <Tag>
          </Tag>
        </IOChannel>
        <IOChannel Number="2">
          <Address>%IW6</Address>
          <Tag>
          </Tag>
        </IOChannel>
        <IOChannel Number="3">
          <Address>%IW8</Address>
          <Tag>
          </Tag>
        </IOChannel>
      </Module>
    </Rack>
  </Station>
</Stations>
```

Exporting labeling data as XML (Page 441)

Determining the print area offset

If you are using a ready-made label sheet, the printing on it must be applied precisely so that the text is properly oriented on the prestamped labels and will have the proper fit relative to the channel status displays of the module. However, the paper feeds vary slightly from one printer to another. For this reason, you must enter a suitable correction value for your printer in the TIA Portal, if necessary. The print area is then shifted in the exported .docx file in such a way that the printing fits precisely on the ready-made label sheet.

The settings for shifting the print area are stored for the specific Windows user. If you log on to Windows using a different user name, you have to enter the correction values again.

The procedure for determining the correction value for your printer is described below.

Requirement

- You require a ready-made label sheet.
- You must have access to the actual printer that you will use subsequently for the printout. The printer must be made ready for printing on standard DIN A4 paper.

Procedure

To determine the correction value for your printer, follow these steps:

1. Print out a label sheet on standard DIN A4 paper, as described in Chapter "Printing labels (Page 439)".
2. Compare the printout on the DIN A4 paper with the ready-made label sheet.
3. If the print area is offset, you must use correction values.
   - Using a ruler, measure the horizontal offset relative to the ready-made label sheet. This will be entered later in the "Horizontal offset" field of the Export dialog box for the printing. If the print area is offset to the right, a negative correction value must be entered. If the print area is offset to the left , a positive correction value must be entered.
   - Using a ruler, measure the vertical offset relative to the ready-made label sheet. This will be entered later in the "Vertical offset" field of the Export dialog box for the printing. If the print area is offset downward, a negative correction value must be entered. If the print area is offset upward, a positive correction value must be entered.

9.6 Undoing and redoing actions

9.6.1 Basics of undoing and redoing actions

Function

You can undo performed actions at any time. For this purpose, every action you perform is saved in an action stack. When undoing actions, the stack is processed from top to bottom. In other words, if you undo an action that lies further down in the stack, all actions located above it in the stack will also be undone automatically.

You can redo previously undone actions until you execute a new action. Once you execute a new action, it is no longer possible to redo previously undone actions.

Particularities for undoing

There are a few actions that empty the action stack. You cannot undo these actions or the actions performed before these actions. The following actions empty the action stack:

- Saving
- Project management (creating a new project, opening project, closing a project, deleting a project)
- Establish and disconnect an online connection

Keep in mind that the action stack is emptied every time you establish and terminate an online connection. This means that the actions executed offline cannot be undone once the online connection is established. All actions which you execute while online can be undone until you terminate the online connection. Once you have disconnected the online connection, only the offline actions executed afterward can be undone.

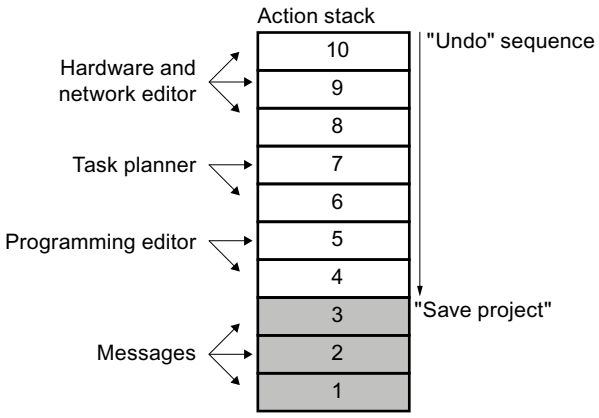
Displaying the action stack

The "Undo" button in the toolbar is enabled as soon as you perform an action that can be undone. This button is split; you can use the arrow down portion to open a drop-down list. containing all actions of the action stack that you can undo. If you had performed actions in an editor other than the currently displayed editor, the corresponding editor is also displayed as a subheading. This allows you to always identify the point at which the undo operation will be applied. The subheadings are removed from the list when the editor responsible can no longer undo actions.

Actions you have undone are entered in the action stack from where they can be redone. Here, you can redo actions you have undone. The display of actions you can redo it is analogous to the display of the actions that you can undo.

Example of undoing actions

The figure below shows how actions performed in various editors and tables are undone:



In this example, you cannot undo actions 1 to 3 because the project was saved. You can undo actions 4 to 10 in the order indicated by the direction of the arrow. In other words, you must undo action 10 first. Once you have undone action 8, you cannot then undo action 5. You must first undo actions 7 and 6. As the final step in the sequence, you can then undo action 4. You also have the option of undoing several actions in a single step by undoing an action located further down in the action stack. All actions located above it in the stack will be undone automatically.

The same principle also applies to redoing of actions.

See also

Undoing an action (Page 447)

Redoing an action (Page 448)

9.6.2 Undoing an action

The following options are available for undoing actions:

- Undoing the last action only
  Only the last action performed is undone.
- Undoing as many actions as required
  Multiple actions in the action stack are undone in a single step.

Undoing the last action only

To undo the last action performed, follow the steps below:

1. Click the "Undo" button in the toolbar.
   - If the action was not performed in the currently displayed editor, a confirmation prompt appears.
   - If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.
   The editor in which the action was performed is displayed and the action is undone.

Undoing as many actions as required

To undo multiple actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Undo" button in the toolbar.
   This opens a drop-down list containing all actions you can undo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to undo.
   The chosen action and all actions in the stack located above the chosen action are undone. If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.
   The editors in which the actions were performed are displayed and the actions are undone.

See also

Basics of undoing and redoing actions (Page 446)

Redoing an action (Page 448)

9.6.3 Redoing an action

You have the option of redoing an action that has been undone, so that you can return to the status present before "Undo" was performed. However, this is only possible until you perform a new action. The following options are available for redoing actions:

- Redoing the last undone action only
  Only the last undone action is redone.
- Redoing as many undone actions as required
  Multiple undone actions in the action stack are redone in a single step.

Redoing the last undone action only

To redo the last undone action, follow the steps below:

1. Click the "Redo" button in the toolbar.
   - If the action is not being redone in the currently displayed editor, a confirmation prompt appears.
   - If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.
   The editor in which the action was undone is displayed and the action is redone.

Redoing as many undone actions as required

To redo multiple undone actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Redo" button in the toolbar.
   This opens a drop-down list containing all actions you can redo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to redo.
   The chosen action and all actions in the stack located above the chosen action are redone. If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.
   The editors in which the actions were undone are displayed and the actions are redone.

Basics of undoing and redoing actions (Page 446)

Undoing an action (Page 447)

9.7 Find and replace

9.7.1 Basics of searching

Introduction

You can use the following search options within TIA Portal:

- Searching and replacing in the editor
- Browsing the hardware catalog

In addition, individual products in TIA Portal offer more search options.

Searching and replacing in the editor

You can search for texts in the editors. The search function finds all texts containing the search key in the currently opened editor. The results are selected in sequence in the opened editor.

You also have the following options:

- Narrowing down the search with additional options
- Replacing found texts

The additional options and the type of texts for which you can search depend on the installed products and the currently open editor.

Browsing the hardware catalog

You can search for a specific hardware component in the hardware catalog.

See also: Browsing the hardware catalog

See also

Searching and replacing in the editor (Page 452)

9.7.2 Searching and replacing in the editor

9.7.2.1 Basics for search in open editors

Introduction

You can start a search which is limited to the editor currently open in the workspace. You can customize the search as follows to suit requirements:

- You can optimize the search with additional options.
- You can specify the search area.
- You can specify the search direction.

Additional options for searching

You can refine the search with the help of the following additional options:

- Whole words only
  Only whole words are taken into account for the search. Compound words that contain the search key as a part are ignored.
- Match case
  Upper- and lowercase letters are taken into account in the search.
- Find in substructures
  The search also includes texts contained in another object.

- Find in hidden texts
  Texts that are assigned to another text but that are currently hidden are also included in the search.
- Use wildcards
  Enter an asterisk as the wildcard for any number of characters. Example: You want to search for all words starting with "Device". Type in "Device*" in the search key box. Enter a question mark as the wildcard, however, if you only want to exclude a single character.
- Use regular expressions (for searching in scripts only)
  A regular expression is a character string used to describe sets of values and for filtering. This allows you to create complex search patterns.

The additional options available depend on the installed products and the editor opened.

Search area and search direction

You have the following options for define the search area:

- Whole document
  The entire is searched regardless of the current selection and position.
- From current position
  The search starts at the current position. Depending on the search direction, all texts above or to the left or below or to the right of the current position are not included in the search.
- Selection
  The search term is only searched for in the current selection.

You can define the search direction independent of the search area:

- Down
  Search takes place in editor from top to bottom or from left to right.
- Up
  Search takes place in editor from bottom to top or from right to left.

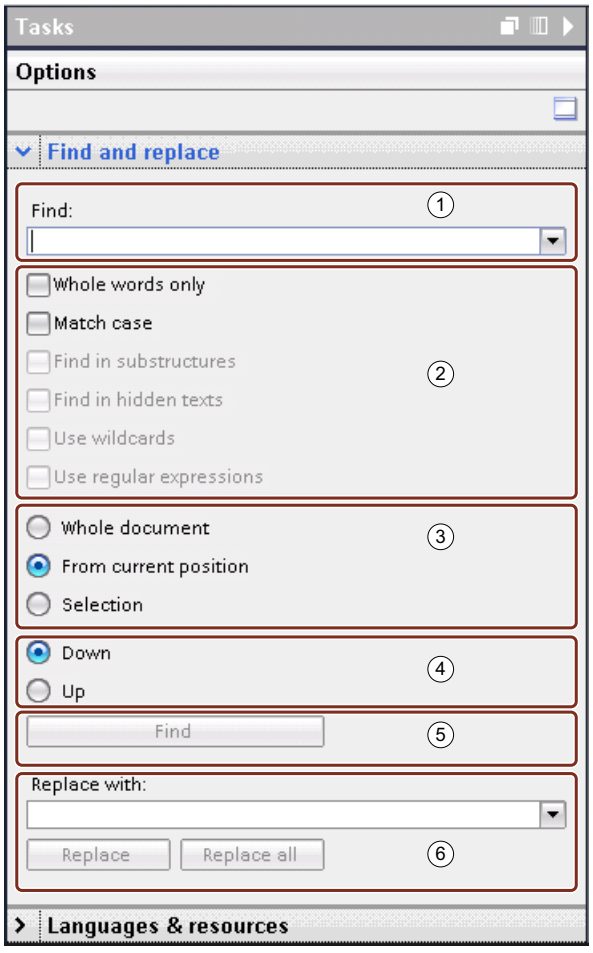
9.7.2.2 Overview of the "Find and replace" palette

Function of the "Find and replace" palette

The "Find and replace" palette in the "Tasks" task card lets you search in an open editor. It includes all options that you need for an efficient search.

Layout of the "Find and replace" palette

The following figure shows the components of the "Find and replace" palette:



① Search field

② Additional options

③ Search area

④ Search direction

⑤ Start search

⑥ Replace

9.7.2.3 Searching and replacing in the editor

You have the option to search for text in an editor or to replace it.

Start search

Follow these steps to start the "Find and replace" function:

1. Select the "Find and replace" command in the "Edit" menu or open the "Find and replace" pane in the "Tasks" task card.
   The "Find and replace" pane opens.
2. Enter a term in the "Find" drop-down list.
   As an alternative, you can select the most recent search key from the drop-down list.
3. Select the options desired for the search.
4. Using the option buttons, select the starting point for the search and the search direction.
5. Click "Find".
   The first hit is marked in the editor.
6. Click "Find" again to display the next hit.
   The next hit is marked in the editor. Repeat this procedure as needed until you reach the last hit.

Replacing the search key

You have the option of replacing hits individually or automatically replacing all the found texts, if the respective editor supports this function. Follow these steps to replace terms:

1. Enter a term in the "Find" drop-down list.
   As an alternative, you can select the most recent search key from the drop-down list.
2. Select the options desired for the search.
3. Click the "Find" button to start a search for the specified search key.
   The first hit is displayed in the editor.
4. In the "Replace" drop-down list, enter the text you wish to use to replace the search key.
   As an alternative, you can select one of the last entered texts from the drop-down list.
5. Click the "Replace" button to replace the selected hit with the specified text.
   The found text is replaced and the next hit is marked in the editor.
   Repeat this procedure until you have replaced all the desired hits. To skip to the next hit without replacing the marked word, click the "Find" button instead of "Replace".
6. Click "Replace all" to automatically replace all hits at once.

Basics of searching (Page 449)

9.8 Working with multi-language projects

9.8.1 Project text basics

Texts in different languages in the project

When you enter texts while working on a project, you would normally do this in your own language. If you then pass on the project to someone else who does not know this language, this person will require a translation of the relevant texts to a language they know. This is why all texts can be translated. In this way, you can ensure that anyone who is subsequently confronted with the texts sees the texts in his/her language of choice.

Project language

Project languages are all languages in which a project will later be used. Based on the editing language, all the texts can be translated to the various project languages. You specify the languages that will be available in the project tree under "Languages & Resources > Project languages".

Editing language

Every project has an editing language. When you enter texts, these are always created in the editing language. You should therefore make sure that the editing language set is the language in which you enter the texts. This avoids problems if you translate the texts later.

The editing language does not depend on the language of the user interface. You could, for example, set English as the user interface language, but use Italian as the editing language. If you enter texts, these will be created in the project language "Italian" in this case, although the user interface of the TIA Portal is displayed in English.

You set the editing language in the project tree under "Languages & Resources > Project languages > Editing language".

Reference language

The reference language is used as a template for translation. The text is displayed in the reference language for each text box in the "Tasks > Languages and resources" task card. You therefore know which text that belongs in a text box, even when no text is entered in the currently selected editing language.

User texts and system texts

For clarification purposes, a distinction is made between user texts and system texts:

- User texts are texts that the user created.
- System texts are texts that are created automatically according to the configuration in the project.

You manage the project texts in the project tree under "Languages & Resources > Project texts".

Examples of multilingual project texts

You can, for example, manage the following project texts in more than one language:

- Block titles and block comments
- Network titles and network comments
- Comments in tables
- Alarm texts
- Operator-relevant texts
- Text lists
- Labels of buttons
- Display names of recipes

Translating texts

The following procedures are available to translate texts.

- Translate all texts used in the project in tabular form
  You can enter the translations for the individual project languages directly in the "Project texts" table. You can find the table in the project tree under "Languages & Resources > Project texts".
- Specify text assigned to individual objects in the Inspector window
  In the Inspector window, you can translate the texts that are assigned to the currently selected objects. Columns are displayed in a table for all available project languages. You can enter the translations for each text in the columns.
- Translating texts using reference texts
  You can change the editing language for shorter texts. All the text cells are filled again with the default values and can be filled in the current language. As orientation, you can display what you last entered in the box in the reference language. To do this, select the "Tasks" task card and open the "Languages & resources".
- Exporting texts and translating them externally
  With larger volumes of text, you can export the texts to an Office Open XML file and translate them in a conventional table calculation program. You then import the translated list again into the TIA Portal.

Note

Using East Asian project languages

You need Microsoft Windows at least in the Professional version or higher to display East Asian project languages. Microsoft Windows in the Professional version must be installed in the local language. With the "Ultimate" or "Enterprise" versions, it is sufficient to install the appropriate language pack.

See also

Overview of the program settings (Page 302)

Changing the settings (Page 306)

Application examples for multilanguage projects (Page 462)

9.8.2 Select project languages

All the texts can be displayed within a project in the same language that you selected for your software user interface. This means that all project texts must exist in the corresponding language. You can select the available project languages yourself.

Requirement

- You are in the project view.
- A project is open.

Procedure

To select the project languages, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree.
   The elements below this are displayed.
2. Double-click on "Project languages".
   In the work area, you will see a list of languages that you can select.
3. Select the required languages.

Result

All texts can be displayed in the activated languages if there is already a translation for these languages.

9.8.3 Setting the editing language

All the texts in the project are created in the editing language when they are entered. If you change the editing language, all future text input will be stored in the new editing language.

Requirement

- You are in the project view.
- A project is open.

Procedure

To change the editing language, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree. The lower-level elements are displayed.
2. Double-click on "Project languages". The possible settings for the project languages are displayed in the work area.
3. Select the editing language in "General > Editing language".

9.8.4 Translating all project texts in tabular form

You can display and edit all project text used in the currently open project in a list. User and system texts are separated into two different lists for clarity. Both lists contain a column for each project language. Enter the translations of the texts in the respective columns.

Requirement

- You are in the project view.
- You have selected at least one further project language.

Procedure

To translate text in the project-wide list, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree. The elements below this are displayed.
2. Double-click "Project texts". A list with the user texts in the project is displayed in the work area.
3. Click on "System texts" if you you want to edit the list of system texts rather than the user texts.
4. You can improve the clarity of the lists if you have a lot of texts.
   - To group identical texts and to translate them all at once, click the "Switch on/off grouping" button in the toolbar.
   - To hide texts that do not have a translation, click the "Filter for empty texts on/off" button in the toolbar.
   - To further limit the displayed project texts to certain devices, select the devices for which you want to display project texts in the drop-down list.
5. Enter the translation of the project texts in the relevant column.

9.8.5 Translating text associated with individual objects

If you want to edit the text of individual objects, it would be too difficult to locate the matching text in the table with all project texts. For this reason, there is a table in the Inspector window in which only the texts assigned to the currently selected objects are displayed. In the table, you can add missing translations for individual project languages or change existing texts.

Requirement

Enter a text in at least one project language for the texts to be translated.

Procedure

To edit the text of the currently selected object, follow these steps:

1. Select the object whose text you want to edit.
2. Open the "Properties" tab in the Inspector window.
3. Open the lower-level "Texts" tab in the inspector window.
   A table with all the texts that belong to the selected objects is displayed. The table contains one column for the currently selected editing language and the reference language, as well as additional columns for the other project languages.
4. Add or change the entries in the table for each project language.

See also

Application examples for multilanguage projects (Page 462)

9.8.6 Translating texts using reference texts

Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for the newly set language, the input boxes are empty or filled with default values.

If you enter text in an input box, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

Note

The display of reference texts depends on the installed products and is not supported by every editor.

Requirement

There is at least one translation into a different project language for an input field.

Procedure

To display the translation of an input cell in a reference language, follow these steps:

1. In the "Tasks" task card, select the "Languages & Resources" pane.
2. Select a reference language from the "Reference language" drop-down list.

Result

The reference language is preset. If you click in a text box, translations that already exist in other project languages are shown in the "Tasks > Languages & Resources" task card.

9.8.7 Exporting project texts

You can export project texts for translation and then reimport them. The texts are exported to an Office Open XML file with the extension ".xlsx". This can be edited in Microsoft Excel or a number of other spreadsheet programs.

The following export options are available:

- Exporting individual project texts
  You can select individual texts in the project texts editor and then export the selected texts.
- Exporting project texts of a device
  When you have selected a device, the "Properties > Texts" tab of the Inspector window includes all texts that are part of the respective device. Here you can export all texts that are part of the respective device.
- Exporting all user texts or system texts at once
  You can either export all texts in the project or further limit the export by categories.

Note

Row limit in Microsoft Excel

Note that spreadsheet programs may be able to process only a certain number of rows. Microsoft Excel 2003 supports a maximum of 65536 rows, for example. Later versions of Microsoft Excel support significantly more rows.

Exporting individual project texts

To export individual project texts, follow these steps:

1. Open the "Languages & Resources" folder in the project tree.
   The lower-level elements are displayed.
2. Double-click "Project texts".
   The project texts editor opens.
3. Choose the "User texts" or "System texts" tab in the editor, depending on which texts you want to export.
4. Select the project texts you want to export.
5. Click "Export project texts" on the editor toolbar.
   The "Export" dialog box opens.
6. Select the language you want to translate from in the "Source language" drop-down list.
7. Select the language you want to translate to in the "Target language" drop-down list. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
8. Specify a file path and a file name for the export file in the "Select file for export" input box.
9. Click "Export".

Exporting project texts of a device

1. To export all project texts that are part of a specific device, follow these steps:
2. Select the device and open the device properties in the Inspector window.
3. Open the "Texts" tab in the Inspector window.
4. On the toolbar, click the "Export project texts" icon.
   The "Export" dialog box opens.
5. Select the language you want to translate from in the "Source language" drop-down list.
6. Select the language you want to translate to in the "Target language" drop-down list. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
7. Specify a file path and a file name for the export file in the "Select file for export" input box.
8. Click "Export".

Exporting all system or user texts

To export all project texts, follow these steps:

1. Select the "Export project texts" command in the "Tools" menu.
   The "Export" dialog box opens.
2. Select the language you want to translate from in the "Source language" drop-down list.
3. Select the language you want to translate to in the "Target language" drop-down list. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
4. In "Select content", select the check box "User texts" to export user texts. To export system texts, select "System texts". To export both user texts and system texts, select both check boxes.
5. In "Select content", select the required text categories for the user texts or the system texts.
6. In the "Export file" input field, specify a file name for the export file.
7. In the "Path" input field, select a path in the data system to which the export file is to be saved.
8. Click "Export".

Importing project texts (Page 461)

9.8.8 Importing project texts

After external compilation in a table calculation program, you import the project texts into the TIA Portal. You can import the project texts at the following locations:

- The "Tools" menu
- In the toolbar of the project texts editor
- In the properties of a device
  When you have selected a device, the "Properties > Texts" tab of the Inspector window includes all texts that are part of the respective device. You can also import the texts of the device at this location.

Importing project texts

To import a file containing project texts, follow these steps:

1. Select the "Import project texts" command in the "Tools" menu.
   Alternatives:
   - Click the "Import project texts" icon in the toolbar of the project texts editor.
   - Select a device and open its properties in the Inspector window. Open the "Texts" tab and click the "Import project texts" icon in the toolbar.
2. The "Import" dialog box opens.
3. Select the path and the file name of the import file from the "Select file for import" field.
4. Select the "Import source language" check box if you have made changes to the source language in the export file and you want to overwrite the entries in the project with the changes.
5. Click "Import".

Exporting project texts (Page 459)

9.8.9 Application examples for multilanguage projects

Let us assume you are working in a team with colleagues some of whom speak English, some French and some German. You have created a project with the TIA Portal and have already created a functioning configuration.

To allow your other colleagues to be able to keep track of the project, you would like all devices being used to have comments in English and German. First, you would like to enter the comments in German. Following this, to save time and costs, you want to have the texts translated into English in a spreadsheet program by an external translation office.

In addition to this, you also want a single comment for a particular device in French so that your French-speaking colleague can continue working on this device.

The section below describes an example of how you can achieve this with the tools of the TIA Portal.

Translating the project into English

To enter the comments in German and to have them translated into English later, follow these steps:

1. Set the editing language to "German" and fill all the comment boxes with the relevant texts in German.
   On the device selected from the French-speaking colleague, enter, for example "Unser neues Gerät" in German first.
   All the comments are now stored in German.
2. Export all user texts to an Office Open XML file with the extension ".xlsx".

3. Have the user texts contained in the file translated into English in a spreadsheet program such as Microsoft Excel.
4. Import the file into the TIA Portal after it has been translated.
   All texts are now available in German and English.

Translating a single comment field to French

To translate an individual comment field to French, follow these steps:

1. Open the comment box for the device on which the French-speaking colleague will be working.
2. Open the "Languages & Resources" pane in the "Tasks" task card.
3. Set "French" as the editing language in the "Languages & Resources" pane. As the reference language, set, for example, "English".
   Since no translation has yet been installed in French, the comment box is empty. In the "Languages & Resources" pane, the English translation "Our new device" is displayed as a reference.
4. Orientating yourself on the English reference text enter "Notre nouvel appareil" in the comment box.
   The comment for this device is now available in the languages German, English and French.

Translating text associated with individual objects (Page 458)

9.9 Working with text lists

9.9.1 Text lists

Introduction

You can centrally manage texts to be referenced in alarms. All the texts are stored in text lists. Each text list has a unique name with which you can call up its content. A range of values is assigned to each text in a text list. If a value from a range of values occurs, the corresponding text is called up.

All the texts can be translated to all project languages. Here, you have two options available:

- You can enter the translation of the texts in a list. You will find the list in the project tree under "Languages & Resources > Project texts".
- You can export all texts to a file in Office Open XML format and enter the translation in a spreadsheet program. The translations can then be imported again. Only export the data to areas that are protected with appropriate access mechanisms. Only import files that originate from trusted sources.

The texts are translated into the other project languages within the framework of the project texts. In the text lists editor, you only have to manage the assignment of individual texts to a text list.

Text lists editor

Each device in the project has its own text lists. For this reason, these lists are arranged under the devices in the project tree. In addition, there are text lists that apply to all devices. These can be found in the project tree under "Common data > Text lists".

The text lists editor is divided into a bottom and top area. The top area displays the individual text lists. As soon as you select a text list, the included texts and the associated value ranges are displayed in the bottom area. You can sort the table columns in the text lists editor in ascending and descending order by clicking the table header of the respective column.

User-defined and system-defined text lists

There are two types of text lists:

- User-defined text lists
  You can create user-defined text lists yourself and fill them with texts; in other words, you can specify value ranges and the corresponding texts yourself. With user-defined text lists, the name of the text list begins with "USER" as default. You can change this name to any suitable name.
- System-defined text lists
  System-defined text lists are created by the system. These always involve texts relating to devices. They are automatically created as soon as you insert a device in the project. With system alarms, the name of the text list begins with "SYSTEM". The name of the text list and the ranges of values it contains cannot be modified. You can only edit texts assigned to individual value ranges.

User-defined text lists	System-defined text lists
A user-defined text list can only be assigned to one device.	System-defined text lists can be assigned both to a device as well as to the entire project.
You can create new text lists and delete existing text lists.	You cannot create new text lists or delete text lists.
You can add and delete value ranges in the text lists.	You cannot add or delete value ranges in the text lists.
You can specify both the value ranges as well as the associated texts.	You can only edit the text associated with one value range.

Device-specific and cross-device text lists

Device-specific text lists relate to only one device in the project and are therefore only valid for this device. For this reason, they are arranged under a device in the project tree. Device-specific text lists can be used-defined or created by the system.

If system-defined text lists are generally valid for several devices or not intended uniquely for one device, these text lists are grouped together in the project tree under "Common data". Text lists in the "Common data" folder are available for all devices. Cross-device text lists are always created by the system and are used solely for system diagnostics alarms. For this reason, you cannot store any user-defined text lists under "Common data".

See also

Exporting project texts (Page 459)

9.9.2 Creating user-defined text lists

You can create user-defined text lists for individual devices.

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Procedure

To create user-defined text lists, follow these steps:

1. Click on the arrow to the left of a device in the project tree.
   The elements arranged below the device are displayed.
2. Double-click on "Text lists".
   All the text lists assigned to the device are displayed in the work area listed in a table.
3. Double-click on the first free row in the table.
   A new user-defined text list is created.
4. Enter a name for your new text list in the "Name" column.
5. Select if you want to specify the value ranges in decimal, binary or in bits from the drop-down list in the "Selection" column. Depending on the device, there may be further options available at this point.
6. Enter a comment in the "Comment" column.
   A new user-defined text list is created and you can now enter the value ranges and texts.

9.9.3 Editing user-defined text lists

You can enter value ranges and the corresponding texts in user-defined text lists. User-defined text lists are always located below a device in the project tree.

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Procedure

To add to user-defined text lists with value ranges and texts, follow these steps:

1. Click on the arrow to the left of a device in the project tree.
   The elements arranged below are displayed.
2. Double-click on "Text lists".
   All the text lists assigned to the device are displayed in the work area listed in a table.
3. Select a text list in the table.
   The contents of the selected text list are displayed in the work area. There, you can enter a value range and assign texts to the individual value ranges.
4. Enter the value ranges you require in the "Range from" and " Range to" columns. The entry must be made in the numeric format selected for the text list.
5. Enter a text for each value range in the "Entry" column.

9.9.4 Editing system-defined text lists

In system-defined text lists, you can modify the individual texts assigned to a value range.

System-defined text lists are located in the project tree either below a device or under "Common data".

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Procedure

To edit texts in system-defined text lists that are assigned to a value range, follow these steps:

1. Click on the arrow to the left of a device in the project tree or the "Common data" element. The elements arranged below are displayed.
2. Double-click on "Text lists".
   All the text lists assigned to the device or used in common are displayed in the work area listed in a table.
3. Select a text list in the table.
   The contents of the selected text list are displayed in the work area. Here, you can add to or edit the texts assigned to a value range.
4. Enter a text for each value range in the "Entry" column.

9.10 Using memory cards

9.10.1 Basics about memory cards

Introduction

Memory cards are plug-in cards that come in a variety of types and can be used for a variety of purposes. Depending on the device type or device family, memory cards can be used for purposes, such as:

- Load memory of a CPU
- Storage medium for projects, firmware backups, or any other files
- Storage medium for performing a firmware update
- Storage medium for the PROFINET device name

For information regarding the technical variants of the respective memory cards and general information on their handling, refer to the respective documentation for the device. For information on handling memory cards in the TIA Portal, refer to the online help under the keyword "Memory Card".

Notice

Memory card is unusable for SIMATIC devices

If you use a SIMATIC memory card for non-SIMATIC purposes or you format it incorrectly, you will overwrite the internal structure of the SIMATIC memory card. The structure is not recoverable and the SIMATIC memory card becomes unusable for SIMATIC devices.

Do not use memory cards for non-SIMATIC-related purposes, and do not format SIMATIC memory cards with third-party devices or Windows tools.

9.10.2 Adding a user-defined card reader

Introduction

If your card reader is not detected automatically, you can add it manually.

Requirement

The project view is open.

Procedure

To add a card reader, follow these steps:

1. Open the project tree.
2. Select the "Card Reader / USB memory > Add user-defined Card Reader" command in the "Project" menu.
   The "Add user-defined Card Reader" dialog opens.
3. In the drop-down list box, select the path for the card reader.
4. Confirm your entries with "OK".

See also

Basics about memory cards (Page 467)

Displaying properties of memory cards (Page 469)

9.10.3 Accessing memory cards

Requirement

- A memory card is inserted in the card reader.
- The project view is open.

Note

You cannot work with multiple memory cards at one time. Only insert one memory card into the card reader.

Procedure

To access memory cards, follow these steps:

1. Open the project tree.
2. Select the "Card Reader / USB memory > Card Reader / Show USB memory" command in the "Project" menu.
   The "Card reader / USB memory" folder is displayed in the project tree.
3. Open the "Card Reader / USB memory" folder.
   You can now access the memory card.

   Note

   If data from a non-installed product is stored on the memory card, the folders that contain these data are shown in gray. You receive an error message when you attempt to access such a folder. Install the corresponding product if needed.

See also

Displaying properties of memory cards (Page 469)

9.10.4 Displaying properties of memory cards

You can display the properties for the utilized memory cards. Note that different memory cards with different properties must be used, depending on the device.

Requirement

- A memory card is inserted in the card reader.
- The project view is open.

Procedure

To display the properties of a memory card, follow these steps:

1. Right-click on the memory card for which you want to display the properties.
2. Select the "Properties" command in the shortcut menu.
   The "Memory Card <name of the memory card>" dialog opens. The properties are displayed in this dialog.

Accessing memory cards (Page 468)

9.11 Using libraries

9.11.1 Library basics

Introduction

You can store objects you want to reuse in libraries. For each project there is a project library that is connected to the project. In addition to the project library, you can create any number of global libraries that can be used over several projects. Since the libraries are compatible with each other, library elements can be copied and moved from one library to another. Libraries are used, for example, to create templates for blocks that you first paste into the project library and then further develop there. Finally, you copy the blocks from the project library to a global library. You make the global libraries available to other employees working on your project. The other employees continue to use the blocks and adapt them to their individual requirements as needed.

Both the project library and global libraries distinguish between two different types of objects:

- Master copies
  Almost every object can be saved as a master copy and pasted into the project again later. You can, for example, save entire devices with their contents or cover sheets for plant documentation as master copies.
- Types
  Elements that are required to run user programs, for example, blocks, PLC data types, user-defined data types or faceplates are suitable as types. Types can be versioned and therefore support professional further development. Projects using the types can be updated as soon as new versions of the types are available.

Project library

Each project has its own library, the project library. In the project library, you store the objects you want to use more than once in the project. The project library is always opened, saved, and closed together with the current project.

Global libraries

In addition to the project library, you use global libraries if you want to use libraries over several projects. Global libraries exist in three versions:

- System libraries
  Siemens supplies global libraries for its own software products. These include off-the-peg functions and function blocks that you can use within your project. The supplied libraries cannot be changed. The supplied libraries are loaded automatically matching the project. If you are working with the project in compatibility mode, the corresponding libraries for the respective product version of the TIA Portal are loaded. For all other projects, the supplied libraries of the latest TIA Portal version are loaded.
- Corporate libraries
  Corporate libraries are made available centrally by your organization, for example, in a central folder on a network drive. The TIA Portal manages the corporate libraries automatically. As soon as a more recent version of an existing corporate library becomes available, you receive a prompt to update the corresponding corporate library to the more recent version.
- User libraries
  Global user libraries are independent of a specific project and can therefore be passed on to other users. Shared access to global user libraries is also possible, for example on a network drive, if all users open the global user library with write protection.
  Global user libraries from older versions of the TIA Portal that you created yourself can still be used. To continue using global user libraries from older versions of the TIA Portal, they must first be upgraded.

Comparing library objects

You can compare blocks and PLC data types with the objects of a device. This allows you to determine, for example, whether certain blocks or PLC data types have been used in a project and whether they have been modified.

Basics on master copies (Page 497)

Basics on types (Page 501)

9.11.2 Using the "Libraries" task card

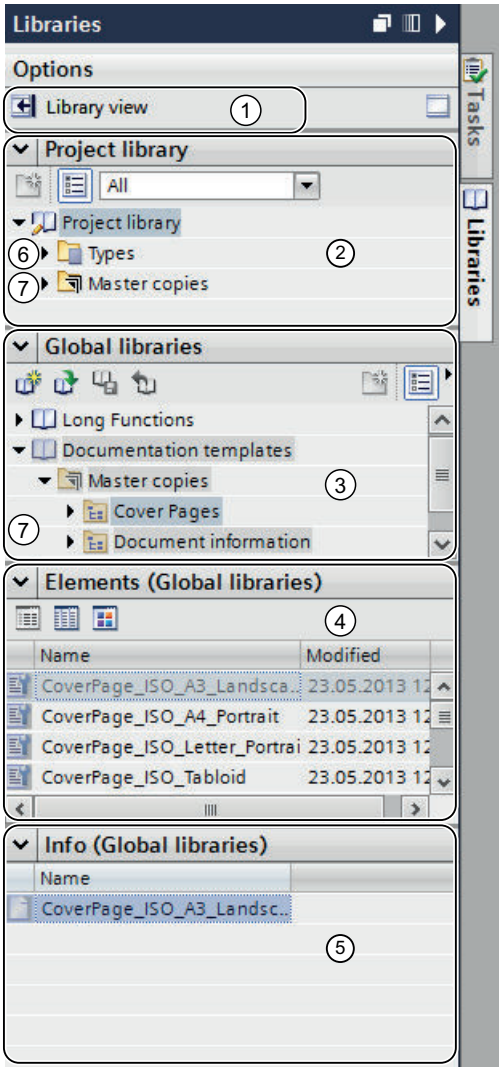
9.11.2.1 Overview of the "Libraries" task card

Function of the "Libraries" task card

The "Libraries" task card enables you to work efficiently with the project library and the global libraries.

Layout of the "Libraries" task card

The "Libraries" task card consists of the following components:



① "Library view" button
② "Project library" pane

③ "Global libraries" pane
④ "Elements" pane
⑤ "Info" pane
⑥ "Types" folder
⑦ "Master copies" folder

"Library view" button

The "Library view" button is used to change to the library view. The "Libraries" task card and the project tree are hidden with this action.

See also: Using the library view (Page 475)

"Project library" pane

In the "Project library" pane, you can store the objects that you want to use more than once in the project.

"Global libraries" pane

In the "Global libraries" pane, you manage the global libraries whose elements you want to reuse over several projects.

The "Global libraries" pane also lists libraries that were shipped together with the products you purchased. These libraries provide you with ready-made functions and function blocks, for example. The supplied global libraries cannot be edited.

"Elements" pane

In this pane, you can display the contents of folders in the library. The "Elements" pane is not displayed by default. If you want to display the "Elements" pane, you have to enable it first. Three view modes are available in the "Elements" palette:

- Details mode
  The properties of folders, master copies and types are shown in table form in details mode.
- List mode
  In list mode, the contents of folders are listed.
- Overview mode
  In overview mode, the contents of folders are displayed with large symbols.

See also: Using the element view (Page 474)

"Info" pane

You can display the contents of the library elements in the "Info" pane. The individual versions of types and the last revision date of the version are also displayed.

"Types" folder

In the "Types" directories, you can manage types and type versions of objects that you use as instances in the project.

See also: Using types (Page 501)

"Master copies" folder

In the "Master copies" directories, you can manage master copies of objects that you can use as copies in the project.

See also: Using master copies (Page 497)

See also

Library basics (Page 470)

Comparing library elements (Page 532)

9.11.2.2 Using the element view

Introduction

When you open the "Libraries" task card the first time, the "Project library" and "Global libraries" palettes are opened and the "Info" palette is closed. You can display the "Elements" palette if needed.

The elements view shows the elements of the selected library. Three view modes are available in the elements view:

- Details
  The properties of folders, master copies and types are shown in table form in details mode.
- List
  In list mode, the contents of folders are listed.
- Overview
  In overview mode, the contents of folders are displayed with large symbols.

The "Info" palette shows the contents of the selected library element. If you select a type in the elements view, for example, the type versions are displayed in the "Info" palette.

Requirement

The "Libraries" task card is displayed.

Procedure

To use the element view, follow these steps:

1. Click "Open or close the element view" in the "Project library" or "Global libraries" pane.
2. To change the view mode from the details view to the list mode or overview mode, click the corresponding icon on the toolbar.

See also

Library basics (Page 470)

Overview of the "Libraries" task card (Page 472)

Using global libraries (Page 483)

Comparing library elements (Page 532)

9.11.3 Using the library view

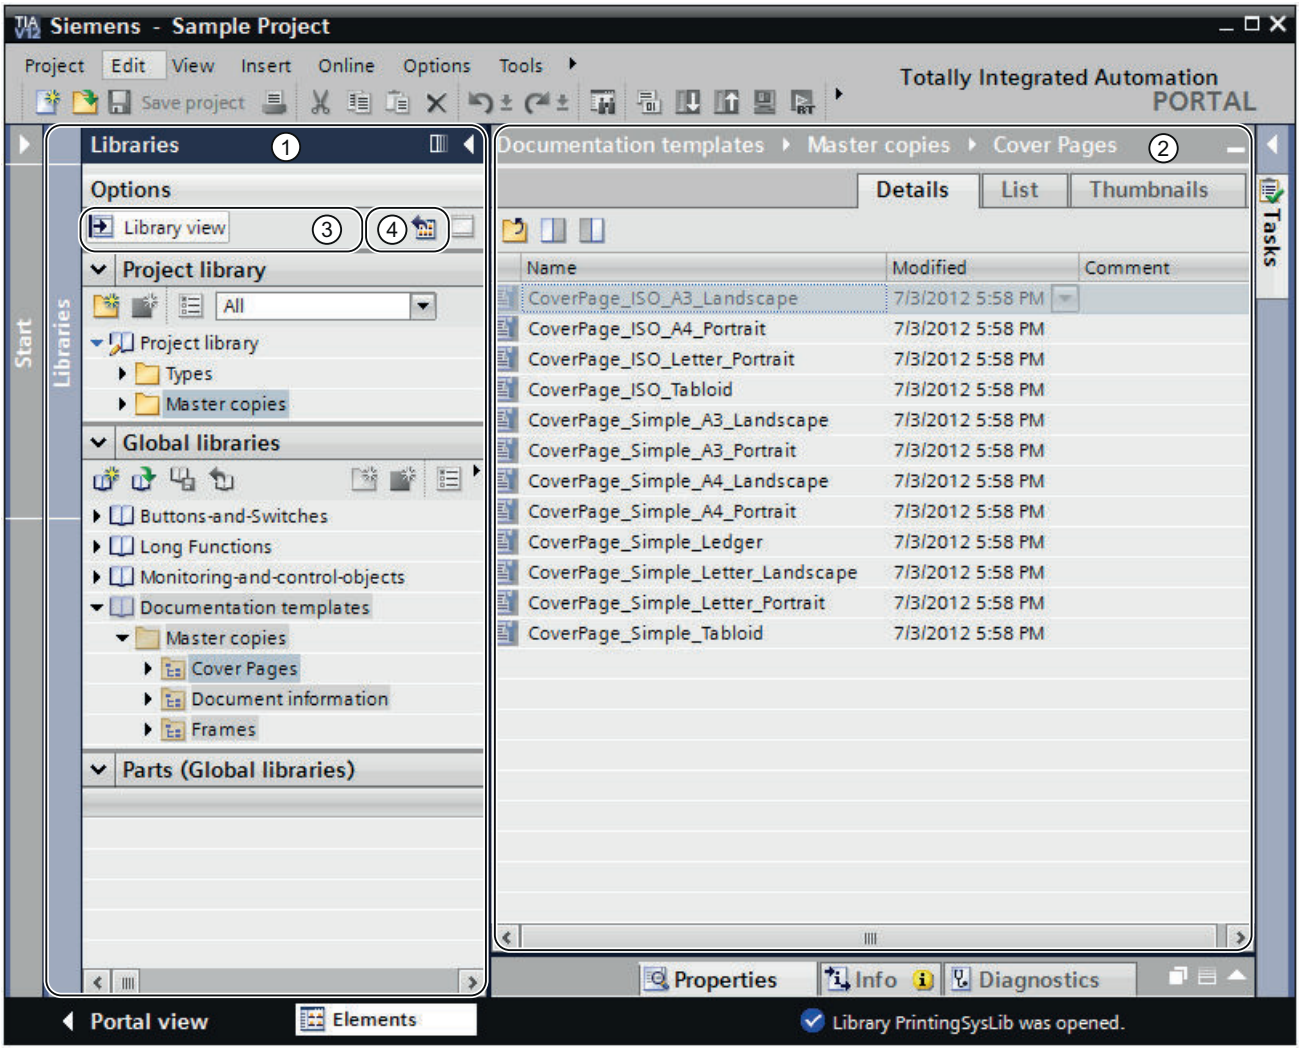
9.11.3.1 Overview of the library view

Function of the library view

The library view combines the functionality of the "Libraries" task card and the overview window. In the library view, the elements of a library are displayed in various views. In the details view, for example, you see additional properties of the individual elements. You can also edit and version the types in the library view.

Layout of the library view

The following figure shows the components of the library view:



① Library tree
② Library overview
③ "Library view" button
④ "Open or close library overview" button

Library tree

The library tree is similar to the "Libraries" task card, apart from a few minor differences. In contrast to the task card, there is no "Elements" palette, because the elements are displayed in the library overview. In addition, you can close the library view in the library tree, or open and close the library overview.

See also: "Libraries" task card (Page 472)

Library overview

The library overview corresponds to the overview window and displays the elements of the currently selected object in the library tree. You can display the elements in three different views:

- Details view
  The objects are displayed in a list with additional information, such as the date of the last change.
- List view
  The objects are displayed in a simple list.
- Icon view
  The objects are displayed as icons according to category.

In addition, you can perform the following actions in the library overview:

- Renaming elements
- Deleting elements
- Copying elements
- Moving elements
- Editing type instances
- Versioning types
- WinCC only: Editing faceplates and HMI user data types

See also: Overview window (Page 331)

Opening and closing the library view (Page 477)

Library basics (Page 470)

Comparing library elements (Page 532)

9.11.3.2 Opening and closing the library view

The library view is opened automatically in some cases, for example, when you edit the test instance of a type or when you edit faceplates and HMI user data types. You can also open the library view manually.

Opening the library view

To open the library view manually, follow these steps:

1. Open the "Libraries" task card.
2. Click the "Open library view" button in the "Libraries" task card.
   The library tree opens. The "Library" task card and the project tree are closed.
3. If the library overview is not displayed, click "Open/close library overview" button in the library tree.
   The library overview opens.

Exit library view

To exit the library view, follow these steps:

1. Click the "Close library view" button in the library tree.
   The library tree closes. The "Libraries" task card and the project tree are opened.

See also

Overview of the library view (Page 475)

Library basics (Page 470)

Using the "Libraries" task card (Page 472)

Using global libraries (Page 483)

Comparing library elements (Page 532)

9.11.4 Using library management

9.11.4.1 Overview of the library management

Function of the library management

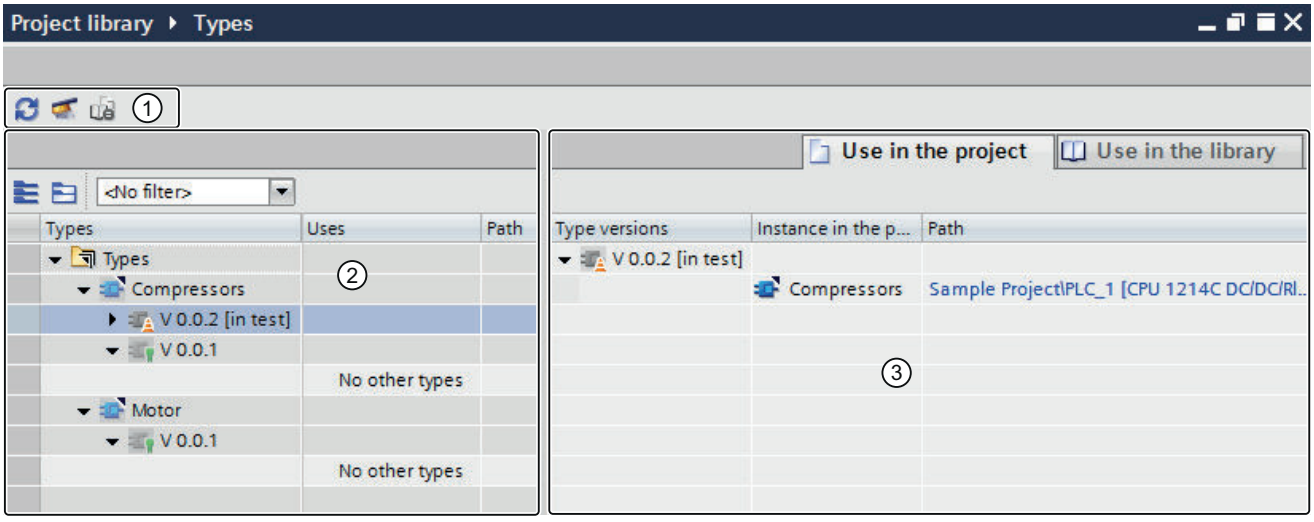
Master copies and types with dependencies to other library elements are subject to some functional restrictions. They cannot be deleted, for example, as long as dependencies still exist. This prevents other library elements from becoming useless. The library management is used to identify the dependencies and to create an overview of the work progress.

The library management offers the following functions:

- Display of the correlations of types and master copies
  If a type is referenced in other types or master copies, the correlations are displayed in the library management. You will also be able to see which library elements reference a type or a master copy.
- Display of points of use of types in the project
- Use of filters to narrow down the displayed types

Layout of the library management

The following figure shows the components of the library management:



① Toolbar of the library management

② "Types" area

③ "Uses" area

Toolbar of the library management

You can perform the following tasks in the toolbar of the library management:

- Update view
  If the project was changed, you can update the view of the library management.
- Clean up library
  By cleaning up a library, you delete all types and type versions that are not linked to an instance in the project.
- Harmonize project
  By harmonizing a project, you adapt the names and the path structures of type uses in the project to the corresponding names and path structures of the types within a library.

"Types" area

The "Types" area displays the contents of the folder that you have selected in the library view. For each type, the types that it references are displayed. You can expand or collapse all type nodes by using the buttons in the toolbar of the "Types" area. You can also filter the view with the "Filter" drop-down list.

"Uses" area

The "Uses" area gives you an overview of the points of use of the selected types and master copies. The "Uses" area is divided into two tabs:

- "Use in the project" tab
  The "Use in the project" tab is used to show the instances of type versions and their respective point of use in the project. When you select an instance, you can show the cross references of the instance in the project in the Inspector window.
- "Use in the library" tab
  The "Use in the library" tab is used to show all points within the library at which a type or a master copy is used.

9.11.4.2 Opening library management

Procedure

To open the library management, follow these steps:

1. Open the library view.
2. Select a type or any folder that contains types.
3. Select the "Library management" command from the shortcut menu.

Result

The library management opens and the types are displayed with their versions.

See also

Overview of the library management (Page 478)

9.11.4.3 Filtering the display of types

Use filters to obtain a better overview of types in extensive libraries. A filter provides you with the option of limiting the displayed types. The following filters are available:

- Display all types that include a version with the "In test" or "In progress" status
- Display all released types
- Display all types that have no instances in the project
- Display all types that have more than one version

Requirement

The library management is open.

Procedure

To filter the displayed types, follow these steps:

1. In the "Types" area, select the folder whose contents you want to filter.
2. Select the required filter in the "Filter" drop-down list.
   In the "Types" area, types are displayed that correspond to the selected filter criteria.

Creating an editing version of a type (Page 514)

9.11.4.4 Displaying instances in the project

In the library management, you can have the instances of all versions of a type or an individual type version displayed. You can jump directly to each instance in the project.

Requirement

The library management is open.

Procedure

To display the instances of a type or its versions, follow these steps:

1. Select a type or one of its versions in the "Types" area.
2. Open the "Uses in the project" tab in the "Uses" area.
   The instances in the project are displayed for each type version. The "Path" column shows the path at which the respective instance is located in the project.
3. Optional: Click the path to jump directly to the respective instance in the project tree.
   The library management is hidden and the instance is selected in the project tree.

Displaying relations to other library objects (Page 483)

9.11.4.5 Displaying cross references of an instance

You can display the cross references of an instance without exiting the library management.

Requirement

The library management is open.

Procedure

To display the cross references of an instance in the project, follow these steps:

1. In the "Types" area, select a type version whose instances you want to display.
2. Select the instance of the required type version in the "Uses > Uses in the project" area.
3. Open the "Info > Cross-references" tab in the inspector window.
   The cross reference of the instance are displayed in the project.

See also

Using cross-references (Page 533)

Overview of the library management (Page 478)

Displaying instances in the project (Page 481)

9.11.4.6 Displaying relations to other library objects

You can display relations between individual library objects in the library management. The references of the individual type versions to the other library objects are automatically displayed in the "Types" area. In the "Uses" area, you can also view the other library objects in which the respective type version is referenced.

Requirement

The library management is open.

Procedure

To display the other library objects from which a type version is referenced, follow these steps:

1. Select a folder, an individual type or an individual version in the "Types" area.
2. Open the "Uses in the library" tab in the "Uses" area.
   In the "Uses" area, you can now see which other library objects are referenced by the individual type versions.
3. Optional: To jump to the referenced library object, click on the respective path in the "Path" column.

See also

Overview of the library management (Page 478)

9.11.5 Using global libraries

9.11.5.1 Creating a global library

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To create a new global library, follow these steps:

1. Click the "Create new global library" icon in the toolbar of the "Global libraries" palette or select the command "Global libraries > Create new library" in the "Options" menu.
   The "Create new global library" dialog opens.
2. Specify the name and the storage location for the new global library.
3. Confirm your entries with "Create".

Result

The new global library is generated and pasted into the "Global libraries" palette. A folder with the name of the global library is created in the file system at the storage location of the global library. The actual library file is given the file name extension ".al13".

Deleting a global library (Page 491)

9.11.5.2 Compatibility of global libraries

You can use the TIA Portal to open global libraries that were created with an older version of the TIA Portal. However, the product version of global libraries must correspond to the product version of the opened project if you want to use objects from the global library in the project. Consequently, you may need to upgrade the global libraries.

Opening global libraries from older product versions

The table below illustrates the behavior of the TIA Portal when global libraries from older product versions are opened:

Product version of the TIA Portal (file extension of the respective global library)	Behavior when global library is opened
V10.5 (.al10) V11.x (.al11)	The global library is automatically upgraded to the latest library version when opened, following your confirmation. The upgraded global library is a copy of the original library. The original global library is retained unchanged. Alternatively, load the global library for viewing as a write-protected library.
V12 (.al12)	You can select between the following options: • Upgrade global library to product version V12 SP1 and open in compatibility mode • Upgrade global library to the current product version and open If you upgrade the global library, a copy of the original global library is created. The original global library is retained unchanged.
V12 SP1 (.al12) V13 (.al13)	You can select between the following options: • Open global library in compatibility mode If you choose compatibility mode, the project should also be opened in compatibility mode. Otherwise, you cannot use or edit contents of the global library. • Upgrade global library to the current product version and open If you upgrade the global library, a copy of the original global library is created. The original global library is retained unchanged. You can select between the following options:

Compatibility mode

If a project is open in compatibility mode for product version V12 SP1 or V13 of the TIA Portal, the global library must also be in compatibility mode. You can use objects from the global library in the project opened in compatibility mode. You can also save new objects in the global library if the objects originate from a project in compatibility mode. A global library in compatibility mode can still be opened and edited with the earlier version of the TIA Portal.

Backward compatibility of the current library version

Global libraries saved with the library format of the current TIA Portal product version are not backward compatible with older versions due to their enhanced functionality. Global libraries in the current library format can only be used in connection with TIA Portal V13 SP1 projects.

Compatibility of projects (Page 377)

Opening a global library (Page 486)

Upgrading global libraries (Page 487)

Upgrading projects (Page 380)

9.11.5.3 Opening a global library

Global libraries can be further developed centrally and used over several projects. Several persons can open a global library simultaneously from a central storage location, provided all users open the global library in write-protected mode.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To open a global library, follow these steps:

1. Click the "Open global library" icon in the toolbar of the "Global libraries" pane or select the command "Global libraries > Open library" in the "Options" menu.
   The "Open global library" dialog box is displayed.
2. Select the global library you want to open. Library files are identified by the file name extension ".al[version number]". This means global libraries that were saved with current TIA Portal product version have the file name extension ".al13".
3. Write protection is activated for the library. If you want to modify the global library, disable the "Open as read-only".
4. Click "Open".
   The global library is opened and pasted into the "Global libraries" pane if the library version matches the project version. The "Upgrade global library" dialog opens if you have selected a global library from an older version of the TIA Portal. More information on upgrading the global library can be found in the chapter "Upgrading global libraries (Page 487)".

Closing a global library (Page 491)

Deleting a global library (Page 491)

9.11.5.4 Upgrading global libraries

If you want to use objects from a global library in a project, the library version must match the product version of the project. For example, if you want to edit a project in V12 SP1 compatibility mode, the global libraries must be present in the library version of the TIA Portal V12 SP1. If you want to edit a project in product version V13 SP1, the global libraries must be present in the library version of the TIA Portal V13 SP1.

Depending on the library version, the following options are available:

- Upgrading the global library to the product version V13 SP1
  You can upgrade each global library from an older product version to the current product version. You are prompted accordingly when you open the global library. You can manually upgrade global libraries that have already been opened in compatibility mode to product version V13 SP1.
- Upgrading the global library to the product version V12 SP1 (compatibility mode)
  If you open a global library from version V12 of the TIA Portal, you also have the option of upgrading the global library to the library version V12 SP1. In this case, however, the global library can only be used in connection with projects from TIA Portal V12 SP1.
- Using a global library in compatibility mode
  If you are using a project in compatibility mode, the global library must also be opened in compatibility mode for the corresponding product version.

Upgrading global libraries from V11.x or lower

To upgrade a global library from TIA Portal V11.x or earlier, follow these steps:

1. Open the global library.
   The "Upgrade global library" dialog box opens.
2. Click "OK".
   A copy of the global library is created and upgraded. The copy of the global library receives the name extension "_V13_SP1". The global library is opened.

Upgrading global libraries from V12

To upgrade a global library from TIA Portal V12, follow these steps:

1. Open the global library.
   The "Upgrade global library" dialog box opens.
2. Select the target version for the upgrade:
   - Click "Yes" to upgrade the global library to the current product version.
   - Click "No" to upgrade the global library to product version V12 SP1 and to work in compatibility mode.

   A copy of the global library is created and upgraded. The copy of the global library receives the name extension "_V13_SP1" or "_V12SP1". The global library is opened.

Upgrading V12 SP1 libraries or using them in compatibility mode

To upgrade a global library from TIA Portal V12 SP1 or to use it in compatibility mode, follow these steps:

1. Open the global library.
   The "Upgrade global library" dialog box opens.
2. Select how you want to proceed with the global library:
   - Click "Yes" to upgrade the global library to the current product version.
     A copy of the global library is created and upgraded. The copy of the global library receives the name extension "_V13_SP1". The global library is opened.
   - Click "No" to use the global library in compatibility mode.

Manually upgrading libraries in compatibility mode to V13 SP1

For this procedure, a global library must already be open in compatibility mode.

To manually upgrade global libraries to the current library version, follow these steps:

1. Right-click on the global library you want to upgrade.
2. Select the "Upgrade library" command in the shortcut menu.
   The "Upgrade" dialog opens.
3. Confirm with "Yes".
   A copy of the global library is created and upgraded. The copy of the global library receives the name extension "_V13_SP1". The upgraded global library is opened. The original global library is closed.

See also

Opening a global library (Page 486)

Compatibility of global libraries (Page 484)

Upgrading projects (Page 380)

9.11.5.5 Displaying properties of global libraries

Global libraries contain properties for describing the respective library in more detail. Properties include the following:

- General information about the library
  This includes the following information: creation time, author, file path, file size, copyright, etc. Many of the attributes can be changed.
- Library history
  The library history contains an overview of the migrations performed. Here you can also call the log file for the migrations. The library history also contains information on updates of the global library.

- Support packages in the library
  You can display an overview of additional software. The additional software is needed to process all devices of the project.
- Software products in the library
  You can display an overview of all installed software products needed for the project.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To display the properties of a global library, follow these steps:

1. Right-click the global library whose properties you want to display.
2. Select the "Properties" command in the shortcut menu.
   A dialog containing the properties of the global libraries opens.
3. Select the properties in the area navigation that you want to have displayed.

9.11.5.6 Displaying logs of global libraries

Logs are created when you update or clean up global libraries or assign a shared version to several types. The logs list all changes you have made to the global library. The logs are stored together with the global library and are always available once you have opened the global library.

Procedure

To open the logs of a global library, follow these steps:

1. Open the global library in the "Libraries" task card or in the library view.
2. Open "Common data > Logs" in the lower-level folder.
3. Double-click the required log.
   The log opens in the work area.

Updating a library with the contents of another library (Page 528)

9.11.5.7 Saving a global library

After you have changed a global library, you need to save it. You can save a global library under another name using the "Save library as" command.

Note

Backward compatibility with older versions of the TIA Portal

Note that global libraries can no longer be opened in older versions of the TIA Portal once they have been saved in the current version.

Requirement

The "Libraries" task card is displayed or the library view is open.

Saving changes

To save a global library, follow these steps:

1. Right-click on the global library you want to save.
2. Select the "Save library" command in the shortcut menu.

Saving a global library under another name

To save a global library under another name, follow these steps:

1. Right-click the global library that you want to save under a different name.
2. Select the "Save library as" command in the shortcut menu.
   The "Save global library as" dialog opens.
3. Select the storage location and enter the file name.
4. Confirm your entries with "Save".
   The library is saved in the specified location under the new name. The original library is retained.

Deleting a global library (Page 491)

9.11.5.8 Closing a global library

Global libraries are independent of projects. This means that global libraries are not closed together with your project. You must therefore close global libraries explicitly.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To close a global library, follow these steps:

1. Right-click on the global library you want to close.
2. Select the "Close library" command in the shortcut menu.
   If you have made changes to the global library, select whether or not you want to save the changes.
   The global library is closed.

Deleting a global library (Page 491)

9.11.5.9 Deleting a global library

If you no longer require a global library, you can delete it. Libraries supplied by Siemens cannot be deleted.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To delete a global library, follow these steps:

1. Right-click the global library you want to delete.
2. Select the "Delete" command in the shortcut menu.
3. Click "Yes" to confirm.

Result

The global library is removed from the "Global libraries" palette. The entire library for the global library is deleted from the file system.

9.11.5.10 Archiving and disabling global libraries

Working with archives of global libraries

If you want to back up global libraries on an external hard drive or send them via e-mail, for example, use the archiving function to reduce the storage space of the library.

Options for reducing the size of the project

There are two ways to reduce the space required to store global libraries:

- Creating a compressed archive of global libraries
  Archives of global libraries are compressed files, each containing an entire global library, including the entire folder structure of the library. Before the directory with the global library is compressed into the archive file, all files are reduced to their essential components to further decrease the storage space. Compressed archives of global libraries are therefore well suited for sending via e-mail.
  Compressed archives of global libraries of the current product version have the file extension ".zal13". Archives from TIA Portal V12.x have the file extension ".zal12".
  To open a compressed archive of a global library, retrieve the archive. The archive file is extracted to a location you have selected with the entire folder structure and all files.
- Minimizing global libraries
  You can skip additional compression in an archive file, and instead create a copy of the global library directory. The included files can be reduced to the essential elements. This minimizes the required storage space. The full functionality of the global library is retained and the global library can be loaded as usual.
  Minimized global libraries are especially well suited for archiving, for example, on an external medium.

See also

Archiving global libraries (Page 493)

Retrieving global libraries (Page 494)

Archiving global libraries

You reduce the storage space of a global library by packing it into a compressed file. You can also reduce the storage space by saving the global library reduced to the essential elements. You can do both of these with the archiving function for global libraries. When you archive a library, the original library version is retained. This means that libraries in compatibility mode for TIA Portal V12 SP1 are still compatible with TIA Portal V12 SP1.

Requirement

The global library is loaded.

Procedure

To archive a global library, follow these steps:

1. Select the global library that you want to archive.
2. Right-click the global library and select the "Archive" command from the shortcut menu.
   The "Archive global library as..." dialog opens.
3. Select the directory where you want to save the archive file or the new directory of the global library.
   The directory may not be located in a project directory or within the directory of a global library.

4. Select the file type from the "File type" drop-down list:
   - Global libraries archive, if you want to create a compressed file of the library.
   - Minimized global library, if you only want to create a copy of the library directory with minimal storage requirement.
5. Enter a file name in the "File name" field if you are creating an archive file. If you are creating a minimized global library, enter the name of the new library directory to be created in the "File name" box.
6. Click "Save".

Result

A compressed file with the extension ".zal13" or ".zal12" is generated. The file extension depends on whether you have archived a library in V12 SP1 compatibility mode or in the library format of TIA Portal V13.

The file includes the complete directory of the global library. The individual files of the global library are also reduced to the essential components in order to save space.

If you have minimized the global library, only a copy of the original directory of the global library is created at the required location. The files contained within it were reduced to their essential components in order to save space.

See also

Working with archives of global libraries (Page 492)

Retrieving global libraries (Page 494)

Retrieving global libraries

Before you can use an archived global library, you have to retrieve it. The global library is extracted and then opened in the TIA Portal.

Procedure

To extract the archive of a global library, follow these steps:

1. Select the "Global libraries > Retrieve library" command in the "Options" menu.
   The "Retrieve archived global library" dialog opens.
2. Select the archive file.
3. Select the check box "Open read-only" if you want to load the global library write-protected.
4. Click "Open".
5. The "Find folder" dialog opens.
6. Select the target directory to which the archived global library should be extracted.
7. Click "OK".

Result

The global library is extracted to the selected directory and opened immediately.

If the archive file contained a global library from TIA Portal V12 SP1, the global library is opened in compatibility mode. Manually upgrade the library to the library version of TIA Portal V13, if necessary.

Working with archives of global libraries (Page 492)

Archiving global libraries (Page 493)

Opening a global library (Page 486)

Compatibility of global libraries (Page 484)

Upgrading global libraries (Page 487)

9.11.5.11 Using global corporate libraries

Basics of corporate libraries

Introduction

Corporate libraries are global libraries made available by an administrator and assigned to the TIA Portal. The administrator can assign new libraries or change libraries at any time. New libraries are automatically loaded in the TIA Portal following your confirmation. As soon as more recent versions of corporate libraries are available, the existing corporate libraries are automatically updated to the more recent version, also following your confirmation.

The corporate libraries are located just like normal global libraries in the "Global libraries" palette of the "Libraries" task card.

Providing corporate libraries

Corporate libraries can be saved in any directory on the hard drive of the computer or on a network drive. You use an XML file to assign corporate libraries to the TIA Portal. The XML file includes the directories and names of the assigned corporate libraries. The XML file must be saved in the following directory on the hard drive of the computer:

`C:\ProgramData\Siemens\Automation\Portal V13\CorporateSettings\`

The XML file must be named "`CorporateSettings.xml`".

You either copy the configuration file yourself to the corresponding directory or the configuration file is assigned to you through the company network. The valid configuration is automatically applied when the TIA Portal is started. When the TIA Portal is started, it continuously monitors the directory for configuration files. If the configuration file has changed, you receive a prompt to apply the new configuration. You can reject this prompt twice. You will always receive the next prompt three hours later. You must apply the new configuration at the third prompt. You receive a changed configuration file from the project administrator, for example, if corporate libraries have been added or deleted.

Options as project administrator

You can automatically assign the configuration file or the corporate libraries to the computers of the team members or distribute updates to the team members. This function is not part of the TIA Portal and requires a corresponding IT infrastructure in your company. If you want to administer the configuration file centrally, discuss this approach with the IT managers at your company.

Creating a configuration file for corporate libraries

You use a configuration file in XML format to make the corporate libraries available in the TIA Portal. The configuration file includes the directories and file names of the libraries to be loaded. Below you will learn how you create the XML configuration file and where to save it.

Procedure

To provide a configuration file for corporate libraries, follow these steps:

1. Create an XML configuration file with the content listed below. Use the coding "UTF-8".
2. Save the XML file under the name "CorporateSettings.xml".
3. Save the file in the following directory on your computer:
   C:\ProgramData\Siemens\Automation\Portal V13\CorporateSettings\

Content of the XML configuration file

The XML configuration file must have the following content:

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
 <Settings.Settings ID="0">
  <ObjectList>
   <Settings.General ID="1" AggregationName="General">
    <AttributeList>
     <CorporateLibraryPaths>
     <!-- Example of an entry -->
     <Item>D:\CorporateLibraries\Corporate_Library_1.al13</Item>
     <!-- Here you enter additional global libraries, if any. -->
     </CorporateLibraryPaths>
    </AttributeList>
   </Settings.General>
  </ObjectList>
 </Settings.Settings>
</Document>
```

Result

As soon as you have saved the XML configuration file in the respective directory, you will receive a prompt in the TIA Portal to load the corporate libraries.

Specifying settings with an XML file (Page 365)

9.11.6 Creating folders in a library

The library elements are stored in the libraries according to their type in the "Types" and "Master copies" folders. Create additional folders below "Types" and "Master copies" to further organize master copies and types.

Requirements

- The "Libraries" task card is displayed or the library view is open.
- If you want to create new folders within a global library, you have to open the global library with write permission.

Procedure

To create a new folder, follow these steps:

1. Right-click any folder within the library.
2. Select "Add folder" from the shortcut menu.
   A new folder is created.
3. Enter a name for the new folder.

See also

Working with types in the project library (Page 506)

Filtering master copies (Page 500)

9.11.7 Using master copies

9.11.7.1 Basics on master copies

Master copies are used to create standardized copies of frequently used elements. You can create as many elements as needed and insert them into the project based on a master copy. The elements inherit the properties of the master copy.

You store master copies either in the project library or in a global library. Master copies in the project library can only be used within the project. When you create the master copy in a global library, it can be used in different projects.

The following elements can be created as master copies in the library, for example:

- Devices with their device configuration
- Tag tables

- Instruction profiles
- Watch tables
- Elements from the documentation settings, for example, cover sheets and frames
- Blocks and groups containing multiple blocks
- PLC data types and groups containing multiple PLC data types
- Text lists
- Alarm classes
- Technology objects

In many cases, the objects you add as master copy contain additional elements. A CPU, for example, can contain blocks. If the included elements are uses of a type version, the used versions of the types are automatically created in the library. The elements contained therein are then used as an instance and linked to the type.

See also

Adding master copies (Page 498)

Using master copies (Page 500)

Basics on types (Page 501)

Filtering master copies (Page 500)

9.11.7.2 Adding master copies

If you want to use objects multiple times, copy them as master copies in the project library or in a global library. You can choose from the following methods for creating master copies:

- You select one or more elements and create individual master copies from them
- You select multiple elements and create a single master copy from them that contains all selected elements.

Requirement

- The "Libraries" task card is displayed.
- If you add a device as a master copy, this device meets the following requirements:
  - The device is compiled and consistent.
  - The device contains no test instance of a type.
- If you add the master copy to a global library, the global library is opened with write permission.

Creating master copies from one or more elements

To create a master copy for one or more elements, follow these steps:

1. Open the library in the "Libraries" task card.
2. Select the desired elements.
3. Using a drag-and-drop operation, move the elements to the "Master copies" folder or any subfolder of "Master copies".

Alternative:

1. Select the desired elements.
2. Copy the elements to the clipboard and paste the elements at the required location.
   Each element is pasted in the library as a master copy. A type is created automatically in each case from any objects contained (e.g., referenced blocks).

Creating a single master copy from multiple elements

To create a single master copy for all elements from multiple elements, follow these steps:

1. Open the library in the "Libraries" task card.
2. Copy to the clipboard the elements that you want to create as master copies.
3. Right-click on the "Master copies" folder or any of its subfolders in the library.
4. In the shortcut menu, select "Paste as a single master copy" command.

Alternative:

1. Select the desired elements.
2. Using a drag-and-drop operation, move the elements to the "Master copies" folder or any subfolder of "Master copies". Meanwhile, keep the <Alt> key pressed.
   The elements are pasted in the library as a single master copy. The single master copy contains all selected elements. A type is created automatically in each case from any objects contained (e.g., referenced blocks).

Note

Avoiding complex structures of master copies

To prevent name conflicts and conflicts regarding the folder structure during subsequent use of master copies, avoid complex master copies. Complex master copies are, for example, master copies that consist of multiple elements and nested folders.

See also

Basics on master copies (Page 497)

Using master copies (Page 500)

Library basics (Page 470)

Adding types to the project library (Page 506)

9.11.7.3 Filtering master copies

To make it easier to keep track of a large number of master copies, you can filter the display according to the type of master copy.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To filter the view, follow these steps:

1. Open the "Master copies" folder in the project library or a global library.
2. In the drop-down list of the toolbar, select the type of objects you want to display under "Master copies".

Result

Only the selected type of master copies is displayed. You can set the filter to "All" to return to an unfiltered view.

See also

Library basics (Page 470)

Creating folders in a library (Page 497)

Basics on master copies (Page 497)

Using master copies (Page 500)

Using the element view (Page 474)

9.11.7.4 Using master copies

Master copies are contained either in the project library or in a global library. You can paste one or more master copies in the project at the same time. If you insert multiple master copies at the same time, ensure that all master copies are compatible with the desired point of use.

Requirement

The "Libraries" task card is displayed.

Procedure

To paste a master copy into the project, follow these steps:

1. Open the "Master copies" folder or any subfolder of "Master copies" in a library.
2. Using a drag-and-drop operation, move the desired master copies or whole folders to the point of use.

Or:

1. Open the element view.
2. Using a drag-and-drop operation, move the desired master copies or whole folders from the "Elements" pane to the point of use.

Result

A copy of the master copies is inserted. If incompatible master copies were included in a multiple selection, these are omitted and a copy is not created in the project.

9.11.8 Using types and their versions

9.11.8.1 Basics on types

Using types

Types are elements that are required for the execution of user programs. Types can be versioned and further developed from a central location.

The following elements can be stored as type in the project library or the global library:

- Functions (FCs)
- Function blocks (FBs)
- PLC data types
- User data types
- Faceplates
- Screens
- Styles
- User-defined functions

Any number of instances can be derived from the versions of types in the project. The instances are then linked to the version of the type. If you are using types from a global library, the type is also created in the project library. If the type already exists in the project library, missing type

versions are added if necessary. The instance is then linked only to the respective type version in the project library.

Types and their instances are marked with a black triangle. The following figure shows an instance, marked with a black triangle, and an ordinary program block:

Basics on versioning of types

Type versioning provides you with the means to develop types centrally and then roll out the most recent version to the individual projects as an update. In this way, error corrections and added functions can be easily integrated into existing projects. If you have created a new version of a global library, you can update existing projects in an automatic process. This minimizes errors and reduces the amount of maintenance work for large automation solutions that contain numerous individual projects.

Versioning allows you to trace the development process of individual types. Before you release a version, you can try it out in a test environment to determine whether changes made to a type integrate smoothly into an existing project. You only release a version for productive use after you have made sure that everything operates without errors. You can view the history of individual instances in the project at any time and determine the version from which the instance was derived.

The TIA Portal also checks automatically whether there are associated objects with individual versions of a type. Associated objects can be, for example, PLC data types or other blocks referenced in a block. All associated objects are already taken into consideration during the creation of a type or during copying between libraries. Before being released, versions of types are checked for their consistency to ensure that no inconsistencies arise in the project.

Versions of types

Versions are assigned to each type. The version number is displayed in both the "Libraries" task card as well as the library view next to the respective type. The version number is also displayed in the project tree next to instances of types. This allows you to see at all times which version of an instance is used in the project.

The version number consists of three numbers separated by periods. You can randomly assign the first two digits. Numbers from 1 to 999 are permitted as the first two numbers. The third digit is the build number. It is automatically incremented by one when you edit an instance related to the version. The build number is reset to 1 when you release the version.

The versions of types can have three states:

- In progress (faceplates and HMI user data types)
- In test (all sorts of types except faceplates and HMI user data types)
- Released

The following figure shows a type with two versions. One version is "in test" and one version is released:

See also

State of type versions (Page 503)

Basics on master copies (Page 497)

Adding types to the project library (Page 506)

Using types (Page 509)

Editing library elements (Page 526)

Duplicating types (Page 509)

9.11.8.2 State of type versions

The versions of types can be in three different states. The states can be determined from the instance or in the library.

"In progress" status

Only versions of faceplates and HMI user data types have the "In progress" status. If a version is in progress, "In progress" appears next to the version in the library.

When you create a new type or a new version of a released type, the type is assigned the status "In progress".

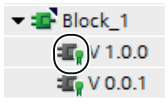
Types with the status "In progress" can be edited in the library view. A reference to an instance in the project does not have to exist. Upon release, the compatibility of the type is tested by a consistency check.

"In test" status

All types except for faceplates and HMI user data types can have the "in test" status. If a version is in test, "in test" appears next to the instance and in the library. A version in the test state is linked to a test instance in the project. This allows you try out the effects of your changes in a test environment including all online functions before you release a type for use in actual operations.

"Released" status

The "released" status is available for all types, regardless of the point of use. If a version has been released, the symbol of the version is marked with a seal in the library:



Released versions can be opened with write protection in their instance. If you want to edit a released version, you must first create a new "In progress" or "in test" version.

Assigning a version (Page 524)

Updating the project to the latest versions (Page 518)

Remove the link between instance and type (Page 520)

Filtering the display of types (Page 481)

9.11.8.3 Displaying a released type version

If you display a released version but do not want to edit it, open the instance with write protection. All types except faceplates and HMI user data types can be opened directly at the instance. Faceplates and HMI user data types can only be opened in the "Libraries" task card or in the library view.

Requirement

The released version has an instance in the project; except with types, this is a faceplate or an HMI user data type.

Opening a type version at an instance

To open a released version of a type with write protection starting from an instance, follow these steps:

1. Select the released version at the instance in the project tree.
2. To do this, right-click the instance and select the "Open" command from the shortcut menu. The instance is opened with write protection.

Opening a type version in the "Libraries" task card or library view

To open a released version of a type in the "Libraries" task card or in the library view, follow these steps:

1. Select the version.
2. To do this, right-click the version and select the "Open" command from the shortcut menu. If it is a faceplate or HMI user data type, it is opened directly in the library view. In this case, skip the remaining steps. If it is any other type, the "Open type" dialog opens.
3. Select the instance with the version that you want to display from the list of instances.
4. Click "OK" to confirm.
   The instance is opened with write protection.

9.11.8.4 Displaying properties of a type or version

You can display the properties of a type or version.

Procedure

To display the properties of a type or a version and to enter a comment, follow these steps:

1. Select a type or the version of a type in the "Libraries" task card or in the library view.
2. To do this, right-click on the type or one of its versions and select the "Properties" command from the shortcut menu.
   The "Properties" dialog box opens.
3. If needed, enter a comment on the type in the "Comment" field or edit an existing comment.

Visible and changeable properties

The following table shows the properties that you can see or change for a type or version:

Property	Description	Version	Types
Name	Name of the type	-	Visible and changeable
Version	Version number	Visible	-
Last change	If you create, release, duplicate or assign a version, this is recorded as a change to the type. The date and time of the change are entered in the "Last change" field.	Visible	-
Author	The creator of the version is indicated as the author.	-	-
Original library	The project and the library from which the current version of the type was generated are indicated. This information is important, for example, for finding the original of the type after it has been copied from another library.	Visible	-

Property	Description	Version	Types
Version GUID or Type GUID	The GUID is used to uniquely identify the type or the version of the type, even if, for example, there are types or versions with an identical name within the project library or the global library. The GUID cannot be changed and is assigned automatically.	Visible	Visible
Comment	Comment on the type or version	Visible and, for versions whose status is "in test" or "in work", changeable	Visible and changeable

9.11.8.5 Working with types in the project library

Adding types to the project library

Types for reuse in the project can be created in the project library for various elements. You can create the following elements as types, for example:

- Program blocks
- Faceplates
- PLC data types
- HMI user data type

If you add an element as a type to the project library and this element has dependencies to other elements, the dependent elements are automatically created as a type as well.

After a type has been added to the project library, the type is linked to the added element from the project.

Requirement

- The "Libraries" task card is displayed.
- The elements that you want to add as type are compiled.
- The elements are consistent.
- For blocks, all other requirements are met as described in section "Block requirements (Page 507)

Procedure

To add an existing element to the project library as a type, follow these steps:

1. Open the project library in the "Libraries" task card.
2. Drag-and-drop one or more elements into the "Types" folder or any subfolder of "Types".
   Alternative: Copy the elements in the project tree to the clipboard and add the elements in the desired project library folder.
   The "Generate type" dialog opens.

3. Enter the properties of the new type:
   - Enter a name for the new type in the "Name of the type" field.
   - Enter a version number for the new type in the "Version" field.
   - Enter the name of the editor who is responsible for the type in the "Author" field.
   - Enter a comment on the type in the "Comment" field.
4. Click "OK" to confirm.
   The new type is generated with a released version. The version is linked to the element that has been added.

See also

Basics on types (Page 501)

Duplicating types (Page 509)

Block requirements (Page 507)

Library basics (Page 470)

Adding master copies (Page 498)

Block requirements

Permitted blocks for creating a type

You can create types of the following blocks in the project library:

- Function blocks
- Functions
- User-defined data types

Consistency and compilation

To create a type from a block, the block must be consistent and compiled. When you create a type, the consistency of the block is checked automatically and the block is compiled if necessary.

Block requirements

To create a type from a block, the block must meet the following requirements:

- The block must match the type of CPU.
  A block which does not match a CPU can be identified by an incompatibility symbol to the right of the block in the project tree. This is the case, for example, when you copy a block from an S7-1500 CPU to an S7-300 CPU. A block of an S7-1500 is not compatible with an S7-300 CPU and cannot be compiled. This means that you cannot create a type from the block.
- The block is not a system data block.
- The block does not include global data access or single instance call of an instance data block.
  This also applies, for example, to the call of a data block within an STL block with the "OPN" command.

Special aspects for know-how-protected blocks

You can also create types of know-how-protected blocks. However, keep in mind the following additional requirements for know-how-protected blocks:

- Release of the block for use as type
  Know-how-protected blocks must be released to be used in a library. You make the necessary settings in the block properties. In the "Attributes" area, select the option "Block can be used as know-how protected library element".
- The block does not include access to data blocks, PLC tags or PLC constants.
  Because you cannot create types from data blocks, PLC tags or PLC constants, you also cannot create a type from know-how-protected blocks with access to the objects listed above. The instance of a know-how-protected block does not work without the associated data blocks, PLC tags or PLC constants.

Access to data blocks, PLC tags or PLC constants

Access to data blocks, PLC tags or PLC constants is permitted in blocks without know-how protection, but you can still create types from these blocks. While function blocks referenced in a block, for example, are also automatically created as type in the project library, this is not the case for access to data blocks, PLC tags and PLC constants. If data blocks, PLC tags or PLC constants are referenced in a block, only the block itself is created as type. The referenced objects are not created as type. If you create an instance from the type of the block later at another point of use (for example, a different CPU), the referenced objects are missing at the new point of use. This means that you should create referenced objects at the later point of use again. Make sure that the referenced objects have the correct name at the new point of use.

See also

Adding types to the project library (Page 506)

Duplicating types

Types in the project library can be duplicated. If you duplicate a type, the following applies to the duplicate:

- The duplicate is created in the same folder.
- The duplicate is created from the highest version of the type.
- The duplicate does not have an instance in the project.

Requirement

The type is released.

Procedure

To duplicate a type in the project library, follow these steps:

1. Right-click on a type.
2. Select the "Duplicate type" command in the shortcut menu.
   The "Duplicate type" dialog opens.
3. Enter the properties of the new type:
   - Enter a name for the new type in the "Name of the type" field.
   - Enter a version number for the new type in the "Version" field.
   - Enter the name of the editor who is responsible for the type in the "Author" field.
   - Enter a comment on the type in the "Comment" field.
4. Click "OK" to confirm.
   The new type is generated with a released version.

See also

Adding types to the project library (Page 506)

Editing library elements (Page 526)

Using types

Types from the project library can be used any number of times within a project. The use of types is always linked to a version of the respective type in the project library. If the type contains dependent elements, these are also created as a type of use at a suitable point in the project. Examples of dependent elements are PLC data types referenced in a block.

You can only assign a version of the same type to a device. If necessary, you can create uses of several types at the same time.

Uses of a type are called instances in the project tree.

Possible points of use for type versions

To use a type, create an instance of a particular version of the type at a suitable point in the project. Suitable points of use are:

- Folder in the project tree
  An instance of a type can be created in a folder in the project tree. The folder must be suitable for the particular type. If the type is a user data type, for example, you can only create the instance in the "PLC data types" folder.
- Editor
  An instance can be created from a type in a suitable editor. For example, you can create an instance from the type of a function block in another block. The type of the function block is called from another block in this way.

Options for creating an instance

You have two options for creating type instances:

- Drag the required type version from the project library and drop it at the location where you want to use it.
  Instances of the types and their dependent elements are generated and pasted at the location where you want to use them. The instances are connected to the respective type version in the project library. If you have created the instances in an editor, instances of the types are also created at the appropriate points in the project tree. By default, the folder structure from the library is reproduced in the project tree. If you want to select a different folder in the project tree, you will find the instances in the same folders as in the library.
- Copying and pasting type instances
  You can copy type instances to the clipboard and paste them at another point. This way you create another instance of the type version. The instance is still connected to the same type version in the project library. When you copy the instance of a type to the clipboard and paste it in another project, all required type versions are accepted in the project library of the other project.

Requirement

- The desired versions have been released.
- A device which supports the category of desired type is already available in the project
- The device is not yet assigned any further instance of the same type.

Procedure

To create an instance of a type, follow these steps:

1. In the project library, select the versions from which you want to create an instance.
2. Using a drag-and-drop operation, move the versions from the project library to the point of use in the project tree or an editor.
   Alternative: To automatically use the newest version, move the types themselves from the project library to the point of use using a drag-and-drop operation.
   For example, use a drag-and-drop operation to move the type of a function block to the block folder of the CPU in the project tree. To call the type directly from another block, for example, move the type from the project library to the point of use in the program editor using a drag-and-drop operation.

Alternative:

1. Copy one or more instances to the clipboard.
2. Paste the instances at a suitable point in the same project or in a different project.

Library basics (Page 470)

Using master copies (Page 500)

Displaying types for an instance

In the project tree, you can jump to a type associated with an instance in the project library.

Procedure

To jump to the type associated with an instance in the project library, follow these steps:

1. Right-click the instance of the type in the project tree.
2. Select the "Go to type" command from the shortcut menu.
   The associated type is displayed in the project library.

See also

Using types (Page 509)

Creating a test version of a type

Before you release a type for productive use, you need to test the type within a project and on the automation system. The test is conducted in a specific test environment. This test environment can be a CPU, for example.

Create a version with "in testing" status for the test. The creation of a version "in testing" is suitable for all sorts of types except for faceplates and HMI user data types. On the other hand, versions "in progress" can be created from faceplates and HMI user data types.

There are two ways to create a test version of a type and define the test environment:

- In the "Libraries" task card or library view
  Generate the new version with "in testing" status in the "Libraries" task card or in the library view. You can generate the new version either directly from the type or from a specific version of the type.
- At an instance in the project tree
  You can also create the test version directly at the instance in the project tree. Since the instance is always used in a specific version in the project, a new version of the type is generated from the version used at the instance.

You can also create test versions from several types at the same time.

The following rules apply to a version "in testing":

- You can set only one version to "in testing" for each type at a given time.
- A version in testing may only be linked to a single instance in the project. Therefore, it is not possible to copy an instance to the clipboard, to duplicate it or to create an additional type from the instance as long as it has "in testing" status.

Requirement

- There is at least one instance of the type within the project in a given version.
- If you want to create the new version from a particular version of the type, the instance must be used in this version in the project.

Procedure

To generate a new test version of a type or the version of a type, follow these steps:

1. Select the type, a version of the type, or the instance.
   When you create the test version directly at the instance, you can select several elements or folders with multiple selection. You can skip steps 3 and 4 because the test environment is already defined by the selected instance.
2. Right-click the selected element and select the "Edit type" command from the shortcut menu.
   If you have started the editing in the "Libraries" task card or in the library view, the "Edit type" dialog opens. If you have started the editing at the instance in the project tree, the test instance is immediately opened for editing in the library view.

3. Select an instance of the type from the list in the project.
   If you have started editing at the type itself, the following applies:
   - The location at which the instance is used (for example, the CPU) is also used as test environment for the subsequent editing of the type.
   - Selecting the test instance also defines the version to be edited.

   The following applies to editing a specific version:
   If your starting point is a specific version, you can only select from the list instances that are used in the same version.
4. Click "OK" to confirm.

Result

A new version of the type is created. The new version is "in testing" and is identified as such in the user interface.

See also

Basics on types (Page 501)

State of type versions (Page 503)

Library basics (Page 470)

Editing a test version of a type

When you edit a version "in testing", a new version is not created. You can start the editing of the test version at the instance in the project tree, in the "Libraries" task card" or in the library view.

Note

Deleting and renaming interface parameters

You can add new parameters. However, if you rename or delete existing parameters, these parameters will not be supplied when the block is called.

Procedure

To edit the test version of a type, follow these steps:

1. Right-click the test version or the instance.
2. Select the "Edit type" command from the shortcut menu.
   The test instance is opened and can be edited.

Library basics (Page 470)

Performing a consistency check for a version (Page 514)

Discarding versions (Page 515)

Release versions (Page 516)

Creating an editing version of a type

If you want to edit a type with faceplates or HMI user data types, create a new "in progress" version of the type. The new version is edited in the library view. To check the compatibility of the changes, a consistency check is automatically performed for the type prior to the release.

Requirement

The project library is opened in the "Libraries" task card or in the library view.

Procedure

To create a new version of a type in progress, follow these steps:

1. Right-click the type or the version of the type.
2. Select the "Edit type" command from the shortcut menu.
   A new "in progress" version is created and opened for editing in the library view.

See also

Basics on types (Page 501)

State of type versions (Page 503)

Library basics (Page 470)

Performing a consistency check for a version

A type version can unintentionally obtain an inconsistent state during editing. To notice errors in the development process in good time, you can regularly perform a consistency check. However, the consistency check always takes place automatically as soon as you release a version.

Details of how to start the consistency check manually for the version of a type are provided below.

Requirement

- The project library is opened in the "Libraries" task card or in the library view.
- The version is "in progress" or "in test".

Procedure

To perform a consistency check for the version of a type, follow these steps:

1. Right-click on the version that you want to check for consistency.
2. Select the "Consistency check" command in the shortcut menu.
   The consistency check is carried out. You receive a message with the result of the consistency check.

Discarding versions (Page 515)

Editing a test version of a type (Page 513)

Basics on types (Page 501)

State of type versions (Page 503)

Library basics (Page 470)

Discarding versions

Discard versions of a type "in test" or "In progress" when you no longer need the version. You can also select several types or folders and discard all test or editing versions contained therein. All uses of the deleted versions are reset to the last released status.

Requirement

- The version that you want to discard is in the state "In testing" or "In progress".
- Your are in the library view of the "Libraries" task card is open.

Procedure

To discard one version, follow these steps:

1. Right-click the version that you want to discard.
2. Select the "Discard changes and delete version" command from the shortcut menu.
   The version is deleted.

Alternative in the library view:

1. Click the "Discard changes and delete version" button in the toolbar while a version is opened for editing.
   The version is deleted.

See also

Basics on types (Page 501)

State of type versions (Page 503)

Library basics (Page 470)

Performing a consistency check for a version (Page 514)

Discarding all versions within a folder

You can discard all versions with the "In test" or "In progress" status at the same time within a folder. All uses of the deleted version are reset to the last released status.

Requirement

Your are in the library view of the "Libraries" task card is open.

Discarding a version of a single type

To discard all versions within a folder, follow these steps:

1. Right-click the folder.
2. Select the "Discard all" command from the shortcut menu.
   All "In test" or "In progress" versions are deleted.

Release versions

When you are finished editing a type version, release the version for productive use. Assign a version number for the release. You can also use a multiple selection to release several versions at the same time.

Requirement

- The "Libraries" task card is open or you are in the library view.
- The versions that you want to release are "in test" or "In progress" status.
- The versions are consistent.
  A consistency check is performed as soon as you start the release. If errors that prevent a release occur during the consistency check, a message is displayed indicating how you can correct the errors.

Procedure

To release type versions, follow these steps:

1. Select the versions you want to release.
2. Right-click your selection.
3. Select the "Release version" command from the shortcut menu.
   The "Release type version" dialog box opens.

4. If necessary, change the properties of the version:
   - Enter a name for the type in the "Name" field. If you have selected several versions for release, the "Name" field cannot be changed.
   - In the "Version" field, define a main and an intermediate version number for the version to be released. If you have selected several versions for release, the "Version" field cannot be changed and the last version number is used for the release.
   - In the "Author" field, enter the editor of the version to be released.
   - In the "Comment" field, enter a comment on the version to be released.
5. Optional: Select the "Delete unused type versions from the library" check box to delete all versions from the library that are not connected to any instance in the project. Versions with dependencies on other types or library elements are not deleted.
6. Click "OK" to confirm.

Alternative in the library view:

1. Click the "Release version" icon in the toolbar while a version is opened for editing.
2. Continue with steps 3 to 5 of the description above.

Result

The selected versions are released.

The properties are applied for the types themselves, the versions to be released, and for all future versions. Versions already released remain unaffected by the changes.

If needed, all instances with the same original version are updated to the most recent version and the unused versions of the type are deleted.

Assigning a version (Page 524)

Adding types to a global library (Page 520)

Updating the project to the latest versions (Page 518)

Releasing all versions within a folder

When you are finished editing all types within a folder, release all versions simultaneously.

Requirement

- Your are in the "Libraries" task card or in the library view.
- The folder includes versions "in test" or "in progress" status.
- All versions "in test" or "in progress" are consistent.
  A consistency check is performed as soon as you start the release. If errors that prevent release occur during the consistency check, a message is displayed indicating how to correct the errors.

Procedure

To release all type versions within a folder, follow these steps:

1. Right-click the required folder.
2. Select the "Release all" command from the shortcut menu.
   The "Release type version" dialog box opens.
3. If necessary, change the properties of the version:
   - In the "Author" field, enter the editor of the versions to be released.
   - In the "Comment" field, enter a comment on the versions to be released.
4. Select the "Delete all unused type versions from the library" check box to delete all versions from the library that are not connected to any instance in the project. Versions with dependencies on other types or master copies are not deleted.
5. Click "OK" to confirm.

Result

All type versions "in test" or "in progress" status within the selected folder are released.

The properties are applied for the versions to be released and for all future versions. Versions already released remain unaffected by the changes.

Versions of types not used in the project may be deleted.

See also

Release versions (Page 516)

Updating the project to the latest versions

After you have updated several types in the project library, update all instances in the project to the most recent version of the types from the project library. If you do not want to apply the changes to the entire project, restrict the update to individual devices in the project.

Each of the following elements can be selected as source for the update:

- The entire project library
- Individual folders within the project library
- Individual types
  You can select multiple types.

Requirement

Your are in the "Libraries" task card or in the library view.

Procedure

To update instances in a project with the contents from the project library, follow these steps:

1. Select the entire project library or elements from it.
2. Right-click the required elements and select the "Update > Project" command from the shortcut menu.
   The "Update project" dialog box opens.
3. Select either the entire project or individual devices for the update.
4. Select the options for the update process:
   - The "Update all instances of the affected types" check box is always selected during this process.
   - Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.
   The update is performed.

Result

The following changes were made to the project:

- All older versions were deleted from the project library as needed.
- All instances within the selected devices were updated to the most recent version of the linked types.
- You can find a log of the update process in the projection tree under "Common data".

Updating the project to the latest type versions (Page 523)

Using logs (Page 376)

Updating a library with the contents of another library (Page 528)

Basics on types (Page 501)

Library basics (Page 470)

State of type versions (Page 503)

Remove the link between instance and type

Instances of types are always connected to the version of the corresponding types. They cannot be edited like an ordinary object. If you edit the instance, a new version of the type is created automatically in the library and the changes therefore affect the entire project.

If you remove the link between the instance and its type, you then edit the object like an ordinary object in the project tree.

Requirement

The instance may not be "in test".

Procedure

To remove the link between instances and their type versions, follow these steps:

1. Select one or more instances in the project tree.
2. Right-click the selection and select the "Terminate connection to type" command from the shortcut menu.
3. The link to the corresponding type versions is removed.

9.11.8.6 Working with types in global libraries

Adding types to a global library

Global libraries are used as a central resource when working on multiple projects. Among the types, only the types in the project library can be edited directly. Therefore, use the project library if you want to work on types. When you are finished editing a type in the project library, you can add the type to a global library. Adding types from the project library corresponds to a normal copy process from the project library.

Requirement

- The "Libraries" task card is displayed or the library view is open.
- The global library to which you want to add types is opened and can be written to.

Procedure

To add types to a global library, follow these steps:

1. Open the required folder in the global library in the "Libraries" task card or in the library view.
2. Drag one or more types from the project library to the "Types" folder or any subfolder of the global library.

Alternative:

1. Copy the required types from the project library to the clipboard.
2. Open the required global library in the "Global library" palette of the "Libraries" task card.
3. Right-click the "Types" folder or any of its subfolders.
4. Select the "Paste" command in the shortcut menu.

Result

The types are inserted in the global library. Dependent types, such as types of HMI user data types or tags, are also copied to the global library, provided they do not already exist there. This ensures that all necessary elements for generating an instance are present in the global library.

If a type already exists in the global library, the described action corresponds to an update of the global library. In this case, the most recent released versions of the types are added to the global library.

See also

Basics on types (Page 501)

Release versions (Page 516)

Assigning a version (Page 524)

Updating the project to the latest type versions (Page 523)

Library basics (Page 470)

Using types

To use types from the global library, create an instance of a particular version of the type at a suitable point in the project. If necessary, you can create uses of several types at the same time. Uses of a type are called instances in the project tree.

Possible points of use for type versions

Suitable points of use for types from the global libraries are:

- Folder in the project tree
  An instance of a type can be created in a folder in the project tree. The folder must be suitable for the particular type. If the type is a user data type, for example, you can only create the instance in the "PLC data types" folder.
- Editor
  An instance can be created from a type in a suitable editor. For example, you can create an instance from the type of a function block in another block. The type of the function block is called from another block in this way.

Linking the instance with the project library

In the project, instances of types from a global library are not linked to the type in the global library. Instead, a copy of the type and its dependent elements is generated in the project library when an instance is created. Dependent elements, for example, can be PLC data types that are referenced in a block. In each case, the copy of the type and the dependent elements in the project library contains the version that you have linked to the instances. If the type or a dependent element already exists in the project library, only the missing version is added in the project library, if necessary.

The instance is finally linked to the copy of the type in the project library. You can only assign a type to a device once irrespective of the version.

Requirement

- A device which supports the category of the type is already available in the project.
- The device is not assigned to any further instances of the same type.

Procedure

To use the version of a type in the project, follow these steps:

1. In the global library, select the versions from which you want to create an instance.
2. Using a drag-and-drop operation, move the desired versions of the types to the point of use.
   Alternative: To automatically use the newest version, move the types themselves from the library to the point of use using a drag-and-drop operation.
   For example, use a drag-and-drop operation to move the type of a function block to the block folder of the CPU in the project tree. To call the type directly from another block, for example, move the type from the library to the point of use in the program editor using a drag-and-drop operation.

Result

Missing types or individual versions are added in the project library. If a type is not yet present in the project library, it is stored in the same folder as before in the global library. An instance is created from the types and their dependent elements and inserted at the point of use. The instances are connected to the respective type version in the project library.

If you have created the instances in an editor, instances of the types are also created at the appropriate points in the project tree. The folder structure from the library is reproduced in the project tree. You will therefore find the instances in the same folders as in the global library.

Basics on types (Page 501)

Updating the project to the latest type versions (Page 523)

Library basics (Page 470)

Using the element view (Page 474)

Updating the project to the latest type versions

In large enterprises with numerous automation projects. the global libraries are frequently edited from a central location. The updated global libraries of the individual projects are made available after the completion of a new version. If you have received a more recent version of a global library, replace the outdated instances in your project with the most recent version. If you do not want to apply the changes to the entire project, restrict the update to individual devices in the project.

The project library is also updated with the new versions of the types in the global library during the updating of the project or individual devices.

The following elements can be selected as source for the updating:

- A global library
- Individual folders within a global library
- Individual types
  You can select multiple types.

Requirement

- Your are in the "Libraries" task card or in the library view.
- The updated global library is open.

Procedure

To update instances in a project with the contents from a global library, follow these steps:

1. Select the updated global library or the individual elements from it.
2. Right-click the global library or the required elements and select the "Update > Project" command from the shortcut menu.
   The "Update project" dialog box opens.
3. Select either the entire project or individual devices for the update.

4. Select the options for the update process:
   - The "Update all instances of the affected types" check box is always selected during this process.
   - Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.
   The update is performed.

Result

The following changes were made to the project:

- The most recent version of the select types is present in the project library. All older versions were deleted if necessary.
- All instances within the selected devices were updated to the most recent version of the linked types.
- You can find a log of the update process in the projection tree under "Common data".

Updating a library with the contents of another library (Page 528)

Basics on types (Page 501)

Library basics (Page 470)

Adding types to a global library (Page 520)

9.11.8.7 Assigning a version

A library is more clearly structured if types related by content have the same version number. The identical version number reflects the work progress. When you have completed the work on multiple associated types, you can assign the same version number to these types.

You have the following options to assign a common version to types:

- The entire project library or a complete global library
- One or more folders in a library
- One or more types

Requirement

- The "Libraries" task card or the library view is open.
- Your selection must not contain types with "in test" or "In progress" status.

Procedure

To assign several types the same version, follow these steps:

1. Select the types to which you want to assign a common version.
2. Select the "Assign version" command from the shortcut menu.
   The "Assign version" dialog box opens.
3. If necessary, change the properties of the version:
   - In the "Version" field, determine the new version number. The version number must be higher than the highest version number of all selected types.
   - In the "Author" field, enter the person responsible for the version to be released.
   - In the "Comment" field, enter a comment on the version to be released.
4. Click "OK" to confirm.

Result

The selected type versions are changed as follows:

- A new version of all selected types is created with the specified version number.
- The properties are applied to all selected types, the new version and to all future versions. Lower versions remain unaffected by the changes. If you make no changes to the properties, the properties of the last released version of each type are applied.
- The build number of dependent types is incremented to the next free build number as long as the dependent types were not in your selection. If you had selected a dependent type as well, the version number you specified will be assigned.

A log of the changes is created. If you have versioned the types in the project library, you find the log in the project tree under "Common data > Logs". If you have versioned types in a global library, you find the log in the "Common data > Logs" folder in the level below the global library.

Displaying logs of global libraries (Page 489)

9.11.9 Editing library elements

Types, master copies and folder can be cut, copied, pasted, moved, renamed or deleted in the usual way within the "Libraries" task card or the library view. Global libraries must be opened with write permission for each of the above-described processes.

Note

User-defined documentation for types and master copies

User-defined documentation is not affected by any of the operations within the library. If you move a master copy or a type to a different location, you also move the associated user-defined documentation in the file system to the corresponding location.

For additional help on using the user-defined documentation, refer to the chapter "Using user-defined documentation (Page 361)".

Copying types

The following rules apply when you copy types to the clipboard:

- Types are always copied to the clipboard with all associated versions. However, only versions that have previously been released are copied.
- Types are always copied to the clipboard with all dependent elements.
- Master copies are always copied to the clipboard with all type versions used in them.

Copying and pasting type versions

When you copy type versions to another library, the types must already exist in the target library.

Cutting elements

You can only paste previously cut library elements into the same library. In so doing, you can only paste master copies into the "Master copies" folder or any of its subfolders. Likewise, you can only paste types into the "Types" folder or any of its subfolders.

Pasting types

Pasting types in a different library corresponds to updating the target library.

The following rules apply when you have pasted a type into a different library:

- A type is always pasted with all its versions.
- If the type already exists in the target library, all versions that are more recent than the existing versions are added to the corresponding types in the target library.
- If there is already a version with released status in the target library, this version is not pasted again.

- If the same version exists with in test or in progress status in the target library, it is replaced by the released version.
- If a type needs other types, these are also added at the respective location.

Pasting master copies

When you paste master copies, all type versions contained in these copies are also pasted. If the corresponding types already exist in the library, only the missing versions are added to the individual types. If one of the types used does not yet exist, it is pasted at the highest level in the library. The type includes the type version that was used in the master copy.

Moving elements

When you move an element from one library to another, the element is copied and not moved. The same rules apply as described under "Pasting types" and "Pasting master copies".

Deleting of types and type versions

Note the following when you delete types or type versions:

- A type or a type version can only be deleted if there are no dependencies to other types.
- When you delete a type, all versions of the type are deleted.
- If you delete all versions of a type, the type is also deleted.
- If you delete a version that has instances in the project, the instances are also deleted from the project.
- If you delete a type that is also stored at the same time as a master copy, the master copy is also deleted.

Deleting instances

If you delete an instance that has dependencies to other instances, this instance is restored during the next compilation. The instance is then linked again to the original type version. This restores the consistency of the project.

Duplicating types (Page 509)

9.11.10 Updating a library with the contents of another library

An existing library can be updated with the contents of another library. The following options are available for updating libraries:

- Updating a global library with types from another global library or from the project library
- Updating the project library with types from a global library

Each of the following elements can be selected as source for the update:

- An entire library
- Individual folders within a library
- Individual types
  You can select multiple types.

During the update, new versions are added to the types that already exist in the target library. Types that do not yet exist in the target library are copied together with all their versions to the target library.

Note

User help for copying types

User help is not copied together with a type to another library. You need to copy the user help for types to the corresponding directory.

Additional help on using the user help can be found in the chapter "Conventions for creating user help (Page 367)".

Requirement

If you want to update a global library, you have to open it with write permission.

Procedure

To update a library with the contents of a different library, follow these steps:

1. Select a library or individual elements from a library as source for the update.
2. Right-click the source and select the "Update > Library" command from the shortcut menu. The "Update library" dialog box opens.
3. Select the type of library you want to update:
   - Select "Update the project library" to update the project library with types from a global library.
   - Select "Update a global library" if you want to update a global library.
4. Optional: In the drop-down list, select the global library that you want to update, if you want to update a global library.

5. Select the options for the update:
   - The "Update all instances of the affected types" option is always disabled during this process.
   - Select the "Delete all unused versions of the affected types" check box to delete all older versions of types from the project library if these are not assigned to any instance in the project and if there are no dependencies to other types. This option cannot be selected for the update of a global library, since types of a global library never have a point of use in the project.
6. Click "OK" to confirm.
   The update is performed.

Result

The following changes were made to the target library:

- Types not yet available in the target library were copied together with all their versions. More recent versions were added to the types that already exist in the target library. If a more recent version of a type already existed in the target library, the latest version was nevertheless copied and automatically assigned a newer version number.
- If needed, all versions of types were deleted from the project library if these were not used in any instance in the project.
- A log listing all performed changes to the target library was created for the update process. If you have updated the project library, you can find the log in the project tree under "Common data > Logs".
  If you have updated a global library, you can find the log in the "Common data > Logs" folder in the level below the global library.

9.11.11 Harmonizing names and path structure

You can harmonize the project with a library. This helps you correct the following items:

- Names of the instances:
  Instances can be created during the development phase of a library, the names of which are appended by "_1", "_2", etc. due to an automatic correction. This extension is used to prevent duplicate names in the project. During harmonization, the instances once again receive the names of their associated types.
- Path structure:
  The original path structure can be lost due to parallel development or copying of dependent instances. This affects the clarity of the project. During harmonization, the path structure within the project is adapted to the path structure of the library.

Procedure

To harmonize the names and the path structure, follow these steps:

1. Open the library management.
2. Click "Harmonize project" in the toolbar.
   The "Harmonize project" dialog box opens.
3. Select the device with which you wish to harmonize the library.
4. Select the "Harmonize paths between project and library" check box if you want to restore the path structure.
5. Select the "Harmonize names between project and library" check box if you want to have the names corrected.
6. Confirm your entries with "OK".

Result

Depending on your settings, the names and the path structure in the project are harmonized with the library.

The changes to the project are logged. The log is available under "Common data > Logs" in the project navigation.

9.11.12 Clean up library

You can clean up the project library or global libraries to remove types or versions that are not connected to any instance in the project. This step provides more clarity within the libraries and decreases the size of the library.

Cleaning up the project library

To clean up the project library, follow these steps:

1. Open the library management.
2. Click on "Clean up library" in the toolbar.
   The "Clean up project library" dialog box opens.
3. Select the scope in which types or versions are to be deleted:
   - to retain the version with the highest version number, even if this has no instance, select the option "Delete old type versions and retain the newest type version".
   - Select the option "Delete complete types" to delete the complete type if no version is connected to an instance.
4. Confirm your entry with "OK".
   Depending on your selection, either unused type versions or types are removed from the project library.
   The changes are logged. The log is available under "Common data > Logs" in the project navigation.

Clean up global library

To clean up a global library, follow these steps:

1. Open the library management.
2. Click on "Clean up library" in the toolbar.
   The "Clean up global library" dialog box opens.
3. Click "Continue".
   Unused type versions are deleted. The latest version of a type is always retained.
   The changes are logged. The log is available in the "Common data > Logs" folder in the level below the global library.

9.11.13 Comparing library elements

Introduction

You can compare devices from libraries with devices from both the current project as well as from the same or another libraries or reference projects. Note, however, that reference projects are write-protected. You can also compare instances in a device with their type version in a library. Not all actions are available for the comparison with types. You cannot, for example, overwrite an instance of a newer version with an older type version from the library.

When comparing library elements, you can always switch between automatic and manual comparison.

Procedure

To compare library elements with the device data of a project, follow these steps:

1. In the project tree, select the device whose data you want to compare to a library element and which allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The compare editor opens and the selected device is displayed in the left area.
3. Open the "Libraries" task card.
4. Select the library element that you want to compare to the device data.
5. Drag the library element into the right drop area of the compare editor.
   You can identify the status of the objects based on the symbols in the status and action area. When you select an object, the object properties and the corresponding object of the assigned device are clearly shown in the property comparison.
   You can drag other devices into the drop areas from the current project, a library or from a reference point at any time to start a new comparison. It does not matter which device you drag into the drop area.

9.12 Using cross-references

9.12.1 Using cross-references

Introduction to cross-references

The cross-reference list provides an overview of the use of objects within the project. You can see which objects are interdependent and where the individual objects are located. Cross-references are therefore part of the project documentation.

You can also jump directly to the point of use of an object.

Which objects you can display and localize in the cross-reference list depends on the installed products.

See also

Displaying cross references of an instance (Page 482)

9.13 Simulating devices

9.13.1 Simulation of devices

Introduction

You can use the TIA Portal to run and test the hardware and software of the project in a simulated environment. The simulation is performed directly on the programming device or PC. No additional hardware is required.

The simulation software provides a graphical user interface for monitoring and changing the configuration. It differs according to the currently selected device.

Integration in the TIA Portal

The simulation software is fully integrated in the TIA Portal but is only supported by certain devices. Therefore, the button for calling the simulation software is only active if the selected device supports simulation.

The simulation software for some devices requires its own virtual interface to communicate with the simulated devices. The virtual interface can be found in the project tree under the "Online access" entry next to the physical interfaces of the programming device/PC.

Once you have opened the software, additional help on the simulation software is available via a separate link.

See also

Starting the simulation (Page 534)

9.13.2 Starting the simulation

Some devices can be simulated with additional software. You therefore do not have to have the actual devices to perform comprehensive testing of your project.

Procedure

To start the simulation software, follow these steps:

1. Select the device you want to simulate, for example, in the project tree.
2. Select the "Simulation > Start" command in the "Online" menu.
   This calls the simulation software.

Simulation of devices (Page 533)

Editing devices and networks

10

10.1 Configuring devices and networks

10.1.1 Hardware and network editor

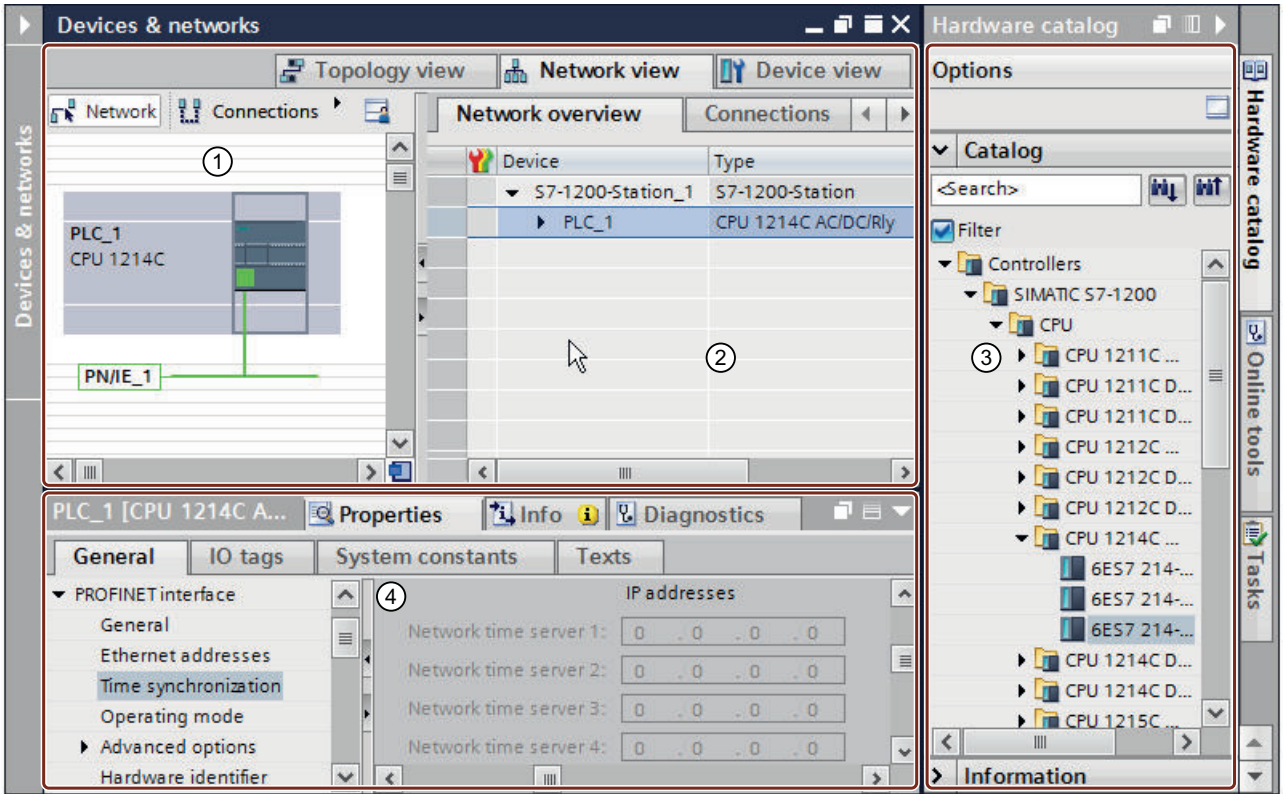
10.1.1.1 Overview of hardware and network editor

Function of the hardware and network editor

The hardware and network editor opens when you double-click on the "Devices and Networks" entry in the project tree. The hardware and network editor is the integrated development environment for configuring, networking and assigning parameters to devices and modules. It provides maximum support for the realization of the automation project.

Structure of the hardware and network editor

The hardware and network editor consists of the following components:



① Device view (Page 539), Network view (Page 537), Topology view (Page 542): Graphic area

② Device view (Page 539), Network view (Page 537), Topology view (Page 542): Table area

③ Hardware catalog (Page 548)

④ Inspector window (Page 547)

The hardware and network editor provides you with three views of your project. You can switch between these three views at any time depending on whether you want to produce and edit individual devices and modules, entire networks and device configurations or the topological structure of your project.

Drag the devices and modules you need for your automation system from the hardware catalog to the network, device ot topology view.

The inspector window contains information on the object currently marked. Here you can change the settings for the object marked.

10.1.1.2 Network view

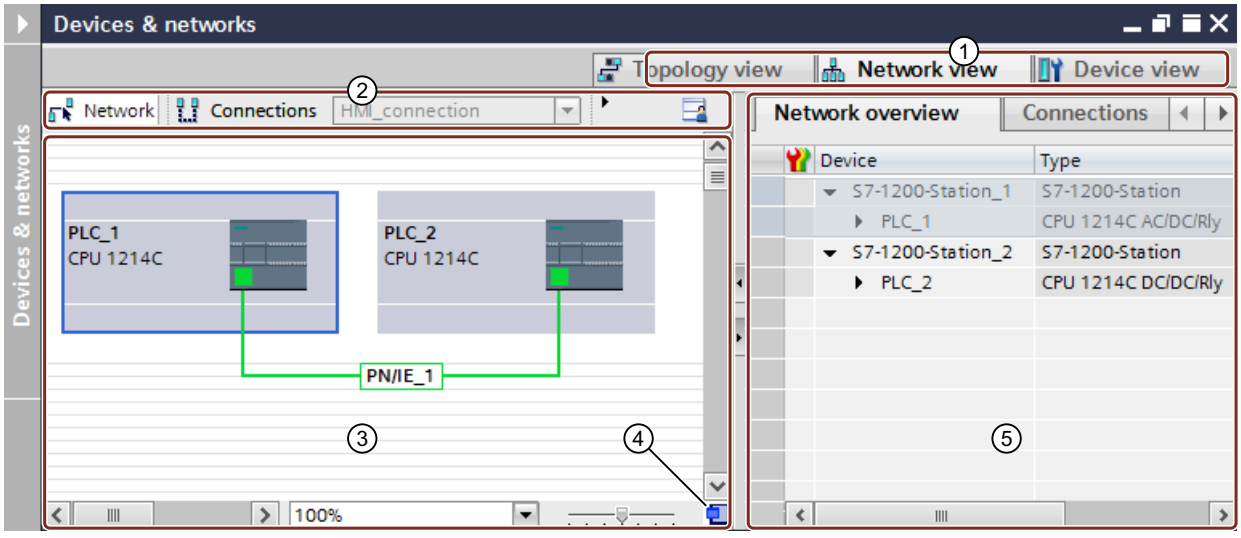
Introduction

The network view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Networking devices with one another

Structure

The following diagram shows the components of the network view:



① Changeover switch: device view / network view / topology view
② Toolbar of network view
③ Graphic area of network view
④ Overview navigation
⑤ Table area of network view

You can use your mouse to change the spacing between the graphic and table areas of the network view. To do this, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Mode to network devices.
	Mode to create connections. You can use the adjacent drop-down list to set the connection type.
	Mode to create relations.
	Opens the dialog for manual name assignment for PROFINET devices. For this purpose the IO device must be inserted and connected online with the IO system.
	Show interface addresses.
	Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.
	You can zoom in (+) or zoom out (-) the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the network view displays any network-related devices, networks, connections and relations. In this area, you add devices from the hardware catalog, connect them with each other via their interfaces and configure the communication settings.

The operator controls for view control are located at the bottom edge of the graphic area:

- Select the zoom leveling using the drop-down list. You can also enter a value directly into the field of the drop-down list.
- You can also set the zoom level using the slider.
- You can re-focus the window of the graphic area using the icon in the bottom right corner.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate in the overview navigation to the desired objects and display them in the graphic area.

Table area

The table area of the network view includes various tables for the devices, connections and communication settings present:

- Network overview
- Connections
- Relations

- IO Communication
- VPN

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

Tabular network overview (Page 585)

10.1.1.3 Device view

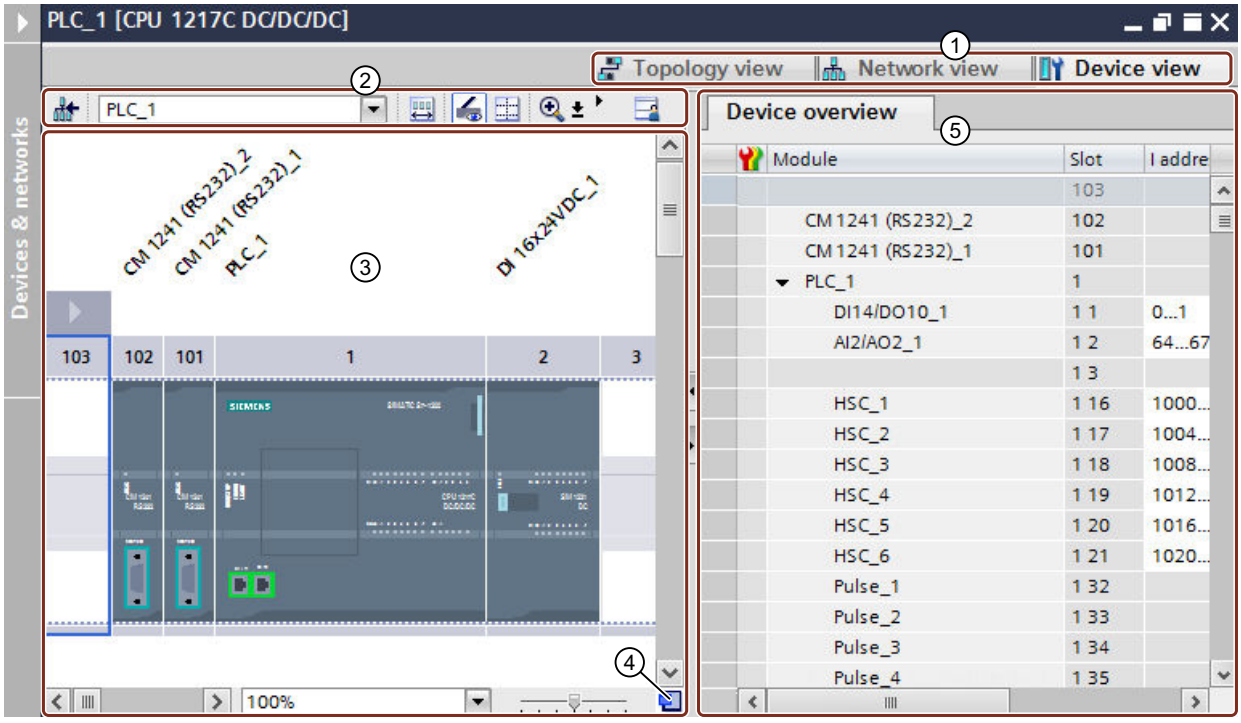
Introduction

The device view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Configuring and assign module parameters

Structure

The following diagram shows the components of the device view:



① Changeover switch: device view / network view / topology view
② Toolbar of device view
③ Graphic area of the device view
④ Overview navigation
⑤ Table area of device view

You can use your mouse to change the spacing between the graphic and table areas of the device view. To do this, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Switches to the network view. The device view can switch between the existing devices using the drop-down list.
	Show the area of unplugged modules.
	Opens the dialog for manual name assignment for PROFINET devices. For this purpose the IO device must be inserted and connected online with the IO system.
	Show module labels.

Icon	Meaning
	Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.
	You can use the Zoom icon to zoom in (+) or out (-) incrementally or to drag a frame around an area to be enlarged. With signal modules, you can recognize the address labels of the I/O channels from a zoom level of 200% or higher.
	Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the device view displays hardware components and if necessary the associated modules that are assigned to each other via one or more racks. In the case of devices with racks, you have the option of installing additional hardware objects from the hardware catalog into the slots on the racks.

The operator controls for view control are located at the bottom edge of the graphic area:

- Select the zoom leveling using the drop-down list. You can also enter a value directly into the field of the drop-down list.
- You can also set the zoom level using the slider.
- You can re-focus the window of the graphic area using the icon in the bottom right corner.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate in the overview navigation to the desired objects and display them in the graphic area.

Table area

The table area of the device view gives you an overview of the modules used and the most important technical and organizational data.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

10.1.1.4 Topology view

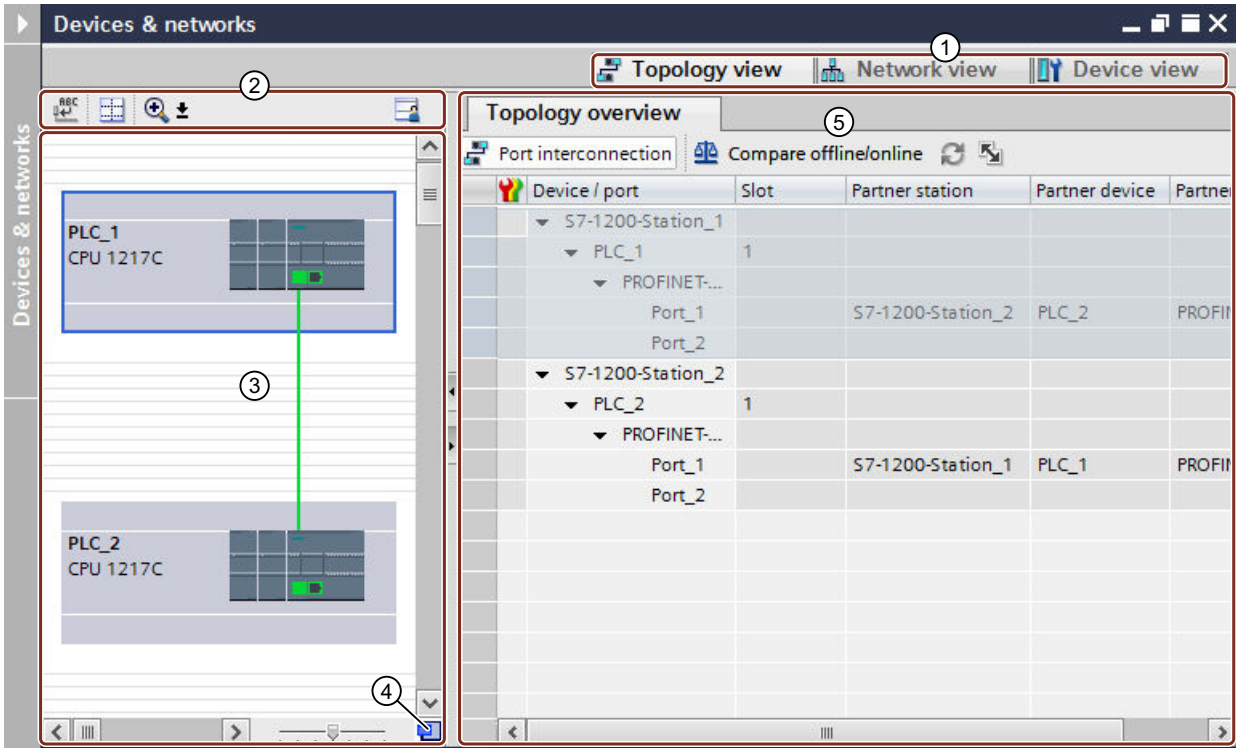
Introduction

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identifying and minimizing differences between the desired and actual topology

Structure

The following figure provides an overview of the topology view.



① Changeover switch: device view / network view / topology view
② Topology view toolbar
③ Graphic area of the topology view
④ Overview navigation
⑤ Table area of the topology view

You can use your mouse to change the spacing between the graphic and table areas of the topology view. To do this, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Opens the dialog for manual name assignment for PROFINET devices. For this purpose the IO device must be inserted and connected online with the IO system.
	Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.
	You can zoom in (+) or zoom out (-) the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the topology view displays Ethernet modules with their appropriate ports and port interconnections. Here you can add additional hardware objects with Ethernet interfaces. See: Adding a device to the hardware configuration (Page 565)

The operator controls for view control are located at the bottom edge of the graphic area:

- Select the zoom leveling using the drop-down list. You can also enter a value directly into the field of the drop-down list.
- You can also set the zoom level using the slider.
- You can re-focus the window of the graphic area using the icon in the bottom right corner.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate in the overview navigation to the desired objects and display them in the graphic area.

Table area

This displays the Ethernet or PROFINET modules with their appropriate ports and port interconnections in a table. This table corresponds to the network overview table in the network view.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

10.1.1.5 Overview of settings for hardware configuration

You can make some hardware configuration settings in the TIA Portal settings.

Overview

The following table provides an overview of the settings for the hardware configuration:

Group	Setting	Description
Information on product support	Deactivated	Prevents access to the Siemens Industry Online Support
	Via Internet	Enables access to product information about individual devices in the hardware catalog via the Internet.
Topological overview	Temporarily assigning an IP address	Assigns a temporary IP address for topology discovery if a device does not have a valid IP address. Topology information (LLDP) cannot be read from a device without valid IP address.
	Show a warning if the option is activated	Shows a warning when a temporary IP address is assigned to a device during topology discovery.
Compiling	Download module comment	Transfers any existing comments in addition to the hardware configuration when loading the hardware configuration to the device. The comment is available after the device is loaded to a programming device.

Changing the settings (Page 306)

10.1.1.6 Printing hardware and network configurations

Printout of hardware and network configurations

You can print out the following elements of the hardware and network view as part of the project documentation:

- Graphic network view
- Network overview table
- Graphic device view
- The device overview table
- The parameters of the object currently selected in the editor

Printout of editor content

If you start a printout within an opened editor and no module is selected, the content of the editor is always printed. This includes a graphic representation of the editor as well as the table for the editor. You can adapt the scope of the printout. You can specify whether only the graphic view, the table or both together are to be printed. Read section "Changing the print options (Page 546)" for more on this.

If the graphic is larger than the page layout you have selected, the printout is continued on the next page. No content is lost this way. Alternatively, you can change the zoom level of the graphic representation to fit the printout on one page. The printout is always made in the currently selected zoom setting.

To check that all content fits on one page, you can either use the print preview or activate the page break preview. When page break preview is activated, dashed lines are displayed within the graphic editor at the location where the page break is later made.

Printing very large tables

If a table is larger than the print area and therefore cannot be fully printed, the content of the table is not printed as a table, but instead as pairs between value and key.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

Object A

Property 1: Value A1

Property 2: Value A2

Object B

Property 1: Value B1

Property 2: Value B2

You can also preset this as a template so that tables are always printed as pairs between the key and the value. Read section "Changing the print settings (Page 421)" for more on this.

Printing module parameters

Parameters of selected modules are printed out along with the current value settings in text form. All parameters from corresponding modules are also printed. For example, if you have selected a CPU, the parameters of an inserted signal board, if present, are printed as well.

You can determine the scope of the module parameters to be printed. In the "Print" dialog, select whether all properties and parameters of a module are to be printed or whether to use the compact printout. If you select the compact form, only the entries in the "General" area of the module properties are printed. Comments on modules, as well as the author and module description, are excluded. In compact mode, the following module parameters are therefore printed, for example:

- Module specifications
  Name, module slot, short description, article number, firmware version
- Name of the PROFINET interface
- Subnet specifications
  Name of the subnet, ID of the S7 subnet

Creating a print preview (Page 433)

Printing project data (Page 436)

Activating the page break preview for printout (Page 546)

10.1.1.7 Activating the page break preview for printout

You can activate the page break preview for the printout in the graphic editor. If this option is activated, dashed lines are shown within the graphic editor at the locations where page breaks are later made during printout.

Procedure

Proceed as follows to activate the page break preview:

1. Select the graphic area of the corresponding view.
2. Click on the "Show page break" symbol in the toolbar of the graphic editor.
   Dashed lines are displayed within the graphic editor at the location a page break is later made.
3. To modify the frame layout, select the "Print" command in the "Project" menu.
4. To disable page break preview, click again on the "Show page break" symbol in the toolbar of the graphic editor.

10.1.1.8 Changing the print options

Changing the scope of the printout

When printing from an editor, you can specify whether both graphics and tables are to be printed or just one of the two. Both are printed by default.

Procedure

To change the scope of the printout, proceed as follows:

1. In the "Options" menu, select the "Settings" command.
2. In the area navigation, open the "Print settings" parameter group under "General".
3. Scroll to the "Hardware configuration" group.
4. Select or clear the "Active graphic view" check box, depending on whether you want to print the graphics of the network and device view as well.
5. Select or clear the "Active table" check box, depending on whether you want to print the table for the editor as well.

See also

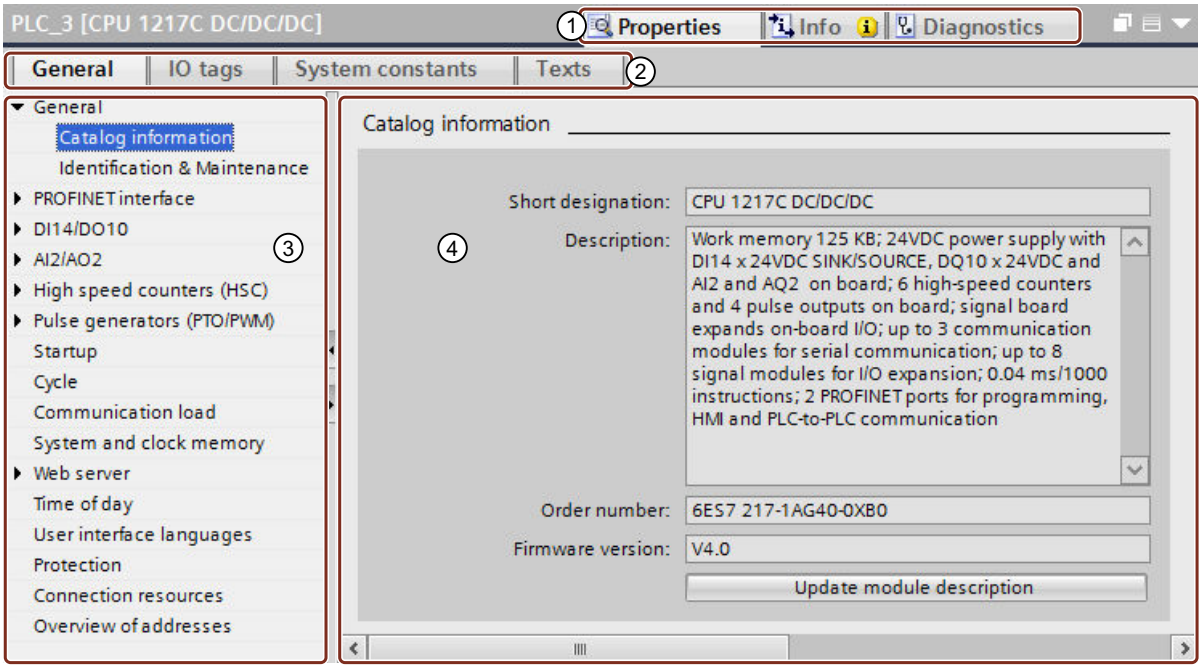
Printing hardware and network configurations (Page 544)

10.1.1.9 Inspector window

The properties and parameters shown for the object selected can be edited in the Inspector window.

Structure

The Inspector window consists of the following components:



① Switch between various information and work areas
② Switch between various tabs of the information and work areas
③ Navigation between various pieces of information and parameters
④ Display showing the selected information and parameters

Function

The information and parameters in the Inspector window are split into different types of information:

- Properties
- Info
- Diagnostics

To display the corresponding information and parameters, click in the relevant area. The "Properties" area is the most important one for configuring an automation system. This area is displayed by default and contains various tabs:

- General: Display the properties and settings of the device or module. Here you can edit the settings and parameters. The left pane of the Inspector window is used for area navigation. Information and parameters are arranged there in groups. If you click on the arrow symbol to the left of the group name, you can expand the group if sub-groups are available. If you select a group or sub-group, the corresponding information and parameters are displayed in the right pane of the Inspector window and can be edited there too.
- IO tags: Display the IO tags of the PLC. You can assign names for the tags, assign the tags to the user-defined tag tables via a drop-down list, and enter comments for the tags. The IO tags are also shown in the PLC tag table.
- System constants: Display the constants required by the system with the HW IDs of the modules. The system constants are also shown in the PLC tag table.
- Texts: Display the reference language and specify the text source for the project texts.

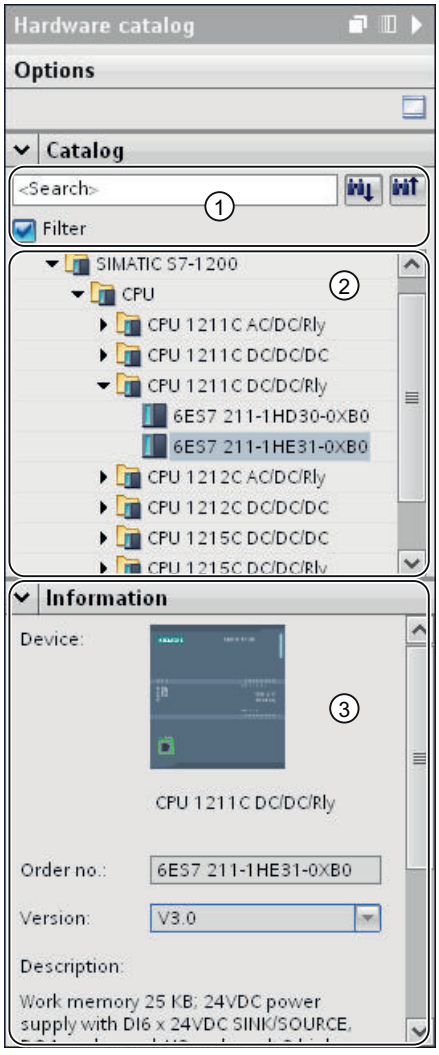
10.1.1.10 Hardware catalog

The "Hardware catalog" task card gives you easy access to a wide range of hardware components.

Structure

The "Hardware catalog" task card consists of the following panes:



① "Catalog" pane, search and filter function
② "Catalog" pane, component selection
③ "Information" pane

Search and filter function

The search and filter functions of the "Catalog" pane make it easy to search for particular hardware components. You can limit the display of the hardware components to certain criteria using the filter function. For example, you can limit the display to objects that you can also place within the current context or which contain certain functions.

Objects that can be used in the current context include, for example, interconnectable objects in the network view or only modules compatible with the device in the device view.

Component selection

The component selection in the "Catalog" pane contains the installed hardware components in a tree structure. You can move the devices or modules you want from the catalog to the graphic work area of the device or network view.

Installed hardware components without a license are grayed out. You cannot use non-licensed hardware components.

Hardware components belonging to various components groups thematically are partially implemented as linked objects. When you click on such linked hardware components, a catalog tree opens in which you can find the appropriate hardware components.

Information

The "Information" pane contains detailed information on the object selected from the catalog:

- Schematic representation
- Name
- Article number
- Version number
- Description

10.1.1.11 Enabling product support

For each device in the hardware catalog, you have the option of displaying additional information that is stored in the Siemens Industry Online Support. By default, the function is disabled. Instructions for enabling the function are given below.

Requirement

The TIA Portal has access to the Internet.

Procedure

To enable access to Siemens Industry Online Support, follow these steps:

1. In the "Options" menu, select the "Settings" command.
2. Open the "Hardware configuration" group in the area navigation.
3. Select the "Via Internet" check box.

Result

You can access product support, FAQs and manuals in the hardware catalog via the shortcut menu for the module.

See also

Displaying product support for hardware components (Page 551)

10.1.1.12 Displaying product support for hardware components

In the hardware catalog, you have direct access to information that is stored for each module in Siemens Industry Online Support. You can jump directly to the following pages in Siemens Industry Online Support:

- Information on product support
- FAQs
- Manuals

Requirement

- You have access to the Internet.
- Access to Product Support is enabled in the settings of the TIA Portal.
  For information on how to enable the function, refer to section "Enabling product support (Page 550)".

Procedure

To display the information for a particular module in Siemens Industry Online Support, follow these steps:

1. Navigate to the required module in the hardware catalog.
2. Right-click the module.
3. Select one of the following entries in the shortcut menu:
   - Information on product support
   - FAQs
   - Manuals

Result

The default browser set in the operating system is opened and the relevant page in the Siemens Industry Online Support is loaded.

Enabling product support (Page 550)

10.1.1.13 Keyboard operation: Navigation in the editor

You can use shortcut keys in the network and device view to navigate between the components of the hardware and network editor and its objects.

Navigating between elements and functions

Function	Shortcut keys
Switch to the next lower selection level You can for example, use <Return> to switch from a selected rack to the lower selection level of the devices and modules that are snapped onto it. If a device is selected, you can use <Return> to switch to the lower selection level of the interfaces that are displayed on the device.	<Return>
Switch to the next higher selection level You can use <Esc>, for example, to switch from a selected interface to the higher selection level of the devices and modules. If a device is selected, you can use <Esc> to switch to the higher selection level of the rack.	<Esc>
Navigation between objects in the current selection level You can use the arrow keys to switch between the objects within a current selection level. To change the selection level, use the <Return> or <Esc> keys.	<Up arrow> <Down arrow> <Right arrow> <Left arrow>
Switches to the device view	<Ctrl+Shift+D>
Switches to the network view	<Ctrl+Shift+N>
Switches to the topology view	<Ctrl+Shift+T>
Switch between editor elements Use the <Tab> key to switch from one editor element to the next element. Use <Shift +Tab> to switch to the previous element. You can switch, for example, between the graphical view, Speedy Splitter, table view or underlying tabs.	<Tab> <Shift+Tab>
Switch between tabs Use the <Ctrl+Tab> keys to switch from one tab to the next tab on the right. Use <Ctrl +Shift+Tab> to switch to the next tab to the left. You can use these keys, for example, to switch between the device view, the network view and the topology view.	<Ctrl+Tab> <Ctrl+Shift+Tab>

Opening elements and functions

Function	Shortcut keys
Opening the online and diagnostics view When a device is selected, <Ctrl+D> opens the online and diagnostics view for the selected device.	<Ctrl+D>
Opening the download to device dialog When a device is selected, <Ctrl+L> opens the advanced download dialog.	<Ctrl+L>
Add new device <Ctrl+N> opens the dialog for adding a new device.	<Ctrl+N>
Opens the "Hardware catalog" task card	<Ctrl+Shift+C>
Opens "Online Tools" task card	<Ctrl+Shift+O>

Keyboard operation in the TIA Portal (Page 339)

10.1.1.14 Keyboard operation: Editing objects

You can execute some of the functions of the network and device view directly with a combination of keyboard and mouse in the hardware and network editor. The keyboard operation in tables (Page 339) corresponds to standard characteristics. Here you find the keyboard operation for the graphic work area of the network and device view.

General keyboard operation

Function	Shortcut keys
Zoom in on view in frame Drag a frame in the graphical view in order to correspondingly change the size of the view.	<Ctrl+Space> + pressed mouse button
Move view Move the mouse pointer in order to move the view.	<Space> + pressed mouse button
Cancel current operation	<Esc>
Separate connection Use <Esc> or a double-click to exit connection mode when dragging a connection.	<Esc> or double-click
Zoom in graphic view The enlargement or reduction depends on the direction of rotation.	<Ctrl> + turn mouse wheel

Selected objects

Function	Shortcut keys
Select object	Mouse click
Cut an object The selected object is copied to the clipboard and deleted from the graphical view.	<Ctrl+X>
Copy object The selected object is copied to the clipboard.	<Ctrl+C>
Paste object The object from the clipboard is inserted into the selection.	<Ctrl+V>
Delete selected object	<Del>
Select several objects 1 You can add several objects to the selected objects by clicking on them individually. Alternatively, you can use <Shift> + pressed mouse key to drag a frame around the objects that are to be selected.	<Shift> + click
Select several objects 2 You can add several objects to the selected objects by clicking on them individually. Alternatively, you can use <Shift> + pressed mouse key to drag a frame around the objects that are to be selected. When holding down the <Ctrl> key, you can use a mouse click to deselect selected objects.	<Ctrl> + click

Function	Shortcut keys
Move selection When the mouse button is pressed, you can drag devices or modules to allowed slots on a rack.	Mouse button pressed
Copy selection Using <Ctrl> + pressed mouse button you can drag devices and modules to allowed slots on a rack. This copies the devices or modules.	<Ctrl> + pressed mouse button

10.1.2 Configuring devices

10.1.2.1 Basics

Introduction to configuring hardware

To set up an automation system, you will need to configure, assign parameters and interlink the individual hardware components. The work needed for this is undertaken in the device and network view.

Configuring

"Configuring" is understood to mean arranging, positioning, and networking devices and modules within the device or network view. Racks are represented symbolically. Just like "real" racks, they allow you to plug in a defined number of modules.

An address is automatically assigned to each module. The addresses can be subsequently modified.

When the automation system is started, the CPU compares the configuration that is preset by the software with the actual configuration of the system. Possible errors can be detected and reported straight away.

Assigning parameters

"Assigning parameters" is understood to mean the setting of properties of the components used. Parameter assignment is carried out for hardware components and for data exchange settings:

- Properties of modules with assignable parameters
- Settings for data exchange between components

The parameters are loaded to the CPU and transferred to the corresponding modules when the CPU starts up. Modules can be replaced with ease since the assigned parameters are automatically loaded into the new module during startup.

Adjusting the hardware to the project requirements

You need to configure hardware if you want to set up, expand or change an automation project. To do this, add hardware components to your configuration, connect them to existing components, and adapt the hardware properties to the tasks.

The properties of the automation systems and modules are preset in such a way that in many cases there is no need for additional parameter assignment. Parameter assignment is however needed in the following cases:

- You want to change the default parameter settings of a module.
- You want to use special functions.
- You want to configure communication connections.

See also

Changing properties of the modules (Page 1184)

Using existing configurations

Open existing projects

When opening existing projects, an automatic check is made to determine if the appropriate software is installed for all modules used within the project. If you try to open a project with modules that are not supported by the current scope of installation of the TIA portal, a message appears on opening the project informing you of the missing software components. If the software components are not absolutely required to open the project, the project can still be opened.

Reaction to missing software components

Projects that contain modules not supported by the current scope of the installation react as follows:

- Display the modules on the GUI
  - The non-supported modules are displayed in the project tree with all of their nested objects. However, the modules themselves cannot be processed in editors or in the inspector window. When possible, a replacement module is used that best matches the original module. Replacement modules are indicated by an exclamation mark.
  - Display of properties in tables is limited. This applies in particular to the display of network parameters, such as the IP address.
- Functional limitations
  - Non-supported modules cannot be printed out or compiled.
  - An online connection cannot be established to the module. It is therefore also impossible to download.
  - To change the device type, the device must first be deleted and then re-inserted. The "Change device type" function is not supported.
  - Copying and inserting nested objects, such as modules, is possible although the device itself cannot be copied and inserted.
  - The network configuration cannot be changed with replacement modules within the network view.
  - Cross-references can be displayed. However, the cross-references only reflect the state last saved within the project because on online comparison to the original module cannot be made.

See also

Opening projects (Page 379)

General slot rules

Introduction

Specific slot rules apply to each automation system and module.

If you select a module from the hardware catalog in the device view, all possible slots for the module selected are marked in the rack. You can only drag modules to marked slots.

If you insert, move or swap a module, the slot rules are also applied.

Consistency

Some slot rules depend on how the environment is configured. This means that you can sometimes plug modules into the rack although this would result in inconsistencies at the current time. If you change the configuration, for example by selecting different modules or module parameter settings, you can make the configuration consistent again.

In cases where inserting a module results in an inconsistency that can be corrected, this will be permitted. A consistency check is run when the configuration is compiled. Inconsistencies are displayed as alarms in the Inspector window under "Info". Based on the result of the consistency check, you can revise your configuration and make it consistent again.

Rules for arranging modules

The following rules apply generally to modules in racks:

- You can only plug modules into a rack.
- You can only plug interface modules into a module.
- You can only use modules of the same product or system family in one rack.

There are also other special rules for some modules:

- Can only be inserted in certain slots
- Insertion depends on other modules, CPUs or settings
- Limited number of uses in a rack

Browsing the hardware catalog

Introduction

Use the "Hardware catalog" task card to select the hardware components you want for a hardware configuration. Use the hardware catalog to select the interconnectable hardware components in the network and topology view and to select the modules you want in the device view.

Context filter

You can use the "Filter" option of the hardware catalog to restrict the number of displayed hardware components and the number of hardware components that can be found by searching.

If you select the filter, only those components are displayed that can be selected currently in the hardware catalog. If the do not select the filter, the entire hardware catalog is displayed.

If you switch between the various views, the view of the filter objects is adapted to the current context.

Search options

You can use the search function to search for specific entries in the hardware catalog. Note the following rules when entering search terms:

- No distinction is made between upper and lower case text.
- Dashes and blanks are ignored during the search.
- The search function considers parts of a search term.
- Several search terms must be separated by a space

You start the search from an object highlighted in the hardware catalog and either search upwards or downwards.

Icon	Meaning
	Downwards search
	Upwards search

Browsing the hardware catalog

If you want to browse the hardware catalog, proceed as follows:

1. Click in the entry field of the search function
2. Enter a search term. The search includes the following elements:
   - Name of device or module
   - Article number (MLFB)
   - Description in "Information" pane
3. Click on either the "Downwards search" or "Upwards search" buttons.

Note

To ensure the right search direction, note which point you have marked in the hardware catalog. To browse the entire catalog, click on the topmost object of the hardware catalog and start the search once you have entered the search term by clicking "Downwards search".

The first match with the search term found is displayed as the result. For more search results, again click on the "Downwards search" or "Upwards search" button.

Observe the context filter of the hardware catalog. If this is selected, the search in the hardware catalog is restricted to the displayed inserted hardware components.

See also

Hardware catalog (Page 548)

Working with racks

Introduction

To assign modules to a device, you need a rack, for example a mounting rail. Secure the modules on the rack and connect these via the backplane bus with the CPU, a power supply or other modules.

Creating a rack

If you insert a device in the network view, a station and a rack suitable for the device selected are created automatically. The rack and slots available are displayed in the device view. The number of slots available again depends on the type of device used.

Rack structure

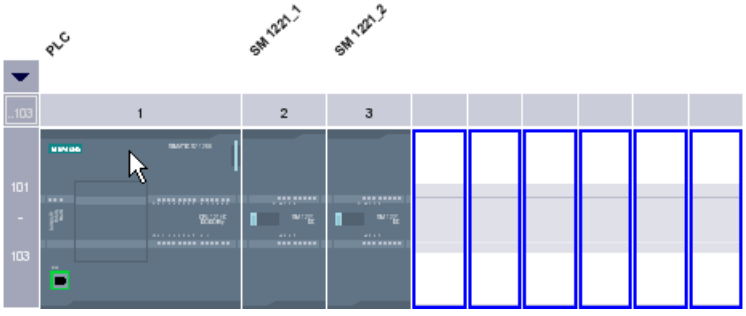
A rack always contains the device that has been inserted in the network view. The device is permanently assigned a slot which will depend on the type of device in question. There are additional slots on the right of the device and, if necessary, on left of the device; slot numbers are located above slots in which devices are plugged.

A corresponding short description is displayed above the plugged devices and modules. You show or hide this short description via the toolbar under "View" with the command "Display module titles" or the corresponding symbol in the toolbar of the device view (Page 539).

Symbol	Meaning
	Show module titles

When modules are selected in the hardware catalog, all the slots permitted for this module are marked. This allows you to see immediately the slot into which the selected module can be inserted.

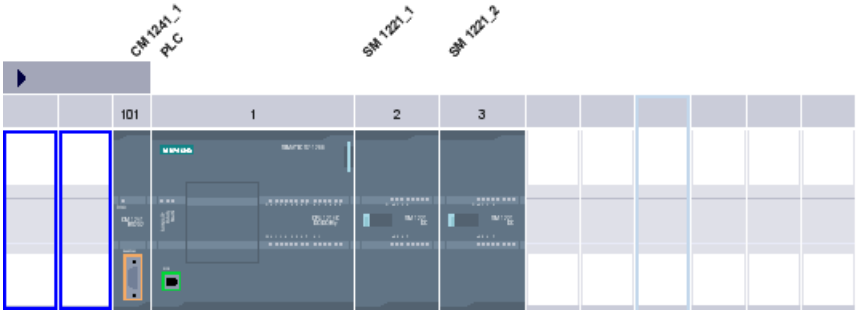
In the following screenshot, a signal module has been selected in the hardware catalog for a partially filled S7-1200 rack:



Since slots 101-103 are reserved for communications modules, only the other free slots are shown as available slots.

You can expand and collapse the front group of slots using an arrow symbol above the expandable slot. When the group of slots is collapsed, the first and last of the group's slot numbers are displayed.

The following figure shows the expanded slot group:



Groups of slots into which modules have already been plugged cannot be collapsed.

Multiple selection of modules and slots

There are various ways of selecting several modules or slots:

- By pressing <Shift> or <Ctrl>, you can select several modules or slots at the same time.
- Click outside the rack and then hold the mouse button and drag a frame to include the modules or slots you want to select.

Objects in the device view

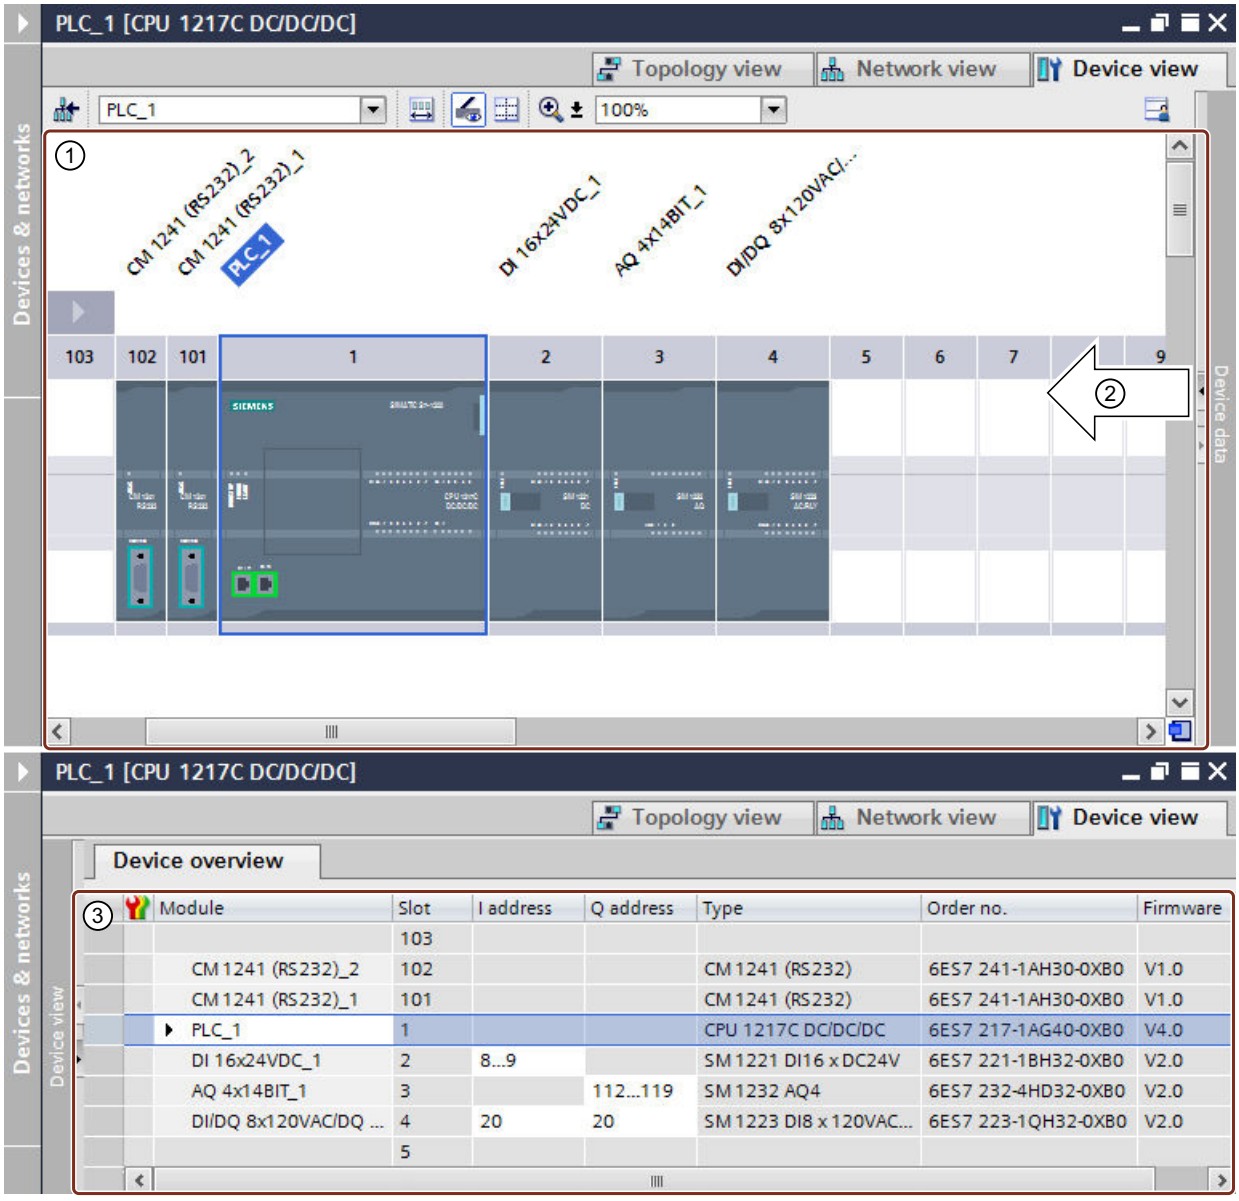
A graphic display of the rack and the devices plugged into it is shown in the left area of the device view. You can see the device overview in the right area of the device view. The device overview is a table showing you the most important information about the modules inserted in the rack. Both areas are displayed in a window. The size of both areas is adjusted using a divider. You can also use it to display one or the other area in full or to hide them.

Structure and content of device view

The offline configuration of the devices in the rack are displayed in the graphic device view. This is a symbolic representation of the configuration on the real rack.

The rack configuration is displayed as a table in the device view. Each line in the table contains the information for assigning a slot.

The following screenshot shows the device view with the configuration of a SIMATIC S7-1200 CPU.



① Graphic view of the allocation of the rack by the CPU and various modules in slots 1 to 4, as well as 101 and 102.

② You can use the divider to adjust the proportion of the device view between the left area (graphic view) and the right area (device overview). If you click on the arrows, you can quickly switch the division of the separate areas.

③ Device view with the tabular representation of the rack's slots and the inserted components. You can show additional columns and hide displayed columns using the shortcut menu of the column title.

Each line in the device overview represents one slot. The key information for each slot is displayed in the various columns:

Column	Meaning
Online status	Symbolic representation of the online status
Fail-safe	Symbolic representation for fail-safe module
Module	Name of module, can be edited in any way

Column	Meaning
Rack	Number of the rack
Slot	Slot number
I address	Input address area, can be edited in any way
Q address	Output address area, can be edited in any way
F-source address	F-source address when using fail-safe I/O
F-destination address	F-destination address when using fail-safe I/O
Type	Catalog name of module
Article no.	Article number of the module
Firmware	Firmware version of the module
Comment	Optional comment

Display in I/O channels

If you set the zoom level in the device view to at least 200%, you can see the individual I/O channels for I/O modules. If you have defined PLC tags for the channels, the names of the PLC tags are displayed.

The figure below shows the input channels of the digital input module with the two PLC tags "Test1" and "Test2" at a zoom level of 400 %.

You can select the individual I/O channels and have the following options for channels with PLC tags:

- You see the general properties of the selected PLC tag in the inspector window under "Properties".
- In the inspector window under "Info > Cross-references" you find the cross-reference information on the selected PLC tag. If you have selected the PLC tag, you can also open the cross-reference information using the shortcut menu.

See also

Device view (Page 539)

Area for unplugged modules

In some cases, the modules for a hardware configuration are not assigned a slot for short periods. Such unplugged modules are moved to the area of unplugged modules, a special area in the device view.

Adding modules to the storage area

The modules that, for example, should be assigned to a device using a copy action but for which the corresponding rack does not have a free compatible slot, are moved automatically into the area of unplugged modules.

Under the following conditions, modules are automatically added to the area of unplugged modules:

- In the network view, a module is moved to a device but the rack does not have a compatible free slot.
- In the device view, a module is moved or copied from the rack, the hardware catalog or the project tree straight into the storage area.

CPs and FMs that occupy a network resource can be moved into the area of unplugged modules but will lose the network resources they have been assigned.

You can add modules to the area of unplugged modules by means of drag-and-drop, for example. To do this, the area must be opened.

Using the area of unplugged modules

Use the corresponding button to open the area of unplugged modules.

You can find the area of unplugged modules in the device view.

You open the area of unplugged modules with the respective icon in the toolbar of the device view (Page 539).

Icon	Meaning
	Open area of unplugged modules

Note

To free up slots, move modules from your configuration into the storage area and plug the modules you want from the storage area into the freed up slots.

You can use this approach to temporarily move modules whose parameters have already been assigned out of the configuration without deleting them.

Treatment of modules in the storage area

The following rules apply to modules in the storage area:

- The modules appear in the project tree under the corresponding device in the "Local modules" folder.
- The modules retain all settings and parameters previously assigned.
- The modules are not taken into account during loading to a target system. This means that a consistency check is not undertaken for modules in the area of unplugged modules.
- Using the context menu, the modules can be copied, cut, or deleted, for example.

10.1.2.2 Configuring individual devices

Selecting a CPU

Introduction

Select a CPU from the hardware catalog and place it, together with a rack, in the network view. On this device drag the desired modules from the hardware catalog; they are arranged automatically on the rack.

Selecting the components in the hardware catalog

Each hardware component is displayed as a folder in the hardware catalog. When you open this folder, you see the different versions of the selected hardware component with its respective article numbers.

There will be an example of how to set up a CPU with a rack in network view.

Requirement

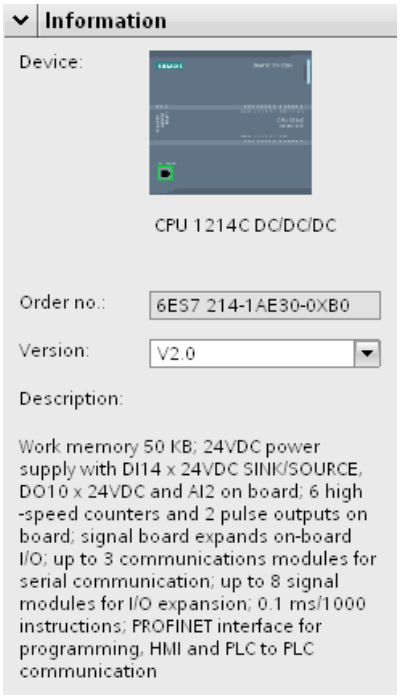
- The hardware catalog is open.
- You must be in the network view.

Procedure

To select a CPU from the hardware catalog, proceed as follows:

1. In the hardware catalog navigate to the folder with the desired CPUs.
2. Open the folder with the desired CPU type; you will see all article numbers for the selected CPU type.

3. Click on a CPU article number to get information about the selected CPU in the "Information" pane.



4. Set up the CPU and a rack. You have the following options:
   - Use drag-and-drop to drag the CPU from the hardware catalog into network view.
   - Use Copy & Paste to copy the CPU to the network view.
   - Double-click the CPU entry in the hardware catalog.

Browsing the hardware catalog (Page 557)

Adding a device to the hardware configuration (Page 565)

Inserting a module into a rack (Page 568)

Working with racks (Page 558)

Creating an unspecified CPU (Page 567)

Adding a device to the hardware configuration

Introduction

There are various ways of adding a connectable device from the hardware configuration in the network view and the topology view:

- Command "Add new device" in the project tree
- Double-click device in hardware catalog

- Drag-and-drop from the hardware catalog in network view or in topology view:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- "Add > Device" command from menu bar in network view or topology view
- Shortcut menu of a device in the hardware catalog for copying and pasting

A suitable rack is created along with the new device. The selected device is inserted at the first permitted slot of the rack.

Regardless of the method selected, the added device is visible in the project tree and the network view of the hardware and network editor.

Adding device using the project tree

To use the project tree to add a device to the hardware configuration, proceed as follows:

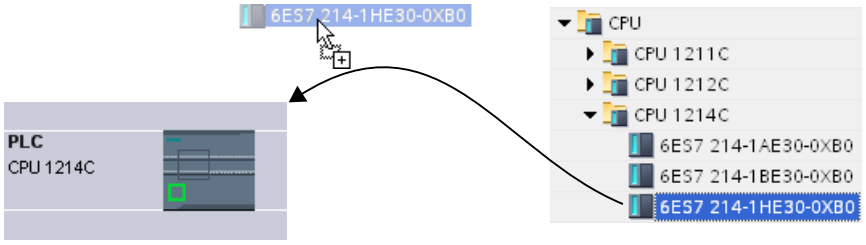
1. Click on the command "Add new device" in the project tree.
   The "Add new device" dialog box opens.
2. Display the required device in the tree structure:
   - Go to required device in the tree structure.
   - Enter a device name in the entry field.
3. Select the required device from the tree.
   More information about the device presently selected is displayed on the right-side of the dialog box.
4. If necessary, set the firmware version using the drop-down list in the dialog box.
5. Select the "Open device view" check box if you want to change to the device view immediately after adding the device.
   There you can immediately continue with device configuration and equipping the rack.
6. Click on "OK" to add the device selected.
   The dialog box closes.

Adding device from the hardware catalog

To add a device to the hardware configuration using the hardware catalog, proceed as follows:

1. Open the network view or the topology view.
2. Open the hardware catalog.
3. Go to the required device in the hardware catalog.
4. Click on the chosen device to select it.

5. If necessary, set the firmware version using the drop-down list in the hardware catalog.
6. Drag the device to the network view or the topology view.



You have now placed the device in the network view or in the topology view. The displayed rectangle (in other words "Station") symbolizes the plugged device together with its rack and any lower-level modules. Double-click on the device or station to open the device view and view the new rack and inserted device. In the next steps, you can configure the device in the device view and equip the rack with modules.

Creating an unspecified CPU (Page 567)

Topology view (Page 542)

Creating an unspecified CPU

Introduction

If you have not yet selected a CPU but have already started programming or want to use an existing program, you have the option of using an unspecified CPU. You can also adjust some settings with unspecified CPUs. The setting options are restricted to parameters that all CPUs of the same CPU family have in common.

Creating an unspecified CPU in the portal view

To create an unspecified CPU in the portal view, follow these steps:

1. Now, click one of the following options:
   - "Devices & networks > Add new device"
   - "PLC programming" > "Device" button
2. For a device family, select an unspecified CPU from the tree structure of the "Add new device" dialog.
3. Click on "Add".

An unspecified CPU is created and the device view for this CPU appears.

Further options for creating unspecified CPUs

In the project view, you can create unspecified CPUs like specified CPUs:

- Using the "Add new device" button in the project tree
- In the "Hardware catalog" task card

You can also use these methods to create multiple unspecified CPUs.

Specifying unspecified CPUs

You have two options for specifying unspecified CPUs:

- Use drag-and-drop to assign an existing CPU from the hardware catalog to an unspecified CPU by means of module replacement (Page 574).
- Select a selected, unspecified CPU and then the menu command "Online > Hardware detection" and assign a CPU identified online. For this purpose, you assign an IP address using the "Add address for PG/PC" button.

Note

If you want to go online after the hardware detection, you have to first download the detected configuration to your project; otherwise, an error may occur due to inconsistent configurations. After hardware detection, the article numbers of the CPU in the project and the actually existing CPU are identical, but their parameters are not. The parameters of the CPU in the project have the default values; the parameters of the actually existing CPU have the values set by you.

Selecting a CPU (Page 564)

Adding a device to the hardware configuration (Page 565)

Inserting a module into a rack

Introduction

Once you have added devices from the hardware catalog to your configuration in network view, you can add modules to the devices. There are various ways of adding a module to a rack in the device view:

- If there is an available valid slot, double-click a module in the hardware catalog.
- Use drag-and-drop to move the module from the hardware catalog to an available valid slot in the graphic or table area:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- Select "Copy" in the shortcut menu for a module in the hardware catalog and then select "Paste" in the shortcut menu on an available valid slot in the graphic or table area.

To access the device view from the network view, double-click a device or station in the network view or select the Device view tab. The device view contains an illustration of the device selected within a rack. The graphic illustration of the rack in the software corresponds to the real structure, i.e. you can see the same number of slots as exist in the real structure.

Note

You can also move a module to a rack in the network view. The filter function for the hardware catalog must be deactivated in this instance. The module is automatically plugged into a free and permitted slot. If there are no slots available, the module will be moved to the area of unplugged modules (Page 563).

Equipping a rack

Arrange the modules on a rack according to the applicable slot rules.

After a module has been inserted in a rack with an already inserted CPU, the address areas are checked automatically so that addresses are not assigned twice. After it has been inserted, each module then has one valid address range. To do so, DP slaves and IO devices must be networked with a CPU via the corresponding DP master or IO system.

Requirements

- You are in the device view.
- The hardware catalog is open.

Adding module from the hardware catalog

How to insert a module from the hardware catalog into a rack is illustrated based on the example of a signal module. To do this, follow these steps:

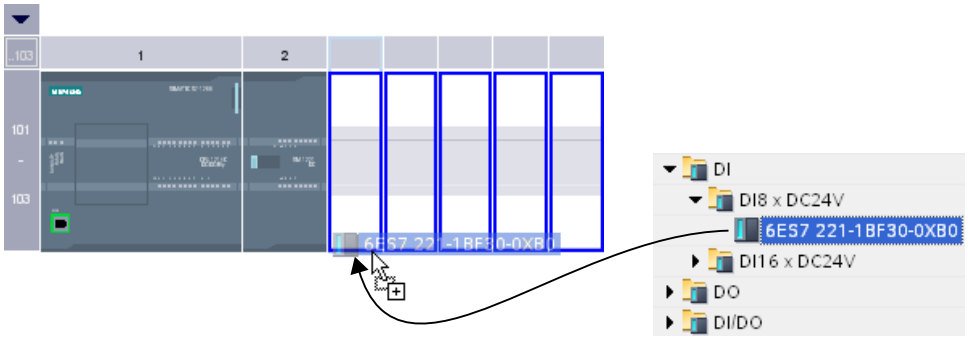
1. Go to the required module board in the hardware catalog.

   Note

   If you activate the filter function of the hardware catalog, only those modules which match the selected device type will be displayed.

2. Select the chosen module.

3. If necessary, set the firmware version using the drop-down list in the hardware catalog.
4. Drag the signal module to a free slot in the rack.

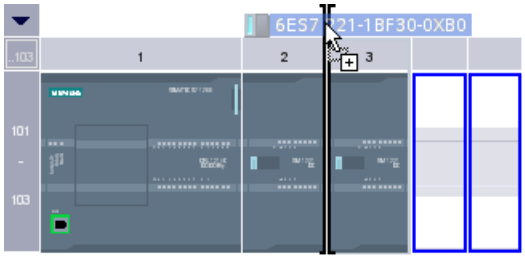


You have now inserted the digital signal module in a slot in the rack. Repeat these steps with the other modules.

The name of the module is displayed above the inserted modules. You can activate or deactivate module labeling in the menu bar with "View > Show module labels".

Inserting module

You can also drag modules and drop them between modules that have already been inserted. To do this, drag a module above and between the two existing modules while holding down the mouse button.



A mouse pointer appears. When you release the mouse button, all modules plugged to the right of the pointer are moved one slot to the right. Any redundant modules are moved to the area of unplugged modules. The new module is plugged at the point of the freed up slot.

Area for unplugged modules (Page 563)

General slot rules (Page 556)

Deleting a hardware component

There are various ways of deleting hardware components. Deleted hardware components are removed from the system and assigned addresses made available again.

Rules

- CPUs or modules from the rack and from the area of unplugged modules can be deleted.
- When a rack is deleted in the device view, the plugged hardware components are moved to the area of unplugged modules.

Procedure

Proceed as follows to delete a hardware component:

1. Select the hardware components you want to delete.
   - Network view: Select devices or network relevant hardware components in the graphic view or in the network view.
   - Device view: In the graphic view or device overview, select racks or modules in racks or in the area of unplugged components.
   - Topology view: Select devices or hardware components with Ethernet interfaces in the graphic view or in the topology view.
   - Project tree: Select devices or individual hardware components from the tree structure.
2. Select "Delete" from the shortcut menu or press <Del>.
   If the "Delete" menu item is unavailable, your selection contains at least one component that cannot be deleted.

The selected hardware components are deleted.

Note

Deleting hardware components may result in inconsistencies in the project, such as violation of slot rules. Inconsistencies are reported during the consistency check. Correct the inconsistencies by taking appropriate action, for example, ensuring compliance with the slot rules.

Keyboard operation: Editing objects (Page 553)

Copying a hardware component

You can copy hardware components in the device or network view. Copied hardware components are stored on a clipboard and can be pasted at another point from this clipboard. Copied stations are pasted as new stations in the network view. Copied devices and modules can be pasted into existing racks in the network and device view.

Rules

- Single objects as well as several objects can be copied at the same time.
- Modules inserted in the rack and in the area of unplugged modules can be copied.

- You can only copy devices and modules to free and valid slots in keeping with the slot rules.
- Racks with a CPU inserted cannot be copied individually, but only as complete units along with all inserted hardware components.

Procedure

Proceed as follows to copy a hardware component:

1. Select the hardware components you want to copy.
   - Device view: Select the module in a rack or put it in the area of unplugged modules.
   - Network view: Select the station or the relevant hardware component from the network view.
   - Project tree: Select the station or module.
2. Select "Copy" from the shortcut menu or press <Ctrl+C>.
   If the "Copy" menu item is unavailable, your selection contains at least one component that cannot be copied.
3. Select the location at which the content of the clipboard is to be pasted.
   - Device view: Select a free slot in the rack or area of unplugged modules.
   - Network view: Select a station where you want to insert devices or modules or move the mouse pointer to a free location in the network view to paste a copied station or a hardware component relevant to the network view.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.
   If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The selected object is pasted at the chosen point.

Once you have selected a station where you want to insert a module in the network view, the module is inserted in the first free and valid slot. If no free, valid slots are available, the object is inserted in the area of unplugged modules.

Note

You can also copy a module from one device to another:

To do so, copy a module in the hardware and network editor, select a different device in the network view or the drop down list of the device view and insert the module.

You can insert the copied object directly in a slot or place it in the area of unplugged modules in the device view. If you add the copied object in the network view of a device or a station, it will be inserted in the first available slot.

If there is no slot available for the object, it is automatically placed in the area of unplugged modules (Page 563).

Note

You can use <Ctrl> and drag-and-drop to directly copy a selected hardware component.

See also

Keyboard operation: Editing objects (Page 553)

Moving a hardware component

You can move hardware components in the device or network view.

Rules

- You can move devices and modules from the rack and the area for unplugged modules taking the slot rules into consideration.
- CPs can be moved in the network view. The CP is plugged in a free and valid slot in the target device. If there are no free slots available, the CP to be inserted is moved to the area for unplugged modules.
- In the network view, CPU and slave head modules can be moved between the devices; depending on CPU type also within the rack.

Note

Moved CPs are disconnected from their network but keep their network parameters and address. If you reconnect the CP to the network and its address has been assigned, use a dialog to assign a new unique address to the CP.

Procedure

Proceed as follows to move a hardware component:

1. Select the hardware component you want to move.
   - Device view: Select the module in a rack or put it in the area of unplugged modules.
   - Network view: Select the hardware component of relevance to the network view.
2. Select "Cut" from the shortcut menu or press <Ctrl+X>.
   If the "Cut" menu item is unavailable, your selection contains at least one component that cannot be cut.
3. Select the location to which the cut object is to be moved.
   - Device view: Select a free slot in the rack or area of unplugged modules.
   - Network view: Select a station where you want to insert devices or modules.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.
   If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The selected hardware component is moved to the target. If the hardware component being moved is a networked object, it is disconnected from the network.

Note

You can use drag-and-drop to directly move a selected hardware component.

See also

Keyboard operation: Editing objects (Page 553)

Replacing a hardware component

You can replace hardware components with others. This, for example, allows you to replace unspecified CPUs (Page 567) with available CPUs from the hardware catalog.

Rules

You can only replace hardware components if they support module replacement and if the two components are compatible.

Procedure

To replace one module with another, proceed as follows:

1. Select the module you want to replace.
2. Open the shortcut menu:
   - If the "Replace device" entry is enabled, the module can be replaced.
   - If the "Replace device" entry is disabled, a module cannot be replaced.
3. Click on "Replace device" in the shortcut menu. The "Replace device" dialog box appears.
4. Under "New device" in the tree structure, select the module with which you want to replace your current module.
5. Click "OK".

The existing module is replaced by the new one.

As an alternative, you can take a module by dragging it from the hardware catalog to the module you are replacing. If the module can be replaced by the selected module, this is indicated by the mouse pointer symbol.

Editing properties and parameters

Once you have inserted hardware components in your rack, you can edit their default properties, for example parameters or addresses in the network or device view.

Requirement

You are in the device view.

Note

You can also edit properties and parameters in the network view. In the graphic network view, you have access to the network-related hardware components and the station. You can access modules and hardware components not displayed in the graphic network view using the table network view.

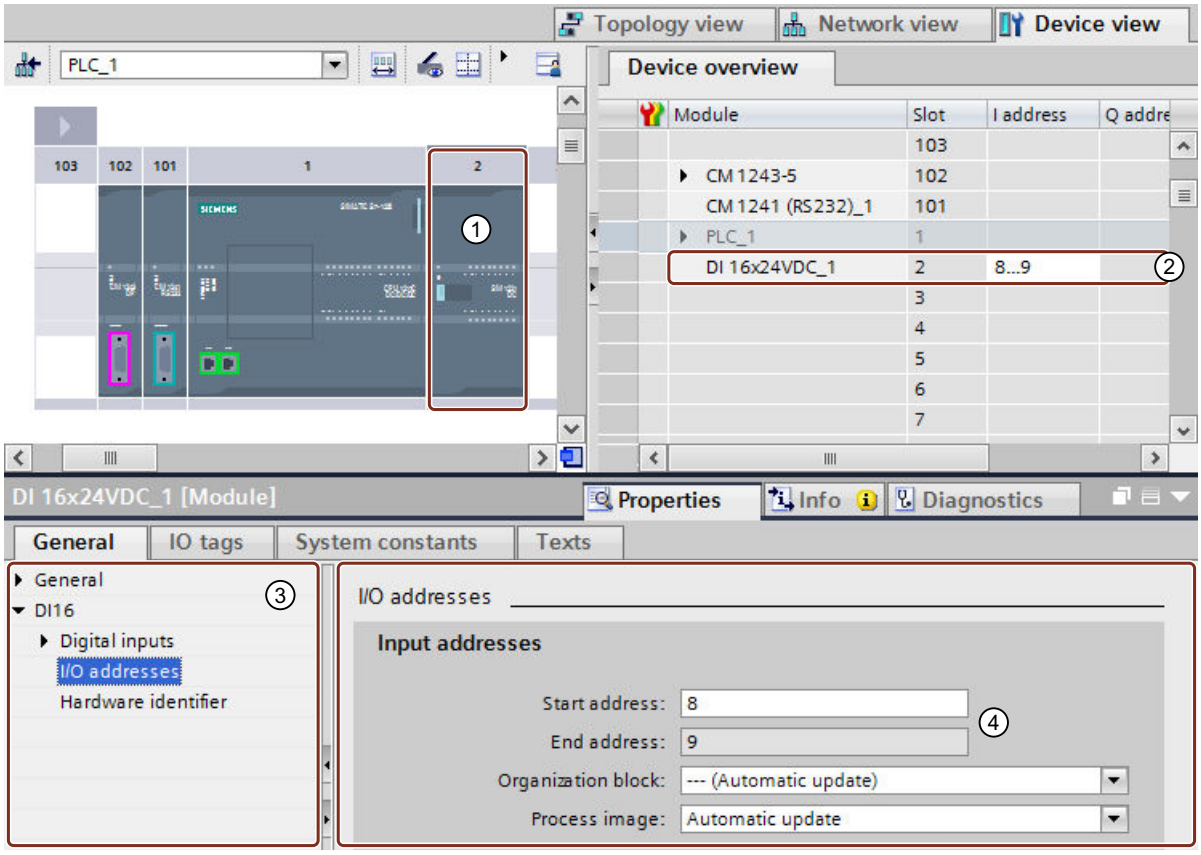
Procedure

To change the properties and parameters of the hardware components, proceed as follows:

1. In the graphic view, select the CPU, module, rack or interface you want to edit.
2. Edit the settings for the selected object:
   - Use the table view to edit addresses and names, for example.
   - In the Inspector window additional setting possibilities are available in "Properties".

Note that modules can only be fully parameterized if they are assigned to a CPU. Therefore, PROFIBUS or PROFINET interfaces modules must first be networked with the CPU or a centrally inserted communication module so that they form a master system or IO system. Only then is it possible, for example, to edit the addresses of the distributed components that are inserted.

Example of changing settings



① Selection of a module
② Editing option for addresses in the device overview
③ Selection options in the inspector window
④ Editing option for addresses in the inspector window

Inspector window (Page 547)

Input and output addresses in the address overview

Introduction

The currently used input and output addresses can be displayed in the address overview in a table form. The address overview can be found in the Inspector window under "Properties" of the CPU.

Design of the address overview

With the different check boxes, you can set which objects should be displayed in the address overview:

- Inputs: Display of the input addresses
- Outputs: Display of the output addresses
- Address gaps: Display of open address spaces
- Slot: Display of the slot number

The following information is typically shown in the address overview:

Table header	Meaning
Type	Indicates whether the area is an input address area or an output address area.
Addr. from	Start address of the address range.
Addr. to	End address in the address range.
Module	Module using the address area.
PIP	Process image partition (see "PIP" below).
OB	Organization block that is assigned to the process image. This column is not available for every CPU.
DP	Number of the master system. You can use the number to determine which slaves are assigned to a master. The value in brackets specifies the PROFIBUS address of the hardware component.
PN	Number of the IO system. The value in brackets stands for the device number of the hardware component.
Rack	Number of the rack on which the hardware component is inserted.
Slot	Number of the slot in the rack in which the hardware component is inserted.

PIP

The "PIP" table column shows the assignment of the address to the cyclic process image or to a process image partition (PIP).

For S7-300/400:

- "OB1-PA": The address is assigned to the cyclic process image. The operating system updates this address automatically in each program cycle.
- "PIP x": The address is assigned to the process image partition x (for example PIP 1, no cyclic process image). The operating system updates this PIP when the assigned OB is executed. If this PIP is not assigned to an OB, the operating system does not update this PIP. You have the option to update the PIP yourself with the instructions "UPDAT_PI" and "UPDAT_PO" (for S7-400 and some S7-300 CPUs).

For S7-1200:

- "Automatic update": The address is assigned to the cyclic process image (PIP 0). The operating system updates this address automatically in each program cycle.
- "None": The address not assigned to any process image partition. You access this address directly in the user program (direct I/O access, no process image).

- "PIP x": The operating system updates this PIP when the assigned OB is executed. If this PIP is not assigned to an OB, the operating system does not update this PIP. You have the option to read inputs or write outputs in the user program via direct I/O access. The instructions "UPDAT_PI", "UPDAT_PO", "SYNC_PI" and "SYNC_PO" are not supported for S7-1200.
- "PIP OB servo": The process image partition "PIP OB Servo" is not assigned to an organization block (fixed setting for organization block: "---(None)"). The operating system does not update this PIP or any of the addresses contained in it: You access the addresses directly in the user program (direct I/O access).

For S7-1500:

- "Automatic update": The address is assigned to the cyclic process image (PIP 0). The operating system updates this address automatically in each program cycle.
- "None": The address not assigned to any process image partition. You access this address directly in the user program (direct I/O access, no process image).
- "PIP x" (PIP 1 to PIP 31): The operating system updates PIP x when the assigned OB is executed. If this PIP is not assigned to an OB, the operating system does not update PIP x. You have the option to update the PIP x in the user program with the instructions "UPDAT_PI" and "UPDAT_PO". If PIP x is assigned to an isochronous mode interrupt OB (OB 61 to OB 64), the operating system does not update PIP x. You have the option to update PIP x in your user program with the instructions "SYNC_PI" and "SYNC_PO".
- "PIP OB servo": The process image partition "PIP OB servo" is permanently assigned to the OB "MC-Servo". STEP 7 generates this OB automatically when you create a technology object in the Motion Control area. When the OB is executed, the PIP OB Servo is updated isochronously. All drives and encoders used by Motion Control are assigned to this process image partition.

Specifying input and output addresses (Page 849)

Update module version

Explanation of terms

The terms "Module version" and "Firmware version" are explained in more detail in the following section.

- Module version: The specific version of the configuration software from which the module description stems.
  Example: V11.0.0.0
- Firmware version: The version of the firmware of the module whose parameters are assigned offline
  Example: V2.0

Requirement

- You have created a device configuration.
- You have installed an update or an optional package at a later date. As a result of this installation, the module version of at least one module type was updated in the hardware catalog, whereby the new version is incompatible with the previous version.
- You have used such modules in your device configuration and want to use the modified or added properties.

Procedure

Perform the following step for each affected module type.

1. Select the affected module in the device view.
2. In the Inspector window, go to "Properties > General > Catalog Information". Click the "Update module version" button there.
3. In the query that then appears, specify whether you want to update the module version only for the selected module or for all modules of this type in the current project.

Result

The selected modules are replaced by the same modules with updated module version in the current project.

In which cases is it unnecessary to update the module version?

An updating of the module version is not necessary in the following cases:

- You do not want to use the modified or added properties of the modules.
- When you open an existing project with a version of the configuration software that is more recent than the version with which you created the project, the system automatically performs a project conversion, for example, from TIA Portal V12 to V13. In this case, all older module versions are automatically adapted.

10.1.2.3 Comparing devices

Basics of device comparison

Function

You have the option of comparing the hardware components of two devices allowing you to identify any differences. You can perform an offline/offline comparison for this purpose. The devices to be compared can be from one project or different projects.

You can compare the central as well as the distributed I/O. The devices to be compared can be assigned either automatically or manually. The automatic assignment of central I/O is based

on the slot number. With the distributed I/O, the automatic assignment can be made according to the following criteria:

- Assignment using the address/HW ID: The assignment is made using the addresses or IDs of the devices. This criterion is suitable for comparing devices within a project.
- Assignment using the name: The assignment is made based on the device names. This criterion is suitable for comparing devices in different projects.

You can either specify the assignment yourself or let the system decide. In the latter case, the system selects the assignment itself depending on the context.

See also

Basics of project data comparison (Page 402)

Overview of the compare editor (Page 405)

Making a device comparison (Page 580)

Making a device comparison

Procedure

Follow the steps below to compare devices:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The comparison editor opens and the selected device is displayed in the left area.
3. Open the "Hardware" tab.
4. Drag an additional device to the drop area in the right-hand pane.
   All existing objects of the selected devices are displayed depending on the settings of the comparison editor in the "Hardware" tab and an automatic comparison is made. You can identify the status of the objects based on the symbols in the comparison editor.
5. If you want to change the matching criterion, click on the arrow of the "Available matching criteria" button in the toolbar. Then, select the matching criterion you want to use.
6. If you want to make a manual comparison, click the button for switching between automatic and manual comparison above the status area. Then select the objects you want to compare.
   The properties comparison is displayed. You can see the status of the objects based on the symbols.

10.1.3 Configure networks

10.1.3.1 Networking devices

Communication and networks

Communication between devices

The basis of all types of communication is always a previously configured network. The network configuration provides the necessary requirements for communication:

- All the devices in a network are provided with a unique address
- Communication of the devices with consistent transmission properties

Network configuration

The following steps are necessary when configuring networks:

- Connect devices to subnet
- Specify the properties/parameters for each subnet
- Specify the device properties for every networked module
- Download configuration data to the devices to supply interfaces with the settings resulting from the network configuration
- Document the network configuration

For Open User Communication, creating and configuring a subnet is supported by the assignment of connection parameters.

Relation between network configuration and project

Within a project, subnets and their properties are managed. Properties result mainly from adjustable network parameters and the quantity and communication properties of the connected devices.

The devices to be networked must be in the same project.

Subnet name and subnet ID

Within the project, subnets are clearly identified by a subnet name and ID. The subnet ID is saved in all components along with interconnectable interfaces. Components can then be clearly assigned to a subnet even after uploading into a project.

Networking options

In the project, you can create and network devices with components capable of communication. The following basic options are available for networking the devices:

- You link the interfaces of the components capable of communication with one another. A new subnet is created suitable for the type of interface.
- You connect the interface of the devices capable of communication with a new or existing subnet.
- You create an Open User Communication connection. When you assign parameters to the connection for Open User Communication, a subnet is created automatically between the communication partners.
- You use the graphic connection configuration to configure connections; missing networks are hereby recognized and are created either automatically or via dialog.

Due to the different tasks of the devices or the span of the plant, you may need to use several subnets. These subnets are managed in a project.

Networking devices in the network view

Options

In the graphic network view, you have an overview of the subnets of the entire system in the project. You can use the tabular network overview for additional support.

Depending on the starting situation, there are various ways of undertaking configuration to network the interface for a component capable of communication. The procedures are described in the following section:

- Creating an individual subnet
- Creating several subnets at one time
- Connecting two target devices via a new subnet
- Connecting devices to existing subnet
- Selecting an existing subnet from a list
- Automatic networking during the configuration of the connection;
  See also: Auto-Hotspot

Possible starting situations are:

- A suitable subnet is not yet available.
- The subnet with which you want to connect the component already exists.

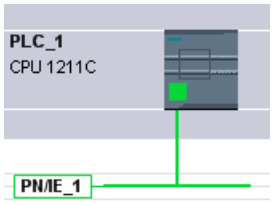
Procedure - creating a single subnet

To create a subnet and to connect it to an interface, proceed as follows:

1. Select the interface of a CPU / a CP.
2. Select the "Create subnet" command in the shortcut menu of the interface.

The selected interface is connected to a new subnet. Consistent address parameters are set automatically for the interface.

The following schematic shows an interface with outgoing line connecting to a subnet:



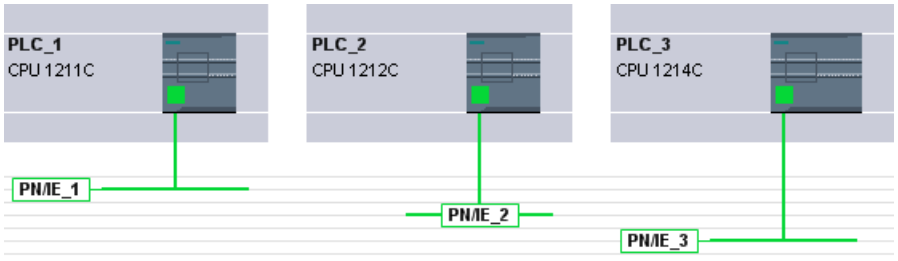
Procedure - creating several subnets at one time

To create several subnets at one time, proceed as follows:

1. Select several interfaces by clicking on them while pressing the <Ctrl> button.
2. Select the "Create subnet" command in the shortcut menu of the interface.

Each selected interface is connected to a new subnet. Consistent address parameters are set automatically for the interface.

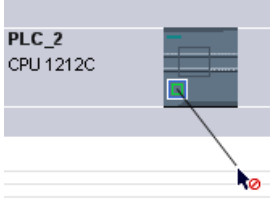
The following figure shows multiple subnets created by selecting multiple interfaces:



Procedure – Connecting two target devices via a new subnet

To connect an interface with another device via a subnet that does not yet exist, proceed as follows:

1. Position the mouse pointer over the interface for a component capable of communication requiring networking.
2. Click with the left mouse button and hold the button down.
3. Move the mouse pointer.
   The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.



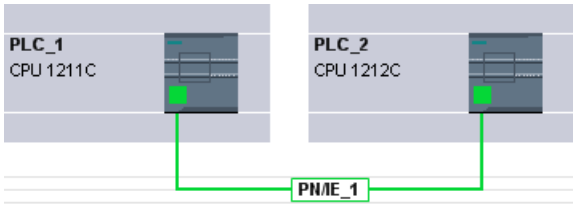
4. Now move the pointer in networking mode onto the interface of the target device. You can either keep the mouse button pressed or release it.
5. Now release the left mouse button or press it again (depending on your previous action).

Note

If you want to exit networking mode beforehand, press <Esc>, right-click or double-click in the background of the network view.

A new subnet is created. The interfaces are now connected via the new subnet. Consistent address parameters are set automatically for the interface.

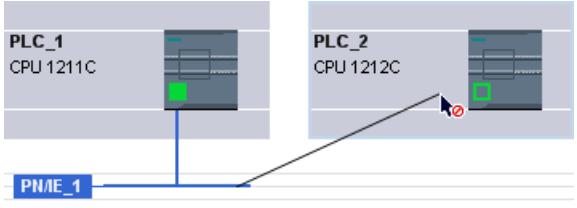
The following schematic shows two networked devices:



Procedure - Connecting devices to existing subnet

To connect an interface to an existing subnet, proceed as follows:

1. Position the mouse pointer on the interface of a communications-compliant component you want to network or on the existing subnet.
2. Click with the left mouse button and hold the button down.
3. Move the mouse pointer.
   The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear once the pointer is moved to a valid target.
4. Now move the mouse pointer to the existing subnet or to the interface to be networked. You can either keep the mouse button pressed or release it.



5. Now release the left mouse button or press it again (depending on your previous action).
   If you want to exit networking mode beforehand, press <Esc>, or right-click.

Result:

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

Procedure - selecting an existing subnet from a list

To link an interface with a subnet that has already been created, proceed as follows:

1. Select the interface of a CPU.
2. Select the "Assign to new subnet" command in the shortcut menu of the interface.
   A list box containing the available subnets appears.
3. Select a subnet from the list.

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

Tabular network overview

Meaning

The tabular network overview adds the following functions to the graphic network view:

- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect components capable of communication with created subnets.

Basic functions for tables

The network overview supports the following basic functions for editing a table:

- Displaying and hiding table columns
  Note: The columns of relevance to configuration cannot be hidden.
- Optimizing column width
- Sorting table
- Displaying the meaning of a column, a row or cell using tooltips.

Networking devices in the device view

Networking in the device view

In the device view, you can check and set all the parameters of the components belonging to a device and the interfaces in detail. Here you can also assign the interfaces to the subnets created in the project.

Requirements

- The subnet with which you want to connect an interface has already been created.
- If the subnet has not yet been created, change to the network view and make the settings required for networking.

Procedure - connecting to an existing subnet

To connect an interface to an existing subnet, proceed in the device view as follows:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group for the selected interface; for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. Select the subnet to be connected from the "Interface connected with" drop-down list.

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

Procedure - creating a new subnet

To create a subnet and to connect it to the interface, proceed as follows in the device view:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group for the selected interface; for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. In "Interface connected with", click the "Add new subnet" button.

The interface is connected to a new subnet of the appropriate subnet type. Consistent address parameters are set automatically for the interface.

Checking or changing network parameters and interface parameters

Introduction

Communication between networked devices requires the following parameters to be configured:

- Network parameters
  Network parameters identify the network within the system configuration, for example, using a name.
- Interface parameters
  Interface parameters define specific properties of a component capable of communication. Addresses and transmission characteristics are set automatically and are consistent with the network parameters.

Note

Network parameters and interface parameters are usually set during networking such that communication can take place for numerous applications without the parameters having to be changed.

Procedure - checking or changing network parameters

Proceed as follows to check or change network parameters:

1. Enter the network view.
2. Select the subnet from the network view.
   You can see the network parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the network parameters in the relevant group of parameters.

Procedure - checking or changing interface parameters

You can check and modify interface parameters in the network and device view.

Proceed as follows to check or change interface parameters:

1. Enter the network view or device view.
2. Select the interface.
   You can see the interface parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the interface parameters in the relevant group of parameters.

Changing networkings

Introduction

You can cancel an interface's network connection or assign it to another subnet of the same subnet type.

Consequences

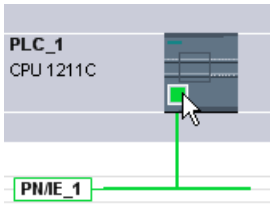
Depending on the version, a distinction should be made between:

- Canceling a network connection for an interface
  The configured parameters for the interface remain unchanged.
- Assigning a network connection to another subnet
  If the addresses in the assigned subnet are not unique, in other words, they already exist, they will be changed automatically to make them unique.

Procedure - disconnecting from a network

Proceed as follows to cancel the network connection for an interface:

1. Select the networked interface.



2. Select the "Disconnect from subnet" command in the shortcut menu of the interface.

The network connection is deleted, the interface addresses are, however, not changed.

Configured connections are retained; however these connections are marked red in the connection table because they are not networked. Specified connections remain specified.

Networking devices in the network view (Page 582)

Copying, cutting or deleting subnets

Introduction

You can copy subnets as individual objects or copy them along with networked devices or other networks.

For example, you can create complex configurations to be used more than once in different variants within the project with no additional effort.

Effects on the copied subnet

Properties that have to be assigned explicitly within a project are re-assigned appropriately when the copied objects are copied.

For subnets, this means: The subnet ID and name are re-assigned to the copied subnet.

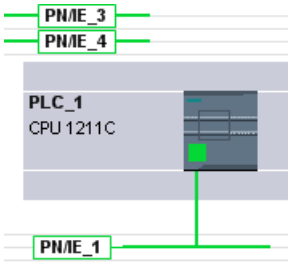
The configured properties are adopted in the copied subnet.

Procedure - copying a subnet

Proceed as follows to copy one or more subnets:

1. Select one or more subnets.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

The copied subnets are shown as "orphaned" subnets in the top part of the network view.



Procedure - copying a subnet with connected devices

To copy one or more subnets with networked devices, proceed as follows:

1. Select one or more subnets with the connected devices, for example by drawing a lasso around them.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

Complete copies of the subnets and connected devices are created.

Configured connections are adopted and remain within the copied devices. Connections to devices that have not been copied are interrupted and become unspecified.

MPI network configuration

Allocating MPI addresses

Note the following for devices with an MPI interface: All devices of a subnet must have a different device address.

CPUs with MPI address ship with the default MPI address 2. Since you can only use this address once in the MPI subnet, you will have to change the default address in all other CPUs.

The following applies to devices with the article no. 6ES7 3xx-xxxxx-0AB0:

When planning the MPI addresses for several CPUs, you have to fill "MPI address gaps" for FMs and CPs with separate MPI addresses to prevent addresses being assigned twice.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

Rules for assigning the MPI address

- Allocate the MPI addresses in ascending order.
- Reserve MPI address 0 for a programming device.
- You can link up to 126 (addressable) devices with one another in an MPI subnet; up to 8 devices at a transfer speed of 19.2 KB/s.
- All MPI addresses in an MPI subnet must be different.

You will find other rules relating to the structure of a network in the manuals for setting up automation systems.

PROFIBUS network configuration

PROFIBUS addresses

Rules for the network configuration

All the devices in a subnet must have a different PROFIBUS address.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

You can connect devices to the PROFIBUS subnet that communicate via configured connections or that belong to a PROFIBUS DP master system.

You can find more information on configuring a DP master system in the following sections.

Requirements

The 121xC CPU is PROFIBUS compatible as of firmware version 2.0.

Rules for assigning PROFIBUS addresses

- Allocate the PROFIBUS addresses in ascending order.
- Reserve the PROFIBUS address "0" for a programming device.
- Allocate a unique PROFIBUS address between 0 and 126 for each device on the PROFIBUS network and/or for each DP master and each DP slave in the PROFIBUS network.
- There are modules with which the smallest address that can be set has to be greater than 1.
- All PROFIBUS addresses of a PROFIBUS subnet must be different.

You will find additional rules relating to the structure of a network in the manuals for setting up automation systems, for example SIMATIC S7-1200.

Note

PROFIBUS address "0"

Reserve PROFIBUS address "0" for a programming device that you will briefly connect up to the PROFIBUS network at a later date for servicing.

What you need to know about PROFIBUS bus parameters (Page 591)

What you need to know about PROFIBUS bus parameters

Matching parameters to one another

The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. You should therefore only change the default values if you are familiar with how to configure the bus profile for PROFIBUS.

Note

It may be possible for the bus parameters to be adjusted depending on the bus profile. If the bus parameters cannot be adjusted, they are grayed out. The offline values of the bus parameters are always shown even if you are online and linked to the target system.

The parameters shown apply to the entire PROFIBUS subnet and are briefly explained below.

Activating cyclic distribution of the bus parameters

If the "Enable cyclic distribution of the bus parameters" check box is selected under "Bus parameters" while PROFIBUS subnet is selected in the Inspector window, the bus parameters are transferred cyclically during operation by the modules that support this function. This allows a programming device, for example, to be easily connected to the PROFIBUS in runtime.

You should deactivate this function:

- For a heterogeneous PROFIBUS subnet (or more accurately: when external devices are connected whose protocol uses the DSAP 63 for Multicast)
- When in constant bus cycle time mode (minimize bus cycle)

Bus parameters for the bus profile of PROFIBUS subnets

Bus parameter	Adjustable?	Limit values
Tslot_Init	Yes	Max. Tsdr + 15 <= Tslot_init <= 16.383 t_bit
Max. Tsdr	Yes	35 + 2*Tset + Tqui <= Max. Tsdr <= 1.023 t_bit
Min. Tsdr	Yes	11 t_bit <= Min. Tsdr <= MIN(255 t_bit, ... Max. Tsdr - 1, 34 + 2*Tset + Tqui)
Tset	Yes	1 t_bit <= Tset <= 494 t_bit
Tqui	Yes	0 t_bit <= Tqui <= MIN(31 t_bit, Min. Tsdr - 1)
GAP factor	Yes	1 <= GAP factor <= 100
Retry limit	Yes	1 <= Retry limit <= 15
Tslot	No	---
Tid2	No	Tid2 = Max. Tsdr
Trdy	No	Trdy = Min. Tsdr
Tid1	No	Tid1 = 35 + 2*Tset + Tqui
Ttr	Yes	256 t_bit <= Ttr <= 16.777.960 t_bit

Bus parameter	Adjustable?	Limit values
Ttr typical	No	This time is provided for information only and is not transferred to the nodes.
Response monitoring		10 ms <= response monitoring (watchdog) <= 650 s

If you want to create a customized bus profile, we recommend the following settings:

- Minimum target rotation time (Ttr) = 5000 x HSA (highest PROFIBUS address)
- Minimum response monitoring (watchdog) = 6250 x HSA

Recalculating

You can use the "Recalculate" button to recalculate the parameters.

PROFIBUS addresses (Page 590)

Description of the bus parameters (Page 592)

Description of the bus parameters

Detailed description of PROFIBUS bus parameters

Bus parameter	Meaning
Tslot_Init	The wait-for-reception (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner. If the influence of the line components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.
Max. Tsdr	The maximum protocol processing time defines the latest time by which the responding node should have replied.
Min. Tsdr	The minimum protocol processing time defines the earliest time by which the responding node may reply.
Tset	The trigger time is the time which may lapse between the reception of a data message frame and the response to it in the node.
Tqui	The modulator quiet time is the time which a sending node needs after the end of the message frame to switch from sending to receiving.
GAP factor	The GAP update factor defines the number of token rotations after which a newly added, active node can be added to the logical token ring.
Retry limit	This parameter defines the maximum number of attempts (message frame repeats) made to reach a node.
Tslot	The wait-for-reception time (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner. If the influence of the bus design components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.

Bus parameter	Meaning
Tid2	Idle time 2 defines the earliest time by which a sending node may send the next message frame after sending a message frame that has not been acknowledged.
Trdy	The ready time specifies the earliest time by which a sending node may receive a response message frame.
Tid1	Idle time 1 defines the earliest time by which a sending node may send the next message frame after receiving a response.
Ttr	The target rotation time is the maximum time made available for a token rotation. During this time, all active nodes (DP masters etc.) have the right to send (token) once. The difference between the target rotation time and the actual token holding time of a node determines how much time is left over for the other active nodes (programming device, other DP masters etc.) to send message frames.
Ttr typical	The typical data cycle time is the average response time on the bus if all configured slaves are exchanging data with the DP master. None of the slaves report diagnostics and there is no extra message frame traffic with programming devices or other active nodes etc. on the bus.
Response monitoring	The response monitoring time is only needed for PROFIBUS-DP bus systems. It defines the latest time by which a DP slave has to be addressed by its DP master with a new data message frame. If this does not happen, the DP slave assumes that the DP master has failed and resets its outputs to a secure mode.

What you need to know about PROFIBUS bus parameters (Page 591)

Bus profiles with PROFIBUS

Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values. For example, if both DP and FMS services are being used on a subnet, the "slower" sets of bus parameters must always be set for all devices, i.e. even the "Universal (DP/FMS)" profile for DP devices.

Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Standard	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Universal (DP-FMS)	9.6 19.2 93.75 187.5 500 1500
Customized	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000

Meaning of profiles

Profile	Meaning
DP	Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices. This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.
Standard	Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.
Universal (DP/FMS)	Select the "Universal (DP/FMS)" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service. This includes the following devices for example: • CP 343-5 (SIMATIC S7) • PROFIBUS-FMS devices of other manufacturers As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.
Customized	The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. Select the "Customized" profile when none of the usual profiles "match" a PROFIBUS device and you need to adapt the bus parameters to your special structure. Information on this can be found in the documentation for the PROFIBUS device. You should only change the default values if you are familiar with how to configure the bus profile for PROFIBUS. Not all combinations that can be theoretically set can be used even with this bus profile. The PROFIBUS standard specifies several parameter limits that depend on other parameters. For example, a responder must not respond (Min Tsdr) before the initiator can receive the message frame (Trdy). These standard specifications are also checked in the "Customized" profile. Tip: The bus parameters last valid on the PROFIBUS subnet are always automatically set as customized. For example, if the "DP" bus profile was valid for the subnet, then the bus parameters for "DP" are set in the "Customized" bus profile. The parameters can be modified on this basis. The monitoring times are not automatically recalculated so that you do not put at risk the consistency of set values, for example with configurations in other configuration tools without realizing that you have done so. You can also have the Ttr monitoring times and target rotation time calculated on the basis of parameters you have set: Click here on the "Recalculate" button.

Note

Both mono-master mode and multi-master mode are possible with all PROFIBUS profiles.

What you need to know about PROFIBUS line configuration

Cable configuration and bus parameters

Information regarding the cable configuration can be taken into consideration when calculating the bus parameters. For this purpose, you must select the "Consider cable configuration" check box in the properties for the PROFIBUS subnet.

The remaining information then depends on the type of cable used; the following settings are available:

- Copper cable
- Fiber-optic cable/optical ring

PROFIBUS line configuration, optical ring

The calculation depends on the OLM types used. The selection is made by activating the check box (multiple activation is possible, at least one OLM type must be selected):

- OLM/P12
- OLM/G12
- OLM/G12-EEC
- OLM/G12-1300

The following bus parameter adjustments are made:

- Configuration of a node not present

  Note

  The following restrictions apply to optical rings, even for passive nodes (DP slaves for example):

  A maximum of HSA-1 nodes may be connected to the PROFIBUS network. With an HSA of 126, addresses 126 and 125 must not be used. A maximum of 125 nodes are possible on the bus (No. 0 to 124).

  If an HSA is less than or equal to 125, the addresses HSA and greater may not be used. The address HSA-1 may not be used.

- Increase the retry value to 3
- Setting of minimum slot time needed for ring mode

  Note

  Short slot time values are needed for OLM/P12, average ones for OLM/G12 and OLM/G12-EEC and long ones for OLM/G12-1300. This results in high performance for small network lengths and average to low performance for average to large network lengths.

PROFIBUS communication load

Communication load - allowing for additional network stations

The bus parameters depend on the volume of communication between the active network nodes. There are differences between cyclic communication (DP) and connection-based, acyclic communication (S7 communication, Send/Receive (FDL), FMS). Unlike DP, the volume and size of communication tasks (communication load) depends on the user program. For this reason, the communication load cannot always be calculated automatically.

To calculate the bus times you can define a network configuration in the "Additional network stations" parameter group that differs from the network configuration.

Taking the profile into account

The network configuration can be defined for the "Standard", "Universal (DP/FMS)", and "User-defined" profiles. Parameters cannot be entered in the "Additional network stations" parameter group for the "DP" profile.

Quantification of the communication load

The following settings are available in order to make allowance for the communication load.

- Information regarding the number of unconfigured network stations;
- Information on the communication load resulting from the user programs for FDL or S7 communication. Here you can selected from the following settings:
  - Low
    Typically used for DP, no great data communication apart from DP.
  - Medium
    Typically used for mixed operations featuring DP and other communication services (such as for S7 communication), when DP has strict time requirements and for average acyclic volumes of communication.
  - High
    For mixed operations featuring DP and other communication services (such as for S7 communication), when DP has loose time requirements and for high acyclic volumes of communication.

Configuring Industrial Ethernet

Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

IP address

The IP parameters are visible if the module capable of communication supports the TCP/IP protocol. This is usually the case for all Ethernet modules.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of:

- Address of IP subnet
- Address of the device (generally also called host or network node)

Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the device.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the device, i.e. 0.2.

It is generally true that:

- The network address results from AND logic operation of the IP address and subnet mask.
- The device address results from the AND NOT logic operation of the IP address and subnet mask.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D, etc). This is not recommended, however, because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of devices they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (for example IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All devices with addresses between 129.80.001.xxx and 129.80.127.xxx are on one IP subnet, all devices with addresses between 129.80.128.xxx and 129.80.255.xxx are on another IP subnet.

Router

The task of the routers is to connect the IP subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, you have to enter the address of the router for each device in the IP subnet.

The IP address of a device in the subnet and the IP address of the router can only differ at the points at which there is a "0" in the subnet mask.

Settings for interconnecting Ethernet devices (Page 598)

Settings for interconnecting Ethernet devices

The following paragraph describes the behavior of STEP 7 during interconnection of PROFINET devices and the effects of the port interconnection on the network view.

Relation between port interconnection and network view

Topology view:

In the topology view, you specify the physical interconnection of Ethernet ports.

You specifically determine which Ethernet port of a device is to be connected with a specific Ethernet port of another device by means of an Ethernet cable (preset topology).

Example:

You specify that port 1 of the PROFINET interface of the CPU is to be connected to port 2 of the PROFINET interface of device A by means of an Ethernet cable.

You also specify the interface for devices with several PROFINET interfaces.

Example:

You specify that port 1 of PROFINET interface X2 of the CPU is to be connected to port 2 of the PROFINET interface of device A by means of an Ethernet cable.

The Ethernet ports can be interconnected in a table or graphically.

Network view:

In the network view, you specify which devices are to be connected with each other via an Ethernet subnet. You do not specify the Ethernet ports by which the devices are interconnected with each other (that is the task of the port interconnection).

The port interconnection has effects on the network view:

When you interconnect Ethernet ports of devices with each other in the topology view, STEP 7 connects the interconnected PROFINET interfaces of the devices in the network view with an Ethernet subnet (green line).

However, the course of the green line does not reflect the actual cable routing. You specify the actual wiring in the topology view.

An Ethernet subnet always has a name and an S7 subnet ID. You can set these two values in the subnet properties.

Which Ethernet subnet is used to link interconnected devices?

STEP 7 distinguishes between the following cases:

- Ethernet subnet specified (default subnet).
- No Ethernet subnet specified (no default subnet).

Ethernet subnet specified (default subnet)

The option "Connect devices that are not linked with this subnet in case of port connection" is activated in the properties of an Ethernet subnet (default).

This option can be activated for exactly one Ethernet subnet.

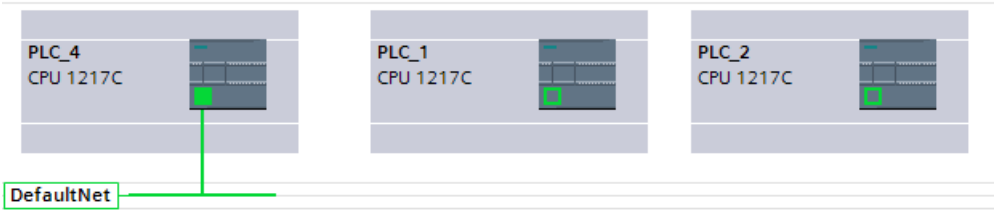
Activate the option, if necessary, for the Ethernet subnet that is to be continued when interconnecting devices that are not linked. This subnet is referred to as "default subnet" below.

Response of STEP 7:

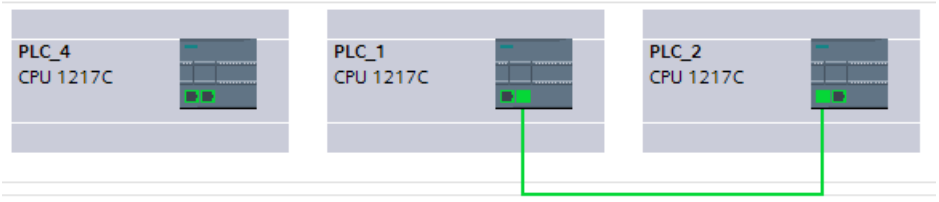
When you interconnect the ports of two devices that are not linked in the topology view, STEP 7 links these devices with the default subnet.

Example:

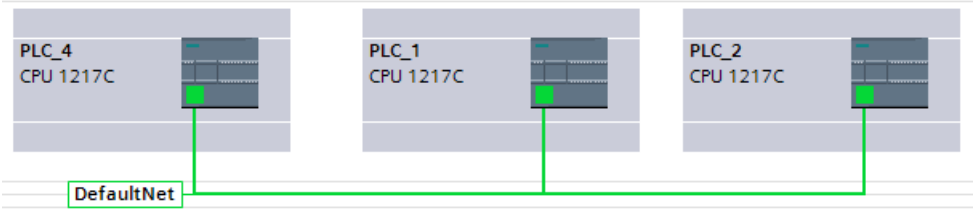
Step 1: Create a subnet in the network view at PLC_4, "Connect devices that are not linked with this subnet in case of port connection" option is **enabled**.



Step 2: Interconnect PLC_1 with PLC_2 (topology view).



Result: All PLCs are now connected to the same default subnet (network view).



No Ethernet subnet specified (no default subnet).

This is the case when the following conditions are fulfilled:

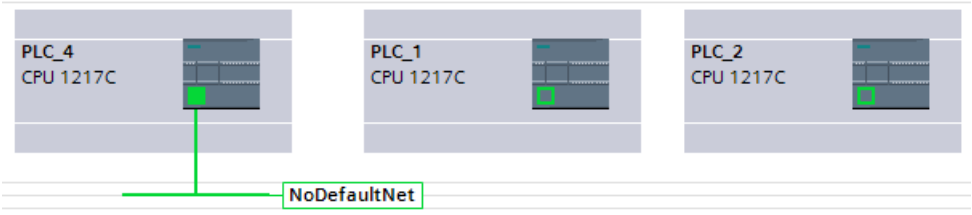
- A subnet has been added to a PROFINET interface (this interface is referred to as "Interface A" below).
- The option "Connect devices that are not linked with this subnet in case of port connection" is deactivated in the properties of this subnet (no default subnet).
- There is no other Ethernet subnet for which this option is activated.

Response of STEP 7:

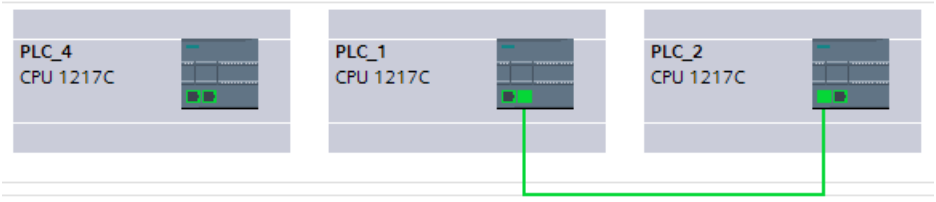
- The Ethernet subnet of interface A is only continued when you interconnect a port of interface A with a port of another device.
- When you interconnect ports of other devices that are not linked with each other, STEP 7 creates a new Ethernet subnet.

Example:

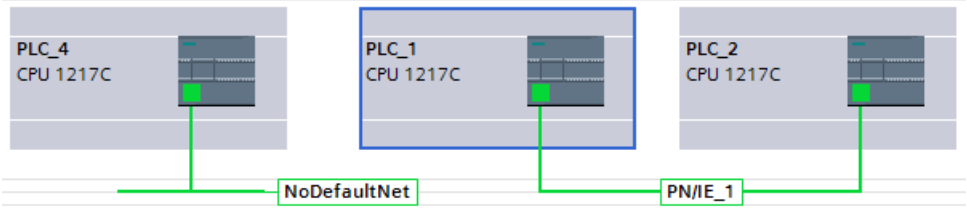
Step 1: Create a subnet in the network view at PLC_4, "Connect devices that are not linked with this subnet in case of port connection" option is **disabled**.



Step 2: Interconnect PLC_1 with PLC_2 (topology view).



Result: PLC_1 and PLC_2 are connected to a new subnet (network view).



Manual adaptation of the IP addresses

It can occur that STEP 7 does not adapt the IP addresses of the interconnected devices in such a way that the resulting network can be correctly compiled, for example, for devices with multiple PROFINET interfaces.

In these situations, you need to adapt the IP addresses of the devices manually.

The following rules apply:

- Devices that are to communicate with each other without a router cannot belong to different IP subnets.
- For devices with multiple PROFINET interfaces, the interfaces must be in different IP subnets.

To change the IP address of a PROFINET interface, perform the following steps:

1. Change to the network view (if not selected already).
2. Left-click on the icon of the PROFINET interface that is not to be part of the IP subnet.
3. Change the subnet part of the IP address in the properties of the PROFINET interface (in the "Ethernet addresses" area).

Example: Manual conversion of the IP subnet part for devices with multiple PROFINET interfaces in a subnet

The IP address is: "192.168.0.1".

The subnet mask is "255.255.255.0".

The first three numbers "192.168.0" form the IP subnet part of the IP address "192.168.0.1".

Change the IP subnet part, for example, to "192.168.1"

Interconnecting ports in the graphic view (Page 670)

Interconnecting ports in the table view (Page 671)

Configuring Industrial Ethernet (Page 596)

Network configuration of AS interface

AS-Interface consists of an AS-i master and AS-i slaves connected to each other over an AS-i subnet.

Rules for AS interface network configuration

All the nodes in an AS-i subnet must have a different AS-i node address.

You should only load the settings over the network when all the modules in a subnet have different addresses and when the actual structure matches that of the network configuration you have created.

One AS-i master and up to 31 AS-i slaves can be operated on one AS-i subnet.

For more information on configuring an AS-Interface with an AS-i master and AS-i slaves, refer to the section on AS-Interface and the documentation of the AS-i master modules.

10.1.3.2 Communication via connections

Working with connections

S7 connection

Introduction to configuring connections

Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (for example, S7 connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an S7 connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A row in this connection table represents a configured connection from the viewpoint of the local communication partner with its properties, for example, between two S7-1200 CPUs.

What you need to know about using connection resources

Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

S7 connections

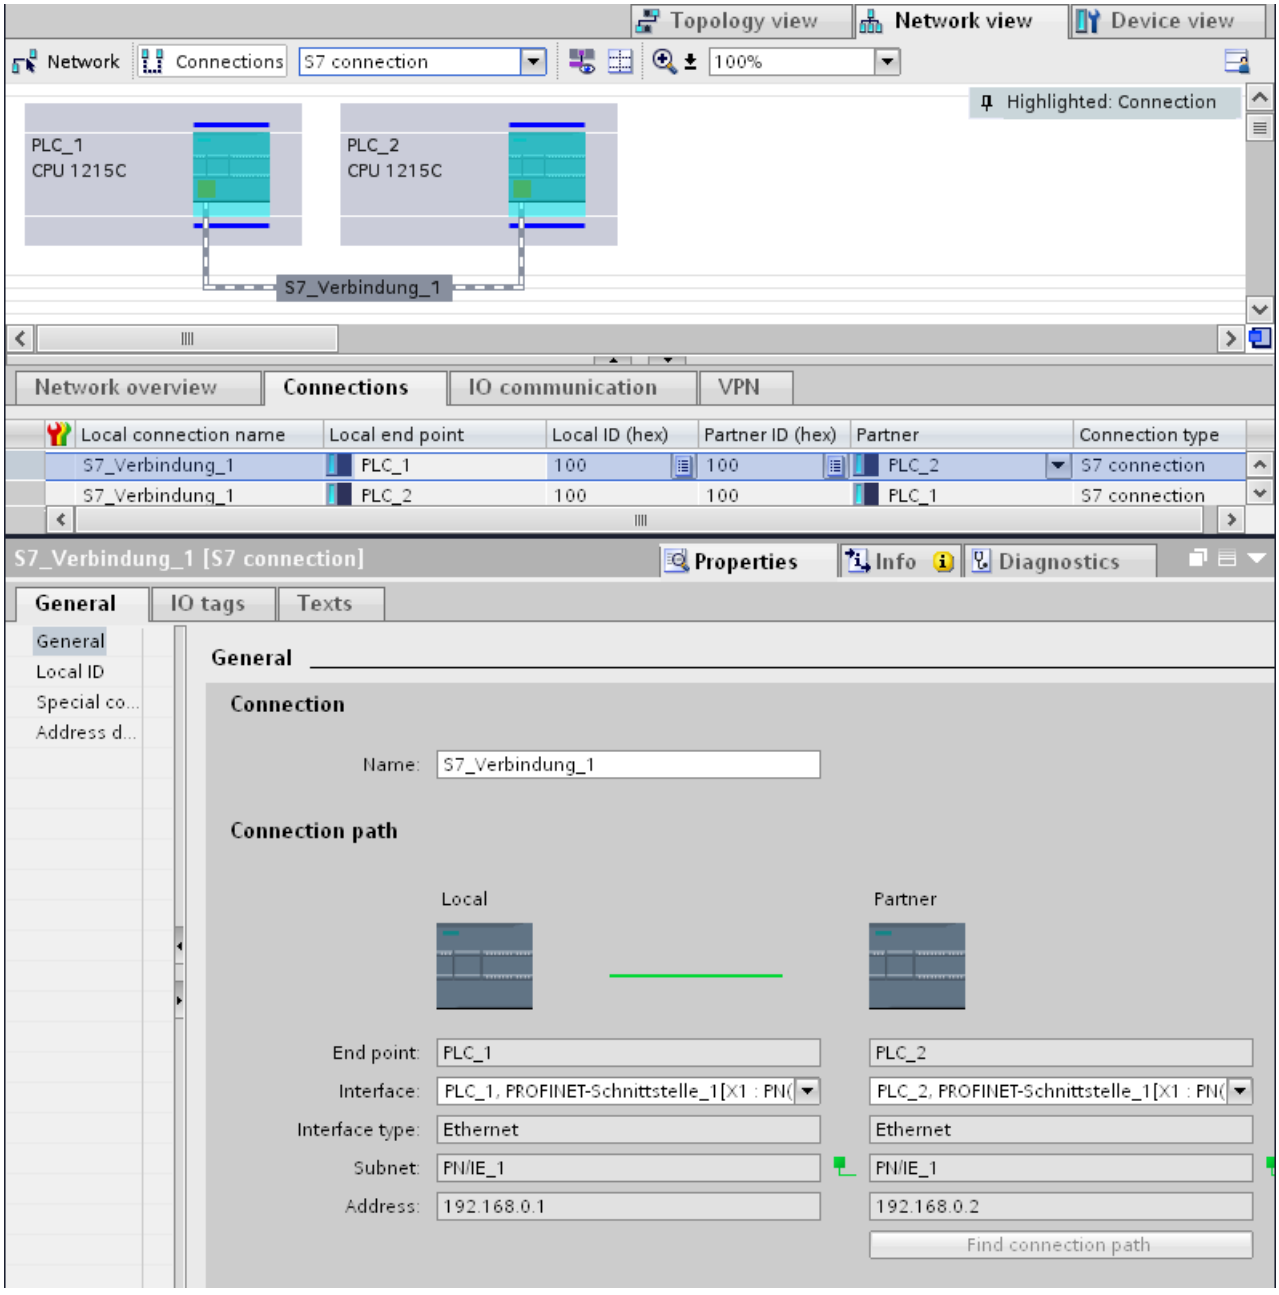
In the case of S7 connections via the PN interface, one connection resource per S7 connection is assigned for the endpoint for the S7-1200 CPU. One connection resource is also required for the connection partner.

You can find an overview of available and assigned connection resources for selected S7-1200 CPU in the Inspector window at "Properties > Connection Resources"

Views containing information about the configured connections

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window



Benefits

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - When connection mode is enabled, the connection path is highlighted in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

The connection table

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view (when connection mode is enabled)
- Changing of connection partners
- Display showing status information

"Properties" tab for a connection in the inspector window

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

Creating a new connection

Creating a connection - alternatives

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

Requirement and result

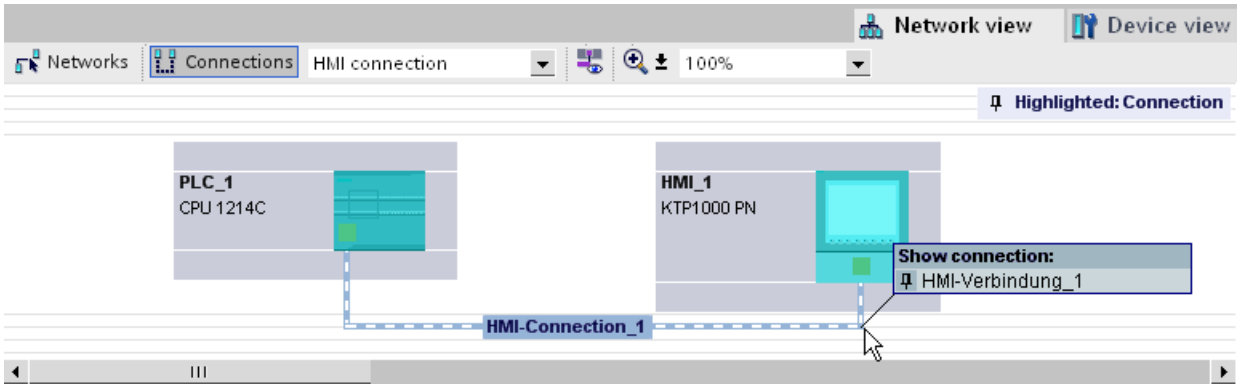
In the network view, you have add devices between which the connections should be configured.

Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically in the connection table of the S7-1200 CPU. A local connection name is assigned for this connection.

The following schematic shows a configured connection with a networked device:



Creating a new connection graphically

Graphically configuring connections

In the case of graphic connection configuration, the connection path is automatically specified provided interfaces and resources are available. Select the devices to be connected in the current configuration.

Automatically determining connection path

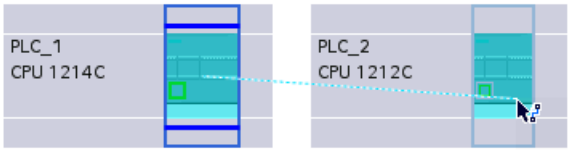
To create a connection graphically, follow these steps:

1. Click the "Connections" button.

   This step activates the connection mode: You can now select the connection type you want. You will see this from the following:
   The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.

3. Release the mouse button over the destination device to create the connection between the two devices.

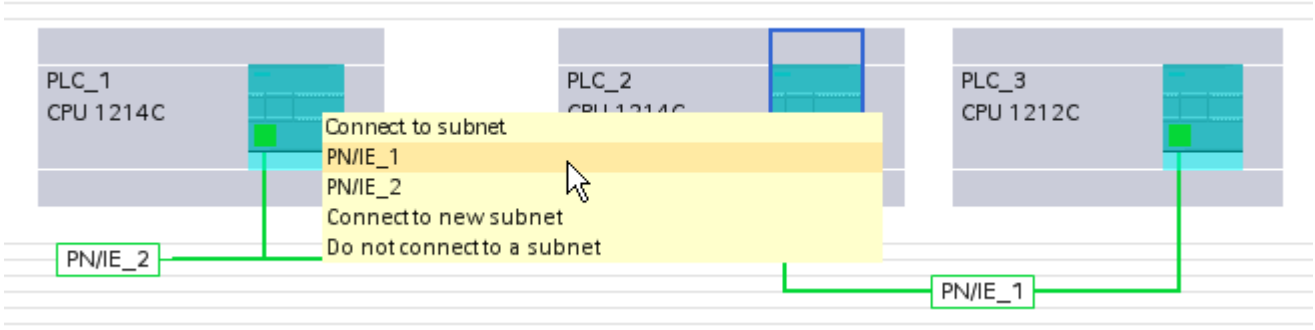
Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

Configuring a connection when there is no or no clear network assignment

Any networking not in place will if possible be created automatically when a connection is created. A query will be made upon completion of connection configuration if unique network assignment is not possible. You will be able to choose from the existing subnets.

Example below: A query is made upon creation of a connection between stations PLC_1 and PLC_2, which are not yet networked.



Interactively creating a new connection

Interactively configuring connections

Define the local device and its connection partners.

Procedure

Proceed as follows to interactively create a connection:

1. Select the "Add new connection" command in the shortcut menu of a connection partner for which you want to create a connection.
   The "Create new connection" dialog appears.
2. Select the partner endpoint.
   In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.
3. To accept the configured connection and to configure additional connections to other endpoints, click "Add".
   To close the dialog, click "OK".

Working in the network view

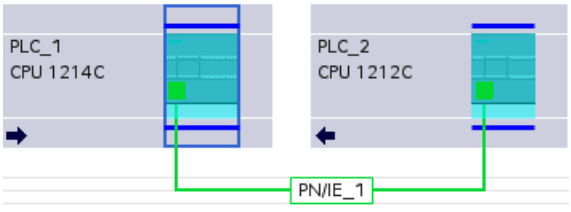
Highlighting connection path and partner in the network view

To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

2. Select the S7-CPU for which you want to display the connection partners in the network view and then select the "Highlight connection partners" command in the shortcut menu.
3. Select "All connection partners" in the following menu.
   The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.
4. To open a list with information on the target devices, click the arrow of the local device. This additional function is useful in complex network configurations in which some devices are not visible.



Note

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

Working with the connection table

Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).
2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
   - "Optimize column width" or
   - "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

If you want to store the layout, width and visibility of the table columns, click on the "Remember layout" function in the top right-hand of the network view.

Symbol	Meaning
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

Changing properties of connection

You can directly edit some of the parameters displayed in the connection table. The name of the connection can, for example, only be changed in the connection table.

Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

Deleting connections

You can delete configured connections using the network view or the connection table.

In the network view you can delete one highlighted connection per action. In the connection table you can delete one or several connections per action.

Procedure

To delete a connection, follow these steps:

1. Select the connection to be deleted:
   - In the network view: Select the connection to be deleted.
   - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

Result

The selected connection is removed completely.

Copying connections

Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

Copying devices

If you copy devices for which connections have been configured, the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is merely a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

Inconsistent connections - connections without assignment

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

Possible causes for inconsistent connections

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

Remedies

To assign a closed connection path to an existing open connection path, expand the device configuration in such a way that the interfaces required for the connection type are available for both partners. At "Properties > General > Interface" in the Inspector window, you can use the "Find connection path" button to create a connection to an existing partner.

S7 connection - general settings

General connection parameters

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can assign the connection path and specify all aspects of the connection partner.

Local ID

The local ID of the module from which the connection is viewed is displayed here (local partner). You can change the local ID. You may need to do this if you have already programmed communication function blocks, and you want to use the local ID specified in those function blocks for the connection.

Special connection properties

Display of connection properties (can be modified depending on the components used):

- One-way
  One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.
- Active connection establishment
  In the case of one-way connection, for example with a S7-1200 CPU (firmware version V1.0), a connection partner can only be provided for the active connection establishment. In the case of a two-way connection you can set which connection partner will assume the active role.
- Sending operating mode messages
  Indicates whether or not the local partner sends operating mode messages to the connection partner.

Address details

Displaying address details of the S7 connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

S7 connection - address details

Meaning

The address details show the end points of the connection and can localize these via the specification of rack and slot.

When a connection is established, the connection-specific resources of a module are assigned permanently to this connection. This assignment requires that the connection resource can be addressed. The TSAP (Transport Service Access Point) is, as it were, the address of the resource that is formed with the help of the connection resource or, in the case of S7-1200 CPUs (firmware V2.0 or higher) with the SIMATIC-ACC (SIMATIC Application Controlled Communication).

Configuration of TSAP for S7-1200

- For S7-1200 CPU (firmare V2.0 or higher):
  "SIMATIC-ACC"<nnn><mm>
  nnn = Local ID
  mm = any value
- For S7-1200 CPU (firmare V1.0):
  <xx>.<yz>
  xx = Number of the connection resource
  y = Rack number
  z = Slot number

TSAP structure, dependent on partner

The configuration of the TSAP for S7-1200 CPUs is dependent on the respective firmware and on the remote connection partner. When a S7-1200 CPU is connected with a S7-300/400 CPU, a S7-1200 CPU also uses a TSAP configuration that includes the connection resource.

See the following examples of TSAPs of various connection configurations

- Connection between two S7-1200 CPUs (both with firmware V2.0):
  - S7-1200 CPU "A" with firmware V2.0 and local ID 100:
    TSAP: SIMATIC-ACC10001
  - S7-1200 CPU "B" with firmware V2.0 and local ID 5AE:
    TSAP: SIMATIC-ACC5AE01
- Connection between two S7-1200 CPUs (firmware V2.0 and V1.0):
  - S7-1200 CPU with firmware V2.0 and local ID 1FF:
    TSAP: SIMATIC-ACC1FF01
  - S7-1200 CPU with firmware V1.0 (rack 0, slot 1, connection resource 03):
    TSAP: 03.01
- Connection between S7-1200 CPUs (firmware V2.0) and S7-300/400 CPU:
  - S7-1200 CPU with firmware V2.0 (rack 0, slot 1, connection resource 12):
    TSAP: 12.01
  - S7-300/400 CPU (rack 0, slot 2, connection resource 11):
    TSAP: 11.02

S7 connections via CM/CP

Introduction

S7-1200 CPUs with a firmware version of V2.0 or higher support one-way and two-way S7 connections via CM/CP interfaces. This increases the number of Ethernet ports and networks that can be used for S7 connections. Even though the connection is then guided via the CM/CP, the associated S7-1200 CPU is an end point of the connection. The other end point can be any other device in the case of two-way connections. This other device must also support S7 connections.

Data volumes and configuration limit

The number of communication connections which are supported by CM/CP can be found in the manual accompanying every CM/CP. The number of connections per device can be further increased by adding other CM/CPs.

If several CM/CPs are fitted in a device, an automatic switch is made to the next CM/CP when this limit is exceeded. Specifically assign the connections using the path selection as required.

Note

Data transfer > 240 byte transfer is supported by the current CPs.

CPs with an older product version support the transfer of data with a data length of up to 240 bytes.

For more information, refer to the details provided in the Ethernet CP equipment manual.

Tasks of the Ethernet CM/CP in online mode

During data transfer via a connection, the Ethernet CM/CP takes on the following tasks:

- Receiving
  Receiving data from the Ethernet and forwarding to the user data area in the CPU
- Sending
  Transferring data from the user data area of the CPU and sending data via the Ethernet

The connection is established automatically as soon as the partner can be reached.

HMI connection

Introduction to configuring connections

Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (e.g., HMI connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an HMI connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A line in this connection table represents a configured connection, e.g., between an HMI device and PLC, along with its properties.

What you need to know about using connection resources

Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

HMI connections

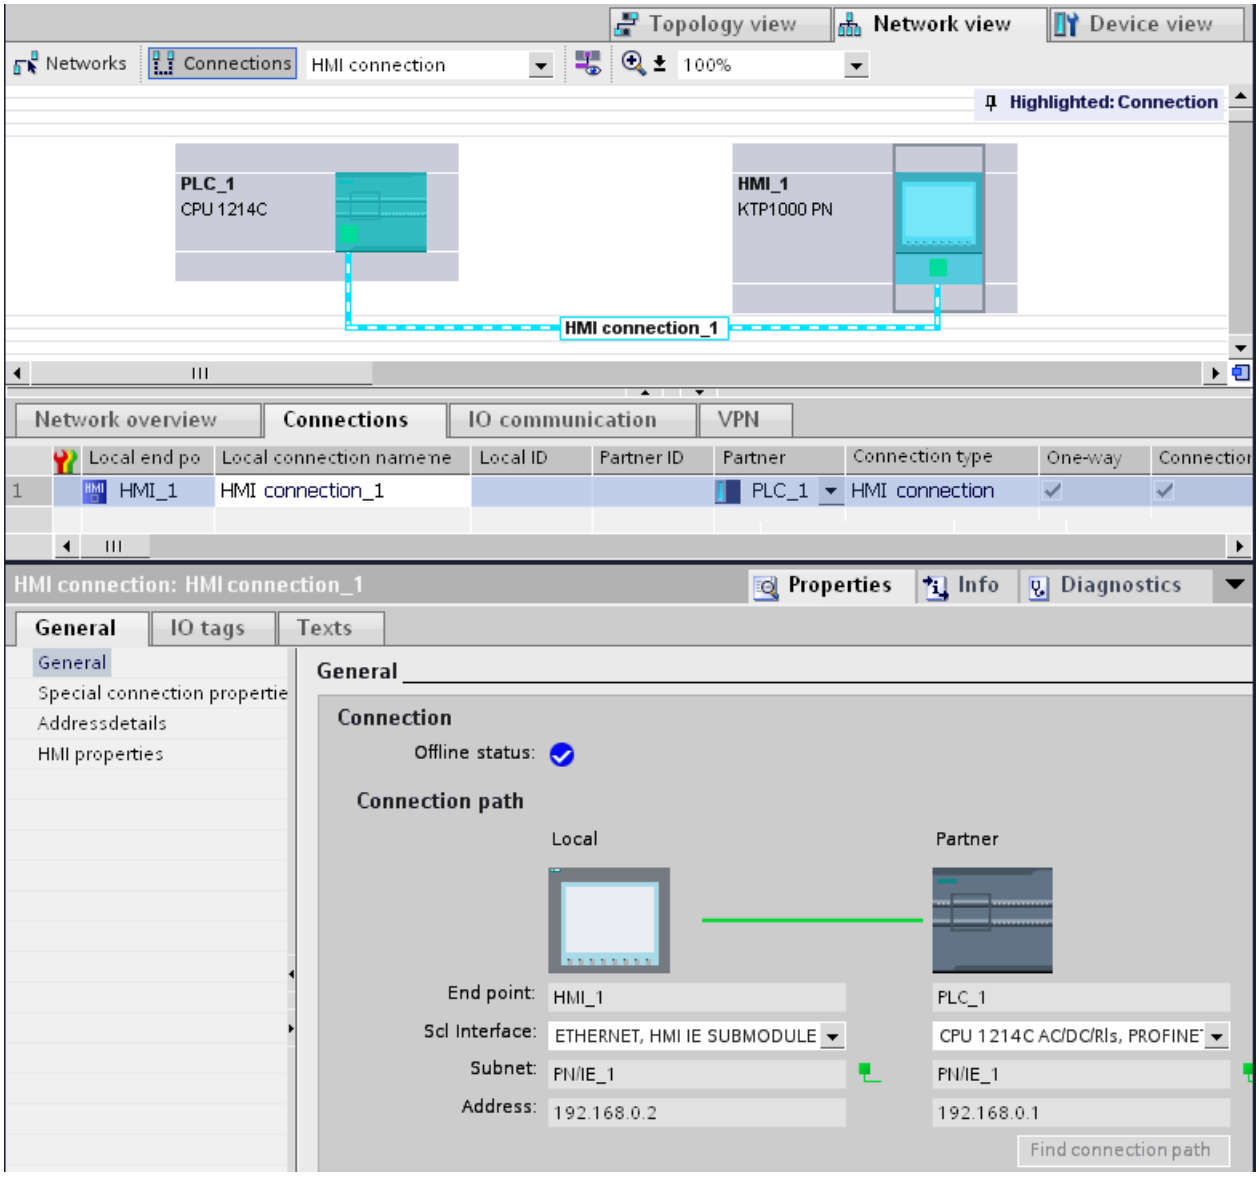
For HMI connections via the **integrated** PN interface, one connection resource for the endpoint per HMI connection is occupied for the HMI device.

One connection resource is also required for the connection partner (PLC).

Views containing information about the configured connections

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window



Benefits

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - You will graphically see the connection path in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

The connection table

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view
- Changing of connection partners
- Display showing status information

"Properties" tab for a connection in the inspector window

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

Creating a new connection

Creating a connection - alternatives

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

Requirement and result

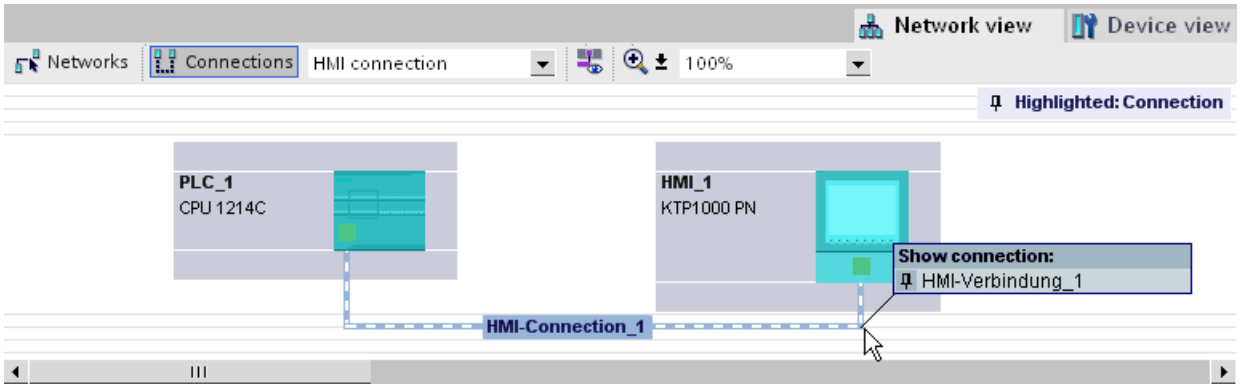
You have created the devices with CPUs and HMI devices between which you want to configure connections in the network view.

Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically into the connection table of the HMI device. A local connection name is assigned for this connection.

The following schematic shows a configured connection with a networked device:



Creating a new connection graphically

Graphically configuring connections

When using the graphic connection configuration, if necessary the system asks you to define the connection path. Select the devices to be connected in the current configuration.

Automatically determining connection path

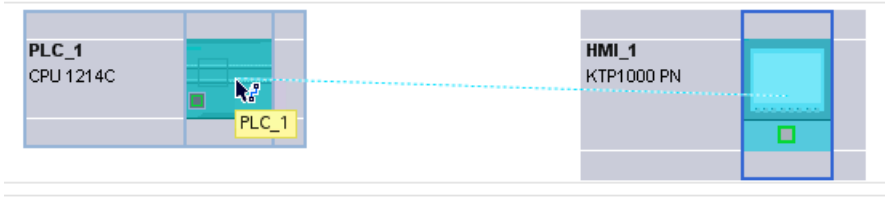
To create a connection graphically, follow these steps:

1. Click the "Connections" button.

   The connection mode for the connection type you have selected is then activated.
   You will see this from the following:
   The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.

3. Release the mouse button over the destination device to create the connection between the two devices.

Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

Interactively creating a new connection

Interactively configuring connections

Define the local device and its connection partners.

Procedure

Proceed as follows to interactively create a connection:

1. Select the "Create new connection" command in the shortcut menu of a connection partner for which you want to create a connection.
   The "Create new connection" dialog is opened.
2. Select the partner endpoint.
   In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.
3. To close the dialog, click "OK".
   To accept the configured connection and to configure additional connections to other endpoints, click "Apply".

Working in the network view

Highlighting connection path and partner in the network view

To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

2. Select the "Highlight connection partners" command in the shortcut menu for the HMI device whose connection partners you want to display in the network view.
3. Select "All connection partners" in the following menu.
   The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.
4. To open a list with information on the target devices, click the arrow of the local device. This additional function is useful in complex network configurations in which some devices are not visible.

Note

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

Creating a new connection graphically (Page 619)

Working with the connection table

Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).
2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
   - "Optimize column width" or
   - "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

Changing properties of connection

You can directly edit the parameters displayed in the connection table in some cases. To change the name of a connection, you do not have to navigate to the Inspector window.

Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

Deleting connections

You can delete configured connections using the network view or the connection table.

In the network view you can delete one highlighted connection per action. In the connection table you can delete one or several connections per action.

Procedure

To delete a connection, follow these steps:

1. Select the connection to be deleted:
   - In the network view: Select the connection to be deleted.
   - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

Result

The selected connection is removed completely.

Copying connections

Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

Copying devices

If you copy devices for which connections have been configured (HMI devices), the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is only a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

Inconsistent connections - connections without assignment

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

Possible causes for inconsistent connections

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Errors when backing up data due to insufficient memory
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

Remedies

If the connection cannot be repaired by opening the connection properties, changing them or undoing them in the configuration, then it may be necessary to delete the connection and re-create it.

HMI connection general settings

General connection parameters

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can also assign the connection path and specify all aspects of the connection partner.

Special connection properties

Display of the connection properties (cannot be changed):

- Active connection establishment
  The connection establishment always starts from the HMI device. This option is selected by default if the address of the partner is specified.
- One-way
  One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.
- Sending operating mode messages
  Not relevant for HMI devices.

Address details

Displaying address details of the HMI connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

Miscellaneous

Display of the access points for the online connection between HMI device and connection partner.

Using Open User Communication

Basics of Open User Communication

Introduction

Open User Communication (OUC) is the name given to a program-controlled communication process for communicating via the integrated PN/IE interface of S7-1200/1500 and S7-300/400 CPUs. Different connection types are available for this communication process.

The main feature of Open User Communication is its high degree of flexibility in terms of the data structures transferred. This allows open data exchange with any communicating devices providing they support the connection types available here. Since this communication is controlled solely by instructions in the user program, event-driven connection establishment and termination is possible. Connections can also be modified by the user program during runtime.

For CPUs with an integrated PN/IE interface, the TCP, UDP, and ISO-on-TCP connection types are available for Open User Communication. The communication partners can be two SIMATIC PLCs or a SIMATIC PLC and a suitable third-party device.

Instructions for Open User Communication

To create the connections, you have various instructions available after opening in the program editor in the "Instructions > Communication > Open User Communication" task card:

- Compact instructions for sending or receiving data via the integrated functions for establishing and terminating the connection (S7-1200/1500 only):
  - TSEND_C (Page 3625) (connection establishment/termination, sending)
  - TRCV_C (Page 3636) (connection establishment/termination, receiving)
- Individual instructions for sending and receiving data or for establishing or terminating connections:
  - TCON (Page 3662) (connection establishment)
  - TDISCON (Page 3669) (connection termination)
  - TSEND (Page 3674) (TCP or ISO-on-TCP: Sending)
  - TRCV (Page 3677) (TCP or ISO-on-TCP: Receiving)
  - TUSEND (Page 3687) (UDP: Sending)
  - TURCV (Page 3690) (UDP: Receiving)

Connection establishment

For Open User Communication, instructions for establishing and terminating the connection must exist for both communication partners. One communication partner sends its data using TSEND, TUSEND or TSEND_C while the other communication partner receives the data using TRCV, TURCV or TRCV_C.

One of the communication partners starts the connection establishment as the active partner. The other communication partner reacts by starting its connection establishment as the passive partner. If both communication partners have initiated their connection establishment, the communication connection is fully established.

Connection configuration

You can specify establishment of the connection via a connection description DB with the TCON_Param, TCON_IP_v4, or TCON_IP_RFC structure by means of parameter assignment as follows:

- Manually create, assign parameters and write directly to the instruction.
- Supported by connection configuration.

Connection configuration supports the establishment of the connection and should, therefore, be given preference over the other methods.

You specify the following in the connection configuration:

- Connection partner
- Connection type
- Connection ID

- Connection description DB
- Address details according to selected connection type

In addition, you specify here which communication partner activates the connection establishment and which partner establishes a connection passively in response to a request from its communication partner.

See also

Principle of operation of connection-oriented protocols (Page 638)

Connection configuration

Overview of connection configuration

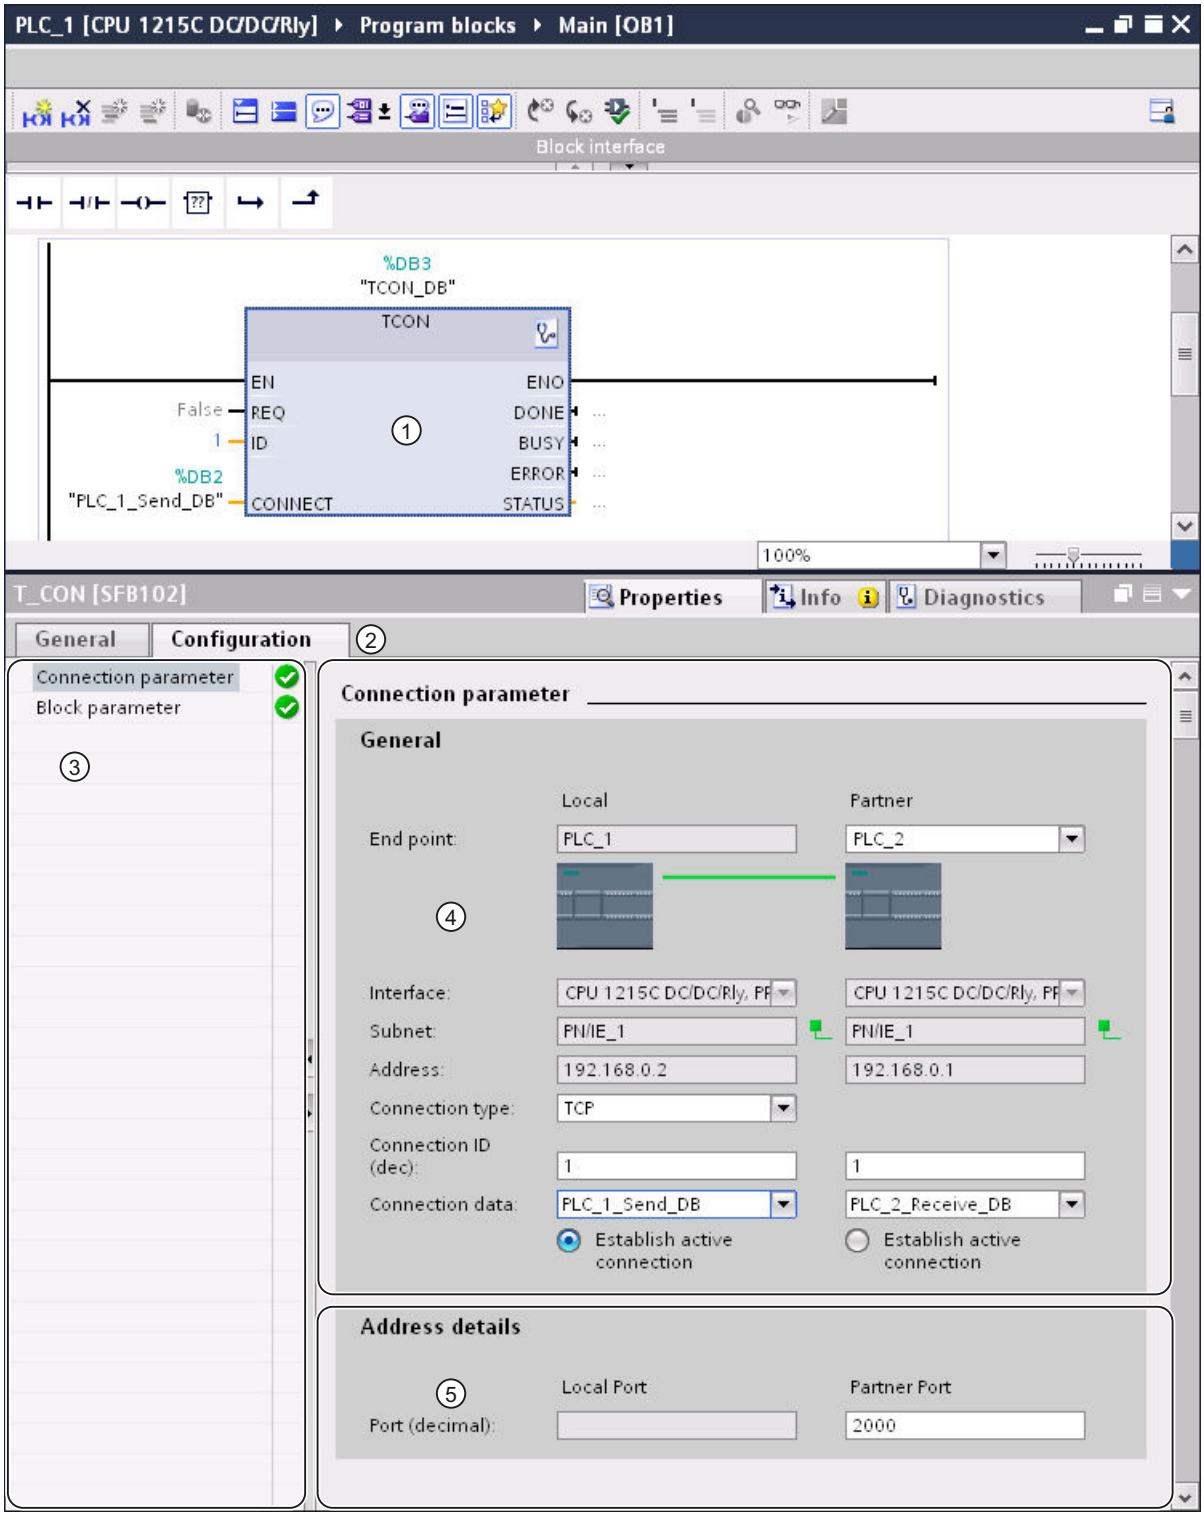
Introduction

You can find the connection configuration in the inspector window of the program editor if you want to program Open User Communication with the communication instructions TSEND_C, TRCV_C or TCON.

Connection configuration supports the flexible functionality of communication programming: The parameters entered for the connection configuration are stored in an automatically generated global DB derived from the TCON_Param, TCON_IP_v4 or TCON_IP_RFC structure. You can modify the connection parameters in this connection description DB.

Structure of the connection configuration

The connection configuration is made up of the following components:



① Communication instruction for TCON, TSEND_C or TRCV_C

② "Configuration" tab in the "Properties" tab
③ Area navigation of the "Configuration" tab
④ General properties of the connection parameters
⑤ Address details of the connection parameters (for selected connection DBs)

"Configuration" tab

Enter the desired connection parameters in the "Configuration" tab. The area navigation of the "Configuration" tab includes the "Connection parameters" group. This group contains the connection configuration. Here, you can enter the parameters for the connections and the address details with system support. Here, you also connect the CONNECT (TCON, TSEND_C, TRCV_C) or ID (TCON, TSEND, TRCV, TUSEND, TURCV) block parameters of the selected communication instructions.

When all the required parameters are assigned, a check mark is set in front of the "Connection parameters" group in the area navigation.

Note

The connection parameter assignment does not check whether the connection IDs and port numbers (TCP, UDP) or TSAPs (ISO-on-TCP, ISO) are unique. When you configure Open User Communication, you should, therefore, make sure that the parameter settings are unique within a device.

Connection parameters with structure according to TCON_IP_v4 (Page 643)

Connection parameters with structure according to TCON_IP_RFC (Page 644)

Description of the connection parameters

Overview

The following table shows the general connection parameters:

Parameter	Description
End point	The names of the local end point and the partner end point are shown. The local end point is the CPU for which TCON, TSEND_C or TRCV_C is programmed. The local end point is, therefore, always known. The partner end point is selected from the drop-down list. The drop-down list shows all available possible connection partners including unspecified connection partners for devices whose data is unknown in the project. For S7-1500, broadcast can be selected as the partner end point (message to all subnet devices). For S7-1500 CPs/CMs, multicast can also be selected as the partner end point (message to a group within the subnet). The connection type is converted automatically to UDP in this case. As long as no connection partner is set, all other parameters in the mask are disabled.
Interface	The interface of the local end point is displayed. If multiple interfaces are available, e.g., by means of CPs or CMs, the interface can be selected from the drop-down list. To display or select the partner interface, a specified partner end point must first be selected.
Subnet	The subnet of the local end point is displayed, provided this exists. The partner subnet is displayed only after the partner end point has been selected. If at least one of the two connection partners is not connected with a subnet, the two connection partners are connected with each other. A connection between partners in different subnets is only possible with IP routing. The IP routing settings can be edited in the properties of the relevant Ethernet interfaces.
Address	The IP address or the PROFIBUS address of the local end point is displayed, depending on the subnet used. The corresponding address of the partner is displayed only after the partner end point has been selected. If you have selected an unspecified connection partner, the input box is empty and has a red background. In this case, you must specify a valid IP address/PROFIBUS address. The address type (IP or PROFIBUS) depends on the type of subnet that is set for the local partner. Broadcast (S7-1500 only): If "Broadcast" is set as the partner end point, a non-editable IP address with host address 255 is entered automatically for the connection partner. The network allocation corresponds to that of the sender. Example: Local IP address 192.168.0.1, partner IP address 192.168.0.255. Multicast (S7-1500 CPs/CMs only): If "Multicast" is set as the partner end point, the editable IP address 224.0.1.0 is entered automatically for the connection partner.
Connection type	Select the connection type you want to use from the "Connection type" drop-down list: • TCP • ISO-on-TCP • UDP With the S7-1500, you can also select the ISO connection type at the configuration type of the configured connections for TSEND_C and TRCV_C or TCON. The connection types can only be used for partners that support the corresponding protocol.

Parameter	Description
Connection type (for S7-1500 only)	With the S7-1500, two different configuration types can be set for TSEND_C and TRCV_C: • Programmed connections use program blocks for the connection description. • Configured connections are saved for the configuration and are only created after download to the device in runtime. You can also use the configured connection to select the connection type ISO. The specified configuration method depends on the selected connection type. If both configuration methods are possible, the programmed connection is preset. The same configuration method must be set for both connection partners.
Connection ID	Enter the connection ID in the input box. You can change the connection ID in the input boxes or enter it directly in TCON. Ensure that the connection ID assigned is unique within the device.
Connection data	The names of the connection description DBs for the connection description structured according to TCON_IP_v4, TCON_IP_RFC or TCON_Param are displayed in the drop-down lists. The drop-down list is still empty after selection of a connection partner. You can use the drop-down list to generate a new data block or to select an existing data block. This data block is filled automatically with the values from the connection configuration. The name of the selected data blocks is entered automatically in the CONNECT block parameter of the selected TSEND_C, TRCV_C or TCON instruction. From the drop-down list, you can also reference another valid data block. If a DB is referenced using the CONNECT input parameter of the TSEND_C, TRCV_C or TCON extended instructions and this does not correspond to the structure of a TCON_IP_v4, TCON_IP_RFC or TCON_Param, the drop-down list is shown with no content on a red background.
Connection name (for S7-1500 only)	If the connection type of the configured connections is set for TSEND_C and TRCV_C for the S7-1500, the "Connection data" parameter is replaced with the "Connection name" parameter. The name of the configured connection serves here as the connection data. The drop-down list is still empty after selection of a connection partner. You can use the drop-down list to generate a new connection or to select an existing connection. If needed, a data block is created and automatically filled with the values from the connection configuration. The name of the data block is entered automatically in the CONNECT block parameter of the TSEND_C or TRCV_C instruction. You can also reference an existing connection from the drop-down list.
Active connection establishment	Use the "Active connection establishment" check box to specify the active partner of the Open User Communication (only with TCP and ISO-on-TCP).
Port (only with TCP and UDP)	Address component for a TCP or UDP connection. The default after creating a new TCP connection is 2000. You can change the port numbers. The port numbers must be unique on the device!
TSAP (ISO-on-TCP only)	Address component for an ISO-on-TCP connection. The default value after creating a new ISO-on-TCP connection is E0.01.49.53.4F.6F.6E.54.43.50.2D.31 (S7-1200/1500) or E0.02.49.53.4F.6F.6E.54.43.50.2D.31 (S7-300/400). You can enter the TSAP-ID with an extension or as an ASCII TSAP. The TSAPs must be unique on the device!

Note

UDP connection for the "Broadcast" setting (S7-300/400/1200)

The parameters of the UDP connection for the "Broadcast" setting for the partner end point are stored in a connection description DB TCON_IP_v4 : With respect to UDP communication with TCON and TUSEND/TURCV , the TCON_IP_v4 is not filled with any partner parameters (value=0). However, the partner address and the partner port are necessary for sending the data and must be entered by the user in the TADDR_Param . The TADDR_Param for UDP communication is referenced by the TUSEND-/TURCV block parameter ADDR . The values for both parameters can be taken from the connection configuration.

The configuration must also be adapted for the other recipients of UDP communication. In order to receive broadcast frames, the partner port must be configured at the receiver end. For this purpose, the RemotePort parameter of the TADDR_Param must be filled at the ADDR block.

Note

Communication via TSEND_C and TRCV_C (S7-1500)

When TSEND_C and TRCV_C are used, a separate TSEND_C and TRCV_C block pair with a configured connection is required for each communication. Multiple TSEND_C and TRCV_C block pairs cannot simultaneously use the same configured connection for communication.

Additional connections for a TSEND_C or TRCV_C instruction can be created in the inspector window for the connection parameters using the appropriate button next to the connection data.

The connections configured using TSEND_C and TRCV_C are displayed in a connection table in the inspector window under "Properties > Configuration > Overview of configured connections" when the TSEND_C or TRCV_C block is selected.

Starting connection parameter assignment

The connection configuration for Open User Communication is enabled as soon as a TCON, TSEND_C or TRCV_C instruction for communication is selected in a program block.

Requirement

- Your project must contain at least one S7-CPU.
- The program editor is open.
- A network is available.

Procedure

To insert the extended instructions for Open User Communication, proceed as follows:

1. Open the task card, pane and folder "Instructions > Communication > Open User Communication".
2. Drag one of the following instructions to a network:
   - TSEND_C
   - TRCV_C
   - TCON

   The "Call options" dialog opens.
3. Edit the properties of the instance DB in the "Call properties" dialog. You have the following options:
   - Change the default name.
   - Select the "Manual" check box to assign your own number.
   - You can also execute the DB as a multi-instance for function blocks.
4. Click "OK" to complete your entry.

Result

A corresponding instance DB is created at a single instance for the inserted instruction TSEND_C, TRCV_C or TCON. In the case of a multi-instance, the instance DB of the function block is used.

With TSEND_C, TRCV_C or TCON selected, you will see the "Configuration" tab under "Properties" in the Inspector window. The "Connection parameters" group in area navigation contains the connection parameter assignment that you can now make.

See also

Creating and assigning parameters to connections (Page 633)

Creating and assigning parameters to connections

In the connection configuration for Open User Communication, you can create and configure connections of the TCP, UDP or ISO-on-TCP type.

Requirement

A CPU exists with a TCON, TSEND_C or TRCV_C communication instruction.

Procedure

To create a connection for Open User Communication, follow these steps:

1. Select a TCON, TSEND_C or TRCV_C block of Open User Communication in the program editor.
2. Open the "Properties > Configuration" tab in the inspector window.
3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.
   The connection parameters already known are displayed:
   - Name of the local end point
   - Interface of the local end point
   - IP address (for Ethernet subnet) or PROFIBUS address (for PROFIBUS subnet) of the local end point.
4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communication partner. Certain connection parameters are then entered automatically.
   The following parameters are set:
   - Name of the partner end point
   - Interface of the partner end point
   - IP address (for Ethernet subnet) or PROFIBUS address (for PROFIBUS subnet) of the partner end point.

   If the connection partners are networked, the name of the subnet is displayed.
5. With the S7-1500, in the "Configuration type" drop-down list, you choose between using program blocks or configured connections.

6. Select an existing connection description DB in the "Connection data" drop-down list or for configured connections select an existing connection under "Connection name". You can also create a new connection description DB or a new configured connection. Later, you can still select other connection description DBs or configured connections or change the names of the connection description DBs in order to create new data blocks:
   - You can also see the selected data block at the interconnection of the CONNECT input parameter of the selected TCON, TSEND_C or TRCV_C instruction.
   - If you have already specified a connection description DB for the connection partner using the CONNECT parameter of the TCON, TSEND_C or TRCV_C instruction, you can either use this DB or create a new DB.
   - If you edit the name of the displayed data block in the drop-down list, a new data block with the changed name but with the same structure and content is generated and used for the connection.
   - Changed names of a data block must be unique in the context of the communication partner.
   - A connection description DB must have the structure TCON_Param, TCON_IP_v4 or TCON_IP_RFC, depending on CPU type and connection.
   - A data block cannot be selected for an unspecified partner.

   Additional values are determined and entered after the selection or creation of the connection description DB or configured connection.
   The following is valid for specified connection partners:
   - ISO-on-TCP connection type
   - Connection ID with default of 1
   - Active connection establishment by local partner
   - TSAP ID
     for S7-1200/1500: E0.01.49.53.4F.6F.6E.54.43.50.2D.31
     for S7-300/400: E0.02.49.53.4F.6F.6E.54.43.50.2D.31

   The following is valid for unspecified connection partners:
   - TCP connection type
   - Partner port 2000

   The following applies for a configured connection with a specified connection partner:
   - TCP connection type
   - Connection ID with default of 257
   - Active connection establishment by local partner
   - Partner port 2000

   The following applies for a configured connection with an unspecified connection partner:
   - TCP connection type
   - Local port 2000

7. Enter a connection ID as needed for the connection partner. No connection ID can be assigned to an unspecified partner.

   Note

   You must enter a unique value for the connection ID at a known connection partner. The uniqueness of the connection ID is not be checked by the connection parameter settings and there is no default value entered for the connection ID when you create a new connection.

8. Select the desired connection type in the relevant drop-down list. Default values are set for the address details depending on the connection type. You can choose between the following:
   - TCP
   - ISO-on-TCP
   - UDP

   For configured connections with S7-1500, ISO applies in addition.
9. You can edit the input boxes in the address details. Depending on the selected protocol, you can edit the ports (for TCP and UDP) or the TSAPs (for ISO-on-TCP and ISO).
10. Use the "Active connection establishment" check box to set the connection establishment characteristics for TCP, ISO and ISO-on-TCP. You can decide which communication partner establishes the connection actively.

Changed values are checked immediately for input errors by the connection configuration and entered in the data block for the connection description.

Note

Open User Communication between two communication partners can only work when the program section for the partner end point has been downloaded to the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

Deleting connections

Introduction

The data of a created connection for Open User Communication is stored in a connection description DB. You can delete the connection by deleting the data block containing the connection description.

Requirement

You have created an Open User Communication connection.

Procedure

To delete a connection, follow these steps:

1. Select a communication partner for Open User Communication in the project tree.
2. Open the "Program blocks > System blocks > Program resources" folder below the selected communication partner.
3. Select the "Delete" command from the shortcut menu of the data block with the connection parameter assignment.

Note

If you are not certain which block to delete, open the extended instruction TCON, TSEND_C or TRCV_C. You will find the name of the data block as the CONNECT input parameter or in the connection parameter assignment as the "Connection data" parameter.

If you only delete the instance DBs of the extended instructions TCON, TSEND_C or TRCV_C, the assigned connections are not deleted as well.

Note

If the connection DB is still being used by other blocks of the extended instructions, then the corresponding calls, their instance DBs, and, if present, the combination blocks TSEND_C and TRCV_C must also be deleted from the block folder, provided they are not used elsewhere.

This action prevents the program from being inconsistent.

Result

You have deleted the connection.

Note

Insert an extended instruction TCON, TSEND_C, or TRCV_C again in order to reference an existing connection description with the TCON_Param, TCON_IP_v4, or TCON_IP_RFC structure again via the "Connection data" parameter.

How protocols work

Principle of operation of connection-oriented protocols

Introduction

Connection-oriented protocols establish a logical connection to the communication partner before data transmission is started. After the data transmission is complete, they then terminate the connection, if necessary. Connection-oriented protocols are used especially when reliable data transmission is important. Several logical connections can exist over one physical line.

Open User Communication supports the following connection types:

- TCP
- ISO-on-TCP
- ISO (S7-1500 only)
- UDP

Both communication partners must support the same connection type for a connection. If a communication partner does not support a connection of the type ISO-on-TCP, for example, use the connection type TCP instead, if it is supported.

For communication partners that cannot be configured in the TIA Portal, such as third-party devices or PCs, enter "unspecified" for the partner end point during connection parameter assignment. The required connection type for unspecified devices is listed in the respective documentation.

Note

Connections with ISO

For S7-1500 CPUs, configured connections of the type ISO can be created using the TSEND_C and TRCV_C instructions. For additional information on these connection types, refer to the general connection descriptions.

Characteristics of TCP

TCP is a streaming protocol in which the length of the data stream is transmitted to the receiver so that it can receive the data stream as individual TCP segments. This means no information about the start and end of a message is transmitted during data transmission via a TCP connection. The receiver cannot determine by the received segments of the data stream where one message in the data stream ends and the next one begins. It is therefore recommended that the number bytes to be received (parameter LEN, instruction TRCV/TRCV_C) be assigned the same value as the number of bytes to be sent (parameter LEN, instruction TSEND/ TSEND_C).

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):
  TRCV/TRCV_C copies the received data to the specified receive area (parameter DATA) only after the assigned length is reached. When the assigned length is reached, data of the subsequent job are already being received. As a result, the receive area contains data from two different send jobs. If you do not know the exact length of the first message, you are unable to recognize the end of the first message and the start of the second message.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):
  TRCV/TRCV_C copies the number of bytes you specified in the LEN parameter to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the value of LEN. With each subsequent call, you receive a further block of the sent data.

A receive area with fixed data length can be specified in the TRCV/TRCV_C instructions with the protocol version of the Ad-hoc mode.

Characteristics of ISO-on-TCP

ISO-on-TCP is a message-oriented protocol which detects the end of the message at the receiver end and indicates the data that belongs to the message to the user. This does not depend on the specified reception length of the message. This means that information regarding the length and the end of a message is included during data transmission via an ISO-on-TCP connection.

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):
  TRCV/TRCV_C copies all the sent data to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the length of the data sent.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):
  TRCV/TRCV_C does not copy any data to the receive data area (parameter DATA), but instead supplies the following error information: ERROR=1, STATUS=W#16#8088 (destination buffer too small).

Characteristics of UDP

UDP is a message-oriented protocol which detects the end of the message at the receiver end and indicates the data that belongs to the message to the user. This does not depend on the specified reception length of the message. This means that information on the length and the end of a message is included during data transmission via a UDP connection.

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TUSEND/TSEND_C): TURCV/TRCV_C copies all the sent data to the receive data area (DATA parameter). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the length of the data sent.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TUSEND/TSEND_C): TRCV/TRCV_C copies as much data to the receive data area (parameter DATA) as the LEN parameter requests. No further error message is generated. In this case, the user has to call a T_URCV again in order to receive the remaining bytes.

Connection parameters with structure according to TCON_Param

Data block for connection description

A connection description DB with a structure according to TCON_Param is used for some S7-1200 CPUs when it comes to the assignment of parameters for TCP, UDP and ISO-on-TCP communication connections. The fixed data structure of the TCON_Param contains all the parameters that are needed to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND_C, TRCV_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND_C, TRCV_C or TCON contains a reference to the data block used.

Structure of the connection description according to TCON_Param

Byte	Parameter	Data type	Start value	Description
0 … 1	block_length	UINT	64	Length: 64 bytes (fixed)
2 … 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.

Byte	Parameter	Data type	Start value	Description
4	connection_type	USINT	17	Connection type: • 17: TCP (17 dec = 0x11 hex) • 18: ISO-on-TCP (18 dec = 0x12 hex) • 19: UDP (19 dec = 0x13 hex)
5	active_est	BOOL	TRUE	Identifier for the type of connection establishment. FALSE always applies to UDP, since data can be sent and received via local ID. The following is valid for TCP and ISO-on-TCP: • FALSE: Passive connection establishment • TRUE: Active connection establishment
6	local_device_id	USINT	1	ID for the local PN/IE interface.
7	local_tsap_id_len	USINT	0	Length of parameter local_tsap_id used, in bytes; possible values: • 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the active side. • 2 to 16, if connection type = 18 (ISO-on-TCP) • 2, if connection type = 19 (UDP)
8	rem_subnet_id_len	USINT	0	This parameter is not used.
9	rem_staddr_len	USINT	4	Length of address of partner end point, in bytes: • 0: unspecified, in other words, parameter rem_staddr is irrelevant. • 4: valid IP address in the parameter rem_staddr (TCP and ISO-on-TCP only)
10	rem_tsap_id_len	USINT	2	Length of parameter rem_tsap_id used, in bytes; possible values: • 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the passive side. • 2 to 16, if connection type = 18 (ISO-on-TCP) • 0, if connection type = 19 (UDP)
11	next_staddr_len	USINT	0	This parameter is not used.
12 … 27	local_tsap_id	ARRAY [1..16] of BYTE	-	Local address component of connection: • TCP and UDP: local port no. (possible values: 1...49151; recommended values: 2000...5000); local_tsap_id[1] = high byte of port no. in hexadecimal notation; local_tsap_id[2] = low byte of port no. in hexadecimal notation; local_tsap_id[3-16] = irrelevant • ISO-on-TCP: local TSAP-ID: local_tsap_id[1] = B#16#E0; local_tsap_id[2] = rack and slot of local end points (bits 0 to 4: Slot number, bits 5 to 7: rack number); local_tsap_id[3-16] = TSAP extension, optional Note: Make sure that every value of local_tsap_id is unique within the CPU.

Byte	Parameter	Data type	Start value	Description
28 … 33	rem_subnet_id	ARRAY [1..6] of USINT	-	This parameter is not used.
34 … 39	rem_staddr	ARRAY [1..6] of USINT	-	TCP and ISO-on-TCP only: IP address of the partner end point, for example, for 192.168.002.003: • rem_staddr[1] = 192 • rem_staddr[2] = 168 • rem_staddr[3] = 002 • rem_staddr[4] = 003 • rem_staddr[5-6]= irrelevant
40 … 55	rem_tsap_id	ARRAY [1..16] of BYTE	-	Partner address component of connection • TCP: partner port no. (possible values: 1...49151; recommended values: 2000...5000); rem_tsap_id[1] = high byte of port no. in hexadecimal notation; rem_tsap_id[2] = low byte of port no. in hexadecimal notation; rem_tsap_id[3-16] = irrelevant • ISO-on-TCP: partner TSAP-ID: rem_tsap_id[1] = B#16#E0; rem_tsap_id[2] = rack and slot of partner end point (bits 0 to 4: Slot number, bits 5 to 7: rack number); rem_tsap_id[3-16] = TSAP extension, optional • UDP: This parameter is not used.
56 … 61	next_staddr	ARRAY [1..6] of BYTE	-	This parameter is not used.
62 … 63	spare	WORD	W#16#0000	Reserved.

Note

TCON_Param for S7-1500 CPU

The connection description DB with the structure according to TCON_Param is also supported by S7-1500 CPUs for migration reasons. However, we recommend that you use the new structures TCON_IP_v4 and TCON_IP_RFC.

Connection parameters with structure according to TCON_IP_v4

Data block for connection description

A connection description DB with a structure according to TCON_IP_v4 is used for CPUs of S7-1200 V4.0 and higher and S7-1500 to assign parameters for TCP and UDP communication connections. The fixed data structure of the TCON_IP_v4 contains all parameters that are required to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND_C, TRCV_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND_C, TRCV_C or TCON contains a reference to the data block used.

Structure of the connection description according to TCON_IP_v4

Byte	Parameter	Data type	Start value	Description
0 … 1	interface_id	HW_ANY	64	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.
4	connection_type	BYTE	11	Connection type: • 11: TCP (11 dec = 0x0B hex) • 19: UDP (19 dec = 0x13 hex) For compatibility and migration reasons, the CPU S7-1500 also allows the values of the connection description DB with a structure according to TCON_Param. For the connection type TCP, the entry 17 is therefore also valid (17 dec = 0x11 hex).
5	active_established	BOOL	TRUE	Identifier for the type of connection establishment: • FALSE: Passive connection establishment • TRUE: Active connection establishment
6 … 9	remote_address	ARRAY [1..4] of BYTE	-	IP address of the partner end point, for example, for 192.168.0.1: • addr[1] = 192 • addr[2] = 168 • addr[3] = 0 • addr[4] = 1
10 … 11	remote_port	UINT	2000	Port address of the remote connection partner (value range: 1 to 49151).
12 … 13	local_port	UINT	2000	Port address of the local connection partner (value range: 1 to 49151).

Connection parameters with structure according to TCON_IP_RFC

Data block for connection description

A connection description DB with a structure according to TCON_IP_RFC is used for CPUs of S7-1200 V4.0 and higher and S7-1500 to assign parameters to ISO-on-TCP communication connections. The fixed data structure of the TCON_IP_RFC contains all parameters that are required to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND_C, TRCV_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND_C, TRCV_C or TCON contains a reference to the data block used.

Structure of the connection description according to TCON_IP_RFC

Byte	Parameter	Data type	Start value	Description
0 … 1	interface_id	HW_ANY	64	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.
4	connection_type	BYTE	12	Connection type 12: ISO-on-TCP (12 dec = 0x0C hex) For compatibility and migration reasons, the CPU S7-1500 also allows the values of the connection description DB with a structure according to TCON_Param. For the connection type ISO-on-TCP, the entry 18 is therefore also valid (18 dec = 0x12 hex).
5	active_established	BOOL	TRUE	Identifier for the type of connection establishment: • FALSE: Passive connection establishment • TRUE: Active connection establishment
8 … 11	remote_address	ARRAY [1..4] of BYTE	-	IP address of the partner end point, for example, for 192.168.0.1: • addr[1] = 192 • addr[2] = 168 • addr[3] = 0 • addr[4] = 1

Byte	Parameter	Data type	Start value	Description
12 … 45	remote_tselector	TSelector	-	TSelector of the remote connection partner: • TSelLength = Value range 0 to 32 as UINT • TSel[1-32] = Value range each 0 to 255 in bytes
46 … 79	local_tselector	TSelector	-	TSelector of the local connection partner: • TSelLength = Value range 0 to 32 as UINT • TSel[1-32] = Value range each 0 to 255 in bytes

Assignment of port numbers

Introduction

When an Open User Communication is created, the value 2000 is automatically assigned as the port number.

Permissible values for port numbers are 1 to 49151. You can assign any port number within this range. However, because some ports may already be used depending on the system, port numbers within the range from 2000 to 5000 are recommended.

Note

Port numbers must be unique. The connection configuration or a corresponding block call is rejected with an error if the port numbers are assigned twice.

Overview of port numbers

The following table summarizes the system reactions to various port numbers.

Port no.	Description	System reaction
2000 … 5000	Recommended range	No warning, no error message on entry Port number is permitted and accepted
1 … 1999, 5001 … 49151	Can be used, but is outside the recommended range	Warning message on entry Port number is permitted and accepted
0, 20, 21, 25, 80, 102, 135, 161, 34962 … 34964	Can be used conditionally*	
53, 80, 102, 135, 161, 162, 443, 520, 9001, 34962 … 34964	Can be used conditionally**	

* Ports defined for specific functions:
0: ANY - Port number is automatically assigned by S7-1500 CPU as value (>49151)
20: FTP data transmission
21: FTP control
25: TMAIL_C (Simple Mail transfer protocol)
80: Web server
102: ISO-on-TCP (RFC1006)
135: DCE Endpoint Mapper for PROFINET
161: SNMP (Simple Network Management Protocol)
34962 ... 34964: PROFINET

Note

The user usually specifies the value 0 for the local port on the active connection end point for UDP/TCP. In this case, the CPU operating system selects the next available port above 49151. The partner port usually has the default 0 with the passive connection end point. The corresponding parameter is disabled in the connection configuration.

** These ports are disabled depending on the function scope of the CPU in use. The documentation of the respective CPUs provides the assignment of these ports.

Description of the connection parameters (Page 630)

Creating and assigning parameters to connections (Page 633)

Ability to read back connection description parameters

Changing parameter values in the connection description

The connection description for exactly one connection of the Open User Communication is entered from the connection configuration in the connection description DB.

You can change the parameter values of the connection description DB outside of the connection configuration in the user program. Connection description DBs containing values you changed subsequently can be read back from the connection configuration. Under "Properties > Configuration > Connection parameters", the inspector window displays only the connection parameters stored in the connection description DB.

Note

You can only change the values in the running user program if the instructions TCON, TSEND_C or TRCV_C are not being processed and the referenced connection is not established.

The connection configuration does not support nested entries of connection descriptions in DB types that can only be found via offset referencing (for example, Global-DB).

The structure of the connection description cannot be changed.

Ability to read back individual connection parameters

For the "Address" parameter of the communication partner in a TCP or ISO-on-TCP connection, its IP address is displayed from the "rem_staddr" parameter of the connection description.

The following values can also be reloaded from the connection description:

- Connection type
- Local connection ID
- Active/passive connection establishment (only with UDP)
- Local TSAP (ISO-on-TCP only)
- Partner TSAP (ISO-on-TCP only)
- Local port (only with TCP and UDP)
- Partner port (only with TCP)

The values of the connection ID parameters of the communication partner, the connection data, as well as the connection establishment, are not included in the connection description in the local connection description DB. Consequently, these parameters cannot be displayed when the connection configuration is reopened. The connection establishment of the partner results from the local connection establishment and is therefore also displayed.

A new communication partner can be selected at any time in the "Partners" drop-down list box.

When a CPU recognized in the project is selected as a specified communication partner, the entry options for the connection ID and the connection data are shown again.

Connection parameters with structure according to TCON_Param (Page 640)

Description of the connection parameters (Page 630)

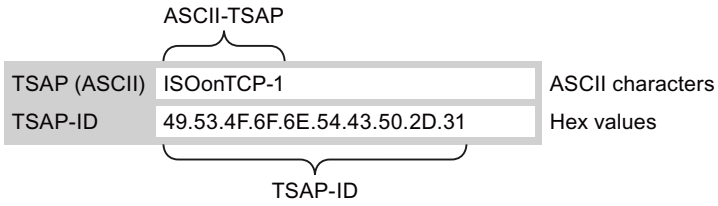
TSAP structure

Introduction

For an ISO-on-TCP connection, Transport Service Access Points (TSAPs) must be assigned for both communication partners. TSAP IDs are assigned automatically after an ISO-on-TCP connection is created. To ensure the uniqueness of TSAP IDs within a device, you can change the preassigned TSAPs in the connection parameter assignment.

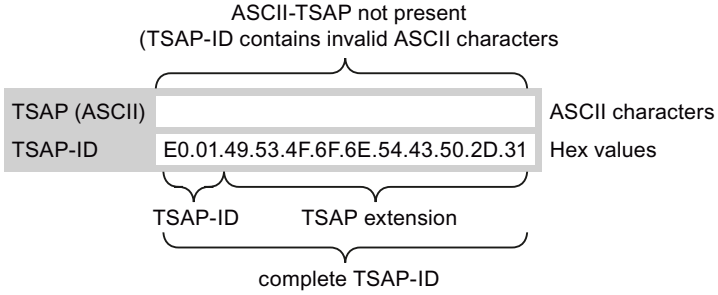
Structure of TSAPs

You must comply with certain rules when assigning TSAPs. A TSAP must contain a certain number of bytes, which are able to be displayed and entered as hexadecimal values (TSAP-ID) or as ASCII characters (ASCII-TSAP):



Entries or changes of the TSAP-ID or the ASCII-TSAP in the corresponding entry fields always take effect in the other display format as well.

If a TSAP contains no valid ASCII characters, the TSAP is displayed only as TSAP-ID and not as ASCII-TSAP. This is the case after a connection is created. The first two hex characters as TSAP-ID identify the communication type and the rack/slot. Because these characters are not valid ASCII characters for a CPU, the ASCII-TSAP is not displayed in this case.



In addition to the rules for length and structure of TSAPs, you must also ensure the uniqueness of the TSAP-ID. The assigned TSAPs are not automatically unique.

Length and content of TSAPs

Structure of the TSAP ID with TSAP extension:

- Valid for CPU S7-1200 firmware V1
  Length = 2 to 16 bytes
  x_tsap_id[0] = 0xE0 (Open User Communication)
  x_tsap_id[1] (bits 0 to 4) = slot number of CPU
  x_tsap_id[1] (bits 5 to 7) = rack number of CPU
  x_tsap_id[2...15] = any characters (TSAP extension, optional)
  (x = loc (local) or x = rem (partner))
- Valid for CPU S7-1500 and S7-1200 firmware as of V2
  Length = 2 to 16 bytes
  x_tsap_id[0] = 0xE0 (Open User Communication)
  x_tsap_id[1] = 0x00 to 0xFF
  x_tsap_id[2...15] = any characters (TSAP extension, optional)
  (x = loc (local) or x = rem (partner))

Structure of the TSAP ID as ASCII TSAP:

- Valid for CPU S7-1200 firmware V1
  Length = 3 to 16 bytes
  x_tsap_id[0...2] = 3 ASCII characters (0x20 to 0x7E)
  x_tsap_id[3...15] = any characters (optional)
  (x = loc (local) or x = rem (partner))
- Valid for CPU S7-1200 firmware as of V2
  Length = 3 to 16 bytes
  x_tsap_id[0...2] for active connection = 3 ASCII characters (0x00 to 0xFF) or any bit string*
  x_tsap_id[0...2] for passive connection = 3 ASCII characters (0x20 to 0x7E) or any bit string*
  x_tsap_id[3...15] = any characters (optional)
  (x = loc (local) or x = rem (partner))
- Valid for S7-1500 CPU
  Length = 3 to 16 bytes
  x_tsap_id[0...2] = 3 ASCII characters (0x00 to 0xFF) or any bit string*
  x_tsap_id[3...15] = any characters (optional)
  (x = loc (local) or x = rem (partner))

* ASCII character strings must not start with "SIMATIC-"

The following table shows the schematic structure of various TSAP IDs:

TSAP-ID	tsap_id_len	tsap_id[0]	tsap_id[1]	tsap_id[2]	tsap_id[3..15]
...with extension (CPU S7-1200 firmware V1)	2...16 bytes	0xE0	0x01 or 0x02 or 0x00*	Extension (optional)	Extension (optional)
...with extension (CPU S7-1500, S7-1200 firmware as of V2)	2...16 bytes	0xE0	0x00...0xFF	Extension (optional)	Extension (optional)
...as ASCII-TSAP (CPU S7-1200 firmware V1)	3...16 bytes	0x20...0x7E	0x20...0x7E	0x20...0x7	Any (optional)

*An S7-1200 CPU is normally inserted on rack 0 and slot 1, and an S7-300/400 CPU on rack 0 and slot 2. For this reason, hex value 01 or 02 is valid for the second position of the TSAP ID with extension. If the connection partner is an unspecified CPU, for example, a third-party device, the hex value 00 is also permissible for the slot address.

Note

For unspecified communication partners, the local TSAP-ID and the partner TSAP-ID can have a length of 0 to 16 bytes, in which all hex values from 00 to FF are permitted.

ASCII code table for entry of ASCII TSAPs

When entering ASCII TSAPs with the hexadecimal values from 20 to 7E, only the following characters are permitted:

Code	..0	..1	..2	..3	..4	..5	..6	..7	..8	..9	..A	..B	..C	..D	..E	..F
2..		!	"	#	$	%	&	’	(	)	*	+	,	-	.	/
3..	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
4..	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
5..	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_
6..	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7..	p	q	r	s	t	u	v	w	x	y	z	{	|	}	~

Examples of TSAP assignment (Page 650)

Description of the connection parameters (Page 630)

Creating and assigning parameters to connections (Page 633)

Examples of TSAP assignment

The following examples show the processing of the TSAPs for CPUs of the S7-1200/1500 (CPU on slot 1) under various points of view:

- Example 1: Creating a new connection for PLC-PLC communication
- Example 2: Entry of a local ASCII-TSAP
- Example 3: Entry of a TSAP extension in the TSAP-ID
- Example 4: Incorrect editing of the TSAP-ID
- Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field

Example 1: Creating a new connection for PLC-PLC communication

Once you have created a new connection with two PLCs for the Open User Communication, the TSAP extension "ISOonTCP-1" is assigned automatically.

This TSAP extension produces the TSAP-ID E0.01.49.53.4F.6F.6E.54.43.50.2D.31, which is entered automatically in the connection description DB and in the entry fields of the local and the partner TSAP. The entry fields of the ASCII-TSAPs remain empty:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

You can change the values in the entry fields of the TSAP-ID and the ASCII-TSAP at any time.

The entry field of the TSAP-ID shows the complete TSAP stored in the data block of the connection description. The TSAP-ID with TSAP extension, which is limited to 16 characters,

is not displayed in the "TSAP (ASCII)" entry field because the character E0 does not represent a valid character for the ASCII-TSAP.

If the displayed TSAP-ID is a valid ASCII-TSAP, it is displayed in the "TSAP (ASCII)" entry field.

Changes in the entry fields for TSAP-ID and ASCII-TSAP affect the other field.

Example 2: Entry of a local ASCII-TSAP

If you have created a new connection and assigned an ASCII value for the local TSAP in the "TSAP (ASCII)" entry field, for example, "ISOonTCP-1", the resulting TSAP-ID is created automatically.

When you exit the "TSAP (ASCII)" entry field, the number of ASCII characters is checked automatically for compliance with the limit (3 to 16 characters) and the resulting TSAP-ID is entered into the corresponding entry field:

	Local TSAP	Partner TSAP
TSAP (ASCII)	ISOonTCP-1	
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

Example 3: Entry of a TSAP extension in the TSAP-ID

If, following creation of a connection and entry of an ASCII-TSAP (see examples 1 and 2) in the entry field of the local TSAP-ID, you add the prefix "E0.01" to the TSAP value, the ASCII-TSAP will no longer be displayed when the entry field is exited.

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

Once you have exited the entry field of the TSAP-ID, a check is performed automatically to determine whether the first character of the TSAP-ID is a valid ASCII character. Since the character "E0" now present in the TSAP-ID is not a valid character for the ASCII-TSAP, the "TSAP (ASCII)" entry field no longer displays an ASCII-TSAP.

If a valid ASCII character is used, the check for compliance with the length specification of 2 to 16 characters follows.

Example 4: Incorrect editing of the TSAP-ID

If you remove the hex value "E0" from a TSAP-ID beginning with "E0.01", the TSAP-ID now begins with "01" and therefore no longer complies with the rules and is invalid:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

After the entry field is exited, a message is output because the TSAP-ID is neither a valid ASCII-TSAP (this would have to have a hex value in the range from 20 to 7E as the first value) or a valid TSAP-ID (this would have to have the identifier "E0" as the first value).

Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field

If you remove the value "01" in addition to the value "E0" from the incorrect TSAP-ID in example 4, the TSAP-ID begins with the hex value 49. This value is within the permissible range for ASCII-TSAPs:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

When you exit the entry field, the TSAP-ID is recognized as a valid ASCII-TSAP and the resulting ASCII-TSAP "ISOonTCP-1" is written to the "TSAP (ASCII)" entry field.

Description of the connection parameters (Page 630)

Communication via PUT and GET instructions

Basic information on communication via the PUT/GET instruction

Basic information on PUT/GET instructions

Use PUT and GET instructions to exchange data between two CPUs via an S7 connection.

The GET instruction is used to read data from a partner CPU. The PUT instruction is used to control the writing of tags by the communication partner via the user program. Apart from the PUT and GET instructions, no additional communication functions are provided for reading and writing tags.

To simplify the use of the two instructions, specify all required parameters for the connection and all block parameters in the Inspector window of the program editor.

Requirement

To be able to use the PUT and GET instructions, the following requirements must be satisfied:

- At least one S7-1200/1500 CPU or S7-300/400 CPU must be created in the project. Firmware 2.0 or higher must be installed on an S7-1200 CPU. If you have not yet created a second CPU in the project, you can initially establish the connection to an unspecified partner.
- An S7 connection must exist between the two CPUs. If you have not yet established a connection between two CPUs, a connection is automatically established during the configuration of the instructions.
- For both instructions, an instance data block is required in which all data used by the instruction is stored. The instance data block is created automatically as soon as you drag a PUT or GET instruction to a network in the program editor. For the correct execution of the program, it is essential that the instance data blocks are not changed; consequently, these data blocks are know-how protected. You only have read access to the instance data blocks.

Overview of connection configuration (Page 653)

Assigning parameters to start request (Page 658)

PUT: Set parameters for write and send area (Page 659)

GET: Set parameters for read and memory area (Page 660)

Connection configuration

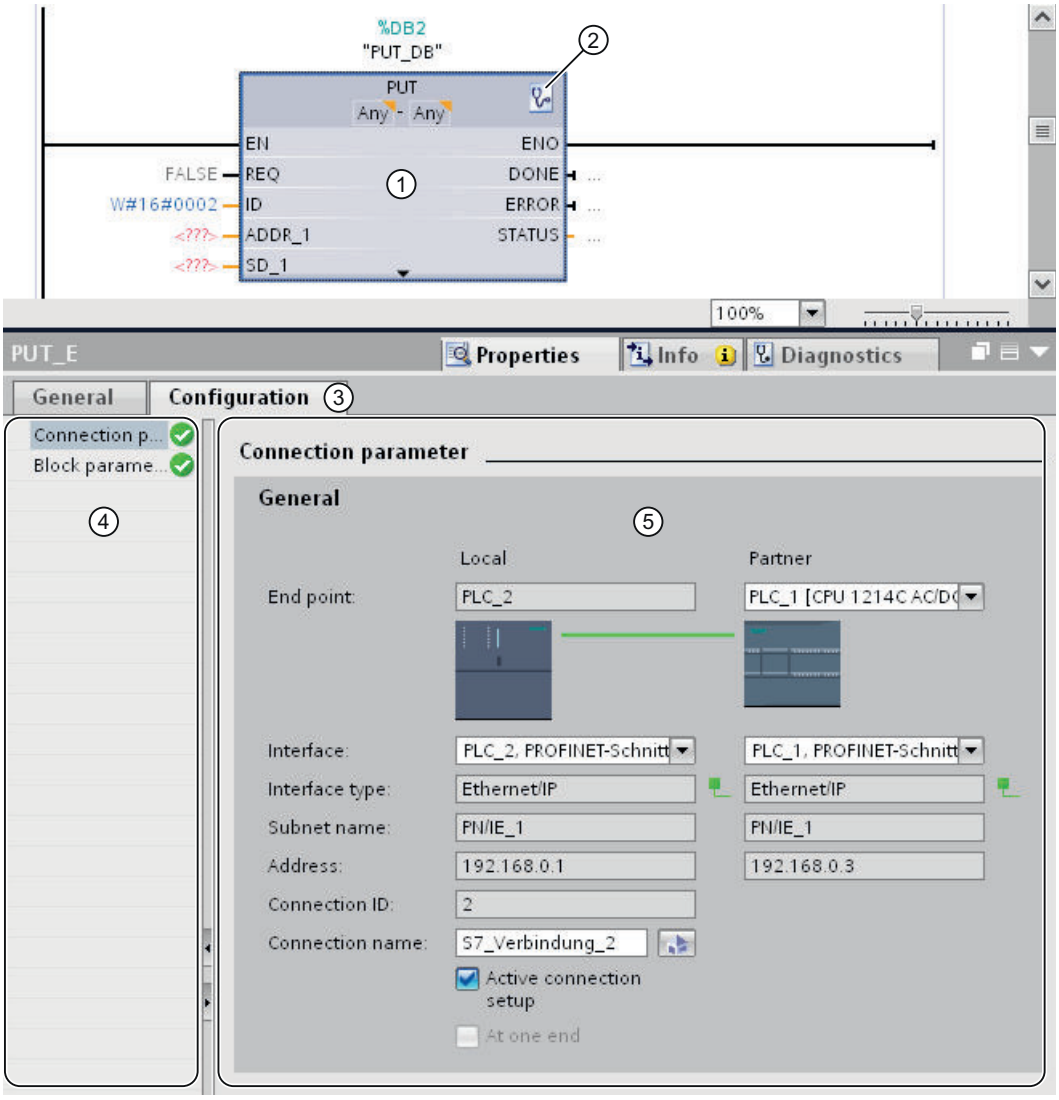
Overview of connection configuration

Introduction

The connection parameters for the PUT and GET instructions are assigned in the inspector window of the program editor. All parameters are saved in the corresponding instance data block.

Structure of the connection configuration

The connection configuration is made up of the following components:



① Communication instruction for PUT or GET
② Call of online and diagnostic functions
③ "Configuration" tab in the "Properties" tab
④ Area navigation of the "Configuration" tab
⑤ General properties of the connection parameters

Display of online and diagnostic functions

If you click the icon for starting the online and diagnostic functions, the associated CPU goes online automatically. The connection table in the network view is opened. In addition, the "Diagnostics" tab and the connection information are displayed in the inspector window.

Entering the connection parameters

Enter the desired connection parameters in the "Configuration" tab. The area navigation of the "Configuration" tab includes the "Connection parameters" group. This group contains the connection configuration. Here, you can enter the parameters for the connections using system functions. When all the required parameters are assigned, a check mark is set behind the "Connection parameters" group in the area navigation.

See also

Assigning parameters to start request (Page 658)

PUT: Set parameters for write and send area (Page 659)

GET: Set parameters for read and memory area (Page 660)

Description of the connection parameters

Overview

The following table shows the general connection parameters:

Parameter	Description
End point	The names of the local end point and the partner end point are shown. • Local end point The local end point is the CPU in which the PUT or GET instruction is programmed. • Partner end point The partner end point is selected from the drop-down list. The drop-down list shows all available possible connection partners including unspecified connection partners for devices whose data is unknown in the project. As long as no connection partner is set, all other parameters in the mask are disabled.
Interface	The interface of the partner CPU is displayed. The partner interface is not displayed until a specified partner CPU has been selected.
Interface type	The type of interface via which communication is handled is displayed.
Subnet name	The subnet of the local end point is displayed, provided this exists. The partner subnet is displayed only after the partner end point has been selected. If at least one of the two connection partners is not connected with a subnet, the two connection partners are automatically connected with each other. The partner which is not connected to a network is hereby connected to the same subnet via which the other partner is already connected to a network. A connection of connection partners to different subnets is only possible with IP or S7 routing. The IP routing settings can be edited in the properties of the relevant Ethernet interfaces.
Address	The IP address of the local end point is displayed. The IP address of the partner is displayed only after the partner end point has been selected. If you have selected an unspecified connection partner, the input box is empty and has a red background. In this case, you will need to specify a valid IP address for the connection partner.
Connection ID	The currently set connection ID is displayed. You can change the connection ID in the connection table in the network view. You can also directly access the connection table while you are setting the connection parameters. To do this, click the "Create new connection" icon.

Parameter	Description
Connection name	The name of the connection which was automatically created when the PUT/GET instruction was inserted is displayed. You can change the name of the connection by entered a different name in the field. You can also create a new connection or edit existing connections by clicking the "Create new connection" icon.
Active connection establishment	Use the "Active connection establishment" option button to specify which partner starts the communication. When the connection is created, the local partner is initially specified by default for the establishment of the connection. If a device does not support active connection establishment, you have to activate active connection establishment on the other partner.
Configured at one end	If this check box is selected, the connection partner is the server for this connection. It cannot actively send or receive. This corresponds to the behavior of the PUT/GET instructions. In this case, other instructions are not possible. If the check box is not selected, other instructions can also be used for the communication.

Starting connection parameter assignment

You can assign the connection parameters for PUT and GET in the inspector window as soon as you have inserted and selected a PUT or GET instruction in a program block.

Procedure

To insert PUT/GET instructions, follow these steps:

1. Open the "Instructions" task card in the "Communication > S7 Communication" folder.
2. Drag a PUT or GET instruction to a network.
   The "Call options" dialog opens.
3. Optional: Edit the properties of the instance DB in the "Call properties" dialog. You have the following options:
   - Change the default name.
   - Select the "Manual" check box to assign your own number.
4. Click "OK".

Result

A corresponding instance data block is created for the inserted PUT or GET instruction. For S7-300 CPUs, a function block is also created in the program resources.

When PUT or GET instruction is selected, you will see the "Configuration" tab under "Properties" in the inspector window. The "Connection parameters" group in area navigation contains the connection parameter assignment that you can now make.

See also

Creating and assigning parameters to connections (Page 657)

Deleting connections (Page 658)

Creating and assigning parameters to connections

You can create S7 connections and assign the parameters for these in the connection parameter assignment of the PUT/GET instructions. Changed values are checked immediately by the connection parameter assignment for input errors.

Requirement

A CPU exists with a PUT or GET communication instruction.

Procedure

To configure an S7 connection using PUT/GET instructions, follow these steps:

1. In the program editor, select the call of the PUT or GET instruction.
2. Open the "Properties > Configuration" tab in the inspector window.
3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.
   The connection parameters already known are displayed:
   - Name of the local end point
   - Interface of the local end point
   - IP address of the local end point
4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communications partner.
   The following parameters are automatically entered as soon as you have selected the connection partner:
   - Interface of the partner end point
   - Interface of the partner end point. If several interfaces are available, you can change the interface as required.
   - Interface type of the partner end point
   - Subnet name of both end points
   - IP address of the partner end point
   - Name of the connection which is used for the communication. If no connection exists yet, it is automatically established.
5. If required, change the connection name in the "Connection name" input box. If you want to create a new connection or edit an existing connection, click on the "Create new connection" icon.

Note

The PUT and GET instructions between two communication partners can only run if both the hardware configuration and the program part for the partner end point have been loaded into the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

Deleting connections

A connection which was automatically created during the insertion of a PUT or GET instruction appears in the connection table of the network view like every standard connection. As a result, it can be deleted in the connection table.

Procedure

To delete a connection, follow these steps:

1. Open the connection table in the network view.
2. In the connection table, select the connection that you want to delete.
3. To do this, right-click the connection and select the "Delete" command from the shortcut menu.

Result

The connection is deleted. The PUT or GET instruction and the associated instance data blocks are retained and must be manually deleted if necessary.

To continue using the PUT or GET instruction, you must configure the connection again in the inspector window of the program editor, since all connection parameters were also deleted when the connection was deleted. In this case, specify a new communication partner and a suitable connection.

Block parameter assignment

Assigning parameters to start request

To start communication via the PUT or GET instruction, you have to specify an event which activates the instruction. This event is referred to as control parameter (REQ). The communication job is activated as soon as there is a positive edge at the control parameter REQ.

Please note that the control parameter REQ is assigned the default FALSE at first call.

Requirement

- The program editor is open.
- You have already inserted a PUT or GET instruction.
- A connection has been established between two communication partners.

Procedure

To define the REQ control parameter, follow these steps:

1. Select the PUT or GET instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.

3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "REQ" field, select a tag of the "BOOL" data type to initialize the execution of the instruction. Alternatively, you can also interconnect a previous instruction in the program editor.

See also

Data consistency (Page 3608)

PUT: Set parameters for write and send area (Page 659)

GET: Set parameters for read and memory area (Page 660)

PUT: Set parameters for write and send area

For communication via the PUT instruction, you must specify the memory area of the partner CPU to which the data should be written. In addition, you must specify the memory area of the local CPU from which the data is to be read.

Requirement

- The program editor is open.
- You have already inserted a PUT instruction.
- A connection has been established between two communication partners.

Procedure

To specify the read and the memory area for the instruction, follow these steps:

1. Select the PUT instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.
3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "In/Outputs > Write area (ADDR_1) > Start" field, select a "REMOTE" data type pointer to the area of the partner CPU which is to be written.
   Only absolute addressing is permitted.
   Example: P#DB10.DBX5.0 Byte 10
5. In the "Length" field, enter the length of the write area and select the data type of the memory area from the drop-down list.
6. In the "In/Outputs > Send area (SD_1) > Start" field, select a pointer to the area in the local CPU which contains the data to be sent.
7. In the Length field, enter the length of the memory area to be read and select the data type from the drop-down list.
   Only the data types BOOL (for a bit array, "0" must be used as address and an integer multiple of byte must be used as length), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIMER are permitted.
   If the VARIANT pointer accesses a DB, the DB must always be specified (for example: P#DB10.DBX5.0 Byte 10).

See also

GET: Set parameters for read and memory area (Page 660)

GET: Set parameters for read and memory area

For communication via the GET instruction, you must specify the memory area of the local CPU to which the data should be written. In addition, you must specify the memory area of the partner CPU from which the data is to be read.

Requirement

- The program editor is open.
- You have already inserted a GET instruction.
- A connection has been established between two communication partners.

Procedure

To specify the read and the memory area for the instruction, follow these steps:

1. Select the GET instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.
3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "In/Outputs > Read area (ADDR_1) > Start" field, select a "REMOTE" data type pointer to the area of the partner CPU which is to be read.
   Only absolute addressing is permitted.
   Example: P#DB10.DBX5.0 Byte 10
5. In the "Length" field, enter the length of the read area and select the data type of the memory area from the drop-down list.
6. In the "In/Outputs > Memory area (RD_1) > Start" field, select a pointer to the area in the local CPU in which the read data is to be stored.
7. In the Length field, enter the length of the memory area and select the data type from the drop-down list.
   Only the data types BOOL (for a bit array, "0" must be used as address and an integer multiple of byte must be used as length), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIMER are permitted.

PUT: Set parameters for write and send area (Page 659)

10.1.3.3 Displaying and configuring topology

Overview of the topology view

Functions of the topology view

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
  - Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports
  - Displaying interconnections between the ports
  - Displaying corresponding logical networks
  - Display diagnostic information of all ports
- Configuring the Ethernet topology
  - Creating, modifying and deleting interconnections of the ports
  - Renaming stations, devices, interfaces or ports
  - Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog
- Identifying and minimizing differences between the desired and actual topology
  - Running an offline/online comparison of Ethernet modules, ports and port interconnections
  - Adopting existing online topology information in the offline project

Note

Devices without valid IP address

Topology information (LLDP) cannot be read from a device without valid IP address.

To prevent devices from having an invalid IP address, specify in the settings of the TIA Portal for hardware configuration that devices without valid IP address are temporarily assigned an IP address.

Note

Subnet membership

Before the topology determination, you have to set for the local interface of your PG/PC the network address that the Ethernet components that are to be determined also have in the real plant. If you do not meet this requirement, no further topology information (information about ports and neighborhood relationships) can be determined.

Differences between network view and topology view

- The network view shows all the logical subnets of the project.
  The topology view shows all Ethernet components of the project. These include passive components such as switches, media converters and cables.

  Note

  Stations with non-Ethernet components are also displayed if the station has a least one Ethernet component.

- The position of a device in the network view and its position in the topology view are not dependent on each other; in other words, the same device generally appears at different locations in the two views.
- If you open the hardware catalog in the topology view, you only see devices with an Ethernet interface.

Structure of the topology view

The topology view (Page 542) essentially consists of a graphic area (called the graphic view below) and a table area (called the table view below).

Which functions are there in the graphic view and which functions are there in the table view?

- Displaying the Ethernet topology

Function	Graphic view	Table view
Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports	yes	yes
Display interconnections between the ports (including type of medium)	yes	yes
Displaying corresponding logical networks	no	yes
Displaying properties of the cables between the ports	no	yes
Display diagnostic information of all ports	yes	yes

- Configuring the Ethernet topology

Function	Graphic view	Table view
Creating, modifying and deleting interconnections of the ports	• Create: yes • Modify: yes • Delete: yes	• Create: yes • Modify: yes • Delete: yes
Renaming stations, devices, interfaces or ports	no	yes
Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog	yes	no

- Identifying and minimizing differences between the desired and actual topology

Function	Graphic view	Table view
Running an offline/online comparison of Ethernet modules, ports and port interconnections	no	yes
Adopting existing online topology information in the offline project	no	yes

Starting the topology view

Requirement

The device or network view is open in the hardware and network editor.

Procedure

To start the topology view of your project, follow these steps:

1. Click on the "Topology view" tab.

Or:

1. Open the network view of the hardware editor.
2. Select a PROFINET device or a PROFINET module.
3. Select the "Go to topology view" command in the shortcut menu.

Result

The graphic view of the topology view is started. If you opened the topology view using the shortcut menu, the selected component remains selected after the change of view.

Displaying topology

Displaying the graphic view of the configured topology

What is shown?

The graphic view of the configured topology shows the following:

- Configured PROFINET devices and passive Ethernet components along with their ports
- Configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports

Type of display

The way in which the graphic view of the topology view and the network view are displayed is very similar:

- Compared with the device view, components are shown in a simplified form.
- The interconnections between ports are shown as horizontal and vertical lines. These are dashed when an interconnection between a tool changer port and its possible partner ports is involved.

Displaying the table view of the configured topology

What is shown?

The table view of the configured topology shows exactly the same content as the graphic view except for the logical PROFINET subnets:

- All the configured PROFINET devices and passive Ethernet components along with their ports
- All the configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports
  For each port with the "Alternating partner port" property, there are as many completed rows as there are potential partner ports plus one empty row.

Type of display

As the name implies, the table view of the topology view consists of a table, the topology overview table. It is structured like the network overview table. It consists of the following columns:

- Device / port
  This is the most important column of the table. The entries in this column have a hierarchical structure with the PROFINET ports being the last element in the hierarchy. You can expand and collapse the hierarchical entries. For a CPU, for example, an entry consists of the following elements:
  - Station name
  - Device name
  - Name of the PROFINET interface
  - Names of the ports

  Note: All the other columns only have entries in the rows containing the port names.
- Type (as default, this column is not displayed)
  Shows what type of station, device or interface the table row relates to or whether it belongs to a port.
- Article no. (by default, this column is not displayed)
  Article no. of the device

- Subnet (as default, this column is not displayed)
  Configured subnet to which the interface belongs
- Master/IO system (as default, this column is not displayed)
  Shows whether or not the interface belongs to a PROFIBUS DP master system or a PROFINET IO system.
- Device address (as default, this column is not displayed)
  Configured address of the interface in the subnet
- Partner station
  Name of the station that contains the partner port
- Partner device
  Name of the device that contains the partner port
- Partner interface
  Interface to which the partner port belongs
- Partner port
- Cable data
  Contains the cable length and the signal delay of the cable connecting the ports

Basic functions for tables

The topology overview table supports the following basic functions for editing a table:

- Displaying and hiding table columns
  Note: The columns that define the configuration cannot be hidden.
- Optimizing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Displaying the diagnostics status of ports and cables in the graphic view

Requirements

The graphic view of the topology view is open.

Procedure

To determine the diagnostics status of the port, follow these steps:

1. Go online with the required component or components.

Result

The following icons are displayed:

- The corresponding diagnostics icon is displayed for each device.
- If there is an error in at least one lower-level component, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon.
- The corresponding diagnostics icon is displayed for each port.
- Every cable between two ports that are online has the color that matches its diagnostics status.

You will find the possible diagnostics icons for ports and the color coding of Ethernet cables in the description of hardware diagnostics. See: Displaying diagnostics status and comparison status using icons (Page 1356)

Showing the diagnostics status of hardware components in the table view

Requirement

The table view of the topology view is open.

Procedure

To obtain the diagnostics status of hardware components of the topology overview table, follow these steps:

1. Go online with the required components.

Result

The following icons are displayed at the left-hand edge of the topology overview table in each row that belongs to the component involved:

- The diagnostics icon belonging to the hardware component is displayed.
- If the hardware component has lower-level components and if there is an error in at least one of the lower-level components, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon of the hardware component.

For the possible diagnostics icons for hardware components, refer to the description of hardware diagnostics. See: Displaying diagnostics status and comparison status using icons (Page 1356)

Note

The display of the diagnostics status of hardware components in the topology overview table and the network overview table is identical.

Running an offline/online comparison and displaying the results

Requirement

The topology view is open. There may be an online connection to one or more devices, but this is not actually necessary.

Procedure

To find the differences between the configured and the actual topology, follow these steps:

1. Click the "Offline/online comparison" button in the toolbar of the topology overview.

Result

The "Partner station", "Partner interface" and "Cable data" columns in the topology overview table are removed.

Two additional groups of columns are added to the right-hand side of the table and these are initially empty:

- On the far right, columns for the topology to be identified online are added.
- Between the columns for the offline and the online topology, the "Status", "Action" and "Description" columns are added to show the result of the offline/online comparison.

Note

As default, the "Description" column is not displayed.

The following buttons are enabled in the toolbar of the table:

Button	Name	Meaning
	Update	The detection of the existing online topology is started again.
	Synchronize	• Adopting the port interconnections identified online in the project (Page 676) • Adopt the devices identified online in the project (Page 677)

After the actual topology has been identified, the added columns are filled. These steps are described in more detail in the following section.

Note

A difference between offline and online view is displayed for that port connected with the PG/PC which is only available online. This is because the PG/PC cannot be configured offline.

Columns for the topology identified online

The following columns are displayed:

- "Device / port"
- "Type" (as default, this column is not displayed)
- "Article no." (by default, this column is not displayed)
- "IP address" (as default, this column is not displayed)
- "Partner device"
- "Partner port"
- "Cable data"

Columns for the result of the offline/online comparison

The following columns are displayed:

- "Status"
  The result of the offline/online comparison is shown here in the form of diagnostics icons. The following icons are possible:

Diagnostics icon	Meaning
	Differing topology information in at least one lower-level component
	Identical topology information
	Topology information only available offline or device is disabled
	Topology information only exists online
	Differing topology information
	If a device does not support topology functions, the "Status" column remains empty.

- "Action"
  The possible actions are shown here in the form of icons. The following icons are possible:

Icon	Meaning
	No action possible
	Adopt the interconnection found online

- "Description"
  This column describes the selected action in words.

Configuring topology

Interconnecting ports

Overview

Interconnecting ports in the topology view

In the topology view, you have the following options for interconnecting ports:

- in the graphic view (Page 670)
- in the graphic view of a tool changer (Page 672)
- in the table view (Page 671)
- in the table view of a tool changer (Page 672)
- by adopting port interconnections identified online (Page 676)

Note

Interconnecting an electric with an optical port

If you want to interconnect an electric and an optical port, you have to decide between RT and IRT communication:

- With RT communication, it is not necessary to configure a media converter.
- With IRT communication, you have to make the interconnection via a media converter.

What effects does the interconnection of ports have on the network view?

Note

In the properties of a subnet in the network view, you can specify that this subnet is used when a port interconnection is created between two devices that are not networked.

When you create an interconnection between two ports, the following effects are possible in the network view:

- If the corresponding interfaces are disconnected: If you have specified a default subnet, this is used. Otherwise a new subnet is created to connect the two interfaces.
- If one (and only one) of the two interfaces involved is networked: The non-networked interface is connected to the same subnet as the already networked interface.
- In all other cases: The corresponding interfaces are not connected to a logical subnet.

See also

Interconnecting ports (Page 1129)

Settings for interconnecting Ethernet devices (Page 598)

Interconnecting ports in the graphic view

Requirement

You are in the graphic view of the topology view.

Procedure – Creating a new interconnection between two ports

To interconnect a port of a device with a port of another device, follow these steps:

1. Place the mouse cursor on the port you want to interconnect.
2. Click with the left mouse button and hold it down.
3. Move the mouse pointer.
   The pointer now shows the networking symbol to indicate "Interconnect" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.
4. Now drag the mouse cursor to the target port. You can do this while holding down or after releasing the mouse button.
5. Now release the left mouse button or press it again (depending on your previous action).

Result: A new port interconnection is created.

Note

Creating a ring for S7-300, S7-400, and S7-1500 CPUs

If you create a ring using port interconnections for S7-300, S7-400, or S7-1500 CPUs, an MRP domain is created automatically.

Procedure – Changing an existing port interconnection without deleting it first

To do this, follow these steps:

1. Place the mouse cursor on the port of an existing interconnection that is to receive a new partner port.
2. Drag the port to the new partner port.

Result: The existing port interconnection is deleted. The new port interconnection is created.

Alternative procedure:

1. Place the mouse cursor on a port without an interconnection that is to be connected with an already interconnected port.
2. Drag the port to the already interconnected port.

Result: The existing port interconnection is deleted. The new port interconnection is created.

Procedure – Interconnecting two interconnected ports with each other without first deleting the two existing port interconnections

To do this, follow these steps:

1. Place the mouse cursor on the interconnected port that is to receive a new partner port.
2. Drag the port to the new partner port that has also already been interconnected.

Result: The two existing port interconnections are deleted. The new port interconnection is created.

Interconnecting ports in the table view

Which actions are possible with port interconnections in the table view?

The following actions are possible with port interconnections in the table view:

- Creating a new port interconnection
- Changing an existing port interconnection
- Deleting an existing port interconnection

Requirement

The row with the port whose interconnection you want to create, modify or delete is visible in the topology overview.

Procedure

To create the interconnection of a port for the first time, to modify it or delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click the drop-down list there.
3. Select the required partner port (when creating or changing a port interconnection) or the "Not interconnected" entry (when deleting a port interconnection).

Result

The required action is performed. The new partner port (after creating or modifying a port interconnection) or the "Select port" entry (after deleting a port interconnection) is displayed in the "Partner port" column.

Interconnecting a port with more than one partner port in the graphic view

Requirement

- You have configured a port of a PROFINET device with the "Alternative partners" property and have specified its possible partner ports.
- The graphic view of the topology view is open.

Procedure

1. Interconnect this port (referred to hereafter as source port) with one of the partner ports you have specified (referred to hereafter as target port).
2. Interconnect the source port with an additional target port.
   You can do this in several ways:
   - Drag the mouse pointer from a partner port that is already interconnected to a target port.
   - Drag the mouse pointer from an interconnection that has already been created to a target port.
   - Drag the mouse pointer from a target port to a partner port that is already interconnected.
   - Drag the mouse pointer from a target port to an already created interconnection.
3. If necessary, repeat the step above one or more times.

Result

An interconnection is created between the source port and the alternative partner ports. This is indicated by a dashed line.

Interconnecting a port with more than one partner port in the table view

Which actions are possible with port interconnections to several partner ports in the table view?

When working with a tool changer, the following actions can be performed with port interconnections to multiple partner ports in the table view:

- Creating a new port interconnection
- Changing an existing port interconnection
- Deleting an existing port interconnection

Requirement

- You have configured a port of a PROFINET device with the "Alternative partners" property and have specified its possible partner ports.
- The row with the port whose interconnection you want to create, modify or delete is visible in the topology overview.

Procedure

To create the interconnection of a port to one or more partner ports for the first time, to modify it, or to delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click the drop-down list there.
3. Select the required partner port (when creating or changing a port interconnection) or the "Not interconnected" entry (when deleting a port interconnection).

Result

The required action is performed:

- If you are creating an interconnection, a new row is inserted in the topology overview table. The new partner port is displayed there in the "Partner port" column.
- If you change an interconnection, the new partner port is displayed in the "Partner port" column.
- If you delete an interconnection, the row with the previous port interconnection is deleted.

Note

With a tool changer, there are normally several rows for a port with port interconnections to more than one partner port. The last row is always an empty row. The first row can be edited, all other rows are read-only.

Renaming stations, devices, interfaces or ports

Rename a station, a device, an interface or a port

Requirement

The table view of the configured topology is open.

Procedure

To rename a station, a device, an interface or a port, proceed as follows:

1. Click twice in the relevant field of the topology overview table (the second click starts the editing mode).
2. Enter the new name and then press the ENTER key (this closes editing mode).

Result

The object is renamed.

Offline/online comparison

Automatic assignment of devices by offline/online comparison

Overview

During the offline/online comparison, the configured topology is compared with the actual existing topology. Devices identified online are automatically assigned to configured devices as far as this is possible.

Start of availability detection

You start the availability detection the first time by clicking the "Compare offline/online" button in the toolbar of the topology overview.

You restart availability detection by clicking the "Update" button.

Note

The availability detection can take several seconds. During this time, no user input is possible.

Automatic assignment

A device identified online is automatically assigned to a configured device if the following properties of the two devices match up:

- Device name
- Article number
- Number of ports

The following section describes the situations that can occur and what action you can take:

- Identical port interconnections
  This is the ideal situation. No action is necessary here.

"Action" column	Meaning
	No action

- There are interconnections for the identified and configured device, there are however differences.
  The following actions are possible:
  - If it is possible to adopt the online configuration

"Action" column	Meaning
	Adopt online interconnection (Page 676)
	No action

  - If it is not possible to adopt the configuration

"Action" column	Meaning
	No action

- The interconnection only exists online.
  The following actions are possible:
  - If it is possible to adopt the online configuration

"Action" column	Meaning
	Adopt online interconnection (Page 676)
	No action

  - If it is not possible to adopt the configuration

"Action" column	Meaning
	No action

- The interconnection only exists in the configuration.
  The following actions are possible:

"Action" column	Meaning
	Adopt the online interconnection (Page 676), in other words, the interconnection in the configuration will be deleted
	No action

No automatic assignment

In the following situations, no automatic assignment is possible:

- No device can be identified online to match a configured device. In this case the corresponding columns in the "Online topology" area of the topology overview table are empty.
  In this case, you should add the already configured device to your system or delete the configured device from the configuration.
- A device identified online cannot be assigned to any configured device. In this case the corresponding columns in the "Offline topology" area of the topology overview table are empty.
  In this case, you can adopt the device identified online in the project (Page 677).

Adopting the port interconnections identified online in the project

Requirement

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online was automatically assigned to a configured device, but that there are differences relating to the interconnection.

Procedure

To adopt one more port interconnections identified online in the project manually, follow these steps:

1. Select the value "Adopt" in the "Action" column for a port of a configured device to which a device identified online was assigned.
2. Repeat the step if necessary for other ports of the same configured device.
3. Repeat the steps up to now if necessary for other configured devices to which devices identified online were assigned and for which there are differences relating to the interconnection.
4. Click the "Synchronize" button.

Result

The port interconnections identified online and the cable information for the corresponding devices are adopted in the project. Successful adoption is indicated by the diagnostics icon "Identical topology information" for each port.

Note

If other port interconnections are recognized for a device identified online and these differ from those that exist in the project, adopting these in the project means that the port interconnections that were previously in the project are replaced by those identified online. If no port interconnections are detected for a device identified online, adopting in the project means that all the port interconnections of this device are deleted in the project.

Adopt the devices identified online in the project

Requirements

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online could not be assigned to any configured device.

Procedure

To adopt one more devices identified online in the project manually, follow these steps:

1. For a configured device without an online partner, move the mouse pointer to the "Device/ port" column of the online topology.
2. Select the device you want to assign to the configured device from the drop-down list of this box.
3. Repeat the previous steps if necessary for other configured devices without an online partner.

Result

The selected device that was identified online is moved up from the end of the table. Following this, it is in the row of the configured device to which you have just assigned it.

10.1.3.4 Industrial Ethernet Security

Configuring security

General

Supported devices

Supported devices

Security functions can be configured for the following products:

- SCALANCE S:
  - S602 V2/V3/V4
  - S612 V2/V3/V4
  - S613 V2
  - S623 V3/V4
  - S627-2M V4
- SOFTNET Security Client:
  - SOFTNET Security Client V4

- S7-CPs: CP 343-1 GX31 Advanced, CP 443-1 GX30 Advanced, CP 1543-1, CP 1243-1 BX30, CP 1242-7 KX31, CP 1243-7
- PC CP: CP 1628
- Mobile wireless router: SCALANCE M875

General terminology "security module"

In this section of the information system, the following products are grouped together under the term "security module": SCALANCE S602 / SCALANCE S612 / SCALANCE S613 / SCALANCE S623 / SCALANCE S627-2M, CP 343-1 GX31 Advanced, CP 443-1 GX30 Advanced, CP 1543-1, CP 1243-1 BX30, CP 1242-7 KX31, CP 1243-7, CP 1628.

Use of the terms "interface" and "port"

In this documentation, the ports of SCALANCE S modules are named as follows:

- "External interface": The external port of the SCALANCE S602 / S612 / S613 / S623 or an external port of the SCALANCE S627-2M (marked red)
- "Internal interface": The internal port of the SCALANCE S602 / S612 / S613 / S623 or an internal port of the SCALANCE S627-2M (marked green)
- "DMZ interface": The DMZ port of the SCALANCE S623 / S627-2M (marked yellow)

The term "port" itself is used when the focus of interest is a special port of an interface.

Naming the S7 CPs

In this documentation, the term "CP x43-1 Adv." includes the following products: CP 343-1 GX31 Advanced / CP 443-1 GX30 Advanced. The name "CP 1243-1" is used for the product CP 1243-1 BX30. The name "CP 1242-7" is used for the product CP 1242-7 KX31.

Structure of this section of the help system

Topics that are relevant to all security modules can be found in the "General" section. Information that is only relevant to certain module types can be found in the sections relating specifically to these modules.

Overview - Scope of performance and method of operation

General use of the term "STEP 7"

Configuration of security functions is supported as of STEP 7 V12. For this reason, in this section of the information system, the name "STEP 7" will be used for all versions of STEP 7 V12 or higher.

Scope of performance

You can use the following security functions in STEP 7:

- Configuration of the security modules
- Creating VPN configuration data for SOFTNET Security Client V4
- Creating VPN configuration data for SCALANCE M875
- Test and diagnostics functions, status displays

Offline configuration view and online diagnostics view

The security functions are configured in two views:

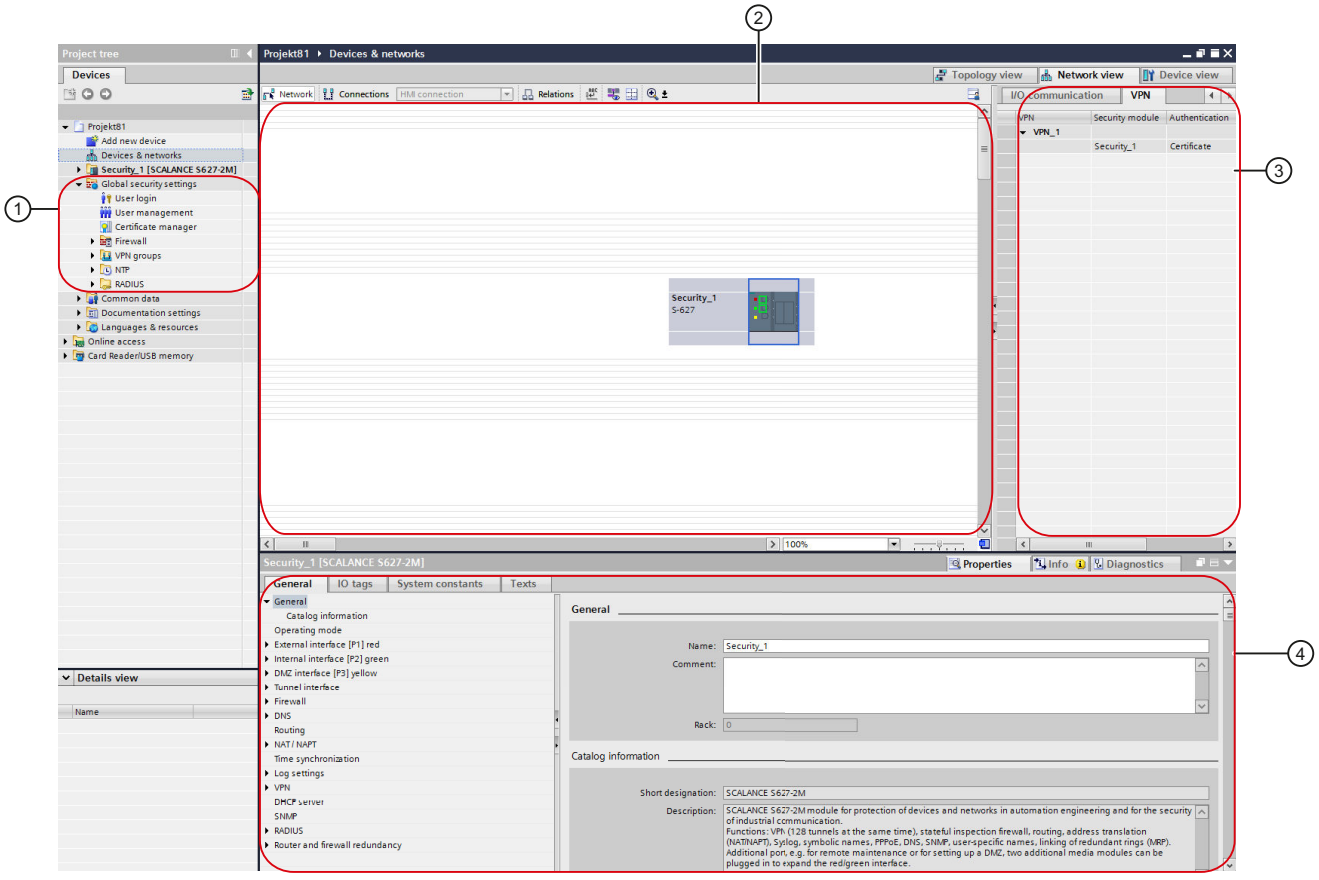
- Offline configuration view
  In the offline configuration view, you create the configuration data for the security modules and the SOFTNET Security Client. Prior to downloading, there must already be a connection to the security modules.
- Online diagnostics view
  The online diagnostics view is used for diagnostics of the security module and, among other things, allows you to run firmware updates.

How it works - security and consistency

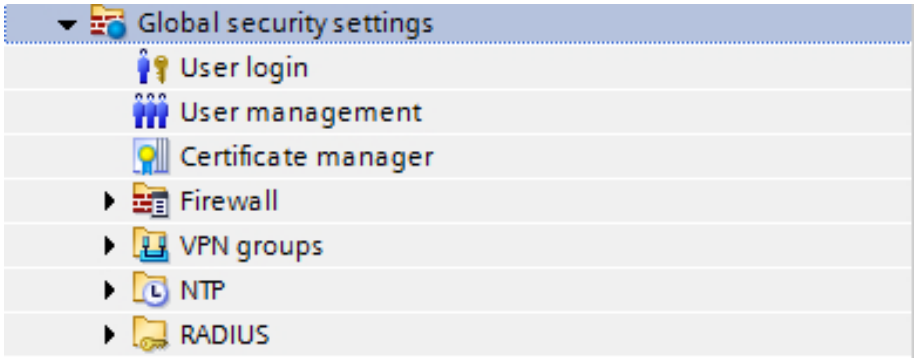
- Access only for authorized users
  The security functions of every project are protected from unauthorized access by assigning user names and passwords. With the help of password policies, project-specific rules for password assignment can be defined.
- Consistent project data
  Consistency checks are running even while you make the entries in the dialogs. In addition, cross-dialog, project-wide consistency checks are carried out.
  Only consistent project data can be downloaded to the security modules.
- Protecting project data by encryption
  The project and configuration data relevant to security are protected by encryption.
  Depending on the security module, data can be stored in the project and/or on the C-PLUG.

User interface - layout and menu commands

User interface for security functions in STEP 7



① Global security settings



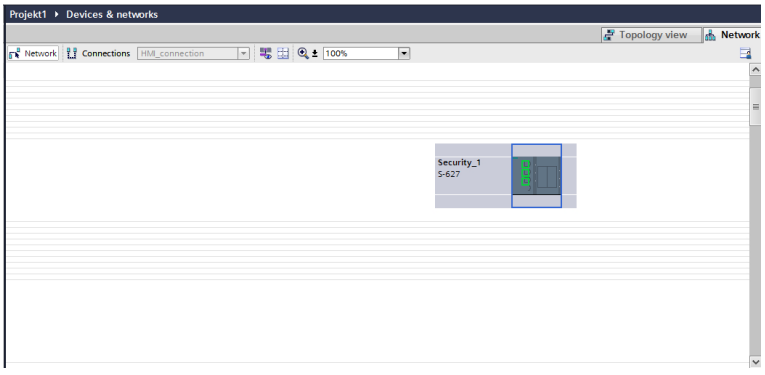
The global security settings are located in the project navigation. These security settings can be configured independently of the module and subsequently assigned to individual security modules as required. Changes to the global security settings must be loaded on all security modules involved. This also applies to the settings of redundancy relationships.

If the first security module to be configured is a CP, the global security settings are only displayed when the security functions have been enabled in the local security settings of the CP. If the first security module to be configured is

a SCALANCE S module, the global security settings are displayed after logging in to the security project. The following main folders and entries are available in the global security settings:

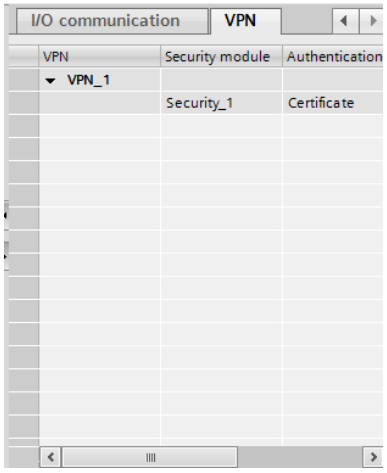
- User login
  For the security configuration within a project, there is a separate user management. Log in to the security configuration using the "User login" entry. The first time that there is a login to the security configuration, a user with the system-defined role "Administrator" is created automatically. You can create further users in the security configuration in the user management.
- User administration
  In user administration, you can create users, define rights for roles and assign these roles to users.
- Certificate manager
  In the certificate manager, you see an overview of all the certificates used in the project. You can, for example, import new certificates as well as export, renew or replace existing certificates.
- Firewall
  Under the "Firewall" entry, you can define global IP and MAC firewall rule sets and user-specific IP rule sets (SCALANCE S modules only) and assign security modules. IP and MAC service definitions are used to define the IP and MAC firewall rules compactly and clearly.
- VPN groups
  All created VPN groups are contained in this folder. You can create new VPN groups here and assign security modules to these VPN groups. You can also adapt VPN group properties of VPN groups that have already been created.
- NTP
  Here, you can create NTP servers and assign them to one or more security modules. This ensures that time synchronization is performed through the assigned NTP server. Unsecured NTP servers can only be configured in the local security settings.
- RADIUS
  Here, you can create RADIUS servers and assign them to one or more security modules. With this, you ensure that authentication queries from users who log on to the selected security module to activate user-specific IP rule sets are forwarded to the assigned RADIUS server.

② Working area with security module



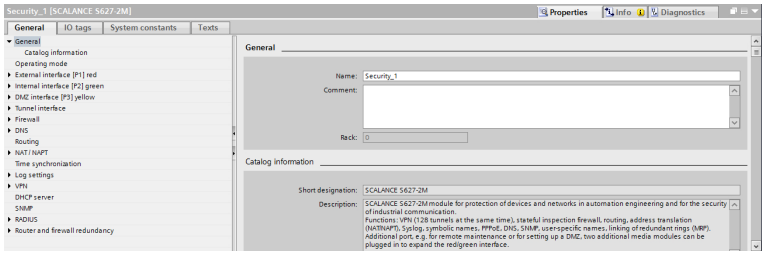
Once you have selected a security module in the work area, you can configure its local security settings in "Properties" > "General". If the selected security module is in a VPN group, related information is displayed in the VPN tab.

③ VPN tab



This tab displays information about all the VPN groups to which the security module that was selected in the working area belongs. Information about the respective participants of a VPN group can be displayed and hidden.

④ Local security settings



Local security settings are configured for a specific security module. After a security module has been selected in the working area, its local security settings are available in the Inspector window under "Properties" > "General".

Note for CPs:

Before local security settings can be configured for CPs, these must first be enabled.

To do this, log in to your security project and then in the Inspector window, select the "Activate security features" check box in the "Properties" > General" tab, "Security" entry. The local security settings are then displayed below the "Security" entry. When the check box is selected, the following settings (assuming they were enabled) are migrated automatically to the local security settings.

CP x43-1 Advanced:

- SNMP
- FTP configuration
- Time-of-day synchronization
- Web server
- Entries of IP access lists

CP 1543-1:

- SNMP
- FTP configuration
- Time-of-day synchronization

CP 1243-1:

- SNMP
- Time-of-day synchronization

CP 1242-7, CP 1243-7:

- Time-of-day synchronization

CP 1628:

- SNMP
- Time-of-day synchronization

Depending on the particular security module, additional security functions are also available such as NTP (secure), SNMPv3, FTPS.

In addition, firewall rules that enable a connection to be established are created automatically for configured connections. Log settings are available to record blocked packets.

Secure and non-secure configuration areas

The user interface can be divided into secure and non-secure configuration areas.

The secure areas are areas in which configuration is possible only after logging in to the security configuration. These areas are encrypted and therefore only available to persons authorized in the user management even if the project is accessible to a wider circle of people.

Functions from the non-secure areas, on the other hand, can be configured without logging in to the security configuration. The correctness of the settings must be checked before downloading the project to the plant components if a wider circle of people can make modifications to the project.

Below, you will find a list of the configuration areas of the user interface showing which areas are secure and which are non-secure. To some extent, this depends on the security module for which the configuration is created.

- All settings from the global security settings are secure.
- Secure and non-secure configuration areas for SCALANCE S modules:
  - All the settings for the interfaces and ports, in particular IP addresses, are non-secure.
  - The settings under the entry "General" in the local security settings are non-secure.
  - Higher-level settings (e.g. MRP settings such as MRP manager etc.) that are not configured on the security module itself but may affect the security module are non-secure. This does not relate to the global security settings.
  - The other settings are protected.
- Secure and non-secure configuration areas for CP 343-1 Advanced GX31, CP 443-1 Advanced GX30, CP 1628, CP 1543-1, CP 1243-1, CP 1242-7, CP 1243-7:
  - All settings outside the "Security" entry are non-secure.
  - Higher-level settings (e.g. MRP settings such as MRP manager, PROFINET settings, connections etc.) that are not configured on the security module itself but may affect the security module are non-secure. This does not relate to the global security settings.
  - All the settings for the interfaces and ports, in particular IP addresses, are non-secure.
  - All settings below the "Security" entry are secure.

Running a consistency check

Overview

The following consistency checks are available:

- Local consistency checks
- Project-wide consistency checks

In the individual dialog descriptions in this help system, the rules you need to take into account for your entries are listed under the keyword "Consistency check".

Local consistency checks

A consistency check is local when it can be performed directly within a dialog. With the following actions, local consistency checks are made:

- After exiting a box
- After exiting a row in a table
- When you confirm a dialog with OK.

Project-wide consistency checks

Project-wide consistency checks provide you with information indicating whether or not project data is correctly configured. With the following actions, there is a consistency check through the entire project:

- When compiling a configuration
- When downloading a configuration

Note

You can only download configured data to a security module if the project-wide consistency check for the security module was successful.

Replacing a security module

Module-specific function

Only SCALANCE S modules as of V3 can be replaced by SCALANCE S modules as of V3, refer to the section:
Replacing a security module (Page 771) in the section "SCALANCE S".

Managing certificates

Overview of certificates

How do you manage certificates?

In the certificate manager, you have an overview of all the certificates, for example, CA certificates used in the project with information about the applicant, issuer, validity, use and the existence of a private key.

The CA certificate is issued by a certificate authority from which the device certificates are derived. These include the SSL certificates and if the security module is a member of a VPN group the VPN group certificates. The SSL certificates are required for authentication during

secure communication between a network node and a security module. Certificate authorities can be:

- STEP 7 itself. If the "applicant" and "issuer" are the same, this is a self-signed certificate; in other words, issued by STEP 7.
- A higher ranking (commercial) certificate authority. These third-party certificates are external to the project and are imported and stored in the certificate store of STEP 7.

Certificates created by one of the two certificate authorities always have a private key so that the device certificates can be derived from them.

The following functions are also available in the certificate manager:

- Import of new certificates and certificate authorities.
- Import of SSL certificates (CP x43-1 Adv. only), e.g. for FTP communication.
- Export of the certificates and certificate authorities used in the project.
- Renewal of expired certificates and certificate authorities.
- Replacing existing certificate authorities.
- Addition of trusted certificates and certificate authorities.
- Deleting manually imported certificates.

Note

Downloading the configuration

After replacing or renewing certificates, the configuration must be downloaded to the relevant security modules.

After replacing or renewing CA certificates, the configuration must be downloaded to all security modules.

Note

Current date and current time of day on the security modules

When using secure communication (for example, HTTPS, VPN...), make sure that the security modules involved have the current time of day and the current date. Otherwise the certificates used are not evaluated as valid and the secure communication does not work.

How to access this function

Double-click on the "Certificate manager" entry in the global security settings.

In the individual tabs, you have the following commands available in the shortcut menu:

Command	Meaning
Import / Export	Import / export of device certificates or CA certificates. The certificates are transferred to the security module. The following formats are permitted: *.cer (certificate only) *.crt (certificate only) *.pem (certificate only) *.p12 (certificate and corresponding private key)
Displays	Opens the certificate dialog of Windows where you see an overview of all certificate data.
Renew (only in the "CA" and "Device certificates" tabs)	Opens the "Create new certificate" dialog in which you can import a certificate or have a new certificate created by STEP 7 when necessary, for example with compromised certificates.
Replace (only in the "CA" tab)	Opens the "Change certificate authority (CA)" dialog in which you can replace an existing certificate authority with a new one.
Delete	Deletes a certificate in the "Trusted certificates and root certification authorities" tab.

Certificate authorities

"CA" tab

The certificates displayed here are created by a certificate authority.

- CA certificates of a project: When you create a new project, a CA certificate is generated for the project. The SSL certificates for the individual security modules are derived from this certificate.
- CA group certificates: When you create a new VPN group, a CA certificate is generated for the VPN group. The VPN group certificates of security modules located in the VPN group are derived from this certificate.

Device certificates

"Device certificates" tab

Display of the device-specific certificates generated by STEP 7 for a security module. These include:

- SSL certificate of a security module: An SSL certificate that is derived from a CA certificate of the project is generated for each security module that you create. SSL certificates are used for authentication during secure communication between PG/PC and security module when downloading the configuration.
- VPN group certificate of a security module: A VPN group certificate is also generated for each security module for each VPN group in which it is located.

Trusted certificates and root certification authorities

"Trusted root certification authorities" tab

Display of the third-party certificates imported into STEP 7. For example, server certificates can be imported from external FTPS servers or project certificates from other projects that were created with STEP 7.

With CPs, the imported third-party certificate is transferred to all the CPs managed in the project and these check the certificate. If you classify the certificate sent to the security modules as trusted, a connection can be established, for example, to an FTPS server. The imported certificate is not used at any other point in STEP 7.

With SCALANCE S modules, the certificate authorities required for verifying the security modules using external services such as dyn. DNS are displayed in this tab.

Renewing certificates

Meaning

In this dialog, you renew CA certificates and device certificates. If necessary, for example with compromised certificates, you can import a certificate or have a new certificate generated by STEP 7.

How to access this function

1. Right-click on a list entry in the certificate manager.
2. Select the "Renew" entry in the shortcut menu.
3. Decide whether or not the new certificate will be self-signed or signed by a certificate authority.
4. If the certificate is to be signed by a certificate authority, select the certificate authority to be used with the "Select" button. Only certificate authorities stored in the certificate store of the current project can be selected.

5. Depending on the certificate, enter the following values in the "Applicant" or "Alternative applicant name" input box:

Certificate to be renewed	Parameter	
	Applicant	Alternative applicant name
CA certificates of the project	Name of the CA certificate	-
CA group certificate	Name of the CA group certificate	-
SSL certificate for S7 CP	Name of the security module	Comma-separated IP addresses of the Gigabit and PROFINET interface
SSL certificate for PC CP	Name of the security module	IP address of the security module
SSL certificate for SCALANCE S, SCALANCE M, SOFTNET Security Client	Name of the security module	For SCALANCE S: External IP address, internal IP address and, if applicable, IP address of the DMZ interface For SCALANCE M: External IP address, internal IP address For SOFTNET Security Client: DNS name
VPN group certificate of the security module	Name of the VPN group certificate	Derived from the CA group certificate.

6. Select a period during which the certificate is valid. As default the current time is entered in the "Valid from:" box and the value of the current certificate is entered in the "Valid to:".

Replacing certificates

Meaning

Open the "Change certification authority (CA)" to replace the existing CA certificate of the project or the CA group certificate with a new one.

How to access this function

1. Right-click a list entry in the "CA" tab.
2. Select the "Replace" entry in the shortcut menu.
3. The "Change certification authority (CA)" dialog opens.

All certificates listed in the "Certificates involved" table are derived once again. This means that the CA group certificate of an already configured VPN group can be replaced in the project by the CA group certificate of a different project. The VPN group certificates for the VPN group members are therefore derived from the same CA group certificate in both projects.

After making changes in the certificate manager, download the configuration to all security modules affected.

Which format can the certificate have?

Other certificates are derived from the imported certificate authority in STEP 7. For this reason, you can only select certificates with a private key.

- *.p12

Managing users and roles

Rules for user names, roles and passwords

Which rules apply to user names, role names and passwords?

When creating or modifying a user, a role or a password, remember the following rules:

Table 10-1 Rules for user management

Permitted characters	The following characters from the ANSI X 3.4-1986 character set are permitted: 0123456789 A...Z a...z !#$%&()*+,-./:;<=>?@ [\]_{|}~^
Characters not allowed	" ' `
Length of the user name (authentication method "password")	1 ... 32 characters
Length of the user name (authentication method "RADIUS")	1 ... 255 characters
Length of the password	8 ... 32 characters
Length of the role name	1 ... 32 characters
Maximum number of users per project	128
Maximum number of users on one security module	32 + 1 administrator when creating the project
Maximum number of roles per project	125
Maximum number of roles on one security module	37

Note

User names and passwords

As an important measure for increasing security, always make sure that user names and passwords are as long as possible and include special characters, upper and lowercase letters and numerals.

Using password policies, you can tighten the restrictions listed above for passwords even further. How to define password policies is described in the section:

Configuring password policies (Page 697)

Password strength

When a new password is entered, its password strength is checked. The following levels are distinguished for the password strength:

- Very weak
- Weak
- Medium
- Good
- Strong
- Very strong

Create users

Meaning

The security functions configured in STEP 7 are protected from unauthorized access by a separate user management. Before you can access the global and local security settings of security modules, you need to log in to the security configuration as a user.

Creating the first user in the project

After creating the first security module in the project, you first need to create a user. To do this, in the local security settings of the created security module, click the "User login" button under the "Security properties" entry and enter the login data of the user you want to create. You will then be logged in as the created user and the user is assigned the system-defined "Administrator" role. This role includes all configuration and module rights.

Creating users in the user management

When you are logged in as a user in the security configuration, you can create further users or delete users with the "User management" entry in the global security settings.

Note

Users with the "Administrator" role

There must always be at least one user with full configuration rights within a project. The administrator that is created automatically when you first enable the security functions in the project can only be deleted if at least one other user exists with the system-defined role "Administrator".

The following parameters are available in user management in the "User" tab:

Table 10-2 Information in the "User" tab

Parameter	Meaning
User name	Name of the user to be created. Click on the "Add new user" entry in the "User name" column to create a new user.
Password (only with the "Password" authentication method)	Entry of the password for the user. When it is entered, the password strength is checked. For more detailed information on password strength, refer to the following section: Rules for user names, roles and passwords (Page 690)
Authentication method	• **Password**: Use this authentication method for users that edit and download the STEP 7 Security project and that need to run diagnostics on the security module. The authentication of the user is performed by the security module when user-specific IP rule sets are activated. • **RADIUS**: (only for SCALANCE S as of V4): The authentication of the user is performed by a RADIUS server when user-specific IP rule sets are activated. The password of the user is not configured in STEP 7 when using this authentication method but must be stored on the RADIUS server. Only use this authentication method for users that only need to log on to the Web page of a security module. A user with the "RADIUS" authentication method cannot log on to STEP 7 Security projects.
Role	Selecting a system-defined or user-defined role.
Maximum time of the session (only for SCALANCE S V3 or higher)	Entry of the time after which a user logged on to the Web page for user-specific IP rule sets of SCALANCE S modules is automatically logged off. The time entered here starts after the logon and after renewing the session on the Web page of the security module. • Default setting: 30 minutes • Minimum value: 5 minutes • Maximum value: 480 minutes
Comment	Entry of optional comments.

Creating roles

Overview

You can assign a system-defined or a user-defined role to a user. Specify the module rights of a user-defined role for each security module.

System-defined roles

The system-defined roles listed below are predefined. Certain rights are assigned to the roles that are the same on all modules and that the administrator can neither change nor delete.

- Administrator
  Default role when creating a security configuration.
  Unlimited access rights to all configuration data and all security modules.
- Standard
  Role with restricted access rights.
- Diagnose
  - Read access to configurations.
  - Read access to the security module in the "Online" mode for testing and diagnostics.
- Remote-Access
  No rights except for logging on to the Web page for user-specific firewall rule sets.
- administrator (radius)
  Role that can be used to activate user-specific IP rule sets with authentication using a RADIUS server.
  Access rights to all configuration data except SNMP MIBs.
- radius
  Role that can be used to activate user-specific IP rule sets with authentication using a RADIUS server.
  Read-only access.

You will find a detailed list of the configuration and module rights assigned to the system-defined roles "Administrator", "Standard" and "Diagnostics" in tables 1-3 to 1-7 of the section Managing rights (Page 694).

For more detailed information on user-specific IP rule sets, refer to the following section: Auto-Hotspot

For more detailed information on authentication using a RADIUS server, refer to the following section: Auto-Hotspot

User-defined role

In addition to the system-defined roles, you can create user-defined roles. For a user-defined role, select the configuration or module rights and specify the appropriate module rights for every security module used in the project. You manually assign the user-defined roles to the relevant user.

How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Roles" tab in User management.

Table 10-3 Information in the "Roles" tab

Parameter	Meaning
Role	Freely selectable role name. Double-click on the "Add new role" entry to create a new user-defined role. You can then set the rights for the created role.
Description	Specifying the system-defined role With user-defined roles, the "User-defined role" character string is displayed.
Maximum time of the session (only for SCALANCE S V3 or higher)	Entry of the time after which a user with the assigned role is automatically logged off from the Web page for user-specific IP rule sets of SCALANCE S modules. The time entered here starts after the logon and after renewing the session on the Web page of the security module. • Default setting: 30 minutes • Minimum value: 5 minutes • Maximum value: 480 minutes
Comment	Entry of additional, optional comments.

Note

Deleting roles

A user-defined role can only be deleted when it is no longer assigned to any user. If necessary, assign the user a different role.

System-defined roles cannot be deleted.

Managing rights

How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Roles" tab in User management.

Creating and assigning a user-defined role

1. Double-click on the "Add new role" entry.
2. Enter a name for the role and, if applicable, specify the maximum session time after which users with the assigned role are automatically logged off from the Web page for user-specific IP rule sets.
3. If necessary, select the system-defined role whose rights will be used as the template for the user-defined role from the drop-down list labeled "<Copy rights from>". User-defined roles cannot be selected from the drop-down list.
   Result: In the list of rights of the user roles, the rights are selected that are assigned to the selected system-defined role.
4. For each security module, enable or disable the rights to be assigned to the user-defined role.
5. Assign the role to a user in the "User" tab.

Configuration rights

Configuration rights are not module dependent and control the rights for configuration in STEP 7.

Depending on the user type, the following configuration rights are available for selection:

Table 10-4 Configuration rights

Configuration right	Administrator	Standard	Diagnose
Diagnose security	x	x	x
Configure security	x	x	-
Managing users and roles	x	-	-

Module rights

Module rights are configured per module. The "Service" column shows the service to which the particular right relates. With the "Copy rights" and "Paste rights" commands in the shortcut menu, you can transfer the rights from one module to another.

Depending on the user type, the following module rights are available for selection:

Table 10-5 Module rights CP x43-1 Advanced

Right within the service	Administrator	Standard	Diagnose	Service
Web: Format CP file system *	x	-	-	File system

* To be able to use the function, the module right "Web: Access Web diagnostics and CP file system" must be enabled as well.

** To be able to use the function, the module right "FTP: Read files from CP file system" must be enabled as well.

*** To be able to use the function, the module right "FTP: Write files to CP file system" must be enabled as well.

**** To use the function, the configuration right "Security diagnostics" must also be enabled.

Setting module rights before and after creating the security modules

Within a user-defined role, the module rights for each security module are defined separately. If a security module was created before this role was added and module rights within a role need to be set, STEP 7 presets the module rights for the security module according to the selected rights template. The preset module rights can then be adapted when adding the role. If a security module was created after adding a role, no rights are preset for this security module. In this case, you will need to edit an existing role and set all the module rights yourself for the security module.

You can also transfer existing module rights to another module by copying and, if necessary, adapting them there. To do this, select a module in the shortcut menu in the module rights and select the "Copy rights" or "Paste rights" menu command.

Configuring password policies

Meaning

Using the password policies, specifications can be defined that need to be taken into account when assigning passwords to new users.

How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Password policies" tab in User management.

After selecting a check box, the corresponding policy is active and can, if necessary, be adapted using the relevant input box.

Parameter	Meaning
Minimum password length	Minimum number of characters that passwords are required to contain. The corresponding check box is enabled as default and cannot be disabled. • Minimum value: 8 characters • Maximum value: 32 characters
Minimum number of digits	Minimum number of digits that passwords are required to contain. • Minimum value: 1 digit • Maximum value: 32 digits
Minimum number of special characters	Minimum number of special characters that passwords are required to contain. A special character is any character that is neither a letter nor digit. • Minimum value: 1 special character • Maximum value: 32 special characters
Number of user passwords blocked for re-use	Number of the most recently used passwords that are not available for use as a new password if the password is changed. • Minimum value: 1 password • Maximum value: 10 passwords
At least one uppercase and lowercase character	If you select this check box, passwords must contain at least one uppercase and one lowercase letter.

Authentication using a RADIUS server

Module-specific function

This function is available only for SCALANCE S V4 modules or higher, refer to:

Auto-Hotspot in the section "SCALANCE S".

Generating configuration data for SCALANCE M modules

Context

You can generate the VPN information for the assignment of parameters to a SCALANCE M using STEP 7. For this to be possible, the module must be in at least one VPN group with a security module or a SOFTNET Security Client. With the generated files, you can then configure the SCALANCE M using the Web Based Management of the device.

Generated files

The following file types are generated:

- Export file with the configuration data
  - File type: *.txt file in ASCII format
  - Contains the exported configuration information for the SCALANCE M including information on the additionally generated certificates.
- VPN group certificates of the module
  - File type of the private key: *.p12 file
  - The file contains the module certificate and the key material.
  - Access is password protected.
- CA certificates of VPN groups
  - File type: *.cer file

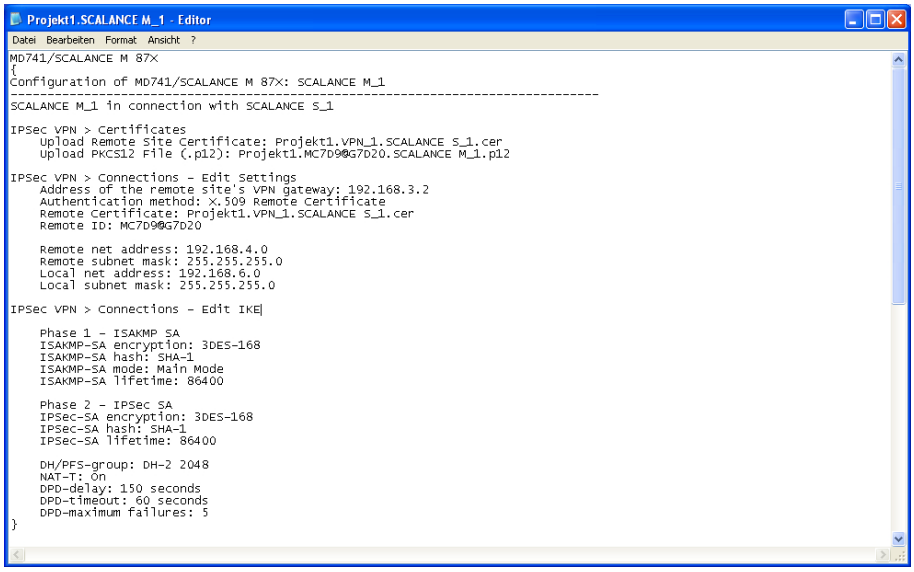

Figure 10-1 SCALANCE M configuration file

Note

No transfer to the security module

Configuration files are not transferred to the security module. An ASCII file is generated with which you can configure the VPN-relevant properties of the SCALANCE M. To allow this, the SCALANCE M must be located in at least one VPN group with another security module.

Note

Protecting exported configuration files from unauthorized access

Configuration files for SCALANCE M exported from STEP 7 can contain security related information. You should therefore make sure that these files are protected from unauthorized access. This is particularly important when passing on the files.

Follow the steps below

1. Select the module of the type "SCALANCE M".
2. In the local security settings, select the entry "SCALANCE M configuration".
3. Select the "Generate SCALANCE M files" check box and select a storage location for the configuration files.
4. Specify a password for the encryption of the VPN group certificate by using the project name as the password or assigning a password of your own.
5. Compile the configuration of the SCALANCE M module.

Result: The files (.txt file and certificates) are stored in the folder you specify.

Configuring interfaces for SCALANCE S modules

Overview

You will find information on configuration interfaces of SCALANCE S modules in Auto-Hotspot of the section "SCALANCE S". The information contained here deals with the following configuration options:

- Mode (bridge mode / routing mode / ghost mode (only for SCALANCE S602 as of V3.1)): Setting the operating mode (Page 773)
- IP address parameters: Configuring IP address parameters (Page 774)
- Port settings (only for SCALANCE S as of V3): Configuring port mode (Page 775)
- Settings for the Internet Service Provider (ISP) if one of the interfaces is operated using PPPoE (only for SCALANCE S as of V3): Configuring an Internet connection (Page 776)
- Dynamic DNS (only for SCALANCE S as of V3): Configuring dynamic DNS (Page 778)
- LLDP (only for SCALANCE S as of V4 in routing mode): Configuring LLDP (Page 781)
- Media redundancy in ring topologies (MRP client), (only for SCALANCE S627-2M as of V4 in routing mode): Auto-Hotspot

For more information on special features of the Ghost mode, refer to the following section: Special features of the ghost mode (Page 784)

The configuration of the interfaces of CPs is described in the sections dealing with the CPs.

Setting up a firewall

Overview of the firewall

Module-specific function

Configuration of the firewall is not possible for the CP 1242-7.

Meaning

The firewall functionality of the security modules is intended to protect networks and stations from third-party influence and interference. This means that only certain, previously specified communications relations are permitted. The firewall discards invalid frames without sending a response.

To filter the data traffic, IP addresses, IP subnets, services or MAC addresses can be used. You can also set a bandwidth limitation.

The firewall functionality can be configured for the following protocol levels:

- IP firewall with stateful packet inspection (layer 3 and 4)
- Firewall also for Ethernet "non-IP" frames according to IEEE 802.3 (layer 2)

With security modules capable of VPN, the firewall can also be used for the encrypted data traffic (IPsec tunnel). With the SCALANCE S602 Security module, the firewall can only be used for unencrypted data traffic.

Firewall rules

Firewall rules describe which packets in which direction are permitted or forbidden. IP rules affect all IP packets of layer 3 or higher. MAC rules only affect frames lower than layer 3.

Types of firewall rules

- Global firewall rule sets: Global firewall rule sets can be assigned to several security modules at the same time. Global firewall rule sets are configured in the global security settings.
- Local firewall rules: Local firewall rules are configured in the local security settings of a security module.
- User-specific IP rule sets (only for SCALANCE S as of V3): User-specific IP rule sets can be assigned to individual or several security modules at the same time. User-specific IP rule sets are configured in the global security settings and assigned there to one or more users.
  SCALANCE S as of V4 (RADIUS): User-specific IP rule sets can be assigned individual or multiple users as well as individual or multiple roles.

Service definitions

With the aid of service definitions, you can also define firewall rules clearly in a compact form. Service definitions are configured in the global security settings and can be used in the global, local and user-specific firewall rules.

Adapting standard rules for IP services

For SCALANCE S modules V3 or higher, you can adapt service-specific firewall rules that are set as default for the interfaces of the security modules. You will find information on configuring these firewall rules in Adapting standard rules for IP services (Page 800) of the section "SCALANCE S".

Automatically generated firewall rules for CP connections

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/ passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

Which firewall rules are generated automatically is described in the following sections.

- For S7-300 CPs/S7-400 CPs/PC CPs: Connection-related automatic firewall rules (Page 833) in the section "Security for S7-300 / S7-400 / PC CPs".
- For S7-1200-/S7-1500-CPs: Connection-related automatic firewall rules (Page 845) in the section "Security for S7-1200 / S7-1500 CPs".

Enabling the firewall

Firewall functionality for a specific security module is controlled in the local security settings using the "Enable firewall" check box. If the check box is enabled, the firewall can be configured and is effective following the download. For a security module that is a member of a VPN group, the "Enable firewall" check box is activated by default and cannot be deactivated. After switching to advanced firewall mode, it is not possible to switch back to standard mode. For more information about the standard and advanced firewall modes, refer to the section:

Overview of local firewall rules (Page 711).

Global firewall rule sets

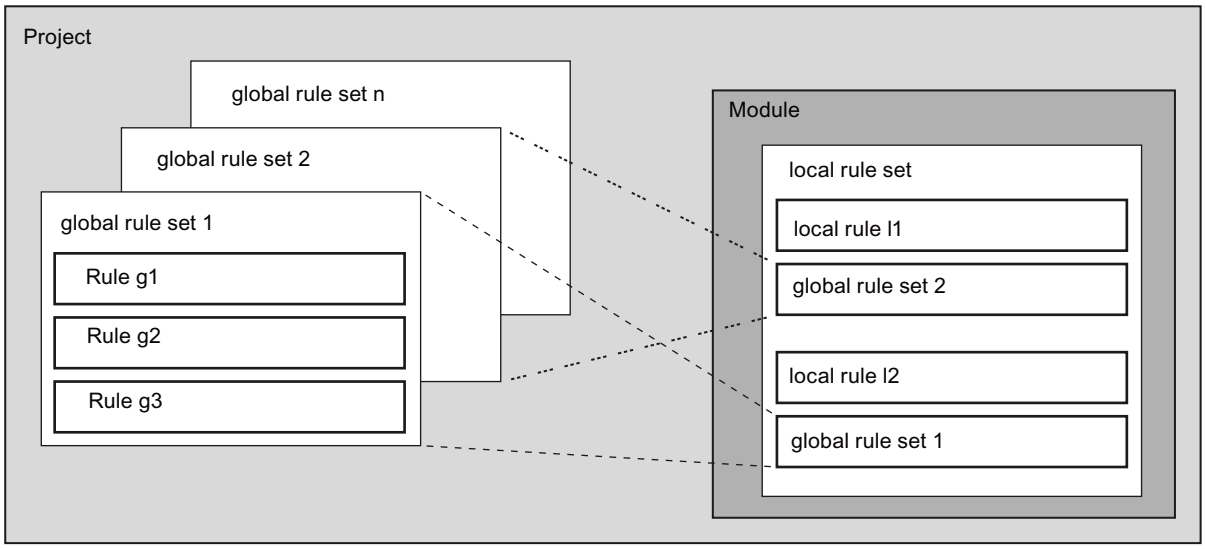
Application

Regardless of the module, global firewall rule sets are configured in the global security settings. A firewall rule set consists of one or more firewall rules and is assigned to the individual security modules.

In the global firewall rule sets, a distinction is made between the following:

- IP rule sets
- MAC rule sets

The following schematic illustrates the relationship between globally defined rule sets and locally used rule sets.



Configuring

When configuring global firewall rules, you can make detailed firewall settings. You can allow individual services for a single node or all services for the node for access to the station or network.

When are global IP and MAC firewall rules useful?

Global firewall rules are useful if you want to define identical filter criteria for communication with several security modules.

Note

Assigning firewall rule sets with incompatible firewall rules

For a security module, only the firewall rules from firewall rule sets are adopted correctly if the security module supports them. A firewall rule contained in a global firewall rule set with the direction "From: External" or "To: Any" is, for example not assigned to a CP 1628. The other firewall rules of the global firewall rule set are adopted if the CP 1628 supports them.

Global firewall rule sets - conventions

Global firewall rule sets are used locally

The following conventions apply when creating a global set of firewall rules and when assigning it to a module:

- Configuration view
  Global firewall rule sets are configured in the global security settings.
- Priority
  As default, locally defined rules have a higher priority than the global IP and MAC firewall rule sets. Newly assigned global IP and MAC firewall rule sets are therefore initially entered at the bottom of the local rule list.
  The priority can be changed by changing the position in the rule list.
- Entering, changing or deleting rule sets
  Global firewall rule sets cannot be edited in the local rule list of the firewall rules in the module properties. They can only be displayed there and positioned according to the required priority.
  It is not possible to delete a single rule from an assigned rule set in the local security settings. Only the entire rule set can be removed from the local list of rules. The firewall rule sets in the global security settings remain unaffected.

Creating global firewall rule sets

How to access this function

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets" > "IP rule sets" or "MAC rule sets".
   Result: The previously created IP rule sets or MAC rule sets are displayed under the selected entry.
2. Double-click on the entry "Add new IP rule set" or "Add new MAC rule set".
3. Enter the following data:
   – Name: Project-wide, unique name of the rule set. The name appears in the local rule list of the security module after the rule set is assigned.
   – Description (optional): Enter a description of the global rule set.
4. Enter the firewall rules one by one in the list.
   Note the parameter description in the following sections:
   For IP rule sets: Defining IP packet filter rules (Page 712)
   For MAC rule sets: Defining MAC packet filter rules (Page 715)

Result

You have created the global firewall rule set and can now assign this to the required security modules.
Note the descriptions in the following section:

Assigning global firewall rule sets (Page 705)

Assigning global firewall rule sets

Requirement

You have enabled the advanced firewall mode for the security modules you want to assign to a firewall rule set.

Procedure

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets" > "Assign module to a firewall rule set".
2. From the "Rule set" drop-down list, select the rule set to which you want to assign the security module.
   In the right-hand table, you will see the security modules that you can assign to the selected firewall rule set. In the left-hand table, you will see the security modules already assigned to the selected firewall rule set.
3. In the "Available modules" area, select the security modules you want to assign to the selected rule set.
4. Click the "<<" button to assign the selected modules to the selected rule set.

Result

The global rule set is used by the assigned security modules as a local rule set and appears automatically at the end of the list of firewall rules in the local security settings.

IP services

Defining IP services

How to access this function

In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".

Procedure

Using the definition of IP services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can also be grouped together under a group name.

When you configure the packet filter rules, you then use this name.

Parameters for IP services

You define the IP services using the following parameters:

Table 10-10 IP services: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Name	Name for the service that is used as identification in the rule definition or in the group. The names of pre-defined services cannot be changed.	• Name must start with a letter. • Name must not contain any special characters. • Name must not be redundant.
Protocol	Selection of the protocol type	• TCP • UDP • TCP+UDP • All
Source port	Filtering is based on the port number specified here; this defines the service access at the frame sender.	With the protocol selection "TCP+UDP", it is not possible to specify a port. Examples: *: Port is not checked 20 or 21: FTP service
Destination port	Filtering is based on the port number specified here; this defines the service access at the frame recipient.	With the protocol selection "TCP+UDP", it is not possible to specify a port. Examples: *: Port is not checked TCP 80: Web HTTP service TCP 102: S7 protocol

Defining ICMP services

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "ICMP" tab.

Procedure

Using the definition of ICMP services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can be grouped together under a group name.

When you configure the packet filter rules, you then use this name.

Parameters for ICMP services

Parameter	Meaning/comment	Available options / ranges of values
Name	User-definable name for the service that is used as identification in the rule definition or in the group. The names of predefined ICMPv6 services cannot be modified.	• Name must start with a letter. • Name must not contain any special characters. • Name must not contain more than 20 characters. • Name must not occur more than once
ICMPv6	If you enable this check box, the ICMP service is declared as an ICMPv6 service and you can select an ICMPv6-specific type and code for the service. An ICMPv6 service can only be used in the firewall rule of a security module that supports IPv6.	• Enabled • Disabled (default)
Type	Type of the ICMPv4 or ICMPv6 message.	If the "ICMPv6" check box is deselected, ICMPv4-specific types can be selected. If the check box is selected, ICMPv6-specific types can be selected.
Code	Code of the ICMP type.	Values depend on the selected type.

Creating service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "Service groups" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name. IPv4 and IPv6 services can be collected in the same service group.

Create groups in the open "Service groups" tab. You can then assign services to a group in the "Group management" tab.

Follow the steps below

1. First, create groups in this tab with names to suit your requirements and add a description if required.
2. Select the "Group management" tab. You can assign the previously specified IP services to the groups defined in this tab.

Managing service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "Group management" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name. IPv4 and IPv6 services can be collected in the same service group.

Use the "Group management" tab to assign services to a selected group you created previously in the "Service groups" tab.

Follow the steps below

1. Select a group created previously in the "Service groups" tab from the "Service groups" drop-down list in this tab.
2. Then assign the required services from the right-hand "Available services" list box to the group.

MAC services

Define MAC services

How to access this function

In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".

Meaning

Using the definition of MAC services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can be grouped together under a group name.

When you configure the global or local packet filter rules, you use this name.

Parameters for MAC services

A MAC service definition is formed using protocol-specific MAC parameters:

Table 10-11 MAC services - parameters

Parameter	Meaning/comment	Available options / ranges of values
Name	User-definable name for the service that is used as identification in the rule definition or in the group.	• Name must start with a letter. • Name must not contain any special characters. • Name must not be redundant.
Protocol	Name of the protocol type: • ISO ISO identifies frames with the following properties: Lengthfield <= 05DC (hex), DSAP= userdefined SSAP= userdefined CTRL= userdefined • SNAP SNAP identifies frames with the following properties: Lengthfield <= 05DC (hex), DSAP=AA (hex), SSAP=AA (hex), CTRL=03 (hex), OUI=userdefined, OUI-Type=userdefined • PROFINET IO • As an alternative, a protocol number can be entered. The protocol entries 0800 (hex) and 0806 (hex) are not accepted since these values apply to IP or ARP frames.	• ISO • SNAP • PROFINET IO • 0x (entry of the protocol number)
DSAP	Destination Service Access Point: LLC recipient address	
SSAP	Source Service Access Point: LLC sender address	
CTRL	LLC control field	
OUI	Organizationally Unique Identifier (the first 3 bytes of the MAC address = vendor ID)	
OUI type	Protocol type/identification	

Note

Processing for S7-CPs

Only settings for ISO frames with DSAP=SSAP=FE (hex) are processed. Other frame types are not relevant for S7 CPs and are therefore discarded even before processing by the firewall.

Special settings for SIMATIC NET services

To filter special SIMATIC NET services, please use the following protocol settings:

- DCP:
  PROFINET IO
- SiClock :
  OUI= 08 00 06 (hex) , OUI-Type= 01 00 (hex)

Creating service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".
2. Select the "Service groups" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name.

Create groups in the open "Service groups" tab. You can then assign services to a group in the "Group management" tab.

Follow the steps below

1. First, create groups in this tab with names to suit your requirements and add a description if required.
2. Select the "Group management" tab. You can assign the previously specified MAC services to the groups defined in this tab.

Managing service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".
2. Select the "Group management" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name.

Use the "Group management" tab to assign services to a selected group you created previously in the "Service groups" tab.

Follow the steps below

1. Select a group created previously in the "Service groups" tab from the "Service groups" drop-down list in this tab.
2. Then assign the required services from the right-hand "Available services" list box to the group.

Overview of local firewall rules

Meaning

Local firewall rules are configured in the local security settings of a security module and apply only to this security module. After enabling the firewall functionality you can either use predefined firewall rules or define firewall rules in the advanced firewall mode.

Using predefined firewall rules

Here, you use simple, predefined rules. You can only enable service-specific rules. The enabled services are allowed for all nodes in the specified direction. You can find detailed information on the definition of firewall rules in this dialog in the following module-specific sections:

- For SCALANCE S: Auto-Hotspot
- For S7-300 CPs/S7-400 CPs/PC CPs: Auto-Hotspot
- For S7-1200-/S7-1500-CPs: Auto-Hotspot

Defining firewall rules in advanced firewall mode

In advanced firewall mode, you can make detailed firewall settings. You can allow individual services for a single node or all services for the node for access to the station or network. You enable the advanced firewall mode using the "Activate firewall in advanced mode" check box. In the local security settings, the firewall rules can then be configured in "Firewall" > "IP rules" or "MAC rules". The configuration options available here are described individually in the following section:

For IP packet filter rules: Defining IP packet filter rules (Page 712)

For MAC packet filter rules: Defining MAC packet filter rules (Page 715)

Note

Deactivating the advanced firewall mode not possible

Once you have activated the advanced firewall mode, you can no longer deactivate it.

Configuration limits

Number of firewall rules (advanced firewall mode)	
SCALANCE S as of V3	Maximum of 256
SCALANCE S below V3	Maximum of 226
CP 1543-1	Maximum of 256
CP 1243-1	Maximum of 256
CP 1243-7	Maximum of 256
CP x43-1 Adv.	Maximum of 226
CP 1628	Maximum of 226

Defining IP packet filter rules

Meaning

With IP packet filter rules, you filter according to IP frames, such as TCP, UDP and ICMP.

Within a packet filter rule, you can also fall back on the definitions of the IP services.

Entering IP packet filter rules

Enter the firewall rules one by one in the list. Note the following parameter description.

Table 10-12 IP rules: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Action	Allow/disallow (enable/block)	• Allow Allow frames according to definition. • Drop Block frames according to definition. For firewall rules generated automatically as result of configuring a connection and subsequently adapted manually: • Allow* • Drop* If you change automatically created connection rules, when the "*" option is selected they are not recreated and overwritten by STEP 7.
From / To	Selection of the communications directions for which the rule will apply.	Described in separate sections. • For SCALANCE S modules: IP packet filter directions SCALANCE S (Page 798) • For S7-300 CPs/S7-400 CPs/PC CPs: IP packet filter directions S7-300-/S7-400-/PC-CPs (Page 831) • For S7-1200-/S7-1500-CPs: IP packet filter directions S7-1200 / S7-1500 CPs (Page 844)

Parameter	Meaning/comment	Available options / ranges of values
IPv6 (for the CP 1243-1 and CP 1543-1 only)	If this check box is selected, you can use a previously defined ICMPv6 service in the firewall rule. For the CP 1243-1 and CP 1543-1 V1.1, after selecting the check box you can enter additional IPv6 addresses in the "Source IP address" and "Destination IP address" input boxes. For the CP 1543-1 V1.0, after enabling the check box you cannot enter any source IP address or any destination IP address for the firewall rule.	The check box can only be selected and deselected if there are no entries in the "Source IP address" and "Destination IP address" input boxes. If IPv6 is disabled in the local settings of the CP 1243-1 and CP 1543-1, you cannot select the "IPv6" check box in the local security settings of the CP and therefore cannot use ICMPv6 services or IPv6 addresses in firewall rules. Existing firewall rules that use IPv6 are shown grayed out if IPv6 is disabled.
Source IP address	The firewall rule is applied to the frames whose sender has the IP address specified here. If you do not specify an IP address, the firewall rule applies to all nodes in the communications direction you selected in the "From" column.	You can find additional information about IP addresses in the IP addresses in IP packet filter rules (Page 717) section. **Configuration options in ghost mode (only for SCALANCE S S602 as of V3.1):** If ghost mode is activated, the IP address of the internal node is dynamically determined by the security module at runtime. Depending on the selected direction, you can select one of the following options in the column "Source IP address" (for direction "From internal to external) or in the column "Destination IP address" (for direction "From external to internal"): • IP address of the internal node: The IP address of the internal node is inserted in the firewall rule by the SCALANCE S. • Limited broadcast: The broadcast IP address 255.255.255.255 is inserted in the firewall rule by the SCALANCE S. • Directed broadcast: The broadcast IP address of the SCALANCE S network is inserted in the firewall rule by the SCALANCE S. A directed broadcast can also be forwarded into the destination network via routers. • Multicast: The multicast address band 224.0.0.0 /24 is inserted in the firewall rule by the SCALANCE S. After selecting this option, as an alternative a specific multicast IP address from the multicast address band can be specified.
Destination IP address	The firewall rule is applied to the frames whose recipient has the IP address specified here. If you do not specify an IP address, the firewall rules applies to all nodes in the communications direction you selected in the "To" column.	
Service	Name of the IP/ICMP service or service group used. Here, you select one of the services you defined in the "IP services" dialog: • IP services or • ICMP services Before you select an ICMPv6 service, you need to select the "IPv6" check box.	The drop-down list box displays the services and service groups configured in the global security settings and you can select them.

Parameter	Meaning/comment	Available options / ranges of values
Bandwidth (Mbps)	Option for setting a bandwidth limitation Can only be entered if the "Allow" action is selected. A packet passes through the firewall if the allow rule matches and the permitted bandwidth for this rule has not yet been exceeded.	CP x43-1, CP 1243-1, CP 1243-7, CP 1543-1 and SCALANCE S below V3.0: 0.001 ... 100 Mbps CP 1628 and SCALANCE S as of V3.0: 0.001 ... 1000 Mbps For global and user-specific rules: 0.001 ... 100 Mbps Note: If the direction "From tunnel to station" is configured in a firewall rule for the CP 1543-1 or CP 1243-1, no bandwidth limitation can be specified.
Logging	Enable and disable logging for this rule. If logging is enabled, the settings for the packet filter logging configured in the local security settings apply.	• Enabled • Disabled (default)
Number	Automatically assigned number for the rule. The numbers are recalculated when rules are moved.	
Comment	Space for your own explanation of the rule	If a comment is marked with "AUTO", it was created for an automatic connection rule. For rules you have created, entry of a comment is optional.

Table 10-13 Meaning of the entries in the shortcut menu

Entry in the shortcut menu	Meaning
Delete	This deletes the selected rule or the selected rule set. Notes on removing a globally defined and locally assigned rule set: if you delete a rule set here, this only cancels the assignment to the security module.
Save as global rule set (only for local firewall rules)	Copies the selected firewall rule(s) and inserts it as a global firewall rule set in the global security settings. The firewall configuration currently configured for the security module remains unaffected by this procedure.
Move up	Use this button to move the selected rule or selected rule set up one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with higher priority.
Move down	Use this button to move the selected rule or selected rule set down one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with lower priority.
Define service for IP rules	This opens the dialog in which you can manage the IP services and service groups.

Defining MAC packet filter rules

Meaning

With the MAC packet filter rules, you filter according to MAC frames.

Within a packet filter rule, you can also fall back on the definitions of the MAC services.

Entering MAC packet filter rules

Enter the firewall rules one by one in the list. Note the following parameter description.

Table 10-14 MAC rules: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Action	Allow/disallow (enable/block)	• Allow Allow frames according to definition. • Drop Block frames according to definition. For firewall rules generated automatically as result of configuring a connection and subsequently adapted manually: • Allow* • Drop* If you change automatically created connection rules, when the "*" option is selected they are not recreated and overwritten by STEP 7.
From / To	Selection of the communications directions for which the rule will apply.	Described in separate sections. • For SCALANCE S modules: MAC packet filter directions SCALANCE S (Page 799) • For S7-300 CPs/S7-400 CPs/PC CPs: MAC packet filter directions S7-300-/S7-400-/PC-CPs (Page 831) • For S7-1200-/S7-1500-CPs: MAC packet filter directions S7-1200 / S7-1500 CPs (Page 844)
Source MAC address	The firewall rule is applied to the frames whose sender has the MAC address specified here. If you do not specify a MAC address, the firewall rule applies to all nodes in the communications direction you selected in the "From" column.	MAC address in the correct format
Destination MAC address	The firewall rule is applied to the frames whose recipient has the MAC address specified here. If you do not specify a MAC address, the firewall rule applies to all nodes in the communications direction you selected in the "To" column.	
Service	Name of the MAC service or service group used	The drop-down list box displays the configured services and service groups you can select.

Parameter	Meaning/comment	Available options / ranges of values
Bandwidth (Mbps)	Option for setting a bandwidth limitation. Can only be entered if the "Allow" action is selected. A packet passes through the firewall if the allow rule matches and the permitted bandwidth for this rule has not yet been exceeded.	CP x43-1, CP 1243-1, CP 1243-7, CP 1543-1 and SCALANCE S below V3.0: 0.001 ... 100 Mbps CP 1628 and SCALANCE S as of V3.0: 0.001 ... 1000 Mbps For global rules: 0.001 ... 100 Mbps Note: If the direction "From tunnel to station" is configured in a firewall rule for the CP 1543-1 or CP 1243-1, no bandwidth limitation can be specified.
Logging	Enable and disable logging for this rule. If logging is enabled, the settings for the packet filter logging configured in the local security settings apply.	• Enabled • Disabled (default)
Number	Automatically assigned number for the rule. The numbers are recalculated when rules are moved.	
Comment	Space for your own explanation of the rule	If a comment is marked with "AUTO", it was created for an automatic connection rule. For rules you have created, entry of a comment is optional.

Table 10-15 Meaning of the menu commands

Button	Meaning
Delete	This deletes the selected rule or the selected global rule set. Notes on removing a globally defined and locally assigned rule set: if you delete a rule set here, this only cancels the assignment to the security module.
Save as global rule set (only for local firewall rules)	Copies the selected firewall rule(s) and inserts it as a global firewall rule set in the global security settings. The firewall configuration currently configured for the security module remains unaffected by this procedure.
Move up	Use this button to move the selected rule or selected global rule set up one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with higher priority.
Move down	Use this button to move the selected rule or selected global rule set down one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with lower priority.
Define service for MAC rules	This opens the dialog in which you can manage the MAC services and service groups.

IP addresses in IP packet filter rules

Entering IP addresses in IP packet filter rules

In IP packet filter rules, you have the following options for entering IP addresses:

- Nothing specified
  The rule applies to all IP addresses.
- An IP address
  The rule applies specifically to the specified address.
- Address range
  The rule applies to all the IP addresses covered by the address range.
  An address range is defined by specifying the number of valid bit places in the IP address in the format: [IP address]/[number of bits to be included]
  - [IP address]/24 therefore means that only the most significant 24 bits of the IP address are included in the filter rule. These are the first three octets of the IP address.
  - [IP address]/25 means that only the first three octets and the highest bit of the fourth octet of the IP address are included in the filter rule.
- Address area
  For the source IP address, an address range can be entered in the following format:
  [Start IP address]-[End IP address]

IPv4 addresses

An IPv4 address consists of 4 decimal numbers in the range from 0 to 255 separated from each other by a dot.

Table 10-16 Examples of address ranges in IPv4 addresses

Source IP address or destination IP address	Address range		Number of addresses*)
	from	to	
192.168.0.0**/16**	192.168.0.0	192.168.255.255	65.536
192.168.10.0**/24**	192.168.10.0	192.168.10.255	256
192.168.10.0**/25**	192.168.10.0	192.168.10.127	128
192.168.10.0**/26**	192.168.10.0	192.168.10.63	64
192.168.10.0**/27**	192.168.10.0	192.168.10.31	32
192.168.10.0**/28**	192.168.10.0	192.168.10.15	16
192.168.10.0**/29**	192.168.10.0	192.168.10.7	8
192.168.10.0**/30**	192.168.10.0	192.168.10.3	4
*) Note: Note that the network address and the broadcast address are not available as IP addresses of network nodes in an address range.			

IPv6 addresses

IPv6 addresses consist of 8 fields each with four hexadecimal numbers (128 bits in total). The fields are separated by a colon. IPv6 addresses can only be entered in IP packet filter rules for the CP 1243-1 and CP 1543-1 V1.1.

Example: fd00:ffff:ffff:ffff:ffff:ffff:2f33:8f21

Rules / simplifications:

- Leading zeros within a field can be omitted.
  Example: Instead of 2001:0db8:2426:08d3:1457:8a2e:0070:7344 it is also possible to use the notation 2001:db8:2426:8d3:1457:8a2e:70:7344.
- If one or more fields have the value 0 (or 0000), a shortened notation is possible.
  Example: Instead of 2001:0db8:0:0:0:0:1428:57ab it is also possible to use the notation 2001:db8::1428:57ab.
  To ensure uniqueness, this shortened form can only be used once within the entire address.
- Decimal notation with periods
  The last 2 fields or 4 bytes can be written in the normal decimal notation with periods.
  Example: The IPv6 address fd00::ffff.125.1.0.1 is equivalent to fd00::ffff:7d01:1.
- Address range notation in IP packet filter rules: In the same way as IPv4 addresses, IPv6 addresses can also be noted in the form of address ranges.
  Example: The entry "2001:0db8:85a3:08d3:1319:8a2e:0:0/96" covers all IPv6 addresses from 2001:0db8:85a3:08d3:1319:8a2e:0:0 to 2001:0db8:85a3:08d3:1319:8a2e:ffff:ffff.

Carrying out module-specific log settings

Log settings - overview

Module-specific function

The recording of packet filter events is not available for the CP 1242-7 and CP 1243-7. The recording of audit events and system events is not available for the CP 1242-7.

Log settings in the configuration

The log settings made here are loaded on the module with the configuration and take effect when the security module starts up.

You can restrict the configured packet filter log settings in the online functions if necessary. For example, you can use the online functions to specify that merely IP logging is displayed if you have configured IP and MAC logging.

Logging procedures and event classes

Here, you can specify which data should be logged. As a result, you enable logging as soon as you download the configuration to the security module.

During configuration, you also select one or both of the possible logging procedures:

- Local logging
- Network Syslog

In both logging procedures, the security module recognizes the three following types of events:

- Packet filter events
- Audit events
- System events

Configuring local logging

How to access this function

1. Select the module to be edited.
2. Select the "Log settings" > "Local log memory" entry in the local security settings.

Configuring local logging

Table 10-17 Local logging - settings for log events

Log event	Meaning	Comments
Packet filter log (firewall)	The packet filter log records certain packets of the data traffic. Only those data packets for which a configured packet filter rule (firewall) applies or to which the basic protection reacts (corrupt or invalid packets) are logged. This is only possible when logging is enabled for the packet filter rule. In the "Packets to be logged" drop-down list, you can specify the data packets to be logged: • "All packets": The data packets that are logged are those to which a configured firewall rule applies. In addition to this, all the response packets to such packets are recorded that have passed the firewall according to a configured allow rule. • "Status generating packets": The only data packets that are logged are those to which a configured firewall rule (standard mode or advanced mode) applies and that initially generate a status in the firewall. Data packets that pass through the firewall by using this firewall status are not logged.	Packet filter log data is not retentive The data is stored in volatile memory on the security module and is therefore no longer available after the power supply has been turned off. For retentive storage, you can also save the log data displayed in the "Online & diagnostics" dialog in a file.
Audit log	The logging of audit events is always enabled. The logged information is always stored in the ring buffer. The audit log automatically records security-relevant events, for example user actions such as activating or deactivating packet logging or downloading configurations to the security module.	Audit log data is retentive The data is stored in a retentive memory of the security module and is therefore still available after turning off the power supply. **Note for CPs:** The audit log files are not retentive on CPs. You should therefore use a Syslog server to backup this data.
System log	The system log automatically logs successive system events, for example the start of a process or the failed login attempt of a user. Select the "Log settings" > "Configure system events" entry to configure the event filter and cable diagnostics functions.	System log data is not retentive The data is stored in volatile memory on the security module and is therefore no longer available after the power supply has been turned off. For retentive storage, you can also save the log data displayed in the "Online & diagnostics" dialog in a file.

Table 10-18 Local logging - storage of recorded data

Storage	Meaning
Ring buffer	At the end of the buffer, the recording continues at the start of the buffer and overwrites the oldest entries.
One-shot buffer	Recording stops when the buffer is full.

Configuring system events

How to access this function

1. Select the module to be edited.
2. Select the "Log settings" > "Configure system events" entry in the local security settings.

Filtering of the system events

In this dialog, you set a filter level for the system events. As default, the following values are set:

- SCALANCE S: Level 3 (Error)
- CP: Level 3 (Error)

The priority of the selected filter level must be the same or lower than the severity set for the cable diagnostics; see the "Setting parameters for line diagnostics" table (not for CPs).

Recommendation: Select "Error" as the filter level or a higher value to exclude logging of general, uncritical events.

Note for CP

For CPs, select only level 3 or level 6 since only events of these levels are generated for CPs.

- Level 0 to level 3 error messages are output if level 3 is selected.
- If you select level 6, the error messages of levels 0 to 6 are output.

Properties of the system events - line diagnostics (only for SCALANCE S)

Line diagnostics generates a special system event. A system event is generated when a selectable percentage of bad frames is reached. This system event is assigned the severity and facility set in this dialog.

Table 10-19 Setting parameters for line diagnostics

Function / option / parameter	Meaning
Enable	Enabling and disabling logging
Limit	Selectable percentage of faulty frames representing the limit at which a system event is triggered.

Function / option / parameter	Meaning
Facility	Select a facility from the drop-down list that identifies the system event to be logged.
Severity	Using the severity, you weight the system events of line diagnostics relative to the severity of the other system events.

Note

Severity of the system events of line diagnostics

Den System-Ereignissen der Leitungsdiagnose darf keine geringere Severity zugewiesen werden, als Sie für den Filter eingestellt haben. Bei einer geringeren Severity können diese Ereignisse den Filter nicht passieren und werden nicht aufgezeichnet.

Configuring the network Syslog

How to access this function

1. Select the module to be edited.
2. Select the "Log settings" > "Network Syslog" entry in the local security settings.

Configuring the network Syslog

Table 10-20 Network Syslog - basic settings

Option / parameter	
Enable network Syslog	Enables and disables the transfer of logging events to the Syslog server.
Syslog server	Here, enter the IP address of the Syslog server. As an alternative, an FQDN can be entered for SCALANCE S modules as of V4. The Syslog server must be accessible from the security module at the specified address and, if applicable, using the router configuration under the "Routing" entry of the local security settings. If the Syslog server cannot be accessed no Syslog messages are sent. You can recognize this operating state on the basis of corresponding system alarms. To activate the sending of the Syslog information again, you may have to update the routing information and initiate a restart of the security module.
Enabling event classes	Enable the classes of events to be transferred to the Syslog server. You can classify packet filter and audit events according to the Severity and using the Facility according to their origin.
Module name	The module name is displayed and cannot be changed at this point.

Note

Non-secure transfer of logging events

Logging events are transferred to Syslog servers in plain language. This should be taken into account when using Syslog servers.

Table 10-21 Network Syslog - settings for log events

Log event	Configuring	Comments
Packet filter events (firewall)	The packet filter log records certain packets of the data traffic. Only those data packets for which a configured packet filter rule (firewall) applies or to which the basic protection reacts (corrupt or invalid packets) are logged. This is only possible if logging is activated for the packet filter rule. Syslog alarms can be classified according to their origin and their severity level by setting Facility and Severity. This assignment is carried out with drop-down lists. The severity and facility that you set here is assigned to every event.	The value you select here depends on the evaluation in the Syslog server. If you retain the "default" value setting, the security module specifies the combination of facility and severity with which the event is displayed.
Audit events	The audit log automatically records security-relevant events, for example user actions such as activating or deactivating packet logging or downloading configurations to the security module. Assignment of the severity and facility is carried out with drop-down lists. The severity and facility that you set here is assigned to every event.	The value you select here for the severity and facility depends on the evaluation in the Syslog server. If you retain the "default" value setting, the security module specifies the combination of facility and severity with which the event is displayed.
System events	The system log automatically logs successive system events, for example the start of a process or the failed login attempt of a user.	Select the "Log settings" > "Configure system events" entry in the local security settings to configure the event filter and cable diagnostics functions.

Security module as router

Overview of the routing settings

Meaning

If you operate the security module in routing mode, the networks connected to the internal and external interface are transformed into separate subnets. The DMZ interface (SCALANCE S623/S627-2M only) is connected in routing mode regardless of the mode. In routing mode, the frames intended for an existing IP address in the subnet are forwarded. The firewall rules for the direction of transmission also apply.

You have the following additional options:

- Setting specific routes - can be set in the local security settings under "Routing" (SCALANCE S only), see Specifying routes (Page 801) in the section "SCALANCE S".
- Use standard router - can be set in the local security settings with "External interface [P1] red", "Internal interface [P2] green" or "DMZ interface [P3] yellow" (SCALANCE S623/ S627-2M only) see Configuring IP address parameters (Page 774) in the section "SCALANCE S".
  A maximum of one standard router can be used per security module.
- NAT/NAPT routing - can be set with "NAT / NAPT" (only for SCALANCE S and CP x43-1 Adv.) in the local security settings. To be able to use NAT/NAPT, the security module must be in routing mode.

Enabling routing mode (required for SCALANCE S modules only)

For this mode, you configure an internal IP address and an internal subnet mask for addressing the router in the internal subnet in the local security settings. All network requests that do not belong to a subnet are forwarded by the security module to a different subnet.

Note: In contrast to the bridge mode of the security module, VLAN tags are lost in routing mode.

1. Select the "Routing mode" option under "Mode" in the local security settings.
2. In the local security settings, enter an internal IP address and an internal subnet mask for addressing the router on the internal subnet in the input boxes under "Internal interface [P2] green" > Ethernet addresses".

Overview of NAT/NAPT

Module-specific function

This function is only available for SCALANCE S and CP x43-1 Adv.

Requirements

- The security module is in routing mode or the DMZ interface is activated (SCALANCE S623 / S627-2M only).
- Since firewall rules that enable communication in the configured address translation direction are generated automatically for NAT / NAPT rules, the advanced firewall mode must be enabled for the security module. For more detailed information, refer to section Relationship between NAT/NAPT router and firewall (Page 732)

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "NAT / NAPT".
3. When required, enable address translation according to NAT(Network Address Translation) or NAPT (Network Address Port Translation).

Address translation with NAT (Network Address Translation)

NAT is a procedure for address translation between two address spaces.
The main task is to translate private addresses into public addresses; in other words into IP addresses that are used and even routed on the Internet. As a result, the IP addresses of the internal network are not known to the outside in the external network. The internal nodes are only visible to the external network by means of external IP address that is specified in the address translation list (NAT table). If the external IP address is not the address of the security module and if the internal IP address is unique, this is known as 1:1 NAT. With 1:1 NAT, the internal address is translated to this external address without port translation. Otherwise, n:1 NAT is being used.

Address translation with NAPT (Network Address Port Translation)

The address translation with NAPT changes the target address and the target port to a communication relation (port forwarding).

Frames coming from the external network or DMZ network and intended for the IP address of the security module are translated. If the destination port of the frame is identical to one of the values specified in the "Source port" column, the security module replaces the destination IP address and the destination port as specified in the corresponding row of the NAPT table. With the reply, the security module uses the values for the destination IP address and destination port as contained in the initial frame as the source IP address and the source port.

The difference to NAT is that with this protocol ports can also be translated. There is no 1:1 translation of the IP address. There is now only a public IP address that is translated to a series of private IP addresses with the addition of port numbers.

Address translation in VPN tunnels

Address translations with NAT/NAPT can also be performed for communications relations established via a VPN tunnel. This is supported for connection partners of the type SCALANCE S612 / S623 / S627-2M as of V4.

You will find further information on address translations in VPN tunnels in the following sections:

- NAT/NAPT routing (Page 726)
- Address translation with NAT/NAPT in VPN tunnels (Page 732)

Consistency check - these rules must be adhered to

Among other things, remember the following rules to obtain consistent entries:

- The IP address of the internal interface must not be used in the NAT / NAPT table.
- An IP address used in the NAT/NAPT address conversion list must not be a multicast or broadcast address.
- The external ports assigned for the NAPT translation are in the range > 0 and ≤ 65535. Port 123 (NTP), 443 (HTTPS), 514 (Syslog), 161 (SNMP), 67+68 (DHCP) and 500+4500 (IPsec) are excluded if the relevant services are activated on the security module.
- The external IP address of the security module or the IP address of the DMZ interface may only be used in the NAT table for the action "Source NAT".

- Checking for duplicates in the NAT table
  An external IP address or an IP address in the DMZ network used in the direction "Destination NAT", "Source NAT +Destination NAT" or "Double NAT" may only be used once in each specified direction.
- Checking for duplicates in the NAPT table: A source port number may only be entered once for each interface.
- Internal NAPT ports can be in the range > 0 and ≤ 65535.

See also

Overview of the routing settings (Page 723)

NAT/NAPT routing

Enabling NAT

The input boxes for NAT are enabled. NAT address translations only take effect with the entries in the address translation list described below. After creating NAT rules, the corresponding firewall rules are generated and displayed in advanced firewall mode, see section:

Relationship between NAT/NAPT router and firewall (Page 732)

If PPPoE is activated for the external interface or the DMZ interface, the action "Destination NAT" cannot be configured. When configuring the action "Source NAT", the IP address cannot be entered in the "Source translation" input box because this is obtained dynamically during runtime.

Possible address translations for NAT

The following tables show the input options for address translation with NAT.

Action "Destination NAT" - "Redirect"

The action "Destination NAT" can be performed in the following direction:

- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Destination NAT" can also be performed in the following directions:

- External to DMZ
- DMZ to internal
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the "Destination NAT" action can also be performed in the following directions:

- Tunnel to internal
- Tunnel to external
- Tunnel to DMZ (only if the DMZ interface is activated)

The following applies, for example for the direction "external to internal": The destination IP address of a frame coming from the external network is checked to see whether it matches the IP address specified in the "Destination IP address" input box. If it matches, the frame is forwarded into the internal network by replacing the destination IP address of the frame with the IP address specified in the "Destination translation" input box. Access from external to internal using the external address is possible.

The following table shows the input required for the action "Destination NAT".

Box	Possible entries	Meaning
Source IP address	Not relevant for this action.	-
Source translation	Not relevant for this action.	-
Destination IP address	IP address in the source network	Destination IP address in the source network with which an IP address in the destination network will be accessed. The destination IP address must not match the IP address of the security module in the source network. If the destination IP address in a frame matches the address entered, the address is replaced by the corresponding IP address in the destination network. The specified destination IP address becomes the alias address. This means that the specified IP address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network. The alias IP addresses of a security module are displayed under the entry "Alias IP addresses" of the relevant interface.
Destination translation	IP address in the destination network	The destination IP address is replaced by the IP address specified here.
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

Action "Source NAT" - "Masquerading"

The action "Source NAT" can be performed in the following direction:

- Internal to external

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Source NAT" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the "Source NAT" action can also be performed in the following directions:

- Internal to tunnel
- External to tunnel
- DMZ to tunnel (only if the DMZ interface is activated)

The following applies, for example for the direction "internal to external": The source IP address of a frame coming from the internal network is checked to see whether it matches the IP address specified in the "Source IP address" input box. If it matches, the frame with the external IP address specified in the "Source translation" input box is forwarded to the external network as a new source IP address. In the external network, the external IP address is effective.

The following table shows the input required for the action "Source NAT".

Box	Possible entries	Meaning
Source IP address	IP address in the source network	The source IP address of the specified node is replaced by the IP address specified in the "Source translation" input box.
	IP address range / IP address band in the source network	The IP addresses of the IP address range / IP address band are replaced by the IP address specified in the "Source translation" input box.
	*	The IP addresses of all nodes in the source network are replaced by the IP address specified in the "Source translation" input box.
Source translation	IP address in the destination network	Entry of the IP address that will be used as the new source IP address. If the IP address entered here is not the IP address of the security module, this becomes an alias address. This means that the specified address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network. The alias IP addresses of a security module are displayed under the entry "Alias IP addresses" of the relevant interface.
Destination IP address	Not relevant for this action.	-
Destination translation	Not relevant for this action.	-
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

Note

You can configure an address translation to the module IP address in the destination network for all frames going from a source network to a destination network. The security module also assigns a port number for each frame. This is an n:1 NAT address translation in which multiple IP addresses of the source network are translated to one IP address of the destination network.

Enter, for example, the following parameters for the direction "internal to external":

- Action: "Source NAT"
- From: "Internal"
- To "External"
- Source IP address: "*"
- Source translation: External IP address of the security module

Action "Source NAT + Destination NAT" - "1:1-NAT"

The action "Source NAT + Destination NAT" can be performed in the following direction:

- Internal to external

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Source NAT + Destination" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the "Source-NAT + Destination-NAT" action can also be performed in the following directions:

- External to tunnel
- Internal to tunnel
- DMZ to tunnel (only if the DMZ interface is activated)

The following applies, for example for the direction "internal to external": When accessing from internal to external, the action "Source NAT" is performed. When accessing from external to internal, the action "Destination NAT" is performed.

The following table shows the input required for the action "Source NAT + Destination NAT":

Box	Possible entries	Meaning
Source IP address	IP address in the source network	The configuration is always specified in the source NAT direction. The IP addresses of the destination NAT direction are then inserted automatically by STEP 7.
Source translation	IP address in the destination network	
Destination IP address	Not relevant for this action.	
Destination translation	Not relevant for this action.	
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rules generated by STEP 7 for the NAT rule.

Action "Double NAT"

The action "Double NAT" can be performed for SCALANCE S modules in the following directions:

- Internal to external
- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Double NAT" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to internal
- DMZ to external

In every direction, Source and Destination NAT always take place at the same time.
The following applies, for example for the direction "external to internal": When accessing from external to internal, the source IP address of the external node is replaced (Source NAT). Access to the internal network also uses the external IP address specified in the "Destination IP address" input box (Destination NAT).

You can, for example, use this action if a standard router other than the security module is entered for a device to be accessed using Destination NAT. Response frames from this device are then not sent to the entered standard router but to the corresponding interface of the security module.

The following table shows the input required for the action "Double NAT":

Box	Possible entries	Meaning
Source IP address	IP address in the source network	IP address of the node in the source network
Source translation	-	The Source NAT address translation is always to the IP address of the security module in the destination network. For this reason, the "Source translation" input box cannot be configured.

Box	Possible entries	Meaning
Destination IP address	IP address in the source network	Destination IP address in the source network with which an IP address in the destination network will be accessed. If the destination IP address in a frame matches the IP address entered, the IP address is replaced by the IP address specified in the "Destination translation" input box. If the IP address entered here is not the IP address of the security module, this becomes an alias address. This means that the specified address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network. The alias IP addresses of a security module are displayed under the entry "Alias IP addresses" of the relevant interface.
Destination translation	IP address in the destination network	The destination IP address is replaced by the IP address specified here.
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

Enabling NAPT

The input boxes for NAPT are enabled. NAPT translations only take effect with the entries in the list described below. After creating NAPT rules, the corresponding firewall rules are generated and displayed in advanced firewall mode, see section:
Relationship between NAT/NAPT router and firewall (Page 732)

The IP address translation with NAPT can be performed in the following direction:

- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the IP address translation with NAPT can also be performed in the following directions:

- External to DMZ
- DMZ to internal
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the IP address translation with NAPT can also be performed in the following directions:

- Tunnel to internal
- Tunnel to external
- Tunnel to DMZ (only if the DMZ interface is activated)

The following applies, for example for the direction "external to internal": Frames intended for the external IP address of the security module and for the port entered in the "Source port" column are forwarded to the specified destination IP address in the internal network and to the specified destination port.

The following table shows the input required for address translation with NAPT:

Box	Possible entries	Meaning
Source port	TCP/UDP port or port range Example of entering a port range: 78:99	A node in the source network can send a frame to a node in the destination network by using this port number.
Destination IP address	IP address in the destination network	Frames intended for the IP address of the security module in the source network and the TCP/UDP port specified in the "Source port" box are forwarded to the IP address specified here.
Destination port	TCP/UDP port	Port number to which the frames coming from the source network are forwarded.
Protocol	• TCP+UDP • TCP • UDP	Selection of the protocol family for the specified port numbers
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAPT rule.

Address translation with NAT/NAPT in VPN tunnels

Module-specific function

Address translation with NAT/NAPT in VPN tunnels is only available for SCALANCE S612/ S623/S627-2M modules as of V4, refer to the section:
Address translation with NAT/NAPT in VPN tunnels (Page 802)

Relationship between NAT/NAPT router and firewall

Meaning

After creating NAT/NAPT rules, STEP 7 automatically generates firewall rules that enable communication in the configured address translation direction. The generated firewall rules are visible in advanced firewall mode and can, if necessary, be moved and expanded (additional IP address / IP address range / IP address band, services, bandwidth). In addition to this, the automatically generated firewall rules should be checked in terms of their priority and their position. If there are also manually configured firewall rules in the rule list that have higher priority than the automatically generated firewall rules, under certain circumstances no NAT / NAPT will be performed.

If there are several identical NAT / firewall pairs of rules, the priority in the firewall rule list decides which rule is used.

Firewall parameters generated by STEP 7 cannot be adapted. After deactivating NAT/NAPT, the firewall rules generated by STEP 7 are disabled.

To clarify the relationship between the NAT/NAPT rules and the corresponding firewall rules, they are identified by corresponding, consecutive numbers.

The following table shows the system behind the firewall rules generated for NAT rules for SCALANCE S modules.

Table 10-22 NAT address translation and corresponding firewall rules for SCALANCE S modules

NAT action	Created firewall rule				
	Action	From	To	Source IP address	Destination IP address
Destination NAT	Allow	Source network	Destination network	-	IP address specified in the "Destination IP address" input box
Source NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	-
Source NAT + Destination NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	-
	Allow	Destination network	Source network	-	IP address that was inserted in the "Destination IP address" input box by STEP 7
Double NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	IP address specified in the "Destination IP address" input box
	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	IP address of the node specified in the "Destination translation" input box

The following table shows the system behind the firewall rules generated for NAT rules for CP x43-1 Adv.

Table 10-23 NAT address translation and corresponding firewall rules for CP x43-1 Adv.

NAT action	Created firewall rule				
	Action	From	To	Source IP address	Destination IP address
Destination NAT	Drop	External	Station	-	IP address of the security module in the external network
	Allow	External	Any	-	IP address of the node specified in the "Destination translation" input box

NAT action	Created firewall rule				
	Action	From	To	Source IP address	Destination IP address
Source NAT	Allow	Any	External	IP address specified in the "Source translation" input box	-
Source NAT + Destination NAT	Allow	Any	External	IP address specified in the "Source translation" input box	-
	Drop	External	Station	-	IP address of the security module in the external network
	Allow	External	Any	-	IP address of the node that was inserted in the "Destination translation" input box by STEP 7

The following table shows the system behind the firewall rules generated for NAT rules for SCALANCE S modules.

Table 10-24 NAPT translation and firewall rules created for SCALANCE S modules

Created firewall rule					
Action	From	To	Source IP address	Destination IP address	Service
Allow	Source network	Destination network	-	IP address of the security module in the source network	[Service_NAPT_rule]

The following table shows the system behind the firewall rules generated for NAPT rules for CP x43-1 Adv.

Table 10-25 NAPT translations and created firewall rules for CP x43-1 Adv.

Created firewall rules					
Action	**From**	**To**	**Source IP address**	**Destination IP address**	**Service**
Drop	External	Station	-	IP address of the security module in the external network	[Service_NAPT_rule]
Allow	External	Any	-	IP address of the security module in the external network	[Service_NAPT_rule]

Stateful packet inspection

The firewall and NAT/NAPT router supports the "Stateful Packet Inspection" mechanism. As a result, reply frames can pass through the NAT/NAPT router and firewall without it being necessary for their addresses to be included extra in the firewall rule and the NAT/NAPT address translation.

Relationship between NAT/NAPT router and user-specific firewall

Module-specific function

The configuration of NAT/NAPT rules in the user-specific firewall is only available for SCALANCE S modules as of V3, refer to the section:

Relationship between NAT/NAPT router and user-specific firewall (Page 804)

Configuring time-of-day synchronization

Overview of time-of-day synchronization

Meaning

The date and time are maintained on the security module to verify the validity (time) of a certificate and for time stamping log entries.

The following alternatives can be configured:

- Set time with each download: The module time is set automatically to the PC time when a configuration is downloaded.
- SIMATIC: If the security module receives MMS time-of-day messages, its local time is synchronized provided the NTP procedure was not configured (MMS = Manufacturing Message Specification).
- Time from partner: The time is obtained from a telecontrol server.
- NTP: Automatic setting and cyclic synchronization of the time-of-day by means of Network Time Protocol server.

Note

Time-of-day synchronization relates solely to the security module and cannot be used to synchronize devices in the internal network of the security module. S7 CPs can forward the time of day to other modules of the station.

Note

Configuring the firewall for communication with NTP servers

If the NTP server cannot be reached by the security module, you will need to allow the frames from the NTP server explicitly in the firewall (UDP, port 123).

Note

Before the security functions of a CP (time-of-day slave) are used, this must receive a valid time-of-day synchronization frame from the time master.

Defining an NTP server

Creating NTP servers in the global security settings

In the global security settings only NTP servers of the type "NTP (secure)" can be created and assigned CPs or SCALANCE S modules as of V4. Non-secure NTP servers for SCALANCE S modules below V4 and CPs therefore need to be created in the local security settings.

1. Double-click the "NTP" entry in the global security settings.
2. Double-click on the "Add new NTP server" entry.
3. Enter a name for the NTP server (secure).
4. Enter the IP address of the NTP server (secure). If the NTP server will only be assigned SCALANCE S modules as of V4, an FQDN can be specified as an alternative.

5. Specify the encryption parameters for the NTP server (secure).

Property	Meaning
Key ID	Numeric value between 1 and 65534.
Authentication	Select the authentication algorithm.
Hex/ASCII	Select the format for the NTP key.
Key	Enter the NTP key with the following lengths: Hex: 22 ... 40 characters ASCII: 11 ... 20 characters

6. Assign a the required security module to the NTP server (secure) you have created, see section:
Assigning the security module to an NTP server (secure) (Page 739).

Creating NTP servers in the local security settings

1. Select the module to be edited.
2. Select the "Time-of-day synchronization" entry in the local security settings.
3. Select the required synchronization mode.
4. Enter a name and the IP address of the NTP server. If you have selected the "NTP (secure)" synchronization mode, you can select an NTP server (secure) that you created in the global security settings in the "Name" column.

Configuration limits for NTP servers

You can assign a maximum of 4 NTP servers to one security module.

Importing/exporting NTP servers (secure)

Using the "Import" or "Export" commands in the shortcut menu, you can export the key list of the currently selected NTP server (secure) and import the file into an NTP server (secure) or vice versa.

Configuring time-of-day synchronization for a security module

How to access this function

1. Select the module to be edited.
2. Select the "Time-of-day synchronization" entry in the local security settings.
3. Select the "Activate time-of-day synchronization" check box.

Alternatives for time-of-day synchronization

The following alternatives can be configured:

Table 10-26 Time synchronization for CP and SCALANCE S

Possible selection	Meaning / effect
Set time with each download (only for SCALANCE S)	The module time is set automatically to the PC time when a configuration is downloaded.
SIMATIC (for CP x43-1 Adv. and CP 1628 only)	If the security module receives MMS time-of-day messages, its local time is synchronized provided the NTP procedure was not configured (MMS = Manufacturing Message Specification).
Time from partner (only for CP 1243-1, CP 1242-7 and CP 1243-7 with communication type "Telecontrol communication")	The time is obtained from the partner (telecontrol server).
NTP (not for CP 1243-1, CP 1242-7 and CP 1243-7 with communication type "Telecontrol communication")	Automatic setting and periodic synchronization of the time using an NTP server.
NTP (secure) (not for SCALANCE S below V4 and CP 1243-1, CP 1242-7 and CP 1243-7 with communication type "Telecontrol communication")	Automatic setting and periodic synchronization of the time using an NTP server (secure).

Selecting the mode of time-of-day synchronization

Follow these steps:

1. Select the synchronization mode.
2. The following configuration options are available to you depending on the selected mode:

- **Set time with each download:** When a configuration is downloaded to a SCALANCE S module, the module time of day is set with the PC time of day.
- **SIMATIC:** For the CP x43-1 Adv. select whether the CP is to adopt or forward the time of day. The CP 1628 always forwards the time of day. Also the set direction for forwarding the time.
  Available directions:
  - Automatic (only for CP x43-1 Adv.): The CP receives the time from the station or from the LAN and forwards it to the station or to the LAN. If multiple CPs are being operated in the station, this automatic setting can cause collisions. To avoid this, you can specifically define the forwarding direction.
  - From station (for CP x43-1 Adv. only).
  - From LAN.

  If forwarding of the time of day is enabled, you can use the "Use corrected time" check box to specify whether or not a correction factor included in the time-of-day frame is used. For the CP 1628, this option is enabled as default and cannot be disabled.

- **Time from partner:** For the CP 1243-1, CP 1242-7 and CP 1243-7 in the communication type "Telecontrol communication", the time of day is obtained from the partner (telecontrol server).
  - Synchronization cycle: Specifies the cycle for time-of-day synchronization. For the synchronization cycle of the CP, and individual hour or minute interval can be specified.
- **NTP:**
  - Time zone (for CP x43-1 Adv. / CP 1628 only): In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred. This corresponds to GMT (Greenwich Mean Time). The time offset from UTC can be set by configuring the local time zone.
  - Update interval in seconds: Defines the interval between the time queries in seconds. For SCALANCE S as of V3, the time interval for querying the NTP server is specified automatically.

    Note

    Setting the update interval for CPs

    If the "Enable security functions" check box is enabled in the local security settings of a CP, the setting for the update interval is transferred from the CP's local settings into the CP's local security settings.

  - Time-of-day synchronization on the full minute (for CP x43-1 Adv./CP 1243-1/CP 1628 only): With this option, you can decide whether or not the time of day is forwarded to the communications bus on the full minute. This option is required for certain special applications.
  - Accept time of non-synchronized NTP servers (only for CPs): Here you can specify whether the security module also accepts the time-of-day from non-synchronized NTP servers.
  - Forward time of day to station (only for CP x43-1 Adv./CP 1628): Disable this option if the CPU requests the time separately from an NTP server. This prevents the time on the CPU obtained directly from the NTP server from being overwritten by the time detected in the CP. The accuracy may be reduced slightly due to forwarding via the CP.
  - NTP server: Creating NTP servers in the local security settings is described in the section Defining an NTP server (Page 736).

Assigning the security module to an NTP server (secure)

Requirement

- You have defined an NTP server (secure) in the global security settings.
- "NTP" or "NTP (secure)" is selected as the time-of-day synchronization mode in the local security settings of the security module that you want to assign to an NTP server (secure).

Procedure

1. Double-click the "NTP" entry in the global security settings.
2. Double-click the entry "Assign module to an NTP server".

3. From the "NTP Server" drop-down list, select the NTP server (secure) to which you want to assign a security module.
4. In the "Available modules" section, select the security module that you want to assign to the selected NTP server (secure).
5. Click the "<<" button to assign the selected security module to the selected NTP server (secure).

Result

You have assigned the security module to the NTP server (secure). The NTP server (secure) is displayed automatically in the local security settings in the list of NTP servers.

Security module as DHCP server

Module-specific function

The use of the security module as a DHCP server is only possible with SCALANCE S modules, see subsection:
Auto-Hotspot in the section "SCALANCE S".

Configuring SNMP

Overview of SNMP

What is SNMP?

The security module supports the transfer of management information using the Simple Network Management Protocol (SNMP). For this purpose, an SNMP agent that receives and responds to SNMP requests is installed on the security module. The information on the properties of SNMPcompliant devices is entered in MIB files (MIB = Management Information Base) for which the user must have the required rights.

In SNMPv1, the "community string" is also sent. The "community string" is like a password that is transmitted along with the SNMP request. If the community string is correct, the security module replies with the required information. If the string is incorrect, the security module discards the query and does not reply. The community string is transmitted via SNMPv1 without encryption.

SNMPv3 lets you transmit encrypted data.

Configuring SNMP - "SNMP" entry

Module-specific function

The configuration of SNMP is possible only for SCALANCE S V3 or higher, CP x43-1 Adv., CP 1543-1, CP 1243-1 and CP 1628.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "SNMP".
3. Activate the "Activate SNMP" check box.
4. Select one of the following SNMP protocol versions:

   Note

   Encrypted data transmission with SNMPv3

   You should use SNMPv3 to transmit data in encrypted form in order to enhance security.

   – SNMPv1
   The security module uses the following default values for the community strings to control the access rights in the SNMP agent. These default values should be adapted to increase security.
   For read access: public
   For read and write access: private
   To enable write access using SNMP, select the "Allow write access" option.

   – SNMPv3
   Select either only an authentication algorithm or an authentication algorithm and an encryption algorithm.
   Authentication algorithm: none, MD5, SHA-1
   Encryption algorithm: none, AES-128, DES

   Note

   Preventing the use of DES

   DES is an insecure encryption algorithm. Therefore, it should only be used for reasons of down compatibility.

   Note

   When using SNMPv3 no RADIUS authentication is possible.

5. If SNMPv3 is to be used, assign a user a role with corresponding activated SNMP rights to enable access to the module via SNMP. An overview of SNMP rights is available in the section:
   Managing rights (Page 694).
6. In the "Advanced settings" area, for SCALANCE S modules configure module-specific information about the author, location and e-mail address overwriting the information from the project properties.
   The following applies to values written to the security module by an SNMP tool using an SNMP-SET command:
   If you select the "Keep values written by SNMP set" check box, the values are not overwritten when there is another download of a STEP 7 configuration to the security module.

Configuring proxy ARP

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Configuring proxy ARP (Page 808)

Activate Web server on security module

Module-specific function

This function is only available for CP x43-1 Advanced, see subsection:
Activating the Web server on CP x43-1 Advanced (Page 835) in the section "Security for S7-300 / S7-400 / PC CPs".

IPsec tunnel: Creating and assigning VPN groups

How to create an IPsec tunnel with VPN groups

Module-specific function

This function is available only for SCALANCE S612/S613/S623/S627-2M, CP x43-1 Adv., CP 1243-1, CP 1543-1 V1.1, 1243-7 and CP 1628.

Requirement

Note

Current date and current time of day on the security modules

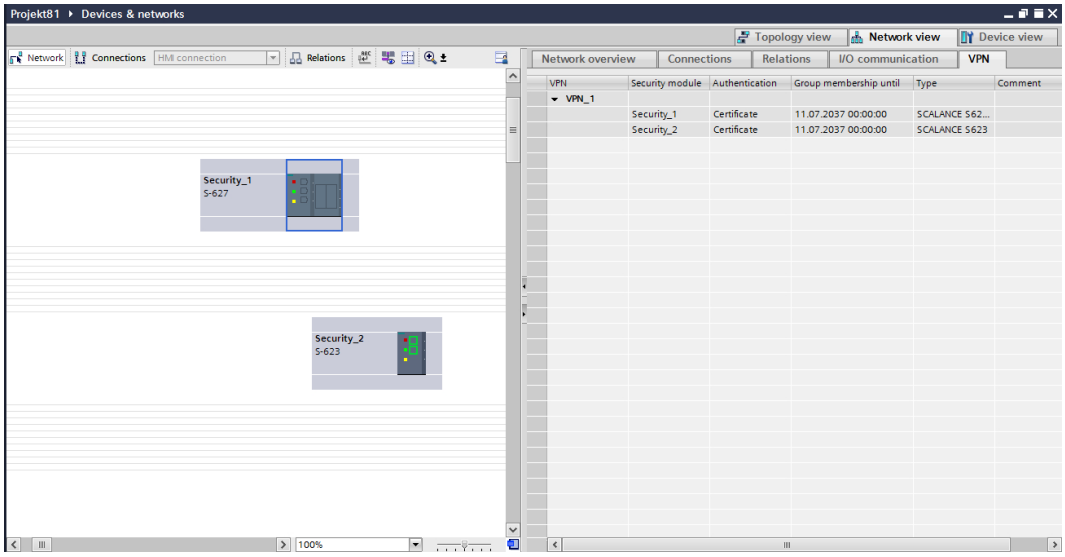
When using secure communication (for example, HTTPS, VPN...), make sure that the security modules involved have the current time of day and the current date. Otherwise the certificates used are not evaluated as valid and the secure communication does not work.

How to access this function

1. Double-click on the entry "VPN groups" > "Add new VPN group" in the global security settings to create a VPN group. As an alternative, in the network view you can right click on an interface of a module with VPN capability and create a VPN group with the shortcut menu command "Add new VPN group" (not possible for SOFTNET Security Client).
2. Double-click on the entry "VPN groups" > "Assign module to a VPN group" in the global security settings and assign the security modules and SOFTNET security client modules to the VPN group between which VPN tunnels will be established. As an alternative, in the network view you can right click on an interface of a module with VPN capability and assign this to the VPN group using the shortcut menu "Assign module to a VPN group" (not possible for SOFTNET Security Client).
   When doing this, remember the rules for forming VPN groups. You will also find these rules in the section:
   Modes of VPN groups (Page 747).

Display of the VPN groups with their properties

If you select a security module that is in one or more VPN group(s), the properties of the VPN group(s) of which the security module is a member are shown in the "Network data" area.



The following properties of the VPN groups are displayed in columns in the "VPN" tab of the "Network data" area:

Property/column	Meaning
VPN	Names of the VPN groups of which the selected security module is member
Security module	Names of the assigned security modules
Authentication	Type of authentication: Preshared key or certificate
Group membership until	Date and time up to which the VPN group certificate of the security module is valid
Type	Model numbers of the assigned security modules
Comment	Comment

Setting the life of certificates

Open the dialog in which you can set the expiry date of the certificate as follows:

1. Select the VPN group you want to edit in the "VPN" tab.
2. In the "Properties" > "General" tab of the Inspector window, select the entry "Authentication".

Note

Expiry of a certificate

Communication through the VPN tunnel continues after the certificate has expired until the tunnel is terminated or the SA lifetime expires. For more information on certificates, refer to section:
Auto-Hotspot.

Configuration limits

Number of IPSec tunnels	
SCALANCE S612 V2	Maximum of 64
SCALANCE S612 V3/V4	Maximum of 128
SCALANCE S613	Maximum of 128
SCALANCE S623 V3/V4	Maximum of 128
SCALANCE S627-2M V4	Maximum of 128
CP x43-1 Advanced	Maximum of 32
CP 1628	Maximum of 64
CP 1543-1 V1.1	Maximum of 16
CP 1243-1	Maximum of 16
CP 1243-7	Maximum of 16

Authentication methods

The following methods are available:

The authentication method is specified per VPN group and decides the type of authentication used.

The following key-based or certificate-based authentication methods are supported:

- Preshared key
  Authentication is achieved using a previously specified character string that is distributed to all modules in the group.
  Enter a preshared key in the "Key" field under "Authentication" > "General" in the VPN group properties dialog.
- Certificate
  Certificate-based authentication "Certificate" is the default setting. The procedure is as follows:
  - When a group is created, a CA certificate is generated as a root certificate.
  - Each security module that is a member of the VPN group also receives a group certificate signed with the key of the CA certificate.

  All certificates are based on the ITU standard X.509v3 (ITU, International Telecommunications Union).
  The certificates are generated by a certificate authority contained in STEP 7.

Note

Restriction in VLAN operation

No VLAN tagging is transmitted in IP frames via the VPN tunnel of the security module. The VLAN tags included in IP frames are lost when they pass through the security modules because IPsec is used to transfer the IP frames.

As default, no IP broadcast or IP multicast frames can be transferred with IPsec through a layer 3 VPN tunnel. Through a layer 2 VPN tunnel of the security module, IP broadcast or IP multicast frames are packaged just like MAC packets including the Ethernet header in UDP and transferred. With these packets, the VLAN tagging is therefore retained.

Group properties for selected VPN group

VPN group properties

Note

Knowledge of IPsec necessary

To be able to set these parameters, you require IPsec experience. If you do not make or modify any settings, the defaults apply.

The following settings can be configured in the properties of a VPN group:

- Authentication method (entry: "General")
- IKE settings (entry: "Advanced settings phase 1")
- IPsec settings (entry: "Advanced settings phase 2")

How to access this function

1. In the global security settings select the VPN group whose properties you want to configure under the entry "VPN groups".
2. Select "Open" in the shortcut menu of this entry.
   Result: The VPN group properties appear in the area of the local security settings.
3. In the "Authentication" entry, select whether to use a preshared key or certificate for authentication. For more detailed information, refer to section:
   Authentication methods (Page 744).

Parameters for advanced settings phase 1

Phase 1: IKE negotiation of the Security Association (SA) for phase 2:

Here you set the parameters for negotiating the security parameters to be used in phase 2:

Parameter	Description
IKE mode	• Main mode • Aggressive mode The difference between the main and aggressive mode is the "identity protection" used in the main mode. The identity is transferred encrypted in main mode but not in aggressive mode.
DH group phase 1	Groups selectable for the Diffie-Hellman Key exchange: • Group 1 • Group 2 • Group 5 • Group 14
SA lifetime type	Phase 1 Security Association (SA): • Time: Time limit in minutes The lifetime of the current key material is limited in time. When the time expires, the key material is renegotiated.
SA lifetime	Numeric value: Range of values for time: 1440 ... 2500000 minutes (default: 2500000)
Phase 1 encryption	Encryption algorithm: • DES*: Data Encryption Standard (56 bit key length, mode CBC) • 3DES-168: Triple DES (168-bit key length, mode CBC) • AES-128, 192, 256: Advanced Encryption Standard (128 bit, 192 bit or 256 bit key length, mode CBC)
Phase 1 authentication	Authentication algorithm: • MD5: Message Digest Algorithm 5 • SHA1: Secure Hash Algorithm 1

*DES is an insecure encryption algorithm. It should only be used for reasons of down compatibility. DES is not supported by CP 1543-1 V1.1, CP 1243-1, CP 1242-7 and CP 1243-7.

Parameters for advanced settings phase 2

Phase 2: IKE negotiation of the Security Association (SA) for IPsec data exchange:

Here, you set the parameters for negotiating the security parameters used for the IPsec data exchange with ESP (Encapsulating Security Payload) and AH (Authentication Header). Communication in phase 2 is already encrypted.

Parameter	Description
SA lifetime type	Phase 2 Security Association (SA): • Time: Time limit in minutes. The lifetime of the current key material is limited in time. When the time expires, the key material is renegotiated. • Limit: Limitation of the data volume in MB
SA lifetime	Numeric value: • Range of values for time: 60 ... 16666666 minutes (default: 2880) • Range of values for limit: 2000 ... 500000 MB (default: 4000)
Phase 2 encryption	Encryption algorithm: • DES*: Data Encryption Standard (56 bit key length, mode CBC) • 3DES-168: Triple DES (168-bit key length, mode CBC) • AES-128: Advanced Encryption Standard (128-bit key length, mode CBC)
Phase 2 authentication	Authentication algorithm: • MD5: Message Digest Algorithm 5 • SHA1: Secure Hash Algorithm 1
Perfect Forward Secrecy	If you enable this check box, new Diffie-Hellmann public key values are exchanged for recalculation of the keys. If the check box is disabled, the values already exchanged in phase 1 are used for recalculation of the keys.

*DES is an insecure encryption algorithm. It should only be used for reasons of down compatibility. DES is not supported by CP 1543-1 V1.1, CP 1243-1, CP 1242-7 and CP 1243-7.

Modes of VPN groups

VPN modes

Depending on the mode of the security modules that were added to a VPN group, different modes of VPN groups are distinguished. The mode of a VPN group provides information about the security modules and their modes that can be added to the VPN group.

Rules for forming groups

Remember the following rules if you want to create VPN groups:

- For SCALANCE S612 / S613 / S623 / S627-2M / SCALANCE M
  The first module assigned in a VPN group decides which other modules can be added to it.
  If the first SCALANCE S module to be added is in routing mode or if the first security module is a SCALANCE M module, only additional SCALANCE S modules with routing activated or SCALANCE M modules can be added because SCALANCE M modules always operate in routing mode. If the first SCALANCE S module added is in bridge mode, you can only add other SCALANCE S modules in bridge mode. If you want to change the mode of a VPN group, you have to remove all the modules contained in the group and add them again. A CP and an SSC can be added to a group with a SCALANCE S in bridge or routing mode.
- For CP / SSC
  If a CP / SSC is the first module in a VPN group, security modules can be added in any mode. The next security module that decides the mode then also decides the mode of the VPN group. A CP / SSC can be assigned to several VPN groups at the same time and use different modes. The CP / SSC is then operated in mixed mode.
- It is not possible to add a SCALANCE M module to a VPN group that contains a module in bridge mode.

Refer to the following table to see which modules can grouped together in a VPN group:

Table 10-27 Security modules and VPN modes

Module	Can be included in a VPN group in...	
	Bridge mode	Routing mode
SCALANCE S612 / S613 / S623 / S627-2M in bridge mode	x	-*
SCALANCE S612 / S613 / S623 / S627-2M in routing mode	-	x
CP x43-1 Adv.	x	x
CP 1543-1 V1.1	x	x
CP 1243-1	x	x
CP 1243-7	x	x
CP 1628	x	x
SOFTNET Security Client V4.0	x	x
SCALANCE M875	-	x

* SCALANCE S623/S627-2M modules in bridge mode can be inserted in a VPN group in routing mode if their DMZ interface is activated (not at the same time).

Including security module in configured VPN group

The configured VPN group properties are adopted for security modules added to in an existing VPN group.

Procedure after including a security module in a configured VPN group

Depending on whether or not you have changed the VPN group properties since the last download, you must make a distinction between the following:

- **Case a:** If you have not changed the VPN group properties and the module to be added actively establishes the connection to modules of the type SCALANCE S, CP x43-1 Adv. or CP 1628:

1. Add the new security module to the VPN group.
2. Download the configuration to the new module.

- **Case b:**If you have changed the VPN group properties or the module being added does not actively establish the connection to the already configured modules:

1. Add the new security module to the VPN group.
2. Download the configuration to all modules that belong to the VPN group.

In case a, it is not necessary to reconfigure and load the already commissioned security modules. Active communication is not influenced or interrupted.

Settings for nodes with an unknown IP address

Nodes whose IP address is unknown at the time of configuration (Unknown Peers) can be inserted in an existing VPN group. Since the nodes are usually mobile and obtain their IP addresses dynamically (for example a SOFTNET security client or SCALANCE M), the VPN tunnel from an Unknown Peer to SCALANCE S, CP x43-1 Adv. and CP 1628 can only be established if you set the parameters for Phase 1 according to one of the following tables ("Encryption parameter 1" to "Encryption parameter 4"). If you use other settings, you cannot establish a VPN tunnel to the modules listed. For establishing a VPN tunnel to CP 1543-1 V1.1, CP 1243-1 and CP 1243-7 there are no restrictions relating to this.

Table 10-28 Encryption parameter 1

Parameter	Setting
Authentication method	Certificate
DH group phase 1	Group 2
SA lifetime	1440 … 2500000 minutes
Encryption phase 1	AES-256
Authentication phase 1	SHA-1

Table 10-29 Encryption parameter 2

Parameter	Setting
Authentication method	Certificate
DH group phase 1	Group 2
SA lifetime	1440 … 2500000 minutes
Encryption phase 1	3DES-168
Authentication phase 1	SHA-1

Table 10-30 Encryption parameter 3

Parameter	Setting
Authentication method	Certificate
DH group phase 1	Group 2
SA lifetime	1440 … 2500000 minutes
Encryption phase 1	DES
Authentication phase 1	MD5

Table 10-31 Encryption parameter 4

Parameter	Setting
Authentication method	Preshared key
DH group phase 1	Group 2
SA lifetime	1440 … 2500000 minutes
Encryption phase 1	3DES-168
Authentication phase 1	SHA1

Additional restrictions for the SOFTNET Security Client

For the SOFTNET security client, the following restrictions also apply:

Table 10-32 Encryption parameters for the SOFTNET Security Client

Parameter	Setting / special feature
Encryption phase 1	AES-256 possible only with Windows 7
SA lifetime phase 1	1440 to 2879 minutes
SA lifetime type	Must be selected identical for both phases
Encryption phase 2	No AES 128 possible
SA lifetime phase 2	60 to 2879 minutes
Authentication phase 2	No MD5 possible

Procedure after removing an active member from a VPN group

If you remove an active node from an existing VPN group, this can still establish a connection to the group members even if you have downloaded the project to all members of the VPN group again.

If you do not want the removed active node to be able to establish the connection any longer, renew the CA group certificate and download the project again to the members of the VPN group. The certificate can be renewed in the group properties of the VPN group or in the "CA" tab of Certificate Manager.

Configuring internal network nodes

Overview of configuring internal network nodes

Module-specific function

This function is available only for SCALANCE S612/S613/S623/S627-2M, CP x43-1 Adv. and CP 1628.

Configuring internal network nodes

Each security module must know the network nodes in the entire internal network to be able to recognize the authenticity of a frame.

The security module must know both its own internal nodes as well as the internal nodes of the security modules in the same VPN group. This information is used on a security module to decide which data packet will be transferred in which tunnel.

By adding a security module to a VPN group, the local internal nodes/subnets of the security module are automatically made known to the security module. To allow communication via the VPN tunnel with other subnets or nodes of another subnet (routed internal network; DMZ network when the VPN tunnel is on the external interface and vice versa), these subnets or nodes must be enabled for VPN tunnel communication in the configuration.

SCALANCE S modules allow network nodes to be learned automatically or configured statically. The mode of the security module also decides the options available for learning internal network nodes.

SCALANCE S in bridge mode

In bridge mode, you can configure the internal IP/MAC nodes and the internal subnets or alternatively can allow automatic learning of internal nodes by the SCALANCE S.

SCALANCE S in routing mode

In routing mode there is no automatic learning mode available. Instead, enter entire subnets here that need to be released for tunnel communication.

CP x43-1 Advanced and CP 1628

- CP x43-1 Adv.
  Decide whether or not tunnel communication to the CP (Gbit interface) and/or to the internal subnet (PROFINET subnet) is permitted for VPN connection partners in routing mode (SCALANCE S / M).
- CP 1628
  Enter the NDIS nodes you want to be reachable through the tunnel of VPN connection partners in routing mode (SCALANCE S / M).

Automatic learning of internal network nodes

Module-specific function

SCALANCE S modules in bridge mode provide a learning mode with which the internal network nodes can be learned automatically during operation. For more detailed information, refer to subsection:
Using the learning mode to learn internal nodes (Page 809) in the section "SCALANCE S".

Configuring IP network nodes manually for SCALANCE S

Module-specific function

How to configure IP network nodes for SCALANCE S modules manually is explained in:
Configuring IP network nodes manually (Page 810) in the section "SCALANCE S".

Configuring MAC network nodes manually for SCALANCE S

Module-specific function

How to configure MAC network nodes for SCALANCE S modules manually is explained in Configuring MAC network nodes manually (Page 811) in the section "SCALANCE S".

Configuring internal subnets for SCALANCE S manually

Module-specific function

How to configure the internal subnets for SCALANCE S modules is explained in Configuring internal subnets manually (Page 811) in the section "SCALANCE S".

Allow access to S7-300 / S7-400 CPs for VPN connection partners

Module-specific function

How to allow access to S7-300 / S7-400 CPs for VPN connection partners is explained in Allow access to S7-300 / S7-400 CPs for VPN connection partners (Page 836) in the section "Security for S7-300 /S7-400 /PC CPs".

Configuring NDIS nodes for PC CPs that can be reached through the tunnel

Module-specific function

How you configure NDIS nodes for PC CPs that can be reached through the tunnel is explained in
Configuring NDIS nodes manually for PC CPs that can be reached through the tunnel (Page 836) in the section "Security for S7-300 / S7-400 / PC CPs".

Configuring module- and connection-specific VPN settings

Requirement

The module is a member of a VPN group.

Module- and connection-specific settings

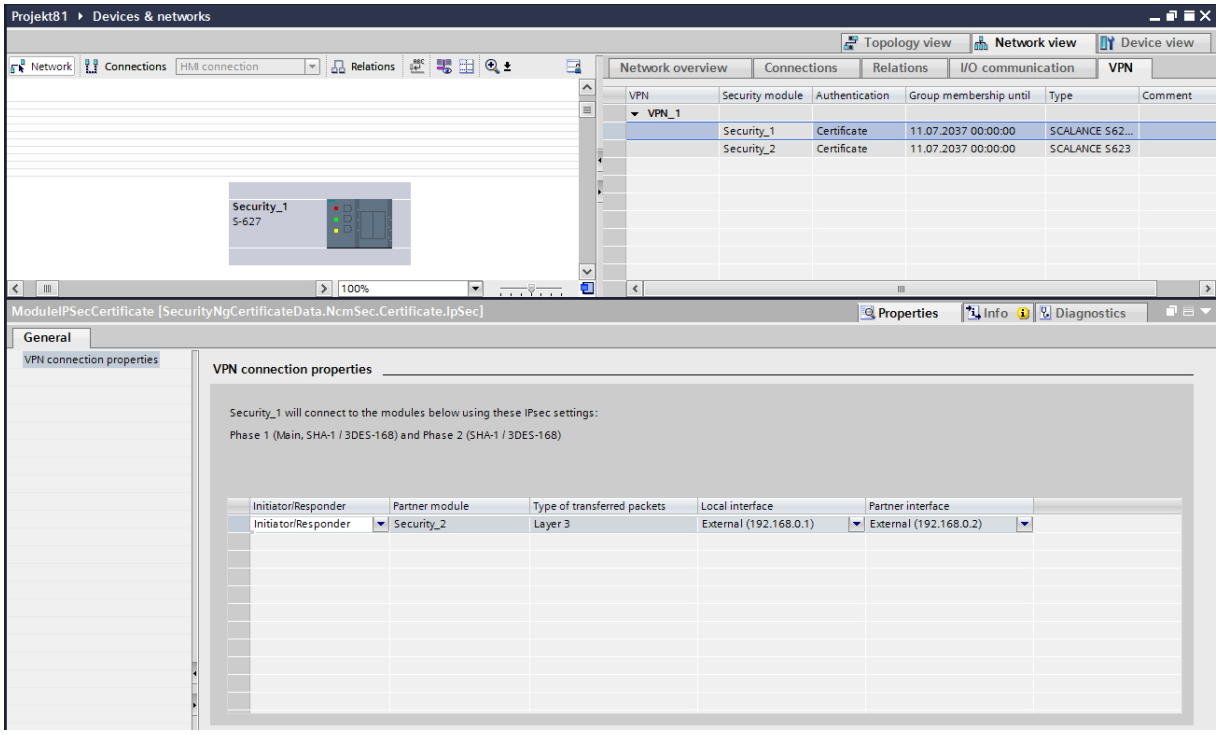
With module- and connection-specific settings, you can configure specific VPN settings. Module-specific settings are configured specifically for a security module while connection-specific settings are configured specifically for a security module in a certain VPN group.

You can configure the following **module-specific** properties in the local security settings with the "VPN" entry:

- Dead peer detection
- Permission to initiate connection establishment
- Public address (IP address / FQDN) for communication via Internet gateways
- Nodes that need to be enabled for tunnel communication

If you select a security module in the list of VPN groups in the "Network data" area, the following **connection-specific** VPN settings can be seen and can be configured:

- Permission to initiate connection establishment
- Partner modules to which tunnel connections exist
- Type of transferred packets
- Selection of the local interface of the selected security module that will serve as the tunnel endpoint
- Selection of the partner interface that will serve as the tunnel endpoint



Dead peer detection (DPD)

As default, DPD is enabled.

When DPD is enabled, the modules exchange additional messages at selectable intervals if no communication occurs at these points in time. This means that it is possible to recognize whether the IPsec connection is still valid or possibly needs to be re-established. If there is no longer a connection, the security associations (SA) of phase 2 are terminated prematurely. If DPD is disabled, the SA is ended only after the SA lifetime has expired. For information on setting the SA lifetime, see section
Group properties for selected VPN group (Page 745).

Permission to initiate connection establishment

You can restrict the permission for initiating the VPN connection establishment to certain modules in the VPN.

The decisive factor for the setting of the parameter described is the assignment of the address for the gateway of the module you are configuring. If a static IP address is assigned, the module

can be found by the partner. If the IP address is assigned dynamically and therefore changes constantly, the partner cannot establish a connection as things stand.

Mode	Meaning
Start connection to partner (initiator/responder) (default)	If this option is selected, the module is "active", in other words, it attempts to establish a connection to the partner with a fixed IP address. The reception of requests for VPN connection establishment is also possible. This option is recommended when you obtain a dynamic IP address from the provider for the gateway of the security module you are configuring. The partner is addressed using its configured WAN IP address, its configured external module IP address or the configured DNS name.
Wait for partner (responder)	If this option is selected, the module is "passive", in other words, it waits for the partner to initiate the connection. This option is recommended when you have been assigned a static IP address by the provider for the gateway of the security module you are configuring. It means attempts to establish a connection can only be initiated by the partner. This partner can, for example, have a dynamic WAN IP address.

Note

Make sure that you do not set all the modules in a VPN group to "Wait for connection from remote VPN gateway" otherwise no connection is established.

WAN IP address / FQDN - addresses of the modules and gateways in a VPN over Internet

When operating a VPN with IPsec tunnel over the Internet, additional IP addresses are generally required for the Internet gateways such as DSL routers. The individual security or SCALANCE M modules must know the external IP addresses of the partner modules in the VPN.

Note

To use a WAN as an external public network, enter the IP address that you received from the provider as the external IP address, through which the security module is then reachable in the WAN (Internet). To allow the security module to send packets via the WAN, you need to enter your DSL router as "Standard router".

If you use a DSL router as Internet gateway, the following ports (at least) must be opened on it as described in the relevant documentation:

- Port 500 (ISAKMP)
- Port 4500 (NAT-T)

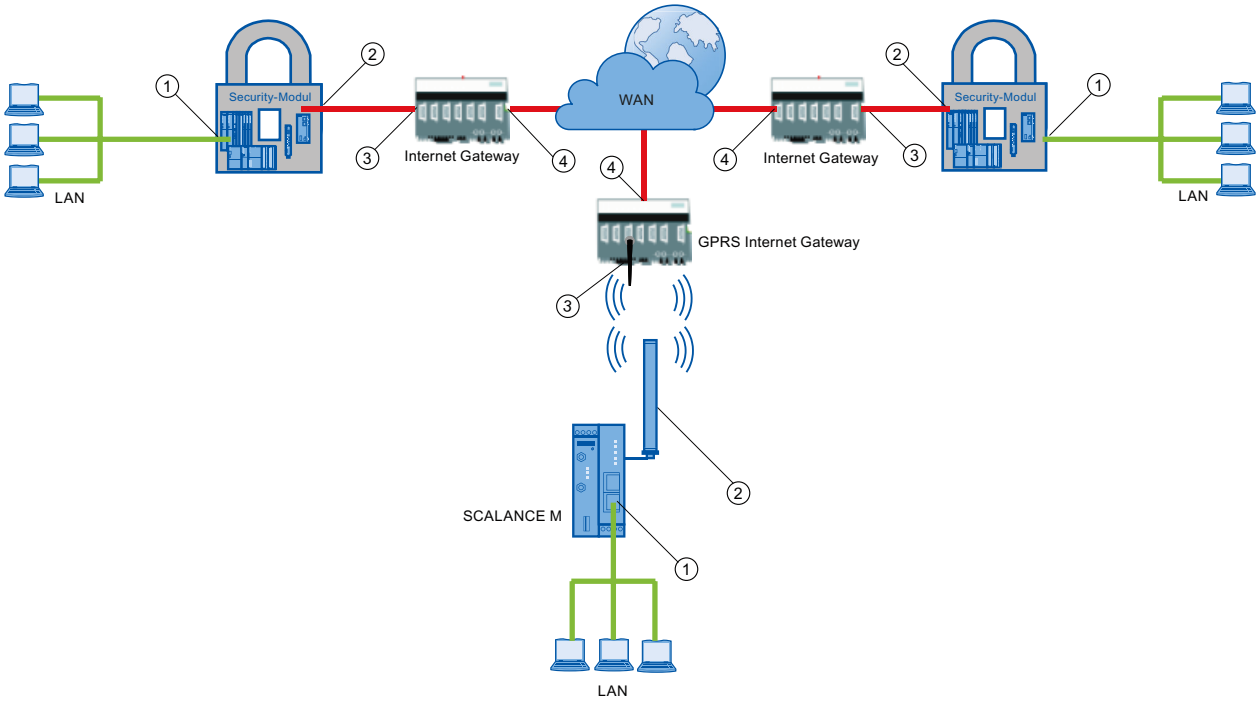
To allow this, in the module-specific VPN settings, you have the option of assigning an IP address as a "WAN IP address". When you download the module configuration, the group members are then informed of the WAN IP addresses of the partner modules. As an alternative

to a WAN IP address, you can also enter an FQDN. Depending on the existing addresses, VPN endpoints are used as default according to the following priorities:

1. WAN address
2. FQDN of the primary dynamic DNS service
3. FQDN of the secondary dynamic DNS service
4. External IP address / DMZ IP address of the security module

Note: After removing an existing WAN address, the external IP address / DMZ IP address is always used.

In the interface selection of the connection-specific VPN settings, you yourself can decide which address the partner will be informed of. In these settings, you can also specify the interface to be used for communication by the nodes of a VPN group and the security module that is authorized to set up connections.



① Internal IP address - of a module
② External IP address - of a module
③ IP address of an Internet gateway (for example, GPRS gateway)
④ IP address (WAN IP address) of an Internet gateway (for example, DSL router)

Configuring internal network nodes

The configuration of internal network nodes is described in the following section: Auto-Hotspot

See also

How to create an IPsec tunnel with VPN groups (Page 742)

Configuring router and firewall redundancy

Module-specific function

This function is available only for SCALANCE S623/S627-2M as of V4, see section Auto-Hotspot.

Online functions - diagnostics and logging

Overview of diagnostics and logging in

For test and monitoring purposes, the security module has diagnostic and logging functions.

- Diagnostic functions
  These include various system and status functions that you can use for an existing network connection to the security module.
- Logging functions
  This involves the logging of system and security events and data packets.

Recording events with logging functions

You select the events to be logged in the log settings for the relevant security module.

You can configure the following variants for logging:

- Local logging
  In this variant, you log events in the local buffer of the security module. You can then access these logs, display them and archive them on the service station in the "Online & diagnostics" dialog. The evaluation of the buffer areas of the security module is only possible if there is a network connection to the selected security module.
- Network Syslog
  With Network Syslog, you use a Syslog server that exists in the network. This logs the events according to the configuration in the log settings for the relevant security module.

Archiving log data and reading in from a file

You can save the logged events for archiving in a log file and open this later even without a network connection to the security module. For more detailed information, refer to section Auto-Hotspot.

Diagnostics in ghost mode (only for SCALANCE S S602 as of V3.1)

When you operate the security module in ghost mode, the external interface of the security module takes over the IP address of the internal node at runtime. Before you can run diagnostics of a security module in ghost mode, you need to establish the connection to the security module via the IP address that the security module obtained from the internal node at runtime.

To find out which IP address the security module currently has, you can search for accessible nodes in STEP 7 using the "Online" > "Accessible devices".

Protecting exported log files from unauthorized access

Log files exported from STEP 7 can contain security related information. You should therefore make sure that these files are protected from unauthorized access. This is particularly important when passing on the files.

Function overview online dialog

Functions of the "Online & diagnostics" dialog

In STEP 7, the security module provides the following functions in the "Online & diagnostics" dialog:

Entry in the online dialog	Function
Status	Display of status information about the selected security module, such as the current IP addresses of the interfaces and the current time and date.
Interface settings (only for SCALANCE S V3 or higher)	Overview of the settings of the individual interfaces.
Dynamic DNS (only for SCALANCE S as of V3)	Overview of the settings for dynamic DNS.
System log (not for CP 1242-7)	Display of logged system events, starting and stopping logging (only if there is an online connection to SCALANCE S modules) and starting and stopping the reading out of log data from the local buffer of the security module.
Audit log (not for CP 1242-7)	Display of logged security events, starting and stopping reading out of log data from the local buffer of the security module.
Packet filter log (not for CP 1242-7 and CP 1243-7)	Display of logged data packets, starting and stopping logging (only if there is an online connection to SCALANCE S modules) and starting and stopping the reading out of log data from the local buffer of the security module.
ARP table (only for SCALANCE S V3 or higher)	Display of the ARP table of the security module.
Logged in users (only for SCALANCE S V3 or higher)	Shows the users logged in to the Internet page for user-specific IP rule sets.
Communication status (not for SCALANCE S602, CP 1242-7 and CP 1543-1 V1.0)	Display of status information about VPN tunnel connections and members of VPN groups to which the selected security module belongs.
Internal nodes (not for SCALANCE S602, CP 1243-1, CP 1242-7, CP 1243-7, CP 1543-1 and PC-CPs)	Display of the learned or configured internal network nodes of the security module.
Dynamically updated firewall rules (only for CP x43-1 Adv.)	Display of the IP addresses that were released dynamically over HTTP or HTTPS, or loaded by a user.

Entry in the online dialog	Function
Firewall blacklist (only for SCALANCE S as of V4)	Display of the IP addresses that were entered in the blacklist of the firewall.
Ghost mode (only for SCALANCE S S602 as of V3.1)	Dialog for the ghost mode of the SCALANCE S602 with information on the address parameters of the internal node (identical to the external IP address of the security module) and on IP address changes of the internal node.
Log files (offline view)	
• System log (not for CP 1242-7)	Display of logged system events as well as starting and stopping the display.
• Audit log (not for CP 1242-7)	Display of logged security events as well as starting and stopping the display.
• Packet filter log (not for CP 1242-7 and CP 1243-7)	Display of logged data packets as well as starting and stopping the display.
Date and time (only for SCALANCE S)	Date and time setting.
Firmware update	Updating the firmware.

Requirements for access

The following requirements must be met to use the online functions of a security module:

- There is a network connection to the selected module
- The project with which the module was configured is open
- a user with the required rights must be logged in to the project
- For CPs the diagnostics access must be opened in the firewall (CP x43-1 and CP 1628: TCP 443; CP 1243-1, CP 1242-7, CP 1243-7 and CP 1543-1: TCP 8448)

Note

Requirement for online diagnostics in ghost mode (only for SCALANCE S S602 as of V3.1)

Online diagnostics is only available in ghost mode if the security module has learned the IP address of the internal node and has adopted this for its external interface. After this, the security module can be reached via the IP address of the external interface.

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. If there is no online connection established to the security module, click the "Connect online" button in the "Diagnostics" entry.

Online settings are not saved in the configuration

Settings that you make in online mode (for example settings for the logging memory) are not stored in the configuration on the security module. This is why the configuration settings are always applied at the restart of the module.

Functions of the online diagnostics

Status information of the security module - "Status" entry

Meaning

Display of the status of the security module selected in the project.

Table 10-33 Online & diagnostics: - "Status" entry

System and status functions	Meaning
Overview	
Hardware type	The type of the security module.
External IP address	The external IP address of the security module. For CP 1243-1, CP 1242-7, CP 1243-7, CP 1543-1, CP 1628: The IP address of the Industrial Ethernet interface. For CP x43-1 Adv.: The IP address of the Gbit interface.
Internal IP address	The internal IP address of the security module. For CP 1628: The IP address of the NDIS interface. If there is more than one NDIS address, only one is displayed. For CP x43-1 Adv.: The IP address of the PROFINET interface.
DMZ IP address (SCALANCE S623 / S627-2M only)	The DMZ IP address of the security module.
Tunnel IP address (only SCALANCE S612/S623/ S627-2M as of V4)	The first alias internal IP address of the security module in the VPN tunnel.
Serial number	The serial number of the security module.
Order number	The MLFB identifier of the security module that is used when ordering.
Firmware version	The firmware version of the security module.
Operating mode	Mode of the security module (bridge mode / routing mode)
External MAC address	The external MAC address of the security module. For CP 1243-1, CP 1242-7, CP 1243-7, CP 1543-1, CP 1628: The MAC address of the Industrial Ethernet interface. For CP x43-1 Adv.: The MAC address of the gigabit interface.
Internal MAC address	The internal MAC address of the security module. For CP 1628: The MAC address of the NDIS interface. For CP x43-1 Adv.: The MAC address of the PROFINET interface.
DMZ MAC address (SCALANCE S623 / S627-2M only)	The DMZ MAC address of the security module

System and status functions	Meaning
Hardware release	The hardware product version of the security module.
C-PLUG	Shows whether or not a C-PLUG is inserted.
Alias IP addresses (only for SCALANCE S as of V4)	
IP address	Alias IP address that was registered on an interface of the security module by a NAT rule.
Corresponding Interface	Interface of the security module on which the alias IP address was registered.
Local time	
Current time	Date and time that is displayed on the security module. Format for "German" user interface language: dd.mm.yyyy (date) hh:mm:ss (time) Format for "English" user interface language: mm/dd/yyyy (date) hh:mm:ss AM/PM (time) Format for "French", "Italian" and "Spanish" user interface language: dd/mm/yyyy (date) hh:mm:ss (time) Format for "Chinese" user interface language: yyyy/mm/dd (date) hh:mm:ss **Note (not for CPs)** You set the local time on the SCALANCE S module in "Functions" > "Date and time".
Operating time	Time since the last restart of the security module. Format with the user interface language "German", "English", "French", "Italian", "Spanish" and "Chinese": dddd.hh:mm:ss
Time-of-day source	The source from which the date and time are obtained.
Configuration	
Created	Date and time when the project was first created. Format with the user interface language "German", "English", "French", "Italian", "Spanish" and "Chinese": dd.mm.yyyy (date) hh:mm:ss (time)
Name	File name of the project last loaded.
Author	Name of the user who created the project. Is adopted from the project properties.
Loaded	Date and time when the project was last loaded on the security module. Format with the user interface language "German", "English", "French", "Italian", "Spanish" and "Chinese": dd.mm.yyyy (date) hh:mm:ss (time)
Storage location	Specifies the location (e.g. town) that was entered in the properties of an SCT project.
File system (not for CPs)	
RAM	Indicates how much RAM and flash is occupied in the file system.
Flash	

Overview of the individual interfaces - "Interface settings" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Overview of the individual interfaces - "Interface settings" entry (Page 816)

Overview of the Dyn. DNS settings - "Dynamic DNS" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Overview of the Dyn. DNS settings - "Dynamic DNS" entry (Page 818)

Display of the ARP table - "ARP table" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Display of the ARP table - "ARP table" entry (Page 820)

Users logged in to the Web page - "Logged in users" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Users logged in to the Web page - "Logged in users" entry (Page 820)

VPN connections of the security module - "Communication status" entry

Module-specific function

This function is available only for SCALANCE S612/S613/S623/S627-2M, CP x43-1 Adv., CP 1243-1, CP 1243-7, CP 1543-1 V1.1 and CP 1628.

Meaning

Display of the communication status of the following network components:

- Other security modules of the VPN group to which the selected security module belongs
- Internal network nodes of these security modules

Table 10-34 Online & diagnostics: "Communication Status" entry

System and status functions	Meaning
Known security devices or modules	Display of the nodes with which the selected security module is in a VPN group. This also shows whether the tunnel status is active or passive. To obtain additional information on one of the nodes, select this in the list. **Note:** Configured, inactive tunnels are indicated for CPs only.
Endpoints	Display of information on the internal network nodes of the security module that you selected in the "Known security devices or modules" table. For each internal network node, this shows whether it was learned or configured. It also shows the subnet in which the internal network node is located. With SCALANCE S modules, the subnet of network nodes is only displayed in bridge mode.
Tunnel properties	Display of properties of the VPN tunnel established to the security module that you selected in the "Known security devices or modules" table.

Found internal network nodes - "Internal nodes" entry

Module-specific function

This function is available only for SCALANCE S612/S613/S623/S627-2M and CP x43-1 Adv.

Meaning

Display of all learned and configured network nodes. This also displays whether or not the learning mode of the security module is enabled.

Updated firewall rules - "Dynamically updated firewall rules" entry

Module-specific function

This function is only available for CP x43-1, see subsection:
Updated firewall rules - "Dynamically updated firewall rules" entry (Page 836) in the section "Security for S7-300 / S7-400 / PC CPs".

Display of the firewall blacklist - "Firewall blacklist" entry

Module-specific function

This function is available only for SCALANCE S V4 modules or higher, see section
Display of the firewall blacklist - "Firewall blacklist" entry (Page 821).

Setting the date and time - "Date and Time" entry

Module-specific function

This function is available only for SCALANCE S, see section Setting the date and time - "Date and time" entry (Page 821).

Diagnostics in ghost mode - "Ghost mode" entry

Module-specific function

This function is available only for SCALANCE S602 as of V3.1, see section Diagnostics in ghost mode - "Ghost mode" entry (Page 821).

Logging functions

Logging system events - "System log" entry

Module-specific function

This function is available only for SCALANCE S, CP x43-1 Adv., CP 1243-1, CP 1243-7, CP 1543-1 and CP 1628.

Meaning

Display of logged system events and starting and stopping reading system events from the local memory of the security module.

The system log automatically logs successive system events, for example the start of a process. The logging can be scaled based on event classes.

System and status functions	Meaning
Start/stop logging (not for CPs)	Starts/stops recording of system events. The method and the event classes that are logged are configured in the local security settings.
Start/stop reading	Starts/stops reading of system events from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name. **Note** If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.

For more information on opening saved system events in log files, refer to section Evaluating system events in offline mode - "System log" entry (offline view) (Page 766).

Logging security events - "Audit log" entry

Module-specific function

This function is available only for SCALANCE S, CP x43-1 Adv., CP 1243-1, CP 1243-7, CP 1543-1 and CP 1628.

Meaning

Display of logged security events and starting and stopping reading of security events from the local memory of the security module.

The audit log automatically logs successive security-relevant events. This includes, for example, user actions such as enabling and disabling packet logging.

System and status functions	Meaning
Start/stop reading	Starts/stops reading of security events from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name. **Note** If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.

For more information on opening security events stored in log files, refer to section Evaluating security events in offline mode - "Audit log" entry (offline view) (Page 767).

Logging data packets - "Packet filter log" entry

Module-specific function

This function is available only for SCALANCE S, CP x43-1 Adv., CP 1243-1, CP 1543-1 and CP 1628.

Meaning

Display of logged data packets and starting and stopping reading of packet filter events.

The packet filter log records certain packets of the data traffic. Data packets are only logged if they match a configured packet filter rule (firewall) or to which the basic protection reacts (corrupt or invalid packets). This is only possible when logging is enabled for the packet filter rule.

For information about activation of the logging, refer to section Auto-Hotspot.

As well as reading the log data from the buffer and transferring it to the display, it can also be saved in a file for archiving.

System and status functions	Meaning
Start/stop logging (not for CPs)	Starts/stops logging of data packets. The method with which the data is logged is configured in the local security settings.
Start/stop reading	Starts/stops reading out of logged data packets from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name. **Note** If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.
Log category	Select the data packets for which the logging will be displayed. The selection depends on the settings you configured offline in the local security settings. Only the data packets for which logging was enabled are logged. If you select a category for which logging was not enabled, no data will be logged for this category.

For information on opening the stored packet filter log data, refer to section Evaluating packet filter events in offline mode - "Packet filter log" entry (offline view) (Page 767).

Evaluating log files in offline mode

Evaluating system events in offline mode - "System log" entry (offline view)

Module-specific function

This function is available only for SCALANCE S, CP x43-1 Adv., CP 1243-1, CP 1243-7, CP 1543-1 and CP 1628.

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "System log".

Meaning

Opens logged system events that you saved as a file in the online view.

For more information, refer to chapter Logging system events - "System log" entry (Page 764).

Evaluating security events in offline mode - "Audit log" entry (offline view)

Module-specific function

This function is available only for SCALANCE S, CP x43-1 Adv., CP 1243-1, CP 1243-7, CP 1543-1 and CP 1628.

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "Audit log".

Meaning

Opens logged security events that you saved as a file in the online view.

For more detailed information, refer to section Logging security events - "Audit log" entry (Page 765).

Evaluating packet filter events in offline mode - "Packet filter log" entry (offline view)

Module-specific function

This function is available only for SCALANCE S, CP x43-1 Adv., CP 1243-1, CP 1543-1 and CP 1628.

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "Packet filter log".

Meaning

Opens logged data packets that you saved as a file in the online view.

For more detailed information, refer to section Logging data packets - "Packet filter log" entry (Page 765).

Download functions

Special features when downloading security configurations

Security configurations can influence the reachability of the security module for the configuration PC. This, for example, is the case if there is a tunnel connection configured for one security module to another security module in a configuration and this configuration is downloaded from the configuration PC to the security module. After the download by the configuration PC, the security module can no longer be reached and the reachability test performed as default by STEP 7 following the download of the configuration fails. The error message output by STEP 7 relates solely to the reachability test; the actual download of the configuration is ensured if the project data is consistent and the IP address relationship between the security module and the configuration PC is correct.

Special features when downloading configurations and firmware to SCALANCE S modules are described in the following subsection of the section "SCALANCE S":
Auto-Hotspot

Uploading configurations to the engineering station

Uploading a configuration from a SCALANCE S module or from the CP 1628 to an engineering station is not possible.

Uploading a configuration from an S7 CP that supports security to an engineering station is also possible if security features were included in the configuration. Configured security functions are not, however, transferred to the engineering station. In the transferred configuration on the engineering station, the "Activate security features" check box is also deselected.

SOFTNET Security Client

Using the SOFTNET Security Client

Area of application - access over VPN

With the SOFTNET Security Client (SSC) PC software, secure remote access is possible from PGs/PCs to automation systems protected by a security module via public networks. You require SOFTNET Security Client V4.0 HF1 for S7-300/S7-400 CPs and for the PC CP 1628. These CPs are not approved for operation with SOFTNET Security Client ≤ V4.0. The SOFTNET Security Client has not been released for other CPs.

With the SOFTNET Security Client, a PG/PC is configured automatically so that it can establish a secure IPsec tunnel communication in the VPN (Virtual Private Network) with one or more security modules.

This IPsec tunnel communication makes it possible for PG/PC applications such as NCM diagnostics to securely access devices or networks that are located in an internal network protected by the security module.

How does the SOFTNET Security Client work?

The SOFTNET Security Client reads the configuration that was created by STEP 7 and, if necessary, determines from the file which certificates are to be imported.

The CA certificate and the private key are imported when applicable and stored on the local PG/PC.

Following this, security settings are made based on the data from the configuration so that applications can access IP addresses downstream from the security modules.

If the learning mode is enabled for the internal nodes or programmable controllers, a security policy is first set for secure access to security modules. Then, the SOFTNET Security Client addresses the security modules in order to obtain the IP addresses of the relevant internal nodes.

The SOFTNET Security Client enters these IP addresses in special filter lists belonging to this security policy. Applications can then communicate with the programmable controllers via VPN.

Note

Additional security measures when using the SOFTNET Security Client

The SOFTNET Security Client provides a solution for secure communication with automation cells via VPN. For self-protection of the PC/PG and the corresponding automation cell, it is advisable to use additional measures such as a virus scanner and the Windows firewall.

In Windows 7, the firewall of the operating system must be enabled so that VPN tunnel establishment works.

Creating a configuration file in STEP 7

Configuring a SOFTNET Security Client module in the project

The SOFTNET security client is created as a module in the project. In contrast to the other security modules, you do not need to configure any further properties.

Assign the SSC module to the VPN group or groups at which an IPsec tunnel to the PG/PC is to be set up.

Note

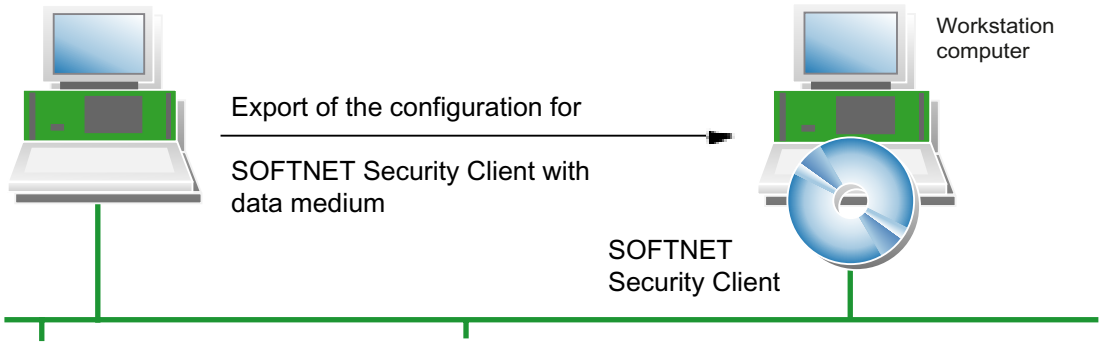
Refer to the information on parameters in section
Including security module in configured VPN group (Page 748).

Note

If you create several SOFTNET Security Clients within a group, no tunnels are set up between these clients but only from the relevant client to the security modules.

Configuration files for the SOFTNET Security Client

The interface between STEP 7 as configuration tool and the SOFTNET Security Client is controlled by configuration files.



The configuration is stored in the file types "*.dat", "*.p12" and "*.cer".

Procedure

To generate the configuration files, perform the following steps in STEP 7:

1. In the "Devices & networks" view, select the "Topology view" or the "Network view" tab.
2. Insert a PC system of the type "SOFTNET Security Client" in the selected tab from the hardware catalog.
3. Assign the SOFTNET Security Client to the VPN groups in which the PG/PC will communicate over IPsec tunnels.
4. Make sure that the "Generate SSC files" check box is selected under the "Configuration of the SOFTNET Security Client" entry in the local security settings of the SOFTNET Security Client.
5. Select the storage location for the configuration files.
6. Compile the configuration of the SOFTNET Security client to export the configuration file.
7. If you selected certificate as the authentication method, specify a password for the certificate of the VPN configuration. If you do not assign a password, the project name (not the project password) is used as the password.
   Result: Export of the configuration files is completed.
8. Adopt the files of the type *.dat, *.p12, *.cer on the PG/PC on which you want to operate the SOFTNET Security Client.

Note

Protecting exported configuration files from unauthorized access

Configuration files for SOFTNET Security Client exported from STEP 7 can contain security related information. You should therefore make sure that these files are protected from unauthorized access. This is particularly important when passing on the files.

SCALANCE S

Replacing a security module

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Requirement

To be able to replace security modules, their module descriptions must be up to date. To update the module description of security modules, follow the steps below:

1. Select the security module to be edited.
2. In the local security settings, click on the entry "General" > "Catalog information".
3. Click the "Update module description" button.

How to access this function

1. Select the security module to be edited in the topology or network view.
2. Right-click on the security module and select the shortcut menu command "Change device...".
   Based on the following table, you can see which security modules you can replace without data loss and which could involve a possible data loss.

Initial module	Possible module replacement									
	S602 V3	S602 V3.1	S602 V4	S612 V3	S612 V4	S623 V3	S623 V4	S623 V4.0.1	S627-2 M V4	S627-2 M V4.0.1
S602 V3	-	x	x	x	x	x	x	x	x	x
S602 V3.1	!	-	x	!	!	!	!	!	!	!
S602 V4	!	!	-	!	!	!	!	!	!	!
S612 V3	!	!	!	-	x	x	x	x	x	x
S612 V4	!	!	!	!	-	!	x	x	x	x
S623 V3	!	!	!	!	!	-	x	x	x	x
S623 V4	!	!	!	!	!	!	-	x	x	x
S623 V4.0.1	!	!	!	!	!	!	!	-	!	x
S627-2M V4	!	!	!	!	!	!	!	!	-	x
S627-2M V4.0.1	!	!	!	!	!	!	!	!	!	-

x Without losses

! Possibly with losses

- The module type and the firmware version are not changed.

Configuring interfaces for SCALANCE S modules

Overview

Configuring the mode

With the mode you specify how interface routing is handled (external/internal). The DMZ interface of the security module (SCALANCE S623/S627-2M only) is always connected in routing mode. For more detailed information, refer to the section
Configuring IP address parameters (Page 774)

Configuring the interfaces

If the external interface, the DMZ interface (SCALANCE S623/S627-2M only) or the tunnel interface (only SCALANCE S612/S623/S627-2M as of V4 in VPN group(s)) of a security module needs to be configured, it must be activated using the "Activate interface" check box. Set the IP address information for each interface and settings for the individual ports. The following options are available with which you can assign an IP address for the external interface and for the DMZ interface in the "General" entry (SCALANCE S623/S627-2M only):

- Static IP address with subnet mask. For more detailed information, refer to the section Configuring IP address parameters (Page 774)
- Address assignment using PPPoE. For more detailed information, refer to the section Configuring an Internet connection (Page 776)
  The internal interface and the tunnel interface can only be configured using a static IP address.

If alias IP addresses were registered on the interfaces of the security module due to configuring NAT rules, these are displayed in the "Alias IP addresses" entry.

Note

External interface and DMZ interface as Internet access

The simultaneous operation of PPPoE on the external interface and on the DMZ interface (dual ISP) is not possible.

Point to Point Protocol over Ethernet (PPPoE)

To allow Internet/WAN access directly via a DSL modem, the IP address on the external interface or on the DMZ interface is assigned using PPPoE. PPPoE is a dial-in protocol for obtaining IP addresses from an Internet service provider (ISP). SCALANCE S is operated here in routing mode.

To use this IP address assignment mode, specify the ISP in the "PPPoE" entry. The IP address, the subnet mask, the standard router and the DNS server of the interface are specified by the ISP.

Note

A configured standard router is not taken into account when using PPPoE. This is assigned dynamically to the module by the ISP.

Note

No network components between SCALANCE S and DSL modem

If the interface of a SCALANCE S module is operated using PPPoE, there must be no other network components between this interface and the connected DSL modem, otherwise the dial-in data of the Internet Service Provider may be transferred unencrypted over this link. When using the "CHAP" authentication protocol, the data is transferred encrypted.

Configuring media modules

In addition to the functions of the SCALANCE S623, the S627-2M has two media module slots in which an electrical or optical media module with two ports can be inserted. This expands both the external and internal interface by up to two ports. In routing mode, the additional ports of the security module can be used to link the external and internal interface to ring topologies.

To integrate media modules in the SCALANCE S627-2M, select the security module and change to the device view. Then select the required media modules from the hardware catalog.

For ports with the port type "Copper", you can set the transmission speed and the duplex method manually using the port mode. For ports with the port type "Optical", the port mode is fixed by the media module used or by the SFP transceiver used and cannot be adapted.

You will find information on connecting the media module ports to MRP rings in the following section:
Auto-Hotspot

Setting the operating mode

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Mode".

Operating mode - possible selections

You can change the operating mode in this dialog if the security module is not included in a VPN group. If the security module is in a VPN group, the mode cannot be changed.

The selection applies to interface routing between the external and internal interface. The DMZ interface (SCALANCE S623 and S627-2M only) is always connected in routing mode.

Bridge mode	For operation in flat networks. External and internal interface are in the same IP subnet. For S623 / S627-2M: External and internal interface are in the same IP subnet, the DMZ interface is in a different IP subnet or is deactivated.
Routing mode	All interfaces are in different IP subnets. If you have activated the routing mode, you must configure an internal IP address and subnet mask for the internal interface of the security module. **Note** If you have enabled the routing mode for the SCALANCE S module, no MAC firewall rules can be defined.
Ghost mode (only for SCALANCE S S602 as of V3.1)	In operation, the security module adopts the IP address of the node connected to the internal interface of the security module for the external interface. The IP address data specified for the external interface is only used for downloading the configuration prior to operation in ghost mode.

Configuring IP address parameters

Meaning

Specify network parameters such as the IP address and subnet mask for the interface(s) of the security module.

How to access this function

1. Select the module to be edited.
2. Select "External interface [P1] red" or "DMZ interface [P3] yellow" in the local security settings. The virtual tunnel interface can only be configured when the security module (only SCALANCE S612/S623/S627-2M as of V4) is in at least one VPN group, refer to the section "Meaning of the tunnel IP address".

   Note

   Configuration of the internal interface in routing mode

   If you have selected the "Routing" mode for the security module, you must also configure an internal IP address and subnet mask for the internal interface of the security module. You can access this function in the local security settings under "Internal interface [P2] green" > Ethernet addresses".

3. If applicable, enable the interface using the "Activate interface" check box.
4. Select the "Ethernet addresses" entry.
5. Complete the settings specified in the following table.

Parameter	Meaning
IP address	IP address for the external interface. The IP address consists of four decimal numbers from 0 to 255, with each number being separated by a period, for example, 141.80.0.16.
Subnet mask	The subnet mask consists of four decimal numbers that are separated by period, for example, 255.255.0.0
Use router (not possible for the tunnel interface)	Select this check box if you want to use a standard router and enter its IP address in the "Router address" input box.

Note

Networking the physical interfaces

Network the physical interfaces of the security module with suitable subnets to avoid IP address conflicts.

Meaning of the tunnel IP address

If you use the function "NAT/NAPT in the VPN tunnel" for a SCALANCE S612/S623/S627-2M module as of V4, you need to assign a tunnel IP address for the security module. This ensures the reachability of the security module via the VPN tunnel and provides a configuration and diagnostics option. The configured tunnel IP address can be expanded with alias tunnel IP addresses using suitable NAT / NAPT rules. The subnet mask is fixed at 32 bits for the tunnel IP address and cannot be changed by the configuration. The tunnel IP address can only be configured if the security module is in at least one VPN group.

You will find further information on address translation with NAT/NAPT in VPN tunnels in the following section:
Address translation with NAT/NAPT in VPN tunnels (Page 802)

Special features with a standard router

- If the IP assignment configured is via "PPPoE", a configured standard router is ignored because the standard route is always automatically via the PPPoE interface.
- If the address assignment configured is with "Static address" and if the security module is connected to the Internet via a DSL (NAPT) router, the DSL router must be entered as the standard router.
- For security modules in ghost mode (SCALANCE S602 as of V3.1 only), no standard routers can be configured since these are identified during runtime. Specific routes cannot be configured for security modules in ghost mode.

Configuring port mode

Meaning

The port mode specifies the transmission speed and the duplex method. The same parameters should be set for the ports involved in communication.

For SCALANCE S V2 modules, the port mode is set to "Autonegotiation" as default. This means the transmission speed and the duplex setting are selected automatically. Moreover, the auto-crossing function is supported.

Configurable port modes

For SCALANCE S V3 and higher, the following port modes can be configured for the permanently installed ports:

Port mode	Meaning
Autonegotiation	The transmission speed and the duplex setting are selected automatically. **Note** A transmission speed of 1000 Mbps and the autocrossing function are supported only if autonegotiation is selected.
10 Mbps, half and full duplex	Transmission speed of 10 Mbps
100 Mbps, half and full duplex	Transmission speed of 100 Mbps

Deactivating a port is possible only for external ports and for the DMZ port of SCALANCE S623/ S627-2M. The port modes for media module ports are configured in the device view and are based on the range of functions of the media module in question.

Configuring an Internet connection

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Requirement

The "PPPoE" entry is only displayed in the local security settings if the IP assignment method "PPPoE" is configured for one of the interfaces.

How to access this function

1. Select the security module to be edited
2. In the local security settings, select the entry "PPPoE".

Meaning

In this entry, you make settings related to the Internet Service Provider (ISP) if a connection using PPPoE is set for one of the interfaces of the security module.

Table 10-35 Settings for the ISP account

Function	Description
Authentication protocol	Select none or one of the following authentication protocols: • PAP (Password Authentication Protocol) • CHAP (Challenge Handshake Authentication Protocol) **Note** Both communications partners have to use the same authentication method otherwise no connection can be established.
User name	Enter the name for logging in with the ISP account.
Password	Enter the password for logging in with the ISP account.
Repeat password	Enter the password for logging in with the ISP account again.

Table 10-36 Rules for user names and passwords

Permitted characters	The following characters from the ANSI X 3.4-1986 character set are permitted: 0123456789 A...Z a...z !#$%&()"*'+`,-./:;<=>?@ [\]_{|}~^
Length of the user name	1 ... 255 characters
Length of the password	1 ... 31 characters

Table 10-37 Settings for the connection

Function	Description
Permanent connection	Permanent Internet connection. After the connection has been terminated by the provider, the connection is automatically restored even if there are currently no packets to be sent.
On-demand connection	The Internet connection is established automatically if packets need to be sent to the Internet. In this setting, delays in the sending of packets are possible.

Maximum idle time (only with the setting "on-demand connection")	If no packets are sent during a certain time, the Internet connection is automatically terminated. In the "Maximum idle time" box, enter the time in seconds after which the connection will be terminated. • Default setting: 300 • Minimum value: 10 • Maximum value: 3600
Forced disconnection (only with the "Permanent connection" setting)	Select the check box to be able to adapt the time of the forced disconnection by the security module.
Forced disconnection time (only with the "Permanent connection" setting)	The provider terminates the Internet connection automatically after a certain period. If you enter a time of day in this box, the security module terminates the Internet connection itself at this time. This allows disconnection of the Internet connection by the provider to be delayed under certain circumstances. A self-initiated forced disconnection is only possible with an existing permanent connection. • Default setting: 00.00 • Permitted entries: 00:00 ... 23:59

Configuring dynamic DNS

Module-specific function

FQDNs can be configured for SCALANCE S V3 or higher. The resolution of FQDNs by SCALANCE S modules is possible for SCALANCE S as of V4.

Meaning

With dynamic DNS, you can access a constantly changing IP address with a permanently defined name (FQDN). This is necessary, for example, if you want to access a server that can be reached via a public IP address that changes.

How it works

The security module signals the current WAN IP address via which the security module can be reached to a provider for dynamic DNS (for example DynDNS.org, no-ip.com). The provider makes sure that DNS queries sent to the FQDN of the security module are replied to with the current WAN IP address of the security module.

Dynamic DNS is permitted on the following interfaces:

- External interface
- DMZ interface

Setting up dynamic DNS - Requirements

Requirement:

- An account has been created with a provider of dynamic DNS and an FQDN has been registered.

Setting up dynamic DNS - Follow the steps below:

1. Select the security module to be edited.
2. In the local security settings, select the entry "DNS".
3. If the security module is downstream from a DSL router or DSL modem, you specify a valid DNS server address. To do this, two options are available:

Option	Meaning
Obtain DNS server address automatically	The address of the DNS server can be obtained automatically using PPPoE if the security module is connected to the Internet via a DSL modem. Can only be set for the external interface and the DMZ interface.
Use the following DNS server address:	Enter the address of the preferred and of the alternative DNS server manually.

4. Activate the "Activate service" check box in the "Primary dynamic DNS service" area and make the following settings:

Setting	Meaning
Provider	Choose the provider with which you have set up an account for dynamic DNS. With the predefined providers (DynDNS.org and No-IP.com), the provider update URL and the check IP service URL are already completed. To use a different provider and/or to use an HTTP URL as the provider update URL, you need to set up a user-defined provider.
User account with the provider	Enter the user name that you specified when you created the account.
Password with the provider	Enter the password that you specified when you created the account.
FQDN	Enter the host name (e.g. mysecuritymodule) and the domain name (e.g. dyndns.org) that is registered with the provider separated by a period. The FQDN can function as a VPN endpoint and differ from the FQDN in the "VPN" entry. You can configure which VPN endpoint the VPN partner is informed of in the connection-specific VPN settings.
Monitor IP address change on DSL router	If the security module is connected to the Internet via a DSL router, enabling this function activates the function of the Check IP service. The security module periodically sends queries to determine the current IP address of the DSL router and to detect an IP address change on the DSL router. The IP address specified in this way is sent to the provider with each change ID.
Period	Specify the interval at which the Check IP service is called. • Default setting: 20 minutes • Minimum value: 10 minutes • Maximum value: 1440 minutes

5. In case the primary provider fails, create a second provider in the "Secondary dynamic DNS service" area (optional setting).

Setting up a user-defined provider - follow the steps below:

Set up a user-defined provider if you are not registered with DynDNS.org or No-IP.com and/or want to use an HTTP URL as the provider update URL. To do this, select the "User-defined" entry in the "Provider" drop-down list and make the following entries:

Setting	Meaning
Ignore errors when checking the server certificate	To ensure that the authentication data is protected, the certificate of the update server is checked as default. If the certificate check fails, the HTTPS connection is terminated and the account data is not transferred. If you select the check box, the function is disabled, for example if the server certificate of the dynamic DNS service is invalid (for example expired). It is advisable not to ignore the check and not to select the check box.
Provider update URL	Enter the URL you received from your provider. The placeholder texts <FQDN> and <CurrentWanIP> need to be placed at the correct positions in the URL.
Check IP service URL	Enter the URL you received from your provider.

Configuring LLDP

Module-specific function

This function is available only for SCALANCE S V4 modules or higher.

Requirement

The security module is in routing mode.

Meaning

LLDP (Link Layer Discovery Protocol) is a protocol used to discover network topologies. A device capable of LLDP can send information about itself to neighboring devices at regular intervals and at the same time receive information from neighboring devices. The received information is stored on every device with LLDP capability in an LLDP MIB file. Network management systems can access these LLDP MIB files using SNMP and therefore recreate the existing network topology.

Configurable parameters

The degree of activity of the security module in terms of LLDP can be configured under the "LLDP mode" entry of the relevant interface.

Parameter	Description
Name	Name of the port for which the setting is configured.
LLDP mode	Configured LLDP mode: • RxTx: LLDP frames can be sent and received • Off: No LLDP frames can be sent or received

Media redundancy in ring topologies

Media redundancy with MRP

Module-specific function

This function is available only for SCALANCE S627-2M modules.

Meaning

The term "media redundancy" groups together various methods for increasing availability in Industrial Ethernet networks in which devices can be reached over different paths. This might be achieved by meshing networks, arranging parallel transmission paths or by closing a linear bus topology to form a ring.

Media redundancy method MRP

Media redundancy within a ring topology is available with SIMATIC NET products among other things with the MRP method (Media Redundancy Protocol).

With this method, one of the nodes is configured as the redundancy manager. The other nodes are redundancy clients. SCALANCE S627-2M modules can only adopt the role of an MRP client. Using test frames, the redundancy manager checks the ring to make sure it is not interrupted. The redundancy clients forward the test frames. If the test frames of the redundancy manager no longer arrive at the other ring port of the redundancy manager due to an interruption, the redundancy manager switches through its two ring ports and informs the redundancy clients of the change immediately.

The time the SCALANCE X switches need to switch through their ring ports as redundancy manager is 200 ms.

Note on the use of MRP

- MRP is supported in ring topologies with up to 100 devices. Exceeding this number of devices can lead to a loss of data traffic.
- It is recommended that you set the ring ports involved to full duplex and 100 Mbps. Otherwise there may be a loss of data traffic.

Possible uses of MRP on media module ports

MRP is supported only on the media module ports of the SCALANCE S627-2M. The following table shows the possible uses of MRP on the media module ports of a SCALANCE S627-2M:

Ring ports	Media module 1		Media module 2	
	P4	P5	P6	P7
MRP Client	-	-	-	-
	Ring 1	Ring 1	-	-
	-	-	Ring 2	Ring 2
	Ring 1	Ring 1	Ring 2	Ring 2

With two lower-layer rings per SCALANCE S module, layer 3 communication is possible between the rings.

Configuring MRP for the security module

Requirement

- The security module is in routing mode.
- Media modules are configured for the interfaces to be connected to MRP rings.
- The interfaces of the security module to be connected to rings are networked with the relevant ring managers.

How to access this function

1. Select the security module to be edited.
2. In the settings of the required interface, select the "Media Redundancy" entry.

Configurable parameters

Parameter	Meaning	Possible selections
MRP domain (only if the "MRP client" media redundancy role is selected)	The members of an MRP ring are specified with the help of MRP domains. The same MRP domain must be selected for the interfaces of all modules to be connected to the same MRP ring.	Display of the MRP domain used for the interface.
Media redundancy role	Selection of the media redundancy protocol or disabling of media redundancy for the interface.	• Not a node in the ring • MRP Client
Ring port 1 (only when the media redundancy role "MRP client" is selected)	Name of the first ring port of the selected interface if the media redundancy role "MRP client" was selected for it.	-

Parameter	Meaning	Possible selections
Ring port 2 (only when the media redundancy role "MRP client" is selected)	Name of the second ring port of the selected interface if the media redundancy role "MRP client" was selected for it.	-
Domain settings	Using the domain settings, you can add new MRP domains, edit the names of existing MRP domains and delete existing MRP domains.	-
Alternative media redundancy protocol	Select this check box to enable the interface of the security module for other media redundancy protocols.	• Enable interface for other media redundancy protocols • Disable interface for other media redundancy protocols (default setting)
Passive listening	Enable this check box if the selected interface will be connected to third-party networks in which STP/RSTP (Spanning Tree Protocol/ Rapid Spanning Tree Protocol) is used.	• Activate passive listening (default) • Deactivate passive listening

Special features of the ghost mode

Module-specific function

This function is available only for SCALANCE S602 as of V3.1.

Meaning

In ghost mode, the security module has no IP address of its own, neither on the internal nor on the external interface. Instead, the security module obtains the IP address for its external interface during runtime from a node connected to the internal interface of the security module whose IP address parameters may be unknown at the time of configuration. It is possible to change an IP address of the internal node and a corresponding IP address at the external interface. Since the internal node is identified based on its MAC address, IP address changes are made only for the learned MAC address. No IP address is configured or obtained at the internal interface of the security module.

As regards the MAC addresses, the security module replaces the MAC address of the internal node with the MAC address of the security module in all outgoing packets on the external interface (responses from the internal node).

Activating ghost mode

1. Select the module to be edited.
2. In the local security settings, select the entry "Mode".
3. Select the "Ghost mode" option.

Configurable module properties

In ghost mode, the following module properties can be configured in the local security settings:

- External interface [P1] red
- Firewall
- Time-of-day synchronization
- Log settings
- SNMP

Since no DNS servers can be configured in ghost mode, no FQDN resolution is possible.

Requirement for identifying an internal node

The security module can only obtain the IP address of the internal node if the internal node initiates data communication with a communications partner of the external network.
In addition to this, the security module does not provide any server services while obtaining the IP address. The security module can only reply to queries from external after data packets have been sent to the security module by the internal node.

Port assignment for incoming and outgoing data connections

Since the external interface of the security module and the internal node have the same IP address, the network components must be addressed explicitly via the TCP/UDP ports. For this reason, the ports are either assigned to the security module or the internal node. The assignments of the ports to the relevant devices are shown in the following tables for incoming and outgoing data connections:

Table 10-38 Port assignment for incoming connections (from external to security module)

Service	Port	Protocol	Comment
Web services, configuration and diagnostics access	443	TCP	The HTTPS port is permanently activated for configuration and diagnostics access using STEP 7 and cannot be changed.
SNMP	161	TCP UDP	Once SNMP is activated in STEP 7, incoming SNMP queries are transmitted via UDP port 161. Transfer via TCP port 161 is also possible, for example, to be able to reach the internal node. **Note** After activating SNMP, the SNMP port is permanently assigned to the security module. If SNMP is not activated, the internal node can be accessed using SNMP with the aid of a firewall rule.

Table 10-39 Port assignment for outgoing connections (from security module to external)

Service	Port	Protocol	Comment
Syslog	514	UDP	If the Syslog service is activated in STEP 7, Syslog messages are transferred via UDP port 514 by the security module. This port assignment cannot be changed.
NTP	123	UDP	If NTP servers are used for time-of-day synchronization, NTP queries are transferred via UDP port 123. This port assignment cannot be changed.

Recognizable IP addresses and subnet masks

The security module only recognizes internal nodes with IP addresses in the network class ranges A, B or C. The subnet mask is identified by the security module based on the network class (refer to the table "Network classes and corresponding subnet masks"). To allow the subnet mask to be determined correctly, a standard router must be entered for the internal node.

Nodes with IP addresses in the network classes D and E are rejected by the security module.

Network class	IP addresses		Subnet mask
	Low limit	High limit	
A	0.0.0.0	127.255.255.255	255.0.0.0
B	128.0.0.0	191.255.255.255	255.255.0.0
C	192.0.0.0	223.255.255.255	255.255.255.0
D	224.0.0.0	239.255.255.255	Rejected by the security module
E	240.0.0.0	255.255.255.255	Rejected by the security module

Configuration limits

A maximum of one internal node is recognized by the security module. If several internal nodes exist, the security module reacts as follows:

- The first device the security module recognizes in the internal network obtains access to the external network segment if the firewall is suitably configured.
- The data traffic of any additional nodes in the internal network area is blocked in the outgoing direction at level 2 (MAC layer) based on the sender address.

Loading configurations and diagnostics after commissioning

After obtaining an IP address from the internal node, the security module has an IP address on the external interface that can differ from the IP address with which the security module was initially configured. To load a configuration or to run diagnostics, in STEP 7 you need to specify the IP address for the connection to the external interface that the security module obtained from the internal node during runtime. This is possible in the local security settings or directly in the "Advanced download" or "Connect online" dialogs. For more detailed information on establishing online connections, refer to the section: Downloading a configuration (Page 823)

Routing information for hierarchical networks on the external interface

If there are hierarchical networks with subnet transitions on the external interface of the security module, the security module needs to obtain the relevant routing information from the internal node. To achieve this, the internal node must respond to ICMP queries sent to it. Responding to ICMP broadcasts is not necessary.

Authentication using a RADIUS server

Overview

Module-specific function

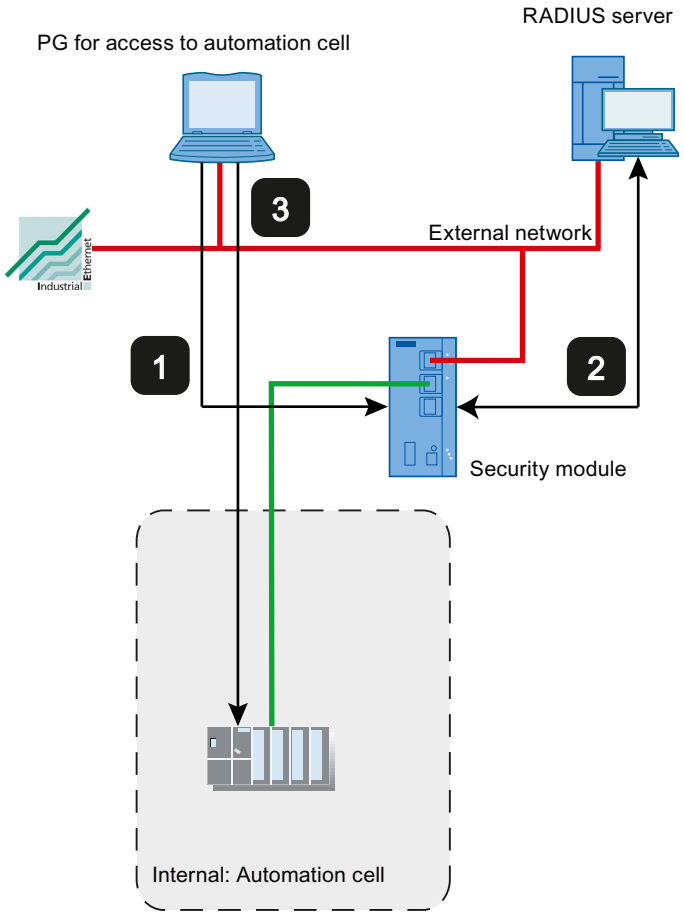
This function is available only for SCALANCE S V4 modules or higher.

Meaning

RADIUS (Remote Authentication Dial-In User Service) is a protocol for authenticating users by servers on which user data can be stored centrally. The use of RADIUS servers can increase the protection of user names, assigned roles and passwords.

Scenario for the use of RADIUS servers

Authentication by RADIUS servers can be performed when activating user-specific IP rule sets.



1 Entry of the user data on the Web page of the security module

2 Authentication by RADIUS server and activation of the user-specific IP rule set

3 Access to an automation cell

The network setup shown above is simply an example. The RADIUS server can also be located in the internal network or in the DMZ network of the security module.

For the configuration options described below, it is assumed that a RADIUS server is configured in STEP 7 and was assigned to the relevant security module. In addition to this, one user or role must be configured with the "RADIUS" authentication method. For more detailed information, refer to the following sections:

- Defining a RADIUS server (Page 791)
- Assigning a RADIUS server to a security module (Page 791)
- Create users (Page 691)
- Creating roles (Page 692)

For general information on user-specific IP rule sets, refer to the following section:

- Auto-Hotspot

Configuration options

To authenticate the user using a RADIUS server, there are two configuration options available:

- The user and the user's role are known on the security module, only the password management for the user is performed on the RADIUS server. The user and the password are configured on the RADIUS server.
  - A user with the "RADIUS" authentication method is configured.
  - The user is assigned to the user-specific IP rule set.

  Result:
  - When a user logs on to the Web page of the security module, the authentication query is forwarded to the RADIUS server.
  - The RADIUS server runs a password check and signals the result back to the security module.
  - If the password check is passed successfully, the user-specific IP rule set is activated.
- The role is known on the security module, user management is via the RADIUS server. The user and the password are configured on the RADIUS server.
  - A user-defined role or a system-defined role is assigned to the user-specific IP rule set.
  - Under the entry "RADIUS" > "RADIUS settings" in the local security settings of the security module, the check box "Allow RADIUS authentication of unconfigured users" and the check box "Filter ID is required for authentication" are enabled.

  Result:
  - When a user logs on to the Web page of the security module, the authentication and authorization query is forwarded to the RADIUS server.
  - The RADIUS server runs a password check and signals the result back to the security module.
  - Case a: If, in addition to this, the role name is configured on the RADIUS server:
    The RADIUS server returns the role name assigned to the user to the security module.
  - Case b: If the role name is not configured on the RADIUS server:
    The security module assigns the user the system-defined role "radius".
  - If the password check is passed successfully, the user-specific IP rule set is activated.

Conventions for RADIUS servers

- The RADIUS servers can be in any network connected to the security module.
- A maximum of two RADIUS servers can be configured per security module. During operation only one of the RADIUS servers is active.
- When defining a RADIUS server, an FQDN can also be used instead of IP an address.

Defining a RADIUS server

Meaning

Before authentication by a RADIUS server is possible, this first needs to be stored in the STEP 7 project. Following this, you assign the defined RADIUS server to the security module for which the RADIUS server will handle user authentication.

Procedure

1. Double-click on the "RADIUS" entry in the global security settings.
2. Double-click on the "Add new RADIUS server" entry.
3. Enter the required parameters according to the following table.

Parameter	Meaning
Name	Freely selectable name for the RADIUS server.
IP address / FQDN	IP address or FQDN of the RADIUS server.
Port	UDP port via which the RADIUS server can be reached. As default, authentication data is received at port 1812.
Shared secret	Entry of the password that will be used when transferring the logon data between the RADIUS server and security modules for encryption. The following characters from the ANSI X 3.4-1986 character set are permitted: 0123456789 A...Z a...z !#$%&()"*'+`,-./:;<=>?@ [\]_{|}~^ Length of the shared secret: 1 ... 31 characters
Repeat shared secret	Confirmation of the password
Authentication method	Display of the method used to check the user data. Only the "PAP" method (Password Authentication Protocol) is supported.
Comment	Entry of freely selectable, optional comments.

Result

You have defined a RADIUS server and can now assign this to the required security modules.

Assigning a RADIUS server to a security module

Requirement

You have defined a RADIUS server.

Procedure

1. Select the module to be edited.
2. Select the "RADIUS" entry in the local security settings.
3. Select the "Enable RADIUS authentication" check box.

   Note

   Changing the method of authentication with the Web server on the security module

   If RADIUS authentication is enabled on the security module, the method for authentication with the Web server is changed from "Digest Access Authentication" to "Basic Access Authentication".

4. In the "RADIUS timeout" input box, enter the maximum time in seconds that the security module will wait for a response from the RADIUS server.
5. In the "RADIUS repetitions" input box, enter the number of connection establishment attempts with the RADIUS server.
6. Select the "Allow RADIUS authentication of unconfigured users" check box if the user-specific IP rule to be activated was assigned a role instead of a user.
7. Select the "Filter ID is required for authentication" check box if the assigned role is a user-defined role.
8. Under the entry "RADIUS server", select the RADIUS server you want to assign to the security module from the "Name" drop-down list.
   As an alternative, you can assign security modules for which RADIUS authentication is enabled to RADIUS servers in the global security settings. You will find general information on authentication by the RADIUS server in the following section:
   Auto-Hotspot

Setting up a firewall

Local firewall rules for SCALANCE S modules

Configuring a firewall with predefined firewall rules

Configuring a firewall using predefined firewall rules

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" entry in the local security settings.

Firewall enabled as default

The "Enable firewall" check box is enabled by default. The firewall is therefore activated automatically and all access from external to the security module is blocked. By clicking the relevant check box, enable the firewall rules for the specific direction.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Enable firewall in advanced mode" check box. For more detailed information about the advanced firewall mode, refer to the section
Overview of local firewall rules (Page 711)

Firewall configuration with VPN

If the security module is in a VPN group, the "Tunnel communication only" check box is enabled as default. This means that only encrypted IPsec data transfer is permitted via the external interface or via the DMZ interface. Only HTTPS access to the module (TCP port 443) remains allowed untunneled.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

Table 10-40 Available firewall rules and directions

Service	From internal to external	From external to internal	From internal to DMZ	From DMZ to internal	Enabled ports	Meaning
Allow IP communication	x	x	x	x	-	IP communication for the selected communication directions is allowed.
Allow S7 protocol	x	x	x	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/ FTPS (explicit mode)	x	x	x	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	x	x	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	x	x	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	x	x	x	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	x	x	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	x	x	x	TCP port 25	For sending e-mails via an SMTP server.

Service	From internal to external	From external to internal	From internal to DMZ	From DMZ to internal	Enabled ports	Meaning
Allow NTP	x	x	x	x	UDP port 123	For synchronization of the time of day.
Allow DHCP	x	x	x	x	UDP port 67 UDP port 68	Only in bridge mode Communication connection with a DHCP server is permitted.

Table 10-41 Logging

Option	Action when activated
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.
Log blocked incoming packets	All incoming IP packets that are discarded are logged.
Log blocked outgoing packets	All outgoing IP packets that are discarded are logged.

You can view the logged packets at the "Packet filter log" entry in the "Online & Diagnostics" dialog. For more detailed information, refer to the section Logging data packets - "Packet filter log" entry (Page 765).

Configuring a firewall with predefined MAC rules

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" entry in the local security settings.

Firewall enabled as default

The "Enable firewall" check box is enabled by default. The firewall is therefore activated automatically and all access from external to the security module is blocked. By clicking the relevant check box, enable the firewall rules for the specific direction.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Enable firewall in advanced mode" check box. For more detailed information about the advanced firewall mode, refer to the section Overview of local firewall rules (Page 711).

Firewall configuration with VPN

If the security module is in a VPN group, the "Tunnel communication only" check box is enabled as default.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

Available MAC rules and directions

Service	From internal to external	From external to internal	Meaning
Allow MAC communication	x	x	MAC traffic for the selected communication directions is allowed.
Allow ISO protocol	x	x	ISO traffic for the selected communication directions is allowed.
Allow SiClock	x	x	SiClock time-of-day frames for the selected communication directions are allowed.
Allow DCP	x	x	DCP traffic for assignment of IP addresses is allowed for the selected communications directions.

Table 10-42 Logging

Option	Action when activated
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.

User-specific IP rule sets

Overview

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Meaning

Initially, individual or multiple users are assigned to user-specific IP rule sets. The user-specific IP rule sets are then assigned to individual or multiple security modules. This makes it possible, to allow user-specific access. If, for example all access to the networks downstream from a security module is blocked, certain nodes can be allowed for a user based on their IP addresses. This means that access is allowed for this user but access remains blocked for other users.

User logon via the Internet

The user can log in to the external interface or the DMZ interface via the Web page of the security module. If authentication is successful, the IP rule set defined for the user for the IP address of the device from which the login is made is enabled.

The connection to the Web page of the security module is via HTTPS using the IP address of the connected port and taking into account the valid routing rules:

Example:

External interface: 192.168.10.1

Call up of the login page with: https://192.168.10.1/

Users can log on with every role as long as the user or the role is assigned to a user-specific firewall rule set.

Options for authenticating the user

Depending on the authentication method selected when the user who will log in to the security module was created, the authentication is handled by different instances:

- Authentication method "Password": Authentication is handled by the security module.
- Authentication method "RADIUS": Authentication is handled by a RADIUS server (SCALANCE S as of V4 only).

Assignment of roles to user-specific IP rule sets

On SCALANCE S modules as of V4, it is also possible to assign user-specific IP rule sets that are assigned to roles. This makes it possible to enable a group of users for access to certain IP addresses.

If a RADIUS server is used for user authentication and a role is assigned to the user-specific IP rule set, users can also be authenticated by the RADIUS server although they are not configured on the security module. These users must be stored on the RADIUS server or on a separate database where they need to be assigned to the role assigned to the user-specific IP rule set in STEP 7. This procedure has the advantage that all user data is stored exclusively on the RADIUS server.

You will find more information on authentication by the RADIUS server in the following section:

Auto-Hotspot

User-specific IP rule sets are used locally - conventions

The same conventions as described in the following section apply:
Global firewall rule sets - conventions (Page 704)

Creating and assigning user-specific IP rule sets

Creating user-specific IP rule sets

1. In the global security settings, select the entry "Firewall" > "User-specific IP rule sets" > "IP rule sets".
2. Double-click on the "Add new IP rule set" entry to create a user-specific IP rule set.
   Result: The created user-specific IP rule set is shown in the entry.
3. Double-click on the created user-specific IP rule set.
   Result: In the "Properties" > "General" tab of the Inspector window, the configurable properties of the user-specific IP rules set are displayed.
4. In the Inspector window, click on the "General" entry and enter the following data:
   - Name: Project-wide, unique name of the rule set. The name appears in the local rule list of the security module after the rule set is assigned.
   - Description (optional): Enter a description of the user-specific IP rule set.
5. Click on the "IP rules" entry and enter the firewall rules one after the other in the list. No IP address can be entered in the "Source IP address" box. This is entered automatically when the node logs on to the security module.
   Note the parameter description in the following sections:
   Defining IP packet filter rules (Page 712)
   Note the special features of firewall rules generated automatically by STEP 7 for NAT/NAPT rules:
   Relationship between NAT/NAPT router and user-specific firewall (Page 804)

Assigning user-specific IP rule sets

1. Click on the "Users and roles" entry in the Inspector window.
2. In the "Available users and roles" area, select the users you want to assign to the user-specific rule set.
3. Click the "<<" button to assign the selected users or roles to the user-specific rule set. The assignment of roles to user-specific IP rule sets is possible only for SCALANCE S modules as of V4.
4. Assign the created user-specific IP rule set to the required security modules using the entry "Assign user-specific IP rule set" in the global security settings. For this, advanced firewall mode must be enabled for the security modules.

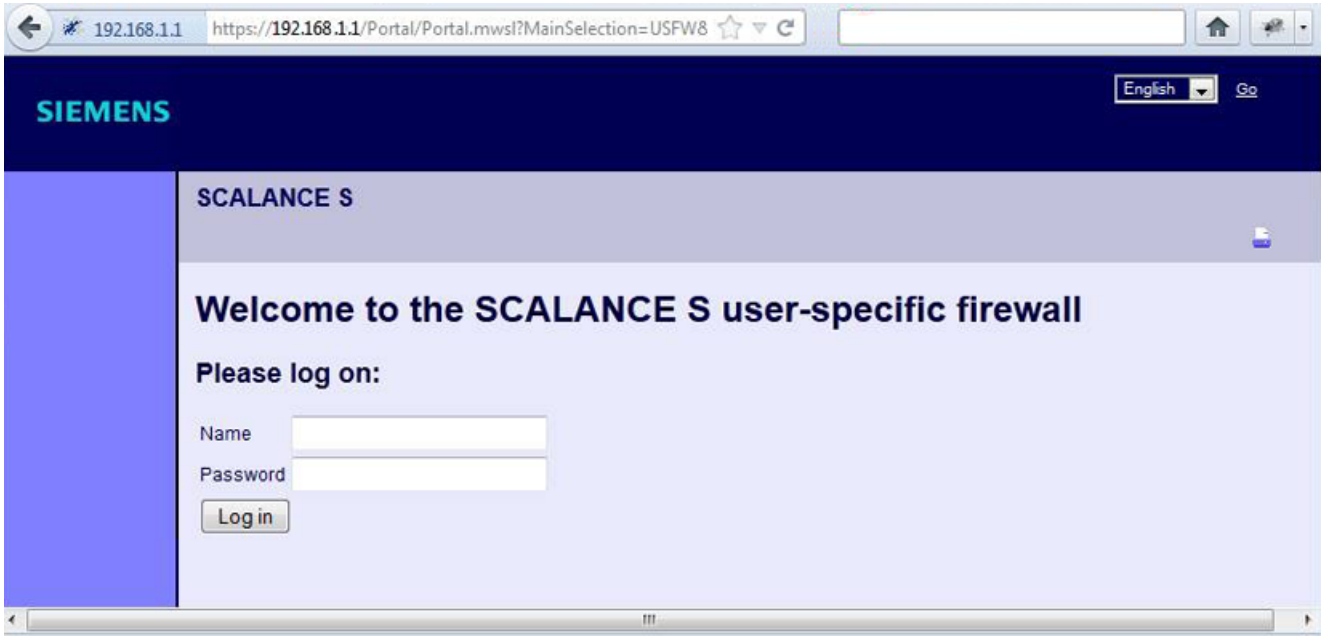
Note

Assignment of user-specific IP rule sets

- A security module can only be assigned one user-specific rule set per user.
- Due to the assignment, the right to log in to the security module is activated implicitly for all users and roles assigned to the IP rule set.

Result

- The user-specific rule set is used by the assigned security modules as a local rule set and automatically appears in the local list of firewall rules.
- The user can log on with the security module. Authentication of the user is performed depending on the selected authentication method either by the security module or a RADIUS server.



Range of values for the maximum session time

The time after which the user is automatically logged out can be specified when creating or editing a user; the default is 30 minutes. On the Web page of the security module, the session time can be extended to the value assigned to the user.

You will find more information creating users in the following section:

Create users (Page 691)

IP packet filter directions SCALANCE S

Meaning

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		
From	**To**	**S602**	**S61x**	**S623 / S627-2M**
Internal	External	**x**	**x**	**x**
	Tunnel	-	**x**	**x**
	Any	-	**x**	**x**
	DMZ	-	-	**x**
	Internal	**x**	**x**	**x**
External	Internal	**x**	**x**	**x**
	Any	-	-	**x**
	Tunnel	-	-	**x**
	DMZ	-	-	**x**
Tunnel	Internal	-	**x**	**x**
	External	-	**x**	**x**
	DMZ	-	-	**x**
Any	Internal	-	**x**	**x**
	External	-	-	**x**
	DMZ	-	-	**x**
DMZ	Internal	-	-	**x**
	External	-	-	**x**
	Any	-	-	**x**
	Tunnel	-	-	**x**

x = communication direction is configurable

- = communication direction is not configurable

MAC packet filter directions SCALANCE S

Meaning

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		
From	**To**	**S602**	**S61x**	**S623 / S627-2M**
Internal	External	**x**	**x**	**x**
	Tunnel	-	**x**	**x**
	Any	-	**x**	**x**
External	Internal	**x**	**x**	**x**
	Any	-	-	**x**
	Tunnel	-	-	**x**

Available options / ranges of values		Security module		
Tunnel	Internal	-	x	x
	External	-	x	x
Any	Internal	-	x	x
	External	-	-	x

x = communication direction is configurable

- = communication direction is not configurable

Adapting standard rules for IP services

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Requirement

This function is available only in advanced firewall mode.

How to access this function

1. Select the security module to be edited.
2. In the local security settings, select the entry "Firewall" > "Standard rules for IP services".

Meaning of the advanced settings

Parameter	Meaning when activated
Use advanced status options	The permitted number of connections and firewall statuses per time unit is limited. If a network node exceeds this limit, its IP address is entered in the IP blacklist of the security module. The node can then no longer communicate via the security module. The IP blacklist of the security module can be viewed in online mode.
Log all activated rules	Packets that are allowed according to the default rules for IP services are logged.
Enable ICMP test for interfaces	Ping queries coming in on an interface of the security module can be forwarded to other interfaces. This means that, for example, ping queries can be made from the external network to the internal interface of the security module.

Default firewall rules for SCALANCE S

The following table lists the default firewall rules for SCALANCE S modules. In some cases, the firewall rules are only set if the relevant service is used by the security module (e.g. SNMP).

Service	Direction	X1 interface (red)	Interface X2 (green)	Interface X3 (yellow) (only for S623, S627-2M)	Tunnel interface* (not for S602)
Interface rerouting	outgoing	-	x	-	-
HTTPS		x	x*	x	x
ICMP	incoming	-	x	-	x
ICMP pathfinder (only for SCALANCE S S602 as of V3.1 in ghost mode)	outgoing	-	x	-	-
SNMP	incoming	x	x	x	x
Syslog	outgoing	x	x	x	x
NTP	outgoing	x	x	x	x
DNS	outgoing	x	x	x	x
HTTP	outgoing	x	-	x	-
VPN (IKE)		x	-	x	-
VPN (NAT Traversal)		x	-	x	-
BootP Server	incoming	-	x	x	-
BootP Client	outgoing	-	x	x	-
RADIUS	outgoing	x	x	x	x
CARP (only for SCALANCE S62x as of V4)	outgoing	x*	x*	-	-
Pfsync (only for SCALANCE S62x as of V4)	outgoing	-	-	x*	-

x enabled as default

- disabled as default

* cannot be adapted

SCALANCE S module as router

Specifying routes

Meaning

Specifies routes for addressing subnets that cannot be reached directly via the security module.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the "Routing" entry.
3. Double-click "Add new" in the table to add a route.
4. Enter the following values:

Parameter	Function	Example of a value
Network ID	Requests to nodes of the subnet with the network ID and the subnet mask specified here are forwarded to the subnet via the specified router IP address. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet. The specified network ID must not be located in the same subnet as the IP address of the security module.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Router IP address	IP address of the router that connects to the subnet. As an alternative, an FQDN can be entered for SCALANCE S modules as of V4. The specified router IP address must be in the same subnet as the IP address of the security module.	192.168.10.2
Activate rerouting (only for SCALANCE S as of V3)	Select this check box if the frames of the entered route will enter and leave on the same interface of the security module (rerouting). Rerouting is only supported on the internal interface of the security module.	

Address translation with NAT/NAPT in VPN tunnels

Module-specific function

Address translation with NAT/NAPT in VPN tunnels is only available for SCALANCE S612/ S623/S627-2M modules as of V4.

Meaning

Address translations with NAT/NAPT can also be performed for communications relations established via a VPN tunnel.

Requirements

The following requirements apply generally to a SCALANCE S module that will perform an address translation with NAT/NAPT in a VPN tunnel:

- The SCALANCE S module is in a VPN group.
- The SCALANCE S module is in routing mode and/or the DMZ interface of the SCALANCE S module is activated.

- The tunnel interface is enabled.
- The advanced firewall mode is enabled.

Supported address translation directions

The address translation directions described in the following section are supported:
NAT/NAPT routing (Page 726)

Supported address translation actions

With tunneled communications relations, the following address translation actions are supported:

- Destination NAT ("Redirect")
- Source NAT ("Masquerading")
- Source and Destination NAT ("1:1-NAT")
- NAPT ("Port forwarding")

You will find basic information on these address translation actions in the following section:
NAT/NAPT routing (Page 726)

Supported VPN links

In conjunction with NAT/NAPT, the following VPN links are supported:

VPN link		VPN link is initiated by	Address translation is performed by
SCALANCE S (a)	SCALANCE S (b)	SCALANCE S (a) or SCALANCE S (b)	SCALANCE S (a) and/or SCALANCE S (b)
SCALANCE S	CP x43-1 Adv. / PC-CP	SCALANCE S or CP x43-1 Adv. / PC-CP	SCALANCE S
SCALANCE S	SCALANCE M	SCALANCE M	SCALANCE S and/or SCALANCE M*
SOFTNET Security Client	SCALANCE S	SOFTNET Security Client	SCALANCE S

* Only 1:1 NAT is supported.

SCALANCE S modules of the type SCALANCE S623 V4 and SCALANCE S627-2M V4 that have a VPN endpoint on the external interface and on the DMZ interface can perform address translations on both interfaces at the same time.

Address translation characteristics when involved in several VPN groups

If a SCALANCE S module is a member of several VPN groups, the address translation rules configured for the tunnel interface of the SCALANCE S module apply for all VPN connections of this SCALANCE S module.

Please note: Once you have configured a NAT address translation to or from the direction of the tunnel, only the IP addresses involved in the NAT address translation rules can be reached via the VPN tunnel.

Relationship between NAT/NAPT router and user-specific firewall

Module-specific function

The configuration of NAT/NAPT rules in the user-specific firewall is only available for SCALANCE S modules as of V3.

Meaning

After creating NAT/NAPT rules, STEP 7 automatically generates a user-specific IP rule set in the user-specific firewall that enables communication in the configured address translation direction. You can then assign this user-specific IP rule set to individual or multiple users and/or individual or multiple roles (only for SCALANCE S modules as of V4).

The generated firewall rules can, if necessary, be moved and expanded (additional IP address, services, bandwidth). Firewall parameters generated by STEP 7 cannot be adapted. If the user-specific IP rule set is assigned to a security module with NAT/NAPT deactivated, the NAT/NAPT rules from the user-specific firewall are also applied to this security module.

Note

The address translation actions "Source-NAT + Destination-NAT" and "Double-NAT" are not supported in conjunction with the user-specific firewall.

How to access this function

"NAT" or "NAPT" entry in the editor for user-specific IP rules sets, refer to the following section: Creating and assigning user-specific IP rule sets (Page 797)

Supported address translation directions for the action "Source NAT"

The action "Source NAT" can be performed in the following directions:

- External to DMZ
- DMZ to external

No IP address can be entered in the "Source IP address" box. This is entered automatically when the node logs on to the security module.

Supported address translation directions for the action "Destination NAT"

The action "Destination NAT" can be performed in the following directions:

- External to internal
- External to DMZ
- DMZ to internal
- DMZ to external
- Tunnel to internal (only SCALANCE S612/S623/S627-2M as of V4)

- Tunnel to external (only SCALANCE S612/S623/S627-2M as of V4)
- Tunnel to DMZ (only SCALANCE S612/S623/S627-2M as of V4)

Supported address translation directions for NAPT

The address translation with NAPT can be performed in the following directions:

- External to internal
- External to DMZ
- DMZ to internal
- DMZ to external
- Tunnel to internal (only SCALANCE S612/S623/S627-2M as of V4)
- Tunnel to external (only SCALANCE S612/S623/S627-2M as of V4)
- Tunnel to DMZ (only SCALANCE S612/S623/S627-2M as of V4)

NAT/NAPT address translation and corresponding user-specific IP rule sets

In the firewall rules for user-specific IP rule sets generated based on NAT/NAPT rules, no IP address can be entered in the "Source IP address" box. This is entered automatically when the node logs on to the security module. The remaining properties generated locally for individual security modules are identical. Refer to the section
Relationship between NAT/NAPT router and firewall (Page 732)

Security module as DHCP server

Overview DHCP server

Overview

You can operate the SCALANCE S module on the internal network and on the DMZ network as DHCP server (DHCP = Dynamic Host Configuration Protocol). This allows IP addresses to be assigned automatically to the devices connected to the internal network or the DMZ network.

Simultaneous DHCP server operation on both interfaces is possible (SCALANCE S623/ S627-2M only).

The IP addresses are either distributed dynamically from an address range you have specified or you can select a specific IP address and assign it to a particular device. If devices on the internal interface or on the DMZ interface should always be assigned the same IP address for firewall configuration, the address assignment must only be static based on the MAC address or based on the client ID.

Requirements

You configure the devices on the internal network or on the DMZ network so that they obtain the IP address from a DHCP server.

Depending on the mode, the security module sends an IP address of the standard router to the nodes in the relevant subnet or you need to inform the nodes in the subnet of a router IP address.

- Router IP address will be transferred
  In the following situations, the DHCP protocol of the security module will inform the nodes of the router IP address:
  - The node is connected to the DMZ interface (SCALANCE S623/S627-2M only)
    In this case, the security module sends its own IP address as the router IP address.
  - The node is connected to the internal interface and the security module is configured for router mode
    In this case, the security module sends its own IP address as the router IP address.
  - The node is connected to the internal interface and the security module is not configured for router mode, there is, however, a standard router specified in the configuration of the security module.
    In this case, the security module transfers the IP address of the standard router as the router IP address.
- Router IP address will not be transferred
  In the following situations, enter the router IP address manually on the node:
  - The node is connected to the internal interface and the security module is not configured for router mode. There is also no standard router specified in the configuration of the security module.

See also

Configuring a DHCP server (Page 806)

Configuring a DHCP server

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "DHCP server".

3. Select the interface for which you want to make the DHCP settings.
4. Make the address assignment. You have the following configuration options:
   - Static address assignment
     Devices with a specific MAC address or client ID are assigned the specified IP addresses. You specify these addresses by entering the devices in the address list in the "Static address assignment" group box.
   - Dynamic address assignment
     Devices whose MAC address or whose client ID was not specified specifically, are assigned a random IP address from the specified address range. For this purpose, activate the "Dynamic IP address pool" check box. Set the address range in the "Dynamic IP address pool" input area.

Note

Dynamic address assignment - reaction after interrupting the power supply

Please note that dynamically assigned IP addresses are not saved if the power supply is interrupted. On return of the power, you must therefore make sure that the nodes request an IP address again.

You should therefore only use dynamic address assignment for the following nodes:

- Nodes that are used temporarily in the subnet (such as service devices).
- Nodes that have been assigned an IP address and send this as the "preferred address" the next time they request an address from the DHCP server (for example PC stations).

For permanent nodes you should preferably use static address assignment by specifying a client ID or the MAC address.

Consistency check - these rules must be adhered to

Remember the following rules when making the entries.

- The IP addresses assigned in the address list in the "Static address assignments" group box must not be in the range of the dynamic IP addresses.
- IP addresses, MAC addresses and client IDs may only occur once in the "Static address assignment" table (related to the security module).
- For the statically assigned IP addresses, you must specify either the MAC address or the client ID (computer name).
- The client ID is a string with a maximum of 63 characters. Only the following characters may be used: a-z, A-Z, 0-9 and - (dash).
  Note
  In SIMATIC S7, a client ID can be assigned to the devices on the Ethernet interface to allow them to obtain an IP address using DHCP.
  With PCs, the procedure depends on the operating system being used; it is advisable to use the MAC address here for the assignment.
- For the statically assigned IP addresses, you must specify the IP address.

- The following IP addresses must not be in the range of the free IP address range (dynamic IP addresses):
  - All router IP addresses in the "Routing" entry
  - Syslog server
  - Standard router
  - Security module address(es)
- DHCP is supported by the security module on the interface to the internal subnet and on the interface to the DMZ network. The following additional requirements for IP addresses in the range of the dynamic address assignments result from this operational behavior of the security module:
  - Bridge mode
    The range must be within the network defined by the security module.
  - Routing mode
    The range must be within the internal subnet defined by the security module.
    Note
    The DMZ network always represents a separate subnet. When using DHCP on the DMZ interface, make sure that the free IP address range (dynamic IP addresses) is within the DMZ subnet.
- The free IP address range must be fully specified by entering the start address and the end address. This end address must be higher than the start address.
- The IP addresses you enter in the address list in the "Static address assignments" input area must be in the address range of the internal subnet or in the DMZ subnet of the security module.

Running a consistency check (Page 684)

Configuring proxy ARP

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Overview

Proxy ARP allows routers to respond to ARP queries for hosts. The hosts are in networks separated by routers but use the same IP address range.

If PC1 sends an ARP request to PC2, it receives an ARP response and the hardware address of the interface (MAC address of the port of the security module) on which the query was received from the security module located in between and not from PC2. The querying PC1 then sends its data to the security module that then forwards it to PC2.

How to access this function

This function is only available for the internal interface of a security module that is a member of a VPN group and is in bridge mode.

1. Select the security module to be edited.
2. In the local security settings, select the entry "Proxy ARP".
3. If the security module is to respond to an ARP query from its own LAN as a substitute for the specific connection partner, enter the corresponding IP address.

IPsec tunnel: Creating and assigning groups

Configuring internal network nodes

Using the learning mode to learn internal nodes

Finding nodes for tunnel communication automatically

One great advantage when configuring and operating tunnel communication is that SCALANCE S modules in bridge mode can find the nodes on the internal interface automatically. New nodes are detected by the security module during operation. The detected nodes are signaled to the security modules belonging to the same VPN group. This allows data exchange within the tunnels of a group in both directions at any time.

Detectable nodes

The following nodes are detected:

- Network nodes with IP capability
  Network nodes with IP capability are found when they transmit an ICMP response to the ICMP subnet broadcast.
  IP nodes downstream from routers can be found if the routers pass on ICMP broadcasts.
- ISO network nodes
  You can also teach-in network nodes without IP capability that can be addressed by means of ISO protocols.
  This is only possible if they reply to XID or TEST packets. TEST and XID (Exchange Identification) are auxiliary protocols for exchanging information on layer 2. By sending these packets with a broadcast address, these network nodes can be located.
- PROFINET nodes
  Using DCP (Discovery and basic Configuration Protocol), it is possible to find PROFINET nodes.

Network nodes that do not meet these conditions must be configured manually.

Subnets located on the other side of internal routers also need to be configured manually.

How to access the function

1. Select the module.
2. In the local security settings, select the entry "VPN" > "Nodes".

Enabling/disabling the learning mode

The learning function is enabled in the configuration as default for every security module.

Learning can also be disabled completely for SCALANCE S. In this case, you will need to configure all internal network nodes participating in the tunnel communication manually.

When is it useful to disable the automatic learning mode?

The default settings for the security module assume that internal networks are always secure; in other words, in a normal situation, no network node is connected to the internal network if it is not trustworthy.

Disabling the learning mode can be useful if the internal network is static; in other words, when the number of internal nodes and their addresses do not change.

If the learning mode is disabled, this reduces the load on the medium and the nodes in the internal network resulting from the learning packets. The performance of the security module is also slightly improved since it does not need to process the learning packets.

Note: In the learning mode, all nodes in the internal network are detected. The information relating to VPN configuration limits relates only to nodes that communicate over VPN in the internal network.

Note

If more than 128 internal nodes are being operated, the permitted configuration limits are exceeded and an illegal operating status results. Due to the dynamics in the network traffic, this causes internal nodes that have already been learned to be replaced by new previously unknown internal nodes.

See also

Configuring internal subnets manually (Page 811)

Configuring IP network nodes manually

Meaning

As an alternative to the learning mode that you enable using the "Enable learning of internal nodes" check box and that allows the security module to learn the internal network nodes dynamically, you can enter the network nodes to be learned manually in the "Internal IP nodes" entry and in doing so enable them for VPN tunnel communication. The MAC address of a network node can be specified as an option.

Requirement

- The security module is in bridge mode.
- The security module is a member of a VPN group.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal IP nodes".

Configuring MAC network nodes manually

Meaning

As an alternative to the learning mode that you enable using the "Enable learning of internal nodes" check box and that allows the security module to learn the internal network nodes dynamically, you can enter the network nodes to be learned manually in the "Internal MAC nodes" entry and in doing so enable them for VPN tunnel communication.

Requirement

- The security module is in bridge mode.
- The security module is a member of a VPN group.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal MAC nodes".

Configuring internal subnets manually

Requirement

- The security module is a member of a VPN group.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal subnets".

Security module in bridge mode - "Internal subnets" entry

To be able to enable internal subnets for VPN tunnel communication manually, you need to enter the following address parameters:

Parameter	Function	Example of a value
Network ID	Network ID of the subnet to be enabled for VPN tunnel communication. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet. Must not be located in the same subnet as the IP address of the security module.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Router IP address	IP address of the router via which the subnet you are allowing is reached. Must be located in the same subnet as the IP address of the security module.	192.168.10.2

Security module in routing mode - "Subnets reachable through tunnel" entry

In routing mode, entire subnets are always tunneled. To be able to enable internal subnets reachable via routers, the external subnet or the DMZ subnet for VPN tunnel communication manually, you need to enter the following address parameters:

Parameter	Function	Example of a value
Network ID	Network ID of the subnet to be enabled for VPN tunnel communication. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Comment	Entry of additional, optional comments.	

Router and firewall redundancy

Overview

Meaning

Failures of the security modules SCALANCE S623 as of V4 and SCALANCE S627-2M as of V4 can be automatically compensated by routers and firewall redundancy during operation. To do this, group two security modules of the type SCALANCE S623 or SCALANCE S627-2M in a redundancy relationship by activating routers and firewall redundancy for both security modules. Following this, you decide which security module of the redundancy relationship is passive in normal mode (secondary module). You make this setting for the security module of the redundancy relationship that is active in normal operation (primary module). If the primary module fails during operation, the secondary module automatically adopts the function as firewall and (NAT/NAPT) router. To ensure the identical configuration of both security modules, these are connected together via their DMZ interfaces and their configurations are synchronized during operation. In this case, the DMZ interfaces of the security modules involved cannot be used for other purposes.

Address redundancy

In addition to their module IP addresses, the two security modules share a common IP address on the external and on the internal interface so that if one of the security modules fails, the IP addresses do not need to be changed. To do this, you need to configure an IP address for the external and for the internal interface of the redundancy relationship.

Effects of redundancy relationships on security modules

When you create redundancy relationships between security modules, some properties of these security modules are automatically adapted to establish compatibility with the redundancy relationship. The following properties are affected by this adaptation:

Module property	Effect on the module property
Operating mode	Where necessary, the mode is changed to the "Routing mode" option.
Membership of VPN groups	Where necessary, the security module is removed from VPN groups.
Interface configuration	Where necessary, the external interface and the DMZ interface of the security module are enabled. Where necessary, the IP assignment method "Static address" is configured for all interfaces.

Configuration of security modules in redundancy relationships

After router and firewall redundancy have been enabled and the primary module of the redundancy relationship selected, some of the module properties are configured only using the primary module. The properties configured for the primary module then apply to the redundancy relationship and cannot be configured for the secondary module. The following properties can be configured for the redundancy relationship:

- Basic settings of the redundancy relationship (secondary module, network parameters)
- Firewall (standard rules for IP services are configured separately for the individual security modules).
- Routing
- NAT/NAPT routing (not 1:1 NAT)

The values of the properties listed above are initially adopted from the primary module for the redundancy relationship.

The settings listed below remain active for the individual security modules even after including them in a redundancy relationship. Configuring these properties for the primary module therefore has no effect on the secondary module.

- Interface configuration (disabling interfaces and changing the VIP assignment method "Static address" is not possible).
- Standard rules for IP services (firewall)
- DDNS
- Time-of-day synchronization
- Log settings
- SNMP
- RADIUS

Note

Loading a configuration on security modules of a redundancy relationship (only SCALANCE S623/S627-2M as of V4)

The properties of a redundancy relationship configured for the primary module must be loaded both on the primary module and on the secondary module. To load the configuration, the physical IP address via which your engineering station can reach the security module must be used. The virtual IP addresses of the redundancy relationship cannot be used for loading.

Creating redundancy relationships between security modules

Requirement

The security modules SCALANCE S623/S627-2M as of V4 are not assigned to any other redundancy relationship.

Procedure

1. Select the security module that will be the active security module in normal operation (primary module).
2. In the local security settings, select the entry "Router and firewall redundancy".
3. Select the "Router and firewall redundancy" check box.
4. In the "Secondary module" drop-down list, select the security module that will be the passive security module in normal operation.

Result: You have created a redundancy relationship between the security modules.

Configuring redundancy relationships

How to access this function

1. Select the primary module of the redundancy relationship.
2. In the local security settings, select the entry "Router and firewall redundancy".

Configuring network parameters of the redundancy relationship

Configurable parameter	Meaning
IP address	IP address of the virtual external or internal interface of the redundancy relationship. The IP address must be located in the external or internal subnet of the primary module.
Subnet mask	Subnet mask of the virtual external or internal interface of the redundancy relationship
MAC address (adaptable only for SCALANCE S623/ S627-2M as of V4.0.1)	MAC address of the virtual external or internal interface of the redundancy relationship

For general information on configuring network parameters, refer to the following section:
Configuring IP address parameters (Page 774)

Configuring the firewall

IP packet filter rules for redundancy relationships are configured on the primary module. The communications directions "From external to internal" and "From internal to external" are available.

For general information on configuring IP packet filter rules in advanced firewall mode, refer to the following section:
Defining IP packet filter rules (Page 712)

Configuring address translation with NAT/NAPT

Address translation with NAT/NAPT for the redundancy relationship is configured on the primary module. For redundancy relationships, only Source NAT and NAPT can be configured. With Source NAT, source IP addresses in the internal subnet can only be replaced with the virtual external IP address of the redundancy relationship. No alias IP addresses can be registered on the external interface of the redundancy relationship. With NAPT, only the "External to internal" address translation direction can be configured.

For general information on configuring address translations with NAT/NAPT, refer to the following section:
Overview of NAT/NAPT (Page 724)

Configuring routing

Routes for the redundancy relationship are configured on the primary module. Standard routers must be specified in the "External interface [P1] red" or "Internal interface [P2] green" entry and must be identical per interface.

For general information on configuring routing, refer to the following section:
Specifying routes (Page 801)

Online functions - diagnostics and logging

Overview of the individual interfaces - "Interface settings" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Meaning

Table 10-43 Online diagnostics: "Interface settings" entry

System and status functions	Meaning
Interfaces	Table above: General overview of the interfaces of the security module. Table below: Information on the interface operated via PPPoE. • Status: Indicates whether or not a connection was established to the Internet Service Provider (ISP). • Current IP address: Current IP address of the interface • Gateway: IP address of the gateway • Primary dynamic DNS service: IP address of the primary dynamic DNS service • Secondary dynamic DNS service: IP address of the secondary dynamic DNS service • Error code (numeric): Error information if no connection could be established to the ISP.
CARP (only SCALANCE S623/S627-2M as of V4)	• CARP interface: Display of the virtual CARP interface • Physical interface: Physical interface on which the virtual CARP interface is operated (external / internal). • Status: Displays which of the modules of the redundancy relationship is active. • MAC address: MAC address of the virtual CARP interface • Preferred: Displays which of the modules of the redundancy relationship is configured as the primary module.

System and status functions	Meaning
Media redundancy (SCALANCE S627-2M only)	• Interface: Interface connected to the MRP ring. • Protocol: Protocol used (MRP) • Ring port 1: Name of the first media module port of the interface connected to the MRP ring. • Ring port 2: Name of the second media module port of the interface connected to the MRP ring. • Domain name: Name of the MRP domain. • Discrepancy: Display whether the domain of the client differs from that of the redundancy manager. • Domain UUID: UUID of the MRP domain.
Media modules (SCALANCE S627-2M only)	• Port: Port ID(s) of the media module port(s) • Name: Name of the media module • MLFB: MLFB of the media module • Revision: Version of the media module • Discrepancy: Displays whether there are differences between the configuration data in STEP 7 and the media modules.

Overview of the Dyn. DNS settings - "Dynamic DNS" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Meaning

Table 10-44 Online diagnostics: "Dynamic DNS"

System and status functions	Meaning
Client status	Indicates whether or not a connection was established to a dyn. DNS server.
Current IP address	WAN IP address via which the security module can currently be reached.
Defined IP address	IP address currently assigned to the FQDN.
Current time	The current time-of-day.
Force update	The security module obtains the current IP address of its Internet access and sends an update query to the configured update server(s). This publishes the current IP address on the Internet. The status is displayed in the primary or secondary dynamic DNS service fields. This means, for example that it is possible to check whether configured data such as the user name and password of the dynamic DNS account are correct.
Cancel suspension	Cancels the suspension (blocking of IP address updates from the dynamic DNS provider on the security module), for example after the dynamic DNS provider password has been corrected or an error has been eliminated.
Primary and secondary dynamic DNS service	
FQDN	Fully Qualified Domain Name registered with the provider.

System and status functions	Meaning
Server IP Address	IP address of the update server used.
Successful update	Successful update in the dynamic DNS update service.
Last update attempt	Last update attempt for DynDNS update service.
Last failed update	Last update error in the dynamic DNS update service.
Error code	Error status of the last unsuccessful update attempt during a dynamic DNS update.

What is the meaning of the messages?

The messages of the last DDNS update attempt have the following meaning:

Message	Meaning
Success	
DDNS_OK	The update query was successful.
Connection-related status messages	
DDNS_E_CON_UDP_SRV_RESOLV_ERR	DNS name of the update server unknown, FQDN cannot be resolved using the known DNS server.
DDNS_E_CON_UDP_SRV_UNREACHABLE	Update server unreachable ("Timeout").
Security-related status messages (errors)	
DDNS_E_CERT_SUBJECT_INVALID	The common name of the subject in the certificate does not match the domain name of the update server or its IP address.
DDNS_E_CERT_UNABLE_TO_GET_ISSUER_CERT	Issuer certificate not found. The certificate chain could not be followed back to the root CA because an issuer certificate was not found. The trust chain is incomplete.
DDNS_E_CERT_SIGNATURE_INVALID	The signature of a certificate could not be read or is invalid.
DDNS_E_CERT_NO_TRUST	A certificate in the trust chain is invalid, in other words: • Not yet valid or ready expired • V3 extensions invalid • Critical V3 extension is not supported
DDNS_E_CERT_DEPTH_ZERO_SELFSIGNED_CERT	The update server has supplied a self-signed certificate and the certificate is not in the certificate store for trustworthy root CA certificates.
DDNS_E_CERT_SELF_SIGNED_CERT_IN_CHAIN	The certificate chain could be established using non trustworthy certificates but no suitable root CA certificate was found in the certificate store for trustworthy certificates.
DDNS_E_CERT_CHAIN_TOO_LONG	The certificate chain exceeds the maximum supported verification depth.
DDNS_E_CERT_INVALID_CA	A CA certificate is invalid, in other words expired, not yet valid or the V3 extensions are not suitable for the intended purpose (for example CA not set to TRUE for CA certificates).
DDNS_E_CERT_KEYUSAGE_UNSUITED	The V3 extensions key usage or extended key usage set in a certificate of the trust chain are not suitable for the use of the certificate.

Message	Meaning
DDNS_E_CERT_EXTENSION_UNSUPPORTED	A certificate in the trust chain used an extension marked as critical that is not supported.
Agent-related status messages (errors)	
DDNS_E_AGT_BAD_AGENT	• The update request does not correspond to the structure required by cRSP, for example URL parameters missing. • The update request was sent to an illegal URL on the update server. • The configured update string contains errors.

Display of the ARP table - "ARP table" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Meaning

Display of the ARP table of the security module.

Table 10-45 Online diagnostics: "ARP table" tab

System and status functions	Meaning
ARP table	Display of the static (proxy ARP) and dynamic entries of the ARP table on the security module. The "Publication type" tab specifies whether the entry is configured statically or learnt.

Users logged in to the Web page - "Logged in users" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Meaning

Shows the users logged in to the Internet page for user-specific IP rule sets.

System and status functions	Meaning
User name	Name of the logged on user.
Source IP address	IP address with which the user logged on.
Time remaining	Remaining time before the user is automatically logged off.

System and status functions	Meaning
Maximum time of the session	Configured total time of the session.
Log off	The selected user is logged off.

Display of the firewall blacklist - "Firewall blacklist" entry

Meaning

Displays the IP addresses of nodes that have exceeded the permitted number of connections and firewall statuses per time unit. These nodes are entered in the IP blacklist of the firewall.

The number of connections and firewall statuses per time unit is only limited if the "Use extended status options" check box is selected in the "Standard rules for IP services" entry in the local security settings.

If you click the "Delete all" button, the displayed IP addresses are removed from the firewall blacklist of the security module. The IP addresses are also no longer displayed.

Setting the date and time - "Date and time" entry

How to access this function

1. Select the security module whose time and date you want to check or set.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. In online diagnostics, select the "Functions" > "Date and time" entry.

Setting the local time on the security module

In this area, you can read out and set the time and date of the security module. When you click the "Apply" button, the security module is assigned the time and date currently entered in the "Date" and "Time" input boxes.

Setting the local time on PC

This area shows the current time and current date of the PC on which STEP 7 is installed. If you click the "Adopt for module" button, the security module is assigned the current time and current date of the PC.

Diagnostics in ghost mode - "Ghost mode" entry

Module-specific function

This function is available only for SCALANCE S602 as of V3.1.

Meaning

Display of address information as well as information on IP address changes of the internal node.

System and status functions	Meaning
Status of SCALANCE S602	Display of the status of the security module in relation to operation in ghost mode.
IP address	IP address of the internal node (identical to the external IP address of the security module).
Subnet mask	Subnet mask of the security module.
MAC address	MAC address of the internal node.
Node found on	Displays when the internal node was recognized by the security module or when an IP address change was made on the internal node.
Number of IP address changes	Number of IP address changes detected by the security module.
IP address	IP address in the external network for which the security module requires route information.
Standard router	Standard router for the IP address in the external network.

Download functions

Downloading a configuration

Downloading the configuration / establishing an online connection

1. From the "PG/PC interface" drop-down list of the "Advanced download" dialog or "Connect online", select the network adapter via which you can reach the module.
2. If the module is in the factory settings status, follow the steps below:
   - From the "Connection to interface/subnet" drop-down list, with which your engineering station is connected and for which the IP address to be assigned is configured in the local security settings.
   - Select the "Show all compatible nodes" check box.
   - Click the "Start search" button.
   - Result: The module is displayed in the "Compatible devices in target subnet" table with its detected MAC address.
   - Select the module entry in the table and click the "Assign IP address" button.
   - Result: The module is assigned the IP address configured in the local security settings for the selected interface.
3. If the module is not in the factory settings status, follow the steps below:
   - From the "Connection with interface/subnet", select the interface / the FQDN address / WAN address of the module via which your engineering station can reach the module. STEP 7 then uses the address configured in the local security settings for the selected component for access to the module.
   - Deselect the "Show all compatible devices" check box.
   - Click the "Start search" button.
   - Result: The "Address" column of the "Compatible devices in the target subnet" displays the detected IP address / FQDN address of the module.
   - Select the address entry in the table and click the "Load" or "Go online" button.

Ideally, you should configure the modules of a group via the common external network of these modules (interface X1). If the engineering station is located in an internal network, you will

need to enable the IP addresses of the other modules of the group explicitly in the firewall of this SCALANCE S and configure this module first.

Note

Downloading the configuration when operating in ghost mode (only SCALANCE S602 as of V3.1)

When you operate the security module in ghost mode, the external interface of the security module takes over the IP address of the internal node at runtime. Before you can download a new configuration via the external interface to the security module, you need to specify the IP address for downloading a configuration that the security module obtained from the internal node during runtime.
To find out the current IP address of the security module, you can search for reachable nodes in STEP 7 with the menu command "Online" > "Accessible devices".

Note

Loading a configuration on security modules of a redundancy relationship (only SCALANCE S623/S627-2M as of V4)

The properties of a redundancy relationship configured for the primary module must be loaded both on the primary module and on the secondary module. To load the configuration, the physical IP address via which your engineering station can reach the security module must be used. The virtual IP addresses of the redundancy relationship cannot be used for loading.

Specifying a different address

In the "Compatible devices in target subnet" dialog area, you have the option of specifying an IP address / an FQDN address that differs from the IP address / FQDN address in the local security settings. To do this, enter the IP address / FQDN address of the module in the editable cell in the "Address" table column.

Firmware version

The configuration of a SCALANCE S as of V3 can also be downloaded to a SCALANCE S module whose firmware version is higher than the firmware version of the SCALANCE S module in STEP 7.

Operating mode

Configurations can be downloaded while the SCALANCE S modules are operating. Restart the SCALANCE S module to activate your configuration changes.

Note

Special characteristics

- As long as a module has not yet set IP parameters (in other words, prior to the first configuration), there must be no router between the module and the configuration computer.
- If you swap a PC from the internal to the external interface of the SCALANCE S, access from this PC to the SCALANCE S is blocked for approximately 20 minutes.

Configuration status

Prior to each download, the existing configuration on the security module is checked and compared with the configuration to be downloaded from the STEP 7 project. If the configuration of the module originates from the STEP 7 project currently to be downloaded and there are differences between these configurations, it is possible to download only files with differences between the module and project configuration to the security module. In some situations, this can speed up the download.

Transferring firmware

This needs to be taken into consideration before transferring new firmware

To transfer new firmware to a security module, the following conditions must be met:

- You have the rights required to transfer firmware; refer to section Auto-Hotspot.
- The security module is configured with an IP address.

The transfer is secure

The firmware is transferred over a secure connection and can therefore also be transferred from the unprotected network.

The firmware itself is signed and encrypted. This ensures that only authentic firmware can be downloaded to the SCALANCE S module.

Restart necessary following transfer

Newly downloaded firmware only becomes active after the SCALANCE S module has been restarted. If the transfer is disturbed and aborted, the module starts up again with the old firmware version.

Security for S7-300 /S7-400 / PC CPs

Setting up a firewall

Local firewall rules for S7-300 /S7-400 / PC CPs

Overview S7-300 CPs / S7-400 CPs /PC CPs

Enabling packet filter rules

If you enable the security function for the CPs in the local security settings, initially all access to and via the CP is permitted. To enable individual packet filter rules, select the "Activate firewall" check box. Then enable the required services. Firewall rules created automatically due to a connection configuration have priority over rules set manually.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Activate firewall in advanced mode" check box.

Firewall configuration with VPN

If the security module is added to a VPN group, the firewall is enabled by default. In addition, the "Tunnel communication only" check box is enabled. This means that only encrypted IPsec data transfer is permitted via the external interface. External data traffic is blocked.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

Updating connection rules

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button. The modified firewall rules are then displayed in advanced firewall mode.

Configuring a firewall with predefined firewall rules - CP x43-1 Advanced

Configuring a firewall with predefined IP rules - CP x43-1 Advanced

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 10-46 Available services and directions

Service	From station/ internal to external	External to internal	From external to station	Enabled ports	Meaning
Allow IP communication	x	x	x	All	IP traffic for the selected communication directions is allowed.
Allow S7 protocol	x	x	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/ FTPS (explicit mode)	x	x	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	x	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	x	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	x	-	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	x	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	x	-	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	x	-	UDP port 123	For synchronization of the time of day.

Table 10-47 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules - CP x43-1 Advanced

How to access this function

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 10-48 Available services and directions

Service	From station to external	From external to station	Meaning
Allow MAC communication	x	x	The MAC traffic from station to external and vice versa is allowed.
Allow ISO protocol	x	x	The ISO traffic from station to external and vice versa is allowed.

Table 10-49 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined firewall rules - CP 1628

Configuring a firewall with predefined IP rules - CP 1628

How to access this function

1. Select the module to be edited.
2. Select the "Security" > "Firewall" > "Predefined IP rules" entry.

Table 10-50 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	UDP port 123	For synchronization of the time of day.

Table 10-51 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules - CP 1628

How to access this function

1. Select the module to be edited.
2. Select the entry "Security" > "Firewall" > "MAC rules".

Table 10-52 Available services and directions

Service	From station to external	From external to station	Meaning
Allow MAC level communication	x	x	The MAC traffic from external to the station and vice versa is allowed.
Allow ISO communication	x	x	ISO traffic from external to the station and vice versa is allowed.
Allow SiClock	x	x	SiClock time-of-day frames from external to the station and vice versa are allowed.

Table 10-53 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		**Action**	**From**	**To**
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

IP packet filter directions S7-300-/S7-400-/PC-CPs

Meaning

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		Meaning
From	To	CP x43-1 Adv.	CP 1628	
Internal	Station	x	-	Access from the internal network to the station.
	Any	x	-	Access from internal to the external network, VPN tunnel partner and the station.
External	Station	x	x	Access from the external network to the station.
	Any	x	-	Access from external to the internal network and the station.
Station	Internal	x	-	Access from the station to the internal network.
	External	x	x	Access from the station to the external network.
	Tunnel	x	x	Access from the station to the VPN tunnel partner.
Tunnel	Station	x	x	Access via the VPN tunnel partner to the station.
	Any	x	-	Access from VPN tunnel partners to the internal network and the station.
Any	External	x	-	Access from the internal network and the station to the external network.

MAC packet filter directions S7-300-/S7-400-/PC-CPs

Context

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		Meaning
From	To	CP x43-1 Adv.	CP 1628	
External	Station	x	x	Access from the external network to the station.
Station	External	x	x	Access from the station to the external network.
	Tunnel	x	x	Access from the station to the VPN tunnel partner.
Tunnel	Station	x	x	Access via the VPN tunnel partner to the station.

Configuring the access list

Module-specific function

This function is not available for the CP 1628.

Meaning

You set access protection for certain IP addresses using the IP access lists. List entries that have already been created and the corresponding rights are displayed in the local settings of the CP in the entry "Firewall" > "IP rules" (advanced firewall mode).

Note

Changed behavior after activation of security

- Once you have activated the security function for a CP, access protection will only apply to the external interface. You can apply access protection to the internal interface as well, by configuring suitable firewall rules in advanced firewall mode.
- The CP also responds to ARP requests from IP addresses that have not been released (layer 2).
- If the IP access list of a CP contains no entries and you activate security for the CP, the firewall will be activated and prevent access to the CP from external locations. Configure the corresponding firewall rules in advanced firewall mode so that the CP can be reached.

Effect of IP access list entries at activation of security

If security is enabled in the local settings of a CP, the corresponding rules are created in the advanced firewall mode. A firewall rule "Allow" > "External" > "Station" is created for an IP address you specified in the address list. The IP address from the IP access list is used accordingly as source IP address. IP addresses from a defined IP address range are also integrated into corresponding firewall rules.

Requirements for editing

Before you can edit created firewall rules, the following condition must be met:

- for editing using STEP 7: "Configure security" configuration right
- for editing using a Web server: Module right "Web: Expand IP access control list"

The requirements for editing the IP access lists outside the local security settings are described in the sections on the specific CPs.

Connection-related automatic firewall rules

Meaning

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/ passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

Note

Enabling UDP multicast and UDP broadcast connections manually

No automatic firewall rules are created for UDP multicast and UDP broadcast connections. To enable the connections, add the relevant firewall rules manually in advanced firewall mode.

Depending on how the connection establishment is configured, the following level 3 firewall rules are created. If the security module is in a VPN group, the direction "External" changes to "Tunnel". This applies only to CPs that support VPN.

The IP address of the connection partner is entered in the "Source IP address" or "Destination IP address" column of these firewall rules.

CP->external	Action	From	To
active	Allow	Station	External
	Drop	External	Station
passive	Drop	Station	External
	Allow	External	Station
active and passive	Allow	External	Station
	Allow	Station	External

CP->internal	Action	From	To
active	Allow	Station	Internal
	Drop	Internal	Station
passive	Drop	Station	Internal
	Allow	Internal	Station
active and passive	Allow	Internal	Station
	Allow	Station	Internal

For level 2 connections, "Allow" rules are created for both directions. If the security module is in a VPN group, the direction "External" changes to "Tunnel".

The MAC address of the connection partner is entered in the "Source MAC address" or "Destination MAC address" column of these firewall rules.

CP->external	Action	From	To
active, passive, active and passive	Allow	Station	External
	Allow	External	Station

Note

Changing the connection configuration

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button.

Conventions for automatically created firewall rules

- Priority
  The rules have highest priority and are therefore inserted at the top in the local rule list.
- Deleting rules
  The rules cannot be deleted. Logging can be enabled and services can be assigned. Moreover, you may insert a bandwidth and a comment.
- Changing the action
  If you set the action from "Allow" to "Drop" or vice versa, this is overwritten again during renewed system synchronization. Select "Allow*" or "Drop*" to retain your changes. In this case, only the IP address is synchronized and the action and direction remain as set. Settings for logging, service, bandwidth and comment are also retained after a renewed system synchronization even without changing the action to "Allow*" or "Drop*". If the configured connection is deleted, the corresponding rules are removed from the list.

Security module in VPN group

As default, the "Tunnel communication only" check box is enabled. If you deselect the check box, in addition to tunnel communication between tunnel partners, communication is also possible with network nodes to which there is no tunnel.

- Communication is untunneled if the partner address belongs to a station known in STEP 7 for which no VPN tunnel is configured.
- Communication is through the tunnel if the partner address is a VPN endpoint.
- If it is not clear whether connection should bypass or run through the VPN tunnel, the connection is assigned to the VPN tunnel and a message to this effect is displayed. The assignment can be adapted in advanced firewall mode, for example, by changing the "From" direction "Tunnel" to "External". To avoid this adaptation being overwritten by the next system synchronization, the "Allow*" or "Drop*" action must be selected.

Note

If you want to ensure that only communication through the tunnel is possible, you will need to create suitable firewall rules in advanced firewall mode, for example, for internal nodes or NDIS addresses.

To allow only tunneled communication for a CP, add a rule with the following settings:

- "Action": "Drop"
- "From": "Any"
- "To": "External"

For the CP 1628, add a rule with the following settings:

- "Action": "Drop"
- "From": "Station"
- "To": "External"

In addition to this, you need to remove existing firewall rules that allow untunneled communication.

Activating the Web server on CP x43-1 Advanced

Module-specific function

This function is only available for CP x43-1.

Meaning

After activating the Web server, you have access to the Web pages of the module. In the local security settings, you can restrict access to these Web pages using the HTTPS protocol. This access is controlled using the "Allow access only using HTTPS" check box. In addition, you must configure the firewall accordingly.

IPsec tunnel: Creating and assigning groups

Configuring internal network nodes - "Nodes" entry

Allow access to S7-300 / S7-400 CPs for VPN connection partners

Possible selections

Decide whether or not the VPN connection partner can have access to the CP and/or the internal subnet of the CP in routing mode (SCALANCE S / M).

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Node".
3. Configure access for the VPN connection partner of the CP in routing mode (SCALANCE S / M):
   - Allow connection to the CP (Gbit interface)
   - Allow connection to the internal subnet (PROFINET subnet)

Configuring NDIS nodes manually for PC CPs that can be reached through the tunnel

Configuring NDIS nodes that can be reached through the tunnel

The internal nodes are learned and assigned to the routes dynamically. This concerns the NDIS IP addresses of the Windows PC.

Follow the steps below

1. Select the module to be edited.
2. In the local security settings, select the entry "Nodes" > "NDIS nodes reachable via tunnel".
3. Enter the NDIS IP addresses.

Online functions - Debug / Diagnostics and Logging

Updated firewall rules - "Dynamically updated firewall rules" entry

Module-specific function

This function is only available for CP x43-1 Adv.

Meaning

Display of the IP addresses or IP address ranges that were enabled dynamically using HTTP or HTTPS, or loaded by a user. The rights assigned for accessing the S7 CP are displayed for the enabled IP addresses. An update of the IP addresses in this tab can only be triggered by the following events:

- Extension/modification of the IP access control list
- Update of firewall rules
- Dynamic extensions transmitted to the CP at runtime, for example, PROFINET IO devices

Since only the dynamically updated firewall rules are displayed here, you also need to take into account the firewall rules that were configured offline and downloaded to the station for a full picture of the current firewall status of the module.

Security for S7-1200-/S7-1500-CPs

Setting up a firewall

Local firewall rules for S7-1200 / S7-1500 CPs

Overview of the local firewall rules for S7-1200 / S7-1500 CPs

Enabling packet filter rules

If you enable the security function for the CPs in the local security settings, initially all access to and via the CP is permitted. To enable individual packet filter rules, select the "Activate firewall" check box. Then enable the required services. Firewall rules created automatically due to a connection configuration have priority over rules set manually.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Activate firewall in advanced mode" check box.

Updating connection rules

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button. The modified firewall rules are then displayed in advanced firewall mode.

Configuring a firewall with predefined firewall rules - CP 1543-1

Configuring a firewall with predefined IP rules - CP 1543-1

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 10-54 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow security diagnostics	x	TCP port 8448	Allow security diagnostics.

Table 10-55 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		**Action**	**From**	**To**
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined IPv6 rules - CP 1543-1

Meaning

With the predefined IPv6 rules, you have the option of configuring the firewall for services in which IPv6 is used. By enabling a predefined IPv6 rule in the local security settings of the CP 1543-1 V1.1, the system-defined ICMPv6 services that can be seen in the global security settings in the "ICMP" tab in "Firewall" > "Services" > "Define services for IP rules"are also enabled in the firewall. The firewall of the CP 1543-1 V1.0 allows ICMPv6 packets through even without enabling a predefined IPv6 rule.

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" > "Pre-defined IPv6 rules" item in the local security settings.

Table 10-56 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.

Table 10-57 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings made in "Predefined IPv6 rules" have no effect on firewall rules that were automatically generated as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules - CP 1543-1

How to access this function

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 10-58 Available services and directions

Service	From station to external	From external to station	Enabled ports	Meaning
Allow MAC communication	x	x	-	The MAC traffic from external to the station and vice versa is allowed.
Allow ISO protocol	x	x	-	ISO traffic from external to the station and vice versa is allowed.
Allow DCP	x	x	-	DCP traffic from external to the station and vice versa is allowed.
Allow LLDP	x	x	-	LLDP traffic from external to the station and vice versa is allowed.

Table 10-59 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined firewall rules - CP 1243-1 and CP 1243-7

Configuring a firewall with predefined IP rules - CP 1243-1 and CP 1243-7

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 10-60 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow security diagnostics	x	TCP port 8448	Allow security diagnostics.

Table 10-61 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined IPv6 rules - CP 1243-1

Meaning

With the predefined IPv6 rules, you have the option of configuring the firewall for services in which IPv6 is used. By enabling a predefined IPv6 rule in the local security settings of the CP 1243-1, the system-defined ICMPv6 services that can be seen in the global security settings in the "ICMP" tab in "Firewall" > "Services" > "Define services for IP rules" are also enabled in the firewall.

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" > "Predefined IPv6 rules" item in the local security settings.

Table 10-62 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.

Table 10-63 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings made in "Predefined IPv6 rules" have no effect on firewall rules that were automatically generated as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules - CP 1243-1 and CP 1243-7

How to access this function

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 10-64 Available services and directions

Service	From station to external	From external to station	Enabled ports	Meaning
Allow MAC communication	x	x	-	The MAC traffic from external to the station and vice versa is allowed.
Allow DCP	x	x	-	DCP traffic from external to the station and vice versa is allowed.

Table 10-65 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

IP packet filter directions S7-1200 / S7-1500 CPs

Meaning

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Meaning
From	**To**	
External	Station	Access from the external network to the station.
Station	External	Access from the station to the external network.
	Tunnel	Access from the station to VPN tunnel partners.*
Tunnel	Station	Access by VPN tunnel partners to the station.*

* Not for the CP 1543-1 V1.0.

MAC packet filter directions S7-1200 / S7-1500 CPs

Meaning

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Meaning
From	**To**	
External	Station	Access from the external network to the station.
Station	External	Access from the station to the external network.
	Tunnel	Access from the station to VPN tunnel partners.*
Tunnel	Station	Access by VPN tunnel partners to the station.*

* Not for the CP 1543-1 V1.0.

Connection-related automatic firewall rules

Meaning

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/ passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

Note

Enabling UDP multicast and UDP broadcast connections manually

No automatic firewall rules are created for UDP multicast and UDP broadcast connections. To enable the connections, add the relevant firewall rules manually in advanced firewall mode.

Depending on how the connection establishment is configured, the following level 3 firewall rules are created. If the CP (not CP 1543-1 V1.0) is in a VPN group, the direction "External" changes to "Tunnel".

The IP address of the connection partner is entered in the "Source IP address" or "Destination IP address" column of these firewall rules.

CP->external	Action	From	To
active	Drop	External	Station
	Allow	Station	External
passive	Drop	Station	External
	Allow	External	Station
active and passive	Allow	External	Station
	Allow	Station	External

For level 2 connections, "Allow" rules are created for both directions. If the CP (not CP 1543-1 V1.0) is in a VPN group, the direction "External" changes to "Tunnel".

The MAC address of the connection partner is entered in the "Source MAC address" or "Destination MAC address" column of these firewall rules.

CP->external	Action	From	To
active, passive, active and passive	Allow	Station	External
	Allow	External	Station

Note

Changing the connection configuration

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button.

Conventions for automatically created firewall rules

- Priority
  The rules have highest priority and are therefore inserted at the top in the local rule list.
- Deleting rules
  The rules cannot be deleted. Logging can be enabled and services can be assigned. Moreover, you may insert a bandwidth and a comment.
- Changing the action
  If you set the action from "Allow" to "Drop" or vice versa, this is overwritten again during renewed system synchronization. Select "Allow*" or "Drop*" to retain your changes. In this case, only the IP address is synchronized and the action and direction remain as set. Settings for logging, service, bandwidth and comment are also retained after a renewed system synchronization even without changing the action to "Allow*" or "Drop*". If the configured connection is deleted, the corresponding rules are removed from the list.

Security module in VPN group

As default, the "Tunnel communication only" check box is enabled. If you deselect the check box, in addition to tunnel communication between tunnel partners, communication is also possible with devices to which there is no tunnel.

- Communication is untunneled if the partner address belongs to a station known in STEP 7 for which no VPN tunnel is configured.
- Communication is through the tunnel if the partner address is a VPN endpoint.

Note

If you want to ensure that only communication through the tunnel is possible, you will need to create suitable firewall rules in advanced firewall mode.

To allow only tunneled communication for a CP, add a rule with the following settings:

- "Action": "Drop"
- "From": "Station"
- "To": "External"

In addition to this, you need to remove existing firewall rules that allow untunneled communication.

10.1.4 Creating configurations

10.1.4.1 Information about the web server

Introduction

The Web server lets you monitor and administer the CPU through authorized users by means of a network. This permits evaluation and diagnostics over long distances. All you need is a web browser.

Alarms and status information are visualized on HTML pages.

Web browser

You need a web browser to access the HTML pages of the CPU.

The following web browsers have been tested for communication with the CPU:

- Internet Explorer (Version 8)
- Mozilla Firefox (Version 21)
- mobileSafari (iOS5)

Web access to the CPU via PG/PC

Proceed as follows to access the Web server:

1. Connect the client (PG/PC) to the CPU via the PROFINET interface.
2. Open the web browser.
   Enter the IP address of the CPU in the "Address" field of the web browser in the format http://ww.xx.yy.zz (example: http://192.168.3.141).
   The start page of the CPU opens. From the start page, you can navigate to further information.

Additional information

Additional information about the Web server of the various CPU families is available under the key word "Web server" in the information system.

Information on creating your own web pages for access to the CPU is available under the keyword "User-defined web pages" in the information system.

You can find links to additional manuals about the subject "Web server" under "See also".

10.1.4.2 Things you should know about PROFIBUS DP operating modes

Introduction

DP master systems that consist of a DP master and DP slaves which are connected via a bus and communicate with one another via the PROFIBUS DP protocol are referred to as distributed I/O.

Below, we refer to communication-capable modules with DP interface that can take on the role of DP master or DP slave.

"DP master" and "DP slave" option

Communication-capable modules, such as CPUs with DP interface and CPs or CMs with DP interface, have the area "Mode" in their module properties.

For S7-300 CPUs with integrated DP interface, for example, you can set the mode "DP master" and "DP slave". A CPU or a CP that is configured as DP slave is also referred to as intelligent DP slave (I-slave).

For S7-1500 CPUs with integrated DP interface, only the "DP master" mode is possible. To operate S7-1500 CPUs as I-slave, you have to insert the communication module CM 1542-5 and configure it as DP slave.

S7-1200 CPUs do not have integrated DP interfaces. To operate an S7-1200 as DP master or DP slave, you must insert a communication module CM 1243-5 (DP master only) or a communication module CM 1242-5 (DP slave only; I-slave).

Additional information

Additional information on distributed I/O is available under the key word "Distributed I/O" and "I-slave" in the information system.

10.1.4.3 Configuring automation systems

Addressing modules

Addressing modules

Introduction

In the device overview, you see the addresses or address ranges of the modules in the I address and Q address columns. There are other addresses as well, which are explained below.

I/O address

I/O addresses (input/output addresses) are required to read inputs and set outputs in the user program.

Input and output addresses are assigned automatically when modules are inserted in the rack. The address of the first channel is the start address of a module. The addresses of the other channels are derived from this start address. The address end is obtained from the module-specific address length.

Device address (e.g., Ethernet address)

Device addresses are addresses of programmable modules (Industrial Ethernet addresses). They are required to address the different stations of a subnet, for example, to download a user program to a CPU.

Hardware identifier for identifying modules and submodules

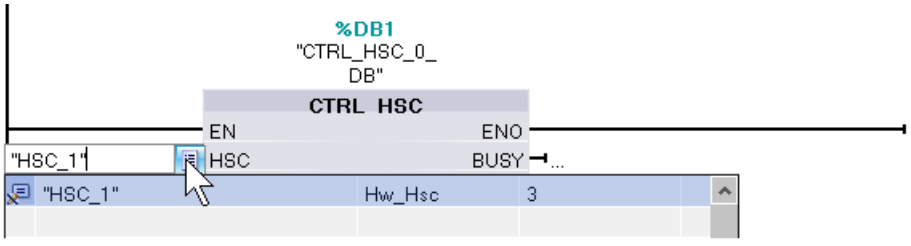
In addition to the I addresses and Q addresses, a hardware identifier (HW ID) is assigned automatically and is used to address and identify the module. Submodules (units of a module), such as an integrated counter, also receive such a hardware identifier.

The hardware identifier consists of an integer and is output by the system with diagnostics alarms to allow the faulty module or the faulty submodule to be localized.

In addition, the hardware identifier is used for a number of instructions to address the corresponding module.

The hardware identifier cannot be changed.

Example: Identifying high-speed counters of the S7-1200 CPU



The hardware identifier is assigned automatically when components are inserted in the device or network view and in the PLC tags. A name is also assigned automatically for the hardware identifier. The system constants of the PLC tags cannot be changed either.

See also

Specifying input and output addresses (Page 849)

Assigning addresses to a location in the program (Page 850)

Introduction to loading a configuration (Page 1146)

Inspector window (Page 547)

Specifying input and output addresses

Default input and output addresses are set automatically. You can, however, change the address assignment later.

All addresses of modules are located in the process image area. The process image is automatically updated cyclically.

Requirement

You are in the device view.

Procedure

To change the preset address range proceed as follows:

1. In the device view, click on the module for which you want to set the start address.
2. Go to "I/O addresses" in "Properties" in the inspector window.
3. Under "Start address" enter the required start address.
4. Press <Return> or click on any object to accept a modified value.

If you have entered an invalid address, a message indicating the next available address is displayed.

Note

You can also change the addresses directly in the device overview.

See also

Editing properties and parameters (Page 574)

Input and output addresses in the address overview (Page 576)

Assigning addresses to a location in the program

You can assign addresses of the I/O channels of modules directly to the points of use in the program or to a tag table.

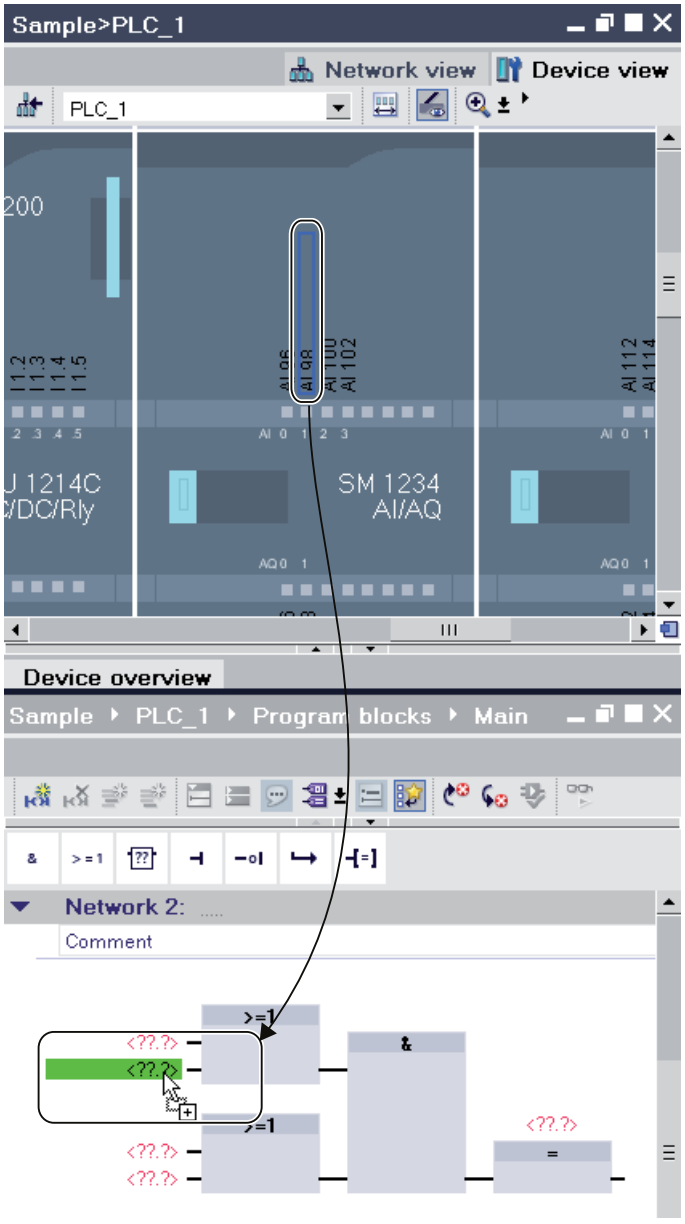
Requirement

- The device view of the hardware and network editor is open.
- The zoom level in the device view must be set to at least 200% to allow you to see the individual I/O channels.
- The instruction window of the programming editor or a tag table is open.

Procedure

To assign I/O channels of modules to the points of use in the program or to a tag table, follow these steps:

1. In the device view, navigate to the module with the desired I/O channel.
2. Click and hold down the mouse button to drag the desired I/O address to the corresponding point of use of the block or to the tag table.



The address of the module is assigned to the point of use in the program or entered as a tag in the tag table.

Note

The tag for an input or output of a block can also be dragged to the input or output of a module in order to link the tag to the I/O channel of the module.

Signal board

Inserting a signal board in a CPU

Introduction

Signal boards allows you to increase the number of the S7-1200 CPU's own inputs and outputs. Just like all other hardware components, you will find signal boards in the hardware catalog. However, you do not insert signal boards in the rack like other modules but directly in a slot of the CPU itself.

Note the following points when using a signal board:

- Each CPU can have only one signal board inserted in it.
- A signal board can only be inserted when the slot in the CPU is free.

There are various ways of inserting a signal board in a CPU:

- Double click on a signal board in the hardware catalog when there is a free slot in the CPU
- Drag from the hardware catalog to a free slot in the CPU
- Shortcut menu of a signal board in the hardware catalog for copying and pasting

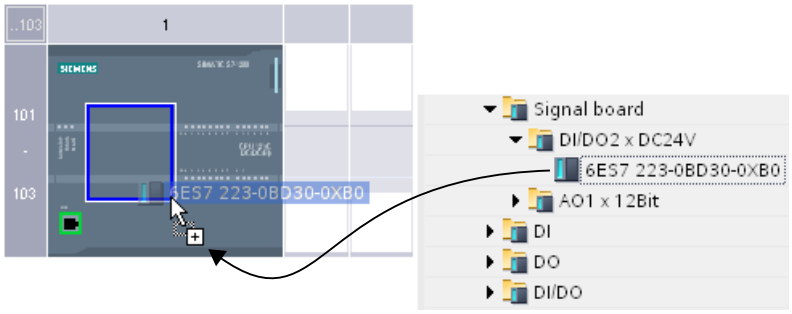
Requirement

- The hardware catalog is open.
- The S7-1200 CPU has a free slot for the signal board.

Inserting a signal board in a CPU

To insert a signal board in a CPU, proceed as follows:

1. Go to the required signal board in the hardware catalog.
2. Select the signal board you want to use.
3. Drag the signal board to the free slot in the CPU.



You have now inserted a signal board in the slot of the CPU.

If you are in the network view, you can also drag a signal board to a device. If the CPU has a an empty slot for a signal board, the signal board is inserted automatically into this slot.

Configurations for Web server

Information about the web server

Introduction

The Web server allows you to monitor the CPU via the Internet or the intranet of your company. This permits evaluation and diagnostics over long distances.

Alarms and status information are visualized on HTML pages.

Web browser

You need a web browser to access the HTML pages of the CPU.

The following PC web browsers, for example, are suitable for communication with the CPU:

- Internet Explorer (Version 8.0, 9.0)
- Mozilla Firefox (Version 17.0.1 and higher)
- Google Chrome 23.0
- Apple Safari 5.1.7 (Windows)
- Apple Safari 6.0.2 (Mac)

The following Web browsers of mobile devices are also suitable:

- Internet Explorer 6.0 for HMI Panels
- Mobile Safari (iOS 5.0.1)

- Mobile Android Browser 2.3.4
- Mobile Google Chrome 23.0

Reading information via the Web server

The following information can be read from the CPU. The availability of the respective web pages depends on the CPU and its firmware version.

As of firmware version 4, the web pages are also available in several languages.

Page/information	Description
Intro/Introduction	Entry page for the standard web pages
Start Page Start page with general CPU information	The start page provides an overview of general information on the CPU, the name of the CPU, the type of CPU and basic information on the current operating state.
Identification Identification information	Displays the static identification information such as serial number, article number and version numbers.
Diagnostic Buffer Diagnostic information	Displays the content of the diagnostics buffer with the most recent entries first.
Module Information Module information	Displays whether the centrally inserted components of a station are OK, whether there are maintenance requirements or components cannot be reached, for example. As of firmware version 4 a firmware update is possible via this Web page.
Communication Communication	Displays the communication connections during open communication (OUC); displays resources and address parameters.
Varable Status Tags	Displays the status of operands of the user program to monitor and change the values.
Data Logs (File Browser as of firmware version 4)	Data logs in CSV format to transfer to the hard disk of the programming device. The data logs are created with data log instructions in the user program and filled with data. As of firmware version 4 you have access to files of the internal load memory and of the external load memory (Memory Card), for example to the content of the directory "DataLogs" and "Recipes" via the Web page "File Browser".
User Pages User pages (if user-defined web pages have been configured and loaded)	The user web pages deliver a list of web pages with customer-specific web applications.

Web access to the CPU via PG/PC

Proceed as follows to access the Web server:

1. Connect the client (PG/PC) to the CPU via the PROFINET interface.
2. Open the web browser.
   Enter the IP address of the CPU in the "Address" field of the web browser in the format http://ww.xx.yy.zz (example: http://192.168.3.141).
   The start page of the CPU opens. From the start page, you can navigate to further information.

S7-1200 web server (http://support.automation.siemens.com/WW/view/en/36932465)

Standard web pages

Requirements for web access

The requirements for access to standard CPU web pages are explained in the following, as well as the effects of missing or existing configuration information.

Requirement

The web server must be started.

The web server only starts when it has been activated in the properties of the CPU in the "Web server" section.

Note the following:

The web pages are normally transmitted via an non-secure connection and are not secured against hacker attacks. If you want to transfer the web pages in encrypted form to the browser, use the URL https://, followed by the IP address of the CPU.

Logon

No logon is required to access the standard web pages read-only. A user must be logged on to execute certain actions like changing the operating mode of the CPU or for write access.

For S7-1200 CPUs up to FW version V3:

You must be logged on as "admin" for the actions listed above. The logon input boxes are on the top left of each standard web page.

If you log on as "admin", you must enter the user name and password there.

Name: admin.

Password: configured CPU password (for password-protected CPU).

For S7-1200 CPUs as of FW version 4:

You can freely select the names of users and the passwords (CPU parameter "Web server", area "User management").

You assign rights to the users, for example the right to query diagnostics or to update the firmware.

JavaScript and cookies

The standard web pages use JavaScript and cookies. You must enable both in your web browser.

If JavaScript is not enabled, the following limitations apply:

- Data from standard web pages is not automatically updated.
- You cannot log on as user.
- Fields cannot be sorted (module information)

If cookies are not enabled, you cannot log on.

Access for HTTPS (Page 857)

Settings for operation

Settings for operation

To be able to use the web server of an S7-1200-CPU, you must select the CPU in the network view or the device view and make the following settings in the inspector window under "Properties > General > Web server":

- Enable the web server
- Restricting access to the CPU to HTTPS transmission protocol (encrypted transmission) Access via port 80 is then blocked. Communication is only possible via port 443.

- Enabling automatic update of web pages
  The update interval is set by default and cannot be changed. The CPU updates web pages with changing content ((for example, status information or diagnostics information) at regular intervals.
- Creating and managing users
  Users are exclusively entitled to options that are assigned to the access rights. Depending on the CPU and firmware used, you can assign different user rights. Rights that your CPU does not support cannot be activated. A user called "Everybody" with minimal access rights, that you can, however, extend, is set by default in the user list. A user who uses the Web server without entering a password has "Everybody" user rights.
  You have the possibility of configuring further users with different access rights. These users have to log on with the configured user name and password.

Warning

Unauthorized access to the CPU by means of the Web server

Unauthorized access to the CPU or the changing of PLC variables to invalid values can result in interruptions of the processes controlled by the CPU and cause death, serious bodily harm or material damage!

Since the activation of the Web server allows authorized persons for example to change operating modes, to write-access CPU data or to update the firmware, we recommend that the following security measures be taken:

- If possible limit access to the HTTPS protocol.
- Create users with secure passwords. An example of a secure password is one which is only used for a single application, is more than 8 characters long, and consists of lower- and upper-case letters as well as symbols and numbers (?!+%$1234...). In addition, passwords based on common keyboard sequences or words from the dictionary should be avoided.
  Change the password at regular intervals.
- Do not extend the rights of the "Everybody" user.
- Check the PLC variables in the user program and limit the range of values to permissible ranges since users can set invalid values via the Web server.

Access for HTTPS

Access via HTTPS

HTTPS is used for encrypting and authentication of communication between the browser and web server.

To transfer data between the browser and the CPU using the HTTPS protocol, enter the URL as https://ww.xx.yy.zz in the address line of your browser, whereby ww.xx.yy.zz stands for the IP address of the CPU.

You require a valid, installed certificate for error-free HTTPS access to the CPU.

If no certificate is installed a warning is displayed with a recommendation not to use this page. To view the page you must explicitly "Add exception".

You can receive a valid certificate (Certification Authority) "SIMATIC CONTROLLER" as a download from the "Intro" web page under "Download certificate". The help function for your respective web browser provides information on how to install a certificate.

Accessing data of the CPU memory

You can access data in the internal or external CPU load memory by means of a standard web page.

- Use the web page "Data logs" for S7-1200 CPUs up to and including FW version 3. From this web page, you transfer the data logs from the CPU to a drive on your PC.
- Use the web page "File Browser" for S7-1200 CPUs as of FW version 4. From this web page, you transfer data from the folders "Data logs" or "Recipes", for example, to a drive on your PC.

Depending on the file type and the access permissions you have configured for the web server user, you can download, delete, rename or upload the files. The actual directories can only be created, deleted or renamed.

Example: Data logs

To open a data log, click on the link of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

Special note: Data logs are saved in U.S. American CSV format. You can only open the file directly using the U.S. version of Microsoft Excel. If you are using another national version of Microsoft Excel, you must import the file, selecting "comma" in the import assistant as the delimiter.

Downloading a data log

To download a data log, click on the download icon of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

Downloading and clearing or deleting a data log

For a CPU with FW version up to V3.0:

To download and delete the current entries of the data log, you must be logged on. To do this, click on the "Download and delete" icon of the required data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

For a CPU as of FW version V4.0:

To reset the data log, follow these steps:

1. Open the CSV file, for example with Excel.
2. Delete the rows between the headline and the row with the entry "//END", if this row exists.

3. Save the file to a drive on your PC.
4. On the web page "File Browser", delete the data log (which means the CSV file) and load the prepared CSV file to the CPU with the "Upload file" button of the "File Browser" web page.

Additional information is available in the S7-1500 CPU system manual.

Data logging - Overview (Page 3318)

Create and download user-defined websites

What you need to know about user-defined web pages

Concept

The concept of user-defined web pages allows you to access freely-designed web pages of the CPU from a web browser. The Web server of the CPU provides this function.

You are not dependent on special tools for the design and functionality of the user-defined web pages. You can adapt the pages in the layout with CSS, provide dynamic content with JavaScript or use any framework to produce web pages.

The totality of files processed by the Web server is also referred to as the "web application".

Web application and user program

Using HTML code in user-defined web pages, you can also transmit data via a web browser to the user program of the CPU for further processing and can display data from the operand area of the CPU in the web browser.

You can use script instructions (such as Javascript) to optimize your web pages, for example to dynamically change contents or validate user entries.

To synchronize between the user program and the Web server, but also to initialize, you must call the WWW (SFC 99) instruction in the user program.

- If no interaction is required between the web application and the user program, for example, if a web page only provides static information, only initialization in the user program is required.
- If a simple data exchange is necessary between PLC tags and tags in web applications, to display the contents of PLC tags or write a value in a PLC tag for example, the syntax for reading and writing tags has to be observed. In this case only an initialization is required in the user program, for example in the startup OB.
- If a further interaction is required between the web application and the user program, you must handle status and control information from the Web Control DB in addition to the synchronization between Web server and user program. This is the case, for example, when user entries are transmitted via the web browser to the Web server for evaluation by the CPU. Unlike simple data exchange, the user program directly influences the time at which the requested web page is relayed back to the web browser. In this case, you must be acquainted with the concept of manual fragments and the structure of the Web Control DB.

Initialization

User-defined web pages are "packaged" in data blocks for processing by the CPU. You must generate appropriate data blocks from the source data (HTML files, images, JavaScript files, etc.) during configuration to be able to download the web application into the CPU. The Web Control DB takes on a special role (default: DB 333). It contains status and control information as well as links to additional data blocks with coded web pages. Data blocks that contain coded web pages are termed "Fragment DBs".

When the data block is downloaded into the CPU, the CPU does not "know" that user-defined web pages are coded inside it. The "WWW" (SFC 99) instruction, for example, in the Startup OB informs the CPU which DB is the Web Control DB. The user-defined web pages can be accessed via a web browser after this initialization.

Synchronization

If the user program is to exchange data with the user-defined web pages, the WWW (SFC 99) instruction must be used in the cyclic program section.

Examples of interaction between user program and web page:

- Check received data
- Assemble and send back data to the web browser making the request

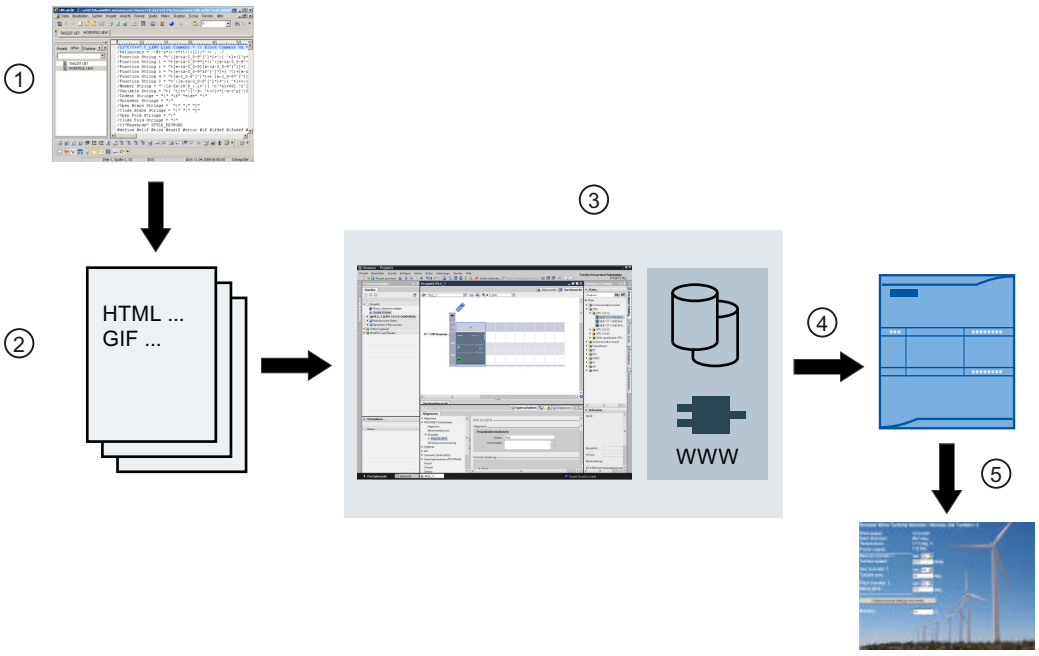
In this case, the status information must be able to be evaluated and control information must be transmitted to the Web server, for example, to release a requested web page.

Procedural overview

Basic information

This section provides a step-by-step explanation of the basic procedure used to create and download custom web pages and to use them in the operating phase.

The following graphic provides a simplified representation of the process used in creating and displaying custom web pages:



① Programming a web application (using suitable tools when required and AWP commands for dynamic pages when applicable).

② The web application is comprised of single source files, for example, *.html, *.gif, *.js, etc.

③ Using STEP 7:

- Generate the data blocks (Web Control DB and fragment DBs) from source files. The DBs contain meta information and the complete web application, including the images and the dynamic and static parts of the web application. The DBs are stored under "System blocks" in the project tree.
- Call the "WWW" instruction in the user program. This instruction initializes the web server of the CPU for a web application.
- If required, complete final programming for interaction between the web server and user program

④ Downloading the blocks to the CPU.

⑤ Call the web page in the browser. The web pages of the CPU are called by entering the IP address of the CPU.

Additional information

You can find additional information and examples relating to the S7-1200 web server on the Internet (http://support.automation.siemens.com/WW/view/en/36932465).

Creating web pages

Web design tools from various companies can be used to create user-defined web pages. As a rule, the web pages should be programmed and designed compliant to the conventions of the W3C (World Wide Web Consortium). No check is made for compliance to W3C criteria in the web server of the CPU.

Rules

- The tool must be able to directly edit the HTML code so that the AWP command can be inserted into the HTML page.
  Only the AWP commands are parsed in the CPU and, for example, replaced by values from the user program/process image of the CPU.
- Files containing AWP commands must be coded in UTF-8. In the metadata of the HTML page, therefore, set the attribute charset to UTF-8 and save the file UTF-8 coded.
- Files containing AWP commands must not contain the following sequence:]]
- Files containing AWP commands must not contain the following sequence outside of the "Tag read ranges" (:=<Tag name>:): :=
  Tip: Replace the first character of a prohibited sequence with its character coding; for the colon, for example, :.

A small example for a custom web page should make clear the basic design.

Requirement

- The CPU must have a web server and the web server of the CPU must be activated.
- To be able to access PLC tags with write access as a user, you must be logged on as "admin".
- For the example below, PLC tags must be defined for those PLC tags that are to be shown on the web page. This is shown here for the first tab used, "Tank_below_max".

		Name	Data type	Address
1		Tank_below_max	Bool	%I0.0

Creating user-defined web pages

The following code for an example web page reads values from the process image and provides them in a table.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN" "http://www.w3.org/
TR/html4/strict.dtd">
<html>
  <head>
   <meta http-equiv="Content-Type" content="text/html;
charset=utf-8">
```

```
   <title>Mix</title>
  </head>
   <body>
    <h1>Mix</h1>
    <h2> Actual State </h2>
    <table border="1">
     <tr>
      <th>Variable</th>
      <th>State</th>
     </tr>
     <tr>
      <td>Tank below max</td>
      <td>:="Tank_below_max":</td>
     </tr>
     <tr>
      <td>Tank above min</td>
      <td>:="Tank_above_min":</td>
     </tr>
    </table>
   </body>
</html>
```

AWP commands

The interface between a freely-programmable web application for a CPU that has a Web server and the CPU data is declared by the AWP command (Automation Web Programming).

To develop web applications you are only subject to the restrictions of the web browser. In one of the programming languages of STEP 7, control with the user program which CPU data is displayed at what time in the web browser of the viewer. Use AWP commands, which you comment within the HTML files, to declare data to be used for intentional interaction between the web application and the user program.

AWP commands are inserted as HTML comments with a special syntax into HTML files; they declare the following features:

- Read PLC tags
- Write PLC tag
- Read special tags
- Write special tags
- Define enum types
- Assign tags to enum types
- Defining fragments
- Import fragments

Syntax of AWP commands

An AWP command begins with "`<!-- AWP_`" and ends with "` -->`". In JavaScript files, the commands should also be enclosed by JavaScript comments ("`/*...*/`").

Notation rules for PLC tag names within an AWP command

The AWP commands "AWP_In_Variable" and "AWP_Out_Variable" contain a name attribute and optionally a use attribute. A PLC tag name is assigned to these attributes, by means of which the PLC tags in the browser are written or read. The following rules apply to handling PLC tag names in HTML code:

- PLC tags must be enclosed in quotation marks (" ... ").
- PLC tags used in AWP commands must also be enclosed by single quotation marks ('" ... "') or with quotation marks masked by a backslash ("\" ... \"").
- If the PLC tag name contains the character \ (backslash) or * (star), this character must be designated with the escape sequence \\ as standard character of the PLC tag name. See below for examples.
- If the PLC tag name in the AWP command is also enclosed by single quotation marks and the single quotation mark (') occurs within the name, it must also be designed as normal character by the escape sequence \'.
- If an absolute address (input, output, bit memory) is used in AWP command, it is enclosed by single quotation marks.

PLC tag	PLC tag in HTML code
"Velocity"	<!-- AWP_In_Variable Name='"Velocity"' -->
	<!-- AWP_In_Variable Name="\"Velocity\"" -->
"abc\de"	<!-- AWP_In_Variable Name='"abc\\de"' -->
"abc'de"	<!-- AWP_In_Variable Name='"abc\'de"' -->
"abc'de"	<!-- AWP_In_Variable Name="abcde" Use'"abc\'de"' -->
"DB name".tag	<!-- AWP_In_Variable Name='"DB name".tag' -->
"DB name"."ta.g"	<!-- AWP_In_Variable Name='"DB name"."ta.g"' -->
-	<!-- AWP_Out_Variable Name=’flag1’ Use='M0.0' -->

See also

Reading tags (Page 864)

Writing tags (Page 867)

Special tags (Page 868)

Reading tags

User-defined web pages can read PLC tags.

The PLC tag must be specified by a PLC tag name.

These OUT variables (direction of output as viewed from the controller) are inserted at any location within the HTML text with the syntax described in the following.

Syntax

```
:=<varname>:
```

These references are replaced when the Web server is in operation by the current values of the PLC tag in each case.

<varname> can be a simple, global PLC tag but also a complete tag path to a structural element.

Notation rules for PLC tag names

- PLC tags in HTML code are enclosed by quotation marks ("), if they are defined in the tag table. In the case of data block tags, the name of the data block is enclosed by quotation marks. If special characters are used in the structure elements of the data block, for example the dot (.) or blank, this part must also be enclosed by quotation marks.
- Quotation marks are not used for absolute addresses of inputs, outputs or bit memories.

PLC tag	PLC tag in HTML code
"DB_name".var_name	:="DB_name".var_name:
"DB_name"."var.name"	:="DB_name"."var.name":
"memory"	:="memory":
-	:=I0.0:
	:=Q0.0:
	:=MW100:
	:=%MW100:
"My_Data_Block".flag1	<!-- AWP_Out_Variable Name='flag1' Use='"My_Data_Block".flag1' -->
	...
	:=flag1:

- If the PLC tag name contains the character : (colon) or \ (backslash), this character must be designated with the escape sequence \: or \\ as standard character of the PLC tag name.

PLC tag	PLC tag in HTML code
"abc:de"	:="abc\:de":
"abc\de"	:="abc\\de":

- Special characters "<, &, >"
  Display problems can occur if these characters are contained in the tag name (for example, "a<b").
  Avoid expressions such as :="a<b": in the HTML page.
  To prevent display problems from occurring, use e.g. an AWP command with a use expression according to the pattern depicted below. The use attribute defines the PLC tag with the problematic character, the name attribute defines the name without problematic character, as it is used in the HTML page.

PLC tag	PLC tag in HTML code
"a<b"	<!-- AWP_Out_Variable Name='simplename' Use='"a<b"' -->
	...
	:=simplename:

Reading tags of the type String and Character

Below, these types of quotation marks are used in the explanation: single quotes ('), double quotes (").

As of firmware V1.6, with the "Read PLC tags" function, an S7-1500 CPU outputs tags of the type String or Character enclosed in single quotes to the browser.
Example:

- String tag "Varname".MyString with the content ABC
- You read the tag in HTML using the function :="Varname".MyString:
- The Web server outputs the character string 'ABC' to the browser

Using String or Character tags in expressions

On your HTML page, you use an expression in which the character string for reading a tag is enclosed in quotes, for example in forms.

Possible HTML code used:

```
<input type="text" name="appfield" value="myvalue">
```

If you read the displayed value for the "value" attribute from a PLC tag in this expression, the HTML code appears as follows:

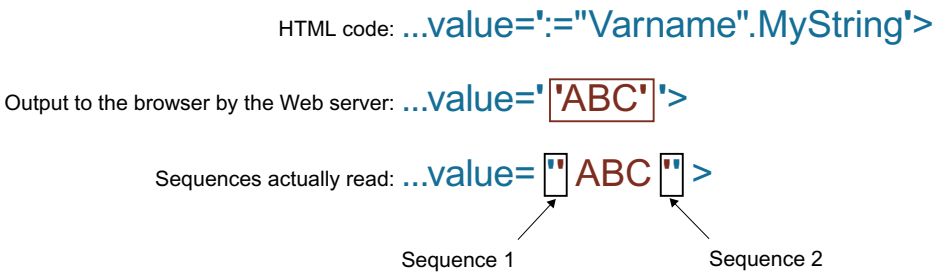
```
<input type="text" name="appfield" value=":="Varname".MyString:">
```

By reading the PLC tag, the Web server outputs the value 'ABC'. In HTML, the code is then represented as follows:

```
<input type="text" name="appfield" value=" 'ABC' ">
```

If you have used single quotes instead of double quotes in your HTML code to enclose the attributes, the Web server passes on the content of the tags enclosed in two single quotes to the browser. As a result of this, the browser does not output the content of the String or Character tag, since two consecutive single quotes each form a closed sequence. The values to be read are located between these sequences and are not output by the browser.

In this context, note in particular that the character string with double quotes is not identical to two single quotes even if they appear to be identical, as shown in the following figure.



See also

AWP commands (Page 863)

Writing tags

Custom web pages can write data into the CPU.

This requires an AWP command that identifies the PLC tag to be written.

The PLC tag must also be specified by a PLC tag name.

The IN tags (direction of input as viewed from the controller) are placed on the browser page. This can be done, for example, in a form.

The tags are either set in the HTTP header (by cookie or POST method) or in the URL (GET method) by the browser and are then written by the Web server into the respective PLC tag.

Syntax

To allow the IN tags to be written to the CPU, the tags must first be defined by an explicit AWP instruction:

```
<!-- AWP_In_Variable Name='<PLC_Varname1>' Name='<PLC_Varname2>'
Name='<PLC_Varname3>' -->
```

Several tags can be defined in an instruction - such as that shown above.

The specific PLC tag name is hereby written in double quotation marks; for example <PLC_Varname1> = "myVar".

In cases where the name of the tag that you use for the web application is not identical to the name of the PLC tag, the "Use" parameter can be used to assign to a PLC tag:

```
<!-- AWP_In_Variable Name='<Webapp_Varname>' Use='<PLC_Varname>'
```

Example

The "AWP_In_Variable" AWP command is indispensable when handling forms.

```
<form method='post' action='/awp/appl/x.html'>
 <p>
  <input name='"var1"' type='text'>
  <input value='set' name='Button1' type='submit'>
 </p>
</form>
```

In the form defined above, the HTTP request method "post" is used to transfer the tag "var1" to the Web server. The user places the "var1" tag in the form field. The tag 'Button1' has the value 'set', but is not required for the CPU. To allow the "var1" tag to be written to the CPU, the following instruction must be included in the same fragment:

```
<!-- AWP_In_Variable Name='"var1"' -->
```

Since PLC tags are enclosed in double quotation marks ("), the name in the AWP command must be enclosed in single quotation marks (') or in masked quotation marks (\"). To avoid the numerous escape sequences, we recommend the use of single quotation marks.

```
<!-- AWP_In_Variable Name='"Info".par1' -->
<!-- AWP_In_Variable Name="\"Info".par1\"" -->
```

Conditions for write access during operation

The following requirement has to be met in order for a user to be able to write to PLC tags from a user-defined web page:

The user must have rights to change tags. The Web server ignores the commands if the user has no change rights.

This rules applies to all writing access to web pages on a CPU.

See also

Requirements for web access (Page 855)

AWP commands (Page 863)

Special tags

Special tags are mainly HTTP tags set in the definition of the World Wide Web Consortium (W3C) . Special tags are also used for cookies and server tags.

The AWP command to read and write special tags differ only in that they have additional parameters than the AWP command used to read and write normal tags.

Reading a special tag

The Web server can read PLC tags and transfer these to special tags in the HTTP Response Header. You can, for example, read a URL for a diversion to another web page and transfer to the special tag HEADER:Location using the special tag HEADER:Location.

The following special tags can be read:

Name	Description
COOKIE_VALUE:name	Value of cookie with name: "name"
COOKIE_EXPIRES:name	Execution time of cookie with name: "name" in seconds (must be set beforehand).
HEADER:Status	HTTP status code (if no other value has been set, status code 302 is returned).
HEADER:Location	Path for forwarding to another page. Status code 302 must be set.
HEADER:Retry-After	Anticipated time in which the service is not available. Status code 503 must be set.
HEADER: …	All other header tags can also be forwarded in this way.

Use the AWP command "AWP_Out_Variable" to specify which PLC tags are to be transferred in the HTTP header to the web browser.

Basic structure:

```
<!-- AWP_Out_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

Parameter description

- Name: Type and name of special tag
- Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, parameter "Use" can be used to assign to a PLC tag.

Example:

```
<!-- AWP_Out_Variable Name="COOKIE_VALUE:siemens" Use='"info".language' -->
```

Writing a special tag

In principle, all HTTP tags written in the HTTP header by the web browser can be evaluated by the user program of the CPU. Examples of tag types:

Name	Description
HEADER:Accept-Language	Accepted or preferred language
HEADER:Authorization	Proof of authorization for a requested resource
HEADER:Host	Host and port of the requested resource
HEADER:User-Agent	Information on the browser
HEADER: …	All other header tags can also be forwarded in this way
SERVER:current_user_id	Indicates whether a user is logged on (current_user_id=0: no user logged on)
SERVER:current_user_name	User name of the user logged on
SERVER:GET	Request method is GET
SERVER:POST	Request method is POST
COOKIE_VALUE:name	Value of cookie with name: "name"

The AWP command "AWP_In_Variable" is used to define which special tags are to be evaluated in the user program of the CPU.

Basic structure:

```
<!-- AWP_In_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

Parameter description:

Name: Type and name of special tag

Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, the parameter Use can be used to assign to a PLC tag.

Examples:

```
<!-- AWP_In_Variable Name="COOKIE_VALUE:siemens" Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use . The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='COOKIE_VALUE:siemens' Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use. The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='"COOKIE_VALUE:siemens"' -->
```

The HTTP-header variable is written in the same-name PLC variable.

See also

AWP commands (Page 863)

Enumeration types

Enumeration types (enums)

Numerical values from the PLC program can be converted into text and vice versa using enums. The numerical values can also be assigned for several languages.

Creating enums

Enter an AWP command using the following syntax at the start of the HTML file:

```
<!-- AWP_Enum_Def Name="<Name of the enum type>"
Values='0:"<Text_1>", 1:"<Text_2>", ... , x:"<Text_x>"' -->
```

For example, for German values to be saved as an HTML file in the "de" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"an", 1:"aus", 2:"Störung"' -->
```

For example, for English values, to be saved as an HTML file in the "en" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"error"' -->
```

Assigning enums

Tags are assigned from the user program to the individual enum texts using a special AWP command:

```
<!-- AWP_Enum_Ref Name="<VarName>" Enum="<EnumTypeName>" -->
```

<VarName> is thereby the symbolic name from the user program and <EnumTypeName> is the previously set name of the enum type.

Note

In each fragment in which enum texts are referenced by a PLC tag, this PLC tag must be assigned by the appropriate AWP command of the enum type name.

Ensure that no AWP command for importing fragments is positioned between an enum assignment and enum usage because this import can result in the enum assignment lying in a different fragment than the enum usage.

Example

Enum type "state" is defined with values "0" and "1". "0" means "off", "1" means "on":

```
<!-- AWP_Enum_Def Name="state" Values='0:"off", 1:"on"' -->
```

The following code is contained in the HTML code of the web page to be output:

```
<!-- AWP_Enum_Ref Name="operating state" Enum="state" -->
:=operating state:
```

Depending on the value of the "operating state" tag, the ´result displayed is no longer "0" or "1", but "off" or "on".

Simplified use of enumeration types

At S7-1200 CPUs as of firmware version 4 it is possible to use enumerations directly in AWP commands to read and write PLC variables.

You create enums as described in the previous section, and you can then utilize the values with user program read and write commands.

Creating enums

```
<!-- AWP_Enum_Def Name="<Name des Enum Typs>" Values='0:"<Text_1>",
1:"<Text_2>", ... , x:"<Text_x>"' -->
```

Utilizing enums in the user program read and write commands

```
<!-- AWP_In_Variable Name='<Varname>' Enum="<EnumType>" -->
<!-- AWP_Out_Variable Name='<Varname>' Enum="<EnumType>" -->
```

Example of reading PLC tags

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms", 1:"Tank is
full", 2:"Tank is empty"' --><!-- AWP_Out_Variable Name='"Alarm"'
Enum="AlarmEnum" -->...<p>The current value of "Alarm"
is :="Alarm":</p>
```

If the value of "Alarm" in the CPU is "2", the following text will be displayed on the HTML page:

'The current value of "Alarm" is Tank is empty' because the enum definition assigns the string "Tank is empty" to the numerical value 2.

Example of writing PLC tags

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms", 1:"Tank is
full", 2:"Tank is empty"' --><!-- AWP_In_Variable Name='"Alarm"'
Enum='AlarmEnum' -->...
<form method="POST">
<p><input type="hidden" name='"Alarm"' value="Tank is full" /></p>
<p><input type="submit" value='Set Tank is full' /></p>
</form>
```

Because the enum definition assigns the string "Tank is full" to the numerical value "1", the value "1" is written to the PLC tag "Alarm".

Definition of fragments

Fragments

Fragments are "logical sections" of a web page to be processed by the CPU individually.

Fragments are usually complete pages but can also be individual elements such as files (for example, images) or complete documents.

Defining fragments

```
<!-- AWP_Start_Fragment Name="<Name>" [Type="<Type>"] [ID="<Id>"]
[Mode=<Mode>]-->
```

The start of a fragment is specified by this command. A fragment runs to the start of the next fragment or to the end of the file.

- <Name> Indicates the name of the fragment.
  The name must start with a letter [a-zA-Z] or an underscore (_). Letters, underscores or numbers [0-9] can follow after this first character.
- <Type> Indicates the type of the fragment.
  - "manual" The user program is informed of the request for a fragment; the web page to be returned can be changed by the user program.
  - "automatic" The page is automatically processed (default).
- <id> A numeric ID can be stipulated for the fragment. If no ID is assigned, the fragment is automatically assigned an ID. For manual pages (<Type>=manual) , the fragment can be addressed in the user program of the CPU by this ID.

  Note

  Keep the ID low because the highest ID influences the size of the Web Control DB.

- <Mode> Fragments support the visible and hidden modes.
  - "visible" The fragment is a part of the web page. This mode is preset and can also be omitted.
  - "hidden" The fragment is not part of the web page. However, the fragment will be saved in the Web DB and is available to the user program for inserting in a requested web page. You use an exchange of the fragment ID (Web-Control-DB.fragment_index tag) to insert a "hidden" fragment in the requested web page.

The input document is completely divided into fragments by the "AWP_Start_Fragment" command. "AWP_End_Fragment" is therefore unnecessary.

Without a start fragment command, a file is mapped as a fragment; the fragment name is derived from the file name. If a file is divided into several fragments (by "AWP_Start_Fragment"), the file must begin with the "AWP_Start_Fragment" command.

Importing fragments

You can declare a fragment in an HTML page and import this fragment into other web pages.

Example

A company logo is to be displayed on all web pages of a web application.

There is only one instance of the HTML code for the fragment that displays the company logo. You can import the fragment as often and into as many HTML files as required.

Syntax

```
<!-- AWP_Import_Fragment Name = "<name>"-->
```

- <name> is the name of the fragment to be imported.

Example

HTML code within a web page that declares a fragment:

```
<!-- AWP_Start_Fragment Name = "My_Company_Logo" -->
<p><img src = "compay_logo.jpg"></p>
```

Example

HTML code within another web page that imports the declared fragment:

```
<!-- AWP_Import_Fragment Name = "My_Company_Logo" -->
```

Creating and loading a data block

Requirement

- All source files required for the web application (*.html, *.js, *.png, ...) have been created.
- The source files are located in one folder, but only those source files that are required for the web application. No other files may be located in this folder.

Note

Length of file names and tag names

If you have a comprehensive web application with many files and directories, the generation of the web data blocks may possibly fail. If this happens, the generation is aborted with the message "Text list overflow...". The cause is system-internal size limitations for management information saved in the web data block.

Remedy: Use short file names and short tag names.

Procedure

To create data blocks from the source files for user-defined web pages in STEP 7, proceed as follows:

1. Select the CPU, for example, in the device configuration.
2. Select the properties for user-defined web pages in the inspector window under "Properties > General > Web server".
3. As "HTML source", select the folder that contains the source files for the web application.
4. Enter the HTMP page to be opened on starting the web application as the start HTML page.

5. Enter a name for the application if required.
6. You can supplement a range of file name extensions as "Files with dynamic content" if necessary. Only enter those file name extensions that also contain AWP commands.
7. The number for the Web Control DB and for the fragment DB start number can be kept as long as they are not already being used by your user program.
8. Click on the "Generate" button to create DBs from the source files.
   The generated data blocks are saved in the project navigation in the "System block" folder (in the "Web server" subfolder).
9. In the CPU, select the network view to be loaded and then select the "Download to device" command in the "Online" menu to download the blocks. Compilation of the blocks is implicitly initiated before downloading.
   If errors are reported during this process, you must correct these errors before you can download the configuration.

Structure of the PLC program

Your user program must call the " WWW" instruction to even allow the web application, for example, the user-defined web pages, to be available to the CPU on the standard web pages and to allow them to be called up there.

The Web Control DB you have created from the source files is the input parameter (CTRL_DB) for the "WWW" instruction. The Web Control DB references the content of the user-defined web pages coded in the fragment DB and then receives status and control information.

Calling the "WWW" instruction in the startup program

If you do not want the user program to influence requested web pages, it is sufficient to only call the "WWW" instruction once in a startup OB. This instruction initializes communication between the web server and the CPU.

Calling the "WWW" instruction in the cyclic program

The "WWW" instruction can also be called in an OB processed in cycles (for example, OB 1). This has the advantage of being able to respond to web server requests from within the user program. Manual fragments must be used for this.

In this case, you must evaluate information from the Web Control DB in order to identify the requested web page or the requested fragment. On the other hand, you must set a bit in the user program in order to explicitly release the web page to be returned by the web server after processing the web page request.

The structure of the Web Control DB is described in the following section.

Web Control DB

The Web Control DB (DB 333 by default) is created by STEP 7 and contains information on the structure of user pages, the status of communication and any errors that occur.

Additional fragment DBs are also created as well as the Web Control DB. These fragment DBs (there may also only be one fragment DB) are referenced in the Web Control DB. The fragment

DBs contain the web pages and media data coded in fragments, for example, images. The content of the fragment DB cannot be changed by the user program. It is created automatically and is only for data management.

The status and control tags of the Web Control DB are accessed via symbols.

The following lists the tags of the Web Control DB required for status evaluation and to control interaction.

The Web Control DB provides two types of information:

- Global status information: Not bound to a concrete web page request.
- Request status and control information: Information about queued requests.

Global status information

"WEB-Control_DB".commandstate.init	Activates and initializes the web application.
"WEB-Control_DB".commandstate.deactivate	Deactivates the web application.
"WEB-Control_DB".commandstate.inititializing	The web application is initialized (read Web Control DB, etc.).
"WEB-Control_DB".commandstate.error	Web application could not be initialized. The reason is coded in "WEB-Control_DB".commandstate.last_error .
"WEB-Control_DB".commandstate.deactivating	The web application is closed.
"WEB-Control_DB".commandstate.initialized	The web application has been initialized and is ready.
"WEB-Control_DB".commandstate.last_error	Refer to the next table for a value table of possible errors.

Last_error	Description
1	Fragment DB is inconsistent (does not match the Web Control DB).
2	A web application already exists with this name.
3	Memory problem initializing in the web server.
4	Inconsistent data in the Web Control DB.
5	A fragment DB is not available (not loaded).
6	No AWP ID for a fragment DB.
7	The enum fragment is not available (contains the texts and information on the enum types).
8	An action requested via the command flag in the Web Control DB is prohibited in the current state.
9	Web application is not initialized (if there is no reinitializing after disabling).
10	Web server is disabled.
...	Last_error is reset once the web application has been successfully initialized.

Request status information

Request status information is bound to one of four possible requests, x = [1 … 4].

"WEB-Control_DB".requesttab[x].idle	Nothing need be done.
"WEB-Control_DB".requesttab[x].waiting	The user program must react to a request from a manual fragment and explicitly initiate further processing in the web browser.
"WEB-Control_DB".requesttab[x].sending	The web server is occupied with processing the request/fragment.
"WEB-Control_DB".requesttab[x].aborting	The TCP connection is closed by the web server.

Request control information

Request control information is bound to one of four possible requests, x = [1 … 4].

"WEB-Control_DB".requesttab[x].continue	Releases the fragment being processed for transmission. Processing of the next fragment is initiated.
"WEB-Control_DB".requesttab[x].repeat	Releases the fragment being processed for transmission. The fragment is then processed again.
"WEB-Control_DB".requesttab[x].abort	Closes the TCP connection.
"WEB-Control_DB".requesttab[x].finish	Releases the fragment being processed for transmission. Stops further processing of requests (terminates the request).

Example:

The tag for the DB is: "WEB-Control_DB". Whether errors have occurred during initialization of the web application can be determined by requesting bit "WEB-Control_DB".commandstate.error in the user program.

If an error has occurred you can analyze it using the "WEB-Control_DB".commandstate.last_error value.

Interaction with the user program

With the help of manual fragments, you can make sure that the user program reacts synchronously to browser entries so that the returned website can be prepared by the user program.

Fragment type

To react to the received data in the user program the "manual" fragment type must be used for the fragment writing the data (for "manual pages"):

```
<!-- AWP_Start_Fragment Name="testfrag" ID="1" Type="manual" -->
```

The values are always transferred to the Web server of the CPU for automatic and manual pages in the same way:

Example:

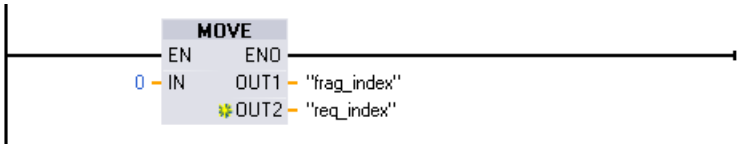
```
<form method="POST" action="">
 <p>
  <input type="submit" value="Set new value">
  <input type="text" name='"Velocity"' size="20">
 </p>
</form>
```

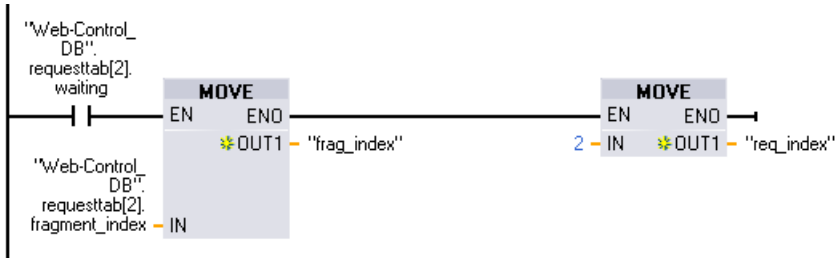
User program for manual fragments

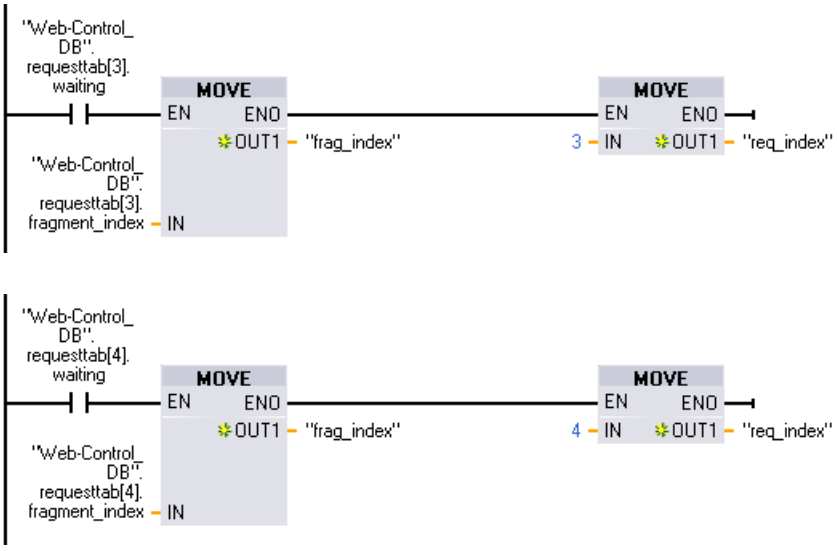
When using manual pages, the "WWW" instruction must be called in cycles in the user program of the CPU.

To react to values entered in the browser, the request - which is made by the manual page to the Web server - must first be evaluated in the user program. The web-control-DB (for example, DB 333) must investigate pending requests to do this. The array that manages four requests is contained in the "requesttab" section of the Web Control DB. Each element of the array contains information about the respective request in a structure.

A simple programming example shows how queued requests are checked based on the tags of the Web Control DB.





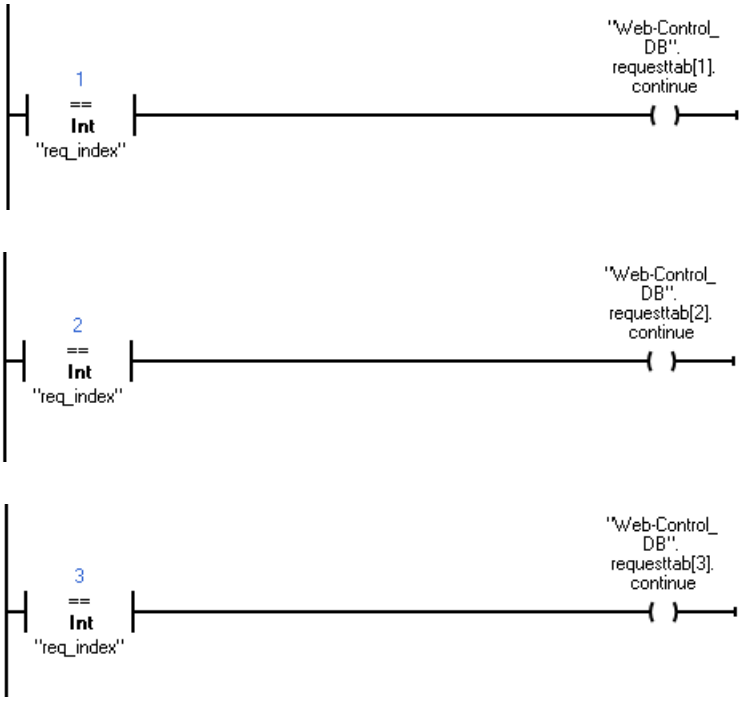


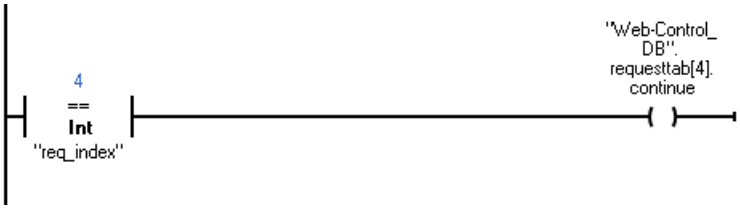
In cases where a request has been made, this program section writes the fragment ID in the #frag_index tag and the request no. (value range 1-4) in the #req_index tag.

Using the information from this, the information transferred in the request can now be processed separately for each fragment ID in the program (for example, plausibility check).

Once processing of the request has been completed by the program, the request must be answered and the appropriate entry is once more reset under"requesttab" of the Web Control DB (for example, DB 333).

A simple programming example for replying to requests:

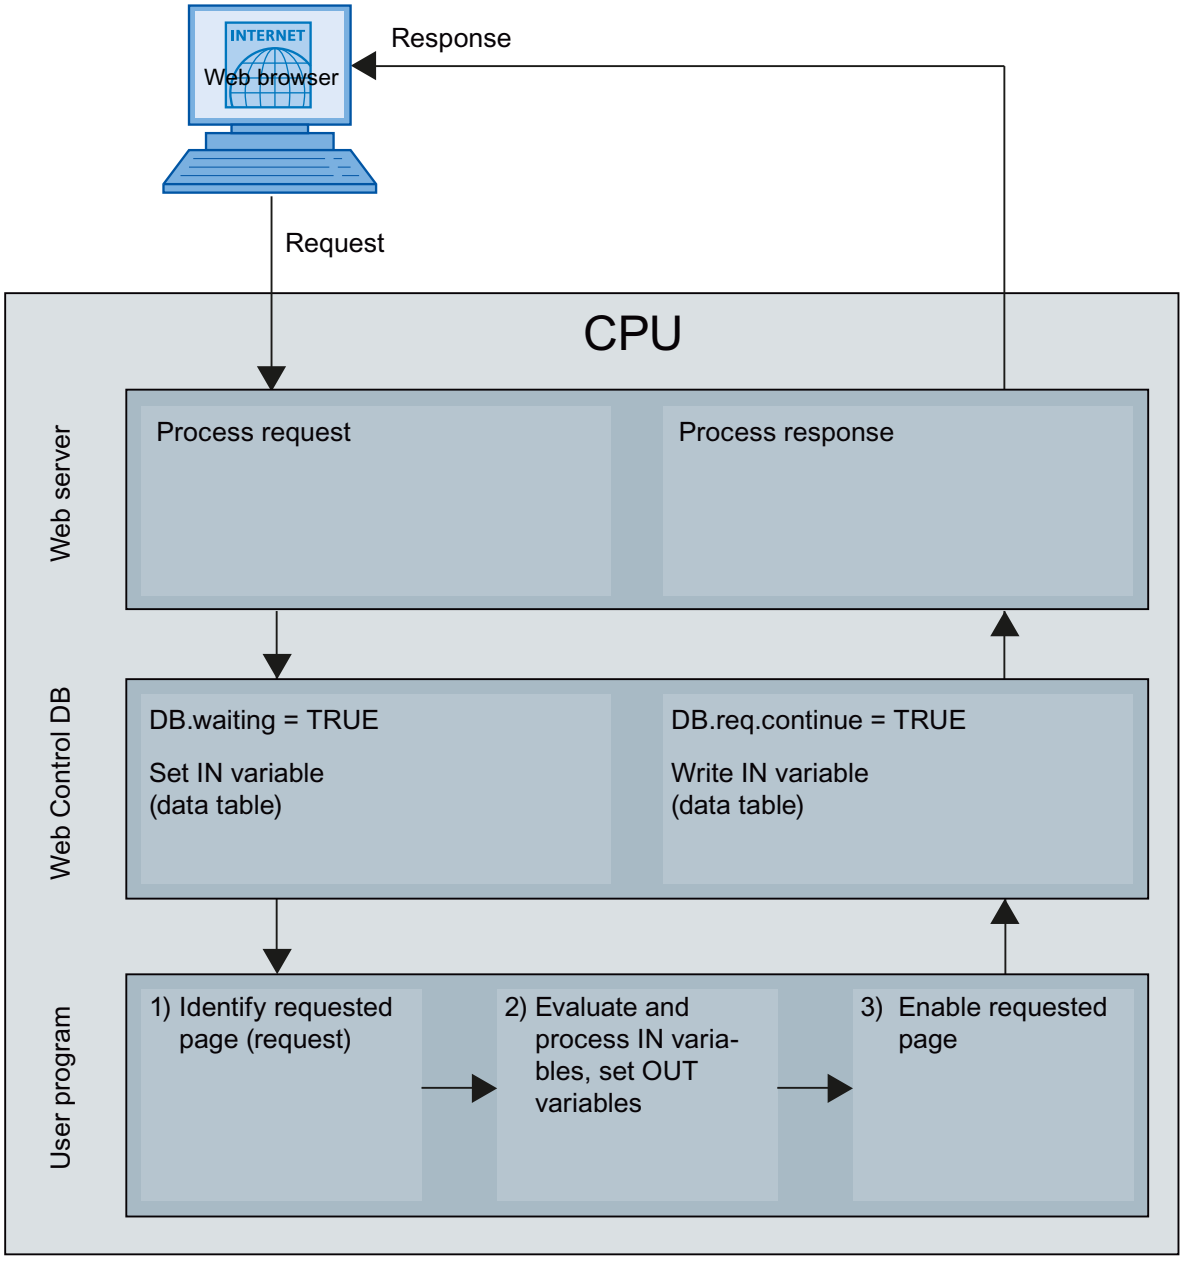




4
==
Int
"req_index"
"Web-Control_
DB".
requesttab[4].
continue

Principle sequence of a browser request with interaction from the user program

The following figure shows the simplified, principle sequence of the web browser request on the effects of Web Control DB content and the actions required from the user program until the processed web page is returned (response).



Displaying custom web pages in the browser

Display web pages in browser

Web pages are called from the standard web pages of the web browser.

In addition to the other links in the navigation bar, the standard web pages also have a link to "user pages".

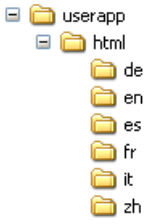
Click on the "user pages" link to open the web browser you have configured as the default HTML page.

Creating custom web pages in several languages

You can make each of your custom web pages available in various languages.

Requirements

The language-dependent HTML; pages must be stored in a folder structure containing folders with the respective language abbreviations:



Specified language abbreviations

Language abbreviations "de", "en", "fr", "es", "it" and "zh" are fixed. Additional language folders or other designated language folders are not supported.

Additional folders within the same folder hierarchy for other files can be created as required; for example, an "img" folder for images and a "script" folder for JavaScript files.

Language switching for custom web pages

Requirements

The HTML pages are contained in the predefined language folders, for example, HTML pages with German text are in the "de" folder, HTML pages with English text are in the "en" folder.

Language switching concept

Language switching is based on a predefined cookie named "siemens_automation_language". If the cookie is set to value "de", at the next web page request or web page update, the web server switches to the web page from the "de" folder.

Similarly, the web server switches to the web page from the "en" folder when the cookie is set to "en".

Example of language switching

The example is structured as follows:

- The language-dependent HTML files with the same name, for example, "langswitch.html" are located in both language folders "de" and "en". The text to be displayed within the two files are German or English, corresponding to the name of the folder.
- There is an additional "script" folder in the folder structure containing the JavaScript file "lang.js". Functions required for language switching are stored in this file .

Structure of the "langswitch.html" file ("de" folder)

Meta data "content language", charset and path to JavaScript file are set in the file header.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="de">
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Switch language to German page</title>
<script type="text/javascript" src="script/lang.js" ></script>
<head>
```

Language selection is implemented in the body of the file by the "select" HTML element. The select element initiates a list box and contains the "de" option, labeled as "German" and "en", labeled as "English"; "de" is the default.

The "DoLocalLanguageChange(this)" function is called using the "onchange" event handler. The "this" parameter transmits the select object with the selected option to this function. "onchange" calls the function each time the option is changed.

```
<!-- Language Selection -->
<table>
    <tr>
        <td align="right" valign="top" nowrap>
         <!-- change language immediately on change of the selection
-->
          <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
                <option value="de" selected >Deutsch</option>
                <option value="en" >English</option>
            </select>
        </td>
     </tr>
</table>
<!-- Language Selection End-->
```

Structure of the "langswitch.html" file ("en" folder)

The header of the HTML file with English text is structured similarly to the HTML file with German text.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="en">
```

```
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Language switching english page</title>
<script type="text/javascript" src="script/lang.js" ></script>
```

Language selection is also implemented in the body of the file by the "select" HTML element. In contrast to the German HTML file, the English option is already selected as a default and the test or the labels are in English.

```
<!-- Language Selection -->
<table>
    <tr>
        <td align="right" valign="top" nowrap>
         <!-- change language immediately on change of the selection
-->
          <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
                <option value="de" >German</option>
                <option value="en" selected >English</option>
            </select>
        </td>
     </tr>
</table>
<!-- Language Selection End-->
```

Structure of "lang.js" file (in the "script" folder)

The " DoLocalLanguageChange" function is defined in the Java script file and calls the "SetLangCookie" function with the language selection value. SetLangCookie combines the cookie name and cookie value and then sets the cookie by means of the corresponding document.cookie property. The web page must then be reloaded (top.window.location.reload) to allow the web server to react to the setting of the cookie by displaying the required language.

```
function DoLocalLanguageChange(oSelect) {
        SetLangCookie(oSelect.value);
        top.window.location.reload();
    }

 function SetLangCookie(value) {
        var strval = "siemens_automation_language=";
            // this is the cookie by which the web server
            // detects the desired language
            // this name is required by the web server
        strval = strval + value;
        strval = strval + "; path=/ ;";
            // set path to the application, since otherwise
            // path would be set to the requesting page
            // would not get the cookie.
            // The path for user defined applications follows this
sample:
            // path=/awp/<application name>/<pagename>
            // example: path=/awp/myapp/myappstartpage.htm
            //(where myapp is the name of the web application
            // entered in the web server properties of the cpu)
```

```
                /*
                use expiration if this cookie should live longer
                than the current browser session
                var now      = new Date();
                var endttime = new Date(now.getTime() + expiration);
                strval = strval + "; expires=" + endttime.toGMTString()
+ ";";
                */
            document.cookie = strval;
        }
```

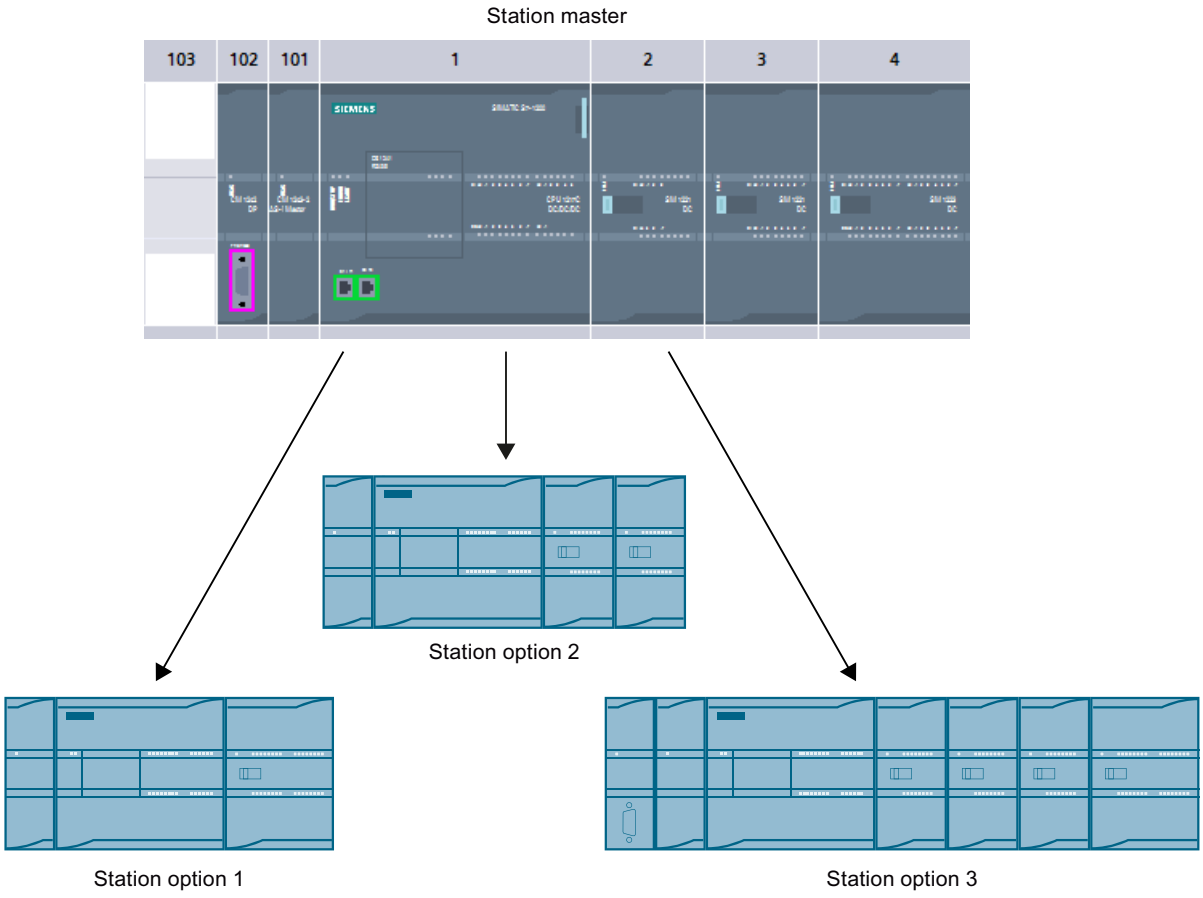
Configuration control for devices

Important information regarding configuration control

Operating principle

With S7-1200 Firmware Version 4.1 or higher, the configuration control enables you to configure the structure of a control system and to work with variants (options) that differ from this configuration.

- All modules that are needed in a set of similar plant units or machines are configured in a master project with a maximum configuration (station master).
- Provision is made in the user program of the master project for various station options for various plant units or machines as well as the selection of a station option. A station option uses, for example, only some of the configured modules and these modules are inserted in varying order.
- An operator selects a station option for a specific plant on-site. The operator does not have to modify the project and thus also does not have to download a modified configuration for this.



A control data record you have programmed in the startup program notifies the CPU as to which modules are missing or located in different slots as compared to the preset configuration. The configuration control has no effect on the parameter assignment of the modules.

Configuration control gives you the flexibility to vary the central installation as long as the real configuration can be derived from a preset maximum configuration.

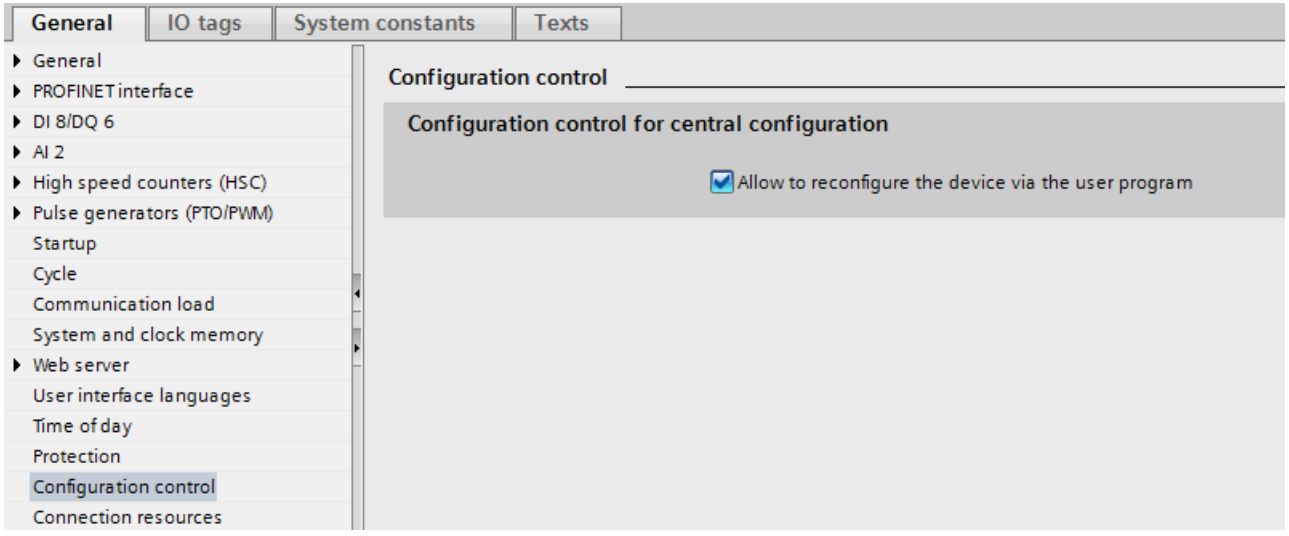
Below you will find a description of how to activate configuration control (CPU parameter assignment) and how to structure the required data record.

Requirement

- STEP 7 Version V13 SP1 or higher
- CPU S7-12XX Firmware Version V4.1 or higher Modules that support the "Configuration control" function also have the "Configuration control" entry in the description (info text) of the hardware catalog.
- Recommendation: Before you load a new program with a modified control data record, perform a memory reset. This action will prevent inconsistent states that may result from the presence of incompatible control data records.
- The startup parameter "Compare preset to actual configuration" is set to "Startup CPU even if mismatch" (default setting).

Required steps

1. Enable the "Allow to reconfigure the device via the user program" parameter when configuring the CPU ("Configuration control" area).



2. Create a control data record (e.g., in a data block) according to the current configuration based on the sample described below for the control data record. The control data record has the number 196. If you want to transfer the control data record as a whole block to the WRREC instruction (input parameter RECORD), note that you must first create a PLC data type containing the structure of the control data record and base the data block on this PLC data type.

ConfDB

	Name	Data type	Start value	...	...	...	...	Comment
1	Static							
2	ConfigControl	Struct			☑	☑		
3	Block_length	USInt	9		☑	☑		Length of control data record, including header
4	Block_ID	USInt	196		☑	☑		Data record number
5	Version	USInt	5		☑	☑		
6	Subversion	USInt	0		☑	☑		
7	Slot_1	USInt	16#FF		☑	☑		Assignment for CPU annex card/Actual annex card
8	Slot_2	USInt	16#FF		☑	☑		Configured slot 2/ Assigned "real" slot
9	Slot_3	USInt	16#FF		☑	☑		Configured slot 3 / Assigned "real" slot
10	Slot_4	USInt	16#FF		☑	☑		Configured slot 4 / Assigned "real" slot
1*	Slot_5	USInt	16#FF		☑	☑		Configured slot 5 / Assigned "real" slot
8	Slot_6	USInt	16#FF		☑	☑		Configured slot 6 / Assigned "real" slot
9	Slot_7	USInt	16#FF		☑	☑		Configured slot 7 / Assigned "real" slot
10	Slot_8	USInt	16#FF		☑	☑		Configured slot 8 / Assigned "real" slot
1*	Slot_9	USInt	16#FF		☑	☑		Configured slot 9 / Assigned "real" slot
8	Slot_101	USInt	16#FF		☑	☑		Configured slot 101 / Assigned "real" slot
9	Slot_102	USInt	16#FF		☑	☑		Configured slot 102 / Assigned "real" slot
10	Slot_103	USInt	16#FF		☑	☑		Configured slot 103 / Assigned "real" slot

3. Transfer the control data record to the CPU in the startup program.
The configuration control for the centrally inserted modules takes effect only after an operating mode change of the CPU from STOP to RUN. For this reason, call the extended WRREC (Write data record) instruction in the startup OB, and transfer the created control data record to the CPU; see next section.

If a valid control data record is not transferred in the startup OB, the control is not ready for operation. The CPU returns from startup to STOP in this case.

Transferring a control data record in the startup program

The CPU processes the WRREC instruction for asynchronous transfer of the control data record. For this reason, you must call WRREC in the startup OB repeatedly in a loop until the output parameter "BUSY" or "DONE" indicate that the data record has been transferred.

Tip: Use the SCL programming language with the REPEAT ... UNTIL instruction for programming the loop.

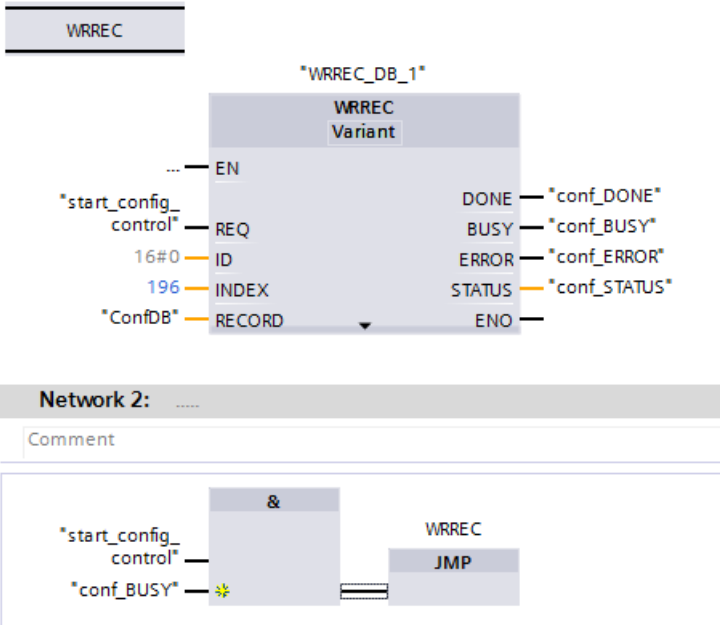
```
REPEAT
    "WRREC_DB"(REQ := "start_config_control",
               ID := 33,
               INDEX := 196,
               LEN := "conf_LEN",
               DONE => "conf_DONE",
               BUSY => "conf_BUSY",
               ERROR => "conf_ERROR",
               RECORD := "ConfDB",
               STATUS => "conf_STATUS");
UNTIL NOT "conf_BUSY"
END_REPEAT;
```

Below, you will find explanations for individual block parameters that you must supply with specific values in the configuration control context. For the remaining block parameters, see also WRREC (Page 3071):

Parameter	Explanation
ID	HW identifier; is always 33 (decimal) for configuration control for centrally arranged modules.
INDEX	Data record number; is always 196 (decimal) for configuration control for centrally arranged modules.
RECORD	Control data record to be transferred. See the section "Control data record" for the structure of the control data record. Tip: The "RECORD" block parameter of the WRREC instruction (V1.1 and higher) is of the "VARIANT" data type and therefore requires a tag with data type. If you store the control data record in a data block, this data block must thus have a data type. The data block created must not be of the "Global-DB" type. Rather, it must be derived from a user data type. Proceed as follows: 1. First, create a new PLC data type (user data type) with the structure of the control data record and name it, for example, "ConfDB". 2. Create a new data block. Select the newly created user data type, e.g., "ConfDB", as the type for this data block.

In graphical programming languages, you realize the loop using instructions for program control.

Example in FBD: Use the LABEL (jump label) and JMP (jump at RLO=1) instructions to program a loop.



Arrangement of the modules

The following table shows the slot number assignment:

Slot	Module	Comment
1	Signal board, communication board, battery board	Slot on front of the CPU
2 - 9	Signal modules	Slots to the right of the CPU
101 - 103	Communications modules	Slots to the left of the CPU

Control data record

A control data record 196 containing a slot assignment is defined for the configuration control.

The following codes apply:

	Module is included in the hardware configuration but is not used in the current configuration.
1 to 9, 101 to 103	Current slot of the module
16#FF (255)	A module is not located in this slot in the hardware configuration.

Byte	Element	Code	Explanation
0	Block length	4 + number of slots	Header
1	Block ID	196	
2	Version	5 (for central I/O)	
3	Subversion	0	
4	Assignment of the CPU expansion board	Expansion board, 0 or 16#FF	Control element Describes in each element which real slot in the device is assigned to the configured slot. The structure of a control element is described in the following section.
5	Assignment of configured slot 2	Real slot, 0 or 16#FF	
...	...	...	
12	Assignment of configured slot 9	Real slot, 0 or 16#FF	
13	Assignment of configured slot 101	Real slot, 0 or 16#FF	In contrast to signal modules, the real slot of the communications modules must correspond to the configured slot.
14	Assignment of configured slot 102	Real slot, 0 or 16#FF	
15	Assignment of configured slot 103	Real slot, 0 or 16#FF	

Structure of a control element

A control element contains the information on which module is inserted in which slot.

The byte numbers represent the configured slots in ascending order (see above):

- Byte 4 stands for the configured slot of the expansion board
- Byte 5 to byte 9 stand for the configured slots 2 to 9
- Byte 13 to byte 15 stand for the configured slots 101 to 103

Which value you must enter in the respective byte results from the following rule:

- If the module is present in the real configuration, enter the real slot number of the module.
  - Example 1: The module configured in slot 2 is located in slot 2.
    Enter value 2 (= actual slot) in byte 5 (= configured slot 2).
  - Example 2: The module configured in slot 3 is located in slot 2.
    Enter value 2 (= actual slot) in byte 6 (= configured slot 3).
- If the module is configured but is missing in the real structure, enter 0 in the byte for the configured slot.
- If a module is not located in this slot in the hardware configuration, enter 16#FF (255) in the byte for the configured slot.

Rules

Observe the following rules:

- The configuration control does not support the repositioning of communications modules. The slot entries in the control data record for slots 101 to 103 must correspond to the real positions of the modules or be defined as not present in the hardware configuration by entering 16#FF (255).
- Slot gaps in the configuration are not allowed. For example, if a signal module is inserted in slot 4 in the real configuration, slots 2 and 3 of the real configuration must also be occupied. The same applies to slots 101 to 103. If a communication module is inserted in slot 102 in the real configuration, slot 101 must also have a communication module inserted in the real configuration.
- If you have enabled configuration control, the CPU is not ready for operation without a control data record. The CPU returns from startup to STOP if a valid control data record is not transferred in the startup OB. The central I/O is not initialized in this case. The cause for the STOP mode is entered in the diagnostics buffer.
- For addressing the WRREC instruction, use the HW identifier 33 (decimal, for the ID block parameter) to write the control data record.
- The control data record is saved retentively in the CPU, which means that it is not necessary to write the control data record 196 again at a restart if the configuration is unchanged. Prior to commissioning, we recommend that a memory reset be performed for the CPU in order to delete any control data record that is present.
- Slot entries in the control data record outside the configured preset configuration are ignored by the CPU.
- Each real slot may only be present once in the control data record.
- A real slot may only be assigned to one configured slot.

Note

Modified configuration

The writing of a control data record with a modified configuration triggers the following automatic reaction by the CPU:

Memory reset with subsequent startup with this modified configuration.

As a result of this reaction, the retentively saved original data record 196 is deleted and the new data record 196 is saved retentively.

Behavior during operation

Effect of the discrepancy between the configured configuration and real configuration:

- For the online display and for the display in the diagnostics buffer (module OK or module faulty), the hardware configuration is always used and not the differing real configuration. Example: A module supplies diagnostic information. This module is configured in slot 4, but is really inserted in slot 3 (missing module; see example in the next section). In the online view, a configured slot 4 is indicated as faulty. In the real configuration, the module in slot 3 indicates an error via an LED display.

If modules are entered as missing in the control data record, the automation system behaves as follows:

- Modules designated as not present in the control data record do not supply diagnostic information and their status is always OK. The value status is OK.
- Direct write access to the outputs or write access to the process image of outputs that are not present: Remains without effect; no access error is signaled.
- Direct read access to the inputs or read access to the process image of inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: An error is signaled because a valid data record cannot be returned.

Error messages

The following error messages are returned if an error occurs during writing of the control data record:

Table 10-66 Error messages

Error code	Meaning
16#80B1	Invalid length; the length information in data record 196 is not correct.
16#80B5	Configuration control parameters not assigned.
16#80E2	Data record was transferred in the wrong OB context. The data record must be transferred in the startup program.
16#80B8	Parameter error; module signals invalid parameters.

S7-1200 System Manual (http://support.automation.siemens.com/WW/view/en/89851659)

Example of a configuration control

A configuration consisting of a CPU and 3 signal modules is configured in the following.

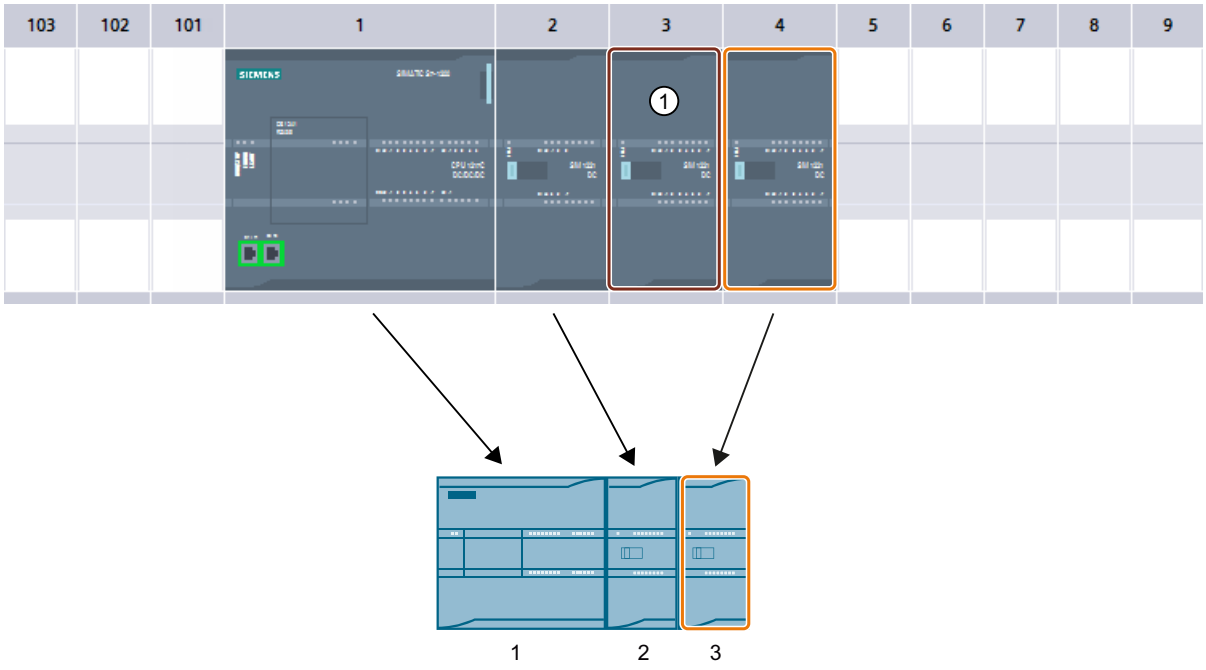
The module at slot 3 is not present in the first configuration expansion and is "hidden" by the configuration control.

In the second configuration expansion, the module that was initially hidden is located in the last slot. The added slot is made known to the CPU by a modified control data record.

Actual configuration with missing module

The specified configuration contains all modules that can be present in a final expansion stage.

The module that is inserted in slot 3 in the specified configuration is missing in the real expanded configuration. For this reason, slot 3 must be coded in the control data record accordingly with "FF_H" (= not present).



ControlDataRecord

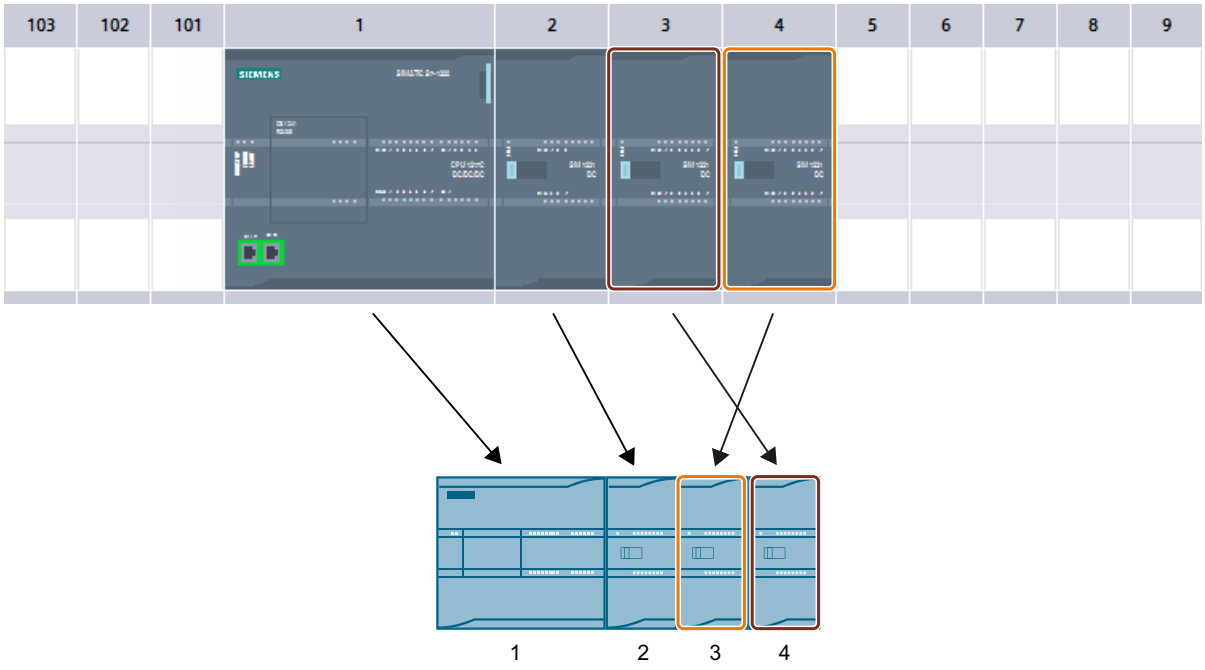
	Name	Data type	Start value	Comment
1	Static			
2	ConfigControl	Struct		
3	Block_length	USInt	16	Length of control data record, including header
4	Block_ID	USInt	196	Data record number
5	Version	USInt	5	
6	Subversion	USInt	0	
7	Slot_1	USInt	16#FF	Assignment for CPU annex card/Actual annex card
8	Slot_2	USInt	2	Configured slot 2 / Assigned "real" slot 2
9	Slot_3	USInt	16#FF	Configured slot 3 / not used ①
10	Slot_4	USInt	3	Configured slot 4 / Assigned "real" slot 3
11	Slot_5	USInt	16#FF	Configured slot 5 / not used
12	Slot_6	USInt	16#FF	Configured slot 6 / not used
13	Slot_7	USInt	16#FF	Configured slot 7 / not used
14	Slot_8	USInt	16#FF	Configured slot 8 / not used
15	Slot_9	USInt	16#FF	Configured slot 9 / not used
16	Slot_101	USInt	16#FF	Configured slot 101 / not used
17	Slot_102	USInt	16#FF	Configured slot 102 / not used
18	Slot_103	USInt	16#FF	Configured slot 103 / not used

① Module is missing in the real configuration

Actual configuration with subsequently added module

The module present in slot 3 in the specified configuration is added to the back of the real configuration by inserting it as the last module in slot 4.

The control data record is adapted accordingly.



ControlDataRecord

		Name	Data type	Start value	Comment
1		Static			
2		ConfigControl	Struct		
3		Block_length	USInt	16	Length of control data record, including header
4		Block_ID	USInt	196	Data record number
5		Version	USInt	5	
6		Subversion	USInt	0	
7		Slot_1	USInt	16#FF	Assignment for CPU annex card/Actual annex card
8		Slot_2	USInt	2	Configured slot 2 / Assigned "real" slot 2
9		Slot_3	USInt	4	Configured slot 3 / Assigned "real" slot 4
10		Slot_4	USInt	3	Configured slot 4 / Assigned "real" slot 3
11		Slot_5	USInt	16#FF	Configured slot 5 / not used
12		Slot_6	USInt	16#FF	Configured slot 6 / not used
13		Slot_7	USInt	16#FF	Configured slot 7 / not used
14		Slot_8	USInt	16#FF	Configured slot 8 / not used
15		Slot_9	USInt	16#FF	Configured slot 9 / not used
16		Slot_101	USInt	16#FF	Configured slot 101 / not used
17		Slot_102	USInt	16#FF	Configured slot 102 / not used
18		Slot_103	USInt	16#FF	Configured slot 103 / not used

Additional configurations

Configuring additional functions

The S7-1200 automation system has numerous additional functions that are useful as integrated CPU functions or available via plug-in modules (for example, communication modules). You can find the description via the following links.

Telecontrol S7-1200

Addressing a double / redundant TCSB system

Addressing of the duplicate or redundant telecontrol server

- **Addressing the main and substitute telecontrol server in TCSB V2**
  With TCSB V2, two independent server PCs can be installed. The second IP address only needs to be configured when these are connected to the Internet via two routers.
- **Addressing the TCSB redundancy group in TCSB V3**
  In the LAN in the master station to which the TCSB server PCs and the DSL router (e.g. SCALANCE M) are connected, the Network Load Balancing (NLB) of the computer operating system will assign a common virtual IP address to the two server PCs.
  This IP address is configured depending on the network setup:
  - If only CP 1243-1 modules without a DSL router are connected, the virtual address assigned by the NLB must be configured in the CPs as the IP address of the telecontrol server.
  - If a DSL router is used, only one IP address will be configured to address the redundant telecontrol server in the stations, the public address of the DSL router.
    Set the port forwarding on the DSL router so that the public IP address (external network) is led to the virtual IP address of the TCSB server PCs (internal network). Only the public IP address is reachable from the Internet. The station does not therefore receive any information telling it which of the two computers of the redundancy group it is connected to.

  If you configure a second IP address, you need to make sure that TCSB is reachable via the IP address of a second router.

Mobile wireless CPs

S7-1200 telecontrol CPs Load, TeleService, project number, station number

Changing the project number or station number for the entire STEP 7 project

If you change the project number or the station number in the "CP identification" parameter group for a telecontrol CP, this parameter is changed for all CPs in the STEP 7 project.

Mobile wireless CPs: Download / TeleService

The following behavior applies to all mobile wireless CPs:

- CP 1242-7 (6GK7 242-7KX30-0XE0)
- CP 1242-7 GPRS V2 (6GK7 242-7KX31-0XE0)
- CP 1243-7 LTE-EU (6GK7 243-7KX30-0XE0)
- CP 1243-7 LTE-USA (6GK7 243-7SX30-0XE0)

Connection resources for TeleService

The TeleService function occupies a connection resource on the engineering station.

The function download to device or upload from device during a TeleService session occupies a second connection resource on the engineering station.

Download to device

Only use the "Download to device" function with the mobile wireless CP via a TeleService connection as follows:

1. Select the CP in STEP 7.
2. Select the "Online" > "Download to device" menu.
3. In the "Extended download" dialog that appears, select the TeleService interface.
4. Download the project data from the "Extended download" dialog.

Upload from device

The "Upload from device" function via a TeleService connection is supported by the mobile wireless CPs with the following TeleService server applications:

- TeleControl Server Basic as of version V3
- TeleService Gateway as of version V3

Operating modes of CP 1242-7

Modes of the CP

The CP 1242-7 allows an S7-1200 to communicate as a GPRS station with a central station or other remote networks via the GSM network. For communication using GPRS, the CP is set to one of the following operating modes:

- **Telecontrol**
  This operating mode of the CP allows the GPRS station to exchange data with the following partners:
  - Communication with the Telecontrol server
    This CP mode allows the GPRS station to exchange data with a telecontrol server. The Telecontrol server is a PC connected to the Internet with the "TCSB" application. It is generally located in the master station and serves to monitor and control the remote GPRS stations. Data can be exchanged with the OPC client of a central control system via the integrated OPC interface.
    The Telecontrol server PC is not configured in STEP 7. The "TCSB" application has its own configuration user interface.
  - Communication with another remote GPRS station
    The message frames are transmitted via the Telecontrol server.
  - Communication with an engineering station (for TeleService)

  Communication with the Telecontrol server is performed via the GSM network and the Internet.
  This operating mode requires a SIM card with GPRS service enabled and a Telecontrol server that can be reached by the CP.
- **GPRS direct**
  This operating mode of the CP is used for direct communication between remote stations via the GSM network. No Telecontrol server is required.
  To allow network nodes in public wireless networks to be directly accessible, these need to be addressed using a fixed address. Here, SIM cards with a fixed IP address are used that allow the stations to address each other directly.
  The possible communications services and security functions (for example VPN) depend on what is offered by the network provider.
  Possible communications partners of the station with a CP 1242-7 in "GPRS direct" mode are:
  - A node that can be reached by the CP via an IP address (S7 station with CP 1242-7)
  - An engineering station (for TeleService)

Connection establishment with a CP 1242-7 (Page 899)

Connection establishment with a CP 1242-7

Connection modes

- "GPRS direct" mode
  There are no different connection modes in the "GPRS direct" mode.
- "Telecontrol" mode
  The CP can be configured for the following connection modes.
  - "Permanent" connection mode
    There is a permanent TCP connection to the telecontrol server. Following connection establishment, there is a permanent TCP connection to the telecontrol server even if data is not transferred permanently.
  - "Temporary" connection mode
    A connection is only established to the telecontrol server when required.

If a TCP connection is established, process data is sent as soon as the telecontrol instructions are called on the CPU.

A connection is always established by the CP. If a connection established by the CP is interrupted, the CP automatically attempts to re-establish the connection.

Triggering connection establishment for permanent stations ("Telecontrol" mode)

In the "Telecontrol" mode, the permanent connection to the telecontrol server is established when the station starts up. If there is an interruption on the connection, the establishment of the connection can be triggered by a wake-up SMS (see below).

Triggering connection establishment for temporary stations ("Telecontrol" mode)

With "temporary" stations, connection establishment can be triggered by the following events:

- Event on the local CPU that needs to be evaluated by the program.
  In terms of the program, two situations need to be distinguished:
  - Events that lead to a single connection establishment (for example alarms or commands from the operator).
  - Expiry of an interval that leads to cyclic connection establishment (for example once daily for data transmission)
- Request by a communications partner (OPC client or S7 station)
  The request from the communications partner leads to the connection being established.
- Request for TeleService by an engineering station
  The request switched by the telecontrol server or TeleService gateway does not need to be evaluated in the program.
- Wake-up SMS of the telecontrol server
  The wake-up SMS can be triggered spontaneously on the telecontrol server. It is also possible to configure cyclic sending on the telecontrol server.

- Telephone wake-up call
  The wake-up call can be sent from a telephone that has a phone number authorized in the STEP 7 project. The telephone must support the CLIP function (transfer of its own call number).
  The connection establishment with the (main) telecontrol server is triggered.
- Telephone wake-up SMS
  The wake-up SMS can be sent from a telephone that has a phone number authorized in the STEP 7 project. The telephone must support the CLIP function (transmission of its own number) and sending of SMS.
  The connection establishment with the telecontrol server specified in the SMS is triggered.

When a temporary station is woken up, all the data is transferred if this has changed since the last data transfer.

Triggering connection establishment in "GPRS direct" mode

In "GPRS direct" mode, a connection establishment is triggered by the following events:

- Event on the local CPU that is evaluated by the program.
- Request by a communications partner (not an engineering station)
  The request in the frame received from the communications partner is evaluated in the program by calling the telecontrol instructions.
- Request for TeleService by an engineering station
  The request switched by the telecontrol server or TeleService gateway does not need to be evaluated in the program.

Right to wake-up by "authorized phone numbers"

The CP only accepts an SMS if the sending communication partner is authorized based on its phone number. These numbers are in configured for the CP in STEP 7 in the "authorized phone numbers" list.

Note

"Authorized phone numbers" in the STEP 7 project

- A phone number entered here gives the sender who transfers this phone number the right to trigger connection establishment.
- If an asterisk (*) is entered in the list, the CP accepts SMS messages from all senders.
- If the list is empty, the CP cannot be woken up for connection establishment.

Wake-up SMS

Depending on the connection type and the triggering server or intermediary TeleService server, the following text must be transferred in the wake-up SMS:

- For telecontrol connections:
  - Text for the wake-up SMS message for establishing a connection to the telecontrol server:
    `TELECONTROL`
  - Text for the wake-up SMS message for establishing a connection to the main telecontrol server:
    `TELECONTROL MAIN`
  - Text for the wake-up SMS message for establishing a connection to the substitute telecontrol server:
    `TELECONTROL BACKUP`

  The configuration of the telecontrol server for the GPRS CP is set in STEP 7 in "Telecontrol interface > Operating mode > main or substitute telecontrol server".

  Note

  Wake-up with a mobile phone

  - One of the texts listed above can be used in a wake-up SMS message.
  - With a wake-up call, the station always connects to the main telecontrol server.

- For TeleService connections:
  - Text for the wake-up SMS message for establishing a connection to the first configured TeleService server:
    `TELESERVICE`
    or
    `TELESERVICE 1`
  - Text for the wake-up SMS message for establishing a connection to the second configured TeleService server:
    `TELESERVICE 2`

  The configuration of the TeleService server for the GPRS CP is set in STEP 7 in "Telecontrol interface > TeleService authorization > 1st or 2nd TeleService server".

Preferred GSM networks

Selection of the preferred mobile wireless networks

The following options are available to select the networks that the mobile wireless CP should preferably dial up:

- Automatic dialup
  The CP dials with highest priority into the mobile wireless network of the contracted network provider set on the SIM card. If a dialing up the contract network fails, the CP dials up other mobile wireless networks with which the network provider has roaming contracts and whose access data is stored on the SIM card.
- Contract network only
  The CP only dials up the mobile wireless network of the contract network provider whose SIM card is plugged into the CP. No roaming.
- Contracted network and alternative network
  The CP dials up the contracted network with the highest priority. If dialing up the contract network is unsuccessful, the CP dials up alternative mobile wireless networks, in decreasing priority, as entered in the list of preferred network providers.
  The alternative networks are entered in the list as "Public Land Mobile Network" (PLMN). PLMN is a construct of Mobile Country Code (MCC) and Mobile Network Code (MNC).
  Example: 26276
  This is the PLMN for the test network of Siemens AG with MCC = 262 and MNC = 76.

CP 1200 with data point configuration

Reconnection delay

"Reconnection delay" parameter

The reconnection delay for connections in telecontrol communication is the waiting time between repeated attempts to establish the connection by the CP when the telecontrol server is not reachable or the connection has aborted. This waiting time avoids continuous connection establishment attempts at short intervals if there are connection problems.

A basic value is configured for the waiting time before the next connection establishment attempt. Starting at the basic value, the current waiting time is doubled after every 3 unsuccessful retries up to a maximum value of 900 s. Range of values for the basic value: 10 to 600 s.

Example: The basic value 20 results in the following intervals (waiting times) between the attempts to re-establish a connection.

- three times 20 s
- three times 40 s
- three times 80 s
- etc. up to max. 900 s

If a second telecontrol server or a second router of the telecontrol server is configured, the CP attempts to connect to the second partner at the 4th attempt. If the second partner is also unreachable, the 7th time the CP attempts to connect to the first partner again and so on.

Note

If the partner cannot be reached, connection establishment via the mobile wireless network can take several minutes. This may depend on the particular network and current network load.

Depending on your contract, costs may result from each connection establishment attempt.

CPU scan cycle

Structure of the CPU scan cycle

The cycle (including the pause) with which the CP scans the memory area of the CPU is made up of the following phases:

- **High-priority read jobs**
  For data points of the type "Input", which are configured with the "High priority" setting in the data point configuration in "General > Priority in the scan cycle", the PLC tags are all read in one scan cycle.
- **Write jobs**
  In every cycle, the values of a certain number of unsolicited write jobs are written to the CPU. The number of tags written per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of write jobs" parameter. The tags whose number exceeds this value are then written in the next or one of the following cycles.
- **Low-priority read jobs - proportion**
  For data points of the type "Input", which are configured with the "Low priority" setting in the data point configuration in "General > Priority in the scan cycle", the values of a part of the PLC tags are read in every scan cycle.
  The number of tags read per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of read jobs" parameter. The tags that exceed this value and can therefore not be read in one cycle are then read in the next or one of the following cycles.
- **Cycle pause time**
  This is the waiting time between two scan cycles. It is used to reserve adequate time for other processes that access the CPU via the backplane bus of the station.

Duration of the CPU scan cycle

Since no fixed time can be configured for the cycle and since the individual phases cannot be assigned a fixed number of objects, the duration of the scan cycle is variable and can change dynamically.

Datapoint types

During the configuration of the user data to be transferred by the CP, each data point is assigned a protocol-specific data point type. The data point types supported by the CP along with the compatible S7 data types are listed below. They are grouped according to format (memory requirements).

The direction relates to the direction of transfer (monitoring direction = "in", control direction = "out").

CP 1243-1, CP 1242-7 GPRS V2, CP 1243-7 LTE-(EU/USA): Supported data point types

Table 10-67 Supported data point types and compatible S7 data types

Format (memory requirements)	Data point type	S7 data types	Operand area
Bit	Digital input	BOOL	I, Q, M, DB
	Digital output	BOOL	I, Q, M, DB
	Command output (CP 1243-1 only)	BOOL	I, Q, M, DB
Byte	Digital input	BYTE, CHAR	I, Q, M, DB
	Digital output	BYTE, CHAR	I, Q, M, DB
Integer with sign (16 bits)	Analog input	INT	I, Q, M, DB
	Analog output	INT	I, Q, M, DB
Counter (16 bits)	Counter input	WORD	I, Q, M, DB
Integer with sign (32 bits)	Analog input	DINT	I, Q, M, DB
	Analog output	DINT	I, Q, M, DB
Counter (32 bits)	Counter input	DWORD, UDINT	I, Q, M, DB
Floating-point number with sign (32 bits)	Analog input	REAL	Q, M, DB
	Analog output	REAL	Q, M, DB
Floating-point number with sign (64 bits)	Analog input	LREAL	Q, M, DB
	Analog output	LREAL	Q, M, DB
Block of data (1 .. 64 bytes)	Data	ARRAY [1]	DB
	Data	ARRAY [1]	DB

[1] For the possible formats of the ARRAY data type, refer to the following section.

Block of data (ARRAY)

With the ARRAY data type, contiguous memory areas up to a size of 64 bytes can be transferred.

Compatible components of ARRAY are the following uniform S7 data types with a size between 1 and 32 bytes:

- BYTE, CHAR (in total up to 64 times per block of data)
- INT (in total up to 32 times per block of data)
- DINT, UDINT, REAL (in total up to 16 times per block of data)

If the array is modified later, the data point must be recreated.

Time stamp in UTC format

Time stamps are transferred in UTC format (48 bits) and contain the time difference in milliseconds since 01.01.1970.

CP 1243-1 DNP3: Supported data point types

Table 10-68 Supported data point types, DNP3 object groups, variants and compatible S7 data types

Format (memory requirements)	Data point type	DNP3 object group [variations]	Direction	S7 data types	Operand area
Bit	Binary Input	**1** [1, 2]	in	BOOL	I, Q, M
	Binary Input Event	**2** [1, 2]	in	BOOL	I, Q, M
	Binary Output [1]	**10** [2]	out		
	Binary Output Event [1]	**11** [1, 2]	out		
	Binary Command	**12** [1]	out	BOOL	I, Q, M
Integer (16 bits)	Counter Static	**20** [2]	in	UINT, WORD	I, Q, M
	Frozen Counter [2]	**21** [2, 6]	in		
	Counter Event	**22** [2, 6]	in	UINT, WORD	I, Q, M
	Frozen Counter Event [3]	**23** [2, 6]	in		
	Analog Input	**30** [1]	in	INT	I, Q, M
	Analog Input Event	**32** [2, 4]	in	INT	I, Q, M
	Analog Output Status [4]	**40** [2]	out		
	Analog Output	**41** [2]	out	INT	I, Q, M
	Analog Output Event [4]	**42** [2, 4]	out		
Integer (32 bits)	Counter Static	**20** [1]	in	UDINT, DWORD	I, Q, M
	Frozen Counter [2]	**21** [1, 5]	in		
	Counter Event	**22** [1, 5]	in	UDINT, DWORD	I, Q, M
	Frozen Counter Event [3]	**23** [1, 5]	in		
	Analog Input	**30** [2]	in	DINT	I, Q, M
	Analog Input Event	**32** [1, 3]	in	DINT	I, Q, M
	Analog Output Status [4]	**40** [1, 3]	out		
	Analog Output	**41** [1]	out	DINT	I, Q, M
	Analog Output Event [4]	**42** [1]	out		
Floating-point number (32 bits)	Analog Input	**30** [5]	in	REAL	Q, M
	Analog Input Event	**32** [5, 7]	in	REAL	Q, M
	Analog Output Status [4]	**40** [3]	out		
	Analog Output	**41** [3]	out	REAL	Q, M
	Analog Output Event [4]	**42** [5, 7]	out		
Floating-point number (64 bits)	Analog Input	**30** [6]	in	LREAL	Q, M
	Analog Input Event	**32** [6, 8]	in	LREAL	Q, M
	Analog Output	**41** [4]	out	LREAL	Q, M
	Analog Output Event [4]	**42** [6, 8]	out		

Format (memory requirements)	Data point type	DNP3 object group [variations]	Direction	S7 data types	Operand area
Block of data (1...64 bytes) [5]	Octet String	**110** [-]	in	[5]	I, Q, M
	Octet String Event [5]	**111** [-]	in	[5]	I, Q, M

[1] This object group can be configured in the Data point editor of STEP 7 using object group 12.

[2] This object group can be configured in the Data point editor of STEP 7 using object group 20.

[3] This object group can be configured in the Data point editor of STEP 7 using object group 22.

[4] This object group can be configured in the Data point editor of STEP 7 using object group 41.

[5] With these data point types, contiguous memory areas up to a size of 64 bytes can be transferred. All S7 data types with a size between 1 and 64 bytes are compatible. If the array is modified later, the data point must be recreated.

Configuration and feedback of binary and analog values

- **Binary values**
  You configure binary values (inputs) using object groups 1 and 2.
  The object groups 10 and 11 are used to feed back the current values in the process image of the CPU to the control system.
- **Analog values**
  You configure analog values using the object groups 30, 32 and 41 depending on the transfer direction.
  The object groups 40 and 42 are used to feed back current values in the process image of the CPU to the control system.

CP 1243-1 IEC: Supported data point types

Table 10-69 Supported data point types, IEC types and compatible S7 data types

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Operand area
Bit	Single point information	<1>	in	BOOL	I, Q, M
	Single point information with time tag	<30>	in	BOOL	I, Q, M
	Single command	<45>	out	BOOL	I, Q, M
Byte	Step position information	<5>	in	BYTE	I, Q, M
	Step position information with time tag	<32>	in	BYTE	I, Q, M
Integer (16 bits)	Measured value, normalized value	<9>	in	INT	I, Q, M
	Measured value, normalized value with time tag	<34>	in	INT	I, Q, M
	Measured value, scaled value	<11>	in	INT	I, Q, M
	Measured value, scaled value with time tag	<35>	in	INT	I, Q, M
	Set point command, normalised value	<48>	out	INT	I, Q, M
	Set point command, scaled value	<49>	out	INT	I, Q, M

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Operand area
Integer (32 bits)	Bitstring of 32 bits	<7>	in	DWORD, UDINT	I, Q, M
	Bitstring of 32 bits with time tag	<33>	in	DWORD, UDINT	I, Q, M
	Integrated totals	<15>	in	DWORD, UDINT	I, Q, M
	Integrated totals with time tag	<37>	in	DWORD, UDINT	I, Q, M
Floating-point number (32 bits)	Measured value, short floating point number	<13>	in	REAL	Q, M
	Measured value, short floating point number with time tag	<36>	in	REAL	Q, M
	Set point command, short floating point number	<50>	out	REAL	Q, M
Block of data (1...32 Bit) [1]	Bitstring of 32 bits [1]	<7>	in	[1]	I, Q, M
	Bitstring of 32 bits with time tag [1]	<33>	in	[1]	I, Q, M
	Bitstring of 32 bits [1]	<51>	out	[1]	I, Q, M

[1] With these data point types, contiguous memory areas up to a size of 32 bits can be transferred. All S7 data types with a size between 1 and 32 bits are compatible. If the array is modified later, the data point must be recreated.

Process image, type of transmission, event classes, triggers

Storage of values

The values of all data points are stored in the image memory of the CP. Values in the image memory are transferred only after being called by TCSB (CP 1243-1, CP 1242-7 GPRS V2, CP 1243-7 LTE) or the master (CP 1243-1 DNP3 / CP 1243-1 IEC).

Events are also stored in the send buffer and can be transferred unsolicited.

The image memory, the process image of the CP

The image memory is the process image of the CP. All the current values of the configured data points are stored in the image memory. New values of a data point overwrite the last stored value in the image memory.

The values are sent after querying the communications partner, see "Transfer after call" in the section "Types of transmission" below.

The send buffer

The send buffer of the CP is the memory for the individual values of data points that are configured as an event. The send buffer has the following size:

- CP 1242-7 GPRS V2 / CP 1243-7 LTE / CP 1243-1 / CP 1243-1 DNP3: Max. 64000 events
- CP 1243-1 IEC: Max. 65535 events

The capacity of the send buffer is divided up equally for all enabled partners.

If the connection to a communications partner is interrupted, the individual values of the events are retained in the buffer. When the connection returns, the buffered values are sent. The frame memory operates chronologically; in other words, the oldest frames are sent first (FIFO principle).

If a frame was transferred to the communications partner, the transferred values are deleted from the send buffer.

If frames cannot be transferred for a longer period of time and the send buffer is threatening to overflow, the response is as follows:

- CP 1243-1 / CP 1242-7 GPRS V2 / CP 1243-7 LTE
  The forced image mode
  If the send buffer reaches a fill level of 80%, the CP changes to the forced image mode. New values from data points configured as an event are no longer added to the send buffer but rather they overwrite older existing values in the image memory.
  When the connection to the communications partner returns, the CP changes back to the send buffer mode if the fill level of the send buffer has fallen below 50%.
- CP 1243-1 DNP3 / CP 1243-1 IEC
  If a send buffer fill level of 100% is reached, the oldest values are overwritten.

Configuration of data points as events

Data points are configured as a static value or as an event using the "Type of transmission" parameter (see below):

- No event (static value)
  The values of data points that are not configured as an event ("Transfer after call") are entered in the image memory of the CP and transferred to the communications partner when it requests this value.
- Event
  The values of data points configured as an event are entered in the image memory and also in the send buffer of the CP.
  The values of events are saved in the following situations:
  - The configured trigger conditions are fulfilled (data point configuration > "Trigger" tab, see below)
  - The value of a status bit of the status identifiers changes.

Status identifiers: Generating an event on a status change

With data points that are configured as an event, the change to the status bit leads to an event being generated, refer also to the section Status IDs of data points (Page 910).

Example: When the value of a data point configured as an event is updated during startup of the station by reading the CPU data for the first time, the status "RESTART" of this data point changes (bit status change 1 → 0). This leads to generation of an event.

Type of transmission

Depending on your CP type, you have the following transmission types available:

- **Transfer after call**
  The current value of the data point is entered in the image memory of the CP. A new value overwrites the older value in the image memory. After being called by the communications partner, the current value at the time is transferred.
- **Event class ...**
  The value is entered in the send buffer as an event and transferred unsolicited to the communications partner.
  The configurable event classes of the various CPs are described in the following sections.

Event classes with the CP 1243-1 / CP 1242-7 GPRS V2 / CP 1243-7 LTE

The process data of the various event classes is handled as follows:

- **Every value triggered**
  Each value change is entered in the send buffer in chronological order.
- **Current value triggered**
  Only the last, current value is entered in the send buffer. It overwrites the value stored there previously.

Event classes with a CP 1243-1 DNP3

The process data of the various event classes is handled as follows:

- **Event class 1 / event class 2**
  Classes according to the DNP3 protocol: Event, class 1 / class 2
  Each value change is entered in the send buffer in chronological order.
  The evaluation of the classification (1 or 2) must be handled by the master.
- **Event class 3**
  Class according to the DNP3 protocol: Static event, class 3
  Only the current value at the time the trigger condition was met is entered in the send buffer and overwrites the last value stored there.

Event classes with a CP 1243-1 IEC

The process data of the various event classes is handled as follows:

- **Event class 1**
  Classes according to the IEC protocol: Event, class 1
  Each value change is entered in the send buffer in chronological order.
- **Event class 3**
  Class according to the IEC protocol: Static event, class 3
  Only the current value at the time the trigger condition was met is entered in the send buffer and overwrites the last value stored there.

Trigger

Various trigger types are available for starting event-driven transfer:

- **Threshold value trigger**
  The value of the data point is transferred when this reaches a certain threshold. The threshold is calculated as the difference compared with the last stored value, refer to the section Threshold value trigger (Page 912).
- **Time trigger**
  The value of the data point is transferred at configurable intervals or at a specific time of day.
- **Event trigger**
  The value of the data point is transferred when a configurable trigger signal is fired. For the trigger signal, the edge change (0 → 1) of a trigger tag is evaluated that is set by the user program. When necessary, a separate trigger tag can be configured for each data point.
  Resetting the trigger tag in the bit memory area / DB:
  If the memory area of the trigger tag is in the bit memory or in a data block, the trigger tag is reset to zero when the data point value is transferred.

You specify whether the value of a data point is transferred to the communications partner immediately after the trigger fires or after a delay in the "Transmission mode" parameter.

Transmission mode

The transmission mode of a frame is set in the "Trigger" tab of the data point. With the two options, you specify whether frames of events are sent immediately or following a delay:

- Spontaneous
  The value is transferred immediately.
- Conditional spontaneous
  The value is transferred only when one of the two following conditions is fulfilled:
  - The communications partner queries the station.
  - The value of another event with the transmission mode "Unsolicited" is transferred.

Status IDs of data points

Status identifiers

The status identifiers of the data points listed in the following tables are transferred along with the value in each frame to the communications partner. They can be evaluated by the communications partner.

Depending on the CP type, the CP sets different status identifiers for each data point. They are transferred in 1 or 2 bytes.

The meaning of the individual status bits relates to the value of the bit in the "Bit status" row in the tables.

CP 1243-1, CP 1242-7 GPRS V2, CP 1243-7 LTE-EU, CP 1243-7 LTE-USA

The status identifiers are transferred in 2 bytes. Byte 1 is not used.

Table 10-70 Byte assignment of status byte 0

Bit	7	6	5	4	3	2	1	0
Flag name	-	NON_ EXISTENT	Substituted	LOCAL_ FORCED	CARRY	OVER_ RANGE	RESTART	ONLINE
Meaning	-	Data point does not exist or S7 address unreachable	Substitute value	Local operator control	Counted value overflow before reading the value	Limit value of the analog preprocessing overshot / undershot	Value not updated after start	Value is invalid
Bit status	*(always 0)*	1	1	1	1	1	1	1

CP 1243-1 DNP3

The status identifiers are transferred in 1 byte.

Table 10-71 Bit assignment of the status byte

Bit	7	6	5	4	3	2	1	0
Flag name	-	-	-	LOCAL_ FORCED	DISCONTI NUITY	OVER_ RANGE	RESTART	ONLINE
Meaning	-	-	-	Local operator control	Counted value overflow before reading the value	Limit value of the analog preprocessing overshot / undershot	Value not updated after start	Value is invalid
Bit status	*(always 0)*	*(always 0)*	*(always 0)*	1	1	1	1	1

CP 1243-1 IEC

The status identifiers are transferred in 1 byte.

Table 10-72 Bit assignment of the status byte

Bit	7	6	5	4	3	2	1	0
Flag name	-	-	SB substituted	-	CY carry	OV overflow	NT not topical	IV invalid
Meaning	-	-	Substitute value	-	Counted value overflow before reading the value	Value range exceeded, analog value	Value not updated	Value is invalid
Bit status	*(always 0)*	*(always 0)*	1	*(always 0)*	1	1	1	0

Rules for configuring the data point index:

Configuration of the data point index (CP 1243-1 IEC)

Data point indexes assigned more than once in a CP are indicated as errors in the consistency check and prevent the project being saved.

Configuration of the data point index (CP 1243-1 DNP3)

On a CP, data point indexes must be unique within each of the following object groups:

- Binary Input / Binary Input Event
- Binary Output / Binary Command
- Counter / Counter Event
- Analog Input / Analog Input Event
- Analog Output
- Octet String / Octet String Event

Indexes of two data points in different object groups can be identical.

Configuration of the data point index (CP 1243-1 / CP 1243-7 LTE / CP 1242-7 GPRS V2)

Within a CP, the indexes of the data point classes must comply with the following rules:

- Input
  The index of a data point of the type input must be unique throughout all data point types (digital inputs, analog inputs etc.).
- Output
  - A data point of the type output can have the same index as a data point of the type input.
  - Several data points of the type output can have the same index.

Note

Data points for the inter-station communication with a CP in another S7 station

Note that for inter-station communication, the indexes of the two corresponding data points (data point pair) must be identical for the sending and receiving CP.

Threshold value trigger

The CP calculates the value for the threshold value trigger after the analog value preprocessing, refer to the section Analog value preprocessing (Page 914).

Threshold value trigger: How the integrattion calculation works

To calculate the threshold value trigger, the integration method is used.

In the integration threshold value calculation, it is not the absolute value of the deviation of the process value from the last stored value that is evaluated but rather the amount of the integrated deviation.

The calculation cycle

The integration threshold value calculation works with a cyclic comparison of the integrated current value with the last stored value. The calculation cycle in which the two values are compared is 500 milliseconds.
(Note: The calculation cycle must not be confused with the scan cycle of the CPU memory areas).

The deviations of the current process value are totaled in each calculation cycle. The trigger is set only when the totaled value reaches the configured value of the threshold value trigger and a new process value is entered in the send buffer.

The method is explained based on the following example in which a threshold value of 2.0 is configured.

Table 10-73 Example of the integration calculation of a threshold value configured with 2.0

Time [s] (calculation cycle)	Process value stored in the send buffer	Current process value	Absolute deviation from the stored value	Integrated deviation
0	**20,0**	**20,0**	0	0
0,5		20,3	+0,3	0,3
1,0		19,8	-0,2	0,1
1,5		20,2	+0,2	0,3
2,0		20,5	+0,5	0,8
2,5		20,3	+0,3	1,1
3,0		20,4	+0,4	1,5
3,5	**20,5**	**20,5**	+0,5	**2,0**
4,0		20,4	-0,1	-0,1
4,5		20,1	-0,4	-0,5
5,0		19,9	-0,6	-1,1
5,5		20,1	-0,4	-1,5
6,0	**19,9**	**19,9**	-0,6	**-2,1**

In this example, a value of 2.0 was configured for the threshold value trigger.

With the changes in the process value shown in the example, the threshold value trigger fires twice, if the value 2.0 is reached:

- At the time 3.5 s: The value of the integrated deviation is at 2.0. The new process value stored in the send buffer is 20.5.
- At the time 6.0 s: The value of the integrated deviation is at 2.1. The new process value stored in the send buffer is 19.9.

In this example, if a deviation of the process value of approximately 0.5 should fire the trigger, then with the behavior of the process value shown here a threshold value of approximately 1.5 ... 2.5 would need to be configured.

Analog value preprocessing

CPs with data point configuration support analog value preprocessing with some or all of the functions described below.

Sequence of processing Threshold value trigger and Analog value preprocessing

Note

Threshold value trigger: Calculation only after "Analog value preprocessing"

Note that the analog value preprocessing is performed before the check for a configured threshold value.

This affects the value that is configured for the threshold value trigger.

Restricted preprocessing options if mean value generation is configured

If you configure mean value generation for an analog value event, the following preprocessing options are not available:

- Unipolar transfer
- Fault suppression time
- Smoothing

No Threshold value trigger if Mean value generation is configured

If mean value generation is configured, no threshold value trigger can be configured for the analog value event involved.

Analog inputs that are configured as an event are processed on the CP in the following sequence:

Sequence of analog value processing

1. Reading the data from the input area of the CPU
2. Analog value preprocessing (part 1)
   Processing involves the following steps:
   - Mean value generation
     - Mean value generation configured: Calculation and then continued at point 4.
     - No mean value generation configured: Continue with "Unipolar transfer".
   - Unipolar transfer (if configured)
   - Fault suppression time (if configured)
   - Smoothing (if configured)
3. Threshold value calculation (if Threshold value trigger is configured)
4. Analog value preprocessing (part 2)
   - Set limit value 'low' / Set limit value 'high' (if configured)
5. Storage of the value in the send buffer
   Transfer of the value to the partner if trigger and threshold value conditions are met.

Unipolar transfer

With unipolar transfer, negative values are corrected to zero. This can be desirable if values from the underrange should not be transferred as real measured values.

Exception: The value -32768 / 8000_h for wire break of live zero inputs is transferred.

Unipolar transfer cannot be configured at the same time as mean value generation.

Mean value generation

With this parameter, acquired analog values are transferred as mean values.

The current values of an analog data point are acquired cyclically and totaled. The number of acquired values per time unit depends on the read cycle of the CPU and the CPU scan cycle of the CP. The mean value is calculated from the accumulated values as soon as the transfer is triggered by a time trigger. Following this, the accumulation starts again so that the next mean value can be calculated.

The mean value can also be calculated if the transmission of the analog value message is triggered by a request from the communications partner. The duration of the mean value calculation period is then the time from the last transmission (for example triggered by the trigger) to the time of the request. Once again, the accumulation restarts so that the next mean value can be calculated.

Overflow range / underflow range

Acquisition of a value in the overflow or underflow range results in the mean calculation being stopped immediately. The value 32767 / $7FFF_h$ or -32768 / 8000_h is saved as an invalid mean value for the current mean value calculation period and sent when the next analog value message is triggered. The calculation of a new mean value is then started. If the analog value remains in the overflow or underflow range, this new value is again saved immediately as an invalid mean value and sent when the next frame is triggered.

Note

Fault suppression time > 0 configured

If you have configured an error suppression time and then enable mean value generation, the value of the error suppression time is grayed out but no longer used. If mean value generation is enabled, the error suppression time is set to 0 (zero) internally.

Smoothing factor

Analog values that fluctuate quickly can be evened out using the smoothing function.

The smoothing factors are calculated according to the following formula as with S7 analog input modules.

$$y_n = \frac{x_n + (k-1)y_{n-1}}{k}$$

where
y_n = smoothed value in the current cycle

x_n = value acquired in the current cycle n
k = smoothing factor

The following values can be configured for the module as the smoothing factor.

- 1 = No smoothing
- 4 = Weak smoothing
- 32 = Medium smoothing
- 64 = Strong smoothing

The smoothing factor cannot be configured at the same time as mean value generation.

Fault suppression time

An analog value in the overflow range (32767 / $7FFF_h$) or underflow range (-32768 / 8000_h) is not transferred for the duration of the fault suppression time. This also applies to live zero inputs. The value in the overflow/underflow range is only sent after the fault suppression time has elapsed, if it is still pending.

If the value returns to the measuring range before the fault suppression time elapses, the current value is transferred immediately.

A typical use case for this parameter is the suppression of peak current values when starting up powerful motors that would otherwise be signaled to the control center as a disruption.

The suppression is adjusted to analog values that are acquired by the S7 analog input modules as raw values. These modules return the specified values for the overflow or underflow range for all input ranges (also for live zero inputs).

The fault suppression time cannot be configured at the same time as mean value generation.

Recommendation for finished values that were preprocessed by the CPU:

If the CPU makes preprocessed finished values available in bit memory or in a data block, suppression is only possible or useful if these finished values also adopt the values listed above 32767 / $7FFF_h$ or -32768 / 8000_h in the overflow or underflow range. If this is not the case, the parameter should not be enabled for preprocessed values.

Set limit value 'low' / Set limit value 'high'

In these two input boxes, you can set a limit value in the direction of the start of the measuring range or in the direction of the end of the measuring range. You can also evaluate the limit values, for example as the start or end of the measuring range.

If the limit value is overshot or undershot, the status identifier "OVER_RANGE" of the data point is set. This status identifiers are described in the section Status IDs of data points (Page 910).

The "OVER_RANGE" bit of the status identifier of the data point is set as follows when the relevant analog value is transferred:

- Limit value 'high':
  - If the limit value is exceeded: OVER_RANGE = 1
  - If the value falls below the limit value: OVER_RANGE = 0
- Limit value 'low':
  - If the value falls below the limit value : OVER_RANGE = 1
  - If the value then exceeds the limit value: OVER_RANGE = 0

Requirements for the function

- Configuration of the threshold trigger for this data point
- PLC tag in the bit memory operand area or data area
  The analog value data point must be linked to a PLC tag in the bit memory or data area (data block). For hardware modules (input operand area) limit value configuration is not possible.

The configuration of limit values is pointless for measured values that have already been preprocessed on the CPU.

Configuration of the limit value

The value to be configured as a whole decimal number therefore depends on the value range of the PLC tags and the raw value of the analog module:

Division	Raw value of the of PLC tags *			Module output [mA]			Measuring range [%]
	Decimal		Hexadeci-mal	0 - 20 (unipolar)	-20 - +20 (bipolar)	4 - 20 (life zero)	
	16 bits	32 bits	16 bits				
Overflow	32767	2147483647	7FFF	> 23.515	> 23.515	> 22.810	> 117.593
Overrange	32511 ... 27649	2130769779 ... 1812067105	7EFF ... 6C01	23.515 ... 20.001	23.515 ... 20.001	22.810 ... 20.001	117.593 ... 100.004
Nominal range (unipolar / life zero)	27648 ... 0	1811994624 ... 0	6C00 ... 0000	20 ... 0		20 ... 4	100 ... 0
Nominal range (bipo-lar)	27648 ... 0 ... -27648	1811994624 ... 0 ... -1811994625	6C00 ... 0000 9400		20 ... 0 ... -20		100 ... 0 ... -100
Underrange (unipolar / life zero)	-1 ... -4864	-1 ... -318729855	FFFF ... ED00	-0.001 ... -3.518		3.999 ... 1.185	-0.004 ... -17.59

Division	Raw value of the of PLC tags *			Module output [mA]			Measuring range [%]
	Decimal		Hexadeci-mal	0 - 20 (unipolar)	-20 - +20 (bipolar)	4 - 20 (life zero)	
	16 bits	32 bits	16 bits				
Underrange (bipolar)	-27649 ... -32512	-1812067105 ... -2130769779	93FF ... 8100		-20.001 ... -23.516		-100.004 ... -117.593
Undershoot / wire break	-32768	−2147483648	8000	< -3.518		< 1.185	< -17.593

* The raw values of the measured values relate to the values of 16-bit or 32-bit PLC tags.

Note

Evaluation of the value even when the option is disabled

If you enable one or both options and configure a value and then disable the option later, the grayed out value is nevertheless evaluated.

To disable the two options, delete the previously configured values limit values from the input boxes and then disable the relevant option.

Recommendation for quickly fluctuating analog values:

If the analog value fluctuates quickly, it may be useful to smooth the analog value first if limit values are configured. If the analog value fluctuates close to a limit value for a longer period of time, with a smoothed value you avoid a status change each time the value exceeds/falls below the limit value and so triggers a transfer.

Processing status of e-mails / SMS

Enable status identifier / External status

If the option is enabled, the CP writes a processing status about the sent e-mail / SMS to a PLC tag.

The meaning of the statuses is as follows:

Table 10-74 SMS: Meaning of the status ID output in hexadecimal format

Status	Meaning
0000	Transfer completed free of errors
8001	Error in the transfer, possible causes: • SIM card invalid. • No network • Wrong destination phone number (number not reachable)

Table 10-75 E-mails: Meaning of the processing status output in hexadecimal format

Status	Meaning
0000	Transfer completed free of errors
82xx	Other error message from the e-mail server Apart from the leading "8", the status corresponds to the three-digit error number of the SMTP protocol.
8401	No channel available Possible cause: There is already an e-mail connection via the CP. A second connection cannot be set up at the same time.
8403	No TCP/IP connection could be established to the SMTP server.
8405	The SMTP server has denied the login request.
8406	An internal SSL error or a problem with the structure of the certificate was detected by the SMTP client.
8407	Request to use SSL was denied.
8408	The client could not obtain a socket for creating a TCP/IP connection to the mail server.
8409	It is not possible to write via the connection. Possible cause: The communications partner reset the connection or the connection aborted.
8410	It is not possible to read via the connection. Possible cause: The communications partner terminated the connection or the connection was aborted.
8411	Sending the e-mail failed. Cause: There was not enough memory space for sending.
8412	The configured DNS server could not resolve specified domain name.
8413	Due to an internal error in the DNS subsystem, the domain name could not be resolved.
8414	An empty character string was specified as the domain name.
8415	An internal error occurred in the cURL module. Execution was aborted.
8416	An internal error occurred in the SMTP module. Execution was aborted.
8417	Requests to SMTP on a channel already being used or invalid channel ID. Execution was aborted.
8418	Sending the e-mail was aborted. Possible cause: Execution time exceeded.
8419	The channel was interrupted and cannot be used before the connection is terminated.
8420	Certificate chain from the server could not be verified with the root certificate of the CP.
8421	Internal error occurred. Execution was stopped.
8450	Action not executed: Mailbox not available / unreachable. Try again later.
84xx	Other error message from the e-mail server Apart from the leading "8", the status corresponds to the three-digit error number of the SMTP protocol.
8500	Syntax error: Command unknown. This also includes the error of having a command chain that is too long. The cause may be that the e-mail server does not support the LOGIN authentication method. Try sending e-mails without authentication (no user name).
8501	Syntax error. Check the following configuration data: Message configuration > Message parameters: • Recipient address ("To" or "Cc").
8502	Syntax error. Check the following configuration data: Message configuration > Message parameters: • Email address (sender)

Status	Meaning
8535	SMTP authentication incomplete. Check the "User name" and "Password" parameters in the CP configuration.
8550	SMTP server cannot be reached. You have no access rights. Check the following configuration data: • CP configuration > E-mail configuration: – User name – Password – Email address (sender) • Message configuration > Message parameters: – Recipient address ("To" or "Cc").
8554	Transfer failed
85xx	Other error message from the e-mail server Apart from the leading "8", the status corresponds to the three-digit error number of the SMTP protocol.

Time-of-day synchronization

Time-of-day synchronization - mode

How the time synchronization modes work

For the time-of-day synchronization of the S7-1200 CPs for telecontrol applications, various methods are used.

There should only ever be 1 time master in a station if this can be set.

- **Time-of-day synchronization by the telecontrol server**
  With CPs that communicate with a telecontrol server, this method is always used. The time of day of the CP is synchronized by the communications partner; in other words, by the telecontrol server.
- **NTP - Network Time Protocol**
  With the NTP method, the CP as NTP client sends time-of-day queries at regular intervals to one or more NTP servers in the subnet (LAN). Based on the replies from the server, the most reliable and most accurate time is calculated and the time of day on the CP is synchronized.
  The advantage of this mode is that it allows the time to be synchronized across subnets. The IP addresses of up to four NTP servers need to be configured. The update interval defines the interval between the time queries (in seconds). The value of the interval ranges between 10 seconds and one day.
  In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred; this corresponds to GMT (Greenwich Mean Time).

Time-of-day synchronization with NTP

NTP mode

In NTP mode, the CP sends time-of-day queries at regular intervals to one or more NTP servers. From the responses of the servers, the CP selects the most accurate time of day.

The advantage of this mode is that it allows the time to be synchronized across subnets.

In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred. This corresponds to GMT (Greenwich Mean Time).

NTP - configuration

Configuration of time-of-day synchronization of the CP using NTP

The IP addresses of up to four NTP servers can be configured.

The update interval specifies the synchronization cycle of the time-of-day queries to the NTP server. The range of values is between 10 seconds and 1 day (86400 seconds).

Time-of-day synchronization of the CPU

CPs with data point configuration can make their time of day available to the CPU via a PLC tag; refer to the "Communication with the CPU" parameter group.

CPUs provide the option of requesting the time of day automatically from an NTP server. If this option is used on the CPU, the time of day on the CPU obtained directly from the NTP server is overwritten again by the CP time of day. In this case, it makes sense to activate time-of-day synchronization only on one device.

"Accept time of day from non-synchronized NTP servers" option

If the option is enabled, the CP also accepts the time-of-day from non-synchronized NTP servers with stratum 16.

If the option is disabled, the response is as follows: If the CP receives a time-of-day frame from an unsynchronized NTP server with stratum 16, the time of day is not set according to the frame. In this case, none of the NTP servers is displayed as "NTP master" in the diagnostics; but rather only as being "reachable".

TeleService with mobile wireless CPs

TeleService via the mobile wireless network

Communication path for TeleService via the mobile wireless network

With TeleService for remote S7 stations with a mobile wireless CP, the connection is always established via an intermediary between the engineering station and remote S7 station.

This intermediary can be either:

- A telecontrol server
  The telecontrol server can be a separate PC or installed on the engineering station in the form of the "TCSB" application.
- A TeleService server
  A TeleService server is used when no telecontrol server is available.

The telecontrol server or TeleService server can be connected to the engineering station via LAN or Internet and the TeleService function can be called from there.

Requirements for TeleService via mobile wireless

- A telecontrol server or a TeleService server
- The STEP 7 project with the required stations

Note on project engineering

The telecontrol server and TeleService server are not configured in STEP 7.

Establishing a TeleService connection via the mobile wireless network

Establishing a connection for TeleService via mobile wireless

The request to establish a connection is triggered by the engineering station and transmitted by a wake-up SMS to the station. The mobile wireless CP in the S7-1200 station establishes a connection to the engineering station via the mobile wireless network and the Internet.

Starting the TeleService via mobile wireless

Start the TeleService via mobile wireless as follows:

1. In the project on the authorized engineering station, select the remote S7 station with which you want to establish a TeleService connection via mobile wireless.
2. Alternatively, open the "Connect online" dialog box as follows:
   – "Connect online" button
   – "Connect online" shortcut menu (right mouse button)
   – "Online" > "Connect online" menu

   The "Connect online" dialog box opens.
3. Choose interface type "TeleService mobile wireless" in the "Type of PG/PC interface" drop-down list.
4. In the "PG/PC interface" drop-down list, select the "Mobile wireless TeleService board" option if it is not automatically displayed.

5. Click on the "Connect" icon next to the "PG/PC interface" drop-down list.
   The "Establish remote connection" dialog box opens.
6. Make the necessary settings in the "Establish remote connection" dialog.
   Details of this are contained in the tooltip cascade of STEP 7.

The following details are required to successfully establish a connection:

Details required to establish a connection with the S7 station

The following information is necessary in the Establish remote connection" dialog:

- IP address or DNS name of the telecontrol server
- TCP port number of the telecontrol server or the DSL router via which the connection between the engineering station and the remote S7 station is running.
- Server password of the ES to authenticate the engineering station at the telecontrol server
  Only required if a group-specific password has been configured in the "TCSB" application.
- TeleService user name
  See CP configuration in STEP 7.
- TeleService password
  See CP configuration in STEP 7.
- Access ID of the CP
  Only required when there are several mobile wireless CPs in the station. See CP configuration in STEP 7.

Status

Connection statuses of TeleService via mobile wireless

The connection statuses described below can be displayed in the "Establish remote connection" dialog box.

When opening the dialog

- Not connected
  There is no connection to the remote S7 station. Connection establishment has not yet started.

Click the "Go online" button

If connection establishment was started by clicking the "Connect" button, the following statuses are displayed one after the other after the connection has been established:

- Connect to telecontrol server
  The engineering station connects to the telecontrol server.
- Wait for S7 station
  The wake-up SMS has been sent to the remote station. Wait for reply from station.

- Authentication at S7 station
  The S7 station has established an IP connection with the engineering station via GPRS and Internet and is checking the received logon and authentication data.
- Connected
  The station has successfully established the connection to the engineering station.

If connection establishment is unsuccessful

The following states may be displayed if the connection cannot be successfully established:

- Telecontrol server not accessible
  Possible causes:
  - The connection between the engineering station and the telecontrol server has been interrupted.
  - The telecontrol server is switched off.
- Wrong server password
  Cause: The wrong server password for logging on and authentication was entered at the telecontrol server.
- S7 station not responding
  Possible causes:
  - Faulty GSM communication between the telecontrol server and the station.
  - There is a disrupted connection between the mobile wireless network and the Internet.
  - Faulty Internet connection.
  - The telecontrol server could not send a wake-up SMS.
  - The CP has not received a wake-up SMS.
  - The sender of the SMS was not configured in the list of authorized wake-up call numbers.
- Wrong TeleService user name or TeleService password
  Possible causes:
  - An incorrect TeleService user name or incorrect TeleService password was entered in the authentication dialog for the mobile wireless CP.
  - The TeleService user name or TeleService password was not configured in STEP 7.
- All TeleService access points are in use.
- The CP is not known to the telecontrol server.
  Cause: The CP originates from a STEP 7 project that does not match the project of the telecontrol server.
- No resources available for TeleService on the CP: Please contact the hotline.
- Protocol error
  Cause: Wrong frame or frame from wrong subscriber. Please contact the hotline.

10.1.4.5 SCALANCE X, W and M

Configuring SCALANCE X / W / M

Legal notice

Qualified personnel

The product/system belonging to this documentation may only be handled by qualified personnel for the intended purpose taking into account the documentation relating to the intended purpose and, in particular, the safety and warning notices it contains. Due to training and experience, **qualified personnel** is capable of recognizing risks and avoiding possible dangers when handling these products/systems.

Configuring SCALANCE X

Useful information

VLAN

Network definition regardless of the spatial location of the nodes

VLAN (Virtual Local Area Network) divides a physical network into several logical networks that are shielded from each other. Here, devices are grouped together to form logical groups. Only nodes of the same VLAN can address each other. Since multicast and broadcast frames are only forwarded within the particular VLAN, they are also known as broadcast domains.

The particular advantage of VLANs is the reduced network load for the nodes and network segments of other VLANs.

To identify which packet belongs to which VLAN, the frame is expanded by 4 bytes (VLAN tagging (Page 927)). This expansion includes not only the VLAN ID but also priority information.

Options for the VLAN assignment

There are various options for the assignment to VLANs:

- Port-based VLAN
  Each port of a device is assigned a VLAN ID. You configure port-based VLAN in "Layer 2 > VLAN > Port-based VLAN".
- Protocol-based VLAN
  Each port of a device is assigned a protocol group. You can configure protocol-based VLAN in "Layer 2 > VLAN > Protocol Based VLAN Port"
- Subnet-based VLAN
  The IP address of the device is assigned a VLAN ID. You configure subnet-based VLAN in "Layer 2 > VLAN > IPv4 Subnet Based VLAN".

processing the VLAN assignment

If more than one VLAN assignment is created on the device, the assignments are processed in the following order:

1. Subnet-based VLAN
2. Protocol-based VLAN
3. Port-based VLAN

The frame is first examined for the IP address. If a rule on the "IPv4 Subnet Based VLAN" tab applies, the frame is sent to the corresponding VLAN. If no rule applies, the protocol type of the frame is examined. If a rule on the "Protocol Based VLAN Port" tab applies, the frame is sent to the corresponding VLAN. If no rule applies, the frame is sent via the port-based VLAN. The rules for the port-based VLAN are specified on the "Port Based VLAN" tab.

Protocol-based VLAN port (Page 1017)

IPv4 subnet-based VLAN (Page 1017)

VLAN tagging

Expansion of the Ethernet frames by four bytes

For CoS (Class of Service, frame priority) and VLAN (virtual network), the IEEE 802.1 Q standard defined the expansion of Ethernet frames by adding the VLAN tag.

Note

The VLAN tag increases the permitted total length of the frame from 1518 to 1522 bytes. With the IE switches, the standard MTU size is 1536 bytes. The MTU size can be changed to values from 64 to 9216 bytes.
The end nodes on the networks must be checked to find out whether they can process this length / this frame type. If this is not the case, only frames of the standard length may be sent to these nodes.

The additional 4 bytes are located in the header of the Ethernet frame between the source address and the Ethernet type / length field:

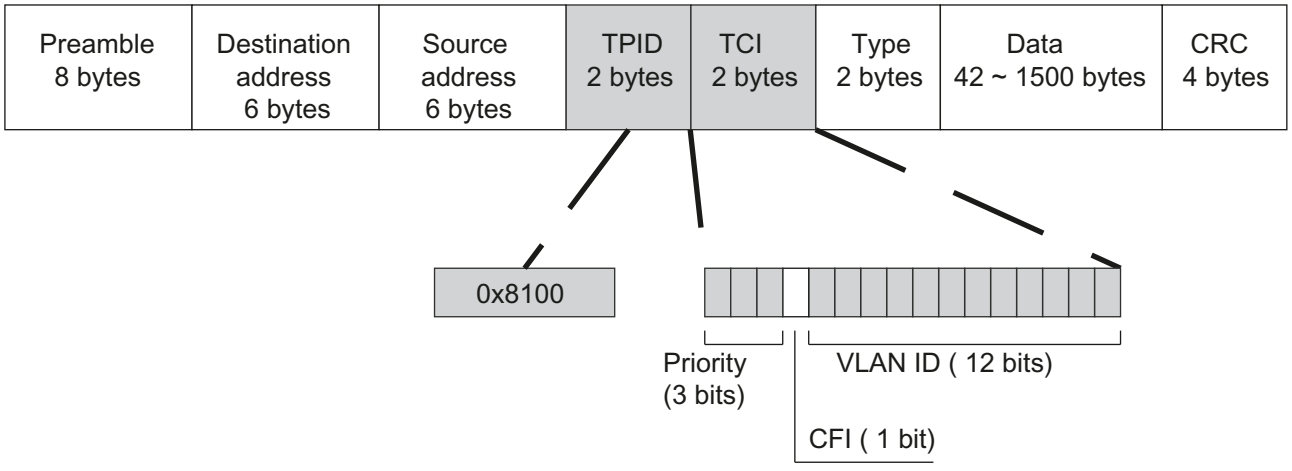

Figure 10-2 Structure of the expanded Ethernet frame

The additional bytes contain the tag protocol identifier (TPID) and the tag control information (TCI).

Tag protocol identifier (TPID)

The first 2 bytes form the Tag Protocol Identifier (TPID) and always have the value 0x8100. This value specifies that the data packet contains VLAN information or priority information.

Tag Control Information (TCI)

The 2 bytes of the Tag Control Information (TCI) contain the following information:

CoS prioritization

The tagged frame has 3 bits for the priority that is also known as Class of Service (CoS). The priority according to IEEE 802.1p is as follows:

CoS bits	Type of data
000	Non time-critical data traffic (less then best effort [basic setting])
001	Normal data traffic (best effort [background])
010	Reserved (standard)
011	Reserved (excellent effort)
100	Data transfer with max. 100 ms delay
101	Guaranteed service, interactive multimedia
110	Guaranteed service, interactive voice transmission
111	Reserved

The prioritization of the data packets is possible only if there is a queue in the components in which they can buffer data packets with lower priority.

The device has eight parallel queues in which the frames with different priorities can be processed. First, the frames with the highest priority ("Strict Priority" method) are processed. This method ensures that the frames with the highest priority are sent even if there is heavy data traffic.

Canonical Format Identifier (CFI)

The CFI is required for compatibility between Ethernet and the token Ring.
The values have the following meaning:

Value	Meaning
0	The format of the MAC address is canonical. In the canonical representation of the MAC address, the least significant bit is transferred first. Standard-setting for Ethernet switches.
1	The format of the MAC address is not canonical.

VLAN ID

In the 12-bit data field, up to 4096 VLAN IDs can be formed. The following conventions apply:

VLAN ID	Meaning
0	The frame contains only priority information (priority tagged frames) and no valid VLAN identifier.
1 - 4094	Valid VLAN identifier, the frame is assigned to a VLAN and can also include priority information.
4095	Reserved

SNMP

Introduction

With the aid of the Simple Network Management Protocol (SNMP), you monitor and control network elements from a central station, for example routers or switches. SNMP controls the communication between the monitored devices and the monitoring station.

Tasks of SNMP:

- Monitoring of network components
- Remote control and remote parameter assignment of network components
- Error detection and error notification

In versions v1 and v2c, SNMP has no security mechanisms. Each user in the network can access data and also change parameter assignments using suitable software.

For the simple control of access rights without security aspects, community strings are used.

The community string is transferred along with the query. If the community string is correct, the SNMP agent responds and sends the requested data. If the community string is not correct, the SNMP agent discards the query. Define different community strings for read and write permissions. The community strings are transferred in plain text.

Standard values of the community strings:

- public
  has only read permissions
- private
  has read and write permissions

Note

Because the SNMP community strings are used for access protection, do not use the standard values "public" or "private". Change these values following the initial commissioning.

Further simple protection mechanisms at the device level:

- Allowed Host
  The IP addresses of the monitoring systems are known to the monitored system.
- Read Only
  If you assign "Read Only" to a monitored device, monitoring stations can only read out data but cannot modify it.

SNMP data packets are not encrypted and can easily be read by others.

The central station is also known as the management station. An SNMP agent is installed on the devices to be monitored with which the management station exchanges data.

The management station sends data packets of the following type:

- GET
  Request for a data record from the agent
- GETNEXT
  Calls up the next data record.
- GETBULK (available as of SNMPv2)
  Requests multiple data records at one time, for example several rows of a table.
- SET
  Contains parameter assignment data for the relevant device.

The SNMP agent sends data packets of the following type:

- RESPONSE
  The agent returns the data requested by the manager.
- TRAP
  If a certain event occurs, the SNMP agent itself sends traps.

SNMPv1 and SNMPv2 and SNMPv3 use UDP (User Datagram Protocol). The data is described in a Management Information Base (MIB).

SNMPv3

Compared with the previous versions SNMPv1 and SNMPv2. SNMPv3 introduces an extensive security concept.

SNMPv3 supports:

- Fully encrypted user authentication
- Encryption of the entire data traffic
- Access control of the MIB objects at the user/group level

Spanning Tree

Avoiding loops on redundant connections

The spanning tree algorithm allows network structures to be created in which there are several connections between two stations. Spanning tree prevents loops being formed in the network by allowing only one path and disabling the other (redundant) ports for data traffic. If there is an interruption, the data can be sent over an alternative path. The functionality of the spanning tree algorithm is based on the exchange of configuration and topology change frames.

Definition of the network topology using the configuration frames

The devices exchange configuration frames known as BPDUs (Bridge Protocol Data Unit) with each other to calculate the topology. The root bridge is selected and the network topology created using these frames. BPDUs also bring about the status change of the root ports.

The root bridge is the bridge that controls the spanning tree algorithm for all involved components.

Once the root bridge has been specified, each device sets a root port. The root port is the port with the lowest path costs to the root bridge.

Response to changes in the network topology

If nodes are added to a network or drop out of the network, this can affect the optimum path selection for data packets. To be able to respond to such changes, the root bridge sends configuration messages at regular intervals. The interval between two configuration messages can be set with the "Hello Time" parameter.

Keeping configuration information up to date

With the "Max Age" parameter, you set the maximum age of configuration information. If a bridge has information that is older than the time set in Max Age, it discards the message and initiates recalculation of the paths.

New configuration data is not used immediately by a bridge but only after the period specified in the "Forward Delay" parameter. This ensures that operation is only started with the new topology after all the bridges have the required information.

RSTP, MSTP, CIST

Rapid Spanning Tree Protocol (RSTP)

One disadvantage of STP is that if there is a disruption or a device fails, the network needs to reconfigure itself: The devices start to negotiate new paths only when the interruption occurs. This can take up to 30 seconds. Fur this reason, STP was expanded to create the "Rapid Spanning Tree Protocol" (RSTP, IEEE 802.1w). This differs from STP essentially in that the devices are already collecting information about alternative routes during normal operation and do not need to gather this information after a disruption has occurred. This means that the reconfiguration time for an RSTP controlled network can be reduced to a few seconds.
This is achieved by using the following functions:

- Edge ports (end node port)
  Edge ports are ports connected to an end device.
  A port that is defined as an edge port is activated immediately after connection establishment. If a spanning tree BPDU is received at an edge port, the port loses its role as edge port and it takes part in (R)STP again. If no further BPDU is received after a certain time has elapsed (3 x hello time), the port returns to the edge port status.
- Point-to-point (direct communication between two neighboring devices)

  By directly linking the devices, a status change (reconfiguration of the ports) can be made without any delays.
- Alternate port (substitute for the root port)

  A substitute for the root port is configured. If the connection to the root bridge is lost, the device can establish a connection over the alternate port without any delay due to reconfiguration.
- Reaction to events

  Rapid spanning tree reacts to events, for example an aborted connection, without delay. There is no waiting for timers as in spanning tree.
- Counter for the maximum bridge hops
  The number of bridge hops a package is allowed to make before it automatically becomes invalid.
  In principle, therefore with rapid spanning tree, alternatives for many parameters are preconfigured and certain properties of the network structure taken into account to reduce the reconfiguration time.

Multiple Spanning Tree Protocol (MSTP)

The Multiple Spanning Tree Protocol (MSTP) is a further development of the Rapid Spanning Tree Protocol. Among other things, it provides the option of operating several RSTP instances within different VLANs or VLAN groups and, for example, making paths available within the individual VLANs that the single Rapid Spanning Tree Protocol would globally block.

Note

Default setting

HTTP is enabled as default on the device.

Common and internal Spanning Tree (CIST)

CIST identifies the internal instance used by the switch that is comparable in principle with an internal RSTP instance.

Routing function

Introduction

The term routing describes the specification of routes for communication between different networks; in other words, how does a data packet from subnet A get to subnet B.

SCALANCE X supports the following routing functions:

- Static routing
  With static routing, the routes are entered manually in the routing table.
- Router redundancy
  With standardized VRRP (Virtual Router Redundancy Protocol), the availability of important gateways is increased by redundant routers.
- Dynamic routing
  The entries in the routing table are dynamic and are updated continuously. The entries are created with one of the following dynamic routing protocols:
  - OSPFv2
  - RIPv2

Static routing

The route is entered manually in the routing table. Enter the route in the routing table on the "Layer 3 > Routes" page.

OSPFv2

Dynamic routing with OSPFv2

OSPF (Open Shortest Path First) is a cost-based routing protocol. To calculate the shortest and most cost-effective route, the Short Path First algorithm by Dijkstra is used. OSPF was developed by the IETF (Internet Engineering Task Force).
You configure OSPFv2 in "Layer 3 > OSPFv2".

OSPFv2 divides an autonomous system (AS) into different areas.

Areas in OSPF

The following areas exist:

- Backbone
  The backbone area is area 0.0.0.0. All other areas are connected to this area. The backbone area is connected either directly or via virtual connections with other areas.
  All routing information is available in the backbone area. As a result, the backbone area is responsible for forwarding information between different areas.
- Stub Area
  This area contains the routes within its area within the autonomous system and the standard route out of the autonomous system. The destinations outside this autonomous system are assigned to the standard route.
- Totally Stubby Area
  This area knows only the routes within its area and the standard route out of the area.
- Not So Stubby Area (NSSA)
  This area can forward (redistribute) packets from other autonomous systems into the areas of its own autonomous system. The packets are further distributed by the NSSA router.

Routers of OSPF

OSPF distinguishes the following router types:

- Internal router (IR)
  All OSPF interfaces of the router are assigned to the same area.
- Area Border Router (ABR)
  The OSPF interfaces of the router are assigned to different areas. One OSPF interface is assigned to the backbone area. Where possible, routes are grouped together.
- Backbone Router (BR)
  At least one of the OSPF interfaces is assigned to the backbone area.
- Autonomous System Area Border Router (ASBR)
  One interface of the router is connected to a different AS, for example an AS that uses the routing protocol RIP.

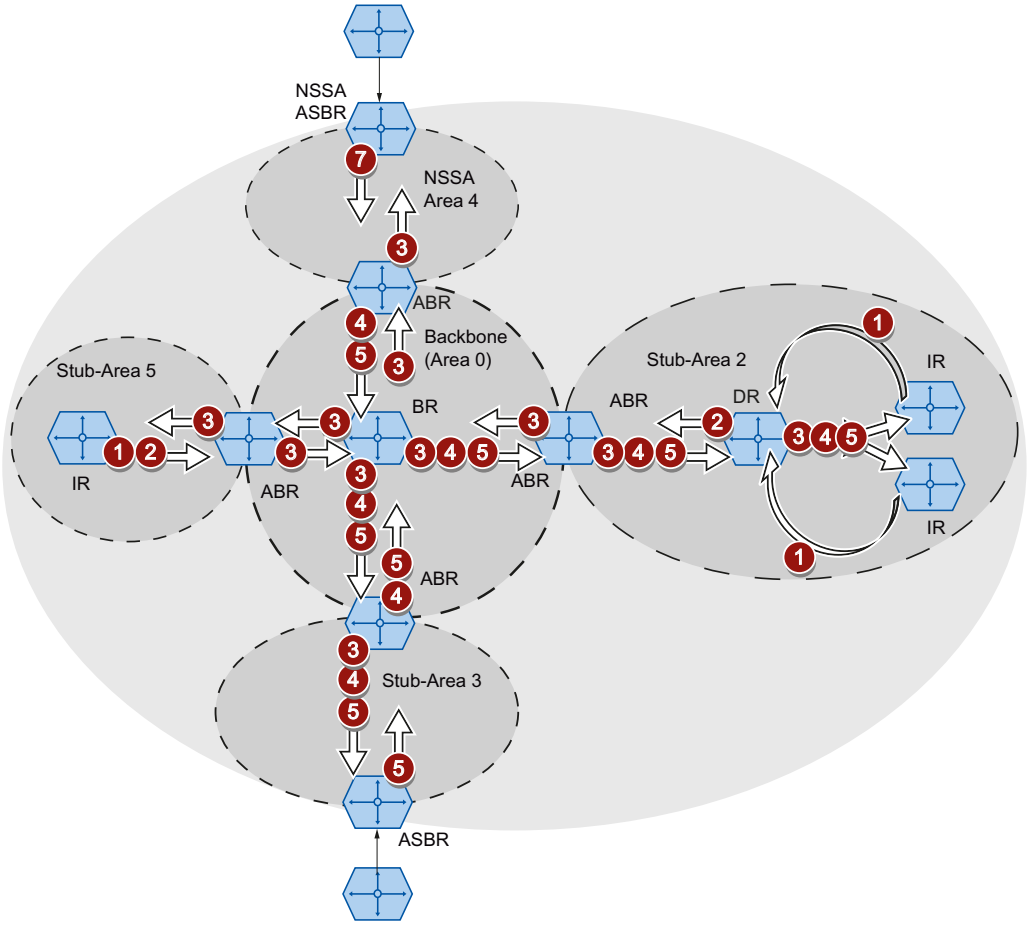
Virtual connection

Each area must be connected to the backbone area. In some situations a direct physical connection is not possible. In this case, a router of the relevant area must be connected to a backbone router via a virtual connection.

LSA types

Within the autonomous system, packets are exchanged that contain information about the connections of a router and the connection status message. The packets are also known as LSAs (Link State Advertisements). The LSAs are always sent from the router to the neighbor router.

If there are changes in the network, LSAs are sent to all routers in the network. The information depends on the LSA type.



1. **Router LSA (LSA Type 1)**
   The LSA Type 1 is only sent within an area. For each active connection of the router that belongs to the area in consideration, an LSA Type 1 is generated. The LSA Type 1 contains information about the status and the costs of the connection, for example IP address, network mask, network type
2. **Network LSA (LSA Type 2)**
   The LSA Type 2 is sent only within an area. For each network that belongs to the relevant area, the router generates an LSA Type 2. If several routers are interconnected in a network, the LSA Type 2 is sent by the designated router (DR). The LSA Type 2 includes the network address, the network mask and a list of routers that are connected to the network
3. **Summary LSA (LSA Type 3 / LSA Type 4)**
   The Summary LSA is generated by the area border router and sent into the area. The
4. Summary LSA contains information about routes outside the area but inside the AS. Where possible, the routes are grouped together.
   - Summary LSA (LSA Type 3)
     The LSA Type 3 describes the routes to the networks and advertises the standard route to the areas.
   - AS Summary LSA (LSA Type 4)
     The LSA Type 4 describes the routes to the ASBR.
5. **External LSA (LSA Type 5 / LSA Type 7)**
   The External LSA is generated by the ASBR. The LSA type depends on the area.
7. - AS External LSA (LSA Type 5)
     The LSA Type 5 is sent by the AS border router into the areas of the autonomous system except the Stub and NSSA areas. The LSA contains information about routes to a network in another AS. The routes are either created manually or learned externally. The ASBR uses LSA Type 5 to distribute standard routes to the backbone area.
   - NSSA External LSA (LSA Type 7)
     The LSA Type 7 is generated by the AS border router of an NSSA. The router is also known as the NSSA ASBR. The LSA Type 7 is sent only within the NSSA. If the P bit in LSA Type 7 = 1, these LSAs are converted to LSA Type 5 by the ABR and sent to the backbone area.

Establishing the neighborhood

The router runs through the following statuses to establish a connection to the neighbor router.

1. Attempt state / Init state
   The router activates OSPF and begins to send and receive Hello packets. Based on the received Hello packets, the router learns which OSPF routers are in its vicinity. The router checks the content of the Hello packet. The Hello packet also contains the list of the neighbor routers (neighbor table) of the "sender".
2. Two way state
   If, for example, the ID of the area, the area type and the settings for the times match, a connection (adjacency) can be established to the neighbor. In a point-to-point network, the connection is established directly. If several neighbor routers can be reached in a network, the designated router (DR) and the designated backup router (DBR) are identified based on Hello packets. The router with the highest router priority becomes the designated router. If two routers have the same router priority, the router with the lower router ID becomes the designated router. The router establishes a connection to the designated router.
3. Exchangestart state
   The neighbor routers decide which router starts communication. The router with the higher router ID becomes master.
4. Exchange state
   The neighbor routers send packets that describe the content of their neighborhood database. The neighborhood database (link state database - LSDB) contains information on the topology of the network.
5. Loading state
   The router completes the received information. If the router still has questions relating to the status of a specific connection, it sends a link state request. The neighbor router sends a response (link state update). The response contains a suitable LSA. The router confirms receipt of the response (link state acknowledge).
6. Full State
   The information exchange with the neighbor router is completed. The neighborhood database of the neighbor router is the same. Based on the Short Path First algorithm, the router calculates a route to every destination. The route is entered in the routing table.

Check the neighborhood

The Hello packets are only used to establish the neighborhood relations. Hello packets are used to check the connection to the neighbor router by sending them cyclically. If no Hello packet is received within a certain interval (dead interval), the connection to the neighbor is marked as "down". The relevant entries are deleted.

Updating the neighborhood database

Once the neighborhood database is established, LSAs are sent to all routers in the network if there are changes in the topology.

RIPv2

Dynamic routing with RIPv2

The Routing Information Protocol (RIPv2) is used to create routing tables automatically. RIPv2 is used in autonomous systems (AS) with a maximum of 15 routers. It is based on the Distance-Vector algorithm.

RIPv2 was developed by the IETF (Internet Engineering Task Force) and is described in RFC 2453.
You configure RIPv2 in "Layer 3 > RIPv2".

Setting up a routing table

Since a router initially only knows its directly connected networks, it sends a request to its direct neighbor routers. As the reply, it receives the routing tables of the neighbor routers. Based on the information it receives, the router set up its own routing table.

The routing table contains entries for all possible destinations. Each entry includes the distance to the destination and the first router on the route.

The distance is also known as the metric. This indicates the number of routers to be passed through on the route to the destination (hop count). The maximum distance is 15 routers (hops).

Updating the routing table

Once the routing table is set up, the router sends its routing table to each direct neighbor router at intervals of 30 seconds.

The router compares new routing information with its existing routing table. If the new information includes shorter routes, the existing routes are overwritten. The router only keeps the shortest route to a destination.

Checking neighbor routers

If a router does not receive messages from a neighbor router for longer than 180 seconds, it marks the router as being invalid. The router assigns the metric 16 for the neighbor router.

Link aggregation

Link aggregation

With link aggregation, several parallel physical connections with the same transmission speed are grouped together to form a logical connection with a higher transmission speed. This method based on IEEE 802.3ad is also known as port trunking or channel bundling.

Link aggregation works only with full duplex connections with the same transmission speed in point-to-point mode. This achieves multiplication of the bandwidth or transmission speed. If part of the connection fails, the data traffic is handled via the remaining parts of the connection.

To control and monitor, the Link Aggregation Control Layer (LACL) and the Link Aggregation Control Protocol (LACP) are used.

Authentication

Authentication method

You can configure the authentication methods "802,1x" and "MAC Authentication" as well as the "Guest VLAN" option separately for each port.

The functions have a hierarchical order. If all three functions are enabled, an attempt is made initially to authenticate the end device using "802.1x". If this authentication is unsuccessful, "MAC Authentication" is started. If this authentication is also unsuccessful, the end device is enabled for communication in the "Guest VLAN". ""Guest VLAN" can only be used if at least one authentication method is active.

The two authentication methods depend on the end device. If the end device supports EAP (Extensible Authentication Protocol), it can be authenticated using the "802.1x" method. If the end device does not support EAP, it can be authenticated using "MAC Authentication". In this case, the IE switch adopts the role of the end device and uses the MAC address of the device as the authentication parameter.

802.1x

The "802.1x" authentication method works as follows:
An end device that supports EAP sends authentication information to the IE switch. The IE switch forwards the information to the authentication server. The authentication server checks the information and allows or denies the end device access to the network.

MAC Authentication

The "MAC Authentication" authentication method works as follows:
As soon as the IE switch receives a frame from the end device, the IE switch sends a query to the RADIUS server to allow or deny the end device access to the network.

Editing properties and parameters

Editing options

You have the following options for editing properties and parameters:

- Hardware and network editor
  Once you have inserted the network component, you can edit the properties and parameters, for example the device name. You will find more detailed information in "Hardware and network editor".
- Web Based Management (WBM)
  The parameters and properties are accessible using the supplied HTML pages (WBM pages). Each WBM page has its own help page that describes the properties and parameters. For further information, refer to the configuration manual "SCALANCE XM400/X-500 Web Based Management". You will find the MIB at Siemens Industry Automation and Drives Service & Support on the Internet under the entry ID 67428305 (http://support.automation.siemens.com/WW/view/en/67428305).
- Command Line Interface
  All the configuration settings for the device can be made using the CLI. The CLI provides the same options as Web Based Management (WBM). For further information, refer to the configuration manual "SCALANCE XM400/X-500 Command Line Interface". You will find the MIB at Siemens Industry Automation and Drives Service & Support on the Internet under the entry ID 67430663 (http://support.automation.siemens.com/WW/view/en/67430663).

Availability

The availability of the settings depends

- on the port type
- on the configuration mode

SCALANCE X distinguishes the following port types:

- Switch port
- Router port

The following configuration modes are available:

- Offline configuration
  You can configure a PC station the first time offline. In this mode only the settings that require no connection to the device are available.
- Online configuration mode
  If there is a connection to the device, there are additional pages available in the Inspector window. These pages include the note "This page is only available if there is an online connection to the device". With some settings, the additional information "only available online" is included.

Creating and deleting an entry

As an example, an entry will be created and deleted on the Syslog client. The procedure is valid on all pages.

Creating a new entry

1. Select the device in the network or device view.
2. Open the properties of the device in the Inspector window.
3. In the Inspector window go to System > Syslog client.
4. Enter the IP address for the Syslog server.
5. Click in the table.
6. Select the entry "New entry" in the shortcut menu.
   A new entry is created in the table.

Deleting an entry

1. Select the required entry in the table.
2. Select the "Delete" entry in the shortcut menu.

Buttons you require often

- **Refresh the display with "Refresh"**
  Pages that display current parameters have a "Refresh" button at the lower edge of the page. Click this button to request up-to-date information from the device for the current page.
- **Save settings for all ports with "Transfer to table"**
  Pages on which you can configure several ports have 2 tables. In the first table, you can make the settings for all ports and transfer these to the second table. In the last column of the first table, there is the "Transfer to table" button. Click this button to save the settings you have made for all ports.

Assigning the IP address

Configuration options

When shipped and after restoring to the factory settings, the device does not have an IP address.

The following options are available to assign an IP address to the device:

- DHCP (default setting)
- Primary Setup Tool
  For further information, refer to the configuration manual "Primary Setup Tool". You will find the MIB at Siemens Industry Automation and Drives Service & Support on the Internet under the entry ID 19440762 (http://support.automation.siemens.com/WW/view/en/19440762).

- STEP 7
- CLI via the serial interface
  For further information, refer to the configuration manual "SCALANCE XM-400/XR-500 Command Line Interface". You will find the configuration manual on the Internet pages of Siemens Industry Automation and Drives Service & Support (http://support.automation.siemens.com/WW/view/en/48805144/133300).

Requirement

- "Set IP address on device" is enabled in the properties of the device. You will find more detailed information in "Addressing PROFINET devices".

Configuring SCALANCE XR-500 as IO device

With a SCALANCE XR500 configured as a PROFINET IO device and assigned to an IO controller, the functions "Compile" and "Download to device" only download the data to the switch that can also be configured in Web Based Management (WBM) (layer 2, layer 3, system, security).

If you want to use the "Compile" or "Download to device" functions for the PROFINET IO device data of the XR500, first select the assigned IO controller.

Show information

Versions

Note

The page is only available if there is an online connection to the device.

This page shows the versions of the hardware and software of the device.

Description

Table 1 has the following columns:

- **Hardware**
  Shows the device being used.
- **Name**
  Shows the name of the device or module.
- **Revision**
  Shows the hardware version of the device.
- **Order ID**
  Shows the order number of the device or module.

Table 2 has the following columns:

- **Software**
  - Firmware
    Shows the current firmware version. If a new firmware file was downloaded and the device has not yet restarted, the firmware version of the downloaded firmware file is displayed here. After the next restart, the downloaded firmware is activated and used.
  - Bootloader
    Shows the version of the boot software stored on the device.
- **Description**
  Shows the short description of the software.
- **Version**
  Shows the version number of the software version.
- **Date**
  Shows the date on which the software version was created.

I&M

Note

The page is only available if there is an online connection to the device.

This page contains information about device-specific vendor and maintenance data such as the order number, serial number, version number etc. You cannot configure anything on this page.

Description of the displayed values

The table has the following rows:

- **Manufacturer ID**
  Shows the manufacturer ID.
- **Order number**
  Shows the order number.
- **Serial number**
  Shows the serial number.
- **Hardware revision**
  Shows the hardware version.
- **Software version**
  Shows the software version.
- **Revision counter**
  Shows the revision counter: Counter for revisions since the initial commissioning
- **Revision Date**
  Date and time of the last revision

- **Function tag**
  Shows the function tag (plant designation) of the device. The plant designation (HID) is created during configuration of the device with HW Config of STEP 7.
- **Location tag**
  Shows the location tag of the device. The location identifier (LID) is created during configuration of the device with HW Config of STEP 7.

ARP table

Note

The page is only available if there is an online connection to the device.

Assignment of MAC address and IP address

With the Address Resolution Protocol (ARP), there is a unique assignment of MAC address to IPv4 addresses. This assignment is kept by each network node in its own separate ARP table. The page shows the ARP table of the device.

Displayed values

The table has the following columns:

- **Interface**
  Shows the interface via which the row entry was learnt.
- **MAC address**
  Shows the MAC address of the target device.
- **IP address**
  Shows the IP address of the target device.
- **Media Type**
  Shows the type of connection.
  - Dynamic
    The device recognized the address data automatically.
  - Static
    The addresses were entered as static addresses

Log table

Logging events

Note

The page is only available if there is an online connection to the device.

The device allows you to log events that occur, some of which you can specify in " System > Events". This, for example, allows you to record when an authentication attempt failed or when the connection status of a port has changed. The content of the events log table is retained even when the device is turned off.

Settings

- **Severity Filters**
  You can filter the entries in the table according to severity. To display all the entries, enable or disable all settings.
  - Info
    Information (6)
  - Warning
    Warnings (4)
  - Critical
    Critical (2)

Displayed values

The table has the following columns:

- **Restart**
  Counts the number of restarts since you last reset to factory settings and shows the device restart after which the corresponding event occurred.
- **System up time**
  Shows the time the device has been running since the last restart when the described event occurred.
  If the system time is set, the time is also displayed at which the event occurred.
- **System Time**
  Shows the date and time of the device.
- **Severity**
  Shows the severity.
- **Log Message**
  Displays a brief description of the event that has occurred.

Buttons

- **Delete**
  Click this button to delete the content of the event log file. The display is also cleared. The restart counter is only reset after you have restored the device to the factory settings and restarted the device.

  Note

  The number of entries in this table is restricted to 400. When this number is reached, the oldest entries are overwritten. The table remains permanently in memory.

Fault

Error status

Note

The page is only available if there is an online connection to the device.

This page displays any errors that occur. If there are no more unanswered error/fault messages, the fault LED goes off.

The time calculation always begins after the last system start. When the system is restarted, a new entry with the type of restart is created in the fault memory.

Description of the displayed values

- **No. of Signaled Faults**
  Shows the number of reported faults.

The table contains the following columns:

- **Fault Time**
  Shows the time the device has been running since the last restart when the described error/ fault occurred.
- **Fault description**
  Display of the fault state for the device.
- **Clear Fault State**
  When you can delete faults, the "Clear Fault State" button is enabled.

Redundancy

Spanning Tree

Note

The page is only available if there is an online connection to the device.

The page shows the current information about the Spanning Tree and the settings of the root bridge.

- If Spanning Tree is turned off, only the basic information about this device is displayed.
- If Spanning Tree is activated, the following is displayed:
  - Parameters of the selected instance
  - Parameters for the ports of the selected instance

  The information depends on the selected Spanning Tree mode.

Displayed values

- **Spanning Tree Mode**
  Shows the set mode. You specify the mode in "Layer 2 > MSTP > General".
  The following values are possible:
  - '-'
  - STP
  - RSTP
  - MSTP
- **Instance ID**
  Shows the number of the instance. The parameter depends on the configured mode.
- **Bridge Priority / Root Priority**
  Which device becomes the root bridge is decided by the bridge priority. The bridge with the highest priority (in other words, with the lowest value for this parameter) becomes the root bridge. If several devices in a network have the same priority, the device whose MAC address has the lowest numeric value will become the root bridge. Both parameters, bridge priority and MAC address together form the bridge identifier. Since the root bridge manages all path changes, it should be located as centrally as possible due to the delay of the frames. The value for the bridge priority is a whole multiple of 4096.
- **Bridge address / root address**
  The bridge address shows the MAC address of the device and the root address shows the MAC address of the root bridge.
- **Root Cost**
  Shows the path costs from the device to the root bridge.
  In MSTP mode, the path costs as far as the root bridge of the CIST are displayed.
- **Bridge Status**
  Shows the status of the bridge, e.g. whether or not the device is the root bridge.
- **Regional root priority** (available only with MSTP)
  For a description, see Bridge priority / Root priority.
- **Regional root address** (available only with MSTP)
  Shows the MAC address of the device.
- **Regional root costs** (only available with MSTP)
  The path costs from this device to the regional root bridge.

The table has the following columns:

- **Port**
  Shows the port via which the device communicates.
- **Role**
  Shows the status of the port. The following values are possible:
  - Disabled
    The port was removed manually from the spanning tree and will no longer be taken into account by the spanning tree.
  - Designated
    The ports leading away from the root bridge.
  - Alternate
    The port with an alternative route to a network segment
  - Backup
    If a switch has several ports to the same network segment, the "poorer" port becomes the backup port.
  - Root
    The port that provides the best route to the root bridge.
  - Master
    This port points to a root bridge located outside the MST region.
- **Status**
  Displays the current status of the port. The values are only displayed. The parameter depends on the configured protocol. The following statuses are possible:
  - Discarding
    The port receives BPDU frames. Other incoming or outgoing frames are discarded.
  - Listening
    The port receives and sends BPDU frames. The port is involved in the spanning tree algorithm. Other outgoing and incoming frames are discarded.
  - Learning
    The port actively learns the topology; in other words, the node addresses. Other outgoing and incoming frames are discarded.
  - Forwarding
    Following the reconfiguration time, the port is active in the network. The port receives and sends data frames.
- **Oper. Version**
  Describes the type of spanning tree in which the port operates
- **Priority**
  If the path calculated by the spanning tree is possible over several ports of a device, the port with the highest priority (in other words the lowest value for this parameter) is selected. A value between 0 and 240 can be entered for the priority in steps of 16. If you enter a value that cannot be divided by 16, the value is automatically adapted.

- **Path costs**
  This parameter is used to calculate the path that will be selected. The path with the lowest value is selected. If several ports of a device have the same value, the port with the lowest port number will be selected.
  If the value "Cost Calc." is "0", the automatically calculated value is displayed. Otherwise, the value of "Cost Calc." is displayed.
  The calculation of the path costs is largely based on the transmission speed. The higher the achievable transmission speed is, the lower the value of the path costs.
  Typical values for path costs with rapid spanning tree:
  - 10,000 Mbps = 2,000
  - 1000 Mbps = 20,000
  - 100 Mbps = 200,000
  - 10 Mbps = 2,000,000.
- **Edge type**
  Shows the type of the connection. The following values are possible:
  - Edge Port

    An edge port is connected to this port.
  - No Edge Port
    There is a spanning tree or rapid spanning tree device at this port.
- **P.t.P. Type**
  Shows the type of point-to-point link. The following values are possible:
  - P.t.P.
    With half duplex, a point-to-point link is assumed.
  - Shared Media

    With a full duplex connection, a point-to-point link is not assumed.

VRRP statistics

Introduction

Note

The page is only available if there is an online connection to the device.

This page shows the statistics of the VRRP protocol and all configured virtual routers.

Description of the displayed values

The following fields are displayed:

- VRID errors
  Shows how many VRRP frames containing an unsupported VRID were received.
- Version errors
  Shows how many VRRP frames containing an invalid version number were received.
- Checksum errors
  Shows how many VRRP frames containing an invalid checksum were received.

The table has the following columns:

- Interfaces
  Interface to which the settings relate.
- VRID
  Shows the ID of the virtual router.
  Valid values are 1 to 255.
- Change to master status
  Shows how often this virtual router changed to the "Master" role.
- Advertisements recd.
  Shows how often a VRRP frame was received that contained a bad address list.
- Advertisement Interval Errors
  Shows how many bad VRRP packets were received whose interval does not match the value set locally.
- IP TTL errors
  Shows how many bad VRRP packets were received whose TTL (Time to live) value in the IP header is incorrect.
- Prio 0 received
  Shows how many VRRP packets with priority 0 were received. VRRP packets with priority 0 are sent when a master router is shut down. These packets allow a fast handover to the relevant backup router.
- Prio 0 sent
  Shows how many VRRP packets with priority 0 were sent. Packets with priority 0 are sent when a master router is shut down. These packets allow a fast handover to the relevant backup router.
- Invalid Type
  Shows how often a VRRP packet was received that had the wrong type.
- Address List Errors
  Shows the number of errors in the address list.
- Invalid Auth. Type
  Shows how many bad VRRP packets were received whose authentication type was not type 0. Type 0 means "no authentication".

- **Auth. Type Mismatch**
  Shows how many bad VRRP frames were received whose authentication type does not match.
- **Frame length error**
  Shows how many bad VRRP frames were received whose length is not correct.

Ring Redundancy

Note

The page is only available if there is an online connection to the device.

Automatic Redundancy Detection (ARD) is the default when the device ships. If you want to use the previous High Speed Redundancy Protocol (HRP), HRP must be configured.

- Reconfiguration time of the frame traffic following a failover in MRP: 200 ms
- Reconfiguration time of the frame traffic following a failover in HRP: 300 ms

This page informs you about the values currently set for the device.

Description

The following fields are displayed:

- **Redundancy Function**
  The following values are shown:
  - Disabled
    Ring redundancy is disabled on the device.
  - MRP Manager
    The device is operating as MRP manager.
  - MRP Client
    The device is operating as MRP client.
  - HRP Client
    The device is operating as HRP client.
  - HRP Manager
    The device is operating as HRP manager.
- **RM Status**
  The "RM Status" column shows whether or not the IE switch is operating as redundancy manager and whether it has opened or closed the ring in this role.
  - Passive
    The IE switch is operating as redundancy manager and has opened the ring; in other words, the line of switches connected to the ring ports is operating problem free. The passive status is also displayed if the IE switch is not operating as the redundancy manager (RM Function Disabled).
  - Active
    The IE switch is operating as redundancy manager and has closed the ring; in other words, the line of switches connected to the ring ports is interrupted (problem). The redundancy manager connects its ring ports through and restores an uninterrupted linear topology.
  - If media redundancy in ring topologies is completely disabled, ring ports configured last are displayed and the text "Ring Redundancy disabled" is displayed.
- **Observer Status**
  Shows the current status of the observer.
- **Ring ports**
  Ring ports 1 and ring port 2 show the ports used for redundancy.
- **No. of Changes to RM Active State**
  Shows how often the device as redundancy manager switched to the active status, i.e. closed the ring.
  If the redundancy function is disabled or the device is not the HRP/MRP manager, the text "Redundancy manager disabled" appears.
- **Max. delay of the RM test frames [ms]**
  Shows the maximum delay for test frames of the redundancy manager.
  If the redundancy function is disabled or the device is not the HRP/MRP manager, the text "Redundancy manager disabled" appears.

Standby

Note

The page is only available if there is an online connection to the device.

This page shows the standby status of the device.

For more information on Ethernet cabling and the topological location of master and slave, refer to the "Industrial Ethernet Network Manual".

Description

The following fields are displayed:

- **Standby ports**
  Shows the ports being used.
- **Standby name**
  Shows the name for the standby connection. The master/slave device pair is defined by this name (both must be in the same ring). This is achieved by entering the same name on two devices in the ring. You can select any name to suit your purposes, however, you can only use the name for one pair of devices in the entire network.
- **Standby Function**
  Shows whether the standby connection is activated or deactivated.
  - Master
    The device has a connection to the partner device and is operating as master. In normal operation, the standby port of this device is active.
  - Slave
    The device has a connection to the partner device and is operating as slave. In normal operation, the standby port of this device is inactive.
  - Disabled
    The standby link is disabled. The device is operating neither as master nor slave. The port configured as a standby port works as a normal port without standby function.
  - Waiting for Connection...
    No connection has yet been established to the partner device. The standby port is inactive. In this case, either the configuration on the partner device is inconsistent (for example incorrect connection name, standby link disabled) or there is a physical fault (for example device failure, link down).
  - Connection Lost
    The existing connection to the partner device has been lost. In this case, either the configuration on the partner device was modified (for example a different connection name, standby link disabled) or there is a physical fault (for example device failure, link down).

- **Standby status**
  Shows the status of the standby port:
  - Active
    The standby port of this device is active; in other words is enabled for frame traffic.
  - Passive
    The standby port of this device is inactive; in other words is blocked for frame traffic.
  - "-"
    The standby function is disabled.
- **No. of Changes to Standby Active State**
  Shows how often the IE switch has changed the standby status from "Passive" to "Active". If the connection of a standby port fails on the standby master, the IE switch changes to the "Active" status.
  Following each restart on the device, the counters are automatically reset.

Ethernet Statistics

Interface statistics

Interface statistics

The page shows the statistics from the interface table of the Management Information Base (MIB).

Note

The page is only available if there is an online connection to the device.

Displayed values

The table has the following columns:

- **Received bytes**
  Shows the number of received bytes.
- **Sent bytes**
  Shows the number of sent bytes.
- **Received unicast frames**
  Shows the number of received unicast frames.
- **Received non-unicast frames**
  Shows the number of received frames that are not of the type unicast.
- **Sent unicast frames**
  Shows the number of sent unicast frames.
- **Sent non-unicast frames**
  Shows the number of sent frames that are not of the type unicast.

Frame length

Frames sorted by length

This page displays how many frames of which size were sent and received at each port.

Note

The page is only available if there is an online connection to the device.

Displayed values

The table has the following columns:

- **Port**
  Shows the available ports and link aggregations.

  Note

  Display of frame statistics

  In the statistics relating to frame lengths, note that both incoming and outgoing frames are counted.

- **Frame lengths**
  The other columns after the port number contain the absolute numbers of frames according to their frame length.
  The following frame lengths are distinguished:
  - 64 bytes
  - 65 - 127 bytes
  - 128 - 255 bytes
  - 256 - 511 bytes
  - 512 - 1023 bytes
  - 1024 - max.

Button

Reset Counter

Click "Reset Counter" to reset all counters. The counters are also reset by a restart.

Frame type

Received frames sorted by type

This page displays how many frames of the type "unicast", "multicast", and "broadcast" were received at each port.

Note

The page is only available if there is an online connection to the device.

Displayed values

The table has the following columns:

- **Port**
  Shows the available ports and link aggregations.
- **Unicast / Multicast / Broadcast**
  The other columns after the port number contain the absolute numbers of the incoming frames according to their frame type "unicast", "multicast" and "broadcast".

Button

Reset Counter

Click "Reset Counter" to reset all counters. The counters are also reset by a restart.

Packet Errors

Received bad frames

This page shows how many bad frames were received per port.

Note

The page is only available if there is an online connection to the device.

Displayed values

The table has the following columns:

- **Port**
  Shows the available ports and link aggregations.
- **Error types**
  The other columns after the port number contain the absolute numbers of the incoming frames according to their error type.
  In the columns of the table, a distinction is made according to the following error types:
  - CRC
    Frames whose content does not match the CRC checksum.
  - Undersize
    Frames with a length less than 64 bytes.
  - Oversize
    Frames discarded because they were too long.
  - Fragments
    Frames with a length less than 64 bytes and a bad CRC checksum.
  - Jabbers
    VLAN-tagged frames with an incorrect CRC checksum that were discarded because they were too long.
  - Collisions
    Collisions that were detected.

Button

Reset Counter

Click "Reset Counter" to reset all counters. The counters are also reset by a restart.

History

Samples of the statistics

The page shows samples from each port with information from the statistics.

Note

The page is only available if there is an online connection to the device.

Settings

- **Port**
  Select the port for which the history will be displayed.

Displayed values

- **Entries**
  Maximum number of samples that can be saved at the same time.
- **Interval [s]**
  Interval after which the current status of the statistics will be saved as a sample.

The table has the following columns:

- **Sample**
  Number of the sample
- **Time for the Sample**
  System up time at which the sample was taken.
- **Unicast**
  Number of received unicast frames.
- **Multicast**
  Number of received multicast frames.
- **Broadcast**
  Number of received broadcast frames.
- **CRC**
  Number of frames with a bad CRC checksum.
- **Undersize**
  Number of frames that are shorter than 64 bytes.
- **Oversize**
  Number of frames discarded because they were too long.
- **Fragments**
  Number of frames that are shorter than 64 bytes and have a bad CRC checksum.
- **Jabbers**
  Number of frames with a VLAN tag that have a bad CRC checksum and will be discarded because they are too long.
- **Collisions**
  Number of collisions of received frames.
- **Utilization**
  Utilization of the port during a sample.

Unicast

This page shows the learnt and static unicast MAC addresses.

Description

- **VLAN ID**
  Shows the VLAN-ID assigned to this MAC address.
- **MAC Address**
  Shows the MAC address of the node that the device has learned or the user has configured.

- **Status**
  Shows the status of each address entry:
  - Learnt
    The specified address was learned by receiving a frame from this node and will be deleted when the aging time expires if no further packets are received from this node.
  - Static
    Configured by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the switch is restarted.
- **Port**
  Shows the port via which the node with the specified address can be reached. Frames received by the device whose destination address matches this address will be forwarded to this port.

Multicast

This page shows the learnt and static multicast MAC addresses.

Description

- **VLAN ID**
  Shows VLAN ID of the VLAN to which the MAC multicast address is assigned.
- **MAC Address**
  Shows the MAC multicast address that the device has learned or the user has configured.
- **Status**
  Shows the status of each address entry. The following information is possible:
  - static
    The address was entered statically by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the device is restarted. These must be deleted by the user.
  - IGMP
    The destination port for this address was obtained by IGMP configuration.
  - GMRP
    The destination port for this address was registered by a received GMRP frame.

LLDP

Note

The page is only available if there is an online connection to the device.

Identifying the network topology

Using LLDP, network components exchange information about the topology of the network.

Description of the displayed values

The table contains the following columns:

- **Device ID**
  Device ID of the connected device.
- **Local interface**
  Port at which the IE switch received the information.
- **Hold Time**
  An entry remains stored in the MIB for the time specified here. If the IE switch does not receive any new information from the connected device during this time, the entry is deleted.
- **Capability**
  Shows the properties of the connected device:
  - (R) Router
  - (B) Bridge
  - (T) Telephone
  - (C) DOCSIS cable device
  - (W) WLAN access point
  - (P) Repeater
  - (S) Station
  - (O) Other
- **Port ID**
  Port of the device with which the IE switch is connected.

Routing

Routing table

This page shows the routing table of the device.

Description

The table has the following columns:

- **Destination network**
  Shows the destination address of this route.
- **Subnet mask**
  Shows the subnet mask of this route.
- **Gateway**
  Shows the gateway for this route.
- **Interface**
  Shows the interface for this route.

- **Metric**
  Shows the metric of the route. The higher value, the longer the packets require to their destination.
- **Routing protocol**
  Shows the routing protocol from which the entry in the routing table originates. The following entries are possible:
  - Connected: Connected routes
  - Static: Static routes
  - RIP: Routes using RIP
  - OSPF: Routes using OSPF
  - other: Other routes

OSPFv2 interfaces

Overview

Note

The page is only available if there is an online connection to the device.

This page shows the configuration of the OSPF interface.

Description of the displayed values

The table has the following columns:

- **IP address**
  Shows the IP address of the OSPF interface
- **Area ID**
  Shows the Area ID to which the OSPF interface belongs.

- **Interface Status**
  Shows the status of the WLAN interface:
  - Down
    The interface is not available.
  - Loopback
    Loopback interface
  - Waiting
    Startup and negotiation of the interface.
  - Point to Point
    Point-to-point connection
  - Designated Router
    The router is a designated router and generates a network LSA.
  - Backup D. Router
    The router is backup for the designated router.
  - Other D. Router
    The interface is started up. The router is neither a designated router nor a backup designated router.
- **OSPF status**
  Shows the status of OSPF.
  - Enabled: OSPF is enabled on the interface.
  - Disabled: OSPF is disabled on the interface.
- **Designated Router**
  Shows the IP address of the designated router for this OSPF interface.
- **Backup Designated Router**
  Shows the IP address of the designated backup router for this OSPF interface.
- **Events**
  Shows the number of status changes of OSPF.

OSPFv2 neighbors

Note

The page is only available if there is an online connection to the device.

This page shows the dynamically detected neighbor routers in the relevant networks.

Description of the displayed values

The table has the following columns:

- **IP address**
  Shows the IP address of the neighbor router in this network.
- **Router ID**
  Shows the ID of the neighbor router. The two addresses can match.

- **Status**
  Shows the status of the neighbor router. The status can adopt the following values:
  - unknown
    Status of the neighbor router is unknown.
  - down
    The neighbor router cannot be reached.
  - attempt and init
    Short-lived statuses during initialization
  - two-way
    Two-way receipt of Hello packets. Specification of the designated router and the designated backup router.
  - exchangestart, exchange and loading
    Status during exchange of the LSAs
  - full
    The database is complete and synchronized within the area. The routes can now be detected.

  Note

  Normal status

  If the partner router is a designated router or a designated backup router, the status is "full". Otherwise the status is "two-way".

- **Assoc. Area Type**
  Shows the area type via which the neighbor-neighbor relation is maintained. The following area types exist:
  - Normal
  - Stub
  - NSSA
  - Backbone
- **Priority**
  Shows the priority of the neighbor router. This is only significant when selecting the designated router on a network. For virtual neighbor routers, this information is irrelevant.
- **Hello Suppr.**
  Shows whether there are suppressed Hello packets to the virtual neighbor router.
  - no: There are no suppressed Hello packets (default).
  - yes: There are suppressed Hello packets.
- **Hello Queue**
  Shows the length of the queue with Hello packets still to be transmitted.
- **Events**
  Shows the number of status changes.

OSPFv2 virtual neighbors

Note

The page is only available if there is an online connection to the device.

This page shows the configured virtual neighbor routers.

Overview

The table has the following columns:

- **IP address**
  Shows the IP address of the virtual neighbor router in this network.
- **Router ID**
  Shows the router ID of the virtual neighbor router.
- **Status**
  Shows the status of the neighbor router. The status can adopt the following values:
  - unknown
    Status of the neighbor router is unknown.
  - down
    The neighbor router cannot be reached.
  - attempt and init
    Short-lived statuses during initialization
  - two-way
    Two-way receipt of Hello packets. Specification of the designated router and the designated backup router.
  - exchangestart, exchange and loading
    Status during exchange of the LSAs
  - full
    The database is complete and synchronized within the area. The routes can now be detected.

    Note

    Normal status

    If the partner router is a designated router or a designated backup router, the status is "full". Otherwise the status is "two-way".
- **Trans. Area ID**
  Shows the ID of the area via which the virtual neighborhood relation exists.
- **Hello Suppr.**
  Shows whether there are suppressed Hello packets to the virtual neighbor router.
  - no: There are no suppressed Hello packets (default)
  - yes: There are suppressed Hello packets.

- **Hello Queue**
  Shows the length of the queue with Hello packets still to be transmitted.
- **Events**
  Shows the number of status changes.

OSPFv2 LSDB

Overview

Note

The page is only available if there is an online connection to the device.

The link state database is the central database for managing all links within an area. It consists of the link state advertisements (LSAs). The most important data of these LSAs is shown on the this WBM page.

Description of the displayed boxes

The table has the following columns:

- **Area ID**
  Shows the ID of the area to which the LSA belongs. If the LSA is an external connection, '-' is displayed.
- **LSA type**
  Shows the LSA type. The following values are possible:
  - unknown
    LSA type is unknown.
  - Router
    The router LSA (Type 1) is sent by the OSPF router within an area. The LSA contains information about the status of all router interfaces.
  - Network
    The network LSA (Type 2) is sent by the designated router within an area. The LSA contains a list of routers connected to the network.
  - NSSA External
    The NSSA external LSA (Type 7) is sent by the NSSA-ASBR within an NSSA. The NSSA-ASBR receives LSAs of Type 5 and converts the information to LSAs of Type 7. The NSSA router can forward these LSAs within an NSSA.
  - Summary
    The summary LSA (Type 3) is sent by the ABR within an area. The LSA contains information about routes to other networks.
  - AS Summary
    The AS summary LSA (Type 4) is sent by the area border router within an area. The LSA contains information about routes to other autonomous systems.
  - AS External
    The AS external LSA (Type 5) is sent by the AS border router within an autonomous system. The LSA contains information about routes from one network to another.
- **Link State ID**
  Shows the ID of the LSA.
- **Router ID**
  Shows the ID of the router that sent this LSA.
- **Sequence number**
  Shows the sequence number of the LSA. Each time an LSA is renewed, this sequence number is incremented by one.

RIPv2 statistics

Overview

Note

The page is only available if there is an online connection to the device.

This page shows the statistics of the RIP interface.

Description of the displayed values

The table has the following columns:

- **IP address**
  Shows the IP address of the RIPv2 interface
- **Bad packets**
  Number of received RIP packets that were deleted and therefore ignored.
- **Bad Routes**
  Number of routes of valid RIP packets that could not be taken into consideration.
- **Updates Sent**
  Shows how often the router has sent its routing table to its neighbor routers.

Configuring system functions

Configuration

On this page, you specify the services with which the device can be accessed. With some services, there are further configuration pages on which more detailed settings can be made.

Settings

- **Telnet Server**
  Enable or disable the "Telnet Server" service for unencrypted access to the CLI.
- **SSH server**
  Enable or disable the "SSH Server" service for encrypted access to the CLI.
- **HTTPS server only**
  Enable or disable access using HTTP.
- **DNS client**
  Enable or disable depending on whether the IE switch should operate as a DNS client. You can configure other settings in "System > DNS Client".
- **SMTP Client**
  Enable or disable the SMTP client. You can configure other settings in "System > SMTP Client".
- **Syslog Client**
  Enable or disable the system event client. You can configure other settings in "System > Syslog client".

- **DCP Server**
  Specify whether or not the device can be accessed with DCP (Discovery and Configuration Protocol):
  - "-" (disabled)
    DCP is disabled. Device parameters can neither be read nor modified.
  - Read/write access
    With DCP, device parameters can be both read and modified.
  - Read-Only
    With DCP, device parameters can be read but cannot be modified.
- **Time**
  Select the required setting. The following settings are possible:
  - Manual
    The system time is set manually.
  - SNTP Client
    The system time is set via an SNTP server. You can configure other settings in "System > System time > SNTP client".
  - NTP Client
    The system time is set via an NTP server. You can configure other settings in "System > System time > NTP client".
  - SIMATIC Time
    The system time is set using a SIMATIC time transmitter. You can configure other settings in "System > System Time SIMATIC Time Client".
  - PTP Client
    The system time is set via a PTP server. You can configure other settings in "System > System Time > PTP Client".
    This function is only available for SCALANCE X500.
- **SNMP**
  Select the required protocol. The following settings are possible:
  - "-" (SNMP disabled)
    Access to device parameters using SNMP is not possible.
  - SNMPv1/v2c/v3
    Access to device parameters is possible with SNMP versions 1, 2c or 3. You can configure other settings in "System > SNMP > General".
  - SNMPv3
    Access to device parameters is possible with SNMP version 3. You can configure other settings in "System > SNMP > General".
- **SNMPv1/v2 Read-Only**
  Enable or disable write access to SNMP variables with SNMPv1/v2c.
- **SNMPv1 traps**
  Enable or disable the sending of SNMP traps (alarm frames). You can configure other settings in "System > SNMP > Traps".

- **NFC (Near Field Communikation)**
  Enable or disable the "NFC" function.
  This function is only available for SCALANCE XM400.
- **Configuration mode**
  Select the required mode. The following modes are possible:
  - Automatic save
    Automatic save mode. Approximately 1 minute after the last parameter change or when you restart the device, the configuration is automatically saved.
  - Trial
    In the "Trial" configuration mode, although changes are adopted, they are not saved in the configuration file (startup configuration).
    To save changes in the configuration file, use the "Write startup config" button. The button is displayed when you set this configuration mode. The display area also shows the message "Trial mode active - Press "Write Startup Config" button to make your settings persistent" as soon as there are unsaved modifications. This message can be seen on every page until the changes made have either been saved or the device has been restarted.

General

Device

This page contains the general device information.

Settings

- **Current System Time**(Only available online)
  Shows the current system time. The system time is either set by the user or by a time-of-day frame: either SINEC H1 time-of-day frame, NTP or SNTP. (readonly)
- **System Up Time**(only available online)
  Shows the operating time of the device since the last restart. (readonly)
- **Device Type**(only available online)
  Shows the type designation of the device. (readonly)
- **System Name**
  You can enter the name of the device. The entered name is displayed in the selection area. A maximum of 255 characters are possible. The system name is also displayed in the CLI input prompt. The number of characters in the CLI input prompt is limited. The system name is truncated after 16 characters.

- **System Contact**
  You can enter the name of a contact person responsible for managing the device.
- **Location**
  You can enter the location of the device. The entered installation location is displayed in the selection area.

Note

The ASCII characters 0x20 to 0x7e are used in the input boxes.

At the start and end of the input boxes"System Name", "System Contact" and "System Location", the characters "<", ">" and "space" are not permitted.

Coordinates

On this page, you configure the geographic coordinates (latitude, longitude and the height above the ellipsoid according to WGS84). These boxes are purely for information with a maximum length of 32 characters.

Getting the coordinates

Use suitable maps for obtaining the geographic coordinates of the device.

The geographic coordinates can also be obtained using a GPS receiver. The geographic coordinates of these devices are normally displayed directly and only need to be entered in the input boxes of this page.

Settings

- **Latitude**
  Enter the north or south latitude for the location of the device.
  For example, +49° 1´ 31.67" means that the device is located at 49 degrees, 1 arc minute and 31.67 arc seconds north latitude.
  A south latitude is shown by a preceding minus character.
  You can also append the letters N (north latitude) or S (south latitude) to the numeric information (49° 1´ 31.67" N).
- **Longitude**
  Enter the value of the eastern or western longitude of the location of the device.
  For example, +8° 20´ 58.73" means that the device is located at 8 degrees, 20 minutes and 58.73 seconds east.
  A western longitude is indicated by a preceding minus sign.
  You can also add the letter E (eastern longitude) or W (western longitude) to the numeric information (8° 20´ 58.73" E).
- **Height**
  Enter the value of the height above sea level in meters.
  For example, 158 m means that the device is located at a height of 158 m above sea level.
  Heights below sea level (for example the Dead Sea) are indicated by a preceding minus sign.

Agent IP

Configuration of the IP addresses

Note

The page is only available if there is an online connection to the device.

On this page, you set the IP configuration for the device.

With devices with more than one IP interface, this call references the "Subnets > Configuration" menu item in the "Layer 3" menu and the configuration of the TIA interface there.

Note

The IP address of the in-band port and the out-band port must belong to different subnets.

Settings

- **IP Address**
  In the input boxes under "In band", enter the IP address, subnet mask and the default gateway. In the input boxes under "Out band", enter the IP address, subnet mask and the default gateway.
  If you change the IP address, the Web browser should automatically set itself to the new address. If this does not happen, enter the new address in the Web browser manually.
- **Subnet mask**
  Here, in "In-band", you enter the subnet mask of the in-band port and in "Out-band" the subnet mask of the out-of-band port.
- **Default Gateway**
  If the device is required to communicate with devices (diagnostics stations, e-mail servers etc.) in another subnet, enter the IP address of the default gateway here. The out-of-band port it is not accessible from a different subnet.
- **Agent VLAN ID**
  From the drop-down list, select the VLAN ID for the in-band management. You can only select VLANs that have already been configured.

  Note

  Changing the agent VLAN ID

  If the configuration PC is connected directly to the device via Ethernet and you change the agent VLAN ID, the device is no longer reachable via Ethernet following the change.

- **MAC Address**
  Shows the MAC address of the device. The MAC address is linked to the hardware and cannot be modified.

DNS client

The DNS () server (Domain Name System) assigns a domain name to an IP address so that a device can be uniquely identified.

If this function is enabled, the IE switch can communicate with a DNS server as a DNS client.

Note

The DNS client function can only be used if there is a DNS server in the network.

Description

The page contains the following boxes:

- **DNS Client**
  Enable or disable depending on whether the IE switch should operate as a DNS client.
- **DNS Server IP Address**
  Enter the IP address of the DNS server.

Restart

On this page, there is a button with which you can restart the device and various options for resetting to the device defaults.

Note

The page is only available if there is an online connection to the device.

Note

Note the following points about restarting a device:

- You can only restart the device with administrator privileges.
- A device should only be restarted with the buttons of this page or with the appropriate CLI commands and not by a power cycle on the device.
- Any modifications you have made only become active on the device after clicking the "Set Values" button on the relevant page. If the device is in "Trial Mode", configuration modifications must be saved manually before a restart. In "Automatic Save" mode, the last changes are saved automatically before a restart.

Settings

The following options are available for restarting:

- **Restart**
  Click this button to restart the system. You must confirm the restart in a dialog box. During a restart, the device is reinitialized, the internal firmware is reloaded, and the device runs a self-test. The learned entries in the address table are deleted. You can leave the browser window open while the device restarts. You then need to log in again:
- **Restore Factory Defaults and Restart**
  Click this button to restart the system. You must confirm the restart in a dialog box. During a restart, the device is reinitialized, the internal firmware is reloaded, and the device runs a self-test. The learned entries in the address table are deleted. You can leave the browser window open while the device restarts. You then need to log in again.

Note

By resetting all the defaults to the factory settings, the IP address and the passwords are also lost. Following this, the device can only be accessed using the Primary Setup Tool or using DHCP.

With the appropriate attachment, a previously correctly configured device can cause circulating frames and therefore the failure of the data traffic.

Load & save

Uploading and saving using HTTP

Loading and saving data via HTTP

On this page, you store device data in an external file on your client PC or load such data from an external file from the PC to the devices. This means, for example, that you can also load new firmware from a file located on your client PC.

Note

The page is only available if there is an online connection to the device.
This page is available both for connections using HTTP and for connections using HTTPS.

Note

Incompatibility with previous firmware versions with/without PLUG inserted

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed.

In this situation, if a PLUG is inserted in the device, following the restart, this has the status "Not Accepted" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data. If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually using System > PLUG.

Note

Configuration files and Trial mode/Automatic Save

In "Automatic Save" mode, the data is saved automatically before the configuration files (ConfigPack and Config) are transferred.
In Trial mode, although the changes are adopted, they are not saved in the configuration files (ConfigPack and Config). Use the "Write Startup Config" button on the "System > Configuration" WBM page to save changes in the configuration file.

Settings

The table has the following columns:

- **Type**
  Shows the file type.
- **Description**
  Shows the short description of the file type.
- **Load**
  With this button, you can upload files to the device. The button can be enabled, if this function is supported by the file type.
- **Save**
  With this button, you can save files from the device. The button can only be enabled if this function is supported by the file type and the file exists on the device.
- **Delete**
  With this button, you can delete files from the device. The button can only be enabled if this function is supported by the file type and the file exists on the device.

Loading new firmware

After successfully downloading the firmware, you will be requested to restart the device.

Restart the device and continue to configure the newly started firmware.

Procedure

Loading files using HTTP

1. Start the upload function by clicking the one of the "Load" buttons.
   The dialog for uploading a file opens.
2. Go to the file you want to upload.
3. Click the "Open" button in the dialog.
   The file is now uploaded.
4. When the message "Restart required" appears, click the "Yes" button to trigger the restart.
   If you click the "No" button, there is no device restart. The changes only take effect after a restart.

Saving files using HTTP

1. Start the save function by clicking the one of the "Save" buttons.
2. You will be prompted to select a storage location and a name for the file. Or you accept the proposed file name. To make the selection, use the dialog in your browser. After making your selection, click the "Save" button.

Deleting files using HTTP

1. Start the delete function by clicking the one of the "Delete" buttons.
   The file will be deleted.

Reusing configuration data

If several devices are to receive the same configuration and the IP addresses are assigned using DHCP, the effort for configuration can be reduced by saving and reading in the configuration data.

Follow the steps below to reuse configuration data:

1. Save the configuration data of a configured device on your PC.
2. Download this configuration file to all other devices you want to configure in this way.
3. If individual settings are necessary for specific devices, these must be made online on the relevant device.

Configuration data has a checksum. If you edit the files, you can no longer upload them to the IE switch.

Uploading and saving using TFTP

Loading and saving data via a TFTP server

On this page, you can configure the TFTP server and the file names. You can also store device data in an external file on your client PC or load such data from an external file from the PC to the devices. This means, for example, that you can also load new firmware from a file located on your client PC.

Note

Incompatibility with previous firmware versions with/without PLUG inserted

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed.
In this situation, if a PLUG is inserted in the device, following the restart, this has the status "Not Accepted" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data. If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually on the "System > PLUG page.

Note

Configuration files and Trial mode/Automatic Save

In "Automatic Save" configuration mode, the data is saved automatically before the configuration files (ConfigPack and Config) are transferred.
In the "Trial" configuration mode, although the changes are adopted, they are not saved in the configuration files (ConfigPack and Config). Use the "Write Startup Config" button on the "System > Configuration" WBM page to save changes in the configuration files.

Settings

- **TFTP Server IP Address**
  Here, enter the IP address of the TFTP server with which you exchange data.
- **TFTP Server Port**
  Here, enter the port of the TFTP server via which data exchange will be handled. If necessary, you can change the default value 69 to your own requirements.

The table has the following columns:

- **File type**
  Shows the file type.
- **Description**
  Shows the short description of the file type.
- **File name**
  Enter a file name.
- **Select action** (only available online)
  Select the action from the drop-down list. The selection depends on the selected file type, for example the log file can only be saved.
  The following actions are possible:
  - Save file
    With this selection, you save a file on the TFTP server.
  - Load file
    With this selection, you load a file from the TFTP server.

Events

Configuration

On this page, you specify how the device reacts to events.

Settings

- **Signaling Contact Response**
  Select the behavior of the signaling contact. The following reactions are possible:
  - conventional
    Default setting for the signaling contact. An error/fault is displayed by the fault LED and the signaling contact is opened. When the error/fault state no longer exists, the fault LED goes off and the signaling contact is closed.
  - User-defined
    The way the signaling contact works does not depend on the error/fault that has occurred. The signaling contact can be opened or closed as required by user actions.
- **Signaling Contact Status**
  Select the status of the signaling contact. The following statuses are possible:
  - close
    Signaling contact is closed.
  - open
    Signaling contact is opened.

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports of table 2.
- **E-mail/Trap/Log table/Syslog/Errors**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Event**
  The "Event" column contains the following values:
  - Cold/Warm Start
    The device was turned on or restarted by the user.
  - Link Change
    This event occurs only when the port status is monitored and has changed, see "System > Fault Monitoring > Link Change".
  - Authentication Failure
    This event occurs when attempting access with a bad password.
  - RMON Alarm
    An alarm or event has occurred relating to the remote monitoring of the system.
  - Power Supply Switchover
    This event occurs only when power supply lines 1 and 2 are monitored. It indicates that there was a change to line 1 or line 2, see System > Fault monitoring > Power supply".
  - RM status change
    The status of the redundancy manager has changed
  - Spanning Tree Topology Change
    The STP or RSTP or MSTP topology has changed.
  - Fault State Change
    The fault state has changed. The fault state can relate to the activated port monitoring, the response of the signaling contact or the power supply monitoring.
  - VRRP State Change (only with routing using VRRP)
    The status of the virtual router has changed
  - Loop Detection
    A loop was detected in the network segment.
  - OSPF State Change (only with routing using OSFP)
    The status of OSPF has changed
- **E-mail**
  The device sends an e-mail. This is only possible if the SMTP server is set up and the "SMTP client" function is enabled.
- **Trap**
  The device sends an SNMP trap. This is only possible if "SNMPv1 traps" is enabled in "System > Configuration".
- **Log table**
  The device writes an entry in the log table.
- **Syslog**
  The device writes an entry to the system log server. This is only possible if the system log server is set up and the "Syslog client" function is enabled.
- **Fault**
  The device triggers a fault. The error LED lights up

Severity filter

On this page, set the threshold levels for sending system event notifications.

Settings

The table has the following columns:

- **Client Type**
  Select the client type for which you want to make settings:
  - E-mail
    Sending system event messages by e-mail
  - Log table
    Entry of system events in the log table.
  - Syslog
    Entering system events in the Syslog file
- **Severity**
  Select the required level. The following settings are possible:
  - Info
    System events are processed as of the severity level "Info".
  - Warning
    System events are processed as of the severity level "Warning".
  - Critical
    System events are processed as of the severity level "Critical".

SMTP client

The device provides the option of automatically sending an e-mail if an alarm event occurs (for example to the network administrator). The e-mail contains the identification of the sending device, a description of the cause of the alarm in plain language, and a time stamp. This allows centralized network monitoring to be set up for networks with few nodes based on an E-mail system. When an e-mail error message is received, the WBM can be started by the Internet browser using the identification of the sender to read out further diagnostics information.

On this page, you can configure up to three SMTP servers and the corresponding e-mail addresses.

Note

Depending on the properties and configuration of the SMTP server, it may be necessary to adapt the "Sender E-Mail Address" input box for the e-mails. Check with the administrator of the SMTP server.

Settings

- **SMTP Client**
  Enable or disable the SMTP client.
- **Email address of the sender**
  Enter the name of the sender to be included in the e-mail, for example the device name. This setting applies to all configured SMTP servers.
- **SMTP Port**
  Enter the port via which your SMTP server can be reached.
- **SMTP Server IP Address**
  Enter the IP address of the SMTP server.

This table contains the following columns:

- **SMTP server address**
  Shows the SMTP server IP address.
- **Email address of the recipient**
  Enter the e-mail address to which the device sends an e-mail if a fault occurs.

Syntax of email addresses

The following conditions apply to e-mail addresses:

- Alphanumeric characters are permitted.
- The following special characters are permitted:
  - @
  - _ (underscore)
  - - (hyphen)
  - . (period)
- A @ character must be included.
- Only one @ may be used.
- The characters "@" and "." must not be the first or last character.

DHCP client

If the DHCP mode is activated, the DHCP client starts a DHCP request to a configured DHCP server and is assigned an IP address as the response. The server manages an address range from which it assigns IP addresses. It is also possible to configure the server so that the client always receives the same IP address in response to its request.

Settings

- **DHCP client configuration request (opt. 66, 67)**
  Select this option if you want the DHCP client to use options 66 and 67 to download and then enable a configuration file.
- **DHCP Mode**
  Select the DHCP mode. The following modes are possible:
  - via MAC Address
    Identification is based on the MAC address.
  - via DHCP Client ID
    Identification is based on a freely defined DHCP client ID.
  - via System Name
    Identification is based on the device name. If the device name is 255 characters long, the last character is not used for identification.

This table contains the following columns:

- **Interface**
  Shows the available interfaces.
- **DHCP**
  Enable or disable the DHCP client.

SNMP

General

On this page, you make the basic settings for SNMP. Enable the functions you want to use.

Settings

- **SNMP**
  Select the SNMP protocol. The following settings are possible:
  - "-" (disabled)
    SNMP is disabled.
  - SNMPv1/v2c/v3
    SNMPv1/v2c/v3 is supported.
  - SNMPv3
    Only SNMPv3 is supported.
- **SNMPv1/v2 Read-Only**
  If you enable this option, SNMPv1/v2c can only read the SNMP variables.

Note

Community String

For security reasons, do not use the standard values "public" or "private". Change the community strings following the initial installation.

- **SNMPv1/v2c Read Community String**
  Enter the community string for access of the SNMP protocol.
- **SNMPv1/v2c Read/Write Community String**
  Enter the community string for read and write access of the SNMP protocol.
- **SNMPv1 Traps**
  Enable or disable the sending of SNMP traps (alarm frames). On the "Trap" tab, specify the IP addresses of the devices to which SNMP traps will be sent.
- **SNMPv1/v2c Trap Community String**
  Enter the community string for sending SNMPv1/v2 messages.

Traps

If an alarm event occurs, a device can send SNMP traps (alarm frames) to up to ten different management stations at the same time. Traps are only sent if events specified in "Events > Configuration" occur.

Note

SNMP traps are sent only when the "SNMPv1 Traps" setting was selected in "SNMP > General".

Settings

- **IP Address**
  Enter the IP address of the stations to which the device sends SNMP traps

The table has the following columns:

- **IP Address**
  Shows the IP addresses of the stations to which the device sends SNMP traps.
- **Trap**
  Enable or disable the sending of SNMP traps. Stations that are entered but not selected do not receive SNMP traps.

v3 Groups

Security settings and assigning permissions

SNMP version 3 allows permissions to be assigned, authentication, and encryption at protocol level. The security levels and read/write permissions are assigned according to groups. The settings automatically apply to every member of a group.

Settings

- **Group Name**
  Enter the name of the group. This name must have at least two characters, the maximum length is 32 characters.
- **Security Level**
  Select the security level (authentication, encryption) valid for the selected group. You have the following options for the security levels:
  - no Auth/no Priv
    No authentication enabled / no encryption enabled.
  - Auth/no Priv
    Authentication enabled / no encryption enabled.
  - Auth/Priv
    Authentication enabled / encryption enabled.

The table has the following columns:

- **Group Name**
  Shows the defined group names.

  Note

  Once a group name and the security level have been specified, they can no longer be modified after the group is created. If you want to change the group name or the security level , you will need to delete the group and recreate it and reconfigure it with the new name.

- **Security Level**
  Shows the configured security level.
- **Read**
  Enable or disable read access.
- **Write**
  Enable or disable write access.

  Note

  For write access to work, you also need to enable read access.

- **Persistence**
  Shows whether or not the group is assigned to an SNMPv3 user. If the group is not assigned to an SNMPv3 user, no automatic saving is triggered and the configured group disappears again after restarting the device.
  - Yes
    The group is assigned to an SNMPV3 user.
  - No
    The group is not assigned to an SNMPV3 user.

v3 users

User-specific security settings

On the WBM page, you can create new SNMPv3 users and modify or delete existing users. The user-based security model works with the concept of the user name; in other words, a user ID is added to every frame. This user name and the applicable security settings are checked by both the sender and recipient.

Settings

- User name
  Enter a freely selectable user name. After you have entered the data, you can no longer modify the name.

The table has the following columns:

- User name
  Shows the created users.
- Group Name
  Select the group to which the user will be assigned.
- Authentication Protocol
  Select the authentication protocol. Can only be enabled, if this group supports the function. The following settings are available:
  - None
  - MD5
  - SHA
- Encryption Protocol
  Specify whether or not the user uses the DES algorithm. Can only be enabled, if the group supports this function.
- Authentication Password
  Enter the authentication password in the first input box.
- Confirm authentication password
  Confirm the password by repeating the entry.
- Encryption Password
  Enter your encryption password.

- **Confirm Encryption Password**
  Confirm the encryption password by repeating the entry.
- **Persistence**
  Shows whether or not the user is assigned to an SNMPv3 group. If the user is not assigned to an SNMPv3 group, no automatic saving is triggered and the configured user disappears again after restarting the device.
  - Yes
    The user is assigned to an SNMPv3 group.
  - No
    The user is not assigned to an SNMPv3 group.

System time

Manual time setting

On this page, you set the date and time of the system. For this setting to be used, enable "Manual time setting".

Note

The page is only available if there is an online connection to the device.

Settings

- **Time Manually**
  Enable or disable the manual time setting.
- **System Time**
  Enter the date and time in the format "MM/DD/YYYY HH:MM:SS". Can only be edited, if manual time setting is enabled.
  After a restart, the time of day begins at 01/01/2000 00:00:00
- **Use PC Time**
  Click the button to use the time setting of the PC.

- **Last Synchronization Time**
  This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".
- **Last Synchronization Mechanism**
  This box displays how the last time-of-day synchronization was performed.
  - Not set
    The time was not set.
  - Manual
    Manual time setting
  - SNTP
    Automatic time-of-day synchronization using SNTP
  - NTP
    Automatic time-of-day synchronization using NTP
  - SIMATIC
    Automatic time-of-day synchronization using the SIMATIC time frame.
  - PTP
    Automatic time-of-day synchronization with PTP

DST overview

On this page, you can create new entries for the daylight saving time changeover.

The table provides an overview of the existing entries.

Settings

- **DST No.**
  Shows the number of the entry.
  If you create a new entry, a new line with a unique number is created.
- **Name**
  Shows the name of the entry.
- **Year**
  Shows the year for which the entry was created.
- **Start Date**
  Shows the month, day and time for the start of daylight saving time.
- **End Date**
  Shows the month, day and time for the end of daylight saving time.
- **Type**
  Shows how the daylight saving time changeover is made:
  - Date
    A fixed date is entered for the daylight saving time changeover.
  - Recurring
    A rule was defined for the daylight saving time changeover.

DST configuration

On this page, you can configure the entries for the daylight saving time changeover. As result of the changeover to daylight saving or standard time, the system time for the local time zone is correctly set.

You can define a rule for the daylight saving time changeover or specify a fixed date.

Settings

Note

The content of this page depends on the selection in the "Type" box.

The boxes "DST No.", "Type" and "Name" are always shown.

- **DST No.**
  Select the type of the entry.
- **Type**
  Select how the daylight saving time changeover is made:
  - Date
    You can set a fixed date for the daylight saving time changeover.
    This setting is suitable for regions in which the daylight saving time changeover is not governed by rules.
  - Recurring
    You can define a rule for the daylight saving time changeover.
    This setting is suitable for regions in which the daylight saving time always begins or ends on a certain weekday.
- **Name**
  Enter a name for the entry.

Settings with "Date" selected

You can set a fixed date for the start and end of daylight saving time.

- **Year**
  Enter the year for the daylight saving time changeover.
- **Start Date**
  Enter the following values for the start of daylight saving time:
  - Day
  - Hour
  - Month
- **End Date**
  Enter the following values for the end of daylight saving time:
  - Day
  - Hour
  - Month

Settings with "Recurring" selected

You can create a rule for the daylight saving time changeover.

- **Start Date**
  Enter the following values for the start of daylight saving time:
  - Hour
  - Month
  - Week
    You can select the 1st to 5th or the last week of the month.
  - Weekday
- **End Date**
  Enter the following values for the end of daylight saving time:
  - Hour
  - Month
  - Week
    You can select the 1st to 5th or the last week of the month.
  - Weekday

SNTP client

SNTP (Simple Network Time Protocol) is used for synchronizing the time in the network. The appropriate frames are sent by an SNTP server in the network.

Settings

- **SNTP Client**
  Enable or disable automatic time-of-day synchronization using SNTP.
- **Current System Time** (only available online)
  Shows the values currently set in the system for date and time.
- **Last Synchronization Time** (only available online)
  This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".

- **Last Synchronization Mechanism** (only available online)
  This box displays how the last time-of-day synchronization was performed.
  - Not set
    The time was not set.
  - Manual
    Manual time setting
  - SNTP
    Automatic time-of-day synchronization using SNTP
  - NTP
    Automatic time-of-day synchronization using NTP
  - SIMATIC
    Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP
    Automatic time-of-day synchronization with PTP
- **Time Zone**
  Enter the time zone you are using in the format "+/- HH:MM". The time zone relates to UTC standard world time. Settings for daylight-saving and standard time are taken into account in this box by specifying the time offset.
- **SNTP Mode**
  Select the synchronization mode. The following types of synchronization are possible:
  - Poll
    If you select this protocol type, the input boxes "SNTP Server IP Address", "SNTP Server Port" and "Poll Interval" are displayed for further configuration. With this type of synchronization, the device is active and sends a time query to the SNTP server.
  - Listen
    With this type of synchronization, the device is passive and "listens" for SNTP frames that deliver the time of day.
- **SNTP Server IP Address**
  Enter the IP address of the SNTP server.
- **SNTP Server Port**
  Enter the port of the SNTP server.
- **Poll Interval [s]**
  Enter the interval in seconds between two time polls.

NTP client

If you require time-of-day synchronization using NTP, you can make the relevant settings here.

Settings

- **NTP Client**
  Enable or disable automatic time-of-day synchronization using NTP.
- **Current System Time** (only available online)
  Shows the values currently set in the system for date and time.

- **Last Synchronization Time** (only available online)
  This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".
- **Last Synchronization Mechanism** (only available online)
  This box displays how the last time-of-day synchronization was performed.
  - Not set
    The time was not set.
  - Manual
    Manual time setting
  - SNTP
    Automatic time-of-day synchronization using SNTP
  - NTP
    Automatic time-of-day synchronization using NTP
  - SIMATIC
    Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP
    Automatic time-of-day synchronization with PTP
- **Time Zone**
  Enter the time zone you are using in the format "+/- HH:MM". The time zone relates to UTC standard world time. Settings for daylight-saving and standard time are taken into account in this box by specifying the time offset.
- **NTP Server IP Address**
  Enter the IP address of the NTP server.
- **NTP Server Port**
  Enter the port of the NTP server.
- **Poll Interval [s]**
  Enter the interval in seconds between two time polls.

SIMATIC Time Client

On this page, you configure time synchronization with the SIMATIC Time Client.

Settings

- **SIMATIC Time Client**
  Enable or disable loop the SIMATIC Time Client.
- **Current System Time** (only available online)
  Shows the values currently set in the system for date and time.

- **Last Synchronization Time** (only available online)
  This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".
- **Last Synchronization Mechanism** (only available online)
  This box displays how the last time-of-day synchronization was performed.
  - Not set
    The time was not set.
  - Manual
    Manual time setting
  - SNTP
    Automatic time-of-day synchronization using SNTP
  - NTP
    Automatic time-of-day synchronization using NTP
  - SIMATIC
    Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP
    Automatic time-of-day synchronization with PTP

PTP Client

On this page, you configure time synchronization with PTP (Precision Time Protocol).

This function is only available for SCALANCE X500.

Settings

- **PTP Client**
  Enable or disable time synchronization using PTP. You can configure other settings in "Layer 2 > PTP".
- **Current System Time** (only available online)
  This box is read-only and displays the current system time.
- **Last Synchronization Time** (only available online)
  This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".

- **Last Synchronization Mechanism** (only available online)
  This box displays how the last time-of-day synchronization was performed.
  - Not set
    The time was not set.
  - Manual
    Manual time setting
  - SNTP
    Automatic time-of-day synchronization using SNTP
  - NTP
    Automatic time-of-day synchronization using NTP
  - SIMATIC
    Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP
    Automatic time-of-day synchronization with PTP
- **Time Zone**
  Enter the time zone you are using in the format "+/- HH:MM". The time zone relates to UTC standard world time.

Auto logout

On this page, set the times after which there is an automatic logout from WBM or the CLI following user in activity.

Note

No automatic logout from the CLI

If the connection is not terminated after the set time, check the setting of the "keepalive" mechanism on the Telnet client.

If the interval is shorter than the configured time, the connection is kept alive although no user data is transferred. Example: you selected 300 seconds for the automatic logout and 120 seconds is set for the keepalive function. In this case, a packet is sent every 120 seconds that keeps the connection up.

- Disable the keepalive mechanism (interval time = 0)
  or
- Set the interval high enough so that the underlying connection is terminated when there is inactivity.

Settings

- **Web Based Management [s]**
  Enter the time in seconds for the automatic logout from WBM. If you enter the value 0, the automatic logout is disabled.
- **CLI (TELNET, SSH, Serial) [s]**
  Enter the time in seconds for the automatic logout from the CLI. If you enter the value 0, the automatic logout is disabled.

Button

The "Select/Set" button has the following functions:

- Change display mode
- Enable redundancy manager
- Restore to factory defaults
- Fault mask and LED display

You will find a detailed description of the individual functions available with the buttons in the operating instructions of the specific device.

Settings

- **Restore Factory Defaults**
  Enables or disables the "Restore Factory Defaults" function for the Select/Set button.

Caution

Button function "Restore Factory Defaults" active during startup

If you have disabled this function in your configuration, disabling is only valid during operation. When restarting, for example after power down, the function is active until the configuration is loaded so that the device can inadvertently be reset to the factory settings. This may cause unwanted disruption in network operation since the device needs to be reconfigured if this occurs. An inserted PLUG is also deleted and returned to the status as shipped

- **Redundancy Manager**
  Enables or disables the redundancy manager function for the Select/Set button.
- **Set Fault Mask**
  Enable or disable the function "Define fault mask via the LED display" with the Select/set button. This function only works in display mode D.

Syslog client

Syslog according to RFC 3164 is used for transferring short, unencrypted text messages over UDP in the IP network. This requires a system log server.

Requirements for sending log entries:

- The system log function is enabled on the device.
- The system log function is enabled for the relevant event.
- There is a system log server in your network that receives the log entries. Since this is a UDP connection, there is no acknowledgment to the sender.
- The IP address of the system log server is entered on the device.

Settings

- **Syslog Client**
  Enable or disable the system log function.
- **Syslog Server IP Address**
  Enter the IP address of the system log server.

This table contains the following columns

- **Server address**
  Shows the IP address of the system log server.
- **Server Port**
  Enter the port of the Syslog server being used.

Ports

Port overview

The page shows the configuration for the data transfer for all ports of the device.

Settings

- **Port**
  Shows the configurable ports.
- **Port name**
  Shows the name of the port.
- **MAC Address** (only available online)
  Shows the MAC address of the port.
- **Mode** (only available online)
  Shows the transfer parameters of the port
- **Negotiation**
  Shows whether the automatic configuration is enabled or disabled.
- **Flow Ctrl. Type**
  Shows whether flow control is enabled or disabled for the port.
- **Flow Ctrl.**
  Shows whether or not flow control is working on this port.
- **MTU**
  Shows the maximum packet size.
- **Port Type** (only with routing)
  Shows the type of the port. The following types are possible:
  - Router Port
  - Switch Port VLAN Hybrid
  - Switch-Port VLAN Trunk
- **Status**
  Shows whether the port is on or off. Data traffic is possible only over an enabled port.

- **Combo Port Media Type**(SCALANCE XM400 only)
  Shows the mode of the combo port:
  - auto
  - rj45
  - sfp
- **Link** (only available online)
  Shows the connection status to the network. With the connection status, the following is possible:
  - Up
    The port has a valid link to the network, a link integrity signal is being received.
  - Down
    The link is down, for example because the connected device is turned off.

Configuration

On this page, you configure the ports of the device

Settings

- **Port**
  Select the port to be configured. The port is made up of the port number and the slot number, for example port 0.1 is slot 0, port 1.
- **Status**
  Specify whether the port is enabled or disabled.
  - enabled
    The port is enabled. Data traffic is possible only over an enabled port.
  - disabled
    The port is disabled but the connection remains.
  - Link down
    The port is disabled and the connection to the partner device is terminated.
- **Port name**
  Enter a name for the port.
- **MAC Address** (only available online)
  Shows the MAC address of the port.
- **Mode Type**
  Shows the transmission speed and the transmission method of the port. You make the settings for "Autonegotiation" and "Transmission rate" in the port options.

  Note

  Before the port and partner port can communicate with each other, the settings must match at both ends.

- **Mode** (only available online)
  Shows which transmission speed and which transmission mode is currently being used.

- **Negotiation**
  Shows whether the automatic configuration of the connection to the partner port is enabled or disabled.
- **Flow Ctrl. Type**
  Shows whether or not flow control is working on this port.

  Note

  Turning flow control on/off with autonegotiation

  Flow control can only be enabled or disabled if the "autonegotiation" function is turned off. The function cannot enabled again afterwards.

- **Flow Ctrl.**
  Shows whether or not flow control is working on this port.
- **MTU**
  Enter the packet size.
- **Port Type** (only with routing)
  Select the type of the port:
  - Router Port
    The port is an IP interface. It does not support layer 2 functions.
  - Switch Port VLAN Hybrid
    The port sends tagged and untagged frames. It is not automatically a member of a VLAN.
  - Switch-Port VLAN Trunk
    The port only sends tagged frames and is automatically a member of all VLANs.
- **Combo Port Media Type**(SCALANCE XM400 only)
  Specify the mode for the combo port:
  - auto
    If you select this mode, the SFP transceiver port has priority. As soon as an SFP transceiver is plugged in, an existing connection at the fixed RJ-45 port is terminated. If no SFC transceiver is plugged in, a connection can be established via the fixed RJ-45 port.
  - rj45
    If you select this mode, the fixed RJ-45 port is used regardless of the SFP transceiver port.
  - sfp
    If you select this mode, the SFP transceiver port is used regardless of the built-in RJ-45 port.

  The factory setting is auto mode.
- **Link** (only available online)
  Shows the connection status to the network. With the connection status, the following is possible:
  - Up
    The port has a valid link to the network, a link integrity signal is being received.
  - Down
    The link is down, for example because the connected device is turned off.

Changing the port configuration

Note

Optical ports only work with the full duplex mode and at maximum transmission rate. As a result, the following settings cannot be made for optical ports:

- Automatic configuration
- Transmission speed
- Transmission technique

Note

With various automatic functions, the device prevents or reduces the effect on other ports and priority classes (Class of Service) if a port is overloaded. This can mean that frames are discarded even when flow control is enabled.

Port overload occurs when the device receives more frames than it can send, for example as the result of different transmission speeds.

Fault monitoring

Power supply

Configure whether or not the power supply should be monitored by the messaging system. Depending on the hardware variant, there are one or two power connectors (Supply 1 / Supply 2). With a redundant power supply, configure the monitoring separately for each individual feed-in line.

If there is no power on one of the monitored lines (Supply 1 or Supply 2) or when the voltage is too low, a fault is signaled by the signaling system.

Note

You will find the permitted operating voltage limits in the compact operating instructions of the device.

An error causes the fault LED to light up on the device. Depending on the configuration, the error may trigger a trap, an e-mail or an entry in the event log table.

Settings

- **Line 1**
  Enable or disable the monitoring of power connector 1.
- **Line 2**
  Enable or disable the monitoring of power connector 2.

Link Change

On this page, you configure whether or not an error message is triggered if there is a status change on a network connection.

If connection monitoring is enabled, an error is signaled

- when there should be a link on a port and this is missing.
- or when there should not be a link on a port and a link is detected.

An error causes the signaling contact to trigger and the fault LED to light up on the device. Depending on the configuration, the error may trigger a trap, an e-mail or an entry in the event log table.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns

- **Port**
  Shows the available ports.
- **Setting**
  Select the setting. You have the following options:
  - Up
    Error handling is triggered when the port changes to the active status.
    (From "Link down" to "Link up")
  - Down
    Error handling is triggered when the port changes to the inactive status.
    (From "Link up" to "Link down")
  - "-" (disabled)
    The error handling is not triggered.

Redundancy

On this page, you configure whether or not an error message is triggered if there is a status change on a network connection.

Setting

- **Redundancy loss (HRP only)**
  Enable or disable connection monitoring. If the redundancy of the connection is lost, an error is signaled.

PNIO

On this page, you configure the device response to PROFINET input and output.

Description

The page contains the following boxes:

- **PNIO runtime mode**
  Shows the status of the PNIO operation.
- **PNIO runtime mode for next startup**
  Select the runtime mode that will be active the next time the device starts up.
- **PNIO AR status**
  This box shows the PROFINET IO application relation status; in other words, whether or not the IE switch is connected "online" or "offline" with a PROFINET controller.
  In this context, online means that a connection to a PROFINET IO controller exists, that the controller has downloaded its configuration data to the IE switch and that the device can send status data to the PROFINET IO controller. In this status known as "in data exchange", the parameters set with the PROFINET IO controller cannot be configured on the IE switch.
- **PNIO Device Name**
  Enter the PROFINET IO device name.
- **Allow PNIO Data Exchange**
  Enable or disable PNIO data exchange
- **Simulate PNIO Data Exchange**
  Enable or disable the simulation of PNIO data exchange.

PLUG

PLUG configuration

Note

The page is only available if there is an online connection to the device.

Notice

Do not remove or insert a C-PLUG / KEY-PLUG during operation!

A PLUG may only be removed or inserted when the device is turned off.
The device checks whether or not a PLUG is present at one second intervals. If it is detected that the PLUG was removed, there is a restart. If a valid KEY-PLUG was inserted in the device, the device changes to a defined error state following the restart.

Information about the configuration of the C-PLUG / KEY-PLUG

This page provides detailed information about the configuration stored on the C-PLUG or KEY-PLUG. It is also possible to reset the PLUG to "factory defaults" or to load it with new contents.

Note

The action is only executed after you click the "Set Values" button.

The action cannot be undone.

If you decide against executing the function after making your selection, click the "Refresh" button. As a result the data of this page is read from the device again and the selection is canceled.

Note

Incompatibility with previous versions with PLUG inserted

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed. In this situation, if a PLUG is inserted in the device, following the restart, this has the status "NOT ACCEPTED" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data.

If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually using "System > PLUG".

Settings

The table has the following rows:

- **Status**
  Shows the status of the PLUG. The following are possible:
  - ACCEPTED
    There is a PLUG with a valid and suitable configuration in the device.
  - NOT ACCEPTED
    Invalid or incompatible configuration on the inserted PLUG.
  - NOT PRESENT
    There is no C-PLUG or KEY-PLUG inserted in the device.
  - FACTORY
    PLUG is inserted and does not contain a configuration. This status is also displayed when the PLUG was formatted during operation.
  - MISSING
    There is no PLUG inserted. Functions are configured on the device for which a license is required.
- **Device Family**
  Shows the SIMATIC NET product line that used the C-PLUG or KEY-PLUG previously.

- **Device Type**
  Shows the device type within the product line that used the C-PLUG or KEY-PLUG previously.
- **Configuration Revision**
  The version of the configuration structure. This information relates to the configuration options supported by the device and has nothing to do with the concrete hardware configuration. This revision information does not therefore change if you add or remove additional components (modules or extenders), it can, however, change if you update the firmware.
- **File System**
  Displays the type of file system on the PLUG.

  Notice

  New file system UBI

  As of firmware version 3.0, UBI is the standard file system for the C-PLUG or KEY-PLUG. If a C-PLUG with the previous file system IECP is detected in such a device, this C-PLUG will be formatted for the UBI file system and the data will be rewritten to the C-PLUG.

  The file system is also changed following a firmware update to V3.0. A downgrade to the previous version of the corresponding software is then a problem. The firmware can neither read nor write the C-PLUG or KEY-PLUG and it is not even possible to "Erase PLUG to factory default".

- **File System Size [bytes]**
  Shows the maximum storage capacity of the file system on the C-PLUG.
- **File System Usage**
  Displays the storage space in use in the file system of the C-PLUG.
- **Info String**
  Shows additional information about the device that used the PLUG previously, for example, order number, type designation, and the versions of the hardware and software. The displayed software version corresponds to the version in which the configuration was last changed. With the "NOT ACCEPTED" status, further information on the cause of the problem is displayed.
- **Modify PLUG**
  Select the required setting.
  - Write current configuration to PLUG
    This option is available only if the status of the PLUG is "NOT ACCEPTED" or FACTORY. The configuration in the internal flash memory of the device is copied to the PLUG.
  - Erase PLUG to factory default
    Deletes all data from the C-PLUG and triggers low-level formatting.

PLUG license

Note

The page is only available if there is an online connection to the device.

Notice

Do not remove or insert a C-PLUG / KEY-PLUG during operation!

A PLUG may only be removed or inserted when the device is turned off.
The device checks whether or not a PLUG is present at one second intervals. If it is detected that the PLUG was removed, there is a restart. If a valid KEY-PLUG was inserted in the device, the device changes to a defined error state following the restart.

If the device was configured at some time with a PLUG, the device can no longer be used without this PLUG. To be able to use the device again, reset the device to the factory settings.

Note

Incompatibility with previous versions with PLUG inserted

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed. In this situation, if a PLUG is inserted in the device, following the restart, this has the status "NOT ACCEPTED" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data.

If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually using "System > PLUG".

Information about the license of the KEY-PLUG

A C-PLUG can only store the configuration of a device. In addition to the configuration, a KEY-PLUG also contains a license that enables certain functions of your SIMATIC NET device.

This page provides detailed information about the license on the KEY-PLUG. In this example, the KEY-PLUG contains the data for enabling the layer 3 functions of the device.

Displayed values

- **Status**
  Shows the status of the KEY-PLUG. The following are possible:
  - ACCEPTED
    The KEY-PLUG in the device contains a suitable and valid license.
  - NOT ACCEPTED
    The license of the inserted KEY-PLUG is not valid.
  - NOT PRESENT
    No KEY-PLUG is inserted in the device.
  - MISSING
    There is no KEY-PLUG or a C-PLUG with the status "FACTORY" inserted in the device. Functions are configured on the device for which a license is required.
  - WRONG
    The inserted KEY-PLUG is not suitable for the device.
  - UNKNOWN
    Unknown content of the KEY-PLUG.
  - DEFECTIVE
    The content of the KEY-PLUG contains errors.
- **Order ID**
  Shows the order number of the KEY-PLUG. The KEY-PLUG is available for various functional enhancements and for various target systems.
- **Serial Number**
  Shows the serial number of the KEY-PLUG.
- **Info String**
  Shows additional information about the device that used the KEY-PLUG previously, for example, order number, type designation, and the versions of the hardware and software. The displayed software version corresponds to the version in which the configuration was last changed. With the "NOT ACCEPTED" status, further information on the cause of the problem is displayed.

Note

When you save the configuration, the information about whether or not a KEY-PLUG was inserted in the device at the time is also saved. This configuration can then only work if a KEY-PLUG with the same order number / license is inserted.

Ping

Reachability of an address in an IP network

Note

The page is only available if there is an online connection to the device.

With the ping function, you can check whether a certain IP address is reachable in the network.

Settings

- **IP Address**
  Enter the IP address of the device.
- **Repeat**
  Enter the number of ping requests.
- **Ping**
  Click this button to start the ping function.
- **Ping Output**
  This box shows the output of the ping function.
- **Delete**
  Click this button to delete the ping output.

PoE

General

On this page, you specify the maximum power for the power sourcing equipment (PSE).

PSE (power sourcing equipment)

The SCALANCE X-500 represents a PSE (Power Sourcing Equipment).

With a SCALANCE XM400, you can use the "Power over Ethernet" function via the port extender PE408PoE. Each group of four ports with PoE capability is known as a PSE. The numbering of the PSEs is fixed and does not change with the number of plugged-in PoE port extenders or the slot. A maximum of 4 PSEs are possible.

Setting

- **PSE**
  Shows the number of the PoE power supply.
- **Maximum Power**
  Maximum power that a PSE provides to supply PoE devices.
- **Allocated Power**
  Sum of the power reserved by the PoE devices according to the "Classification".
- **Used power**
  Sum of the power used by the end devices.
- **Usage Threshold [%]**
  When the power being used by the end devices exceeds the percentage shown here, an event is triggered.

Port

Settings for the ports

For each individual PoE port, you can specify whether or not the power will be supplied via Ethernet. You can also set a priority for each connected powered device (PD). Devices for which a high priority was set, take preference over other devices for the power supply.

Settings

The table has the following columns:

- Port
  Shows the configurable PoE ports.
  The port is made up of the port number and the slot number, for example port 0.1 is slot 0, port 1.
- Setting
  Enable the PoE power supply for this port or interrupt it.
- Priority
  Select which priority this port will have for the power supply.
  The following settings are possible, in ascending order of relevance:
  - low
    low priority
  - high
    medium priority
  - critical
    high priority

  If the same priority is set for two ports, the port with the lower port number will be preferred when necessary.
- Type
  Here, you can enter a string to describe the connected device in greater detail.
- Classification
  The classification specifies the class of the device. From this, it is possible to recognize the maximum power of the device.

- **Status**
  Shows the current status of the port.
  The following states are possible:
  - disabled
    The PoE power supply is deactivated for this port.
  - delivering
    The PoE power supply is activated for this port and a device is connected.
  - searching
    The PoE power supply is activated for this port but there is no device connected.

  Note

  If a device is connected to a port with PoE capability, a check is made to determine whether the power of the port is adequate for the connected device. If the power of the port is inadequate, although PoE is enabled in "Setting", the port nevertheless has the status "disabled". This means that the port was disabled by the PoE power management.

- **Power [mW]**
  Shows the power that the SCALANCE provides at this port.
- **Voltage [V]**
  Shows the voltage applied to this port.
- **Current [mA]**
  Shows the current with which a device connected to this port is supplied.

Port diagnostics

Cable tester

Note

The page is only available if there is an online connection to the device.

With this page, each individual Ethernet port can run independent fault diagnostics on the cable. This test is performed without needing to remove the cable, connect a cable tester and install a loopback module at the other end. Short-circuits and cable breaks can be localized to within a few meters.

Note

Please note that this test is permitted only when no data connection is established on the port to be tested.

Settings

- **Port**
  Select the required port from the drop-down list.
- **Run Test**
  Activates error diagnostics. The result is shown in the table.

This table contains the following columns:

- **Pair**
  Shows the wire pair in the cable.

  Note

  Wire pairs

  Wire pairs 4-5 and 7-8 of 10/100 Mbps network cables are not used.

  In 1000 Mbps or gigabit Ethernet, all 4 wire pairs are used.

  The wire pair assignment - pin assignment is as follows (DIN 50173):

  Pair 1 = pin 4-5

  Pair 2 = pin 1-2

  Pair 3 = pin 3-6

  Pair 4 = pin 7-8

- **Status**
  Displays the status of the cable.
- **Distance [m]**
  Displays the distance to the cable end, cable break, or short-circuit.

SFP diagnostics

On this page, you run independent error diagnostics for each individual SFP port. This test is performed without needing to remove the cable, connect a cable tester or install a loopback module at the other end.

Note

Please note that this test is permitted only when no data connection is established on the port to be tested.

If, however, there is a data connection to the port to be tested, this is briefly interrupted.

Automatic re-establishment of the connection can fail and then needs to be done manually.

Description

The page contains the following boxes:

- **Port**
  Select the required port from the drop-down list.

The values are shown in the following boxes:

- **Name**
  Shows the name of the interface.
- **Model**
  Shows the type of interface.
- **Revision**
  Shows the hardware version of the SFP.
- **Serial**
  Shows the serial number of the SFP.
- **Nominal Bit Rate [Mbps]**
  Shows the nominal bit rate of the interface.
- **Max. Link (50.0/125um) [m]**
  Shows the maximum distance in meters that is possible with this medium.
- **Max. Link (62.5/125um) [m]**
  Shows the maximum distance in meters that is possible with this medium.

The following table shows the values of the SFP transceiver used in this port:

- **Temperature [°C]**
  Shows the temperature of the interface.
- **Voltage [V]**
  Shows the voltage applied to the interface [V].
- **Current [mA]**
  Shows the current consumption of the interface [mA].
- **RX Power [mW]**
  Shows the receive power of the interface [mW].
- **Tx Power [mW]**
  Shows the transmit power of the interface [mW].
- **Current**
  Shows the current value.
- **Low**
  Shows the lowest value.
- **High**
  Shows the highest value.

Configuring layer 2 functions

Configuration

The functions of layer 2 are configured on this page. With some functions, there are further configuration pages on which more detailed settings can be made. You can also check the settings on the configuration pages.

Settings

- **Protocol Based VLAN**
  Enable or disable protocol-based VLAN. You can configure other settings in "Layer 2 > VLAN".
- **Subnet Based VLAN**
  Enable or disable subnet-based VLAN. You can configure other settings in "Layer 2 > VLAN".
- **Dynamic MAC Aging**
  Enable or disable the "Aging" mechanism. You can configure other settings in "Layer 2 > Dynamic MAC Aging".
- **Redundancy Type**
  The following settings are available:
  - **"-" (disabled)**
    The redundancy function is disabled.
  - **Ring**
    Enables ring redundancy. You can configure other settings in "Layer 2 > Ring Redundancy > Ring".
  - **Spanning Tree**
    If you select this option, you specify the required redundancy mode in "Redundancy Mode".

- **Redundancy Mode**
  If you select "Spanning Tree" for the "Redundancy Type", the following options are then available:
  - **STP**
    Enables the Spanning Tree Protocol (STP). Typical reconfiguration times with spanning tree are between 20 and 30 seconds. You can configure other settings in "Layer 2 > Spanning Tree".
  - **RSTP**
    Enables the Rapid Spanning Tree Protocol (RSTP). If a spanning tree frame is detected at a port, this port reverts from RSTP to spanning tree. You can configure other settings in "Layer 2 > Spanning Tree".

    Note

    When using RSTP (Rapid Spanning Tree Protocol), loops involving duplication of frames or frames being overtaken may occur briefly. If this is not acceptable in your particular application, use the slower standard spanning tree mechanism.
  - **MSTP**
    Enables the Multiple Spanning Tree Protocol (MSTP). You can configure other settings in "Layer 2 > Spanning Tree".

  If you select "Ring" for the "Redundancy Type", the following options are then available:
  - **Automatic Redundancy Detection**
    Select this setting to create an automatic configuration of the redundancy mode. In this mode, the device automatically detects whether or not there is a device with the "HRP Manager" role in the ring. If this is the case, the device adopts the role of "HRP Client". If no HRP manager is found, all devices with the "Automatic Redundancy Detection" or "MRP Auto Manager" setting negotiate among themselves to establish which device adopts the role of "MRP Manager". The device with the lowest MAC address will always become "MRP Manager". The other devices automatically set themselves to redundancy type "MRP Client".
  - **MRP Auto-Manager**
    Automatic media redundancy manager
  - **MRP Client**
    Media redundancy client
  - **HRP Client**
    High Speed Redundancy Protocol client
  - **HRP Manager**
    High Speed Redundancy Protocol manager
- **Standby**
  Enable or disable the "Standby redundancy" function. You can configure other settings in "Layer 2 > Ring Redundancy > Standby".
- **Passive Listening**
  Enable or disable the "passive listening" function.

- **RMON**
  If you select this check box, Remote Monitoring (RMON) allows diagnostics data to be collected on the device, prepared and read out using SNMP by a network management station that also supports RMON. This diagnostic data, for example port-related load trends, allow problems in the network to be detected early and eliminated.
- **Dynamic Multicast**
  The following settings are possible:
  - **"-" (disabled)**
  - **IGMP Snooping**
    Enables IGMP (Internet Group Management Protocol). You can configure other settings in "Layer 2 > Multicast > IGMP".
  - **GMRP**
    Enables GMRP (GARP Multicast Registration Protocol). You can configure other settings in "Layer 2 > Multicast > GMRP".

    Note

    GMRP and IGMP cannot operate at the same time.
- **GVRP**
  Enable or disable "GVRP" (GARP VLAN Registration Protocol). You can configure other settings in "Layer 2 > VLAN > GVRP".
- **Mirroring**
  Enable or disable port mirroring. You can configure other settings in "Layer 2 > Mirroring > Port".
- **Loop Detection**
  Enable or disable loop detection. You can configure other settings in "Layer 2 > Loop Detection".
- **PTP**
  Specify how the device will process PTP messages. You can configure other settings in "Layer 2 > PTP".
  - Off
    The device does not process any PTP messages. PTP messages are, however, forwarded according to the rules of the switch.
  - transparent
    The device adopts the function of a transparent clock and forwards PTP messages to other nodes while at the same time making entries in the correction field of the PTP message.

QoS

CoS map

On this page, CoS priorities are assigned to certain queues (traffic queues).

Settings

- **CoS**
  Shows the CoS priority of the incoming packets.
- **Queue**
  Select the forwarding queue (send priority) that is assigned the CoS priority.
  The higher the number of the queue, the higher the send priority.

DSCP map

On this page, DSCP settings are assigned to various queues (traffic queues).

Settings

- **DSCP**
  Shows the DSCP priority of the incoming packets.
- **Queue**
  Select the forwarding queue (send priority) that is assigned the DSCP value. The higher the queue number, the higher the send priority.

Load limitation

Limiting the transfer rate of incoming and outgoing data

On this page, you configure the load limitation (maximum number of data packets per second) for the individual ports. You can specify the category of frame for which these limit values will apply.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports.
- **Limit Ingress Unicast (DLF) / Limit Ingress Broadcast / Limit Ingress Multicast**
  Select the required setting.
  - enabled: Enables the function.
  - disabled: Disables the function
  - No Change: The setting in table 2 remains unchanged
- **Total Ingress Rate [pkts/s]**
  Specify the maximum number of incoming packets processed by the device. If "No Change" is entered, the entry in table 2 remains unchanged.

- **Egress Rate [Kb/s]**
  Specify the data rate for all outgoing frames. If "No Change" is entered, the entry in table 2 remains unchanged
- **Transfer to table**
  If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the port to which the settings relate.
- **Limit Ingress Unicast (DLF)**
  Enable or disable the data rate for limiting incoming unicast frames with an unresolvable address (Destination lookup failure).
- **Limit Ingress Broadcast**
  Enable or disable the data rate for limiting incoming broadcast frames.
- **Limit Ingress Multicast**
  Enable or disable the data rate for limiting incoming multicast frames.
- **Total Ingress Rate [pkts/s]**
  Specify the maximum number of incoming packets processed by the device.
- **Egress Rate [Kb/s]**
- Specify the data rate for all outgoing frames.

Note

Rounding of the values, deviation from desired value

When you enter the values for transmission rates, note that the WBM rounds to correct values.

If values are configured for total ingress transmission rate and egress transmission rate, the actual values in operation can exceed or fall below the set values by 10%.

VLAN

General

On this page, you define the VLAN and specify the use of the ports.

Note

Changing the "Agent VLAN ID"

If the configuration PC is connected directly to the device via Ethernet and you change the "agent VLAN ID", the device is no longer reachable via Ethernet following the change.

Important rules for VLANs

Make sure you keep to the following rules when configuring and operating your VLANs:

- Frames with the VLAN ID "0" are handled as untagged frames but retain their priority value.
- As default, all ports on the device send frames without a VLAN tag to ensure that the end node can receive these frames.
- With SCALANCE X devices, the VLAN ID "1" is the default on all ports.
- If an end node is connected to a port, outgoing frames should be sent without a tag (static access port). If, however, there is a further switch at this port, the frame should have a tag added (trunk port).
- With a trunk port, the VLAN assignment is dynamic. Static configurations can only be created if, in addition to the trunk port property, the port is also entered statically as a member in the VLANs involved. An example of a static configuration is the assignment of the multicast groups in certain VLANs.

Settings

- **VLAN ID**
  Enter the VLAN ID.

The table has the following columns:

- **VLAN ID**
  Shows the VLAN ID. The VLAN ID is assigned once when you create a new data record and can then no longer be changed. To make a change, the entire data record must be deleted and created again.
- **Name**
  Enter a name for the VLAN. The name only provides information and has no effect on the configuration.
  The VLAN name can be a maximum of 32 characters long.

- **Status**
  Shows the status of the entry. Here, static means that the address was entered as a static address by the user. The entry GVRP means that the configuration was registered by a GVRP frame. This is, however, only possible if GVRP was enabled for the device.
- **List of ports**
  Specify the use of the port. The following options are available:
  - "-"
  - The port is not a member of the specified VLAN.
    With a new definition, all ports have the identifier "-".
  - M
    The port is a member of the VLAN. Frames sent in this VLAN are forwarded with the corresponding VLAN tag.
  - R
    The port is a member of the VLAN. A GVRP frame is used for the registration.
  - U (upper case)
    The port is an untagged member of the VLAN. Frames sent in this VLAN are forwarded without the VLAN tag. Frames without a VLAN tag are sent from this port.
  - u (lower case)
    The port is an untagged member of the VLAN, but the VLAN is not configured as a port VLAN. Frames sent in this VLAN are forwarded without the VLAN tag.
  - F
    The port is not a member of the specified VLAN and it is not possible for the VLAN to be registered dynamically at this port using GVRP. You can configure other settings in "Layer 2 > VLAN > Port-based VLAN".

GVRP

Configuration of GVRP functionality

Using GVRP frame, a different device can register at the port of the device for a specific VID. A different device, can, for example be an end device or a switch. The device can also send GVRP frames via this port.

Settings

- **GVRP**
  Enable or disable the "GVRP" function.

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports of table 2.
- **Setting**
  Select the setting. You have the following setting options:
  - enabled
    Enables the sending of GVRP frames.
  - disabled
    Disables the sending of GVRP frames.
  - No Change
    No change in table 2.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2. If you have selected "No Change", the content of table 2 will not be changed.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **Setting**
  Enable or disable the sending GVRP frames.

Port-based VLAN

Processing received frames

On this page, you specify the configuration of the port properties for receiving frames.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports.
- **Priority / Port VID / Acceptable Frames / Ingress Filtering**
  Select the setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports and link aggregations.
- **Priority**
  Select the priority assigned to untagged frames.
  The CoS priority (Class of Service) used in the VLAN tag. If a frame is received without a tag, it will be assigned this priority. This priority specifies how the frame is further processed compared with other frames.
  There are a total of eight priorities with values 0 to 7, where 7 represents the highest priority (IEEE 802.1p Port Priority).
- **Port VID**
  Select the VLAN ID. Only VLAN IDs defined on the "VLAN > General" page can be selected.
  If a received frame does not have a VLAN tag, it has a tag with the VLAN ID specified here added to it and is sent according to the rules at the port.
- **Acceptable Frames**
  Specify which types of frames will be accepted. The following alternatives are possible:
  - Tagged Frames Only
    The device discards all untagged frames. Otherwise, the forwarding rules apply according to the configuration.
  - All
    The device forwards all frames
- **Ingress Filtering**
  Specify whether the VID of received frames is evaluated.
  The following options are available:
  - enabled
    The VLAN ID of received frames decides whether they are forwarded: To forward a VLAN tagged frame, the receiving port must be a member in the same VLAN. Frames from unknown VLANs are discarded at the receiving port.
  - disabled
    All frames are forwarded.

Protocol-based VLAN group

On this page, you specify groups to which a protocol will be assigned.

Settings

- **Protocol Based VLAN**
  Enable or disable the protocol-based VLAN assignment.
- **Protocol Value**
  Enter the hexadecimal protocol value.
  A few examples are shown below:
  - PROFINET: 88:92
  - IP: 08:00
  - Novell: 81:37
  - netbios: f0:f0
  - appletalk: 80:9b
- **Group ID**
  Enter the ID of the group.

The table has the following columns:

- **Protocol Value**
  Shows the file value.
- **Group ID**
  Shows the group ID.

Protocol-based VLAN port

On this page, you specify which protocol and which VLAN is assigned to the individual port.

Settings

- **Port**
  Select the required port. All available ports and the link aggregations can be selected.
- **Group ID**
  Select the group ID from the drop-down list. Specify the ID in "Layer 2 > VLAN > Protocol Based VLAN Group".

The table has the following columns:

- **Port**
  All available ports and the link aggregations are shown.
- **Group ID**
  Shows the group ID assigned to the port.
- **VLAN ID**
  Select the required VLAN ID to be assigned to the port.

IPv4 subnet-based VLAN

On this page, you specify which VLAN ID is assigned to the subnet.

Settings

- **Subnet Based VLAN**
  Enable or disable the subnet-based VLAN assignment
- **Port**
  Select the port. All available ports and the link aggregations can be selected.
- **Subnet Address**
  Enter the IP address of the subnet.
  Example: 192.168.10.0 for the network 192.168.10.x with nodes 192.168.10.1 to 192.168.10.254.
- **Subnet Mask**
  Enter the subnet mask.

The table has the following columns:

- **Port**
  All available ports and the link aggregations are shown.
- **Subnet Address**
  Shows the subnet assigned to the port.
- **Subnet Mask**
  Shows the subnet mask.
- **VLAN ID**
  Select the VLAN ID you want to assign to the port or the subnet.

Mirroring

Basics

Mirroring

The device provides the option of simultaneously channeling incoming or outgoing data streams via other interfaces for analysis or monitoring. This has no effect on the monitored data streams. This procedure is known as mirroring. In this menu section, you enable or disable mirroring and set the parameters.

Mirroring ports

Mirroring a port means that the data traffic at a port (mirrored port) of the IE switch is copied to another port (monitor port). You can mirror one or more ports to a monitor port.

If a protocol analyzer is connected to the monitor port, the data traffic at the mirrored port can be recorded without interrupting the connection. This means that the data traffic can be investigated without being affected. This is possible only if a free port is available on the device as the monitor port.

General

On this page, you can enable or disable the mirroring function and make the basic settings.

Note

If the maximum data rate of the mirrored port is higher than that of the monitor port, data may be lost and the monitor port no longer reflects the data traffic at the mirrored port. Several ports can be mirrored to one monitor port at the same time.

Mirroring a port does not work beyond switch core boundaries.

Disable port mirroring if you want to connect a normal end device to the monitor port.

Settings

- **Mirroring**
  Enable or disable mirroring of the data traffic.
- **Monitor Barrier**
  Enable or disable the option to restrict communication via the monitor port.

  Note

  Monitor Barrier

  If you enable the monitor barrier, the data traffic on the destination port is automatically blocked (broadcast, multicast, unicast, DCP forwarding, LLDP) so that only the mirrored traffic is present. To be able to allow other data traffic again, you need to configure this. The previous statuses of these options are not restored after stopping the monitor barrier and must be reconfigured.

  – enabled
    The monitor port is taken out of normal frame switching.
  – disabled
    Communication via the monitor port is unrestricted.

This table has the following columns:

- **Session ID**
  Enable or disable listening in on incoming packets at the required port.
- **Session Type**
  Specify which data traffic is mirrored. The following options are available:
  - '-'
    None
  - Port Based
    Port-based mirroring You can configure other settings in "Layer 2 > Mirroring > Port".
  - VLAN
    VLAN-based mirroring. You can configure other settings in "Layer 2 > Mirroring > VLAN".
  - MAC ACL
    Mirroring of the MAC Access Control List. You can configure other settings in "Layer 2 > Mirroring > MAC Flow".
  - IP ACL
    Mirroring of the IP Access Control List. You can configure other settings in "Layer 2 > Mirroring > IP Flow".
- **Status**
  Shows whether or not mirroring is active.
- **Dest. Port**
  Select the destination port to be mirrored to in this session.

Port

Mirroring ports

You can only configure the settings on this page if you have already generated a session ID with the session type "Port Based" on the "General" tab.

Settings

- **Session ID**
  Select the session ID. Only session IDs of the session type "Port Based" are available.

The table has the following columns:

- **Port**
  Shows the port to be monitored.
- **Ingress Mirroring**
  Enable or disable mirroring of incoming packets at the required port.
- **Egress Mirroring**
  Enable or disable mirroring of outgoing packets at the required port.

VLAN

VLAN sources of the port mirroring function

You can only configure the settings on this page if you have already generated a session ID with the session type "VLAN" on the "General" tab.

On this page, you specify the VLAN whose incoming data traffic will be mirrored to the monitor port.

Settings

- **Session ID**
  Select the session ID. Only session IDs of the session type "VLAN" are available.
- **VLAN ID**
  Enter a VLAN ID. The VLAN ID can only be assigned once when you create a new data record and can then no longer be changed. To make a change, the entire data record must be deleted and created again.

The table has the following columns:

- **VLAN ID**
  Shows the VLAN ID.

MAC Flow

You can only configure the settings on this page if you have already generated a session ID with the session type "MAC ACL" on the "General" tab.

The MAC ACL filter decides which data is available at the monitor port.

Settings

- **Session ID**
  Select the session ID. Only session IDs of the session type "MAC ACL" are available.

The table has the following columns:

- **ACL Filter Number**
  Shows the number of the ACL filter. You configure the MAC ACL filter in "SecurityPort ACL MAC".
- **Ingress Mirroring**
  Shows whether incoming packets are mirrored.

  Note

  Rules

  A rule selected for ingress mirroring only becomes active if it was configured as a port ingress rule on at least one port. You configure the port ingress rules in "Security> Port MAC IP > Port Ingress Rules".

- **Source MAC**
  Shows the MAC address of the sender.

- **Dest. MAC**
  Shows the MAC address of the recipient.
- **Ingress Port**
  Shows a list of all ports to which this rule applies.
- **Egress Port**
  Shows a list of all ports to which this rule applies.

IP Flow

You can only configure the settings on this page if you have already generated a session ID with the session type "IP ACL" on the "General" tab.

The IP ACL filter decides which data is mirrored to the monitor port.

Settings

- **Session ID**
  Select the session ID. Only session IDs of the session type "IP ACL" are available.

The table has the following columns:

- **ACL Filter Number**
  Shows the number of the ACL filter. You configure the IP ACL filter in "Security > Port ACL IP".
- **Ingress Mirroring**
  Shows whether incoming packets are mirrored.

  Note

  Rules

  A rule selected for ingress mirroring only becomes active if it was configured as a port ingress rule on at least one port. You configure the port ingress rules in "Security> Port ACL IP > Port Ingress Rules".

- **Source IP**
  Shows the IP address of the sender.
- **Source Subnet Mask**
  Shows the subnet mask of the sender.
- **Dest. IP**
  Shows the IP address of the recipient.
- **Dest. Subnet Mask**
  Shows the subnet mask of the recipient.
- **Ingress Port**
  Shows a list of all ingress ports to which this rule applies.
- **Egress Port**
  Shows a list of all egress ports to which this rule applies.

Dynamic MAC Aging

The device automatically learns the source addresses of the connected nodes.

This information is used to forward data frames to the nodes specifically involved. The network load for the other nodes is reduced.
If a device does not receive a frame whose source address matches a learnt address within a certain time, the learnt address is deleted. This mechanism is known as aging. Aging prevents frames being forwarded incorrectly, for example when an end device (for example a programming device) is connected to a different port. If the check box is not enabled, a device does not delete learned addresses automatically.

Settings

- **Dynamic MAC Aging**
  Enable or disable the function for automatic aging of learned MAC addresses:
- **Aging Time [s]**
  Enter the time in seconds. After this time, a learned address is deleted if the device does not receive any further frames from this sender address.

Ring Redundancy

Ring

On this page, you can select the required mode for fast ring redundancy. The "Automatic Redundancy Detection" ring redundancy mode is the default when the device ships.

Note

The ring redundancy cannot be enabled if Spanning Tree is still enabled on the device.

Settings

- **Ring Redundancy**
  Enable or disable ring redundancy.
- **Ring redundancy mode**
  Specify the ring redundancy mode. The following options are available:
  - **"-" (disabled)**
    The redundancy function is disabled.
  - **Automatic Redundancy Detection**
    Select this setting to create an automatic configuration of the redundancy mode. In this mode, the device automatically detects whether or not there is a device with the "HRP Manager" role in the ring. If this is the case, the device adopts the role of "HRP Client". If no HRP manager is found, all devices with the "Automatic Redundancy Detection" or "MRP Auto Manager" setting negotiate among themselves to establish which device adopts the role of "MRP Manager". The device with the lowest MAC address will always become "MRP Manager". The other devices automatically set themselves to redundancy mode "MRP Client".
  - **MRP Auto Manager**
    Devices with the setting "Automatic Redundancy Detection" or "MRP Auto Manager" negotiate among themselves which device will adopt the "MRP Manager" role. The device with the lowest MAC address will always become "MRP Manager". In contrast to the setting "Automatic Redundancy Detection", the devices are not capable of detecting whether or not an HRP manager is in the ring. This means that they never adopt the role of HRP client.
  - **MRP Client**
    In a ring whose devices are configured with MRP, at least one device must be set to the "Automatic Redundancy Detection" or "MRP Auto Manager" mode. You can set the "MRP Client" role for all other devices. If all devices except one are configured as "MRP Client", this one device automatically adopts the role of "MRP Manager".
    Select "MRP Client" mode if you want to operate the device along with components that do not originate from Siemens in the ring.
  - **HRP Client**
    Here, you can select the role "HRP Client".
  - **HRP Manager**
    When you configure an HRP ring, one device must be set as HRP manager. All other devices must be configured as HRP clients.
- **Ring ports**
  Specify the ports to be used as ring ports in media redundancy in ring topologies.
  The ring port you select in the upper drop-down menu is the "Isolated Port" in HRP.

Note

If you restore the factory defaults, the default redundancy mode "Automatic Redundancy Detection" becomes active.

The ring port configuration is also reset to the factory default ports. If other ports were used previously as ring ports, with the appropriate attachment, a previously correctly configured device can cause circulating frames and therefore the failure of the data traffic.

- **Observer**
  Enable or disable the observer. The "Observer" function is only available in HRP rings. The ring port selected in the upper drop-down menu is connected to the "Isolated Port" of an HRP manager.
  The observer monitors malfunctions of the redundancy manager or incorrect configurations of an HRP ring.
  If the observer is enabled, it can interrupt the connected ring if errors are detected. To do this, the observer switches a ring port to the "blocking" status. When the error is resolved, the observer enables the port again.
- **Restart Observer** (only available online)
  If numerous errors occur in quick succession, the observer no longer enables its port automatically. The ring port remains permanently in the "blocking" status. This is signaled by the error LED and a message text.
  After the errors have been eliminated, you can enable the port again using the "Restart Observer" button.

Standby

Standby manager

The standby manager allows the redundant linking of two HRP rings. To do this, two neighboring devices within a ring must be configured as standby partners. Enable the standby manager for both standby partners and select the port via which the device is connected to the ring you want to link to. For the "Standby Connection Name", a name unique within the ring must be assigned for both partners. This identifies the two modules as standby partners that belong together.

Note

To be able to use the function, HRP must be activated.

Settings

- **Standby**
  Enable or disable the standby manager.

  Note

  If two devices are linked by the standby function, the "Standby" function must be enabled on both devices.

  Note

  The standby manager always requires an activated HRP client.

- **Standby Connection Name**
  Enter the name for the standby connection. This name defines the master/slave device pair. Both must be located in the same ring. This is achieved by entering the same name on two devices in the ring.

  Note

  Make sure that the standby name (for one pair of devices) is used only once in the network.

- **Force device to standby master**
  When selected, the device is configured as standby master regardless of its MAC address.
  - If the setting is enabled for neither of the two devices for which the standby function is enabled, then assuming that no error has occurred, the device with the higher MAC address adopts the role of standby master.
  - If the setting is enabled for both devices or if the setting is only supported by one device, the standby master is also selected based on the MAC address.

  This type of assignment is important in particular when a device is replaced. Depending on the MAC addresses, the previous device with the slave function can take over the role of the standby master.

This table has the following columns:

- **Port**
  Shows the port to which the setting relates.
- **Setting**
  Here, you specify which ports are standby ports. The standby ports are involved in the redirection of data traffic.
  If there are no problems, only the standby ports of the master are enabled and handle to the data traffic into the connected HRP rings (buses). If the master or the Ethernet connection (link) of one of the standby ports of the master fails, all standby ports of the master will be disabled and the standby ports of the slave enabled. As a result, a functioning Ethernet connection to the connected network segments (HRP rings/linear buses) is restored.

Spanning Tree

General

General settings of MSTP

On this page, you configure the settings for MSTP. As default, Rapid Spanning Tree is enabled that can be set to the MSTP, RSTP or STP compatible mode with a switch.

On the configuration pages of these functions, you can make detailed settings.

Depending on the compatibility mode, you can configure the corresponding function on the relevant configuration page.

Settings

- **Spanning Tree**
  Enable or disable Spanning Tree.
- **Protocol Compatibility**
  Select the compatibility mode of Spanning Tree. If, for example, you select RSTP, Spanning Tree behaves like RSTP.
  The following settings are available:
  - STP
  - RSTP
  - MSTP

Using a link aggregation in an MSTP instance

If you want to use a link aggregation in an MSTP instance, follow the steps below during configuration:

1. Create a link aggregation in "Layer 2" > "Link aggregation (Page 1037)".
2. Create an MSTP instance in "Layer 2" > "Spanning Tree" > "MST General (Page 1032)".
3. Configure the link aggregation in "Layer 2" > "Spanning Tree" > "MST port (Page 1033)".

Automatic activation of MRP in redundant topologies

If you connect SCALANCE X switches with redundant network structures in the topology view, MRP is activated automatically on the switches involved.

If there is an existing configuration with other redundancy mechanisms, such as MSTP, this is automatically deactivated.

CIST general

On this page, you configure CIST.

Settings

- **Bridge Priority / Root Priority** (only available online)
  Which device becomes the root bridge is decided based on the bridge priority. The bridge with the highest priority becomes the root bridge. The lower the value, the higher the priority. If several devices in a network have the same priority, the device whose MAC address has the lowest numeric value will become the root bridge. Both parameters, bridge priority and MAC address together form the bridge identifier. Since the root bridge manages all path changes, it should be located as centrally as possible due to the delay of the frames.
- **Bridge Address / Root Address**(only available online)
  The bridge address shows the MAC address of the device and the root address shows the MAC address of the root bridge.
- **Root Port** (only available online)
  Shows the port via which the switch communicates with the root bridge.
- **Root Cost** (only available online)
  The path costs from this device to the root bridge.
  In MSTP mode, path costs up to the root bridge are shown.
- **Topology Changes** / **Last Topology Change** (only available online)
  The entry for the device shows the number of reconfigurations due to the spanning tree mechanism since the last startup. For the root bridge, the time since the last reconfiguration is displayed as follows:
  - Seconds: sec unit after the number
  - Minutes: min unit after the number
  - Hour: hr unit after the number
- **Bridge Hello Time / Root Hello Time** (only available online)
  Each bridge regularly sends configuration frames (BPDUs). The interval between two such frames is the Hello time. The default for this parameter is 2 seconds.
- **Bridge Forward Delay / Root Forward Delay**
  New configuration data is not used immediately by a bridge but only after the period specified in the parameter. This ensures that operation is only started with the new topology after all the bridges have the required information.
- **Bridge Max Age / Root Max Age** (only available online)
  Bridge Max Age defines the maximum "age" of a received BPDU for it to be accepted as valid by the switch.
- **Bridge Max Hop Count**
  This parameter specifies how many MSTP nodes a BPDU may pass through. If an MSTP BPDU is received and has a "Bridge Max Hop Count" that exceeds the value configured here, it is discarded.
- **Regional root priority** (only available online)
  For a description, see Bridge Priority / Root Priority
- **Regional root address** (only available online)
  The MAC address of the device.
- **Regional root costs** (only available online)
  Shows the path costs from this device to the regional root bridge.

- **Region Name**
  Enter the name of the MSTP region to which this device belongs. As default, the MAC address of the device is entered here. This value must be the same on all devices that belong to the same MSTP region.
- **Region Version**
  Enter the version number of the MSTP region in which the device is located. This value must be the same on all devices that belong to the same MSTP region.
- **Reset Counter** (only available online)
  Click this button to reset the counters on this page to zero.

CIST port

MSTP-CIST port configuration

When the page is called, the table displays the current status of the configuration of the port parameters.

To configure them, click the relevant cells in the port table.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **MSTP Status**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **MSTP Status**
  Specify whether or not the port is integrated in the spanning tree.

  Note

  If you disable the "MSTP Status" option for a port, this may cause the formation of loops. The topology must be kept in mind.

- **Priority**
  Enter the priority of the port. The priority is only evaluated when the path costs are the same. The value must be divisible by 16. If the value that cannot be divided by 16, the value is automatically adapted.
- **Cost Calc.**
  Enter the path cost calculation. If you enter the value "0" here, the automatically calculated value is displayed in the "Path Costs" box.

- **Path Costs** (only available online)
  This parameter is used to calculate the path that will be selected. The path with the lowest value is selected as the path. If several ports of a device have the same value for the path costs, the port with the lowest port number is selected.
  If the value for "Cost Calc." is "0", the automatically calculated value is displayed. Otherwise, the value of the "Cost Calc." box is displayed. The calculation of the path costs is largely based on the transmission speed. The higher the achievable transmission speed is, the lower the value of the path costs.
  Typical values for path costs with rapid spanning tree:
  - 10,000 Mbps = 2,000
  - 1000 Mbps = 20,000
  - 100 Mbps = 200,000
  - 10 Mbps = 2,000,000

  The values can, however, also be set individually.
- **Status** (only available online)
  Displays the current status of the port. The values are only displayed and cannot be configured. The "Status" parameter depends on the configured protocol. The following is possible for status:
  - Disabled

    The port only receives and is not involved in STP, MSTP and RSTP.
  - Discarding
    In the "Discarding" mode, BPDU frames are received. Other incoming or outgoing frames are discarded.
  - Listening

    In this status, BPDUs are both received and sent. The port is involved in the spanning tree algorithm.
  - Learning

    Stage prior to the forwarding status, the port is actively learning the topology (in other words, the node addresses).
  - Forwarding

    Following the reconfiguration time, the port is active in the network; it receives and forwards data frames.

- **Fwd. Trans** (only available online)
  Specifies the number of changes from the "Discarding" status to the "Forwarding" status
- **Edge type**
  Specify the type of edge port. You have the following options:
  - "-"
    Edge port is disabled. The port is treated as a "no edge port".
  - Admin
    Select this option when there is always an end device on this port. Otherwise a reconfiguration of the network will be triggered each time a connection is changed.
  - Auto
    Select this option if you want a connected end device to be detected automatically at this port. When the connection is established the first time, the port is treated as a "no Edge Port".
  - Admin/Auto
    Select these options if you operate a combination of both on this port. When the connection is established the first time, the port is treated as an Edge Port.
- **Edge** (only available online)
  Shows the status of the port.
  - Enabled

    An edge port is connected to this port.
  - Disabled
    There is a spanning tree or rapid spanning tree device at this port.

  With an end device, a switch can change over the port faster without taking into account spanning tree frames. If a spanning tree frame is received despite this setting, the port automatically changes to the "Disabled" setting for switches.

- **P.t.P. Type**
  Select the required option. The selection depends on the port that is set.
  - "-"
    Point to point is calculated automatically. If the port is set to half duplex, a point-to-point link is not assumed.
  - P.t.P.

    Even with half duplex, a point-to-point link is assumed.
  - Shared Media

    Even with a full duplex connection, a point-to-point link is not assumed.

    Note

    Point-to-point connection means a direct connection between two devices. A shared media connection is, for example, a connection to a hub.

- **Hello Time**
  Enter the interval after which the bridge sends configuration BPDUs

  Note

  The port-specific setting of the Hello time is only possible in MSTP compatible mode.

MST General

Multiple Spanning Tree configuration

With MSTP, in addition to RSTP, several VLANs can be managed in a LAN with separate RSTP trees.

Settings

- **MSTP Instance ID**
  Enter the number of the MSTP instance.

The table has the following columns:

- **MSTP Instance ID**
  Shows the number of the MSTP instance.
- **Root Address**
  Shows the MAC address of the root bridge
- **Root Priority**
  Shows the priority of the root bridge.
- **Bridge Priority**
  Enter the bridge priority. The value for the bridge priority is a whole multiple of 4096.
- **VLAN ID**
  Enter the VLAN ID. Here, you can also specify ranges with Start ID, "-", End ID. Several ranges or IDs are separated by ",".

MST port

Configuration of the Multiple Spanning Tree port parameters

On this page, you set the parameters for the ports of the configured multiple spanning tree instances.

Settings

- **MSTP Instance ID**
  Select the ID of the MSTP instance.

Table 1 has the following columns

- **1st column**
  Shows that the setting is valid for all ports.
- **MSTP Status**
  Select the setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2

Table 2 has the following columns:

- **Port**
  Shows all available ports and link aggregations.
- **MSTP Instance ID**
  ID of the MSTP instance.
- **MSTP Status**
  Enable or disable MSTP for this port.
- **Priority**
  Enter the priority of the port. The priority is only evaluated when the path costs are the same. The value must be divisible by 16. If the value that cannot be divided by 16, the value is automatically adapted.
- **Cost Calc.**
  Enter the path cost calculation in the input box. If you enter the value "0" here, the automatically calculated value is displayed in the next box "Path Costs".

- **Path Costs** (only available online)
  This parameter is used to calculate the path that will be selected. The path with the lowest value is selected as the path. If several ports of a device have the same value for the path costs, the port with the lowest port number is selected.
  If the value for "Cost Calc." is "0", the automatically calculated value is displayed. Otherwise, the value of the "Cost Calc." box is displayed. The calculation of the path costs is largely based on the transmission speed. The higher the achievable transmission speed is, the lower the value of the path costs.
  Typical values for path costs with rapid spanning tree:
  - 10,000 Mbps = 2,000
  - 1000 Mbps = 20,000
  - 100 Mbps = 200,000
  - 10 Mbps = 2,000,000

  The values can, however, also be set individually.
- **Status** (only available online)
  Displays the current status of the port. The values are only displayed and cannot be configured. The "Status" parameter depends on the configured protocol. The following is possible for status:
  - Disabled

    The port only receives and is not involved in STP, MSTP and RSTP.
  - Discarding
    In the "Discarding" mode, BPDU frames are received. Other incoming or outgoing frames are discarded.
  - Listening

    In this status, BPDUs are both received and sent. The port is involved in the spanning tree algorithm.
  - Learning

    Stage prior to the forwarding status, the port is actively learning the topology (in other words, the node addresses).
  - Forwarding

    Following the reconfiguration time, the port is active in the network; it receives and forwards data frames.
- **Fwd. Trans** (only available online)
  Specifies the number of changes from the "Discarding" status to the "Forwarding" status

Enhanced Passive Listening Compatibility

Enabling the function

On this page, you enable the expanded compatibility for passive listening.

Settings

- **Enhanced Passive Listening Compatibility**
  Enable or disable this function for the entire device.

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Displays the port of the device.
- **Setting**
  - enabled
    Enables the function for all ports of the device.
  - disabled
    Disables the function for all ports of the device.

Loop detection

With the "Loop Detection" function, you specify the ports for which loop detection will be activated. The ports involved send special test frames - the loop detection frames. If these frames are sent back to the device, there is a loop.

A "local loop" involving this device means that the frames are received again at a different port of the same device. If the sent frames are received again at the same port, there is a "remote loop" involving other network components.

Note

A loop is an error in the network structure that needs to be eliminated. The loop detection can help to find the errors more quickly but does not eliminate them. The loop detection is not suitable for increasing network availability by deliberately including loops.

Note

Note that loop detection is only possible at ports that were not configured as ring ports or standby ports.

Settings

- **Loop Detection**
  Enable or disable loop detection.
- **VLAN Loop Detection**
  Enable or disable loop detection in a VLAN.

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports of table 2
- **Threshold / Remote Reaction / Local Reaction**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **Setting**
  Specify how the port handles loop detection frames.

  Note

  Test frames create additional network load. We recommend that you only configure individual switches, for example at branch points of the ring, as "sender" and the others as "forwarder".

  – sender
    Loop detection frames are sent out and forwarded.
  – forwarder
    Loop detection frames from other devices are forwarded.
  – blocked
    The forwarding of loop detection frames is blocked.
- **Threshold**
  Specify the number of received loop detection frames as of which a loop is assumed.
- **Remote Reaction**
  Specify how the port will react if a remote loop occurs. Select one of the two options from the drop-down list:
  – no action
    A loop has no effect on the port.
  – disable
    The port is blocked.

- **Local Reaction**
  Specify how the port will react if a local loop occurs. Select one of the two options from the drop-down list:
  - no action
    A loop has no effect on the port.
  - disable
    The port is blocked
- **Status** (only available online)
  This box shows whether loop detection is enabled or disabled for this port.
- **Source Port** (only available online)
  Shows the output port of the loop detection frame that triggered the last reaction
- **Source VLAN** (only available online)
  Shows the VLAN ID of the loop detection frame that triggered the last reaction.
  This is only possible if "VLAN Support Enabled" was selected earlier on the "Loop Detection Configuration" page.
- **Reset** (only available online)
  After a loop in the network has been eliminated, click this button to reset the port again

Link aggregation

Bundling network connections for redundancy and higher bandwidth

A link aggregation according to IEEE 802.3ad allows several connections between neighboring devices to be bundled to achieve higher bandwidths and to protect against failure.

Ports on both partner devices are included in link aggregations and the devices are then connected via these ports. To assign ports (in other words links) correctly to a partner device, the Link Aggregation Control Protocol (LACP) from the IEEE 802.3ad standard is used.

Up to 8 link aggregations can be defined. A maximum of 8 ports can be assigned to each link aggregation.

You can also use link aggregations within an MSTP instance, see "Layer 2" > "Spanning Tree" > "General (Page 1027)".

Settings

The table has the following columns:

- **Port**
  Shows the virtual port number of this link aggregation. This identifier is assigned internally by the firmware.
- **Link Aggregation Name**
  Enter the name for the link aggregation. This name can be specified by the user during configuration. The name is not absolutely necessary but can be useful to distinguish between the various link aggregations.
- **MAC Address**
  Shows the MAC address.

- **Status**
  Enable or disable link aggregation.
- **MTU**
  Specify the packet size.
- **LACP**
  - on
    Enables the sending of LACP frames.
  - off
    Disables the sending of LACP frames.
- **Frame Distribution**
  Set the type of distribution of packets on the individual links of an aggregation.
  - Destination&Source Mac
    The distribution is based on a combination of the destination and source MAC address.
  - Destination&Source IP-MAC
    The distribution is based on a combination of the destination and source IP address and MAC address.
- **VLAN Mode**
  Specify how the link aggregation is entered in a VLAN:
  - Hybrid
    The link aggregation sends tagged and untagged frames. It is not automatically a member of a VLAN.
  - Trunk
    The link aggregation only sends tagged frames and is automatically a member of all VLANs.
- **Port**
  Shows the ports that belong to this link aggregation. The following values can be selected from the drop-down list:
  - "-" (disabled)
    Link aggregation is disabled.
  - "a" (active)
    The port sends LACP frames and is only involved in the link aggregation when LACP frames are received.
  - "p" (passive)
    The port is only involved in the link aggregation when LACP frames are received.
  - "o" (on)
    The port is involved in the link aggregation and does not send any LACP frames.

  Note

  Within a "link aggregation", only ports with the following configuration are possible:
  - all ports with "o"
  - all ports with "a" or "p".

DCP forwarding

Applications

The DCP protocol is used by STEP 7 and the PST Tool for configuration and diagnostics. When shipped, DCP is enabled on all ports; in other words, DCP frames are forwarded at all ports. With this option, you can disable the sending of these frames for individual ports, for example to prevent individual parts of the network from being configured with the PST Tool or to divide the full network into smaller parts for configuration and diagnostics.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **Setting**
  Specify whether the port should block or forward outgoing DCP frames. The following options are available:
  - forward
    DCP frames are forwarded via this port.
  - block
    No outgoing DCP frames are forwarded via this port. It is nevertheless still possible to receive via this port.

LLDP

Applications

PROFINET uses the LLDP protocol for topology diagnostics. In the default setting, LLDP is enabled for all ports; in other words, LLDP frames are sent and received on all ports. With this function, you have the option of enabling or disabling sending and/or receiving per port.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the port.
- **Setting**
  Specify the LLDP functionality. The following options are available:
  - Rx
    This port can only receive LLDP frames.
  - Tx
    This port can only send LLDP frames.
  - Rx & Tx
    This port can receive and send LLDP frames.
  - "-" (disabled)
    This port can neither receive nor send LLDP frames.

Unicast

Filter

Address filtering

This page shows the current content of the unicast filter table. This table lists the source addresses of unicast address frames. The displayed entries were made statically, in other words, the user set them.

On this page, you also define the static unicast filters.

Settings

- **VLAN ID**
  Select the VLAN ID in which you configure a new static MAC address. If nothing is set, "VLAN1" is set as the basic setting.
- **MAC Address**
  Enter the MAC address here.

This table contains the following columns:

- **VLAN ID**
  Shows the VLAN-ID assigned to this MAC address.
- **MAC Address**
  Shows the MAC address of the node that the device has learned or the user has configured.
- **Status**
  Shows the status of each address entry:
  - static
    Configured by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the switch is restarted.
- **Port**
  Shows the port via which the node with the specified address can be reached. Frames received by the device whose destination address matches this address will be forwarded to this port.

Note

You can only specify **one** port for unicast addresses.

Learning

Starting/stopping learning

Note

The page is only available if there is an online connection to the device.

With the automatic learning function, all connected devices are automatically entered in the unicast filter table. As long as the "Start learning" function is enabled, all learned unicast addresses are created immediately as static unicast entries.
The learning process is ended only after clicking the "Stop learning" button. With this method, learning can take a few minutes or several hours in larger networks before all nodes have really been learned. Only nodes that send packets during the learning phase are found.
By subsequently enabling the Port Lock function, only packets from the nodes known after the end of the learning phase (static unicast entries) will be accepted at the relevant ports.

Note

If the Port Lock function was already active on individual ports prior to the automatic learning phase, no addresses will be learned on these ports. This makes it possible to restrict learning to certain ports. To do this, first enable the Port Lock function of the ports that are not intended to learn addresses.

Settings

- **Start learning**
  Click the "Start learning" button to start the learning phase.
  The device now enters the addresses of connected devices until you stop the function.
- **Stop learning**
  Click the "Stop Learning" button to stop the learning phase.
  The learned entries are stored.
- **Deleting all static unicast addresses**
  Click the "Clear all static unicast addresses" button to delete all static entries.
  In large networks with numerous nodes, automatic learning may lead to a lot of undesired static entries. To avoid having to delete these individually, this button can be used to delete all static entries. This function is disabled during automatic learning.

Note

Depending on the number of entries involved, deleting may take some time.

Locked ports

Activating the access control

On this page, you can block individual ports for unknown nodes.

If the Port Lock function is enabled, packets arriving at this port from unknown MAC addresses are discarded immediately. Packets from known nodes are accepted by the port.
Since ports with the port lock function enabled cannot learn any MAC addresses, learned addresses on these ports are automatically deleted after the port lock function is enabled.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **Setting**
  Enable or disable access the port lock function for the port.

Blocking

Blocking the forwarding of unknown unicast frames

On this page, you can block the forwarding of unknown unicast frames for individual ports.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **Setting**
  Enable or disable the blocking of unicast frames

Note

Ring redundancy / standby

If ring redundancy or standby is enabled, the ports configured for this are not included in the blocking.

Multicast

Groups

Multicast applications

In the majority of cases, a frame is sent with a unicast address to a particular recipient. If an application sends the same data to several recipients, the amount of data can be reduced by sending the data using one multicast address. For some applications, there are fixed multicast addresses (NTP, IETF1 Audio, IETF1 Video etc.).

Reducing network load

In contrast to unicast frames, multicast frames represent a higher load for the device. Generally, multicast frames are sent to all ports. There are three ways of reducing the load caused by multicast frames:

- Static entry of the addresses in the multicast filter table.
- Dynamic entry of the addresses by listening in on IGMP parameter assignment frames (IGMP Configuration).
- Active dynamic assignment of addresses by GMRP frames.

The result of all these methods is that multicast frames are sent only to ports for which an appropriate address is entered.

"Multicast" shows the multicast frames currently entered in the filter table and their destination ports. The displayed entries were made statically, in other words, the user set them.

Settings

- VLAN ID
  Select the VLAN ID to be assigned to the MAC multicast address.
- MAC Address
  Here you enter a new MAC multicast address you want to configure.

The table has the following columns:

- VLAN ID
  Shows VLAN ID of the VLAN to which the MAC multicast address is assigned.
- MAC Address
  Shows the MAC multicast address that the device has learned or the user has configured.
- Status
  Shows the status of each address entry. The following information is possible:
  - static
    The address was entered statically by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the device is restarted. These must be deleted by the user.

IGMP

Function

IE switches support "IGMP snooping" and the IGMP querier function. If "IGMP snooping" is enabled, IGMP frames are evaluated and the multicast filter table is updated with this information. If "IGMP Querier is also enabled, IE switches also send IGMP queries that trigger responses from IGMP-compliant nodes.

IGMP Snooping Aging Time

In this menu, you can configure the aging time for IGMP Configuration. When the time elapses, entries created by IGMP are deleted from the address table if they are not updated by a new IGMP frame.

This applies to all ports; a port-specific configuration is not possible.

IGMP Snooping Aging Time depending on the querier

SCALANCE XR500 as IGMP querier:

If a SCALANCE XR500 is used as an IGMP querier, the query interval is 125 seconds. For the "IGMP Snooping Aging Time", set at least 250 seconds.

Other IGMP queriers

If a different IGMP querier is used, the value of the "IGMP Snooping Aging Time" should be at least twice as long as the query interval.

Settings

- **IGMP Snooping**
  Enable or disable IGMP (Internet Group Management Protocol). The function allows the assignment of IP addresses to multicast groups. If the check box is selected, IGMP entries are included in the table and IGMP frames are forwarded.
- **IGMP Snooping Aging Time**
  Enter the value for the aging time in seconds in this box.
- **IGMP Querier**
  Enable or disable "IGMP Querier". The device sends IGMP queries.

GMRP

Enabling GMRP

By selecting the check box, you specify whether or not GMRP is used for each individual port. If "GMRP" is disabled for a port, no registrations are made for it and it cannot send GMRP frames.

Settings

- **GMRP**
  Enable or disable the GMRP function.

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports and the link aggregations.
- **Setting**
- Enable or disable GMRP for the port or for the link aggregation.

Blocking

On this page, you can block the forwarding of unknown multicast frames for individual ports.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **Setting**
  Enable or disable the blocking of multicast frames.

Broadcast

Blocking the forwarding of broadcast frames

On this page, you can block the forwarding of broadcast frames for individual ports.

Note

Some communication protocols work only with the support of broadcast. In these cases, blocking can lead to loss of data communication. Block broadcast only when you are sure that you do not need it.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the setting is valid for all ports of table 2.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  All available ports and the link aggregations are shown.
- **Setting**
  Enable or disable the blocking of broadcast frames.

PTP

General

Note

PTP is only available with SCALANCE X500.

The Precision Time Protocol (PTP) complying with IEEE 1588v2 allows the time-of-day synchronization of devices connected to the ports of a device. These devices forward the synchronization frames through the network using the "Transparent Clock" (TC) mechanism. The connection mechanisms "end-to-end" and "peer-to-peer" are supported.

To use IEEE 1588v2, enable this function and configure every port that is on the synchronization path as well as ports that are blocked due to redundancy mechanisms. IEEE 1588v2 can also be used with redundancy mechanisms in the ring such as HRP, standby linking of rings, MRP and RSTP.

Setting

- **1588 Mode**
  You can make the following settings:
  - **off**
    The device does not process any PTP messages. PTP messages are, however, forwarded according to the rules of the device.
  - **transparent**
    The device adopts the function of a transparent clock and forwards PTP messages to other nodes while at the same time making entries in the correction field of the PTP message.

TC general

1588 Transparent Clock

On this page, you specify the general settings for PTP.

Settings

- **Delay Mechanism**
  Specify the delay mechanism the device will work with:
  - End-to-end(delay request response mechanism will be used)
  - Peer-to-peer (peer delay mechanism will be used)
- **Domain Number**
  Enter the identification number for the time domain. Synchronization is only for the devices within the domain. The device ignores PTP messages with a different domain number. A SCALANCE device can only be assigned to one synchronization domain.

TC port

On this page, you specify the ports that can process PTP messages.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports of table 2.
- **Setting / Transport Mechanism**
  Select the setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the available ports.
- **Setting**
  Enable or disable PTP. When enabled, the port processes PTP messages.
- **Faulty Flag**
  Shows error status relating to PTP.
  - **true**
    An error occurred.
  - **false**
    No error has occurred on this port.
- **Transport Mechanism**
  Specifies the protocol for transferring the PTP messages. This protocol must also be supported by the communications partner of the port
  - Ethernet
  - UDP IPv4

RMON

Statistics

Statistics

On this page you can specify the ports for which statistics are displayed.

Settings

- **RMON**
  If you select this check box, Remote Monitoring (RMON) allows diagnostics data to be collected on the device, prepared and read out using SNMP by a network management station that also supports RMON. This diagnostic data, for example port-related load trends, allow problems in the network to be detected early and eliminated.
- **Port**
  Select the ports for which statistics will be displayed.

The table has the following columns:

- **1st column**
  Select the check box of the ports for which no more statistics will be displayed.
- **Port**
  Shows the ports for which statistics will be displayed.

History

Samples of the statistics

On this page, you can specify whether or not samples of the statistics are saved for a port. You can specify how many entries should be saved and at which intervals samples should be taken.

Settings

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports.
- **Setting**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Entries**
  Enter the maximum number of samples to be stored at the same time. If "No Change" is entered, the entry in table 2 remains unchanged.
- **Interval [s]**
  Enter the interval after which the current status of the statistics will be saved as a sample. If "No Change" is entered, the entry in table 2 remains unchanged.
- **Transfer to table**
  If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the port to which the settings relate.
- **Setting**
  Enable the port for which the history will be displayed.
- **Entries**
  Enter the maximum number of samples to be stored at the same time.
- **Interval [s]**
  Enter the interval after which the current status of the statistics will be saved as a sample.

Configuring layer 3 functions

Configuration

The page contains the overview of the layer 3 functions of the device. To use the "Routing", "VRRP", "OSPF" and "RIP" functions, the device requires a KEY-PLUG.

Settings

- **Routing** (only available on layer 3)
  Enable or disable the "Routing" function.
- **DHCP Relay Agent**
  Enable or disable the DHCP relay agent. You can configure other settings in "Layer 3 > DHCP Relay Agent".
- **VRRP** (only available on layer 3)
  Enable or disable routing using VRRP. To use VRRP, first enable the "Routing" function. You can configure other settings in "Layer 3 > VRRP".
- **OSPF** (only available on layer 3)
  Enable or disable routing using OSPF. To use OSPF , first enable the "Routing" function. You can configure other settings in "Layer 3 > OSPFv2".
- **RIP** (only available on layer 3)
  Enable or disable routing using RIP. To use RIO , first enable the "Routing" function. You can configure other settings in "Layer 3 > RIPv2".

Subnets

Overview

Subnet

The page shows the subnets for the selected interface. If more than one subnet is available on an interface, the first entry of this interface is of the address type "Primary". All other subnets have the address type "Secondary".

On this page, you can create further subnets "Layer 3 > Subnets > Overview". In "Layer 3 > Subnets > Configuration", you configure the settings of the created subnets.

Settings

The following settings are possible for subnets of the "Secondary" address type:

- **Interface**
  Select the interface on which you want to configure another subnet.

The table has the following columns:

- **Interface**
  Shows the interface.
- **TIA Interface**
  Shows whether or not the entry is a TIA interface.
- **Interface Name**
  Shows the name of the interface.
- **MAC Address**
  Shows the MAC address.

- **IP Address**
  Shows the IP address of the subnet.
- **Subnet Mask**
  Shows the subnet mask.
- **Address Type**
  Shows the address type. The following values are possible:
  - Primary
    The first IP address that was configured on an IP interface.
  - Secondary
    All other IP addresses that were configured on an interface.
- **IP Assignment Method**
  Shows how the IP address is assigned.
  - Static
    The IP address is static. You enter the IP settings in "IP Address" and "Subnet Mask".
  - Automatic (DHCP)
    The device obtains a dynamic IP address from a DHCP server.
- **Address Collision Detection Status**
  Shows the status of the "Detection of address collisions" function.
  - Idle
    The interface is not enabled and does not have an IP address.
  - Starting
    This status indicates the start-up phase. In this phase, the device initially sends a query as to whether the planned IP address already exists. If the address is not yet been assigned, the device sends the message that it is using this IP address as of now.
  - Conflict
    The interface is not enabled. The interface is attempting to use an IP address that is already been assigned.
  - Defending
    The interface uses a unique IP address. Another interface is attempting to use the same IP address.
  - Active
    The interface uses a unique IP address. There are no collisions.
  - Not supported
    The function for detection of address collisions is not supported.

Configuration

On this page, you configure the subnet. You create the subnet in "Layer 3 > Subnets > Overview".

Settings

- **Interface (Name)**
  Select the required interface.
- **Interface Name**
  Enter the name of the interface, e.g. eth0; P3.
- **MAC Address** (only available online)
  Shows the MAC address of the selected interface
- **DHCP**
  Enable or disable the DHCP client for this interface.
- **IP Address**
  Enter the IP address of the subnet. The IP address must not be used more than once.
- **Subnet Mask**
  Enter the subnet mask of the subnet you are creating. Subnets on different interfaces must not overlap.
- **Address Type**
  Shows the address type. The following values are possible:
  - Primary
    The first subnet of the interface.
  - Secondary
    All other subnets of the interface.
- **Address Collision Detection**
  Enable or disable the function.
  If new IP addresses become active in the network, this function checks whether this can result in address collisions.
  With this function, IP addresses that will be assigned twice can be detected.

  Note

  The function does not run a cyclic check.

- **TIA Interface**
  Enable or disable the setting.
  The following conditions apply to the TIA interface:
  - Only interfaces with the address type "Primary" can be enabled as the TIA interface.
  - There must only ever be one TIA interface.
  - There can only be one TIA interface.
  - A TIA interface is always a VLAN interface.

TIA interface and PROFINET interface

The IP address of the TIA interface is linked to the IP address located in the parameter group "Properties > General > PROFINET interface > Ethernet addresses".

Both IP addresses always have the same value. If you change the value of one IP address, the other IP address changes accordingly.

TIA Interface

The TIA interface is the interface via which all PROFINET functions of the IE switch are handled.

TIA interface is the name of the IP address for PROFINET from the perspective of the IE switch.

PROFINET interface

You make the IP setting of the PROFINET device in TIA under PROFINET interface.

PROFINET interface is the name of the IP address for PROFINET from the perspective of the TIA Portal.

Routes

Static route

On this page, you create the static routes. During automatic adaptations, static routes are not taken into account and need to be adapted manually.

Settings

- **Destination Network**
  Enter the network address of the destination.
- **Subnet Mask**
  Enter the corresponding subnet mask.
- **Gateway**
  Enter the IP address of the next gateway.
- **Metric**
  Enter the metric for the route. The metric corresponds to the quality of a connection, for example speed, costs.

The table has the following columns:

- **Destination Network**
  Shows the network address of the destination.
- **Subnet mask**
  Shows the corresponding subnet mask.
- **Gateway**
  Shows the IP address of the next gateway.
- **Interface** (only available online)
  Shows the interface of the route.
- **Metric**
  Enter the metric for the route. When creating the route, "not used" is entered automatically. The metric corresponds to the quality of a connection, for example speed, costs. If there are several equal routes, the route with the lowest metric value is used.
- **Status** (only available online)
  Shows the status of the route.

Route maps

General

Route maps

With route maps, you control how routing information is further processed. You can filter routing information and specify whether the information is further processed, modified or discarded.

Route maps operate according to the following principle:

- Routing information is compared with the filters of the route maps.
- The comparison is continued until the filters of a route map match the properties of an item of information.
- The information is then processed according to the route map settings:
  - The routing information is discarded.
  - The properties of the routing information are changed.

Settings

- **Name**
  Enter the name for the route map.
- **Sequence No**
  Enter a number for the route map.
  The number specifies the order in which the route maps are processed.

The table has the following columns:

- **Name**
  Shows the name of the route map.
- **Sequence No**
  Shows the sequence number of the route map.
- **Action**
  Specify what happens to the routing information that matches the settings of the route map:
  - permit
    The routing information is further processed according to the settings you make in the "Settings" tab.
  - deny
    The routing information is discarded.

Interface and value match

On this page, you specify whether or not the routing information for a route map is filtered according to interfaces or metric.

Settings

- **Route Map (name/seq. no.)**
  Select a route map.
  The created route maps are available to you.
- **Type**
  Select the basis for the filtering:
  - Interface
  - Metric
  - Tag
- **Interface**
  Select an interface.
  This box is active only if you have selected the "Interface" entry in the "Type" drop-down list.
- **Metric**
  Enter a value for the metric.
  This box is active only if you have selected the "Metric" entry in the "Type" drop-down list.
- **Tag**
  Enter a value for the tag.
  This box is active only if you have selected the Tag entry in the "Type" drop-down list.

The table has the following columns:

- **Type**
  Shows the selected type:
  - Interface
  - Metric
  - Tag
- **Value**
  Shows the selected interface or the value of the metric.

Destination match

On this page, you specify whether or not the routing information for a route map is filtered based on the destination IP address.

Settings

- **Route Map (name/seq. no.)**
  Select a route map.
- **IP Address**
  Enter the IP address of the destination on which the filtering is based.
- **Subnet Mask**
  Enter the subnet mask of the destination on which the filtering is based.

The table has the following columns:

- **IP Address**
  Shows the IP address of the destination.
- **Subnet mask/prefix**
  Shows the subnet mask of the destination.

Next hop match

On this page, you specify whether or not the filtering for a route map will be based on the router to which the routing information is sent next.

Settings

- **Route Map (name/seq. no.)**
  Select a route map.
- **IP Address**
  Enter the IP address of the router to which the routing information will be sent next.

The table has the following columns:

- **IP Address**
  Shows the IP address of the next router.

Settings

On this page, you specify whether or not the routing information for a route map will be changed.

If, for example, you have filtered based on a certain metric, you can change the value of the metric here. The routing information is then forwarded with the new value.

Settings

- **Route Map (name/seq. no.)**
  Select a route map.

The table has the following columns:

- **Name**
  Shows the name of the route map.
- **Sequence No**
  Shows the sequence number of the route map.
- **Metric**
  Enter the new value for the metric with which the routing information will be forwarded.
- **Tag**
  Enter the new value for the tag with which the routing information will be forwarded.

DHCP Relay Agent

General

If the DHCP server is in a different network, the device cannot reach the DHCP server. The DHCP relay agent intercedes between a DHCP server and the device. The DHCP relay agent forwards the port number of the device with the DHCP query to the DHCP server. If a DHCP server is unreachable, the device can switch to a different DHCP server.

Settings

- **DHCP Relay Agent (Opt. 82)**
  Enable or disable the DHCP relay agent.
- **Server IP Address**
  Enter the IP address of the DHCP server.

The table has the following columns:

- **Server IP address**
  Shows the IP address of the DHCP server.

Option

Parameters of the DHCP relay agent

On this page, you can specify parameters for the DHCP server, for example the circuit ID. The circuit ID describes the origin of the DHCP query, for example which port received the DHCP query.

You specify the DHCP server on the "General" tab.

Settings

Global configuration

- **Circuit ID router index**
  When enabled, the router index is added to the generated circuit ID.
- **Circuit ID recipient VLAN ID**
  When enabled, the VLAN ID is added to the generated circuit ID.
- **Circuit ID receiving port**
  When enabled, the receiving port is added to the generated circuit ID.

  Note

  You need to select a least one option.

- **Remote ID**
  Shows the device ID.

Interface-specific configuration

- **Interface**
  Select the required interface.

The table has the following columns:

- **Interface**
  Shows the selected interface.
- **Remote ID type**
  Select the type of the device ID. You have the following options:
  - IP Address
    The current IP address of the interface will be used as the device identifier and copied to the "Remote ID" box.

    Note

    No automatic updating

    There is no link between the "Remote ID" box and the currently set IP address.

    If the IP address is changed, the new IP address is not entered in the "Remote ID" box automatically. Only the value of the "Remote ID Type" box changes to "Free Text". To use the current IP address again, select "IP Address" again in the "Remote ID Type" box.

  - MAC Address
    The MAC address of the device is used as the device ID.
  - Free Text
    If you use "Free Text", you can enter the device name as the device identifier in the "Remote ID" box.
- **Remote ID**
  The box can only be edited if you select the entry "Free Text" for "Remote ID Type".
  The remote IP must be unique.
- **Circuit ID Type**
  Select the type of circuit ID from the drop-down list. You have the following options:
  - Predefined
    The circuit ID is created automatically based on the router index, VLAN ID or port.
  - Free Number
    If you use "Free Number", you can enter the ID for "Circuit ID".
- **Circuit ID**
  Enter the circuit ID.
  The box can only be edited if you select the "Free Number" entry for the "Circuit ID Type".

VRRP

Router

On this page, you create virtual routers. You can configure other parameters in "Layer 3 > VRRP > Configuration".

Note

- VRRP is available only on layer 3.
- VRRP can only be used in conjunction with VLAN interfaces. Router ports are not supported.
- Select "VRRP" to configure VRRP

Settings

The following settings are available:

- **VRRP**
  Enable or disable routing using VRRP.
- **React to pings on virtual interfaces**
  When enabled, the virtual IP addresses also reply to the ping.
- **Interface**
  Select the interface operating as virtual router.
- **VRID**
  Enter the ID of the virtual router in the input box. This ID defines the group of routers that form a virtual router (VR). In the group, this is the same. it can no longer be used for other groups.

The table has the following columns:

- **Interface**
  Shows the Interface that functions as the virtual router.
- **VRID**
  Shows the ID of the virtual router.
- **Virtual MAC Address**
  Shows the virtual MAC address of the virtual router.
- **Primary IP Address**
  Shows the primary IP address in this VLAN. The entry 0.0.0.0 means that the "Primary" address on this VLAN is used. Otherwise all IP addresses configured in this VLAN in "Layer 3 > Subnets" are valid values.

- **Router Status**
  Shows the current status of the virtual router. Possible values are as follows:
  - Master
    The router is the master router and handles the routing functionality for all assigned IP addresses.
  - Backup
    The router is the backup router. If the master router fails, the backup router takes over the tasks of the master router.
  - Initialize
    The virtual router has just been turned on. It will soon change to the "Master" or "Backup" status.
- **Master IP Address** (only available online)
  Shows the IP address of the master router.
- **Priority**
  Shows the priority of the virtual router.
  The current master router is automatically given 255. All other priorities can be distributed freely among the VRRP routers. The higher the priority, the earlier the VRRP router becomes "Master".
- **Advert. Internal**
  Shows the interval at which the master router sends VRRP packets.
- **Preempt**
  Shows the precedence of a router when changing roles between backup and master.
  - yes
    This router has precedence when changing roles.
  - no
    This router does not have precedence when changing roles.

Configuration

Introduction

On this page, you configure the virtual router.

Note

VRRP is available only on layer 3.

Description of the displayed values

The page contains the following boxes:

- **Interface / VRID**
  Select the ID of the virtual router to be configured.
- **Primary IP Address**
  Select the primary IP address. If the router becomes master router, the router uses this IP address.

  Note

  If you only configure one subnet on this VLAN, no entry is necessary. The entry is 0.0.0.0. If you configure more than one subnet on the VLAN and you want a specific IP address to be used as the source address for VRRP packets, select the IP address from the drop-down list. Otherwise, the IP address with priority will be used.

- **Master**
  If this option is enabled, the primary IP address is entered for "Associated IP Address". This means that the highest priority IP address of the VRRP router is used as the virtual IP address of the virtual master router. The option must be disabled for the backup routers in this group and the IP address of the router in "Assigned IP address" must be used.
- **Priority**
  Enter the priority of this virtual router.
  The current master router is always given 255. All other priorities can be distributed freely among the redundant routers. The higher the priority, the earlier the router becomes "Master".
- **Advertisement Interval [s]**
  Enter the interval in seconds after which a master router sends a VRRP packet again.
- **Preempt lower priority master**
  Allow the precedence when changing roles between Backup and Master based on the selection process.

Address overview

Overview

This page shows which IP addresses the virtual router monitors.

Note

VRRP is available only on layer 3.

Settings

The table has the following columns:

- **Interface**
  Shows the Interface that functions as the virtual router.
- **VRID**
  Shows the ID of this virtual router.
- **Number of Addresses**
  Shows the number of IP addresses.
- **Associated IP Address (1) ... Associated IP Address (4)**
  Shows the router IP addresses monitored by this virtual router. If a router takes over the role of master, the routing function is taken over by this router for all these IP addresses.

Address configuration

Note

VRRP is available only on layer 3.

Settings

The following settings are possible:

- **Interface / VRID**
  Select the required virtual router.
- **Associated IP Address**
  Enter the IP address that the virtual router will monitor.

The table has the following columns:

- **Associated IP Address**
  Shows the IP addresses that the virtual router monitors.

OSPFv2

Configuration

Introduction

On this page, you configure routing with OSPF.

Note

OSPF is available only on layer 3.

Settings

- **OSPFv2**
  Enable or disable routing using OSPF.
- **Router ID**
  Enter the name of one of the OSPF interfaces. The name is entered in the IP address format and does not need to match the local IP address.
- **OSPFv2 RFC1583 Compatibility**
  Enable the option if you still have old OSPF routers in operation that are not compatible with RFC 2328.
- **Border Router**
  Shows the status of the OSPF router. If the local system is an active member in at least 2 areas, this is an area border router.
- **AS Border Router**
  Specify whether the router is an AS border router. An AS border router intercedes between multiple autonomous systems, for example if you have an additional RIP network. An AS border router is also necessary to add and to distribute static routes.
- **New LSA Received** (only available online)
  Shows the number of received LSAs.
  Updates and local LSAs are not counted.
- **New LSA Configured** (only available online)
  Number of different LSAs sent by this local system.
- **External LSA Maximum**
  To limit the number of entries of external LSAs in the database, enter the maximum number of external LSAs.
- **Exit Interval [s]**
  Enter the interval after which the OSPF router once again attempts to come out of the overflow status. A 0 means that the OSPF router attempts to exit the overflow status only following a restart.
- **Inbound Filter**
  Select a route map that filters inbound routes.

- **Redistribute Routes**
  Specify which known routes are distributed using OSPF.
  The following types of route exist:
  - Default
  - Connected
  - Static
  - RIPv2

  Note

  The settings can only be enabled on an AS border router. Enabling "Default" and "Static", in particular, can cause problems if they are enabled at too many points in the network, for example, forwarding loops.

- **Route Map**
  Select a route map that filters which routes are forwarded using OSPF.

Areas

Overview

An autonomous system can be divided into smaller areas.

On this page, you can view, create, modify or delete the areas of the router.

Note

OSPF is available only on layer 3.

Settings

- **Area ID**
  Enter the ID of the area. The database is synchronized for all routers of an area.
  Input format: x.x.x.x
  x = 0 ... 255

This table contains the following columns:

- **Area ID**
  Shows the ID of the area.

- **Area Type**
  Select the area type from the drop-down list.
  - Normal
  - Stub
  - NSSA
  - Backbone
- **Summary**
  Specify whether summary LSAs are generated for this area.
  - Summary: Summary LSAs are sent to the area.
  - No Summary: Summary LSAs are not sent to the area.
- **Metric**
  Shows the costs of the default route for the area types "Stub" and "NSSA". The initial value depends on the assigned OSPF interface.
  - The metric can be edited for the area types "Stub" and "NSSA". It specifies the costs for the default route via which external networks can be reached.
  - The metric cannot be edited for the area type "Normal".

Area range

Creating a new OSPFv2 area range

On this page, networks can be grouped together under one area ID. The method is used only with area border routers. This means that an area border router only propagates one route for each address area to the outside.

Note

OSPF is available only on layer 3.

Settings

- **Area ID**
  Select the area ID. You configure the ID in "Layer 3 > OSPFv2 > Areas".
- **Subnet Address**
  Enter the address of the network that will be grouped.
- **Subnet Mask**
  Enter the subnet mask of the network that will be grouped.

This table contains the following columns:

- **Area ID**
  Shows the ID of the area.
- **Subnet Address**
  Shows the address of the network that will be grouped with other networks.

- **Subnet Mask**
  Shows the subnet mask of the network that will be grouped with other networks.
- **Advertise**
  Enable this option to advertise the grouped network.

Interfaces

Overview

On this page, you can configure OSPF interfaces.

Note

OSPF is available only on layer 3.

Settings

- **IP Address**
  Select the IP address of the OSPF interface.
- **Area ID**
  Select the area ID of the area with which the OSPF interface is connected.

  Note

  For secondary address types, select the same Area ID as for the corresponding primary address type.
  The information whether an address type is primary or secondary can be found in the "Address Type" column on the "Subnets > Overview" page.

This table contains the following columns:

- **IP Address**
  Displays the IP address of the OSPF interface.
- **Area ID**
  Select the area ID with which the OSPF interface is connected.
- **OSPF Status**
  Specify whether or not OSPF is active on the interface.
  - Enabled: OSPF is enabled on the interface.
  - Disabled: OSPF is disabled on the interface
- **Metric**
  Enter the costs for the OSPF interface.
- **Priority**
  Enter the router priority. The priority is only relevant for selecting the designated router. This parameter can be selected differently on routers within the same subnet.
- **Trans. Delay**
  Enter the required delay when sending a connection update.

- **Retrans. Delay**
  Enter the time after which an OSPF packet is transferred again if no confirmation was received.
- **Hello Interval**
  Enter the interval between two Hello packets.
- **Dead Interval**
  Enter the interval after which the neighbor router is marked as "failed" if no more Hello packets are received from it during this time.

Interface authentication

Configuring the interface login

On this page, you define the authentication of the interface.

Note

OSPF is available only on layer 3.

Settings

- **OSPF Interface**
  Select the OSPF interface for which you want to configure authentication.
- **Authentication type**
  Select the authentication method of the OSPF interface. You have the following options:
  - None: No authentication
  - simple: Authentication using an unencrypted password
  - MD5: Authentication using MD5

Simple authentication

- **Password**
  For "Simple authentication, enter the password if you have selected this type of authentication.
- **Confirmation**
  Confirm the entered password.

MD5 authentication

- **Authentication Key ID**
  If you have selected this type of authentication, enter the ID for the MD5 authentication under which the password is used as the key. Since the key ID is transferred with the protocol, the same key must be stored under the same key ID on all neighboring routers.

The table has the following columns:

- Authentication Key ID
  Can only be edited if you set the MD5 authentication method. It is only possible to use several keys there.
- MD5 Key
  Enter the MD5 key.
- Confirm MD5 Key
  Confirm the entered key.
- Youngest Key ID (only available online)
  Shows whether or not the MD5 key is the latest key ID.

Virtual links

Overview

Due to the protocol, each area border router must have access to the backbone area. If a router is not connected directly to the backbone area, a virtual link to it is created.

Note

OSPF is available only on layer 3.

Note

Note that when creating a virtual link both the transit area and the backbone area must already be configured.

the virtual link must be configured identically at both ends.

Note

- Virtual links are not effective unless the device is an ABR. (only available online)
  This is displayed when at least one virtual link entry is configured and the device is not an area border router.

Settings

- Neighbor Router ID
  Enter the ID of the neighbor router at the other end of the virtual connection.
- Transit Area ID
  Select the ID of the area that connects the two routers.

This table contains the following columns:

- Transit Area ID
  Shows the ID via which the two routers are connected.
- Neighbor Router ID
  Shows the ID of the neighbor router at the other end of the virtual connection.

- **Virt. Link Status**
  Specify the status of the virtual link. The following statuses are possible:
  - down: The virtual link is inactive.
  - point-to-point: The virtual link is active.
- **Trans. Delay**
  Enter the required delay when sending a link update packet (in seconds).
- **Retrans. Delay**
  Enter the time after which a packet is transferred again if no confirmation was received (in seconds).
- **Hello Interval**
  Enter the interval between two Hello packets (in seconds).
- **Dead Interval**
  Enter the interval after which the neighbor router counts as "failed" if no more Hello packets are received from it during this time (in seconds).

Virtual Link Authentication

Configuring the virtual link login

On this page, you define the authentication for the virtual link.

Note

OSPF is available only on layer 3.

Settings

- **Virtual link (area/neighbor)**
  Select the virtual link for which you want to configure authentication.
- **Authentication type**
  Select the authentication method of the OSPF interface. You have the following options:
  - None: No authentication
  - simple: Authentication using an unencrypted password.
  - MD5: Authentication using MD5

Simple authentication

- **Password**
  Enter the password for "simple authentication".
- **Confirmation**
  Confirm the entered password.

MD5 authentication

- **Authentication Key ID**
  Enter the ID for MD5 authentication with which the password will be used as a key. Since the key ID is transferred with the protocol, the same key must be stored under the same key ID on all neighboring routers.

The table has the following columns:

- **Authentication Key ID**
  Can only be edited if you set the MD5 authentication method. It is only possible to use several keys there.
- **MD5 Key**
  Enter the MD5 key.
- **Confirm MD5 Key**
  Confirm the entered key.
- **Youngest Key ID**
  Shows whether or not the MD5 key is the latest key ID.

RIPv2

Configuration

On this page, you configure routing with RIP.

Note

RIPv2 is available only on layer 3.

Settings

- **RIPv2**
  Enable or disable routing using RIPv2.
- **Inbound Filter**
  Select a route map that filters inbound routes.
- **Redistribute Routes**
  Specify which known routes are distributed using RIPv2.
  The following types of route exist:
  - Static Default
  - Connected
  - Static
  - OSPF
- **Route Map**
  Select a route map that filters which routes are forwarded using RIPv2.

Interfaces

Overview

On this page, you can configure RIPv2 interfaces.

Note

RIPv2 is available only on layer 3.

Settings

- **IP Address**
  Select the IP address of the RIPv2 interface.

This table contains the following columns:

- **IP Address**
  Displays the IP address of the RIPv2 interface.
- **Send Updates**
  Select the way in which updates are sent:
  - no send
    No updates are sent.
  - RIPv1
    Updates for RIPv1 are sent.
  - RIPv1-compat.
    RIPv2 updates are sent as broadcasts according to the rules of RIPv1.
  - RIPv2
    Updates for RIPv2 are sent as multicasts.
  - RIPv1 demand/RIPv2 demand
    RIP packets are sent only as a response to an explicit query.
- **Receive Updates**
  Select the form in which received updates are accepted:
  - no receive
    No updates are received.
  - RIPv1
    Only updates of RIPv1 are received.
  - RIPv2
    Only updates of RIPv2 are received.
  - RIPv1/v2
    Updates of RIPv1 and RIPv2 are received.
- **Default Metric**
  Enter the costs for the RIPv2 interface.

Configuring security functions

Passwords

Note

The page is only available if there is an online connection to the device.

Only the administrator can change the device passwords for administrator and users.

The factory settings for the passwords when the devices ship are as follows:

- Administrator: admin
- User: user

Note

If you log on the first time or log on after a "Reset to factory defaults and restart", you will be prompted to change the password.

Note

Changing the password in "Trial" configuration mode

Even if you change the password in "Trial" configuration mode, this change is saved immediately.

Settings

- **Current Admin Password**
  Enter the valid administrator password.
- **User name**
  Select the required user. The following options are available:
  - Administrator: admin
  - User: user
- **New Password**
  Enter the new password.
- **Password Confirmation**
  Confirm the new password.

AAA

General

The term "AAA" used in the menu stands for "Authentication, Authorization, Accounting" and is used to identify and allow network nodes, to provide them with the appropriate services and to determine the amount of use.

On this page, you configure the login.

Settings

- **Login Authentication**
  Specify how the login is made:
  - Local
    Login with local user name and password.
  - RADIUS
    Login using a RADIUS server.

RADIUS client

The term "AAA" used in the menu stands for "Authentication, Authorization, Accounting" and is used to identify and allow network nodes, to provide them with the appropriate services and to determine the amount of use.

Authentication over an external server

The concept of RADIUS is based on an external authentication server. An end device can only access the network after the device has verified the logon data of the device with the authentication server. Both the end device and the authentication server must support the EAP protocol (Extensive Authentication Protocol).

Each column of the table contains access data for one server. In the search order, the primary server is queried first. If the primary server cannot be reached, secondary servers are queried in the order in which they are entered.

If no server responds, there is no authentication. The client has no access to the network although a link is indicated at the port.

Settings

The table has the following columns:

- **Server IP Address**
  Enter the IP address of the RADIUS server.
- **Server Port**
  Here, enter the input port on the RADIUS server. As default, input port 1812 is set.
- **Shared Secret**
  Enter your access ID.
- **Confirm Shared Secret**
  Enter your access ID again as confirmation.
- **Max. Retrans**
  Enter the maximum number of query attempts before another configured RADIUS server is queried or the login counts as having failed. As default, 3 is set.

- **Primary Server**
  Specify whether or not this server is the primary server. You can select one of the options "yes" or "no".
- **Status**
  Enable or disable the RADIUS server.

Note

You can configure a maximum of three servers on this page.

802.1x-Authenticator

The term "AAA" used in the menu stands for "Authentication, Authorization, Accounting" and is used to identify and allow network nodes, to provide them with the appropriate services and to determine the amount of use.

Enabling authentication for individual ports

By selecting the check box, you specify whether or not network access protection according to IEEE 802.1x is enabled on this port.

Settings

- **MAC Authentication**
  Enable or disable MAC authentication for the device.
- **Guest VLAN**
  Enable or disable the "Guest VLAN" function for the device.

Table 1 has the following columns:

- **1st column**
  Shows that the settings are valid for all ports of table 2.
- **802.1x Auth. Control**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **802.1x Re-authentication**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **MAC Authentication**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Adopt RADIUS VLAN Assignment**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **MAC Auth. Max Permitted Addresses**
  Enter how many end devices are allowed to be connected to the port at the same time. If "No Change" is entered, the entry in table 2 remains unchanged.

- **Guest VLAN**
  Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Guest VLAN ID**
  Enter the VLAN ID of the port. If "No Change" is entered, the entry in table 2 remains unchanged.
- **Guest VLAN max. Permitted Addresses**
  Enter how many end devices are allowed in the guest VLAN at the same time.
- **Transfer to table**
  If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**
  Shows the port to which the setting relates.
  If a configuration is not possible for a port, it is displayed grayed out and you cannot modify the settings.
- **802.1x Auth. Control**
  Specify the authentication of the port:
  - Force Unauthorized
    Data traffic via the port is blocked.
  - Force Authorized
    Data traffic via the port is allowed without any restrictions.
    Default setting
  - Auto
    End devices are authenticated on the port with the "802.1x" method.
    The data traffic via the port is permitted or blocked depending on the authentication result.
- **802.1x Re-authentication**
  Enable this option if you want reauthentication of an already authenticated end device to be repeated cyclically.
- **MAC Authentication**
  Enable this option if you want end devices to be authenticated with the "MAC Authentication" method.
- **Adopt RADIUS VLAN Assignment**
  The RADIUS server informs the IE switch of the VLAN to which the port belongs.
  Enable this option if you want the information of the server to be taken into account. The port then belongs to the corresponding VLAN.
  If the option is disabled, the VLAN information is discarded.
- **MAC Auth. Max Permitted Addresses**
  Enter how many end devices are allowed to be connected to the port at the same time.
- **Guest VLAN**
  Enable this option if you want the end device to be permitted in the guest VLAN if authentication fails.
- **Guest VLAN ID**
  Enter the VLAN ID of the port.

- **Guest VLAN max. Permitted Addresses**
  Enter how many end devices are allowed in the guest VLAN at the same time.
- **MAC Auth. Currently Permitted Addresses**
  Shows the number of currently connected end devices.
- **MAC Auth. Currently Blocked Addresses**
  Shows the number of currently blocked end devices.
- **Guest VLAN Currently Permitted Addresses**
  Shows how many end devices are currently allowed in the guest VLAN.

Port ACL MAC

Rule configuration

On this page, you specify the ACL rules for the MAC-based ACL.

Settings

The table has the following columns:

- **Rule Number**
  Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source MAC**
  Enter the unicast MAC address of the source.
  Dest. MAC
  Enter the unicast MAC address of the destination.
- **Action**
  Select the action. The following is possible:
  - Forward
    If the frame complies with the ACL rule, the frame is forwarded.
  - Discard
    If the frame complies with the ACL rule, the frame is not forwarded.
- **Ingress Port**
  Shows a list of all ingress ports to which this rule applies.
- **Egress Port**
  Shows a list of all egress ports to which this rule applies.

Note

If you enter the address "00:00:00:00:00:00" for the source and/or destination MAC address, the rule created in this way applies to all source or destination MAC addresses.

Port ingress rules

On this page, you specify the ACL rule according to which incoming frames are handled by the port.

Settings

- **Ports**
  Select the required port.
- **Add Rule**
  Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**
  To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**
  Select the ACL rule to be deleted.
- **Remove**
  To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**
  Shows the order of the ACL rules.
- **Rule Number**
  Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source MAC**
  Shows the unicast MAC address of the source.
- **Dest. MAC**
  Shows the unicast MAC address of the destination.
- **Action**
  Select the action. The following is possible:
  - Forward
    If the frame complies with the ACL rule, the frame is forwarded.
  - Discard
    If the frame complies with the ACL rule, the frame is not forwarded.

Port egress rules

On this page, you specify the ACL rule according to which outgoing frames are handled by the port.

Description

- **Ports**
  Select the required port.
- **Add Rule**
  Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**
  To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**
  Select the ACL rule to be deleted.
- **Remove**
  To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**
  Shows the order of the ACL rules.
- **Rule Number**
  Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source MAC**
  Shows the unicast MAC address of the source.
- **Dest. MAC**
  Shows the unicast MAC address of the destination.
- **Action**
  Select the action. The following is possible:
  - Forward
    If the frame complies with the ACL rule, the frame is forwarded.
  - Discard
    If the frame complies with the ACL rule, the frame is not forwarded.

Port ACL IP

Rule configuration

On this page, you specify the rules for the IP-based ACL.

Settings

The table has the following columns:

- **Rule Number**
  Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source IP**
  Enter the IP address of the source.
- **Source Subnet Mask**
  Enter the subnet mask in which the source is located.
- **Dest. IP**
  Enter the IP address of the destination.
- **Dest. Subnet Mask**
  Enter the subnet mask in which the destination is located.
- **Action**
  Select the action from the drop-down list. The following is possible:
  - Forward
    If the frame complies with the ACL rule, the frame is forwarded.
  - Discard
    If the frame complies with the ACL rule, the frame is not forwarded.
- **Ingress Port**
  Shows a list of all ingress ports to which this rule applies.
- **Egress Port**
  Shows a list of all egress ports to which this rule applies.

Protocol configuration

On this page, you specify the rules for protocols.

Settings

The table has the following columns:

- **Rule Number**
  Shows the number of the protocol rule. When you create a rule, a new row with a unique number is created.
- **Protocol**
  Select the protocol for which this rule is valid.
- **Protocol Number**
  Enter a protocol number to define further protocols.
  This box can only be edited if you have set "Other Protocol" for the protocol.
- **Source Port Min.**
  Enter the lowest possible port number of the source port.
  This box can only be edited if you have set "TCP" or "UDP" for the protocol.

- **Source Port Max.**
  Enter the highest possible port number of the source port.
  This box can only be edited if you have set "TCP" or "UDP" for the protocol.
- **Dest. Port Min.**
  Enter the lowest possible port number of the destination port.
  This box can only be edited if you have set "TCP" or "UDP" for the protocol.
- **Dest. Port Max.**
  Enter the highest possible port number of the destination port.
  This box can only be edited if you have set "TCP" or "UDP" for the protocol.
- **Message Type**
  Enter a message type to decide the format of the message.
  This box can only be edited if you have set "ICMP" for the protocol.
- **Message Code**
  Enter a message code to specify the function of the message.
  This box can only be edited if you have set "ICMP" for the protocol.
- **DSCP**
  Enter a value for classifying the priority.
  This box cannot be edited if you have set "ICMP" for the protocol.

Port ingress rules

On this page, you specify the ACL rule according to which incoming frames are handled by the port.

Settings

- **Ports**
  Select the required port.
- **Add Rule**
  Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**
  To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**
  Select the ACL rule to be deleted.
- **Remove**
  To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**
  Shows the order of the ACL rules.
- **Rule Number**
  Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.

- **Protocol**
  Shows the protocol for which this rule is valid.
- **Protocol Number**
  Shows the protocol number.
- **Source IP**
  Shows the IP address of the source.
- **Source Subnet Mask**
  Shows the subnet mask in which the source is located.
- **Dest. IP**
  Enter the IP address of the destination.
- **Dest. Subnet Mask**
  Enter the subnet mask in which the destination is located.
- **Action**
  Select the action. The following is possible:
  - Forward
    If the frame complies with the ACL rule, the frame is forwarded.
  - Discard
    If the frame complies with the ACL rule, the frame is not forwarded.
- **Source Port Min.**
  Shows the lowest possible port number of the source port.
- **Source Port Max.**
  Shows the highest possible port number of the source port.
- **Dest. Port Min.**
  Shows the lowest possible port number of the destination port.
- **Dest. Port Max.**
  Shows the highest possible port number of the destination port.
- **Message Type**
  Shows the message type.
- **Message Code**
  Shows the message code.
- **DSCP**
  Shows the value for classifying the priority.

Port egress rules

On this page, you specify the ACL rule according to which outgoing frames are handled by the port.

Settings

- **Ports**
  Select the required port.
- **Add Rule**
  Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**
  To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**
  Select the ACL rule to be deleted.
- **Remove**
  To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**
  Shows the order of the ACL rules.
- **Rule Number**
  Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Protocol**
  Shows the protocol for which this rule is valid.
- **Protocol Number**
  Shows the protocol number.
- **Source IP**
  Shows the IP address of the source.
- **Source Subnet Mask**
  Shows the subnet mask in which the source is located.
- **Dest. IP**
  Enter the IP address of the destination.
- **Dest. Subnet Mask**
  Enter the subnet mask in which the destination is located.
- **Action**
  Select the action from the drop-down list. The following is possible:
  - Forward
    If the frame complies with the ACL rule, the frame is forwarded.
  - Discard
    If the frame complies with the ACL rule, the frame is not forwarded.
- **Source Port Min.**
  Shows the lowest possible port number of the source port.
- **Source Port Max.**
  Shows the highest possible port number of the source port.

- **Dest. Port Min.**
  Shows the lowest possible port number of the destination port.
- **Dest. Port Max.**
  Shows the highest possible port number of the destination port.
- **Message Type**
  Shows the message type.
- **Message Code**
  Shows the message code.
- **DSCP**
  Shows the value for classifying the priority.

Management ACL

On this page, you can increase the security of your device. To specify which station with which IP address is allowed to access your device, configure the IP address or an entire address range.

You can select the protocols and the ports of the station with which it is allowed to access the device. You define the VLAN in which the station may be located. This ensures that only certain stations within a VLAN have access to the device.

Note

Note that a bad configuration may mean that you can no longer access the device.

Settings

- **Management ACL**
  Enable or disable the function.
- **IP Address**
  Enter the IP address or the network address to which the rule will apply. If you use the IP address 0.0.0.0, the settings apply to all IP addresses.
- **Subnet Mask**
  Enter the subnet mask. The subnet mask 255.255.255.255 is for a specific IP address. If you want to allow a subnet, for example a C subnet, enter 255.255.255.0. The subnet mask 0.0.0.0 applies to all subnets.

The table has the following columns:

- **Rule Order**
  Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **IP Address**
  Shows the IP address.
- **Subnet Mask**
  Shows the subnet mask.

- **VLANs Allowed**
  Enter the number of the VLAN from which access is allowed.
  Only stations located in these VLANs can access the device. If this input box remains empty, there is no restriction.
  You can enter several individual VLANs and VLAN ranges separated by commas, for example 1,5,10-12.
- **SNMP**
  Specify whether the station or the IP address can access the device using the SNMP protocol.
- **TELNET**
  Specify whether the station or the IP address can access the device using the TELNET protocol.
- **HTTP**
  Specify whether the station or the IP address can access the device using the HTTP protocol.
- **HTTPS**
  Specify whether the station or the IP address can access the device using the HTTPS protocol.
- **SSH**
  Specify whether the station or the IP address can access the device using the SSH protocol.
- **Px.y**
  Specify whether the station or the IP address can access this device via this port.

10.1.4.6 Configuring PROFIBUS DP

The basics of configuring a DP master system

Distributed I/O

DP master systems that consist of a DP master and DP slaves which are connected via a bus and communicate with one another via the PROFIBUS DP protocol are referred to as distributed I/O.

Firmware version of the S7-1200 CPU

Use of the PROFIBUS functions with the S7-1200, requires CPUs with firmware version 2.0 or higher.

Configuring distributed I/O

Since DP masters and DP slaves are different devices, these instructions only provide a basic configuration procedure. However, the process for configuring distributed I/O is practically identical to that of non-distributed configuration.

Creating the DP master system in the network view

After you have used dragged a DP master and a DP slave (for example, a CM 1243-5 and a CM 1243-5) from the hardware catalog to the network view, connect them both to a PROFIBUS subnet.

Additional information

Observe additional information on the scope of functions in the manuals of the respective device.

DP slaves within the hardware catalog

DP slaves within the hardware catalog

You will find the DP slaves in the "Distributed I/O" folder of the hardware catalog. Compact and modular DP slaves are located there:

- Compact DP slaves
  Modules with integrated digital/analog inputs and outputs, for example, ET 200L
- Modular DP slaves
  (Interface modules with S7 modules assigned, for example, ET 200M

The available DP master and the desired functionality will determine which DP slaves can be used.

I slaves within the hardware catalog

The CM 1242-5 is, for example, an DP slave that can be configured as intelligent DP slave. You can find it in the hardware catalog at:

- CM 1242-5
  "PLC > SIMATIC S7 1200 > Communication module > PROFIBUS"

DP/DP coupler in the hardware catalog

Introduction

A DP/DP coupler connects two PROFIBUS DP networks as a gateway so that the DP master from one network can transfer data to the DP master of the other network.

The maximum amount of data that can be transferred is 244 bytes input data and 244 bytes output data.

DP/DP coupler in the hardware catalog

Details of a DP/DP coupler as gateway between two DM master systems are contained in the hardware catalog in the folder "Other field devices > PROFIBUS-DP > Gateways".

Configuring the DP/DP coupler

DP/DP couplers are configured in both PROFIBUS networks, each in their own master systems.

The input and output areas of both networks must thereby be matched to one another. The output data from one end of the DP/DP coupler are accepted as input data at the other respective end and vice versa.

Configurations involving PROFIBUS DP

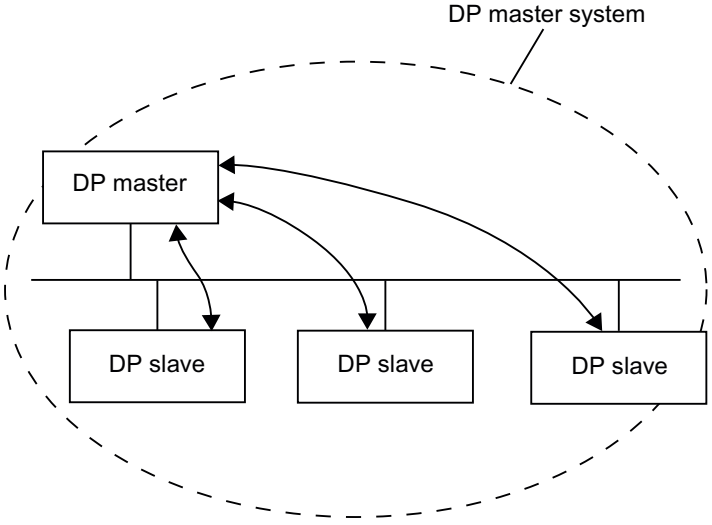
Configurations involving basic DP slaves

Communication between DP master and DP slave

In the case of a configuration involving simple DP slaves, data is exchanged between the DP master and simple DP slaves, i.e. with I/O modules via the DP master. The DP master sequentially polls each DP slave configured within the DP master system and contained in its polling list. In doing so, it transfers the output data to the slaves and receives their input data in return.

Mono-master system

The configuration with only one DP master is also described as mono-master system. A single DP master with its associated DP slaves is connected to a physical PROFIBUS DP subnet.



Configurations involving intelligent DP slaves

Definition

DP slaves that feature their own preprocessing program are referred to as intelligent DP slaves (I-slaves).

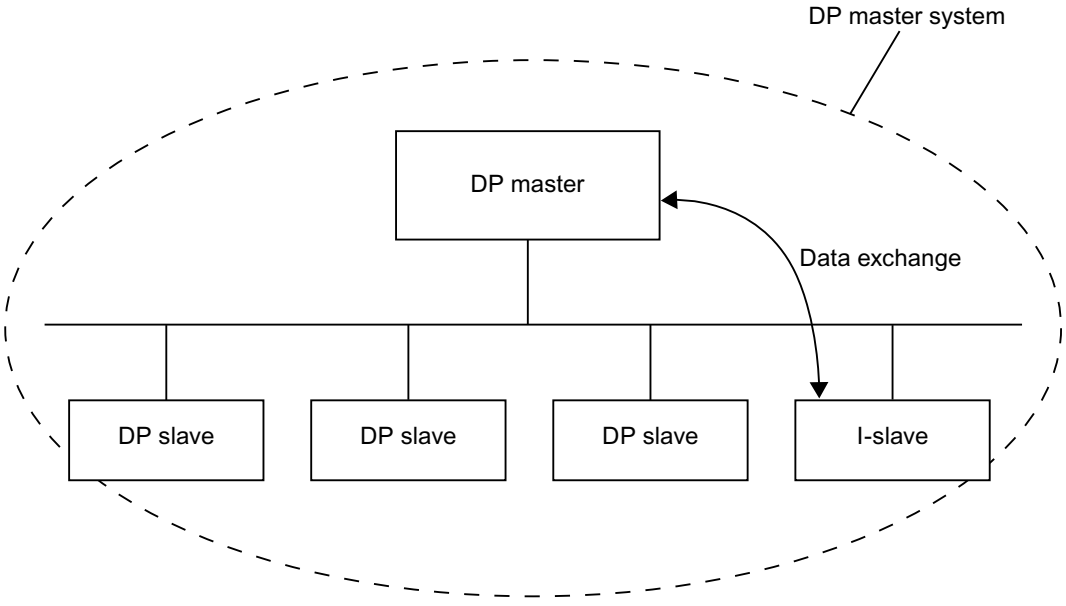
CM 1242-5 is an intelligent DP slave.

I-slave <> DP master data exchange

A higher-level automation system processes the automation task, which is broken down into sub-tasks. The sub-tasks are processed in the lower-level automation systems. The necessary control tasks are processed separately and efficiently in the CPUs as preprocessing programs.

In the case of configurations involving intelligent DP slaves, the DP master only accesses the operand area of the I-slave's CPU, and not the I/O modules of the intelligent DP slave. The operand area must not be assigned to any actual I/O modules in the I-slave. The assignment must be made during I-slave configuration.

The addresses of the data to be exchanged between the master and slave are configured in the transfer area of the I-slave.



Configuring distributed I/O systems

Hint: Quick configuration of master systems

If the DP master system has several DP slaves, use drag-and-drop operation to assign to the master in one step all DP slaves that were placed.

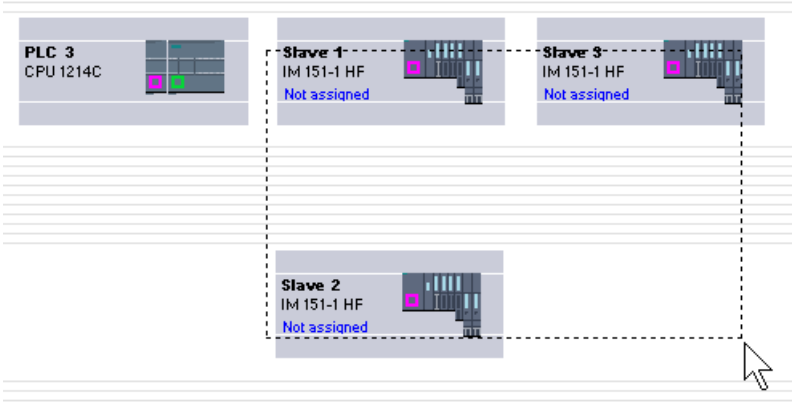
Requirements

DP master and DP slaves are placed in the network view.

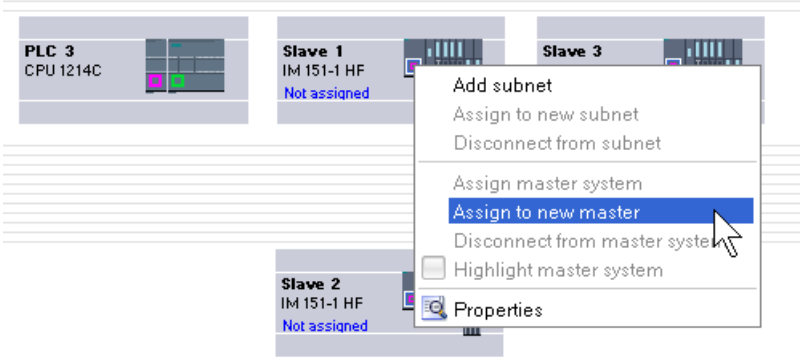
Assigning DP slaves to a DP master system

To do this, follow these steps:

1. Select an appropriate zoom factor so that you can see as many DP slaves as possible in the network view.
2. Arrange the DP slaves in a maximum of two rows.
3. Select all DP interfaces with the mouse cursor (not all devices!). This only works if you begin to drag the mouse cursor outside of the first DP slave and release the mouse button at the last DP slave (selection with the lasso).



4. Select the shortcut menu "Assign to new master" and select the corresponding DP interface for the DP master in the subsequent dialog.



5. The DP slaves are automatically networked with the DP master and combine with it to form a DP master system.

Note

When a DP master system is highlighted, you can double-click on a DP slave in the hardware catalog and thereby quickly add additional DP slaves. This will result in the DP slave being added to the highlighted DP master system automatically.

Creating a DP master system

Introduction

To create a DP master system, you need to have one DP master and at least one DP slave. As soon as you connect a DP master to a DP slave, a master-slave link is established.

DP master

You can use any of the following devices as a DP master:

- CM 1243-5

Requirement

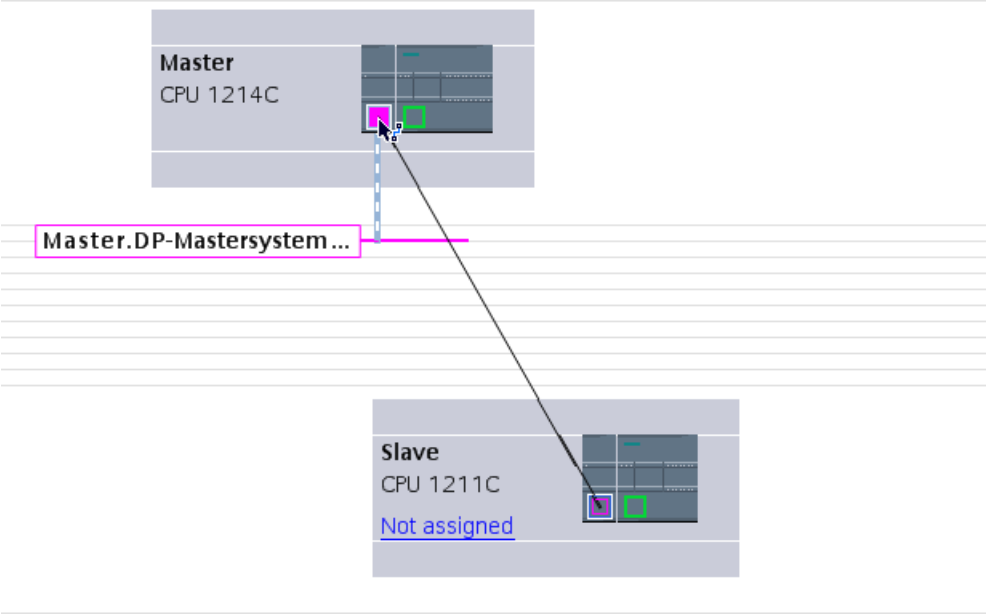
- You must be in the network view.
- The hardware catalog is open.

Procedure

To create a DP master system, follow these steps:

1. Select a DP master from the hardware catalog.
2. Pull the DP master onto the free area within the network view.
3. Right-click on the DP master's DP interface.
4. Select "Create master system" from the shortcut menu.
   A DP master system with one DP master will be created as a single node.

If you connect a DP slave's DP interface to that of the DP master, the DP slave will be added to the master system.



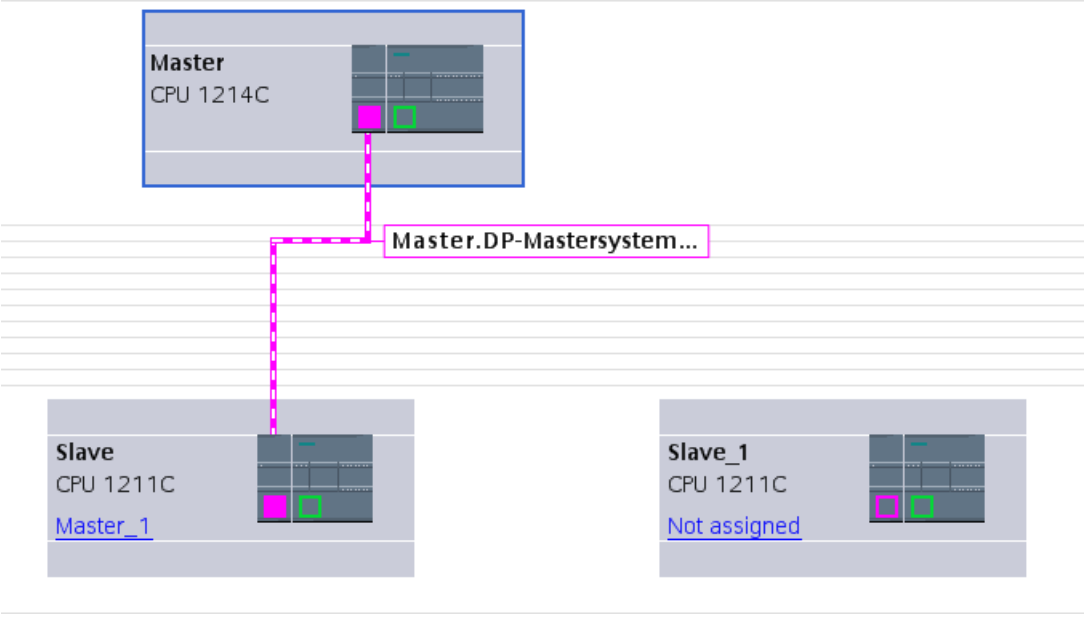
Assuming that you have already placed both a DP master and a DP slave within the network view, you can drag-and-drop to connect the two and thereby create a DP master system. To do so, follow these steps:

1. Click on the DP interface of either the DP master or DP slave.
2. Hold down the mouse button and draw a connecting line between this DP interface and that of the desired communication partner.

This will create a subnet with one DP master system between the DP master and DP slave.

DP master display on the DP slave

When you connect a DP slave to a DP master, the name of the DP master is displayed on the DP slave as a hyperlink. Click the hyperlink to select the associated DP master.

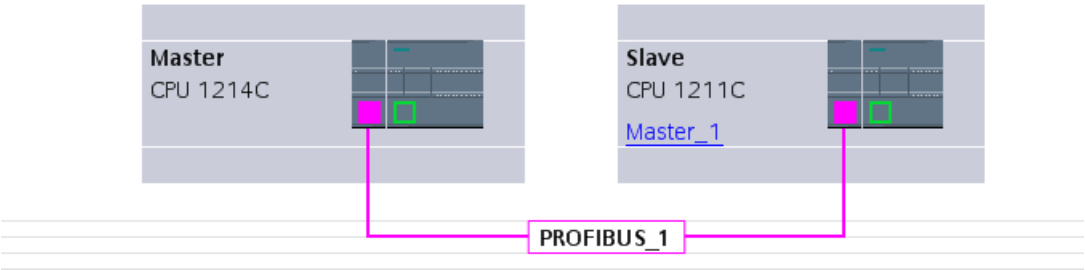


Highlighting applied to the DP master system

When you create a new DP master system, highlighting will be applied to it. This enables you to identify quickly which devices belong to the DP master system. You can also highlight a DP master system yourself by moving the mouse pointer over a subnet. This will result in the names of the available DP master systems being displayed. Click the required DP master system to highlight it.

There are various ways of removing the highlighting from a DP master system:

- Highlight a different master system.
- Click on the drawing pin with the name of the master system in the top right-hand corner of the network view.



Editing DP master systems and interfaces

Introduction

Once you have created a DP master system, you also have the option of disconnecting the DP master system from its components. This can result in subnets with DP slaves but without DP master.

Generally, there is no need to edit the interfaces of a DP master.

You can change the name and number on the DP master system.

Disconnection of master or slaves from the DP master system

If you have configured a PROFIBUS CP as a DP master with master system, you can then disconnect the DP master system from the DP master. After this, the device will no longer be connected to the DP master system.

Disconnecting the subnet from a DP master effectively eliminates the master system in the sense that it is no longer assigned to a DP master. However, the individual DP slaves are still interconnected via the subnet.

If you delete the DP slaves or disconnect them from the master system, the master system is then retained on the DP master.

Requirement

- You must be in the network view.
- There has to be a DP master system with one DP master and at least one DP slave.

Disconnecting the DP master from the DP master system

To disconnect the DP master system, proceed as follows:

1. Right-click on the DP master's DP interface.
2. Select "Disconnect from master system" from the shortcut menu.

The selected DP master will be disconnected from the DP master system. A subnet with the DP slaves will be retained.

Adding a DP master to the DP master system

To reassign a DP master to a subnet, proceed as follows:

1. Right-click on the DP master's DP interface.
2. Select "Create master system" from the shortcut menu.
3. Draw connecting lines between the new DP master system and the DP interfaces of the DP slaves.

The DP master combines with the DP slaves to recreate a DP master system.

Editing the properties of a DP master system

To edit the properties of a DP master system, proceed as follows:

1. Move the mouse pointer over a subnet with a DP master system.
2. A message will appear displaying the available DP master systems. Click the one you want to edit. The DP master system will now be color-highlighted.
3. Click on the highlighted DP master system.
4. In the inspector window, edit the DP master system attributes under "Properties > General".

Note

If you click a subnet when no DP master system is highlighted, you will be able to edit the properties of the entire subnet under "Properties" in the inspector window.

Adding DP slaves to the master system and configuring them

In the network view, you can add various DP slaves from the hardware catalog directly by using the drag-and-drop function or by double-clicking.

DP slaves

For configuration purposes, DP slaves are broken down into the following categories:

- Compact DP slaves
  (Modules with integrated digital/analog inputs and outputs, for example, ET 200L)
- Modular DP slaves
  (interface modules with S5 or S7 modules assigned, for example ET 200M)
- Intelligent DP slaves (I slaves)
  (CM 1242-5 or ET 200S with IM 151-7 CPU)

Rules

- Your DP master system should only contain one DP master, but it may contain one or or more DP slaves.
- You may only configure as many DP slaves in a DP master system as are permitted for the specific DP master.

Note

When configuring the DP master system, remember to observe the DP master technical data (max. number of nodes, max. number of slots, max. quantity of user data). User data restrictions may possibly prevent you from being able to use the maximum number of nodes that is theoretically possible.

Requirements

- You must be in the network view.
- A DP master system must have been created.

Adding a DP slave to the DP master system

To add a DP slave from the hardware catalog to the DP master system, follow these steps:

1. Select a DP slave from the hardware catalog.
2. Drag-and-drop the DP slave from the hardware catalog into the network view.
3. Draw a connecting line between the DP master's DP interface or a highlighted DP master system and the DP interface of the new DP slave.

A DP master system will be created and the DP slave will be connected to the DP master automatically.

Note

When a DP master system is highlighted, you can double-click the required DP slave in the hardware catalog. This will result in the DP slave being added to the highlighted DP master system automatically.

Disconnecting a DP slave from the DP master system

To disconnect a DP slave from the DP master system, follow these steps:

1. In the network view, right-click on the DP slave's DP interface.
2. From the shortcut menu, select the method for disconnecting from the DP master system:
   - "Disconnect from subnet": The PROFIBUS connection is broken and the device is no longer connected to the DP master system or a subnet.
   - "Disconnect from master system": The DP slave remains connected to the subnet, but is no longer assigned to the DP master system as a DP slave.

The selected DP slave will be disconnected from the DP master system.

Assigning a DP slave to a new DP master system

To assign an existing DP slave to a new DP master system, follow these steps:

1. Right-click on the DP slave's DP interface.
2. From the shortcut menu, select "Assign to new master".
   It does not matter whether the DP slave concerned is already assigned to another DP master system.
3. From the selection list, select the DP master whose DP master system is to have the DP slave connected to it.
   The selected DP slave is now assigned to a new DP master system.

The "Assign to new subnet" function works in a similar way in that it allows you to connect a DP slave to a new subnet. However, in this case, the DP slave will not be connected to an existing DP master system.

Configuring a DP slave

To configure a DP slave, follow these steps:

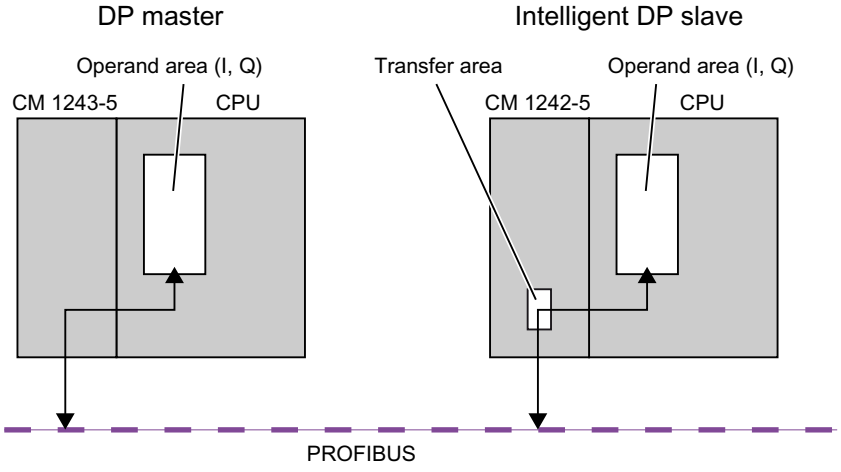
1. Switch to the DP slave's device view.
2. Select the module you want.
3. Configure the DP slave in the Inspector window.

Configuring intelligent DP slaves

Adding an I-slave to a DP master system

Introduction

One of the characteristics of an intelligent DP slave (I-slave) is that the DP master is not provided with I/O data directly by a real I/O, but by a preprocessing CPU. Together with the CP, this preprocessing CPU forms the I-slave.



Difference: DP slave v. intelligent DP slave

In the case of a DP slave, the DP master accesses the distributed I/O directly.

In the case of an intelligent DP slave, the DP master actually accesses a transfer area in the I/O address space of the preprocessing CPU instead of accessing the connected I/O of the intelligent DP slave. The user program running on the preprocessing CPU is responsible for ensuring data exchange between the address area and I/O.

Note

The I/O areas configured for data exchange between the DP master and DP slaves must not be used by I/O modules.

Applications

Configurations involving intelligent DP slaves: I-slave <> DP master data exchange

Procedure

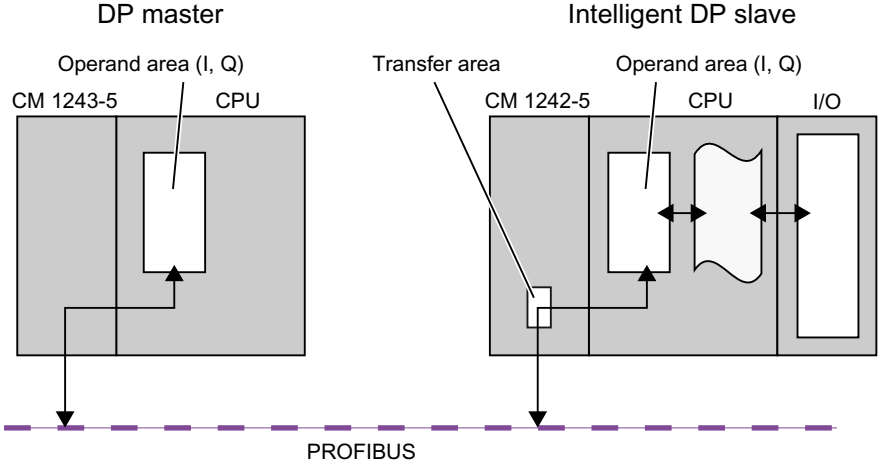
To add an I-slave to a DP master system, follow these steps:

1. In the network view, drag from the hardware catalog to a station one CM 1242-5 as an I-slave and one CM 1243-5 as a DP master.
2. Draw a connecting line between the DP interfaces of both devices.
   This way you connect the I-slave with a DP master in a DP master system.
   Result: You have now set up a DP master system with one DP master and one I-slave.

Configuring access to I slave data

Data access

The following applies to the CP 1242-5 in its function as I-slave: The addresses for the data transfer area and the address for the I/O modules in the I-slave differ. This means that the start address occupied by an I/O module can no longer be used for the transfer memory. If the higher-level DP master is to access the data of an I/O module in the I-slave, you must configure this data exchange between the I/O module and transfer area in the I-slave user program.



Configuration of the transfer area for the CM 1242-5 (transfer area)

With CM 1242-5, the transfer area for the cyclic PROFIBUS data exchange is configured as transfer area in the parameter group "PROFIBUS interface > Mode > I Slave Communication".

Direct data access from CPU to CPU

Direct data access from CPU to CPU via PROFIBUS is supported by the S7-1200 PROFIBUS CMs only via the PUT/GET services.

Configuring DP slaves as distributed I/O devices

Configuring an ET 200S

Slot rules for configuring an ET 200S

The following rules apply when configuring an ET 200S:

- Do not leave any gaps when inserting the ET 200S modules.
- Slot 1: only for PM-E or PM-D Power Modules.
- To the left of an Electronics Module (EM): an EM or a Power Module (PM-E or PM-D) only.
- To the left of Motor Starter (MS): an MS, a PM-D, PM-D Fx (1..x..4) Power Module or a PM-X Power Module only.
- To the left of a PM-X: a motor starter or a PM-D only
- Up to 63 modules and one IM Interface Module are permitted

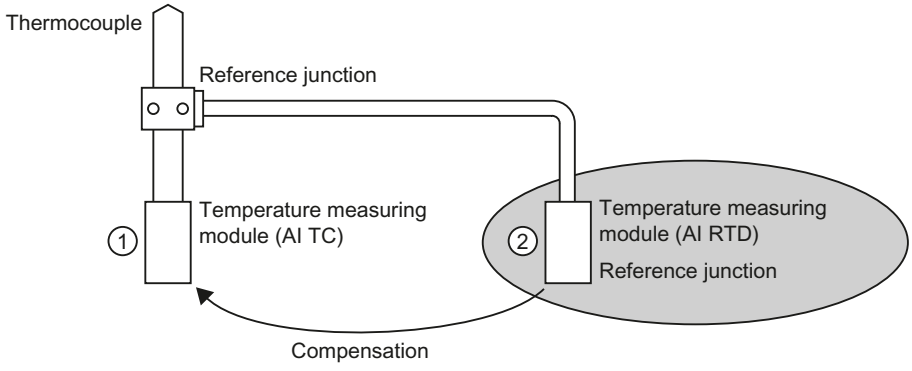
Note

Remember to ensure that the correct PM-E and EM voltage ranges are assigned.

Configuring reference junctions

A reference junction is the connection of a thermocouple to a supply line (generally in the terminal box). The voltage that occurs due to the effects of temperature falsifies the temperature value measured by the module.

On the ET 200S, one channel of the AI RTD module can be programmed as a reference junction. Other AI TC modules can correct their measured values using the temperature at the reference junction as measured by this module.



① Configuring the AI TC:
→ Selection of the reference junction used

② Configuring of the AI RTD:
→ Activation of the reference junction
→ Specifying the slot and channel of the AI RTD

Special characteristics to be noted when assigning parameters for reference junctions

The process of assigning parameters for reference junctions will be explained based on the example of a resistance thermometer with a Pt 100 climatic range that is used for measuring the reference junction temperature.

To assign parameters for the reference junction, follow these steps:

1. In the ET 200S device view, insert an analog electronics module, for example a 2AI RTD HF.
2. Select the module on the rack.
3. Under "Properties > Inputs" in the inspector window, set a channel for the reference junctions function to the "RTD-4L Pt 100 climatic range" measuring range.
4. Select the ET 200S.
5. Under "Properties > Module parameters > Reference junctions" in the inspector window, select the "Reference junction" check box and specify the slot and channel number of the relevant RTD module.
6. Insert the analog electronics module for measuring the temperature using a thermocouple (TC module) and parameterize it with the reference junction number of the RTD module.

Additional information

For additional information on the various types and uses of ET 200S modules, please refer to the operating instructions and the manual titled "ET 200S Distributed I/O System".

For additional information on analog value processing, please see the documentation for the ET 200S distributed I/O system.

Packing addresses

Introduction

DP slaves and I/O devices from the ET 200S family are configured in the same way as other modular DP slaves and I/O devices. As well as supporting all the standard modular DP slave and I/O device functions, the ET 200S also offers the "Pack addresses" function:

When digital electronics modules requiring an address space of 2 or 4 bits are inserted into the device view, they will initially be spread over a total area of 1 byte. However, the address area actually occupied can be compressed after configuration using the "Pack addresses" function.

	Initial state	After "Pack addresses"
Module	I address	I address
2DI (2-bit)	Byte 10	10.0...10.1
4DI (4-bit)	Byte 11	10.2...10.5

Requirements

- You are in the device view.
- An ET 200S, for example an IM 151-1, must be present.
- A pair of digital electronics modules, for example 2DI AC120V ST, must be inserted into the slots.

Packing addresses

To pack addressed, follow these steps:

1. Select the electronics modules whose addresses are to be packed. The following options are available for selecting multiple electronics modules:
   - Press and hold down <Shift> or <Ctrl> while clicking the relevant electronics modules.
   - Click off the rack and select the required electronics modules by drawing round them with the mouse.
2. Click "Pack addresses" in the shortcut menu for the selected electronics modules.

The address areas for inputs, outputs and motor starters are packed separately. The packed addresses will be displayed in the I address and Q address columns of the device overview.

How packed addresses are generated and structured

If you make use of the "Pack addresses" function, the addresses of the selected electronics modules will be packed in accordance with the following rules:

- The start of the address area is determined by the lowest address of the selected electronics modules: X.0
- If the bit address is not "0", then the next (free) byte address as of which the selected area can be compacted will be selected automatically: (X+n).0
- If no coherent area exists, the addresses will be automatically packed into any available address gaps.

Electronics modules with packed addresses and the same byte address form a packing group.

Unpacking addresses

To unpack addressed, follow these steps:

1. Select one or more electronics modules with packed addresses.
2. Click "Unpack addresses" in the shortcut menu for the selected electronics modules.

The packing groups of the selected electronics modules will be disbanded and the packed addresses for the relevant electronics modules unpacked.

The packing group will also be disbanded and the packed addresses unpacked in the following cases: if you delete electronics modules from a packing group, move electronics modules out of a packing group or insert electronics modules on a free slot within a packing group.

The start addresses of the unpacked electronics modules will be assigned to the next available byte addresses in each case.

Special characteristics of electronics modules with packed addresses

The following special characteristics apply to electronics modules with packed addresses:

- As far as the CPU is concerned, there is no way of assigning a slot for the electronics module. Consequently, the instruction GADR_LGC (SFC 5) outputs error information W#16#8099 "Slot not configured" for the actual slot of the electronic module.
- The instruction LGC_GADR (SFC 49) and SZL-ID W#16#xy91 "module status information" cannot be evaluated for an electronics module.
- The electronics module receives an additional diagnostics address via the DPV1 function, because otherwise the packed addresses would prevent interrupts from being assigned as far as the CPU is concerned.
- The "Insert/remove interrupt" is not possible. This is because the "Pack addresses" and "Insert/remove interrupt" functions are mutually exclusive.

Configuring option handling with standby modules

You can use the option handling function to prepare the ET 200S with PROFIBUS interface for future expansions (options). This section describes option handling with standby modules.

You do this by assembling, wiring, configuring, and programming the maximum configuration envisaged for the ET 200S and by using cost-effective standby modules (138-4AA00 or 138-4AA10) during assembly until it becomes time to replace them with the necessary electronics modules.

Note

The ET 200S can be completely factory-wired with the master cabling, as no connection exists between a standby module and the terminals of the terminal module (and, in turn, to the process).

Requirement

- ET 200S interface module
  - IM 151-1 STANDARD (6ES7 151-1AA03-0AB0 or higher)
  - IM 151-1 FO STANDARD (6ES7 151-1AB02-0AB0 or higher)
- Power module with option handling
  - PM-E DC24..48V
  - PM-E DC24..48V/AC24..230V

Procedure

To activate option handling, follow these steps:

1. Select the IM 151-1 in the device view and enable it in "Option handling" check box under "Properties > General > Option handling" in the inspector window.
2. Select the numbered check boxes for the slots that are initially to accommodate the standby modules prior to the future electronics modules.
3. Select the power module in the device view and enable it in the "Option handling" check box under "Properties > Addresses" in the inspector window. Reserve the necessary address space for the control and check-back interface in the process image output (PIQ) and process image input (PII).

The assembled standby modules can be replaced with the configured modules at a later date without having to modify the configuration.

Note

The addresses for these interfaces are reserved as soon as you activate option handling on the power module. The "Option handling" function must also be activated on the DP slave (IM 151-1 STANDARD Interface Module). If it is not activated, the addresses reserved for the control and check-back interface will be released again.

Note that activating and deactivating the option handling function repeatedly can change the address of the control and check-back interface.

Option handling may be activated for one PM-E DC24..48V or one PM-E DC24..48V/ AC24..230V Power Module only.

Additional information

For additional information on the assignment and significance of bytes within the process image, option handling with PROFIBUS and the use of standby modules, please refer to the documentation for the ET 200S distributed I/O system.

How option handling works during startup

If "Startup when expected/actual config. differ" is not available, the ET 200S will still start up if a standby module is inserted instead of the configured electronics module and option handling has been activated for the slot concerned.

How option handling works during operation

During operation, the option handling mode varies in accordance with the following:

- Option handling enabled for a slot:
  Either the standby module (option) or the configured electronics module can be plugged into this slot. If any other kind of module is present on this slot, diagnostics will be signaled (no module/incorrect module).
- Option handling disabled for a slot:
  Only the configured electronics module can be plugged into this slot. If any other kind of module is present, diagnostics will be signaled (no module/incorrect module).

Standby module substitute values

- Substitute value for digital inputs: 0
- Substitute value for analog inputs: 0x7FFF

Control and evaluation in the user program

The ET 200S is equipped with a control and feedback interface for the "Option handling" function.

The control interface is located in the process image output (PIQ). Each bit in this address area controls one of the slots from 2 to 63:

- Bit value = 0: Option handling parameterized. Standby modules are permitted.
- Bit value = 1: Option handling canceled. Standby modules are not permitted on this slot.

The check-back interface is located in the process image input (PII). Each bit in this address area provides information about the modules that are actually plugged into slots 1 to 63:

- Bit value = 0: This slot has the standby module, an incorrect module or no module plugged into it.
- Bit value = 1: The configured module is plugged into this slot.

See also

Which modules support option handling? (http://support.automation.siemens.com/WW/view/en/22564754)

Configuring option handling without standby modules

You can use the option handling function to prepare the ET 200S for future expansions (options) without installing standby modules. This section describes option handling without standby modules.

Note

ET 200S with PROFINET interface

This description refers to the ET 200S with PROFIBUS interface. In principle, option handling for ET 200S with PROFINET interface functions as described here without standby modules. PN interface modules are to be used instead of the DP interface modules listed here. You can find additional information about option handling for ET 200S with PROFINET interface in the corresponding manuals.

Requirement

- ET 200S interface module
  - IM 151-1 HIGH FEATURE (6ES7151-1BA02 or higher)
  - IM 151-1 STANDARD (6ES7 151-1AA05-0AB0 or higher)
- Power module with option handling
  - PM-E DC24..48V
  - PM-E DC24..48V/AC24..230V

Procedure

To activate option handling, follow these steps:

1. Select the IM 151-1 in the device view and enable it in "Option handling" check box under "Properties > General > Option handling" in the inspector window.
2. Select the power module in the device view and enable it in the "Option handling" check box under "Properties > Addresses" in the inspector window. Reserve the necessary address space for the control and check-back interface in the process image output (PIQ) and process image input (PII).
3. Configure the slave's maximum configuration. The selection/clearing of options is controlled via the user program.

   Note

   The addresses for these interfaces are reserved as soon as you activate option handling on the power module. The "Option handling" function must also be activated on the DP slave (IM 151-1 interface module). If it is not activated, the addresses reserved for the control and check-back interface will be released again.

   Note that activating and deactivating the option handling function repeatedly can change the address of the control and check-back interface.

   Option handling may be activated for one PM-E DC24..48V or one PM-E DC24..48V/ AC24..230V Power Module only.

Additional information

For additional information on the assignment and significance of bytes within the process image, option handling with PROFIBUS and the use of standby modules, please refer to the documentation for the ET 200S distributed I/O system.

Control and evaluation in the user program

The ET 200S is equipped with a control and feedback interface for the "Option handling" function.

The control interface is located in the process image output (PIQ). Each bit in this address area controls one of the slots from 1 to 63:

- Bit value = 0: Slot is not available in the actual configuration.
- Bit value = 1: Slot is available in the actual configuration.

The check-back interface is located in the process image input (PII). Each bit in this address area provides information about the modules that are actually plugged into slots 1 to 63:

- Bit value = 0: Slot belongs to an option that is not available or module status is faulty.
- Bit value = 1: The configured module is plugged into this slot.

See also

Sample applications for ET 200S, option handling without standby module (http://support.automation.siemens.com/WW/view/en/29430270)

Configuring the ET 200S in DPV1 mode

PROFIBUS DPV1 enables you to access extended PROFIBUS functions.

Requirement

- You must be in network view.
- A DP master with DPV1 functionality must be available.
- A master-slave connection must be established with PROFIBUS.

Procedure

To switch the DP slave over to DPV1, follow these steps:

1. Select the DP slave.
2. Under "Properties > Module parameters" in the Inspector window, select "DPV1" mode from the "DP interrupt mode" drop-down list.

or

1. Select the DP master.
2. In the I/O communications table, select the row with the connection between the DP master and the desired DP slave.
3. Under "Properties > Module parameters" in the Inspector window, select "DPV1" mode from the "DP interrupt mode" drop-down list.

Special characteristics

The parameters are subject to interdependencies, which are outlined below:

Parameter	DPV0 mode	DPV1 mode
Operation when target configuration does not match actual configuration	Fully available	Fully available
Diagnostics interrupt (OB 82)	Not available, not set	Fully available
Hardware interrupt (OB 40 to 47)	Not available, not set	Fully available
Insert/remove interrupt (OB 83)	Not available, not set	Only available when addresses are not packed. "Startup when target configuration does not match actual configuration" is activated automatically along with an insert/remove interrupt.

Interrupts in the case of modules with packed addresses

If the module is capable of triggering interrupts and the bit address is not equal to 0 because of packed addresses, you will need to assign a diagnostics address in the ET 200S address dialog.

The diagnostics address is required for the purpose of assigning a DPV1 interrupt to the module as an interrupt trigger. The CPU will only be able to assign an interrupt correctly and store information on the interrupt in the interrupt OB start information/in the diagnostics buffer if the module concerned has this "unpacked" address. In this context, the CPU cannot make use of "packed" addresses.

From the point of view of interrupt processing (interrupt OB), this means the module will have the assigned diagnostics address, but from the point of view of processing the input and output data in the user program, the module will have the packed addresses.

Note

When the module addresses are packed, the insert/remove interrupt for the ET 200S is unavailable.

Using GSD files

GSD revisions

What you need to know about GSD revisions

The properties of DP slaves are made available to configuration tools by means of GSD files.

Functional enhancements in the area of the distributed I/O will have an effect on the GSD specification, for example, they will require the definition of new keywords.

This results in the versioning of the specification. In the case of GSD files, the version of the specification on which a GSD file is based is called a "GSD revision".

From GSD revision 1, the GSD revision must be included as a keyword "GSD_revision" in GSD files. GSD files without this keyword will therefore be interpreted by configuration tools as GSD revision "0".

GSD files can be interpreted up to GSD revision 5. This means that DP slaves that support the following functions, for example, will be supported:

- Diagnostic alarms for interrupt blocks
- Isochronous mode and constant bus cycle time
- SYNC/FREEZE
- Clock synchronization for DP slaves

Installing the GSD file

Introduction

A GSD file (generic station description file) contains all the DP slave properties. If you want to configure a DP slave that does not appear in the hardware catalog, you must install the GSD file provided by the manufacturer. DP slaves installed via GSD files are displayed in the hardware catalog and can then be selected and configured.

Requirement

- The hardware and network editor is closed.
- You have access to the required GSD files in a directory on the hard disk.

Procedure

To install a GSD file, follow these steps:

1. In the "Options" menu, select the "Install general station description file (GSD)" command.
2. In the "Install general station description file" dialog box, select the folder in which the GSD files are stored.
3. Choose one or more files from the list of displayed GSD files.

4. Click on the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.
   Any problems during the installation can be tracked down using the log file.

You will find the new DP slave installed by means of the GSD file in a new folder in the hardware catalog.

See also

Overview of hardware and network editor (Page 535)

Deleting GSD file

Introduction

You can delete installed DP slaves using GSD files. These DP slaves are then no longer displayed in the hardware catalog.

Requirement

- The hardware and network editor is closed.
- The hardware catalog contains DP slaves installed via GSD files.

Procedure

To delete a GSD file, follow these steps:

1. In the "Options" menu, select the "Install general station description file (GSD)" command.
2. In the "Install general station description file" dialog box, select the folder in which the GSD file is stored.
3. Select the file that is to be deleted from the list of displayed GSD files.
4. Click the "Delete" button.

The selected GSD file was deleted and the DP slave is no longer located in the hardware catalog.

Configuring GSD-based DP slave

DP slaves that you have inserted through installation of a GSD file can be selected as usual via the hardware catalog and inserted in the network view. If you want to insert the modules of the GSD-based DP slaves, you must take into account some particular details.

Requirement

- You have installed a DP slave using a GSD file.
- You have inserted the head module in the network view in the usual manner.

- The device overview opens in the device view.
- The hardware catalog is open.

Procedure

To add the modules of a GSD-based DP slave, proceed as follows:

1. In the hardware catalog, navigate to the modules of the GSD-based DP slave.
   GSD-based DP slaves, also referred to as DP standard slaves, can be found in the "Other field devices" folder of the hardware catalog.
2. Select the desired module.
3. Use drag-and-drop to move the module to a free space in the device overview.
4. Select the module in the device overview to edit parameters.

You have now inserted the module in a free slot of the GSD-based DP slave and can edit its parameters.

Note

You can see only the GSD-based DP slave in the graphic area of the device view. The added modules of GSD-based DP slaves are only found in the device overview.

Preset configuration

For modules with an adjustable preset configuration, you can change this configuration in the inspector window under "Properties > Preset configuration".

10.1.4.7 Configurations for PROFINET IO

What you need to know about PROFINET IO

What is PROFINET IO?

PROFINET IO

PROFINET is an Ethernet-based automation standard of PROFIBUS Nutzerorganisation e.V. (PNO) which defines a manufacturer-neutral communication, automation and engineering model.

Objective

The objective of PROFINET is:

- Integrated communication via field bus and Ethernet
- Open, distributed automation
- Use of open standards

Architecture

The PROFIBUS User Organisation e.V. (PNO) has designated the following aspects for PROFINET architecture:

- Communication between controllers as components within distributed systems.
- Communication between field devices, such as I/O devices and drives.

Implementation by Siemens

The demand for "Communication between controllers as components within distributed systems" is implemented by "Component Based Automation" (CBA). Component Based Automation is used to create a distributed automation solution based on prefabricated components and partial solutions.

The demand for "Communication between field devices" is implemented by Siemens with "PROFINET IO". Just as with PROFIBUS DP, the complete configuration and programming of the components involved is possible using the Totally Integrated Automation Portal.

The following sections deal with the configuration of communication between field devices using PROFINET IO.

Overview of RT classes

RT classes in PROFINET IO

PROFINET IO is a scalable, real-time communication system based on Ethernet technology. The scalable approach is reflected in several real-time classes:

- **RT:** Transmission of data in prioritized, non-isochronous Ethernet frames. The required bandwidth is within the free bandwidth area for TCP/IP communication.
- **IRT:** Isochronous transmission of data with high stability for time-critical applications (for example, motion control). The required bandwidth is from the area of bandwidth reserved for cyclic data.

Depending on the device, not all real-time classes are supported.

Which IO controllers and IO devices support which PROFINET functions?

Additional information and overviews

In the following Siemens Industry Online Support article (http://support.automation.siemens.com/WW/view/en/44383954), you will find an overview of the PROFINET IO controllers and IO devices that support the following PROFINET functions:

- Isochronous real-time communication (IRT)
- Prioritized startup
- Media redundancy (MRP)
- PROFIenergy
- Shared device
- I-device
- Isochronous mode of process data

The functions are explained in the following sections, but without naming the respective hardware that supports these functions.

In the hardware catalog, you can also find an overview of the supported functions in the description below the selected components.

You can also find a description of PROFINET in the respective current STEP 7 version here (http://support.automation.siemens.com/WW/view/en/49948856).

Connecting existing bus systems

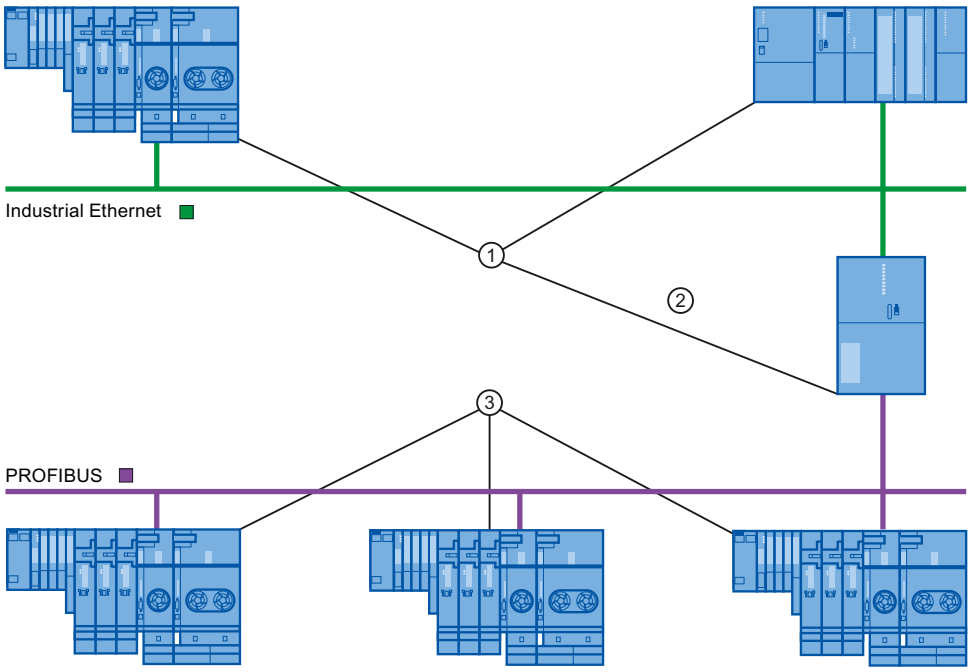
Connection of PROFINET and PROFIBUS

PROFINET IO and PROFIBUS DP can be connected with each other as follows:

- via Industrial Ethernet:
  To connect the two network types, Industrial Ethernet (plant control level) and PROFIBUS (cell level/field level), use the IE/PB link, for example.
- via Industrial Wireless LAN:
  PROFIBUS devices, for example, can be connected to PROFINET IO via a wireless LAN/PB link. This allows existing PROFIBUS configurations to be integrated into PROFINET.

AS interface devices can be connected by an IE/AS-i link PN IO to the interface of a PROFINET device. This allows the existing AS-i network to be integrated into PROFINET.

The following figure shows the connection of a PROFIBUS subnet via a PROFINET device with proxy functions.



① PROFINET devices
② PROFINET device with proxy functions (for example, IE/PB link)
③ PROFIBUS devices

PROFINET device with proxy functions used as proxy for a PROFIBUS device

The PROFINET device with proxy functions is the proxy for a PROFIBUS device on the Ethernet. The proxy functionality enables a PROFIBUS device to communicate with all devices on the PROFINET and not just with its master.

Existing PROFIBUS systems can easily be integrated into PROFINET communication using the proxy functions.

If, for instance, you connect a PROFIBUS device via an IE/PB link to PROFINET, the IE/PB link acts as a proxy for the PROFIBUS components for communicating via PROFINET.

Configuration using IE/PB link PN IO

Configuration using IE/PB Link PN IO

You can use the IE/PB Link PN IO to connect PROFIBUS DP configurations to PROFINET IO.

From the CPU perspective, the PROFIBUS DP slaves are connected to the same network as the IE/PB Link PN IO. These slaves have the same device name and IP address as the IE/PB Link PN IO, but different device numbers. Furthermore, each also has a specific PROFIBUS address.

In the properties of the IE/PB link, the PROFIBUS addresses of the connected DP slaves are displayed in addition to the PROFINET device numbers, as this device has two addressing schemes.

Handling device numbers and PROFIBUS addresses on the master system

During placement, the same number is assigned for the PROFINET device number and the PROFIBUS address.

In the Inspector window under "General Properties > PROFINET device number", you can find an overview of the device numbers used and the PROFIBUS addresses of an IE/PB link. The device number can also be changed here. You can also set that the device number and the PROFIBUS address should or should not always be identical. If the "PROFINET device number=PROFIBUS address" option is activated, you do not have to update the device number when the PROFIBUS address changes.

The PROFIBUS address can be changed in the properties of the PROFIBUS device.

Restrictions

The following restrictions apply to DP slaves configured as described above on the PROFIBUS subnet of an IE/PB link:

- No pluggable IE/PB link
- No pluggable DP/PA link
- No pluggable Y link
- Not CiR-compliant
- No pluggable redundant slaves
- No isochronous transmission / constant bus cycle time can be configured
- SYNC/FREEZE instructions ("DPSYC_FR") of a CPU on the the Ethernet subnet for DP slaves behind the IE/PB-Link are not supported.

Connect the DP slave via the IE/PB Link to a PROFINET IO system (Page 1138)

Configuration using IWLAN/PN link

Maximum number of devices in a IWLAN segment

If an Ethernet subnet is set up as wireless network (IWLAN = Industrial Wireless LAN), cyclic data exchange between IO controllers and IO devices is possible via a wireless route.

On one side of the wireless route there are fixed installed access points (for example, SCALANCE W 788) and on the other side mobile stations (with, for example IWLAN/PB links with PROFIBUS devices).

If the action radius of the mobile stations is large, it may be necessary to install several access points (SCALANCE W 788). Since each access point forms a segment with its wireless range, the IWLAN is made up of a series of segments.

The mobile devices "on the one side" of the wireless link with their IWLAN/PB links can move along the segments.

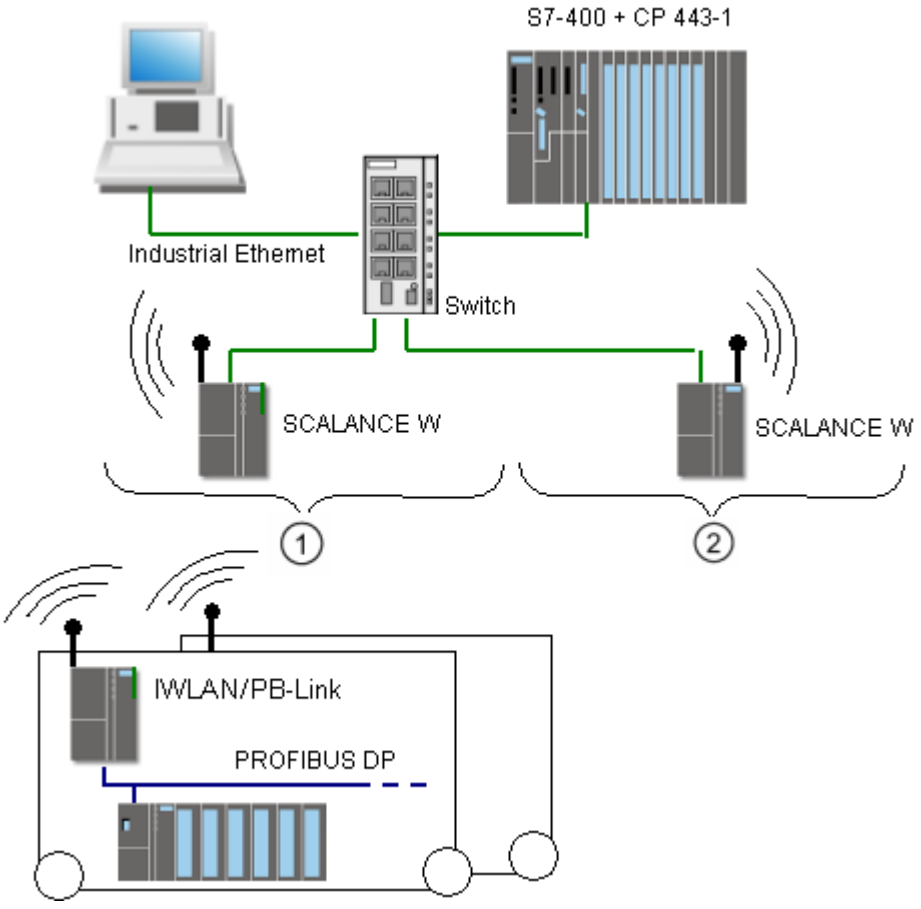
Special feature

If several IWLAN/PB links are located within a segment, they have to share the bandwidth that is available for wireless transmission. This leads to a lengthening of the update time for these devices.

Example

In the following example there are two IO devices (IWLAN/PB link) with a segment.

If no more than a maximum of two IWLAN/PB links are present in a IWLAN segment at the same time, enter a "2".



① Segment 1
② Segment 2

Configure PROFINET IO

Addressing PROFINET devices

Assigning addresses and names to PROFINET devices

In this chapter you will learn which address and naming conventions are valid for the PROFINET devices.

IP addresses

All PROFINET devices work with the TCP/IP protocol and therefore require an IP address for Ethernet operation.

You can set the IP addresses in the module properties. If the network is part of an existing company Ethernet network, ask your network administrator for this data.

The IP addresses of the IO devices are assigned automatically, usually at CPU startup. The IP addresses of the IO devices always have the same subnet mask as the IO controller and are assigned in ascending order, starting at the IP address of the IO controller.

Device names

Before an IO device can be addressed by an IO controller, it must have a device name. This procedure was chosen for PROFINET because names are easier to administer than complex IP addresses.

Both the IO controller as well as IO devices have a device name. When the "Generate PROFINET device name automatically" option is activated, the device name is automatically derived from the name configured for the device (CPU, CP or IM):

- The PROFINET device name is made up of the name of the device (for example, the CPU), the name of the interface (only with multiple PROFINET interfaces) and optionally the name of the IO system:
  <CPU name>.<Name of the interface>.<IO system name>
  You cannot change this name directly. You change the PROFINET device name indirectly, by changing the name of the affected CPU, CP or IM in the general properties of the module. This PROFINET device name is also displayed, for example, in the list of accessible devices. If you want to set the PROFINET device name independently of the module name, you have to deactivate the "Generate PROFINET device name automatically" option.
- A "converted name" is generated from the PROFINET device name. This is the device name that is actually loaded into the device.
  The PROFINET device name is only converted if it does not comply to the rules of IEC 61158-6-10. You cannot change this name directly either.

Rules for the converted name

The rules for the converted name are listed in the following section. If the converted name is **not** different from the name of the module, the name of the module must comply with this rule.

- The name consists of one or more labels , which are separated by a dot [.].
- Restricted to a total of 240 characters (lower case letters, numbers, dash, or dot)
- A name component within the device name, which means a character string between two dots, must not exceed 63 characters.
- A name component consists of the characters [a-z, 0-9].
- The device name must not begin or end with the "-" character.
- The device name must not begin with a number.
- The device name form n.n.n.n (n = 0, ... 999) is not permitted.
- The device name must not begin with the string "port-xyz" or "port-xyz-abcde" (a, b, c, d, e, x, y, z = 0, ... 9).

Example of device names

```
device-1.machine-1.plant-1.vendor
```

If you assign this name to a CPU, for example, STEP 7 will not convert it since it conforms to the rules described above.

Device number

In addition to the device name, a device number is also automatically assigned when an IO device is plugged in. You can change this number.

Devices in the PROFINET subnet

In a PROFINET subnet the maximum allowable number of devices is monitored during configuration.

Assigning the device name and IP address (Page 1116)

Retentivity of IP address parameters and device names (Page 1124)

Assigning the device name and IP address

Assigning an IP address and subnet mask for an IO controller the first time

There are various options for this.

During parameter assignment of the PROFINET interface you must specify if the IP address is set in the project (which means in the hardware configuration) or if the IP address is to be set on the device.

Assignment of an IP address	Comments
Option "IP address is set in the project": The IO controller receives the IP address by loading the hardware configuration, for example, via one of the PROFINET interfaces, by means of the PROFIBUS interface or via the MPI interface.	When the hardware configuration is loaded to the IO controller (e.g. CPU), the IP address and the device name, if set, are also loaded. Example PROFINET interface: 1. Connect your programming device/PC to the same network as the relevant PROFINET device. The interface of the PG/PC must be set to TCP/IP (Auto) mode. 2. Have a list of accessible devices displayed. 3. Select the target device by using its MAC address and load the hardware configuration including the configured IP address (IP address is then saved retentively). If your PROFINET device has an MPI or PROFIBUS DP interface, connect your programming device/PC directly to the PROFINET device via the MPI or PROFIBUS DP interface. The configured IP address is applied when the hardware configuration is loaded.
Option "IP address is set directly at the device": • Assign online • Assignment by user program (instruction IP_CONFIG for S7-300/400, T_CONFIG for S7-1200/1500) • Assign via CPU display (S7-1500) • Higher-level IO controller makes assignment (only with I-devices)	If you have selected this option in the properties of the PROFINET interface, the IP address can be assigned by the online and diagnostics editor, by the primary setup tool, or by the user program ("IP_CONFIG" instruction). This option is set automatically if the option "Multiple use IO system" has been enabled in the properties of the PROFINET IO system (standard machine project). In case of an S7-1200-CPU, make sure that access to the CPU is not protected by a password. If the CPU is write-protected, no IP address and no device name can be assigned directly on the device.

Commissioning a PROFINET interface

Further details of how to commission a PROFINET interface can also be found in the operating instructions for the PROFINET devices of the SIMATIC family.

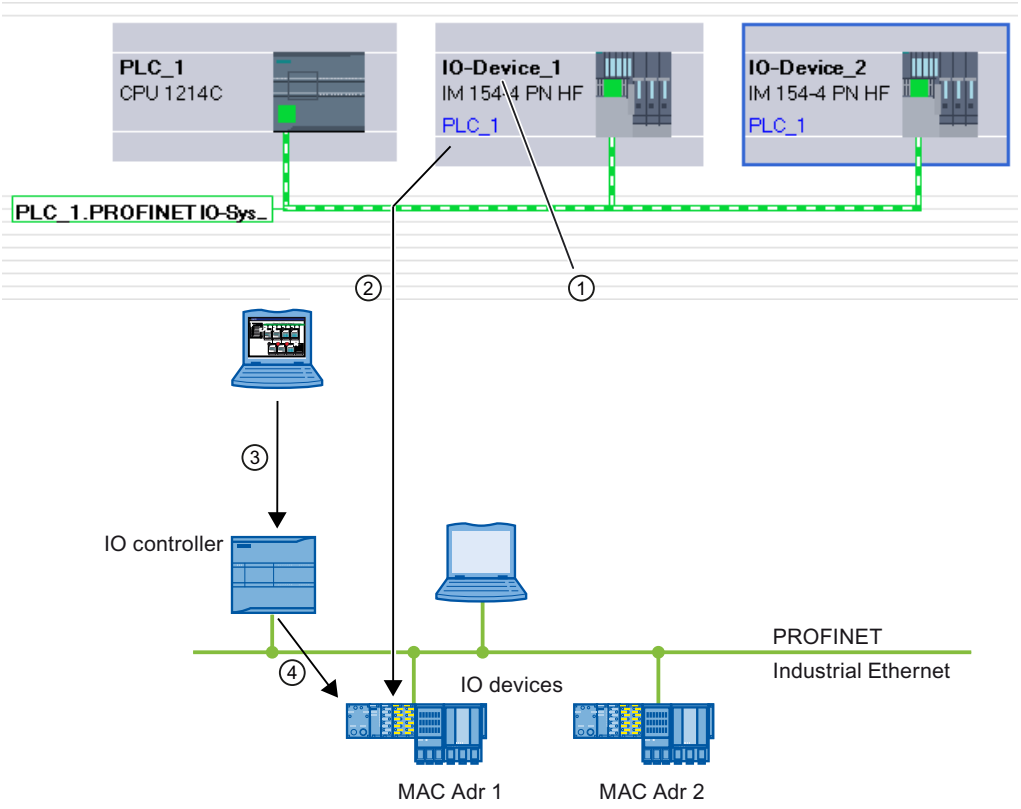
Assignment of device name for IO devices when the "Support device replacement without exchangeable medium" option is selected

For IO controllers with the "Support device replacement without exchangeable medium" option selected, you do not have to assign device names to the IO devices locally, for example in the event of device replacement. Another application is automatic commissioning, in which the CPU automatically assigns the device name and IP address parameters to the IO devices during startup.

Requirement: The ports of the devices are interconnected, and the devices involved support LLDP. The devices have been put into delivery state or - for S7-1500 CPUs version V1.5 and higher - the "Permit overwriting device names of all assigned IO devices" option is selected for the IO controller ("Ethernet addresses" area, "PROFINET" section of the properties of the PROFINET interface).

Assignment of device name and address for an IO device

The following graphic illustrates the process for assigning the device name and address. This process does not apply when the "Support device replacement without exchangeable medium" option is selected.



① Each device receives a name; STEP 7 automatically assigns an IP address.

② From the name, STEP 7 generates a PROFINET device name that you assign to an IO device online (MAC address) and that is written to the device.

③ You load the configuration to the IO controller.

④ The IO controller assigns the appropriate IP address to the IO device with the assigned PROFINET device name during startup.

Changing the device name and IP address

You can change the name and IP address manually. The device name must first be changed in the configuration in order to subsequently assign it to the IO device via the memory card or online with programming device/PC.

Offline with memory card:

1. Place the configured data (device name: for example, turbo-3) for the IO device on the MMC in the PG/PC. Use the command "SIMATIC Card Reader > Save Device Name to Memory Card" in the "Project" menu for this.
2. Then insert the MMC into the IO device. The IO device automatically adopts the configured device name.

Online with programming device/PC:

1. Connect the programming device/PC directly to the Ethernet subnetwork via the PROFINET interface.
2. In the network view, select the subnet or I/O device, and click the "Assign device name" command:
   - Either in the shortcut menu of the selected subnet / I/O device or
   - in the menu bar of the graphic view on the corresponding button.
3. In the "Assign PROFINET device name" dialog box, select the suitable PG/PC interface to connect to the Ethernet subnet. All configured PROFINET device names are in the top drop-down list. Select a PROFINET device name from it and select the IO device to receive this device name from the table at the bottom. You can filter the display of devices in the table according to various criteria.
4. You can easily identify the device using the "Flash LED" button.
5. Click "Assign name".

The IO controller recognizes the IO device by its device name and automatically assigns the configured IP address to it.

IP address assignment for special IO devices

Special IO devices, for example, SCALANCE X, S7-300 CPs, support the option of assigning the IP addresses not from the IO controller during startup. In this case, the IP address is assigned in a different way. The option is called "IP address is set directly at the device". For additional information, refer to the manual of the respective PROFINET device of the SIMATIC device family.

Another special case is the option "IP address is set by the IO controller during runtime" in the "IP protocol" area of the Ethernet address properties of an IO device. This option is set automatically when the option "Multiple use IO system" is selected for a standard machine project in the associated PROFINET IO system. In this case, an adapted IP address is not assigned by the IO controller until the IO controller itself has received a local IP address.

Requirement for additional procedures when assigning IP address and device name

If the IO device, as described above, should not obtain the IP address or device name from the IO controller, proceed as follows:

1. Select device or network view.
2. Open the properties of the respective PROFINET device and select the area "PROFINET interface [X1]" > "Ethernet addresses".
3. Select the option "IP address is set directly at the device" under "IP parameters" or the option "Permit setting of PROFINET device name directly on the device" under "PROFINET".

Rules

If the "IP address/device name is set directly at the device" option is used for a PROFINET device, note the following:

- The subnet part of the IP address of the IO device must match the subnet part of the IP address of the IO controller.
- The corresponding PROFINET device cannot be used as a gateway.

See also

Assigning a name in the online and diagnostics view opened via "Accessible devices" (Page 1392)

Enabling device replacement without exchangeable medium (Page 1137)

Example of the assignment of the device name

In this example you assign device names to a PROFINET IO controller and a PROFINET IO device. To make assignment easier, the device names should also contain the names of the PROFINET IO system.

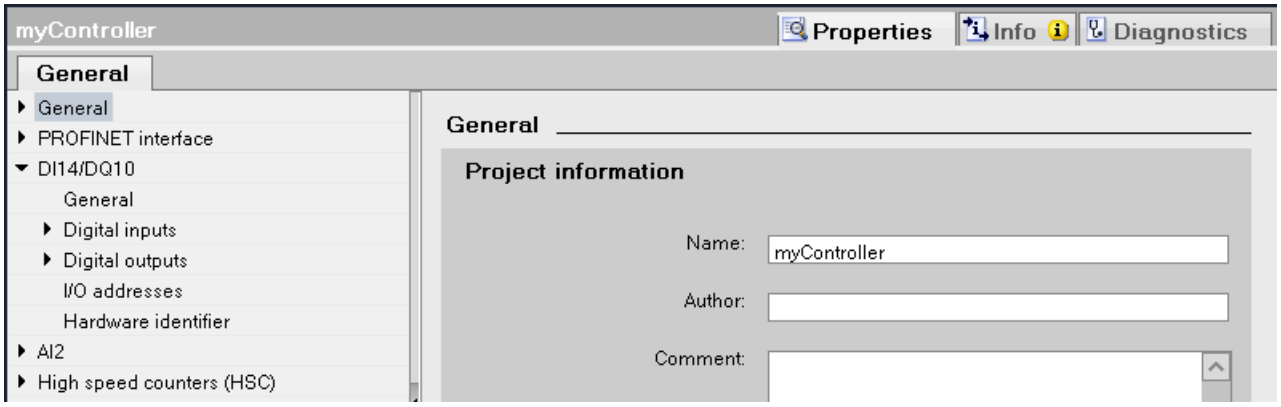
Requirement

- You must be in the network view.
- A CPU 1214C (V2.0 or higher) must be available in the network view.
- An interface module IM 151-3PN exists.
- The PROFINET interfaces of both modules are networked.

Procedure

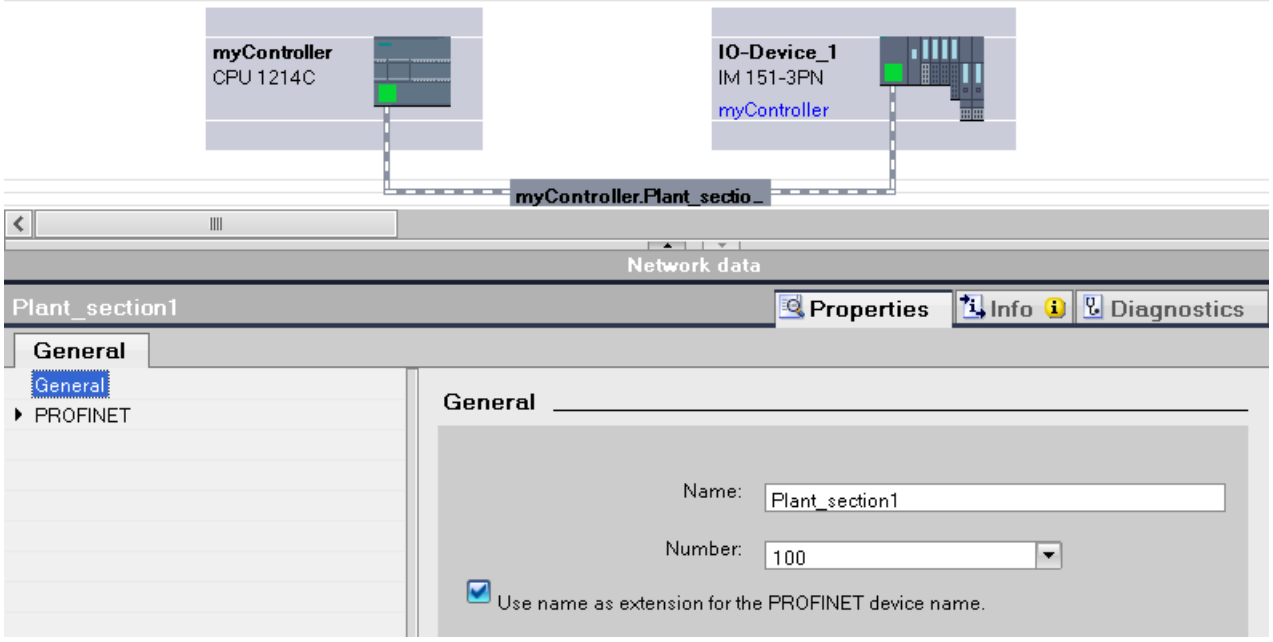
To assign the names, follow these steps:

1. Select the CPU.
   Make sure that you have selected only the CPU and not the complete device!
2. Assign the name "myController" in the Inspector window, under "General".

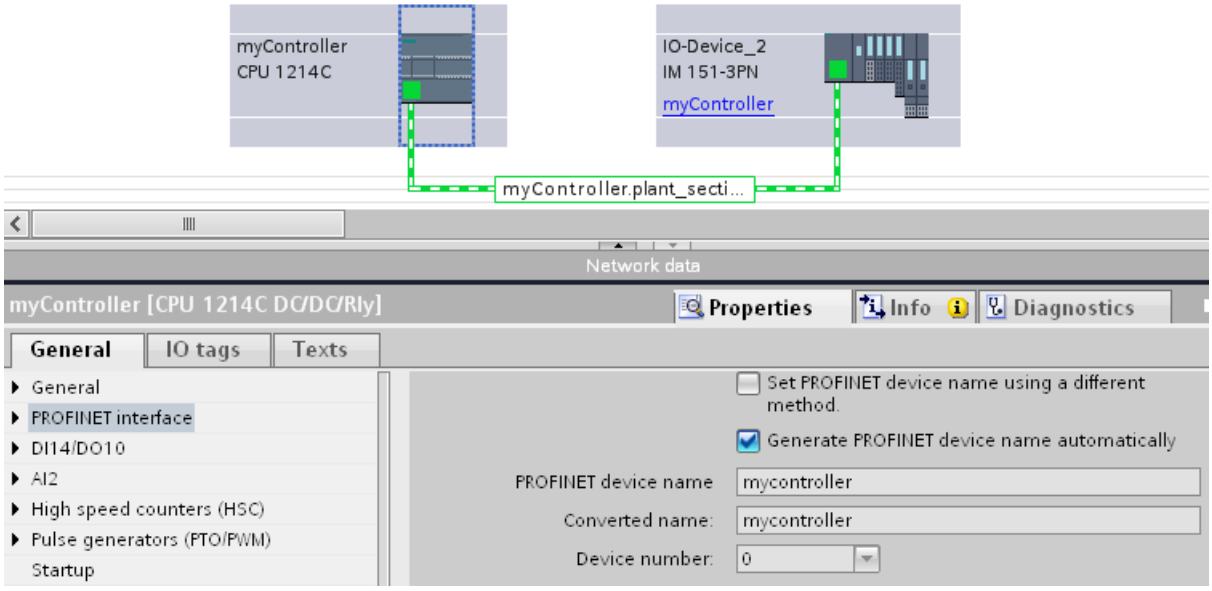


3. Select the interface module.
   Ensure that you have selected only the interface module and not the complete ET 200S device.
4. Assign the name "Device_1" in the Inspector window, under "General".
5. Right-click on the PROFINET IO system and select the "Properties" command.

6. Assign the name "Plant_section1" to the IO system and select the check box "Use name as extension for PROFINET device names".



7. You can find the automatically generated PROFINET device names at the selected device in the Inspector window, at "PROFINET interface".



The PROFINET device name corresponds to the name of the module (with the name of the IO system as extension) with the difference that only lower case text is used.
Background: No distinction is made between upper and lower case ("case insensitive") for the storing of the name.
If you want to specify the device name independently of the module name, you have to deactivate the "Generate PROFINET device name automatically" option. The PROFINET device name can be edited in this case.

The converted name is displayed below. This is the name that is automatically generated from the PROFINET device name and satisfies the DNS conventions. If you work with STEP 7, you do not require this name. This name is displayed here as a check and corresponds to the name that is stored in the device. If you work with other tools that are able to record the data exchange and read the actual device names, then you find the converted names.

Other special features

For PROFINET devices with multiple PROFINET interfaces, the name of the interface is attached to the name of the module, separated by a dot.

Example:

- Name of the module: myController
- Name of the interface: Interface_1
- PROFINET device name: mycontroller.interface_1

Assign device name via memory card

Introduction

You can configure the device names of PROFINET IO devices offline. To do this, store a configured device name on a memory card and then insert the card into the appropriate IO device.

If an IO device has to be completely replaced due to a device defect, the IO controller automatically reconfigures the new device. Using the memory card, a device can be replaced without a programming device.

Requirements

- The programming device has a card reader for memory cards.
- The IO device must support the assignment of the device name via memory card.
- The station and its PROFINET IO system is configured.

Procedure

To store a device name on a memory card, follow these steps:

1. Insert the memory card into the card reader.
2. Select the IO device whose device name is to be assigned by the memory card.
3. Select the "Card reader > Save Device Name to Memory Card" command in the "Project" menu.
   If the memory card is not empty, a message will be issued informing you of this and you will have the option to delete the card.

Retentivity of IP address parameters and device names

The retentivity of IP address parameters (IP address, subnet mask, router setting) and device name depends on how the address is assigned.

The non-retentive, temporary assignment means:

- IP address parameters and device name remain valid for the following time period:
  - Until the next POWER OFF
  - Until the next memory reset
  - Until termination of the online connection (for example, after loading the program) After POWER OFF / POWER ON or a memory reset, the CPU can only be accessed via the MAC address.

If the IP address parameters are not retentive, communication based on the IP protocol can no longer take place after the above described events (for example, after POWER OFF/ POWER ON).

The assignment of a temporary IP address also deletes retentively saved IP address parameters.

Assigning IP address parameters and device name non-retentively

IP address parameters and device name are not retentive in the following cases:

- A temporary IP address that is not retentive is implicitly assigned with the "Accessible devices" function, if the device (e.g. CPU) does not yet have an IP address.
- The device is a "normal" IO controller (i.e., not an I-device), and it is specified in the user program ("IP_Conf" instruction) that the IP address parameters/device name are not to be retentive.

Assigning IP address parameters and device name retentively

IP address parameters and device name are retentive in the following cases:

- In the properties of the PROFINET interface, it is specified that the IP address parameters are set in the project ("Set IP address in the project" option).
- In the properties of the PROFINET interface, it is specified that the IP address is to be set on the device.
  - Once the configuration is loaded, the IP address parameters and the device name are assigned via STEP 7 or a setup tool such as PST (STEP 7: online and diagnostic function "Assign IP address"). The assigned IP address parameters are retentive.
  - The device is a "normal" IO controller (i.e., not an I-device), and it is specified in the user program ("IP_Conf" instruction) that the IP address parameters/device name are to be retentive.

Special features of the I-device

In the properties of the PROFINET interface of the I-device, it is specified that the IP address parameters are to be set on the device. The IP address parameters for the I-device are assigned by the higher-level IO controller.

- If prioritized startup is set, the IP address parameters are retentive.
- If **no** prioritized startup is set, the IP address parameters are not retentive.

Recommendation

If possible, use the "Set IP address in project" option and specify an appropriate IP address. In this case, the IP address is assigned retentively.

Resetting of retentive IP address parameters and device names

Retentive IP address parameters and device names are reset via the online and diagnostic function "Reset to factory settings".

Note

Consequences of reassignment of IP address parameters on top of existing IP parameters

- The temporary assignment of IP address parameters/device names results in a reset of any retentively saved IP address parameters/device names.
- With a fixed assignment of IP address parameters/device names, previously retentively-saved parameters are replaced by the newly assigned parameters.

Note

Reuse of devices

Execute the "Reset to factory settings" before you install a device with retentive IP address parameters and device name in another subnet or system or before you place it in storage.

Creating a PROFINET IO system

A PROFINET IO system is comprised of a PROFINET IO controller and its assigned PROFINET IO devices.

To create a PROFINET IO system you require an IO controller (for example, CPU 1214C) and one or more IO devices (for example, a head module from the distributed I/O family ET 200S).

As soon as you connect an IO controller to an IO device, a controller-device link is established.

Procedure

To create a PROFINET IO system, proceed as follows:

1. Use drag-and-drop to pull an IO controller from the hardware catalog (for example, CPU 1214C) into the free area of the network view.
   The IO controller is created in the project.
2. Use drag-and-drop to move an IO device from the hardware catalog (for example, ET 200S) into the free area of the network view.
3. Click on the PROFINET interface of the IO controller or the IO device.
4. Hold down the mouse button and draw a connecting line between this selected interface and that of the partner device.
   A subnet with an IO system between the IO controller and the IO device is created.
5. If required, adapt the properties of the Ethernet subnet or the IO controller (for example, IP address) under "Properties" in the inspector window.

Handling PROFINET IO systems

Using shortcut menu commands, you can delete PROFINET IO systems, create new ones or even connect the interface to another subnet from within the network view.

An existing PROFINET configuration can thereby be corrected in the network view.

Create new PROFINET IO system for IO controller

To create a new PROFINET IO for an IO controller, proceed as follows:

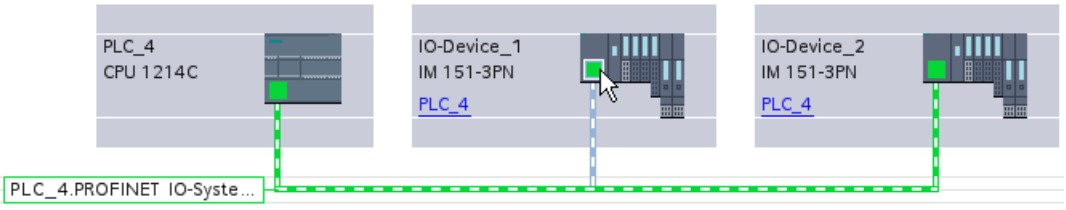
1. Make sure that no IO system is already assigned to the IO controller. If an IO system is already assigned to the IO controller, the "Assign IO system" shortcut menu command is disabled.
2. Select the PROFINET interface and then select the "Assign IO system" shortcut menu command.

A new PROFINET IO system is created at the IO controller and you can assign IO devices to this IO system.

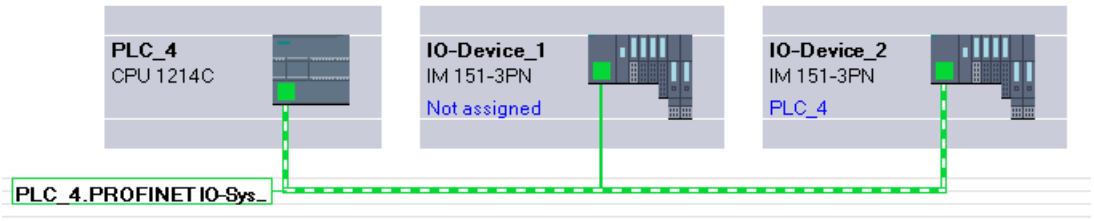
Disconnecting PROFINET IO devices from PROFINET IO system

To disconnect an already networked PROFINET IO device from its PROFINET IO system, follow these steps:

1. Click on the PROFINET interface of an IO device.



2. Select the "Disconnect from IO system" shortcut menu command.
   The IO device that was assigned to this IO system is then no longer assigned to it.



You can create a new IO systems and can assign each of the non-assigned IO devices to an IO controller.

Assign PROFINET IO devices to other IO controllers

Existing PROFINET IO systems can be easily reconfigured in the network view:

1. Select the interface of an IO device and then select the shortcut menu. You have the following options here:
   - Assign a new subnet to the IO device or disconnect it from the existing subnet
   - Assign a new IO controller to the IO device
   - Assign a new IO system to the IO device or disconnect it from the existing subnet
2. To assign another IO controller to the IO device, select the "Assign to new IO controller" shortcut menu command.
   If there is no connection, a subnet is automatically created and the IO device is assigned to the IO system of the new IO controller.

Tip: Quick configuration of IO systems

If the IO system has a lot of IO devices, assign all IO devices placed by drag-and-drop operation to an IO controller on one step.

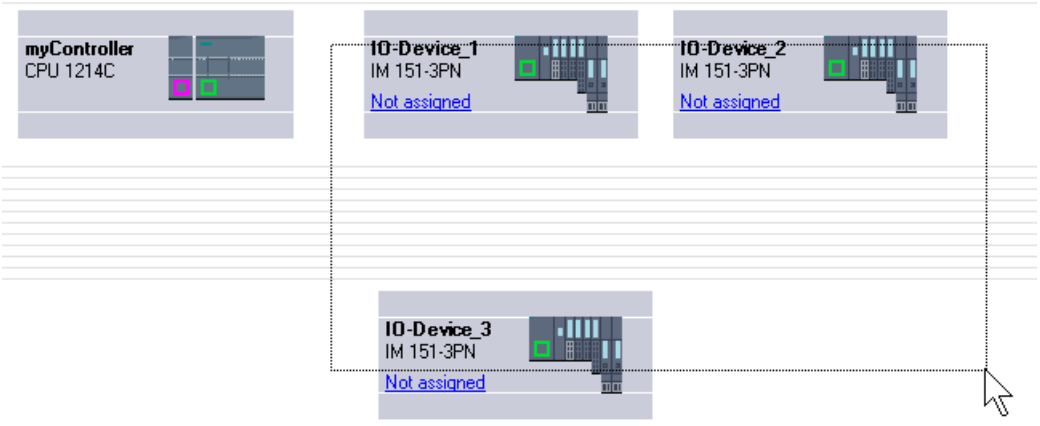
Requirements

IO controller and IO devices are placed in the network view.

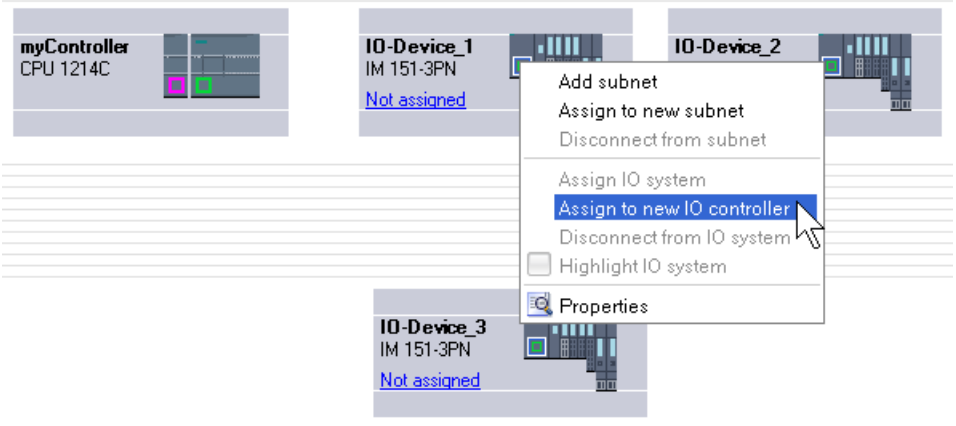
Assign IO devices to an IO system

To do this, follow these steps:

1. Select an appropriate zoom factor so that you can see as many IO devices as possible in the network view.
2. Arrange the IO devices in not more than of two rows.
3. Select all IO interfaces (not all devices) with the mouse cursor. This only works if you begin to drag the mouse cursor outside of the first IO device and release the mouse button at the last IO device (selection with the lasso).



4. Select the shortcut menu "Assign new IO controller" and select the corresponding IO interface of the IO controller in the subsequent dialog.



5. The IO devices are automatically networked with the IO controller and combine with it to form an IO system.

Note

When an IO system is highlighted, you can double-click on an IO device in the hardware catalog and thereby quickly add additional IO devices. Result: The IO device is automatically added to the highlighted IO system.

Interconnecting ports

If an IO device is assigned to an IO controller, this does not yet specify how the ports are connected to each other.

Although a port interconnection is not required to make use of the Ethernet/PROFINET functions, it does offer the following advantages:

- A target topology is specified with the port interconnection. Based on an online-offline comparison, it is possible to conduct a target-actual comparison with all devices that support this function.
- Only with IRT communication: If a port interconnection is configured, STEP 7 can determine the required bandwidth more precisely. As a rule, this leads to a higher performance.

Make sure that no invalid ring structures occur through the interconnection of ports.

Port interconnection is only advisable for devices that support the topology configuration.

Interconnecting ports in the Inspector window

To interconnect ports, follow these steps:

1. Select the Ethernet/PROFINET device or the Ethernet/PROFINET interface.
2. Navigate to the port property "Port interconnection".
   When the Ethernet/PROFINET interface is selected, you can find this setting in the Inspector window as follows: Properties > General > Advanced Options > Port [...] > Port Interconnection.
3. In the "Local port" section, you can find the settings at the local port. In the case of fiber-optic cable you can, for example, set the cable names here.
   In the "Partner port" section, click on the black triangle in the "Partner port" box to display and select the available partner ports.
4. If the port interconnection is a port interconnection with copper as medium and the devices support IRT communication, you can also set cable length and signal transit time.

If the Ethernet/PROFINET interface was disconnected, it is automatically networked by this action. In the properties of the subnet you can set whether this subnet should or should not be used for the networking.

Note

Interconnecting an electric with an optical port

If you want to interconnect an electric and an optical port, you have to decide between RT and IRT communication:

- With RT communication, it is not necessary to configure a media converter.
- With IRT communication, you have to make the interconnection via a media converter.

Information on monitoring the partner port

After you have interconnected the two ports, you receive information on the monitoring of the partner port in a text field. The following displays are possible:

- Monitoring of the partner port is not possible.
- Partner port is being monitored.

It is not possible to monitor the partner port if you, for example, select a deactivated port as partner port. In this case it is not possible to monitor the target topology and the signal propagation time. A device replacement is then only possible with a Micro Memory Card.

Overview (Page 669)

Setting the send clock

Requirements to change the send clock at the PROFINET device

No IRT (Isochronous Realtime) should be configured. In detail, this means:

- No device must be configured at the IO system as a sync slave or sync master.
- All devices at the IO system must be unsynchronized.

If IRT is configured (in other words, if the IO controller is configured as sync master), the send clock can only be configured in the sync domain.

Procedure

To set the send clock on the PROFINET device, follow these steps:

1. Select the PROFINET IO controller in the device or network view.
2. Change the value for the shortest possible update interval in the properties of the PROFINET interface under "PROFINET Interface > Advanced options > Real-time settings > IO communication > Send clock".

The send clock is valid for all PROFINET devices at the IO system. If the synchronization role is set to a value other than "Unsynchronized", you can only set the send clock in the sync domain, in other words, centrally at the PROFINET IO system.

Setting the update time

Update time

An IO device / IO controller in the PROFINET IO system is supplied with new data from the IO controller / IO device within this time period. The update time can be separately configured for each IO device and determines the time interval in which data is transmitted from the IO controller to the IO device (outputs) as well as data from the IO device to the IO controller (inputs).

STEP 7 calculates the update time automatically in the default setting for each IO device of the PROFINET IO system, taking into account the volume of data to be exchanged as well as the set send clock.

Setting the update time

If you do not want to have the update time calculated automatically, you can change the setting.

To change the update time, proceed as follows:

1. Select the PROFINET interface of the IO device in the network or device view.
2. Change the update time in the interface properties under "Advanced options > Realtime settings > IO cycle".
   - To have a suitable update time calculated automatically, select "Automatic".
   - To set the update yourself, select "Can be set" and enter the required update time in ms.
3. if you want to keep the relationship between the send clock and the update time constant, enable the "Adapt update time when send clock changes" option.
   This option ensures that the update time is not set to less than the send clock.

Manual setting of the send clock may result in errors if the available bandwidth is not adequate or when other limits/configuration limits are exceeded (for example, too many nodes are configured).

No update time can be calculated

STEP 7 determines the sequence of the cyclic data exchange based on the configuration information (IO controller properties, IO device properties, number and type of the IO devices, consistency of the cyclic user data...). The cyclic data is packed in frames and sent/received successively at calculated time intervals.

The maximum number/size of the frames and the maximum number of intervals available must be sufficient to "accommodate" all the data. The resulting send/receive interval must also be supported by every PROFINET device.

If the limits relating to the amount of cyclic user data/number of frames or relating to the intervals available are exceeded, STEP 7 cannot calculate an update time.

If there is no common basis for the send/receive interval, calculating the update time is also not possible.

If there is a reason preventing the calculation of the update time, STEP 7 reports the cause when compiling the hardware configuration.

How to eliminate the problem:

- Reduce the number of IO devices
- Reduce the number of modules within the IO devices
- If you are using an IE/PB link: Reduce the number of DP slaves downstream from the IE/PB link
- Use a more powerful IO controller or IE/PB link
- Increase the send clock
  - With RT: in the properties of the IO controller
  - With IRT: in the properties of the sync domain
- Check the device properties of the IO devices ('MinDeviceInterval' and the possible scan rates) due to the common basis for the send/receive interval. Replace unsuitable IO devices. This device properties are stored in the GSD file of the IO device.
- With IRT configuration:
  - Check whether the ports of the sync master and sync slaves are interconnected.
  - Check the order of the IO devices: There can be no unsynchronized device connected between the sync master and sync slave
    (Example of bad configuration: Sync master --- unsynchronized device --- sync slave).
  - Check whether you have configured more than one sync master.
  - Check the bandwidth remaining for RT data. The bandwidth for RT data available for the transfer can be restricted by IRT communication on the same Ethernet subnet.
- When using I-devices:
  It may not be possible to use the set send clock together with the existing I-device configuration.
  - Configure the I-device without lower-level IO devices and activate the setting "Parameter assignment of PN interface by higher-level IO controller".
  - Change the send clock of the IO controller to an even value (... 0.250, 0.500, 1.000, ...).

Identification of the IO devices involved:

You can identify the IO devices involved for which no update time can be calculated in the "I/O communication" table of the PROFINET IO system in the network view. No entry is made in the "Update time" column for the IO device involved (entry "-").

Setting the watchdog time

Watchdog time

You can configure the watchdog time for PROFINET IO devices.

If the IO device is not supplied with input or output data (IO data) by the IO controller within the watchdog time, it switches to the safe state.

Do not enter the watchdog time directly, but as "Accepted number of update cycles when IO data is missing". This makes setting easier because the update time can be shorter or longer, depending on the power of the IO device or the setting.

The resulting watchdog time is automatically calculated from the "Accepted number of update cycles when IO data is missing".

Configuring the watchdog time

To specify the watchdog time, follow these steps:

1. Select the PROFINET interface of the IO device in the network or device view.
2. In the properties of the interface, navigate to "Advanced options > Realtime settings > IO cycle".
3. Select the required number of cycles from the drop-down list "Trigger watchdog after # cycles with missing IO data".

The watchdog time is subsequently calculated automatically based on the preset factor. It must not be more than 1.92 seconds.

Note

The default setting should only be changed in exceptional cases, for example, during the commissioning phase.

Calculated bandwidth for cyclic IO data

Calculated bandwidth for cyclic IO data

Adherence to the maximum available bandwidth for cyclic IO data is monitored by the system. The maximum bandwidth depends on the send clock cycle. If the send clock cycle is greater than or equal to 1 ms, the maximum bandwidth is 0.5 ms. If the send clock cycle is shorter, the maximum available bandwidth is also reduced.

The bandwidth actually required for cyclic IO data is determined by the system based on the number of configured IO devices and IO modules. Furthermore, the required bandwidth depends on the update time that is used.

In general, the calculated bandwidth increases in the following cases:

- There is a greater number of IO devices
- There is a greater number of IO modules
- The update times are shorter.

Maximum bandwidth for cyclic IO data depending on the send clock

The following table shows how the maximum available bandwidth for cyclic IO data reacts based on the send clock:

Send clock cycle	Maximum bandwidth for cyclic IO data
250 µs – 468.75 µs	<< 125 µs
500 µs – 968.75 µs	= send clock / 2
1 – 4 ms	= 500 µs

Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission medium/duplex

Depending on the selected device, you can make the following settings for "Transmission medium/duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the partner port. The "Enable autonegotiation" option is automatically selected by default.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop-down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option is used to activate or deactivate the port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because, with this option, the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can therefore not be optimally set.

Note

When a local port is interconnected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not support the setting, an error message is generated.

GBIT PROFINET interface

The PROFINET interface (X3) of the CPU 1518-4 PN/DP supports a maximum transmission rate of 1000 Mbps (GBIT).

In order to achieve this transmission rate, the following requirements must be met:

- CPU Firmware Version V1.7 or higher.
- Devices on the same PROFINET subnet must also support the 1000 Mbps transmission rate.
- The network infrastructure (network cables and outlets) must be category CAT 5e or better.
- The port options of PROFINET interface X3 must be set as follows:
  - “Transmission rate/Duplex”: Automatic
  - “Autonegotiation”: Activated

See also

Wiring rules for disabled autonegotiation (Page 1135)

Boundaries at the port (Page 1136)

Wiring rules for disabled autonegotiation

Requirement

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission speed
- Autonegotiation incl. autocrossing disabled

This saves you the time required to negotiate the transmission rate during startup.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

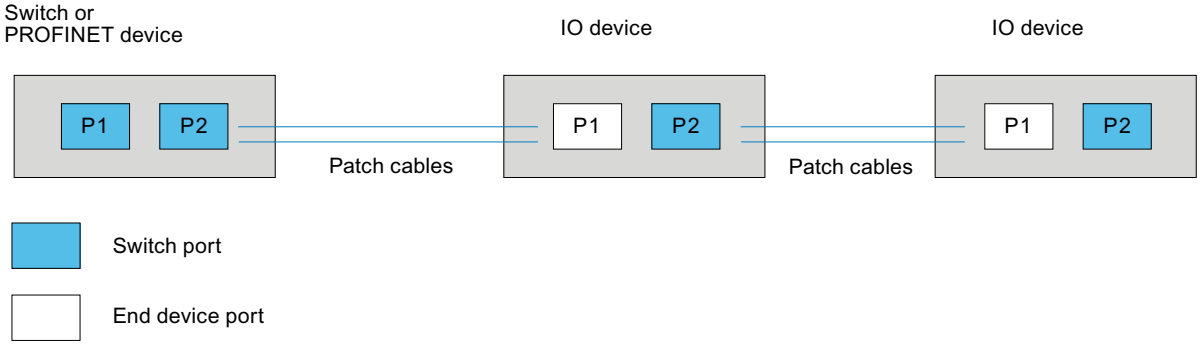
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in a line using a patch cable (one-to-one wiring of both connectors). To do this, you connect port 2 (P2) of the IO device to port 1 (P1) of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirement

To use boundaries, the respective device must have more than one port. If the device for PROFINET does not support boundary settings, the corresponding parameters are disabled.

This applies, for example, to the 1215C CPUs V3; although these have more than one port, they do not support boundary settings.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of detection of accessible devices"
  DCP frames for detection of accessible devices are not forwarded. Devices located behind this port are no longer displayed in the project tree under "Accessible devices". Devices located behind this port can no longer be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) for topology detection are not forwarded.
- "End of sync domain"
  Sync frames transmitted for synchronization of devices within a sync domain are not forwarded.
  For example, if you operate a PROFINET device with more than two ports in a ring, you should prevent the sync frames from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device of the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been defined for the port, the following check boxes cannot be used:
  - "End of detection of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

Enabling device replacement without exchangeable medium

Replacing an IO device without exchangeable medium

It is often necessary to replace IO devices in automation systems. The IO devices are generally assigned a device name by either inserting an exchangeable medium or via the programming device. The IO controller uses this device name to identify the IO device.

Subject to certain conditions, IO devices can also receive their device names without the insertion of an exchangeable medium (e.g., memory card) or without a programming device. For this purpose, the IO controller uses Ethernet mechanisms (LLDP protocol; Link Layer Discovery Protocol) to analyze the relationships between the individual IO devices and the IO controller. From these relationships, the IO controller detects which IO device was replaced and assigns the configured device name to it.

Requirements

- A port interconnection is already configured.
- The affected IO devices in the automation system must support device replacement without exchangeable medium (LLDP protocol).
  If the individual IO devices in the automation system do not support device replacement without exchangeable medium, a corresponding alarm is output for the IO device.

Note

Use only new IO devices as replacement devices, or restore IO devices with an existing parameter assignment to delivery state prior to commissioning.

For S7-1500 CPUs with firmware version V1.5 or higher, it is not necessary to reset IO devices with an existing parameter assignment to delivery state. The condition for this is that the "Permit overwriting of device name" option is enabled for the IO controller ("Ethernet addresses" area, "PROFINET" section of the properties of the PROFINET interface).

Procedure

In order to enable the replacement of an IO device without exchangeable medium, proceed as follows:

1. In the device or network view, select the PROFINET interface of the corresponding IO controller.
2. In the interface properties under "Advanced settings > Interface options", select the "Support device replacement without exchangeable medium" check box.

The option "Support device replacement without exchangeable medium" also permits automatic commissioning, which means you can commission the IO system with the IO devices without assigning their device names in advance.

Connect the DP slave via the IE/PB Link to a PROFINET IO system

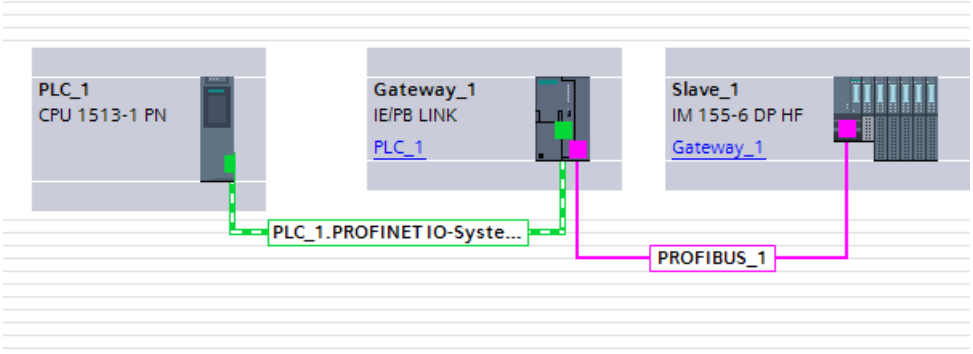
Requirements

- STEP 7 as of V12
- S7-1500 CPU as of firmware version 1.7
- ET 200SP CPU as of firmware version 1.7
- S7-1500 software controller
- S7-300/400 CPU

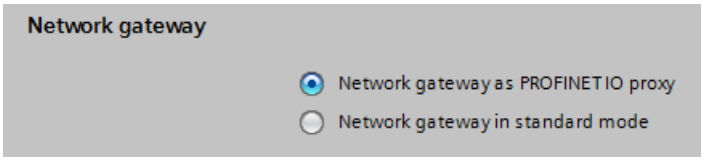
Procedure for connecting a DP slave via an IE/PB Link

To connect a DP slave to a PROFINET IO system via an IE/PB Link in STEP 7, follow these steps:

1. Drag a PROFINET CPU, e.g. 1513-1 PN, from the hardware catalog to the network view of STEP 7.
2. Drag an IE/PB Link PN IO from the hardware catalog to the network view of STEP 7. You will find the IE/PB Link PN IO under Network components > Gateways > IE/PB Link PN IO.
3. Assign the IE/PB Link PN IO to the CPU.
4. Drag a PROFIBUS interface module e.g. IM155-6 DP HF, from the hardware catalog to the network view.
5. Assign the interface module to the IE/PB Link.



6. Select the IE/PB Link PN IO in the network view of STEP 7.
7. In the Inspector window, go to the "Gateway" area and select the "Network gateway as PROFINET IO proxy" option.



8. In the PROFINET device number area, you can assign a PROFINET device number for the DP slave.
   If you have selected the "Device number = PB address" check box (default), STEP 7 automatically assigns the device number according to the PROFIBUS address of the slave. In addition, you no longer need to update the device number if the PROFIBUS address changes.

Configuration using IE/PB link PN IO (Page 1112)

Using GSD files

GSD files for IO devices

Basic information on GSD files of IO devices

The properties of PROFINET IO devices are not stored in a keyword-based text file (as for PROFIBUS DP slaves), but in an XML file whose structure and rules are determined by a GSDML schema.

The language used to describe the GSD files is GSDML (Generic Station Description Markup Language). It is defined by the GSDML schema.

A GSDML schema contains validation rules that allow it, for example, to check the syntax of a GSD file. GSDML schemas (as schema files) are acquired by IO device manufacturers from PROFIBUS International.

Functional enhancements in the area of PROFINET IO will have an effect on the GSDML specification and the corresponding schema. A new version of the specification and of the schema is created by the functional enhancement.

Names of GSD files for IO devices

One possible example of a GSD file name for IO devices is:

"GSDML-V1.0-Siemens-ET200S-20030616.xml"

Name component	Explanation
GSDML	String at the start of each GSD file for IO devices
V1.0	Version of the GSDML schema
Siemens	Manufacturer
ET200S	Name of the device
20030616	Version code (date)
.xml	File extension

Versioning of GSD files for IO devices

The version information of GSD files is two-fold:

First, the version of the GSDML schema is indicated. This determines the language scope used by a GSD file.

This is followed by the version, listed as an issue date. The version number of GSD files is incremented, for example, after elimination of an error or introduction of a functional enhancement.

Functional enhancements may result in a new version of the GSDML schema. A new version of a GSDML schema might only be supported with restrictions.

Installing the GSD file

Introduction

A GSD file (general station description file) contains all properties of an IO device. If you want to configure an IO device that is not available in the hardware catalog, you must install the GSD file provided by the manufacturer. IO devices installed via GSD files are displayed in the hardware catalog and can then be selected and configured.

Requirement

- The hardware and network editor is closed.
- You have access to the required GSD files in a directory on the hard disk.

Procedure

To install a GSD file, follow these steps:

1. In the "Options" menu, select the "Install general station description file (GSD)" command.
2. In the "Install general station description file" dialog box, select the folder in which the GSD files are stored.
3. Choose one or more files from the list of displayed GSD files.
4. Click on the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.
   Any problems during the installation can be tracked down using the log file.

You will find the new IO devices installed by means of GSD files in the hardware catalog under "Additional field devices > PROFINET".

See also

Overview of hardware and network editor (Page 535)

Deleting GSD file

Introduction

You can delete installed DP slaves using GSD files. These DP slaves are then no longer displayed in the hardware catalog.

Requirement

- The hardware and network editor is closed.
- You will find the new IO devices installed by means of GSD files in the hardware catalog under "Additional field devices > PROFINET".

Procedure

To delete a GSD file, follow these steps:

1. In the "Options" menu, select the "Install general station description file (GSD)" command.
2. In the "Install general station description file" dialog box, select the folder in which the GSD file is stored.
3. Select the file that is to be deleted from the list of displayed GSD files.
4. Click the "Delete" button.

The selected GSD file was deleted and the DP slave is no longer located in the hardware catalog.

Changing the revision of a GSD file

Changing the revision of a GSD file

You can change the revision of a GSD file for an IO device:

- Only for the current IO device
- All suitable IO devices within the IO system
- All suitable IO devices within the complete project

First, all existing GSD files for the current IO device are shown. The only difference between the GSD files shown is their revision status. The currently used GSD file is highlighted.

Requirement

- The I/O data is the same for all IO devices whose revision is to be changed.
- The article number has not changed.
- The number of submodules is identical.
- The configuration data has not changed.
- There must be no module or submodule in a slot that is invalid after the new GSD file has been created.

Procedure

To change the revision of one or more IO devices, proceed as follows:

1. Select the IO device whose GSD file revision is to be changed.
2. Click on the "Change revision" button under "General> Catalog information" in the properties of the IO device.
   The "Change revision" dialog box opens.
3. Select the GSD revision you want to use in the "Available revisions" table.
4. Under "Use selected revision for", select the devices whose version are to be changed:
   - Only for the current IO device
   - For all suitable IO devices in the IO system
   - For all suitable IO devices in the project
5. Click the "Apply" button.

10.1.4.8 Bus coupling with PN/PN coupler

Application and function

Application

The PN/PN coupler is used to link two Ethernet subnets with one another and to exchange data. That way use data about input or output address areas or datasets can be used. The maximum size of the transferable input and output data is 1024 bytes. The division into input and output data is preferable, so that e.g. 800 byte input data and 200 byte output data can be configured.

As a device, the PN/PN coupler has two PROFINET interfaces, each of which is linked to one subnet.

In the configuration, two IO Devices are produced from this one PN/PN coupler which means that there is one IO Device for each station with its own subnet. The other part of PN/PN coupler in each case is known as the bus node. Once configuring is complete, the two parts are joined.

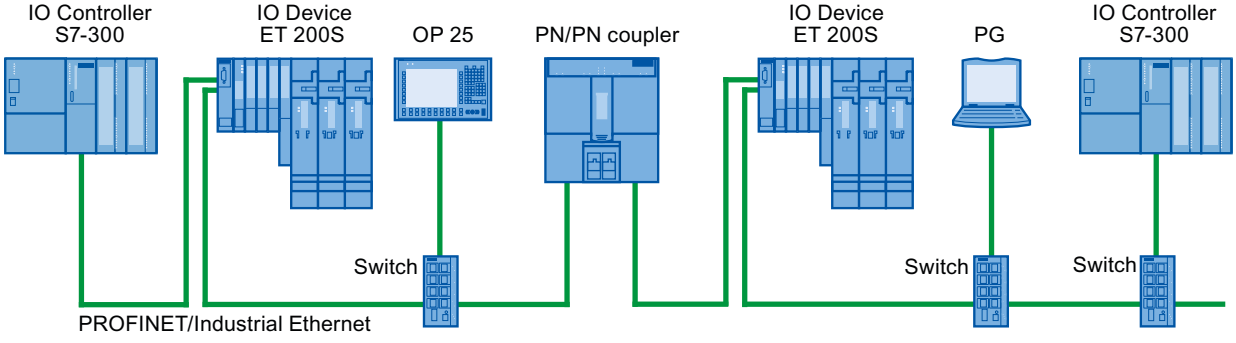

Figure 10-3 Coupling two PROFINET IO subnets with one PN/PN coupler

Additional information

For additional information on "PN/PN couplers", refer to Service & Support on the Internet (http://support.automation.siemens.com/WW/view/en/44319532).

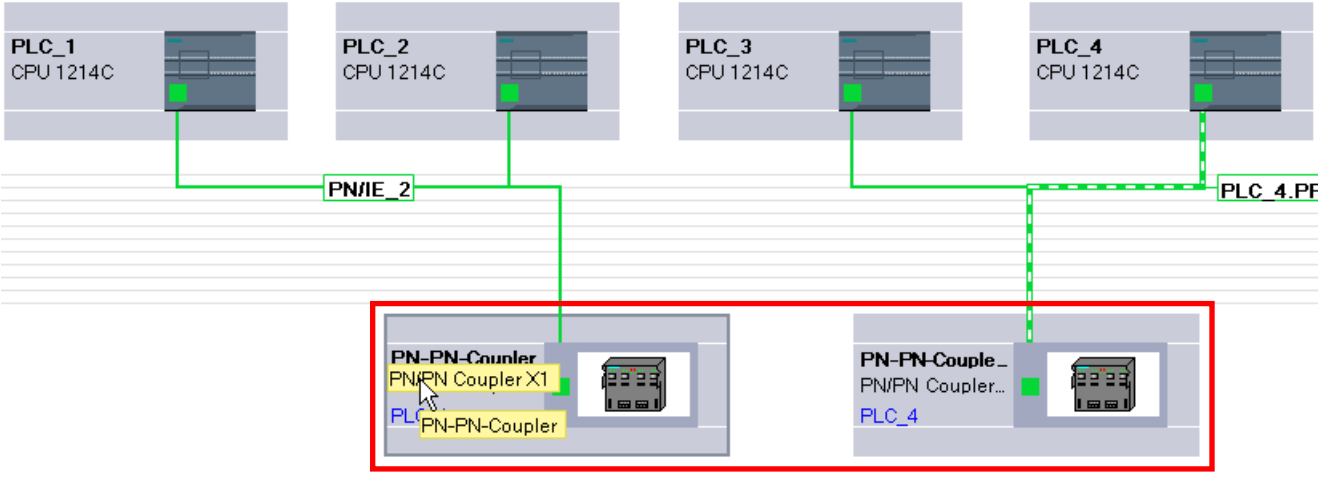
Linking Ethernet subnets

Linking Ethernet subnets with a PN/PN coupler

You can link Ethernet subnets with the standard device PN/PN coupler.

To link Ethernet subnets, follow these steps:

1. Create your Ethernet subnets.
2. Select the standard field devices in the hardware catalog. Find the PN/PN coupler as head module in the "PROFINET IO" folder.
3. In the network view, drag the two components X1 and X2 to the required version of the PN/PN coupler per drag-and-drop operation. The components form a device, but are shown separately to make handling easier.
4. Connect the Ethernet interface of the PN/PN coupler X1 to the first Ethernet subnet.
5. Connect the Ethernet interface of the PN/PN coupler X2 to the second Ethernet subnet. The Ethernet subnets are now linked through the two components of the PN/PN coupler.



10.1.4.9 Integrating external tools

Integrating S7-external tools

Introduction

Tools external to STEP 7 ("Device Tools") with a special call interface (Tool Calling Interface) can be used to configure distributed devices. Such devices are also referred to as "TCI capable".

The performance range of these tools exceeds the possibilities provided within GSD configuration, for example, they can provide expanded graphical input options.

Distributed devices can be as follows:

- PROFIBUS DP slaves
- Modules within a DP slave
- PROFINET IO devices
- Modules within an IO device

Note

Warranty and liability

Siemens accepts no liability for third-party software (device tools) called with the TCI (Tool Calling Interface) or for proper interaction with the associated devices.

Requirement

The call interface of the tool complies with the TCI specification. Parameters and commands are forwarded to the distributed device via this call interface.

Such tools have to be installed using a setup provided by the manufacturer. The "S7-PCT" (Port Configuration Tool) device tool for IO-Link master modules and IO-Link devices is an exception; this is supplied with STEP 7. Special note: After the installation, the tool is not shown in the list of installed software or in the list of software products in the project.

The GSD file of the distributed device that is to be configured with the Device Tool must be installed.

Starting the device tool

The command for starting the device tool is available in the shortcut menu of the TCI-capable device in the shortcut menu of the graphical and tabular device view: "Start device tool".

See also

Starting the SIMATIC S7-PCT (Page 1145)

Starting the SIMATIC S7-PCT

Introduction

The "S7-PCT" (Port Configuration Tool) device tool is installed with STEP 7.

The tool is used to assign parameters to the ports of IO-Link modules such as 4SI IO-Link (S7-1200, ET 200S) or 4IOL+8DI+4DO (ET 200eco PN).

Requirement

You have configured the corresponding CPU, the DP slave or the IO device with an IO-Link module.

Procedure

To start via the graphical device view, follow these steps:

1. Select the IO-Link module in the device view.
2. Select "Start device tool" from the shortcut menu.

OR, to start with the tabular device view, follow these steps:

1. Select the IO-Link module in the device view.
2. Arrange the areas in the work area in such a way that the tabular device overview is visible (it is located between the device view and the inspector window).
3. Select the row with the IO-Link module in the device overview.
4. Select "Start device tool" from the shortcut menu.

Result

The tool starts and you can configure the ports.

Integrating S7-external tools (Page 1144)

10.1.4.10 Loading a configuration

Introduction to loading a configuration

In order to commission a device, identical configurations must be stored on the programming device/PC and on the connected devices. To synchronize the configurations on the programming device/PC and the connected devices, you load a configuration. Configuration data can be loaded in two directions:

- From the programming device/PC to a device
- From the device to a PG/PC

See also

Uploading project data from a device (Page 399)

General information on loading (Page 394)

Downloading a configuration to a device (Page 1147)

Downloading project data to a device (Page 396)

General information on loading to PG/PC (Page 1148)

Special features during startup (Page 1167)

Downloading a configuration to a device

Loading the hardware configuration

After you have inserted a new device in the project and configured it or if you have modified an existing hardware configuration, the next step is to load the current configuration to the device. This ensures that the same configuration is set on the programming device/PC and on the module that is physically present. Use the "Online > Download to device (Page 396)" menu command for this.

In the first download, the complete hardware configuration is downloaded. In subsequent downloads, only changes to the hardware configuration are downloaded.

You have the following options for loading the hardware configuration:

- Loading in the device or network view
- Loading in the project tree
- Loading to an accessible device

Warning

Perform load operation only in STOP mode

Following loading, the machine or process may behave unexpectedly if the parameter assignment is incorrect. A CPU must be set to STOP mode for the load operation to rule out possible damage to equipment or personal injury.

Special considerations for loading isochronous applications

Isochronous applications consist of a hardware configuration part and a software part.

Example: If you change the number of an IO system, the delay time, or the assignment of a process image partition of the isochronous I/O in the hardware configuration, this affects the parameters of the isochronous mode interrupt OB and thus also the software part.

With isochronous applications, you should always load the complete project (hardware and software). With partial loading (loading hardware and software separately at different times), inconsistencies can arise that, for example, can prevent CPU startup or isochronous operation of the application.

See also

General information on loading (Page 394)

Loading a configuration to PG/PC

General information on loading to PG/PC

Introduction

If you bring your PG/PC to a plant and the STEP 7 project used to create the configuration of this plant is not available, load the configuration to a new project on your PG/PC, for example. Use the "Online > Loading the device as new station (hardware and software) (Page 399)" menu command for this.

The list of accessible devices in the project tree is always used when loading a device to your programming device. You can select multiple devices and load them to the project at the same time.

Requirements

- The hardware configuration in the device must be created in TIA Portal, V12 or higher. A hardware configuration present in the device that was created with an older version cannot be loaded and must be upgraded (Page 380).
- Modules present in the device from GSD (ML), HSPs, or service packs must be installed in TIA Portal on the PG/PC.
- A project must be open. This project can be a new (empty) project or an existing project.
- The opened project is in offline mode.

Scope of load operation

The following list shows an overview of the loadable components of a configuration:

- The device (e.g., a CPU) with all I/O modules and all parameter settings
- PROFIBUS master systems and all PROFIBUS-relevant settings
- PROFINET IO systems and all PROFINET-relevant settings
- I devices and I slaves
- Settings for direct data exchange

After loading a CPU, all other modules within the address area of the CPU are also loaded.

The following connections are also loaded when the configuration is loaded:

- S7 connections (including routed connections) in combined PB/IE networks, including via IE-CP or PB-CM interfaces. S7 connections are automatically accepted as configured at one end when a device configuration is loaded, even if the S7 connection was configured at both ends in the original project. When both connection partners are loaded, the connection is joined together again during the next compilation.
- TCP connections via CPU-internal Ethernet interface, UDP/ISOonTCP connections, and TCP, UDP, ISO, and ISOonTCP connections via IE-CP interface
- Connections via the OUC connection parameter assignment for projects from STEP 7 V13 and higher

Note

The hardware configuration loaded to PG/PC is not completely identical to the configuration originally loaded to the device. Note the additional information on loading, in particular with regard to partially loaded configuration data in the case of cross-device communication.

Loading PC systems, such as WinAC or PC-based automation, is not possible.

See also

General information on loading (Page 394)

Loading specific device configurations

Information on loading

When device configurations are loaded to the PG/PC, all assigned parameters are transferred from the device to the project. If the CPU is connected to a subnet, all parameters of the device are loaded and the CPU is displayed in the network view as networked.

Note

CPUs reset to their factory settings do not have any hardware configuration. Therefore, nothing is loaded in this case after "Load to PG/PC" is selected in the "Online" menu.

Loading S7-300/400 configurations

To avoid conflicts when loading a device to an existing project, the following rules must be followed:

- Device names for CPUs, PROFIBUS slaves (DP slaves, I-slaves) and PROFINET devices (IO devices, I devices) must be unique
- The combination of network name, subnet ID, and IP/DP address for modules must be unique

If conflicts occur, the load operation is canceled and an alarm provides information about the problems that occurred. You can then adapt the project correspondingly or install missing components and then repeat the load operation.

Alarm configurations are not loaded to PG/PC.

Loading S7-1200/1500 configurations

Take the following into consideration when loading:

- CPUs of the S7-1200 series with firmware version V1.0 are not supported when loading.
- Device-specific diagnostic interrupts of the S7-1200 are not supported when loading. For device-specific diagnostic interrupts of the S7-1200 to be generated on the PG/PC once again, the hardware configuration must be compiled once again.
- Module comments of the S7-1200/1500 are loaded from the device to the PG/PC if the same project language is set that was used during loading to the device. You can deselect the loading of comments, if desired.

Note

All types of PC systems, such as WinAC, Embedded Controller, CP 1616 or PC CPs, do not support loading to PG/PC.

Loading distributed I/O

The following functionalities and settings of the distributed I/O are loaded:

- DP master systems/IO systems with associated DP masters/IO controllers (CPUs and CPs), DP slaves/IO devices, the utilized modules and their parameter assignment and properties, such as options handling, status bytes, or SYNC/FREEZE
- Connection of process image partitions (PIP) to organization blocks (OB). Applies to the module and OB properties
- Configured hardware interrupts with the associated properties
- DP master systems with I-slave
- CPs as PROFIBUS I-slave or PROFINET I-device
- Direct data exchange

Master-slave relationships between the I-slave/I-device and assigned DP master/IO controller are only established in the project if both the master as well as the I-slave are loaded to the PG. It does not matter whether you load the DP master/IO controller or the I-slave/I-device first. As soon as both devices are loaded, the master-slave/controller-device relationships will also be re-established.

Loading subnets and devices with MPI, PROFIBUS, Ethernet, and PtP

The following special considerations apply to loading subnets and end points of connections for MPI, PROFIBUS, Ethernet, and PtP with their respective connection properties:

- If a device with PROFIBUS interface is loaded, the bus parameters of the device will initially be different from the settings in the original project. The bus parameters will only match those of the original project after all devices involved are loaded and no additional devices are on the same bus.
- Passive communication devices that are not connected as DP slaves or IO devices to a corresponding master system or IO system do not participate in the data exchange. They are therefore not loaded.
- All devices involved should therefore be loaded for cross-device configurations. A warning is output during compiling of the project for missing network stations. Missing routing information due to communication stations that are not loaded is displayed as warning during compilation. If the configuration is loaded from the PG/PC back to the device, different routing information results.

When you compile the project after loading devices to the PG/PC, STEP 7 checks if all devices to which communication relationships have been configured are available. If devices are missing, you receive an alarm with the number of missing communication stations.

Notice

Cross-device communication

When you load a configuration with cross-device communication to the PG/PC, you must also load all corresponding network stations to the PG/PC. If required network stations are missing and the configuration is loaded back to the device, there is no guarantee that cross-device communication is working again.

Upgrading projects (Page 380)

Loading configurations with web server

Information on loading

The hardware configuration of a CPU also contains the Web server settings. A number of restrictions apply to loading a Web server configuration to the PG/PC:

- The assignment of the Web server language and project language is not loaded for S7-300/400. The project texts are not loaded and an alarm is output that no project languages are assigned. The languages assigned in STEP 7 are loaded without restriction for S7-1200/1500 CPU.
- User administration data of the S7-1200/1500 can be loaded but not edited. You can use a check box to select whether you want to use the existing data as read-only data or discard these data and enter new data.
- Watch tables of the Web server are not loaded.

The source files of the user-defined web pages (HTML pages, Java scripts, etc.) are not loaded. The program blocks generated during loading can only be edited if you enter the properties and the HTML page yourself.

See also

Information about the web server (Page 853)

Loading configurations with PROFIBUS

Information on loading

A DP master is loaded to PG/PC. The DP master system and all connected DP slaves are inserted into the project. The respective settings remain unchanged. If a suitable PROFIBUS subnet has already been created, the loaded devices with PROFIBUS interface are connected to the existing subnet.

As a prerequisite for loading DP master systems with standard slaves, the corresponding GSD files must be installed in the TIA Portal and available in the hardware catalog. If a required GSD file is not available in the same version as in the device, differences are identified during the consistency check.

Note

Direct data exchange in a configuration is only loaded if all communication partners involved in the direct data exchange are loaded to the PG/PC.

Isochronous mode

Note the following when loading DP master systems with activated PROFIBUS functionality "Isochronous mode":

- Bus parameters and the settings for isochronous mode are only identical after the device is loaded to the PG/PC if all devices relevant for calculation of isochronous mode are loaded.
- Only mono-master systems with isochronous mode are supported. Therefore, only configurations with just one DP master on the PROFIBUS subnet are loaded.

I-slave

Master-slave relations between DP master and I slave are only established in the project if both the DP master and the I slave are downloaded to the PG. It does not matter whether you load the DP master or the I-slave first. If you load the DP master from a DP master system with connected I-slave, the DP master and its DP slaves are loaded. An I-slave proxy is loaded as dummy module for an involved I-slave.

For I-slave proxy devices:

- DP master can be complied and loaded
- Properties are displayed but cannot be changed
- Diagnostics in the project tree is not carried out

In the network view, proxy devices are represented with a question mark:

In order to edit the I-slave in the project, you must load the I-device from the device to the PG/PC. The I-slave proxy is hereby fully replaced by the I-slave.

It is possible to load an DP master with connected I-slave proxy from the PG/PC to the device.

Note

The replacement of I-slave proxy devices is only possible if the required I-device is available in the hardware catalog.

Loading configurations with PROFINET

Information on loading

If you have selected a CPU in the list of accessible devices and perform an load operation to PG/PC, all IO controllers and IO devices associated with this device along with their IO systems will be loaded. Settings for the topology are also transferred. If there is already a suitable Ethernet network in the project, the loaded devices are integrated into the existing network.

Relationships between the IO controllers and IO devices are only established within the project if both the IO controller as well as the I-device are loaded to the PG. It does not matter whether you load the IO controller or the I-devices first.

Supported functions

The following functionalities and settings are loaded:

- PROFINET configurations (RT and IRT) in IO systems with the associated IO controllers (CPUs and CPs), IO devices, and the modules used
- Logical addresses and interface properties
- Port interconnections
- Isochronous mode
- Sync domains/MRP domains
- Redundancy role "Client" or "Manager" for MRP configurations

Note

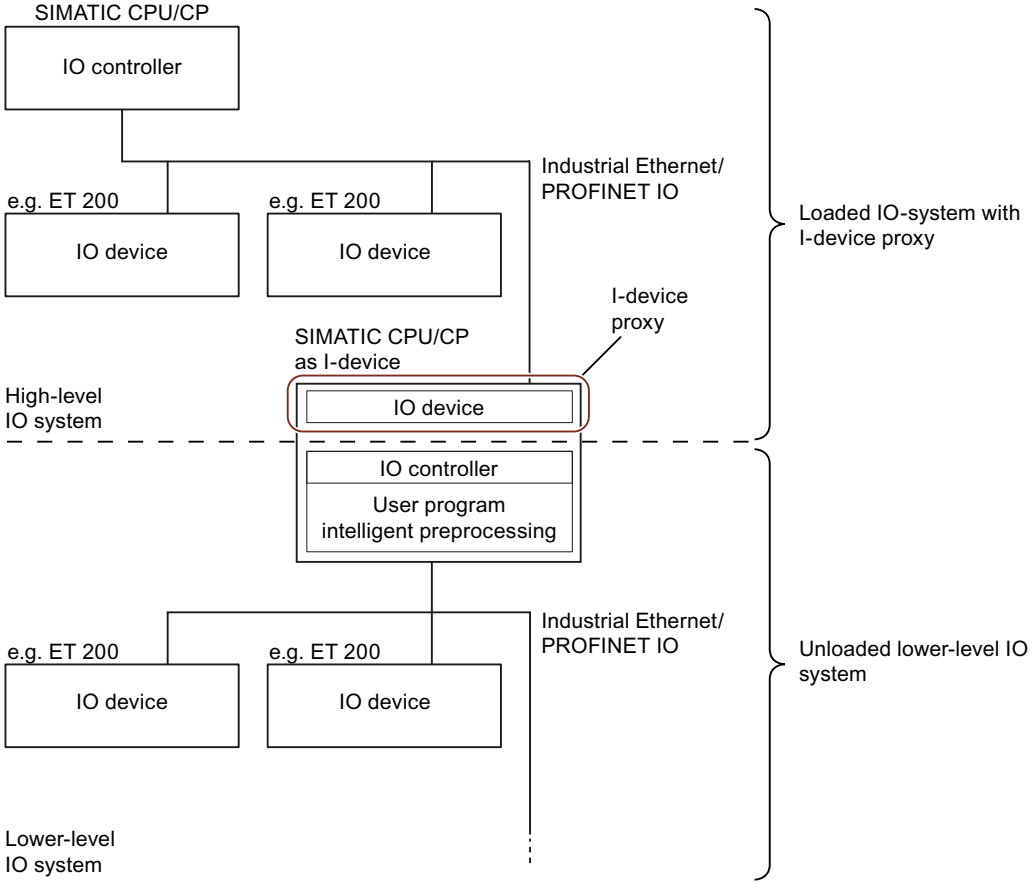
Empty Sync domains and MRP domains are not included in the loading.

GSD-based IO devices

As a prerequisite for loading GSD-based IO devices, the corresponding GSD files must be installed in the TIA Portal and available in the hardware catalog. If a required GSD file is not available in the same version as in the device, differences are identified during the consistency check.

I-device

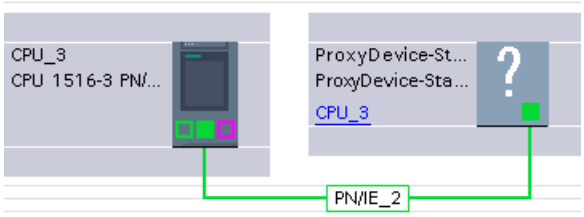
If you load the IO controller from an IO system with connected I-device, the IO controller and its IO devices will be loaded. An I-device proxy is loaded as dummy module for an involved I-device. The CPU parameter assignment, including the parameter assignment of the CPU's "own" (subordinate) IO system, is missing in the I-device proxy. Only the interface to the higher-level IO controller is loaded.



For I-device proxy devices:

- IO controller can be compiled and loaded
- Properties are displayed but cannot be changed
- Diagnostics in the project tree is not carried out

In the network view, proxy devices are represented with a question mark:



In order to edit the I-device in the project, you must load the I-device from the device to the PG/PC. This replaces the I-device proxy with the complete I-device along with its subordinate IO devices.

It is possible to load an IO controller with connected I-device proxy from the PG/PC to the device.

Note

The replacement of I-device proxy devices is only possible if the required I-device is available in the hardware catalog.

An I-device proxy representing a SIMOTION I-device cannot be loaded and replaced.

Configurations with IE/PB link

If one of the following configurations with IE/PB Link PN IO as PROFINET IO device is present, the complete configuration with all subordinate PROFIBUS devices is loaded:

- CPU/CP of S7-300/400
- PC station and connected PROFIBUS master system

The complete configuration consists of the following:

- CPU
- CP configuration
- PROFINET IO system with connected IE/PB link
- PROFIBUS master system of the IE/PB link with connected DP slaves

An example configuration consists of an S7-300 CPU with a CP as PROFINET IO controller. An IE/PB link as IO device is connected to the IO controller. As the PROFIBUS DP master, the IE/PB link polls a PROFIBUS DP slave, e.g., ET 200L. If you load the CPU from the device to the PG/PC, the complete configuration is loaded.

Note

If the IE/PB link is not operated as a PROFINET IO proxy but rather as a gateway in standard mode, the IE/PB link functions as a CPU and can be loaded separately.

Loading Shared Devices

The following applies to loading comments: If an input/output module with the Module-internal Shared Input (MSI) or Module-internal Shared Output (MSO) function consists of only one submodule, the submodule does not have its own comment. Instead, it uses the comment of the input/output module. The module must be subdivided into several submodules for the input/output module and all submodules to have their own comment fields.

Loading HMI devices

Information on loading

We distinguish between the following cases when loading HMI devices to PG/PC:

- HMI devices connected to a DP master as DP slave or to an IO controller as IO device are loaded as DP slave or IO device respectively (for example, PP 17-I PROFIsafe).
- HMI devices in a master system as I-slave or in an IO system as I-device are loaded as I-slave proxies or I-device proxies (Page 1153) (for example, SIMATIC Comfort Panels). The settings of the device proxy are read-only.
- HMI devices are not loaded if they are connected to a subnet (PROFIBUS or PROFINET) but not to a master system or IO system (for example, KP600 Basic color DP).

Going online with loaded configurations

You can go online with the loaded project or with loaded portions of the project.

Requirement

The hardware configuration loaded from the device to the PG/PC has been compiled. The statuses of the central and distributed modules are only correctly displayed after compilation.

Note

If you go online before compiling, the diagnostics icon “?” is displayed (diagnostics not possible). A corresponding alarm is displayed under "Info > General" in the Inspector window.

Dependencies

Depending on how completely the hardware configuration was loaded to the PG, restrictions apply to going online and to diagnostics:

- Completely loaded device with all associated central and distributed modules, such as DP slaves or IO devices:
  Going online and diagnostics are possible.
- Loaded device with connected I-devices/I-slaves:
  - I device/I slave is not loaded: Going online for the device and its modules is possible. For the dependent components of the configuration that are not loaded, device proxies are handled with only minimum diagnostics support. The online status is represented as an icon. The standard diagnostics is shown in the online and diagnostics view. I&M data are not loaded.
  - I device/I slave is also loaded: Going online is possible for all devices; diagnostics is fully supported.

10.1.5 Displaying alarms

10.1.5.1 Overview of the alarm display

The "Alarm display" function can be used to output asynchronous alarms of diagnostics events and user-defined diagnostics alarms as well a alarms from ALARM instructions.

From the alarm display, you can also start the alarm editor with the "Edit alarm" shortcut menu command and then create user diagnostics alarms.

Icons

The following table shows the icons and their functions:

Icon	Function
 Archive view	Shows the alarms located in the archive.
 Active alarms	Shows the currently active (pending) alarms. Alarms that must be acknowledged are shown in blue lettering.
 Ignore	Ignores the arrival of alarms, These alarms are neither shown in the window nor stored in the archive.
 Acknowledge	Confirms the selected alarm as read. Alarms requiring acknowledgment are shown in blue lettering.
 Clear archive	Deletes all alarms in the archive.

Icon	Function
 Export archive	Exports the current alarm archive to a file in xml format.
 Multiple lines	Shows the alarms with multiple lines.
 Automatically display the last alarm	Always show the last incoming alarm first.

10.1.5.2 Archive view

In the archive view, alarms are displayed and archived according to the time they appear. You can set the size of the archive (between 200 and 3000 alarms) with the menu command "Options > Settings > Online & Diagnostics". If the selected archive size is exceeded, the oldest alarm it contains is deleted.

Alarms that must be acknowledged are displayed in blue lettering and can be acknowledged with the shortcut menu command "Acknowledge alarm(s)".

The archive is constantly updated and does not need to be saved explicitly.

10.1.5.3 Layout of the alarms in the archive view

In the archive view, all events occurring on the selected CPUs are logged. A new entry is created for each individual event and shown as a further row in the table.

Table structure

All attributes of the alarms can be shown as columns. You can show or hide individual columns as well as modify the width and order of the columns. These settings are saved when the project is closed.

You can sort the columns in ascending or descending order. However, this setting is not saved when you close the project.

The alarms can be displayed in one or more rows. In the single row display, only the first row of the multiple-row alarm data is displayed.

The alarms either require acknowledgment or do not require acknowledgment. The alarms requiring acknowledgment that have not yet been acknowledged are highlighted in blue lettering and can be acknowledged either with the button in the toolbar for the particular context or with the shortcut menu command "Acknowledge alarm(s)".

10.1.5.4 Receiving alarms

To allow alarms to be displayed, you must first set the receipt of alarms for each CPU.

Procedure

Toe receive alarms, follow these steps:

1. Double-click on the "Online & Diagnostics" folder of the relevant CPU in project navigation.
2. Click the "Online access" group in the area navigation.
3. Select the option "Receive alarms".

Note

If you select this procedure, alarms are only received after you have re-established an online connection to the device.

Or:

1. Select the relevant CPU in the device, network, or topology view.
2. Select the command "Receive alarms" in the "Online" menu or in the shortcut menu.

Or:

1. Select the CPU in project navigation.
2. Select the command "Receive alarms" in the "Online" menu or in the shortcut menu.

Note

If you select one of the two above-named procedures, you must have first established an online connection to the device.

10.1.5.5 Export archive

To archive alarms, you can export the archive. Follow these steps:

1. Go to the archive view.
2. Click the "Export archive" button.
3. In the dialog that opens, select the path to export the archive.

Result

The archive is saved as an xml file at the location you selected.

10.1.5.6 Clear archive

The archive is organized as a ring buffer, in other words, when it is full, the oldest alarms are deleted from the archive. With the "Clear archive" button, you can delete the entire archive.

Procedure

To clear the archive, follow these steps:

1. Click the "Clear archive" button in the toolbar of the alarm display.

10.1.5.7 "Active alarms" view

The "Active alarms" view is an image of the alarm acknowledgement memory of the selected CPU(s).

10.1.5.8 Layout of the alarms in the "Active alarms" view

The "Active alarms" view represents an image of the alarm acknowledgment memory of the selected CPUs. One entry is shown in the table per active alarm. Events of an alarm ("incoming", "outgoing" and "acknowledged") are displayed in one row.

Table structure

All attributes of the alarms can be shown as columns. You can show or hide individual columns as well as modify the width and order of the columns. These settings are saved when the project is closed.

You can sort the columns in ascending or descending order. However, this setting is not saved when you close the project.

The alarms can be displayed in one or more rows. In the single row display, only the first row of the multiple-row alarm data is displayed.

The alarms either require acknowledgment or do not require acknowledgment. The alarms requiring acknowledgment that have not yet been acknowledged are highlighted in bold print and can be acknowledged either with the button in the toolbar for the specific context or with the shortcut menu command "Acknowledge alarm(s)".

10.1.5.9 Status of the alarms

Depending on whether you are in the "Active alarms" view or the archive view, the displayed alarms may have a different status.

Status of the alarms in the "Active alarms" view

- I: Alarm came
- IA: Alarm came and was acknowledged
- IO: Alarm has gone

If more signal changes occur than can be sent (signal overflow), OV is displayed as the status and the status is shown in red.

Status of the alarms in the archive view

- No information: only with alarms generated by the PG/PC and displayed in the "Archive" tab, for example logon status, connection abort, mode changes
- I: Alarm came
- A: Alarm came and was acknowledged
- O Alarm has gone
- D: The alarm was deleted.

If more signal changes occur than can be sent (signal overflow), OV is displayed as the status and the status is shown in red.

10.1.5.10 Acknowledging alarms

Alarms that must be acknowledged are shown in blue lettering.

Procedure

To acknowledge an alarm, follow these steps:

1. Select the required alarm or alarms from the table.
2. Click the "Acknowledge" button.

Note

You can select more than one alarm to acknowledge at the same time. To do this, hold down the <Ctrl> key and then select the alarms you want to acknowledge.

Result

The selected alarm was acknowledged and is then shown in normal characters.

Note

In the "Active alarms" view, acknowledged alarms that have already gone are no longer displayed.

10.1.5.11 Ignoring alarms

Ignoring alarms

To ignore alarms, follow these steps:

1. Click the "Ignore" button.
   The icon is shown on a gray background.

Result

From this point onwards, all alarms will be ignored. A message is created in the archive view indicating that the display of alarms and events is disabled.

Canceling the ignoring of alarms

To cancel the ignoring of alarms, follow these steps:

1. Click the "Ignore" button.
   The icon is shown on a white background.

Result

All alarms, in other words, even the alarms currently pending on the CPU while the "Ignore alarms" function was active, are displayed again from this point onwards. A message is created in the archive view indicating that the display of alarms and events is enabled again.

10.1.5.12 Sort table in alarm display

Sorting a table in ascending or descending order

To sort the table by a column in ascending or descending order, follow the steps below:

1. Click the table header of a column if you want to sort the column in ascending order.
2. Click again on the same column of the table header to sort the column in descending order.
3. Click a third time on the table header of the same column to cancel the sorting.

10.1.5.13 Keyboard commands in the alarm display

Alarm display

Function	Shortcut keys
Select all alarms	Ctrl+A
Acknowledge all selected alarms	Ctrl+Q

10.1.6 Additional information on configurations

10.1.6.1 Functional description of S7-1200 CPUs

Operating modes

Principles of the operating modes of S7-CPUs

Introduction

Operating modes describe the behavior of the CPU. The following operating modes are possible:

- STARTUP
- RUN
- STOP

In these operating modes, the CPU can communicate via the PN/IE interface, for example.

Other operating modes

If the CPU is not ready for operation, it is in one of following two operating modes:

- Deenergized, i.e. the supply voltage is switched off.
- Defective, which means an internal error has occurred.
  If the "Defective" status is caused by a firmware error, this state is indicated by the status LEDs of the CPU (refer to the description of the CPU). To find out the cause, follow these steps:
  - Turn the power supply switch off and on again.
  - Read out the diagnostics buffer when the CPU starts up and send the data for analysis to Customer Support.

  If the CPU does not start up, replace it.

See also

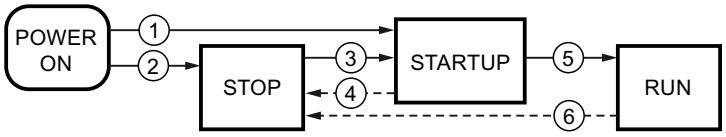
STOP mode (Page 1168)

RUN mode (Page 1168)

Operating mode transitions

Overview

The following figure shows the operating modes and the operating mode transitions of S7-1200 CPUs:



The following table shows the conditions under which the operating modes will change:

No.	Operating mode transition	Conditions
①	POWER ON → STARTUP	After switching on, the CPU goes to "STARTUP" mode if: • "Warm restart" startup type is set, and • the hardware configuration and the program blocks are consistent. Non-retentive memory is cleared and the contents of non-retentive DBs are reset to the initial values of the load memory. Retentive memory and retentive DB contents are retained.
②	POWER ON → STOP	When startup type "No startup" is set, the CPU goes to "STOP" mode after the supply voltage is switched on. Non-retentive memory is cleared and the contents of non-retentive DBs are reset to the initial values of the load memory. Retentive memory and retentive DB contents are retained.
③	STOP → STARTUP	The CPU switches to "STARTUP" mode if: • CPU is set to "RUN" from the programming device, and • the hardware configuration and the program blocks are consistent.
④	STARTUP → STOP	The CPU returns to the "STOP" mode in the following situations: • Error detected during startup. • The CPU is set to "STOP" from the programming device. • A STOP command is processed in the STARTUP OB.
⑤	STARTUP → RUN	If the STARTUP is successful, the CPU switches to "RUN".
⑥	RUN → STOP	The CPU returns to the "STOP" mode in the following situations: • An error is detected that prevents continued processing. • The CPU is set to "STOP" from the programming device. • A STOP command is processed in the user program.

"STARTUP" operating mode

Principles of the STARTUP mode

Function

After turning on the CPU, it executes a startup program before starting to execute the cyclic user program.

By suitably programming startup OBs, you can specify certain initialization variables for your cyclic program in the startup program. There is no rule in terms of the number of startup OBs. That is, you can set up one or several startup OBs in your program, or none at all.

Parameter settings for startup characteristics

You can specify whether the CPU remains in STOP mode or whether a warm restart is run. Over and above this, you can set the response during startup (RUN or previous mode) in the "Startup" group of the CPU properties.

Special characteristics

Note the following points regarding the "STARTUP" mode:

- The startup OBs are executed. All startup OBs you have programmed are executed, regardless of the selected startup mode.
- No time-based program execution can be performed.
- Interrupt controlled program execution limited to:
  - OB 82 (diagnostics interrupt)
- The outputs on the modules are disabled.
- The process image is not updated; direct I/O access to inputs is possible.

See also

Editing properties and parameters (Page 574)

Principles of the operating modes of S7-CPUs (Page 1163)

Organization blocks for startup (Page 1213)

Warm restart (Page 1165)

Warm restart

Function

During a warm restart, all non-retentive bit memory is deleted and non-retentive DB contents are reset to the initial values from load memory. Retentive bit memory and retentive DB contents are retained.

Program execution begins at the call of the first startup OB.

Triggering a warm restart

You can trigger a "Warm restart" using a corresponding menu command on your programming device in the following situations:

- The CPU must be in "STOP" mode.
- After a memory reset
- After downloading a consistent program and a consistent hardware configuration in the "STOP" mode of the CPU.

"POWER ON" triggers a "warm restart" if you have set the following parameters for the startup response:

- Startup type "warm restart - RUN" (regardless of the CPU operating mode prior to POWER OFF).
- "Warm restart - mode prior to POWER OFF" (depending on the CPU operating mode prior to POWER OFF. The CPU must have been in RUN mode prior to this.)

See also

Retentive memory areas (Page 1173)

Startup activities

Overview

The following table shows which activities the CPU performs at STARTUP:

Activities in execution sequence	At warm restart
Clear non-retentive bit memories	Yes
Clear all bit memories	No
Clear the process image output	Yes
Processing startup OBs	Yes
Update the process image input	Yes
Enable outputs after changing to "RUN" mode	Yes

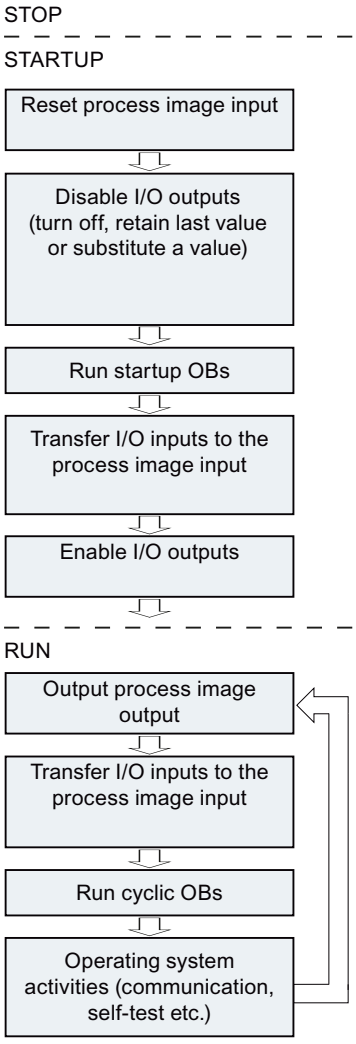
Sequence

The following figure shows the activities of the CPU in "STOP", "STARTUP", and "RUN" modes.

You can use the following measures to specify the state of the I/O outputs in the first cycle of the user program:

- Use assignable output modules to be able to output substitute values or to retain the last value.
- Set default values for outputs in startup OBs.

During the startup, all interrupt events are entered in a queue so that they can be processed later during RUN mode. In RUN mode, hardware interrupts can be processed at any time.



Special features during startup

Response when expected and actual configurations do not match

The expected configuration is represented by the engineering configuration loaded on the CPU. The actual configuration is the actual configuration of the automation system.

If the expected configuration and actual configuration differ, the CPU nevertheless initially changes to RUN.

Canceling a STARTUP

If errors occur during startup, the startup is canceled and the CPU remains in "STOP" mode.

Under the following conditions, a startup will not be performed or will be canceled:

- If an invalid SD card is inserted.
- If no hardware configuration has been downloaded.

See also

Overview of the CPU properties (Page 1185)

RUN mode

Function

In "RUN" mode the cyclic, time-driven, and interrupt-driven program sections execute:

- The process image output is read out.
- The process image input table is read.
- The user program is executed.

Active data exchange between S7-1200 CPUs by means of Open User Communication is only possible in "RUN" mode.

Running the user program

Once the CPU has read the inputs, the cyclic program runs from the first to the last instruction.

If you have configured a minimum cycle time, the CPU will not end the cycle until this minimum cycle time is up even if the user program is completed sooner.

A maximum cycle time is set which you can adjust according to your requirements. This ensures that the cyclic program is completed within a specified time. The system will respond with a time error if the cyclic program is not completed within this time.

Other events such as hardware and diagnostic interrupts can interrupt the cyclic program flow and prolong the cycle time.

See also

Principles of the operating modes of S7-CPUs (Page 1163)

Events and OBs (Page 1177)

STOP mode

Function

In "STOP" mode, the user program is not executed. All outputs are disabled or react according to the parameter settings: They provide a substitute value as set in the parameters or retain the last value output and bring the controlled process to a safe status.

The CPU checks the following points:

- Hardware, for example whether are all modules are available
- Whether the default settings for the CPU are applicable or parameter sets are present
- Whether the general conditions for the programmed startup behavior are correct

See also

Principles of the operating modes of S7-CPUs (Page 1163)

Basics of a memory reset

Function

A memory reset on the CPU is possible only in STOP mode.

When memory is reset, the CPU is changed to an "initial status". This means:

- An existing online connection between your programming device/PC and the CPU is terminated.
- The content of the work memory and the retentive and non-retentive data are deleted.
- The diagnostic buffer, the time, the IP address, the hardware configuration, and active force jobs are retained.
- The load memory (code and data blocks) is then copied to work memory. As a result, the data blocks no longer have current values but their configured initial values.

Memory areas

Useful information on memory cards

How the memory card functions

The SIMATIC Memory Card for a S7-1200 is an SD memory card preformatted by Siemens for the CPU user program.

You may only delete files and folders. If you format the memory card with Windows, for example with a commercially available card reader, you make the memory card unusable as a storage medium for an S7 CPU.

Setting the card type

You can use the memory card as a transfer card, a program card or a firmware update card.

To set the card type, insert the memory card into the card reader of the programming device and select the "Card reader/USB memory" folder from the project tree. In the properties of the selected memory card, designate the card type:

- Program
  If it is used as a program card, you can load the user program on the memory card. In this case, the internal load memory of the device is replaced by the memory card and the internal load memory is erased. The user program is then fully executable from the memory card. If the memory card with the user program is removed, there is no longer a program available.
- Transfer
  If it is used as a transfer card, you can transfer the user program from the memory card to the internal load memory of the CPU. You can then remove the memory card again.
- Firmware card
  Firmware for the S7-1200 modules can be stored on a memory card. Therefore it is possible to perform a firmware update with the help of a specifically prepared memory card. Likewise, a backup copy of firmware for a module can be stored on a memory card.

Transferring objects from the project to a memory card

When the memory card is inserted in the programming device or in an external card reader, you can transfer the following objects from the project tree to the memory card:

- Individual blocks (multiple selection possible)
  In this case a consistent transfer is available, as the dependencies of the blocks to each other is taken into account with block selection.
- PLC
  In this case, all objects relevant to processing are transferred, such as blocks and the hardware configuration on the memory card, just as with downloading.

To perform the transfer, you can move the objects with drag-and-drop or use the command "Card reader/USB memory > Write to memory card" in the "Project" menu.

Transferring objects from the memory card to the project

You can transfer Individual blocks (multiple selection is possible) by dragging them to the project. A hardware configuration cannot be transferred from the memory card to the project.

Updating firmware with a memory card

You can get the latest firmware data on the Internet from the Service & Support pages:

http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/34143537)

Save the firmware files on the hard disk and plug the SIMATIC Memory Card into the card reader of your programming device.

To store the file on the memory card, select the memory card in the "Card Reader/USB memory" folder in the project tree. Select the shortcut menu "Card Reader/USB memory > Create firmware update memory card".

Then follow the instructions in the Service & Support portal for performing a firmware update with your CPU.

Updating the firmware changes the CPU firmware status. If you have used the CPU in the project, you will have to update the CPU already configured to the CPU with the new firmware status by changing devices offline, and adapt and then load the program or configuration.

See also

Replacing a hardware component (Page 574)

Useful information on CPU firmware versions and STEP 7 versions (Page 1235)

Displaying properties of memory cards (Page 469)

Load memory

Function

Each CPU has an internal load memory. The size of this internal load memory depends on the CPU used.

This internal load memory can be replaced by using external memory cards. If there is no memory card inserted, the CPU uses the internal load memory; if a memory card is inserted, the CPU uses the memory card as load memory.

However, the size of the usable external load memory cannot be greater than the internal load memory even if the inserted memory card has more free space.

See also

Using memory cards (Page 467)

Work memory

Function

Work memory is a non-retentive memory area for storing elements of the user program that are relevant for program execution. The user program is executed exclusively in work memory and system memory.

System memory

System memory areas

Function

System memory contains the memory elements that each CPU makes available to the user program, such as the process image and bit memory.

By using appropriate operations in your user program, you address the data directly in the relevant operand area.

The following table shows the operand areas of the system memory:

Operand area	Description	Access via units of the following size:	S7 notation
Process image output	The CPU writes the values from the process image output table to the output modules at the start of the cycle.	Output (bit)	Q
		Output byte	QB
		Output word	QW
		Output double word	QD
Process image input	The CPU reads the inputs from the input modules and saves the values to the process image input table at the start of the cycle.	Input (bit)	I
		Input byte	IB
		Input word	IW
		Input double word	ID
Bit memory	This area provides storage for intermediate results calculated in the program.	Bit memory (bit)	M
		Memory byte	MB
		Memory word	MW
		Memory double word	MD
Data block	Data blocks store information for the program. They can either be defined so that all code blocks can access them (global DBs) or assigned to a specific FB or SFB (instance DB). Requirement: The block attribute "Optimized block access" is not enabled.	Data bit	DBX
		Data byte	DBB
		Data word	DBW
		Data double word	DBD

Operand area	Description	Access via units of the following size:	S7 notation
Local data	This area contains the temporary data of a block while the block is being processed. Requirement: The block attribute "Optimized block access" is not enabled. Recommendation: Access local data (temp) symbolically.	Local data bit	L
		Local data byte	LB
		Local data word	LW
		Local data double word	LD
I/O input area	The I/O input and output areas permit direct access to central and distributed input and output modules.	I/O input bit	<tag>:P
		I/O input byte	
		I/O input word	
		I/O input double word	
I/O output area		I/O output bit	
		I/O output byte	
		I/O output word

Retentive memory areas

Retentive memory areas

Data loss after power failure can be avoided by marking certain data as retentive. This data is stored in a retentive memory area. A retentive memory area is an area that retains its content following a warm restart, in other words, after cycling the power when the CPU changes from STOP to RUN.

The following data can be assigned retentivity:

- Bit memory: The precise width of the memory can be defined for bit memory in the PLC tag table or in the assignment list.
- Tags of a function block (FB): You can define individual tags as retentive in the interface of an FB if you have enabled optimized block access. Retentivity settings can be defined only in the assigned instance data block if optimized block access has not been activated for the FB.
- Tags of a global data block: You can define retentivity either for individual or for all tags of a global data block depending on the settings for access.
  - Block with optimized access: retentivity can be set for each individual tag.
  - Block with standard access: The retentivity setting applies to all tags of the DB; either all tags are retentive or no tag is retentive.

Warm restart (Page 1165)

process image input/output

Basic principles of process images

Function

When the user program addresses the input (I) and output (O) operand areas, it does not query or change the signal states on the digital signal modules. Instead, it accesses a memory area in the system memory of the CPU. This memory area is referred to as the process image.

Advantages of the process image

Compared with direct access to input and output modules, the main advantage of accessing the process image is that the CPU has a consistent image of the process signals for the duration of one program cycle. If a signal state on an input module changes during program execution, the signal state in the process image is retained until the process image is updated again in the next cycle. The process of repeatedly scanning an input signal within a user program ensures that consistent input information is always available.

Access to the process image also requires far less time than direct access to the signal modules since the process image is located in the internal memory of the CPU.

Updating the process images

Sequence

The operating system updates the process images at cyclic intervals unless defined otherwise in your configuration. The process image input/output is updated in the following order:

1. The internal tasks of the operating system are performed.
2. The process image output (PIQ) table is written to the outputs of the module.
3. The status of inputs is read to the process image input (PII) table.
4. The user program is executed with all the blocks that are called in it.

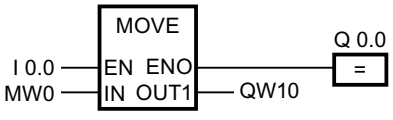
The operating system automatically controls the writing of the process image output to the outputs of the modules and the reading of the process image input.

Special characteristics

You have the option of accessing inputs or outputs directly using direct I/O access.

- If an instruction accesses an output directly and the output address is located in the process image output, the process image of the relevant output is updated.
- If an instruction accesses an output directly and the output address is **not** located in the process image output, the process image of the relevant output is **not** updated.

Example of normal I/O access by way of the process image



Update QW10 in the I/O output area with the value from MW0.

I/O access error during process image updating

If an error occurs during process image updating (I/O access error), the CPU reacts with the default system reaction "Ignore".

Startup activities (Page 1166)

Diagnostics buffer

Function

The diagnostics buffer is part of the system memory of the CPU. It contains the errors detected by the CPU or modules with diagnostics capability. It includes the following events:

- Every mode change of the CPU (for example, POWER UP, change to STOP mode, change to RUN mode)
- Every diagnostics interrupt

The diagnostics buffer of the S7-1200-CPU has a capacity of 50 entries of which the last (most recent) 10 entries are retained following power cycling.

Those entries can only be cleared by restoring the CPU to factory defaults.

You can read the content of the diagnostics buffer with the help of the Online and Diagnostics view.

Basic information on the diagnostics buffer (Page 1398)

I/O data area

Start address of a module

Definition

The start address is the lowest byte address of a module. It acts as the initial address of the module user data area.

Configuring module start addresses

The addresses used in the user program and the module start addresses are coordinated when the modules are configured.

In the module properties ("I/O addresses" group), you can change the start addresses that were assigned automatically after the modules were inserted.

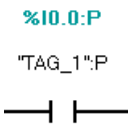
You can also make a setting that decides whether or not the addresses are located in the process image.

Access to the I/O addresses

I/O addresses

If you insert a module in the device view, its user data is located in the process image of the S7-1200 CPU (default). The CPU handles the data exchange between the module and the process image area automatically during the update of the process images.

Append the suffix ":P" to the I/O address if you want the program to access the module directly instead of using the process image.



This could be necessary, for example, during execution of a time-sensitive program which also has to control the outputs within the same cycle.

Basics of program execution

Events and OBs

Events and OBs

The operating system of S7-1200-CPUs is based on events. There are two types of events:

- Events which can start an OB
- Events which cannot start an OB

An event which can start an OB triggers the following reaction:

- It calls the OB you possibly assigned to this event. The event is entered in a queue according to its priority if it is currently not possible to call this OB.
- The default system reaction is triggered if you did not assign an OB to this event.

An event which cannot start an OB triggers the default system reaction for the associated event class.

The user program cycle is therefore based on events, the assignment of OBs to those events, and on the code which is either contained in the OB, or called in the OB.

The following table provides an overview of the events which can start an OB, including the associated event classes and OBs. The table is sorted based on the default OB priority. Priority class 1 is the lowest.

Event class	OB no.	Number of OBs	Start event	OB priority (default)
Cyclic program	1, >= 123	>= 1	Starting or end of the last program cycle OB	1
Startup	100, >= 123	>=0	STOP to RUN transition	1
Time-of-day interrupt	>= 10	Max. 2	Start time has been reached	2
Time-delay interrupt	>= 20	Max. 4	Delay time expired	3
Cyclic interrupt	>= 30		Constant bus cycle time expired	8
Hardware interrupt	>= 40	Max. 50 (more can be used with DETACH and ATTACH)	• Positive edge (max. 16) • Negative edge (max. 16)	18
			• HSC: Count value = reference value (max. 6) • HSC: Count direction changed (max. 6) • HSC: External reset (max. 6)	18
Status interrupt	55	0 or 1	CPU has received status interrupt	4
Update interrupt	56	0 or 1	CPU has received update interrupt	4
Manufacturer- or profile-specific interrupt	57	0 or 1	CPU has received manufacturer-specific or profile-specific interrupt	4
Diagnostic error interrupt	82	0 or 1	Module has detected an error	5
Pull/plug interrupt	83	0 or 1	Removal/insertion of modules of distributed I/O	6
Rack error	86	0 or 1	Error in the I/O system of the distributed I/O	6
Time error	80	0 or 1	• Maximum cycle time exceeded • Called OB is still being executed • Time-of-day interrupt missed • Time-of-day interrupt missed during STOP • Queue overflow • Interrupt loss due to high interrupt load	22

The following table describes events which do not trigger an OB start, including the corresponding reaction of the operating system. The table is sorted based on event priority.

Event class	Event	Event priority	System reaction
Insert/remove central modules	Insert/remove a module	21	STOP
I/O access error during process image update	I/O access error during process image update	22	Ignore
Programming error	Programming error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	23	RUN

Event class	Event	Event priority	System reaction
I/O access error	I/O access error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	24	RUN
Maximum cycle time exceeded twice	Maximum cycle time exceeded twice	27	STOP

Assignment between OBs and events

With the exception of the cyclic program and startup program and event can only be assigned to one OB. However, in certain event classes such as hardware interrupts one and the same OB can be assigned to several events.

The assignment between OBs and events is defined in the hardware configuration. Defined assignments can be changed at runtime by means of ATTACH and DETACH instructions.

OB priority and runtime behavior

S7-1200-CPUs support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

OBs are always executed on a priority basis: The OBs with the highest priority are executed first. Events of the same priority are processed in order of occurrence.

As of firmware version V4.0 of the S7-1200 CPUs you can specify in the device configuration, under properties of the CPU, if the OBs are interruptible or not. This parameter assignment has an effect on all OBs with exception of the cycle OBs which are always interruptible.

The following applies to S7-1200 CPUs with firmware version < V4.0:

- Any OB with priority >= 2 will interrupt cyclic program execution.
- An OB of priority 2 to 25 cannot be interrupted by any event of priority group 2 to 25. This rule also applies to events of a priority higher than that of the currently active OB. Such events are processed later.
- A time error (priority 26) will interrupt any other OB.

The following applies to S7-1200 CPUs as of firmware version V4.0:

If you do not configure the OBs as interruptible, an OB is always processed completely even if an event of a higher priority occurs during its runtime. Specifically, this means:

- Any OB with priority >= 2 will interrupt cyclic program execution.
- An OB of priority 2 to 25 cannot be interrupted by any event. This rule also applies to events of a priority higher than that of the currently active OB, which also includes a time error. Such events are processed later.

If you do configure the OBs as interruptible and an event of a higher priority occurs during the runtime of an OB, the running OB is interrupted and the OB associated with the occurring event

is processed. Once this OB has been completed, processing of the interrupted OB continues. Specifically, this means:

- Any OB with priority >= 2 will interrupt cyclic program execution.
- An OB of priority 2 to 25 can be interrupted by any event whose priority is higher than that of the running OB. This is also true for time errors: A time error (priority 26) will interrupt any OB.

OB start information

Certain OBs have start information, while others do not. This is explained in greater detail in the description of the relevant OB.

ATTACH: Attach an OB to an interrupt event (Page 3216)

DETACH: Detach an OB from an interrupt event (Page 3218)

Event-based program execution

OB priority and runtime behavior

S7-1200-CPUs support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

Interrupt OBs can only be interrupted by time error interrupts. This rule also applies to events of a priority higher than that of the currently active OB. That is, only one interrupt OB can be active, with exception of the time error interrupt OB.

Any further event of generated while an interrupt OB is being executed is added to a queue in accordance with its priority. Start events within a queue are processed later based on the chronological order of their occurrence.

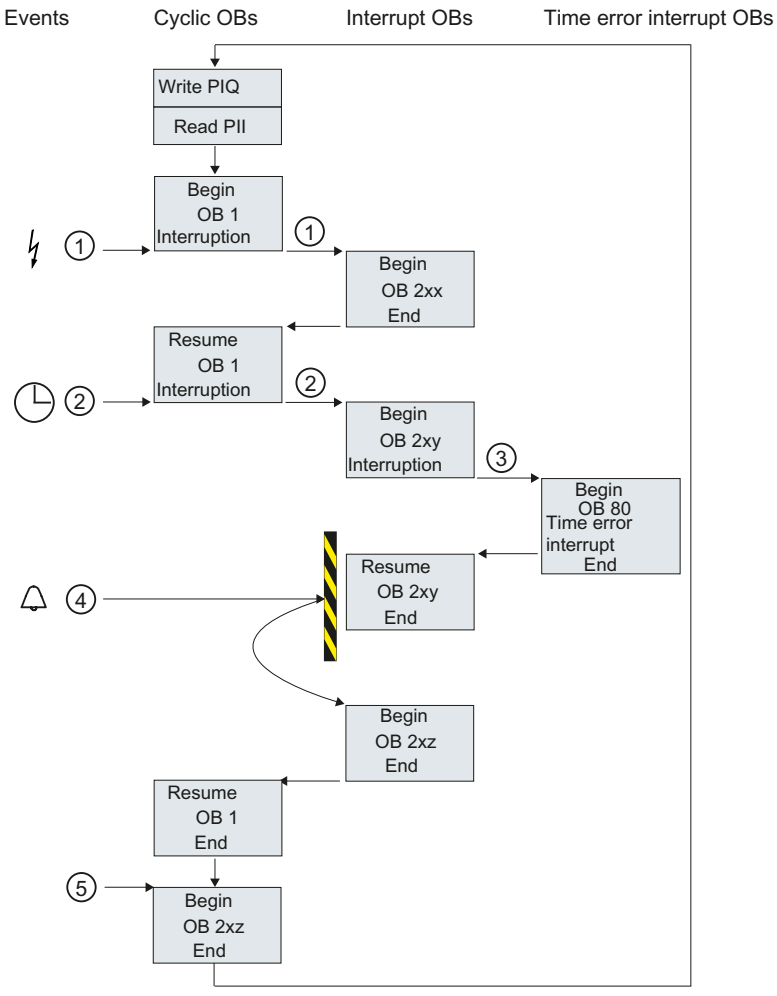
Program execution on the CPU

Cyclic OBs are interrupted by interrupt OBs.

Reactions to events which start an interrupt OB:

- For CPUs up to firmware version V3: Interrupt OBs can only be interrupted by time error interrupt OBs.
- For CPUs as of firmware version V4: Interrupt OBs can be interrupted by interrupt OBs of a higher priority.

The figure below shows the basic procedure in case interrupt OBs cannot be interrupted (behavior up to firmware version V3):



① and ② An event (e.g. a hardware interrupt) calls its associated OB.

A called OB is executed without interruption, including all of its nested blocks. Execution of the cyclic OB is resumed on completion of interrupt processing, provided the queue does not contain any events which trigger an OB start.

③ An interrupt OB can only be interrupted by a time error interrupt OB (OB 80).

④ An new alarm-triggering event occurs during interrupt processing.

Reaction for CPUs up to and including firmware version V3:

This new event is added to a queue. The queued events successively call their corresponding OBs only after execution of the current interrupt OBs was completed and according to the following rules:

- Events are processed in the order of their priority (starting at the highest priority).
- Events of the same priority are processed in chronological order.

Reaction for CPUs as of firmware version V4:

You use a CPU parameter to set the interruptibility for CPUs as of firmware version V4. Default behavior: OBs are interruptible. In this case: If the new event has a higher priority than the currently running OB, the OB started by the new event interrupts the currently running OB.

If you disable the option, the interrupt OBs cannot be interrupted.

⑤ The cyclic OBs are processed one after the other.

Notes on queues

- Every priority class (OBs of the same priority to be called) is assigned a separate queue. The size of those queues is set by default.
- Any new event leading to the overflow of a queue is discarded and therefore lost. A "time error interrupt event" is generated simultaneously. Information identifying the OB that caused the error is included in the start information of the time error interrupt OB (OB 80). A corresponding reaction such as an alarm trigger can be programmed in the time error interrupt OB.

Example of a hardware interrupt event

The function principle of event-oriented program execution in the S7-1200 CPU is described based on the example of a hardware interrupt-triggering module.

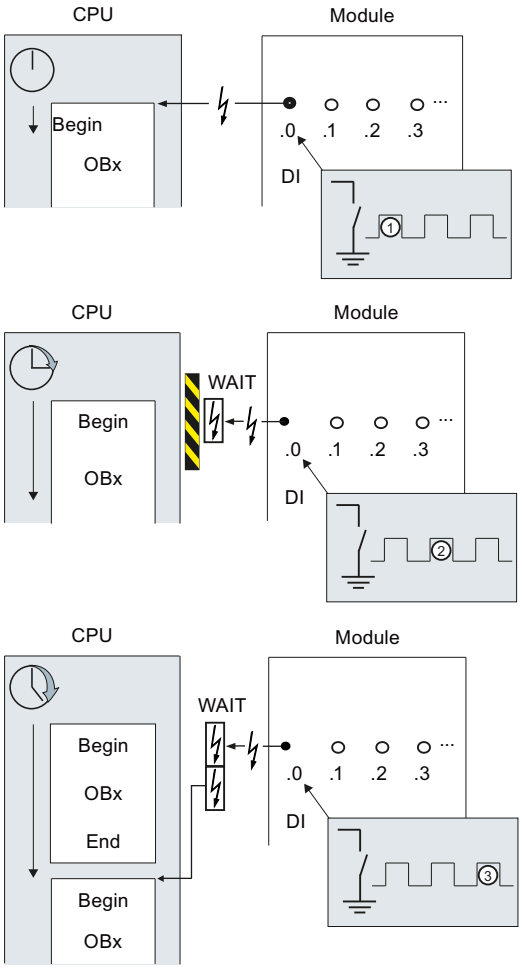
Process events and their priority

Process events are triggered by the I/O (e.g. at a digital input) and initiate a call of the assigned OB in the S7-1200 CPU. OBs assigned to a process event are called hardware interrupt OBs.

Examples of process events and their priority:

- Process events "rising edge" or "falling edge" at an interrupt-triggering module: The hardware interrupt OB started by such an event is always assigned priority 5.
- Process events from a high-speed counter
  - Count value corresponds to the reference value
  - Change count direction
  - External reset of the high-speed counter
    The hardware interrupt OB started by this event is always assigned priority 6.

The figure below shows the chronological sequence of hardware interrupt execution: In the case of two hardware interrupt events in immediate succession, the second hardware interrupt triggering event is held back in the queue until the first OBx has been processed. The next hardware interrupt triggering event can only start the associated OBx when the OBx has been processed. Additional hardware interrupt triggering events are lined up in the queue according to this principle.



Hardware interrupt execution

① A hardware interrupt-triggering event such as a rising edge at the input calls the OB to which it is assigned.

② If a new event occurs that triggers a hardware interrupt while the OB is executing, this event is entered in a queue.

③ The new event that triggers a hardware interrupt starts the hardware interrupt OB assigned to the event.

Assigning the interrupt-triggering event

The interrupt-triggering event is assigned to an OB in the input properties of the device view.

- An interrupt-triggering event can only be assigned to a single OB.
- OBs, however, can be assigned to several interrupt-triggering events.
  This means, for example, that you can assign both the rising and the falling edge to the same interrupt OB in order to trigger the same reaction to any change of the input signal.

- The started OB can interrupt a cycle OB at every instruction. Consistent data access is secured up to dword size.
- You can parameterize module-specific interrupt-triggering events such as a rising and the falling edge at the input.
- Assign the interrupt-triggering event and the OB to be started in the configuration of the interrupt-triggering module. However, within the started hardware interrupt OB you can override this assignment using the DETACH instruction, or assign the same event to a different OB using the ATTACH instruction. This functionality allows a flexible reaction to external process signals.

Setting the operating behavior

Changing properties of the modules

Default settings

When they leave the factory, all hardware components with parameters have default settings suitable for standard applications. These default values allow the hardware components to be used immediately without making any additional settings.

You can, however, modify the behavior and the properties of the hardware components to suit the requirements and circumstances of your application. Hardware components with settable parameters include, for example, communications modules and several analog and digital modules.

Setting and loading parameters

When you have selected a hardware component in the device or network view, you can set the properties in the Inspector window. When you save a device configuration with its parameters, data is generated that needs to be loaded on the CPU. This data is transferred to the relevant modules during startup.

Properties of the CPUs

The properties of the CPUs have special significance for system behavior. For example for a CPU you can set:

- Interfaces
- Inputs and outputs
- High-speed counters
- Pulse generators
- Startup behavior
- Time-of-day
- Protection level
- Bit memory for system and clock

- Cycle time
- Communications load

The entry possibilities specify what is adjustable and in which value ranges. Fields that cannot be edited are disabled or are not shown in the properties window.

Requirement

You have already arranged the hardware components for which you want to change properties on a rack.

Procedure

To change the properties and parameters of the hardware components, follow these steps:

1. In the device or network view, select the hardware component or interface that you want to edit.
2. Edit the settings for the selected object:
   - For example in the device view you can edit addresses and names.
   - In the Inspector window additional setting possibilities are available.

You do not need to confirm your entries, the changed values will be applied immediately.

CPU properties

Overview of the CPU properties

Overview

The following table provides you with an overview of the CPU properties:

Group	Properties	Description
General	Project information	General information to describe the inserted CPU. Except for the slot number, you can change this information.
	Catalog information	Read-only information from the hardware catalog for this CPU.

Group	Properties	Description
PROFINET interface	General	Name and comment for this PROFINET interface. The name is limited to 110 characters.
	Ethernet addresses	Select whether the PROFINET interface is networked. If subnets have already been created in the project, they are available for selection in the drop-down list. If not, you can create a new subnet with the "Add new subnet" button. Information on the IP address, subnet mask and IP router usage in the subnet is available in the IP protocol. If an IP router is used, the information about the IP address of the IP router is necessary.
	Advanced options	Name, comment and additional setting options of the Ethernet interface port.
	Time synchronization	Settings for time synchronization in the NTP time format. The NTP (network time protocol) is a general mechanism for synchronizing system clocks in local and global area networks. In NTP mode, the interface of the CPU sends time queries (in client mode) at regular intervals to NTP servers on the subnet (LAN) and the addresses must be set in the parameters here. Based on the replies from the server, the most reliable and most accurate time is calculated and synchronized. The advantage of this mode is that it allows the time to be synchronized across subnets. The accuracy depends on the quality of the NTP server being used.
DI#/DO#	General	Name of and comment on the integrated digital inputs of the CPU.
	Digital inputs	Input delays can be set for digital inputs. The input delays can be set in groups (in each case for 4 inputs). The detection of a positive and a negative edge can be enabled for each digital input. A name and a hardware interrupt can be assigned to this event. Depending on the CPU, pulse catches can be activated at various inputs. When the pulse catch is activated, even pulse edges that are shorter than the cycle time of the program are detected.
	Digital outputs	The reaction to a mode change from RUN to STOP can be set for all digital outputs: The state can either be frozen (corresponds to retain last value) or you set a substitute value ("0" or "1")
	I/O addresses	The address space of the input and output addresses is specified as is the process image.
	Hardware identifier	The hardware identifier of the device is displayed.

Group	Properties	Description
AI#	General	Name of and comment on the integrated analog inputs of the CPU.
	Analog inputs	During noise reduction, the specified integration time suppresses interference frequencies at the specified frequency (in Hz). The channel address, measurement type, voltage range, smoothing and overflow diagnostics must be specified in the "Channel #" group. The measurement type and voltage range are set permanently to voltage, 0 to 10 V. Smoothing analog values provides a stable analog signal for further processing. Smoothing analog values can be useful with slow measured value changes, for example, in temperature measurement. The measured values are smoothed with digital filtering. Smoothing is achieved by the module forming mean values from a specified number of converted (digitalized) analog values. The selected level (slight, medium, strong) decides the number of analog signals used to create the mean value. If overflow diagnostics is enabled, a diagnostics event is generated if an overflow occurs.
	I/O addresses	The address space of the input addresses is specified as is the process image.
	Hardware identifier	The hardware identifier of the device is displayed.
High-speed counter (HSC)	High-speed counter (HSC)#	High-speed counters are typically used to drive counting mechanisms. See: Configuring high-speed counters (Page 1196)
Pulse generators (PTO/PWM)	PTO#/PWM#	A pulse generator is activated and can be initialized with project information. For the configuration of an activated pulse generator, specify the usage as PWM (Pulse Width Modulation) or as PTO (Pulse Train Output). Specify the output source, time base, pulse width format, cycle time and initial pulse width for PWM. A pulse output is specified as the hardware output. The PWM output is controlled by the CTRL_PWM instruction, see CTRL_PWM (Page 3310). Specify the output source for PTO. A pulse output and a direction output are specified as the hardware outputs. A PTO is operated together with a high-speed counter in the "axis of motion" count mode and controlled by the Motion Control technology object (see keyword "Motion Control S7-1200") . The hardware ID is displayed in the I/O-diagnostics addresses and, if the PWM function is selected, the address space of the output addresses and the process image can be selected.

Group	Properties	Description
Startup	Startup after POWER ON	Setting the startup characteristics after cycling power. See: Principles of the STARTUP mode (Page 1165)
	Comparison of preset configuration and actual configuration	Specifies whether modules (SM, SB, CM, CP or even the CPU) can be replaced: • Startup of the CPU only if compatible • Startup of the CPU even if there are differences Example: A signal module with 16 digital inputs and 16 digital outputs (DI16/DQ16) can be a compatible replacement for a signal module with 8 digital outputs (DQ8) or 4 digital inputs (DI4).
	Parameter assignment time for distributed I/O	Specifies a maximum period (standard: 60000 ms) in which the distributed I/O must start up. (The CMs and CPs are supplied with voltage and communication parameters during the CPU startup. This configuration time provides a time period during which I/O modules connected to the CM or CP must start up.) The CPU switches to RUN as soon as the distributed I/O has started and is ready for operation, regardless of the "Parameter assignment time for distributed I/O" parameter. If the distributed I/O has not started up during this period, the CPU switches to RUN without the distributed I/O.
Cycle	Maximum cycle time and minimum cycle time.	Specification of a maximum cycle time or a fixed minimum cycle time. If the cycle time exceeds the maximum cycle time, the CPU goes to STOP mode. See: Cycle time and maximum cycle time (Page 1189)
Communication load	Maximum allocation of the cycle for communication (as a percentage)	Controls the duration of communication processes that always also extend the cycle time, within certain limits. Examples of communication processes include: Transferring data to another CPU or loading blocks (initiated via the PC). See: Cycle loading by communications (Page 1190)
System and clock memory	System memory bits and clock memory bits	You use system memory bits for the following scans: • Is the current cycle the first since cycling power? • Have there been any diagnostics state changes compared with the previous cycle? • Scan for "1" (high) • Scan for "0" (low) Clock memory bits change their values at specified periodic intervals. See: Enabling system memory (Page 1206) See: Using clock memory (Page 1207)
Web server	Automatic update	Sends the requested web page with current CPU data periodically to the web browser. Enter the period duration under "Update interval". Automatic update can only be activated if the web server is enabled. See: Auto-Hotspot
	User-defined web pages	Allows access to freely-designed web pages of the CPU via a web browser. See: Auto-Hotspot

Group	Properties	Description
Time	Local time and daylight saving time	Setting of the time zone in which the CPU is operated and setting of the daylight-saving/standard time changeover.
Protection	Protection and password for read/write access	Setting the read/write protection and the password for access to the CPU. See: Setting options for the protection level (FW V1 to V3) (Page 1208) See: Setting options for the protection (FW as of V4) (Page 1209)
Connection resources	-	Display of available, reserved and previously configured connection resources of the CPU.
Address overview	-	Tabular representation of all addresses used by the CPU for integrated inputs/outputs as well as for the inserted modules. Addresses that are not used by any module are represented as gaps. The view can be filtered according to • Input addresses • Output addresses • Address gaps

Cycle time and maximum cycle time

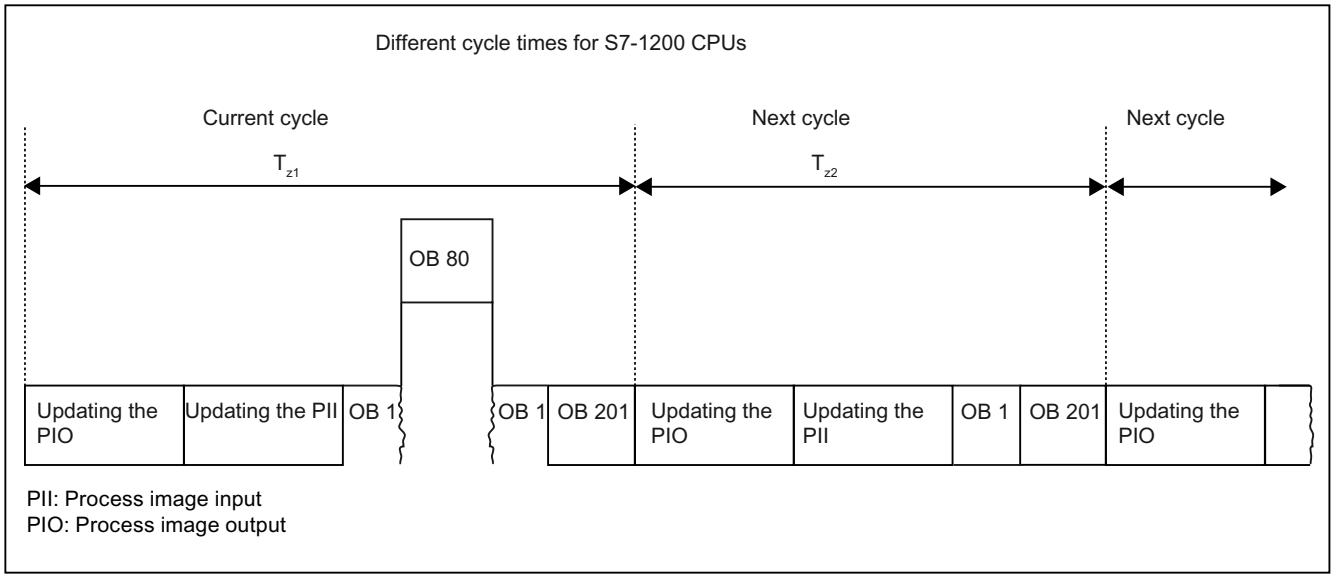
Function

The cycle time is the time that the operating system requires to execute the cyclic program and all the program sections that interrupt this cycle. The program execution can be interrupted by:

- Time errors and 2xMaxCycleTime errors
- System activities, e.g., process image updating

The cycle time (Tcyc) is therefore not the same for every cycle.

The following schematic shows an example of different cycle times (TZ1 ≠ TZ2) for S7-1200 CPUs:



In the current cycle, the cyclic OB used here (e.g. OB 1) will be interrupted by a time error (e.g. OB 80). Following the cyclic OB, the next cycle OB 201 is processed.

Maximum cycle time

The operating system monitors the execution time of the cyclic program for a configurable upper limit known as the maximum cycle time. You can restart this time monitoring at any point in your program by calling the RE_TRIGR instruction.

If the cyclic program exceeds the maximum cycle time, the operating system will attempt to start the time error OB (OB 80). If the OB is not available, the CPU ignores the overshoot of the maximum cycle time.

In addition to monitoring the runtime for overshooting of the maximum cycle time, adherence to a minimum cycle time is guaranteed. To do this, the operating system delays the start of the new cycle until the minimum cycle time has been reached. During this waiting time, new events and operating system services are processed.

If the maximum cycle time is exceeded a second time, for example while the time error OB is being processed (2xMaxCycleTime error), the CPU changes to STOP mode.

Cycle loading by communications

Function

The cycle time of the CPU can be extended due to communications processes. These communications processes include for example:

- Transferring data to another CPU
- Loading of blocks initiated by a programming device

You can control the duration of these communications processes to some extent using the CPU parameter "Cycle load due to communication".

In addition to communications processes, test functions also extend the cycle time. The "Cycle load due to communication" parameter can be used to influence the duration.

How the parameter works

You use the "Cycle load due to communication" parameter to enter the percentage of the overall CPU processing capacity that can be available for communications processes. This CPU processing capacity is now available at all times for communication. This processing capacity can be used for program execution when not required for communication.

Effect on the actual cycle time

The "Cycle load due to communication" parameter can be used to extend the cycle time of the cyclic organization block (e.g., OB 1) by a factor calculated according to the following formula:

$$\frac{100}{100 - \text{"Cycle load due to communication"}}$$

The formula does not take into account the effect of asynchronous events such as hardware interrupts or cyclic interrupts on the cycle time.

If the cycle time is extended due to communication processes, more asynchronous events may occur within the cycle time of the cyclic organization block. This extends the cycle still further. The extension depends on how many events occur and how long it takes to process them.

Example 1 – no additional asynchronous events:

If the "Cycle load due to communication" parameter is set to 50%, this can cause the cycle time of the cyclic organization block to increase by up to a factor of 2.

Example 2 – additional asynchronous events:

For a pure cycle time of 500 ms, a communication load of 50% can result in an actual cycle time of up to 1000 ms, provided that the CPU always has enough communications jobs to process. If, parallel to this, a cyclic interrupt with 20 ms processing time is executed every 100 ms, this cyclic interrupt would extend the cycle by a total of 5*20 ms = 100 ms without communication load. That is, the actual cycle time would be 600 ms. Because a cyclic interrupt also interrupts communications, it affects the cycle time by adding 10 * 20 ms at 50 % communication load. That is, in this case, the actual cycle time amounts to 1200 ms instead of 1000 ms.

Note

Observe the following:

- Check the effects of changing the value of the "Cycle load due to communication" parameter while the system is running.
- You must always consider the communication load when setting the minimum cycle time as time errors will otherwise occur.

Recommendations

- Increase this value only if the CPU is used primarily for communication purposes and the user program is not time critical.
- In all other situations you should only reduce this value.

Time-of-day functions

Basic principles of time of day functions

All S7-1200 CPUs are equipped with an internal clock. The backup supports the display of the correct time for up to 10 hours if the power supply is interrupted.

Time-of-day format

The clock always shows the time of day with a resolution of 1 millisecond and the date including the day of the week. The time adjustment for daylight-saving time is also taken into account.

Setting and reading the time of day

Setting and reading the time with instructions

You can set, start and read the time-of-day and date on the CPU clock with the following instructions in the user program:

- Set the time-of-day: "WR_SYS_T"
- Read time of day "RD_SYS_T"
- Read local time "RD_LOC_T"
- Set time zone "SET_TIMEZONE"

Manual setting

You can also read and set the time-of-day manually in the online and diagnostics view under "Functions > Set time-of-day".

See also

WR_SYS_T: Set time-of-day (Page 2981)

RD_SYS_T: Read time-of-day (Page 2983)

RD_LOC_T: Read local time (Page 2985)

SET_TIMEZONE: Set time zone (Page 2989)

Assigning the clock parameters

Clock parameters

The clock parameters allow you to make the following settings:

- Enable time synchronization via NTP server
  Select this check box if you want the internal clock to be synchronized using the NTP synchronization mode.
- Network time server
  The IP addresses of up to four NTP servers need to be configured.
- Update interval
  The update interval defines the interval between time queries.

High-speed counters

General information on high-speed counters

Introduction

High-speed counters are typically used to drive counting mechanisms in which a shaft turning at a constant speed is equipped with an incremental step encoder. The incremental step encoder ensures a certain number of count values per rotation and a reset pulse once per rotation. The clock memory bit(s) and the reset pulse of the incremental step encoder supply the inputs for the high-speed counter.

The various S7-1200 CPUs have differing numbers of high-speed counters available:

S7-1200 CPU	Number of HSCs	HSC designation
CPU 1211C	3 (with digital signal board 4)*	HSC1…3 (and HSC5)*
CPU 1212C	4 (with digital signal board 5)*	HSC1…4 (and HSC5)*
CPU 1214C CPU 1215C CPU 1217C	6	HSC1…6

* with DI2/DO2 signal board

How it works

The first of several default values is loaded on the high-speed counter. The required outputs are enabled for the time during which the current value of the counter is lower than the default value. The counter is set up so that an interrupt occurs if the current value of the counter is equal to the default value or when the counter is reset.

If the current value is equal to the default value and an interrupt event results, a new default value is loaded and the next signal state is set for the outputs. If an interrupt event occurs because the counter is reset, the first default value and the first signal states of the outputs are set and the cycle repeated.

Since the interrupts occur much less frequently than the high-speed counter counts, a precise control of the fast operations can be implemented with only a slight influence on the overall cycle of the automation system. Since you can assign specific interrupt programs to interrupts, each new default can be loaded in a separate interrupt program allowing simple control of the state.

Note

You can also process all interrupt events in a single interrupt program.

Count algorithms of the various counters

All counters work in the same way, however some high-speed counters do not support all count algorithms. There are four basic count algorithms:

- Single-phase counter with internal direction control
- Single-phase counter with external direction control
- 2-phase counter with 2 clock inputs
- A/B counter

Each high-speed counter can be used with or without a reset input. If the reset input is activated, this resets the current value. The current value remains reset until the reset input is deactivated.

See also

Configuring high-speed counters (Page 1196)

Interdependency of the counter mode and counter inputs (Page 1194)

Interdependency of the counter mode and counter inputs

General information on counter mode and counter inputs

You can assign not only the counter modes and counter inputs to the high-speed counters but also functions such as clock pulse generator, direction control, and reset. The following rules apply:

- An input cannot be used for two different functions.
- If an input is not required by the current counter mode of the defined high-speed counter, it can be used other purposes.

If, for example, you set HSC1 to counter mode 1, in which inputs I0.0 and I0.3 are required, you can use I0.1 for edge interrupts or for HSC2.

If, for example, you set HSC1 and HSC5, inputs I0.0 (HSC1) and I1.0 (HSC5) are always used with the counting and frequency counter modes. As a result, these two inputs are not available for any other functions when counters are operated.

You have additional inputs available if you use a digital signal board.

Overview of the interdependency of counter mode and counter inputs

Counter mode	Description	Inputs		
	HSC1	I0.0 (CPU) I4.0 (signal board)	I0.1 (CPU) I4.1 (signal board)	I0.3 (CPU) I4.3 (signal board)
	HSC2	I0.2 (CPU) I4.2 (signal board)	I0.3 (CPU) I4.3 (signal board)	I0.1 (CPU) I4.1 (signal board)
	HSC3*	I0.4 (CPU)	I0.5 (CPU)	I0.7 (CPU)
	HSC4 (CPU 1212/14/15/17C only)	I0.6 (CPU)	I0.7 (CPU)	I0.5 (CPU)
	HSC5 (CPU 1214/15/17C only)**	I1.0 (CPU) I4.0 (signal board)	I1.1 (CPU) I4.1 (signal board)	I1.2 (CPU) I4.3 (signal board)
	HSC6 (CPU 1214/15/17C only)**	I1.3 (CPU)	I1.4 (CPU)	I1.5 (CPU)
Counting / frequency	Single-phase counter with internal direction control	Clock pulse generator	-	-
Counting				Resetting
Counting / frequency	Single-phase counter with external direction control	Clock pulse generator	Direction	-
Counting				Resetting
Counting / frequency	2-phase counter with 2 clock inputs	Clock pulse generator forwards	Clock pulse generator backwards	-
Counting				Resetting
Counting / frequency	A/B counter	Clock pulse generator A	Clock pulse generator B	-
Counting				Resetting
Motion axis	Pulse generators PWM/PTO	HSC1 and HSC2 support the motion axis count mode for the PTO1 and PTO2 pulse generators: • For PTO1, HSC1 evaluates the Q0.0 outputs for the number of pulses. • For PTO2, HSC2 evaluates the Q0.2 outputs for the number of pulses. Q0.1 is used as the output for the motion direction.		

* HSC3 can only be used for CPU 1211 without a reset input

** HSC5 can be also be used for CPU 1211/12 if a DI2/DO2 signal board is used

General information on high-speed counters (Page 1193)

Configuring high-speed counters (Page 1196)

Configuring high-speed counters

Requirement

An S7-1200 CPU has been inserted in the hardware configuration.

Procedure

To configure a high-speed counter, follow these steps:

1. Select an S7-1200 CPU in the device or network view.
2. Click on the required high-speed counter under "Properties > High-speed counter" in the inspector window:
   - CPU 1211C: HSC1 to HSC3 (also HSC5 with a DI2/DO2 signal board)
   - CPU 1212C: HSC1 to HSC4 (also HSC5 with a DI2/DO2 signal board)
   - CPU 1214C / 1215C / 1217C: HSC1 to HSC6
3. Enable the high-speed counter in the "General" parameter group using the relevant check box.

   Note

   If you use a CPU 1211C or CPU 1212C with a DI2/DO2 signal board, you can also enable the high-speed counter HSC5.

   Note

   If you activate the pulse generators and operate them as PTO1 or PTO2, they use the associated high-speed counter HSC1 or HSC2 with "Motion axis" counting mode to evaluate the hardware outputs. If you configure high-speed counter HSC1 or HSC2 for other counting tasks, these cannot be used by pulse generator PTO1 or PTO2, respectively.

   If required, you can enter a name and a comment for the high-speed counter here.
4. Define the functionality of the high-speed counter in the "Function" parameter group:
   - Count mode: Select what you want to be counted from the drop-down list.
   - Operating phase: Select the count algorithm from the drop-down list.
   - Input source: Select the onboard CPU inputs or the inputs of an optional digital signal board as the input source for the count pulses from the drop-down list.
   - Count direction is specified by: If you have selected a single-phase operating phase, open the drop-down list and select whether the count direction is set internally by an SFB parameter of the user program or externally via a digital input.
   - Initial count direction: If the user program is set as the internal direction control for the count direction, you can select the count direction at the start of counting from the drop-down list.
   - Frequency meter period: If frequency is set as the count mode, you can select the duration of the frequency meter periods in the drop-down list.

5. Specify the initial values and reset condition of the high-speed counter in the "Reset to initial values" parameter group:
   - Initial counter value: Enter a start value for the high-speed counter.
   - Initial reference value: Enter a maximum value for the high-speed counter.

   Here, you can also specify whether the high-speed counter will use a reset input and the set the corresponding signal level for the reset input from the drop-down list.
6. Configure the reaction of the high-speed counter to certain events in the "Event configuration" parameter group. The following events can trigger an interrupt:
   - The counter value matches the reference value.
   - An external reset event was generated.
   - A change of direction was triggered.

   Enable an interrupt reaction using the check box, enter a name and select a hardware interrupt for the interrupt from the drop-down list.
7. Assign the start address for the high-speed counter in the "I/O/Diagnostics addresses" parameter group.

Note

In the "Hardware inputs" parameter group, you can only see which hardware inputs and values are being used for the clock, direction determination, reset pulse, and maximum count speed.

Result

You have now adapted the parameters of the high-speed counter to the requirements of your project.

Point-to-point communication

Overview of point-to-point communication

PtP communication is communication via a serial interface that uses standardized UART data transmission (Universal Asynchronous Receiver/Transmitter). The S7-1200 uses communications modules with an RS-232 or RS-485 interface to establish PtP communication.

Functions of point-to-point communication

Point-to-point communication (PtP) allows numerous applications:

- Direct transmission of information to an external device, for example a printer or a barcode reader
- Reception of information from external devices such as barcode readers, RFID readers, cameras and third-party optical systems as well as many other devices.
- Exchange of information with third-party devices, for example GPS devices, radio modems and many others

The Freeport protocol

The S7-1200 supports the Freeport protocol for character-based serial communication. Using Freeport communication, the data transmission protocol can be configured entirely by the user program.

Siemens provides libraries with Freeport communication functions that you can use in your user program:

- USS Drive protocol
- Modbus RTU Master protocol
- Modbus RTU Slave protocol

Using RS-232 and RS-485 communications modules

Communications modules with RS-232 and RS-485 interfaces

In an S7-1200 CPU, you can use two different communications modules:

- RS-232 communications module
- RS-485 communications module

The communications modules can be connected to the S7-1200 CPU via the I/O channel on the left. You can plug in up to three different modules.

Properties of the communications modules

The communications modules have the following features:

- Support of the Freeport protocol
- Configuration by the user program with the aid of expanded instructions and library functions

Configuring a communications port

Configuring a communications port

After you have inserted a communications module with an RS-232 or RS-485 interface, you then set the interface parameters. You set the parameters for the interface either in the properties of the interface or you control the interface parameters from the user program using the PORT_CFG instruction. The following description relates to the graphic configuration.

Note

If you use the user program to change the port setting, the settings of the graphic configuration are overwritten.

You should also keep in mind that the settings made by the user program are not retained if there is a power down.

Requirement

- A communications module is already plugged in.
- You are in the device view.

Procedure

To configure the communications port, proceed as follows:

1. Select the interface in the graphic representation in the device view.
   The properties of the interface are displayed in the Inspector window.
2. Select the "Port configuration" group in the area navigation of the Inspector window.
   The settings of the port are displayed.
3. From the "Transmission speed" drop-down list, select the speed for the data transmission.
   With user-programmed communication, remember the influence of the transmission speed on the changeover time.
4. From the "Parity" drop-down list, select the type of detection of bad information words.
5. Using the "Data bits" drop-down list, decide whether a character consists of eight or seven bits.
6. From the "Stop bit" drop-down list, select how many bits will identify the end of a transmitted word.

7. From the "Flow control" drop-down list, select the method for ensuring a trouble-free data stream between sender and receiver. This parameter can only be set for the RS-232 interface.
   - Enter a HEX value in the "XON character" box that will cause the transmission of the message to be continued when it is detected. This parameter can only be set for software-controlled data flow control.
   - Enter a HEX value in the "XOFF character" box that will cause the transmission of the message to be suspended for the set wait time. This parameter can only be set for software-controlled data flow control.
8. In the "Wait time" box, enter a wait time in ms that must be kept to after the end of the message before the next transmission can start.

Note

You can configure the interface in the network view as well. To do so, you must first select the communication module in the tabular network view and then select the interface in the Inspector window. Then you can continue as described above.

Setting data flow control (Page 1200)

Setting data flow control

Data flow control

Data flow control is a method that ensures a balanced send and receive behavior. In the ideal situation, the intelligent control does not allow data to be lost. It ensures that a device does not send more information than the receiving partner can process.

There are two methods of data flow control:

- Hardware-controlled data flow control
- Software-controlled data flow control

With both methods, the DSR signals of the communications partners must be active at the beginning of transmission. If the DSR signals are inactive, the transmission is not started.

The RS-232 communications module can handle both methods. The RS-485 communications module does not support data flow control.

Hardware-controlled data flow control

Hardware-controlled data flow control uses the request to send (RTS) and clear to send (CTS) signals. With the RS-232 communications module, the RTS signal is transmitted via the output by pin 7. The CTS signal is received via pin 8.

If hardware-controlled data flow control is enabled, the RTS signal is then always set to activated when data is sent. At the same time, the CTS signal is monitored to check whether

the receiving device can accept data. If the CTS signal is active, the module can transfer data until the CTS signal becomes inactive. If the CTS signal is inactive, the data transfer must be suspended for the set wait time. If the CTS signal is still inactive after the set wait time, the data transfer is aborted and an error is signaled back to the user program.

Data flow control using hardware handshaking

If data flow control is controlled by hardware handshaking, the sending device sets the RTS signal to active as default. A device such as a modem can then transfer data at any time. It does not wait for the CTS signal of the receiver. The sending device itself monitors it own transmission by sending only a limited number of frames (characters), for example to prevent overflow of the receive buffer. If there is nevertheless an overflow, the transferring device must hold back the message and signal an error back to the user program.

Software-controlled data flow control

Software-controlled data flow control uses certain characters within the messages and these control the transfer. These characters are ASCII characters selected for XON and XOFF.

XOFF indicates when a transmission must be suspended. XON indicates when a transmission can be continued.

If the sending device receives the XOFF character, it must suspend sending for the selected wait time. If the XON character is sent after the selected wait time, the transfer is continued. If no XON character is received after the wait time, an error is signaled back to the user program.

Software data flow control requires full duplex communication because the receiving partner needs to send the XON character during the ongoing transfer.

Configuring a communications port (Page 1199)

Configuration of message transfer

User-programmed communication

You can control the data traffic between a communications module and a device connected externally via the serial interface using your own mechanisms. If you want to do this, you will need to define a communications protocol yourself. In freely programmable communication, ASCII and binary protocols are supported for message transfer.

Within the communications protocol, you will need to specify the criteria by which the start and end of a transferred message can be recognized in the data stream.

User-programmed communication can only be activated in RUN mode. If there is a change to STOP mode, the user-programmed communication is stopped.

Specifying the communications protocol

You can specify the communications protocol as follows:

- With the user program
  - The behavior when sending data is controlled by the SEND_CFG instruction.
  - The behavior when receiving data is controlled by the RCV_CFG instruction.
- Using parameter settings set graphically in the Inspector window

Note

If you change the communications protocol from the user program, the settings of the graphic configuration are overwritten.

You should keep in mind that the settings made by the user program are not retained if there is a power down.

Specifying the end of the message (Page 1205)

User-programmed communication with RS-232 devices

RS-232/PIP multi-master cable and user-programmed communication with RS-232 devices

Using the RS-232/PIP multi-master cable and user-programmed communication, you can connect a wide variety of RS-232-compliant devices to the communications modules of the S7-1200. The cable must, however, be set to the "PIP/user-programmed communication" mode.

Settings on the cable

The switches on the cable must be set as follows:

- Switch 5 must be set to 0
- Switch 6 sets either the local mode (DCE) or the remote mode (DTE):
  - Switch set to 0 for the local mode
  - Switch set to 1 for the remote mode

Changing over between send and receive mode

The RS-232/PIP multi-master cable is in send mode when data is sent from the RS-232 interface to the RS-485 interface. The cable is in receive mode when it is idle or when data is sent from the RS-485 interface to the RS-232 interface. The cable changes from receive to send mode immediately when it detects characters on the RS-232 send line.

Supported transmission speeds

The RS-232/PIP multi-master cable supports transmission rates between 1200 baud and 115.2 kbaud. The RS-232/PIP multi-master cable can be set to the required transmission rate using the DIP switch on the PC/PIP cable.

The following table shows the switch settings for the various transmission speeds:

Transmission speed	Switchover time	Settings (1 = up)
115200 bps	0.15 ms	110
57600 bps	0.3 ms	111
38400 bps	0.5 ms	000
19200 bps	1.0 ms	001
9600 bps	2.0 ms	010
4800 bps	4.0 ms	011
2400 bps	7.0 ms	100
1200 bps	14.0 ms	101

The cable returns to receive mode when the RS-232 send line is idle for a certain time that is defined as the changeover time of the cable. The set transmission speed influences the changeover time as shown in the table.

Influence of the changeover time

When working with an RS-232/PIP multi-master cable in a system in which user-programmed communication is used, the program must take into account the changeover time for the following reasons:

- The communications module reacts to messages sent by the RS-232 device.
  Once the communications module has received a request from the RS-232 device, it must delay the reaction message for a period that is equal to or longer than the changeover time of the cable.
- The RS-232 device reacts to messages sent by the communications module.
  Once the communications module has received a reaction message from the RS-232 device, it must delay the next request message for a period that is equal to or longer than the changeover time of the cable.

In both situations, the RS-232-PIP multi-master cable has enough time to change from send to receive mode so that the data can be sent from the RS-485 interface to the RS-232 interface.

Configuration of message transfer (Page 1201)

Making the settings for sending (Page 1204)

Specifying the start of the message (Page 1204)

Specifying the end of the message (Page 1205)

Making the settings for sending

Sending messages

You can program pauses between individual messages.

The following table shows which pauses can be set:

Parameter	Definition
RTS ON delay	You can set the time that must elapse after the send request RTS (request to send) before the actual data transfer starts.
RTS OFF delay	You can set the time that must elapse after the complete transfer before RTS signal is deactivated.
Send pause at the start of the message	You can specify that a pause is sent at the start of every message transfer when the RTS ON delay has elapsed. The pause is specified in bit times.
Send Idle Line after a pause	You can make a setting so that following a selected pause at the start of the message, the "Idle Line" signal is output to signal that the line is not in use. To enable the parameter, "Send pause at message start" must be set. The duration of the "Idle Line" signal is specified in bit times.

Specifying the start of the message (Page 1204)

Specifying the end of the message (Page 1205)

User-programmed communication with RS-232 devices (Page 1202)

Specifying the start of the message

Recognizing the start of the message

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

If a criterion is met that indicates the start of a message, the receiver starts searching the data stream for criteria that mean the end of the message.

There are two different methods for identifying the start of a message:

- Starting with any character:
  Any character can defined the start of a message. This is the default method.
- Starting with a specific condition:
  The start of a message is identified based on selected conditions.

Conditions for detecting the start of a message

The following table shows the various options for defining the start of a message:

Parameter	Definition
Recognize start of message by line break	The receiver recognizes a line break when the received data stream is interrupted for longer than one character. If this is the case, the start of the message is identified by the line break.
Recognize start of message by idle line	The start of a message is recognized when the send transmission line is in the idle state for a certain time (specified in bit times) followed by an event such as reception of a character.
Recognize start of message with individual characters	The start of a message is recognized when a certain character occurs. You can enter the character as a HEX value.
Recognize start of message by a character string	The start of a message is detected when one of the specified character sequences arrives in the data stream. You can specify up to four character sequences each with up to five characters.

The individual conditions can be logically linked in any way.

See also

Making the settings for sending (Page 1204)

User-programmed communication with RS-232 devices (Page 1202)

Specifying the end of the message

Recognizing the end of the message

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

In total, there are six different methods of recognizing the end of a message and these can all be logically linked in any way. The following table shows the various possible setting options:

Parameter	Definition
Recognize end of message by message timeout	The end of a message is recognized automatically when a selected maximum duration for a message is exceeded. Values from 0 to 65535 ms can be set.
Recognize end of message by reply timeout	The end of a message is recognized when there is no reply within a set time after transferring data. Values from 0 to 65535 ms can be set.

Parameter	Definition
Recognize end of message by timeout between characters	The end of a message is detected when the time between two characters specified in bit times is exceeded. Values from 0 to 2500 bit times can be set. The S7-1200 CPU only accepts a maximum time of eight seconds even if the value that is set results in a duration of more than eight seconds.
Recognize end of message by maximum length	The end of a message is recognized when the maximum length of a message is exceeded. Values from 1 to 1023 characters can be set.
Read message length from message	The message itself contains information about the length of the message. The end of a message is reached when the value taken from the message is reached. Which characters are used for the evaluation of the message length is specified with the following parameters: • Offset of the length field in the message The value decides the position of the character in the message that will be used to indicate the message length. Values from 1 to 1022 characters can be set. • Size of the length field This value specifies how many characters starting at the first evaluation position will be used to indicate the message length. Values of 0, 1, 2 and 4 characters can be set. • The data following the length field (does not belong to the message length) The value specifies the number of bytes after the length field that must be ignored in the evaluation of the message length. Values from 0 to 255 characters can be set.
Recognize message end with a character sequence	The end of a message is detected when the specified character sequence arrives in the data stream. You can define up to five characters in the character string that are to be checked. If the specified characters appear at the correct location in the message, the message end is recognized. To recognize the message end when character 1 and character 3 have a certain value, for example, you have to activate the check box for character 1 and character 3 and enter a character value.

Making the settings for sending (Page 1204)

User-programmed communication with RS-232 devices (Page 1202)

Enabling system memory

System memory

A system memory is a bit memory with defined values.

You decide which memory byte of the CPU will become the system memory byte when assigning the system memory parameters.

Benefits

You can use system memory in the user program, for example to run program segments in only the first program cycle after start-up. Two system memory bits are constant 1 or constant 0.

Bits of the system memory bytes

The following table shows the meaning of the system memory:

Bit of the system memory bytes	7	6	5	4	3	2	1	0
Meaning	Reserved (=0)	Reserved (=0)	Reserved (=0)	Reserved (=0)	=0	=1	=1 with change to the diagnosis status	=1 in first program cycle after startup, otherwise 0

Note

The selected memory byte cannot be used for intermediate storage of data.

Using clock memory

Clock memory

A clock memory is a bit memory that changes its binary status periodically in the pulse-no-pulse ratio of 1:1.

You decide which memory byte of the CPU will become the clock memory byte when assigning the clock memory parameters.

Benefits

You can use clock memory, for example, to activate flashing indicator lamps or to initiate periodically recurring operations such as recording of actual values.

Available frequencies

Each bit of the clock bit memory byte is assigned a frequency. The following table shows the assignment:

Bit of the clock memory byte	7	6	5	4	3	2	1	0
Period (s)	2.0	1.6	1.0	0.8	0.5	0.4	0.2	0.1
Frequency (Hz)	0.5	0.625	1	1.25	2	2.5	5	10

Note

Clock memory runs asynchronously to the CPU cycle, i.e. the status of the clock memory can change several times during a long cycle.

The selected memory byte cannot be used for intermediate storage of data.

Protection

Setting options for the protection level (FW V1 to V3)

Protection level

The following section describes how to use the various protection levels of the S7-1200 CPUs V1 to V3.

Effects of the protection level setting

You can choose between the following protection levels:

- No protection: This corresponds to the default behavior. You cannot enter a password. Read and write access is always permitted.
- Write protection: Only read-only access is possible. You cannot change any data on the CPU and cannot load any blocks or a configuration. HMI access and communication between CPUs are excluded from the write protection. Assignment of a password is required to select this protection level.
- Write/read protection: No write or read access is possible in the "Accessible devices" area or in the project for devices that are switched online. Only the CPU type and the identification data can be displayed in the project tree under "Accessible devices". Display of online information or blocks under "Accessible devices", or in the project for devices interconnected online, is possible.
  HMI access and communication between CPUs are excluded from the write protection.
  Assignment of a password is required to select this protection level.

Behavior of a password-protected CPU during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was assigned write protection and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on with a password.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights". Access authorization will also expire when the project is closed.

Note

You can not restrict functions for process control, monitoring, and communications.

Some functions are still protected due to their use as online data. RUN/STOP in the "Online Tools" task card or "Set the time" in the diagnostics and online editor is therefore write-protected.

Setting options for the protection (FW as of V4)

Protection level

The following section describes how to use the various access levels of the S7-1200 CPUs as of V4.

S7-1200 CPUs provide various access levels to limit the access to specific functions.

The parameters for the access levels are assigned in a table. The green checkmarks in the columns to the right of the respective access level specify which operations are possible without knowing the password of this access level. If you want to use the functions of check boxes that are not selected, a password has to be entered.

Notice

Configuring an access level does not replace know-how protection

Configuring access levels prevents unauthorized changes to the CPU by restricting download privileges. However, blocks on the memory card are not write- or read-protected. Use know-how protection to protect the code of blocks on the memory card.

Default characteristics

The default access level is "Full access (no protection)". Every user can read and change the hardware configuration and the blocks. A password is not set and is also not required for online access.

The access levels in detail

With an S7-1200 CPU, you can configure the following access levels:

- Full access (no protection): The hardware configuration and the blocks can be read and changed by all users.
- Read access: With this access level, only read access to the hardware configuration and the blocks is possible without entering a password - meaning that you can load the hardware configuration and blocks into the programming device. In addition, HMI access and access to diagnostics data is possible.
  You cannot load blocks or a hardware configuration into the CPU without entering the password. Moreover, writing test functions and firmware updates are **not** possible without a password.
- HMI access: With this access level, only HMI access and access to diagnostics data is possible without entering the password.
  Without entering the password, you can neither load blocks and hardware configuration into the CPU, nor load blocks and hardware configuration from the CPU into the programming device. In addition, the following is **not** possible without a password: Writing test functions, changing the operating state (RUN/STOP) and firmware updates.
- No access (complete protection): When the CPU is completely protected, no read or write access to the hardware configuration and the blocks is possible. HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed).
  Authorization with the password again provides you full access to the CPU.

Behavior of a password-protected module during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was configured with read access and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights".

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

Configuring access levels

The following section describes how to configure an access level and enter passwords for an S7-1200 CPU as of V4.

For an S7-1200 CPU, you can enter multiple passwords and thereby set up different access rights for individual user groups.

The passwords are entered in a table in such a way that exactly one access level is assigned to each password.

The effect of the password is visualized in the "Access" column and explained in the text below the table.

Example

You select the "No access (complete protection)" access level for a standard CPU (in other words, not an F-CPU) and enter a separate password for each of the access levels that lie above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the set passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (Full access (no protection)) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (read access) allows access as if the CPU were write-protected. Users who know this password have read-only access to the CPU.
- The password in row 3 (HMI access) allows access as if the CPU were write-protected and read-protected so that only HMI access is possible for users who know this password.

Procedure

To configure the access levels of an S7-1200 CPU, follow these steps:

1. Open the properties of the module in the inspector window.
2. Open the "Protection" entry in the area navigation.
   A table with the possible access levels appears in the inspector window.

Protection level	Access			Access permission	
Protection	HMI	Read	Write	Password	Confirmation
Full access (no protection)	✓	✓	✓		
Read access	✓	✓			
HMI access	✓				
No access (complete protection)					

Figure 10-4 Access protection

3. Activate the required access level in the first column of the table. The green checkmarks in the columns to the right of the respective protection level show you which operations are still available without entering the password.

4. In the "Password" column, specify a password for full access in the first row. In the "Confirmation" column, enter the selected password again to protect against incorrect entries.
   Ensure that the password is sufficiently secure, in other words, that is does not follow a machine-recognizable pattern!
   You must enter a password in the first row "Full access (no protection)". This enables unrestricted access to the CPU for those who know the password, regardless of the selected protection level.
5. Assign additional passwords as needed to other access levels if the selected protection level allows you to do so.
6. Download the hardware configuration so that the access level takes effect.

Result

The hardware configuration and the blocks are protected against unauthorized access according to the set access level. If an operation cannot be executed without a password due to the set access level, a dialog for entering a password is displayed.

Restriction of communication services

Introduction

The CPU can be the server for a number of communication services. This means that other communication participants can access CPU data even if you have not configured and programmed connections for the CPU.

The local CPU as a server thus does not have the possibility to control communication to the clients.

The parameter "Connection mechanisms" in the "Protection" area of the CPU parameters is used to specify whether this type of communication is permitted or not for the local CPU during operation.

Permit access with PUT/GET communication from remote partners

By default, the "Permit access with PUT/GET communication from remote partners (...)" option is disabled. In this case, read and write access to CPU data is only possible for communication connections that require configuration or programming both for the local CPU and for the communication partner. Access through BSEND/BRCV instructions is possible, for example.

Connections for which the local CPU is only a server (meaning that no configuration/ programming of the communication with the communication partner exists at the local CPU), are therefore not possible during operation of the CPU, for example,

- For PUT/GET, FETCH/WRITE or FTP access via communication modules
- For PUT/GET access from other S7 CPUs
- For HMI access that is realized via PUT/GET communication

If you want to allow access to CPU data from the client side, meaning that you do not want to restrict the communication services of the CPU, activate the "Permit access with PUT/GET communication from remote partners" option.

Organization blocks

Organization blocks for startup

Description

You can determine the boundary conditions for the startup characteristics of your CPU, for example, the initialization values for "RUN". To do this, write a startup program. The startup program consists of one or more startup OBs (OB numbers 100 or >= 123).

The startup program is executed once during the transition from "STOP" mode to "RUN" mode. Current values from the process image of the inputs are not available for startup program, nor can these values be set.

After the complete execution of the startup OBs, the process image of the inputs is read in and the cyclic program is started.

There is no time limit for executing the startup routine. Therefore the scan cycle monitoring time is not active. Time-driven or interrupt-driven organization blocks cannot be used.

Start information

A startup OB has the following start information:

Tag	Data type	Description
LostRetentive	BOOL	= 1, if retentive data storage areas have been lost
LostRTC	BOOL	= 1, if realtime clock has been lost

See also

Events and OBs (Page 1177)

Organization blocks for cyclic program execution

Introduction

For the program execution to start, at least one program cycle OB must be present in the project. The operating system calls this program cycle OB once in each cycle and thereby starts the execution of the user program. You can use multiple OBs (OB numbers >= 123). When multiple program cycle OBs are used, these are called in one after the other in the order of their OB numbers. The program cycle OB with the lowest OB number is called first.

The program cycle OBs have the priority class 1. This corresponds to the lowest priority of all OBs. The cyclic program can be interrupted by events of any other event class.

Programming cyclic program execution

You program cyclic program execution by writing your user program in the cycle OBs and the blocks that they call.

The first cyclic program execution begins as soon as the startup program has ended without errors. The cycle restarts after the end of each cyclic program execution.

Sequence of cyclic program execution

One cycle of the program execution encompasses the following steps:

1. The operating system starts the maximum cycle time.
2. The operating system writes the values from the process image output to the output modules.
3. The operating system reads out the state of the inputs of the input modules and updates the process image input.
4. The operating system processes the user program and executes the operations contained in the program.
5. At the end of a cycle, the operating system executes any tasks that are pending, for example, loading and deleting blocks or calling other cycle OBs.
6. Finally, the CPU returns to the start of the cycle and restarts the scan cycle monitoring time.

See also: Auto-Hotspot

Options for interrupting

Cyclic program execution can be interrupted by the following events:

- Interrupt
- A STOP command, triggered by
  - Operation of the programming device
  - "STP" instruction
- Supply voltage failure
- Occurrence of a device fault or program error

Start information

- None
- Optimized start information:

Name	Data type	Meaning
first_scan	BOOL	= TRUE in the first call of this OB: • Transition from STOP or HOLD to RUN • After reloading
retentivity	BOOL	= TRUE, if retentive data are available

See also

Events and OBs (Page 1177)

Organization blocks for interrupt-driven program execution

Organization blocks for time-of-day interrupt

Function

Organization blocks for time-of-day interrupt (OB number >=123) can be processed as follows:

- One time to a preset time (date with time of day)
- Periodically with preset start time and the following intervals:
  - Every minute
  - Hourly
  - Daily
  - Weekly
  - Monthly
  - Yearly
  - End of month

Time-of-day interrupt-OBs are therefore used to run parts of the user program on a time-controlled basis.

Status for time-of-day interrupt

The following table contains the possible status of a time-of-day interrupt as well as it's meaning.

Status	Meaning
Cancelled	The one-time processing has already taken place, or the start event of an not yet processed time-of-day interrupt has been deleted with the extended instruction CAN_TINT.
Set	You have scheduled the time or start time for processing.
Activated	You have scheduled whether processing takes place one time or periodically, and in the case of periodic processing, you have scheduled the interval.

Rules for time-of-day interrupts

The following rules apply to the use of time-of-day interrupts:

- A time-of-day interrupt can only be processed if it is set and activated, and a corresponding organization block exists in the user program.
- The start times of periodic time-of-day interrupts must correspond to a real date. For example, it is not possible to repeat an organization block monthly which first occurs on January 31st. In this case, on OB will only be started in the months that have 31 days.

- A time-of-day interrupt activated during startup by extended instruction call ACT_TINTwill not be executed until the startup is complete.
- After each CPU startup, you must reactivate previously set time-of-day interrupts

Setting and activating a time-of-day interrupt OB

Before a time-of-day interrupt can be deleted and the corresponding time-of-day interrupt OB can be processed from the operating system, you must set and activate the interrupt. You have the following options:

Set time-of-day interrupt	Activate time-of-day interrupt
Means of configuring	Means of configuring
Means of configuring	By extended instruction call ACT_TINT
By extended instruction call SET_TINTL	By extended instruction call ACT_TINT

Note

If you configure a time-of-day interrupt in such a way that the corresponding OB is to be processed once, the start time must not be in the past (relative to the real-time clock of the CPU).

If you configure a time-of-day interrupt in such a way that the corresponding OB is to be processed periodically, but the start time is in the past, then the time-of-day interrupt will be processed the next time it is due.

Time-of-day interrupt status query

In order to query the status of the time-of-day interrupt, call the extended instruction QRY_TINT.

Cancelling a time-of-day interrupt

You can cancel a time-of-day interrupt which has not yet been processed with the extended instruction CAN_TINT.

You can reset cancelled time-of-day interrupts with the extended instruction SET_TINTL and activate them with the extended instruction ACT_TINT.

Conditions that effect the time-of-day interrupt OBs

Since a time-of-day interrupt occurs only at specific intervals, certain conditions can affect the function of the associated OBs during execution of your program. The following table shows some of these conditions and describes how these affect the processing of a time-of-day interrupt OB.

Condition	Result
The extended instruction CAN_TINT is called in the user program.	The operating system deletes the start event (date and time) of the time-of-day interrupt. You must reset and reactivate the time-of-day interrupt if you are going to call the corresponding time-of-day interrupt OB again.
By synchronizing or correcting the CPU system clock, the time of day will be set ahead. With this, the start time for a time-of-day interrupt OB will be bypassed.	The operating system calls the time error interrupt OB (OB 80) and records the start event, the number, and the priority of the first bypassed time-of-day interrupt OB in its start information. After completion of the OB 80, the operating system processes the bypassed time-of-day interrupt OB only once.
By synchronizing or correcting the CPU system clock, the time of day will be set back. The corrected clock time is before the start time of an already processed time-of-day interrupt OB.	The time-of-day interrupt OB is repeated.
A time-of-day interrupt OB is still being processed when the start event for its next execution occurs.	The operating system then calls time error interrupt OB 80. The requested OB is processed only after the processing and further execution of the current time-of-day interrupt OB has completed.

Start information

A time-of-day interrupt OB has the following start information:

Tag	Data type	Description
CaughtUp	BOOL	=1, if the OB call is executed because clock time is turned ahead.
SecondTime	BOOL	=1 if the OB is called a second time because clock time is turned back (more exactly, if the planned time of the current OB processing is earlier than or the same time as the planned time for the previous OB processing). Note: SecondTime is only set once.

Organization block for status interrupts

Description

When it receives a status interrupt, the operating system of the S7-1200 CPU calls the status interrupt OB from a DP master or IO controller. This may be the case if a module of a slave changes its operating mode, for example, from "RUN" to "STOP". For more detailed information on events that trigger a status interrupt, refer to the documentation of the slave or device manufacturer.

Structure of the start information

The status-interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

See also

Events and OBs (Page 1177)

Organization block for update interrupts

Description

When it receives a status interrupt, the operating system of the S7-1200 CPU calls the update interrupt OB from a DP master or IO controller. This may be the case if you changed a parameter on a slot of a slave or device. For more detailed information on events that trigger an update interrupt, refer to the documentation of the slave or device manufacturer.

Structure of the start information

The update interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

See also

Events and OBs (Page 1177)

Organization block for manufacturer-specific or profile-specific interrupts

Description

When it receives a manufacturer-specific or profile-specific interrupt from a DP master or IO controller, the operating system of the S7-1200 CPU calls OB 57. For more detailed information on events that trigger this type of interrupt, refer to the documentation of the slave or device manufacturer.

Structure of the start information

The OB for manufacturer-specific and profile-specific interrupts has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

See also

Events and OBs (Page 1177)

Organization blocks for time-delay interrupts

Description

A time-delay interrupt OB is started after a configurable time delay of the operating system. The delay time starts after the SRT_DINT instruction is called.

You can use up to four time-delay interrupt OBs or cyclic OBs (OB numbers >= 123) in your program. If, for example, you are already using two cyclic interrupt OBs, you can insert a maximum of two further time-delay interrupt OBs in your program.

You can use the CAN_DINT instruction to prevent the execution of a time-delay interrupt that has not yet started.

Function of time-delay interrupt OBs

The operating system starts the corresponding OB after the delay time, which you have transferred with an OB number and an identifier to the SRT_DINT instruction.

To use a time-delay interrupt OB, you must execute the following tasks:

- You must call the instruction SRT_DINT.
- You must download the time-delay interrupt OB to the CPU as part of your program.

The delay time is measured with a precision of 1 ms. A delay time can immediately start again after it expires.

Time delay interrupt OBs are executed only when the CPU is in the "RUN" mode. A warm restart clears all start events of time-delay interrupt OBs.

The operating system calls the time-delay interrupt OB if one of the following events occurs:

- If the operating system attempts to start an OB that is not loaded and you specified its number when calling the SRT_DINT instruction.
- If the next start event for a time-delay interrupt occurs before the time delay OB has completely executed.

You can disable and re-enable time-delay interrupts using the DIS_AIRT and EN_AIRT instructions.

Note

If you disable an interrupt with DIS_AIRT after executing SRT_DINT, this interrupt executes only after it has been enabled with EN_AIRT. The delay time is extended accordingly.

Start information

- None
- Optimized start information:

Name	Data type	Meaning
sign	WORD	User ID: Input parameter SIGN from the call of the "SRT_DINT" instruction

SRT_DINT: Start time-delay interrupt (Page 3230)

CAN_DINT: Cancel time-delay interrupt (Page 3231)

Events and OBs (Page 1177)

Organization blocks for cyclic interrupts

Description

Cyclic interrupt OBs serve to start program in periodic time intervals independently of the cyclic program execution. The start times of a cyclic interrupt OB are specified using the time base and the phase offset.

The time base defines the intervals at which the cyclic interrupt OB is started and is an integer multiple of the basic clock cycle of 1 ms. The phase offset is the time by which the start time is offset compared with the basic clock cycle. If several cyclic interrupt OBs are being used, you can use this offset to prevent a simultaneous start time if the time bases of the cyclic interrupt OBs have common multiples.

You can specify a time period between 1 ms and 60000 ms as the time base.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers >= 123) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

Note

The execution time of each cyclic interrupt OB must be noticeably smaller than its time base. If a cyclic interrupt OB has not been completely executed but execution is again pending because the cycle clock has expired, the time error OB is started. The cyclic interrupt that caused the error is executed later or discarded.

Example of the use of phase offset

You have inserted two cyclic interrupt OBs in your program:

- Cyclic interrupt OB1
- Cyclic interrupt OB2

For cyclic interrupt OB1, you have set a time base of 20 ms and for cyclic interrupt OB2 a time base of 100 ms. After expiration of the time base of 100 ms, the cyclic interrupt OB1 reaches the start time for the fifth time, cyclic interrupt OB2 for the first time. To nevertheless execute the cyclic interrupt OBs offset, enter a phase offset for one of the two cyclic interrupt OBs.

Start information

- None
- Optimized start information:

Name	Data type	Meaning
first_scan	BOOL	= TRUE in the first call of this OB • At the transition from STOP or HOLD to RUN • After reloading
event_count	INT	Number of lost start events since the last start of this OB

See also

Assigning parameters to cyclic interrupt OBs (Page 1229)

Events and OBs (Page 1177)

Organization blocks for hardware interrupts

Description

You can use hardware interrupt OBs to react to specific events. You can assign an event that triggers an alarm to precisely one hardware interrupt OB. A hardware interrupt OB in contrast can be assigned to several events.

Hardware interrupts can be triggered by high-speed counters and input channels. For each high-speed counter and input channel that should trigger a hardware interrupt, the following properties need to be configured:

- The process event that should trigger the hardware interrupt (for example, the change of a count direction of a high-speed counter)
- The number of the hardware interrupt OB which is assigned to this process event

You can use up to 50 hardware interrupt OBs (OB numbers >= 123) that are independent of each other in your program.

Functionality of a hardware interrupt OB

After triggering a hardware interrupt, the operating system identifies the channel of the input or the high-speed counter and determines the assigned hardware interrupt OB.

If no other interrupt OB is active, the determined hardware interrupt OB is called. If a different interrupt OB is already being executed, the hardware interrupt is placed in the queue of its priority class. The hardware interrupt is acknowledged after the completion of the assigned hardware interrupt OB.

If another event that triggers a hardware interrupt occurs on the same module during the time between identification and acknowledgement of a hardware interrupt, the following applies:

- If the event occurs on the channel that previously triggered the hardware interrupt, then no additional hardware interrupt is triggered. Another hardware interrupt can only be triggered if the current hardware interrupt is acknowledged.
- If the event occurs on a different channel, a hardware interrupt is triggered.

Hardware interrupt OBs are called only in the CPU's "RUN" mode.

Start information

- None
- Optimized start information:

Name	Data type	Meaning
Laddr	HW_IO	Hardware identifier of the module that triggers the hardware interrupt
USI	WORD	Identifier for future extensions (not user-relevant)
IChannel	USINT	Number of the channel that triggered the hardware interrupt
EventType	BYTE	Identifier for the event type associated with the event triggering the interrupt (e.g., positive edge) This identifier can be found in the description of the respective module.

See also

Assigning parameters to hardware interrupt OBs (Page 1230)

Events and OBs (Page 1177)

Organization block for time error

Description

The operating system calls the time error OB (OB 80) if one of the following events occurs:

- The cyclic program exceeds the maximum cycle time.
- The OB called is currently still being executed (possible for time-delay interrupt OBs and cyclic interrupt OBs).
- A time-of-day interrupt was missed because the clock time was set forward by more than 20 seconds.
- A time-of-day interrupt was missed during a STOP.
- An overflow has occurred in an interrupt OB queue.
- An interrupt was lost due to the excessive interrupt load.

If you have programmed no time error OB, the S7-1200 CPU reacts as follows:

- CPUs with firmware version V1.0: The CPU remains in RUN mode.
- CPUs with firmware version V2.0:
  - The CPUs goes to STOP mode when the maximum cycle time is exceeded.
  - With all other start events of the time error OB, the CPU remains in RUN mode.

With CPUs with firmware version V1.0, the two-time overshooting of the maximum cycle time does not lead to the calling of an OB, but to the STOP of the CPU. You can avoid the second violation by restarting the cycle monitoring of the CPU with the RE_TRIGR instruction.

You can use only one time error OB in your program.

Start information

The time error OB has the following start information:

Tag	Data type	Description
fault_id	BYTE	• 0x01: Maximum cycle time exceeded • 0x02: Called OB is still being executed • 0x05: Expired time-of-day interrupt due to time jump • 0x06: Expired time-of-day interrupt on return to RUN mode • 0x07: Queue overflow • 0x09: Interrupt loss due to high interrupt load
csg_OBnr	OB_ANY	Number of the OB being executed at the time of the error
csg_prio	UINT	Priority of the OB being executed at the time of the error

See also

Events and OBs (Page 1177)

Organization block for diagnostic interrupts

Description

You can enable the diagnostic error interrupt for diagnostics-capable modules so that the module detects changes in the I/O status. As a result, the module triggers a diagnostic error interrupt in the following cases:

- A fault is present (incoming event)
- A fault is no longer present (outgoing event)

If no other interrupt OB is active, then the diagnostic interrupt OB (OB 82) is called. If another interrupt OB is already being executed, the diagnostic error interrupt is placed in the queue of its priority group.

You can use only one diagnostic interrupt OB in your program.

Start information

The diagnostic interrupt OB has the following start information:

Tag	Data type	Description
IO_state	WORD	Contains the I/O status of the diagnostics-capable module.
laddr	HW_ANY	HW-ID
Channel	UINT	Channel number
multi_error	BOOL	= 1, if there is more than one error

IO_state tag

The following table shows the possible I/O states that the IO_state tag can contain:

IO_state	Description
Bit 0	Configuration correct: = 1, if the configuration is correct = 0, if the configuration is no longer correct
Bit 4	Error: = 1, if an error is present, e.g., a wire break = 0, if the error is no longer present
Bit 5	Configuration not correct: = 1, if the configuration is not correct = 0, if the configuration is correct again
Bit 6	I/O cannot be accessed: = 1, if an I/O access error has occurred In this case, laddr contains the hardware identifier of the I/O with the access error. = 0, if the I/O can be accessed again

See also

Events and OBs (Page 1177)

Organization block for pulling and plugging

Description

The S7-1200 CPU operating system calls the pull/plug interrupt OB (OB 83) if a configured and non-disabled distributed I/O module or submodule (PROFIBUS, PROFINET, AS-i) is removed or inserted.

Note

The removal or insertion of a central module leads to the STOP of the CPU.

Start information

The pull/plug interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware identifier of the affected module or submodule
Event_Class	BYTE	• B#16#38: (Sub)module plugged • B#16#39: (Sub)module pulled or not responding
Fault_ID	BYTE	Error code (possible values: B#16#51, B#16#54, B#16#55, B#16#56, B#16#57, B#16#58)

The following table shows which event caused the start of the pull/plug interrupt OB.

ev_class (B#16# ...)	fault_id (B#16# ...)	Meaning
39	51	Module pulled
39	54	Submodule pulled
38	54	Submodule plugged, which conforms to the parameterized submodule
38	55	Submodule inserted, which does not conform to the submodule parameter assignment
38	56	Submodule inserted, but error in module parameter assignment
38	57	Submodule or module inserted, but with a fault or maintenance
38	58	Submodule access error remedied

See also

Events and OBs (Page 1177)

Organization block for rack fault

Description

The S7-1200 CPU operating system calls the OB 86 in the following cases:

- The failure of a DP master system or of a PROFINET IO system is detected (in the case of either an incoming or an outgoing event).
- The failure of a DP slave or of an IO device is detected (in the case of either an incoming or an outgoing event).
- Failure of some of the submodules of a PROFINET I-device is detected.

Structure of the start information

The rack fault OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware identifier of the defective hardware object
Event_Class	BYTE	• B#16#32: Activation of a DP slaves or an IO device • B#16#33: Deactivation of a DP slaves or an IO device • B#16#38: outgoing event • B#16#39: incoming event
Fault_ID	BYTE	Error code (possible values: B#16#C3, B#16#C4, B#16#C5, B#16#C6, B#16#C7, B#16#C8, B#16#C9, B#16#CA, B#16#CB, B#16#CC, B#16#CD, B#16#CE, B#16#CF, B#16#F8, B#16#F9)

The following table shows which event caused the start of OB 86.

Ev_class B#16# ...	Fault_id B#16# ...	Meaning
39	C3	Failure of a DP master system
39/38	C4	Failure/return of a DP slave
38	C5	Return of a DP slave; however, slave is faulty
38	C6	Expansion unit return, but error in module parameter assignment
38	C7	Return of a DP device, but there is error in module configuration
38	C8	Return of a DP device, but discrepancy between preset/actual configuration
32/33	C9	Activation/deactivation of a DP slave with the "D_ACT_DP" instruction
39	CA	Failure of a PROFINET IO system
39/38	CB	Failure/return of a PROFINET IO device
38	CC	Return of a PROFINET IO device with fault or maintenance
38	CD	Return of a PROFINET IO device, deviation between preset/actual configuration
38	CE	Return of a PROFINET IO device, error in module configuration
32/33	CF	Activation/deactivation of an IO device with the "D_ACT_DP" instruction
39/38	F8	Failure/return of some of the submodules of a PROFINET I-device
38	F9	Return of some of the submodules of a PROFINET I-device with a device configuration difference

Events and OBs (Page 1177)

Block parameters of organization blocks

Basics of block parameters

Introduction

Several organization blocks (OBs) have properties with which you can control their behavior or their assignment to specific events. You can influence these properties by assigning parameters.

Overview

You can assign parameters to the properties for the following organization blocks:

- Time-of-day interrupt OBs
- Cyclic interrupt OBs
- Hardware interrupt OBs

See also

Assigning parameters to hardware interrupt OBs (Page 1230)

Assigning parameters to cyclic interrupt OBs (Page 1229)

Parameter assignment for time-of-day interrupt OBs

Procedure for setting the parameters

To set the parameters of a time-of-day interrupt OB, proceed as follows:

1. Open the "Properties" dialog belonging to the time-of-day interrupt OB in question.
2. Click the "Time-of-day interrupt" group in the area navigation.

Overview of the parameters that can be set

You can set the following parameters:

- Execution
- Start date and time-of-day
- Option buttons "Local time" and "System time"

"Execution" parameter

Use the drop-down list "Execution" to define the periods at which the time-of-day interrupt OB is to be executed. The time intervals relate to the settings for "Start date" and "Time-of-day".

The following values are possible for "Execution":

- Never
- Once
- Every minute
- Hourly
- Daily
- Weekly
- Monthly
- Yearly
- End of month

Note

With the value "End of month", the value specified under "Start date" is irrelevant.

"Start date" and "Time-of-day" parameter

Here, you specify the time at which the time-of-day interrupt is to be executed for the first time.

Example: Start date = 07/05/2013, time =11:16

Depending on the value of the "Execution" parameter, the CPU generates additional time-of-day interrupts periodically. Depending on the setting, the start time relates either to the local time or to the coordinated universal timeUTC.

Note

If you set the "Execution" parameter to "Monthly", the start date cannot be set to the 29th, the 30th, or the 31st. If you want the time-of-day interrupt OB to start at the end of the month, you should set the parameter "Execution" to "End of month".

"Local time" or "System time"

Here, you decide which time the start time of the time-of-day interrupt OB relates to:

- "Local time": The start time relates to the time zone set for the CPU.
- "System time": The start time relates to the coordinated universal time UTC (Universal Time Coordinated).

Assigning parameters to cyclic interrupt OBs

Introduction

You can use cyclic interrupt OBs to start programs at regular time intervals. To do so you must enter a scan time and a phase shift for each cyclic interrupt OB used.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers >= 200) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

Note

If you assign multiple cyclic OBs, make sure that you assign a different cycle time or phase offset to each cyclic interrupt OB to avoid them executing at the same time or having to queue. When you create a cyclic interrupt OB, the cycle time 100 and the phase offset 0 are entered as start value.

Procedure

To enter a scan time and a phase shift for a cyclic interrupt OB, proceed as follows:

1. Open the "Program blocks" folder in the project tree.
2. Right-click on an existing cyclic interrupt OB.
3. Select the "Properties" command in the shortcut menu.
   The "<Name of the cyclic interrupt OB>" dialog box opens.
4. Click the "Cyclic interrupt" group in the area navigation.
   The text boxes for the scan time and the phase shift are displayed.
5. Enter the scan time and the phase shift.
6. Confirm your entries with "OK".

Assigning parameters to hardware interrupt OBs

Introduction

You must select the corresponding event and assign the following parameters for every input channel and high-speed counter that should trigger a hardware interrupt:

- Event name
- Number of the hardware interrupt OB that is assigned to this process event

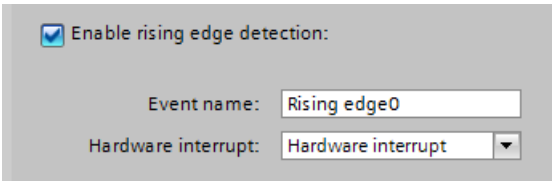
The parameters of the hardware interrupt are assigned in the properties of the corresponding device. You can assign parameters for up to 50 hardware interrupt OBs.

You can create the hardware interrupt OB to be assigned parameters either before or during activation of an event.

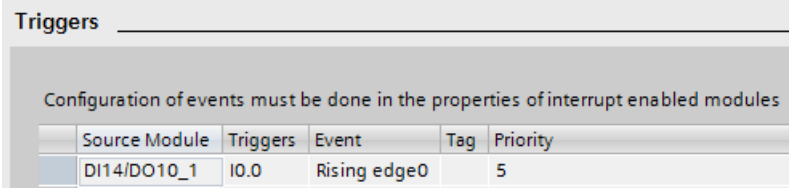
Procedure

To configure a hardware interrupt event, follow these steps:

1. Double-click the "Devices & Networks" command in the project tree.
   The hardware and network editor opens in the network view.
2. Change to the device view.
3. If the Inspector window closed in the device view, select the "Inspector window" check box in the "View" menu.
   The Inspector window opens.
4. Click the "Properties" tab.
5. In the device view, select the module for which you want to a assign a hardware interrupt.
6. Select the corresponding event that will trigger a hardware interrupt, e.g., a positive edge.



7. Enter an event name.
8. Select an existing hardware interrupt OB from the "Hardware interrupt" drop-down list or create a new hardware interrupt OB. If you have not previously created any hardware interrupt OBs, you can click the "Add new block" button in the drop-down list.
   The start information of the corresponding hardware interrupt OB, including all specifications for the interrupt-triggering event, is updated.



9. If you want to assign further hardware interrupts, repeat steps 5 to 8.

A system constant of data type Event_HwInt is created automatically for the event identified by the explicit event name. The system constants are displayed in the standard tag table.

Symbolic and numerical names of instructions

Description

The instructions from the task card are comprised of functions (FC), function blocks (FB), system functions (SFC) and system function blocks (SFB) that are identified internally by numbers.

The following tables show the assignment of numerical and symbolic names.

Function blocks (FBs)

Numerical name	Symbolic name
FB 105	TC_CONFIG
FB 110	Port_Config
FB 111	Send_Config
FB 112	Receive_Config
FB 113	Send_P2P
FB 114	Receive_P2P
FB 115	Receive_Reset
FB 116	Signal_Get
FB 117	Get_Features
FB 118	Set_Features
FB 163	TC_SEND
FB 164	TC_RECV
FB 165	TC_CON
FB 166	TC_DISCON
FB 804	SET_TIMEZONE
FB 1030	TSEND_C
FB 1031	TRCV_S
FB 1071	USS_DRIVE
FB 1080	MB_COMM_LOAD
FB 1081	MB_MASTER
FB 1082	MB_SLAVE

Numerical name	Symbolic name
FB 1084	MB_CLIENT
FB 1085	MB_SERVER
FB 1100	MB_Halt
FB 1101	MC_Home
FB 1102	MC_MoveAbsolute
FB 1103	MC_MoveJog
FB 1104	MC_MoveRelative
FB 1105	MC_MoveVelocity
FB 1107	MC_Power
FB 1108	MC_Reset
FB 1110	MC_MoveInterrupt
FB 1111	MC_ChangeDynamik
FB 1112	MC_CommandTable
FB 1113	MC_MoveLinearAbs_2D
FB 1114	MC_MoveLinearRel_2D
FB 1115	MC_MoveCircular_2D
FB 1130	PID_Compact
FB 1134	PID_3Step
FB 1140	HSC
FB 2040	RecipeCreate
FB 2041	RecipeOpen
FB 2042	RecipeRead
FB 2043	RecipeWrite
FB 2044	RecipeAppend
FB 2045	RecipeClose

Functions (FCs)

Numerical name	Symbolic name
FC 2 (1)	CONCAT
FC 4 (1)	DELETE
FC 11 (1)	FIND
FC 17 (1)	INSERT
FC 20 (1)	LEFT
FC 21 (1)	LEN
FC 22 (1)	LIMIT
FC 25 (1)	MAX
FC 26 (1)	MID
FC 27 (1)	MIN
FC 31 (1)	REPLACE
FC 32 (1)	RIGHT
FC 36 (1)	ENCO

Numerical name	Symbolic name
FC 36 (1)	SEL
FC 37	DECO
FC 800	LED
FC 801	IM_DATA
FC 802	DeviceStates
FC 803	ModuleStates
FC 1070	USS_PORT
FC 1072	USS_RPM
FC 1073	USS_WPM
(1) MC7+ instruction	

System data types (SDTs)

Numerical name	Symbolic name
SDT 99	WWW_CDB
SDT 513	CONDITIONS
SDT 581	Send_Conditions
SDT 582	Receive_Conditions

System function blocks (SFBs)

Numerical name	Symbolic name
SFB 0 (1)	CTU
SFB 1 (1)	CTD
SFB 2 (1)	CTUD
SFB 3 (1)	TP
SFB 4 (1)	TON
SFB 5 (1)	TOF
SFB 27	START_OB
SFB 52	RDREC
SFB 53	WRREC
SFB 54	RALRM
SFB 105	T_CONFIG
SFB 106	TDIAG
SFB 107	TRESET
SFB 110	PORT_CFG
SFB 111	SEND_CFG
SFB 112	RCV_CFG
SFB 113	SEND_PTP
