80C8	A value that is equal to 0 was entered at the RCVTIME parameter while the "Reply timeout" end condition was set.
80C9	A value that is equal to 0 or greater than 2500 was entered at the CHARGAP parameter while the "Timeout within a character string" end condition was set.
80CA	A value that is equal to 0 or greater than 2500 was entered at the IDLETIME parameter while the "Idle line" start condition was set.
80CB	All characters of the character string are marked as "Don't care" even though "Character string" is set as the end condition.
80CC	All characters of the character string are marked as "Don't care" even though "Character string" is set as the start condition.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3741)".

SEND_PTP: Transmit send buffer data

Description

You use the "SEND_PTP" instruction to start the transmission of data. The "SEND_PTP" instruction does not execute the actual transmission of the data. The data of the send buffer is transmitted to the relevant point-to-point communication module (CM). The CM executes the actual transmission.

Parameters

The following table shows the parameters of the "SEND_PTP" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Enables the requested transmission on a rising edge of this enable input. The content of buffer is transmitted to the point-to-point communication module (CM).
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
BUFFER	Input	VARIANT	I, Q, M, D, L or constant	Pointer to the start address of the send buffer. Boolean values or Array of BOOL are not supported.
LENGTH	Input	UINT	I, Q, M, D, L or constant	Length of the send buffer
PTRCL	Input	BOOL	I, Q, M, D, L or constant	This parameter selects the buffer for normal point-to-point communication or for specific Siemens protocols implemented in the connected CM. FALSE = point-to-point operations controlled by the user program (only valid option)
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: Job not yet started or is still executing • 1: Job executed without errors
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: No error • 1: Error occurred
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

STATUS parameter

Error code* (W#16#...)	Description
7000	The send operation is not active.
7001	The send operation is processing the first call.
7002	The send operation is processing subsequent calls (queries following the first call).
8080	The identifier entered for the communications port number is invalid.

Error code* (W#16#...)	Description
8088	The length of the LENGHT parameter does not correspond to the length of data to be sent. See also: Parameters LENGHT and BUFFER.
80D0	A new send request was received while a transmission was taking place.
80D1	The transmission was interrupted because the CTS signal was not confirmed within the specified wait time.
80D2	The send request was interrupted because the communications partner (DCE) signaled that it was not willing to receive (DSR).
80D3	The send request was interrupted because the maximum size of the waiting loop was exceeded (more than 1024 Byte).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3741)".

Parameters LENGTH and BUFFER

The minimum data size that can be sent by the "PTP_SEND" instruction is one byte. The parameter BUFFER defines the size of the data to be sent. You can use neither the BOOL nor the Array of BOOL data type for the BUFFER parameter.

LENGTH parameter	BUFFER parameter	Description
LENGTH = 0	Not used	The complete data is sent as defined by the BUFFER parameter. If LENGTH = 0, you do not need to specify the number of bytes transferred.
LENGTH > 0	Elementary data type	The LENGTH value must contain the byte count of this data type. Otherwise, data is not transferred and error 8088 is output.
	STRUCT	The LENGTH value can contain a byte count that is smaller than the complete byte length of the structure. In this case, only the first LENGTH bytes are transferred.
	ARRAY	The LENGTH value can contain a byte count that is smaller than the complete byte length of the field. In this case, only the field elements that fit completely in the LENGTH bytes are transferred. The LENGTH value must be a multiple of the byte count of the data elements. Otherwise, STATUS = 8088, ERROR = 1, and no data is transferred.
	STRING	The complete memory arrangement of the character sequence format will be transmitted as well as the information about maximum length of the character string and the actual length of the character string. The LENGTH value must contain bytes for maximum length, actual length, and the characters of the character string. With the data type STRING, all lengths and characters have the size of one byte. If a character string is used for the BUFFER parameter, the LENGTH value must also contain two bytes for the two length fields.

RCV_PTP: Enable receive messages

Description

With the RCV_PTP instruction you enable receipt of a sent message. Each message must be enabled individually. The sent data is only available in the receive area when the message has been acknowledged by the relevant communications partner.

Parameters

The following table shows the parameters of the "RCV_PTP" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L or constant	Enables receipt on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
BUFFER	Input	VARIANT	I, Q, M, D, L or constant	Points to the start address of the receive buffer. Do not use a tag of the type STRING in the receive buffer.
NDR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: Job not yet started or is still executing • 1: Job executed without errors
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: No error • 1: Error occurred
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction
LENGTH	Output	UINT	I, Q, M, D, L	Length of the message in the receive buffer

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

STATUS parameter

Error code* (W#16#....)	Description
80E0	Receipt of messages was terminated because the receive buffer is full.
80E1	Receipt of messages was terminated as a result of a parity error.
80E2	Receipt of messages was terminated as a result of a framing error.
80E3	Receipt of messages was terminated as a result of an overflow error.
80E4	Receipt of messages was terminated because the calculated message length (N+LEN+M) exceeds the size of the receive buffer.
8080	The identifier entered for the communications port number is invalid.
8088	A data type STRING is referenced via the BUFFER parameter.
0094	Receipt of messages was terminated because the maximum character length was received.
0095	Receipt of messages was terminated as a result of a timeout.
0096	Receipt of messages was terminated because of a timeout within the character string.

Error code* (W#16#....)	Description
0097	Receipt of messages was terminated as a result of a reply timeout.
0098	Receipt of messages was terminated because the "N+LEN+M" length condition has been satisfied.
0099	Receipt of messages was terminated because the character string defined as the end condition was received.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3741)".

RCV_RST: Delete receive buffer

Description

With the "RCV_RST" instruction, you delete the receive buffer of a communications partner.

Parameters

The following table shows the parameters of the "RCV_RST" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Enables deleting of the receive buffer on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: Job not yet started or is still executing • 1: Job executed without errors
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: No error • 1: Error occurred
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3741)".

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

SGN_GET: Query RS-232 signals

Description

With the "SGN_GET" instruction, you query the current state of several signals of an RS-232 communications module.

Parameters

The following table shows the parameters of the "SGN_GET" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Enables the query on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
NDR	Output	BOOL	I, Q, M, D, L	Is set for one cycle if new data are ready for sending and the instruction was executed error-free.
DTR	Output	BOOL	I, Q, M, D, L	Data terminal ready, module ready
DSR	Output	BOOL	I, Q, M, D, L	Data set ready, communications partner ready
RTS	Output	BOOL	I, Q, M, D, L	Send request, module ready to send
CTS	Output	BOOL	I, Q, M, D, L	Clear to send, communications partner can receive data (reaction to RTS = ON of the module).
DCD	Output	BOOL	I, Q, M, D, L	Data carrier detect, received signal level
RING	Output	BOOL	I, Q, M, D, L	Ring display, display of an incoming call
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: No error • 1: Error occurred
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

STATUS parameter

Error code* (W#16#....)	Description
80F0	The communication module is an RS-485 module and no signals are available.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3741)".

SGN_SET: Set RS-232 signals

Description

With the "SGN_SET" instruction, you set the status of the output signals of an RS-232 communications module.

Parameters

The following table shows the parameters of the "SGN_SET" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Activates the action on a rising edge Initial value: FALSE
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID) Initial value: FALSE
SIGNAL	Input	BYTE	I, Q, M, D, L or constant	Specifies the signals to be set: • Set 01H = RTS • Set 02H = DTR • Set 04H = DSR Initial value: FALSE
RTS	Input	BOOL	I, Q, M, D, L or constant	Send request, module ready to send Initial value: FALSE
DTR	Input	BOOL	I, Q, M, D, L or constant	Data terminal ready, module ready Initial value: FALSE
DSR	Input	BOOL	I, Q, M, D, L or constant	Data set ready (applies only to interfaces of the DCE type) Initial value: FALSE
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: Job not yet started or is still executing • 1: Job executed without errors Initial value: FALSE
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: • 0: No error • 1: Error occurred Initial value: FALSE
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction Initial value: 0

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

STATUS parameter

Error code* (W#16#...)	Description
80F0	The communication module is an RS-485 module and no signals are available.
80F1	No signals are settable because H/W flow control is enabled.
80F2	The DSR signal cannot be set because the module is a DTE device.
80F3	The DTR signal cannot be set because the module is a DCE device.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3741)".

General status information of the communications blocks

General information on execution status of the communications blocks

The following table shows which general information can be output at the STATUS parameter of the communications blocks:

Error code* (W#16#....)	Description
0000	No error
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0.
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8x3A	Invalid pointer at parameter x.
8070	All internal instance memories are in use.
8080	The identifier entered for the communications port is invalid
8081	Timeout, module error, internal error
8082	Parameter assignment failed because parameter assignment is currently being performed in the background.
8083	Buffer overflow: The CM or CB has returned a receipt message with a length that is greater than permitted by the length parameter.
8085	Error specifying the length at the LENGHT parameter. The specified length is "0" or greater than the maximum permitted value.
8090	Message length invalid, module invalid, message invalid
8091	Incorrect version in parameterization message
8092	Invalid record length in parameterization message
* The error codes can be displayed as integer or hexadecimal values in the program editor. For information on switching the display formats, refer to "See also".	

USS

Overview of USS instructions

Introduction

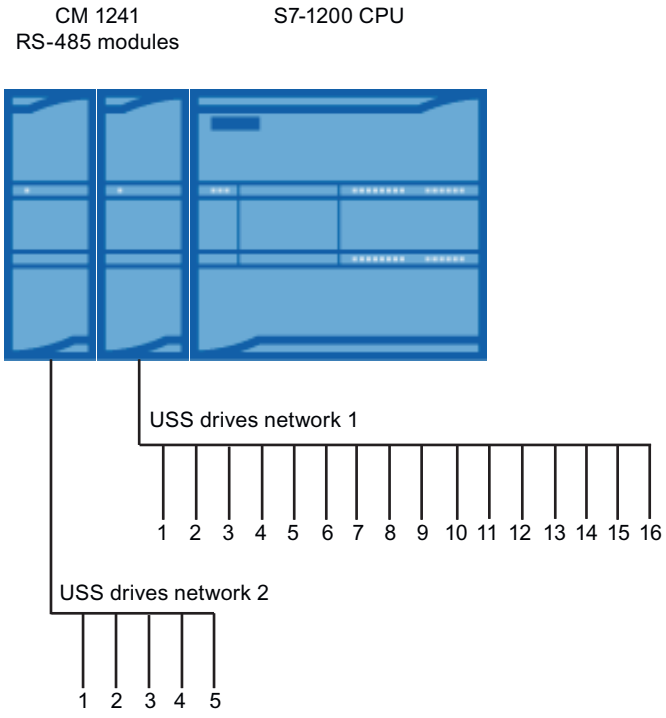
The USS instructions control the operation of drives that support the universal serial interface (USS). With the USS instructions, you can communicate with more than one drive via an RS-485 connection.

To do this, you require a CM 1241 RS-485 communications module or a CB 1241 RS-485 communications board. Up to three CM 1241 RS-485 modules and one CB 1241 RS-485 board can be installed in an S7-1200 CPU.

Each RS-485 port can operate up to sixteen drives.

The USS protocol uses a master/slave network for communication via a serial bus. The master uses an address parameter to send a message to a selected slave. A slave itself can never send without previously receiving a request. Direct exchange of messages between slaves is not possible. USS communication works in half duplex mode.

The following figure shows an example of a USS network diagram:



Requirements for using the USS protocol

General requirements for setting up a drive

- The use of 4 PKW words must be set up for the drives.
- The drives can be configured for 2, 4, 6 or 8 PZD words.
- The number of PZD words in the drive must correspond to the PZD_LEN input of the "USS_DRIVE (Page 3747)" instruction of the drive.
- The baud rate of all drives must match the baud rate of the BAUD input parameter of the "USS_PORT (Page 3746)" instruction.
- The drive must be set up for remote control.
- USS must be specified for the desired frequency value on the COM connection of the drive.
- 1 to 16 must be set as the drive address. This address must correspond to the address of the DRIVE input parameter of the "USS_DRIVE (Page 3747)" instruction.
- To control the direction of the drive, the polarity of the drive desired value must be set up.
- The RS-485 network must be connected correctly.

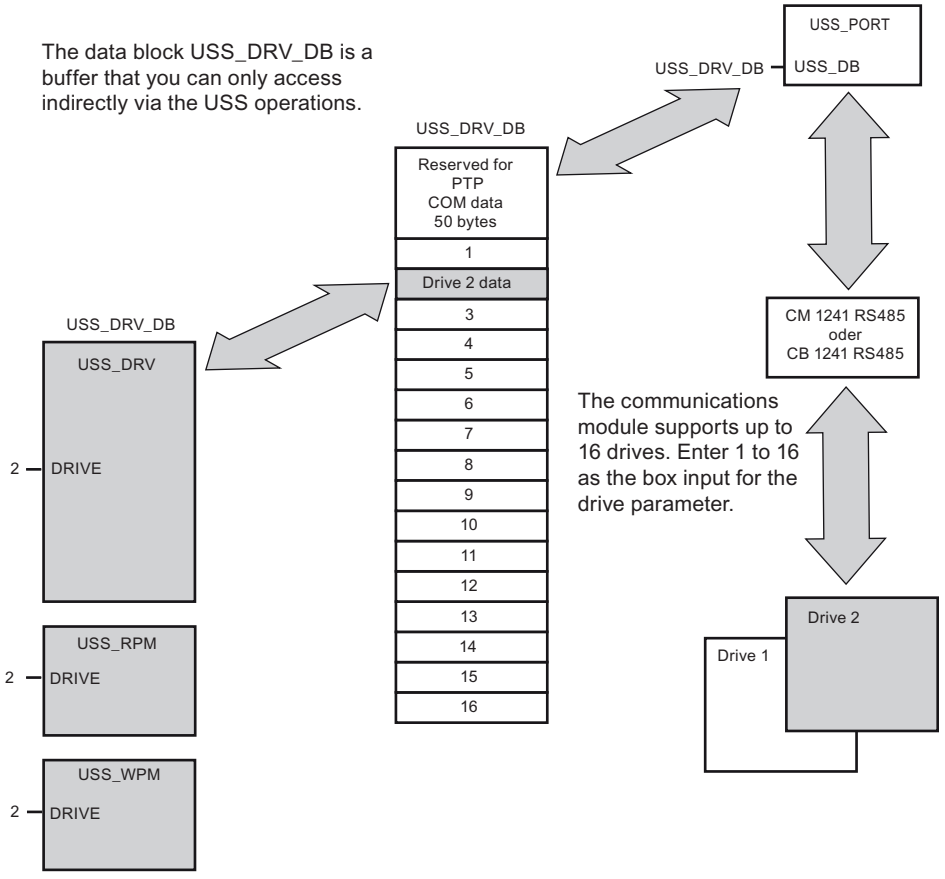
Definition: PKW / PZD area

- The PKW area relates to the handling of the parameter-identifier-value interface.
  The PKW interface is not a physical interface but describes a mechanism that controls the exchange of parameters between two communications partners, in other words, reading and writing parameter values, parameter descriptions and corresponding texts and the handling of parameter changes due to spontaneous messages. All the tasks handled via the PKW interface are essentially tasks for operator control and monitoring, service and diagnostics.
- The PZD area includes the signals required for automation:
  - Control word(s), and setpoint(s) from the master to the slave
  - Status word(s), and actual value(s) from the slave to the master.

Both areas together result in the user data field. This is transferred by the master to the slave as a job frame or by the slave to the master as a reply frame.

Description

Each communication module CM 1241 RS485 supports a maximum of 16 drives. A single instance data block contains temporary memory and buffer functions for all drives in the USS network that are connected to a PtP communications module you installed. The USS instructions for these drives have shared access to the information in this data block.



- All drives (max. 16) that are connected to an RS485 port are part of the same USS network. All drives that are connected to a different RS485 port are part of a different USS network. As the S7-1200 supports up to three CM 1241 RS485 modules, you can set up up to three USS networks, each having a maximum of 16 drives, thus a total of 48 USS drives are supported.
- Each USS network is managed via a unique data block (three data blocks are required for three USS networks with three CM 1241 RS485 modules). All instructions that belong to a USS network must share this data block. This includes all "USS_DRIVE (Page 3747)", "USS_PORT (Page 3746)", "USS_RPM (Page 3749)", and "USS_WPM (Page 3751)" instructions for controlling all drives in a USS network.

- The instruction "USS_DRIVE (Page 3747)" is a function block (FB). When you insert the instruction "USS_DRIVE" in the editor, the "Call options" dialog will ask you to assign a DB to the instruction.
  - If this is the first "USS_DRIVE" instruction in this program for this USS network, you can accept the default DB assignment (or, if necessary, change the name) and the new DB will be created.
  - If, however, this is not the first "USS_DRIVE" instruction for this network, you must select the DB that was previously assigned to this USS network in the drop-down list in the "Call options" dialog.
- All "USS_PORT (Page 3746), USS_RPM (Page 3749)", and "USS_WPM (Page 3751)" instructions are functions (FCs). When you insert these FCs in the editor, no DB is assigned. Instead, you have to assign the DB in question to the USS_DB input of these instructions (double-click on the parameter field and then on the icon to display the available DBs).
- The instruction "USS_PORT (Page 3746)" controls communication between the CPU and the drives via the PtP communications module. Whenever this instruction is called, communication with a drive is processed. Your program must call this function quickly enough so that the drives do not report a timeout. The instruction can be called from the main program or any interrupt OB.
- The function block "USS_DRIVE (Page 3747)" gives your program access to a specified drive in the USS network. Its inputs and outputs correspond to the states and operating functions of the drive. If there are 16 drives in the network, "USS_DRIVE" must be called at least 16 times in your program, i.e., once for each drive. How quickly these blocks are called depends on the required speed for controlling drive functions.
  You can only call the instruction "USS_DRIVE" from the main program OB.

Caution

Call "USS_DRIVE", "USS_RPM", "USS_WPM" only from the main program OB. The instruction "USS_PORT" can be called from any OB, it is usually called from a time-delay interrupt OB. If the instruction "USS_PORT" is interrupted during execution, this may result in unexpected errors.

The "USS_RPM" and "USS_WPM" instructions are used to read and write the operating parameters of the drive. These parameters control the internal mode of operation of the drive. A definition of these parameters can be found in the drive manual.

Your program may also contain any number of these instructions; however only one read or write request can be active for a drive. You may only call the instructions "USS_RPM" and "USS_WPM" from the main program OB.

Calculating the time for communication with the drive

Communication with the drive is runs asynchronous to the cycle of the S7-1200. The S7-1200 runs through several cycles before communication with a drive is completed.

The interval of "USS_PORT" is the time required for a drive transaction. The following table shows the minimum intervals for "USS_PORT" for each baud rate. Calling the "USS_PORT" more frequently than the "USS_PORT" interval will not increase the number of transactions. The timeout interval of the drive is the period of time available to a transaction if 3 attempts

are required to complete the transaction due to communications errors. By default, up to 2 further attempts are made for each transaction with the USS protocol.

Baud rate	Calculated minimum interval for calling USS_PORT (ms)	Drive message interval timeout per drive (ms)
1200	790	2370
2400	405	1215
4800	212.5	638
9600	116.3	349
19200	68.2	205
38400	44.1	133
57600	36.1	109
115200	28.1	85

USS_PORT: Edit communication via USS network

Description

The "USS_PORT" instruction handles communication over the USS network. In the program, use one "USS_PORT" instruction per PtP communications port to control the transmission to or from one drive.

All USS instructions that are assigned to one USS network and one PtP communications port must use the same instance data block.

Call

Your program must execute the "USS_PORT" instruction often enough to prevent timeouts in the drive. You should therefore call the "USS_PORT" instruction from a cyclic interrupt OB to prevent drive timeouts and keep the most recent USS data updates available for "USS_DRIVE (Page 3747)" calls.

Parameters

The following table shows the parameters of the "USS_PORT" instruction:

Parameter	Declaration	Data type	Memory area	Description
PORT	Input	PORT	D, L or constant	PtP communications port identifier Constant that can be referenced within the "Constants" tab of the default tag table.
BAUD	Input	DINT	I, Q, M, D, L or constant	Baud rate for USS communication.
USS_DB	InOut	USS_BASE	D	Reference to the instance DB of the "USS_DRIVE (Page 3747)" instruction.

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	ERROR is set to TRUE if an error occurs. A corresponding error code will be output at the STATUS output.
STATUS (Page 3752)	Output	WORD	I, Q, M, D, L	Status value of the request. It indicates the result of the cycle or initialization. Additional information is available in the "USS_Extended_Error (Page 3752)" tag for some status codes.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

USS_DRIVE: Swap data with drive

Description

The "USS_DRIVE" instruction exchanges data with the drive by creating request messages and interpreting the drive response messages. A separate instruction must be used for each drive, but all USS instructions assigned to one USS network and one PtP communications module must use the same instance data block. You must create the DB name when you place the first "USS_DRIVE" instruction. Then reuse this DB that was created when the initial instruction was inserted.

When the "USS_DRIVE" instruction is executed the first time, the drive indicated by the USS address (parameter DRIVE) is initialized in the instance DB. After this initialization, subsequent "USS_PORT (Page 3746)" instructions can start communication with the drive at this drive number.

Changing the drive number requires a PLC STOP to RUN mode transition that initializes the instance DB. Input parameters are configured in the USS send buffer, and outputs are read from a "previous" valid response buffer if any exists. There is no data transmission during execution of the "USS_DRIVE" instruction. Communication with the drives takes place when "USS_PORT (Page 3746)" is executed. "USS_DRIVE" only configures the messages to be sent and interprets data received in a previous request.

You can control the drive direction of rotation using either the DIR (BOOL) input or using the sign (positive or negative) at the SPEED_SP (REAL) input. The following table explains how these inputs work together to determine the drive direction, assuming the motor is wired for forward rotation.

SPEED_SP	DIR	Direction of rotation of drive
Value > 0	0	Reverse
Value > 0	1	Forward
Value < 0	0	Forward
Value < 0	1	Reverse

Parameters

Expand the box to display all the parameters by clicking the bottom of the box. The parameter connections that are grayed are optional and do not need to be assigned.

The following table shows the parameters of the "USS_DRIVE" instruction:

Parameter	Declaration	Data type	Memory area	Description
RUN	Input	BOOL	I, Q, M, D, L or constant	Drive start bit: If this parameter has the value TRUE, this input enables the drive to run at the preset speed.
OFF2	Input	BOOL	I, Q, M, D, L or constant	"Electrical stop" bit: If this parameter has the value FALSE, this bit cause the drive to coast to a stop without braking.
OFF3	Input	BOOL	I, Q, M, D, L or constant	Fast stop bit - If this parameter has the value FALSE, this bit causes a fast stop by braking the drive.
F_ACK	Input	BOOL	I, Q, M, D, L or constant	Fault acknowledge bit - This bit resets the fault bit on a drive. This bit is set after the fault is cleared to indicate to the drive that it no longer needs to indicate the previous fault.
DIR	Input	BOOL	I, Q, M, D, L or constant	Drive direction control - This bit is set to indicate that the direction is forward (when SPEED_SP is positive).
DRIVE	Input	USINT	I, Q, M, D, L or constant	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PZD_LEN	Input	USINT	I, Q, M, D, L or constant	Word length - This is the number of words of PZD data. Valid values are 2, 4, 6, or 8 words. The default is 2.
SPEED_SP	Input	REAL	I, Q, M, D, L or constant	Speed setpoint - This is the speed of the drive as a percentage of configured frequency. A positive value specifies forward direction (when DIR has the value TRUE).
CTRL3	Input	WORD	I, Q, M, D, L or constant	Control word 3 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL4	Input	WORD	I, Q, M, D, L or constant	Control word 4 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL5	Input	WORD	I, Q, M, D, L or constant	Control word 5 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL6	Input	WORD	I, Q, M, D, L or constant	Control word 6 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive.
CTRL7	Input	WORD	I, Q, M, D, L or constant	Control word 7 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL8	Input	WORD	I, Q, M, D, L or constant	Control word 8 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
NDR	Output	BOOL	I, Q, M, D, L	New data ready - If this parameter has the value TRUE, the bit indicates that the output contains data from a new communication request.
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred - If this parameter has the value TRUE, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported at the ERROR and STATUS outputs of the "USS_PORT" instruction.

Parameter	Declaration	Data type	Memory area	Description
STATUS (Page 3752)	Output	WORD	I, Q, M, D, L	Status value of the request. It indicates the result of the cycle. This is not a status word returned from the drive.
RUN_EN	Output	BOOL	I, Q, M, D, L	Run enabled - This bit indicates whether the drive is running.
D_DIR	Output	BOOL	I, Q, M, D, L	Drive direction - This bit indicates whether the drive is running forward.
INHIBIT	Output	BOOL	I, Q, M, D, L	Drive inhibited - This bit indicates the state of the inhibit bit on the drive.
FAULT	Output	BOOL	I, Q, M, D, L	Drive fault - This bit indicates that the drive has registered a fault. The user must eliminate the fault and then set the F_ACK bit to clear this bit.
SPEED	Output	REAL	I, Q, M, D, L	Drive current speed (scaled value of drive status word 2) - The value of the speed of the drive as a percentage of configured speed.
STATUS1	Output	WORD	I, Q, M, D, L	Drive status word 1 - This value contains fixed status bits of a drive.
STATUS3	Output	WORD	I, Q, M, D, L	Drive status word 3 - This value contains a user-configurable status word on the drive.
STATUS4	Output	WORD	I, Q, M, D, L	Drive status word 4 - This value contains a user-configurable status word on the drive.
STATUS5	Output	WORD	I, Q, M, D, L	Drive status word 5 - This value contains a user-configurable status word on the drive.
STATUS6	Output	WORD	I, Q, M, D, L	Drive status word 6 - This value contains a user-configurable status word on the drive.
STATUS7	Output	WORD	I, Q, M, D, L	Drive status word 7 - This value contains a user-configurable status word on the drive.
STATUS8	Output	WORD	I, Q, M, D, L	Drive status word 8 - This value contains a user-configurable status word on the drive.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

USS_RPM: Readout parameters from the drive

Description

The "USS_RPM" instruction reads a parameter from the drive. All USS functions that are assigned to one USS network and one PtP communications module must use the same instance data block. "USS_RPM" must be called from the main program OB.

Parameter

The following table shows the parameters of the "USS_RPM" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Send request: If this parameter has the value TRUE, it indicates that a new read request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	Input	USINT	I, Q, M, D, L or constant	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	Input	UINT	I, Q, M, D, L or constant	Parameter number: This input specifies which drive parameter is written. The range of this parameter is 0 to 2047. See your drive manual for details on how to access any parameters above this range.
INDEX	Input	UINT	I, Q, M, D, L or constant	Parameter index: This input specifies which drive parameter index is to be written. This is a 16-bit value where the least significant byte is the actual index value with a range of (0 to 255). The most significant byte may also be used by the drive and is drive-specific. See your drive manual for additional information.
USS_DB	InOut	USS_BASE	D	Reference to the instance DB that is created and initialized when a "USS_DRIVE" instruction is inserted in your program.
DONE	Output	BOOL	I, Q, M, D, L	If this parameter has the value TRUE, it indicates that the VALUE output holds the previously requested read parameter value. This bit is set when the "USS_DRIVE" instruction recognizes the read response from the drive. This bit is reset when either: • you request the response data via another "USS_RPM" poll or • the second of the next two calls of "USS_DRIVE (Page 3747)" is executed
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred - If this parameter has the value TRUE, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported at the ERROR and STATUS outputs of the "USS_PORT (Page 3746)" instruction.
STATUS (Page 3752)	Output	WORD	I, Q, M, D, L	This is the status value of the request. It indicates the result of the read request. Additional information is available in the "USS_Extended_Error (Page 3752)" tag for some status codes.
VALUE	Output	VARIANT	I, Q, M, D, L	This is the value of the parameter that was read and is valid only when the DONE bit has the value TRUE.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

USS_WPM: Change parameters in the drive

Description

The "USS_WPM" instruction modifies a parameter in the drive. All USS functions that are assigned to one USS network and one PtP communications module must use the same instance data block. "USS_WPM" must be called from the main program OB.

Note

EEPROM write operations

Beware of overusing the EEPROM write operation. Minimize the number of EEPROM write operations to extend the EEPROM life.

Parameter

The following table shows the parameters of the "USS_WPM" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Send request: If this parameter has the value TRUE, it indicates that a new write request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	Input	USINT	I, Q, M, D, L or constant	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	Input	UINT	I, Q, M, D, L or constant	Parameter number: This input specifies which drive parameter is written. The range of this parameter is 0 to 2047. See your drive manual for details on how to access any parameters above this range.
INDEX	Input	UINT	I, Q, M, D, L or constant	Parameter index: This input specifies which drive parameter index is to be written. This is a 16-bit value where the least significant byte is the actual index value with a range of (0 to 255). The most significant byte may also be used by the drive and is drive-specific. See your drive manual for additional information.
EEPROM	Input	BOOL	I, Q, M, D, L or constant	Store to drive EEPROM: If this parameter has the value TRUE, values written to the drive parameter will be stored in the drive EEPROM. If this parameter has the value FALSE, the value written is only temporarily saved and will be lost the next time the drive is switched on.
VALUE	Input	VARIANT	I, Q, M, D, L or constant	The value of the parameter that is to be written. It must be valid on the transition of REQ.
USS_DB	InOut	USS_BASE	D	This is a reference to the instance DB that is created and initialized when a "USS_DRIVE (Page 3747)" instruction is inserted in your program.

Parameter	Declaration	Data type	Memory area	Description
DONE	Output	BOOL	I, Q, M, D, L	If this parameter has the value TRUE, the VALUE input was written to the drive. This bit is set when the "USS_DRIVE (Page 3747)" instruction recognizes the write response from the drive. This bit is reset when either: You request the drive's confirmation that the write operation has been completed via another "USS_WPM" query or when the second of the next two calls of "USS_DRIVE (Page 3747)" is executed.
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred: If this parameter has the value TRUE, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported at the ERROR and STATUS outputs of the "USS_PORT (Page 3746)" instruction.
STATUS (Page 3752)	Output	WORD	I, Q, M, D, L	This is the status value of the request. It indicates the result of the write request. Additional information is available in the "USS_Extended_Error (Page 3752)" tag for some status codes.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

Parameter STATUS of USS instructions

STATUS parameter

The following table contains the status codes of the USS operation that are output at the STATUS output of the USS instructions:

STATUS* (W#16#....)	Description
0000	No error
8180	The length of the drive response did not match the characters received from the drive. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
8181	The parameter VALUE is not of the data type WORD, REAL, or DWORD
8182	User supplied a parameter value of the type word and received a DWORD or REAL from the drive in the response
8183	User supplied a parameter value of the type DWORD or REAL and received a word from the drive in the response
8184	Response telegram from drive had a bad checksum. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
8185	Illegal drive address (valid drive address range: 1-16)
8186	Speed set point out of valid range (valid speed SP range: -200% to 200%)
8187	Wrong drive number responded to the request sent. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
8188	Illegal PZD word length specified (valid range = 2, 4, 6 or 8 words)

STATUS* (W#16#....)	Description
8189	Illegal baud rate was specified
818A	Parameter request channel is in use by another request for this drive
818B	Drive has not responded to requests and retries. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
818C	Drive returned an extended error on a parameter request operation. See the extended error description below this table.
818D	Drive returned an invalid access error on a parameter request operation. See your drive manual for information of why parameter access may be limited
818E	Drive has not been initialized: This error code is output at "USS_RPM (Page 3749)" or "USS_WPM (Page 3751)" if the "USS_DRIVE (Page 3747)" instruction has not been called at least once for this drive. This prevents the initialization of the first cycle of "USS_DRIVE (Page 3747)" from overwriting a pending parameter read or write request since it initializes the drive as a new entry. To eliminate this error, call the "USS_DRIVE (Page 3747)" instruction for this drive.
80Ax-80Fx	Specific errors returned from PtP (Point-to-Point) communication instructions called by the USS library: These error code values are not modified by the USS library and are defined in the PtP instruction descriptions.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

USS_Extended_Error - USS drive extended error codes

USS drives support read and write access to a drive's internal parameters. This feature allows distributed control and configuration of the drive. Drive parameter access operations can fail due to errors such as values out of range or invalid requests in a drive's current mode. The drive generates an error code that is output in the "USS_Extended_Error" variable in the instance DB of the "USS_DRIVE (Page 3747)" instruction. This error code value is only valid for the last execution of the "USS_RPM (Page 3749)" or "USS_WPM (Page 3751)" instruction. The drive error code is put into the "USS_Extended_Error" tag when the value of STATUS is hexadecimal 818C. The error code of "USS_Extended_Error" depends on the drive variant. See the drive's manual for a description of the extended error codes for read and write parameter operations.

MODBUS (RTU)

MB_COMM_LOAD: Configure port on the PtP module for Modbus RTU

Description

The "MB_COMM_LOAD" instruction configures a port for communication using the Modbus RTU protocol. The following hardware can be used for this:

- Up to three point-to-point modules (PtP) CM 1241 RS485 or CM 1241 RS232
- A communications board CB 1241 RS485 in addition to this

After configuration of the port, you communicate over Modbus by executing the "MB_SLAVE" or "MB_MASTER" instruction.

Call

"MB_COMM_LOAD" must be called once to configure the port for the Modbus RTU protocol. On completion of the configuration, the port can be used by the "MB_MASTER (Page 3757)" and "MB_SLAVE (Page 3765)" instructions.

"MB_COMM_LOAD" only needs to be called again if one of the communication parameters has to be modified. Each "MB_COMM_LOAD" call deletes the communications buffer. To avoid data loss during communication, you should not call the instruction unnecessarily.

One instance of "MB_COMM_LOAD" must be used to configure the port of each communication module that is used for Modbus communication. You assign a unique "MB_COMM_LOAD" instance data block for each port that you use. The S7-1200 CPU is limited to three communication modules.

An instance data block is assigned when you insert the "MB_MASTER (Page 3757)" or "MB_SLAVE (Page 3765)" instruction. This instance data block is referenced when you specify the MB_DB parameter on the "MB_COMM_LOAD" instruction.

Parameters

The following table shows the parameters of the instruction "MB_COMM_LOAD":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Execution of the instruction upon a rising edge.
PORT	Input	PORT	I, Q, M, D, L or constant	ID of the communications port: After you have inserted the communications module in the device configuration, the port ID appears in the drop-down list at the PORT box connection. This constant can also be referenced within the "Constants" tab of the tag table.
BAUD	Input	UDINT	I, Q, M, D, L or constant	Baud rate selection: 300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200 All other values are invalid.
PARITY	Input	UINT	I, Q, M, D, L or constant	Parity selection: • 0 – None • 1 – Odd • 2 – Even
FLOW_CTRL	Input	UINT	I, Q, M, D, L or constant	Flow control selection: • 0 – (default) No flow control • 1 – Hardware flow control with RTS always ON (does not apply to RS485 ports) • 2 - Hardware flow control with RTS switched

Parameter	Declaration	Data type	Memory area	Description
RTS_ON_DLY	Input	UINT	I, Q, M, D, L or constant	RTS on-delay selection: • 0 – (default) No delay of RTS active until the first character of the message is transmitted. • 1 to 65535 – Delay in milliseconds of "RTS active" until the first character of the message is transmitted (does not apply to RS-485 ports). RTS delays must be applied independent of the FLOW_CTRL selection.
RTS_OFF_DLY	Input	UINT	I, Q, M, D, L or constant	RTS off-delay selection: • 0 – (default) No delay after the last character transmitted until "RTS inactive" • 1 to 65535 – Delay in milliseconds after the last character transmitted until "RTS inactive" (does not apply to RS-485 ports). RTS delays must be applied independent of the FLOW_CTRL selection.
RESP_TO	Input	UINT	I, Q, M, D, L or constant	Response timeout: Time in milliseconds allowed by "MB_MASTER (Page 3757)" for the slave to respond. If the slave does not respond in this time, "MB_MASTER (Page 3757)" repeats the request or terminates the request with an error if the specified number of retries has been sent. 5 ms to 65535 ms (default = 1000 ms).
MB_DB	Input	MB_BASE	D	A reference to the instance data block of the "MB_MASTER (Page 3757)" or "MB_SLAVE (Page 3765)" instructions. After you insert "MB_SLAVE (Page 3765)" or "MB_MASTER (Page 3757)" in your program, the DB identifier appears in the drop-down list at the MB_DB box connection.
DONE	Output	BOOL	I, Q, M, D, L	Execution of instruction completed without error.
ERROR	Output	BOOL	I, Q, M, D, L	Error: • 0 – No error detected • 1 – Indicates that an error was detected. An error code is output in the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Port configuration error code

For additional information on valid data types, refer to "Overview of the valid data types (Page 1908)".

Parameter STATUS

Error code* (W#16#...)	Description
0000	No error
8180	Invalid value for the port ID (wrong address for the communications module).

Error code* (W#16#...)	Description
8181	Invalid baud rate value.
8182	Invalid parity value.
8183	Invalid flow control value.
8184	Invalid value for the timeout of the response (the time before which a timeout is reported must be at least 25 ms).
8185	Incorrect pointer in the MB_DB parameter to the instance DB of the "MB_MASTER (Page 3757)" or "MB_SLAVE (Page 3765)" instruction.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

MB_COMM_LOAD data block tags

The table below shows the public static tags in the instance DB of MB_COMM_LOAD that you can use in your program.

Table 11-97 Static tags in the instance DB

Tag	Data type	Default	Description
ICHAR_GAP	WORD	0	Delay for the character spacing between characters. This parameter is specified in milliseconds and is used to increase the anticipated period between the received characters. The corresponding number of bit times for this parameter is added to the Modbus standard value of 35 bit times (3.5 character times).
RETRIES	WORD	2	The number of repeated attempts by the master before the error code 0x80C8 is returned for "No response".
MODE	USINT	0	Mode Permitted modes are: • 0 = Full duplex (RS232) • 1 = Full duplex (RS422) four-wire mode (point-to-point) • 2 = Full duplex (RS422) four-wire mode (multipoint master) • 3 = Full duplex (RS422) four-wire mode (multipoint slave) • 4 = Half duplex (RS485) two-wire mode

Tag	Data type	Default	Description
LINE_PRE	USINT	0	Receive line initial state Permitted defaults are: • 0 = "No" default • 1 = Signal R(A)=5V, signal R(B)=0 V (break detection): No break detection is possible with this default. Can only be selected with: "Full duplex (RS422) four-wire mode (point-to-point connection)" and "Full duplex (RS422) four-wire mode (multipoint slave)". • 2 = Signal R(A)=0 V, signal R(B)=5 V: This default corresponds to the at-rest state (no send process is active). No break detection is possible with this default.
CABLE-BREAK	USINT	0	Activate cable break detection: • 0 - not activated • 1 - activated

MB_MASTER: Communicate via the PtP port as Modbus master

Description of MB_MASTER

Description

The "MB_MASTER" instruction allows your program to communicate as a Modbus master using a port on a point-to-point module (CM) or a communications board (CB). You can access data in one or more Modbus slave devices.

Before the "MB_MASTER" instruction can communicate with a port, "MB_COMM_LOAD (Page 3753)" must first execute.

An instance DB is created when you insert the "MB_MASTER" instruction in your program. You specify this instance DB in the MB_DB input parameter of the "MB_COMM_LOAD (Page 3753)" instruction.

Rules for Modbus master communication

- A port used for Modbus master requests cannot be used for "MB_SLAVE".
- A port can be used for one or more "MB_MASTER" calls if the same instance DB is used.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must poll the "MB_MASTER" instruction for completed send and receive operations.

- Calling the instruction:
  - Call the "MB_MASTER" instruction if possible in a cyclic program OB. The instruction can only be called in a time delay or cyclic interrupt OB.
  - Do not call more than one "MB_MASTER" instruction in organization blocks with different priority classes. If a "MB_MASTER" instruction executes "preemptively" from a higher priority class, the instruction may execute incorrectly.
  - Do not call the "MB_MASTER" instruction in a startup, diagnostics or time error OB.
- After a transfer has started, the EN parameter (LAD/FBD) must remain set to the value "1" until the DONE or ERROR output parameter is set to "1" by the instruction. A renewed call by the REQ parameter while the instruction is executing causes an error. After the instruction executes, the bit in the REQ parameter remains set for the time specified by the BLOCKED_PROC_TIMEOUT parameter in the instance DB.
- If "MB_MASTER" sends a request to a slave, make sure that "MB_MASTER" continues to execute until the response from the slave arrives.

Parameters

The following table shows the parameters of the "MB_MASTER" instruction:

Parameters	Declaration	Data type	Memory area	Description
REQ (Page 3760)	Input	BOOL	I, Q, M, D, L	Request input: • 0 – No request • 1 – Request to transmit data to Modbus slave(s)
MB_ADDR	Input	UINT	I, Q, M, D, L or constant	Modbus RTU station address: • Default address range: 0 to 247 • Extended address range: 0 to 65535 The value "0" is reserved for broadcasting a message to all Modbus slaves. Modbus function codes 05, 06, 15, and 16 are the only function codes supported for broadcast.
MODE (Page 3760)	Input	USINT	I, Q, M, D, L or constant	Mode selection: Specifies the type of request: Read, write, or diagnostics: Refer to the Modbus functions table for details.
DATA_ADDR (Page 3760)	Input	UDINT	I, Q, M, D, L or constant	Starting address in the slave: Specifies the starting address of the data to be accessed in the Modbus slave. You will find the valid addresses in the Modbus functions table.
DATA_LEN	Input	UINT	I, Q, M, D, L or constant	Data length: Specifies the number of bits or words to be accessed in this request. You will find the valid lengths in the Modbus functions table.
DATA_PTR (Page 3762)	Input	VARIANT	M, D	Points to the DB or bit memory address of the CPU for the data to be written or read. For a DB, this must be created with the "Standard - compatible with S7-300/400" access type.
DONE	Output	BOOL	I, Q, M, D, L	• 0: Transaction not completed • 1: Transaction completed without error

Parameters	Declaration	Data type	Memory area	Description
BUSY	Output	BOOL	I, Q, M, D, L	• 0: No "MB_MASTER" transaction in progress • 1: "MB_MASTER" transaction in progress
ERROR	Output	BOOL	I, Q, M, D, L	• 0: No error • 1: Error, the error code is indicated by the STATUS parameter
STATUS	Output	WORD	I, Q, M, D, L	Execution condition code

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

STATUS parameter

Table 11-98 Communications and configuration error messages of the instruction

Error code* (W#16#....)	Description
0000	No error
80C8	Slave timeout. Check the baud rate, parity and the connectors on the slave.
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission within the wait time. This error is also generated during hardware flow control if the recipient does not detect CTS within the wait time.
80D2	The send request was aborted because no DSR signal is received from the DCE.
80E0	The message was terminated because the receive buffer is full.
80E1	The message was terminated as a result of a parity error.
80E2	The message was terminated as a result of a framing error.
80E3	The message was terminated as a result of an overrun error.
80E4	The message was terminated as a result of the specified length exceeding the total buffer size.
8180	Invalid value for the port ID.
8186	Invalid Modbus station address
8188	The MODE parameter has an invalid value for a broadcast call.
8189	Invalid data address value.
818A	Invalid data length value.
818B	Invalid pointer to the local data source/destination: Size not correct
818C	The DATA_PTR parameter has an invalid pointer. Use a pointer to a bit memory area or a DB with the "Standard - compatible with S7-300/400" access type.
8200	Port is busy processing a send request
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Table 11-99 Error messages of the Modbus protocol

Error code* (W#16#....)	Response code of slave	Description
8380	-	CRC error
8381	01	Function code not supported
8382	03	Data length error
8383	02	Error in the data address or address outside the valid range of DATA_PTR
8384	> 03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)
8386	-	Function code of the response does not match the function code of the query.
8387	-	Response from wrong slave
8388	-	The response of the slave to a write call is not correct. The data sent by the slave does not match the query from the master.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

Parameter REQ

Description

- REQ = FALSE: No request
- REQ = TRUE: Request to transmit data to Modbus slave(s)

You can control this input by means of a level-controlled or edge-controlled contact.

A state machine is started every time this input is activated to ensure that another instruction "MB_MASTER" that uses the same instance DB can only issue a request when the current request has been processed. All other input states are recorded and saved internally for the current request until the reply has been received or an error has been detected.

If the same instance of "MB_MASTER" is executed again with REQ input = 1 before the current request is completely processed, no subsequent transfers are made. However, if the request has been processed, a new request is issued at the time when "MB_MASTER" is executed again with REQ input = 1.

DATA_ADDR and MODE parameters

Description

You specify the start address for data access to the Modbus slave using the DATA_ADDR parameter.

With the MODE parameter and the Modbus address, you specify the function code to be transferred to the Modbus slave. The following table shows the relationship between the MODE parameter, the function code and Modbus address range.

MODE	Modbus function	Data length	Operation and data	Modbus address
0	01	1 to 2000 1 to 1992 (1)	Read output bits: 1 to (1992 or 2000) bits per query	1 to 9999
0	02	1 to 2000 1 to 1992 (1)	Read input bits: 1 to (1992 or 2000) bits per query	10001 to 19999
0	03	1 to 125 1 to 124 (1)	Read holding register: 1 to (124 or 125) WORD per query	40001 to 49999 or 400001 to 465535
0	04	1 to 125 1 to 124 (1)	Read input WORD: 1 to (124 or 125) WORD per query	30001 to 39999
1	05	1	Writing an output bit: One bit per query	1 to 9999
1	06	1	Writing a holding register: 1 WORD per query	40001 to 49999 or 400001 to 465535
1	15	2 to 1968 2 to 1960 (1)	Writing multiple output bits: 2 to (1960 or 1968) bits per query	1 to 9999
1	16	2 to 123 2 to 122 (1)	Writing multiple holding registers: 2 to (122 or 123) WORD per query	40001 to 49999 or 400001 to 465535
2	15	1 to 1968 2 to 1960 (1)	Writing one or more output bits: 1 to (1960 or 1968) bits per query	1 to 9999
2	16	1 to 123 2 to 122 (1)	Writing one or more holding registers: 1 to (122 or 123) WORD per query	40001 to 49999 or 400001 to 465535
11	11	0	Reading out the communications status word of the slaves and the event counter: The status word indicates execution of the instruction (0: is not executing; 0xFFFF: is executing). The event counter is incremented each time a message is transferred successfully. The DATA_ADDR and DATA_LEN parameters of the "MB_MASTER" instruction are ignored with this function.	-
80	08	1	Checking the slave status by reading the error code (0x0000): 1 WORD per query	-
81	08	1	Resetting the event counter of the slave with the diagnostics code 0x000A: 1 WORD per query	-
3 to 10, 12 to 79, 82 to 2555			Reserved	-
(1) For the "Extended address range", the maximum data length is reduced by one byte or one WORD depending on which data type is used for the function.				

Parameter DATA_PTR

Description

The DATA_PTR parameter is a pointer to a data block or bit memory from which the data should be written or read. If you use a data block, create a global data block with the "Standard - compatible with S7-300/400" access type.

Data block structures for the DATA_PTR parameter

- These data types are valid for **reading of words** of Modbus addresses 30001 to 39999, 40001 to 49999, and 400001 to 465536 and also for **writing of words** to Modbus addresses 40001 to 49999 and 400001 to 465536.
  - Standard array of WORD, UINT, or INT data types (see below).
  - Named WORD, UINT, or INT structure where each element has a unique name and 16 bit data type.
  - Named complex structure where each element has a unique name and 16 bit or 32 bit data type.
- For reading and writing of bits of Modbus addresses 00001 to 09999 and 10001 to 19999.
  - Standard array of Boolean data types.
  - Named Boolean structure of uniquely named Boolean variables.
- Although not required, it is recommended that each "MB_MASTER" instruction has its own separate memory area in a global data block. The reason for this recommendation is that there is a greater possibility of data corruption if multiple "MB_MASTER" instructions are reading and writing the same area of a global data block.
- The memory areas for DATA_PTR do not need to be in the same global data block. You can create one data block with multiple areas for Modbus read operations, one data block for Modbus write operations, or one data block for each slave station.

Instance DB of the "MB_MASTER" instruction

Static variables of the instance DB

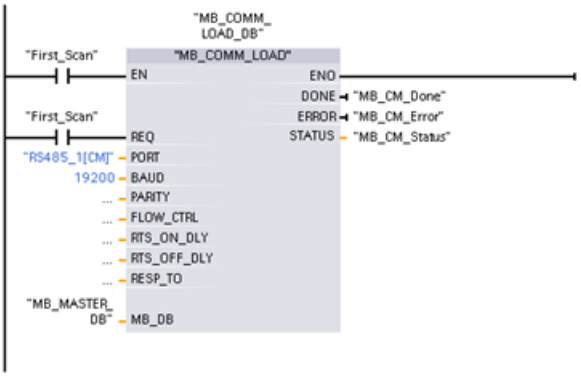
The following table describes the static variables of the instance DB of the instruction that you can use in the user program.

Variable	Data type	Description
MB_STATE	UINT	Internal status of the Modbus instruction
BLOCKED_ PROC_TIMEOUT	REAL	Time between completion of the instruction call and resetting the ACTIVE bit in the instance DB. The time buffer is used to avoid execution of the instruction being terminated before a job has been sent completely. The default time is 500 ms.
EXTENDED_ AD-DRESSING	BOOL	Configuring addressing: • 0: Default address area (1 byte) • 1: Extended address area (2 bytes) For additional information, refer to the section EXTENDED_AD-DRESSING: Instance DB of the "MB_SLAVE" instruction (Page 3768)

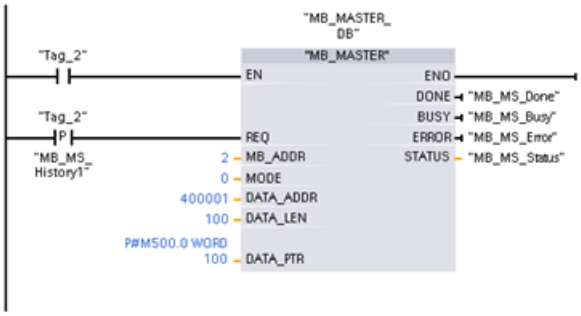
Sample program for a Modbus master

Networks (LAD)

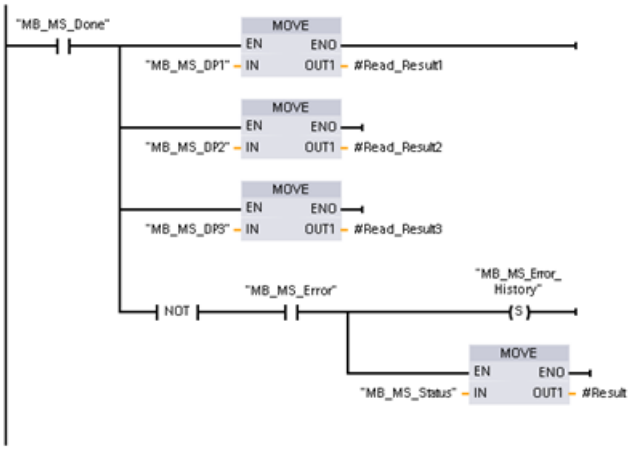
Network 1: Initialize parameters of the RS-485 module only once during the first cycle.



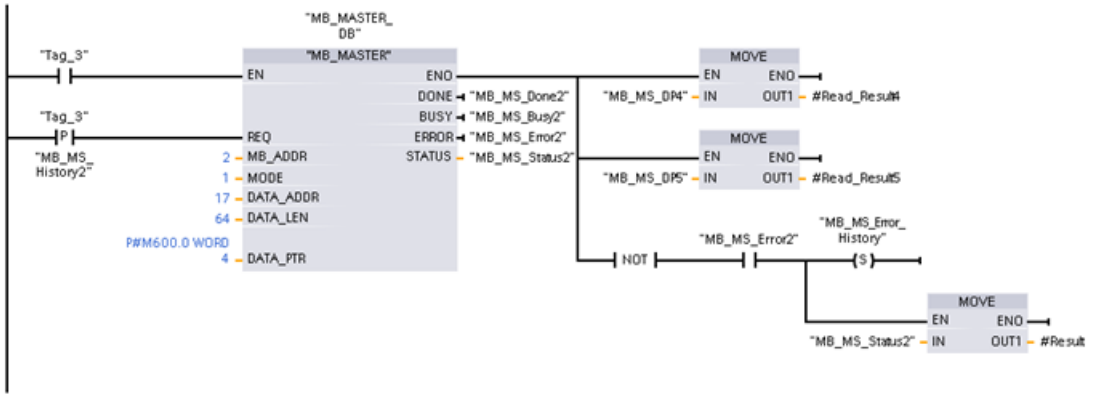
Network 2: Read 100 words from the holding register of the slave.



Network 3: This is an optional network that displays the values of the first 3 words as soon as the read operation has executed.



Network 4: Write 64 bits to the process image output, starting at slave address Q2.0.



MB_SLAVE: Communicate via the PtP port as Modbus slave

Description of MB_SLAVE

Description

The "MB_SLAVE" instruction allows your program to communicate as a Modbus slave using a port on a point-to-point module (PtP) or a communications board (CB). A Modbus RTU master can issue a request and then your program responds via "MB_SLAVE" execution.

You must assign a unique instance data block when you insert the "MB_SLAVE" instruction in your program. This instance data block is used when you specify it at the MB_DB parameter of the "MB_COMM_LOAD (Page 3753)" instruction.

Modbus communication function codes (1, 2, 4, 5, and 15) can read and write bits and words directly in the process image input and process image output in the target system. The following table shows the mapping of Modbus addresses to the process image in the CPU.

Modbus functions of "MB_SLAVE"						S7-1200	
Codes	Function	Data area	Address range			Data area	CPU address
01	Read bits	Output	1	to	8192	Process image output	Q0.0 to Q1023.7
02	Read bits	Input	10001	to	18192	Process image input	I0.0 to I1023.7
04	Read words	Input	30001	to	30512	Process image input	IW0 to IW1022
05	Write bit	Output	1	to	8192	Process image output	Q0.0 to Q1023.7
15	Write bits	Output	1	to	8192	Process image output	Q0.0 to Q1023.7

Modbus communication function codes (function codes 3, 6, 16) use a separate holding register. To do this, you can use bit memory or a data block with the "Standard - compatible with S7-300/400" access type.

You specify the type of the holding register using the MB_HOLD_REG parameter of the MB_SLAVE instruction. The following table shows the mapping of the Modbus holding register to the DB address of MB_HOLD_REG in the target system.

Modbus functions of "MB_SLAVE"				S7-1200	
Codes	Function	Data area	Address range (WORD number)	Address in the DB (BYTE number)	Bit memory address (BYTE number)
03	Read words	Holding register	40001 to 49999 or	DW0 to DW19998 or	MW0 to CPU limit
			400001 to 465535	DW0 to DW131068	
06	Write word	Holding register	40001 to 49999 or	DW0 to DW19998 or	
			400001 to 465535	DW0 to DW131068	
16	Write words	Holding register	40001 to 49999 or	DW0 to DW19998 or	
			400001 to 465535	DW0 to DW131068	

The table below shows the supported Modbus diagnostic functions.

S7-1200 "MB_SLAVE" Modbus diagnostic functions		
Codes	**Subfunction**	**Description**
08	0000H	Return query data echo test: The "MB_SLAVE" instruction returns the echo of a received data word to a Modbus master.
08	000AH	Clear communication event counter: The "MB_SLAVE" instruction clears the communication event counter that is used for Modbus function 11.
11	-	Get communication event counter: The "MB_SLAVE" instruction uses an internal communication event counter for recording the number of successful Modbus read and write requests that are sent to the Modbus slave. The counter is not incremented on any Function 8, Function 11, or broadcast requests. It is also not incremented on any requests that result in a communication error (for example, parity or CRC errors).

The "MB_SLAVE" instruction supports broadcast write requests from Modbus masters as long as the requests include access to valid addresses.

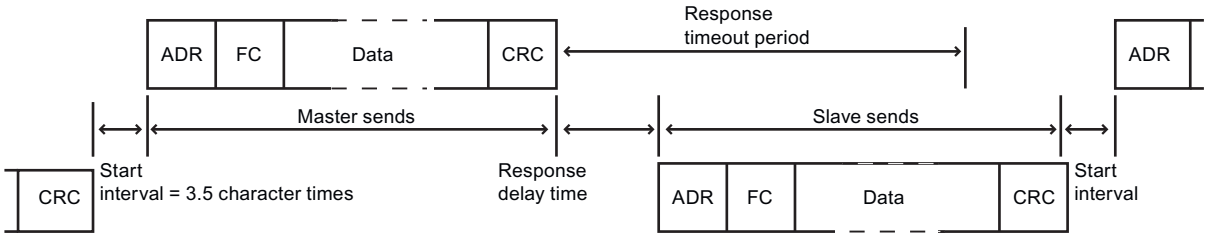
Regardless of the validity of a request, "MB_SLAVE" gives no response to a Modbus master as the result of a broadcast request.

Rules of Modbus slave communication

- "MB_COMM_LOAD" must be executed to configure a port, before the "MB_SLAVE" instruction can communicate with this port.
- If a port is to respond as a slave to a Modbus master, then that port cannot be used by "MB_MASTER (Page 3757)". Only one instance of "MB_SLAVE" can be used with a given port.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must control the communication process by polling the "MB_SLAVE" instruction for completed send and receive operations.
- The "MB_SLAVE" instruction must be executed periodically at a rate that allows it to make a timely response to incoming requests from a Modbus master. It is therefore advisable to call the instruction in a cyclic program OB. Calling the "MB_SLAVE" instruction in an interrupt OB is possible but not advisable since it can lead to long delays in execution.

Frequency of execution of "MB_SLAVE"

The "MB_SLAVE" instruction must be executed periodically to receive each request from the Modbus master and to respond as required. The frequency of execution of "MB_SLAVE" is dependent upon the specified response timeout period of the Modbus master. This is illustrated in the following diagram.



The response timeout period is the amount of time a Modbus master waits for the start of a response from a Modbus slave. This time period is not defined by the Modbus protocol, but rather by a parameter of each Modbus master. The frequency of execution (time between one execution and the next execution) of "MB_SLAVE" must be based on the particular parameters of your Modbus master. As a minimum, you should execute "MB_SLAVE" twice within the response timeout period of the Modbus master.

Parameters

The following table shows the parameters of the "MB_SLAVE" instruction:

Parameter	Declaration	Data type	Memory area	Description
MB_ADDR	Input	USINT	I, Q, M, D, L or constant	Station address of the Modbus slave (address range: 0 to 255)
MB_HOLD_REG	Input	VARIANT	D	Pointer to the Modbus holding register DB. The DB must be created with the "Standard - compatible with S7-300/400" access type.
NDR	Output	BOOL	I, Q, M, D, L	New data ready: • 0: No new data • 1: Indicates that new data has been written by the Modbus master
DR	Output	BOOL	I, Q, M, D, L	Read data: • 0: No data read • 1: Indicates that data has been read by the Modbus master
ERROR	Output	BOOL	I, Q, M, D, L	• 0: No error detected • 1: Error, a corresponding error code is output in the STATUS
STATUS	Output	WORD	I, Q, M, D, L	Error code

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

STATUS parameter

STATUS* (W#16#....)	Description
80C8	The specified response timeout (refer to RCVTIME or MSGTIME) is "0".
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission within the wait time. This error is also generated during hardware flow control if the recipient does not detect CTS within the wait time.
80D2	The send request was aborted because no DSR signal is received from the DCE.
80E0	The message was terminated because the receive buffer is full
80E1	The message was terminated as a result of a parity error
80E2	The message was terminated as a result of a message frame error

STATUS* (W#16#....)	Description	
80E3	The message was terminated as a result of a overrun error	
80E4	The message was terminated as a result of the specified length exceeding the total buffer size	
8180	Invalid value for the port ID.	
8186	Invalid Modbus station address	
8187	Invalid pointer to MB_HOLD_REG-DB	
818C	Pointer to a type safe DB type MB_HOLD_REG (must be a Classic DB type)	
Response code sent to Modbus master (B#16#...)		
8380	No response	CRC error
8381	01	Function code not supported or not supported in a broadcast
8382	03	Data length error
8383	02	Error in the data address or address outside the valid range of MB_HOLD_REG
8384	03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

Instance DB of the "MB_SLAVE" instruction

Static variables of the instance DB

The following table describes the static variables of the instance DB of the instruction that you can use in the user program. Your program can write values to the HR_Start_Offset and Extended_Addressing variables and control the Modbus slave operations.

The other variables can be read to monitor the Modbus status.

Variable	Data type	Description
HR_Start_Offset	WORD	Start address of the Modbus holding register (default = " 0")
Extended_ Addressing	BOOL	Configuring addressing: • 0: Default address area (1 byte) • 1: Extended address area (2 bytes)
Request_Count	WORD	Total number of queries received by the slave
Slave_Message_Count	WORD	Number of queries sent to this specific slave
Bad_CRC_Count	WORD	Number of received queries with CRC errors
Broadcast_Count	WORD	Number of received broadcast queries
Exception_Count	WORD	Number of Modbus-specific errors that require the return of an exception
Success_Count	WORD	The number of requests received for this specific slave without protocol errors

HR_Start_Offset

The addresses of the Modbus holding register start at 40001 or 400001. These addresses correspond to the start address of the holding register in the target system memory. Using the HR_Start_Offset variable, you can set the offset to a different start address.

Example: A holding register starts at MW 100 and has a length of 100 WORD. With an offset of 20 in the HR_Start_Offset parameter, the holding register begins at address 40021 instead of 40001. Each address below 40021 and above 400119 causes an addressing error.

	HR_Start_Offset = 0			**HR_Start_Offset = 20**	
	Modbus word address	S7-1200 byte address		Modbus word address	S7-1200 byte address
Minimum	40001	MW100		40021	MW100
Maximum	40099	MW198		40119	MW198

Extended_Addressing

To address the Modbus slave, a single byte (default address range) or a double byte (extended address range) can be configured. Extended addressing is used to address more than 247 devices in a single network. If you decide on extended addressing, you can address a maximum of 64,000 addresses. Below, you will see a frame of Modbus function 1 as an example.

Table 11-100 Slave address with one byte (byte 0)

Function 1	**Byte 0**	**Byte 1**	**Byte 2**	**Byte 3**	**Byte 4**	**Byte 5**	
Request	Slave address	F code	Start address		Length of the coils		
Valid response	Slave address	F code	Length	Coil data			
Error response	Slave address	0x81	E code				

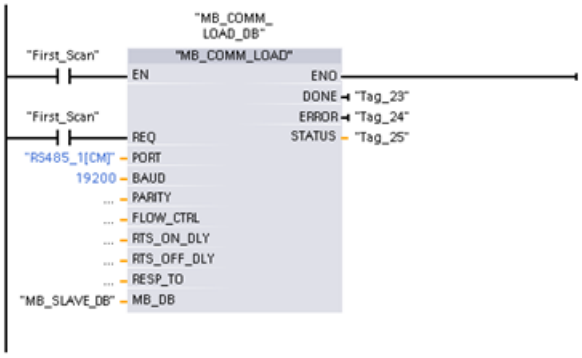
Table 11-101 Slave address with two bytes (byte 0 and byte 1)

Function 1	**Byte 0**	**Byte 1**	**Byte 2**	**Byte 3**	**Byte 4**	**Byte 5**	**Byte 6**
Request	Slave address		F code	Start address		Length of the coils	
Valid response	Slave address		F code	Length	Coil data		
Error response	Slave address		0x81	F code			

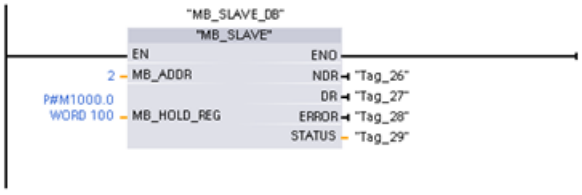
Sample program for a Modbus slave

Networks (LAD)

Network 1: Initialize parameters of the RS-485 module only once during the first cycle.



Network 2: Check the requests of the Modbus master in every cycle. 100 words starting at MW1000 are configured for the Modbus holding register.



MODBUS (TCP)

MODBUS (TCP)

MB_CLIENT: Communicating via PROFINET as a Modbus TCP client

Description of MB_CLIENT

Description

The "MB_CLIENT" instruction communicates as a Modbus TCP client via the PROFINET connection of the S7-1200 CPU. To use the instruction, you do not require any additional hardware module. With the "MB_CLIENT" instruction, you establish a connection between the client and the server, send requests and receive responses and control connection termination of the Modbus TCP server.

Parameters

The following table shows the parameters of the "MB_CLIENT" instruction:

Parameter	Declaration	Data type	Description
REQ (Page 3773)	Input	BOOL	Communication request with the Modbus TCP server The REQ parameter is level-controlled. This means that as long as the input is set (REQ=true), the instruction sends communication requests. • The instance DB for other clients is blocked with the communications request. • Changes to the input parameters will not become effective until the server has responded or an error message has been output. • If the parameter REQ is set again during an ongoing Modbus request, no additional transmission takes place afterwards.
DISCONNECT (Page 3773)	Input	BOOL	With this parameter, you control the establishment and termination of the connection to the Modbus server: • 0: Establish a communications connection to the specified IP address and port number. • 1: Disconnect the communication connection. No other function is executed during connection termination. The value 7003 is output at the STATUS parameter after successful connection termination. The request is sent immediately if the REQ parameter is set during connection establishment.
CONNECT_ID	Input	UINT	Unique ID to identify the connection. Each instance of the instructions "MB_CLIENT" and "MB_SERVER (Page 3778)" must be assigned a unique connection ID.
IP_OCTET_1	Input	USINT	1. Octet of the IP address* of the Modbus TCP server.
IP_OCTET_2	Input	USINT	2. Octet of the IP address* of the Modbus TCP server.
IP_OCTET_3	Input	USINT	3. Octet of the IP address* of the Modbus TCP server.
IP_OCTET_4	Input	USINT	4. Octet of the IP address* of the Modbus TCP server.
IP_PORT	Input	UINT	IP port number of the server to which the client establishes the connection and communicates using the TCP/IP protocol (default value: 502).
MB_MODE (Page 3774)	Input	USINT	Selects the mode of the request (read, write or diagnostics).
MB_DATA_ADDR (Page 3774)	Input	UDINT	Start address of the data accessed by the "MB_CLIENT" instruction.
DATA_LEN	Input	UINT	Data length: Number of bits or words for the data access (see "MB_MODE and MB_DATA_ADDR parameters" - data length).
MB_DATA_PTR (Page 3775)	InOut	VARIANT	Pointer to the Modbus data register: The register is a buffer for the data received from the Modbus server or to be sent to the Modbus server. The pointer must reference a global data block with standard access. The number of bits addressed must be divisible by 8.
DONE	Out	BOOL	The bit at output parameter DONE is set to "1" as soon as the last job is completed without errors.

Parameter	Declaration	Data type	Description
BUSY	Out	BOOL	• 0: No "MB_CLIENT " job in progress • 1: "MB_ CLIENT " job in progress
ERROR	Out	BOOL	• 0: No error • 1: Error occurred. The cause of error is indicated by the STATUS parameter.
STATUS (Page 3776)	Out	WORD	Error code of the instruction.
* 8-bit long component of the 32-bit IPv4 IP address of the Modbus TCP server.			

You can find additional information on valid data types under "Overview of the valid data types (Page 1908)".

Note

Consistent input data during an "MB_CLIENT" call

When a Modbus client calls a Modbus instruction, the status of the input parameters is stored internally and then compared at the next call. The comparison is used to determine whether this particular call initialized the current request. Several "MB_CLIENT" calls can be executed if you use a common instance DB. The values of the input parameters must not be changed while an "MB_CLIENT" instance is being executed. If the input parameters are changed during execution, "MB_CLIENT" cannot be used to check whether or not the instance is currently being executed.

Multiple client connections

A Modbus TCP client can support several TCP connections and the maximum number of connections depends on the CPU being used. The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections. Modbus TCP connections can also be shared by client and/or server connections.

With individual client connections, remember the following rules:

- Each "MB_CLIENT" connection must use a unique instance DB.
- For each "MB_CLIENT" connection, a unique server IP address must be specified.
- Each "MB_CLIENT" connection requires a unique connection ID.
  The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- Unique numbers for the IP port may or may not be required depending on the server configuration.

Static tags of the instruction

The following table describes the editable static tags of the instance data block of the "MB_CLIENT" instruction.

Tag	Data type	Start value	Description
Blocked_Proc_Time-out	REAL	3.0	Wait time in seconds before the static tag ACTIVE is reset if there is a blocked Modbus instance. This can, for example, occur if a client request is output and the execution of the client function aborts before the request was fully executed. The maximum wait time is 55 seconds.
MB_Transaction_ID	WORD	1	Transaction ID of the Modbus TCP protocol. The start value of "1" should only be changed if the Modbus TCP server requires a different value.
MB_Unit_ID	BYTE	255	Modbus device detection: A Modbus TCP server is addressed using its IP address. For this reason, the MB_UNIT_ID parameter is not used in the case of Modbus TCP addressing. The MB_UNIT_ID parameter corresponds to the field of the slave address in the Modbus RTU protocol. If a Modbus TCP server is used as a gateway for a Modbus RTU protocol, the slave device in the serial network can be identified using MB_UNIT_ID. The MB_UNIT_ID parameter would in this case forward the request to the correct Modbus RTU slave address. Please note that some Modbus TCP devices may require the MB_UNIT_ID parameter for the initialization within a limited value range.
RCV_TIMEOUT	REAL	2.0	Time interval in seconds in which the "MB_CLIENT" instruction waits for a response from the server.
Connected	BOOL	0	Indicates whether the connection to the assigned client has been established or not: 1 = connected, 0 = not connected.

MB_CLIENT example 1: Send several requests via a TCP connection (Page 3784)

MB_CLIENT example 2: Send multiple requests via several TCP connections (Page 3785)

MB_CLIENT example 3: Coordinate several requests (Page 3786)

REQ and DISCONNECT parameters

Description

If no instance of the "MB_CLIENT" instruction is executing and if the value of the DISCONNECT parameter is "0", a new job executes if REQ=1. If there is not yet a connection, this is established during execution.

If the same instance of the "MB_CLIENT" instruction executes again (DISCONNECT = 0 and REQ = 1), before the active job was executed, this is not executed on completion of the active job. A new job can only be started on completion of the active job (REQ = 1).

You can monitor the status of execution with the DONE parameter. You can use this to monitor the status of execution if the "MB_CLIENT" instruction is executed sequentially.

Description of MB_CLIENT (Page 3770)

MB_MODE and MB_DATA_ADDR parameters

Description

Instead of a function code, the "MB_CLIENT" instruction uses the MB_MODE parameter. The MB_DATA_ADDR parameter is used to specify the Modbus start address of the data you want to access. The combination of the parameters MB_MODE and MB_DATA_ADDRdefines the function code used in the current Modbus message.

The following table shows the relationship between the MB_MODE parameter, the Modbus function and the address space.

MB_MODE	Modbus function	Data length	Function and data type	MB_DATA_ADDR
0	01	1 to 2000	Read output bits: 1 to 2000 bits per call	1 to 9999
0	02	1 to 2000	Read input bits: 1 to 2000 bits per call	10001 to 19999
0	03	1 to 125	Read holding register: 1 to 125 WORD per call	40001 to 49999
0	04	1 to 125	Read input words: 1 to 125 WORD per call	30001 to 39999
1	05	1	Write an output bit: One bit per call	1 to 9999
1	06	1	Write a holding register: 1 WORD per call	40001 to 49999
1	15	2 to 1968	Write multiple output bits: 2 to 1968 bits per call	1 to 9999
1	16	2 to 123	Write several holding registers: 2 to 123 WORD per call	40001 to 49999
2	15	1 to 1968	Write one or more output bits: 1 to 1968 bits per call	1 to 9999
2	16	1 to 123	Write one or more holding registers: 1 to 123 WORD per call	40001 to 49999

MB_MODE	Modbus function	Data length	Function and data type	MB_DATA_ADDR
11	11	0	Read status word and event counter of server communication: • The status word reflects the the processing status (0 - not processing, 0xFFFF - processing). • The event counter is incremented each time a message is sent successfully. The MB_DATA_ADDR and MB_DATA_LEN parameters of the "MB_CLIENT" instruction are not evaluated when this function executes.	-
80	08	1	Check the server status with the error code 0x0000 (return loop test - the server sends the request back): 1 WORD per call	-
81	08	1	Reset the event counter of the server with the error code 0x000A: 1 WORD per call	
3 to 10, 12 to 79, 82 to 255			Reserved

Description of MB_CLIENT (Page 3770)

MB_DATA_PTR parameter

Description

The MB_DATA_PTR parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. As the data buffer, you can use a global data block or a memory area (M).

For a buffer in the memory area (M), use a pointer in the ANY format as follows: "P#bit address" "data type" "length" (example: P#M1000.0 WORD 500).

The MB_DATA_PTR parameter uses a communications buffer:

- For the communication functions of the "MB_CLIENT" instruction:
  - Reading and writing of 1 bit of data of the Modbus server addresses 00001 to 09999 and 10001 to 19999.
  - Reading of 16-bit WORD data of the Modbus server addresses 30001 to 39999 and 40001 to 49999.
  - Writing 16-bit WORD data of the Modbus server addresses 40001 to 49999.
- During data transmission (length: bit or WORD) from or to the global DB or the memory area (M) that you assigned with the MB_DATA_PTR parameter.

If you use a data block for the buffer in the MB_DATA_PTR parameter, you will need to assign data types to the DB elements.

- Use the 1-bit data type BOOL for a Modbus bit address
- Use a 16-bit data type such as WORD, UINT, INT or REAL for a Modbus WORD address.
- Use a 32-bit data type (double word) such as DWORD, DINT or REAL for two Modbus WORD addresses.
- With MB_DATA_PTR, you can also access complex DB elements such as:
  - Standard arrays
  - Structures with unique element names
  - Complex structures with unique naming of the elements and data type lengths of 16 or 32 bits.
- The data areas for the MB_DATA_PTR parameter can also be in different global data blocks (or in different memory areas). You can, for example, use a data block for the the read jobs and another one for the write jobs or a separate data block for each "MB_CLIENT" station.

Parameter STATUS

Parameter STATUS (general status information)

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active (REQ=0).
7001	First call with REQ=1: Processing started; BUSY has the value 1.
7002	Intermediate call (REQ irrelevant). Processing already active; BUSY has the value 1.
7003	Connection is being terminated.
7004	Connection established and monitored. No job processing active.
7005	Data was sent.
7006	Data was received.
80BB	Invalid value at ACTIVE_EST parameter (identifier for the type of connection establishment, see T_CON_PARAM): • Only passive connection establishment permitted for server (ACTIVE_EST = FALSE). • Only active connection establishment permitted for client (ACTIVE_EST = TRUE).
8380	Received Modbus frame has incorrect format or too few bytes were received.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Parameter STATUS (protocol error)

STATUS* (W#16#)	Code of the response to the Modbus client (B#16#)	Description
8381	01	Function code is not supported.
8382	03	Error in data length.
8383	02	Error in the data address or access outside the address area of MB_DATA_PTR (Page 3775).
8384	03	Error in data value.
8385	03	Error codes of diagnostics not supported (function code 08).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

Parameter STATUS (parameter error)

In addition to the errors listed in the following table, errors are also possible with the "MB_CLIENT" instruction caused by the communications instructions ("TCON", "TDISCON", "TSEND" and "TRCV").

STATUS* (W#16#)	Description
80C8	No response of the server in the defined period. Check the connection to the Modbus server. This error is only reported on completion of the configured repeated attempts. If the "MB_CLIENT" instruction does not receive an answer with the originally transferred transaction ID (MB_TRANSACTION_ID tag) within the defined period, this error code is output.
8188	The MB_MODE parameter has an invalid value.
8189	Invalid addressing of data at the MB_DATA_ADDR parameter.
818A	Invalid data length at the MB_DATA_LEN parameter.
818B	The MB_DATA_PTR parameter has an invalid pointer. You should also check the values of the MB_DATA_ADDR (Page 3774) and MB_DATA_LEN parameters.
818C	• The MB_DATA_PTR (Page 3775) pointer references an an optimized data block. Either use a data block with standard access or a memory area • Timeout at parameter BLOCKED_PROC_TIMEOUT (see static tags of instruction). The limit of 55 seconds has been exceeded.
818D	The transaction ID (MB_TRANSACTION_ID tag) does not correspond to the one sent originally (see static tags of instruction).
8200	• A further Modbus request is currently being processed via the port. • Another instance of MB_CLIENT with the same connection parameters is processing an existing Modbus request.
8380	Received block of transferred Modbus data is not well-formed or too few bytes were received.
8386	Received function code does not match the one sent originally.
8387	• The assigned connection ID is different from that used for previous requests. Only one connection ID can be used for each instance DB of the "MB_CLIENT" instruction. • The error code is also output when the ID of the Modbus TCP protocol received by the server is not "0".

STATUS* (W#16#)	Description
8388	The Modbus server sent a different data length than was requested. This error occurs only when using the Modbus functions 15 or 16.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Note

Error codes of internally used communications instructions.

With the "MB_CLIENT" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND" and "TRCV") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB_CLIENT" instruction. The error codes are displayed for the respective instruction under STATUS in the Static section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

MB_SERVER: Communicating via PROFINET as a Modbus TCP server

Description of MB_SERVER

Description

The "MB_SERVER" instruction communicates as a Modbus TCP server via the PROFINET connection of the S7-1200 CPU. To use the instruction, you do not require any additional hardware module. The "MB_SERVER" instruction processes connection requests of a Modbus TCP client, receives requests from Modbus functions and sends responses.

Notice

Security information

Note that each client of the network is given read and write access to the process image inputs and outputs and to the data block or bit memory area defined by the Modbus holding register.

The option is available to restrict access to an IP address to prevent unauthorized read and write operations. Note, however, that the shared address can also be used for unauthorized access.

Parameters

The following table shows the parameters of the "MB_SERVER" instruction:

Parameter	Declaration	Data type	Description
DISCONNECT	Input	BOOL	The instruction "MB_SERVER" enters into a passive connection with a partner module, which means the server responds to a TCP connection request from each requesting IP address. You can use this parameter to control when a connection request is accepted: • 0: A passive connection is established when there is no communications connection. • 1: Initialization of the connection termination. If the input is set, no other operations are executed. The value 7003 is output at the STATUS parameter after successful connection termination.
CONNECT_ID	Input	UINT	The parameter uniquely identifies a connection within the CPU. Each individual instance of the instructions "MB_CLIENT (Page 3770)" and "MB_SERVER" must have a unique CONNECT_ID parameter.
IP_PORT	Input	UINT	Start value = 502. The number of IP ports defines which IP port is monitored for connection requests of the Modbus client. The following TCP port numbers must not be used for the passive connection of the "MB_SERVER" instruction: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.
MB_HOLD_REG (Page 3782)	InOut	VARIANT	Pointer to the Modbus holding register of the "MB_SERVER" instruction: Use a global data block with standard access as holding register. The holding register contains the values that may be accessed by a Modbus client using the Modbus functions 3 (read), 6 (write) and 16 (read).
NDR	Output	BOOL	"New Data Ready": • 0: No new data • 1: New data written by the Modbus client written
DR	Output	BOOL	"Data Read": • 0: No data read • 1: Data read by the Modbus client
ERROR	Output	BOOL	If an error occurs during the call of the "MB_SERVER" instruction, the output of the ERROR parameter is set to TRUE. Detailed information about the cause of the problem is indicated by the STATUS parameter.
STATUS (Page 3783)	Output	WORD	Error code of the instruction.

You can find additional information on valid data types under "Overview of the valid data types (Page 1908)".

Mapping of Modbus addresses to the process image

The "MB_SERVER" instruction allows incoming Modbus functions (1, 2, 4, 5 and 15) direct read and write access to the process image input and output of the S7-1200 CPU (use of the data types BOOL and WORD).

For the data transfer of the function codes 3, 6 and 16, the holding register (MB_HOLD_REG parameter) must be defined longer than one byte. The following table shows the mapping of the Modbus addresses to the process image of the CPU.

Modbus function						S7-1200	
Code	**Function**	**Data area**	**Address space**			**Data area**	**CPU address**
01	Read: Bits	Output	1	to	8192	Process image output	Q0.0 to Q1023.7
02	Read: Bits	Input	10001	to	18192	Process image input	I0.0 to I1023.7
04	Read: WORD	Input	30001	to	30512	Process image input	IW0 to IW1022
05	Write: Bits	Output	1	to	8192	Process image output	Q0.0 to Q1023.7
15	Write: Bits	Output	1	to	8192	Process image output	Q0.0 to Q1023.7

Incoming Modbus alarms with the function codes 3, 6 and 16 write to or read from the Modbus holding registers (you specify the holding registers with the MB_HOLD_REG parameter).

Multiple server connections

You can create multiple Server connections. This allows a single CPU to establish connections to more than one Modbus TCP client at the same time.

A Modbus TCP server can support several TCP connections and the maximum number of connections depends on the CPU being used.

The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections.

Modbus TCP connections can also be shared by client and/or server connections.

In the case of Server connections, remember the following rules:

- Each "MB_SERVER" connection must use a unique instance DB.
- Each "MB_SERVER" connection must be created with a unique IP port number. Only one connection is supported for each port.
- Each "MB_SERVER" connection must use a unique connection ID.
  The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- For each connection, the "MB_SERVER" instruction must be called individually.

Modbus diagnostics functions

The table below contains a description of the Modbus diagnostics functions.

Code	Subfunction	Description
08	0x0000	Echo test: The "MB_SERVER" instruction receives a data word and returns this unchanged to the Modbus master.
08	0x000A	Reset event counter: The "MB_SERVER" instruction resets the event counter for communication that is used for Modbus function 11.
11	-	Fetch event counter of the communication: The "MB_SERVER" instruction uses an internal event counter for communication to record the number of successfully executed read and write requests sent to the Modbus server. The event counter is not incremented by the functions 8, 11 or broadcast requests. The same applies to requests that result in a communications error (for example parity errors or CRC errors). The broadcast function is not available for Modbus TCP because only one client/server connection can exist at any one time.

Static tags of the instruction

The following table describes the static tags of the instance data block of the "MB_SERVER" instruction used in the program. You can write the HR_Start_Offset tag. You can read the other tags to monitor the Modbus status.

Tag	Data type	Start value	Description
HR_Start_Offset	WORD	0	Assign the start address of the Modbus holding register.
Request_Count	WORD	0	Total number of requests received by the server.
Server_Message_Count	WORD	0	Total number of received alarms for the relevant server.
Xmt_Rcv_Count	WORD	0	Counter for detecting the number of transfers during which an error occurred. The counter is also incremented if an invalid Modbus alarm is received.
Exception_Count	WORD	0	Counter for detecting the number of errors specifically for Modbus cause an exception.
Success_Count	WORD	0	Counter for detecting the number of requests that contain no error in the transferred protocol.
Connected	BOOL	0	Indicates whether the connection to the assigned client has been established or not: 1 = connected, 0 = not connected.

Example: Addressing via static tag HR_Start_Offset

The addresses of the Modbus holding register start at 40001. These addresses correspond to the address space of the CPU memory area for the holding register. You can also define the HR_Start_Offset tag so that the Modbus holding register has a start address other than 40001.

Example: The holding register begins at MW100, and has a length of 100 WORD. An offset value in the HR_Start_Offset parameter means that the start address of the holding register is

moved from 40001 to 40021. Whenever the holding register is addressed below the address 40021 and above the address 40119, this causes an error.

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (WORD)	40001	40099
	S7-1200 address	MW100	MW298
20	Modbus address (WORD)	40021	40119
	S7-1200 address	MW100	MW298

MB_HOLD_REG parameter

Description

The MB_HOLD_REG parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. As the data buffer, you can use a global data block or a memory area (M).

As pointer to a buffer in the memory area (M), use the ANY format as follows: "P#bit address" "data type" "length" (example: P#M1000.0 WORD 500).

The following table shows examples of mapping Modbus addresses to the holding register for the Modbus functions 3 (read WORD), 6 (write WORD) and 16 (write several WORD). The upper limit for the number of addresses in the data block is decided by the maximum work memory of the CPU. If you use a memory area, the upper limit for the addresses is decided by the size of the memory area of the CPU.

Modbus addresses	MB_HOLD_REG parameter - examples		
P#M100.0 WORD 5	P#DB10.DBx0.0 WORD 5	"Recipe".ingredient	
40001	MW100	DB10.DBW0	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	"Recipe".ingredient[5]

Description of MB_SERVER (Page 3778)

Parameter STATUS

Parameter STATUS (general status information)

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active (REQ=0).
7001	First call with REQ=1: Processing started; BUSY has the value 1.
7002	Intermediate call (REQ irrelevant). Processing already active; BUSY has the value 1.
7003	Connection is being terminated.
7004	Connection established and monitored. No job processing active.
7005	Data was sent.
7006	Data was received.
80BB	Invalid value at ACTIVE_EST parameter (identifier for the type of connection establishment, see T_CON_PARAM): • Only passive connection establishment permitted for server (ACTIVE_EST = FALSE). • Only active connection establishment permitted for client (ACTIVE_EST = TRUE).
8380	Received Modbus frame has incorrect format or too few bytes were received.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Parameter STATUS (parameter error)

STATUS* (W#16#)	Code of the response to the Modbus server (B#16#)	Description
8187	No response	The MB_HOLD_REG parameter has an invalid pointer. Data area is too small.
818C	No response	• The MB_HOLD_REG parameter references an an optimized data block. Either use a data block with standard access or a memory area • Error due to timeout of execution (more than 55 seconds).
8381	01	Function code is not supported.
8382	03	Error in data length
8383	02	Error in data address or access outside the address area of the holding register (MB_HOLD_REG (Page 3782) parameter).
8384	03	Error in data value
8385	03	Value of the diagnostic code is not supported (only with function code 08).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

Note

Error codes of internally used communications instructions.

With the "MB_SERVER" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND" and "TRCV") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB_SERVER" instruction. The error codes are displayed for the respective instruction under STATUS in the Static section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

Description of MB_SERVER (Page 3778)

Examples

MB_CLIENT example 1: Send several requests via a TCP connection

Description

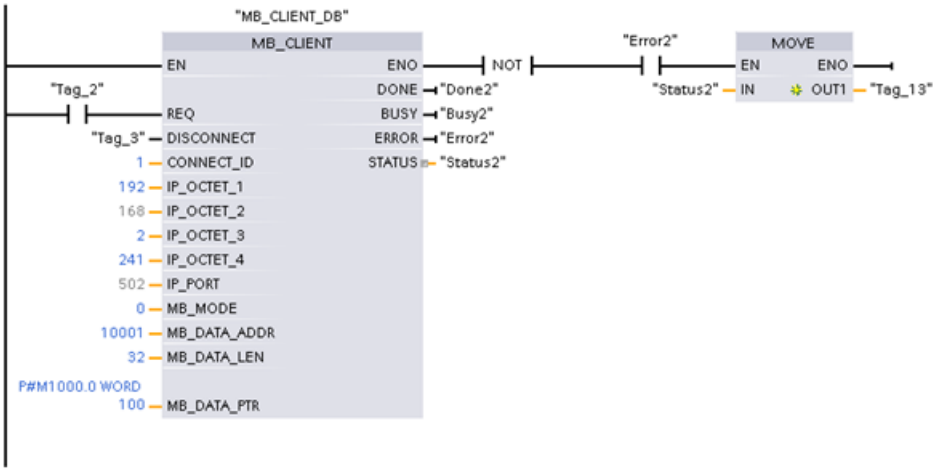
Several requests of the Modbus Client can be sent via a TCP connection. To do this, use the same instance DB, the same connection ID and the same port number.

Only one client can be active at any one time. After processing of a client has been completed, the next client is processed. The order of execution must be defined in the program.

In the following sample program, the value of the STATUS output parameter is also copied.

Network 1: Modbus function 1 - 16 read output bits

Network 2: Modbus function 2 - 32 read input bits



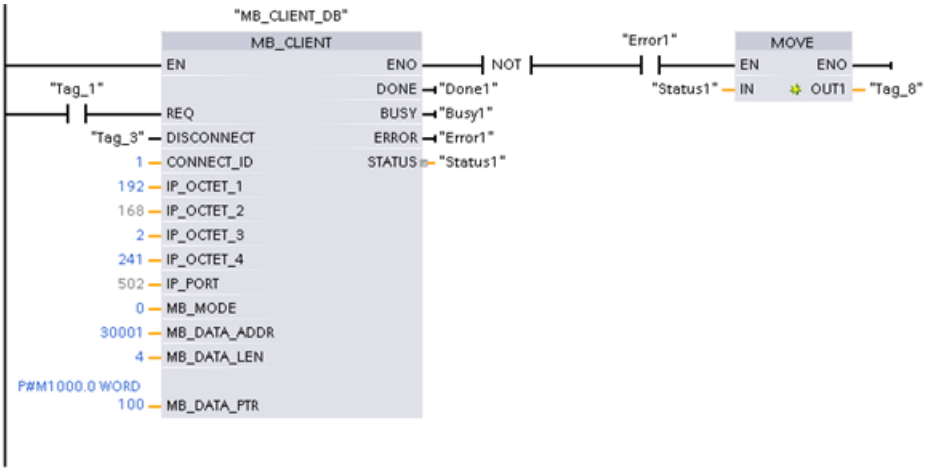
MB_CLIENT example 2: Send multiple requests via several TCP connections

Description

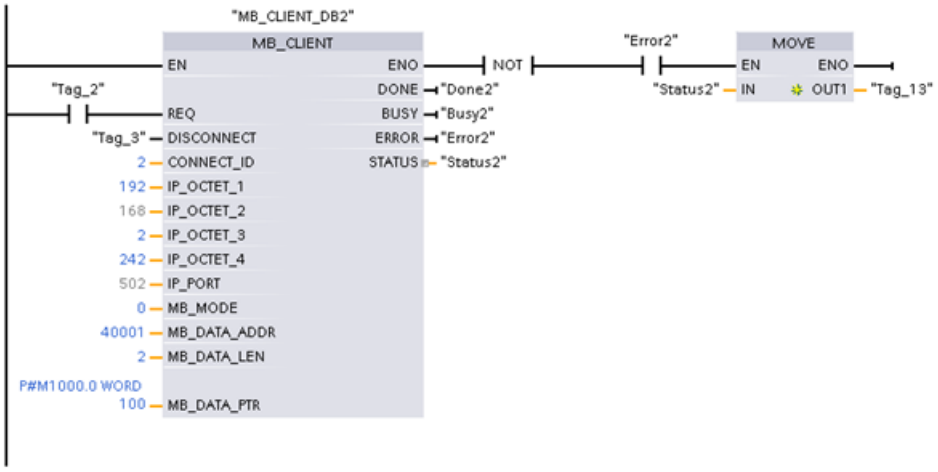
Requests from the Modbus client can be sent via different TCP connections. If you require this, use a different instance DB and a different connection ID.

Use a different port number, if the connections are to the same Modbus server. If the connections are to different Modbus servers, you can freely assign the port number.

Network 1: Modbus function 4 - read input (WORD)



Network 2: Modbus function 3 - read holding register (WORD)

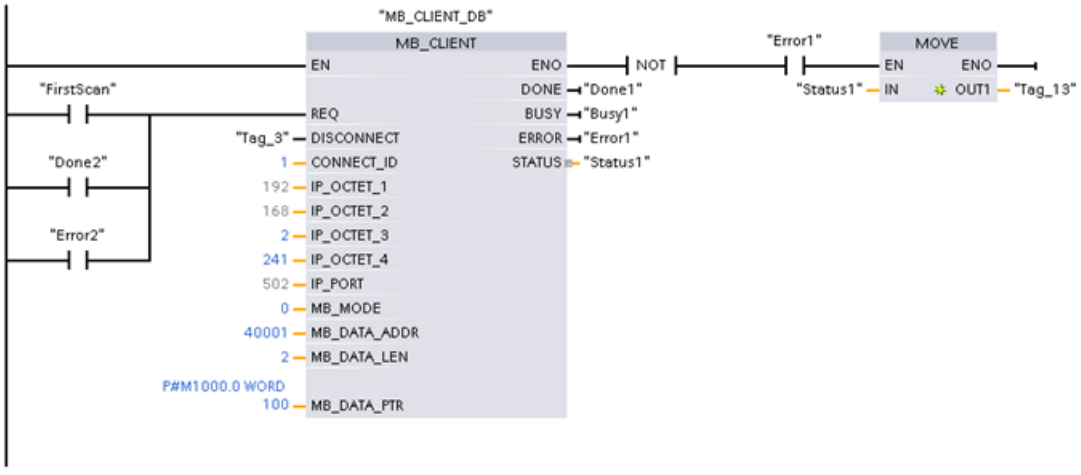


MB_CLIENT example 3: Coordinate several requests

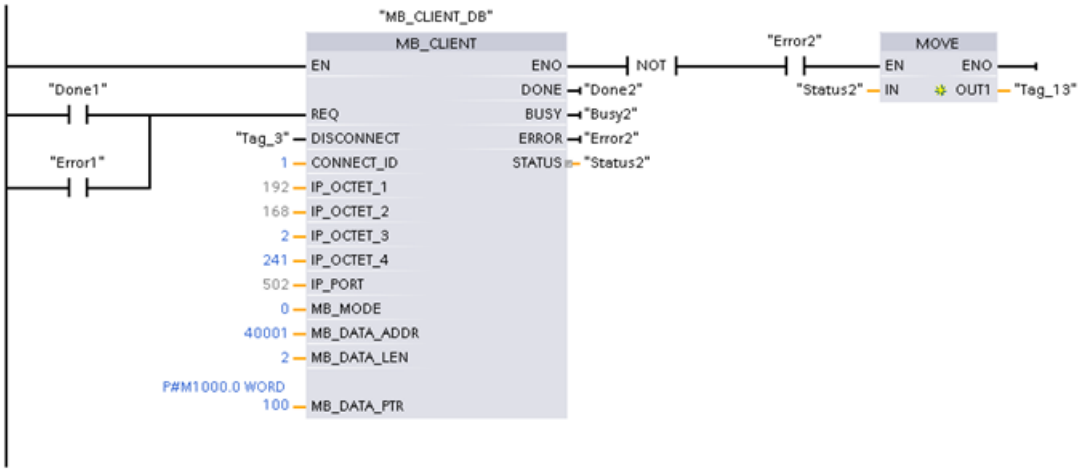
Description

Make sure that the individual Modbus requests are executed. You control coordination of requests with the program. The following example demonstrates how the output parameters of the first and second client request can be used to coordinate execution of the instructions.

Network 1: Modbus function 3 - read holding register (WORD)



Network 2: Modbus function 3 - read holding register (WORD)



MB_SERVER example: Multiple TCP connections

Description

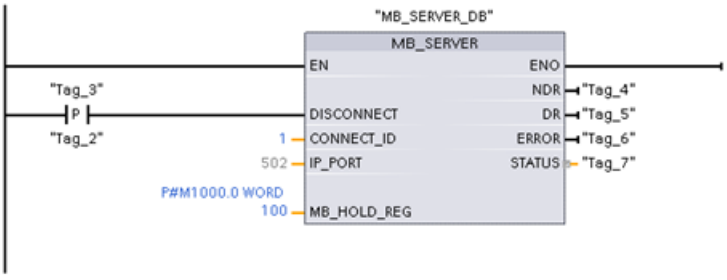
You can use several Modbus TCP server connections. To do this, the "MB_SERVER" instruction must be called independently for each connection.

Every connection requires the following:

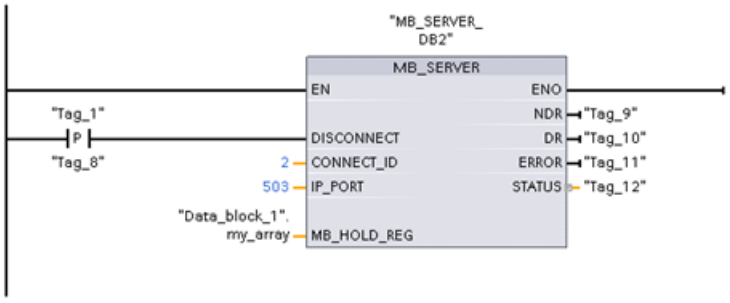
- An independent instance data block of the instruction
- A unique connection ID
- A separate IP port (on the S7-1200, only one connection is permitted per IP port)

To optimize the performance "MB_SERVER" should be executed once per program cycle for each connection.

Network 1: Connection #1 with associated IP port connection ID and instance DB



Network 2: Connection #1 with associated IP port connection ID and instance DB



MODBUS (TCP)

MB_CLIENT: Communicating via PROFINET as a Modbus TCP client

Description of MB_CLIENT

Description

The "MB_CLIENT" instruction communicates as a Modbus TCP client via the PROFINET connection. With the "MB_CLIENT" instruction, you establish a connection between the client and the server, send Modbus requests and receive responses and control connection termination of the Modbus TCP client.

In V3.0 and higher, the "MB_CLIENT" instruction can be used for the S7-1500 as well as for the S7-1200 version 4.0 and higher. The connection can take place via the local interface of the CPU or CM/CP.

To use the instruction, you do not require an additional hardware module.

Multiple client connections

A Modbus TCP client can support several TCP connections and the maximum number of connections depends on the CPU being used. The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections. Modbus TCP connections can also be shared by "MB_CLIENT" and/or "MB_SERVER" instances.

With individual client connections, remember the following rules:

- Each "MB_CLIENT" connection must use a unique instance DB.
- For each "MB_CLIENT" connection, a unique server IP address must be specified.

- Each "MB_CLIENT" connection requires a unique connection ID.
  The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- Unique numbers for the IP port may or may not be required depending on the server configuration.

Parameters

The following table shows the parameters of the "MB_CLIENT" instruction:

Parameter	Declaration	Data type	Description
REQ (Page 3792)	Input	BOOL	Communication request with the Modbus TCP server The REQ parameter is level-controlled. This means that as long as the input is set (REQ=true), the instruction sends communication requests. • The instance DB for other clients is blocked with the communications request. • Changes to the input parameters will not become effective until the server has responded or an error message has been output. • If the parameter REQ is set again during an ongoing Modbus request, no additional transmission takes place afterwards.
DISCONNECT (Page 3792)	Input	BOOL	With this parameter, you control the establishment and termination of the connection to the Modbus server: • 0: Establish communications connection to the connection partner configured at the CONNECT parameter (see CONNECT parameter). • 1: Disconnect the communication connection. No other function is executed during connection termination. The value 0003 is output at the STATUS parameter after successful connection termination. The Modbus request is sent immediately if the REQ parameter is set during connection establishment.
MB_MODE (Page 3792)	Input	USINT	Selects the mode of the Modbus request (read, write or diagnostics).
MB_DATA_ADDR (Page 3792)	Input	UDINT	Start address of the data accessed by the "MB_CLIENT" instruction.
MB_DATA_LEN	Input	UINT	Data length: Number of bits or words for the data access (see "MB_MODE and MB_DATA_ADDR parameters" - data length).
MB_DATA_PTR (Page 3794)	InOut	VARIANT	Pointer to the Modbus data register: The register is a buffer for the data received from the Modbus server or to be sent to the Modbus server. The pointer must reference a global data block with optimized access. The number of bits addressed must be divisible by 8.

Parameter	Declaration	Data type	Description
CONNECT (Page 3795)	InOut	VARIANT	Pointer to the structure of the connection description The following structures (system data types) can be used: • TCON_IP_v4: Includes all address parameters required for establishing a programmed connection. When using TCON_IP_v4, the connection is established when calling the instruction "MB_SERVER". • TCON_Configured: Includes the address parameters of a configured connection. When using TCON_Configured, an existing connection is used that was created by the CPU after download of the hardware configuration.
DONE	Out	BOOL	The bit at output parameter DONE is set to "1" as soon as the last job is completed without errors.
BUSY	Out	BOOL	• 0: No Modbus request in progress • 1: Modbus request being processed The output parameter BUSY is not set during connection establishment and termination.
ERROR	Out	BOOL	• 0: No error • 1: Error occurred. The cause of error is indicated by the STATUS parameter.
STATUS (Page 3797)	Out	WORD	Detailed status information of the instruction.

You can find additional information on valid data types under "Overview of the valid data types (Page 1908)".

Note

Consistent input data during an "MB_CLIENT" call

When a Modbus client instruction is called, the status of the input parameters is stored internally and then compared at the next call. The comparison is used to determine whether this particular call initialized the current request. Several "MB_CLIENT" calls can be executed if you use a common instance DB. The values of the input parameters must not be changed while an "MB_CLIENT" instance is being executed. If the input parameters are changed during execution, "MB_CLIENT" cannot be used to check whether or not the instance is currently being executed.

Static tags of the instruction

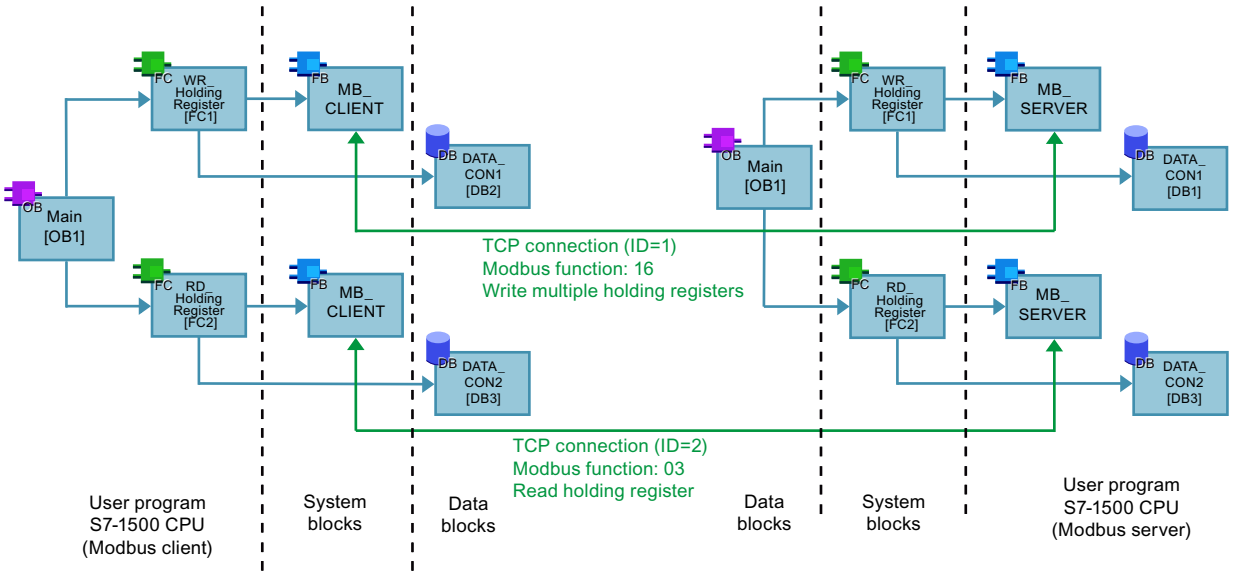
The following table describes the editable static tags of the instance data block of the "MB_CLIENT" instruction.

Tag	Data type	Start value	Description
Blocked_Proc_Time-out	REAL	3.0	Wait time in seconds before the static tag ACTIVE is reset if there is a blocked Modbus instance. This can, for example, occur if a client request is output and the execution of the client function aborts before the request was fully executed. The maximum wait time is 55 seconds.
MB_Transaction_ID	WORD	1	Transaction ID of the Modbus TCP protocol. The start value of "1" should only be changed if the Modbus TCP server requires a different value.
MB_Unit_ID	BYTE	255	Modbus device detection: A Modbus TCP server is addressed using its IP address. For this reason, the MB_UNIT_ID parameter is not used in the case of Modbus TCP addressing. The MB_UNIT_ID parameter corresponds to the field of the slave address in the Modbus RTU protocol. If a Modbus TCP server is used as a gateway for a Modbus RTU protocol, the slave device in the serial network can be identified using MB_UNIT_ID. The MB_UNIT_ID parameter would in this case forward the request to the correct Modbus RTU slave address. Please note that some Modbus TCP devices may require the MB_UNIT_ID parameter for the initialization within a limited value range.
RCV_TIMEOUT	REAL	2.0	Time interval in seconds in which the "MB_CLIENT" instruction waits for a response from the server.
Connected	BOOL	0	Indicates whether the connection to the assigned server has been established or not: 1 = connected, 0 = not connected.

Example

An example project for the Modbus TCP communication between two S7-1500 CPUs can be found in the Service and Support Portal under Entry ID 94766380 (http://support.automation.siemens.com/WW/view/en/94766380).

Two Modbus functions are used in this example. For each Modbus function, a Modbus TCP connection is established using a Modbus block pair (MB_CLIENT and MB_SERVER).



REQ and DISCONNECT parameters

Description

If no instance of the "MB_CLIENT" instruction is executing and if the value of the DISCONNECT parameter is "0", a new job executes if REQ=1. If there is not yet a connection, this is established during execution.

If the same instance of the "MB_CLIENT" instruction executes again (DISCONNECT = 0 and REQ = 1), before the active job was executed, this is not executed on completion of the active job. A new job can only be started on completion of the active job (REQ = 1).

The status of the execution is output by the output parameters. You can use it to monitor the execution status when the "MB_CLIENT" instruction is executed sequentially.

MB_MODE and MB_DATA_ADDR parameters

Description

Instead of a function code, the "MB_CLIENT" instruction uses the MB_MODE parameter. The MB_DATA_ADDR parameter is used to specify the Modbus start address of the data you want to access.

The combination of the parameters MB_MODE, MB_DATA_ADDR and MB_DATA_LEN defines the function code used in the current Modbus message. For example:

- Function code 5
  - MB_MODE=1
  - MB_DATA_ADDR=1
  - MB_DATA_LEN=1
- Function code 15
  - MB_MODE=1
  - MB_DATA_ADDR=1
  - MB_DATA_LEN=2

The following table shows the relationship between the input parameters of the "MB_CLIENT" instruction and the Modbus function.

MB_MODE	MB_DATA_ADDR	MB_DATA_LEN	Modbus function	Function and data type
0	Start address: • 1 to 9999	Data length (bits) per call: • 1 to 2000	01	Read output bits: • 1 to 2000
0	Start address: • 10001 to 19999	Data length (bits) per call: • 1 to 2000	02	Read input bits: • 1 to 2000
0	Start address: • 40001 to 49999 • 400001 to 465535	Data length (WORD) per call: • 1 to 125 • 1 to 125	03	Read holding register: • 0 to 9998 • 0 to 65534
0	Start address: • 30001 to 39999	Data length (WORD) per call: • 1 to 125	04	Read input words: • 0 to 9998
1	Start address: • 1 to 9999	Data length (bits) per call: • 1	05	Writing an output bit: • 0 to 9998
1	Start address: • 40001 to 49999 • 400001 to 465535	Data length (WORD) per call: • 1 • 1	06	Write a holding register: • 0 to 9998 • 0 to 65534
1	Start address: • 1 to 9999	Data length (bits) per call: • 2 to 1968	15	Write multiple output bits: • 0 to 9998

MB_MODE	MB_DATA_ADDR	MB_DATA_LEN	Modbus function	Function and data type
1	Start address: • 40001 to 49999 • 400001 to 465535	Data length (WORD) per call: • 2 to 123 • 2 to 123	16	Write multiple holding registers: • 0 to 9998 • 0 to 65534
2	Start address: • 1 to 9999	Data length (bits) per call: • 1 to 1968	15	Write one or more output bits: • 0 to 9998
2	Start address: • 40001 to 49999 • 400001 to 465535	Data length (WORD) per call: • 1 to 123 • 1 to 123	16	Write one or more holding registers: • 0 to 9998 • 0 to 65534
11	The MB_DATA_ADDR and MB_DATA_LEN parameters are not evaluated when this function is executed.		11	Read status word and event counter of the server: • The status word reflects the the processing status (0 - not processing, 0xFFFF - processing). • The event counter is incremented when the Modbus request was executed successfully. If an error occurred during execution of a Modbus function, a message is sent by the server but the event counter is not incremented.
80	-	Data length (WORD) per call: • 1	08	Check the server status with the diagnostic code 0x0000 (return loop test - the server sends the request back): • 1 WORD per call
81	-	Data length (WORD) per call: • 1	08	Reset the event counter of the server with the diagnostic code 0x000A: • 1 WORD per call
3 to 10, 12 to 79, 82 to 255				Reserved

MB_DATA_PTR parameter

Description

The MB_DATA_PTR parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. As the data buffer, you can use a global data block or a memory area (M).

For a buffer in the memory area (M), use a pointer in the ANY format as follows: "P#bit address" "data type" "length" (example: P#M1000.0 WORD 500).

The MB_DATA_PTR parameter uses a communications buffer:

The communications buffer is used:

- For the communication functions of the "MB_CLIENT" instruction:
  - Reading and writing of 1 bit of data of the Modbus server addresses 00001 to 09999 and 10001 to 19999.
  - Reading of 16-bit WORD data of the Modbus server addresses 30001 to 39999 and 40001 to 49999.
  - Writing of 16-bit WORD data of the Modbus server addresses 40001 to 49999.
- During data transmission (length: bit or WORD) from or to the global DB or the memory area (M) that you assigned with the MB_DATA_PTR parameter.

If you use a data block for the buffer in the MB_DATA_PTR parameter, you will need to assign data types to the DB elements.

- Use the 1-bit data type BOOL for a Modbus bit address
- Use a 16-bit data type such as WORD, UINT, INT or REAL for a Modbus WORD address.
- Use a 32-bit data type (double word) such as DWORD, DINT or REAL for two Modbus WORD addresses.
- With MB_DATA_PTR, you can also access complex DB elements such as:
  - Standard arrays
  - Structures with unique element names
  - Complex structures with unique naming of the elements and data type lengths of 16 or 32 bits.
- The data areas for the MB_DATA_PTR parameter can also be in different global data blocks (or in different memory areas). You can, for example, use a data block for the the read jobs and another one for the write jobs or a separate data block for each "MB_CLIENT" station.

CONNECT parameter

Connection descriptions at CONNECT parameter

Two different connection descriptions can be used for the "MB_CLIENT" instruction:

- Programmed connections with the structure TCON_IP_v4
  The connection parameters are stored in the TCON_IP_v4 structure and the connection is set up with the call of the instruction "MB_CLIENT".
- Configured connections with the structure TCON_Configured
  The configured connection has already been established by the CPU. Use the structure TCON_Configured to specify which existing connection is to be used for the instruction.

Each instance of the instruction "MB_CLIENT" requires a unique connection. Create a separate structure TCON_IP_v4 or TCON_Configured for each instance of the instruction to describe the connection.

Connection description for programmed connections

Use the following structure for connection description to TCON_IP_v4 for programmed connections at the CONNECT parameter:

- Make sure that only connections of the type TCP are specified in the TCON_IP_v4 structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 … 1	InterfaceID	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). The parameter uniquely identifies a connection within the CPU. Each individual instance of the instruction "MB_CLIENT" must use a unique ID.
4	ConnectionType	BYTE	11	Connection type Select 11 (decimal) for TCP. Other connection types are not permitted. If another connection type (e.g. UDP) is used, a corresponding error message is output at the STATUS parameter of the instruction.
5	ActiveEstablished	BOOL	TRUE	ID for the manner in which the connection is established Select TRUE for active connection establishment.
6 … 9	RemoteAddress	ARRAY [1..4] of BYTE	-	IP address of the connection partner (Modbus server), for example, for 192.168.0.1: • addr[1] = 192 • addr[2] = 168 • addr[3] = 0 • addr[4] = 1
10 … 11	RemotePort	UINT	502	Port number of the remote connection partner (value range: 1 to 49151). Use the IP port number of the server to which the client establishes the connection and communicates using the TCP/IP protocol (default value: 502).
12 … 13	LocalPort	UINT	0	Port number of the local connection partner: • Port numbers: 1 to 49151 • Any port: "0"

Note

Migration of the instruction "MB_CLIENT" version 2.1

The parameters CONNECT_ID, IP_PORT and IP_OCTET_x are mapped in version 3.0 of the "MB_CLIENT" instruction in the TCON_IP_v4 structure:

- The parameter CONNECT_ID of the "MB_CLIENT" V2.1 instruction corresponds to the ID parameter of TCON_IP_v4.
- The parameter IP_PORT of the "MB_CLIENT" V2.1 instruction corresponds to the RemotePort parameter of TCON_IP_v4.
- The four parameters IP_OCTET_x of the "MB_CLIENT" V2.1 instruction correspond to the array of the RemoteAddress parameter of TCON_IP_v4.

Connection description for configured connections

For programmed connections at the CONNECT parameter, use the following structure for connection description to TCON_Configured.

- Make sure that only connections of the type TCP are specified in the TCON_Configured structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 … 1	InterfaceId	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). Enter the connection ID of the existing connection.
4	ConnectionType	BYTE	0	Connection type Select 254 (decimal) for a configured connection.

Parameter STATUS

Parameter STATUS (general status information)

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active and no connection established (REQ=0).
7001	Connection establishment triggered.
7002	Intermediate call. Connection is being established.
7003	Connection is being terminated.
7004	Connection established and monitored. No job processing active.

STATUS* (W#16#)	Description
7005	Data is being sent.
7006	Data is being received.
80BB	Invalid value at ActiveEstablished parameter (identifier for the type of connection establishment, see CONNECT parameter (Page 3795)): • Only passive connection establishment permitted for server (ActiveEstablished = FALSE). • Only active connection establishment permitted for client (ActiveEstablished = TRUE).
8380	Received Modbus frame has incorrect format or too few bytes were received.
* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Parameter STATUS (protocol error)

STATUS* (W#16#)	Error code in the error message from MB_SERVER (B#16#)	Description
8381	01	Function code is not supported.
8382	03	Error in data length: • Invalid length specification in received Modbus frame. • The length of the Modbus frame in the frame header does not match the number of received bytes. • The number of bytes does not match the number of actually transmitted bytes (only functions 1-4). • The received start address does not match the one sent originally (functions 5, 6, 15, 16). • The number of words does not match the number of actually transmitted words (only functions 15 and 16).
8383	02	Error reading or writing data or access outside the address area of MB_DATA_PTR (Page 3794). The error can occur locally as well as with the instruction "MB_SERVER".
8384	03	Error in data value: • Error in data value for function 5 (error on server). • A different data value was received than was originally sent by the client (functions 5 and 6) (local error). • Invalid exception code received.
8385	03	Diagnostic code is not supported (function code 08). The error can occur locally as well as on the server.
8386	-	Received function code does not match the one sent originally.
8387	-	• The assigned connection ID is different from that used for previous requests. Only one connection ID can be used for each instance DB of the "MB_CLIENT" instruction. • The error code is also output when the protocol ID of the Modbus TCP frame received by the server is not "0".

STATUS* (W#16#)	Error code in the error message from MB_SERVER (B#16#)	Description
8388	15 or 16	The Modbus server sent a different data length than was requested. This error occurs only when using the Modbus functions 15 or 16.
* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

Parameter STATUS (parameter error)

STATUS* (W#16#)	Description
80B6	Invalid connection type, only TCP connections are supported.
80C8	No response of the server in the defined period. Check the connection to the Modbus server. This error is only reported on completion of the configured repeated attempts. If the "MB_CLIENT" instruction does not receive an answer with the originally transferred transaction ID (see static MB_TRANSACTION_ID tag) within the defined period, this error code is output.
8188	The MB_MODE parameter has an invalid value.
8189	Invalid addressing of data at the MB_DATA_ADDR parameter.
818A	Invalid data length at the MB_DATA_LEN parameter.
818B	The MB_DATA_PTR parameter has an invalid pointer. You should also check the values of the MB_DATA_ADDR (Page 3794) and MB_DATA_LEN parameters.
818C	Timeout at parameter BLOCKED_PROC_TIMEOUT or RCV_TIMEOUT (see static tags of instruction). The limit of 55 seconds has been exceeded.
818D	The transaction ID (MB_TRANSACTION_ID tag) does not correspond to the one sent originally (see static tags of instruction).
8200	• A different Modbus request is currently being processed via the port. • Another instance of MB_CLIENT with the same connection parameters is processing an existing Modbus request.
* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Note

Error codes of internally used communications instructions

With the "MB_CLIENT" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND", "TRCV", "T_DIAG" and "TRESET") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB_CLIENT" instruction. The error codes are displayed for the respective instruction under STATUS in the "Static" section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

GET_ERR_ID: Get error ID locally (Page 2417)

MB_SERVER: Communicating via PROFINET as a Modbus TCP server

Description of MB_SERVER

Description

The "MB_SERVER" instruction communicates as Modbus TCP server via a PROFINET connection. The "MB_SERVER" instruction processes connection requests of a Modbus TCP client, receives and processes Modbus requests and sends responses.

In V3.0 and higher, the "MB_SERVER" instruction can be used for the S7-1500 as well as for the S7-1200 version 4.0 and higher. The connection can take place via the local interface of the CPU or CM/CP.

To use the instruction, you do not require an additional hardware module.

Notice

Security information

Note that each client of the network is given read and write access to the process image inputs and outputs and to the data block or bit memory area defined by the Modbus holding register.

The option is available to restrict access to an IP address to prevent unauthorized read and write operations. Note, however, that the shared address can also be used for unauthorized access.

Multiple server connections

You can create multiple Server connections. This allows a single CPU to accept connections from multiple Modbus TCP clients at the same time.

A Modbus TCP server can support several TCP connections and the maximum number of connections depends on the CPU being used.

The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections.

Modbus TCP connections can also be shared by "MB_CLIENT" and/or "MB_SERVER" instances.

In the case of Server connections, remember the following rules:

- Each "MB_SERVER" connection must use a unique instance DB.
- Each "MB_SERVER" connection must use a unique connection ID.
  The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- For each connection, the "MB_SERVER" instruction must be called individually.

Parameters

The following table shows the parameters of the "MB_SERVER" instruction:

Parameter	Declaration	Data type	Description
DISCONNECT	Input	BOOL	The "MB_SERVER" instruction is used to enter into a passive connection with a partner module. The server responds to a connection request from the IP address which is entered in the SDT "TCON_IP_v4" in the CONNECT parameter. You can use this parameter to control when a connection request is accepted: • 0: A passive connection is established when there is no communications connection. • 1: Initialization of the connection termination. If the input is set, no other operations are executed. The value 0003 is output at the STATUS parameter after successful connection termination.
MB_HOLD_REG (Page 3804)	InOut	VARIANT	Pointer to the Modbus holding register of the "MB_SERVER" instruction The holding register contains the values that may be accessed by a Modbus client using the Modbus functions 3 (read), 6 (write) and 16 (multiple write). As the holding register, use either a global data block with optimized access or the memory area of the bit memories.
CONNECT (Page 3805)	InOut	VARIANT	Pointer to the structure of the connection description The following structures (SDTs) can be used: • TCON_IP_v4: Includes all address parameters required for establishing a programmed connection. The default address is 0.0.0.0 (any IP address), but you can enter a specific IP address so that the server only responds to requests from this address. When using TCON_IP_v4, the connection is established when calling the instruction "MB_SERVER". • TCON_Configured: Includes the address parameters of a configured connection. When using TCON_Configured, the connection is established by the CPU after download of the hardware configuration.
NDR	Output	BOOL	"New Data Ready": • 0: No new data • 1: New data written by the Modbus client written
DR	Output	BOOL	"Data Read": • 0: No data read • 1: Data read by the Modbus client
ERROR	Output	BOOL	If an error occurs during the call of the "MB_SERVER" instruction, the output of the ERROR parameter is set to "1". Detailed information about the cause of the problem is indicated by the STATUS parameter.
STATUS (Page 3807)	Output	WORD	Detailed status information of the instruction.

You can find additional information on valid data types under "Overview of the valid data types (Page 1908)".

Static tags of the instruction

The following table describes the static tags of the instance data block of the "MB_SERVER" instruction used in the program. You can write the HR_Start_Offset tag. You can read the other tags to monitor the Modbus status.

Tag	Data type	Start value	Description
HR_Start_Offset	WORD	0	Assign the start address of the Modbus holding register.
Request_Count	WORD	0	Total number of requests received by the server.
Server_Message_Count	WORD	0	Total number of received alarms for the relevant server.
Xmt_Rcv_Count	WORD	0	Counter for detecting the number of transfers during which an error occurred. The counter is only incremented when an invalid Modbus request is received.
Exception_Count	WORD	0	Counters for detecting the number of errors specifically for Modbus which cause an error message to "MB_CLIENT".
Success_Count	WORD	0	Event counter for detecting the number of requests that were successfully executed by the server.
Connected	BOOL	0	Indicates whether the connection to the assigned client has been established or not: 1 = connected, 0 = not connected.

Mapping of Modbus addresses to the process image

The "MB_SERVER" instruction allows incoming Modbus functions (1, 2, 4, 5 and 15) direct read and write access to the process image inputs and outputs of the CPU (use of the data types BOOL and WORD).

For the data transfer of the function codes 3, 6 and 16, the holding register (MB_HOLD_REG parameter) must be defined longer than one byte. The following table shows the mapping of the Modbus addresses to the process image of the CPU.

Modbus function						S7-1500, S7-1200 V4.0	
Function code	Function	Data area	Address space			Data area	CPU address
01	Read: Bits	Output	1	to	9999	Process image output	Q0.0 to Q1249.6
02	Read: Bits	Input	1	to	9999	Process image input	I0.0 to I1249.6
04	Read: WORD	Input	1	to	9999	Process image input	IW0 to IW19996
05	Write: Bits	Output	1	to	9999	Process image output	Q0.0 to Q1249.6
15	Write: Bits	Output	1	to	9999	Process image output	Q0.0 to Q1249.6

Incoming Modbus requests with the function codes 3, 6, 16 and 23 write to or read from the Modbus holding register (you specify the holding register with the MB_HOLD_REG parameter).

Example: Addressing via static tag HR_Start_Offset

The addresses of the Modbus holding register start at 40001. These addresses correspond to the address space of the CPU memory area for the holding register. You can also define the HR_Start_Offset tag so that the Modbus holding register has a start address other than 40001.

Example: The holding register begins at MW100, and has a length of 100 WORD. An offset value in the HR_Start_Offset parameter means that the start address of the holding register is

moved from 40001 to 40021. Whenever the holding register is addressed below the address 40021 and above the address 40120, this causes an error.

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (WORD)	40001	40100
	CPU address	MW100	MW298
20	Modbus address (WORD)	40021	40120
	CPU address	MW100	MW298

Modbus diagnostics functions

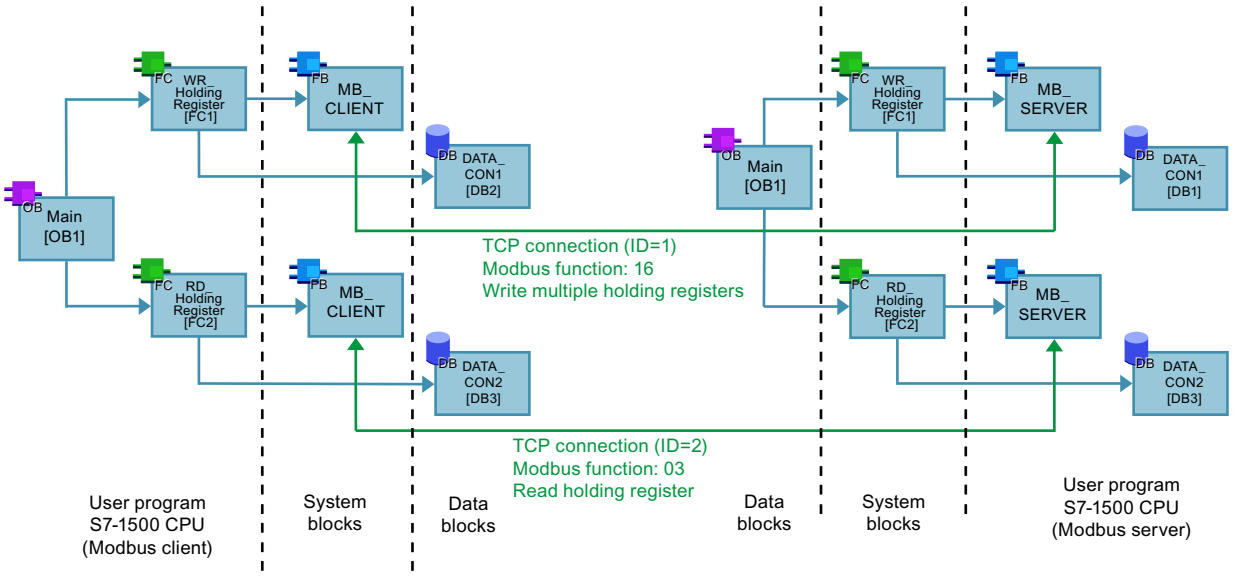
The table below contains a description of the Modbus diagnostics functions.

Function code	Diagnostic code	Description
08	0x0000	Echo test: The "MB_SERVER" instruction receives a data word and returns this unchanged to the Modbus client.
08	0x000A	Reset event counter: The "MB_SERVER" instruction resets the following event counters: "Success_Count", "Xmt_Rcv_Count", "Exception_Count", "Server_Message_Co" and "Request_Count".
11	-	Fetch event counter of the communication: The "MB_SERVER" instruction uses an internal event counter for communication to record the number of successfully executed read and write requests sent to the Modbus server. The event counter is not incremented with the functions 8 or 11. The same holds true for requests that cause a communications error, for example, if a protocol error has occurred (e.g., the function code in the received Modbus request is not supported).

Example

An example project for the Modbus TCP communication between two S7-1500 CPUs can be found in the Service and Support Portal under Entry ID 94766380 (http://support.automation.siemens.com/WW/view/en/94766380).

Two Modbus functions are used in this example. For each Modbus function, a Modbus TCP connection is established using a Modbus block pair (MB_CLIENT and MB_SERVER).



MB_HOLD_REG parameter

Description

The MB_HOLD_REG parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. You can use a global data block or a bit memory (M) as memory area.

- The high limit for the number of addresses in the data block (D) is determined by the maximum work memory of the CPU.
- The high limit for the number of bit memories (M) is determined by the size of the CPU memory area.

The following table shows examples of mapping Modbus addresses to the holding register for the Modbus functions 3 (read WORD), 6 (write WORD), 16 (write several WORD) and 23 (write and read several words).

Modbus addresses	MB_HOLD_REG parameter - examples		
40001	MW100	DB10.DBW0	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	"Recipe".ingredient[5]

CONNECT parameter

Connection descriptions at CONNECT parameter

Two different connection descriptions can be used for the "MB_SERVER" instruction:

- Programmed connections with the structure TCON_IP_v4
  The connection parameters are stored in the TCON_IP_v4 structure and the connection is set up with the call of the instruction "MB_SERVER".
- Configured connections with the structure TCON_Configured
  The configured connection has already been established by the CPU. Use the structure TCON_Configured to specify which existing connection is to be used for the instruction.

Each instance of the instruction "MB_SERVER" requires a unique connection. Create a separate structure TCON_IP_v4 or TCON_Configured for each instance of the instruction to describe the connection.

Connection description for programmed connections

For programmed connections at the CONNECT parameter, use the following structure for connection description to TCON_IP_v4.

- Make sure that only connections of the type TCP are specified in the TCON_IP_v4 structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 … 1	InterfaceID	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). The parameter uniquely identifies a connection within the CPU. Each individual instance of the instruction "MB_SERVER" must use a unique ID.
4	ConnectionType	BYTE	11	Connection type Select 11 (decimal) for TCP. Other connection types are not permitted. If another connection type (e.g. UDP) is used, a corresponding error message is output at the STATUS parameter of the instruction.
5	ActiveEstablished	BOOL	FALSE	ID for the manner in which the connection is established Select FALSE for passive connection establishment.
6 … 9	RemoteAddress	ARRAY [1..4] of BYTE	0.0.0.0	IP address of the connection partner, for example, for 192.168.0.1: • addr[1] = 192 • addr[2] = 168 • addr[3] = 0 • addr[4] = 1 If the instruction "MB_SERVER" is to accept connection requests from any connection partner, use "0.0.0.0" as IP address.

Byte	Parameter	Data type	Start value	Description
10 … 11	RemotePort	UINT	0	Port number of the remote connection partner (value range: 1 to 49151). If the instruction "MB_SERVER" is to accept connection requests from any remote partner, use "0" as port number.
12 … 13	LocalPort	UINT	502	Port number of the local connection partner (value range: 1 to 49151). The number of the IP port defines which IP port is monitored for connection requests of the Modbus client. The following TCP port numbers must not be used for the passive connection of the "MB_SERVER" instruction: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Note

Migration of the instruction "MB_SERVER" version 2.1

The parameters CONNECT_ID and IP_PORT are mapped in version 3.0 of the "MB_SERVER" instruction in the TCON_IP_v4 structure:

- The parameter CONNECT_ID of the "MB_SERVER" V2.1 instruction corresponds to the ID parameter of TCON_IP_v4.
- The parameter IP_PORT of the "MB_SERVER" V2.1 instruction corresponds to the LocalPort parameter of TCON_IP_v4.

Connection description for configured connections

For configured connections at the CONNECT parameter, use the following structure for connection description to TCON_Configured.

- Make sure that only connections of the type TCP are specified in the TCON_Configured structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 … 1	InterfaceID	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). Enter the connection ID of the existing connection.
4	ConnectionType	BYTE	-	Connection type Select 254 (decimal) for a configured connection.

Parameter STATUS

Parameter STATUS (general status information)

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active (REQ=0).
7001	First call. Connection establishment triggered.
7002	Intermediate call. Connection is being established.
7003	Connection is being terminated.
7005	Data is being sent.
7006	Data is being received.
80BB	Invalid value at ActiveEstablished parameter (identifier for the type of connection establishment, see CONNECT parameter (Page 3805)): • Only passive connection establishment permitted for server (active_established = FALSE). • Only active connection establishment permitted for client (active_established = TRUE).
8380	Received Modbus frame has incorrect format or too few bytes were received.
* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Parameter STATUS (parameter error)

STATUS* (W#16#)	Error code in the error message from "MB_SERVER" (B#16#)	Description
8187	No response	The MB_HOLD_REG parameter has an invalid pointer. Data area is too small.
8381	01	Function code is not supported.
8382	03	Error in data length: • Invalid length specification in received Modbus frame • The frame length entered in the header of the Modbus frame does not match the number of actually received bytes. • The number of bytes entered in the header of the Modbus frame does not match the number of actually received bytes (functions 15 and 16).
8383	02	Error in data address or access outside the address area of the holding register (MB_HOLD_REG (Page 3804) parameter).
8384	03	Invalid data value (function 5).
8385	03	Diagnostic code is not supported (only with function code 08).
* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

Note

Error codes of internally used communications instructions

With the "MB_SERVER" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND", "TRCV", "T_DIAG" and "T_RESET") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB_SERVER" instruction. The error codes are displayed for the respective instruction under STATUS in the "Static" section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

Instructions for FTP services

FTP_CMD for FTP services

Overview of FTP_CMD

Meaning

Using the FTP_CMD instruction, you can establish FTP connections and transfer files from and to an FTP server.

Data transfer is possible using FTP or FTPS (secure SSL connections).

Note

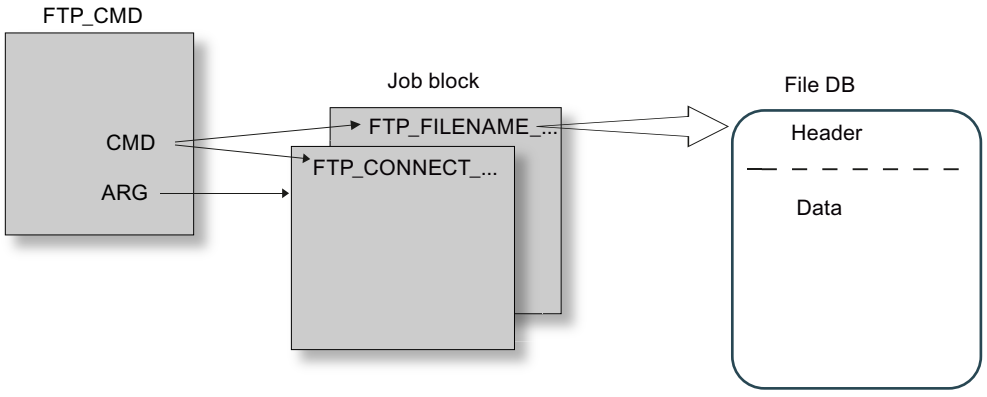
FTPS: Comparing certificates

FTPS requires a comparison of the certificates between FTP server and FTP client. If the FTP server is configured outside the STEP 7 project of the FTP client, the certificate needs to be imported from the FTP server. Import the certificate of the FTP server as a trusted certificate in the certificate manager.

How it works

The FTP_CMD instruction references a job block (ARG) in which the FTP command is specified. Depending on the type of FTP command (CMD), this job block uses different data structures for parameter assignment. Suitable data types (UDTs) are available for these various structures.

The following diagram shows the call structure:



Job blocks

The following data structures are used for the job blocks:

- Connection establishment
  Various data structures are available for the connection establishment using the following types of access:
  - FTP_CONNECT_IPV4: Connection establishment with IP addresses according to IPv4
  - FTP_CONNECT_IPV6: Connection establishment with IP addresses according to IPv6
  - FTP_CONNECT_NAME; Connection establishment with server name (DNS)
- Data transfer
  For the data transfer, two different data structures are available:
  - FTP_FILENAME: Data structure for access to a complete file
  - FTP_FILENAME_PART: Data structure for read access to a data area

Data transfer in the File_DB

The data transfer is achieved using data blocks containing a header for job data and the area for the user data. The data block is specified in the job buffer.

Requirements in the CPU configuration

Use the following settings to allow FTP access:

- In the configuration data of the CPU in "Properties > General > Protection": Disable the "Disable PUT/GET communication" option.
- For all data blocks being used as file DBs, disable the "Optimized block access" attribute

Validity

The FTP_CMD instruction can be used with the following module types:

- CP 1543-1

Call interface

Call interface in FBD representation

Output parameters and status information FTP_CMD (Page 3817)

Input parameter - FTP_CMD (Page 3810)

Structure of the data blocks (file DBs) for FTP services - FTP client mode (Page 3821)

Input parameter - FTP_CMD

Explanation of the input parameters

You supply the FTP_CMD instruction with the following input parameters:

Table 11-102 Formal parameters of the FTP_CMD instruction - input parameters

Parameter	Declaration	Data type	Memory area	Meaning / remarks
REQ	Input	BOOL	I, Q, M, D, L	Starts the send job on a rising edge.
ID *	INPUT	INT	1, 2 ... 64	The FTP jobs are handled on FTP connections. The parameter identifies the connection being used.

Parameter	Declaration	Data type	Memory area	Meaning / remarks
CMD *	INPUT	BYTE	See following table "Commands".	FTP command to be executed when the instruction is called. You will find value ranges for the FTP command types after the table. Note: The FTP command specified here must be specified identically in the job block (ARG parameter). If a command is not supported by the CP firmware, an error message with STATUS = $8F6B_H$ is output.
ARG *	INPUT	VARIANT	See following table "Commands".	Job block References the data area with the execution parameters suitable for the FTP command. Specific data types (UDT) are used depending on the FTP command. The UDTs are shown below. The ANY data type is not permitted for the pointer to be specified here!

* The values of the input parameters "ID" and "CMD" overwrite the value of the input parameter "ARG".

FTP commands in the "CMD" parameter

The following table shows you the significance of the commands of the "CMD" parameter and which UDTs you use to supply the job blocks.

Table 11-103 Command types

CMD (command type)	Relevant job blocks / UDT	Meaning / handling
0 (NOOP)	*	The called FC does not execute any action. The status codes are set as follows when these parameters are supplied: DONE=1; ERROR=0; STATUS=0
1 (CONNECT)	FTP_CONNECT_IPV4 FTP_CONNECT_IPV6 FTP_CONNECT_NAME	FTP connection establishment With this command, the FTP client establishes an FTP connection to an FTP server (port 21). The connection is available under the connection ID specified here for all further FTP commands. Data is then exchanged with the FTP server specified for this user.
2 (STORE)	FTP_FILENAME	This function call transfers a data block (file DB) from the FTP client (S7-CPU) to the FTP server. Caution: If the file (file DB) already exists on the FTP server, it will be overwritten.
3 (RETRIEVE)	FTP_FILENAME	This function call transfers a file from the FTP server to the FTP client (S7-CPU). Caution: If the data block (file DB) on the FTP client already contains a file, it will be overwritten.
4 (DELETE)	FTP_FILENAME	With this function call, you delete a file on the FTP server.
5 (QUIT)	*	With this function call, you establish the FTP connections selected with the ID.

CMD (command type)	Relevant job blocks / UDT	Meaning / handling
6 (APPEND)	FTP_FILENAME	Similar to "STORE", the "APPEND" command saves a file on the FTP server. With "APPEND", the file on the FTP server is, however, not overwritten. The new content is appended to the existing file. If the file (file DB) does not exist on the FTP server, it will be created.
7 (RETR_PART)	FTP_FILENAME_PART	Using the "RETR_PART" command (retrieve part) , you can request a section of a file from the FTP server. If very large files are involved, this allows you to restrict the read to the part you currently require. To do this, you need to know the structure of the file. Enter the required part of the file using the two parameters "OFFSET" and "LEN" in FB40.

***** With the command types 0 (NOOP) and 5 (QUIT) a freely selectable job block (UDT) must be specified. This is not evaluated.

Overview of FTP_CMD (Page 3808)

Job blocks for FTP_CMD

Meaning

You supply the FTP_CMD instruction with a job block using the ARG parameter. The structure depends on the FTP command type. By using the default data types (UDT), the instruction recognizes the type of the job block. Below, you will find the relevant data types (UDTs) for the following job blocks:

- FTP connection establishment with IP address according to IPv4
- FTP connection establishment with IP address according to IPv6
- FTP connection establishment with server name
- Write and read access and other FTP commands
- FTP command RETR_PART

Job block for FTP connection establishment with IP address according to IPv4

For FTP connection establishment with IP address according to IPv4, the following data structure is used.

Table 11-104 FTP_CONNECT_IPV4

Parameter	Type	Range of values	Meaning / remarks
InterfaceID	HW_ANY		Module start address When you call an instruction, you transfer the module start address of the CP in the LADDR parameter. You will find the module start address of the CP in the configuration of the CP under: "Properties>Addresses>Inputs"
ID	CONN_OUC	1, 2...64	The FTP jobs are handled on FTP connections. The parameter identifies the connection being used.
ConnectionType	BYTE	0	Connection type "FTP"
ActiveEstablishment	BOOL	TRUE	
FTPCmd	BYTE	1	FTP command "CONNECT" FTP command that executes when the instruction is called. You will find the ranges of values in Table 11-103 Command types (Page 3811) Note: The FTP command specified here must be specified identically in the CMD input parameter.
CertIndex	BYTE	0 = FTP 1 = FTPS	Here, choose between the protocol types FTP or FTPS. Note on FTPS: If the FTP server is configured outside the STEP 7 project of the FTP client, the certificate needs to be imported from the FTP server.
UserName	STRING[32]	'benutzer'	User name for the login on the FTP server
Password	STRING[32]	'passwort'	Password for the login on the FTP server
FTPserverIPaddr	IP_V4	ADDR(1) ... ADDR(4)	IP address of the FTP server as Array[1..4] of Byte, where 1 byte specifies one block of the address. Example: ADDR(1) specifies the first address block (the first byte of the address).

Job block for FTP connection establishment with IP address according to IPv6

For FTP connection establishment with IP address according to IPv6, the following data structure is used.

Table 11-105 FTP_CONNECT_IPV6

Parameter	Type	Range of values	Meaning / remarks
InterfaceID	HW_ANY		Module start address When you call an instruction, you transfer the module start address of the CP in the LADDR parameter. You will find the module start address of the CP in the configuration of the CP under: "Properties>Addresses>Inputs"
ID	CONN_OUC	1, 2...64	The FTP jobs are handled on FTP connections. The parameter identifies the connection being used.
ConnectionType	BYTE	0	Connection type "FTP"
ActiveEstablishment	BOOL	TRUE	
FTPCmd	BYTE	1	FTP command "CONNECT" FTP command that executes when the instruction is called. You will find the ranges of values in Table 11-103 Command types (Page 3811) Note: The FTP command specified here must be specified identically in the CMD input parameter.
CertIndex	BYTE	0 = FTP 1 = FTPS	Here, choose between the protocol types FTP or FTPS. Note on FTPS: If the FTP server is configured outside the STEP 7 project of the FTP client, the certificate needs to be imported from the FTP server.
UserName	STRING[32]	'user'	User name for the login on the FTP server
Password	STRING[32]	'password'	Password for the login on the FTP server
FTPserverIPaddr	IP_V6	ADDR(1) ... ADDR(16)	IP address of the FTP server as Array[1..16] of Byte, where 2 bytes specify one block of the address. Example: ADDR(1) + ADDR(2) specify the first address block.

Job block for FTP connection establishment with server name

For FTP connection establishment specifying the server name, the following data structure is used. The server name is assigned to an IP address using DNS.

Table 11-106 FTP_CONNECT_NAME

Parameter	Type	Range of values	Meaning / remarks
InterfaceID	HW_ANY		Module start address When you call an instruction, you transfer the module start address of the CP in the LADDR parameter. You will find the module start address of the CP in the configuration of the CP under: "Properties>Addresses>Inputs"
ID	CONN_OUC	1, 2...64	The FTP jobs are handled on FTP connections. The parameter identifies the connection being used.
ConnectionType	BYTE	0	Connection type "FTP"
ActiveEstablishment	BOOL	TRUE	
FTPcmd	BYTE	1	FTP command "CONNECT" FTP command that executes when the instruction is called. You will find the ranges of values in Table 11-103 Command types (Page 3811) Note: The FTP command specified here must be specified identically in the CMD input parameter.
CertIndex	BYTE	0 = FTP 1 = FTPS	Here, choose between the protocol types FTP or FTPS. Note on FTPS: If the FTP server is configured outside the STEP 7 project of the FTP client, the certificate needs to be imported from the FTP server.
UserName	STRING[32]	'benutzer'	User name for the login on the FTP server
Password	STRING[32]	'passwort'	Password for the login on the FTP server
FTPserverName	STRING[254]		IP address of the FTP server

Job block for write and read access and other FTP commands

The following data structure is used for the FTP commands store, retrieve, delete and append.

Table 11-107 FTP_FILENAME

Parameter	Type	Range of values	Meaning / remarks
InterfaceID	HW_ANY		Module start address When you call an instruction, you transfer the module start address of the CP in the LADDR parameter. You will find the module start address of the CP in the configuration of the CP under: "Properties>Addresses>Inputs"
ID	CONN_OUC	1, 2...64	The FTP jobs are handled on FTP connections. The parameter identifies the connection being used.
ConnectionType	BYTE	0	Connection type "FTP"
ActiveEstablishment	BOOL	TRUE	

Parameter	Type	Range of values	Meaning / remarks
FTPcmd	BYTE	2, 3, 4, 6	FTP command "STORE / RETRIEVE / DELETE / APPEND" FTP command that executes when the instruction is called. You will find the ranges of values in Table 11-103 Command types (Page 3811) Note: The FTP command specified here must be specified identically in the CMD input parameter.
CertIndex	BYTE	0 = FTP 1 = FTPS	Here, choose between the protocol types FTP or FTPS. Note on FTPS: If the FTP server is configured outside the STEP 7 project of the FTP client, the certificate needs to be imported from the FTP server.
DataBlockNumber	UINT		The data block specified here contains the file DB to be read / written.
LenFilename	UINT	0...1000	The "LenFilename" parameter for specifying the total length of the file name is not evaluated. Instead the length information in the string of the "Filename" parameter is evaluated.
Filename	ARRAY[0..3] OF STRING[220]		File name of the destination or source file.

Job block for the RETR_PART FTP command

The following data structure is used for the RETR_PART FTP command.

Table 11-108 FTP_FILENAME_PART

Parameter	Type	Range of values	Meaning / remarks
InterfaceID	HW_ANY		Module start address When you call an instruction, you transfer the module start address of the CP in the LADDR parameter. You will find the module start address of the CP in the configuration of the CP under: "Properties>Addresses>Inputs"
ID	CONN_OUC	1, 2...64	The FTP jobs are handled on FTP connections. The parameter identifies the connection being used.
ConnectionType	BYTE	0	Connection type "FTP"
ActiveEstablishment	BOOL	TRUE	
FTPcmd	BYTE	7	FTP command "RETR_PART" FTP command that is executed when the instruction is called. You will find value ranges in Table 11-103 Command types (Page 3811) Note: The FTP command specified here must be specified identically in the CMD input parameter.

Parameter	Type	Range of values	Meaning / remarks
CertIndex	BYTE	0 = FTP 1 = FTPS	Here, choose between the protocol types FTP or FTPS. Note on FTPS: If the FTP server is configured outside the STEP 7 project of the FTP client, the certificate needs to be imported from the FTP server.
Offset	DWORD		Offset in bytes starting at which the file will be read.
Length	DWORD		Sublength in bytes that is read starting at the value specified in "OFFSET". Special features: • If "DW#16#FFFFFFFF" is specified, the available rest of the file will be read. Result OK (DONE = 1, STATUS = 0) if no other error occurred. • When OFFSET > length of the original file: Length of the destination file (ACT_LENGTH in file DB): 0 bytes on the CPU. Result OK (DONE = 1, STATUS = 0) if no other error occurred. • When OFFSET + LEN > length of the original file (and LEN ≠ 0xFFFFFFFF): Length of the destination file (ACT_LENGTH in file DB): Available bytes starting at "OFFSET". Result OK (DONE = 1, STATUS = 0) if no other error occurred.
DataBlockNumber	UINT		The data block specified here contains the file DB to be read / written.
LenFilename	UINT	0...1000	The "LenFilename" parameter for specifying the total length of the file name is not evaluated. Instead the length information in the string of the "Filename" parameter is evaluated.
Filename	ARRAY[0..3] OF STRING[220]		File name of the destination or source file.

Overview of FTP_CMD (Page 3808)

Input parameter - FTP_CMD (Page 3810)

Output parameters and status information FTP_CMD

Parameters BUSY, DONE and ERROR

You control the execution status with the parameters BUSY, DONE, ERROR and STATUS. The BUSY parameter indicates the processing status. With the DONE parameter, you check whether or not a job was correctly executed. The ERROR parameter is set if errors occur during execution of "FTP_CMD". Error information is output in the STATUS parameter.

The following table shows the relationship between the parameters BUSY, DONE and ERROR:

BUSY	DONE	ERROR	Description
1	-	-	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job was terminated with an error. The cause of the error is specified in the STATUS parameter.
0	0	0	No new job was assigned.

Evaluating status codes

Note

For entries coded with 8FxxH in STATUS, refer to the information in the STEP 7 Standard and System Functions reference manual. The chapter describing error evaluation with the RET_VAL output parameter contains detailed information.

Table 11-109 FTP_CMD: Meaning of the STATUS parameter in conjunction with DONE and ERROR

DONE	ERROR	STATUS	Meaning
0	0	0000_H	No job is being executed.
1	0	0000_H	the job was completed without error.
0	0	7001_H	The job was triggered the first time (BUSY=1)
0	0	7002_H	The job is still being executed (BUSY=1)
0	0	$80C4_H$	Communication error (occurs temporarily, it is usually best to repeat the job in the user program).
0	0	8183_H	The configuration does not match the job parameters.
0	1	8401_H	Unknown error Possible causes: • A timeout was detected on the connection. • The FTP server has aborted the connection. Remedy: • Send the QUIT and CONNECT commands again to re-establish the connection.
0	1	8402_H	The connection has an error status. The timeout of the connection may have been exceeded or the FTP server may have terminated the connection. Remedy: Send the QUIT and CONNECT commands to re-establish the connection.
0	1	8403_H	Login has failed.
0	1	8404_H	FTP server is not obtainable.
0	1	8405_H	Transfer has failed.

DONE	ERROR	STATUS	Meaning
0	1	8406_H	Timeout for current action
0	1	8407_H	File was not found on the FTP server.
0	1	8408_H	Transfer not possible.
0	1	8409_H	File could not be fetched.
0	1	8410_H	Setting the TCP port for the data connection has failed.
0	1	8411_H	Offset information does not match.
0	1	8412_H	Error changing the specified directory
0	1	8413_H	Error receiving data
0	1	8414_H	Error sending data
0	1	8415_H	Specified CMD (command type) was rejected by the client.
0	1	8416_H	Connection was closed by the FTP server.
0	1	8418_H	Error in the user data. Possible causes: • File name is empty. • Data length is "0" • etc.
0	1	8419_H	There is no socket resource for opening a data connection.
0	1	8420_H	There is no socket resource for opening a control connection.
0	1	8421_H	Error opening the file DB to be read.
0	1	8422_H	Error opening the file DB to be written.
0	1	8423_H	Connection establishment to the FTP server has failed.
0	1	8424_H	Internal error
0	1	8425_H	Format error in the domain name
0	1	8426_H	There are too many DNS queries pending.
0	1	8427_H	The specified DNS server could not assign the specified domain name.
0	1	8428_H	There is no connection resource available.
0	1	8429_H	Unknown channel ID
0	1	8430_H	The file DB is too short.
0	1	8431_H	Error when writing to the file DB.
0	1	8432_H	Error when reading from the file DB.
0	1	8433_H	Error when accessing the file DB.
0	1	8434_H	Action was aborted.
0	1	8435_H	Channel will be reset.
0	1	8436_H	Unexpected server reply
0	1	8437_H	Certificate could not be verified.
0	1	8438_H	Unknown error occurred
0	1	8439_H	The FTP command causes an error. The cause must be looked for on the FTP server (REST command).
0	1	8440_H	The FTP server does not support the requested SSL protocol.
0	1	8446_H	After the FTP password was sent to the FTP server, an unexpected code was returned by the FTP server.
0	1	8451_H	An error was signaled when attempting to change the transmission mode from binary to ASCII.

DONE	ERROR	STATUS	Meaning
0	1	8455_H	A memory request has failed on the CM/CP.
0	1	8460_H	A problem has occurred handling SSL/TLS.
0	1	8469_H	Interface error The specified output interface could not be used. Remedy: Set the interface to be used for outgoing connections.
0	1	8475_H	The SSL certificate or the SSH md5 fingerprint was not considered trusted.
0	1	8476_H	Nothing was received from the FTP server. In the current status, an incorrect response must be assumed.
0	1	8477_H	The specified "Crypto engine" (cryptographic module) was not found.
0	1	8478_H	The attempt to set the selected SSL "Crypto engine" as the default failed.
0	1	8480_H	A problem has occurred with the certificate of the FTP client.
0	1	8481_H	The specified number could not be used.
0	1	8482_H	The FTP server uses a coding that is not supported.
0	1	8484_H	The maximum file size was exceeded.
0	1	8485_H	The file DB was modified while being processed to be sent or the file DB is incorrectly structured.
0	1	8489_H	Data could not be sent. There is not enough memory available for the action on the FTP server.
0	1	8492_H	The file already exists. The file will not be overwritten.
0	1	8496_H	A problem occurred reading the SSL CA certificate.
0	1	8497_H	An unexpected error occurred in the SSH session.
0	1	8498_H	It was not possible to terminate the SSL connection.
0	1	8499_H	The socket is not ready for sending/receiving. Wait until it is ready and try again.
0	1	8501_H	The SSL certificate check by the FTP server has failed.
0	1	8507_H	A timeout has occurred establishing the connection during the active FTP session while waiting for the FTP server.
0	1	$8F55_H$	Header status bit: Locked
0	1	$8F56_H$	The NEW bit in the file DB header was not reset
0	1	$8F6B_H$	Possible causes: • Bad value for the CMD parameter Values from 0 to 15 are permitted. • An FB40 command is not supported. Possible cause: Wrong firmware on the CP Remedy: Firmware update (with older CPs, use the functions FC 40...FC 44 instead of FB 40.)
0	1	$8F7F_H$	Internal error, for example illegal ANY reference

Overview of FTP_CMD (Page 3808)

Structure and use of the file DB - FTP client mode

Structure of the data blocks (file DBs) for FTP services - FTP client mode

How it works

To transfer data with FTP, create data blocks (file DBs) on the CPU of your S7 station. These data blocks must have certain structure to allow them to be handled as transferable files by the FTP services. They consist of the following sections:

- Section 1: File DB header (has a fixed length of 20 bytes)
- Section 2: User data (has a variable length and structure)

Requirements in the CPU configuration

Use the following settings to allow FTP access:

- In the configuration data of the CPU in "Properties > General > Protection": Disable the "Disable PUT/GET communication" option.
- For all data blocks being used as file DBs, disable the "Optimized block access" attribute.

File DB header for FTP client mode

Note: The file DB header described here is largely identical to the file DB header for server mode. The differences relate to the following parameters:

- WRITE_ACCESS
- FTP_REPLY_CODE

Parameter	Type	Value / meaning	Supply
EXIST	BOOL	The EXIST bit indicates whether the user data area contains valid data. The retrieve FTP command executes the job only when EXIST=1. • 0: The file DB does not contain valid user data (file does not exist). • 1: The file DB contains valid user data (file exists).	The DELETE FTP command sets EXIST=0. The STORE FTP command sets EXIST=1.
LOCKED	BOOL	The LOCKED bit is used to restrict access to the file DB. • 0: The file DB can be accessed. • 1: The file DB is locked.	The "STORE" and "RETRIEVE" FTP commands set LOCKED=1 when they are executed. The user program on the S7 CPU can set or reset LOCKED during write access to achieve data consistency. Recommended sequence in the user program: 1. Check LOCKED bit (if = 0) 2. Set WRITEACCESS bit = 0 3. Check LOCKED bit (if = 0) 4. Set LOCKED bit = 1 5. Write data 6. Set LOCKED bit = 0
NEW	BOOL	The NEW bit indicates whether data has been modified since the last read access. • 0: The content of the file DB is unchanged since the last write access. The user program of the S7 CPU has registered the last modification. • 1: The user program of the S7 CPU has not yet registered the last write access.	After execution, the stor FTP command sets NEW=1 After reading the data, the user program in the S7-CPU must set NEW=0 to allow a new "RETRIEVE" command.
WRITE_ACCESS	BOOL	• 0: The user program (FTP client blocks) has write access rights for the file DBs on the S7 CPU. • 1: The user program (FTP client blocks) has no write access rights for the file DBs on the S7 CPU.	During the configuration of the DB, the bit is set to an initialization value. Recommendation: Whenever possible, the bit should remain unchanged! In special situations, adaptation during operation is possible.
ACT_LENGTH	DINT	Current length of the user data area. The content of this field is only valid when EXIST = 1.	The current length is updated following write access.

Parameter	Type	Value / meaning	Supply
MAX_LENGTH	DINT	Maximum length of the user data area (length of the entire DB less 20 bytes header).	The maximum length should be specified during configuration of the DB. The value can also be modified by the user program during operation.
FTP_REPLY_CODE	INT	Unsigned integer (16-bit) containing the last reply code from FTP as a binary value. The content of this field is only valid when EXIST = 1.	This is updated by the FTP client when the FTP command is executed.
DATE_TIME	DATE_AND_TIME	Date and time of the last modification to the file. The content of this field is only valid when EXIST = 1.	The current date is updated following a write access. If the function for forwarding the time of day is used, the entry corresponds to the time that was passed on. If the function for forwarding the time of day is not used, a relative time is entered. The reference is the startup time of the (initialization value: 01.01.1994 00:00h).

FILE_DB_HEADER data block as template - FTP client mode (Page 3823)

FILE_DB_HEADER data block as template - FTP client mode

Meaning

The data type FILE_DB_HEADER is predefined for creating a file DB header.

How it works

To transfer data with FTP, create data blocks (file DBs) on the CPU of your S7 station. These data blocks must have certain structure to allow them to be handled as transferable files by the FTP services. They consist of the following sections:

- Section 1: File DB header (has a fixed length of 20 bytes)
- Section 2: User data (has a variable length and structure)

Follow the steps outlined below:

1. In the CPU on which you create the user program with the FTP instructions, create a data block of the type "Global DB".
2. Select the line you want to use as the start line for the file DB.

3. In the "Data type" column, select a structure element of the type "FILE_DB_HEADER" (in the drop-down list at the very bottom).
   Result: A data structure with the header structure required for the file DB is created.
4. Select the properties of the newly created data block (shortcut menu) and disable the "Optimized block access" attribute.

Note

"Add new block" function - type selection

When you create new data blocks, the "FILE_DB_HEADER" block type is also available under the "Type" entry in the drop-down list. Do not use this option! The data block created in this way only contains the header structure and cannot be expanded by the area required for storing user data.

FILE_DB_HEADER data block - example and template for the file DB header

In the declaration view, you will see the following structure:

Address	Name	Type	Initial value	Comment
0.0		STRUCT		
+0.0	bit08	BOOL	FALSE	reserved
+0.1	bit09	BOOL	FALSE	reserved
+0.2	bit10	BOOL	FALSE	reserved
+0.3	bit11	BOOL	FALSE	reserved
+0.4	bit12	BOOL	FALSE	reserved
+0.5	bit13	BOOL	FALSE	reserved
+0.6	bit14	BOOL	FALSE	reserved
+0.7	bit15	BOOL	FALSE	reserved
+1.0	EXIST	BOOL	FALSE	if TRUE: File DB does not contain valid data
+1.1	LOCKED	BOOL	FALSE	if TRUE: The file DB is blocked due to a change to the content.
+1.2	NEW	BOOL	FALSE	if TRUE: The content of the File DB is new and must not be overwritten.
+1.3	WRITE_ACCESS	BOOL	FALSE	if TRUE: The FTP server has write access.
+1.4	bit04	BOOL	FALSE	reserved
+1.5	bit05	BOOL	FALSE	reserved
+1.6	bit06	BOOL	FALSE	reserved
+1.7	bit07	BOOL	FALSE	reserved

Address	Name	Type	Initial value	Comment
+2.0	ACT_LENGTH	DINT	L#0	Current length of the content in bytes (not including 20 bytes for the header)
+6.0	MAX_LENGTH	DINT	L#0	Maximum length of the content in bytes (not including 20 bytes for the header)
+10.0	FTP_REPLY_CODE	INT	0	Last replay information from the remote FTP server.
+12.0	DATE_TIME	DATE_AND_TIME	DT#00-1-1-0:0:0.000	Date and time of the last change to the content of the file DB.
=20.0		END_STRUCT		

Differences in the modes

File DB header for FTP client mode

The file DB header described here is largely identical for the FTP client mode and FTP server mode. The differences relate to the following parameters:

- WRITE_ACCESS
- FTP_REPLY_CODE

S7-1200 CM/CP

Telecontrol

Telecontrol instructions

TC_CON: Establish connection via the GSM network

Meaning

The TC_CON instruction allows an S7-1200 with a CP 1242-7 to establish a connection of the following types:

- ISO-ON-TCP
  Connection partner is a CP 1242-7.
  ISO-ON-TCP connections are used only in "GPRS direct" mode.
- UDP
  Any connection partner is possible.

- SMS
  The connection partner is an SMS client.
- Telecontrol connection
  The connection partner is either a telecontrol server or another station that can be reached via the telecontrol server.

A TC_CON establishes exactly one connection. Depending on the mode of the CP 1242-7 and the protocol you are using, a maximum of 3 to 5 simultaneous connections with unique IDs (see below) are supported per CP. You will find the maximum number of simultaneous connections in the performance data of the CP.

The CONNECT parameter uses a data block (DB) with the structure of a system data type (SDT) for the connection description.

The required connection type is defined using a connection-specific SDT "TCON_..." (see below). For each of the connection types listed above, one of the following SDTs must be assigned:

- TCON_IP_RFC for ISO-ON-TCP connections
- TCON_IP_V4 for UDP connections
- TCON_PHONE for SMS connections
- TCON_WDC for telecontrol connections

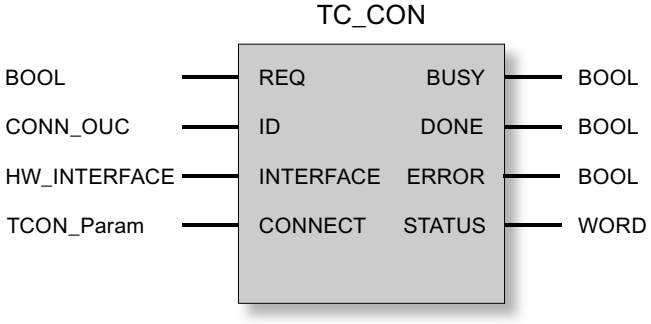
The "ActiveEstablished" parameter of these SDTs also specifies whether or not connection establishment is active or passive.

For parameter settings for these SDTs, see TCON_...: SDTs for the telecontrol connection establishment (Page 3841).

The ID parameter references the GPRS connection. The ID is assigned and must be unique within the CPU.

The INTERFACE parameter references the GPRS interface of the required local CP. This must be taken from STEP 7.

Call interface in FBD representation



Explanation of the formal parameters

The following table explains all the formal parameters for the TC_CON instruction.

Parameter	Declaration	Data type	Range of values	Description
REQ	INPUT	BOOL	0, 1	The instruction is started and the status codes initialized on a rising edge. Updating of the DONE, ERROR and STATUS status codes when there is a positive edge.
ID	INPUT	CONN_OUC	1...07FF$_h$	Reference to the relevant connection. The ID is assigned. The value of ID is also required by the system data type (SDT) of the CONNECT parameter.
INTERFACE	INPUT	HW_INTERFACE		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
CONNECT	INOUT	TCON_Param	See also "TCON_...: SDTs for telecontrol connection establishment"	Reference to a data block for connection establishment. The SDTs of the type TCON_IP_RFC, TCON_IP_V4, TCON_PHONE or TCON_WDC specify the structure of the data block suitable for the relevant connection. In the SDTs, note the parameter "ActiveEstablished" (active / passive connection establishment).
ENO	OUTPUT	BOOL	0: Error 1: Error-free	Enable output If there is a runtime error with the instruction, ENO = 0 is set.
BUSY	OUTPUT	BOOL	0: Execution of the instruction not started, completed or aborted 1: The instruction is executing	Display of the processing status of the instruction
DONE	OUTPUT	BOOL	0: - 1: The instruction executed successfully	This parameter indicates whether or not the job was completed without errors. For the meaning in conjunction with the parameters ERROR and STATUS, refer to Codes of the instruction.
ERROR	OUTPUT	BOOL	0: - 1: Error	Error code For the meaning in conjunction with the parameters DONE and STATUS, refer to Codes of the instruction.
STATUS	OUTPUT	WORD		Status code For the meaning in conjunction with the parameters DONE and ERROR, refer to Codes of the instruction.

The codes BUSY, DONE and ERROR

The codes of DONE and ERROR are relevant only when BUSY = 0.

BUSY	DONE	ERROR	Meaning
0	0	0	No job being executed

You will find all other code combinations of DONE and ERROR in the following table.

When called, the instruction remains in the BUSY = 1 state for several seconds. In the following situations, the BUSY state = 1 can last for a longer time:

- On active ISO-on-TCP connections if the partner cannot be reached.
- On passive connections when no frame is received.

The codes DONE, ERROR and STATUS

The following table shows the condition codes formed based on DONE, ERROR and STATUS that must be evaluated by the user program.

DONE	ERROR	STATUS	Meaning
1	0	0000_H	Job executed without errors
0	0	7000_H	No job processing active (first instruction call)
0	0	7001_H	Job processing started (first instruction call)
0	0	7002_H	Job processing already active (renewed instruction call when BUSY = 1)
0	1	8086_H	Illegal value for ID
0	1	8087_H	Maximum number of connections reached, no further connection possible
0	1	$80E3_H$	The ID is already being used by another connection. This means for TC_SEND, TC_RECV or TC_DISCON, BUSY is currently TRUE. The status code is output when EN_R of TC_RECV is permanently TRUE. This mostly results in TC_RECV being called. Remedy for this situation: Turn EN_R off before TC_CON or TC_DISCON is called. EN_R may only be turned on again if TC_CON executed free of errors.
0	1	$80E6_H$	No query in progress (instruction call not started)
0	1	$80E8_H$	Remote partner cannot be reached. Check the connection parameters. In the "GPRS direct" mode, the message is output if the partner can be reached but is not accepting a connection request.
0	1	$80EB_H$	Request temporarily denied (TC_CON has already been called with the same destination address.)
0	1	$80EC_H$	Opening the Listener Port failed: Check the connection parameters.
0	1	$80F2_H$	The CP is in the wrong mode: • Telecontrol connections are permitted only in "Telecontrol" mode. • ISO-ON-TCP connections are permitted only in "GPRS direct" mode.
0	1	$80F3_H$	No free connection endpoint for sending data: • Use less connections or • Use less passive connections or • Turn off NTP. Remember the maximum number of simultaneous connections of the CP 1242-7.

DONE	ERROR	STATUS	Meaning
0	1	$80F4_H$	Connection endpoint cannot be generated: Repeat the call. If necessary, check the connection parameters.
0	1	$80F5_H$	Invalid connection endpoint: Connection establishment by TC_CON failed. Repeat the block call.
0	1	$80F6_H$	Format error of a parameter in the called data block (wrong length, wrong format, invalid value or phone number in TCON_Phone longer than 20 characters) Check the configuration of the "TC_CON..." SDT.

TC_DISCON: Terminate connection via the GSM network

Meaning

The TC_DISCON instruction on an S7-1200 with CP 1242-7 terminates an ISO-ON-TCP, UDP, SMS or telecontrol connection that was established with the TC_CON instruction.

You will find detailed information on the connection types in the description of the TC_CON instruction.

TC_DISCON terminates the connection to the telecontrol server only logically. At the TCP/IP level, the connection is retained.

If you want the connection to the telecontrol server to be terminated physically, configure the connection as a "Temporary connection" in the "telecontrol server" parameter group in STEP 7. Temporary stations terminate the connection automatically after sending the data.

Note

Stopping the execution of further program blocks by TC_DISCON

Calling up TC_DISCON ends the execution of TC_CON, TC_SEND, and TC_RECV blocks, that were called up with the same connection ID (parameter "ID") and interface (parameter "INTERFACE"). These blocks then signal an ERROR.

Do not call up TC_DISCON if TC_CON indicates "Error = 1".

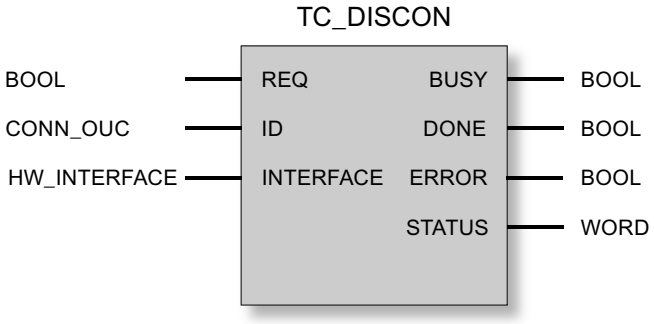
If TC_CON indicates "ERROR", then the connection is not established. In this case TC_DISCON must not be called.

If TC_DISCON is called in this case, the connection ID ("ID") is briefly reserved, and a TC_CON called up immediately afterwards would indicate ERROR and STATUS 80E3.

The ID parameter references the GPRS connection. The ID must be unique within the CPU and the same as the ID used with TC_CON.

The INTERFACE parameter references the GPRS interface of the required local CP. The value must be the same as that used by TC_CON for INTERFACE.

Call interface in FBD representation



Explanation of the formal parameters

The following table explains all the formal parameters for the TC_DISCON instruction

Parameter	Declaration	Data type	Range of values	Description
REQ	INPUT	BOOL	0, 1	The instruction is started and the status codes initialized on a rising edge. Updating of the DONE, ERROR and STATUS status codes when there is a positive edge.
ID	INPUT	CONN_OUC	1...07FF$_h$	Reference to the relevant connection
INTERFACE	INPUT	HW_INTERFACE		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
ENO	OUTPUT	BOOL	0: Error 1: Error-free	Enable output If there is a runtime error with the instruction, ENO = 0 is set.
BUSY	OUTPUT	BOOL	0: Execution of the instruction not started, completed or aborted 1: The instruction is executing	Display of the processing status of the instruction
DONE	OUTPUT	BOOL	0: - 1: The instruction executed successfully	This parameter indicates whether or not the job was completed without errors. For the meaning in conjunction with the parameters ERROR and STATUS, refer to Codes of the instruction.
ERROR	OUTPUT	BOOL	0: - 1: Error	Error code For the meaning in conjunction with the parameters DONE and STATUS, refer to Codes of the instruction.
STATUS	OUTPUT	WORD		Status code For the meaning in conjunction with the parameters DONE and ERROR, refer to Codes of the instruction.

The codes BUSY, DONE and ERROR

The codes of DONE and ERROR are relevant only when BUSY = 0.

BUSY	DONE	ERROR	Meaning
0	0	0	The instruction has not yet been called.

You will find all other code combinations of DONE and ERROR in the following table.

Note

When called, the instruction remains in the BUSY = 1 state for several seconds.

The codes DONE, ERROR and STATUS

The following table shows the condition codes formed based on DONE, ERROR and STATUS that must be evaluated by the user program.

DONE	ERROR	STATUS	Meaning
1	0	0000_H	Job executed without errors
0	0	7000_H	No job processing active (first instruction call)
0	0	7001_H	Job processing started (first instruction call)
0	0	7002_H	Job processing already active (renewed instruction call when BUSY = 1)
0	1	8086_H	Illegal value for ID
0	1	$80E4_H$	Unknown ID: No connection with this ID has been established by TC_CON.
0	1	$80E6_H$	No query in progress (instruction call not started)
0	1	$80F5_H$	Invalid connection endpoint: • Connection establishment by TC_CON failed or • Connection terminated by remote partner.
0	1	$80F6_H$	Format error of a parameter in the called data block (wrong length, wrong format or invalid value) Check the configuration of the "TC_CON..." SDT.

TC_SEND: Send data via the GSM network

Meaning

The TC_SEND instruction allows the sending of data via programmed connections of the following types:

- ISO-ON-TCP connections
- UDP connections

- SMS connections
  The sending of SMS messages is supported only if this was set up in the STEP 7 configuration of the CP.
- Telecontrol connections

Note

Sending SMS messages to multiple recipients

If you want to send an identical SMS message to several recipients, you need to establish a connection to each recipient.

You will find more detailed information on the connection types in the description of the TC_CON instruction.

The ID parameter references the GPRS connection. The value of ID must correspond to the value used for ID by TC_CON.

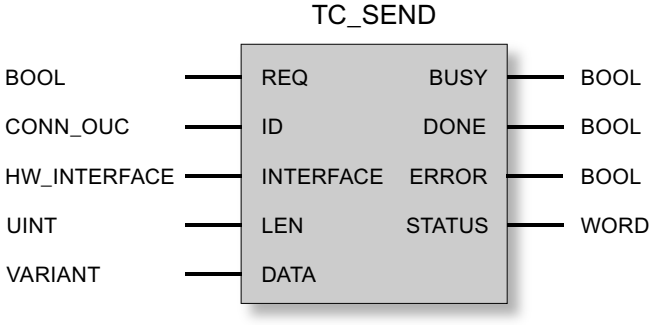
The INTERFACE parameter references the GPRS interface of the required local CP. The value must be the same as that used by TC_CON for INTERFACE.

The amount of data to be sent is specified with the LEN parameter.

The size of the data area specified in DATA must be at least as large as the number of bytes configured for LEN. Permitted data types in the data area specified in DATA are all except BOOL and ARRAY of BOOL.

The destination address (connection partner) for the data to be sent is configured in the TC_CON instruction.

Call interface in FBD representation



Explanation of the formal parameters

The following table explains all the formal parameters for the TC_SEND instruction.

Parameter	Declaration	Data type	Range of values	Description
REQ	INPUT	BOOL	0, 1	The instruction is started and the status codes initialized on a rising edge. Updating of the DONE, ERROR and STATUS status codes when there is a positive edge.
ID	INPUT	CONN_OUC	1...07FF$_h$	Reference to the relevant connection
INTERFACE	INPUT	HW_INTERFACE		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
LEN	INPUT	UINT	1...2048	Number of bytes of data to be sent. The value must be ≥ 1 and ≤ 2048. The value should match the size of the range of DATA.
DATA	INOUT	VARIANT		Address reference to the send data area of the CPU *
ENO	OUTPUT	BOOL	0: Error 1: Error-free	Enable output If there is a runtime error with the instruction, ENO = 0 is set.
BUSY	OUTPUT	BOOL	0: Execution of the instruction not started, completed or aborted 1: The instruction is executing	Display of the processing status of the instruction
DONE	OUTPUT	BOOL	0: - 1: The instruction executed successfully	This parameter indicates whether or not the job was completed without errors. ** For the meaning in conjunction with the parameters ERROR and STATUS, refer to Codes of the instruction.
ERROR	OUTPUT	BOOL	0: - 1: Error	Error code For the meaning in conjunction with the parameters DONE and STATUS, refer to Codes of the instruction.
STATUS	OUTPUT	WORD		Status code For the meaning in conjunction with the parameters DONE and ERROR, refer to Codes of the instruction.

* For special features of the DATA parameter for SMS texts, refer to the next section.

** After sending a frame, TC_SEND sets DONE = 1. Note the following response:
The loss of an ISO-on-TCP connection is only recognized by the sender after 1 to 2 minutes. The transferred data may be lost although TC_SEND has set DONE = 1 at the sender.
If an ISO-on-TCP connection is aborted after receiving a frame before TC_RECV was started, the transferred data may be lost even if TC_SEND sets DONE = 1 at the sender.

Configuring SMS texts with the DATA parameter

The instruction sends the data referenced by the pointer of the type VARIANT of the DATA parameter as an SMS text.

If an operand of the data type STRING is referenced by DATA for SMS texts, the first two bytes are transferred with length information of the string.

One option for the correct text representation of SMS messages to be sent is to convert the text string into an Array of BYTE or Array of CHAR using the conversion function Strg_TO_Chars. Strg_TO_Chars at the EN parameter is linked to the output parameter ENO by TC_SEND.

For SMS texts, the CP does not support all special characters, for example umlauts (ü, ä etc.). The specification GSM 03.38 applies. There may be additional restrictions imposed by the GSM network provider.

The codes BUSY, DONE and ERROR

The codes of DONE and ERROR are relevant only when BUSY = 0.

BUSY	DONE	ERROR	Meaning
0	0	0	No job being executed

You will find all other code combinations of DONE and ERROR in the following table.

The codes DONE, ERROR and STATUS

The following table shows the condition codes formed based on DONE, ERROR and STATUS that must be evaluated by the user program.

DONE	ERROR	STATUS *	Meaning
1	0	0000_H	Job executed without errors
0	0	7000_H	No job processing active (first instruction call)
0	0	7001_H	Job processing started (first instruction call)
0	0	7002_H	Job processing already active (renewed instruction call when BUSY = 1)
0	1	8086_H	Illegal value for ID
0	1	$80E0_H$	Internal error If you send the frames directly to the telecontrol server (mode "Telecontrol"), make sure that the send cycle time is ≥ 1 second.
0	1	$80E1_H$	Timeout: • Increase the value of the "Connection monitoring time" in the configuration of the CP 1242-7 or • Check the connection partner.
0	1	$80E4_H$	Unknown ID: First call TC_CON.
0	1	$80E6_H$	No query in progress (instruction call not started)
0	1	$80E7_H$	Data to be sent not completely transferred: Repeat the job.

DONE	ERROR	STATUS *	Meaning
0	1	$80E8_H$	Remote partner cannot be reached. Check the connection parameters. In the "GPRS direct" mode, the message is output if the partner can be reached but is not accepting a connection request.
0	1	$80E9_H$	Connection establishment by remote partner: Check the connection partner. If necessary, terminate the connection with TC_DISCON and establish it again with TC_CON.
0	1	$80EA_H$	Error message from remote partner: • Check the connection partner. Enable the "TC_RECV" instruction on the communications partner. • If necessary, terminate the connection with TC_DISCON and establish it again with TC_CON.
0	1	$80EF_H$	SMS could not be sent: • Check whether the destination address (telephone number of the destination subscriber) exists. • Check whether the inserted SIM card allows sending of SMS. • Check the length of the SMS text that was sent. SMS texts > 160 characters will not be sent. • Make sure that when the data block TCON_PHONE was created, the "Standard" option was selected for block access.
0	1	$80F1_H$	Sending of SMS messages is not enabled in the STEP 7 configuration of the CP: Enalble the "Allow SMS" option in the configuration of the CP.
0	1	$80F4_H$	Connection endpoint cannot be generated: Check the connection partner.
0	1	$80F5_H$	Invalid connection endpoint: • Connection establishment by TC_CON failed. or • Connection terminated by remote partner: First call TC_DISCON.
0	1	$80F6_H$	Format error of a parameter in the called data block (wrong length, wrong format or invalid value): Check the configuration of the "TC_CON..." SDT.

* Further statuses that are not listed here can be found in the status display is of the "RDREC" or "WRREC" instructions in the two middle status bytes (STATUS[2], STATUS[3]).

TC_RECV: Receive data via the GSM network

Meaning

The TC_RECV instruction allows the reception of data via programmed connections of the following types:

- ISO-ON-TCP connections
- SMS connections
  To receive SMS messages, the phone number of the sender must be configured in the STEP 7 configuration of the receiving CP (authorized phone numbers). The sender must support the CLIP function.
  The phone number of the connection partner must be entered in the "TCON_PHONE" SDT.
  Wake-up SMS messages are filtered out.
- Telecontrol connections

Note

Receiving SMS messages from different senders

If you want to receive SMS messages from different senders, you have two alternatives:

- You configure several connections (TC_CON, TC_RECV, TC_DISCON).
  or
- You may only enter no telephone number for only one configured connection in the required data block "TCON_PHONE" in the "PhoneNumber" parameter. When receiving messages, this is then interpreted as a placeholder for all authorized connection partners.

You will find more detailed information on the connection types in the description of the TC_CON instruction.

The ID parameter references the GPRS connection. The value of ID must correspond to the value used for ID by TC_CON.

The INTERFACE parameter references the GPRS interface of the required local CP. The value must be the same as that used by TC_CON for INTERFACE.

The maximum amount of data to be received is specified with the LEN parameter.

The size of the data area specified in DATA must be at least as large as the number of bytes configured for LEN. Permitted data types in the data area specified in DATA are all except BOOL and ARRAY of BOOL. The received data is interpreted as if the sending partner had used the same data types.

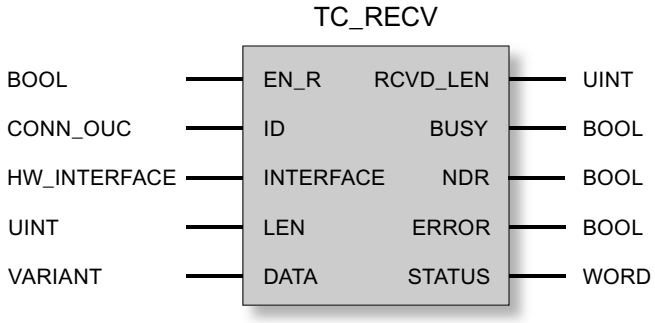
The DB (system data type) used for the connection description of TC_RECV must differ from a DB used for TC_SEND.

Storing SMS messages

Received SMS messages are stored retentively in the CP 1242-7 (25 storage spaces) and on the SIM card (varying number of storage spaces).

- After an SMS message has been read by TC_RECV the SMS message will be deleted from its storage space.
- If all of the storage spaces have been allocated and a new SMS message is received, the oldest SMS message is deleted.

Call interface in FBD representation



Explanation of the formal parameters

The following table explains all the formal parameters for the TC_RECV instruction

Parameter	Declaration	Data type	Range of values	Description
EN_R	INPUT	BOOL	0: Data reception locked 1: Data reception enabled	Enables / locks the reception of data. • Block version 1.1: After setting 1 to 0, the block is inactive. • Block version 1.0: After setting 1 to 0, the program block receives data again (until DONE = 0 and ERROR = 0). Note the information on the status code 80E3 of TC_CON.
ID	INPUT	CONN_OUC	1...07FF$_h$	Reference to the relevant connection
INTERFACE	INPUT	HW_INTER-FACE		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
LEN	INPUT	UINT	1...2048	(minimum) number of bytes of data to be received, maximum 2048
DATA	INOUT	VARIANT		Address reference to the receive data area of the CPU *
ENO	OUTPUT	BOOL	0: Error 1: Error-free	Enable output If there is a runtime error with the instruction, ENO = 0 is set.
RCVD_LEN	OUTPUT	UINT		Number of bytes of received data

Parameter	Declaration	Data type	Range of values	Description
BUSY	OUTPUT	BOOL	0: Execution of the instruction not started, completed or aborted 1: The instruction is executing	Display of the processing status of the instruction
DONE	OUTPUT	BOOL	0: - 1: The instruction executed successfully	This parameter indicates whether or not the job was completed without errors. For the meaning in conjunction with the parameters ERROR and STATUS, refer to Codes of the instruction.
ERROR	OUTPUT	BOOL	0: - 1: Error	Error code For the meaning in conjunction with the parameters DONE and STATUS, refer to Codes of the instruction.
STATUS	OUTPUT	WORD		Status code For the meaning in conjunction with the parameters DONE and ERROR, refer to Codes of the instruction.

* For special features of the DATA parameter for SMS texts, refer to the next section.

Configuring SMS texts with the DATA parameter

The instruction references the received SMS text with the pointer of the type VARIANT of the DATA parameter to the data area of the CPU.

If DATA references an operand of the data type STRING for the SMS text, the first two bytes of the SMS text will be interpreted as length information of the data type STRING and not as SMS text.

One option for the correct text representation of SMS messages to be received is to convert an Array of BYTE or Array of CHAR to a text string using the conversion function Chars_TO_Strg. Chars_TO_Strg at the EN parameter is linked to the output parameter ENO of TC_RECV.

For SMS texts, the CP does not support all special characters, for example umlauts (ü, ä etc.). The specification GSM 03.38 applies. There may be additional restrictions imposed by the GSM network provider.

The codes BUSY, DONE and ERROR

The codes of DONE and ERROR are relevant only when BUSY = 0.

BUSY	DONE	ERROR	Meaning
0	0	0	No job being executed

You will find all other code combinations of DONE and ERROR in the following table.

The codes DONE, ERROR and STATUS

The following table shows the condition codes formed based on DONE, ERROR and STATUS that must be evaluated by the user program.

DONE	ERROR	STATUS *	Meaning
1	0	0000_H	Job executed without errors
0	0	7000_H	No job processing active (first instruction call)
0	0	7001_H	Job processing started (first instruction call)
0	0	7002_H	Job processing already active (renewed instruction call when BUSY = 1)
0	1	$80A3_H$	• An attempt is made to re-establish an existing connection. • An attempt is made to terminate a non-existent connection.
0	1	$80E0_H$	Internal error
0	1	8086_H	Illegal value for ID
0	1	$80E4_H$	Unknown ID: First call TC_CON.
0	1	$80E6_H$	No query in progress (instruction call not started)
0	1	$80F5_H$	Invalid connection endpoint: • Connection establishment by TC_CON failed. or • Connection terminated by remote partner: First call TC_DISCON.
0	1	$80F6_H$	Format error of a parameter in the called data block (wrong length, wrong format or invalid value) Check the configuration of the "TC_CON..." SDT.

* Further statuses that are not listed here can be found in the status display is of the "RDREC" or "WRREC" instructions in the two middle status bytes (STATUS[2], STATUS[3]).

TC_CONFIG: Transferring configuration data to a CP

Meaning

With the TC_CONFIG instruction, parameters of a the CP 1242-7 configured in STEP 7 can be modified. The configured values are not overwritten retentively. The overwritten values remain valid until TC_CONFIG is called again or until the station starts up again (cold restart after cycling power).

If the STEP 7 configuration data of the CP needs to be changed permanently, the instruction needs to be called again each time the station restarts (cold restart) or a modified project must be downloaded to the station.

The CONFIG parameter points to the memory area with the configuration data. The configuration data is stored in a data block (DB). The structure of the DB is specified by the system data type (SDT) IF_CONF.

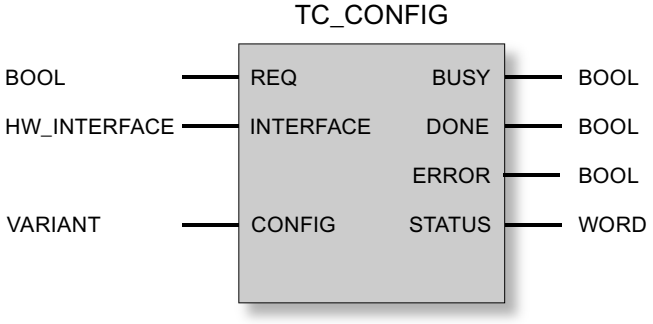
The configuration data to be modified on the CP is put together as necessary in blocks in IF_CONF "IF_CONF_..." for the individual parameters.

Parameters that are not intended to change as a result of the instruction are not entered in IF_CONF. They retain the value configured in STEP 7.

For detail information on assigning value to IF_CONF, refer to the section IF_CONF: SDT for telecontrol configuration data (Page 3846).

The INTERFACE parameter references the GPRS interface of the required local CP.

Call interface in FBD representation



Explanation of the formal parameters

The following table explains all the formal parameters for the TC_CONFIG instruction

Parameter	Declaration	Data type	Range of values	Description
REQ	INPUT	BOOL	0, 1	The instruction is started and the status codes initialized on a rising edge. Updating of the DONE, ERROR and STATUS status codes when there is a positive edge.
INTERFACE	INPUT	HW_INTERFACE (WORD)		Reference to the interface of the local CP 1242-7
CONFIG	INOUT	VARIANT	See also "IF_CONF: SDT for telecontrol configuration data	Reference to the memory area with the collected configuration data to be modified
ENO	OUTPUT	BOOL	0: Error 1: Error-free	Enable output If there is a runtime error with the instruction, ENO = 0 is set.
BUSY	OUTPUT	BOOL	0: Execution of the instruction not started, completed or aborted 1: The instruction is executing	Display of the processing status of the instruction
DONE	OUTPUT	BOOL	0: - 1: The instruction executed successfully	This parameter indicates whether or not the job was completed without errors. For the meaning in conjunction with the parameters ERROR and STATUS, refer to Codes of the instruction.

Parameter	Declaration	Data type	Range of values	Description
ERROR	OUTPUT	BOOL	0: - 1: Error	Error code For the meaning in conjunction with the parameters DONE and STATUS, refer to Codes of the instruction.
STATUS	OUTPUT	WORD		Status code For the meaning in conjunction with the parameters DONE and ERROR, refer to Codes of the instruction.

The codes BUSY, DONE and ERROR

The codes of DONE and ERROR are relevant only when BUSY = 0.

BUSY	DONE	ERROR	Meaning
0	0	0	No job being executed

You will find all other code combinations of DONE and ERROR in the following table.

The codes DONE, ERROR and STATUS

The following table shows the condition codes formed based on DONE, ERROR and STATUS that must be evaluated by the user program.

DONE	ERROR	STATUS	Meaning
1	0	0000_H	Job executed without errors
0	0	7000_H	No job processing active (first instruction call)
0	0	7001_H	Job processing started (first instruction call)
0	0	7002_H	Job processing already active (renewed instruction call when BUSY = 1)
0	1	$80E6_H$	No query in progress (instruction call not started)
0	1	$80EB_H$	Query temporarily rejected (the CP is currently being configured by STEP 7).
0	1	$80F6_H$	Format error of a parameter in the called data block (wrong length, wrong format or invalid value) Check the "IF_CONF" SDT.
0	1	$80F7_H$	Wrong ID in the parameter fields of the configuration data: Check the "IF_CONF" SDT.

TCON_...: SDTs for the telecontrol connection establishment

System data types TCON_... for the TC_CON instruction

To configure a telecontrol connection using the TC_CON instruction, the CONNECT parameter of the instruction is used for the connection description.

The connection description is specified by the structure of the system data type (SDT). The structure of the relevant SDT contains the parameters necessary to establish the connection with the remote communications partner.

For different connection types that depend on the remote communications partner, the following SDTs are used:

- TCON_IP_RFC for ISO-on-TCP connections to IPv4 stations with CP 1242-7
- TCON_IP_V4 for UDP connections to IPv4 stations (sending only)
- TCON_PHONE for connections to SMS clients
- TCON_WDC for connections to telecontrol servers or stations that can be reached via the telecontrol server.

The parameter assignment of the connection description is made in a data block of the same type as the SDT.

Creating a DB of the type TCON_...

You will need to type in the data types of the relevant DBs with the keyboard. They are not displayed in the selection list. The data types are not case-sensitive.

To create a TCON_... DB, follow the steps outlined below:

1. Create a data block of the type "global DB" with block access "Standard".
2. Create an SDT in the table of the parameter configuration of the DB by assigning the name and typing in the required type (for example "TCON_IP_RFC") in the cell of the data type. The SDT and its parameters are created (see below).
3. Configure the parameters that are described below for each SDT type.

Reserved bits are not displayed.

System data type TCON_IP_RFC for connections to IPv4 stations

This connection type is supported only on ISO-on-TCP connections to communications partners with a fixed IP address. The CP must be configured for the "GPRS direct" mode.

Table 11-110 Parameters of TCON_IP_RFC

Byte	Parameter	Data type	Initial value	Description
0 ... 1	InterfaceID	HW_ANY		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
2 ... 3	ID	CONN_OUC	1...07FF$_h$	Reference to the GPRS connection. The ID is assigned and must be unique within the CPU. Here, the same value as that of the ID parameter of the TC_CON instruction must be used.
4	ConnectionType	BYTE	W#16#0C	Protocol variant 12 (C_h): ISO-on-TCP connection
5	ActiveEstablished	BOOL		Identifier for the type of connection establishment: • 0: Passive connection establishment • 1: Active connection establishment
6 ... 7	-	-	-	- reserved -

Byte	Parameter	Data type	Initial value	Description
8 ... 11	RemoteAddress	IP_V4		IP address of the connection partner
	ADDR	Array [1...4] of Byte		IP address of the relevant connection partner
12 ... 13	RemoteTSelector	TSelector		Remote T selector
	TSelLen	UINT		Length of the remote T selector "RemoteTSelector"
14 ... 45	TSel	Array [1...32] of Byte	any	Remote transport selector of the connection • When "ActiveEstablished" = 1: With active connection establishment, the T selector of the local partner must be the same as the T selector of the connection partner (passive connection establishment on the remote partner). • When "ActiveEstablished" = 0 correspondingly (passive connection establishment local, active connection establishment remote)
46 ... 47	LocalTSelector	TSelector		Local T selector
	TSelLen	UINT		Length of the local T selector "LOCAL_TSel"
48 ... 79	TSel	Array [1...32] of Byte	any	Local transport selector of the connection • When "ActiveEstablished" = 1: With active connection establishment, the T selector of the local partner must be the same as the T selector of the connection partner (passive connection establishment on the remote partner). • When "ActiveEstablished" = 0 correspondingly (passive connection establishment local, active connection establishment remote)

System data type TCON_IP_V4 for connections to IPv4 stations

This connection type is supported only for sending on UDP connections to communications partners with a fixed IP address.

To receive, ActiveEstablished = 0 must be set.

Table 11-111 Parameters of TCON_IP_V4

Byte	Parameter	Data type	Initial value	Description
0 ... 1	InterfaceID	HW_ANY		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
2 ... 3	ID	CONN_OUC	1...07FF$_h$	Reference to the GPRS connection. The ID is assigned and must be unique within the CPU. Here, the same value as that of the ID parameter of the TC_CON instruction must be used.
4	ConnectionType	BYTE	W#16#0B	Protocol variant 11 (B_h): UDP connection

Byte	Parameter	Data type	Initial value	Description
5	ActiveEstablished	BOOL		Identifier for the type of connection establishment: • 0: Passive connection establishment Setting for sending and receiving data. • 1: Active connection establishment Setting for sending data only.
6 ... 9	RemoteAddress	IP_V4		IP address of the connection partner
	ADDR	Array [1...4] of Byte		The four bytes (ADDR[1] ... ADDR[4]) specify the four blocks of the IP address.
10 ... 11	RemotePort	UINT	1...65535	IP port of the connection partner Not relevant if ActiveEstablished = 0.
12 ... 13	LocalPort	UINT	1...65535	Local IP port ("0" is not permitted) Not relevant if ActiveEstablished = 1.

System data type TCON_PHONE for SMS connections

Note

Authorized phone numbers

The CP only accepts an SMS if the sending communication partner is authorized based on its phone number. These numbers are in configured for the CP in STEP 7 in the "authorized phone numbers" list.

SMS text

- Programmed SMS texts for SMS messages to be sent are accessed using the DATA parameter of the TC_SEND instruction.
- The text of a received SMS message is assigned to the address area of the CPU by the DATA parameter of the TC_RECV instruction.

Table 11-112 Parameters of TCON_PHONE

Byte	Parameter	Data type	Initial value	Description
0 ... 1	InterfaceID	HW_ANY		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
2 ... 3	ID	CONN_OUC	1...07FF$_h$	Reference to the GPRS connection. The ID is assigned and must be unique within the CPU. Here, the same value as that of the ID parameter of the TC_CON instruction must be used.
4	ConnectionType	BYTE	W#16#0E	Protocol variant 14 (E_h): SMS connection
5	ActiveEstablished	BOOL		Identifier for the type of connection establishment (not relevant for the CP 1242-7): • 0: Passive connection establishment (not relevant here) • 1: Active connection establishment

Byte	Parameter	Data type	Initial value	Description
6...7	-	-	-	- reserviert -
8 ... 31	PhoneNumber	STRING[22]		Call number of the connection partner Permitted values: Plus character (+) and numbers Note the exact notation of the international dialing code of the relevant phone number assigned by the network provider ("+" character or zeros). Without an entry for the PhoneNumber parameter, no connection partner is specified and SMS messages can be received reception from all authorized connection partners. Note the following during startup: Without an entry, TC_RECV first delivers the oldest received SMS message.

System data type TCON_WDC for connections to telecontrol servers or remote stations

You can configure the connection to the telecontrol server assigned to the S7-1200 or to a remote station that can be reached via the telecontrol server with TCON_WDC. The address data of the telecontrol server assigned to the CP can be found in STEP 7 in the "Telecontrol interface > Mode" tab of the CP. The telecontrol server or a remote station is addressed using the host name or the IP address.

The "RemoteWdcAddress" parameter of TCON_WDC specifies the Access ID of the connection partner.

Table 11-113 Parameters of TCON_WDC

Byte	Parameter	Data type	Initial value	Description
0 ... 1	InterfaceID	HW_ANY		Reference to the interface of the local CP 1242-7 (see STEP 7 > CP configuration > Telecontrol interface > "Hardware identifier")
2 ... 3	ID	CONN_OUC	1...07FF$_h$	Reference to the GPRS connection. The ID is assigned and must be unique within the CPU. Here, the same value as that of the ID parameter of the TC_CON instruction must be used.
4	ConnectionType	BYTE	W#16#0F	Protocol variant 15 (F$_h$): Telecontrol connection using an IP address
5	ActiveEstablished	BOOL		Identifier for the type of connection establishment: • 0: Passive connection establishment • 1: Active connection establishment

Byte	Parameter	Data type	Initial value	Description
6 ... 7	-	-	-	- reserved -
8 ... 11	RemoteWdcAddress	DWORD		Specifies the Access ID (hex). The access ID depends on the connection partner. • Connection to a remote CP: The access ID is made up of the following: – STEP 7 project number – Station number – Slot If the remote station has more than one GPRS-CP and you do not want to specify the path, the last byte for the slot must be set to 0. You will find the access ID in the STEP 7 project in the "CP authentication of the CP" parameter group. • Connection to the telecontrol server: Access ID = 0 • To only write to the process image of the CP: Access ID = DW#16#FEEDDADA

IF_CONF: SDT for telecontrol configuration data

Structure of the system data type IF_CONF for the TC_CONFIG instruction

The CONFIG parameter of the TC_CONFIG instruction references the memory area with the configuration data of the CP 1242-7 to be modified. The configuration data stored in a data block is described as a structure of the system data type (SDT) IF_CONF.

IF_CONF is made up of a header followed by fields that correspond to the parameters or parameter areas of the CP in the device properties of the STEP 7 project.

The CP configuration data to be modified is collected together as IF_CONF fields. Parameters that will not be modified are ignored in the IF_CONF structure and remain as they were configured in the STEP 7 project.

Creating the DB and the IF_CONF structures

You can create the parameters of the CP within the IF_CONF DB in one or more structures each with one or more fields.

You will need to type in the data types of the fields using the keyboard. They are not displayed in the selection list. The data types are not case-sensitive.

Follow the steps below to create IF_CONF:

1. Create a data block of the type "global DB" with block access "Standard".
2. Create a structure (data type "Struct") in the table of the parameter configuration of the DB. You can specify any name.

3. Under this structure add a header by assigning the name of the header and typing it in the cell of the data type "IF_CONF_Header".
   The header of the structure and its three parameters (see below) is created.
4. Create a field for the first parameter to be changed by typing in the required data type (for example "IF_CONF_APN") in the cell of the data type.
5. Repeat the last step for all parameters you want to change on the CP using the TC_CONFIG instruction.
6. Finally, update the number of fields in the header in the "subfieldCnt" parameter.

Header of IF_CONF

Table 11-114 IF_CONF_Header

Byte	Parameter	Data type	Initial value	Description
0 ... 1	fieldType	UINT		Field type: Must always be 0.
2 ... 3	fieldId	UINT		Field ID: Must always be 0.
4 ... 5	subfieldCnt	UINT		Total number of fields contained in the structure

General parameters of the parameter fields

Each field has the following general parameters:

- Id
  This parameter identifies the field and must not be modified.
- Length
  This parameter indicates the length of the field. The value serves as information.
  Fields with strings and / or arrays have a variable length. Due to hidden bytes, the actual length of fields can be greater than the sum of the displayed parameters.
- Mode
  The following values are permitted to these parameters:

Table 11-115 Values of "Mode"

Value	Meaning
1	Permanent validity of the configuration data Not relevant for the CP 1242-7
2	Temporary validity of the configuration data, including deleting of existing permanent configuration data The permanent configuration data is replaced by the parameter fields of IF_CONF.

Field for the parameter area "GPRS access"

Table 11-116 IF_CONF_APN

Parameter	Data type	Initial value	Description
Id	UINT	4	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 174
Mode	UINT		Validity (1: permanent, 2: temporary)
AccesspointGPRS	STRING [98]		APN: Name of the access point of the GSM network provider to the Internet
AccesspointUser	STRING [42]		APN user name
AccesspointPassword	STRING [22]		APN password

Field for the parameter area "CP identification"

Table 11-117 IF_CONF_Login

Parameter	Data type	Initial value	Description
Id	UINT	5	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 54
Mode	UINT		Validity (1: permanent, 2: temporary)
ModemName	STRING [22]		Access ID The value cannot be set.
ModemPassword	STRING [22]		Telecontrol password (max. 20 characters)

Field for the parameter area "Telecontrol server access"

This field is only used when the telecontrol server is addressed with a name that can be resolved by DNS. If the telecontrol server is addressed with its IP address, the "IF_CONF_TCS_IP_V4" field is used.

In STEP 7, the corresponding data is located in the "Mode" parameter area.

If there is more than one telecontrol server, use the field once per server.

Table 11-118 IF_CONF_TCS_Name

Parameter	Data type	Initial value	Description
Id	UINT	6	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 266
Mode	UINT		Validity (1: permanent, 2: temporary)
TcsName	-	-	- reserved -
	STRING [254]		Name of the telecontrol server that can be resolved by DNS
RemotePort	UINT		Port of the telecontrol server
Rank	UINT		Priority of the server [1, 2] 1 = first telecontrol server, 2 = second telecontrol server

Field for the parameter area "Telecontrol server access"

This field is only used when the telecontrol server is addressed by its IP address. If the telecontrol server is addressed by its DNS name, the "IF_CONF_TCS_Name" field is used.

In STEP 7, the corresponding data is located in the "Mode" parameter area.

If there is more than one telecontrol server, use the field once per server.

Table 11-119 IF_CONF_TCS_IP_v4

Parameter	Data type	Initial value	Description
Id	UINT	7	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 14
Mode	UINT		Validity (1: permanent, 2: temporary)
RemoteAddress	IP_V4		IP address of the telecontrol server
RemotePort	UINT		Port of the telecontrol server
Rank	UINT		Priority of the server [1, 2] 1 = first telecontrol server, 2 = second telecontrol server

Field for the "Mode" parameter area

In STEP 7, the corresponding data is located in the parameter areas "Mode" and Modem settings".

Table 11-120 IF_CONF_GPRS_Mode

Parameter	Data type	Initial value	Description
Id	UINT	8	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 10
Mode	UINT		Validity (1: permanent, 2: temporary)
GPRSmode	UINT		Mode of the CP: • 0 = Telecontrol • 1 = GPRS direct
TemporaryStation	BOOL		Bit 0: Temporary connection If this option is selected, the CP only establishes a temporary connection to send data. Once the frames have been transferred, the CP terminates the connection again. • 1: activated (temporary connection) • 0: deactivated (permanent connection)
SMS_Enabled	BOOL		Bit 1: Allow SMS Selecting the option allows the S7 station to send SMS messages. • 1: activated (SMS allowed) • 0: deactivated (no SMS)

Field for the "SMSC" parameter

In STEP 7, the corresponding data is located in the parameter area "Modem settings".

Table 11-121 IF_CONF_SMS_Provider

Parameter	Data type	Initial value	Description
Id	UINT	10	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 28
Mode	UINT		Validity (1: permanent, 2: temporary)
SMSProvider	STRING [20]		Node number of the SMS center (SMSC) of the GSM network provider with which the contract was signed for this station.

Field for the "PIN" parameter

In STEP 7, the corresponding data is located in the parameter area "Modem settings".

Table 11-122 IF_CONF_PIN

Parameter	Data type	Initial value	Description
Id	UINT	11	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 16
Mode	UINT		Validity (1: permanent, 2: temporary)
Pin	STRING [8]		PIN of the SIM card inserted in the SIM card The parameter is not relevant if the PIN was correctly configured. If the PIN was incorrectly configured, the correct PIN can be entered.

Field for monitoring times

In STEP 7, the corresponding data is located in the parameter areas "Keepalive timeout" and Operating mode".

Table 11-123 IF_CONF_TC_Timeouts

Parameter	Data type	Initial value	Description
Id	UINT	12	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 12
Mode	UINT		Validity (1: permanent, 2: temporary)
KeepAliveTimeout	-	-	- Reserved - (cannot be set)

Parameter	Data type	Initial value	Description
SendTimeout	UINT		Connection monitoring time: Monitoring time of the connection to the communications partner (seconds) Relevant in the modes "Telecontrol" and "GPRS direct"
RedialTimeout	UINT		Reconnection delay: Basic value for the wait time until the next attempt to establish a connection following an unsuccessful connection establishment. After every 3 attempts, the basic value is doubled up to a maximum of 900 s. Range of values: 10 to 600 s. Example: Basic value 20 results in the following dialing intervals: three times 20 s, three times 40 s, three times 80 s etc. up to a maximum of 900 s. If a second telecontrol server / router is configured, the CP attempts to connect to the second partner at the 4th attempt. If the second partner is also unreachable, the 7th time the CP attempts to connect to the first partner again. Not relevant for SMS connections

Field for the "Wake up right" parameter area

Table 11-124 IF_CONF_WakeupList

Parameter	Data type	Initial value	Description
Id	UINT	13	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 246
Mode	UINT		Validity (1: permanent, 2: temporary)
WakeupPhone [1...10]	ARRAY [1...10] of STRING [22]		Phone number subscriber authorized to wake up The asterisk (*) at the end of a call number is used a placeholder for direct dialing numbers.

Field for the "Preferred GSM networks" parameter area

Table 11-125 IF_CONF_PrefProvider

Parameter	Data type	Initial value	Description
Id	UINT	14	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 46
Mode	UINT		Validity (1: permanent, 2: temporary)
Provider [1...5]	ARRAY [1...5] of STRING [6]		Alternative GSM networks with priority 1 to 5 into which the CP dials. Up to 5 networks can be configured. No. 1 with highest priority, no. 5 with lowest priority. Entry of the Public Land Mobile Network (PLMN) of the network provider consisting of Mobile Country Code (MCC) and Mobile Network Code (MNC). Example (test network of Siemens AG): 26276

Field for the "DNS configuration" parameter area

Table 11-126 IF_CONF_DNS

Parameter	Data type	Initial value	Description
Id	UINT	16	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 14
Mode	UINT		Validity (1: permanent, 2: temporary)
DNS_IP [1]	IP_V4		IP address of the 1st domain name system server
DNS_IP [2]	IP_V4		IP address of the 2nd domain name system server

Field for the "Time-of-day synchronization" parameter area

Table 11-127 IF_CONF_NTP

Parameter	Data type	Initial value	Description
Id	UINT	17	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 24
Mode	UINT		Validity (1: permanent, 2: temporary)
NTP_IP [1]	ARRAY [1...4] of IP_V4		IP address of NTP server 1
...	...		(IP address of NTP server 2...3)
NTP_IP [4]	ARRAY [1...4] of IP_V4		IP address of NTP server 4

Block for activating / deactivating TeleService users

SDT for activating or deactivating TeleService users already configured in the STEP 7 project of the CP. In STEP 7, the corresponding data can be found in the parameter area "TeleService settings" > "TeleService user management".

Table 11-128 IF_CONF_GPRS_UserList

Parameter	Data type	Initial value	Description
Id	UINT	19	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 506
Mode	UINT		Validity (1: permanent, 2: temporary)
GPRS_User [1...10]	ARRAY [1...10] of GPRS_User		TeleService user no. 1 to max. no. 10

The array is formed from the parameter records for the TeleService users ("GPRS_User" [1...n]).

Table 11-129 GPRS_User [n] (parameter for TeleService user)

Parameter	Data type	Initial value	Description
UserName [n]	STRING [22]		TeleService user name
Password [n]	STRING [22]		- The string must be empty! -
Diag_Allowed [n]	BOOL		- Reserved - (cannot be set)
Teleserv_Allowed [n]	BOOL		Activation of the TeleService user • 0 = user is deactivated • 1 = user is activated
FW_Load_Allowed [n]	BOOL		- Reserved - (cannot be set)

Field for setting the parameters for TeleService access (DNS name of the server)

Access data of the TeleService server (switching station).

In STEP 7, the corresponding data is located in the parameter area "TeleService settings".

If there is more than one TeleService server, use the field once per server.

Table 11-130 IF_CONF_TS_Name

Parameter	Data type	Initial value	Description
Id	UINT	20	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 266
Mode	UINT		Validity (1: permanent, 2: temporary)
ts_name	String [254]		Name of the TeleService server that can be resolved by DNS
RemotePort	UINT		Port of the engineering station
Rank	UINT		Priority of the server [1] or [2] 1 = server 1, 2 = server 2

Field for setting the parameters for TeleService access (IP address of the server)

Access data of the TeleService server (switching station).

In STEP 7, the corresponding data is located in the parameter area "TeleService settings".

If there is more than one TeleService server, use the field once per server.

Table 11-131 IF_CONF_TS_IF_V4

Parameter	Data type	Initial value	Description
Id	UINT	21	ID of the parameter field
Length	UINT		Length of the parameter field in bytes: 14
Mode	UINT		Validity (1: permanent, 2: temporary)
RemoteAddress	IP_V4		IP address of the TeleService server

Parameter	Data type	Initial value	Description
RemotePort	UINT		Port of the TeleService server
Rank	UINT		Priority of the server [1] or [2] 1 = server 1, 2 = server 2

11.6.5.5 TeleService

TM_MAIL: Transfer email

Description of TM_MAIL

Description

The "TM_MAIL" instruction works asynchronously, in other words, its execution extends over multiple calls. You must specify an instance when you call the instruction "TM_MAIL". The attribute "retentive" may not be set in the instance. This attribute ensures that the instance is initialized when the CPU switches from STOP to RUN and that a new e-mail send job can be triggered afterwards.

You start the sending of an e-mail with an edge change from "0" to "1" for the REQ parameter. The job status is indicated by the output parameters BUSY , "DONE", "ERROR", "STATUS" and "SFC_STATUS". "SFC_STATUS" corresponds in this case to the "STATUS" output parameter of the called communication blocks.

The output parameters DONE, ERROR, STATUS, and SFC_STATUS are each displayed for only one cycle if the status of the BUSY output parameter changes from "1" to "0". The following table shows the relationship between BUSY, DONE, and ERROR. Using this table, you can determine the current status of the instruction "TM_MAILand when the sending of the e-mail is complete.

DONE	BUSY	ERROR	Description
0	1	0	The job is being processed.
1	0	0	Job successfully completed.
0	0	1	The job ended with an error. The cause of the error can be found in the STATUS and SFC_STATUS parameters.
0	0	0	The "TM_MAIL" instruction was not assigned a (new) job.

If the CPU changes to STOP mode while "TM_MAIL" is active, the communication connection to the mail server aborts. The communication connection to the mail server will also be lost if

communication problems occur on the Industrial Ethernet bus. In this case, the transfer of the e-mail will be interrupted and it will not reach its recipient.

Notice

Changing user programs

You can change the parts of your user program that directly affect calls of "TM_MAIL" only:

- when the CPU is in "STOP" mode or
- when no mail is being sent (REQ = 0 and BUSY = 0).

This relates, in particular, to deleting and replacing program blocks that contain "TM_MAIL" calls or calls for the instance of "TM_MAIL".

Ignoring this restriction can tie up connection resources. The automation system can change to an undefined status for the TPC/IP communication functions via Industrial Ethernet.

A warm or cold restart of the CPU is required after the changes are transferred.

Data consistency

The ADDR_MAIL_SERVER input parameter of the instruction is taken from the "TM_MAIL" instruction again each time the sending of an e-mail is triggered. If a change is made during operation, the "new" value only becomes effective once an e-mail is triggered again.

In contrast, the WATCH_DOG_TIME, TO_S, CC, FROM, SUBJECT, TEXT, ATTACHMENT, and, if applicable, USERNAME and PASSWORD parameters are taken from the "TM_MAIL" instruction while it is running, which means that they may only be changed after the job is complete (BUSY = 0)

Setting the parameters of the TS Adapter IE

On the TS Adapter IE, you need to specify parameters for outgoing calls in such a way as to enable the TS Adapter IE to establish a connection to the dial-up server of your service provider.

If you set "When required" for connection establishment, the connection will only be established when an e-mail needs to be sent.

Connection establishment can take longer (approx. one minute) for an analog modem connection. When you specify the WATCH_DOG_TIME parameter, remember to allow for the time required to establish the connection.

Parameters

The following table shows the parameters of the "TM_MAIL" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter REQUEST: Activates the sending of an e-mail on a rising edge.
ID	Input	CONN_OUC (Word)	D, L or constant	Reference to the connection to be established. See ID parameter of the TCON (Page 3662), TDISCON (Page 3669), TSEND (Page 3674), and TRCV (Page 3677) instructions. A number that is not used for any additional instances of this instruction in the user program must be entered here.
TO_S (Page 3858)	Input	STRING	D	Input parameter for receiver addresses: STRING with a maximum length of 240 characters (see example call).
CC (Page 3858)	Input	STRING	D	Input parameter for CC recipient addresses (optional): STRING with a maximum length of 240 characters (see example call). If an empty string is assigned here, the e-mail is not sent to a CC recipient.
SUBJECT	Input	STRING	D	Input parameter for subject of the e-mail: STRING with a maximum length of 240 characters.
TEXT	Input	STRING	D	Input parameter for text of the e-mail (optional): Reference to a data string with a maximum length of 240 characters. If an empty string is assigned at this parameter, the e-mail is sent without text.
ATTACHMENT	Input	VARIANT	I, Q, M, D, L	Input parameter for e-mail attachment (optional): Reference to a byte/word/double word field with a maximum length of 65534 bytes. If no value is assigned, the e-mail is sent without an attachment.
DONE	Output	BOOL	I, Q, M, D, L	• DONE = 0: Job not yet started or still executing. • DONE = 1: Job was executed without errors.
BUSY	Output	BOOL	I, Q, M, D, L	• BUSY = 1: E-mail transmission is not yet complete. • BUSY=0: The processing of "TM_MAIL" was stopped.
ERROR	Output	BOOL	I, Q, M, D, L	ERROR=1: An error occurred during processing. STATUS and SFC_STATUS supply detailed information about the type of error.
STATUS (Page 3859)	Output	WORD	I, Q, M, D, L	Output/status parameter STATUS: Return value or error information of the "TM_MAIL" instruction.

Parameter	Declaration	Data type	Memory area	Description
ADDR_MAIL_SERVER	Static*	DWORD	I, Q, M, D, L	IP address input parameter of the mail server: Specify as a data word in HEX format, for example: IP address = 192.168.0.200. ADDR_MAIL_SERVER = DW#16#C0A800C8, where: • 192 = 16#C0, • 168 =16#A8 • 0 = 16#00 and • 200 = 16#C8.
WATCH_DOG_TIME	Static*	TIME	I, Q, M, D, L	Input parameter for max. period of time: The "TM_MAIL" instruction should establish a connection within the period specified by WATCH_DOG_TIME. The block is exited with an error if this period is exceeded. The time before the block is exited and the error is output can exceed the WATCH_DOG_TIME because connection termination also takes a certain amount of time. To begin with, you should set a period of 2 minutes. If you have an ISDN telephone connection, a significantly shorter period can be selected.
USERNAME	Static*	STRING	D	Input parameter for user name: STRING with a maximum length of 180 characters. A user name is an absolute requirement for authentication.
PASSWORD	Static*	STRING	D	Input parameter for password: STRING with a maximum length of 180 characters. A password is an absolute requirement for authentication.
FROM (Page 3858)	Static*	STRING	D	Input parameter for sender address: STRING with a maximum length of 240 characters (see example call).
SFC_STATUS (Page 3859)	Static*	WORD	I, Q, M, D, L	Output/status parameter "SFC_STATUS": Error information of the called communication blocks.
*The values of the parameter are not modified at every call of the instruction "TM_MAIL". The values are in the static parameters of the instance and are only written once at the first call of the instruction.				

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1908)".

Note

Optional parameters

The optional parameters CC, TEXT, and ATTACHMENT are only sent with the e-mail if the corresponding parameters contain a string of length > 0.

SMTP authentication

Authentication refers here to a procedure for ensuring an identity, for example, by a password query.

The "TM_MAIL" instruction supports the SMTP authentication procedure AUTH-LOGIN that is requested by most mail servers. For information about the authentication procedure of your mail server, please refer to your mail server manual or the website of your Internet service provider.

To use the AUTH-LOGIN authentication procedure, the "TM_MAIL" instruction requires the user name with which it can log onto the mail server. This user name corresponds to the user name with which you set up a mail account on your mail server. It is made available to the "TM_MAIL" instruction in the USERNAME parameter.

To log on, the "TM_MAIL" instruction also requires the associated password. This password corresponds to the password you specified when you set up your mail account. It is made available to the "TM_MAIL" instruction in the PASSWORD parameter.

The user name and the password are each transferred to the mail server unencrypted (BASE64-coded).

If no user name is specified in the DB, the AUTH-LOGIN authentication procedure is not used. The e-mail is then sent without authentication.

Parameters TO_S, CC, and FROM

Description

The TO_S, CC, and FROM parameters are strings with, for example, the following content:

- TO: <wenna@mydomain.com>, <ruby@mydomain.com>,
- CC: <admin@mydomain.com>, <judy@mydomain.com>,
- FROM: <admin@mydomain.com>

Note the following rules when entering the parameters:

- The "TO:", "CC:", and "FROM:" characters must be entered.
- A space and an opening pointed bracket "<" must be entered before each address.
- A closing pointed bracket ">" must be entered after each address.
- A comma must be entered after each address in TO and CC.
- Only one e-mail may be entered in FROM, and there must not be a comma at the end of this address

Because of runtime and memory space, the "TM_MAIL" instruction does not perform any syntax check of the parameters TO_S, CC and FROM.

STATUS and SFB_STATUS parameters

Description

The return values of the "TM_MAIL" instruction can be classified as follows:

- W#16#0000: "TM_MAIL" was completed successfully
- W#16#7xxx: Status of "TM_MAIL"
- W#16#8xxx: An error was reported during the internal call of a communication block or from the mail server.

The following table shows the return values of "TM_MAIL" except for error codes of the internally called communication blocks.

Return value STATUS* (W#16#...):	Return value SFB_STATUS (W#16#...):	Explanation	Notes
0000	-	The processing of "TM_MAIL" was completed without error.	A without error completion of "TM_MAIL" does not mean that the sent e-mail will necessarily arrive (see below - note on point 1)
7001		"TM_MAIL" is active (BUSY = 1).	Initial call; job has started
7002	7002	"TM_MAIL" is active (BUSY = 1).	Intermediate call; job already active
8xxx	xxxx	The processing of "TM_MAIL" was completed with an error code of the internally called communication instructions.	For detailed information on the evaluation of the SFB_STATUS parameter, refer to the descriptions of the STATUS parameter of the communication instructions.
8010	xxxx	Error during connection establishment.	For further information on the evaluation of the SFB_STATUS parameter, refer to the descriptions of the STATUS parameter of the "TCON (Page 3662)" instruction.
8011	xxxx	Error sending the data.	For further information on the evaluation of SFB_STATUS, refer to the descriptions of the STATUS parameter of the "TSEND (Page 3674)" instruction.
8012	xxxx	Error receiving the data.	For further information on the evaluation of SFB_STATUS, refer to the descriptions of the STATUS parameter of the "TRCV (Page 3677)" instruction.
8013	xxxx	Error during connection establishment.	For further information on the evaluation of SFB_STATUS, refer to the descriptions of the STATUS parameter of the "TCON (Page 3662)" and "TDISCON (Page 3669)" instructions.

Return value STATUS* (W#16#...):	Return value SFB_STATUS (W#16#...):	Explanation	Notes
8014	-	Establishment of a connection is not possible.	You have possibly entered an incorrect mail server IP address (ADDR_MAIL_SERVER) or a time span that is too short (WATCH_DOG_TIME) to establish the connection. It is also possible that the CPU has no connection to the network or that the CPU configuration is incorrect.
8016	-	Error copying the attachment	-
82xx, 84xx, or 85xx	-	The error message originates from the mail server and corresponds, except for the "8", to the error number of the SMTP protocol. The following columns list several error codes that can occur:	See point 2 in the note.
8450	-	Action not executed: Mailbox not available/ not reachable.	Try again later.
8451	-	Action aborted: Local processing error	Try again later.
8500	-	Syntax error: Error not recognized. This also includes the error when a command string is too long. This can also be occur when the e-mail server does not support the LOGIN authentication procedure.	Check the parameters of "TM_MAIL". Try to send an e-mail without authentication. To do this, replace the USERNAME parameter with an empty string.
8501	-	Syntax error: Parameter or argument incorrect	You have possibly entered an incorrect address in TO_S or CC.
8502	-	Command unknown or not implemented.	Check your entries, in particular the FROM parameter. This is possibly incomplete and you have forgotten "@" or ".".
8535	-	SMTP authentication incomplete.	You have possibly entered an incorrect user name or incorrect password.
8550	-	Mail server cannot be reached, you have no access rights.	You have possibly entered an incorrect user name or password, or the mail server does not support your LOGIN. Another cause of error could be an incorrect entry of the domain name after the "@" in TO_S or CC.
8552	-	Action aborted: Assigned memory size has been exceeded	Try again later.
8554	-	Transmission failed.	Try again later.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".			

Note

Status error

1. An incorrect entry of the recipient addresses does not generate a status error of the "TM_MAIL" instruction. In this case, there is no guarantee that the e-mail will be sent to other recipients, even if these were entered correctly.
2. You can find more detailed information on the SMTP error code and other error codes in SMTP protocol on the Internet or in the error documentation of the mail server. You can also view the most recent message from the mail server in your instance DB in the BUFFER1 parameter. If you look under "Data", you will find the data most recently sent by the "TM_MAIL" instruction.

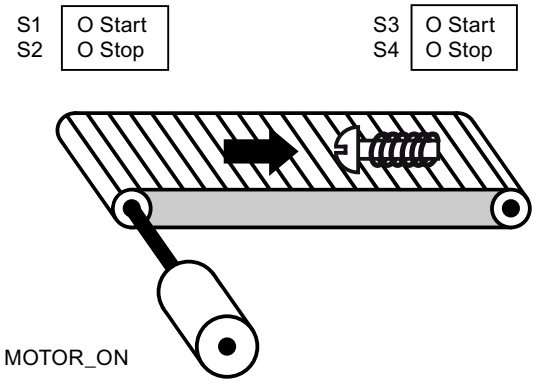
11.7 Programming examples

11.7.1 LAD programming examples

11.7.1.1 Example of controlling a conveyor belt

Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two pushbuttons at the beginning of the conveyor belt: S1 for START and S2 for STOP. There are also two pushbuttons at the end of the conveyor belt: S3 for START and S4 for STOP. It is possible to start and stop the conveyor belt from either end.



Implementation

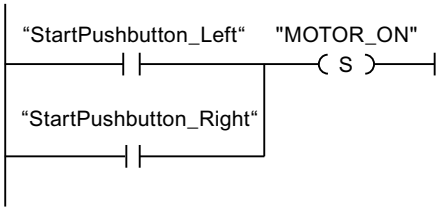
The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
StartPushbutton_Left (S1)	Input	BOOL	Start pushbutton on the left side of the conveyor belt
StopPushbutton_Left (S2)	Input	BOOL	Stop pushbutton on the left side of the conveyor belt
StartPushbutton_Right (S3)	Input	BOOL	Start pushbutton on the right side of the convey-or belt
StopPushbutton_Right (S4)	Input	BOOL	Stop pushbutton on the right side of the convey-or belt
MOTOR_ON	Output	BOOL	Turn on the conveyor belt motor

The following networks show the LAD programming for solving this task:

Network 1:

The conveyor belt motor is switched on when start pushbutton "S1" or "S3" is pressed.



Network 2:

The conveyor belt motor is switched off when stop pushbutton "S2" or "S4" is pressed.

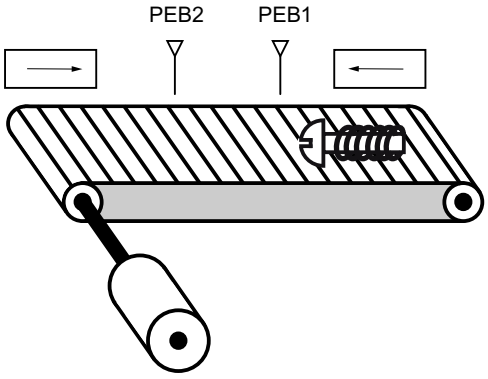
11.7.1.2 Example of detecting the direction of a conveyor belt

Detecting the direction of a conveyor belt

The detected running direction of the belt is indicated by a RIGHT arrow or a LEFT arrow. If additional conveyed material is approaching PEB1 from the right or PEB2 from the left, the displayed arrow is initially switched off until, after both photoelectric barriers are passed, the running direction can be detected again and the corresponding arrow displayed. For the solution of the task, 2 edge memory bits are needed that detect the signal change from "0" to "1" at the two photoelectric barriers.



Implementation

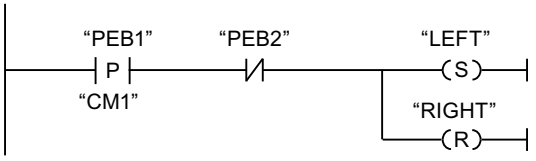
The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
PEB1	Input	BOOL	Photoelectric barrier 1
PEB2	Input	BOOL	Photoelectric barrier 2
RIGHT	Output	BOOL	Display during movement to right
LEFT	Output	BOOL	Display during movement to left
CM1	Input	BOOL	Edge bit memory 1
CM2	Input	BOOL	Edge bit memory 2

The following networks show the LAD programming for solving this task:

Network 1:

If the signal state changes from "0" to "1" (positive edge) at photoelectric barrier "PEB1" and, at the same time, the signal state at "PEB2" is "0", the object on the belt is moving to the left.



Network 2:

If the signal changes from "0" to "1" (positive edge) at photoelectric barrier "PEB2" and, at the same time, the signal state at "PEB1" is "0", the object on the belt is moving to the right.

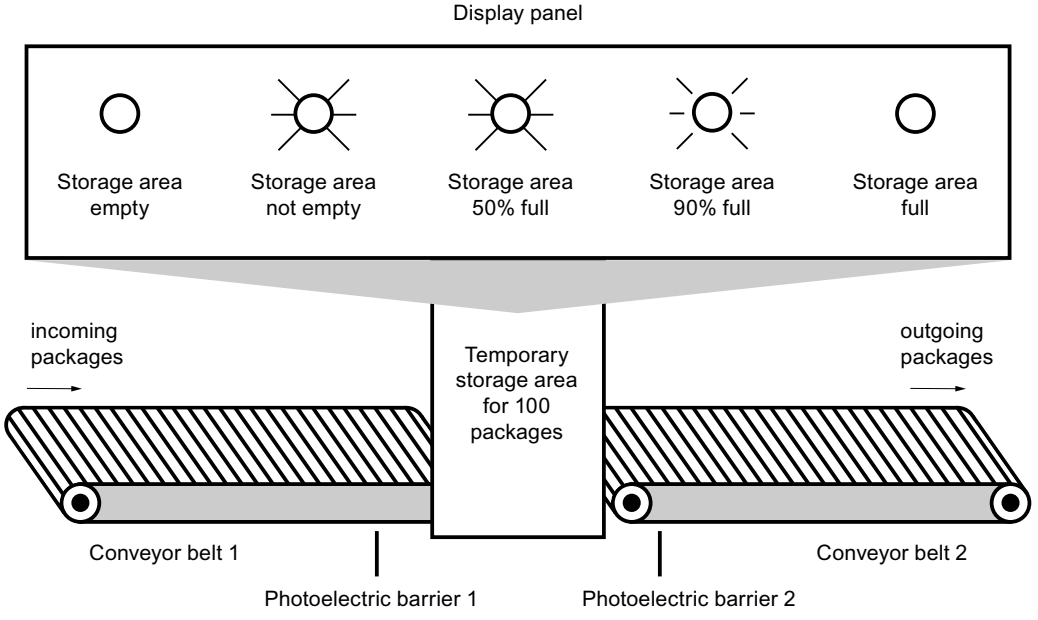
11.7.1.3 Example of detecting the fill level of a storage area

Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage area to be transported to the loading dock. Five display lamps indicate the capacity of the temporary storage area.



Implementation

The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
PEB1	Input	BOOL	Photoelectric barrier 1
PEB2	Input	BOOL	Photoelectric barrier 2
RESET	Input	BOOL	Reset counter
LOAD	Input	BOOL	Adjust the current counter value to the value of the PV parameter.
MAX STORAGE AREA FILL AMOUNT	Input	INT	Maximum possible number of packages in the storage area
PACKAGECOUNT	Output	INT	Number of packages in the storage area (current count value)
STOCK_PACKAGES	Output	BOOL	Is set when the current count value is greater than or equal to the value of the "MAX STORAGE AREA FILL AMOUNT" tag.
STOR_EMPTY	Output	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	Output	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	Output	BOOL	Display lamp: Storage area 50 % full
STOR_90%_FULL	Output	BOOL	Display lamp: Storage area 90 % full
STOR_FULL	Output	BOOL	Display lamp: Storage area full
VOLUME_50	Input	INT	Comparison value: 50 packages
VOLUME_90	Input	INT	Comparison value: 90 packages
VOLUME_100	Input	INT	Comparison value: 100 packages

The following networks show the LAD programming for activating the lamps:

Network 1:

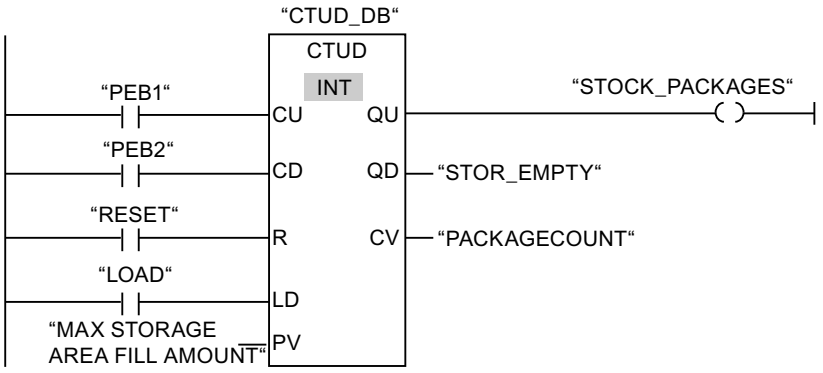
When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

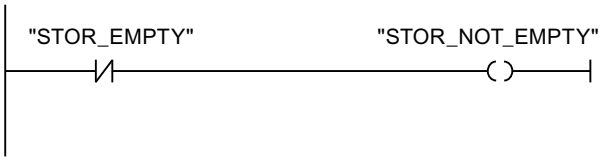
The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "MAX STORAGE AREA FILL AMOUNT" tag. As long as the current count value is greater than or equal to the value of the "MAX STORAGE AREA FILL AMOUNT" tag, the "STOCK_PACKAGES" tag supplies the signal state "1".



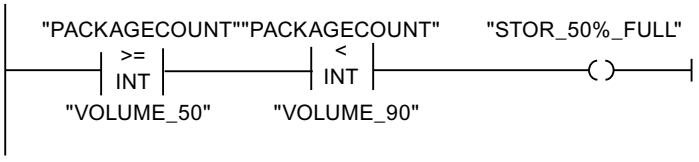
Network 2:

As long as there are packages in the storage area, the "STOR_NOT_EMPTY" tag is set to signal state "1", and the "Storage area not empty" lamp is switched on.



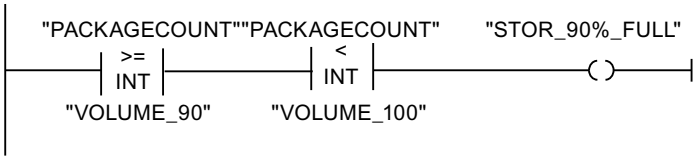
Network 3:

If the number of packages in the storage area is greater than or equal to 50, the "Storage area 50 % full" lamp switches on.

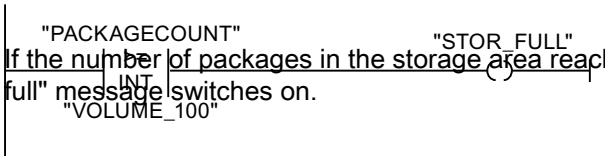


Network 4:

If the number of packages in the storage area is greater than or equal to 90, the "Storage area 90% full" lamp switches on.



Network 5:



If the number of packages in the storage area reaches 100, the lamp for the "Storage area full" message switches on.

11.7.1.4 Example of calculating an equation

Calculating a complex equation

Do you want to program a complex calculation consisting of multiple arithmetic operations or logic operations within one instruction box? The "CALCULATE" instruction is available to you for this purpose.

Depending on the data type you choose, different arithmetic operations are available to you which can be combined with one another.

The following programming example shows how you can enter and calculate a complex equation:

RESULT = ((5 + 10) x 4) / 6

Implementation

1. First, define the following tags in the block interface of your LAD block:

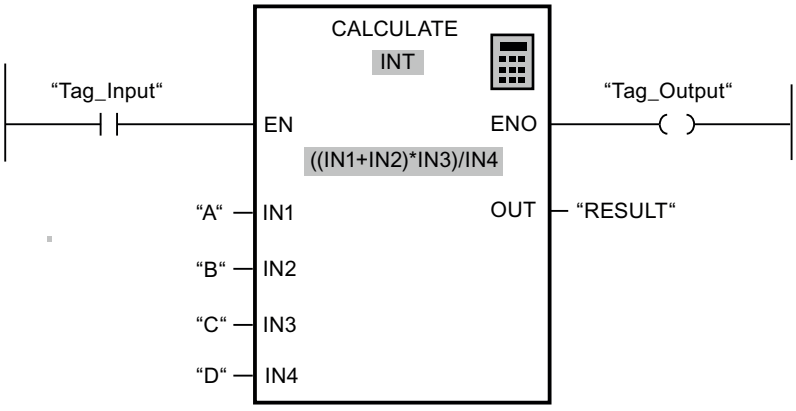
Name	Declaration	Data type	Comment	Values
A	Input	INT	First value for addition	5
B	Input	INT	Second value for addition	10
C	Input	INT	Multiplier	4
D	Input	INT	Divisor	6
RESULT	Output	INT	End result	10

2. You can select the data type INT for the instruction from the "<???>" drop-down list.
3. Interconnect the tags declared in the block interface with the inputs and outputs of the instruction box.

4. Click the "Calculator" icon on the top right corner of the instruction box to enter the equation to be calculated.
   The dialog "Edit "Calculate" instruction" opens.
5. Enter the following expression in the "OUT:=" field:
   ((IN1 + IN2) * IN4) / IN3
   The equation is shown in the instruction box.

Result

The following network shows the result in the LAD programming language:



If the "Tag_Input" has the signal state "1", the instruction is executed. The value of operand "A" is added to the value of operand "B". The subtotal is multiplied by "C" and then divided by the value of the "D" operand. The end result is saved in the "RESULT" operand.

11.7.1.5 Example of controlling room temperature

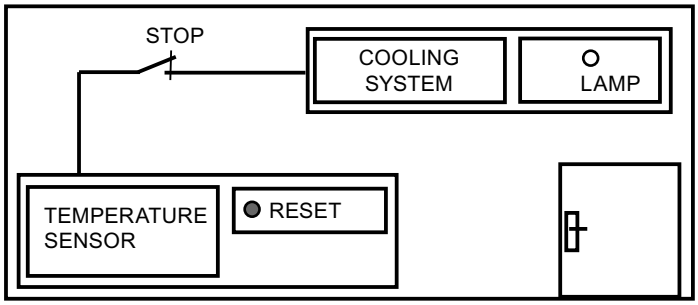
Controlling room temperature

In a cold room, the temperature must be maintained below zero degrees Celsius. A sensor is used to check for any temperature fluctuations. If the temperature rises above zero degrees Celsius, the cooling system switches on for a preset time. The "Cooling system on" lamp is lit during this time.

The cooling system and the lamp are turned off if one of the following conditions is met:

- The sensor reports a temperature fall below zero degrees Celsius.
- The preset cooling time has elapsed.
- The "STOP" pushbutton is pressed.

If the preset cooling time has expired and the temperature in the cold room is still too high, the cooling system can be restarted with the "RESET" pushbutton.



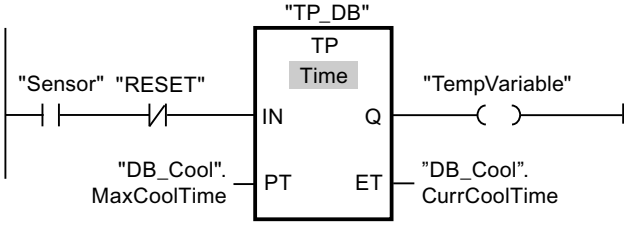
Implementation

The following table shows the definition of the tags used:

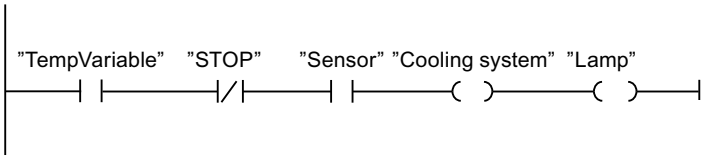
Name	Declaration	Data type	Comment
Sensor	Input	BOOL	Temperature sensor signal
RESET	Input	BOOL	Restart
STOP	Input	BOOL	The cooling system is switched off.
MaxCoolTime	-	TIME	Preset cooling time This tag is defined in the "DB_Cool" data block.
CurrCoolTime	-	TIME	Currently elapsed cooling time This tag is defined in the "DB_Cool" data block.
Cooling system	Output	BOOL	The cooling system is switched on.
Lamp	Output	BOOL	The lamp for the "Cooling system on" message is switched on.
TempVariable	Temp	BOOL	Temporary tag This tag stores the signal state of the IEC timer TP.

The following network shows the LAD programming for controlling room temperature:

Network 1:



Network 2:



When the temperature in the cold room rises above zero degrees Celsius, the signal state at the "Sensor" operand switches from "0" to "1" (positive signal edge). In the case of a positive signal edge at the IN input of the timer function, the preset cooling time is started and the "TempVariable" receives the signal state "1". The signal state "1" of the "TempVariable" causes the cooling system as well as the display lamp to be turned on in network 2. The "Sensor", "Cooling system" and "Lamp" outputs must be programmed in network 2, because program only one coil can be programmed at the Q output of the timer function.

If the temperature in the cold room falls below zero degrees Celsius, the signal state of the sensor switches back to "0". This switches the cooling system and lamp off.

If the sensor does not signal a temperature drop, the cooling system and lamp are switched off after the preset cooling time has elapsed, at the latest. In this case, the cooling process can be restarted with the "RESET" pushbutton. Pressing and releasing the pushbutton generates a new positive signal edge at the IN input that restarts the cooling system.

The cooling system and the display lamp can be turned off with the "STOP" pushbutton at any time.

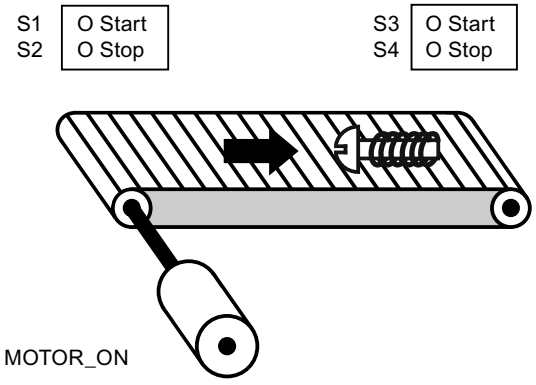
11.7.2.1 Example of controlling a conveyor belt

Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two pushbuttons at the beginning of the conveyor belt: S1 for START and S2 for STOP. There are also two pushbuttons at the end of the conveyor belt: S3 for START and S4 for STOP. It is possible to start and stop the conveyor belt from either end.



Implementation

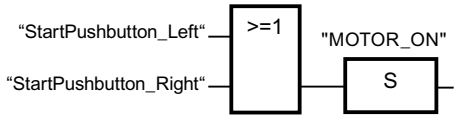
The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
StartPushbutton_Left (S1)	Input	BOOL	Start pushbutton on the left side of the conveyor belt
StopPushbutton_Left (S2)	Input	BOOL	Stop pushbutton on the left side of the conveyor belt
StartPushbutton_Right (S3)	Input	BOOL	Start pushbutton on the right side of the convey-or belt
StopPushbutton_Right (S4)	Input	BOOL	Stop pushbutton on the right side of the convey-or belt
MOTOR_ON	Output	BOOL	Turn on the conveyor belt motor

The following networks show the FBD programming for solving this task:

Network 1:

The conveyor belt motor is switched on when start pushbutton "S1" or "S3" is pressed.



Network 2:

The conveyor belt motor is switched off when stop pushbutton "S2" or "S4" is pressed.

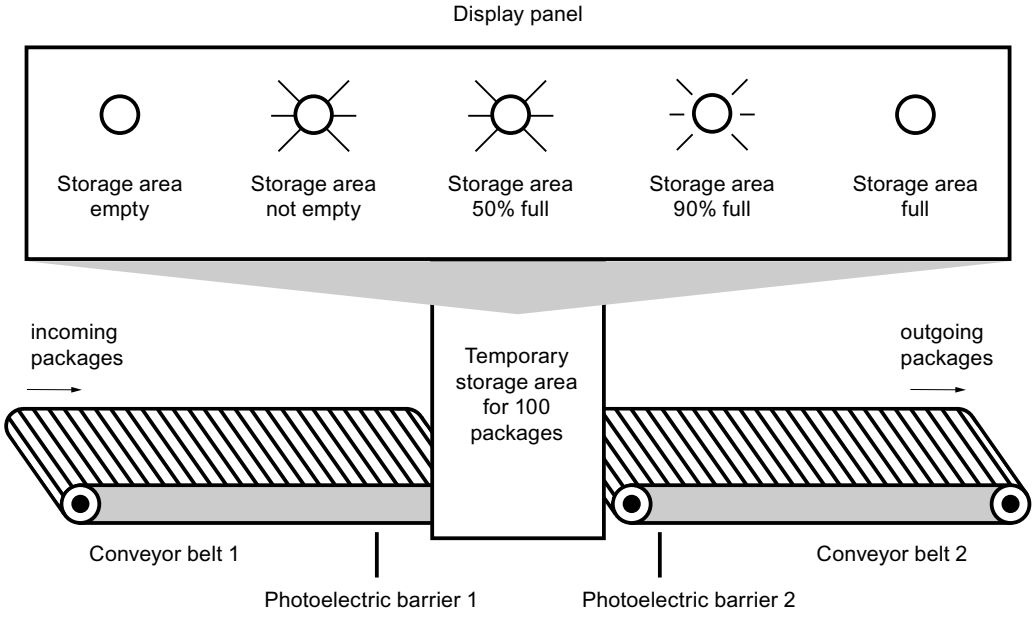
Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage area to be transported to the loading dock. Five display lamps indicate the capacity of the temporary storage area.



Implementation

The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
PEB1	Input	BOOL	Photoelectric barrier 1
PEB2	Input	BOOL	Photoelectric barrier 2
RESET	Input	BOOL	Reset counter
LOAD	Input	BOOL	Adjust the current counter value to the value of the PV parameter.
MAX STORAGE AREA FILL AMOUNT	Input	INT	Maximum possible number of packages in the storage area
PACKAGECOUNT	Output	INT	Number of packages in the storage area (current count value)

Name	Declaration	Data type	Description
STOCK_PACKAGES	Output	BOOL	Is set when the current count value is greater than or equal to the value of the "MAX STORAGE AREA FILL AMOUNT" tag.
STOR_EMPTY	Output	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	Output	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	Output	BOOL	Display lamp: Storage area 50 % full
STOR_90%_FULL	Output	BOOL	Display lamp: Storage area 90 % full
STOR_FULL	Output	BOOL	Display lamp: Storage area full
VOLUME_50	Input	INT	Comparison value: 50 packages
VOLUME_90	Input	INT	Comparison value: 90 packages
VOLUME_100	Input	INT	Comparison value: 100 packages

The following networks show the FBD programming for activating the lamps:

Network 1:

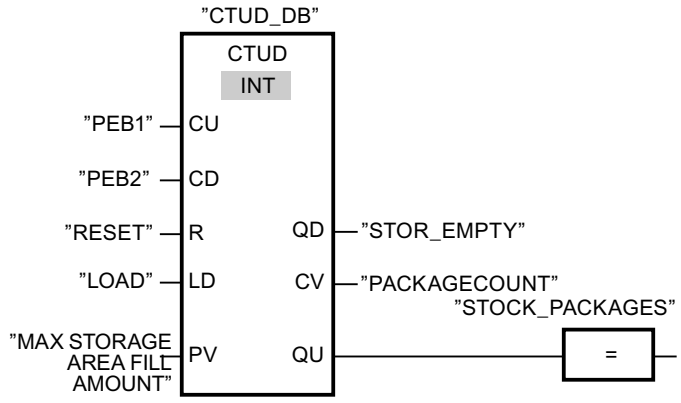
When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

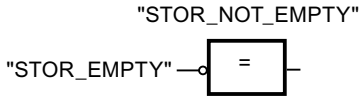
The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "MAX STORAGE AREA FILL AMOUNT" tag. As long as the current count value is greater than or equal to the value of the "MAX STORAGE AREA FILL AMOUNT" tag, the "STOCK_PACKAGES" tag supplies the signal state "1".



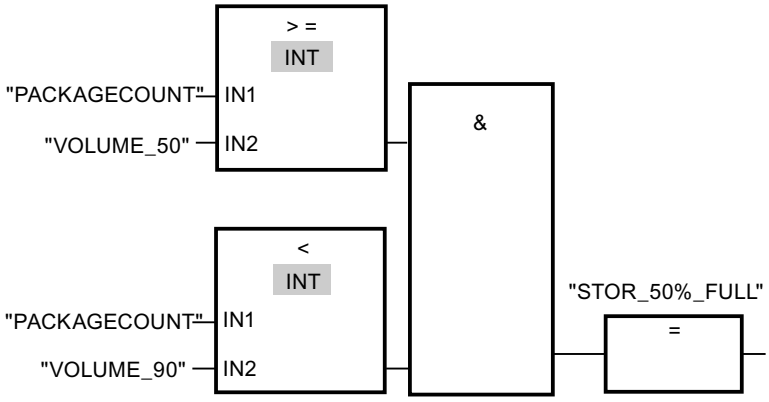
Network 2:

As long as there are packages in the storage area, the "STOR_NOT_EMPTY" tag is set to signal state "1", and the "Storage area not empty" lamp is switched on.



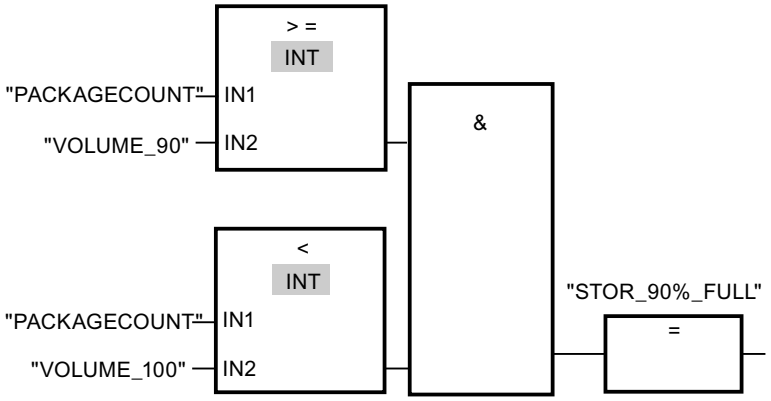
Network 3:

If the number of packages in the storage area is greater than or equal to 50, the "Storage area 50 % full" lamp switches on.



Network 4:

If the number of packages in the storage area is greater than or equal to 90, the "Storage area 90% full" lamp switches on.



Network 5:

If the number of packages in the storage area reaches 100, the lamp for the "Storage area full" message switches on.

11.7.2.5 Example of controlling room temperature

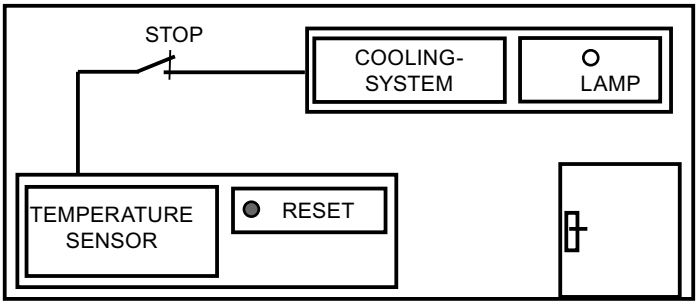
Controlling room temperature

In a cold room, the temperature must be maintained below zero degrees Celsius. A sensor is used to check for any temperature fluctuations. If the temperature rises above zero degrees Celsius, the cooling system switches on for a preset time. The "Cooling system on" lamp is lit during this time.

The cooling system and the lamp are turned off if one of the following conditions is met:

- The sensor reports a temperature fall below zero degrees Celsius.
- The preset cooling time has elapsed.
- The "Stop" pushbutton is pressed.

If the preset cooling time has expired and the temperature in the cold room is still too high, the cooling system can be restarted with the "RESET" pushbutton.



Implementation

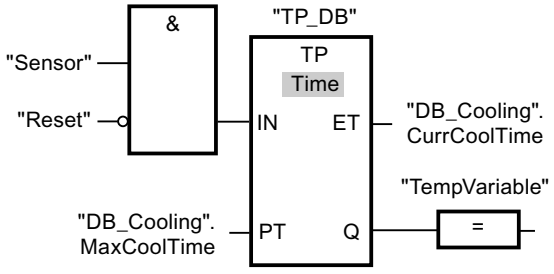
The following table shows the definition of the tags used:

Name	Declaration	Data type	Comment
Sensor	Input	BOOL	Temperature sensor signal
RESET	Input	BOOL	Restart
STOP	Input	BOOL	The cooling system is switched off.
MaxCoolTime	-	TIME	Preset cooling time This tag is defined in the "DB_Cool" data block.
CurrCoolTime	-	TIME	Currently elapsed cooling time This tag is defined in the "DB_Cool" data block.
Cooling system	Output	BOOL	The cooling system is switched on.

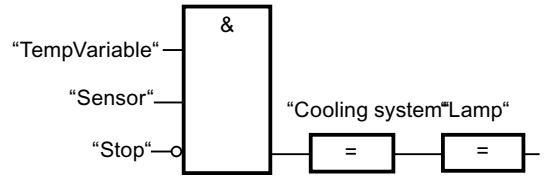
Name	Declaration	Data type	Comment
Lamp	Output	BOOL	The lamp for the "Cooling system on" message is switched on.
TempVariable	Temp	BOOL	Temporary tag This tag stores the signal state of the IEC timer TP.

The following network shows the FBD programming for controlling room temperature:

Network 1:



Network 2:



When the temperature in the cold room rises above zero degrees Celsius, the signal state at the "Sensor" operand switches from "0" to "1" (positive signal edge). In the case of a positive signal edge at the IN input of the timer function, the preset cooling time is started and the "TempVariable" receives the signal state "1". The signal state "1" of the "TempVariable" causes the cooling system as well as the display lamp to be turned on in network 2. The "Sensor", "Cooling system" and "Lamp" outputs must be programmed in network 2, because program only one coil can be programmed at the Q output of the timer function.

If the temperature in the cold room falls below zero degrees Celsius, the signal state of the sensor switches back to "0". This switches the cooling system and lamp off.

If the sensor does not signal a temperature drop, the cooling system and lamp are switched off after the preset cooling time has elapsed, at the latest. In this case, the cooling process can be restarted with the "RESET" pushbutton. Pressing and releasing the pushbutton generates a new positive signal edge at the IN input that restarts the cooling system.

The cooling system and the display lamp can be turned off with the "STOP" pushbutton at any time.

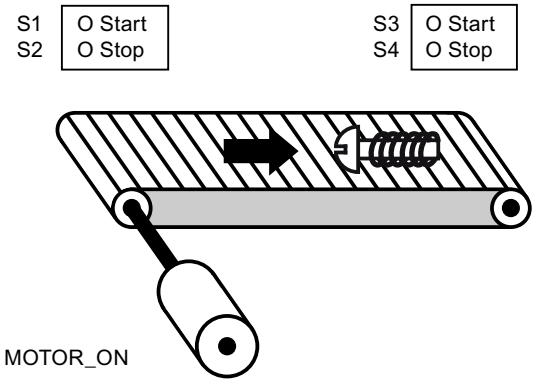
11.7.3 SCL programming examples

11.7.3.1 Example of controlling a conveyor belt

Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two pushbuttons at the beginning of the conveyor belt: S1 for START and S2 for STOP. There are also two pushbuttons at the end of the conveyor belt: S3 for START and S4 for STOP. It is possible to start and stop the conveyor belt from either end.



Implementation

The following table shows the definition of the tags used:

Operand	Declaration	Data type	Description
StartPushbutton_Left (S1)	Input	BOOL	Start pushbutton on the left side of the conveyor belt
StopPushbutton_Left (S2)	Input	BOOL	Stop pushbutton on the left side of the conveyor belt
StartPushbutton_Right (S3)	Input	BOOL	Start pushbutton on the right side of the convey-or belt
StopPushbutton_Right (S4)	Input	BOOL	Stop pushbutton on the right side of the convey-or belt

Operand	Declaration	Data type	Description
MOTOR_ON	Output	BOOL	Turn on the conveyor belt motor
MOTOR_OFF	Output	BOOL	Turn off the conveyor belt motor

The following SCL program shows how to implement this task:

SCL

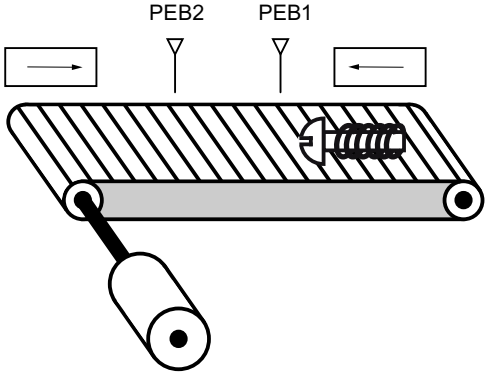
```
IF "StartPushbutton_Left_S1" OR "StartPushbutton_Right_S3" THEN
"MOTOR_ON" := 1;
"MOTOR_OFF" := 0;
END_IF;
IF "StopPushbutton_Left_S2" OR "StopPushbutton_Right_S4" THEN
"MOTOR_ON" := 0;
"MOTOR_OFF" := 1;
END_IF;
```

The conveyor belt motor is switched on when start pushbutton "StartPushbutton_Left_S1" or "StartPushbutton_Right_S3" is pressed. The conveyor belt motor is switched off when stop pushbutton "StopPushbutton_Left_S2" or "StopPushbutton_Right_S4" is pressed.

11.7.3.2 Example of detecting the direction of a conveyor belt

Detecting the direction of a conveyor belt

The detected running direction of the belt is indicated by a RIGHT arrow or a LEFT arrow. If additional conveyed material is approaching PEB1 from the right or PEB2 from the left, the displayed arrow is initially switched off until, after both photoelectric barriers are passed, the running direction can be detected again and the corresponding arrow displayed. For the solution of the task, 2 edge memory bits are needed that detect the signal change from "0" to "1" at the two photoelectric barriers.



Implementation

The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
Photoelectric barrier PEB1	Input	BOOL	Photoelectric barrier 1
Photoelectric barrier PEB2	Input	BOOL	Photoelectric barrier 2
RIGHT	Output	BOOL	Display for movement to the right
LEFT	Output	BOOL	Display for movement to the left
Auxiliary flag PEB1	Input	BOOL	Edge bit memory 1
Auxiliary flag PEB2	Input	BOOL	Edge bit memory 2

The following SCL program shows how to implement this example:

SCL

```
// Program code for left running
IF "Photolelectric barrier PEB1" = 1 AND "Auxiliary flag PEB2" = 0 THEN
          "Auxiliary flag PEB1" := 1; // Set auxiliary flag for PEB1
          "LEFT" := 0; // Switch off arrow display left
          "RIGHT" := 0; // Switch off arrow display right
END_IF;

IF "Auxiliary flag PEB1" = 1 AND "Photoelectric barrier PEB2" = 1 THEN // The conveyor belt
is running to the left
          "LEFT" = 1;
          "RIGHT" := 0;
END_IF;

IF "LINKS" = 1 AND "Photoelectric barrier PEB2" = 0 THEN // Reset auxiliary flag for PEB1
          "Auxiliary flag PEB1" = 0
END_IF;
```

SCL

```
// Program code for right running
IF "Photolelectric barrier PEB2" = 1 AND "Auxiliary flag PEB1" = 0 THEN
          "Auxiliary flag PEB2" := 1; // Set auxiliary flag for PEB2
          "LEFT" := 0; // Switch off arrow display left
          "RIGHT" := 0; // Switch off arrow display right
END_IF;

IF "Auxiliary flag PEB2" = 1 AND "Photoelectric barrier PEB1" = 1 THEN // The conveyor belt
is running to the right
          "LEFT" = 0;
```

SCL

```
          "RIGHT" := 1;
END_IF;

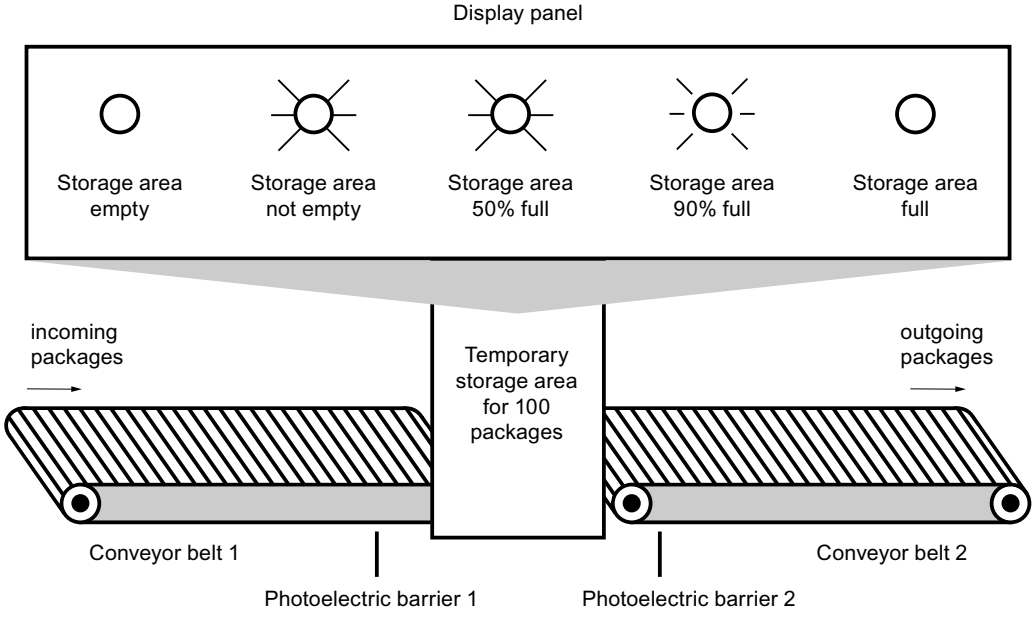
IF "RIGHT" = 1 AND "Photoelectric barrier PEB1" = 0 THEN // Reset auxiliary flag for PEB2
          "Auxiliary flag PEB2" := 0;
END_IF;
```

If the photoelectric barrier "PEB1" has signal state "1" and the photoelectric barrier "PEB2" has signal state "0" at the same time, the object on the belt is moving to the left. If the photoelectric barrier "PEB2" has signal state "1" and the photoelectric barrier "PEB1" has signal state "0" at the same time, the object on the belt is moving to the right. The displays for a movement to the left or right will be turned off when the signal state at both photoelectric barriers is "0".

11.7.3.3 Example of detecting the fill level of a storage area

Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage area to be transported to the loading dock. Five display lamps indicate the capacity of the temporary storage area.



Implementation

The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
PEB1	Input	BOOL	Photoelectric barrier 1
PEB2	Input	BOOL	Photoelectric barrier 2
RESET	Input	BOOL	Reset counter
LOAD	Input	BOOL	Adjust the current counter value to the value of the PV parameter.
MAX STORAGE AREA FILL AMOUNT	Input	INT	Maximum possible number of packages in the storage area
PACKAGECOUNT	Output	INT	Number of packages in the storage area (current count value)
STOCK_PACKAGES	Output	BOOL	Is set when the current count value is greater than or equal to the value of the "MAX STORAGE AREA FILL AMOUNT" tag.
STOR_EMPTY	Output	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	Output	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	Output	BOOL	Display lamp: Storage area 50 % full
STOR_90%_FULL	Output	BOOL	Display lamp: Storage area 90 % full
STOR_FULL	Output	BOOL	Display lamp: Storage area full
VOLUME_50	Input	INT	Comparison value: 50 packages
VOLUME_90	Input	INT	Comparison value: 90 packages
VOLUME_100	Input	INT	Comparison value: 100 packages

The following SCL program shows how to implement this example:

When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "MAX STORAGE AREA FILL AMOUNT" tag. As long as the current count value is greater than or equal to the value of the "MAX STORAGE AREA FILL AMOUNT" tag, the "STOCK_PACKAGES" tag supplies the signal state "1".

SCL

```
"VOLUME_50" := 5; // Preassigning of the comparison value to 50 packages (for the test only
5 packages)
"VOLUME_90" := 9; // Preassigning of the comparison value to 90 packages (for the test only
9 packages)
"VOLUME_100" := 10; // Preassigning of the comparison value to 100 packages (for the test
only 10 packages)
"MAX STORAGE AREA FILL AMOUNT" := 10; // Preassigning of the maximum amount in storage area
to 100 packages (for the test only 10 packages)

"IEC_Counter_0_DB".CTUD(CU := "PEB1",
                        CD := "PEB2",
                        R := "RESET",
                        LD := "LOAD",
                        PV := "MAX STORAGE AREA FILL AMOUNT",
                        QU => "STOCK_PACKAGES",
                        QD => "STOR_EMPTY",
                        CV => "PACKAGECOUNT");
```

As long as the storage area contains packages, the "Storage area not empty" lamp is switched on.

SCL

```
"STOR_NOT_EMPTY" := NOT "STOR_EMPTY"
```

If the number of packages in the storage area is lower than 50%, the lamps for the alarms "Storage area 50% full", "Storage area 90% full" and "Storage area full" switch off.

SCL

```
IF "PACKAGECOUNT" < "VOLUME_50" THEN
"STOR_50%_FULL" := 0;
"STOR_90%_FULL" := 0;
"STOR_FULL" := 0;
END_IF;
```

If the number of packages in the storage area is greater than or equal to 50 %, the "Storage area 50 % full" lamp switches on.

```
IF "PACKAGECOUNT" >= "VOLUME_50" AND "PACKAGECOUNT <= "VOLUME_90" THEN
"STOR_50%_FULL" := 1;
"STOR_90%_FULL" := 0;
"STOR_FULL" := 0;
END_IF;
```

If the number of packages in the storage area is greater than or equal to 90 %, the "Storage area 90 % full" lamp switches on. The display lamp for 50 % full also remains on.

SCL

```
IF "PACKAGECOUNT" >= "VOLUME_90" AND "PACKAGECOUNT < "VOLUME_100" THEN
"STOR_50%_FULL" := 1;
"STOR_90%_FULL" := 1;
"STOR_FULL" := 0;
END_IF;
```

If the number of packages in the storage area reaches 100 %, the lamp for the "Storage area full" message switches on. The display lamps for 50 % and 90 % full also remain on.

SCL

```
IF "PACKAGECOUNT" >= "VOLUME_100" THEN
"STOR_50%_FULL" := 1;
"STOR_90%_FULL" := 1;
"STOR_FULL" := 1;
END_IF;
```

Visualize processes

12

12.1 Creating screens

12.1.1 Basics

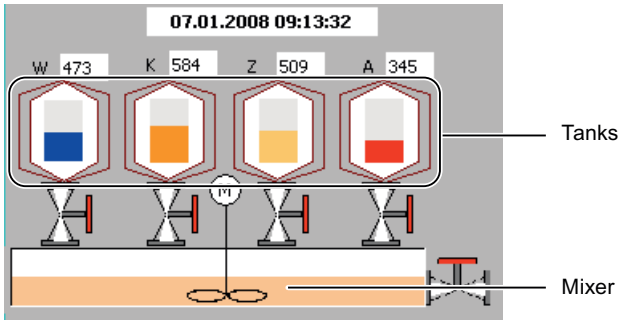
12.1.1.1 Screen basics

Introduction

In WinCC you create screens that an operator can use to control and monitor machines and plants. When you create your screens, the object templates included support you in visualizing processes, creating images of your plant, and defining process values.

Application example

The figure shows a screen that was created in WinCC. With the help of this screen, the operator can operate and monitor the mixing station of a fruit juice manufacturing system. Fruit juice base is supplied from various tanks to a mixing unit. The screen indicates the fill level of the tanks.



Screen design

Insert an object you need to represent a process into your screen. Configure the object to correspond to the requirements of your process.

A screen may consist of static and dynamic elements.

- Static elements such as text or graphic objects do not change their status in runtime. The tank labels (W, K, Z, A) shown in this example of a mixing unit are static elements.
- Dynamic elements change their status based on the process. Visual current process values as follows:
  - From the memory of the PLC
  - From the memory of the HMI device in the form of alphanumeric displays, trends and bars.

  Input fields on the HMI device are also considered dynamic objects. The fill level values of the tanks in our example of a mixing plant are dynamic objects.

Process values and operator inputs are exchanged between the controller and the HMI device via tags.

Screen properties

The screen layout is determined by the features of the HMI device you are configuring. It corresponds with the layout of the user interface of this device. If the set HMI device has function keys, the screen shows these function keys. Other properties such as the screen resolution, fonts and colors are also determined by the characteristics of the selected HMI.

Function keys

A function key is a key on the HMI device to which you can assign one or several functions in WinCC. The functions are triggered as soon as the operator presses the key on the HMI device.

A function key can be assigned global or local functions:

Global function keys always trigger the same action, regardless of the currently displayed screen.

Local function keys trigger different actions depending on the currently displayed screen on the HMI device. This assignment applies only to the screen in which you have defined the function key.

Navigation

You configure a screen navigation to enable the operator to call a screen on the HMI device in Runtime.

- The "Screen" editor is used to configure buttons for calling other screens.
- You use the "Global Screen" editor to configure globally assigned function keys.

12.1.1.2 Device-dependent functional scope of screens

Introduction

The functions of an HMI device determine the display of the device in WinCC and the scope of functions of the editors.

The following screen properties are determined by the functions of the selected HMI device:

- Device layout
- Screen resolution
- Number of colors
- Fonts
- Objects available

Device layout

The device layout of a screen forms the image of the HMI device in your configuration. The device layout of the screen shows all the function keys available on the HMI device, for example.

Screen resolution

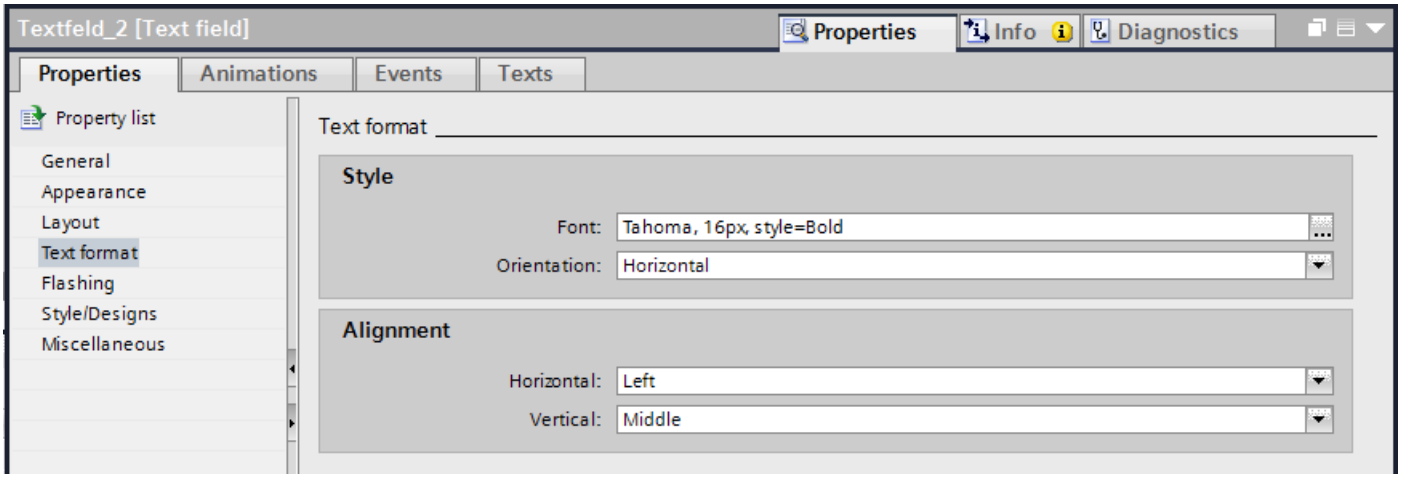
The screen resolution is determined by the different display dimensions of the various operator panels. You can only change the screen resolution if you configure the "WinCC Runtime Advanced" or "WinCC Runtime Professional" HMI device.

Number of colors

You can assign colors to the screen objects. The number of possible colors is determined by the color depth and specific colors supported on the selected HMI device.

Fonts

You can customize the appearance of the texts in all the screen objects that contain static or dynamic text. How to highlight individual texts in a screen. Select the font, font style and size, and set additional effects such as underscoring, for example.



The settings for the text markups such as font style and effects always refer to the entire text of a screen object. That is, you can display the complete title in bold format, but not its individual characters or words, for example.

Objects available

Some of the screen objects can not be configured globally for all HMI devices. These screen objects are not displayed in the "Tools" task card. For a KTP 1000 touch panel unit you can not configure a slider, for example.

Screen basics (Page 3889)

12.1.1.3 Elements and basic settings

Task cards

Introduction

The following task cards are available in the "Screens" editor:

- Tools: Display and operating objects
- Animations: Templates for dynamic configuration

- Layout: Aid for customizing the display
- Libraries: Administration of the project library and of the global libraries

Note
WinCC Basic

The "Animations" task card is not available in WinCC Basic.

Tools

The "Tools" task card contains objects in different panes:

- Basic objects
- Elements
- Controls
- User controls (optional)
- Graphics

You paste objects from the palettes into your screens by drag&drop or a double click. The objects available for selection are determined by the features of the HMI device you are configuring. The following icons are used to change the display mode:

Icon	Meaning
	Displays the objects as a list.
	Displays the objects as a graphic.

Animations

The "Animations" task card contains the possible dynamizations of a screen object in the palettes. You paste the animations to a screen object by drag&drop or a double click from the "Movements", "Display" and "Tag Binding" palettes.

Layout

The "Layout" task card contains the following panes for displaying objects and elements:

- Layers: Serves to manage screen object layers The layers are displayed in a tree view and contain information about the active layer and the visibility of all layers.
- Grid: You specify whether you want to align the objects to a grid or to other objects and set the grid size for a grid.
- Objects out of range: Objects that lie outside the visible area are displayed with name, position and type.

Libraries

The "Libraries" task card show the following libraries in separate panes:

- Project library: The project library is stored together with the project.
- Global library: The global library is stored in a separate file in the specified path on your configuration PC.

Moving the view (Page 3894)

Zooming the view (Page 3895)

Screen basics (Page 3889)

Moving the view

Introduction

To display only a section of the entire screen in the work area, use the icon of the "Screens" editor:

Requirement

- A screen is open.
- The view shows only a screen section.

Procedure

To move the view:

1. Click the icon at the bottom right corner of the work area and press the left mouse button. A miniature view of the full screen is shown. An orange frame shows the currently selected area.
2. Hold down the mouse button and drag the frame to the desired area.

Note

The screen is scrolled when you drag a screen object from the visible to a currently hidden section.

See also

Task cards (Page 3892)

Zooming the view

Introduction

To view a small screen section in closer detail, use the zoom tool to magnify the screen in the working area. The maximum zoom amounts to 800%.

You can zoom with the toolbar in the work area or with the "Layout > Zoom" task card.

There are different ways to increase the screen, for example, with the zoom factor or by adapting the work area to the height of the screen.

Requirement

The screen is opened.

Procedure

Proceed as follows to zoom a view with the selection frame:

1. Click the  toolbar button.
2. Use the mouse to draw a selection frame in the screen.

After you have released the mouse button, the section enclosed by the selection frame is zoomed to fit the complete work area.

Alternatively, use the slider in the lower right-hand corner of the screen.

Result

The selected screen section is magnified.

Task cards (Page 3892)

12.1.1.4 Working with screens

Steps

Steps

To create screens, you need to take the following initial steps:

- Plan the structure of the process visualization: Number of screens and their layout
  Example: Subprocesses are visualized in separate screens, and merged in a master screen.
- Define your screen navigation control strategies.

- Adapt the templates and the global screen.
  You define objects centrally and assign function keys for example.
- Create the screens. Use the following options of efficient screen creation:
  - Working with libraries
  - Working with layers
  - Working with faceplates

Creating a new screen (Page 3896)

Managing screens (Page 3897)

Defining the start screen of the project (Page 3898)

Screen basics (Page 3889)

Creating a new screen

Introduction

Create screens to display processes in your system.

Requirement

- The project has been created.
- The Inspector window is open.

Procedure

1. Double-click "Screens > Add New Screen" in the project navigation.
   The screen is generated in the project and appears in your view. The screen properties are shown in the Inspector window.
2. Enter a meaningful name for the screen.
3. Configure the screen properties in the Inspector window:
   - Specify whether and on which template the screen is based.
   - Set the "Background Color" and the "Screen Number."
   - Specify a documenting text under "Tooltip".
   - Specify the layers to be displayed under "Layers" in the engineering system.
   - Select dynamic screen update under "Animations."
   - Select "Events" to define which functions you want to execute in Runtime when you call and exit the screen or at other events.

     Note

     Not all HMI devices support the "Visibility" animation.

Result

You created the screen in your project. You can now paste objects and control elements from the "Tools" task card and assign function keys in further work steps.

See also

Steps (Page 3895)

Managing screens

Introduction

You can move screens within a project to other groups, or copy, rename, and delete them.

Moving screens in a group

1. Select the "Screens" folder in the project tree.
2. Select the "Add group" command from the shortcut menu.
   A folder called "Group_x" is inserted.
3. Select the screen in the project tree.
4. Drag-and-drop the screen to the required group.
   The screen is moved into this group.

Copy screen

1. Select the screen in the project tree.
2. Select the "Copy" command in the shortcut menu to copy the screen to the clipboard.
3. In the project tree, select the screen insert position.
4. Select "Paste" from the shortcut menu to insert the screen.
   A copy of the screen is inserted. A consecutive number is appended to the name of the original in the copy.

Alternatively, press <Ctrl> while you drag the screen to the required position.

Note

If you copy a screen with interconnected template for several devices and projects, the template will also be copied. Any existing matching template is not used. This holds particularly true when you copy the screens with drag-and-drop.

Rename screen

1. Select the screen in the project tree.
2. Select "Rename" from the shortcut menu.
3. Type in a new name.
4. Press <Enter>.

As an option, use the <F2> function key to rename the screen.

Delete screen

1. Select the screen in the project tree.
2. Select "Delete" from the shortcut menu.
   The screen and all its objects are deleted from the current project.

See also

Steps (Page 3895)

Defining the start screen of the project

Introduction

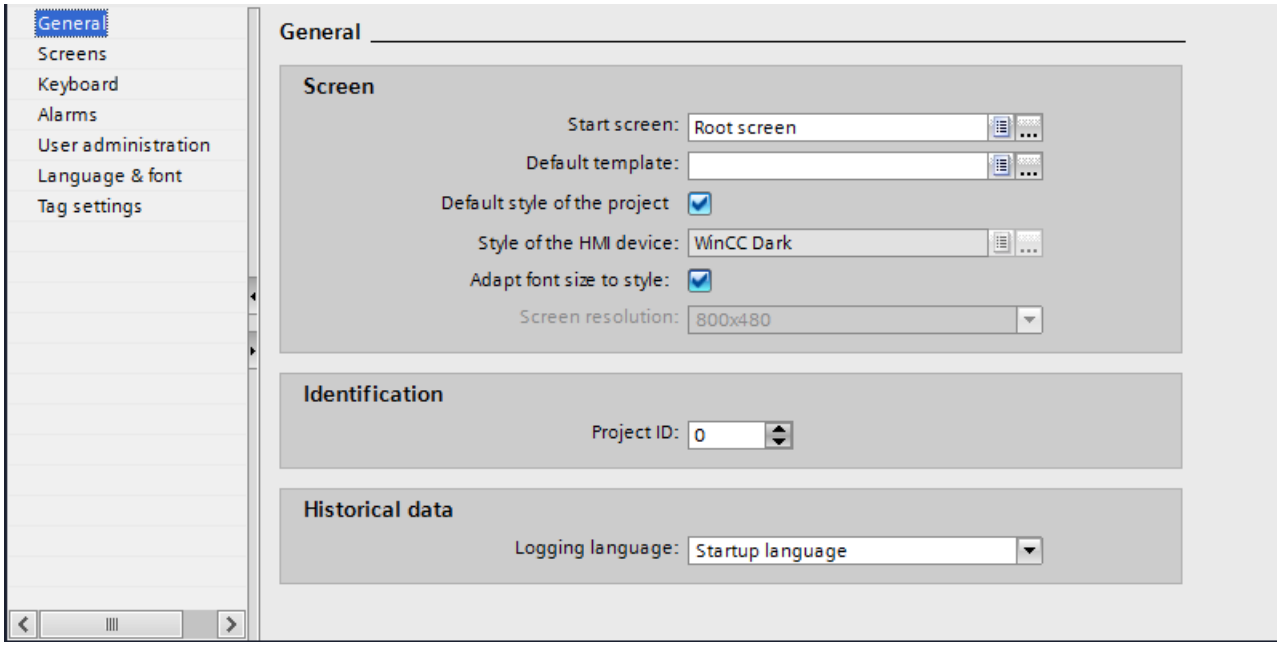
The start screen is the initial screen opened at the start of project in Runtime. You can define a different start screen for each one of the HMI devices. Beginning at this start screen, the operator calls the other screens.

Requirement

The project contains the screen you want to use as the start screen.

Procedure

1. Double-click "Runtime settings > General" in the project tree.



2. Select the desired screen as "Start screen".

Alternatively select a screen in the project tree and select "Use as start screen" in the shortcut menu.

Result

The start screen opens on the HMI at the start of Runtime.

See also

Steps (Page 3895)

Changing the screen resolution

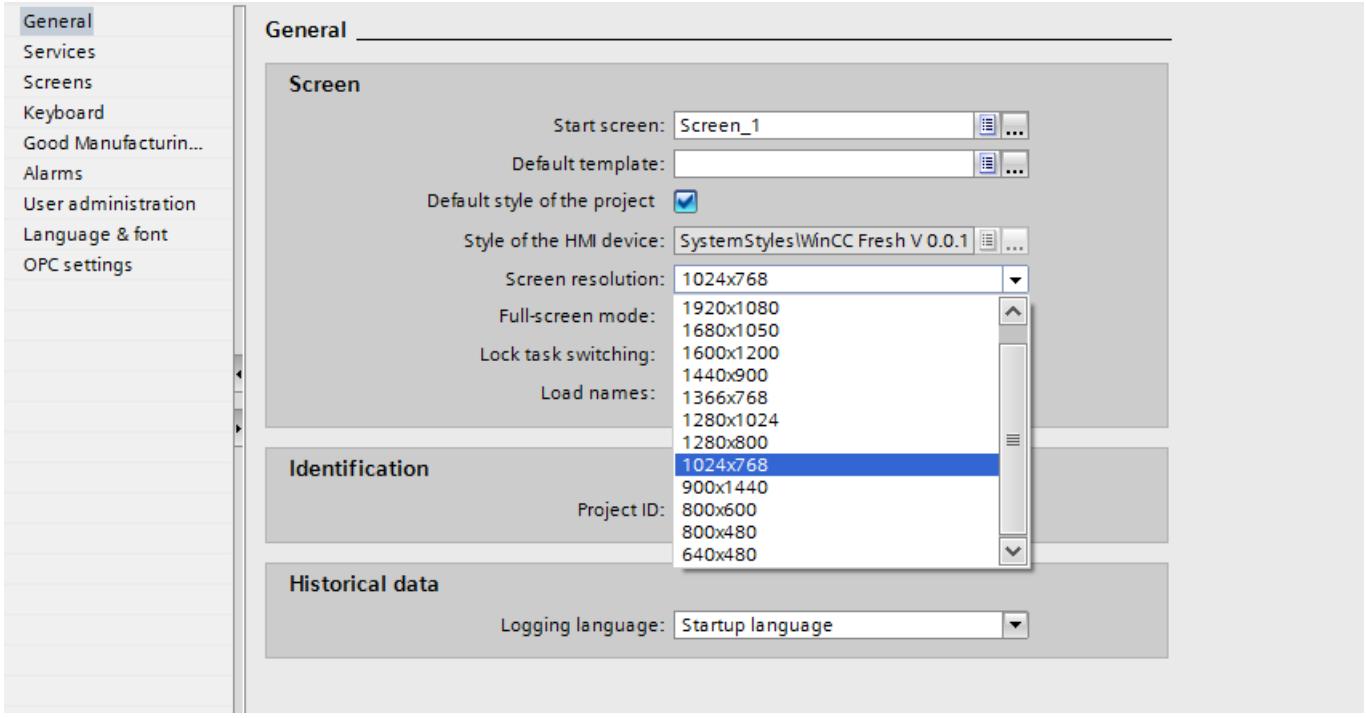
You change the screen resolution in the Runtime settings of the HMI device.

The screen resolution can be configured for the following HMI devices:

- RT Advanced

Configuring a fixed screen resolution

1. Open the Runtime settings of the HMI device.
2. Select the screen resolution under "General > Screen > Screen resolution".



Configuring a user-defined screen resolution

1. Open the Runtime settings of the HMI device.
2. Select the "User-defined" function under "General > Screen > Screen resolution".
   A dialog appears to input the width and height of the user-defined screen resolution.
3. Enter the width and height of the screen resolution.

12.1.1.5 Working with templates

Basics on working with templates

Introduction

Configure the objects in a template which are to be displayed in all screens based on this template.

Note the following rules:

- A screen must not be based on a template.
- A screen is only based on one template.
- You can create several templates for one device.
- A template cannot be based on another template.

Objects for a template

You determine functions and objects in the template which are to apply for all screens based on this template:

- Assignment of function keys: You also assign the function keys in the template for HMI devices with function keys. This assignment overwrites a possible global assignment.
- Permanent window: Some devices support a permanent window for all screens in the top area of the screen. In contrast to the template, the permanent window occupies an area of the screen for itself alone.
- Operator controls: You can paste all screen objects which you also use for a screen into a template.

Application examples

- You want to assign the ActivateScreen" function to a function key in the template. The operator uses this key to switch to another screen in runtime. This configuration applies to all screens that are based on this template.
- A graphic with your company logo can be added to the template. The logo appears on all screens that are based on this template.

Note

If an object from the template has the same position as an object in the screen, the template object is covered.

See also

Managing templates (Page 3903)

Creating a new template (Page 3904)

Global screen (Page 3902)

Screen basics (Page 3889)

Using a template in the screen (Page 3906)

Configuring a permanent window in the template (Page 3905)

Global screen

Introduction

You define global elements for all screens of an HMI device independently of the used template.

Function keys

For HMI devices with function keys you assign the function keys globally in the "Global Screen" editor. This global assignment applies for all screens of the HMI device.

Proceed as follows to assign function keys locally in screens or templates:

1. Click the function key in your screens or templates.
2. Deactivate "Properties > Properties > General > Use Global Assignment" in the inspection window.

Indicator and control objects for alarms

The "Alarm window" and "Alarm indicator" objects that are available as global objects are configured within the "Global screen" editor.

The "Alarm window" and "Alarm indicator" are always shown in the foreground.

For Comfort Panels you also have the possibility of configuring a "System diagnostic view" in the global screen.

Note

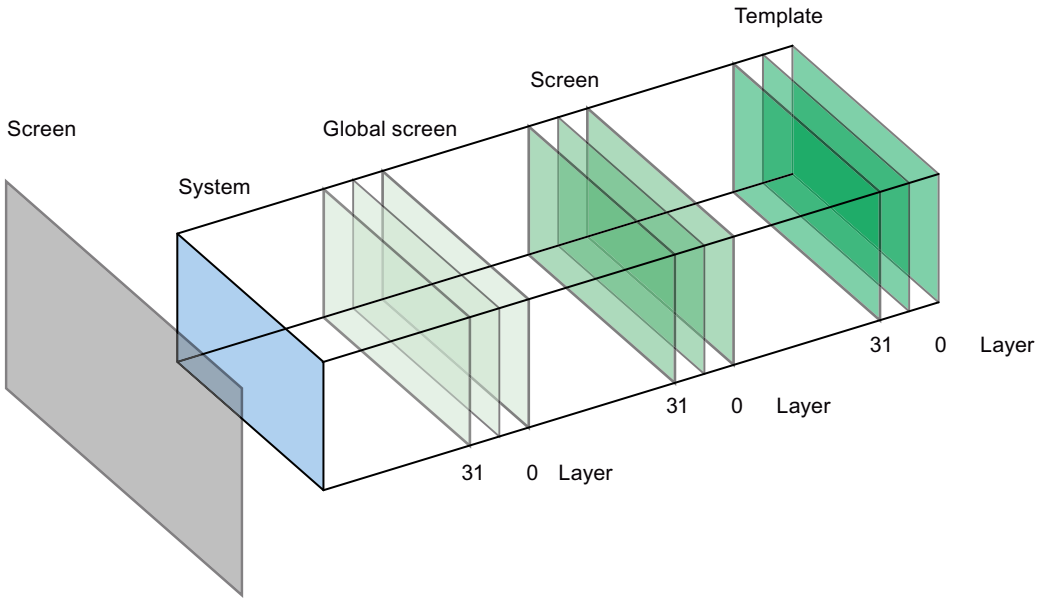
If you have configured a permanent window in a template, do not position the alarm window and alarm indicator in the area of the permanent window. Otherwise, the alarm window and the alarm indicator will not be displayed in Runtime.

The permanent window is not visible in the "Global screen" editor.

Order of configuration of screens

The following order applies for the configuration:

- The global screen comes before screens and templates
- Screens come before templates



The system layer is not configurable. This contains

- input dialog boxes
- alarms from the operating system
- the direct keys for touch panels

See also

Basics on working with templates (Page 3900)

Managing templates

Introduction

You can move, copy, rename, and delete templates within a project in the Project window.

Moving a template into a group

1. Select the templates in the project navigation "Screen management > Templates".
2. Select "Add group" in the shortcut menu.
   A folder called "Group_x" is inserted.

3. Select the template in the project navigation.
4. Drag-and-drop the template to the required group.
   The template is moved to this group.

Copying templates

1. Select the template in the project navigation.
2. Select "Copy" in the shortcut menu.
3. Select the position in the project navigation where you want to paste the template.
4. Select "Paste" from the shortcut menu to insert the template.
   A unique name is assigned automatically to the copy.

Alternatively, you can hold down the <Ctrl> key, and drag the template into position.

Deleting a template

1. In the project navigation, select the template to be deleted.
2. Select "Delete" in the shortcut menu.
   The template, and all its objects are deleted from the current project.

Assigning a template to a screen

1. In the project navigation, select the screen to which you want to assign the template.
2. In the Inspector window, select "Properties > Properties > General".
3. Select the desired template under "Template."
   The selected template and all the objects contained in it are assigned to the screen.

See also

Basics on working with templates (Page 3900)

Creating a new template

Introduction

In a template, you can centrally modify objects and function keys. Changes to an object or of a function key assignment in the template are applied to the object in all the screens which are based on this template.

Note

HMI device dependency

Function keys are not available on all HMI devices.

Requirement

- The project has been created.
- The Inspector window is open.

Procedure

1. Select "Screen management > Templates" in the project tree and then double-click "Add new template".
   The template is created in the project, and appears in your view.
   The properties of the template are displayed in the Inspector window.
2. Define the name of the template under "Properties > Properties > General" in the Inspector window.
3. Specify the layers in the engineering system that are displayed under "Properties >Properties >Layers" in the Inspector window.
4. Add the necessary objects from the "Tools" task card.
5. Configure the function keys.

Result

The template is created in your project.

See also

Basics on working with templates (Page 3900)

Configuring a permanent window in the template

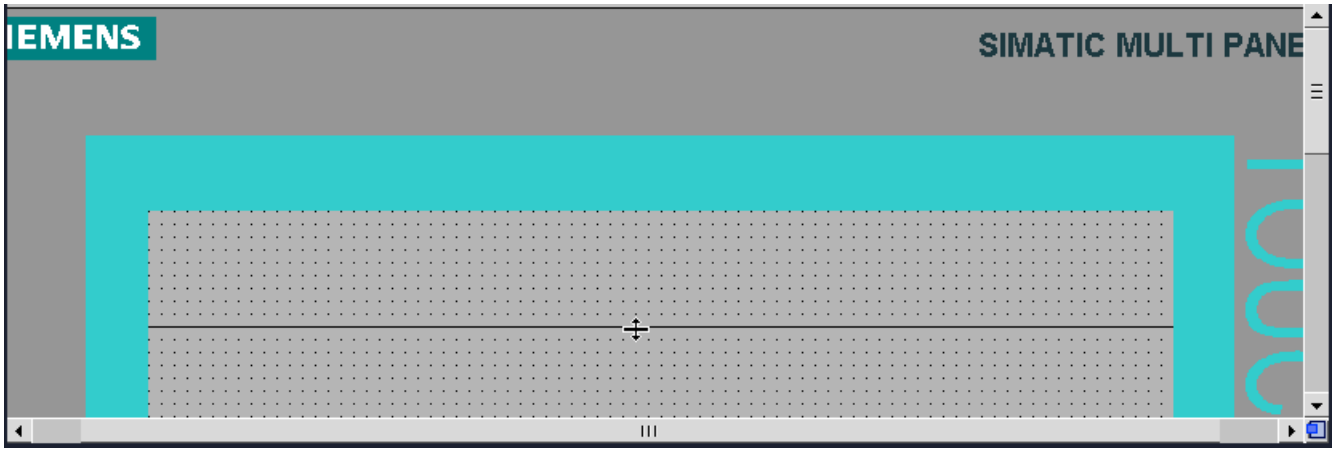
Introduction

In the permanent window you configure objects which are visible in all screens. In contrast to the template, the permanent window occupies an area of the screen for itself alone.

Configuring permanent windows

Proceed as follows to configure a permanent window:

1. Open a template for a HMI device with a permanent window.
2. Use the mouse (cursor shape:) to drag the top edge of the editable screen area down.



3. Configure the desired objects in the area of the permanent window.

The default height of the permanent window is "0". The maximum height is the maximum height of the screen minus 10 pixels.

Result

The content of the permanent window appears on every screen, and in the template. The area above this line is now used as a permanent window in all the screens of the HMI device. Already configured objects in the screens are moved down by the height of the permanent window.

See also

Basics on working with templates (Page 3900)

Using a template in the screen

Introduction

You use a template in the screen. All the objects configured in the template are also available in the screen.

Requirement

A template has been created.

A screen has been created.

Procedure

Proceed as follows to use a template in a screen:

1. Double click a screen in the project tree. The screen opens in the work area.
2. Open "Properties > Properties > General" in the inspector window.
3. Select a template that is to be applied to the screen under "Template".

Show template in screen

When you edit a screen, you can show an existing template in the screen.

Proceed as follows to show a template in the screen:

1. Activate "Extras > Settings > Visualization > Show template in screens" in the menu.

Result

The screen is based on the selected template. All objects which you have configured in the template are available in the screen. The template is displayed in the screen.

See also

Basics on working with templates (Page 3900)

12.1.1.6 Working with pop-up screens

Basics on working with pop-up screens

Introduction

You use the pop-up screen to configure a screen for additional content, for example, object settings. The pop-up screen is displayed on top of the current screen as soon as you call a system function.

Only one pop-up screen at a time is displayed in a screen.

Note

Device dependency of the "Pop-up screen" object

The "Pop-up screen" object is only available for KTP Mobile Panels, Comfort Panels and RT Advanced.

Application

You configure a button in the screen and assign it the function "ShowPopupScreen". When operating the button, a pop-up screen is opened or closed. In the pop-up screen, you make the settings.

Objects in the pop-up screen

You configure the following objects in the pop-up screen:

- Basic objects, such as lines and polygon-based objects
- Elements, such as buttons
- Controls, such as trend view or alarm view
- Faceplates

Note

You cannot configure alarm windows, system diagnostics windows and alarm indicators in the pop-up screen.

Softkeys and hotkeys are not supported in the "Pop-up screen" object.

Note

Objects in the pop-up screen as well as the pop-up screen itself do not support access with VB scripting.

Creating a new pop-up screen

Introduction

A new pop-up screen is created in Project tree > Screen management. The size of a pop-up screen is defined in the properties. The maximum size of a pop-up screen is limited by the screen size.

Requirements

- The project has been created.
- The Inspector window is open.

Creating a new pop-up screen

1. Double-click "Screen management > Pop-up screens > Add new pop-up screen" in the project tree.
   The pop-up screen is generated in the project and is displayed in the work area.
   The pop-up screen properties are displayed in the Inspector window.
2. Define the name of the pop-up screen under "Properties > Properties > General" in the Inspector window.
3. Specify the layers in the engineering system that are displayed under "Properties >Properties >Layers" in the Inspector window.

4. Define the height and width of the pop-up screen under "Properties > Properties > Layout" in the Inspector window.
5. Add the necessary objects from the "Tools" task card.
6. Configure the function keys.

Note

You cannot address the "Pop-up screen" object and the objects configured in it with VB scripts.

Note

Objects and controls can be dynamized in the pop-up screen. The pop-up screen itself does not support dynamization.

Result

You have created a new pop-up screen in which you have configured objects and functions.

Managing pop-up screens

Introduction

You can move, copy, rename, and delete pop-up screens within a project in the Project window.

Moving pop-up screens in a group

1. Select "Screen management > Pop-up screens" in the project tree.
2. Select "Add group" in the shortcut menu.
   A folder called "Group_x" is inserted.
3. Select the pop-up screen in the project tree.
4. Drag-and-drop the pop-up screen to the required group.
   The pop-up screen is moved into this group.

Copying pop-up screen

1. Select the pop-up screen in the project tree.
2. Select "Copy" from the shortcut menu.
3. In the project tree, select the pop-up screen insert position.
4. Select "Paste" in the shortcut menu.
   A unique name is assigned automatically to the copy.

Deleting pop-up screen

1. Select the pop-up screen you want to delete in the project tree.
2. Select "Delete" in the shortcut menu.
   The pop-up screen and all its objects are deleted from the current project.

Using the pop-up screen

Introduction

You configure the system function to open a pop-up screen to the event of a screen object. The linked system function is executed when the event occurs in runtime.

Requirements

- A pop-up screen has been configured.
- A screen is open.
- The Inspector window is open.

Procedure

1. Configure a button.
2. Click "Properties > Events" in the Inspector window.
3. Select an event, for example, "Click".
4. Click on "Add function" in the table.
5. Select the "ShowPopupScreen" system function.

Result

The pop-up screen opens when the operator clicks the button in runtime.

12.1.1.7 Working with slide-in screens

Basics on working with slide-in screens

Introduction

The "Slide-in screen" object provides quick navigation between the start screen and the slide-in screens containing additional configured contents stored outside the start screen. Navigation is supported by the multi-touch functions. The configurable handles appearing at the edges of the start screen provide quick access to the stored slide-in screens.

The size of the slide-in screens depends on the HMI device used.

Note

Device dependency of the "Slide-in screen" object

The "Slide-in screen" object is only available for KTP Mobile Panels, Comfort Panels and RT Advanced.

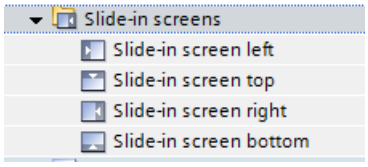
Application

The "Slide-in screen" is used to configure up to four slide-in screens for additional contents and operator controls, for example, a virtual keyboard or a system dialog.

By default, the following slide-in screens are set up for each device:

- "Slide-in screen top": appears at the top of the start screen in Runtime
- "Slide-in screen bottom": appears at the bottom of the start screen in Runtime
- "Slide-in screen left": appears at the left of the start screen in Runtime
- "Slide-in screen right": appears at the right of the start screen in Runtime

It is possible to configure objects in each of these slide-in screens.



Note

It is not possible to delete the default slide-in screens or to set up your own slide-in screens.

Objects in the slide-in screen

You configure the following objects in the slide-in screen:

- Basic objects, such as lines and polygon-based objects
- Elements, such as buttons
- Controls, such as trend view or alarm view
- Faceplates

Note

Objects in the slide-in screen as well as the slide-in screen itself do not support access with VB scripting.

Note

Release buttons and locked operator controls cannot be configured in the slide-in screen.

Softkeys and hotkeys are not supported in the slide-in screen.

See also

Configuring slide-in screens (Page 3912)

Configuring slide-in screens for devices without multi-touch function (Page 3914)

Using slide-in screens (Page 3915)

Configuring slide-in screens

Introduction

By default, four slide-in screens are preset for each device in the project tree under "Screen management > Slide-in screens". For each of these slide-in screens, you configure the size, the layout and the handle for operation in Runtime using the properties.

Requirement

- The project has been created.
- An HMI device has been created.
- The Inspector window is open.

Configuring properties for slide-in screens

1. Select the slide-in screen you wish to configure in the project tree under "Screen management > Slide-in screens.
   The slide-in screen properties are displayed in the Inspector window.

   Note

   The names of all slide-in screens are write-protected and cannot be changed.

2. Define the background color of the slide-in screen in the "Background color" selection list of the "Properties > Properties > General" Inspector window.
3. Define the grid color of the slide-in screen in the "Grid color" selection list.
4. Enable the "Activate" check box.

5. Specify the layers in the engineering system that are displayed under "Properties >Properties >Layers" in the Inspector window.
6. Define the height and width of the slide-in screen in "Properties > Properties > Layout" in the Inspector window:
   - Define the height only for "Slide-in screen top" and "Slide-in screen bottom".
   - Define the width only for "Slide-in screen left" and "Slide-in screen right".

Note

If you do not need all four slide-in screens, enable the slide-in screens relevant to you only.

If you do not need any slide-in screens, leave the "Activate" check box empty for all four slide-in screens.

Note

Slide-in screens cannot be deleted nor copied to a different HMI device.

However, it is possible to copy the objects configured in a slide-in screen to another slide-in screen.

Configuring handles for slide-in screens

1. Define the color of the first line of the handle in the "Lines" area of the "Color" selection list under "Properties > Properties > Handle" in the Inspector window.
2. Define the color of the second line of the handle in the "Alternative color" selection list.
3. Define the color for the operable area of the handle in the "Color" selection list under "Operable area".
4. Select one of the following options from the "Visibility" area:
   - "Hide handle automatically" (activated by default)
   - "Always display handle"
   - "Never display handle"

Note

When selecting the "Hide handle automatically" option, the handle only becomes visible once the user clicks the operable area.

The "Never display handle" option is selected when the slide-in screen is configured using the "ShowSlideInScreen" system function.

Note

You are notified by a warning if a handle which is configured as visible covers a configured object in a screen, such as a button, completely or partially.

Note

The following dimensions are defined for the handle:

- The width of a handle for the "Slide-in screen top" and "Slide-in screen bottom" objects is one-third of the screen length.
- The height of a handle for the "Slide-in screen left" and "Slide-in screen right" objects is one-third of the screen width.

Result

You have configured the properties of the slide-in screens and the handle for operation in Runtime.

See also

Basics on working with slide-in screens (Page 3910)

Configuring slide-in screens for devices without multi-touch function (Page 3914)

Configuring slide-in screens for devices without multi-touch function

Introduction

You use the "ShowSlideInScreen" system function to make the slide-in screens available on devices without multi-touch functions, for example Key Panels. You link this system function to buttons. Buttons are used to navigate between the start screen and the slide-in screens.

Requirements

- The project has been created.
- An HMI device has been created.
- A screen is open.
- The Inspector window is open.

Procedure

1. Drag the "Button" object to the screen from the toolbox.

   Note

   Navigation in Runtime is much easier if the buttons for operating the slide-in screens are created directly in the start screen.

2. Enter a suitable text of any length for the button.
3. In the Inspector window, select "Properties > Events > Click".
   The "Function list" dialog box is opened.

4. Select the "ShowSlideInScreen" system function from the "Keyboard operation for screen objects" group.
5. Assign the ID of the slide-in screen appearing in Runtime when the button is operated to the "ShowSlideInScreen" function:
   - "Top"
   - "Bottom"
   - "Left"
   - "Right"
6. Assign the appropriate mode to the "ShowSlideInScreen" function:
   - "Switching"
   - "Off"
   - "On"

Result

You have configured the slide-in screens for operation on devices without multi-touch function. When clicking on the respective button in the screen in Runtime, the slide-in screen behaves in accordance with the configuration.

Basics on working with slide-in screens (Page 3910)

Configuring slide-in screens (Page 3912)

Using slide-in screens

Introduction

In slide-in screens, you configure additional contents and operator controls, for example, navigation buttons, an alarm view or a trend view.

Requirements

- The project has been created.
- An HMI device has been created.
- A slide-in screen is open.
- The Inspector window is open.

Procedure

1. Add the necessary objects from the "Tools" task card to the slide-in screen.
2. Configure the function keys.

Note

You cannot address the "Slide-in screen" object and the objects configured in it with VB scripts.

Note

Objects and controls can be dynamized in the slide-in screens. The slide-in screens as such do not support dynamization.

Result

You have configured objects and functions in the slide-in screen.

Basics on working with slide-in screens (Page 3910)

12.1.1.8 Working with styles

Basics on working with styles

Introduction

The style editor is a global editor. You define a uniform appearance for display and operating elements in the style editor. In this way, you harmonize the display of objects in Runtime. The style editor offers predefined styles. Additional predefined styles are available for download at Siemens Industry Online Support (http://support.automation.siemens.com/WW/view/en/91174767).

You can choose one of the predefined styles or create your own style. You use the style editor independently of devices and projects.

Views in the style editor

Objects are grouped in the style editor according to their main visual features.

The following groups are available:

- Buttons, lines, and polygon-based objects
- Text-based objects
- Trend-based objects, such as trend view,
- graphic or value-based objects, such as value table.

Style items

You use a style item to define the appearance of a screen object within a style. You can design several objects of the same type differently in one style. You define, for example, different style items for simple buttons and navigation buttons.

You create and manage style items in the style editor.

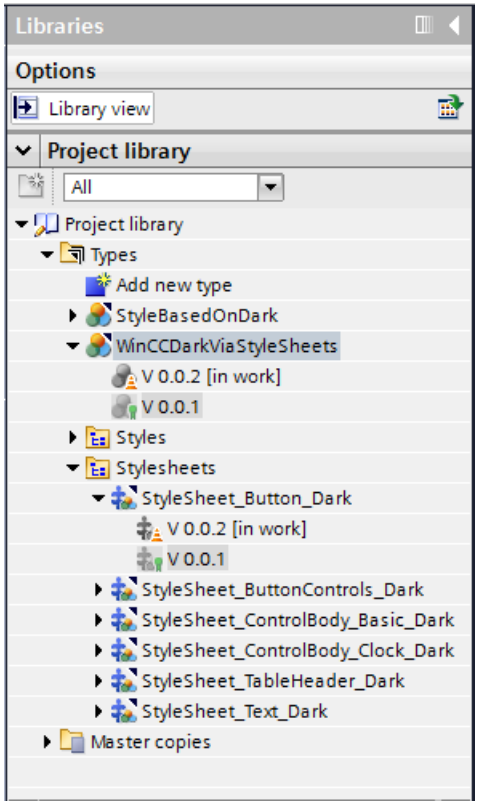
Style sheets

You use style sheets to configure the same properties for a group of objects. In a style sheet you can, for example, define the width and background color of table headers for all table-based objects. Style sheets are divided into predefined types depending on the included properties, for example, buttons, limits, table headers.

You use style sheets to define the design of shared object properties. Some special object properties are not included in style sheets. You use styles to design all objects of a project with visual consistency.

Managing styles and style sheets

You create and edit styles and style sheets in the project library. To get a better overview of types in expansive libraries, you save styles and style sheets in folders with meaningful names. You should also assign meaningful names to the styles and style sheets you create yourself.



Support of styles in faceplates

Styles and style items can be assigned to faceplate instances.

However, there is no direct connection between the faceplate types and styles, so selection and preview of a style item in the faceplate editor is not possible. To assign a style item to a faceplate, enter the name of the style item under "Style item appearance".

The configured style item is used in the instance of a faceplate, provided the name of the style item exists in the style used. Ensure that the name is written correctly.

Defining a style (Page 3919)

Managing styles (Page 3921)

Using style items (Page 3924)

Working with style sheets (Page 3926)

Displaying predefined styles

Introduction

In the "Style" editor, you see predefined styles and create your own styles for representing display and operating objects in Runtime.

Open "Styles" editor

1. Double-click "Common data" in the project navigation.
2. Click the "Styles" editor. The editor opens.

   Note
   Style editor in the project navigation

   The style editor is only visible in the project navigation if a device that supports styles, e.g., Comfort Panels, is created in the project.

3. The standard styles are displayed in the work area of the "Style" editor:

- WinCC Light
- WinCC Dark
- WinCC Fresh
- WinCC Wireframe.

Result

The settings for the groups and individual objects are displayed in the work area.

You will assign predefined styles or define your own styles in the next steps.

Predefined styles are write-protected and cannot be changed.

See also

Managing styles (Page 3921)

Defining a style (Page 3919)

Defining a style

Introduction

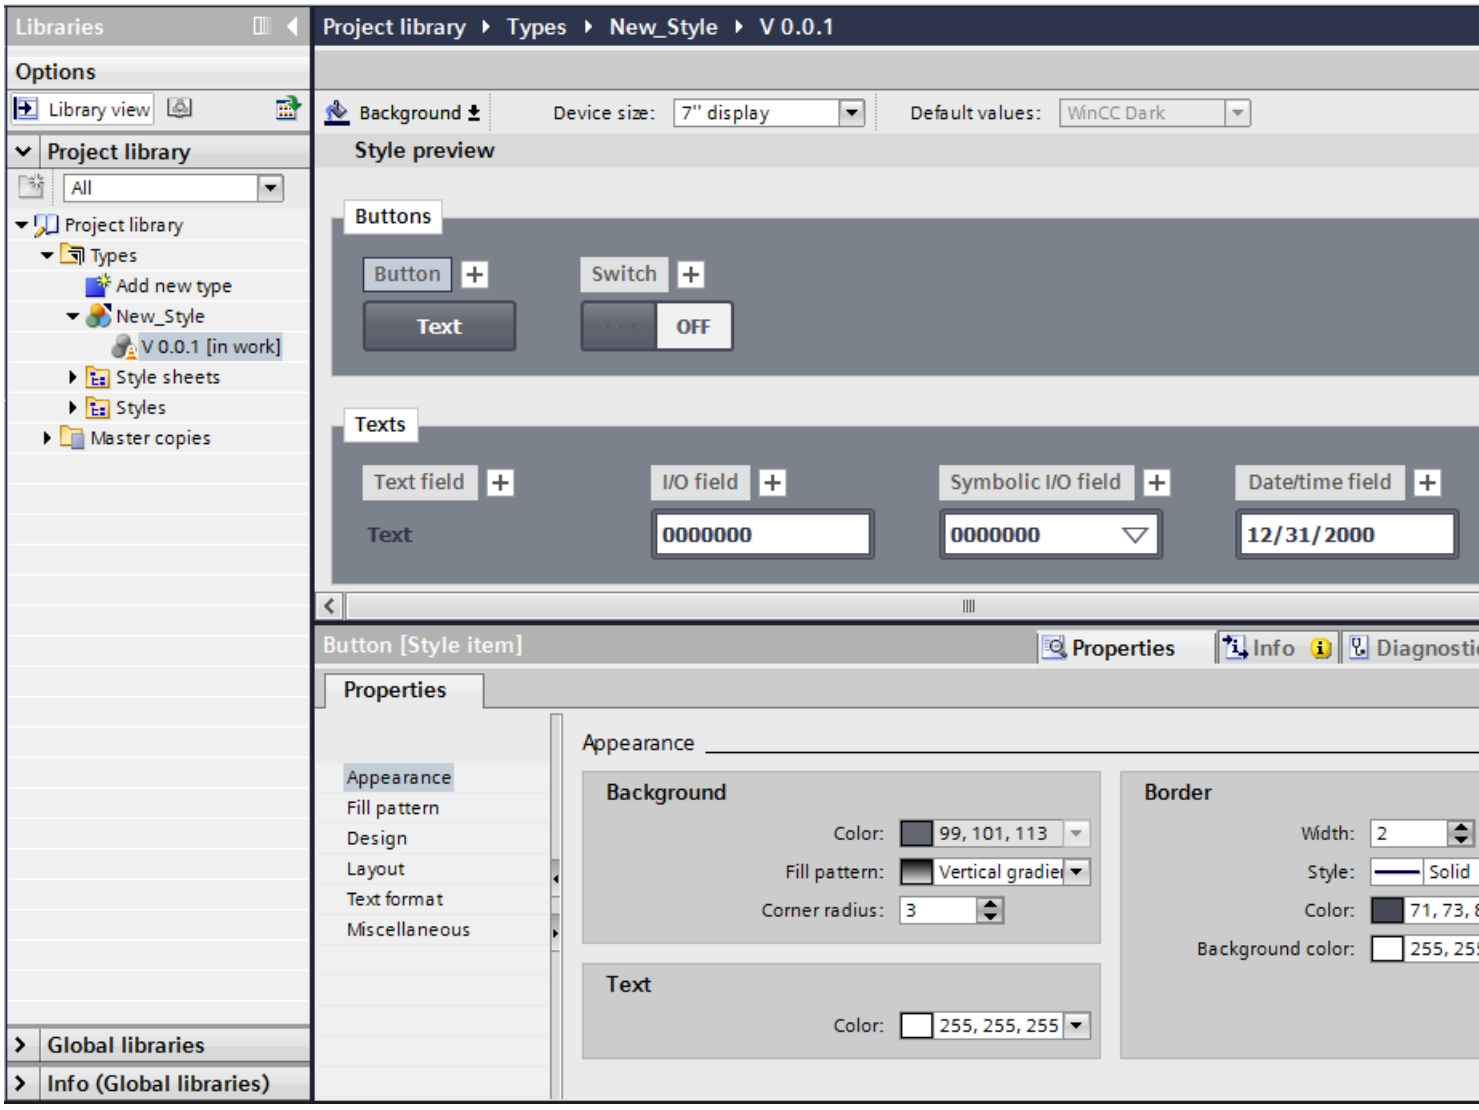
In the "Styles" editor, you see predefined styles. Predefined styles are write-protected and cannot be changed.

In addition, you have the option of defining your own styles and applying them to individual objects, groups, and even projects.

Defining a style

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Click "Add" in the "Styles" area.
   A new style is created.
   The library view opens. The version of the type is displayed in the "Types" folder. The version 0.0.1 has the status "in progress".

4. In the Inspector window, select the colors, borders and other settings for individual objects.



5. In order to activate the new style, select the current version "in progress" and select "Release version" in the shortcut menu.
   The new style appears in the "Styles" editor.

Result

You have added a new style which can be applied to objects or projects.

Defining a style based on a predefined style

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Select a predefined style in the work area.

4. Select the "Duplicate type" command in the shortcut menu.
   The "Duplicate type" dialog opens.
5. Overwrite the suggested name with a meaningful name.
6. In the "Comment" column, enter a description of the style, e.g. the intended use.
7. Click "OK" to confirm your input.
8. Select the created type in the project library.
9. Select "Edit new type" in the shortcut menu.
   The library view opens. The version of the type is displayed in the "Types" folder. The version 0.0.2 has the status "in progress".
10. Configure the type as required.
11. Select the "Release version" command from the shortcut menu of the edited version.

Result

They have configured a new style based on the predefined style of WinCC.

See also

Displaying predefined styles (Page 3918)

Managing styles

Deleting a style

You can delete styles that you have defined yourself.

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Select the style in the work area that you want to delete.

   Note

   You cannot delete the predefined styles of WinCC.

4. Select the "Delete" command in the shortcut menu.

The style is deleted.

Editing a style

You can edit styles that you have defined yourself.

1. Open the project library.
2. Select the released version of the style that you want to change.
3. Select "Edit type" in the shortcut menu.
   A new version "in progress" is created.

4. Make the required changes in the Inspector window.
5. Select the "Release version" command from the shortcut menu of the edited version to put the changes into effect.
   The changes made take effect.

Determining a standard style for a project

A project can be assigned a standard style to achieve a visual conformity of all display objects in the project.

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Activate a style in the work area.

The activated style is used as standard style in the project. When you add a device to the project, this device uses the standard style.

Changing the style for a specific device

Within a project, you change the style for a specific device.

1. Open the "Runtime settings" editor of the HMI device.
2. Select a device style under "General".

The selected style is applied to the device.

If the device style is not assigned, the device uses the standard style of the project.

See also

Displaying predefined styles (Page 3918)

Adjusting the font size to the device size

Introduction

You define the size of the device to whose objects you want to apply a style in the style editor. This means you specify device-dependent font sizes in a style. All font sizes are automatically adapted to the device size by selecting a specific reference size.

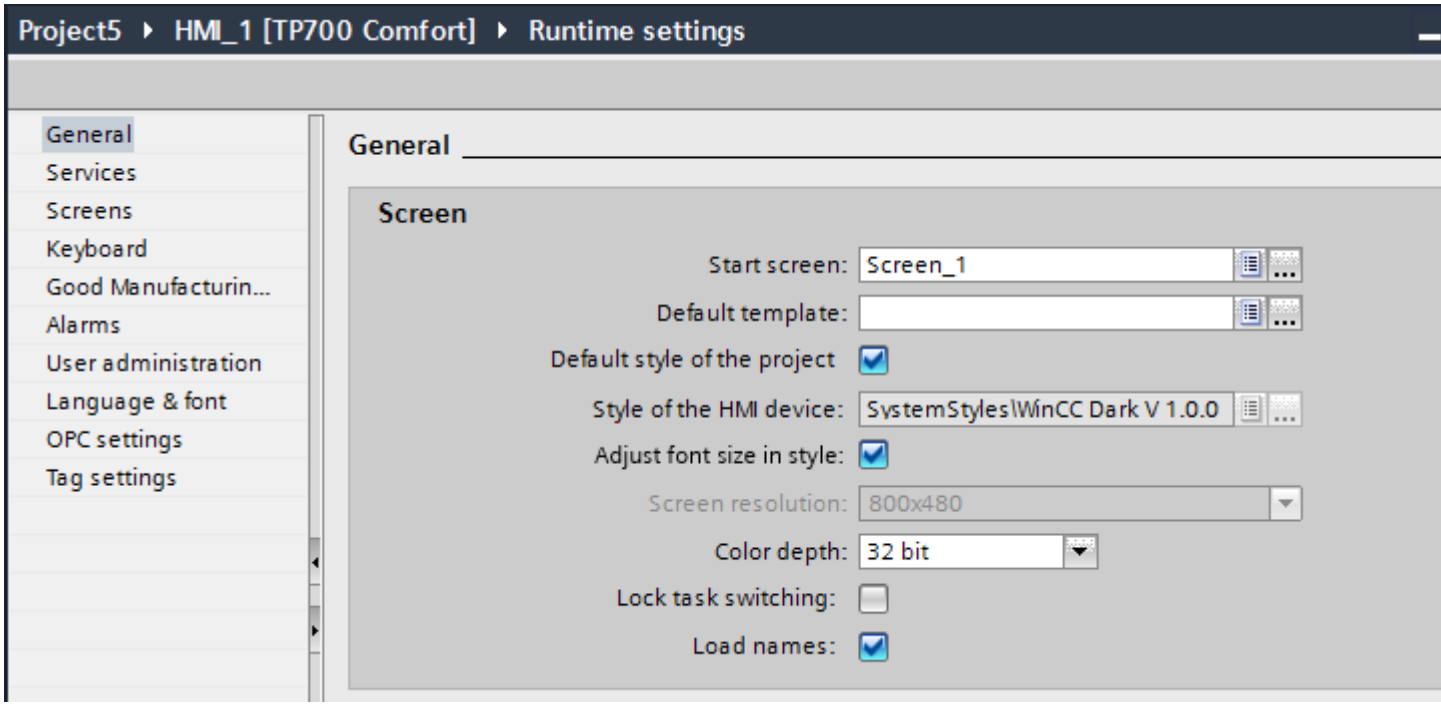
The table below shows the device sizes and the reference font sizes in pixels:

Device size	Font size in pixels
4" display	15 px
7" display	17 px
9" display	15 px
12" display	19 px
15" display	19 px

Device size	Font size in pixels
19" display	17 px
22" display	21 px
WinCC RT Advanced	17 px

Activating automatic adjustment of font sizes

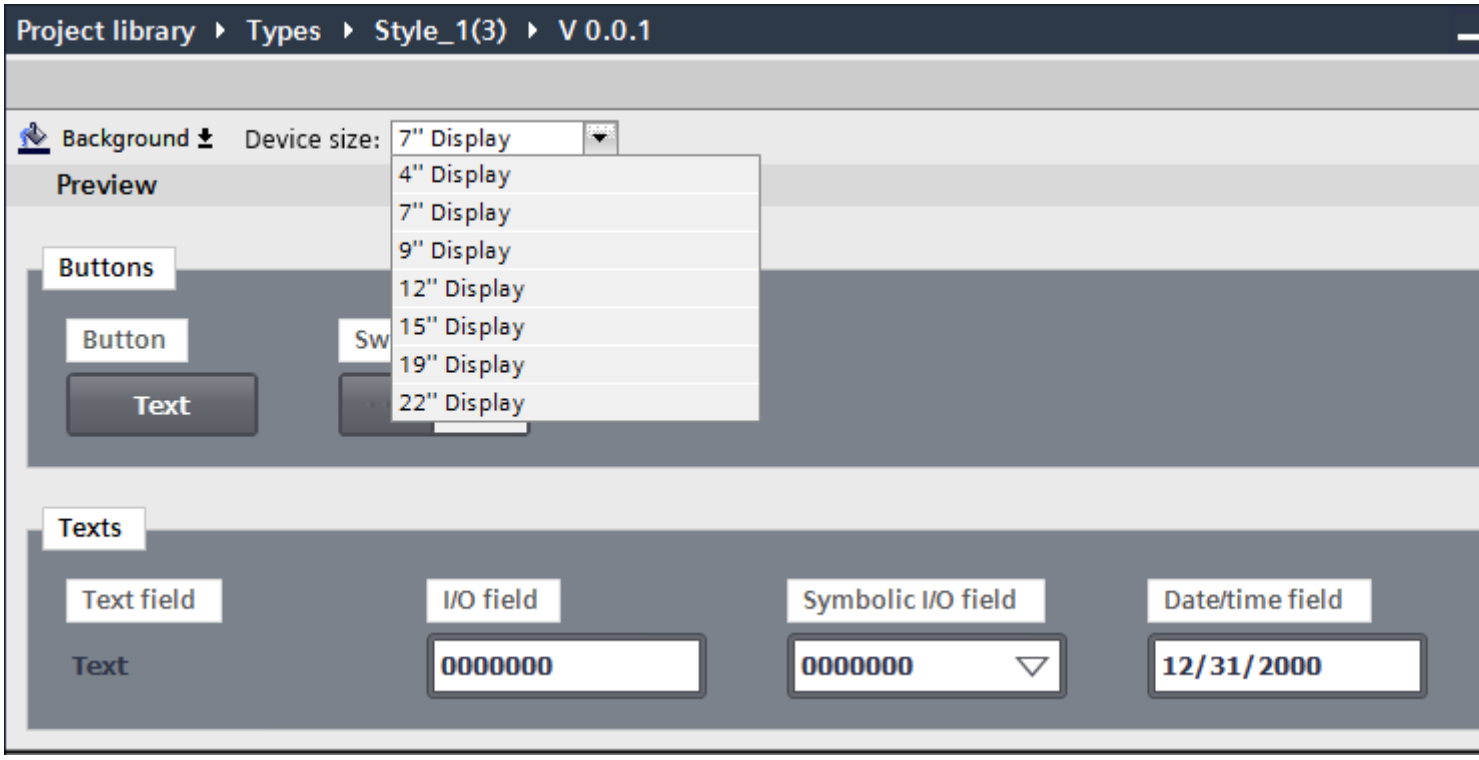
1. Double-click the "Runtime settings" editor in the project window.
2. Click "General".
3. Activate the option "Adjust font size in style" under "General > Screen".



Automatic adjustment of font sizes to the device size was activated in a style.

Adjusting font size in a device style

1. Open the corresponding style for editing in the project library.
2. Select the reference size of the HMI device in the work area.



All font sizes in the style are automatically adjusted to the selected device size.

Using style items

Introduction

You use style items to change the style of a screen object without changing the entire device style. You can, for example, define types of buttons with the help of different style items that are to receive the same appearance in one or several devices.

You define style items in the style editor.

Adding a new style item

1. Open the project library.
2. Select the released version of the style that you want to change.
3. Select "Edit type" in the shortcut menu.
   A new version "in progress" is created.
4. Select the object that you want to use in a different style.

5. Click the plus sign next to the object name.

   A new style item has been created.
   You can also select "Duplicate style item" in the shortcut menu of the object.

6. Make the required changes in the inspector window.
7. Assign a meaningful name to the new style item under "Properties > Miscellaneous > Object > Name".
8. Release the version of the style.

Deleting a style item

You can delete style items that you have defined yourself.

1. Open the project library.
2. Select the style that includes the style item.
3. Open the "in progress" version.
4. Select the style item that you want to delete in the work area.
5. Select the "Delete" command in the shortcut menu.

   Note

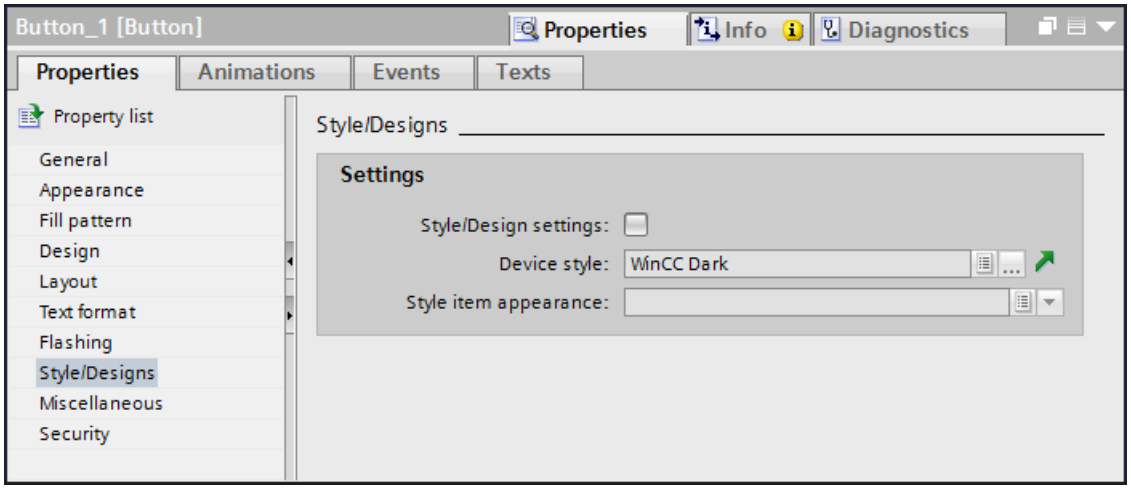
   You cannot rename or delete predefined WinCC style items.

The style item is deleted.

Specifying a style item for an object

If you have configured additional style items for an object in the device style, you can use the predefined style item for a screen object.

1. Open "Properties > Styles/Designs > Settings".
2. Enable the option "Use style/design".
3. Select the predefined style item under "Style item appearance".



The object is displayed as selected style item.

Working with style sheets

Basics on working with style sheets

Introduction

Some screen objects have the same properties which can be configured similarly. These general properties are grouped in style sheets. You can configure several properties for several objects simultaneously and consistently by using style sheets.

Types of style sheets

Style sheets are divided into several predefined categories. Each category contains a specific number of common properties shared by different objects. Select the required category when you create a style sheet. A style sheet can only be applied to objects for which the corresponding category is defined.

The table below shows the available categories and objects that can be configured with them.

Category/Objects	Polylines/ Lines	Text-based objects	Buttons	Value-based objects	Table-based objects	Diagrams
Button	-	-	X	-	X	X
Object body	X	-	-	X	X	X

Category/Objects	Polylines/ Lines	Text-based objects	Buttons	Value-based objects	Table-based objects	Diagrams
Diagram body	-	-	-	-	-	X
Focus and selection	-	X	X	-	X	X
Limits	-	X	-	X	-	-
Labels	-	-	-	X	-	-
Scale	-	-	-	X	-	-
Table body	-	-	-	-	X	X
Table header	-	-	-	-	X	X
Text field	-	-	-	-	-	-

Use of style sheets

You apply a style sheet to a style item when editing a style. The properties configured in the style sheet are transferred to the style item.

To apply a style sheet to a style item, drag the required style sheet from the task card to the style item in the work area using drag-and-drop.

Managing style sheets

Style sheets are library types. You manage style sheets in the project library. Style sheet categories are available in the project library in the "Style sheets > Categories" task card during style editing.

The style sheets that are available for a style sheet type are available in the "Style sheets > Visual attributes" task card. The task card includes predefined style sheets as well as style sheets you have created yourself and released.

Creating a new style sheet

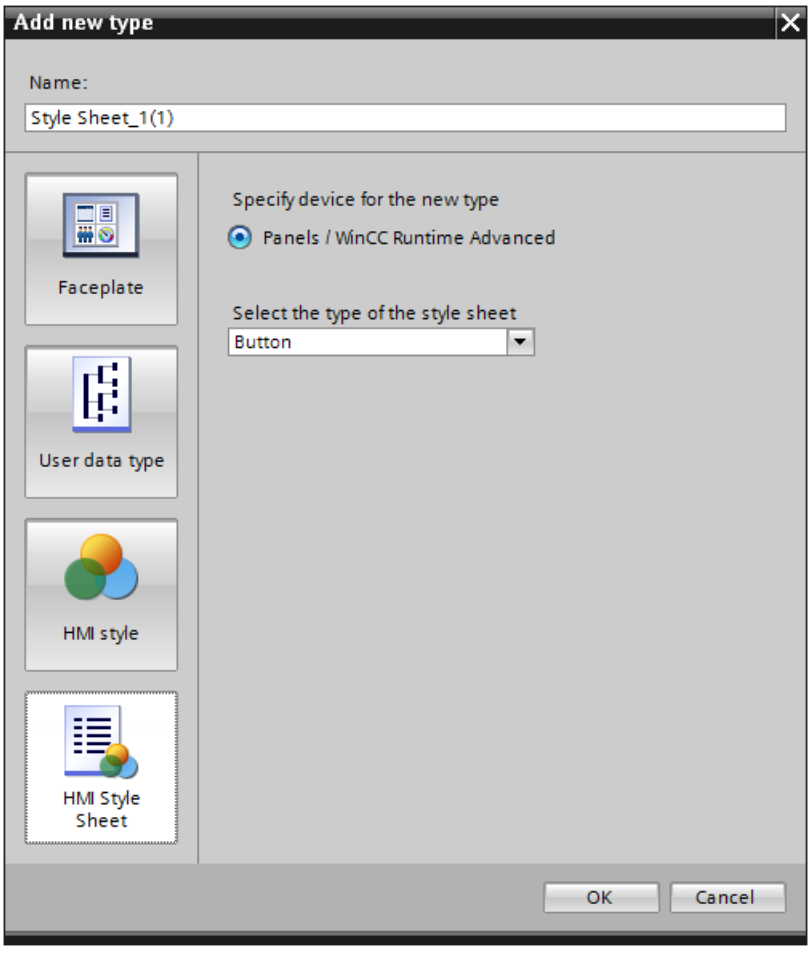
Introduction

You configure the properties for several objects of a similar type in a style sheet.

Create new style sheet

1. Open the project library.
2. Click the "Add new type" button.
   The "Add new type" dialog opens.
3. Select the option "HMI style sheet" in the dialog.

4. Select the type of the style sheet.



5. Assign a meaningful name to the style sheet.
6. Click "OK" to confirm your input.
   The new style sheet was created.

Create new style sheet based on a style

To automatically configure the properties for similar screen objects when editing a style, create a new style sheet based on properties of a style item that have already been configured.

1. Select the style item you want to use to create a style sheet.
2. Select "Create new style sheet" in the shortcut menu.
3. Select the category for the style sheet in the submenu.
   The "Add type" dialog opens.

4. Assign a meaningful name to the style sheet.
5. Click "OK" to confirm.
   The new style sheet based on a style was created and has been added to the "Style sheets > Visual attributes" task card.
   The properties in the style sheet were applied from the selected style item. The properties of the style sheet not included in the selected style have been assigned default values.

Managing style sheets

Introduction

You edit, copy and delete the style sheets in the project library.

You can also open, copy, create and delete style sheets with the commands in the shortcut menu of the "Style sheets > Categories" task card.

Edit style sheet

You can edit style sheets that you have created yourself.

1. Open the project library.
2. Select the released version of the style sheet that you want to change.
3. Select "Edit type" in the shortcut menu.
   A new version "in progress" is created.
4. Make the required changes in the Inspector window.
5. Select the "Release version" command from the shortcut menu of the edited version to put the changes into effect.
   The changes made take effect.

Delete style sheet

You can delete style sheets that you have defined yourself.

1. Open the project library.
2. Select the style sheet that you want to delete in the project library.

   Note

   You cannot delete the predefined style sheets of WinCC.

   Note

   You cannot delete the style sheet which includes an "in progress" type. To delete the style sheet, start by releasing all versions of the style sheet.

3. Select the "Delete" command in the shortcut menu.

The style sheet is deleted.

Copy style sheet

1. Open the project library.
2. Select the style sheet that you would like to copy.
3. Select "Duplicate type" in the shortcut menu.
4. Overwrite the suggested name with a meaningful name.
5. In the "Comment" column, enter a description of the style sheet, for example, the intended use.
6. Click "OK" to confirm your input.
   The required style sheet was copied and stored in the same folder.

Using style sheets

Introduction

You are using a style sheet while editing a style in the style editor. Style sheets are object-specific and are only applied to style items with which they are compatible.

Only a released version of a style sheet can be applied to a style item.

You have the following options to use a style sheet:

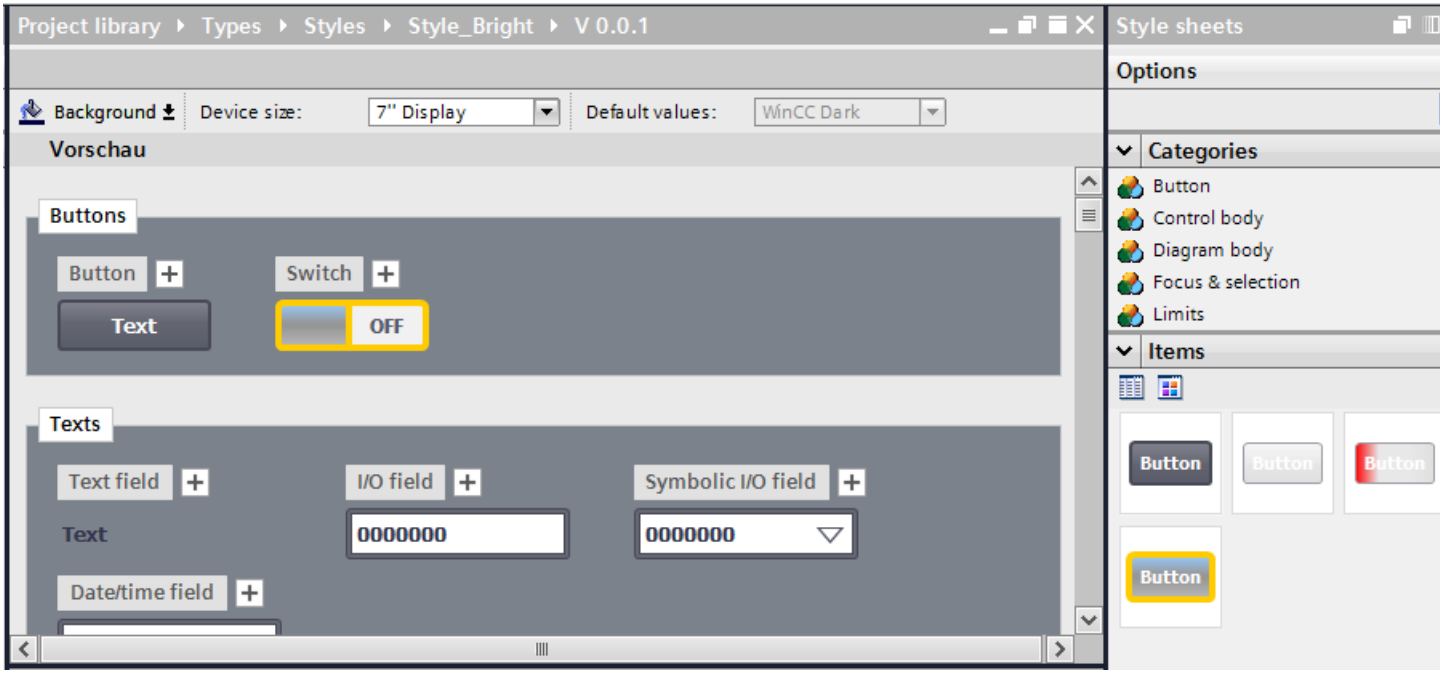
- To design the selected style item, drag the style sheet to a style item in the style editor.
- To design several style items of a group, drag the style sheet to a group of style items.
- To design all style items of the style which are compatible with the style sheet, drag the style sheet to an empty area in the style editor.

Requirement

- You have created a style.
- A version of the style is opened "in progress".

Apply style sheet to style item

1. Select the style sheet category in the "Style sheets > Categories" task card.
2. Select the required style sheet in the "Style sheets > Visual attributes" task card.
3. Drag the selected style sheet to a style item with drag&drop.



When you drop the style sheet on the style item, the style item applies the settings from the style sheet.

Note

There is no connection between the style item and the used style sheet. When you change the style sheet, the changes are not automatically applied in the style item. Apply the style sheet again to make the changes to the style sheet effective in the style item.

Note

Style sheets are not linked with screen objects. Unused or outdated style sheet versions are deleted by cleaning up or versioning the library.

Result

You have applied a style sheet to a style item in a style.

12.1.2 Working with objects

12.1.2.1 Overview of objects

Introduction

Objects are graphics elements which you use to design the screens of your project.

The "Tools" task card contains all objects that can be used for the HMI device. Display the Task Card with menu command "View" by activating the "Task Card" option.

The toolbox contains various palettes, depending on the currently active editor. If the "Screens" editor is open, the toolbox contains the following palettes:

- "Basic objects"
  The basic objects include basic graphic objects such as "Line", "Circle", "Text field" or "Graphic view".
- "Elements"
  The elements include basic operator controls, e.g. "I/O field", "Button" or "Gauge".
- "Controls"
  The controls provide advanced functions. They also represent process operations dynamically, for example Trend view and Recipe view.

- "Graphics"
  Graphics are broken down into subjects in the form of a directory tree structure. The various folders contain the following graphic illustrations:
  - Machine and plant areas
  - Measuring equipment
  - Operator controls
  - Flags
  - Buildings

  You can create links to your own graphic folders. The external graphics are located in these folders and subfolders. They are displayed in the toolbox and incorporated into the project using links.
- "Libraries" task card
  In addition to the display and operating elements, the library objects are available. They are located within the palettes of the "Libraries" task card. A library contains preconfigured objects such as graphics of pipes, pumps, or preconfigured buttons. You can also integrate multiple instances of library objects into your project without having to reconfigure them. The WinCC software package includes libraries, e.g. "HMI Buttons & Switches".
  You can also store customized objects, and faceplates in user libraries.
  Faceplates are objects that you create from existing screen objects, and for which you define the configurable properties.

Note

HMI device dependency

Some of the toolbox objects are either available with restricted functionality, or not at all. This depends on the HMI device you are configuring. Unavailable properties of an object are displayed as deactivated, and cannot be selected.

Basic objects

Symbol	Object	Instructions
	"Line"	-
	"Ellipse"	-
	"Circle"	-
	"Rectangle"	-
	"Text field"	One or more lines of text. The font and layout are adjustable.
	"Graphic view"	Displays graphics from external graphic programs, and inserts OLE objects. The following graphic formats can be used: "*.emf", "*.wmf", "*.dib", "*.bmp", "*.jpg", "*.jpeg", "*.gif" and "*.tif".

Elements

Symbol	Object	Instructions
	"I/O field"	Outputs the values of a tag, and/or writes values to a tag. You can define limits for the tag values shown in the I/O field. To hide the operator input in runtime, configure "Hidden input".
	"Button"	Executes a function list, or a script as configured.
	"Symbolic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A text from a text list is displayed in relation to the tag value.
	"Graphic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A graphic from a graphics list is displayed in relation to the tag value.
	"Date/time field"	Outputs the system date and time, or the time and date from a tag. This allows the operator to enter new values. The display format is adjustable.
	"Bar"	The bar represents a value from the PLC in the form of a scaled bar graph.
	"Switch"	Toggles between two defined states. You can label a switch with text, or a graphic.

Controls

Symbol	Object	Description
	"Alarm view"	Shows currently pending alarms or alarm events from the alarm buffer or alarm log.
	"Trend view"	Represents multiple curves with values from the PLC, or from a log.
	"User view"	Allows an administrator to administer users on the HMI device. It also allows an operator without administrator rights to change his password.
	"HTML Browser"[1)]	Displays HTML pages.
	"Recipe view"	Displays data records, and allows them to be edited.
	"System diagnostics view"	Provides an overview of all devices capable of diagnostics. Displays errors in the plant.

[1)]Available for Basic Panels 2nd Generation.

12.1.2.2 Overview of objects

Introduction

Objects are graphics elements which you use to design the screens of your project.

The "Tools" task card contains all objects that can be used for the HMI device. Display the Task Card with menu command "View" by activating the "Task Card" option.

The toolbox contains various palettes, depending on the currently active editor. If the "Screens" editor is open, the toolbox contains the following palettes:

- "Basic objects"
  The basic objects include basic graphic objects such as "Line", "Circle", "Text field" or "Graphic view".
- "Elements"
  The elements include basic operator controls, e.g. "I/O field", "Button" or "Gauge".
- "Controls"
  The controls provide advanced functions. They also represent process operations dynamically, for example Trend view and Recipe view.
- "Graphics"
  Graphics are broken down into subjects in the form of a directory tree structure. The various folders contain the following graphic illustrations:
  - Machine and plant areas
  - Measuring equipment
  - Operator controls
  - Flags
  - Buildings

  You can create links to your own graphic folders. The external graphics are located in these folders and subfolders. They are displayed in the toolbox and incorporated into the project using links.
- "Libraries" task card
  In addition to the display and operating elements, the library objects are available. They are located within the palettes of the "Libraries" task card. A library contains preconfigured objects such as graphics of pipes, pumps, or preconfigured buttons. You can also integrate multiple instances of library objects into your project without having to reconfigure them. The WinCC software package includes libraries, e.g. "HMI Buttons & Switches".
  You can also store customized objects, and faceplates in user libraries.
  Faceplates are objects that you create from existing screen objects, and for which you define the configurable properties.

Note

HMI device dependency

Some of the toolbox objects are either available with restricted functionality, or not at all. This depends on the HMI device you are configuring. Unavailable properties of an object are displayed as deactivated, and cannot be selected.

Basic objects

Symbol	Object	Instructions
	"Line"	-
	"Polyline"	The polyline is an open object. Even if the start and end points have the same coordinates, the area they enclose cannot be filled in. If you want to fill a polygon, select the "Polygon" object.
	"Polygon"	-
	"Ellipsis"	-
	"Circle"	-
	"Rectangle"	-
	"Text field"	One or more lines of text. The font and layout are adjustable.
	"Graphic view"	Displays graphics from external graphic programs, and inserts OLE objects. The following graphic formats can be used: "*.emf", "*.wmf", "*.dib", "*.bmp", "*.jpg", "*.jpeg", "*.gif" and "*.tif".

Elements

Symbol	Object	Instructions
	"I/O field"	Outputs the values of a tag, and/or writes values to a tag. You can define limits for the tag values shown in the I/O field. To hide the operator input in runtime, configure "Hidden input".
	"Button"	Executes a list of functions, or a script as configured.
	"Symbolic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A text from a text list is displayed in relation to the tag value.
	"Graphic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A graphic from a graphics list is displayed in relation to the tag value.
	"Date/time field"	Outputs the system date and time, or the time and date from a tag. This allows the operator to enter new values. The display format is adjustable.
	"Bar"	The bar represents a value from the PLC in the form of a scaled bar graph.
	"Charge condition"	Shows the charge condition of the battery for Mobile Wireless

Symbol	Object	Instructions
	"Switch"	Toggles between two defined states. You can label a switch with text, or a graphic.
	"Slider"	Displays a current value from the PLC, or sends a numeric value to the PLC.
	"Symbol library"	Used to add screen objects based on controls of the same name.
	"Effective range name"	Shows the name of the effective range.
	"Effective range name (RFID)"	Displays the name of the effective range (RFID).
	"Effective range signal"	Indicates how accurately the Mobile Panel Wireless is positioned within an effective range.
	"WLAN reception"	Indicates how good the WLAN radio connection is.
	"Gauge"	Displays numeric values. The appearance of the gauge is adjustable.
	"Zone name"	Displays the name of the zone.
	"Zone signal"	Indicates how accurately the Mobile Panel Wireless is positioned within a zone.
	"Clock"	Displays the system time in analog or digital format.

Controls

Symbol	Object	Description
	"Alarm view"	Shows currently pending alarms or alarm events from the alarm buffer or alarm log.
	"Trend view"	Represents multiple curves with values from the PLC, or from a log.
	"User view"	Allows an administrator to administer users on the HMI device. It also allows an operator without administrator rights to change his password.
	"HTML browser"	Displays HTML pages.
	"Camera view"[1)]	Displays pictures from a connected network camera.
	"PDF view"	Displays PDF documents.
	"Status/Force"	This function gives the operator direct read / write access from the HMI device to individual address areas in the connected SIMATIC S7.

Symbol	Object	Description
	"Sm@rtClient view"	Allows an operator to monitor and maintain a connected device remotely.
	"Recipe view"	Displays data records, and allows them to be edited.
	"f(x) trend view"	Represents the values of a tag as a function of another tag.
	"System diagnostics view"	Provides an overview of all diagnostics capable devices. Displays errors in the plant.
	"Media Player"	Media files are shown in the media player.

[1] Available for Comfort Panels and KTP Mobile Panels (as of device version V13).

12.1.2.3 Options for editing objects

Introduction

Objects are graphics elements which you use to design the screens of your project.

You have the following options for editing objects:

- Copying, pasting or deleting objects using the shortcut menu If you copy an object in a screen and the screen already includes an object of the same name, the name of the object is changed.
- Maintaining the standard size of the objects you are inserting or customizing their size on insertion.
- Moving an object in front of or behind other objects
- Rotating objects
- Mirroring objects
- Defining the tab sequence for objects
- Stamping: Inserting several objects of the same type
- Selecting several objects simultaneously
- Repositioning and resizing multiple objects
- You can assign external graphics to objects, e.g. in the Graphic View.
  You can view only the images you have previously stored in the graphic browser of your WinCC project.
  You can save graphics in the graphic browser:
  - Via drag & drop from the "Graphics" object group to the working area
  - As graphic files in the following formats: *.bmp, *.dib, *.ico, *.emf, *.wmf, *.gif, *.tif, *.jpeg or *.jpg
  - As an OLE object
    You either create a new OLE object or save an existing graphic file as an OLE object. To save an OLE object, an OLE-compatible graphics program must be installed on the configuration computer.

12.1.2.4 Inserting an object

Introduction

In the "Screens" or "Reports" editor, insert the objects to the "Toolbox" task card. Use the mouse to drag the objects into the work area. You either keep the objects in their original size, or scale them up or down when you paste them.

In addition, you can copy or move objects via the clipboard from one editor to another, for example to transfer a screen object to a report. Alternatively, you can also use the mouse instead of the clipboard for copying and moving:

- Copying: <Ctrl + Drag&Drop>
- Moving: Drag&drop

Note

Basic Panels

The "Reports" editor is not available for Basic Panels.

Requirement

The "Tools" task card is open.

Inserting objects in their standard size

1. In the "Toolbox" task card, select the desired graphic object or the desired graphic in the WinCC graphics folder.
   When you move the cursor across the work area, it turns into a crosshair with an appended object icon.
2. Click the location in the work area where you want to insert the object or graphic.
   The object is inserted with its standard size at the desired position in the work area.

Alternatively, double-click the object in the "Toolbox" task card.

Copying an object

1. Select the desired object.
2. Select "Copy" in the shortcut menu.
3. Click the desired location and select "Paste" in the shortcut menu.

WinCC inserts a copy of the object at the desired location. You can only change the properties that are appropriate for the relevant context.

Example: In the "Screens" editor, you can set for I/O fields and the mode for input and output. In the "Reports" editor, the mode is set to "Output".

Original and copy are not interconnected and are configured independently from one another.

Inserting lines

1. Select the desired graphic object in the "Tools" task card.
2. Click on a location in the work area. A line in the standard size is inserted.

Inserting a polygon or polyline

1. Select the desired object "Polyline" or "Polygon" in the "Tools" task card.
2. Click on a location in the work area. This fixes the starting point of the object.
3. Click another location in the work area. A corner point is set.
4. For every additional corner point, click on the corresponding location in the work area.
5. Double-click on a location in the work area. The last corner point is set.
   This fixes all the points of the polygon or polyline.

Note

Basic Panels

The "Polyline" and "Polygon" objects are not available for Basic Panels.

Note

If you want to insert several objects of the same type, use the "Stamp" function. This avoids having to reselect the object in the "Tools" task card every time before inserting it. To do so, select the  icon in the toolbar of the "Tools" task card.

See also

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.5 Deleting an object

Introduction

You can delete objects individually or with a multiple selection.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to delete.
   To delete multiple objects, keep the <Shift> key pressed and select the objects to be deleted one after the other. Alternatively, drag and maximize an area around the desired objects with the mouse.
2. Select "Delete" from the shortcut menu.

Result

The selected objects are deleted.

Overview of objects (Page 3935)

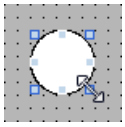
Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.6 Positioning an object

Introduction

When you select an object, it is enclosed by a rectangle with resizing handles. This rectangle is the rectangle which surrounds the object. The position of an object is defined by the coordinates of the top left corner of the rectangle surrounding the object.



Note

If the position is outside the work area the object is not displayed in Runtime.

Position and align

You have the possibility of having a grid displayed in the work area. You have three options for easier positioning of objects:

- "Snap to grid" When you resposition objects, they are automatically snapped and pasted to the grid. If you hold down the <Alt> key, the object is no longer snapped to the grid.
- "Snap to objects" When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.
- "None": You position the objects in any position.

You activate and deactivate the grid and options as follows:

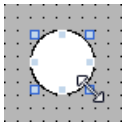
- In the "Options > Settings > Visualization > Screens" menu
- In the "Layout > Grid" task card

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to move.
   The selected object is framed by a rectangle with resizing handles.



2. Left-click the object and keep the mouse button pressed.
3. Move the mouse pointer onto the new position.
   The contour of the object moves with the mouse and displays the new position for the object.

   The object initially remains at its original position.
4. Now release the mouse button.
   The object is moved into the position indicated by the contour of the selection rectangle.

Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the X and Y values for the position under "Position & Size".

Result

The object appears at its new position.

See also

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.7 Resizing objects

Introduction

When you select an object, it is enclosed by a rectangle with handles. You have the following options of resizing an object:

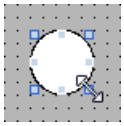
- Drag the handles using the mouse.
- Modify the "Size" property in the Inspector window.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to resize.
   The selection rectangle appears. The following figure shows a selected object:



2. Drag a resizing contact of the rectangle to a new position.
   The size of the object changes.
   - The size of the object is aligned to the grid pattern, provided the "Snap to grid" function is set.
   - Press <ALT> to disable this function while you drag the object.
     In order to scale the object proportionally, keep the <Shift> key pressed while changing the size with the mouse.

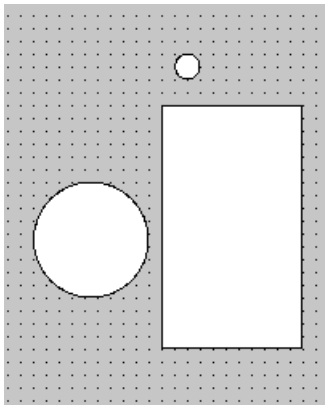
Alternative procedure

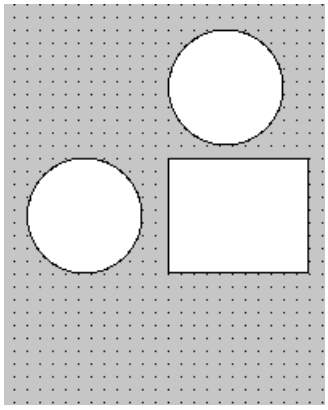
1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the size of the object under "Position & Size".

Harmonizing the object size

1. Select the objects.
2. Now, click one of the following buttons:  or  or 
   The size of the selected objects is matched to each other.

The following screen shows how the selected objects are adapted to the height of the reference object:





Icon	Description
	Aligns the selected objects to the width of the reference object.
	Aligns the selected objects to the height of the reference object.
	Aligns the selected objects to the width and height of the reference object.

Result

The object now appears with its new size.

See also

Overview of objects (Page 3935)

Designing an object (Page 3952)

12.1.2.8 Aligning objects

Procedure

1. Select the objects via multiple selection.
2. Specify an object as the reference object.
3. Select the desired command in the toolbar or the shortcut menu - see table below.
   The selected objects will be aligned.

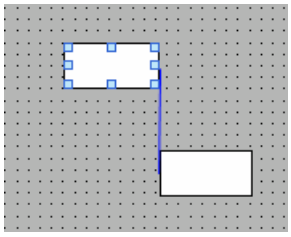
Aligning objects flush

The selected objects will be aligned flush to the reference object.

Icon	Description
	Aligns the selected objects to the left edge of the reference object.
	Aligns the selected objects to the vertical center axis of the reference object.
	Aligns the selected objects to the right edge of the reference object.
	Aligns the selected objects to the upper edge of the reference object.
	Aligns the selected objects to the horizontal center axis of the reference object.
	Aligns the selected objects to the lower edge of the reference object.
	Centers the selected objects to the center points of the reference object.
	Centers the selected objects vertically in the screen.

Snap to object

When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.



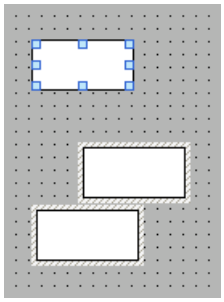
If you are working with the keyboard, press the Alt key. When you move the selected object with the arrow keys, the next anchor point is displayed.

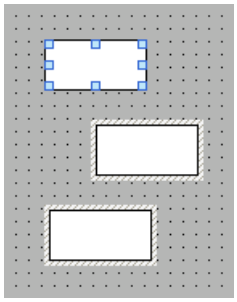
Distributing objects evenly

You need at least three selected objects. A reference object is not required.

1. Select the objects.
2. Click one of the buttons "Distribute horizontally equal" or "Distribute vertically equal".
   The selected objects are distributed at equal distances.

The following screen shows how you align the vertical spacing of the selected objects:





Icon	Description
	Aligns the horizontal distance between the objects. The position of the objects on the extreme left and right side remains unchanged. All other objects are distributed evenly between them.
	Aligns the vertical distance between the objects. The position of the objects at the extreme top and bottom (right and left) remains unchanged. All other objects are distributed evenly between them.

Overview of objects (Page 3935)

Designing an object (Page 3952)

12.1.2.9 Moving an object forwards or backwards

Introduction

You can use the "Order" functions in the shortcut menu of a selected object or in the toolbar to move a selected object in front of or behind other objects within an object layer.

Note

ActiveX controls are always positioned in front of an object layer (.NET property).

Requirement

You have opened a screen which contains a layer with multiple objects.

Procedure

1. Select the object you want to move forward or backward.
2. Select the "Sort" command and one of the following commands from the shortcut menu:

Icon	Description
	Moves the selected object before all the other objects of the same layer
	Moves the selected object to the lowest position in the same layer
	Moves the selected object up by one position
	Moves the selected object down by one position

Alternative procedure

1. Open the "Layers" palette of the "Layout" task card.
2. Navigate to the required object.
3. Hold down the mouse button, and drag the object in the tree topology to the required position in the layer.
4. Now release the mouse button.

Result

The object is moved up or down.

See also

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.10 Showing objects outside the screen area

Introduction

If you assign objects to positions that are outside the configurable area, these objects will be hidden. The functions of the "Objects outside the visible area" palette in the "Layout" task card are used to move these objects back into the screen.

Requirement

- You have opened a screen which contains objects that are outside the configurable area.
- The "Layout" task card is open.

Procedure

1. Open the "Layout > Objects outside the area" task card.
   This displays a list of objects that are outside the configurable area.
2. Select the the object which you want to move back into the screen from the list.
3. Select "Move to screen" in the object shortcut menu.

Alternatively open the "Layout > Layer" task card. Objects outside the area are indicated by the  icon. If you click this icon, the object is moved back into the screen.

Result

The objects are moved to the configurable area.

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.11 Rotating objects

Introduction

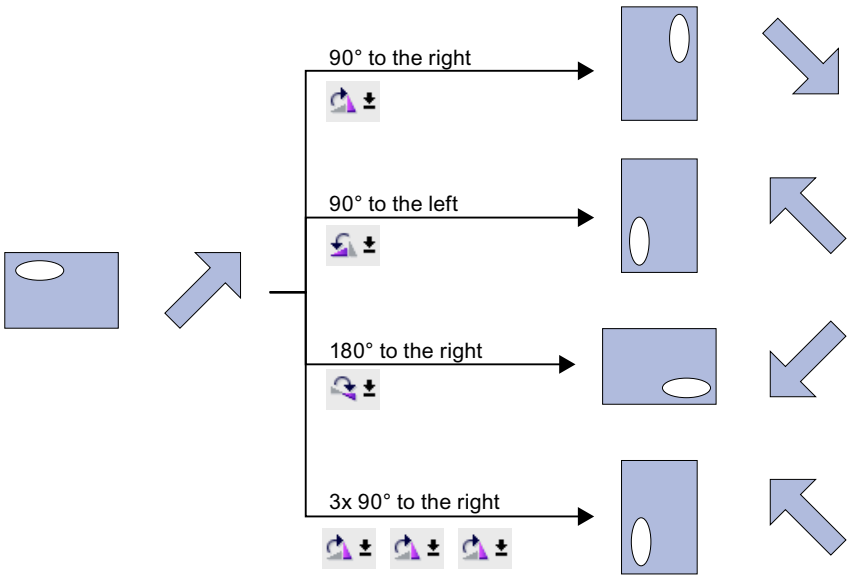
You can rotate a suitable object clockwise or counterclockwise around its center axis in steps of 90°.

Note

Not all the objects can be rotated. Some objects that can be rotated in screens cannot be rotated in reports.

You can also rotate multiple objects using the multiple selection function. Certain WinCC objects such as buttons cannot be rotated.

The alignment of elements in an object will change in a rotated object. The following figure shows how a rectangle and an ellipse behave under the different commands for rotating an object:



Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to rotate.
2. Click one of the following toolbar icons:
   , to rotate the object clockwise around its center point. The angle of rotation is 90°.
   , to rotate the object counterclockwise around its center point. The angle of rotation is 90°.
   , to rotate the object clockwise by 180°.

Result

The object is shown at its new angle.

See also

Overview of objects (Page 3935)

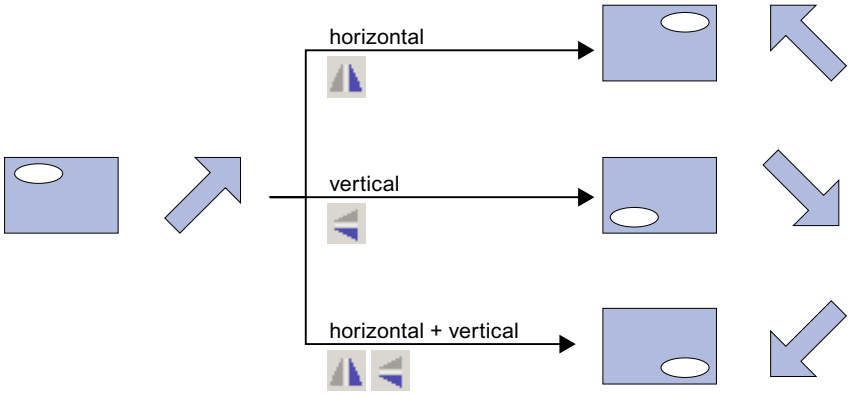
Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.12 Flipping objects

Introduction

You can flip an object along its vertical or horizontal center axis. The alignment of elements in an object will change when you flip an object. The following figure shows how a rectangle and an ellipse behave under the different commands for flipping an object.



Requirement

You have opened a screen which contains at least one object.

Procedure

1. Select the object that you want to flip.
2. Click the "Flip" command in the shortcut menu and select one of the options displayed:
   - , to flip the selected object along its vertical center axis.
   - , to flip the selected object along its horizontal center axis.

Result

The object is shown at its flipped position.

Designing an object (Page 3952)

12.1.2.13 Flashing

Introduction

You want an object to flash in Runtime.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to flash.
2. In the Inspector window, select the type "Default" under ""Properties > Properties > Flashing".

Result

The object flashes in runtime.

See also

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.14 Designing an object

Introduction

You design the border and background of an object.

Requirements

A line has been created in a screen.

Procedure

1. Select the line on your screen.
2. In the Inspector window, select "Properties > Properties > Appearance":
3. Select "Dash" as the style.
4. To display the dashed line in two colors, select the line width "1".
5. Select the setting "Arrow" in the "Line ends" area.

Result

The line is displayed in two colors as a dashed line. The end of the line is an arrow.

12.1.2.15 Designing the fill pattern

Introduction

WinCC lets you design the background color and the fill pattern of an object. The design options change in the Inspector window depending on object for which you are making the filling pattern.

For certain objects, you can not only define the color, but also a transparent background or a background with a color gradient.

Note

Device-specific nature of the properties

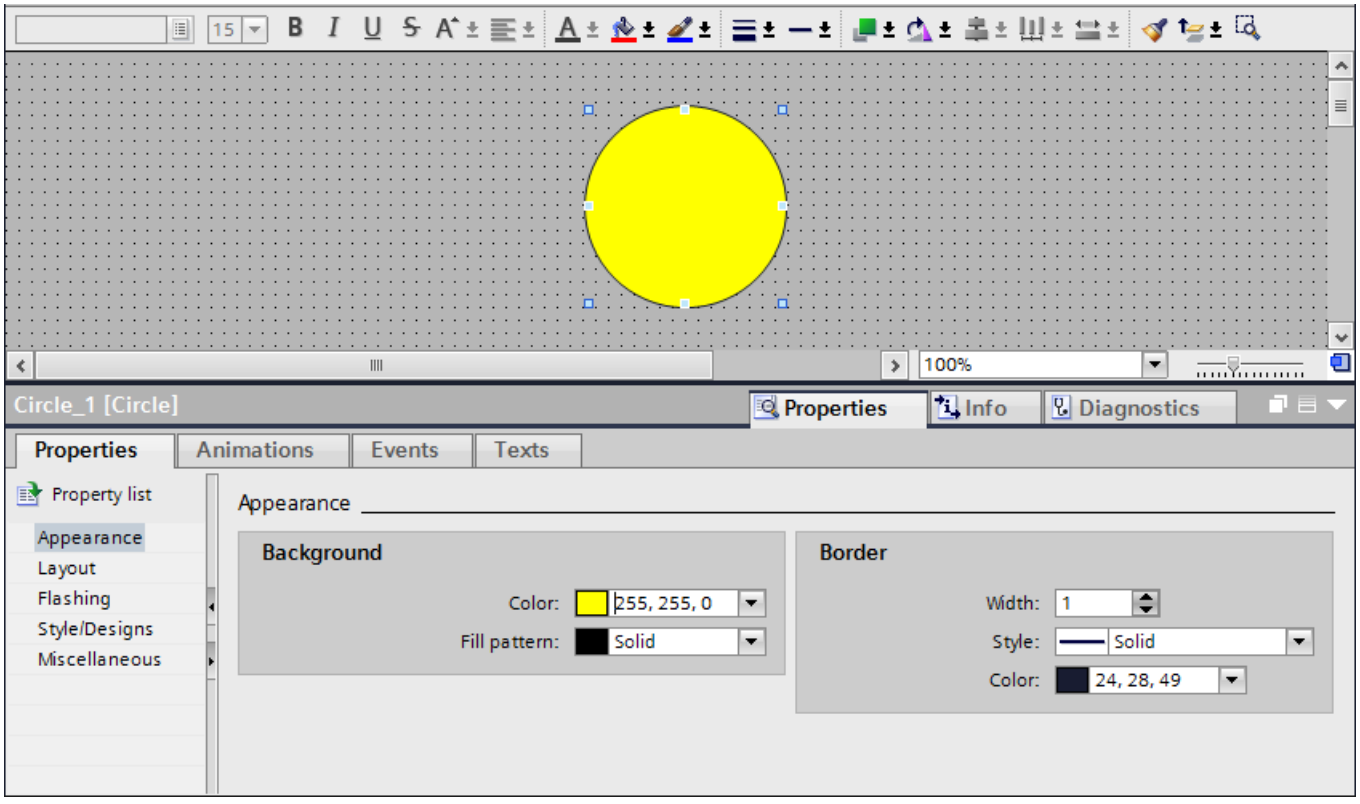
The fill style that is available depends on the object and the HMI device used.

Requirement

The object has been created and selected.

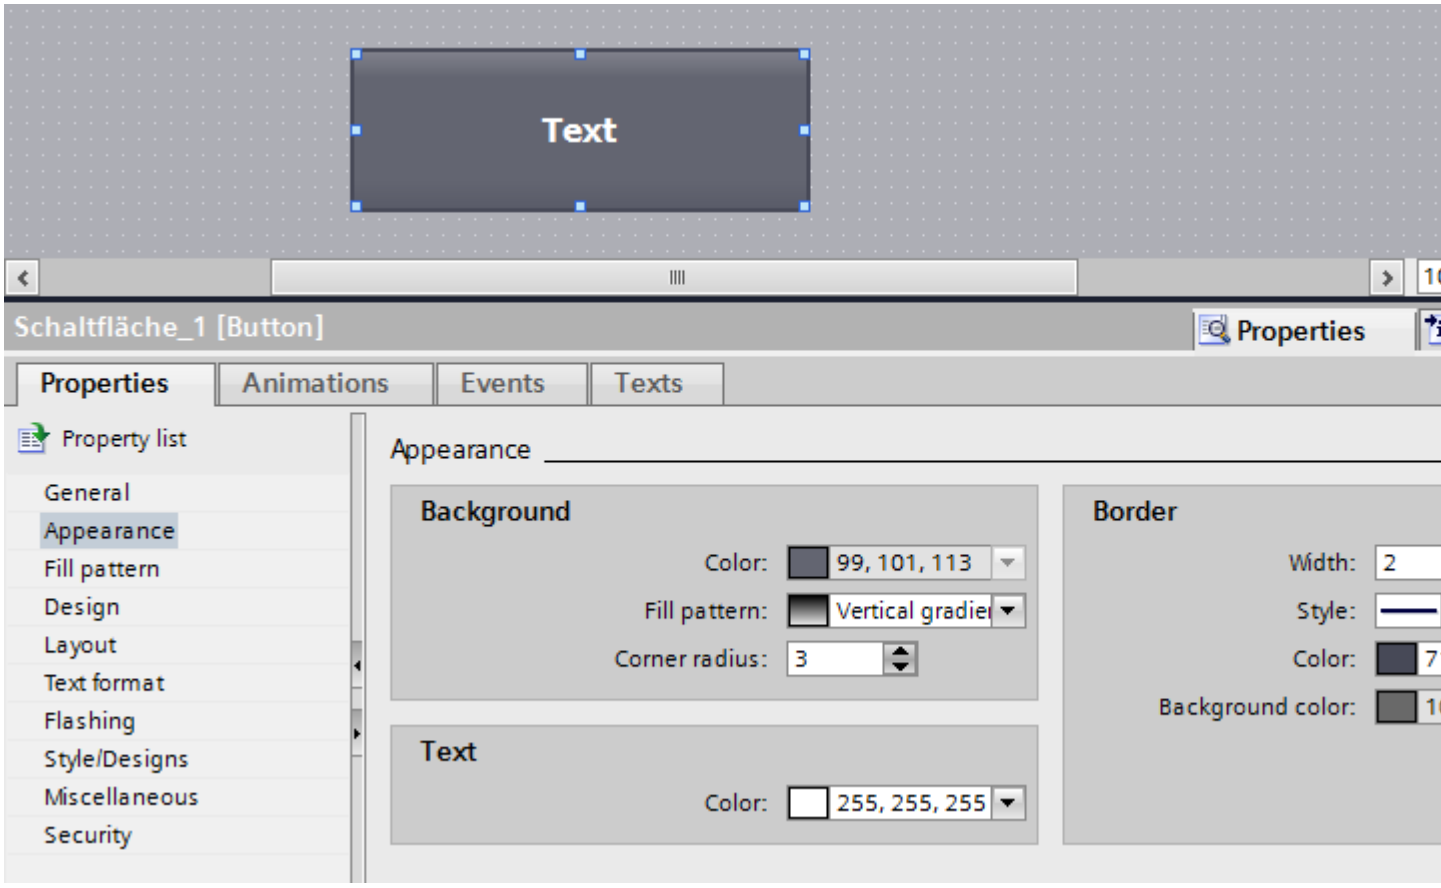
Designing the background color of an object

1. In the Inspector window, select "Properties > Properties > Appearance".
2. Select a color for the background of the object, for example, yellow.
   The object is filled with the selected color.



Designing the fill pattern of an object

1. In the Inspector window, select "Properties > Properties > Appearance".
2. To define a transparent background for the object, select transparent.
   You can find information about designing a fill pattern with a color gradient in the section Defining color gradients (Page 3962).
   The object is shown as transparent.



You can optionally set the fill pattern in the Inspector window under "Properties > Properties > Fill Pattern".

See also

Defining color gradients (Page 3962)

12.1.2.16 Formatting text in an object

Introduction

Some objects, for example, the I/O field, support text within the object.

You have several options to align text.

Configuring the distance from the object border

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the value "5" for the left border, for example.

The text is aligned five pixels from the left border of the object.

Aligning the text position

1. In the Inspector window, select "Properties > Properties > Text format".
2. Select the horizontal alignment, for example, centered.
3. Select the vertical alignment, for example, top.
   The text is shown at the top center in the object.

Defining the text orientation

1. In the Inspector window, select "Properties > Properties > Text format".
2. Select the orientation of the text, for example, vertical, right.
   The text flow is shown from bottom to top.

12.1.2.17 Formatting graphics in an object

Introduction

WinCC lets you insert graphics into some objects and format them. You can change the size, orientation and distances of a graphic to the object border. You change the properties of the graphic in the Inspector window of the relevant object.

Requirement

- The selected object is in graphic mode.
- The selected object contains at least one graphic.

Resizing a graphic

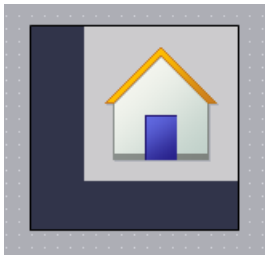
1. In the Inspector window, select "Properties > Properties > Layout".
2. Select "No stretching of picture" or "Stretch picture".
   The contained graphic is displayed in its original size or stretched to the size of the object.

Note

To adjust the object size to the contained graphic, select "Fit object to contents".

Aligning a graphic horizontally and vertically

1. In the Inspector window, select "Properties > Properties > Layout".
2. To determine the horizontal position of the graphic, select "Right", for example.
3. To determine the vertical position of the graphic, select "Top", for example.
   The graphic is then shown at the top right of the object.



Defining the distance from the object border

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the value for the distance to the object border, for example, "20" for the top border.
   The graphic is shown with a distance of 20 pixels to the top border of the object.

Icon	Description
	Sets the distance from the left border of the object.
	Sets the distance from the right border of the object.
	Sets the distance from the top border of the object.
	Sets the distance from the bottom border of the object.

12.1.2.18 Connecting tags and text lists in the text

Introduction

Comfort Panels and WinCC Runtime Advanced give you the option to add output fields for tags or entries to a text list for the following objects:

- Symbolic I/O field
- Text field

Note

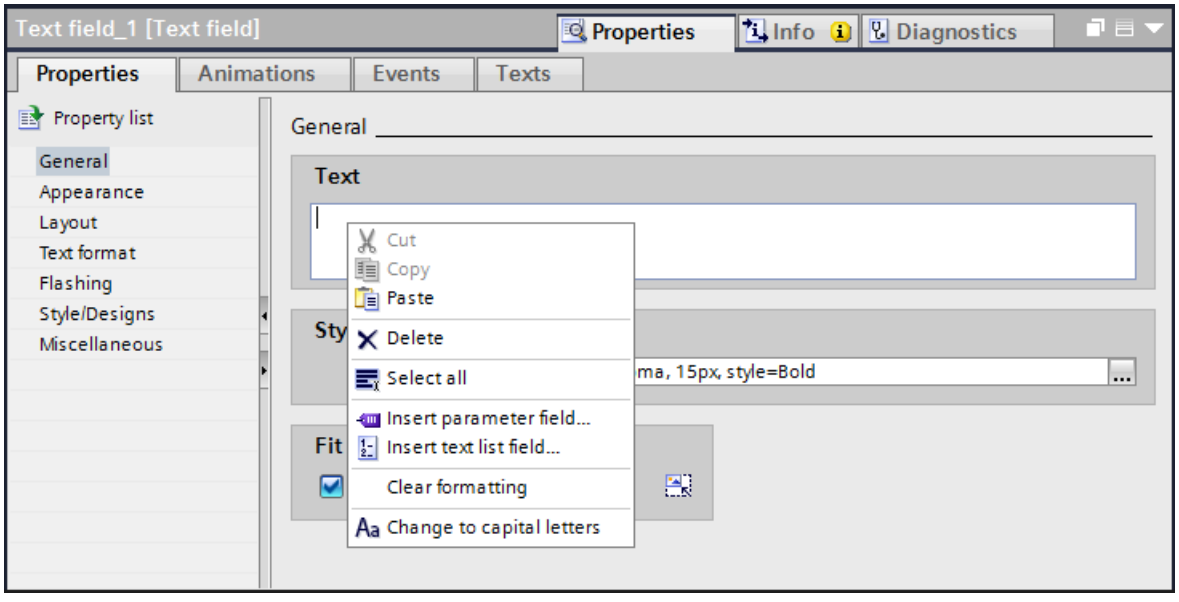
The symbolic I/O field supports the connection of tags and text list entries in the "Two states" mode.

Requirement

- The object has been created and selected

Connecting tags in a text field

1. Open "Properties > Properties > General" in the inspector window.
2. Open the shortcut menu of the input field.



3. Select the command "Insert parameter field ...".
   A dialog opens.
4. Select the tag and the format in which you want to display the tag.
5. Confirm your entries.

The name of the connected tag is displayed in the text field of the object.

Connecting the text list

1. Open "Properties > Properties > General" in the inspector window.
2. Open the shortcut menu of the input field.
3. Select the command "Insert text list field ...".
   A dialog opens.
4. Select the text list from which a text entry is displayed.
5. Confirm your entries.

The reference to the text list entry is displayed in the text field of the object.

Note

The number of references to text list entries that in turn include references to text list entries or tags is limited to three layers.

12.1.2.19 Designing a border

Introduction

WinCC offers various properties for designing display and operating objects.

The I/O field example below shows the possible settings for designing borders.

You change the appearance in the Inspector window of the relevant object.

Designing a border

1. Open "Properties > Properties > Appearance".
2. Select the width of the border, e.g. "5".
3. Select the style of the border, e.g. double line.
4. Select the foreground color.
5. Select the background color.

Figure 12-1 "Double line" border style

Border style

The figure below shows a border in "3D style".

The figure below shows a border in "Solid" style.

Note

Device-specific nature of the properties

The border style that is available depends on the object and the HMI device used.

12.1.2.20 Designing table-based objects

Introduction

WinCC offers various properties for designing display and operating objects.

You change the properties of table-based objects in the Inspector window of the relevant object.

Designing colors

Select the colors for font, selections and areas under "Properties > Properties > Appearance".

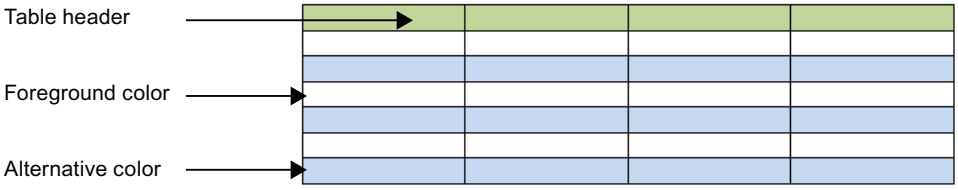


Figure 12-2 Selecting table properties

Designing the border of the table header

1. In the Inspector window, open "Properties > Properties > Table header border".
2. Select "Solid", for example, as the style.
3. Select 5, for example, as the "Width".
4. Select red, for example, as a foreground color.

The border of the table header is shown with a red border and width of 5 pixels. With "Solid" border style, only the foreground color is visible.

Colors and color gradient in the table header

1. Select the table-based object in the screen.
2. In the Inspector window, open "Properties > Properties > Table header fill pattern".
3. Select the fill pattern, for example "Horizontal gradient".
4. Select a background color, for example, blue, under "Gradient".
5. Activate "Gradient 1".
6. Select a color for "Gradient 1", for example, white.
7. Select a "Width" for the color gradient, for example, 12.
8. Activate Gradient 2.
9. Select a color for Gradient 2, for example, yellow.
10. Select a "Width" for the color gradient, for example, 10

The table header is displayed with a color gradient.

12.1.2.21 Defining color gradients

Introduction

For the objects in WinCC, color gradients can be specified as background for various surfaces.

Change the category in the Inspector window, depending on which surface you fill with a color gradient. The procedure remains the same.

The following section describes how to configure the color gradient of buttons.

Horizontal color gradient with two colors

1. Select an object with buttons, for example, a button.
2. In the Inspector window, select "Properties > Properties > Fill Pattern".
3. Select "Fill Pattern > Horizontal gradient".
4. Select a background color for the vertical color gradient, for example, orange.
5. Activate "Gradient 1".
6. Select a "Color" for Gradient 1, for example, red.
7. Select a "Width" for Gradient 1, for example, "10".

The background of the button is displayed in orange.

For the horizontal color gradient, Gradient 1 is shown from the left border. Gradient 1 is 10 pixels wide.

Vertical color gradient with three colors

1. Select a button in the screen.
2. In the Inspector window, select "Properties > Properties > Fill Pattern".
3. Select the "Vertical gradient" background.
4. Select a background color under "Gradient", for example, orange.
5. Activate "Gradient 1".
6. Select a color for "Gradient 1", for example, red.
7. Select a "Width" for the color gradient, for example, 8.
8. Activate Gradient 2.

9. Select a color for Gradient 2, for example, yellow.
10. Select a "Width" for the color gradient, for example, 10.

	← Color Gradient 1
	← Background color
	← Color Gradient 2

For the vertical color gradient, Gradient 1 is shown from top to bottom. Gradient 1 is 8 pixels wide.

The background of the button is displayed in orange.

Gradient 2 is shown at the bottom border. Gradient 2 is 10 pixels wide.

12.1.2.22 Using predefined styles

Introduction

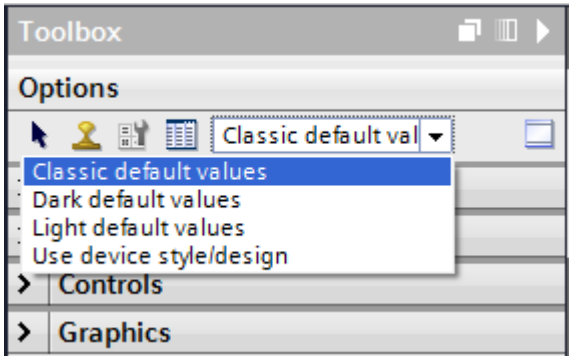
You can assign predefined styles to objects and faceplates in Runtime. You can change the background color of the display and operating elements using predefined styles. In this way, you harmonize the display in Runtime.

Requirement

The "Tools" task card is open.

Setting predefined styles

1. Select the object that you want to insert in the "Toolbox" task card.
2. Select one of the following options in the "Toolbox" task card:
   - "Classic default values" to use the default style
   - "Dark default values" to use the dark color scheme
   - "Light default values" to use the light color scheme
   - "Use device style/design" to use the settings from the current device design



3. Insert the required object in the work area.
   The object is displayed in the selected style.
4. The objects are created in the selected style as long as the style remains activated in the toolbar.
   To return to the default style, select the "Default" option in the toolbar.

See also

Working with styles (Page 3916)

12.1.2.23 Inserting multiple objects of the same type (stamping)

Introduction

WinCC offers the possibility to "stamp" several objects of the same type directly one after the other, i.e. paste without having to reselect the object every time. In addition you have the possibility of multiplying an object that has already been inserted.

Requirement

The "Tools" task card is open.

Inserting several objects of one type

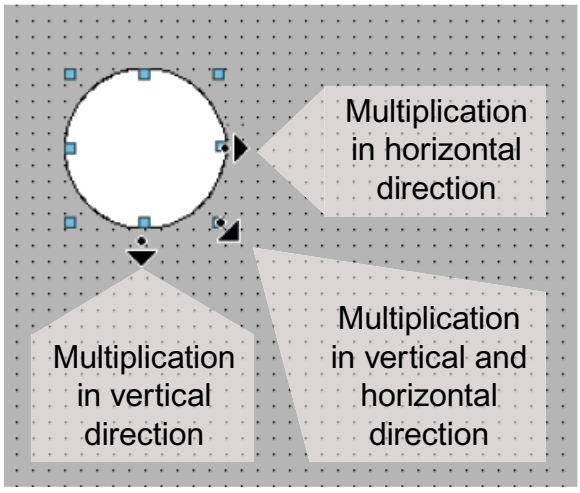
1. Select the object that you want to insert in the "Tools" task card.
2. Click the icon in the toolbar of the "Tools" task card.
   The "Stamp" function is activated.
3. To insert the object with its standard size, click the relevant insertion position in the work area.
   To insert the object with another size, position the mouse pointer at the desired location in the work area. Press the left mouse button and drag the object to the required size.
   The object is inserted in the work area as soon as you release the mouse button.
4. Repeat step 3 to insert further objects of the same type.
5. Click the icon again.
   The "Stamp" function is deactivated.

Note

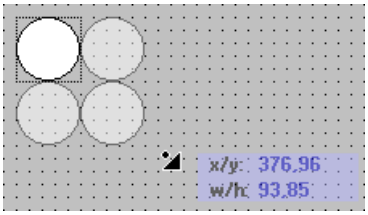
You can copy existing objects using the drag-and-drop +<CTRL> function. The existing object is not moved in this case. You paste a copy of this object into the new position instead.

Inserting and multiplying an object

1. Insert the desired object from the "Tools" task card.
2. Press the <Ctrl> key and position the cursor on one of the handles displayed in the figure shown below.



3. Drag the handles to the right and/or down while keeping the left mouse button pressed.
4. The object is multiplied depending on available space if you keep moving the cursor.



Result

You have pasted and stamped an object in a screen.

See also

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.24 Selecting multiple objects

Introduction

Select all objects you want to align with each other or to change global properties. This procedure is called "multiple selection."

The Inspector window shows all the properties of the selected objects.

You now have several options of selecting multiple objects:

- Draw a selection frame around the objects.
- Hold down the <Shift> key, and click the required objects.

Selection frame of a multiple selection

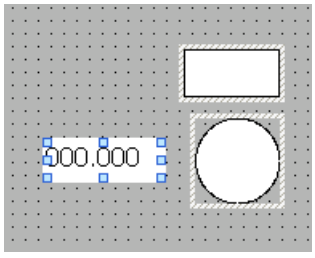
The selection frame surrounds all objects of a multiple selection. The selection frame is comparable with the rectangle that surrounds an individual object.

The selection frame is not visible. When you have made your multiple selection, the following frame is displayed:

- The reference object is indicated by the rectangle around it.
- The other selected objects are indicated by a dashed-line frame.

Specifying a reference object

The reference object is the object upon which the other objects are oriented. The reference object is framed by a rectangle with handles. The following figure shows a reference object with two other selected objects:



You have the following options to specify the reference object:

- Select the objects via multiple selection. The object selected first is then the reference object.
- Draw a selection frame around the objects. The reference object compiled automatically. If you wish to specify a different object within the selection as the reference object, click on the desired object. This action does not cancel your multiple selection.

Requirement

You have opened the work area containing at least two objects.

Selecting multiple objects with a selection frame

1. Position the mouse pointer in the work area close to one of the objects to be selected.
2. Hold down the mouse button, and draw a selection frame around the objects to be selected.

Or:

1. Hold down the <Shift> key.
2. Click the relevant objects, working in succession.
   All the selected objects are identified by frames.
   The object selected first is identified as reference object.

Note

To remove an object from the multiple selection, press <SHIFT>, hold it down and then click the relevant object once again.

Result

Multiple objects are selected. One of those is identified as the reference object. You can now perform the following steps:

- Changing the object properties of all the objects
- Resizing all the objects by the same ratio, by dragging the selection frame to increase or reduce the size
- Moving all the objects in one group
- Aligning the objects to the reference object

See also

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.25 Repositioning and resizing multiple objects

Possible modifications

After you have selected multiple objects, you edit them:

- Shift using the mouse
  - To change the absolute position of the marked objects, position the mouse pointer over an object, and shift the multiple selection with the mouse button pressed.
  - To resize all the objects by the same ratio, grab the resizing handles of the reference object.
- Move over the work area with the icons of the toolbar
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects
- Moving with the shortcut menu commands of the work area
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects

Overview of objects (Page 3935)

Designing an object (Page 3952)

12.1.2.26 Managing own controls

Introduction

Add standardized or user-defined controls in the "Toolbox > My Controls" task card. All the ActiveX controls registered in the operating system and the .Net controls on your system are available for use in WinCC.

- ActiveX controls
  ActiveX controls are operator controls from any providers, which can be used by other programs over a defined OLE-based interface.
- .Net controls
  .Net controls are operator controls from any providers based on the Microsoft .Net Framework.
- Specific .Net controls
  .Net controls are operator controls from any providers based on the Microsoft .Net Framework.

When you intend to run external controls in your WinCC project, you need to verify that these run on the HMI device you are configuring. If you are using controls from third parties, you

must first of all add these to the "My controls" palette before you copy the project to different PCs.

Note

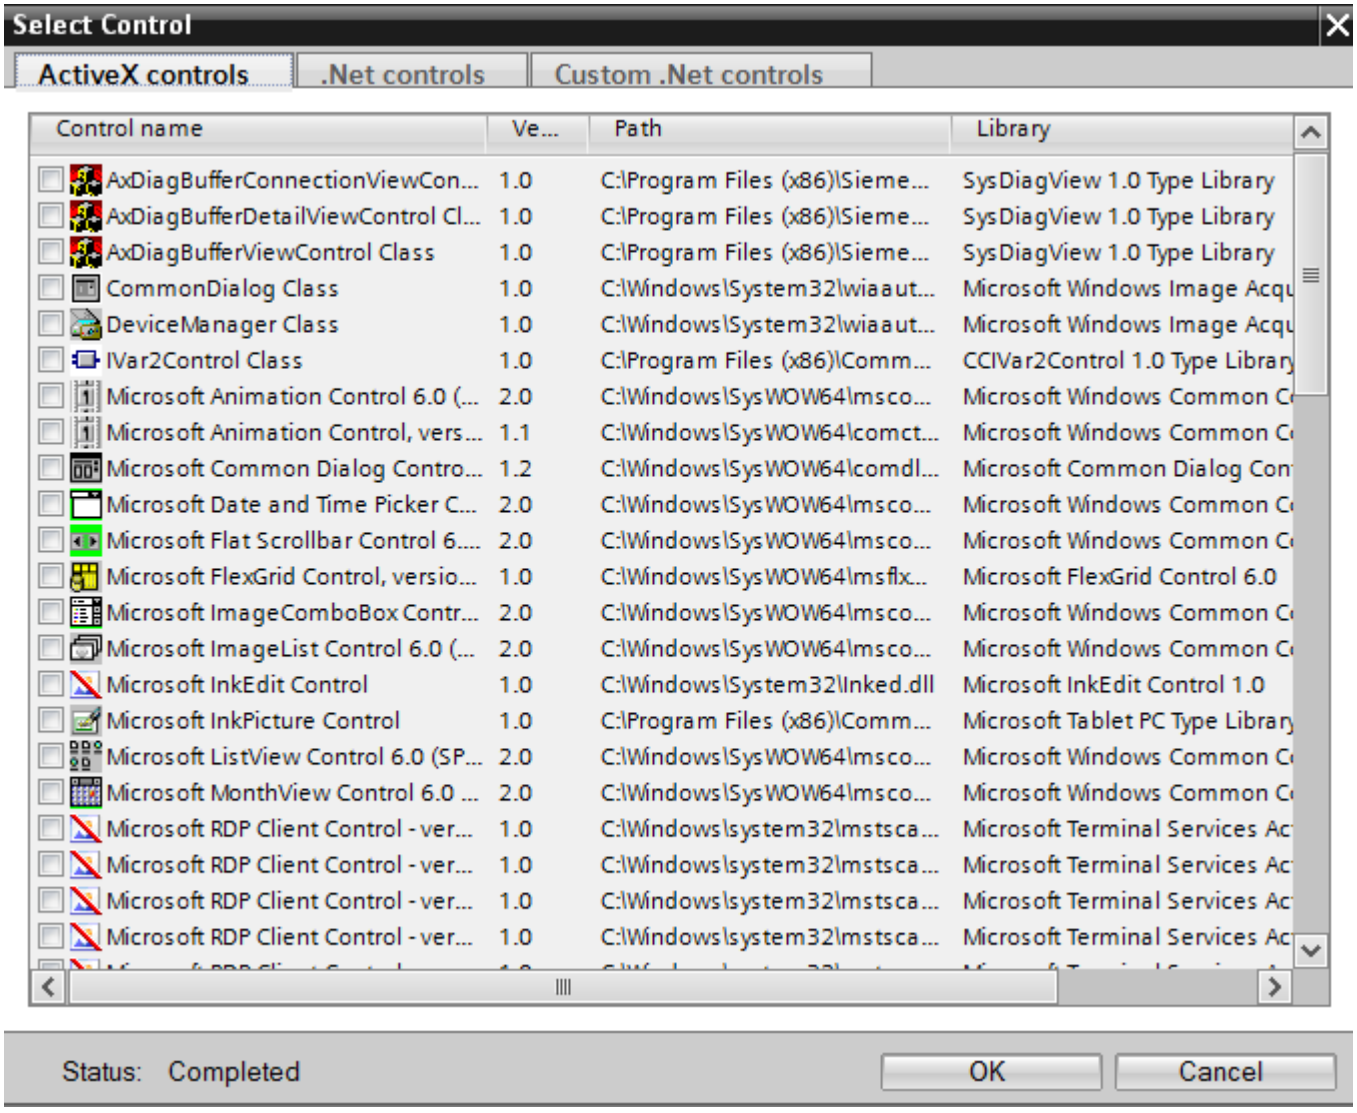
If you use any controls that are not included in the product package (for example, from third parties), errors may occur, for example, reduced performance or system crashes. The user of such control software is alone responsible for any problems caused by its use. We therefore advise you to closely examine such elements prior to their use.

Requirement

- The required ActiveX control is installed in the PC's operating system.
- The required or specific .Net control is available on the PC in an assembly.
- A screen is open.
- The "Toolbox" task card is open.

Adding a new control to the "My controls" group

1. Open "Toolbox > My controls" in the "Toolbox" task card.
2. Select "Select objects" from the shortcut menu.
   A dialog opens. This contains all the controls available on the system. Controls that already exist in the "Toolbox" task card are identified by a check mark.



3. Select the desired tab, e.g. ActiveX controls.
4. Activate the required control.
5. Confirm your selection with "OK".

Inserting a specific .Net control in the "My controls" group

1. Select the "Specific .Net controls" tab. The list is empty the first time you select the tab.
2. Click the "…" button.

3. Select the folder in which the assembly is contained.
4. Select a file.
5. Click "Open." All the available controls are displayed in the "Specific .Net controls" tab.
6. Activate the required .Net control.
7. Confirm your selection with "OK".

Note

.Net-Controls in Runtime Advanced

If you have incorporated a .Net Control in your project as "Specific .Net-Control", you have to copy the files belonging to these controls to the installation directory of WinCC Runtime, e.g. "C:\ProgramFiles\Siemens\Automation\WinCC RT Advanced". Otherwise, the control cannot be loaded in Runtime.

Result

The control now appears in the "Toolbox > My controls" task card and can be configured in a screen.

Removing a control from the "My controls" group

1. Select "Delete" from the shortcut menu for the control concerned.
   The control is removed from the "My controls" group.

Designing an object (Page 3952)

12.1.2.27 External graphics

Introduction

You can use graphics created with an external graphic program in WinCC. To use these graphics you store them in the graphic browser of the WinCC project.

You can save graphics in the graphic browser:

- When you drag-and-drop graphics objects from the "Graphics" pane into the work area, these are stored automatically in the graphic browser. The graphic names are numbered in the order of their creation, for example, "Graphic_1." Use the <F2> function key to rename the graphic.
- As a graphic file with the following formats:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tif, *.png, *.jpeg or *.jpg
- As an OLE object that is embedded in WinCC and is linked to an external graphic editor. In the case of an OLE link, you open the external graphic editor from WinCC. The linked object is edited using the graphic editor. An OLE link only works if the external graphic editor is installed on your PC, and supports OLE.

Use of graphics from the graphic browser

Graphics from the graphic browser are used in your screens:

- In a Graphic view
- In a graphics list
- As labeling for a button/function key

Transparent graphics

In WinCC you also use graphics with a transparent background. When a graphic with a transparent background is inserted into a graphic object of WinCC, the transparency is replaced by the background color specified for the graphic object. The selected background color is linked firmly with the graphic. If you use the graphic in another graphic object of WinCC, this object is displayed with the same background color as the graphic object that was configured first. If you want to use the graphic with different background colors, include this graphic in the graphic browser again under a different name. The additional background color is configured when the graphic is used at the corresponding graphic object of WinCC.

Managing graphics

An extensive collection of graphics, icons and symbols is installed with WinCC, for example:

In the Toolbox window of the "Graphic" pane the graphic objects are structured by topic in the "WinCC graphics folder." The link to the WinCC graphics folder cannot be removed, edited or renamed.

The "Graphics" pane is also used to manage the external graphics. The following possibilities are available:

- Creating links to graphics folders
  The external graphic objects in this folder, and in the subfolders, are displayed in the toolbox and are thus integrated in the project.
- Editing folder links
- You open the program required for editing of the external graphic in WinCC.

See also

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.28 Managing external graphics

Introduction

External graphics that you want to use in WinCC are managed in the "Screens" editor by using the "Tools" task card in the "Graphics" pane.

Requirement

- The "Screens" editor is open.
- The "Tools" task card is open.
- The graphics are available.
- The graphics have the following formats:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tif, *.jpeg or *.jpg

Creating a folder link

1. Click "My graphics folder."
2. Select "Link" in the shortcut menu.
   The "Create link to folder" dialog is opened. The dialog suggests a name for the folder link.
3. Edit the name as required. Select the path containing the graphic objects.
4. Click "OK" to confirm your input.
   The new folder link is added to the "Graphics" object group. The external graphics that are located in the target folder and in sub-folders are displayed in the toolbox.

Editing folder links

1. Select the folder link to edit.
2. Select the "Edit link..." command from the shortcut menu.
   The "Create link to folder" dialog is opened.
3. Edit the name and path of the folder link as required.
4. Click "OK" to confirm your input.

Renaming the folder link

1. Select the folder link to rename.
2. Select "Rename" from the shortcut menu.
3. Assign a name to the new folder link.

Removing a folder link

1. Select the folder link you want to delete.
2. Select "Remove" in the shortcut menu.

Edit external graphics

1. Select the graphic you want to edit.
2. Select the "Edit graphic" command from the shortcut menu.
   This opens the screen editor associated with the graphic object file.

Editing graphics folders from WinCC

1. Select the graphic you want to edit.
2. Select the "Open parent folder" command from the shortcut menu.
   The Windows Explorer opens.

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.29 Storing an external image in the graphics library

Introduction

To display graphics that have been created in an external graphics program in your screens, you will first have to store these graphics in the graphics browser of the WinCC project.

Requirement

- A screen has been created.
- A Graphic View is inserted in the screen.
- The Inspector window of the Graphic view is open.

To store an external graphic in the image browser:

- A graphic is available.

To store an OLE object in the browser:

- An OLE-compatible graphics program is installed on your configuration computer.

Save graphics file

1. Open the Windows Explorer.
2. Select the graphic that you want to store.
3. Drag-and-drop the graphic into the graphic browser.

Creating and saving a new graphic as an OLE object

1. Select the Graphic view on your screen.
2. In the Inspector window, select "Properties > Properties > General":
3. Open the graphic selection list.
4. Click  .
5. The "Insert object" dialog box opens.

   Note

   In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

6. From the "Insert object" dialog box, select "New" and an object type. The settings in "Settings > "OLE settings" determine which object types are shown.
7. Click "OK." The associated graphic program is opened.
   When you are finished creating graphics, end the graphic programming software with "File > Close" or "File > Close & return to WinCC."
   The graphic will be stored in the graphic programming software standard format and added to the graphic browser.

Inserting created graphics in WinCC

Note

A new graphic object created as OLE object may not be directly accepted in WinCC when you save it to an external graphics program.

1. Reopen the dialog for inserting a graphic.
2. From the "Insert object" dialog box, select "Create from file."
3. Click the "Browse" button.
4. Navigate to the created graphic and select it.

Saving an existing graphic object as an OLE object

1. In the Inspector window, select "Properties > Properties > General":
2. Open the graphic selection list.
3. Click  .
4. The "Insert object" dialog box opens.

Note

In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

5. From the "Insert object" dialog box, select "Create from file."
6. Click the "Browse" button.
7. Use the dialog to help you navigate to the folder in which the graphic file is saved.

Note

To import graphics files, note the following size restrictions:

*.bmp, *.tif, *.emf, *.wmf ≤4 MB

*.jpg, *.jpeg, *.ico, *.gif "*≤1 MB

Result

The image file is now stored in your image browser. It is shown in a screen with a Graphic view , or is added as a list element in an image list.

You can double-click OLE objects in your library to open them for editing in the corresponding graphic editor. When you have finished editing graphics, end the graphic programming software with "File > Close" or "File > Close & return to WinCC." The changes are applied to WinCC.

Example: Configuring a rectangle (Page 3987)

Designing an object (Page 3952)

12.1.2.30 Working with object groups

Basics on groups

Introduction

Groups are several objects that are grouped together with the "Group" function. You edit a group in the same way as any other object.

Overview

WinCC offers the following methods for editing multiple objects:

- Multiple selection
- Grouping objects

Editing mode

To edit an individual object in a group, select the object in the "Layout > Layers" task card.

Alternatively select "Group > Edit group" in the object group's shortcut menu.

Hierarchical groups

You add further objects or groups to extend a group. The group is enlarged by the new objects and is structured hierarchically in main and sub-groups. Such hierarchical groups must be broken up in stages. You also break up the group in the same order in which you grouped the objects or groups. It takes exactly the same number of steps to break up these hierarchical groups as it did to create them.

Rectangle surrounding the object

Only one surrounding rectangle is now displayed for the whole group. The surrounding rectangles of all objects are displayed for a multiple selection on the other hand.

Layers

All objects of a group are located in the same layer.

Properties of a group

A group has its own properties, such as authorization. If you set a property at a group, all objects of the group inherit this setting. If the same property is configured differently at an object in the group, the value of the property at the object and not the value in the group applies in Runtime.

Grouping objects (Page 3978)

Ungroup (Page 3979)

Adding objects to a group (Page 3980)

Removing objects from the group (Page 3981)

Editing an object in a group (Page 3982)

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Grouping objects

Introduction

The "Group" command combines multiple objects to form a group.

You can change the size and position of the group. The following rules apply:

- The system automatically adapts the position coordinates of the grouped objects when you reposition the group. The relative position of the grouped objects to the group is not affected.
- The system automatically adapts the height and width of the grouped objects in proportion to a change of the group size.
- To change the size of the group proportionately, hold down the <Shift> key and drag the rectangle around the object until has the required size.

Note

To create a hierarchical group, organize the individual groups like objects.

Requirement

- You have opened a screen which contains at least two objects.

Creating object groups

1. Select all the objects you want to organize in a group.
2. Select the command "Group > Group" from the shortcut menu.

The objects of the group are displayed with a rectangle around the objects.

Grouping objects within a group

1. Select the group you want to edit.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group that you are editing is highlighted by a red frame.

3. Select the objects of a group that you want to combine into a subgroup.
4. Select the command "Group > Group" from the shortcut menu.

A subgroup with the objects is created.

Adding objects into an existing group

1. Select the group to which you want to add objects.
2. Press the <Shift> key and select the object you want to add to the group.
3. Select the "Group > Add to group" command from the shortcut menu.

The object is added to this group.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

Result

The selected objects are combined in a group. The multiple selection rectangle becomes the rectangle surroundings the objects in the group. The handles are shown only for the group. The group in in the active layer.

See also

Basics on groups (Page 3977)

Example: Configuring a rectangle (Page 3987)

Ungroup

Introduction

Select the "Ungroup" command to split a group into the original object fractions.

Requirement

- You have opened a screen that contains a group.

Ungroup

1. Select the group.
2. Select the "Group > Ungroup" command from the shortcut menu.

Ungrouping a group within a group

1. Select the higher-level group.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group that you are editing is highlighted by a red frame.
3. Select the lower-level group.
4. Select the "Group > Ungroup" command from the shortcut menu.

Result

The lower-level group is ungrouped. The objects are assigned to the next higher group.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

See also

Basics on groups (Page 3977)

Example: Configuring a rectangle (Page 3987)

Adding objects to a group

Introduction

The "Add objects to group" command is used to add objects to a group, without ungrouping it first.

Requirements

A screen with one group and at least one other object is opened.

Procedure

1. Select the group.
2. Press the <Shift> key and select the object you want to add to the group.
3. Select the "Group > Add to group" command from the shortcut menu.

Result

The group consists of the original objects, and the newly-added objects. The added objects are arranged at the front of the group.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag&drop you can also easily edit hierarchical groups in the "Layers" palette.

See also

Basics on groups (Page 3977)

Example: Configuring a rectangle (Page 3987)

Removing objects from the group

Introduction

You use the "Remove objects from group" command to remove individual objects from a group, without ungrouping it first.

You do not have to remove the object from the group to edit an object in a group. You can edit the objects of a group individually.

Requirement

- You have opened a screen that contains a group.

Removing objects from a group

To remove an object from a group:

1. Select the group.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group you want to edit is highlighted by a red frame.
3. Select all objects in the group that you want to remove from the group.
4. Select the "Group > Remove from group" command from the shortcut menu.

The objects are removed from the group.

Note

If there are only two objects in the group, the menu command "Remove from group" is not available.

Deleting objects from a group

To remove an object from the group, and from the screen:

1. Select the group.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group you want to edit is highlighted by a red frame.
3. Select the objects in the group that you want to delete.
4. Select "Delete" from the shortcut menu.

Note

If there are only two objects in the group, the menu command "Delete" is not available.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

See also

Basics on groups (Page 3977)

Example: Configuring a rectangle (Page 3987)

Editing an object in a group

Introduction

You can edit the objects of a group individually.

Requirement

You have opened a screen that contains a group.

Editing grouped objects

1. Select the group.

   The properties of the group are displayed in the Inspector window.
2. Change the position and size of the grouped objects in "Properties > Properties >Layout."
3. Change the name of the group in "Properties > Properties > Miscellaneous."

Modifying the properties of an object within a group

1. Select the group.
2. Select the object whose properties you want to change in the Inspector window.

   The properties of the object are displayed.
3. Change the object properties.

Note

The dynamization of properties for all objects of the group which have these properties is not possible in a group. You can only dynamize the properties of the objects associated with a group for each object itself.

Result

Although you have edited the object, it is still an element of the group. These changes do not affect the other objects of the group.

See also

Basics on groups (Page 3977)

Example: Configuring a rectangle (Page 3987)

12.1.2.31 Configuring the keyboard access

Overview of keyboard access

Introduction

For keyboard units without a mouse, the operator activates control objects using the <Tab> key. You can set up keyboard input to make the process easier to run, and to make sure that the operator enters all the necessary values. If you are using the keyboard, use the <Tab> key to activate the objects in a certain order, and to enter the necessary values.

For HMI devices without key, you can simulate the <Tab> key by configuring the "SimulateSystemKey" system function to a function key.

Operator authorizations and operator control enables

If you configure an object for operator input with the <Tab> key, the object must have both an operator authorization, and an operator control enable.

Editing the tab sequence

The tab sequence is determined automatically when the control objects are created. The numbers of the tab sequence are assigned in the sequence in which the libraries are created.

It makes sense to change the tab sequence in the following cases:

- The operator changes directly to a specific control object.
- The screen requires a specific sequence

Change to the tab sequence mode to change the tab sequence. In this mode, the tab sequence number is displayed at the top left of the control objects. The tab sequence numbers of hidden objects are also shown. The distribution of these numbers is edited using the mouse.

Note

Other functions are not available in the tab sequence mode.

See also

Setting the tab sequence order (Page 3986)

Defining the operator authorization and operator control enable for an object (Page 3985)

Overview of objects (Page 3935)

Example: Configuring a rectangle (Page 3987)

Defining the operator authorization and operator control enable for an object

Introduction

If you configure an object for operator input with the <Tab> key, the object must have both an operator authorization, and an operator control enable.

Requirement

You have opened a screen which contains at least one object.

Procedure

1. Select the object.
2. Select "Properties > Properties > Security" in the Inspector window.
3. Select the operator authorization under "Authorization."
4. Activate the authorization to operate.

Result

The operator can use the <Tab> key in Runtime to select the object.

See also

Overview of keyboard access (Page 3984)

Example: Configuring a rectangle (Page 3987)

Setting the tab sequence order

Introduction

All operable objects can be reached in runtime with the <Tab> key. You use the "Tab sequence" command to define the order in which the operator can activate objects in runtime.

Note

You cannot reach objects with the "Output" or "Two states" mode in runtime with the <Tab> key.

You can operate the screen in runtime:

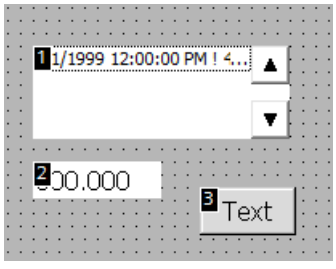
- Using the <Tab> key
- Using the mouse
- Using a configured hotkey

Requirement

- The active screen contains operable objects.
- No object is selected.
- The objects have been enabled for use in runtime, and have operator authorization.

Procedure

1. Select "Edit tab sequence" in the "Edit" menu.
   Tab sequence mode is activated. The tab sequence number is displayed for all objects that can be used. The tab sequence number is also displayed for hidden objects.
2. Use edit the tab sequence mode, click the accessible objects in the order in which you want them to be activated using <Tab> in runtime.
   The following figure shows how the tab sequence is defined in the screen. In runtime, the <Tab> key first activates the alarm view (number 1), then the I/O field (number 2), and then the button (number 3):



3. To exclude a screen object from the tab sequence, press the key combination <Shift+Ctrl> and click on the desired object.
   The tab sequence number is no longer displayed in the screen object. The screen object is now excluded from the tab sequence. The remaining tab sequence numbers are automatically decreased by 1.
4. To reenter an excluded screen object in the tab sequence, repeat step 3.
   The screen object entered as the first object in the tab sequence.

Result

The operator selects the objects in the specified order in Runtime with the <Tab> key.

Overview of keyboard access (Page 3984)

Example: Configuring a rectangle (Page 3987)

12.1.2.32 Examples

Example: Configuring a rectangle

Task

In this example you configure a rectangle:

- Color = red
- Black frame 2 pixels wide
- Position = (20, 20)
- Size = (100,100)

Changing the color of the rectangle

To change the color of the rectangle:

1. Select the rectangle.
2. Define the background color in "Properties > Properties > Appearance > Background > Color" in the Inspector window.
3. Select "Solid" as the fill pattern.
4. Define the color for the border in "Properties > Properties > Appearance > Border > Color" in the Inspector window.
5. Enter the value "2" for "width".
6. Select "Solid" as the "Style".

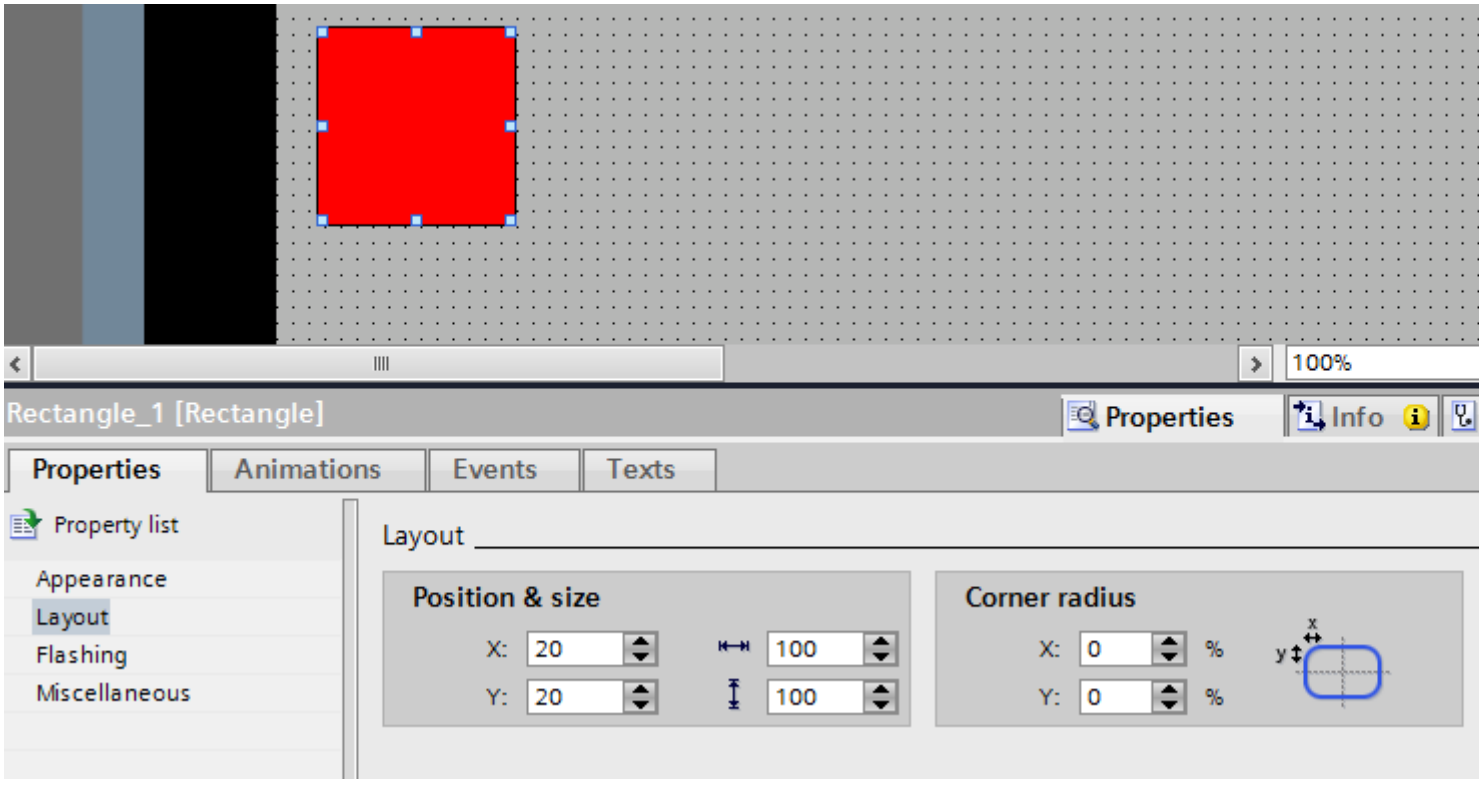
Interim result

The rectangle is red and has a black frame with a width of two pixels.

Repositioning and resizing the rectangle

To change the position and size of the rectangle:

1. Select the rectangle.
2. In the Inspector window, select "Properties > Properties > Layout".



3. Set "20" for the both the X and Y coordinates under "Position & Size".
4. Set "100" for the height and for the width.

Result

The rectangle is positioned at the coordinates (20, 20), and has a width and height of 100 pixels.

See also

Example: Inserting and configuring a rectangle (Page 3989)

Example: Inserting a rectangle (Page 3989)

Overview of objects (Page 3935)

Example: Inserting a rectangle

Task

In this example, you insert and rename a rectangle. Do not use the special characters ?, ", /, \, *, <, > for the name.

Requirement

- A screen is open.
- The Inspector window is open.
- The "Tools" task card is open.

Procedure

1. Click the "Basic objects" palette in the "Tools" task card.
2. Drag the "Rectangle" object into the screen.
3. In the Inspector window, select "Properties > Properties > Miscellaneous".
4. Type in the new name "MyRectangle".

Result

The rectangle is now inserted and named "MyRectangle". The rectangle has the default properties of the "rectangle" object.

See also

Example: Configuring a rectangle (Page 3987)

Example: Inserting and configuring a rectangle

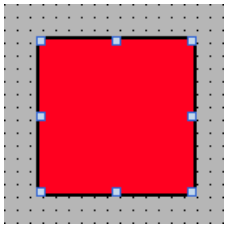
Task

In this example, you insert a rectangle in a screen. You can configure the following properties:

- Name = "MyRectangle"
- Position = (20, 20)
- Size = (100,100)
- Color = red
- Black frame 2 pixels wide

Principle

The rectangle is a closed object which can be filled with a color or pattern. The height and width of a rectangle can be adjusted to allow its horizontal and vertical alignment.



Overview

Carry out the following steps in order to create a rectangle:

- Inserting a rectangle
- Configuring a rectangle

See also

Example: Configuring a rectangle (Page 3987)

12.1.3 Working with text lists and graphics lists

12.1.3.1 Working with text lists

Basics on text lists

Introduction

Texts are assigned to the values of a tag in a text list. Assign the text list to a symbolic I/O field for example in the configuration. This supplies the text to be displayed to the object. The text lists are created in the ""Text List" editor. You configure the interface between the text list and a tag at the object that uses the text list.

The selection of objects that can have a text list assigned depends on the Runtime.

Application

The text list is used, for example, to display a drop-down list in a symbolic I/O field.

If the symbolic I/O field is a display field, the associated texts will differ according to the value of the configured tags. If the symbolic I/O field is an input field, the configured tag assumes the associated value when the operator selects the corresponding text in Runtime.

Note

Display of tag values without text

The display of tag values to which no text has been assigned depends on the Runtime:

- The display and operating element remains empty.
- Three asterisks *** are displayed.

Ranges for the text list

Three types are available for the text lists:

- Value/Range
  This setting assigns text entries from the text list to integer values or value ranges of a tag. You can select the number of text entries as needed. The maximum number of entries depends on the HMI device you are using.
  You specify a default value which is shown if the value of the tag lies outside the defined range.
- Bit (0, 1)
  This setting assigns text entries from the text list to two states of a binary tag. You can create a text entry for each state of the binary tag.
- Bit number (0 - 31)
  This setting assigns a text entry from the text list to each bit of a tag. The maximum number of text entries is 32. This form of text list can be used, for example, in a sequence control when processing a sequence in which only one bit of the used tag may be set. You influence the behavior of the bit number (0 - 31) with the set bit of the least significance and a default value.

Multilingual texts

You can configure multiple languages for the texts in a text list. The texts will then be displayed in the set language in Runtime. To this purpose you set the languages in the Project window under "Language support > Project languages."

Configuration steps

The following steps are necessary to display texts in a symbolic I/O field for example:

1. Creating the text list
2. Assignment of the texts to values or value ranges of a text list
3. Assignment of a text list in the display object, for example, to the symbolic I/O field

See also

Creating a text list (Page 3992)

Assigning texts and values to an area text list (Page 3993)

Assigning texts and values to a bit text list (Page 3995)

Assigning texts and values to a bit number text list (Page 3996)

Configuring objects with a text list (Page 3999)

Screen basics (Page 3889)

Creating a text list

Introduction

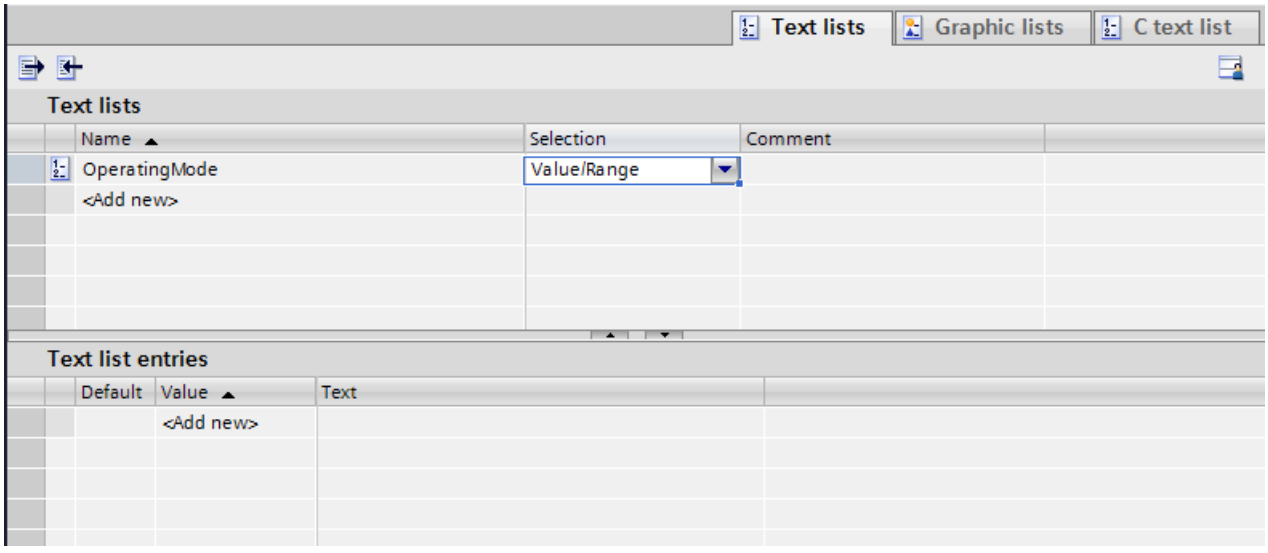
The text list allows you to assign specific texts to values and to output these in Runtime, for example in a symbolic I/O field. The type of symbolic I/O field can be specified, for example as a pure input field.

The following types of list are available:

- Value/Range
- Bit
- Bit Number

Procedure

1. Double-click "Text and graphics lists" in the project window.
2. Open the "Text lists" tab.



3. Click "Add" in the "Text lists" table.
   The Inspector window of the text list is open.

4. Assign a name to the text list that indicates its function.
5. Select the text list type under "Selection":
   - Value/Range: Text from the text list is displayed when the tag has a value that lies within the specified range.
   - Bit (0,1): A text from the text list is displayed when the tag has the value 0. A different text from the text list is displayed when the tag has the value 1.
   - Bit number (0-31): Text from the text list is displayed when the tag has the value of the assigned bit number.
6. Enter a comment for the text list.

Note

You should not use semicolons in the texts in a text list in WinCC Runtime Professional. The semicolon is a control character and is automatically deleted from a text.

Result

A text list is created.

See also

Basics on text lists (Page 3990)

Assigning texts and values to an area text list

Introduction

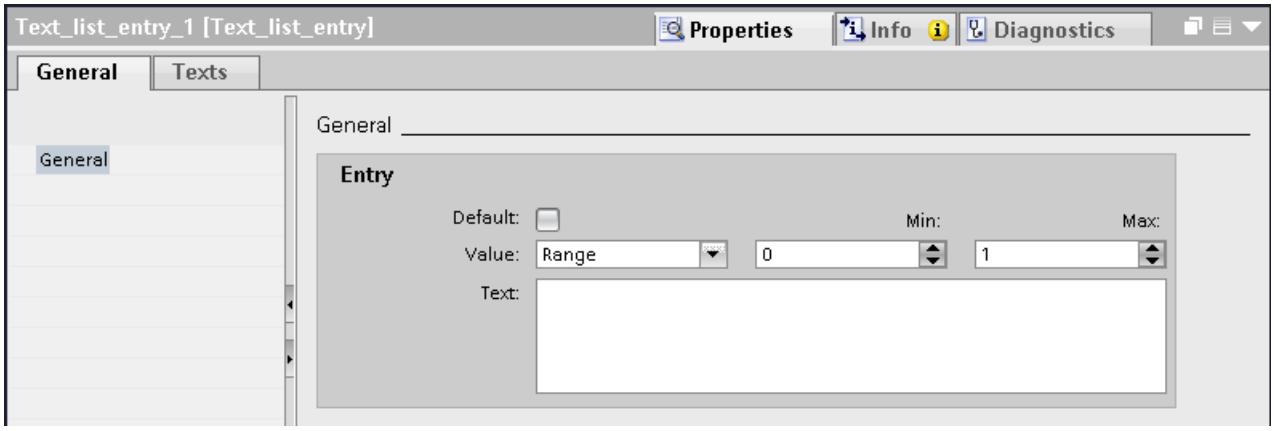
For each area text list you specify which texts are displayed at which value range.

Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- An area text list has been created and selected.

Procedure

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Range" in "Properties > Properties > General > Value" in the Inspector window.

   – Enter the value "1" for "Min" for example.
   – Enter the value "20" for "Max" for example.
   – For "Text", enter the text that is displayed in Runtime if the tag is within the specified value range.

   Note

   Use a maximum of 320 characters for the text.

3. Click "Add" in the "Text list entries" table. A second list entry is created.
4. Select the setting "Range" in "Properties > Properties > General > Value" in the Inspector window.
   – Enter the value "21" for "Min" for example.
   – Enter the value "40" for "Max" for example.
   – For "Text", enter the text that is displayed in Runtime when the tag is within the specified value range.
5. If required, activate the "default entry".
   The entered text is always displayed when the tag has an undefined value. Only one default entry is possible per list.

Result

An area text list is created. Texts have been assigned to the possible value ranges.

Basics on text lists (Page 3990)

Notes for bit number text list (Page 3998)

Assigning texts and values to a bit text list

Introduction

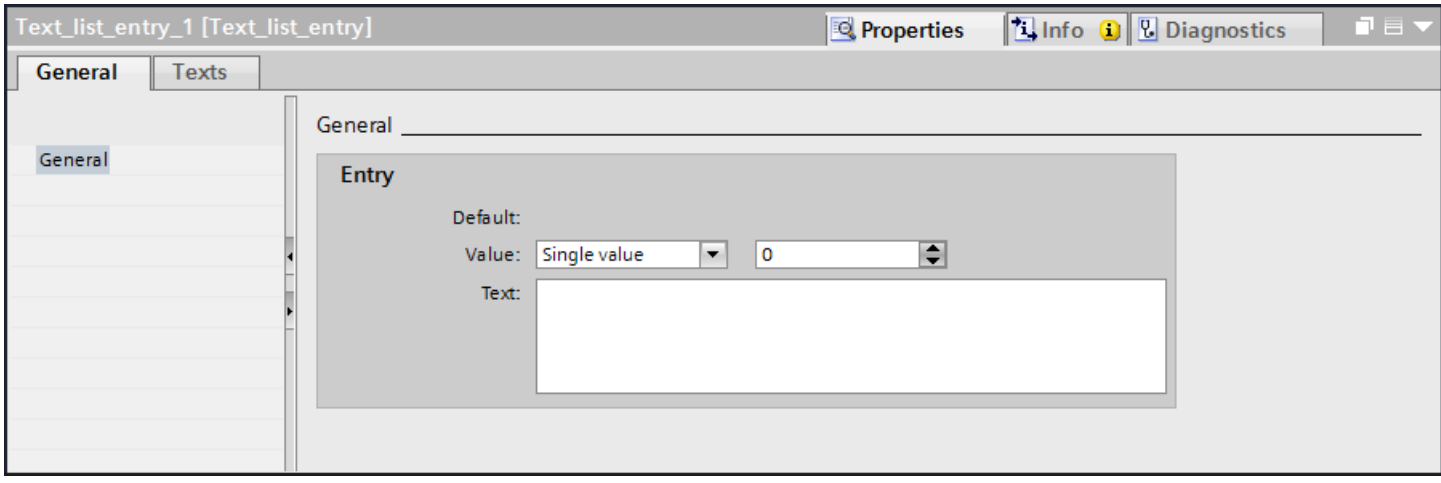
For each text list, you specify which text is displayed at which bit value.

Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- A bit text list has been created and selected.

Procedure

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
   - Enter "0" for "Value."
   - Enter the text which is displayed in Runtime under "Text" if the bit tag is set to "0".
3. Click "Add" in the "Text list entries" table. A second list entry is created.
4. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
   - Enter "1" under "Value."
   - Enter the text which is to be displayed in Runtime under "Text" if the bit tag is set to "1".

Note

Use a maximum of 320 characters for the text.

Use a maximum of 255 characters and no semicolons for the text in WinCC Runtime Professional.

Result

A bit text list is created. Texts that appear in Runtime are assigned to the possible values "0" and "1".

See also

Basics on text lists (Page 3990)

Assigning texts and values to a bit number text list

Introduction

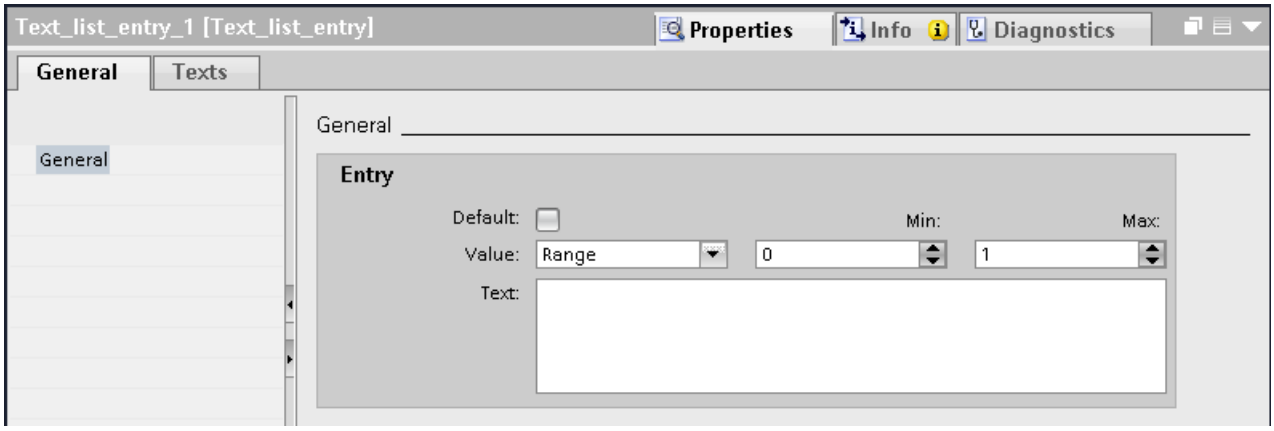
For each bit number text list you specify which texts are displayed at which bit number.

Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- A bit number text list has been created and selected.

Procedure

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
   - Enter "10", for example, for "Value".
   - Under "Text", enter the text that is displayed in Runtime when the tag has the value "10".
3. If required, activate the "default entry".
   The entered text is always displayed when the tag has an undefined value. Only one default entry is possible per list.
4. Create further list entries for additional bit numbers of the same text list.

Note

Use a maximum of 320 characters for the text.

Use a maximum of 255 characters and no semicolons for the text in WinCC Runtime Professional.

Note

Bit selection for text lists

The output of the text list depends on the "Bit selection for text and graphics lists" option in the Runtime settings. Use this option to specify that the bit selection for text lists should be used on your HMI device. When you enable the option, the text displayed is the one configured for the set bit with the least significance. When you disable this option, only the text that has been configured for the set bit is displayed .

Result

A bit number text list is created. Texts that appear in Runtime are assigned to the specified bit numbers.

See also

Basics on text lists (Page 3990)

Notes for bit number text list

Introduction

The bit number (0 - 31) range assigns a text entry from the list to each bit of a tag. If the option "Bit selection for text and graphic lists" is disabled in the Runtime settings and no default value is set, the following standard behavior applies:

- If only 1 bit is configured of all set bits, the stored text is displayed for the configured bit. In the following example, only the set bit with significance "4" is configured. Text 2 is displayed.

Significance	7	6	5	4	3	2	1	0
Set bits	0	0	1	1	0	1	0	0
Configured	-	Text 3	-	Text 2	Text 1	-	-	-

- If no bit is set or when several configured bits are set, no text is displayed.

Default value

Define a default value to prevent an empty display. A configured default value is displayed in the following cases:

- The option "Bit selection for text and graphic lists" is disabled. No bit or several configured bits are set in the tag.
- The option "Bit selection for text and graphic lists" is enabled and no bit is set or a text is not configured for the set bit with the least significance.

Displaying the default value

1. Enable the text for the default entry in the "Default" column of the "Text list entries" table. The value "Default entry" appears in the "Value" column of the text entry.
2. You can also select the "Default" option under "Properties > General" in the inspector window.

Set bit with the least significance

If no text is configured for the set bit with the least significance and if no

default value is set, nothing is displayed. If a default value is configured, the default value is displayed.

If no text is configured for the set bit with the least significance and if no default value is set, nothing is displayed. If a default value is configured, the default value is displayed.

To only display the text for the set bit with the least significance, enable the "Bit selection for text and graphic lists" option in the "Runtime settings" editor.

This setting is deselected by default to maintain downward compatibility. The setting is valid for all text lists of the HMI device.

Multiline text list entries

Use the <SHIFT>+<RETURN> shortcut to enter a line break in the text entry. Line breaks are represented by the "¶" paragraph mark.

Multiline text list entries are only output in symbolic output fields as well as on buttons with multiple lines. In all other cases, multiline texts are displayed with the paragraph mark.

Configuring objects with a text list

Introduction

The output value and value application for text lists are specified in the display and operating object that displays the texts of the text list in Runtime. The properties of these objects are configured as required.

Requirement

- A text list is created.
- You have created a tag.
- The "Screens" editor is open.
- A screen with a symbolic I/O field is open. The object is edited.

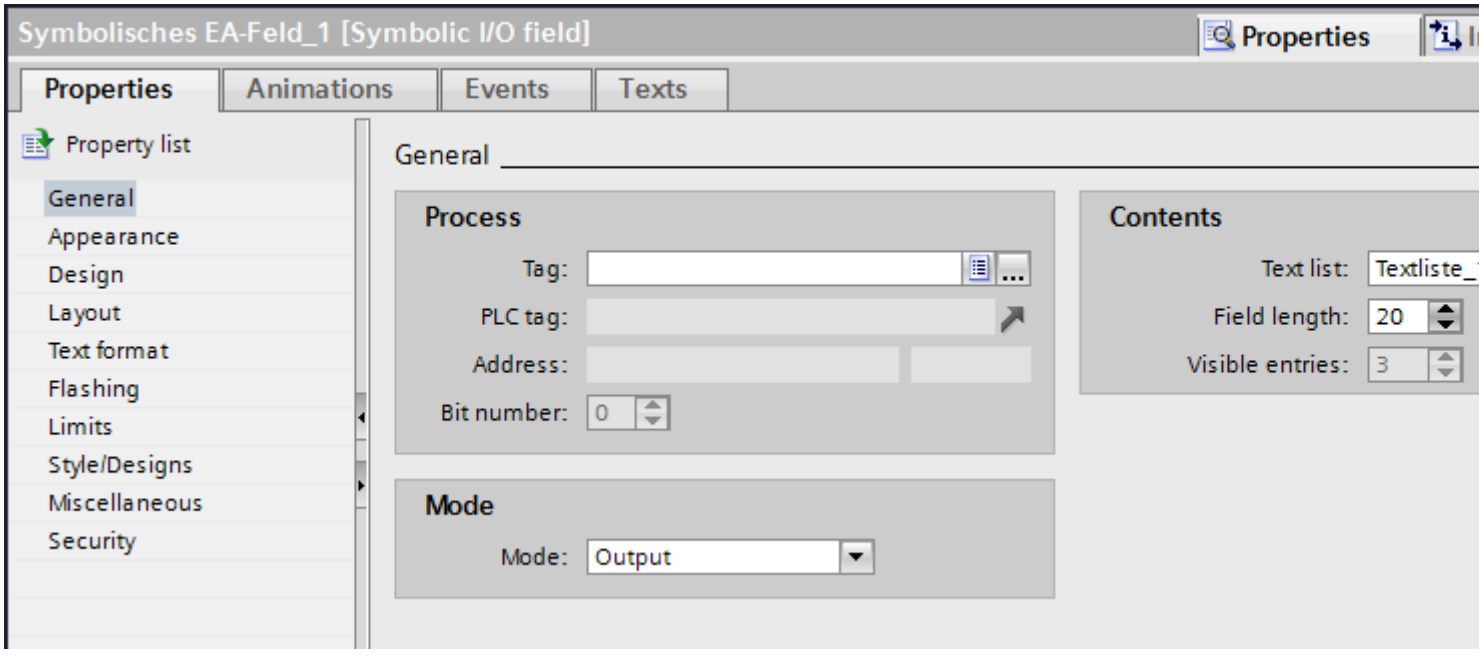
Procedure

1. Select the text list which you want to have displayed in Runtime in "Properties > Properties > General > Text list" in the Inspection window.
2. Select the setting "Output" as the "Mode".

   Note
   Runtime dependency

   Different field types are available for a symbolic I/O field depending on the Runtime.

3. Select the tag the value of which determines the display in the symbolic I/O field as "Tag".



Result

The defined texts of the text list are displayed in the symbolic I/O field in Runtime when the tag has the specified value.

Basics on text lists (Page 3990)

12.1.3.2 Working with graphics lists

Basic principles of graphics lists

Introduction

The possible values of a tag are assigned to specific graphics in a graphics list. During configuration, you can create a graphics list for a button or a graphic I/O field. This supplies the graphics to be displayed to the object.

The graphics lists are created with the "Text and graphics list" editor. You configure the interface between the graphics list and a tag at the object that uses the graphics list. The availability of the graphics list is determined by the HMI device used.

Application

You can configure the graphics list for the following situations:

- Drop-down list with a graphic I/O field
- State-specific graphic for a button

The graphics in a graphics list can be configured as multilingual. The graphics will then be displayed in the set language in Runtime.

Graphic sources

Graphics can be added to the graphics list from the following sources:

- By selecting from a graphic browser
- By selecting an existing file
  You can use the following file types:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tiff, *.png, *.jpeg and *.jpg.
- By creating a new file

Function

If the graphic I/O field is a display field, the associated graphics will differ according to the value of the configured tags. If the graphic I/O field is an input field, the configured tag assumes the associated value when the operator selects a graphic in Runtime.

Ranges for the graphics list

Three types are available for the graphics lists:

- Value/Range
  This setting assigns graphic entries from the graphics list to integer values or value ranges of a tag. You can select the number of graphic entries as needed. The maximum number of entries depends on the HMI device you are using.
  You specify a default value which is shown if the value of the tag lies outside the defined range.
- Bit (0, 1)
  This setting assigns graphic entries from the graphics list to two states of a binary tag. You can create a graphic entry for each state of the binary tag.
- Bit number (0 - 31)
  This setting assigns a graphic entry from the graphics list to each bit of a tag. The maximum number of graphic entries is 32. This form of graphics list can be used, for example, in a sequence control when processing a sequence in which only one bit of the used tag may be set. You influence the behavior of the bit number (0 - 31) with the set bit of the least significance and a default value.

Configuration steps

The following tasks are required to display graphics, for example, in a graphic I/O field:

1. Creating the graphics list
2. Assignment of the graphics to values or value ranges of a graphics list
3. Assignment of a graphics list in the display object, for example, the graphic I/O field

Configuring objects with a graphics list (Page 4010)

Screen basics (Page 3889)

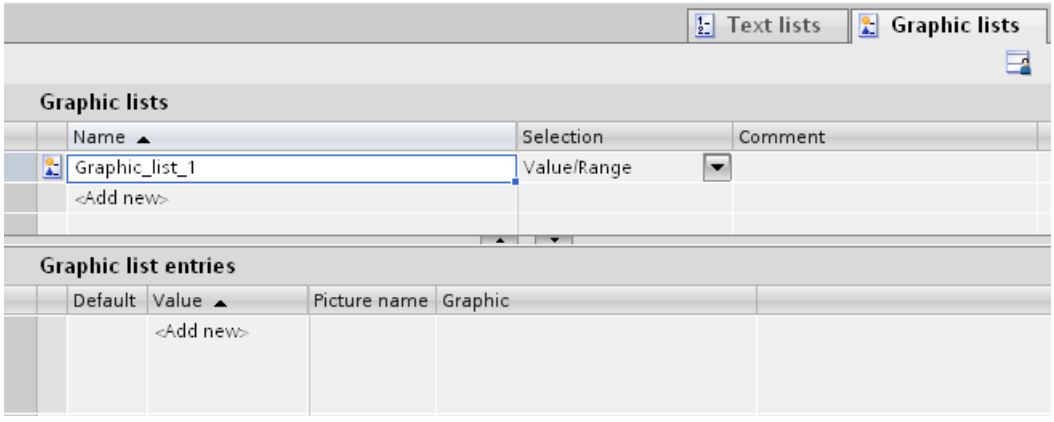
Creating a graphics list

Introduction

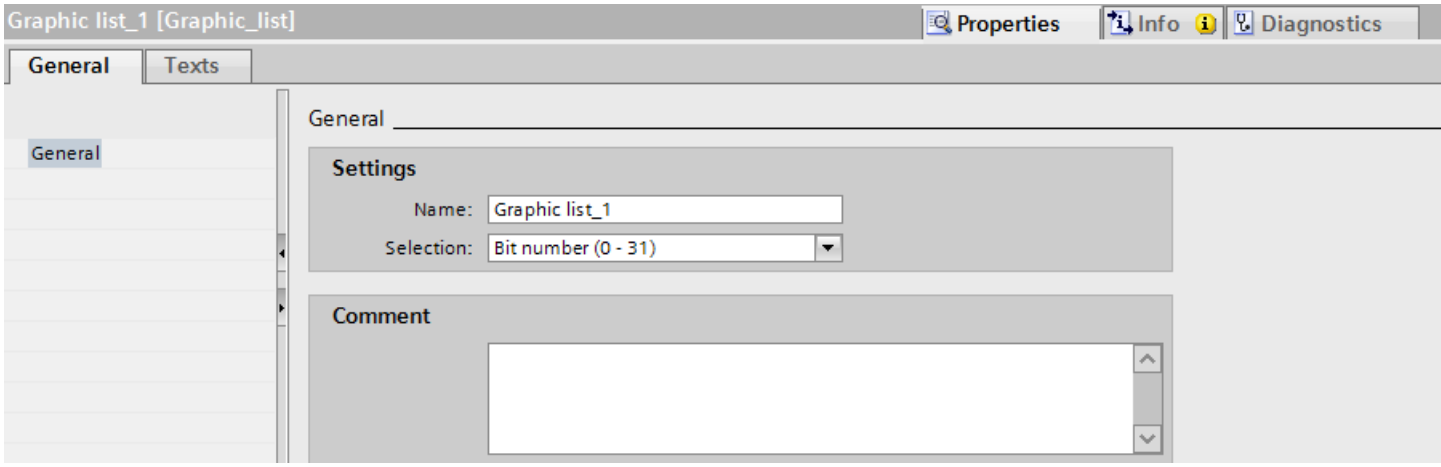
The graphics list allows you to assign specific graphics to variable values and to output these in a graphic IO field in Runtime. You can specify the type of graphic I/O field, for example as a pure output field.

Procedure

1. Double-click "Text and graphics lists" in the project window.
2. Open the "Graphics lists" tab.



3. Click "Add" in the "Graphics lists" table. The Inspector window of the graphics list will open up.



4. Assign a name to the graphics list that indicates its function.
5. Select the graphics list type "Bit number (0 - 31)" for example under "Select".
6. Enter a comment for the graphics list.

Result

A graphics list of the type "Range (0 - 31)" is created.

See also

Basic principles of graphics lists (Page 4001)

Assigning a graphic and values to an area graphics list

Introduction

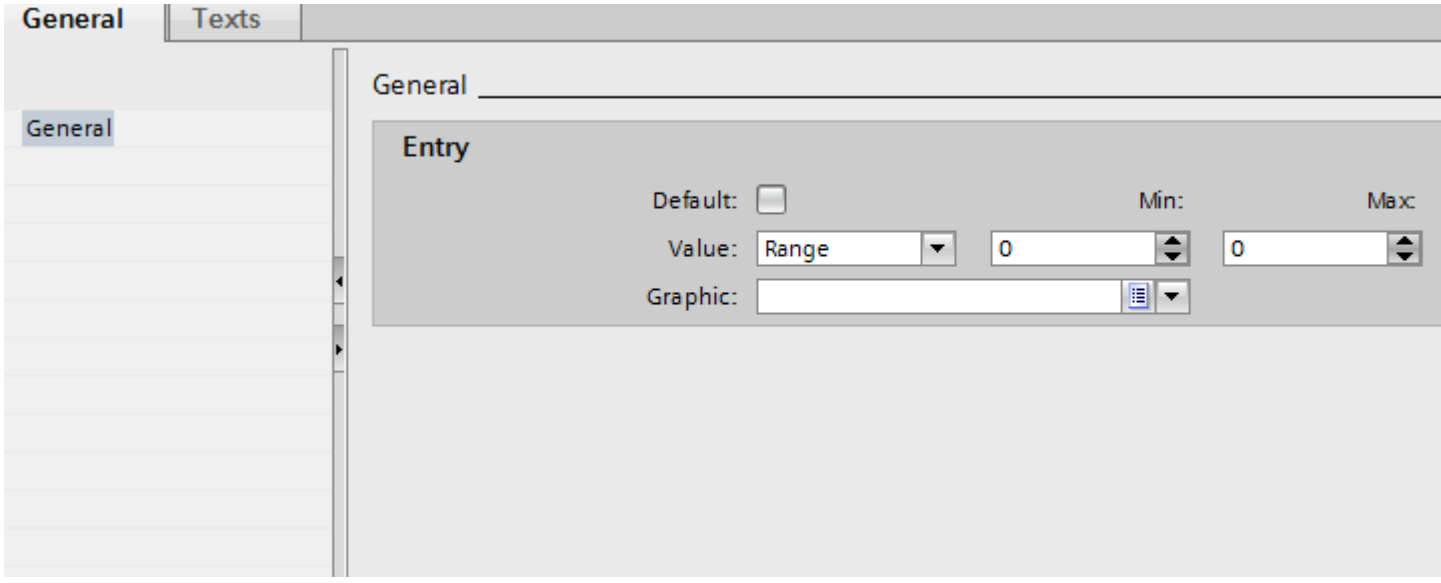
For each area graphics list you specify which graphics are displayed at which value range.

Requirement

- The "Text and graphics list" editor is open.
- The "Graphics list" tab is open.
- An area graphics list has been created and selected.

Procedure

1. Click "Add" in the "Graphics list entries" table.
   The Inspector window for this list entry opens.



2. Select the settings "Range" in "Properties > Properties > General > Value" in the Inspector window:
   - Enter the value "1" for "Min" for example.
   - Enter the value "20" for "Max" for example.
   - Select a graphic that is displayed in Runtime when the tag is within the specified value range.

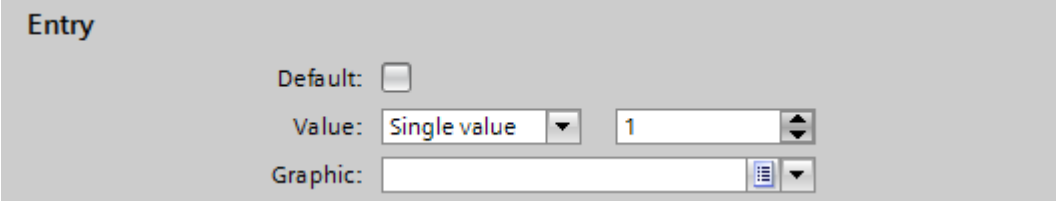
Note

As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:

1. Select a graphic in the library or in your file system.
2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.

3. Click "Add" in the "Graphics list entries" table. A further list entry is created.

4. Select the settings "Single value" in "Properties > Properties > General > Value" in the Inspector window:
   - Enter the value "21" for example.
   - Select a graphic which is displayed in Runtime if the bit "21" is set in the tag.



5. If required, activate the "default entry".
   The graphic is always displayed when the tag has an undefined value. Only one default entry is possible per list.

Result

An area graphics list is created. Graphics that appear in Runtime are assigned to the possible values.

See also

Basic principles of graphics lists (Page 4001)

Assigning graphics and values to a bit graphics list

Introduction

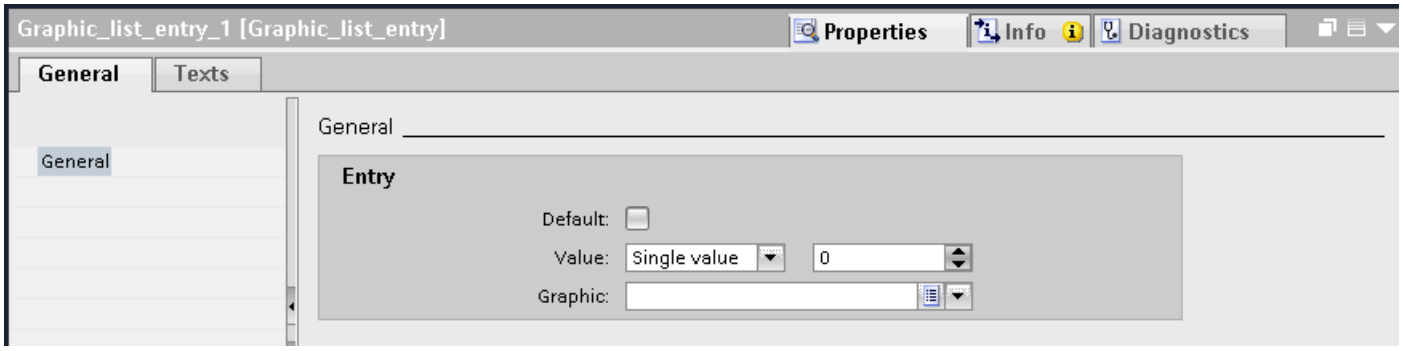
For each graphics list you specify which graphic is displayed at which bit value.

Requirement

- The "Text and graphics list" editor is open.
- The "Graphics list" tab is opened.
- A bit graphics list has been created and selected.

Procedure

1. Click "Add" in the "Graphics list entries" table.
   The Inspector window for this list entry opens.



2. Select the settings "Single value" in the inspector window "Properties > Properties > General > Value":
   - Enter "0" as the value.
   - Select a graphic which is displayed in Runtime if the bit "0" is set in the tag.

   Note

   As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:
   1. Select a graphic in the library or in your file system.
   2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.

3. Click "Add" in the "Graphics list entries" table. A new list entry is created.
4. Select "Properties > Properties > General > Value > Single value": in the Inspector window.
   - Enter "1" as the value.
   - Select a graphic which is displayed in Runtime if the bit "1" is set in the tag.

Result

A bit graphics list is created. Graphics that appear in Runtime are assigned to the values "0" and "1".

See also

Basic principles of graphics lists (Page 4001)

Assigning graphics and values to a bit number graphics list

Introduction

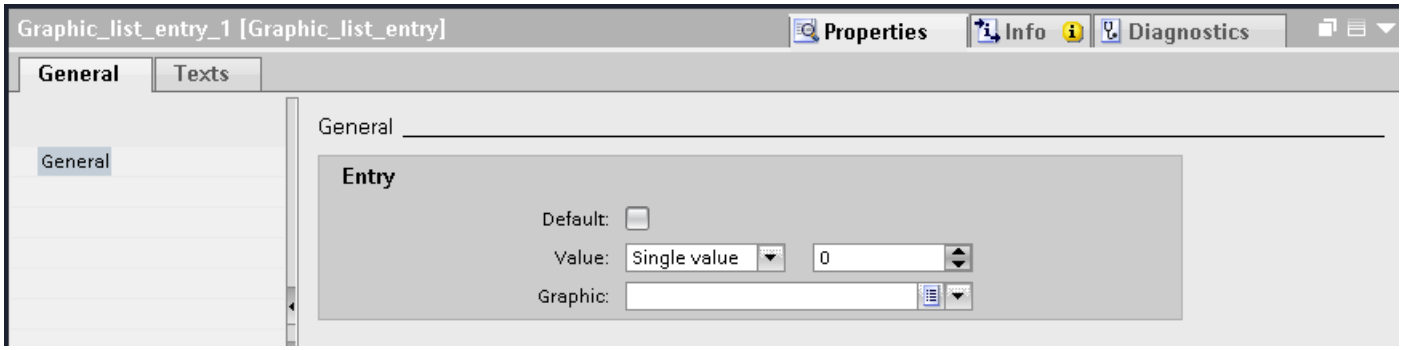
For each bit number graphics list you specify which graphics are displayed at which bit number.

Requirement

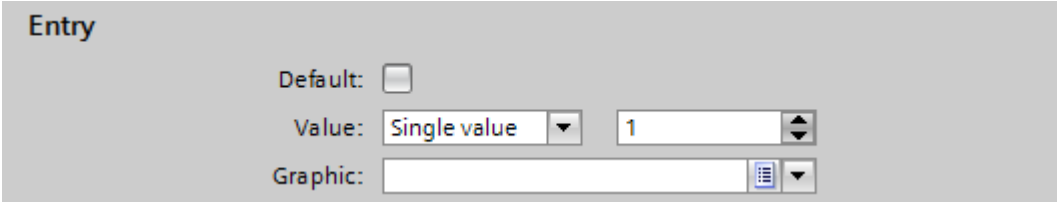
- The "Text and graphics list" editor is open.
- The "Graphics list" tab is open.
- A bit number graphics list has been created and selected.

Procedure

1. Click "Add" in the "Graphics list entries" table.
   The Inspector window for this list entry opens.



2. Select the settings "Single value" in the Inspector window "Properties > Properties > General > Value":
   - Enter the value "1" for example.
   - Select a graphic which is displayed in Runtime if the bit "0" is set in the tag.



Note

As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:

1. Select a graphic in the library or in your file system.
2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.

3. If required, activate the "default entry".
   The graphic is always displayed when the tag has an undefined value. Only one default entry is possible per list.
4. Create further list entries for additional bit numbers of the same graphics list.

Note

Bit selection for graphic lists

The output of the graphic list depends on the "Bit selection for text and graphics lists" option in the Runtime settings. Use this option to specify that the bit selection for graphic lists should be used on your HMI device. When you enable the option, the graphic displayed is the one configured for the set bit with the least significance. When you disable this option, the graphic that has been configured only for the set bit is displayed.

Result

A bit number graphics list is created. Graphics that appear in Runtime are assigned to the specified bit numbers.

See also

Basic principles of graphics lists (Page 4001)

Notes for bit number graphics list

Introduction

The bit number (0 - 31) range assigns a graphic entry from the list to each bit of a tag. If the option "Bit selection for text and graphic lists" is disabled in the Runtime settings and no default value is set, the following standard behavior applies:

- If only 1 bit is configured of all set bits, the stored graphic is displayed for the configured bit. In the following example, only the set bit with significance "4" is configured. Graphic 2 is displayed.

Significance	7	6	5	4	3	2	1	0
Set bits	0	0	1	1	0	1	0	0
Configured	-	Graphic 3	-	Graphic 2	Graphic 1	-	-	-

- If no bit is set or when several bits are set that are also configured, only the cactus graphic is displayed.

Default value

Define a default value to prevent an empty display. A configured default value is displayed in the following cases:

- The option "Bit selection for text and graphic lists" is disabled. No bit or several configured bits are set in the tag.
- The option "Bit selection for text and graphic lists" is enabled and no bit is set or a graphic is not configured for the set bit with the least significance.

Displaying the default value

1. Enable the graphic for the default entry in the "Default" column of the "Graphics list entries" table.
   The value "Default entry" appears in the "Value" column of the entry.
2. You can also select the "Default" option under "Properties > General" in the inspector window.

Set bit with the least significance

When "Bit selection for text and graphic lists" is enabled, the graphic displayed is the one configured for the set bit with the least significance.

If no graphic is configured for the set bit with the least significance and if no default value is set, the cactus graphic is displayed. If a default value is configured, the graphic configured for the default value is displayed.

To only display the graphic for the set bit with the least significance, enable the "Bit selection for text and graphic lists" option in the "Runtime settings" editor.

This setting is deselected by default to maintain downward compatibility. The setting is valid for all graphic lists of the HMI device.

Configuring objects with a graphics list

Introduction

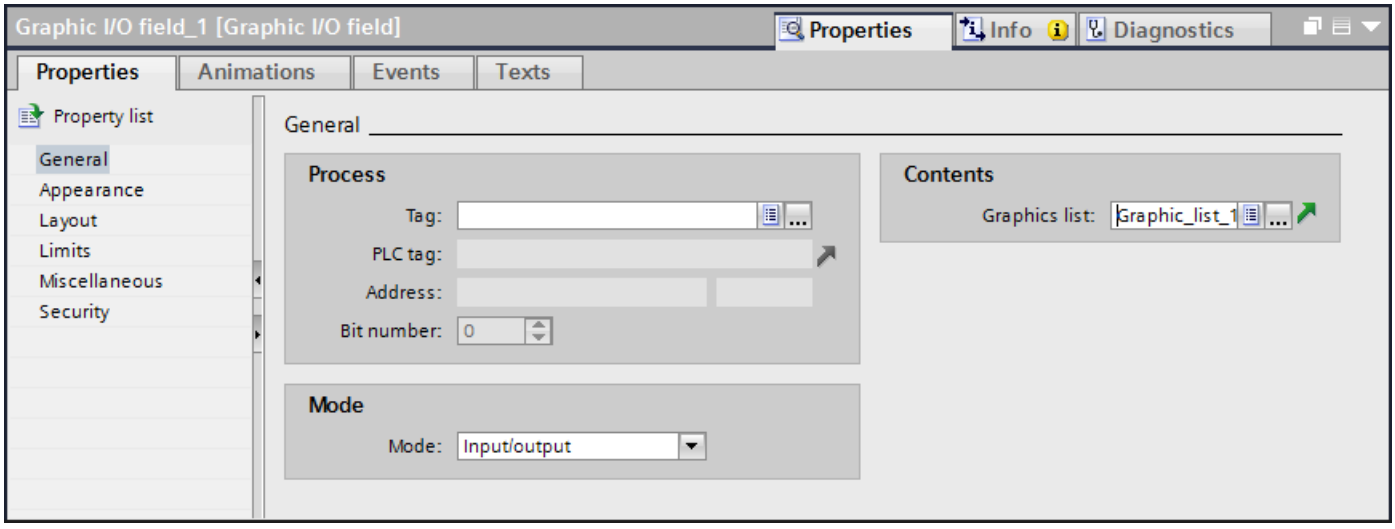
The output value and value application for graphics list are specified in the display and operating object that displays the graphics of the graphics list in Runtime. The properties of these objects are configured as required.

Requirement

- A graphics list is created. The values have been defined. Graphics have been assigned to the values.
- You have created a tag.
- The "Screens" editor is open.
- A screen with a graphics I/O field is open. The object is edited.

Procedure

1. Select the graphics list the graphics of which you want to have displayed in Runtime in "Properties > Properties > General > Graphics list" in the Inspector window.
2. Select the "Input/output" setting for "Mode".



Note

Runtime dependency

Different field types are available for a graphic I/O field depending on the Runtime.

3. As "Tag", select the tag whose values are defined by the display in the graphic I/O field.

Result

The defined graphics of the graphics list are displayed in the graphic I/O field in Runtime when the tag has the specified value.

12.1.4 Dynamizing screens

12.1.4.1 Basics on dynamizing screens

Dynamizing objects

In WinCC you dynamize objects to map your system and show processes on HMI devices.

You implement dynamizations by

- Animations
- Tags
- System functions

One example is the mapping of a tank, the liquid level of which rises or falls in relation to a process value.

The options for dynamization depend on the object involved. When you copy an object, its dynamization functions are included.

Basics on dynamization in the property list (Page 4030)

Dynamization in the inspector window (Page 4013)

Dynamization in the inspector window (Page 4015)

12.1.4.2 Basics on dynamizing screens

Dynamizing objects

In WinCC you dynamize objects to map your system and show processes on HMI devices.

You implement dynamizations by

- Animations
- System functions
- Tags
- Local scripts

One example is the mapping of a tank, the liquid level of which rises or falls in relation to a process value.

The options for dynamization depend on the object involved. When you copy an object, its dynamization functions are included.

See also

Basics on dynamizing screens (Page 4012)

12.1.4.3 Dynamization in the inspector window

Introduction

Basically, you can dynamize all the screen objects which you have configured in a screen. Which dynamization possibilities and which events are available depends on the device and the selected object.

Animations

WinCC helps you to implement dynamization using predefined animations. If you want to animate an object, first configure the desired animation in the object's inspector window. Then adapt the animation to the requirements of your project.

The selection of the supported animations depends on the HMI device and the selected object. You choose between the following types of animation:

- Layout: Appearance, visibility
- Movements: direct, diagonal, horizontal and vertical movement
- Variable binding

You can configure the "Variable binding" type of animation several times for one object.

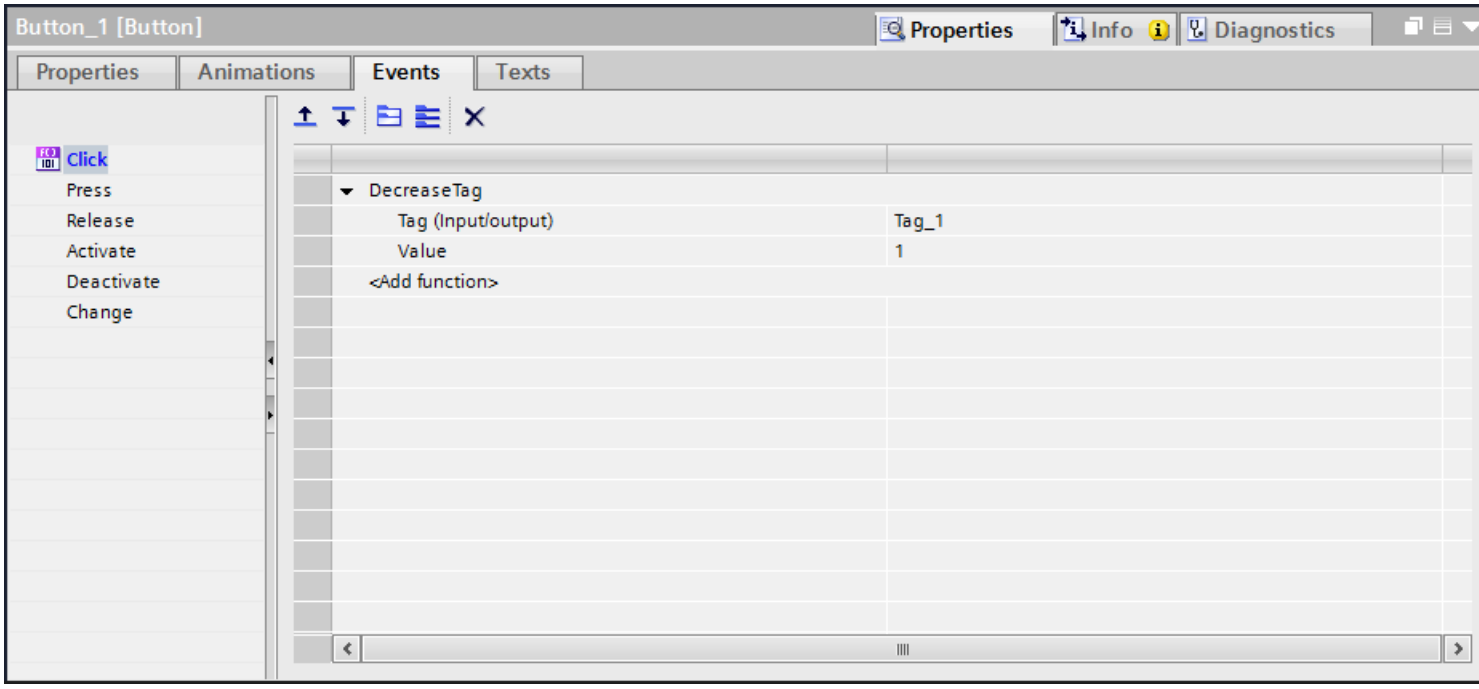
You configure animations in the "Properties > Animations" inspector window.

Events

Operable objects also react to events, such as a mouse click.

You configure a function list with system functions on an event. The system functions are processed as a reaction to the triggered event.

You configure events in the "Properties > Events" inspector window.



You will find further information in "Working with function lists".

See also

Basics on dynamizing screens (Page 4012)

12.1.4.4 Dynamization in the inspector window

Introduction

Basically, you can dynamize all the screen objects which you have configured in a screen. Which dynamization possibilities and which events are available depends on the device and the selected object.

The inspector window offers you the possibilities for dynamization of screen objects in three tabs.

Property list

With the  button you go to the properties list in the "Properties > Properties" inspector window.

In the property list, you set any dynamization for the individual object properties using tags or local C and VB scripts. You can, for example, dynamically change the background color of an object.

In the "Dynamic Value" column you can dynamize the object property of a tag, a C-script or a VB-script.

Whether an object property can be dynamized is indicated in the Property list by means of the background color:

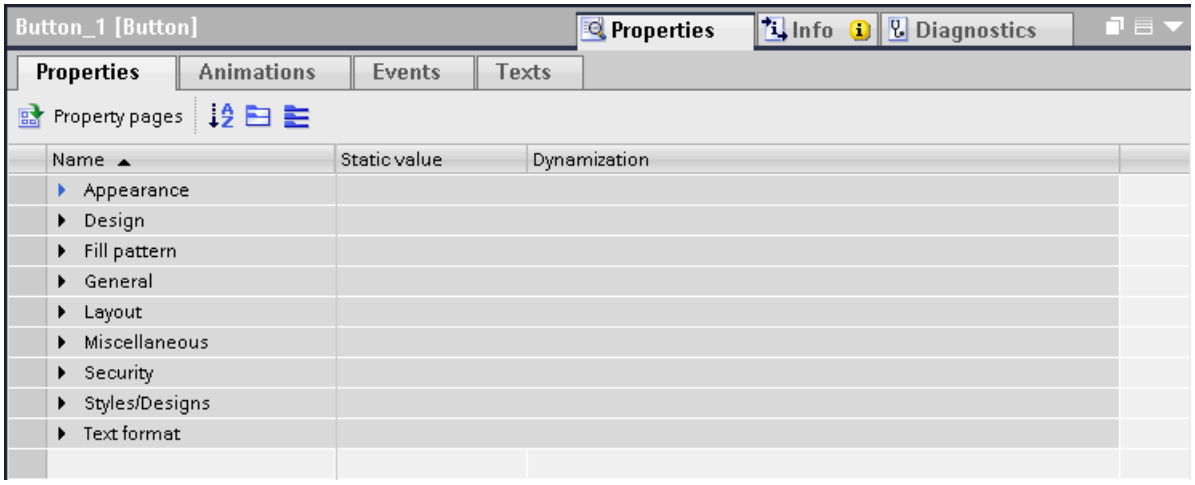
- Light gray: Can be dynamized
- Dark gray: Cannot be dynamized

Any animations you have already configured will also appear in the object property list, where you can edit the animations.

The following table shows you how to sort the property list:

	Sort by alphabet
	Sort by category

With the  button you return to the property pages in the inspector window.



Animations

You have two different options for animating objects.

You configure animations

- in the inspector window under "Properties > Animations",
- in the "Animations" task card.

WinCC helps you to implement dynamization using predefined animations. If you want to animate an object, first configure the desired animation with the tools of the toolbox or in the object's inspector window. Then customize the animation in the Inspector window to suit the requirements of your project.

The selection of the supported animations depends on the device and the selected object. You choose between the following types of animation:

- Tag binding
- Layout: Appearance, control enable, visibility
- Movements: direct, diagonal, horizontal and vertical movement
- Property animation

Note

HMI device dependency

The "Control enable" animation is not available for every HMI device.

You can configure the "Tag binding" and "Property animation" types of animation several times for one object.

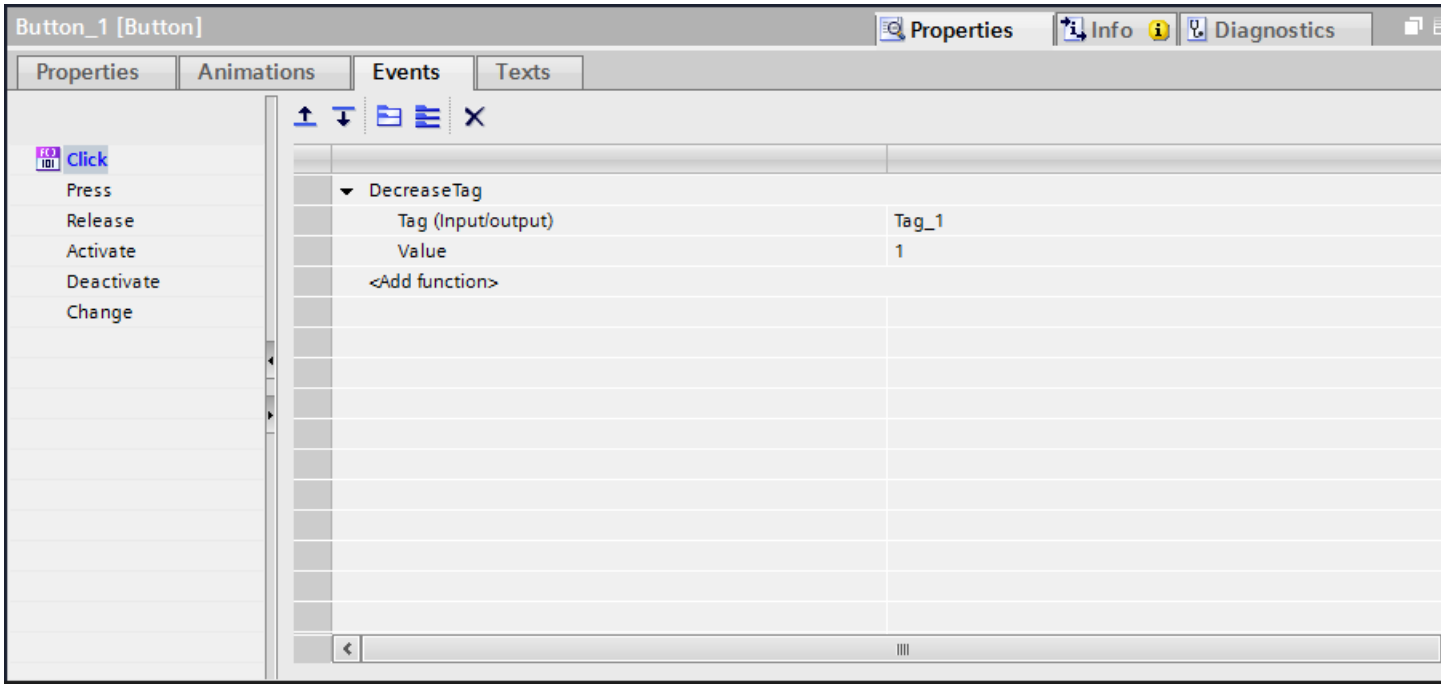
You configure animations in the "Properties > Animations" inspector window.

Events

Operator control enabled objects also react to events, such as a mouse click.

You configure a function list with system functions or local scripts on an event. The system functions or the local script are processed as a reaction to the triggered event.

You configure events in the "Properties > Events" inspector window.



You will find further information in "Working with function lists".

Basics on dynamizing screens (Page 4012)

12.1.4.5 Dynamization with animations

Configuring a new animation

Introduction

Use predefined animations to dynamize screen objects.

Requirement

- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure in the inspector window

1. In the Inspector window, select "Properties > Animations".
2. Select the animation you want to use.
3. Click the  button.

Procedure in the "Animations" task card.

1. Open the object group containing the required animation in the "Animations" task card.
2. Drag the animation onto the object that you want to make dynamic.

Alternatively you select the object in the screen and double click the desired animation in the "Animation" task card.

Result

The animation appears in the Inspector window of the object. You configure the animation in the following steps.

In the animations overview the green arrow indicates which animation is already configured. The configured animation opens in the inspector window when you click the green arrow.

Configuring movements (Page 4021)

Dynamizing the appearance of an object (Page 4019)

Dynamizing the appearance of an object

Introduction

The appearance of a screen object is controlled by changing the value of a tag in runtime. When the tag adopts a certain value, the screen object changes its color or flashing characteristics according to the configuration.

Type

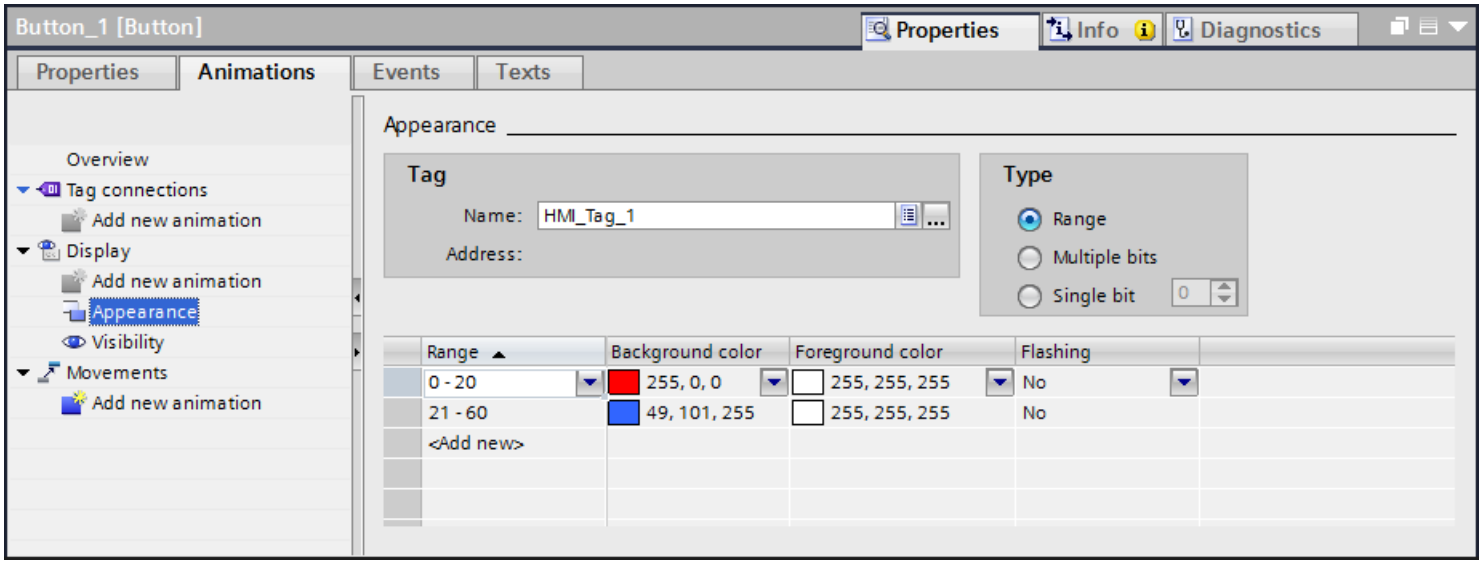
Areas or single values of the tag are observed in Runtime depending on the selection. The appearance of the object changes according to the configuration.

Requirement

- A screen is open.
- A dynamic object is contained and selected in the screen.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure

1. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.
2. Select the animation "Appearance" and click the button.
   The parameters of the animation are displayed.
3. Select a tag in "Tag > Name".
4. Select "Type > Range" for example.
5. Click "Add" in the table.
6. Enter the tag interval "0 - 20" in the "Range" column for example.
7. For "Foreground color" and "Background color", select the color the object is to acquire in Runtime when the tag reaches the interval.
8. Select a flashing mode for the object from the "Flashing" list.
9. Repeat steps 5 to 8 to create another tag interval, e.g. "21 - 60".



Result

In Runtime, the flashing response, and color of the object change dynamically according to the process value returned in the tag.

See also

Configuring a new animation (Page 4018)

Configuring movements

Introduction

You can configure dynamic objects in such a way that they move on a certain track. The movement is controlled via tags. The object moves every time the tag is updated.

You can only program one type of movement for each object.

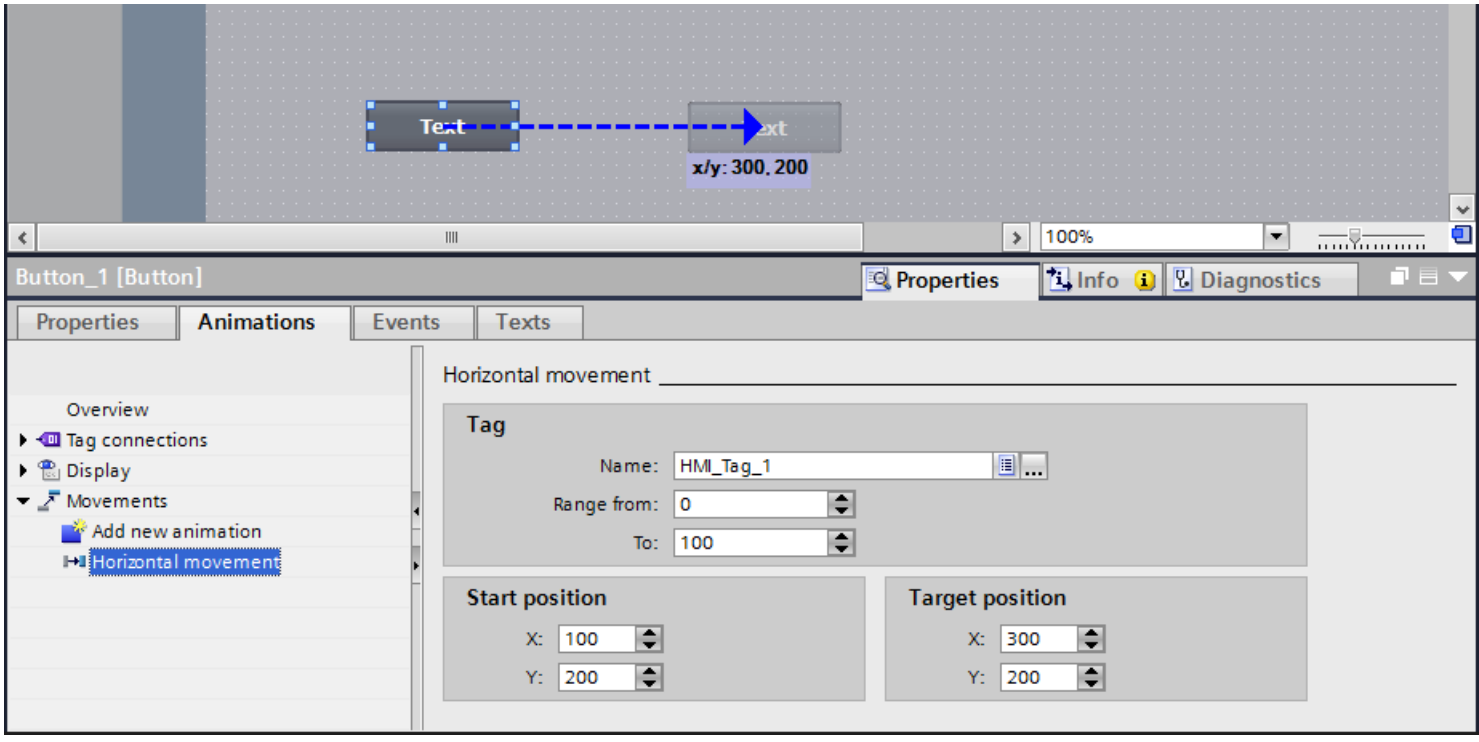
Requirement

- You have created a tag.
- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure

1. Select the screen object you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.
3. Select "Horizontal movement" and click the  button.
   The parameters of the animation are displayed.
   A transparent copy of the object is shown in the work area, which is connected to the source object by means of an arrow.
4. Select a tag for control of movement.

5. Move the object copy to the relevant destination. The system automatically enters the pixel values of the final position in the Inspector window.
6. Customize the range of values for the tag as required.



Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement. The direction of movement corresponds to the configured type of movement "horizontal".

Note

You configure vertical and diagonal movements similar to horizontal movements

See also

Configuring a new animation (Page 4018)

Configuring direct movement

Introduction

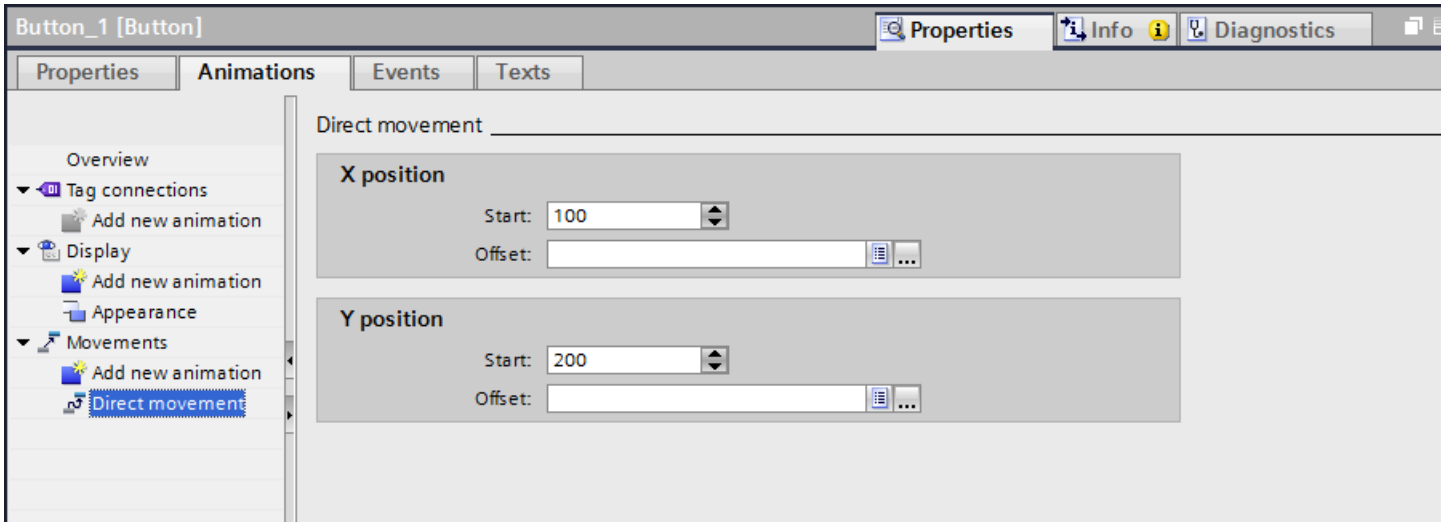
The object is moved respectively in x direction and y direction with "Direct movement". Two tags define the number of pixels by which the object moves from its original static start position.

Requirement

- Two tags are set up.
- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

Configuring "Direct movement"

1. Select the screen object you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
3. Select "Direct movement" and click the button.
   The parameters of the animation are displayed.
4. Select a tag for the X position with which the movement in x direction is controlled.
5. Select a tag for the Y position with which the movement in y direction is controlled.



Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement.

See also

Configuring a new animation (Page 4018)

Dynamization of the control enable state of an operating element

Introduction

You can dynamically change the usability of an operating element. The object either can, or cannot be used in Runtime, depending on the value of a tag.

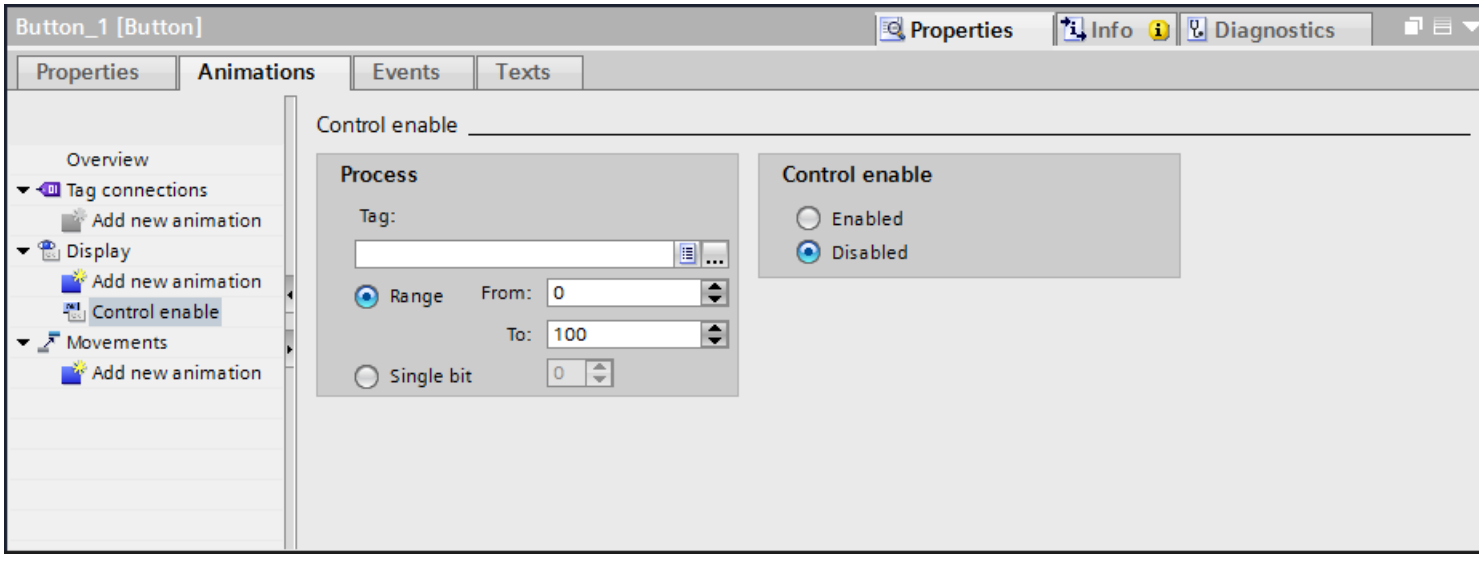
You can use this dynamic control to restrict operator access to an operating element to specific situations, such as for maintenance.

Requirement

- You have created a tag.
- A screen with an operating element is open.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure

1. Select the operating element in the screen that you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.
3. Select "Control enable" and click the button.
   The parameters of the animation are displayed.



4. Select a tag.

5. Activate "Range".
   - For "From:" enter e.g. the value "0"
   - For "To:" enter e.g. the value "100"
6. Activate "Control enable > Activated".

Result

The screen object is operator control enabled in Runtime depending on the tag value:

- The object becomes operator control enabled when the tag value is between 0 and 100.
- The object is not operator control enabled if the tag value is outside the range.

See also

Configuring a new animation (Page 4018)

Dynamizing the visibility of an object

Introduction

Dynamization of the "Visibility" property allows you to output an alarm to your screen, which is triggered when the tag value exceeds a critical range, for example. The alarm is cleared when the tag value returns to the non-critical range.

The "Simple recipe view" and "Simple alarm view" objects are always visible.

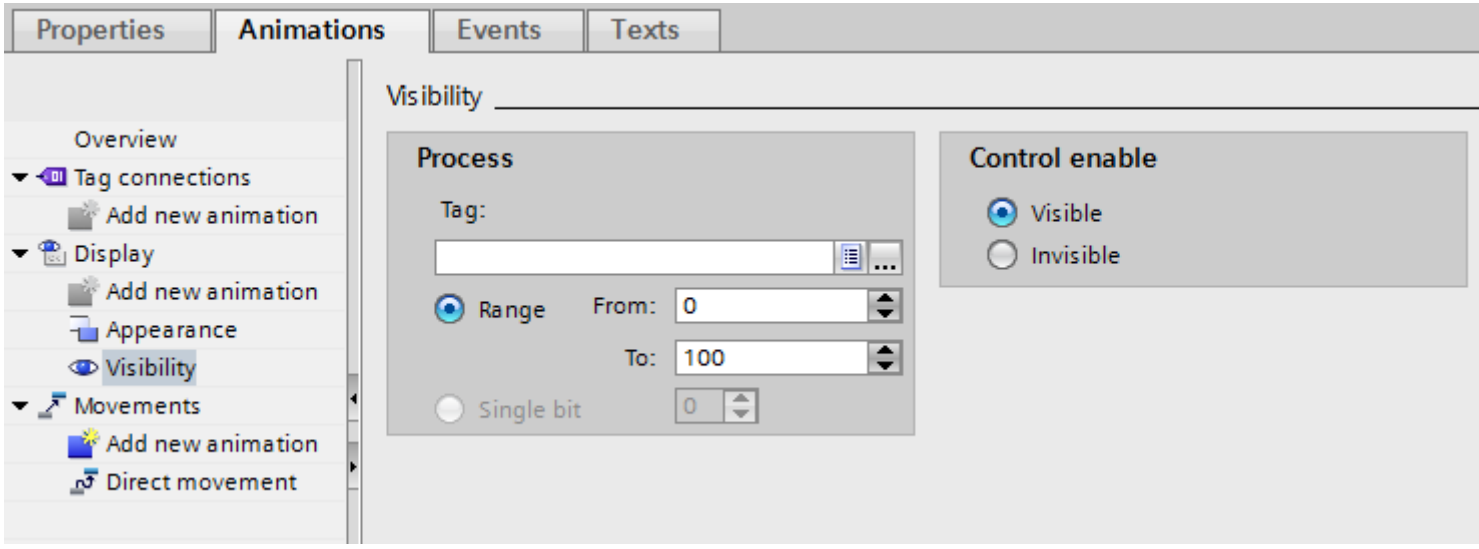
Requirement

- You have created a tag.
- You have opened a screen containing an object that you want to show or hide in Runtime.
- The Inspector window is open.

Procedure

1. Select the screen object you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.
3. Select "Visibility" and click the  button.
   The parameters of the animation are displayed.
4. Select a tag.
5. Activate "Range".

6. Select, for example, "from 20" and "to 40"
7. Activate "Visible".



Result

The screen object is shown or hidden in Runtime depending on the tag value.

- If the tag value matches the configured range between 20 and 40, the screen object is shown.
- If the tag value is outside the configured range, the screen object is hidden.

See also

Configuring a new animation (Page 4018)

Configuring animation with tag connection

Introduction

When you object property an object property with a tag, the object property is changed in Runtime depending on the tag value.

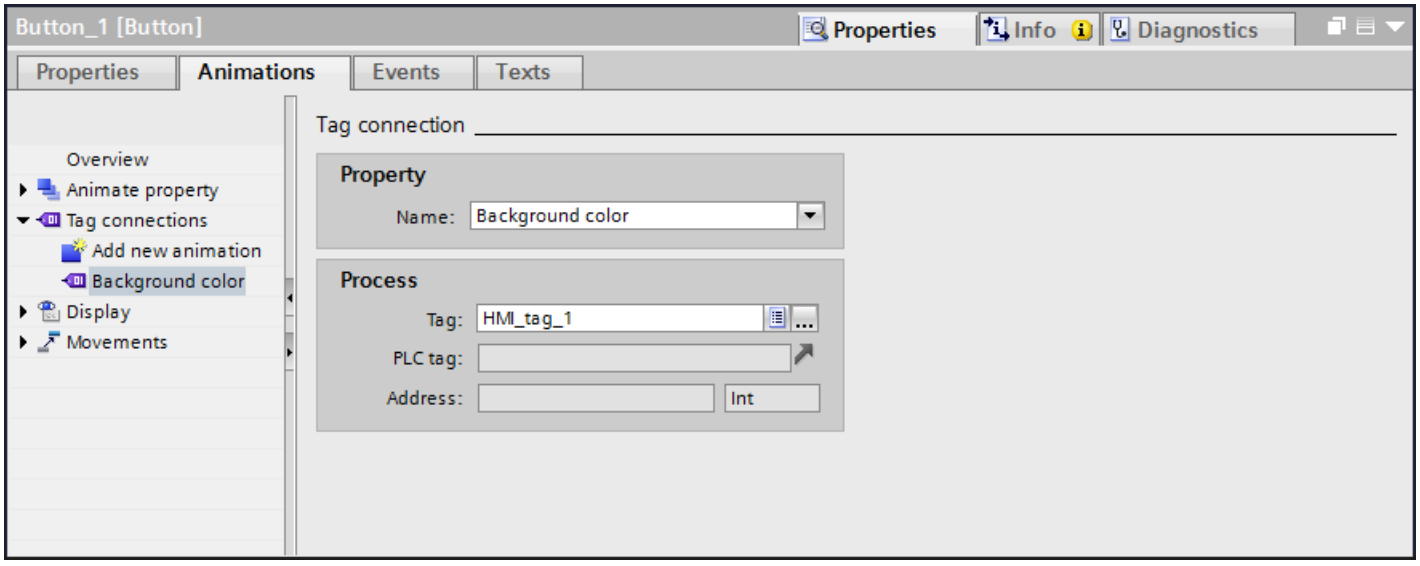
The following example shows the tag binding in the "Properties > Animations" inspector window. If you have configured tag binding it is also visible in the property list or in the property pages in the inspector window.

Requirement

- An object with the property to be dynamized is selected.
- You have created a tag.
- The Inspector window is open.

Procedure

1. Select the screen object whose properties you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animation".
   The animations available for the selected object are displayed.
3. Select "Tag connection" and click the button.
   The parameters of the animation are displayed.
4. Select the object property that you want to dynamize in "Properties > Animation > Tag binding > Property > Name", e.g. "Background color".
5. Select a tag.



Result

You have dynamized the "Background color" property with a tag. The background color of the screen object changes in Runtime depending on which value the tag adopts.

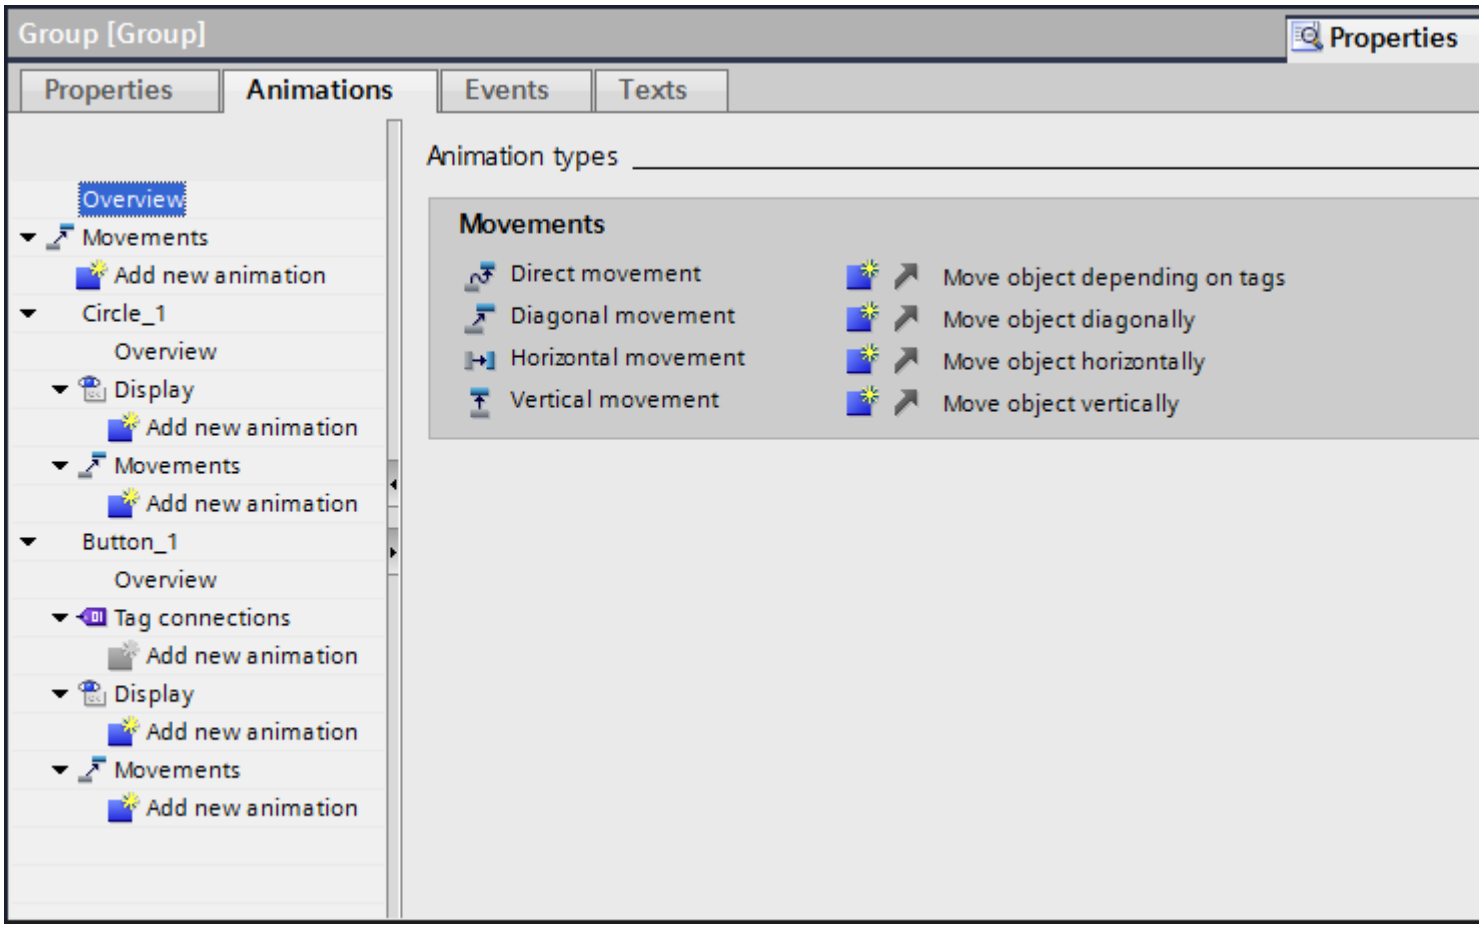
See also

Configuring a new animation (Page 4018)

Animations of object groups

Applying animations to object groups

The inspector window shows all objects of a group and their possible animations. The animation types which are supported by all objects in the group are also listed separately.



If you configure an animation for an object group, this animation will apply to all individual objects that support this animation.

Application example

The "horizontal movement" animation is configured for the object of an object group. The "direct movement" animation is configured for the whole object group. Only the animation of the object group i.e. "direct movement" is executed in Runtime. This also applies for object groups within object groups. Only the animation of the group on the top layer is listed.

See also

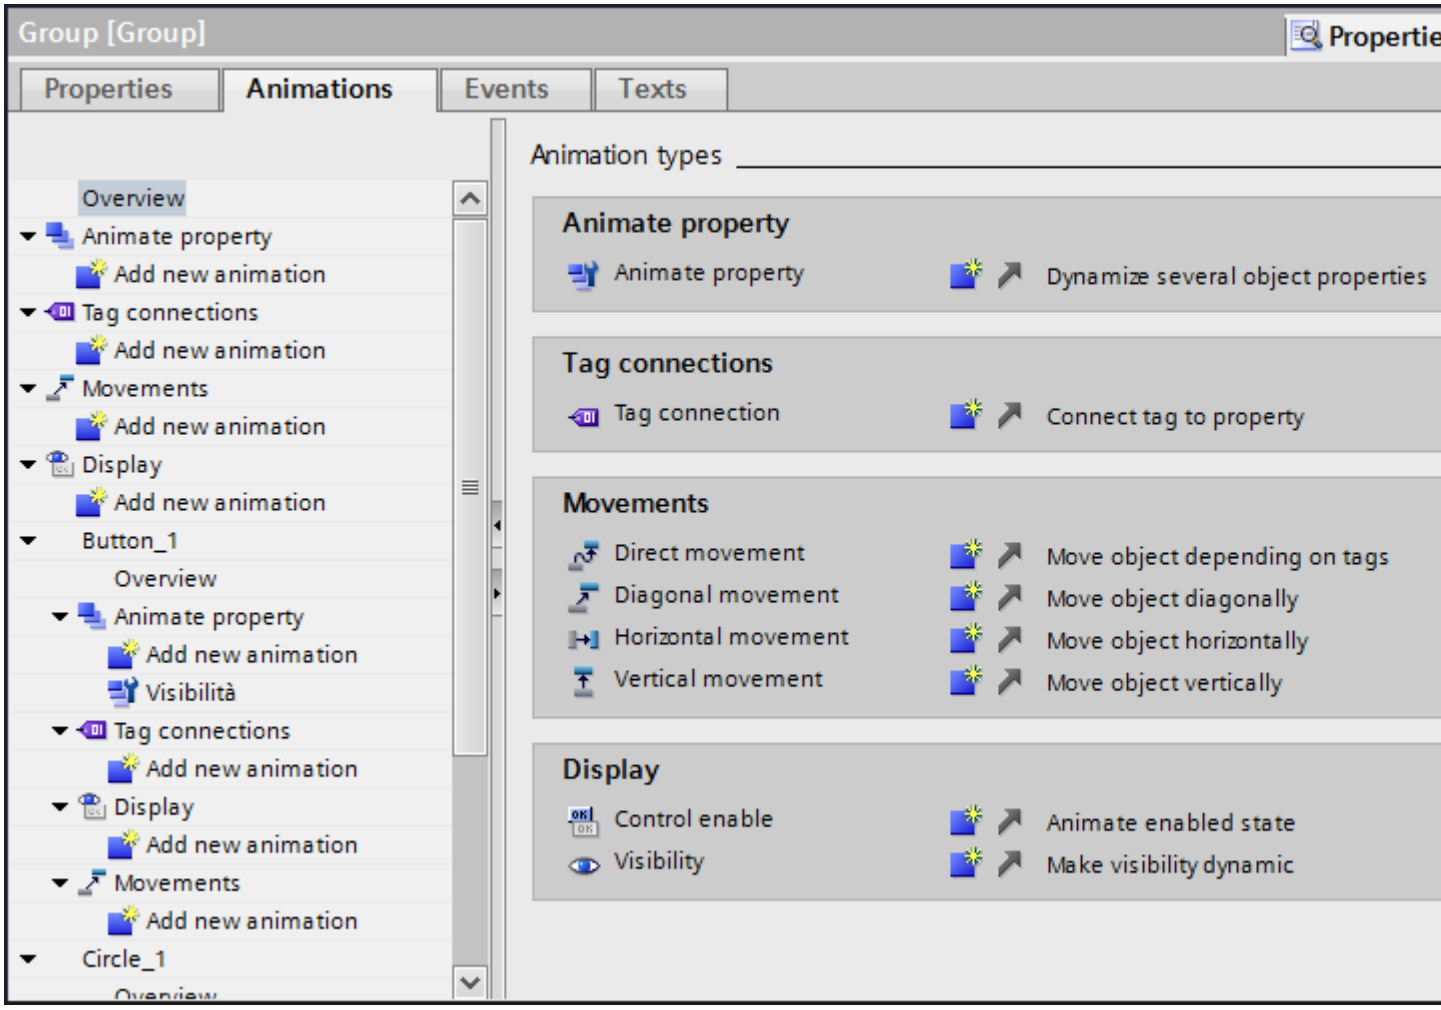
Configuring a new animation (Page 4018)

Animations of object groups

Changing animations of object groups

The inspector window shows all objects of a group and their possible animations. The animation types which are supported by all objects in the group are also listed separately.

If you configure an animation for an object group, this animation will apply to all individual objects that support this animation.



Application example

The "horizontal movement" animation is configured for the object of an object group. The "direct movement" animation is configured for the whole object group. Both animation types are executed in runtime. This also applies for object groups within object groups.

See also

Configuring a new animation (Page 4018)

Animations in multiple selection

Changing animations for multiple objects

For a multiple selection, the animations that are configured for the reference object appear in the Inspector window. You can change the animations as usual. The changes will apply to all the objects in the multiple selection that support the configured animation. This means that even objects for which you have not yet configured an animation will have the reference object's animation.

Application example

Select a button, and a circle at the same time. The button is the reference object. The "Appearance" animation is already configured for the button, so it appears in the Inspector window of the multiple selection. When you activate "Properties > Animations >Appearance > Flashing" in the inspector window, the settings of the "Appearance" animation apply for the button and for the circle.

Configuring new animations for multiple objects

If you configure a new animation for the objects of a multiple selection, this animation will apply to all selected objects that support the configured animation. If the new animation replaces an existing animation, a security prompt appears.

Application example

You select a circle, and a rectangle. The "Diagonal movement" animation is already configured for the circle. You configure the "Horizontal movement" animation for the multiple selection. This animation applies to the rectangle since no animation of the Movement type is yet configured for it. For the circle, you are asked to confirm that you want to replace the existing "Diagonal movement" animation with the new "Horizontal movement" animation.

See also

Configuring a new animation (Page 4018)

12.1.4.6 Dynamization in the property list

Basics on dynamization in the property list

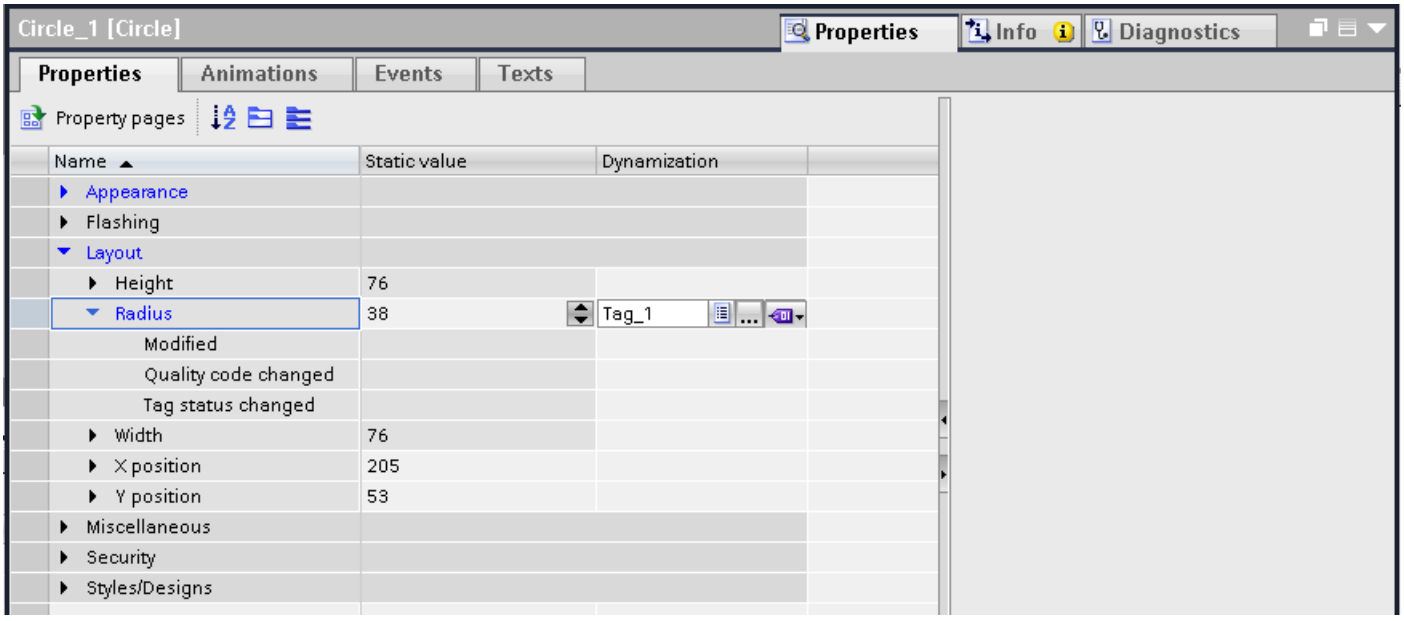
Basic principle of dynamization

Select a tag from the object list for a dynamizable object property in the property list. The object is dynamized if the tag value changes in Runtime.

Dynamization with tags

You dynamize an object property with a tag and configure a function list. The tags are updated in the update cycle set for the screen.

The figure below shows the "Radius" object property dynamized with a tag. When the value of the tag changes, a function list is executed additionally:



You can also convert the function list into a local script.

You can find additional information under "Basics on the function list".

See also

Basics on dynamizing screens (Page 4012)

Programming a dynamization method for a tag change (Page 4033)

Dynamizing an object property with a tag (Page 4031)

Dynamizing an object property with a tag

Introduction

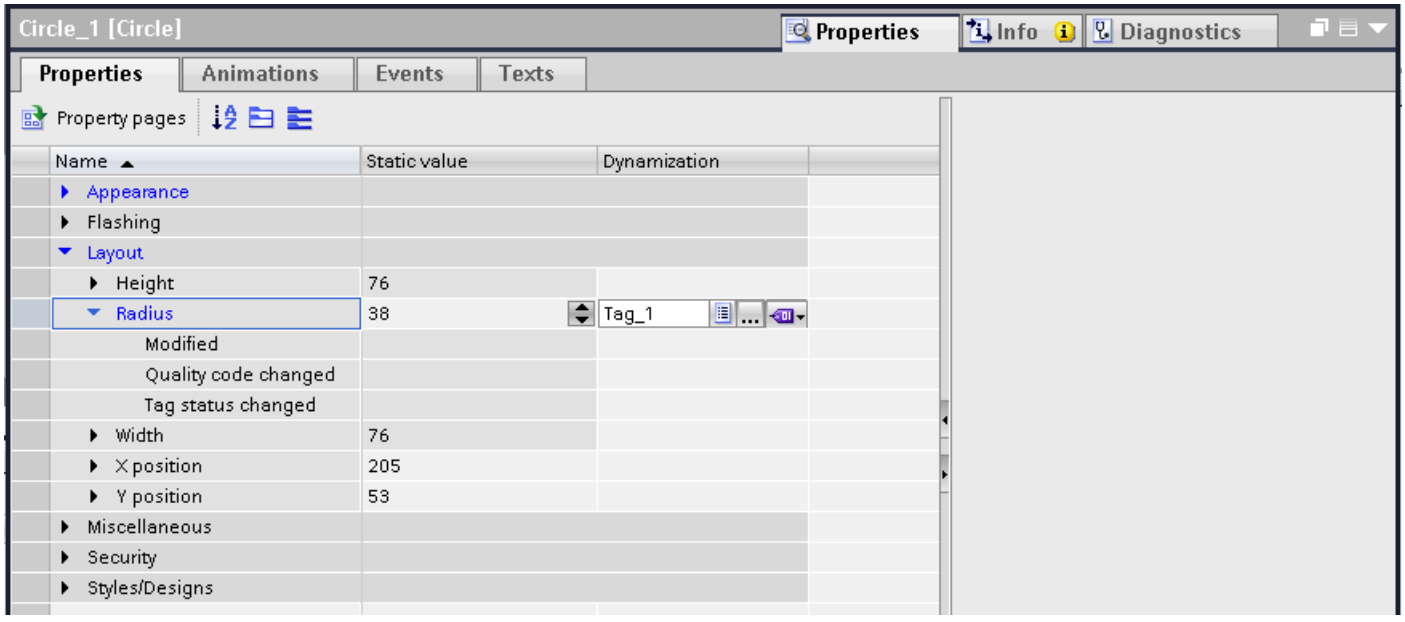
When you dynamize an object property with a tag, the object property is changed in Runtime depending on the tag value. When you indirectly dynamize the object property, you connect the property to a tag that sets the property value in Runtime.

Requirement

- An object with the property to be dynamized is selected.
- You have created a tag.
- The Inspector window is open.

Procedure

1. Select the screen object whose properties you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. Click the button in the Inspector window.
   The property list is displayed with the properties of the selected object.
3. Select the property to be dynamized.
4. In the "Dynamization" column, select the entry "HMI_Tag".
   A dialog opens.
5. Select a tag.
6. Activate "Use indirect addressing" to dynamize the object property.



Result

The object property changes in Runtime according to how the property list is configured.

Representation of a multiple selection in the property list

If you selected multiple objects at the same time, the "Object type" column is added to the property list. The objects that support the property displayed in the row are displayed in this column. Changes to, or dynamization applied to a property affect all the objects displayed in the "Object type" column.

See also

Basics on dynamization in the property list (Page 4030)

Programming a dynamization method for a tag change

Introduction

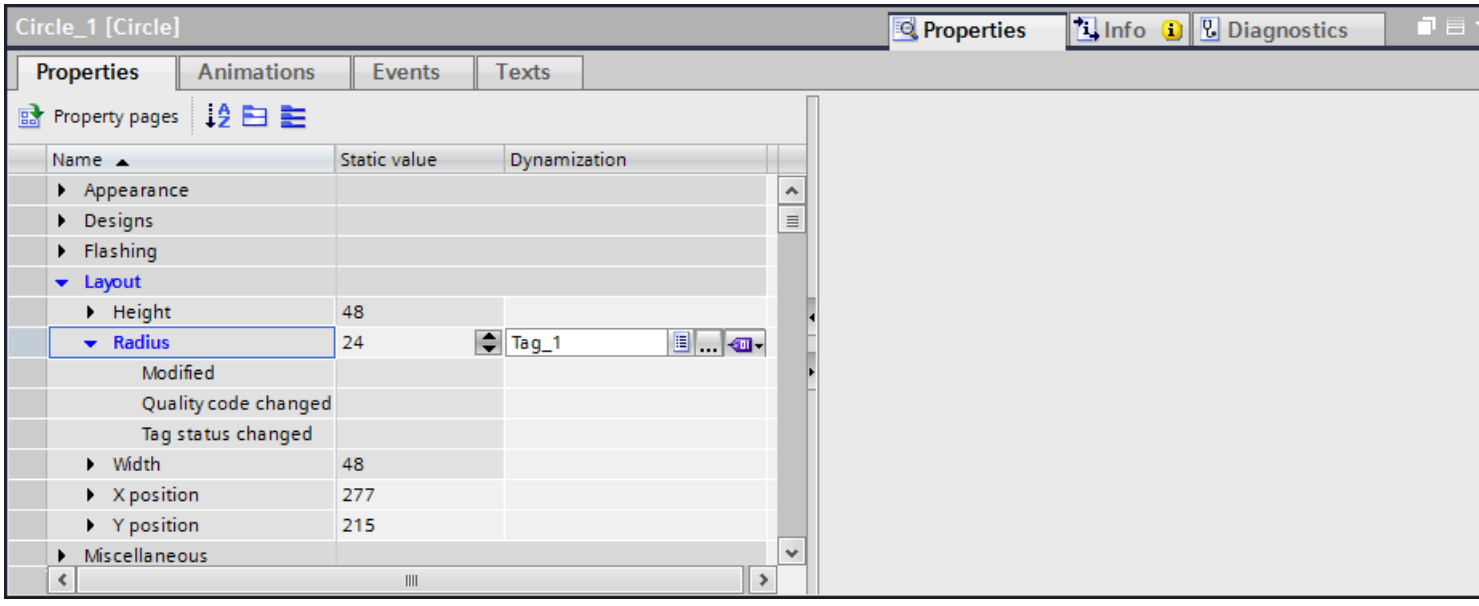
If you have entered a tag in the "Dynamization" column, you can configure a function list additionally on different events.

Requirement

- An object with the property to be dynamized is selected.
- You have created a tag.
- The property list is open in the inspector window.
- An object property is connected with the tag.

Procedure

1. Extend the property list by clicking next to the property which you have dynamized with a tag.
2. Three other lines with the following events are displayed below the property.
   - Changed
   - Tag status changed
   - Quality code changed
3. Configure a function list for the required event.
   Alternatively you can convert the function list into a local script.



Result

The object property changes in Runtime according to how the property list is configured.

See also

Basics on dynamization in the property list (Page 4030)

12.1.4.7 Dynamizing with system functions

Basic on events

Introduction

Screen objects react to events. You configure a function list with system functions on the events of an object.

Events

Which events and system functions are available depends on the object used.

If the operator activates a screen object for example, the configured system function is executed.

You can find additional information under "Basics on the function list".

See also

Basics of the function list (Page 4574)

Basics on dynamizing screens (Page 4012)

Example: Configuring a button for language switching (Page 4036)

Configure system function on the "Click" event (Page 4035)

Configure system function on the "Click" event

Introduction

You configure a function list on an object event. The linked system function is executed when the event occurs in runtime.

Requirements

A screen is open.

A button has been created in the screen.

The inspector window is open.

Procedure

1. Select the button.
2. Click "Properties> Events" in the Inspector window.
3. Select the "Click" event.
4. Click "Add function" in the table.
5. Select the "ShowAlarmWindow" system function.

Result

The alarm window opens in the screen if the operator clicks the button in runtime.

See also

Basics of the function list (Page 4574)

Basic on events (Page 4034)

Example: Configuring a button for language switching

Introduction

In this example, you configure a button that can be used to toggle between multiple runtime languages during runtime.

Requirements

- You have completed the "Configuring a button in multiple languages" example.
- The "Screen_1" screen is open.
- The button on the screen has been selected.

Procedure

1. In the Inspector window, select "Properties > Events > Press".
2. Click on "Add function" in the table.
3. Select the "SetLanguage" system function and the "Switch" setting.

Result

You have assigned the button the function "SetLanguage". Pressing the button during runtime will switch the runtime language. The runtime languages are switched in the order specified by the number sequence in the "Languages and fonts" editor.

See also

Basic on events (Page 4034)

Button (Page 4161)

12.1.5 Working with function keys

12.1.5.1 Working with function keys

Introduction

The function key is a physical key on your HMI device and its functions can be configured. A function list can be configured for the events "Key pressed" and "Release key".

A function key can be assigned global or local functions.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Global function keys

Global function keys always trigger the same action, regardless of the displayed screen.

Global function keys are configured in the "Global Screen" editor. The global assignment applies for all the screens of the set HMI device.

Global function keys reduce programming considerably, because there is no need to assign these global keys to each individual screen.

Local function keys in screens

Local function keys in screens can trigger a different action in each screen. This assignment applies only to the screen in which you have defined the function key.

Within a screen, a function key has only one function assignment, either a global or local one. The project planner specifies which assignment has priority.

Note

If a screen with local function keys is overlapped by an alarm view or an alarm window, then the function keys are still active in runtime. This may happen in particular on HMI devices with a small display.

Local function keys in templates

Local functions keys that are assigned in templates are valid for all the screens based on this template. They can trigger a different action in every screen. Function keys for templates are assigned in the template of the "Screens" editor. Within a template, a function key has only one function assignment, either a global or local one. The project planner specifies which assignment has priority.

Hotkey assignment

You can assign hotkeys, such as buttons, to control objects. The available hotkeys depend on the HMI device.

Note

The function key has a local or global action assigned to it. If the function key also has a hotkey assigned to it, then the hotkey function will be executed in Runtime.

Graphics

When a function key is placed directly next to the display, you can assign a graphic to it to make the function of the function key more clear.

Display of assignment

Table 12-1 The following table shows which symbols display the assignment of the function keys:

Function key	Description
	Not assigned
	Global assignment
	Assigned locally in the template
	Local assignment
	Local assignment (local assignment of the template overwrites global assignment)
	Local assignment (local assignment overwrites global assignment)
	Local assignment (local assignment overwrites local assignment of the template)
	Local assignment (local assignment overwrites local assignment of the template, which already overwrites global assignment)
	Assigning buttons with screen navigation

Note

Basic Panels

The "Screen Navigation" editor is not available for Basic Panels.

12.1.5.2 Assigning function keys globally

Introduction

You define the global assignment of a function key in the "Global Screen" editor. The global assignment applies to all screens of the set HMI device.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

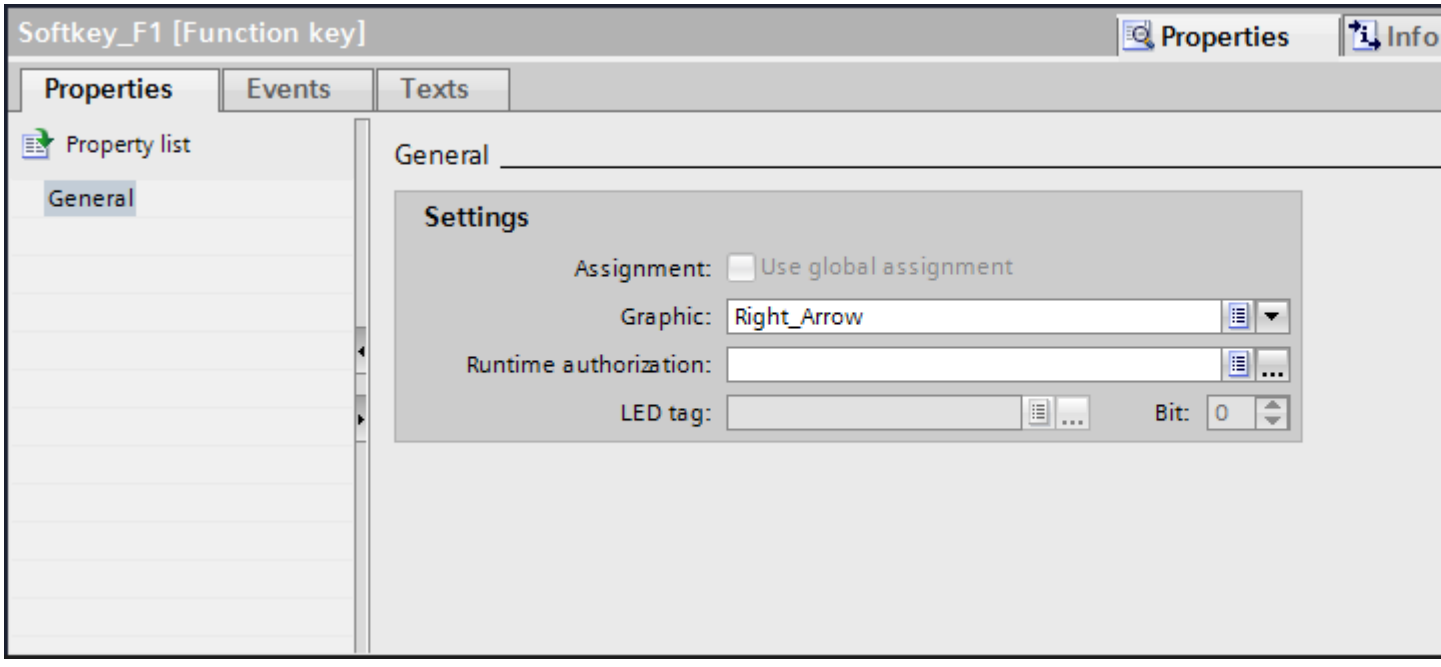
Requirement

- You have opened the project.
- The Inspector window is open.

Procedure

Proceed as follows to assign a screen-based function to a function key:

1. To open the "Global Screen" editor, double-click "Global Screen" in the "Screen management" group of the Project window.
2. Select the desired function key.
   The properties of the function key are shown in the Inspector window.



3. Under "General", configure a graphic and an operator authorization for the function key.
4. Configure a function list for the required event under "Events".

Result

If a local assignment does not overwrite the global assignment, the assignment of the function key changes in all the screens of the set HMI device in accordance with your entry.

See also

Working with function keys (Page 4036)

12.1.5.3 Local assignment of function keys

Introduction

Function keys are assigned globally and locally. A local assignment of the function keys is only valid for the screen or the template in which it was defined. The following local function keys are available:

- Local function keys of a screen
  Different functions are assigned to the function key for each screen. This assignment applies only to the screen in which you have defined the function key.
- Local function keys of a template
  You assign the function keys in a template. The assignment applies to all the screens that are based on this template and are not overwritten by a local assignment in a screen.

A local assignment overwrites the global assignment of a function key.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Using existing assignments

The option for using existing assignments is referred to as follows in the Inspector window:

- In a template: "Use global assignment"
- In a screen:
  - Screen based on a template: "Use local template"
  - Screen not based on a template: "Use global assignment"

The "Use local template" option includes the use of the local assignment in the template and the global assignment.

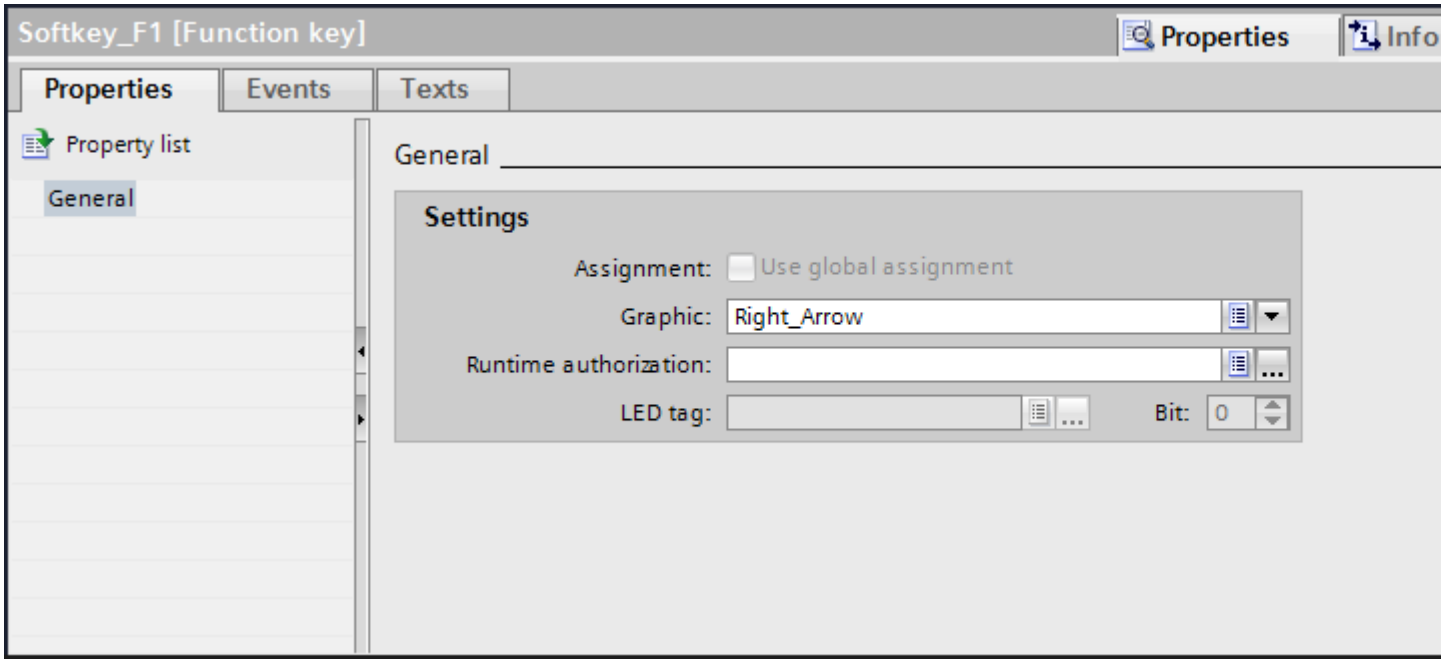
Requirement

- You have opened the screen or the template in which you want to assign a function key locally.
- The Inspector window is open.

Procedure

Proceed as follows:

1. Select the desired function key in the screen or in the template.
   The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.



3. Disable the "Use local template" or "Use global assignment" option.
4. Under "General", configure a graphic and an operator authorization for the function key.
5. Configure a function list for the required event under "Events".

Result

The function key is assigned the configured function in the screen or in the template.

See also

Working with function keys (Page 4036)

12.1.5.4 Assigning a function to a function key

Introduction

A function key can have two states:

- Pressed: Defined by the "Key pressed" event.
- Released: Defined by the "Release key" event.

Both of these events are configured in the Inspector window of the function key. You can assign any event a function list which contains system functions or scripts. Execution of this function list is event-driven in runtime.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Note

Basic Panels

Scripts are not available for Basic Panels.

Requirement

To assign the function key a global function:

- The "Global Screen" editor is open.

To assign the function key a local function:

- The screen in which you want to assign a function key is open.

If you want to assign a function key locally in a template:

- The template in which you want to assign a function key is open.
- The Inspector window is open.

Procedure

Proceed as follows:

1. Select the function key you want to define.
   The properties of the function key are shown in the Inspector window.
2. Configure the function list for the desired result in the Inspector window under "Properties" in the "General" group.

Result

The function list is executed in runtime when the operator presses or releases the function key.

See also

Working with function keys (Page 4036)

12.1.5.5 Assigning operator authorization for a function key

Introduction

In WinCC you can assign an operator authorization for a function key in runtime. This allows you to restrict access to the function keys to specific persons or operator groups when you configure your project. Only authorized personnel can then change important parameters and settings in runtime.

You configure access protection in order to avoid operator errors and increase plant or machine security.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Requirement

- The user groups have been defined.

To protect a global function key:

- The "Global Screen" editor is open.

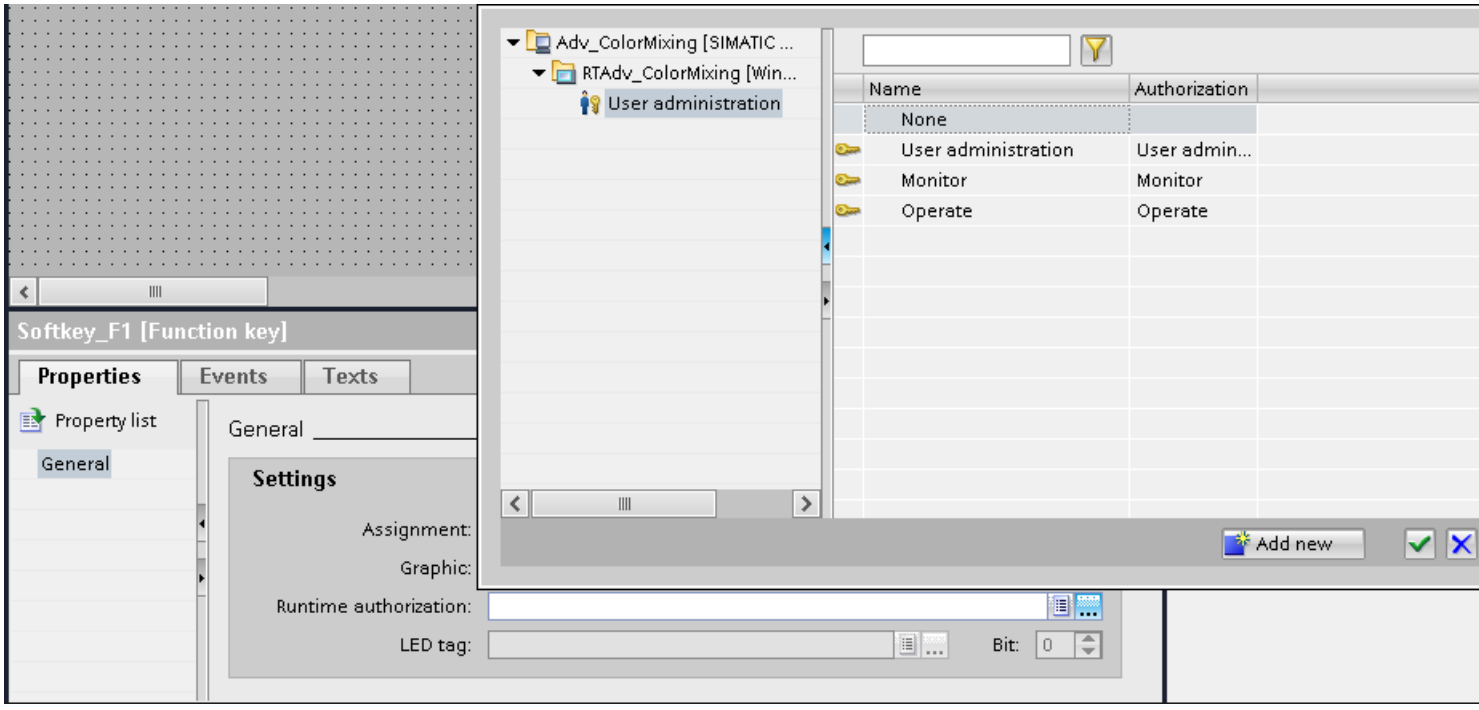
If you want to protect a local function key of a screen or of a template:

- The screen or the template which contains the function key is open.
- The Inspector window is open.

Procedure

Proceed as follows:

1. Select the relevant function key.
   The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.



3. In the "Authorization" list, select the user group you want to allow runtime access to the function key.

Result

The operator authorization is configured.

See also

Working with function keys (Page 4036)

12.1.5.6 Assigning a graphic to a function key

Introduction

In order to make the function of a key more clear, you can insert a graphic in the screen alongside the function key. Graphics can only be assigned to function keys that border the screen margin of the HMI device.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Requirement

To assign a graphic to a global function key:

- The "Global Screen" editor is open.

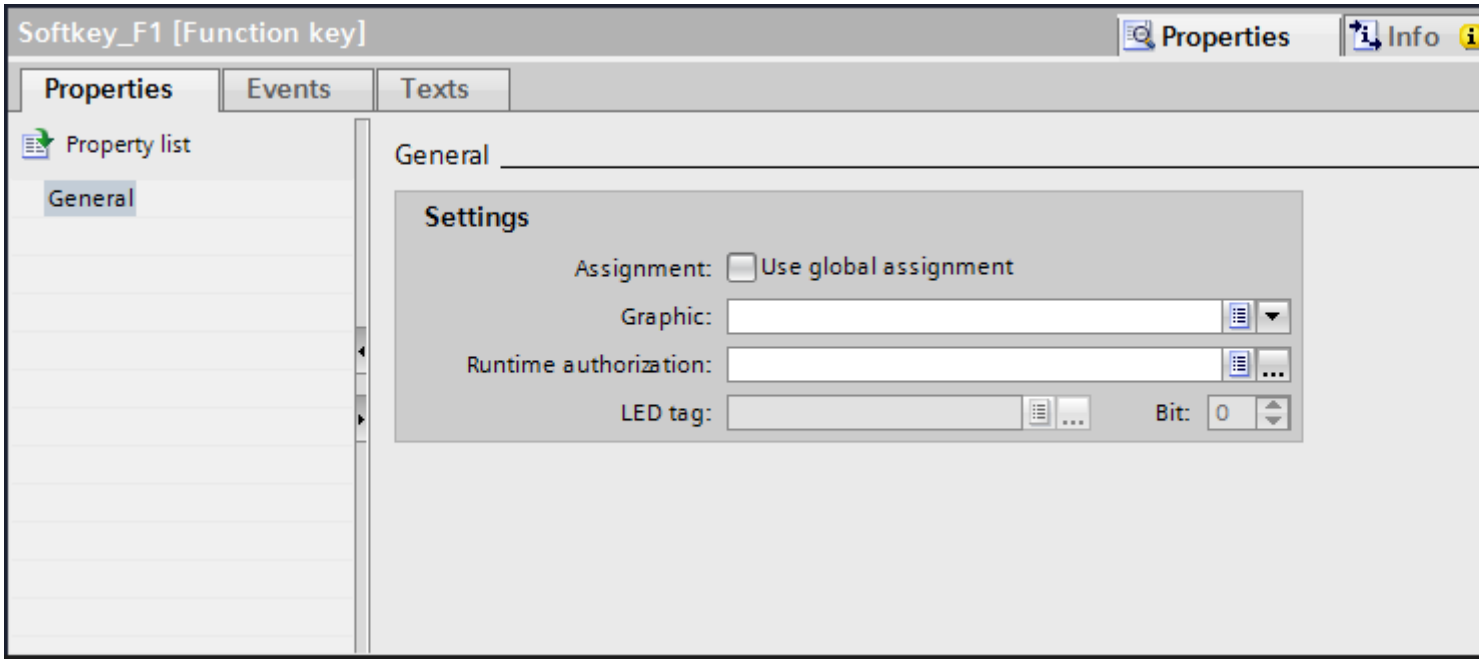
If you want to assign a graphic to a local function key in a screen or template:

- The screen or the template that contains the corresponding function key is open.
- The Inspector window is open.
- You have created the graphic for the function key.

Procedure

Proceed as follows:

1. Select the relevant function key.
   The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.



3. Click in the "Graphic" area of the list.
   The graphic browser of your WinCC project appears. The pane on the left side shows the external graphics which are stored in the browser. The pane on the right side shows you a preview of the graphic you have selected in the browser.

   Using the  and  icons, you can display the collection either in form of thumbnails or as a list.
   In order to open and edit OLE objects with the associated graphics program, double-click on the object.

4. In the browser click the desired graphic or store the relevant graphic in the graphic browser.
   The graphic preview is shown in the right pane.
5. Click "Select" to add the graphic to the screen.
   Click "Clear" to remove the graphic from the screen.

Result

The graphic is displayed next to the function key.

See also

Working with function keys (Page 4036)

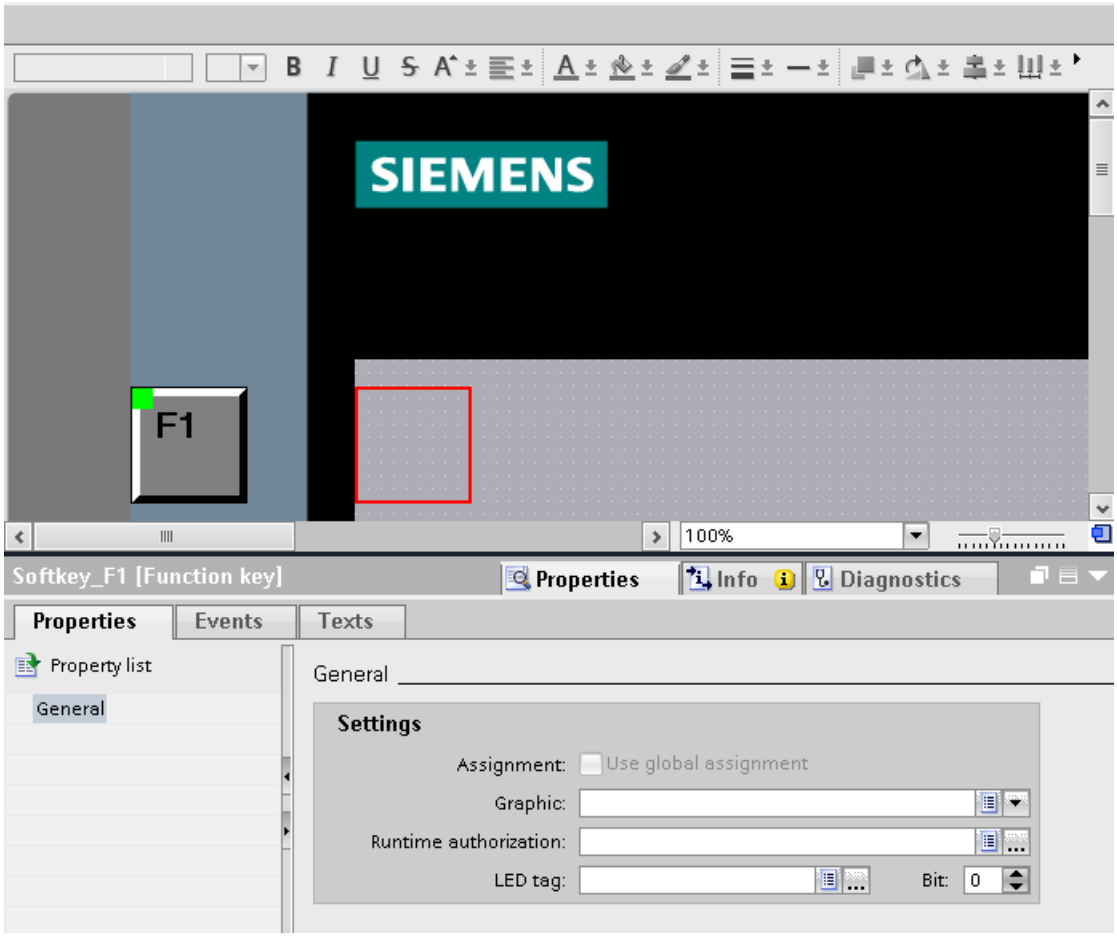
12.1.5.7 Configuring LED tags

Requirements

- An HMI device with key operation has been created.
- You have created an LED tag.
- The global screen is open.

Procedure

1. Click an F-key of the HMI device.
2. In the Inspector window, click "Properties > Properties > General".



3. Select a tag under "LED tag" in the "General > Settings" area.
4. Under "Bit" enter the correct bit number.
   The correct bit number depends on the HMI device and the input and output assignments on the HMI device.

Assignment of inputs and outputs

The exact assignment of inputs and outputs can be found under:

- PROFINET IO direct keys: Auto-Hotspot
- PROFIBUS DP direct keys: Auto-Hotspot

12.1.5.8 Example: Using function keys for screen navigation

Task

In this example you create a local function key in a screen. When the operator presses this function key, a screen change to a predefined screen is triggered, for example "Boiler 2".

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

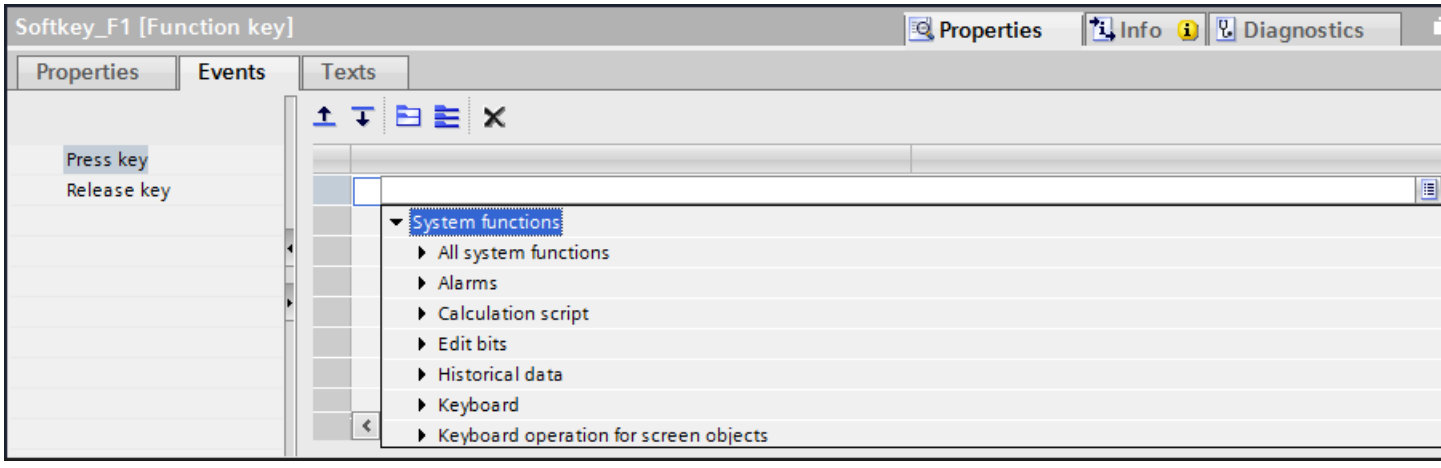
Requirement

- The screen in which you want to assign the function key is open.
- You have created the "Boiler 2" screen.
- The Inspector window is open.

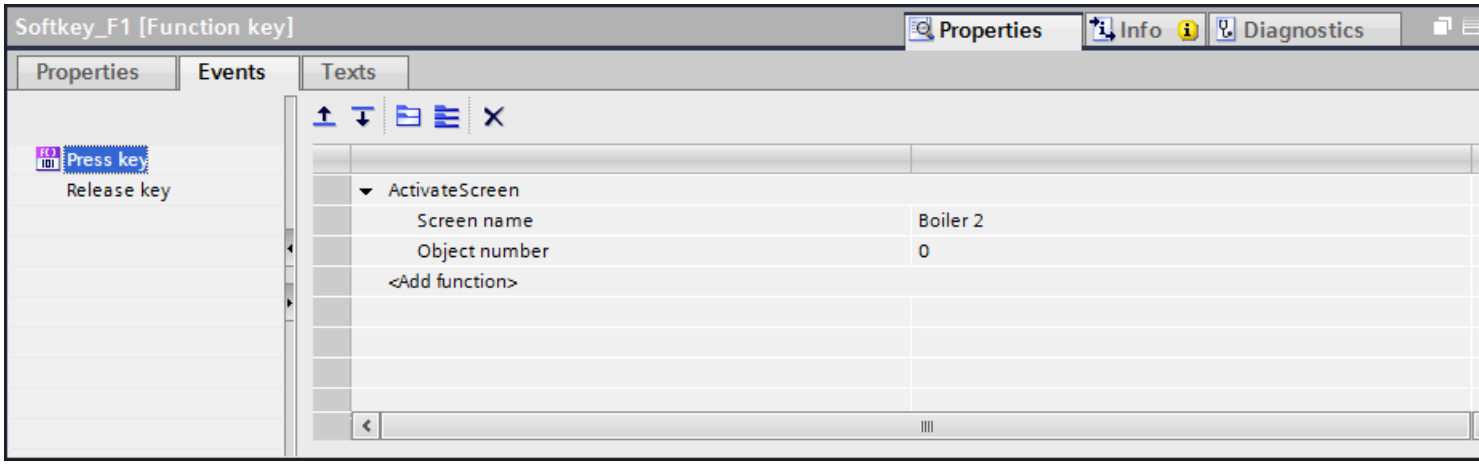
Procedure

Proceed as follows to use the "ActivateScreen" function:

1. Select the desired function key.
   The properties of the function key are shown in the Inspector window.
2. Click "General."
3. To overwrite a global assignment, disable the "Use local template" option.
4. Click "Key pressed" under "Events".



5. Select the "ActivateScreen" system function from the list.
   The "ActivateScreen" function appears in the "Function list" dialog box, including the "Screen name" and "Object number" parameters.



6. Select the "Boiler 2" screen from the "Screen name" list.

Result

The operator changes to the "Boiler 2" screen in runtime by pressing the selected function key.

See also

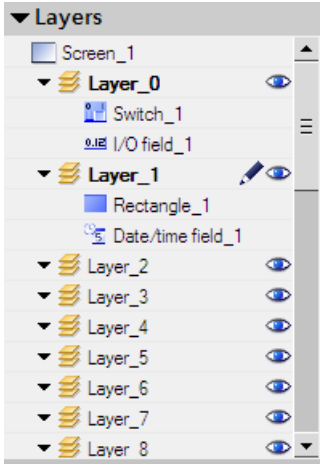
Working with function keys (Page 4036)

12.1.6 Working with layers

12.1.6.1 Basics on working with layers

Layers

Use layers in order to achieve differentiated editing of the objects in a screen. A screen consists of 32 layers that you can give any names. If you assign objects to the layers, you thereby define the screen depth. Objects of layer 0 are located at the screen background, while objects of layer 31 are located in the foreground.



The objects of a single layer are also arranged hierarchically. When you create a screen, the object inserted first is located at the rear within the layer. Each further object is placed one position towards the front. You can shift objects forwards and backwards within a layer.

Principle of the layer technique

Always one layer of the 32 layers is active. New objects you add to the screen are always assigned to the active layer. The number of the active level is displayed in the inspector window of the screen and in the "Layout > Layers" task card.

When you open a screen, all 32 layers of the screen are displayed. You can hide all the layers except for the active layer in the inspector window of the screen and in the "Layout > Layers" task card. You then explicitly edit objects of the active layer.

In the tree view of the "Layers" palette in the "Layout" task card, you administer layers and objects with drag-and-drop and the context menu.

Application examples

Use layers, for example, in the following cases:

- To hide the labeling of objects when editing,
- To hide objects, e.g. alarm windows, while configuring other objects

See also

Screen basics (Page 3889)

Renaming layers (Page 4055)

Showing and hiding layers (Page 4054)

Setting the active layer (Page 4053)

Moving objects on layers (Page 4052)

12.1.6.2 Moving objects on layers

Introduction

By default, a new object is inserted on the active layer. You can, however, assign an object to another layer at a later time.

Requirement

- A screen with an object is open.
- The Inspector window is open.

Procedure

1. Select the object in the screen.
   The object properties are displayed in the Inspector window.
2. Enter the layer to which you want to move the object in "Properties > Properties > Miscellaneous > Layer" in the Inspector window.

Alternatively, select the object from the "Layout" task card and drag it to the required layer.

Changing the order of objects

1. Select the object in the screen.
   The object properties are displayed in the Inspector window.
2. To move the object to the front or back, select the "Order" > "Move backward" or "Move forward" command from the shortcut menu.
   Alternatively, use the  or  button in the toolbar.

Result

The object is assigned to the selected layer, and positioned at the top of the layer.

See also

Setting the active layer (Page 4053)

Showing and hiding layers (Page 4054)

Renaming layers (Page 4055)

Basics on working with layers (Page 4051)

12.1.6.3 Setting the active layer

Introduction

The screen objects are always assigned to one of the 32 layers. There is always an active layer in the screen. New objects you add to the screen are always assigned to the active layer.

The number of the active layer is indicated in the "Layer" toolbar. The active layer is indicated by the icon in the "Layout > Layers" task card.

Layer 0 is the active layer when you start programming. You can activate a different layer during configuration, if necessary.

Requirement

- You have opened a screen which contains at least one object.
- The Inspector window of the active screen is open.

Procedure

1. Click "Properties > Properties > Layers" in the Inspector window of the current screen.
2. Enter the layer number in "Settings > Active layer".

Alternative procedure

1. Select "Layout > Layers" in the "Layout" task card.
2. Select the "Set to active" command from the shortcut menu of a layer.

Result

The layer with the specified number is now active.

See also

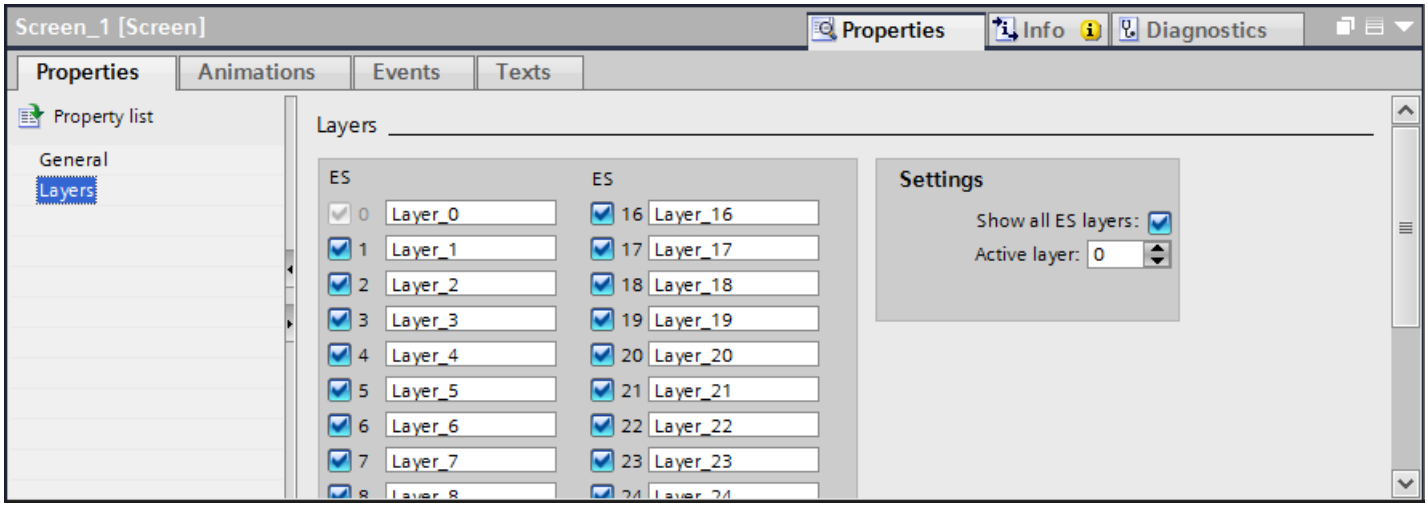
Moving objects on layers (Page 4052)

Basics on working with layers (Page 4051)

12.1.6.4 Showing and hiding layers

Introduction

You can show or hide the layers of a screen as required. You specify the layers that are shown in the Engineering System. When you open a screen, all the layers are always shown.



Requirement

- The screen is opened.
- The "Layout" task card is open.

Procedure

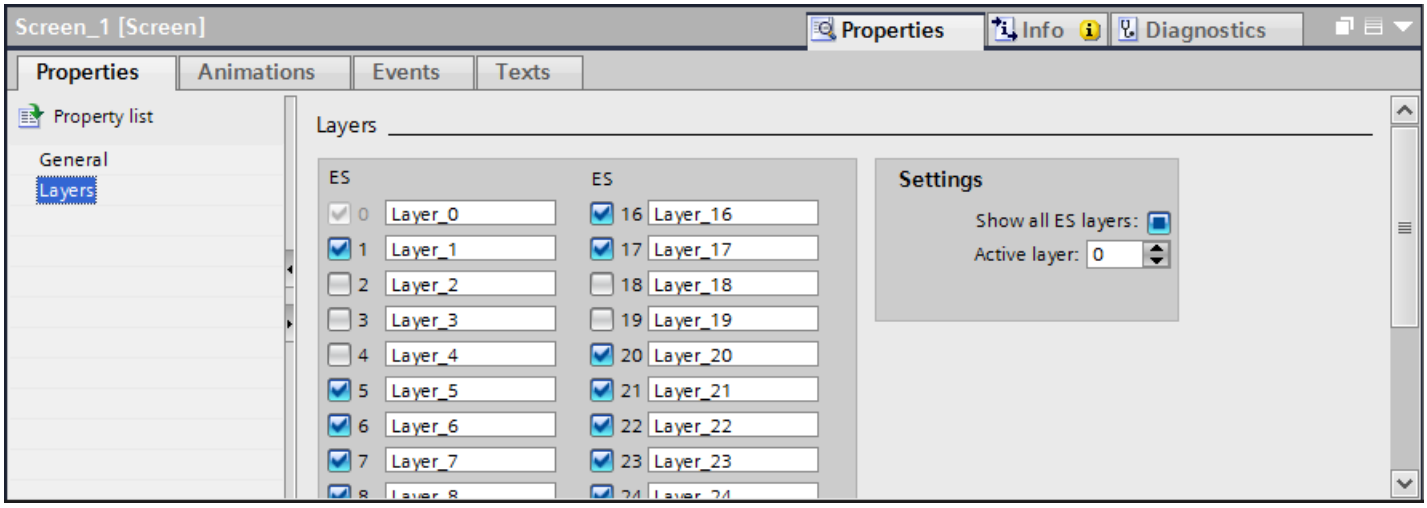
1. Select the layer that you want to hide or show in the "Layout > Layers" task card.
2. Click one of the icons next to the corresponding layer:
   - A shown layer is hidden
   - A hidden layer is shown

   Note

   The active layer cannot be hidden.

Alternative procedure

1. Click in an area of the screen that does not contain an object.
   The screen properties are shown in the Inspector window.
2. In the Inspector window, select "Properties > Properties > Layers":



3. In the list, disable the levels you wish to hide.
   If you activate "All ES layers" for a layer, the objects in this layer will be shown in the Engineering System.

Result

The layers are shown according to your settings.

See also

Moving objects on layers (Page 4052)

Basics on working with layers (Page 4051)

12.1.6.5 Renaming layers

Introduction

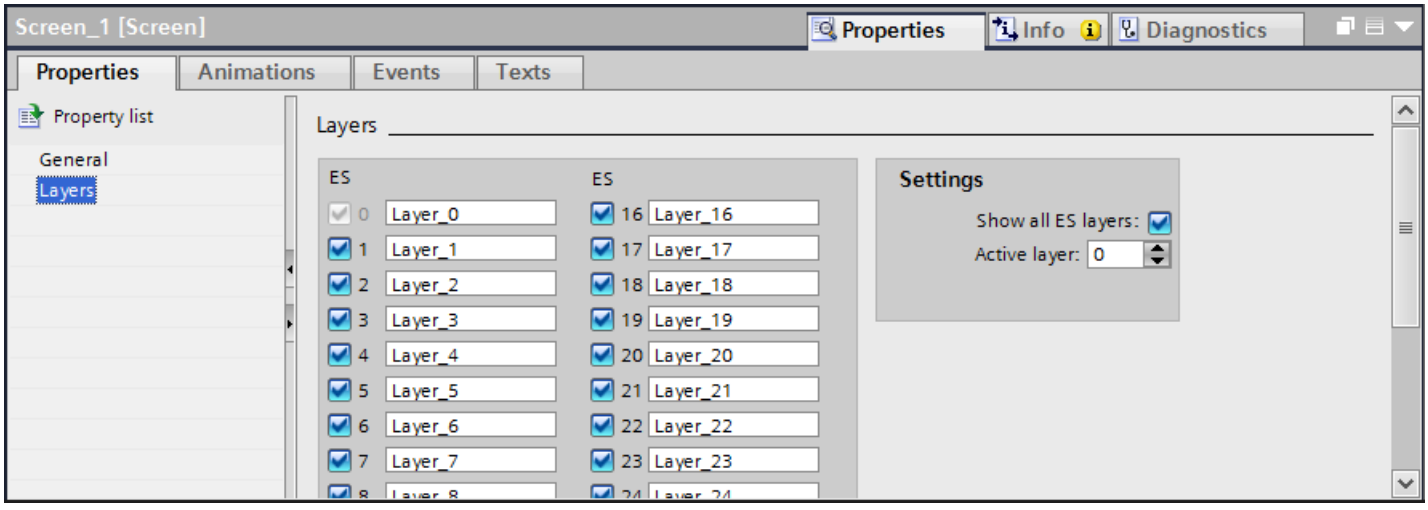
When you create a screen, the 32 layers are numbered consecutively by default. To improve clarity, you can rename the layers to suit your requirements.

Requirement

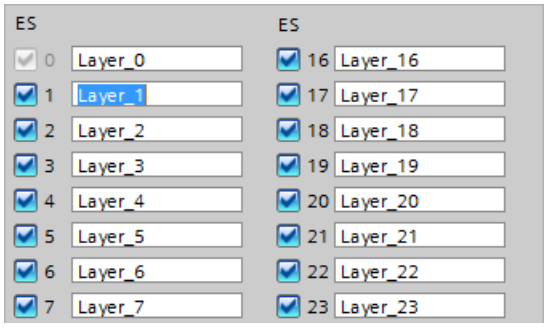
- The screen is opened.

Procedure

1. Click in an area of the screen that does not contain an object.
   The screen properties are shown in the Inspector window.
2. In the Inspector window, select "Properties > Properties > Layers".



3. Enter the new layer name.



Result

The layer is displayed with the new name.

See also

Moving objects on layers (Page 4052)

Basics on working with layers (Page 4051)

12.1.7 Working with faceplates

12.1.7.1 Basics on faceplates

Introduction

Faceplates are a configured group of display and operating objects that you manage and change centrally in a library. You can use a faceplate in several projects as required. The faceplates are stored in the project library.

Use

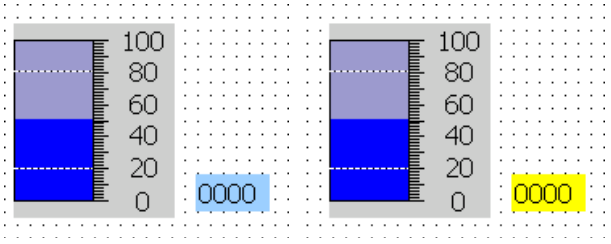
You use faceplates to create individually configured display and operating objects. You can use faceplates several times in the project or in different projects. All instances of a faceplate in the project are changed centrally. This reduces the configuration effort.

Types and instances

Faceplates are based on a type-instance model to support the central changeability. You create central properties for an object in types. The instances represent local points of use of the types.

- Faceplate type
  You create a display and operating object according to your requirements and store it in the project library. The instances are bound to the respective faceplate type. If you change a property of a faceplate type, the property is saved centrally and also changed in all instances. In the faceplate type, you define the properties that can be changed on the faceplate. You edit a faceplate type in the "Faceplates" editor.
- Faceplate
  The faceplate is an instance of the faceplate type. You use a faceplate in screens as a display and operating object. You configure the variable properties of the faceplate type on the instance. You assign the tags of your project to the faceplate, for example. If you configure properties on the faceplate, you overwrite the properties of the faceplate type. The changes on the faceplate are saved at the point of use and have no effect on the faceplate type.

The figure below shows the relationships between the faceplate type and the faceplate. The background color of the I/O field is configured in the faceplate type in such a way that every instance can change the property. Blue is used as the background color in the faceplate type. You use yellow as the background color in the faceplate.



When you change the background color in the faceplate type, this has no effect on the faceplate because the "Background color" property is assigned on an instance-specific basis.

See also

Faceplate editor (Page 4059)

Creating a faceplate type (Page 4062)

Screen basics (Page 3889)

Basics of dynamizing faceplates (Page 4079)

Example: Configuring a faceplate (Page 4081)

12.1.7.2 Device dependency of faceplates

Device dependency of faceplates

Not all HMI devices support every display and operating object. The screen objects that are not available in the respective HMI device are not displayed when using the faceplate.

The following devices support faceplates:

Runtimes

- WinCC Runtime Advanced
- WinCC Runtime Professional

Comfort Panels

- KTP 400

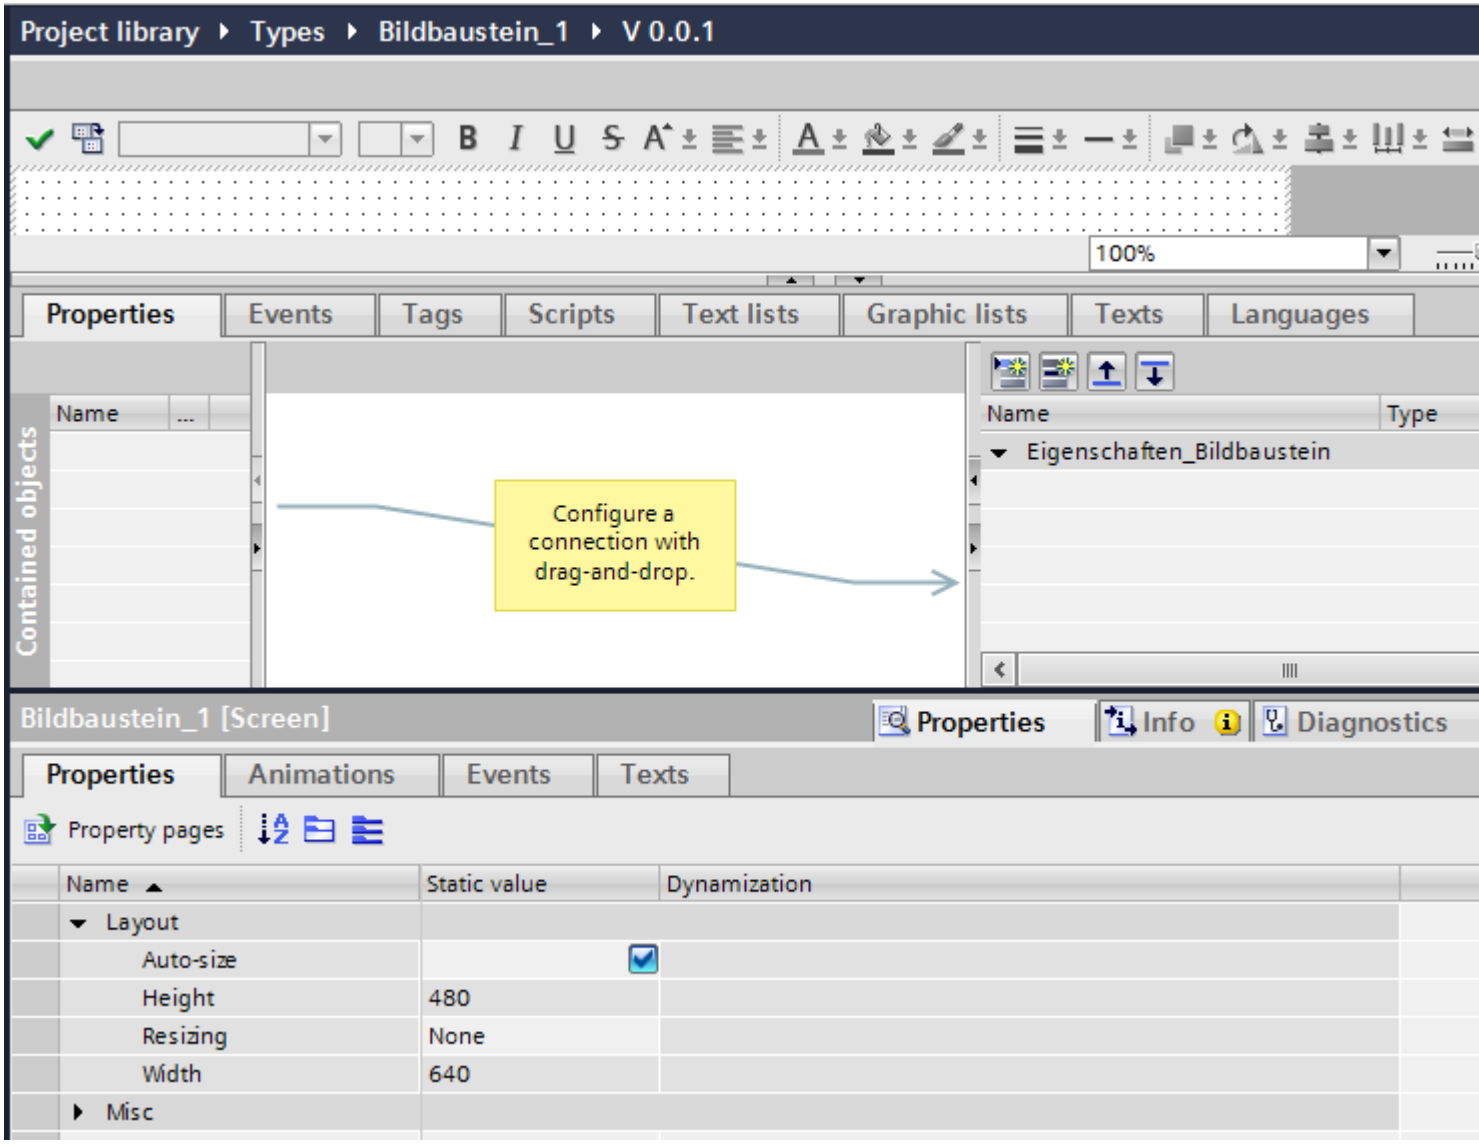
12.1.7.3 Faceplate editor

Open

Create faceplate types and edit them in the library view.

Layout

The library view for faceplate types consists of several editors, e.g. "Screens" and "Tags" which are arranged in the work area and the configuration area.



Work area

In the work area, place the objects contained in the faceplate type as you usually do in the "Screens" editor. You can remove objects, or use the "Toolbox" task card to add new objects.

Configuration section

- Properties
  The static and dynamic properties are identified as follows:
  - The symbol identifies a dynamic property. Dynamic implementation of this property, using tags or text and graphic lists.
  - The symbol identifies a static property. You change only the values of a static property.

    Note

    Device dependency of static properties

    Static properties are only available for panels and RT Advanced.

  You define the faceplate type properties in the "Properties" tab.
  You use the following two lists for this:
  - The "Contained objects" list
    This list includes the properties of the objects contained in the faceplate type. These properties can only be configured in the faceplate type in the "Faceplate" editor.
  - The "Interface" list contains the properties and tags of the faceplate type. The "Interface" list consists of the pre-defined category "Dynamic properties" and user-defined categories.
- Events
  You define the faceplate type events in the "Events" tab. You use the following two lists for this:
  - The "Contained objects" list contains the events of the objects embedded in the faceplate type.
  - The "Interface" list contains the events of the faceplate.
    You create links between the two lists using a drag and drop operation.
- Tags
  You can also create faceplate tags on the "Tags" tab. The tags are only available within the faceplate type. You can interconnect the faceplate type tags directly with an object contained in the faceplate type.
- Scripts
  In the "Scripts" tab, you can configure scripts for the faceplate type. In the script, you can call up system functions or program new functions, for example to convert values. The scripts are only available within the faceplate type. They work with VB Script code.

  Note

  The "Scripts" tab is not available for Runtime Professional.

- Text lists
  You can also create and edit texts lists for the faceplate type in the "Text lists" tab. These text lists are only available within the faceplate type. You can interconnect the text lists of the faceplate type directly with an object contained in the faceplate type, such as a symbolic I/O field.

- Graphics lists
  If necessary, you can also create graphics lists for the faceplate type in the "Graphics lists" tab. These graphic lists are only available within the faceplate type. You can interconnect the graphic lists of the faceplate type directly with an object contained in the faceplate type, e.g. a graphic I/O field.
- User texts
  The "User text" tab shows the contained user text of the opened faceplate type, for example entries from text lists. You can enter the compilations for the individual project languages directly in the "User text" tab.

12.1.7.4 Creating and managing faceplates

Creating a faceplate type

Introduction

Faceplate types are display and operating objects which are made up of several objects, e.g. controller modules.

Requirement

You have opened a screen which contains multiple objects.

Procedure in the project view

1. Select all the objects that you need for the faceplate type.
2. Select the "Create faceplate type" command in the shortcut menu of the multiple selection. A dialog opens.
3. Enter a name for the faceplate.
4. If necessary, add a comment or change the version number.

Result

The library view opens. Two versions of the type are displayed in the "types" folder. Version 0.0.1 has been released and contains the currently selected objects.

The 0.0.2 version has the status "in progress". Edit the faceplate type in version 0.0.2 as required.

Procedure in the library view

1. The library view is open.
2. Select the "Add new type" command in the shortcut menu of the project library. A dialog opens.
3. Select the runtime for which the faceplate type is to be available. An empty faceplate type is created.
4. Drag-and-drop the objects from the "Toolbox" task card to the work area of the faceplate type.

Result

The new faceplate type is created and displayed under the selected name in the project library.

The faceplate type is assigned the status "in progress" and the version 0.0.1.

Configuring a graphics list in the faceplate type (Page 4073)

Configuring text lists in the faceplate type (Page 4072)

Removing faceplate from faceplate type (Page 4078)

Resizing a faceplate (Page 4077)

Configuring a faceplate type

Introduction

In the configuration area of the "Faceplates" editor you define which properties and process values of the objects contained in the faceplate can be configured in the "Properties" tab.

Note

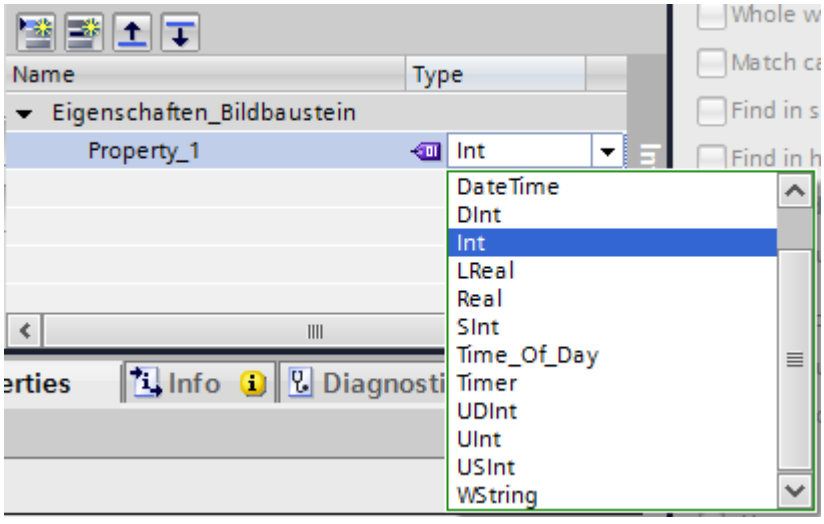
For tooltip texts configured for objects in the faceplate to be displayed in Runtime, insert the property "Tooltip text" as faceplate property.

Requirement

- The faceplate is generated and is displayed in the "Faceplate" editor.
- The "Properties" tab is open in the configuration area.

Procedure

1. To create a new property, click the "Add property" button in the interface list.
   A new property is displayed in the "Interface" list.
2. To create a new category, click the "Add category" button in the interface list.
   A new category including a new property is displayed in the "Interface" list.
3. Click the name of the property and assign a name, for example, "Color".
4. Select the data type.



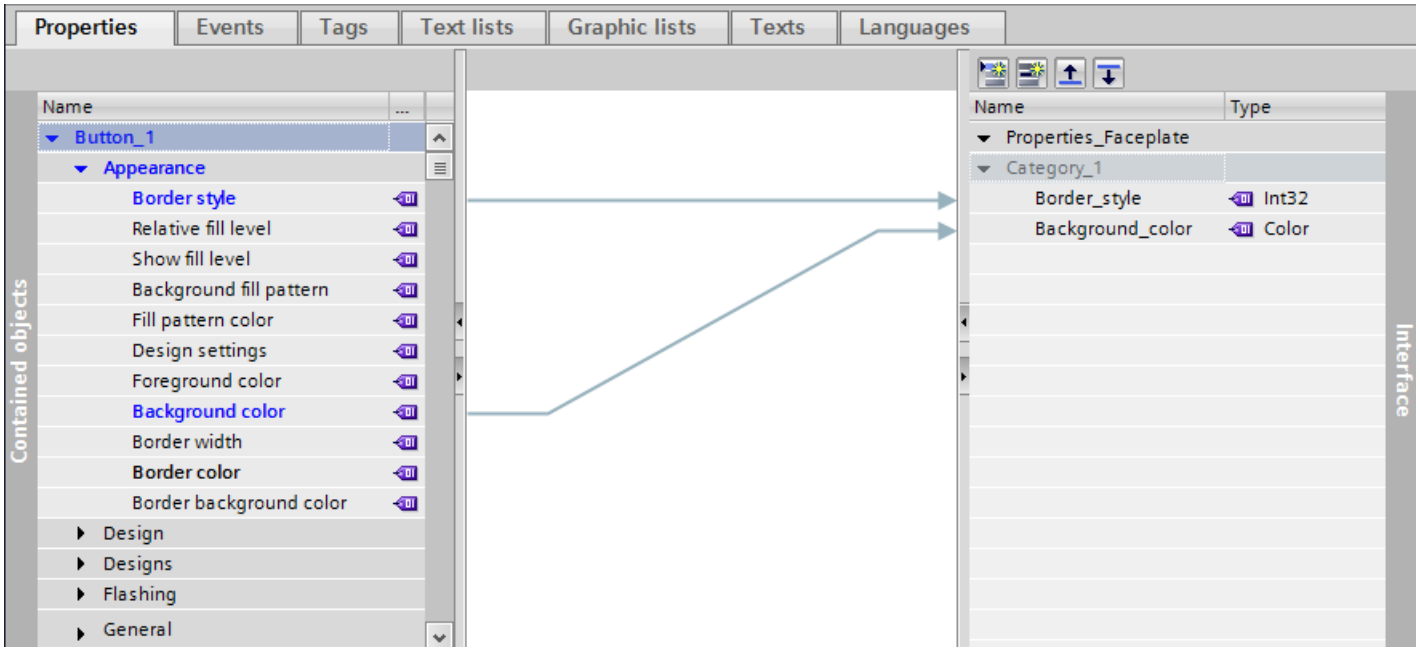
Interim result

You have created a new property.

1. Click an object in the "Contained objects" list.
2. Select a property, e.g. "Appearance > Background color".
3. Move the property from the "Contained objects" list to the desired property in the "Interface" list by drag&drop.
   The connection is displayed as a colored line.
   The system assigns the same data type to the property in the "Interface" list as that of the property in the "Contained objects" list.
   To change the data type, select the data type from the data types of the connected property.
4. Repeat step 3 to connect other properties of the contained properties with the interface.

Note

The property from the "Contained objects" list must be in concordance with the data type of the already connected property of the "Interface" list.



Deleting a connection

1. Click the connection that you wish to delete.
2. In the shortcut menu select the "Delete" command or use the <DEL> key.
   The connection is deleted.

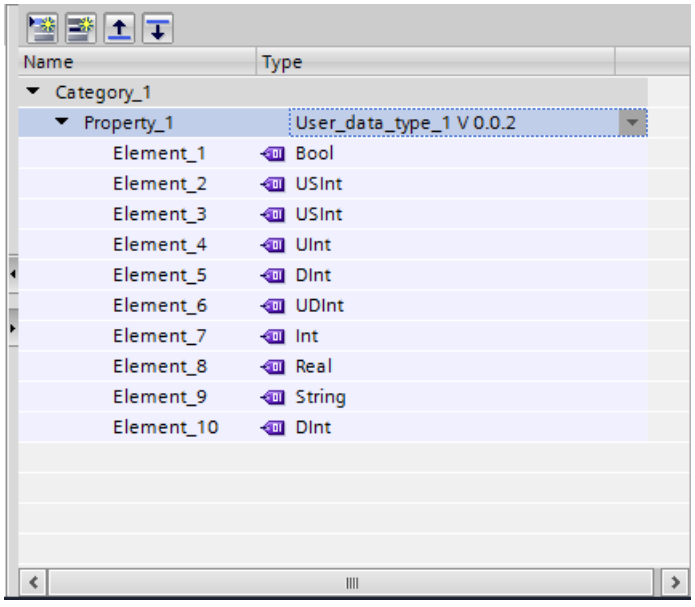
Interconnecting user data types with faceplates

As of V13 SP1, you can use the HMI user data types and the PLC user data types as properties of the faceplates.

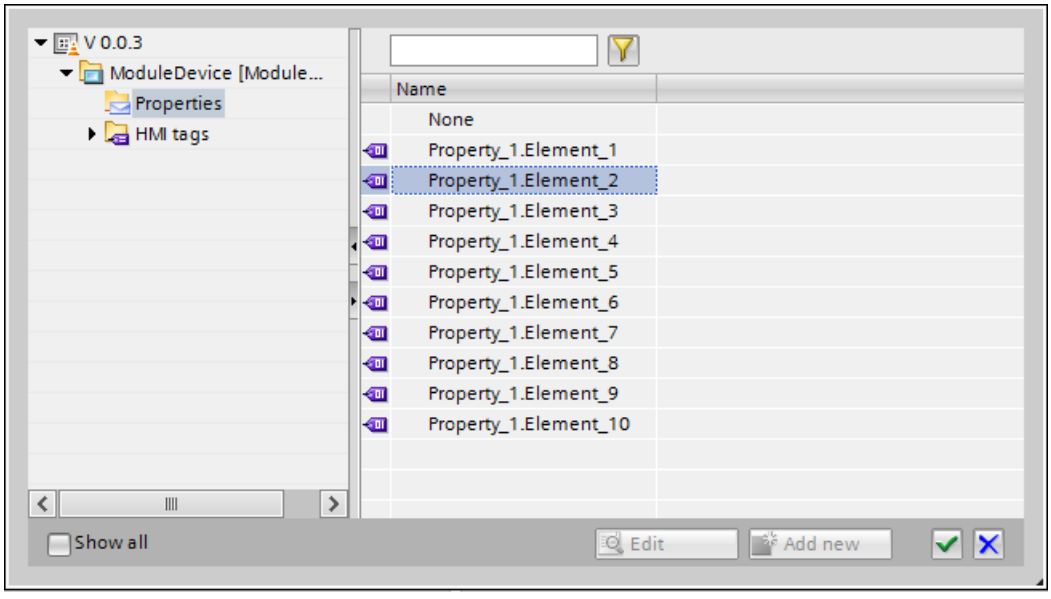
You interconnect the HMI user data types and the PLC user data types with the faceplates using interface properties by connecting the faceplates with the structural elements of the interface properties.

To set the HMI user data types and the PLC user data types as properties of the faceplates, follow these steps:

1. Select the user data type in the selection list under "Type".



2. In the Inspector window under "Properties > Properties > General", select the interface property of the faceplate in the "Tag" selection list.



The faceplate is interconnected with the user data type.

Result

You have created a new property or a new category with a property. You have connected the property of the interface with a property of the contained objects. If you use an instance of the faceplate type in a screen, you configure the properties of the faceplate which you have created in the "Interface" list.

Note

Device dependency of static properties

Static properties are only available for panels and RT Advanced. You work with dynamic properties in RT Professional.

See also

Creating a faceplate type (Page 4062)

Example: Configuring a faceplate (Page 4081)

Editing the category and property of a faceplate type

Deleting a property in the "Interface" list

1. Select "Edit faceplate" in the shortcut menu. The "Faceplates" editor is open.
2. Select the property which you want to delete in the "Interface" list.
3. Select "Delete" in the shortcut menu.

The property is deleted from the "Interface" list. Existing connections to the contained objects are deleted. All linked faceplates lose their instance-specific property.

Deleting a category in the "Interface" list

1. Select "Edit faceplate" in the shortcut menu. The "Faceplates" editor is open.
2. Select the category which you want to delete in the "Interface" list.
3. Select "Delete" in the shortcut menu.

The category including the properties is deleted from the "Interface" list. Existing connections to the contained objects are deleted. All linked faceplates lose their instance-specific properties.

Moving a property to another category

1. Select a property in the "Interface" list.
2. Move the property to a new category by "drag&drop".

You have moved the property to a new category.

Changing the data type of a property

1. Select a property in the "Interface" list.
2. Click the second column of the drop-down list.
3. Select a data type.

You have changed the data type of the property in the "Interface" list.

See also

Creating a faceplate type (Page 4062)

Configuring a tag in the faceplate type

Introduction

You connect a tag in the faceplate type directly with the properties of the objects contained in the faceplate type. The tags in the faceplate type are a central means of defining dynamic properties in the faceplate type.

The tags of a faceplate type have limited functionality. The "Tags" tab of the configuration area has the same structure as the "Tags" editor.

Array elements for faceplates

In the following situations you may not assign an array element or a multiplex tag that is interconnected with a faceplate to the property of a screen object.

- The property is configured in a faceplate as parameter of a system function.
- System functions or scripts are assigned in the faceplate to events of the property.

Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Tags" tab is open in the configuration area.

Procedure

1. Click "Add" in the "HMI tags" table. A new tag is created in the faceplate type.
2. Open "Properties > Events" in the inspector window if necessary. You configure the "Value change" event on the tag for example.

3. In the work area, select the object to which you want to assign this tag, e.g. an I/O field.
4. Select the tag in the inspector window of the I/O field "Properties > Properties > General > Process > Tag".

Note

Only tags of the faceplate type are displayed in the object list in the "Faceplates" editor.

Result

You have created a tag in the faceplate type. You are using the tag in the faceplate for scripting, for example.

See also

Creating a faceplate type (Page 4062)

Example: Configuring a faceplate (Page 4081)

Configuring an event in the faceplate type

Introduction

In the configuration area of the "Faceplates" editor you define which events of the objects contained in the faceplate can be configured in the "Events" tab. You configure a function list on the events of the faceplate in the "Screens" editor.

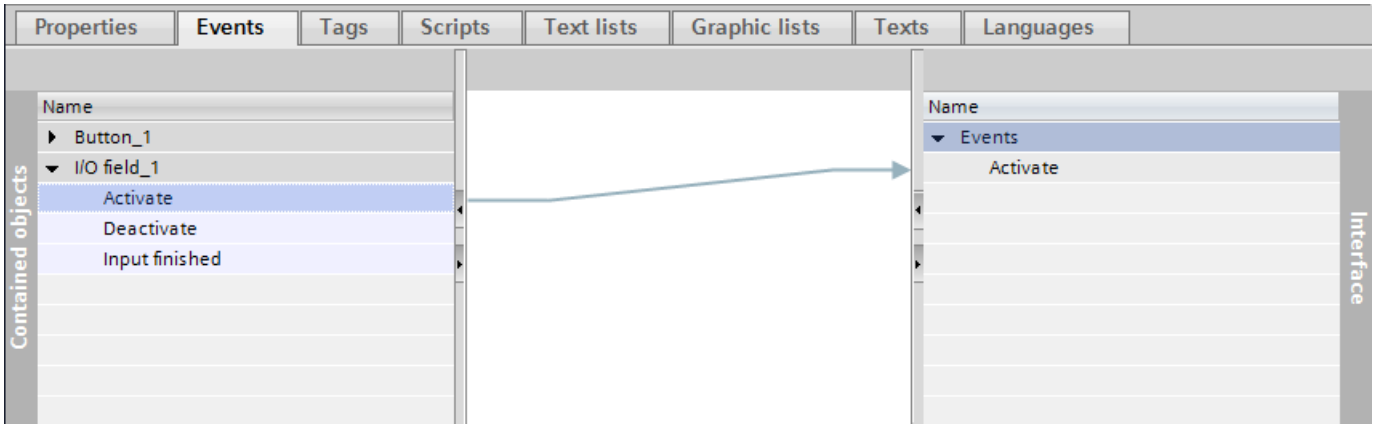
Requirement

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Events" tab of the configuration area is open.

Procedure

1. Click an object in the "Contained objects" list.
2. Select an event, e.g. "Activate".

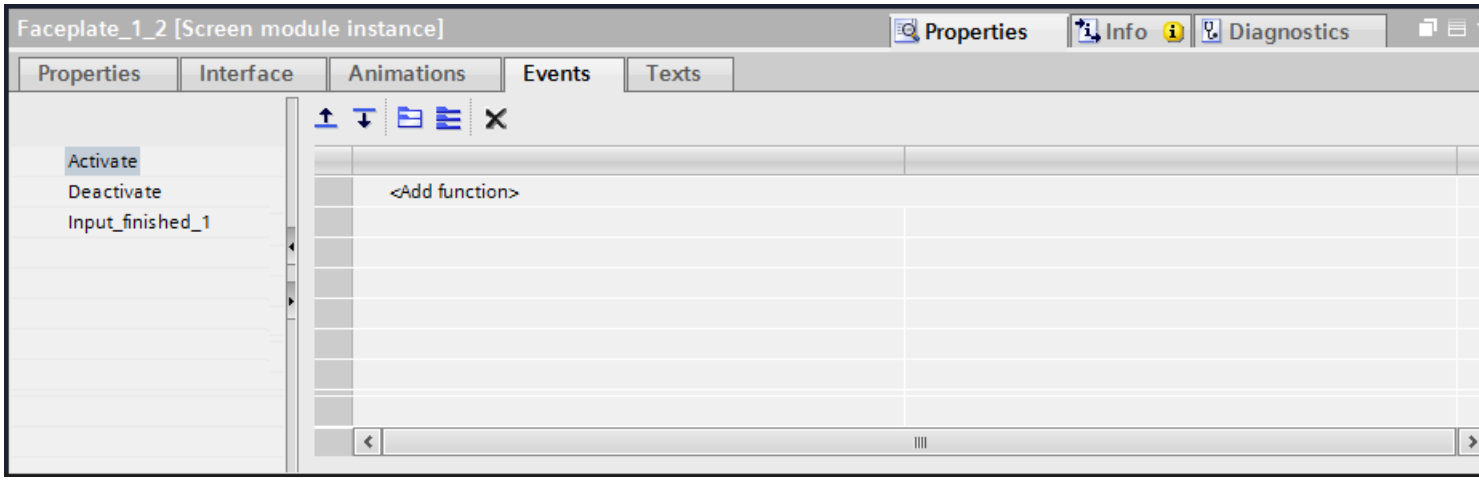
3. Move the event from the "Contained objects" list to a new category in the "Interface" list.
   The new event is displayed in the "Interface" list.
   The connection appears as a colored line.



4. Double-click the event and, if required, change the name of the event.

Result

You have created an event in the faceplate type. if you use an instance of the faceplate type, you will only be offered the configured events in the inspector window. You configure a function list on the event in the faceplate.



See also

Creating a faceplate type (Page 4062)

Example: Configuring a faceplate (Page 4081)

Configuring scripts in the faceplate type

Introduction

In the configuration area of the "Faceplates" editor you create scripts which you only use within a faceplate type. You can only refer to tags of the faceplate type or properties of the contained objects within the script. The script is used as a copy in the instance of the faceplate type.

Requirement

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- Faceplate tags or dynamic properties have been created.

Procedure

1. Click the "Scripts" tab in the configuration area of the faceplate.
2. Double click "Faceplate scripts > Add VB script".
3. Write the program code.
4. Press the shortcut keys <CTRL+J> to Include tags of the faceplate type in the script. The object list opens.
5. Click "HMI tags".
   All tags of the faceplate type are displayed in the object list.
6. Select a tag and confirm the selection.
7. Press the shortcut keys <CTRL+J> to use properties of the faceplate type in the script. The object list opens.
8. Click "Properties".
   All dynamic properties of the "Interface" list for the faceplate type are displayed in the object list.

Result

You have created a script in the faceplate type. The instance of the faceplate type uses a copy of the script. The script is executed in runtime depending on the configuration.

Creating a faceplate type (Page 4062)

Example: Configuring a faceplate (Page 4081)

Configuring text lists in the faceplate type

Introduction

In a faceplate type, you connect a text list with an object included in the faceplate type. Text is assigned to the values of a tag in a text list. The text list is used, for example, to display a selection list in a symbolic I/O field contained in the faceplate type. The interface between the text list and a tag of the faceplate type is configured at the object that uses the text list.

Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Text list" tab is open in the configuration range.
- A tag has been created in the faceplate type.

Procedure

1. Click "Add" in the "Text lists" table. A new text list is created in the faceplate type.
2. Assign a name to the text list that indicates its function.
3. Select the text list type, e.g. "Value/Range" under "Select".
4. Click "Add" in the "Text list entries" table.
5. Define the values or range of values for the text list.
6. Enter a text for every value range which is displayed in Runtime when the tag is within the specified value range.
7. Select an object, for example a button in the work area of the faceplate type.
8. In the Inspector window of the object, enable "Properties > Properties > General > Label > Text list".
9. Select the "Text list" from the selection list.
10. Select a tag of the faceplate type under "Process > Tag".

Result

You have created a text list in the faceplate type. This text list is linked to an object contained in the faceplate type. You have configured a faceplate type tag at the object.

See also

Creating a faceplate type (Page 4062)

Configuring a graphics list in the faceplate type

Introduction

In a graphics list, specific graphics are assigned to possible values of a tag. In a faceplate type, you connect a graphics list with an object included in the faceplate type. Graphics are assigned to the values of a tag in a graphics list. For example, the graphics list is used to display a selection list in a graphic I/O field contained in the faceplate type. The interface between the graphics list and a tag of the faceplate type is configured at the object that uses the graphics list.

Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Graphics list" tab is open in the configuration range.
- A tag has been created in the faceplate type.

Procedure

1. Click "Add" in the "Graphics lists" table. A new graphics list is created in the faceplate type.
2. Assign a functional name to the graphics list.
3. Select a graphics list type, e.g. "Range (... - ...)", under "Selection".
4. Click "Add" in the "Graphics list entries" table. A new entry is created in the list.
5. Define the values or range of values for the graphics list.
6. Select a graphic for every value or value range which is displayed in runtime when the tag is within the specified value range.
7. Select an object, e.g. a graphic I/O field, in the work area of the faceplate type.
8. Activate "Properties > Properties > General > Contents > Graphics list" in the object's Inspector window.
9. Select the "Graphics list" from the selection list.
10. Select a tag of the faceplate type in "Process > Tag".

Result

You have created a graphics list in the faceplate type. This graphics list is linked to an object contained in the faceplate type. You have configured a faceplate type tag at the object.

Creating a faceplate type (Page 4062)

Translating texts directly in the faceplate type

Translating texts

If you use several languages in your project, you can translate individual texts directly. As soon as you change the language of the software user interface, the translated texts are available in the selected language.

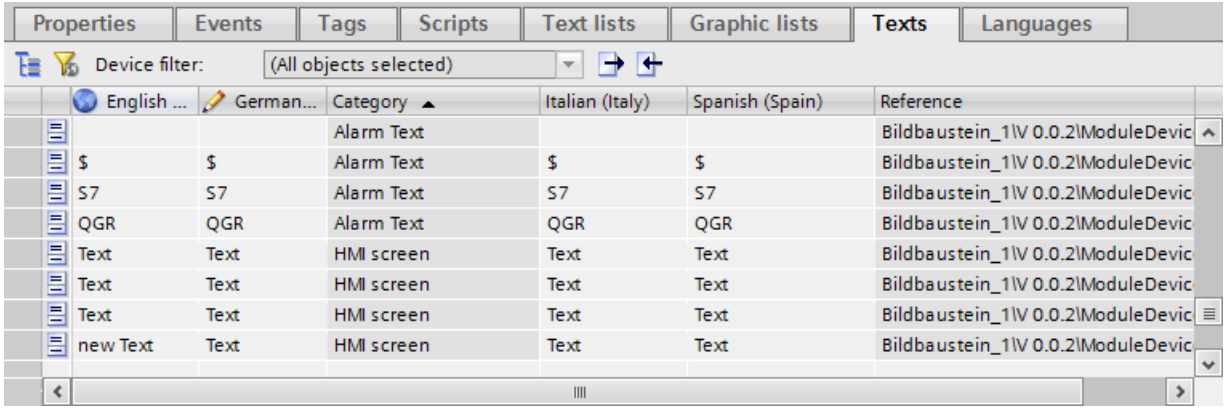
Requirements

- A project is open.
- You have opened the "Faceplates" editor.
- You have created a faceplate type.
- The faceplate type contains at least one object with text, e.g. a text field.

Procedure

Proceed as follows to translate individual texts:

1. Open the "Tasks" task card.
2. Click the button under "Languages & Resources > Editing language". The "Project languages" editor opens.
3. Activate at least two project languages.
4. Open the "Texts" tab in the "Faceplates" editor.
   A list with the texts in the project is displayed in the work area. There is a separate column for each project language.



5. Click on the button in the toolbar to group identical texts together.
6. To hide texts that do not have a translation, click on the button in the toolbar.
7. Click on an empty column and enter the translation.

Result

You have translated individual texts in the "Texts" tab of the faceplate type. The texts will then be displayed in the runtime language.

Editing a faceplate type

Introduction

All faceplate types in the project library have a status. You create a faceplate type in the "in progress" status. You can edit the faceplate types as required in this status. When editing is complete, release the faceplate type.

Requirement

- A faceplate type has been created.
- The faceplate type has the version 0.0.1. and the status "in progress".
- The "Library" task card or the library view is open.

Enable faceplate type

1. Select version 0.01 of the faceplate type in the project library.
2. Select "Release version" in the shortcut menu.

You have released version 0.0.1 of the faceplate type.

Edit faceplate type

1. Select, for example, the released version 0.0.1 of a faceplate type in the project library.
2. Select "Edit faceplate type" in the shortcut menu.

The library view opens. The new version 0.0.2 of the faceplate type has been created.

The faceplate type has the "In progress" status.

Restoring the last version of the faceplate type

The last released version of the faceplate type is version 0.0.2.

Edit the faceplate type. A new version 0.0.3 is created and the "in progress" status is assigned to it.

1. Select the faceplate type from the project library.
2. Select "Discard changes and restore type" in the shortcut menu.

All changes to the faceplate type since the last enabling operation are rejected. The faceplate type is enabled again and has the version 0.0.2.

See also

Creating a faceplate type (Page 4062)

Example: Configuring a faceplate (Page 4081)

Duplicating faceplate type

Introduction

You can duplicate a released faceplate type and a released version of the faceplate type in the project library.

Requirement

- A faceplate type has been created.
- The faceplate type is released and no version of the faceplate type has the "in progress" status.
- The "Libraries" task card or the library view is open.

Duplicating faceplate type

1. Select a released faceplate type from the project library.
2. Select "Duplicate faceplate type" in the shortcut menu.
   A dialog opens.
3. Enter a name for the new faceplate type.
4. If necessary, add a comment or change the version number.
   The new faceplate type is in the same folder as the original.

Duplicating a version of a faceplate type

1. Select a released version of a faceplate type in the project library.
2. Select "Duplicate faceplate type" in the shortcut menu.
   A dialog opens.
3. Enter a name for the new faceplate type.
4. If necessary, add a comment or change the version number.
   The new faceplate type is in the same folder as the original.

See also

Editing a faceplate type (Page 4075)

Creating a faceplate type (Page 4062)

Resizing a faceplate

Introduction

In the faceplate type, specify the response of the faceplate when it is resized.

Requirements

- A faceplate type has been created.
- You have opened the "Faceplates" editor.
- The Inspector window is open.

Specifying the response to resizing

1. Activate "Properties > Properties > Layout > Fit to size > Auto-size".
2. Select the "Fixed aspect ratio" setting, for example.
   This setting retains the aspect ratio when you resize the faceplate.
3. Click the faceplate in the "Libraries" task card.
4. Select "Release version" in the shortcut menu.

Result

You have specified how the faceplate responds when its size in a screen is changed. You can change the response for a particular faceplate.

Select a faceplate in the screen. Select the required setting in "Properties > Properties > Layout > Characteristics" in the Inspector window.

See also

Creating a faceplate type (Page 4062)

Creating an instance of the faceplate type

Introduction

The faceplate type is stored in the project library. If you use the faceplate type in a screen, you create an instance of the faceplate type.

Note

Note that a faceplate is always configured for a particular class of HMI devices. For example, you cannot use a faceplate type that is configured for "RT Professional" in a screen on an "RT Advanced" HMI device.

Note

The number of faceplate instances per screen is not limited. However, you should be aware of the fact that the number of faceplate instances used, or the use of scripts in the faceplate instances, will have an impact on performance.

Requirement

- A screen is open.
- The "Libraries" task card is opened.
- The project library is open and it contains at least one faceplate type.

  Note

  Faceplate types are also stored in global libraries. When you add a faceplate type from the global library to the screen, the system automatically saves a copy of it to the project library.

- The Inspector window is open.

Procedure

1. Move the desired faceplate type from a library to the screen by drag&drop.

Result

You have created an instance of the faceplate type. The instance is given the version number of the most recently released type.

Configure the properties of the faceplate in the Inspector window as required. To dynamize the faceplate, open the interface in the Inspector window.

See also

Creating a faceplate type (Page 4062)

Example: Configuring a faceplate (Page 4081)

Removing faceplate from faceplate type

Introduction

Cancel application, to remove specified instances from the update of the faceplate type.

Requirement

- A faceplate type has been created.
- The faceplate must be used in a minimum of one screen.

Disconnect the faceplate object from faceplate type.

1. Select a faceplate on the screen.
2. In the shortcut menu, select "Disconnect faceplate object from faceplate type".

Result

The faceplate is independent of the associated faceplate type. Changes to the faceplate type are not updated in the faceplate.

See also

Creating a faceplate type (Page 4062)

12.1.7.5 Dynamizing faceplates

Basics of dynamizing faceplates

Application

You can dynamically control events and properties of faceplates in two ways:

- Dynamically controlling faceplates
  You configure the events or dynamic properties individually for the application point on the faceplate. To do this, define in the "Faceplates" editor that these properties and events are configurable in the faceplate. To dynamize the faceplates in the "Screens" editor, use the scripts and tags that are created in the project.
- Dynamizing the faceplate type
  You dynamize the objects which are contained in the faceplate type in the "Faceplates" editor. You configure the individual objects as in the "Screens" editor. Tags and scripts are available in the "Faceplates" editor to dynamize properties and events. You do not have access to the tags and scripts of the project within the faceplate.
  Every faceplate created with the faceplate type has the same preconfigured dynamization. You can edit this dynamic control only in the "Faceplates" editor.

Animation

WinCC provides preconfigured dynamic control in the "Animations" task card. You use animations to dynamize faceplates and faceplate types.

See also

Basics on faceplates (Page 4057)

Example: Configuring a faceplate (Page 4081)

Dynamizing faceplates

Introduction

You dynamize a faceplate in exactly the same way as you dynamize an object from the "Tools" task card.

You connect the dynamic properties of the faceplate in the "Screens" editior with a tag or a script which supplies values to the property in runtime.

You Include tags and scripts which you have created in the project for the faceplate.

Requirement

- A faceplate is inserted in the screen.

Procedure

1. Select the faceplate.
2. In the Inspector window, open "Properties > Animation".
   The animations available for the selected object are displayed.
3. Select "Horizontal movement" and click the  button.
   The parameters of the animation are displayed.
   A transparent copy of the object is shown in the work area, which is connected to the source object by means of an arrow.
4. Select a tag for control of movement.
5. Move the object copy to the relevant destination. The system automatically enters the pixel values of the final position in the Inspector window.
6. Customize the range of values for the tag as required.

Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement. The direction of movement corresponds to the configured type of movement "horizontal".

12.1.7.6 Examples of faceplates

Example: Configuring a faceplate

Introduction

In this example you create a faceplate in which you can convert the value of a length measuring system from kilometers into meters. The length in meters is displayed in an output field.

Procedures overview

The example is divided into the following steps:

1. Creating a faceplate type
2. Configuring a faceplate type
3. Creating a script in the faceplate type
4. Connecting a script with the contained objects of the faceplate type
5. Creating a faceplate and connecting with a tag

See also

Example: Creating an instance of the faceplate type (Page 4086)

Example: Configuring included objects (Page 4085)

Example: Creating a script in the faceplate type (Page 4083)

Example: Configuring a faceplate type (Page 4082)

Example: Creating a faceplate type (Page 4081)

Example: Creating a faceplate type

Task

You create a faceplate type.

Requirement

- A screen is open.
- The toolbox window is displayed.

Settings

For the example you require objects with the following settings:

Object	Object name	Properties
Text field	Label_Meter	Text: Meter
I/O field	Output_Meter	Mode: Output
Button	KM_to_Meter	Text OFF: Convert

Procedure

1. In the toolbox, click the individual objects and drag&drop the objects into the screen.
2. Set the properties as shown above.
3. Select all objects.
4. Select the "Create faceplate type" command in the shortcut menu of the multiple selection. The "Add type" window opens.
5. Enter "KMtoMeter" as type name.

Result

The faceplate type appears in the project library under the name "KMtoMeter". The faceplate type is assigned the "in progress" status.

See also

Example: Configuring a faceplate (Page 4081)

Example: Configuring a faceplate type

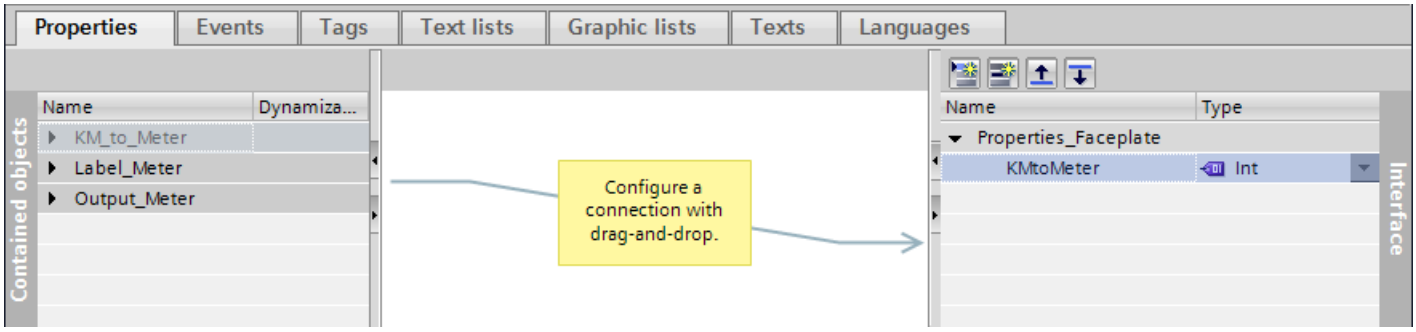
Job

You create the dynamic property and tag of the faceplate type.

Creating a new property

1. Click "Properties" in the configuration area of the faceplate.
2. In the "Interface" list, click the  icon "Add property".
   A new property is added to the "Interface" list.

3. Double click the name of the property and enter "KMToMeter".
4. Click the selection list and select the data type "Int".



Interim result

The "KMToMeter" property is displayed in the "Interface" list. The symbol identifies the dynamic property. The property will be linked to a tag in the next step.

Creating a tag in the faceplate type

1. Click "Tags" in the configuration area.
2. Click "Add" in the "HMI tags" table. A new tag is added to the table. The inspector window of the tag is opened.
3. In the Inspector window, select "Properties > Properties > General":
4. Enter "BB_Tag" as the name. Select the "Int" data type.

Result

The "KMToMeter" property and the "BB_Tag" of the faceplate type are created in the configuration area of the "Faceplates" editor.

See also

Example: Configuring a faceplate (Page 4081)

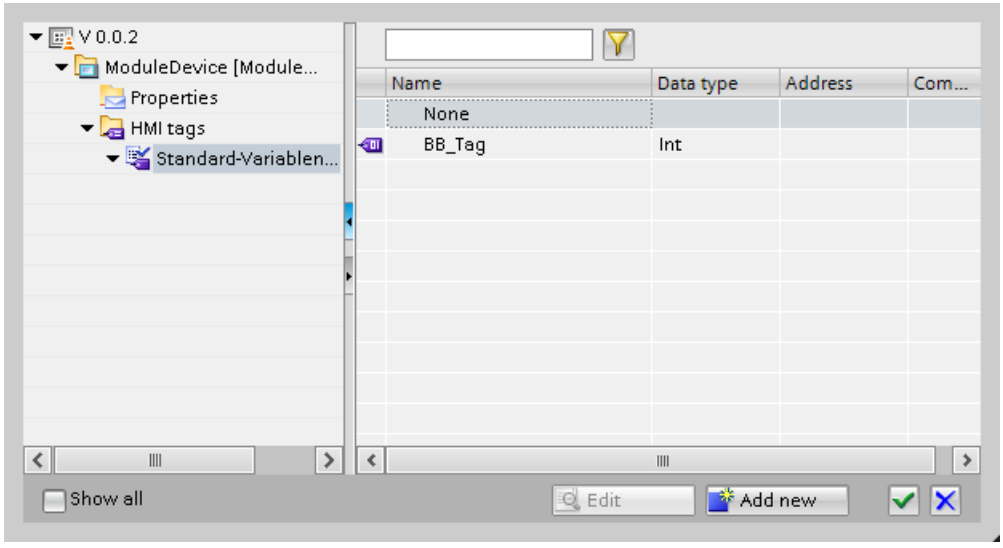
Example: Creating a script in the faceplate type

Task

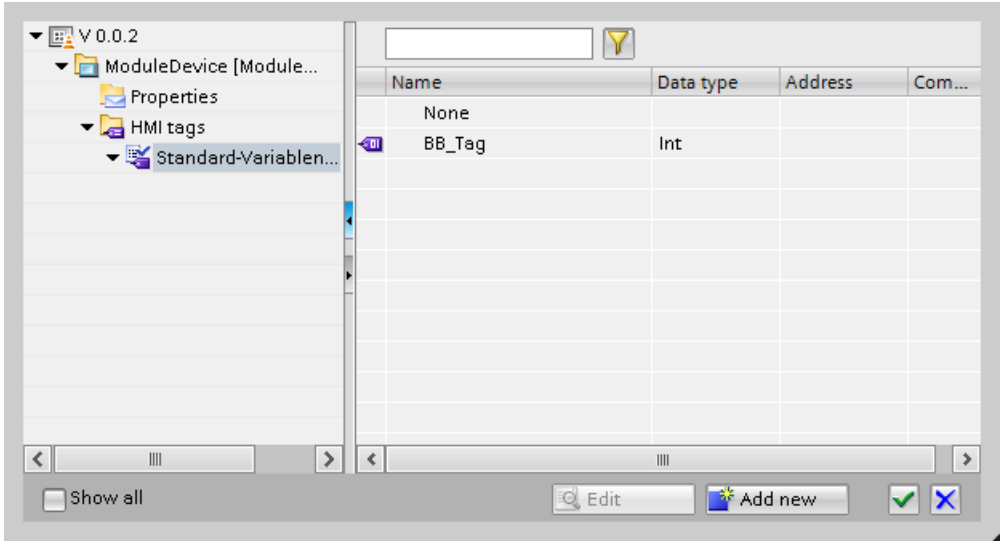
You create a script that converts the value of a length measuring system from kilometers to meters.

Procedure

1. Click "Scripts > Faceplate scripts" in the configuration area.
2. Double click "Add VB script".
3. Press the shortcut keys <CTRL+J>.
   The object list opens.
4. Click "HMI tags".
   The faceplate tag "BB_Tag" is displayed in the object list.

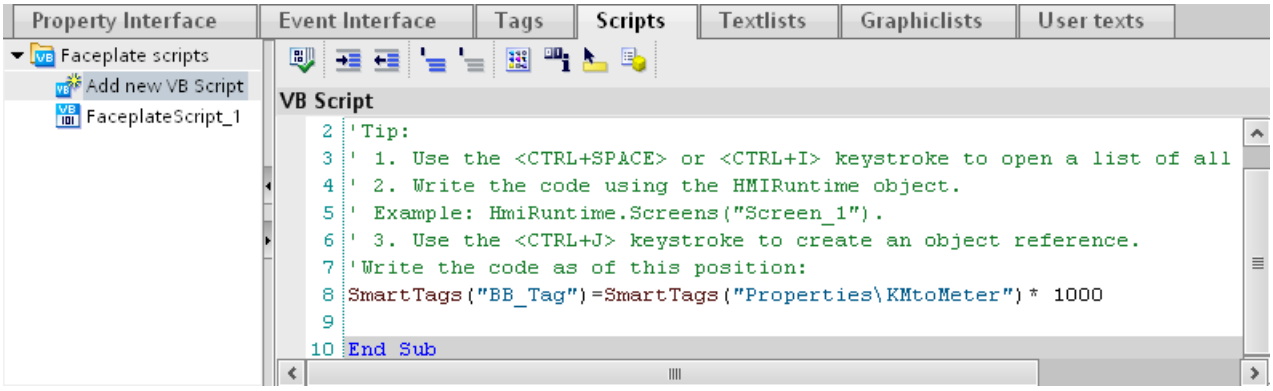


5. Select the faceplate type tag "BB_Tag". Confirm the selection.
6. Insert an "=" sign.
7. Press the shortcut keys <CTRL+J>. The object list is opened.
8. Click "Properties."
   The dynamic property "KMtoMeter" is displayed in the object list.



9. Select the "KMToMeter" dynamic property. Confirm the selection.

10. Enter "*1000" at the end of the code. This corresponds to the conversion factor from kilometers to meters.
11. Enter the name "Script_1" under "Properties > Properties > General >Setting > Name" in the Inspector window.



Result

The script has been created in the faceplate type. If you use the "KMtoMeter" faceplate type in a screen, you assign a tag to the "KMtoMeter" property. The value of this tag is multiplied by factor 1000 and assigned to the tag of the faceplate type "BB_Tag" as a new value. In this way you supply values to the tags of the faceplate type.

See also

Example: Configuring a faceplate (Page 4081)

Example: Configuring included objects

Task

You connect the included objects in the faceplate "KMtoMeter" to a faceplate tag and a faceplate script.

You connect the I/O field with the "BB_Var" tag of the faceplate type. You connect the "Click" event for a button to the script "Script_1".

Requirement

The faceplate is displayed in the "Faceplates" editor.

Interconnecting I/O field with a tag

1. Select the "Output_Meter" I/O field in the faceplate.
2. Connect the I/O field with the faceplate tag "BB_Tag" in the "General > Process > Tag" inspector window.

Connecting an event to a faceplate script

1. Select the "KM_to_Meter" button in the faceplate.
2. Select "Script_1" in the inspector window under "Events > Click".

Result

The I/O field is connected with the tag of the faceplate type. The button is connected with the script of the faceplate type.

If you click the button of the faceplate during runtime, the script is executed. The value of the tag of the faceplate is output in the I/O field.

See also

Example: Configuring a faceplate (Page 4081)

Example: Creating an instance of the faceplate type

Task

You insert the faceplate type "KMtoMeter" in a screen and assign a tag to the dynamic property "KMtoMeter".

Requirement

- The "Screens" editor is open.
- A new screen has been created.

Settings

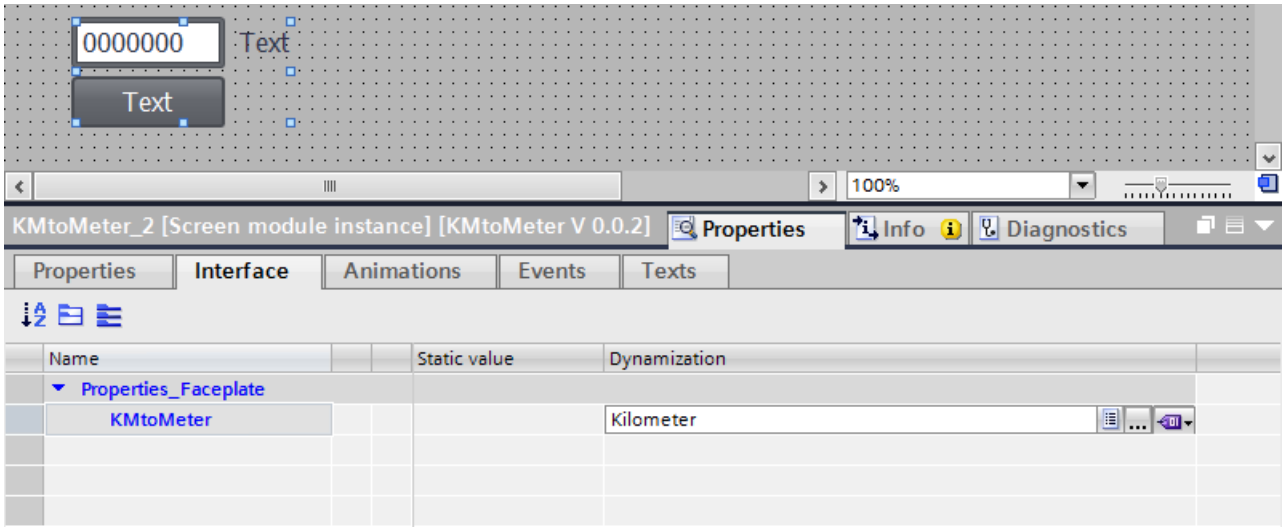
For the example you require a tag with the following settings:

Name	PLC connection	Type
Kilometer	No	ULong

Procedure

1. Create the HMI tag "Kilometer" with the settings named above.
2. Open the "project library" in the "Libraries" task card.
3. Move the "KMtoMeter" faceplate type into the screen by drag&drop.

4. Click "Properties > Properties > Interface" in the Inspector window.
   The table shows all the properties which you can dynamize in the faceplate.



5. Click the "Dynamization" column in the "KMtoMeter" line.
6. Select "HMI tag".
7. Click the "..." button.
8. Select the tag "Kilometer" from the object list.
9. Confirm the selection.

Result

The dynamic property "KMtoMeter" is linked with the "Kilometer" tag. During runtime the dynamic property is supplied with values of the "Kilometer" tag. The values are multiplied by factor 1000 in the script of the faceplate type and assigned to the tag in the faceplate as a new value.

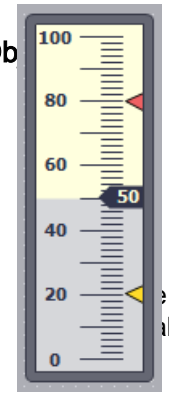
12.1.8.2 Ob



Bar

Application

displayed graphically using the "Bar" object. The bar graph can be labeled with lues.

Layout

In the Inspector window, you customize the settings for the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Color transition: Specifies the change in color display when limit values are exceeded.
- Displaying the limit lines / limit markers: Shows the configured limit as a line or marker.
- Define bar segments: Defines the gradations on the bar scale.
- Define scale gradation: Defines the subdivisions, scale markings and intervals of a bar scale.

Color transition

You define how the color change is represented in "Properties > Properties > Appearance" in the Inspector window.

Color transition	Description
"Segmented"	If a particular limit was reached, the bar changes color segment by segment. With segment by segment representation, you visualize, for example, which limits are exceeded by the displayed value.
"Entire bar"	If a particular limit was reached, the entire bar changes color.

Displaying limit lines and limit markers

You display the configured limit in the bar as a line or marking in Runtime using the "Lines" and "Markings" property:

1. In the Inspector window, select "Properties > Properties > Appearance":
2. Activate "Lines" and "Markings".

Define bar segments

Use the "Subdivisions" property to define the number of segments into which the bar is divided by the main gradations on the scale.

Use the "Interval" property to divide the distance between the main gradations. The value appears as the difference in value between two adjacent main gradations:

1. In the Inspector window, select "Properties > Properties > Scales":
2. Activate "Show scale."
3. Select the corresponding value for "Settings > Subdivisions".
4. Select the corresponding value for "Settings > Marks label".
5. Select the corresponding value for "Large interval > Interval".

See also

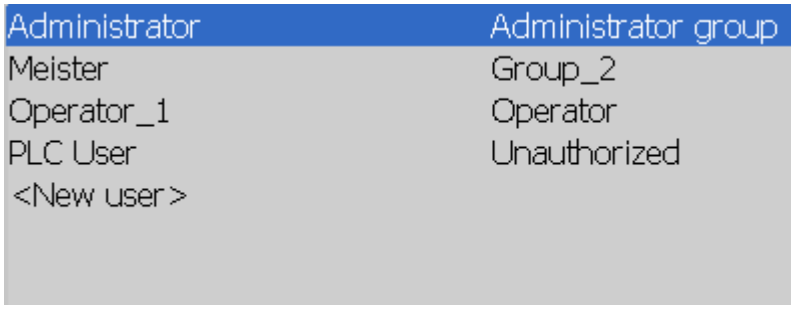
Device dependency of the objects (Page 4088)

User view

Simple user view

Application

The "User view" object is used to set up and administer users and authorizations.



Note

Do not use the user view in a group.

Note

The "Simple user view" object cannot be operated dynamically with a script.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Number of lines: Specifies the maximum number of visible entries.

Number of lines

The number of lines in the user view displayed in Runtime is specified in the Inspector window. The setting for the number of lines is only effective if the property "Fit object to contents" is active.

1. In the Inspector window, select "Properties > Properties > View".
2. Enter an integer value under "Number of lines".
3. In the Inspector window, activate "Properties > Properties > Layout".
4. Select "Fit object to contents".

Display in Runtime

The appearance depends on the authorizations:

- All users on the HMI device are displayed in the User view to the administrator or to a user with administrator authorizations.
- For a user without administrator rights, only the user's own entry is shown.

Operation

Depending on the configuration you can:

- Manage users, e.g. create, delete.
- Change existing user data.
- Export or import user data.

Note

The number is limited to 100 users and one PLC user on an HMI device. This restriction does not apply to PCs. On a PC, the maximum number of users is restricted by the physical memory.

Advanced user view

Application

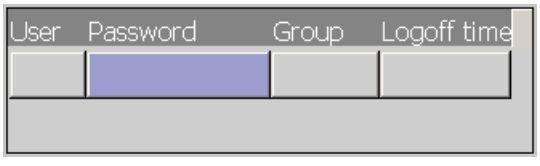
The "User view" object is used to set up and administer users and authorizations. The user view is used, for example, to create new users in Runtime and assign them to a user group.

Note

Configure only one user view at a time in one screen on the HMI devices TP 177A 6", TP 177A 6" (Portrait), OP 73 and OP 77A. Otherwise, a corresponding error message appears during generation.

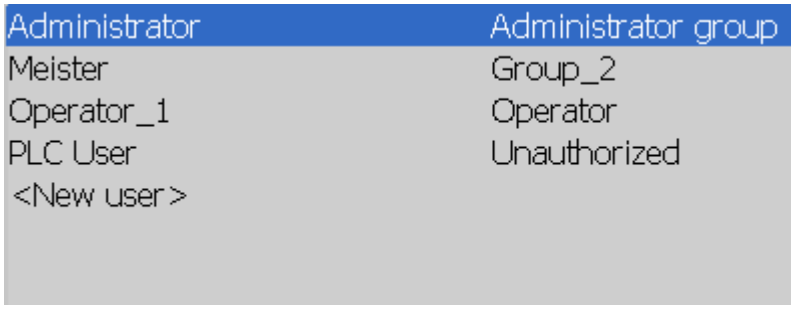
Advanced user view

Depending on the HMI devices, the extended or simple user view is available for administration of users and authorizations.



Changing the view type

On HMI devices with a display size larger than 6 ", you can configure both the advanced user view and a simplified user view. The view type is only available for configuration on devices up to device version V13.



Proceed as follows to configure the appropriate user view:

1. Click "Properties > Properties > Layout > Mode" in the Inspector window.
2. Select "Simplified" or "Advanced".

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Number of lines: Specifies the maximum number of visible entries.
- Columns moveable: Specifies whether the operator can change the sequence of columns in Runtime.

Number of lines

The number of lines in the user view displayed in Runtime is specified in the Inspector window. The setting for the number of lines is only effective if "Fit object to contents" is active.

1. Click "Properties > Properties > View" in the Inspector window.
2. Enter an integer value under "Number of lines".
3. Click "Properties > Properties > Layout" in the Inspector window.
4. Select "Fit object to contents".

Columns moveable

The operator can change the sequence of columns in Runtime with the "Columns movable" property.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Activate "Columns moveable".

This option is only available at the complex user view.

See also

Device dependency of the objects (Page 4088)

Configuring a user view (Page 4549)

User view (Page 4548)

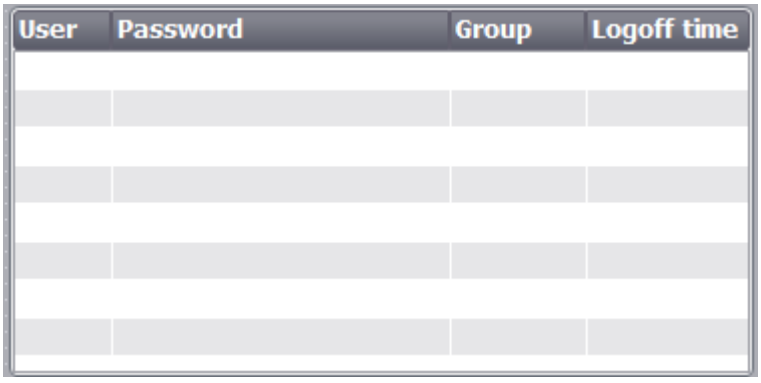
Creating users (Page 4550)

User view (as of V13)

Application

The "User view" object is used to set up and administer users and authorizations. The user view is used, for example, to create new users in Runtime and assign them to a user group.

On HMI devices with device version V13 or later, the table-based user view is available for managing users and authorizations.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Number of lines: Specifies the maximum number of visible entries.
- Columns moveable: Specifies whether the operator can change the sequence of columns in Runtime.

In addition, you set the borders, the fill pattern and the colors of the table header in the Inspector window.

Number of lines

The number of lines in the user view displayed in Runtime is specified in the Inspector window. The setting for the number of lines is only effective if "Fit object to contents" is active.

1. Click "Properties > Properties > View" in the Inspector window.
2. Enter an integer value under "Number of lines".

3. Click "Properties > Properties > Layout" in the Inspector window.
4. Select "Fit object to contents".

Columns moveable

The operator can change the sequence of columns in Runtime with the "Columns moveable" property.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Activate "Columns moveable".

Column width

In the Inspector window, you can change the width of columns displayed in runtime.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Enter integer values for the column width under "Columns".

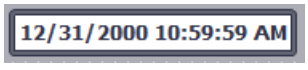
Note

The "Password" column is a dynamic column: it adapts to the outer dimensions of the object so that the object content occupies the entire width. The column width you assign is applied as the minimum size. In a dynamic column, the minimum size is changed; however, the width is displayed dynamically to fill the display.

Date/time field

Application

The "Date/time field" object shows the system time and the system date. The appearance of the "Date/time field" depends on the language set on the HMI device.



Layout

In the Inspector window, you customize the position, style, colors and font types of the object. You can adapt the following properties in particular:

- Display system time: Specifies that the system time is displayed.
- Include tag: Specifies that the time of the connected tag is displayed.
- Long date/time format: This setting defines the format displayed for the data and time.

Display system time

The time displayed in the "Date/time field" on the HMI device is specified in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "Format > System time".

Using tags

The time of the interconnected tag is displayed in the date/time field.

1. In the Inspector window, select "Properties > Properties > General".
2. In the "Format" area, select a tag with the "DateTime" data type, e.g. an internal tag.

Long date/time format

Visualization of the date and time is specified in the "Format" area under "General" in the Inspector window.

Option	Description
"Enabled"	Date and time are displayed in full, e.g. "Sunday, December 31, 2000 10:59:59 AM"
"Disabled"	Date and time are displayed in short form, e.g. "12/31/2000 10:59:59 AM"

Behavior during operation

When the operator ignores the syntax when entering values, or enters illegal values, the system rejects these. Instead, the original value (plus the time that has elapsed in the meantime) appears in the date/time field and a system event is displayed on the HMI device.

See also

Device dependency of the objects (Page 4088)

Example: 2. Configuring a Date/time field (Page 5993)

I/O field

Application

The "I/O field" object is used to enter and display process values.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Specifies the response of the object in Runtime.
- Display format: Specifies the display format in the I/O field for input and output of values.
- Hidden input: Specifies whether the input value is displayed normally or encrypted during input.

Note

Reports

In reports, I/O fields only output data. "Output" mode is preset. Properties for configuring input are not available, e.g. "hidden input".

Mode

The response of the I/O field is specified in the Inspector window in "Properties > Properties > General > Type".

Mode	Description
"Input"	Values can only be input into the I/O field in Runtime.
"Input/output"	Values can be input and output in the I/O field in Runtime.
"Output"	The I/O field is used for the output of values only.

Layout

The "display format" for the input and output of values is specified in "Properties > Properties > General > Format" in the Inspector window.

Layout	
"Binary"	Input and output of values in binary form
"Date"	Input and output of date information. The format depends on the language setting on the HMI device.
"Date/time"	Input and output of date and time information. The format depends on the language setting on the HMI device.
"Decimal"	Input and output of values in decimal form
"Hexadecimal"	Input and output of values in hexadecimal form
"Time"	Input and output of times. The format depends on the language setting on the HMI device.
"Character string"	Input and output of character strings.

Note

Data formats

Not all data formats are available for selection for Runtime Professional.

Hidden input

In Runtime the input can be displayed normally or encrypted, for example for hidden input of a password. A "*" is displayed for every character during hidden input. The data format of the value entered cannot be recognized.

1. In the Inspector window, select "Properties > Properties > Response":
2. Select "Hidden input".

Avoid overlaps in output fields

If several I/O fields are configured as output fields with a transparent background in a screen, these I/O fields may overlap. The transparent part of the one field covers the digits of the other field. This may cause display problems in Runtime. In order to avoid such overlaps, set the borders of the I/O fields to zero in the object properties under "Properties > Properties > Appearance". Select "Properties > Properties > Layout > Fit object to contents."

Limits

Under "Properties > Properties > Limits" in the Inspector window, set the colors for the values that violate the high or low limits.
You define the limits via the properties of a tag.

In Runtime Professional, you can also define the limit range for the entry in the I/O field via "Properties > Properties > Limits".

If you enter a numeric value outside this limit, it is not accepted; for example, 80 with a limit of 78. In this case, the HMI device generates a system event, if an alarm window is configured. The original value is displayed again.

Decimal places for numerical values

The configuration engineer can define the number of decimal places for a numerical input field. The number of decimal places is checked when you enter a value in this type of I/O field. Decimal places in excess of the limit are ignored. Empty decimal places are filled with "0".

Behavior when switching between input fields

When you change to another input field within the same screen, and the screen keyboard appears, the "Exit field" event is not executed for the previous field unless you close the screen keyboard.

See also

Using multiple tags simultaneously in a screen (Page 4214)

Ellipse

Application

The "Ellipse" is an enclosed object that can be filled with a color or pattern.

Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- Horizontal radius: Specifies the horizontal radius of the elliptical object.
- Vertical radius: Specifies the vertical radius of the elliptical object.

Horizontal radius

The horizontal radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 under "Horizontal."

Vertical radius

The vertical radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 at "Vertical."

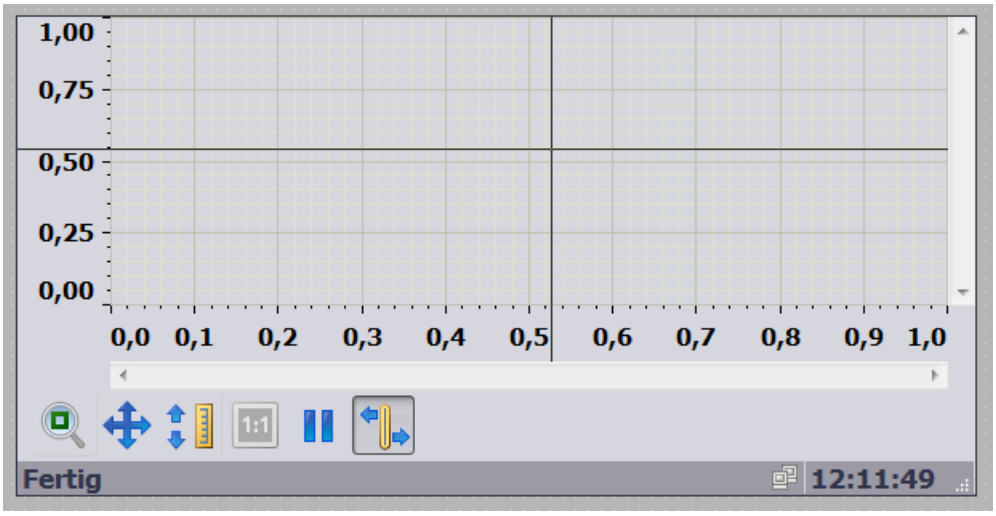
Flipping objects (Page 3951)

f(x) trend view

Application

You use the "f(x) trend view" object to represent the values of a tag as a function of another tag. This means that you can present temperature trends as a function of the pressure, for example.



Layout

In the Inspector window, you customize the position, shape, style, colors and font types of the object. You can adapt the following properties in particular:

- Adding and configuring trends
- Configuring a diagram
- Window settings
- Persistence
- Toolbar

Configuring trends

You create and configure trends in the Inspector window "Properties > Properties > Properties > Trend".

1. Select the data supply for the trend in the "Data source" column.
   - "Log tag": The trend window is supplied with values from a data log.
   - "Tags": The trend view is supplied with current values from the PLC. The values are constantly updated.
2. Configure the area of the trend display under "Data area".
   - "Time span": You define the time range using a starting time and a following time span.
   - "End time": You define the time range using a starting time and an end time.
   - "Measuring points": You define the time range using a starting time and a number of measuring points.
3. Configure the value range of the trend display under "X axis" and "Y axis".
4. Under "Limits", configure the colored marking of specific values, .e.g.. high and low limit, uncertain status.

Configuring a diagram

Configure the display of several trends under "Properties > Properties > Appearance":

- Common diagram or separate diagrams
- Common or separate axes
- Writing direction of all trends

Toolbar

The operator controls of the f(x) trend display are defined in the "Properties > Properties > Toolbar" Inspector window. The following operator controls are available for the f(x) trend view:

Button	Name	Function
	Zoom +/-	Increases or decreases the size of the trends in the trend window. Increase the size of the trends by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the trends.
	Zoom area	Increases the size of any section of the trend window. Specify an area in the trend window by using the mouse. This area of the trend window is enlarged.
	Zoom X axis	Increases or decreases the size of the X axis in the trend window. Enlarge the X axis by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the X axis.
	Zoom Y axis	Increases or decreases the size of the Y axis in the trend window. Enlarge the Y axis by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the Y axis.
	Trend area	Shift the trends in the trend window along the X axis and Y axis by using this button.

Button	Name	Function
	Axis area	Shift the trends in the trend window along the value axis by using this button.
	Original view	Switches from the magnified trend view back to the normal view
	Start/stop	Stops and starts the trend update. The values are buffered and updated as soon as you start trend update again.
	Ruler	Determines the coordination of a point of the trend.

The order of the buttons is fixed. The operator can set up individual key assignments, and shortcuts for every button on the toolbar.

Bar (Page 4097)

Device dependency of the objects (Page 4088)

Trend view (Page 4123)

Graphic view

Application

The "Graphic view" object is used to display graphics.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Graphic: Specifies the graphic file that is displayed in the object.
- Adjust graphic: Specifies the automatic size stretching for objects with graphics.
- Transparent color: Specify whether or not the transparent color is used for the graphic.

Inserting graphics

The following graphic format is used in the "Graphic view" object: *.bmp, *.tif, *.png, *.ico, *.emf, *.wmf, *.gif, *.jpg or *.jpeg. You may also use graphics as OLE objects in the Graphic view .

1. In the Inspector window, select "Properties > Properties > General".
2. Select the graphic that you wish to insert.
   The graphic preview is shown in the right pane.
3. Click "Apply" to insert the graphic in the Graphic view .

Adjust graphic

Whether a graphic displayed in a Graphic view is stretched to the size of the Graphic view in Runtime is specified in the Inspector window.

Option	Description
"No auto-sizing"	The size is not automatically adapted in Runtime.
"Fit graphic to object size"	The graphic is automatically adapted to the object size in Runtime.
"Fit object size to graphic"	Graphic display is adapted to the largest used graphic and other graphics are stretched.
"Adjust object size to graphic"	Graphic display is adapted to the largest used graphic but the other graphics retain their original size.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select the required size adjustment for the graphic.

Transparent color

This property defines whether the transparent color is used for the graphic to be displayed.

1. Click "Properties > Properties > Appearance" in the Inspector window:
2. Select "Background > Transparent".
3. Select a transparent color.

Note

When using bitmaps in WinCC screens the "Transparent color" setting demands a high character performance in the layout on the panel. Visualization performance is enhanced by disabling the "Transparent" setting in the properties of the relevant display object. This restriction applies in particular when bitmaps are used as background image.

Note

Basic Panels

The "Transparent" property is not available for Basic Panels.

See also

Device dependency of the objects (Page 4088)

Options for editing objects (Page 3939)

Storing an external image in the graphics library (Page 3974)

Graphic I/O field

Application

The "Graphic I/O field" object can be used to configure a list for display and selection of graphic files.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Specifies the response of the object in Runtime.
- Scroll bar type: Specifies the graphic layout of the scroll bar.

Note

Scroll bar

The scroll bar is available for Panels and Runtime Advanced up to device version V12.

Note

Reports

Graphic I/O fields output exclusively graphics in reports. "Output" mode is preset. Properties for configuring the selection of graphics are not available, e.g. "scroll bar".

Note

Border

You can configure the width and the style of the border of a graphic I/O field in the "Two states" mode.

Mode

The response of the "Graphic I/O field" object is specified under "Properties > Properties > General > Type > Mode" in the Inspector window.

Mode	Description
"Input"	The "Graphic I/O field" object is only used to select graphics.
"Input/output"	The "Graphic I/O field" object is used to select and display graphics.
"Output"	The "Graphic I/O field" object is used to display graphics only.
"Two states"	The "Graphic I/O field" object is only used to display graphics and can have a maximum of two states. You use no graphics list but insert one graphic each for the "ON" and "OFF" state.

Adjust graphic

Whether a graphic displayed in a graphic I/O field is stretched to the size of the view in Runtime is specified in the Inspector window.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select the required size adjustment for the graphic.

Scroll bar type

The response for the graphic representation of the scroll bar is specified under "Properties > Properties > Appearance > Scroll Bar > Type" in the Inspector window.

Type	Description
"Permanent"	The scroll bar is always visible.
"No scrollbar"	The scroll bar is not visible.
"Visible after clicking"	The scroll bar is made visible by a mouse click.

Behavior during operation

If the graphic I/O field displays a cactus image, a graphic to be output for a specific value has not been defined in the project. The contents of the graphic I/O field change color to show that it is now activated. The frame in 3D is only shown graphically in an output field.

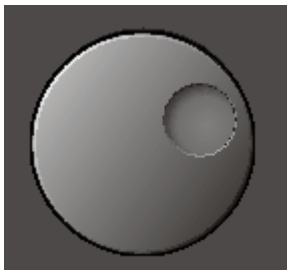
Device dependency of the objects (Page 4088)

Symbolic I/O field (Page 4174)

Handwheel

Application

The object "Handwheel" is a control element for some SIMATIC Mobile Panels. You can enter incremental values in Runtime using the "HandWheel" object.



Layout

You can set the following property in the Inspector window:

- Tag: Specifies the tags to which the "HandWheel" object is linked.

Tag

Global assignment

The "Tag" property is specified in the template for the global assignment of the "HandWheel" object. There is only one template for each HMI device.

1. In the Inspector window, select "Properties > Properties > General":
2. Select a tag from the selection list under "Settings > Tag".

Local assignment

The "HandWheel" object is assigned to another tag. To do so you configure a function that assigns the tag to the handwheel in Runtime.

Example for configuration to a button:

1. Open the screen in which the "HandWheel" object is assigned to another tag.
2. Drag the "Button" object from the toolbox to the screen. Select the button on your screen.
3. Click "Properties > Events > Click" in the Inspector window.

4. The "Function list" dialog box opens. Click the first line of the function list. The list of system functions and scripts available in the project appears.
5. Select the system function "SetTagToHandWheel" from the "Other functions" group. Select a tag from the combo box at "Value".

Note

The Mobile Panel may ignore the change of the value in the PLC made at another location while the handwheel is being operated. The value is the PLC is overwritten again.

See also

Device dependency of the objects (Page 4088)

Illuminated pushbutton (Page 4126)

Help indicator

Application

The object "help indicator" is available for the HMI devices OP 73 and KP300 Basic. If a a tooltip exists for the selected object, the help indicator is displayed during runtime. If a tooltip was configured for the opened screen, the help indicator always remains visible.

You configure the object "help indicator" exclusively in the global screen.

Layout

You can adapt the following properties in the Inspector window:

- Position: Determines the position of the object "Help indicator."

Position

You can use this property to set the position of the object "Help indicator."

1. Select the object "Help indicator" in the template.
2. In the Inspector window, select "Properties > Properties > Layout".
3. Enter a value for X and Y. You can also use the cursor keys to position the selected object.

If you have configured a screen object at this position, the visible help indicator covers the screen object. The help indicator is covered only by incoming system alarms and dialogs.

See also

Device dependency of the objects (Page 4088)

HTML Browser

Use

The "HTML Browser" object is designed for the visualization of simple HTML pages. This function allows you to draw up machine-specific descriptions which are stored centrally and which can then be displayed from different HMI devices.

Note

Switching the functionality of the HTML Browser to that of a file explorer by one of the following methods, for example, is not authorized in the context of WinCC:

- Entering a folder or drive, for example "\" or "C:" or
- Connecting to an FTP server, for example "ftp://"

One reason is to prevent inadvertent changes to files, their deletion or execution.

When configuring, ensure that the operator can only enter valid Internet addresses, for example, by using symbolic I/O fields. Configure a password-protected input for service purposes.

Note

Only one instance of the HTML Browser is supported per screen in Panels and RT Advanced to preserve memory space.

If you move quickly from a slide-in-screen to a pop-up screen and an HTML browser is configured in both screens, the second HTML browser will not open. Wait two seconds after closing the slide-in screen until the handle is no longer visible and then open the pop-up screen.

Layout

Customize the object position and size in the Inspector window. In particular, you can customize the following property:

- URL: Specifies which Internet address is opened in the HTML Browser.
- Tag for URL: Specifies the tag which sets the Internet address.

Address

The Internet address is specified in "Properties > Properties > General >URL" in the Inspector window.

Browser type (RT Advanced as of V13 SP1)

You can select the browser type in Runtime Advanced as of version V13 SP1.

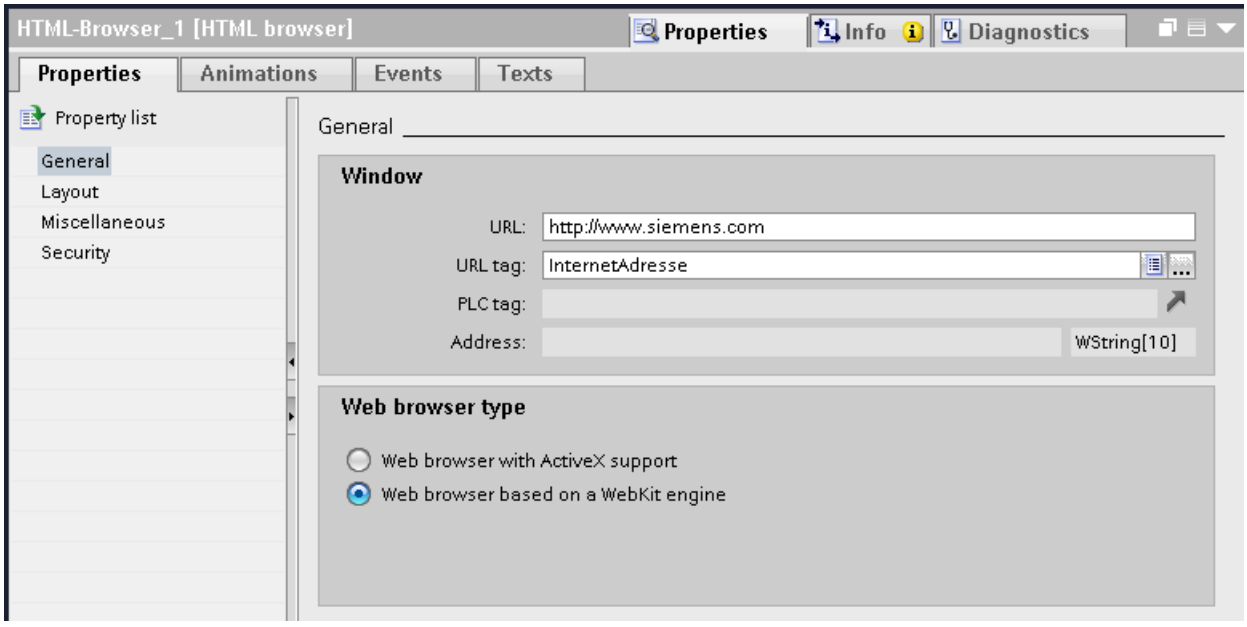
Specify the type of the web browser under "Properties > Properties > General > HTML Browser type" in the Inspector window.

Two options are available:

- Web browser based on WebKit engine without Active X support
- Web browser based on Internet Explorer with Active X support

Basic procedure

1. Create an internal tag of the "String" data type, for example, InternetAddress, in the "Tag" editor.
2. Insert the "HTML Browser" object in the screen in the "Screens" editor.
3. In the Inspector window, select "Properties > Properties > General".
4. At "Tag for the URL", select the "InternetAddress" tag from the selection list.
5. Insert an I/O field in the screen in the "Screens" editor.
6. In the Inspector window of the IO field "Properties > Properties > General > Tag for URL", select the "InternetAddress" tag from the selection list.



The HTML Browser opens the relevant page after the operator has entered an address in the I/O field.

Operator controls

Operator controls are configured buttons in the process screen or softkeys on the HMI device.

The "HTML Browser" object does not have its own operator controls. Assign the system functions used to control the "HTML Browser" object to your configured operator controls, such as buttons.

1. For example, drag the "Button" object to the screen from the toolbox.
2. Input a text of any length or select a graphic, for example Update.
3. In the Inspector window, select "Properties > Events > Click".
   The "Function list" dialog opens.
4. The system functions for controlling the "HTML Browser" object can be found in the list of system functions in the "Keyboard operation for screen objects" group.
   Select a function from the list, for example, HTMLBrowserRefresh.
5. Select the object name of the HTML Browser in which the command will be executed from the "Screen object" list.

Defining the website selection

To define the website selection that is provided in the HTML browser, you can define a number of allowed URL addresses.

You define a String or Wstring type tag or for the "Tag for URL" property of the HTML browser that can be filled with the predefined URL addresses in the following ways:

- Using the "SetTag" system function, which you configure on a button
- Using an I/O field

  Note

  Any website can be accessed by entering the address in an I/O field.

  To restrict the selection of allowed websites, use the provided pre-defined URL addresses via a system function or a script.

- Via a script (panels and RT Advanced only)
- Via the PLC

Comments

The functional scope of the HTML Browser is limited in comparison to the Internet Explorer:

- The HTML Browser will only show pure HTML pages. VBScript, Java, JavaScript, Flash and ActiveX controls are not supported. Set up the HTML pages for display in the HTML Browser by using a text editor or using a simple HTML editor.
- Links to embedded files, for example *.pdf or *.xls, are not supported.
- Queries and dialogs that are conducted during the access of, for example protected pages are not supported. When accessing protected pages enter your user name and password in the URL: <http://User_Name:Password@Server_Name> (for example, "http://Administrator:Admin123@192.168.0.199").

Note

The object "HTML Browser" supports dynamization.

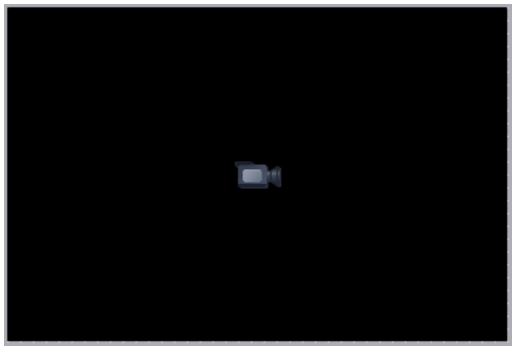
If you select the HTML browser type "Web browser, based on a WebKit En", only the variable connection is available for dynamization under "Address".

Camera view

Use

You use the "Camera view" object to configure the camera view which outputs screens for the operator in runtime from a connected network camera.

Monitoring with the help of the network camera lends itself for situations in which the operator has limited visibility of the plant or cannot get close to the machines. The operator can then respond to any problem much faster to remedy its cause.



The camera view can be configured in the following screens:

- In a screen
- In a template
- In a slide-in screen
- In a pop-up screen

Note

Device-dependency of the "Camera view" object

The "Camera view" object is available for Comfort Panels and KTP Mobile Panels (as of device version V13).

Note

Only one camera view may be in operation in runtime at the time.

Layout

You enter the information on the source of the video stream as well as position and size of the camera view in the Inspector window. You can adapt the following properties in particular:

- URL for the source of the video stream:
  - Camera URL: Specifies a static URL which is only entered during configuration.
  - Camera URL tag: Specifies a dynamic URL which the operator can change later in runtime.
- Transmission protocol: Specifies the transmission protocol by which the data exchange between the panel and the network camera takes place.
- Position and size of the camera view: Specifies position and size of the camera view as well as the aspect ratio and size of the displayed video stream.

Specifying URL for the source of the video stream

1. Insert the camera view in the screen in the "Screens" editor. The camera view is found in the task card "Tools" > "Controls".
2. Click "Properties > Properties > General > Media" in the Inspector window.
3. Enter the static camera URL in the "Camera URL" field, for example, "rtsp://user:password@192.168.56.208" for a Siemens camera.
   The address of the network camera is available in the network camera manual.

   Note

   The camera URL always starts with "rtsp://" and must only include permitted characters. If you enter characters that are not permitted or if the URL does not start with "rtsp://", the camera cannot be operated in runtime. The operator will receive an error message in the "Camera view" to indicate the problem.

   The following characters of the US ASCII character set are permitted:

   0123456789

   A...Z a...z

   !#$%&()*+,'-_./:;<=>?@ [\]_{|}~^(")`
4. Assign a tag to the camera view under "Camera URL tag" in the Inspector window. The tag must be of the data type "String" for external tags and "WString" for internal tags.
   When you assign a tag to the camera view, the user can change the source of the video stream in runtime.

Note

If you leave the "Camera URL tag" field blank, the static URL is used in runtime.

If you enter information in the "Camera URL" and "Camera URL tag" field, the dynamic URL is used in runtime.

Specifying the transmission protocol

1. Click "Properties > Properties > General > Media" in the Inspector window.
2. Specify the transmission protocol with the "Use UDP instead of TCP" check box.
   The selection of the protocol depends on the protocol types which your network camera supports. Information on supported protocols is available in the network camera manual.

Specifying position and size of the camera view

1. Click "Properties > Properties > General > Layout" in the Inspector window.
2. Enter the size of the object under "Camera view" in the "Position & Size" area. To achieve the best picture quality of the video stream, enter the physical resolution of the network camera as size of the camera view.
   The recommended setting "Keep video size" is selected by default in the "Fit to size" area. The "Keep aspect ratio" check box is disabled and cannot be selected.
3. To keep the aspect ratio of the video stream, disable "Keep video size".
   The "Keep aspect ratio" check box is automatically selected.

Note

The screen is not scaled when you keep the size of the video stream. The screen size of the network camera is output 1:1 by the camera view. If the camera view is smaller than the selected resolution of the network camera, only a corresponding section of the camera screen is output by the camera view. If the camera view is greater than the selection solution of the network camera, any blank spaces are displayed as black horizontal or vertical margins.

Any blank spaces are output as black horizontal or vertical margins by the camera view when you keep the aspect ratio of the video stream.

Note

When you disable the "Keep video size" and "Keep aspect ratio" check boxes, the camera screen may be distorted.

Result

You have configured a camera view which can be used for monitoring the plant in runtime.

Note

You cannot configure system functions for the camera view.

Note

When you test a project with the simulator, a black screen with a camera symbol is output.

See also

Device dependency of the objects (Page 4088)

Circle

Application

The "Circle" object is a closed object which can be filled with a color or pattern.

Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- Radius: Specifies the size of the circle.

Radius

The radius of the "Circle" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 in the "Radius" area.

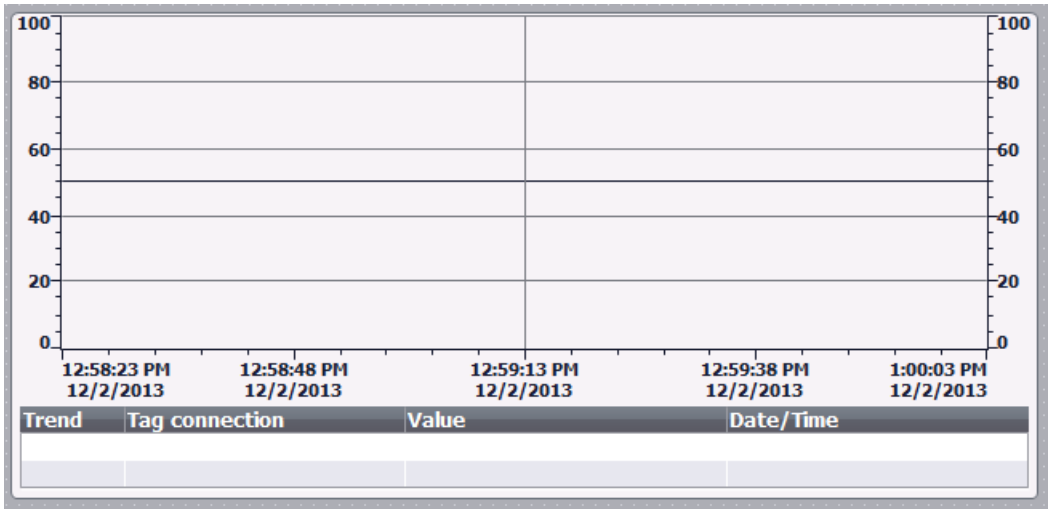
See also

Device dependency of the objects (Page 4088)

Trend view

Use

The trend view is meant for the graphical representation of tag values from the current process or from a log in form of trends.



Layout

In the Inspector window, you customize the position, geometry, style, color, and font types of the object. You can adapt the following properties in particular:

- Display value table, ruler and grid: Specifies whether a value table, a ruler or a grid is displayed in addition to the coordinate system to improve legibility.
- Toolbars: Defines the display of the operator controls.

Display value table, ruler and grid

For improved legibility a value table, a ruler and a grid can be displayed in Runtime.

1. Activate "Properties > Properties > Appearance > Show ruler".
2. Activate "Properties > Properties > Table > Show table".
3. Activate "Properties > Properties > Table > Show grid".

Toolbars

The layout of the operator controls is defined in the "Properties > Properties > Toolbar" inspector window.

Note

Basic Panels

Because archiving with Basic Panels is only possible for devices as of the 2nd Generation, the operator controls are not available on all Basic Panels.

Toolbar button	Brief description	Description
	"Go to start"	Scroll to the current value of the trend.
	"Zoom in"	Reduces the displayed time slice.
	"Zoom out"	Zooms into the displayed time section.
	"Ruler backward"	Moves the ruler back.
	"Ruler forward"	Moves the ruler forward.
	"Backward"	Scrolls back one display width.
	"Forward"	Scrolls forward one display width.
	"Ruler"	Shows or hides the ruler. The ruler displays the X-value associated with a Y-value.
	"Start/stop"	Stops trend recording or continues trend recording.

Configuration behavior

Displaying column headers

The layout of the table in the trend view depends on the view settings in the Control Panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Consistency test

If warnings or errors are displayed in the output window during a consistency check in connection with trend views, clicking "Go to Error/Tag" on the shortcut menu will not always take you to the exact error position. In some cases only the trend view is shown as cause of error.

Adding, configuring, and removing trends

The trends of the trend view are managed in the Inspector window under "Properties > Properties > Trend". You can copy trends between different trend views.

Trends (Page 4270)

Outputting tag values in screens (Page 4272)

Configuring trend display for values from the PLC (Basic) (Page 4268)

Charge condition

Application

The object "Charging condition" is a control element for some SIMATIC Mobile Panels. The "Charging condition" object indicates the charging status of the battery. Charge the battery in good time. Alternatively, you can replace the battery with a spare battery.

Layout

Symbol	Description	Charging condition
	Battery is charged	>20 %
	Battery must be charged	<20 % and >6 %
	Battery is weak	< 6 %

Operation

The object is for display only and cannot be controlled by the operator.

Effective range name (Page 4184)

Effective range name (RFID) (Page 4186)

Effective range signal (Page 4187)

WLAN reception (Page 4189)

Zone name (Page 4192)
Zone signal (Page 4193)

Illuminated pushbutton

Application

The object "Illuminated pushbutton" is a control element for some SIMATIC Mobile Panels. The LEDs can be activated by the PLC. The illuminated LED signals the operator in Runtime that the illuminated pushbutton has to be pressed. The illuminated pushbutton is configured in the global screen.

Layout

You can adapt the following properties in the Inspector window:

- Tag: Specifies the tag in which the status of the illuminated pushbutton is written.
- LED assignment: Specifies the assignment of the LED to the bit in the LED tag.

Tag

The "Tag" property is used to specify the global assignment of the "Illuminated pushbutton" object in the global screen.

Note

Information for configuring

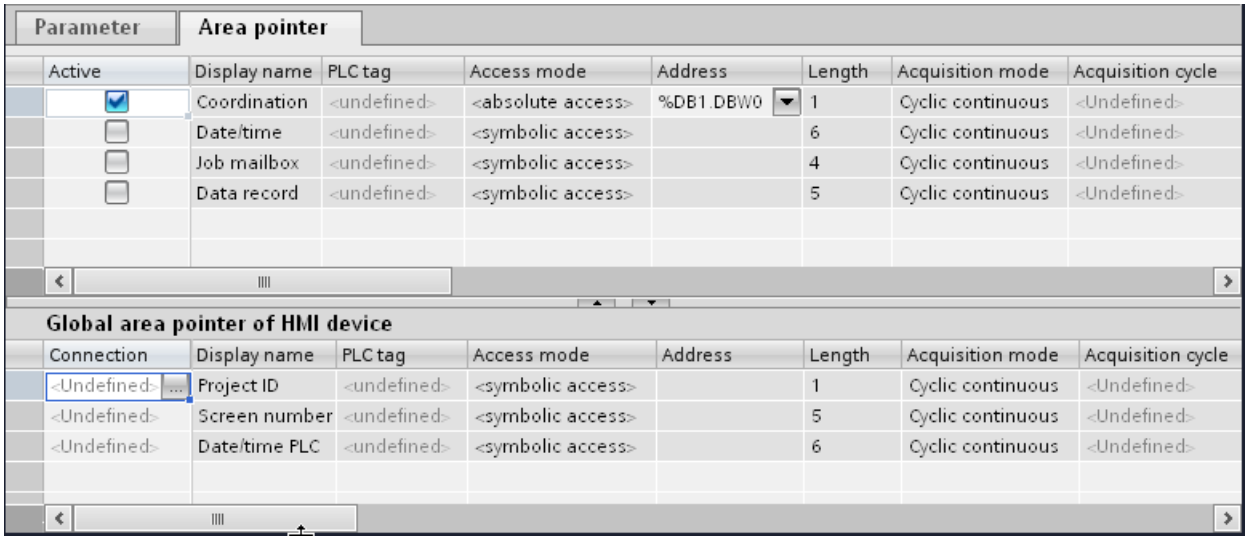
The current status of the illuminated pushbutton is written to the tag when Runtime is started and whenever the button is pressed. This may cause inconsistencies between the status of the illuminated pushbutton and the illuminated pushbutton tags.

1. If the tag has a connection to the PLC, the current value is transferred from the PLC to the tag after establishment of communication. The tag that contains the current status of the key is overwritten by this process. The illuminated pushbutton tag may therefore no longer reflect the current value of the illuminated pushbutton, for example if the Mobile Panel is switched off while the illuminated pushbutton is pressed.
2. If the illuminated pushbutton is pushed before communication to the PLC could be established (for example after a device start-up), it may not be possible to send the value of the illuminated pushbutton tag to the PLC. In this case the value of the tag in the PLC is different from the current status of the key.

Carry out the following configuration steps so that the illuminated pushbutton always reflects the actual state.

Basic procedure

1. Specify the connection to the PLC in the "Connections" editor. Activate the "Coordination" area pointer to ensure that the life bit is available to the PLC side.

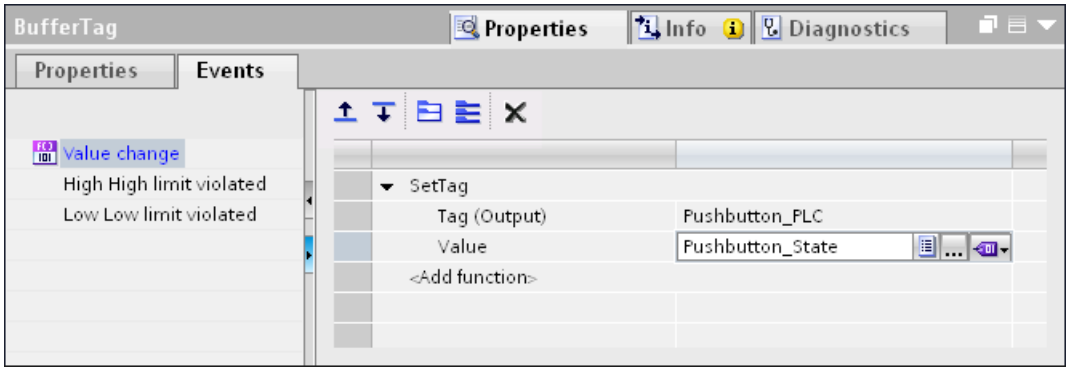


2. Open the "HMI tags" editor and create three tags.
   - Internal tag: Pushbutton_State
   - External tag: BufferTag
   - External tag: Pushbutton_PLC

3. Open the Inspector window of the "Pushbutton_State" tag.
4. In the Inspector window, select "Properties > Events > Value change". Click the first line of the function list. The list opens, showing the system functions available in the project.
5. Select the "SetTag" system function.
   - Select the "Pushbutton_PLC" tag at "Tag (output)".
   - Select the "Pushbutton_State" tag at "Value".

   The value of the "Pushbutton_PLC" tag is written to the PLC with the "Pushbutton_PLC" tag. A program in the PLC evaluates the life bit. If communication is established, the current value is written to the "Pushbutton_PLC" tag from the PLC. The "BufferTag" is required to transfer the current position of the pushbutton to the PLC.

6. Open the Inspector window of the "BufferTag" tag.
7. In the Inspector window, select "Properties > Events > Value change".
8. Click the first line of the function list. The list opens, showing the system functions available in the project.
9. Select the "SetTag" system function.
   - Select the "Pushbutton_PLC" tag at "Tag (output)".
   - Select the "Pushbutton_State" tag at "Value".



After establishing communication the current value is written to the "BufferTag" from the PLC. The "SetTag" system function is executed by the value change in the auxiliary tag. The system function re-allocates the value of the "Pushbutton_State" tag to the "Pushbutton_PLC" tag.

10. Open the global screen in the "Screen navigation" editor.
11. Select the illuminated key on the global screen.
12. Select the tag "Pushbutton_State" in "Properties > Properties > General > Settings >Tag" in the Inspector window.
    If you press the illuminated pushbutton, the value is written to the "Pushbutton_PLC" tag.

LED assignment

To actuate the LED an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration. The LED tag is specified at "LED tag" in the "Settings" area in the "General" group. With "LED bit" the allocated bit is given. When the bit is set the following states of the LED can be realized in runtime.

Bit n+1	Bit n	LED function
0	0	Off
0	1	Fast flash
1	0	Slow flash
1	1	On permanently

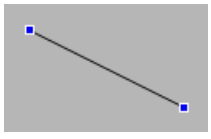
Device dependency of the objects (Page 4088)

Handwheel (Page 4114)

Line

Application

The "Line" object is an open object. The line length and gradient slope are defined by the height and width of the rectangle enclosing the object.



Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- Line style
- Line start and end

Line style

The representation of the line is specified under "Properties > Properties > Appearance" in the Inspector window. The line is shown without interruption if you select "Solid", for example.

Note

The line styles available depend on the selected HMI device.

Line start and end

The start and end points of the line are specified under "Properties > Properties > Appearance > Line ends" in the Inspector window.

Use arrow point, for example, as start and end point. The available start and end points depend on the device.

See also

Device dependency of the objects (Page 4088)

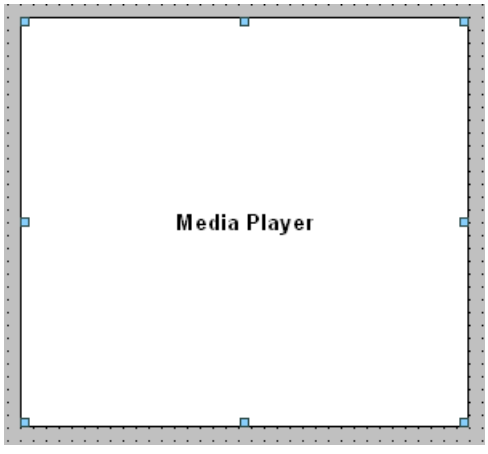
Media Player

Application

The Media Player is used in Runtime to play back video or audio files.

The Media Player is only available for the following devices:

- MP 377
- Comfort Panels



Layout

You can set the following properties in the Inspector window:

- Display status bar: Determines whether to display the status bar.
- Display operator controls: specifies the operator controls in Runtime.
- Show seek: establishes, whether a slider is available for the operation.

Operator controls

The operator controls that can be used to control the Media Player in Runtime are specified in the Inspector window under "Properties > Properties > Appearance > Elements".

Supported file formats

The following audio formats are supported by Media Player:

- Moving Picture Experts Group standard 1, Layer 1, 2, 3 (.mpa, .mp2, .mp3)
- Windows Media Audio (.wma)
- Waveform Audio (.wav)

The following video formats are supported by Media Player:

- Moving Picture Experts Group standard 1 (.mpg, .mpeg, .mpv, .mpe)
- Advanced Streaming Format (.asf)
- Windows Media Video Format (.wmv)
- Audio-Video Interleaved (.avi)

Note

Media Player does not support the creation and management of favorites. If you create favorites before closing the Media Player, they will not reappear when you open it again.

Note

The Media Player cannot be operated using the keyboard.

You cannot simulate the Media Player. A static screen appears in the simulation window instead of the Media Player.

Device dependency of the objects (Page 4088)

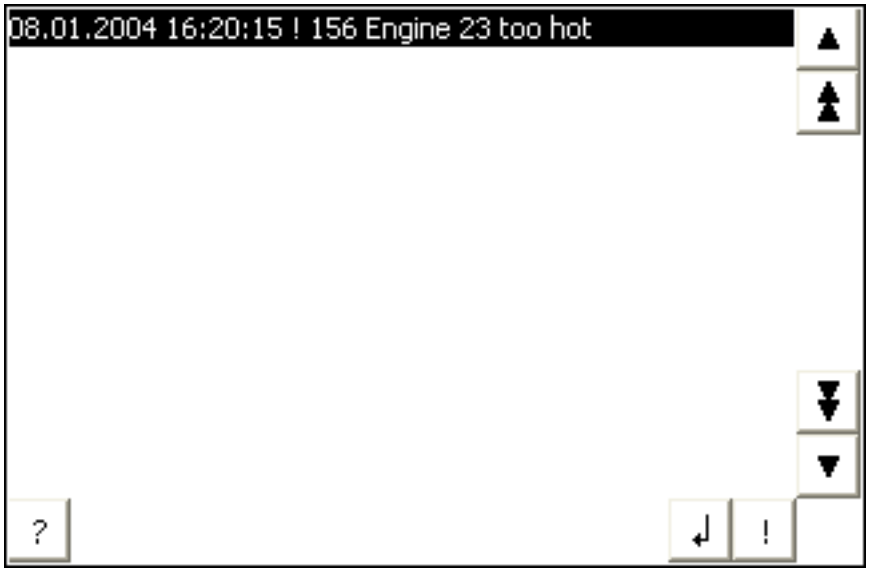
Alarm view

Simple alarm view

Application

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device.

The following screen contains a simple alarm view:



Note

The "Single alarm view" object cannot be operated dynamically with a script.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object.

Note

The fonts available for selection depend on the fonts you have configured in the Runtime settings under "Language & font" and the fonts supported by your HMI device.

You can adapt the following properties in particular:

- Operator controls: Defines the operator controls of the alarm view.
- Alarm classes: This setting defines which alarm classes are displayed in the alarm view.
- Columns: Specifies the displayed columns in Runtime.

Note

If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm display in Runtime are specified in the Inspector window under "Display > Settings". The following table shows the operator controls in the alarm view, and what they do:

Button		Function
"Info text"		Displays info text for an alarm.
"Acknowledge"		Acknowledges an alarm.
"Loop-In-Alarm"		If a screen change is configured, the display switches to a screen containing information about the alarm.

Select alarm classes

1. Click "Properties" in the Inspector window.
2. Under "Alarm classes", activate the alarm classes to be displayed in the alarm view in Runtime.

Define columns

Define the columns to be displayed in the alarm view in Runtime in the Inspector window.

1. In the Inspector window, click "Properties > Columns".
2. Activate the columns that are to be displayed in Runtime under "Columns".

Displaying column headers

The layout of the alarm view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Layout tab" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

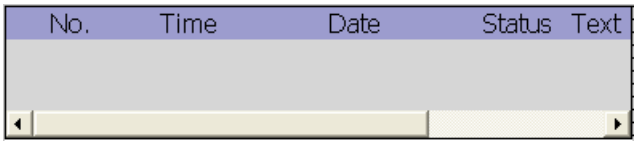
Note

In the engineering system you can dynamically control the visibility of an object, for example, in the "Animations" group of the Inspector window. In Runtime, the "Simple alarm view" does not support animations. If you have configured an animation and, for example, wish to perform a consistency check of the project, then an error alarm is issued in the Output window.

Extended alarm view

Alarm view

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device. The following screen contains an alarm view with no content:



Alarm line

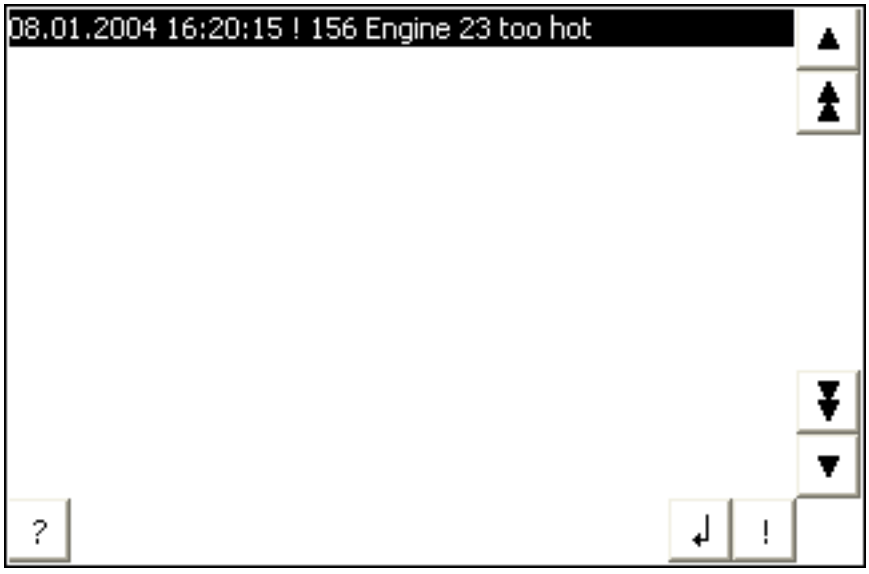
The alarm line allows display of the most current pending alarm in Runtime. The following figure shows an alarm line:

How to configure the alarm line:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Mode > Alarm line".

Changing the view type

On HMI devices with a display size larger than 6 ", you can configure both the advanced alarm view and a simplified alarm view. The view type is only available for configuration on devices up to device version V13.



Proceed as follows to configure the simplified user view:

1. Click "Properties > Properties > Layout > Mode" in the Inspector window.
2. Select "Simplified".

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object.

Note

The fonts available for selection depend on the "Language and fonts" you have configured in the device settings and the fonts your HMI device supports.

You can adapt the following properties in particular:

- Operator controls: Defines the operator controls of the alarm view.
- Alarm classes: This setting defines which alarm classes are displayed in the alarm view.
- Columns: Specifies the displayed columns in Runtime.
- Sequence of columns: Specifies whether the sequence of columns can be changed in Runtime.
- Identification of alarm classes: To be able to distinguish various alarm classes, they are identified in the first column of the alarm view.
- Filter: Defines that only alarms that contain a specific character string will be displayed in the alarm text.

- Enable sorting: Specifies whether the alarms can be sorted in Runtime by date and time.
- Define display area: This setting specifies the date from which alarms are displayed in the alarm view.

Note

If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm view in Runtime are specified in the Inspector window under "Properties > Properties > Display > Settings". The following table shows the operator controls in the alarm view, and what they do:

Button		Function
"Tooltip"		Displays a tooltip for an alarm.
"Acknowledge"		Acknowledges an alarm.
"Loop-In-Alarm"		If a screen change is configured, the display switches to a screen containing information about the alarm.

Select alarm classes

1. Click "Properties > Properties > General" in the Inspector window.
2. Under "Alarm classes", activate the alarm classes to be displayed in the alarm view in Runtime.

Access protection in Runtime

Configure access protection in the "Properties > Security" group in the properties of the alarm view. If a logged-on user has the required authorization, he can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-on user does not have the required authorization, or if no user is logged in, pressing the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the logon dialog.

Define columns

Define the columns to be displayed in the alarm view in Runtime in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate the columns that are to be displayed in Runtime under "Columns".

Sequence of columns

If this property is enabled, the column sequence in the alarm view can be changed in Runtime.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Column order".

Enable sorting

If this property is enabled, the alarms displayed in the alarm view in Runtime can be sorted by date and time.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Sorting by date/time possible".

Filter alarms

This property is used to define that only alarms that contain a configured string in the alarm text will be displayed in Runtime for the extended alarm view.

1. In the Inspector window, select "Properties > Properties > Filter.
2. Enter the required term for filtering in the field "Filter string".
   Alternatively, you configure a filter tag using the field "Filter tag". The contents of the filter tag serve as the filter criterion in Runtime.

Identify alarm classes

An icon is displayed in the first column of the alarm view. This symbol allows the alarm to be allocated to an alarm class.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Columns > Alarm class".
3. Open the "Alarms" editor, and click the "Alarm classes" tab.
4. Specify an icon for use to identify the alarms of this alarm class for an alarm class in the "Display name" column.

Note

The "alarm view" object cannot be grouped.

Define display area

You select a tag which defines the time from which alarms should be displayed. The following data types are permitted:

- External tags: Date, Date_and_Time, Time_of_Day
- Internal tags: DateTime

To define the display area, proceed as follows:

1. Click "Properties > Properties > Display" in the Inspector window.
2. Define the tag in which the time is specified under "Control tag for the display area".

Configuration behavior

Displaying column headers

The layout of the alarm view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Layout tab" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Displaying the buttons for operation

The alarm view in the HMI devices OP 73, OP 77A and TP 177A has a button which displays the alarm text in a separate window. This button is not shown during configuration.

The display of the buttons for using the alarm view depends on the configured size. You should check on the HMI device whether all necessary buttons are available.

See also

Device dependency of the objects (Page 4088)

Alarm window (Page 4142)

Alarm indicator (Page 4144)

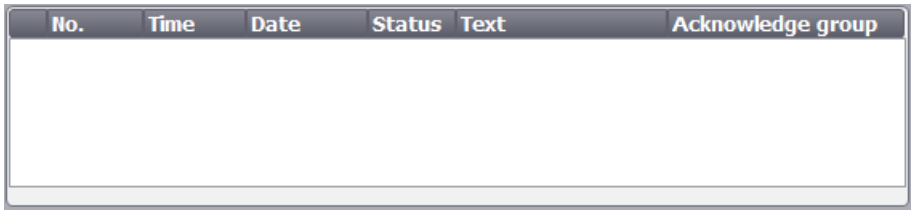
Configuring an alarm view for active alarms (Page 4318)

Alarm view (as of V13)

Use

Advanced alarm view is used to display alarms on the HMI device.

On HMI devices with device version V13 or later, the advanced table-based alarm view is available for managing alarms.



Alarm line

The alarm line allows display of the most current pending alarm in Runtime. The following figure shows an alarm line:

How to configure the alarm line:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Mode > Alarm line".

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object.

Note

The fonts available for selection depend on the fonts you have configured in the Runtime settings under "Language & font" and the fonts supported by your HMI device.

You can adapt the following properties in particular:

- Toolbar: Defines the operator controls of the alarm view.
- Alarm classes: This setting defines which alarm classes are displayed in the alarm view.
- Columns: Specifies the displayed columns in Runtime.
- Columns moveable: Specifies whether the sequence of columns can be changed in Runtime.
- Identification of alarm classes: To be able to distinguish various alarm classes, they are identified in the first column of the alarm view.
- Filter: Defines that only alarms that contain a specific character string will be displayed in the alarm text.
- Define display area: This setting specifies the date from which alarms are displayed in the alarm view.
- Sorting by date/time possible: Specifies whether the alarms can be sorted in Runtime by date and time.

  Note

  If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm view in Runtime are specified in the Inspector window under "Properties > Properties > Toolbar". The following table shows the operator controls in the alarm view and their function:

Button	Designation	Function
	"Tooltip"	Displays a tooltip for an alarm.
	"Acknowledge"	Acknowledges an alarm.
	"Loop-in-alarm"	If a screen change is configured, the display switches to a screen containing information about the alarm.

Select alarm classes

1. Click "Properties > Properties > General" in the Inspector window.
2. Under "Alarm classes", activate the alarm classes to be displayed in the alarm view in Runtime.

Access protection in Runtime

You can configure access protection in the "Properties > Security" group in the properties of the alarm view. A logged-on user with the required authorization can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-on user does not have the required authorization, or if no user is logged in, pressing the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the logon dialog.

Define columns

Define the columns to be displayed in the alarm view in Runtime in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate the columns that are to be displayed in Runtime under "Visible columns".

Sequence of columns

If this property is enabled, the column sequence in the alarm view can be changed in Runtime.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Columns moveable".

Sorting

If this property is enabled, the alarms displayed in the alarm view in Runtime can be sorted by date and time.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Sorting by date/time possible".

Filter alarms

This property is used to define that only alarms that contain a configured string in the alarm text will be displayed in Runtime for the extended alarm view.

1. In the Inspector window, select "Properties > Properties > Filter.
2. In the "Filter string" field, enter the desired term for filtering.
   Alternatively, you can configure a filter tag using the "Filter tag" field. The contents of the filter tag serve as the filter criterion in Runtime.

Identify alarm classes

An icon is displayed in the first column of the alarm view. This symbol allows the alarm to be allocated to an alarm class.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Visible columns > Alarm class name".
3. Open the "Alarms" editor, and click the "Alarm classes" tab.
4. Specify an icon for use to identify the alarms of this alarm class for an alarm class in the "Display name" column.

Note

The "alarm view" object cannot be grouped.

Define display area

You select a tag which defines the time from which alarms should be displayed. The following data types are permitted:

- External tags: Date, Date_and_Time, Time_of_Day
- Internal tags: DateTime

To define the display area, proceed as follows:

1. Click "Properties > Properties > Display" in the Inspector window.
2. Define the tag in which the time is specified under "Control tag for display area".

Displaying column headers

The layout of the alarm view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Layout tab" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Alarm window

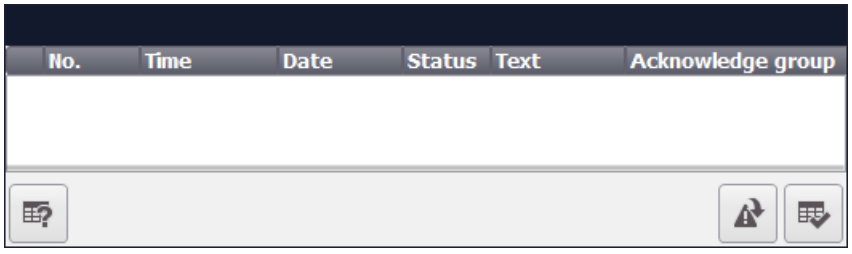
Use

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device. The layout and operation of the Alarm window are similar to that of the Alarm view. The Alarm window has the following characteristics that are the same as in the Alarm view:

- Alarm window
- Alarm line: The alarm line is not available on Basic Panels.

The Alarm window is configured in the "Global screen" editor.

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged.

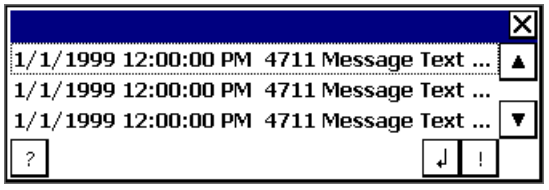


Note

In the engineering system you dynamize, for example, the visibility of an object in "Properties > Animations" in the inspector window. In Runtime, the "Simple alarm window" object does not support animations. If you have configured an animation and, for example, wish to perform a consistency check of the project, then an error alarm is issued in the Output window.

Simple alarm window

The simple alarm window is available on Basic Panels with a device version prior to V13 to display the alarms.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You configure the Alarm window in the same way as the Alarm view. In addition you adapt the following properties:

- Fixed alarm window: Specifies that the Alarm window retains the focus after a screen change.
- Window: You define the operator input and response of the Alarm window in Runtime.

Note

If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm view in Runtime are specified in the inspector window under "Properties >Display > Settings". The following table shows the operator controls in the Alarm window, and what they do:

Button		Function
"Tooltip"		Displays a tooltip for an alarm.
"Acknowledge"		Acknowledges an alarm.
"Loop-In-Alarm"		If a screen change is configured, the display switches to a screen containing information about the alarm.

Access protection in Runtime

Configure access protection under "Properties > Properties > Security" in the inspector window of the alarm view. If a logged-on user has the required authorization, he can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-in user does not have the required authorization, or if no user is logged in, clicking the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the login dialog box.

Note

Basic Panels

Access protection is not available for Basic Panels.

Activating the focus of the Alarm window

Select the following option so that the Alarm window does not lose the focus after a screen change:

1. In the Inspector window, select "Properties > Properties > Mode".
2. Enable "Label".

Window

Define the response of the Alarm window under "Properties > Properties > Mode > Window" in the inspector window. The following table shows the possible properties:

Option	Function
Automatic display	The Alarm window is automatically displayed when a system alarm occurs, for example.
Closable	The window closes again after a set time has elapsed. You define the display duration in the alarm settings.
Modal	The Alarm window is linked to a confirmation, such as: Alarm must be acknowledged. If the modal alarm window has the focus, the buttons in the screen behind it cannot be used. The functions configured on a function key are carried out.
Sizeable	You can change the size of the Alarm window in Runtime.

Device dependency of the objects (Page 4088)

Extended alarm view (Page 4134)

Alarm indicator (Page 4144)

Configuring an alarm window (Page 4325)

Alarm indicator

Application

The alarm indicator is a graphic symbol that shows current errors or errors that need to be acknowledged, depending on the configuration. The alarm indicator is configured in the "Global screen" editor. The following figure shows an alarm indicator:

Alarm indicator OP 73

A "simple" alarm indicator is available for the HMI OP 73. The following diagram shows the alarm indicator for the OP 73 HMI devices:

The "simple" alarm indicator shows alarms to be acknowledged or alarms which have already been acknowledged and have not yet gone. Only the position can be defined for the "simple" alarm indicator. The alarm indicator is displayed on the device at the selected position. If you have configured a screen object at this position, the visible alarm indicator covers the screen object. The alarm indicator is covered by system dialogs, such as the login dialog, Help dialog, and alarm windows.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Alarm classes: Establishes the alarm classes where the alarm indicator is displayed.
- Operator control in Runtime: Defines the operator actions in Runtime that cause the Alarm window to open.

Alarm classes

You define which alarm classes are shown with an alarm indicator in "General > Alarm classes" in the Inspector window. Alarm classes, such as "Warnings" or "Errors".

Define operator control in Runtime

1. Select the alarm indicator in the screen.
2. Click "Events > Click" or "Click when flashing" in the Inspector window.
3. The "function list" opens. Click the first line of the function list. The list of system functions, and scripts available in the project opens.
4. Select the "ShowAlarmWindow". system function under "Alarms."
5. Under "object name" select the name of the Alarm window from the selection list. Under "Layout", define whether the Alarm window should be visible, hidden, or should toggle between the two states.

Extended alarm view (Page 4134)

Alarm window (Page 4142)

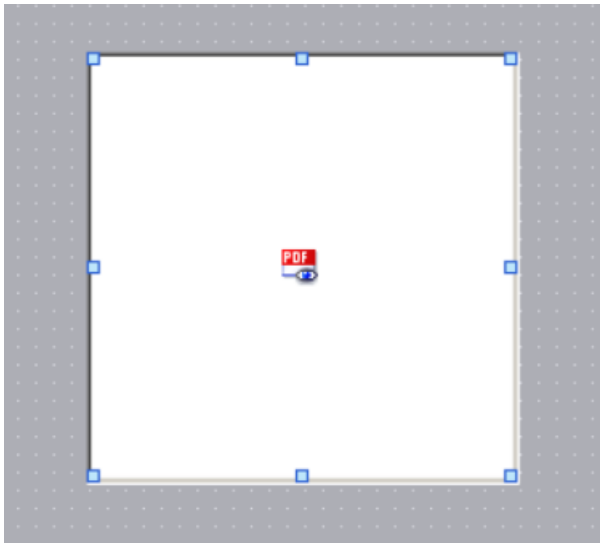
Configuring an alarm indicator (Page 4326)

PDF view

Application

Using the object "PDF view" you project a PDF view on which the operator can open and display documents in PDF format in runtime. The documents in PDF format are located in the internal or external memory of the respective HMI device in this case.

The PDF view supports the PDF version 1.7.



You can configure the PDF view in the following:

- In a screen
- In a template
- In a slide-in screen
- In a pop-up screen

Note

The "PDF view" object may be configured multiple times in a project. However, a maximum of one PDF view may be active at the same time.

Note

Device dependency of the "PDF view" object

The "PDF view" object is only available for KTP Mobile Panels, Comfort Panels and RT Advanced.

Note

Only one "PDF view" object may be inserted per screen.

Layout

You provide information about the position and size of the PDF view in the Inspector window. You can adapt the following properties in particular:

- File name: Specifies the PDF file that opens by default in the PDF view.
- File name tag: Specifies the tag that opens any PDF file.

Basic procedure

1. Create an internal tag of data type "String" in the "Tag" editor, for example, "PDFFile".
2. Insert the PDF view in the screen of the "Screens" editor. The PDF view is available in the "Tools > Controls" task card.
3. In the Inspector window, select "Properties > Properties > General".
4. Enter the file name of the PDF file that opens by default in runtime in "File name". You can also leave the "File name" field blank.
5. For "File name tag", select the "PDFFile" tag from the selection list.
6. Insert an I/O field in the screen in the "Screens" editor.
7. In the Inspector window of the I/O field "Properties > Properties > General > Tag" select the "PDFFile" tag from the selection list.
8. Assign the PDF view the "PDFFile" tag under "File name tag" in the Inspector window.
9. Create a text field for the label in the configured I/O field, for example, "PDF path".

If the operator enters the file name along with the path in the I/O field, the PDF view opens the file in question.

Operator controls

Operator controls are configured buttons in the process picture or softkeys on the HMI device for operating the object.

The "PDF view" object does not have its own operator controls. Configure operator controls yourself, for example, buttons, and link the operator controls with system functions.

1. For example, drag the "Button" object to the screen from the toolbox.
2. Enter a text of any length.
3. In the Inspector window, select "Properties > Events > Click". The "Function list" dialog box is opened.
4. The system functions for operation of the PDF view are available in the list of system functions in the group "Keyboard operation for screen objects". From the list select a function, for example, "PDFZoomIn".
5. From the "Screen object" list, select the object name of the PDF view in which the command is executed.

System functions

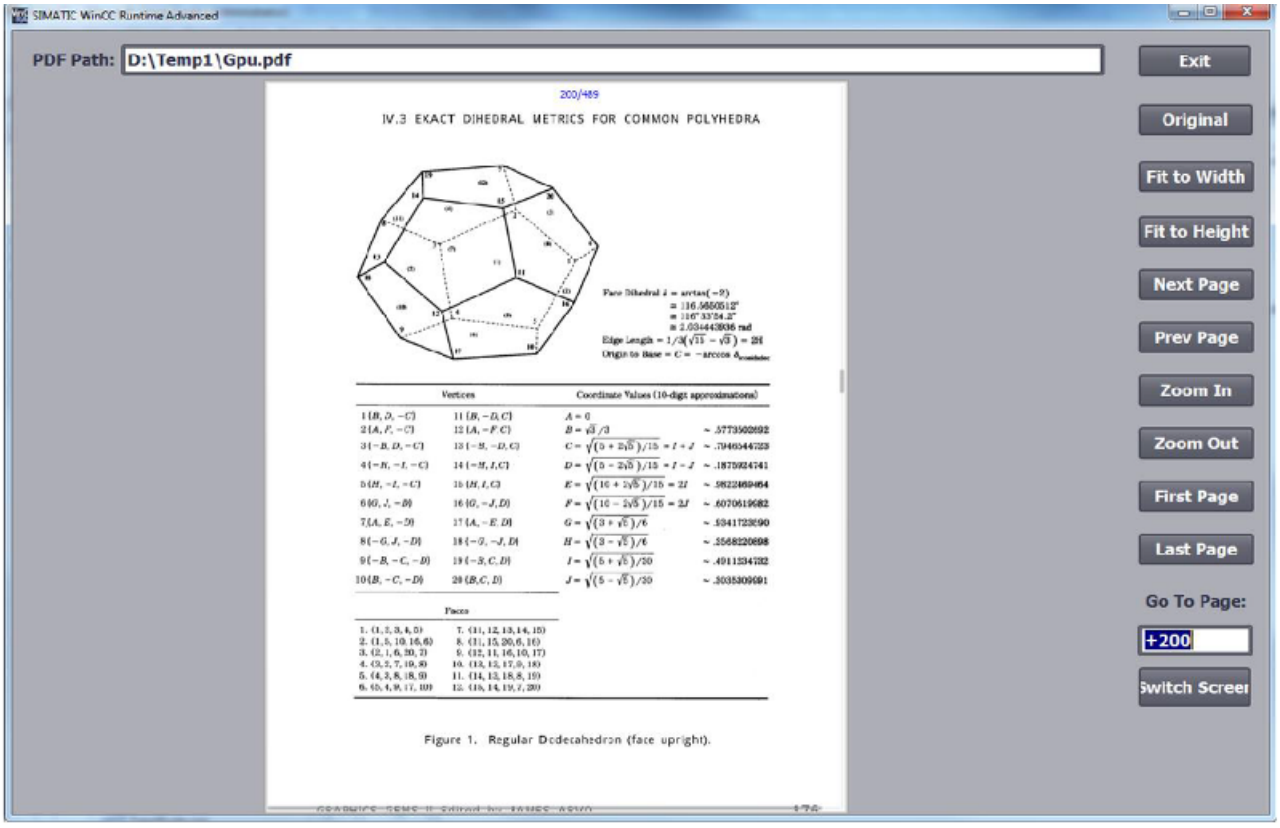
The following system functions are available for the "PDF view" object:

System function	Description
"PDFZoomIn"	Zooms in one zoom level
"PDFZoomOut"	Zooms out one zoom level
"PDFGotoNextPage"	Moves to the next page
"PDFGotoPrevious-Page"	Moves to the previous page
"PDFGotoFirstPage"	Moves to the first page
"PDFGotoLastPage"	Moves to the last page
"PDFFitToWidth"	Fits the display to fit the width of the PDF view window
"PDFFitToHeight"	Fits the display to the height of the PDF view window
"PDFZoomOriginal"	Changes the display to the original size
"PDFScrollUp"	Scrolls up
"PDFScrollDown"	Scrolls down
"PDFScrollLeft"	Scrolls to the left
"PDFScrollRight"	Scrolls to the right
"PDFGotoPage"	Moves to the specified page

Note

Scrolling on all HMI devices also works with multi-touch operation.

The figure below shows a PDF view with the configured operator controls:



Comments

Compared to Adobe Acrobat, the PDF view has limited functionality:

- The PDF view does not support links.
- The PDF view supports zoom levels 25% to 200%.

Note

The "PDF view" object cannot be addressed by using VB scripting.

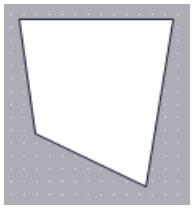
See also

Device dependency of the objects (Page 4088)

Polygon

Application

The "Polygon" is a closed object which you can fill with a background color.



Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. In particular, you can customize the following property:

Geometry: Modifies, deletes or adds corners.

Geometry

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select the required corner point in the "Geometry" area. Input a value at "X position " and "Y position ".
3. To add a corner point, click the button.
4. To delete a corner point, click the button.

Alternative procedure

You can also change, delete, or add new corner points using the mouse:

1. Select the object. Position the mouse cursor on the desired corner. The mouse cursor changes to a crosshair.
2. Drag the corner to the desired position while holding down the mouse button.
3. Right-click the position at which you want to insert the corner point. Select "Add point" from the shortcut menu.

Configuring Rotation in runtime

You configure the "Polygon" object so that it rotates about a reference point in runtime. The rotation in runtime is only possible for devices with Runtime Professional.

Enter the values for the angle of rotation using Degrees as the unit.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter values for the following attributes in the "Rotation" area.
   - X
   - Y
   - Angle

See also

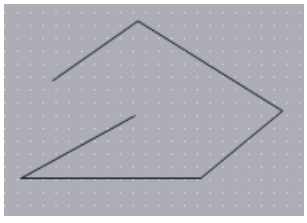
Device dependency of the objects (Page 4088)

Polyline (Page 4151)

Polyline

Application

The "Polyline" is an open object. Use the "Polygon" object if you want to fill the object with color.



Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- Line start and end: Specifies the type of line start and line end.
- Geometry: Modifies, deletes or adds corners.

Line start and end

You define the start point and the end point of the line under "Properties > Properties >"Appearance" in the Inspector window. Use arrow point, for example, as start and end point. The available start and end points depend on the device.

Geometry

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select the required corner point in the "Geometry" area. Input a value at "X position" and "Y position".
3. To add a corner point, click the button.
4. To delete a corner point, click the button.

Alternative procedure

You can also change, delete, or add new corner points using the mouse:

1. Select the object. Position the mouse cursor on the desired corner. The mouse cursor changes to a crosshair.
2. Drag the corner to the desired position while holding down the mouse button.

Configuring rotation in Runtime

You configure the "Polyline" object so that it rotates about a reference point in Runtime. The rotation in Runtime is only possible for devices with Runtime Professional.

Enter the values for the angle of rotation using Degrees as the unit.

1. Click "Layout" in the Inspector window.
2. Enter values for the following attributes in the "Rotation" area.
   - X
   - Y
   - Angle

Further information can be found in "Auto-Hotspot".

See also

Polygon (Page 4150)

Rectangle

Application

The "Rectangle" is a closed object which you can fill with a color.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Corner radius: Specifies the horizontal and vertical distance between the corner of the rectangle and the start point of a rounded corner.

Corner radius

The corners of the "Rectangle" object can be rounded to suit your requirements. When the properties "X" and "Y" are set to the 100 % value, the rectangle is displayed as an ellipse. As soon as one of the properties has the value 0%, a normal rectangle without a rounded corner is shown.

1. Click "Properties > Properties > Layout" in the inspector window.
2. Enter a value for "X" in the "Corner radius" area.
   The input value is the percentage proportion of half the width of the rectangle.
3. Enter a value for "Y" in the "Corner radius" area.
   The input value is the percentage proportion of half the height of the rectangle.

Rotating objects (Page 3949)

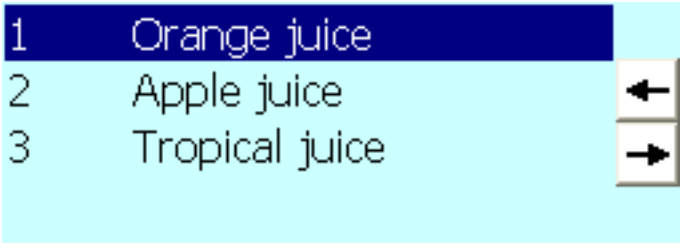
Flipping objects (Page 3951)

Recipe view

Simple recipe view

Application

The "Recipe view" object is used to display and modify recipes.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Toolbar: Specifies the menu commands of the recipe view.

Toolbar

The menu items with which the recipe view is operated in Runtime are configured under "Properties > Properties > Toolbar" in the Inspector window.

Menu command	Description
"Tooltip"	Calls up the configured tooltip for the selected recipe.
"New record"	Creates a new recipe record in the recipe.
"Delete record"	Deletes the selected record.
"Saving"	Saves the modified record with its current name.
"Save as"	Saves the modified record with a new name.
"Write to PLC"	Sends the current value to the PLC.
"Read from PLC"	Reads the current value from the PLC.
"Rename"	Specifies that the "Rename" button is shown.
"Forward"	Specifies that the menu buttons are visible.
"Back"	Specifies that the "Back" button is shown.

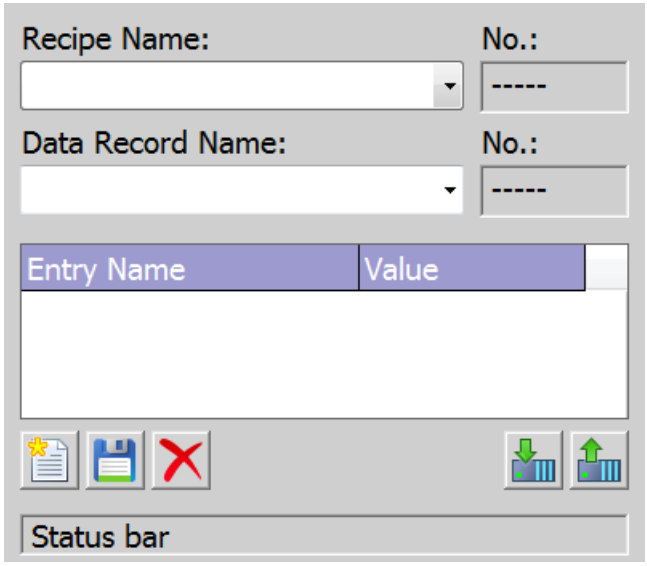
See also

Objects for Basic Panels (Page 4088)

Advanced recipe view

Advanced recipe view

The "Recipe view" object is used to display and modify recipes. The advanced or the simple user view is available depending on the HMI device

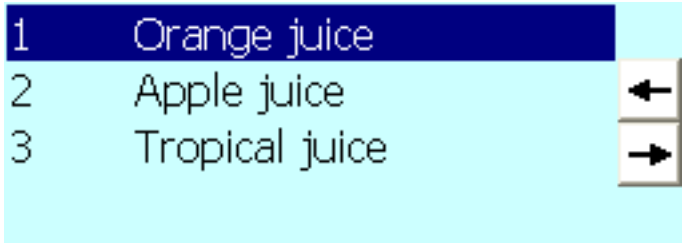


Changing the view type

On HMI devices with a display larger than 6", both the advanced and the simplified recipe view can be used to manage and process recipes. The view type is only available for configuration on devices up to device version V13.

Note

Do not use the simple recipe view in a group.



Configuring the simple recipe view:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Mode > Display type > Simplified".

Note

Behavior for Runtime Professional, Runtime Advanced and Panels

In the Engineering System you can dynamically control the visibility of an object, for example, in the "Animations" tab of the Inspector window. In Runtime, the "Simple recipe view" does not support animations. If you have configured an animation and, for example, want to check the consistency of the project, an error alarm is displayed in the Output window.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Operator controls: Defines the operator controls of the recipe view.
- Display number: Defines whether the number of the recipe and the number of the recipe data record is displayed.

Operator controls

The operator controls with which the recipe view is operated in Runtime are configured under "Properties > Properties > Buttons" in the Inspector window. In the simple recipe view, the operator controls are based on the functions of the menu.

Operator control		Description
	"Tooltip"	Calls up the configured tooltip for the selected recipe.
	"Add data record"	Creates a new recipe data record in the recipe.
	"Delete data record"	Deletes the selected data record.
	"Save"	Saves the modified record with its current name.
	"Save as"	Saves the modified record with a new name.
	"Write to PLC"	Sends the current value to the PLC.
	"Read from PLC"	Reads the current value from the PLC.
	"Synchronize recipe tags"	Compares the values of the selected data record with the values on the PLC.

Display number

Specifies whether the number of the recipe and the number of the recipe data record are displayed in Runtime. The number of the recipe uniquely identifies the recipe in the project.

1. Click "Properties > Properties > View" in the Inspector window.
2. Select "Display > Display numbers".

Configuration behavior

Displaying column headers

The layout of the recipe view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Display of recipes (Page 4427)

Configuring the Advanced Recipe View (Page 4464)

Recipe view (as of V13)

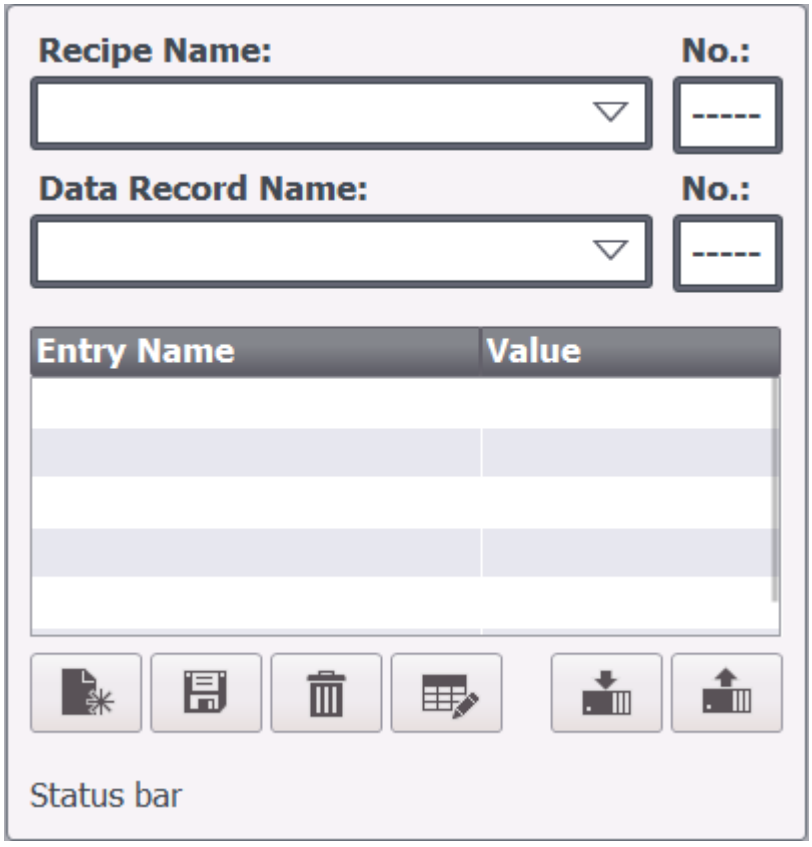
Application

The "Recipe view" object is used to display recipes on the HMI device.

Note

Device dependency of the "Advanced recipe view" object

The "Advanced recipe view" object is available on the HMI devices Basic Panels 2nd Generation, Comfort Panels, Mobile Panels with the device version V13.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Toolbar: Defines the operator controls of the recipe view.
- Display number: Defines whether the number of the recipe and the number of the recipe data record is displayed.
- Label: Sets the label for the name of the recipe and the recipe data record.

Operator controls

The operator controls with which the recipe view is operated in Runtime are configured under "Properties > Properties > Buttons" in the Inspector window. In the simple recipe view, the operator controls are based on the functions of the menu.

Operator control		Description
	"Tooltip"	Calls up the configured tooltip for the selected recipe.
	"Add data record"	Creates a new recipe data record in the recipe.
	"Delete data record"	Deletes the selected data record.
	"Rename data record"	Changes the name of selected data record.
	"Save"	Saves the modified record with its current name.
	"Save as"	Saves the modified record with a new name.
	"Write to PLC"	Sends the current value to the PLC.
	"Read from PLC"	Reads the current value from the PLC.
	"Synchronize recipe tags"	Compares the values of the selected record with the values on the PLC.

Display number

Specifies whether the number of the recipe and the number of the recipe data record are displayed in Runtime. The number of the recipe uniquely identifies the recipe in the project.

1. Click "Properties > Properties > View" in the Inspector window.
2. Select "Display > Display numbers".

Display label

Use this property to specify the name to be shown for recipes and data records in the recipe view.

1. Click "Properties > Properties > Label" in the Inspector window.
2. Select "Display labels".
3. Enter the labels for the recipe and the recipe data record.

Behavior during configuration

Displaying column headers

The layout of the recipe view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Switch

Application

The "Switch" object is used to configure a switch that is used to switch between two predefined states in runtime. The current state of the "Switch" object can be visualized with either a label or a graphic.

The following figure shows a "Switch" type switch.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. In particular, you can customize the following property:

- Type: Defines the graphic representation of the object.

Type

Button visualization is specified at "Properties > Properties > General >Type" in the Inspector window.

Type	Description
"Switch"	The two states of the "Switch" are displayed in the form of a switch. The position of the switch indicates the current state. The state is changed in runtime by sliding the switch. You specify the direction of movement of the switch in "Switch orientation" with this type.
"Switch with text"	The switch is shown as a button. The current state is visualized with a label. In runtime click on the button to actuate the switch.
"Switch with graphic"	The switch is shown as a button. The current state is visualized with a graphic. In runtime click on the button to actuate the switch.

Note

Basic Panels

The "Switch" type is not available for Basic Panels.

Overview of objects (Page 3935)

Switch (Page 5167)

Button

Application

The "Button" object allows you to configure an object that the operator can use in Runtime to execute any configurable function.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Defines the graphic representation of the object.
- Text / Graphic: Defines whether the Graphic view is static or dynamic.
- Define hotkey: Defines a key, or shortcut that the operator can use to actuate the button.

  Note

  You can only define a hotkey for HMI devices with keys.

Mode

The button display is defined in "Properties > Properties > General >Mode" in the Inspector window.

Mode	Description
"Invisible"	The button is not visible in Runtime.
"Text"	The button is displayed with text. This text explains the function of the button.

Mode	Description
"Graphic"	The button is displayed with a graphic. This graphics represents the function of the button.
"Graphics or text"	The button is displayed with text or graphics. If the graphics cannot be displayed, the corresponding text is displayed.
"Graphics and text"	The button is displayed with text and graphics.

Different options are available depending on the device.

Text / Graphic

The "Mode" property settings are used to define whether the display is static or dynamic. The display is defined in "Properties > Properties > General >Text" or "Graphic" in the Inspector window.

You can, for example, select the following options for the "Graphic" or "Text" type.

Type	Option	Description
"Graphic"	"Graphic"	Use "Graphic when button is "not pressed"" to specify a graphic displayed in the button for the "OFF" state. Use "Graphic when button is "pressed"" to specify a graphic for the "ON" state.
	"Graphics list"	The graphic in the button depends on the state. The corresponding entry from the graphics list is displayed depending on the state.
"Text"	"Text"	Use "Text when button is "not pressed"" to specify the text displayed in the button for the "OFF" state. Use "Text when button is "pressed"" to specify text for the "ON" state.
	"Text list"	The text in the button depends on the state. The entry from the text list corresponding to the state is displayed.

Define hotkey

In the Inspector window, a key or key combination is defined that the operator can use to control the button in Runtime.

1. In the Inspector window, select "Properties > Properties > General".
2. Select a key or key combination from the selection list in the "Hotkey" area.

Device dependency of the objects (Page 4088)

Example: Configuring a button for language switching (Page 4036)

Example: Configuring a button with logon dialog box (Page 4559)

Example: Configuring a button with access protection (Page 4564)

Slider

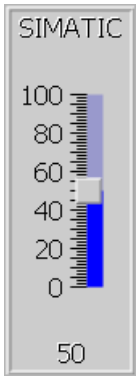
Application

Process values are monitored and adapted within a defined range with the "Slider" object. The monitored range is visualized in the form of a slider. By adjusting the slider, you intervene in the process and correct the displayed process value.

Note

Do not configure a system function at the "Change" event for a regulated project if it is used to execute a GMP-relevant action.

Instead configure the system functions at the "Value change" event of the tags in order to reduce the number of user actions.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can, in particular, adapt the following properties as required:

- Maximum Value and Minimum Value: Specifies the top and bottom values of the scale.
- Display current value: Specifies whether the current position of the controller appears below the slider.
- Display of bars: The sliders above and below the bar can be hidden.

Maximum Value and Minimum Value

The top and bottom end values of the scale are specified in the Inspector window.

1. In the Inspector window, activate "Properties > Properties > General".
2. Enter a number at "Maximum value" and "Minimum value". If you select a tag as the end value of the scale, the number will be no longer available.

Display current value

Specify that the value of the current position is displayed below the slider in the Inspector window.

1. In the Inspector window, activate "Properties > Properties > Layout".
2. Select "Show current value."

Display bar

The bar can be hidden.

1. In the Inspector window, activate "Properties > Properties > Layout".
2. Deactivate "Display bar".

Behavior during operation

The displayed value on the slider control may deviate from the actual value of the associated tag in the following circumstances:

- The value range (minimum and maximum value) configured for the slider control does not correspond to the configured limits for the slider control tag.
- An invalid password has been entered for a password-protected slider control.

See also

Device dependency of the objects (Page 4088)

KeySwitch

Application

The object "KeySwitch" is an optional control element for the SIMATIC Mobile Panel. The key switch is used to lock functions that can be triggered from the Mobile Panel.

You configure the object "key switch" object in the "global screen" or in a template.

Layout

You can set the following properties in the Properties view:

- Tag: Specifies the tag in which the position of the key switch is written.

Tag

The "Tag" property is used to specify the "Key switch" object assignment in the global screen or template.

Note

Notes on configuring

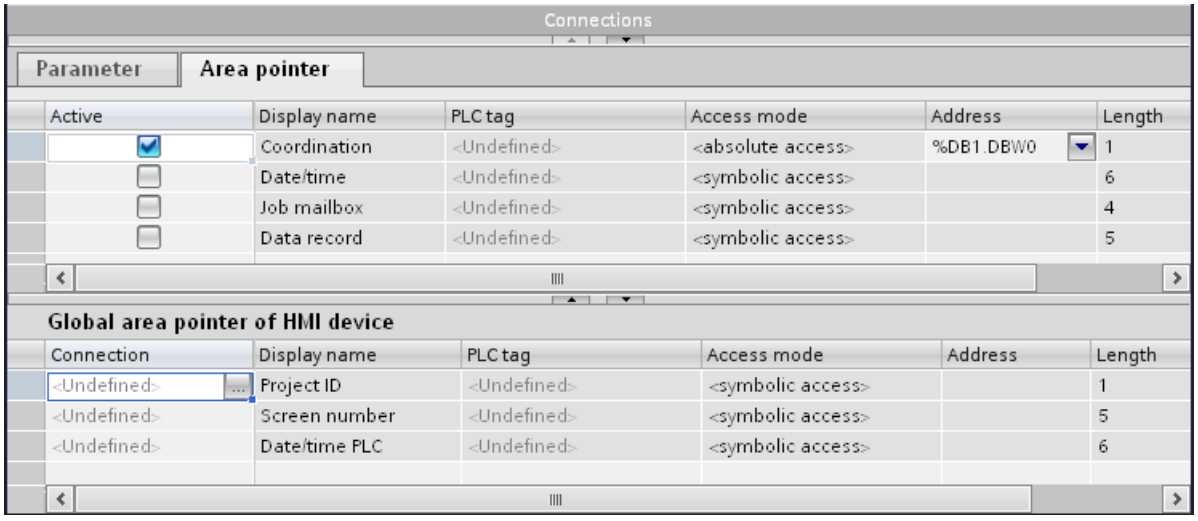
When starting runtime and every time the key is pressed the current position of the key switch is written to the tag. In doing so it can cause inconsistencies between the position of the key switch and the key switch tags.

1. If the tag has a process connection, the current value is transferred from the PLC to the tag after establishment of communication. The tag that contains the current position of the key is overwritten by this process. It can be that the key switch tag no longer reflects the current value of the key switch, e.g. if the Mobile Panel is switched off while the key is being turned.
2. If the key switch is pressed before communication with the PLC has been established (e.g. after a device start-up), it may not be possible to send the value of the key switch tag to the PLC. In this case the value of the tag in the PLC is different from the current position of the key.

A specific configuration is required to make sure that the key switch tag reflects the actual position of the key switch at all times. See the instructions below for the basic procedure.

Basic procedure

1. Specify the connection to the PLC in the "Connections" editor. Activate the "Coordination" area pointer to ensure that the life bit is available to the PLC side.



2. Create three tags in the "Tag" editor.
   - Internal tag: Position_Keyswitch
   - External tag: Auxiliary tag
   - External tag: Keyswitch_PLC

3. Open the Inspector window of the "Position_KeySwitch" tag.
4. In the Inspector window, select "Properties > Events > Value change".
5. Click the first line of the function list. The list of system functions available in the project appears.
6. Select the "SetTag" system function.
   - Select the "Keyswitch_PLC" tag at "Tag (output)".
   - Select the "Position_Keyswitch" tag at "Value".

   The value of the "Keyswitch_PLC" tag is written to the PLC with the "Position_Keyswitch" tag. A program in the PLC evaluates the life bit. If communication is established, the current value is written to the "Keyswitch_PLC" tag from the PLC.
7. Open the Inspector window of the "Auxiliary tag" tags.
8. In the Inspector window, select "Properties > Events > Value change".
9. Click the first line of the function list. The list of system functions available in the project appears.

10. Select the "SetTag" system function.
    - Select the "Keyswitch_PLC" tag at "Tag (output)".
    - Select the "Position_Keyswitch" tag at "Value".

    After establishing communication the current value is written to the "Auxiliary Tag" from the PLC. The "SetTag" system function is executed by the value change in the auxiliary tags. The system function re-allocates the value of the "Position_Keyswitch" tag to the "Keyswitch_PLC".

11. Open the global screen or a template in the "Screen navigation" editor.
12. Select the key switch in the screen.
13. Select the "Position_KeySwitch" tag in the Inspector window under "Properties > Properties > General > Settings > Tag".
    If you press the illuminated pushbutton, the value is written to the "Position_KeySwitch" tag.

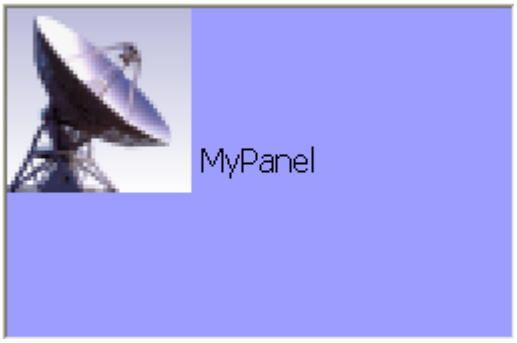
Field of application of the Mobile Panel Wireless (Page 5944)

Sm@rtClient view

Application

The "Sm@rtClient View" object is used to configure a network connection to the remote monitoring and remote maintenance of a connected unit.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Connect on start: Establishes whether when opening the Sm@rtClient view the connection to the HMI device is automatically created which should be remote-controlled.
- Shared use_ Specifies that an HMI device is shared by several Sm@rtClient Views.
- Local cursor: Specifies whether the cursor data is transferred separately in order to increase the performance.
- Use cursor key scroll: For keyboard devices places the control of the horizontal and vertical scroll with the cursor keys.
- Show controls: Establishes whether additional fields exist for entering the address and password.
- Allow menu: Specifies whether the shortcut menu is enabled to control the Sm@rtClient view.
- Connection type: Establishes the expected transfer speed for the remote monitoring.
- Scaling: Specifies whether the Sm@rtClient view can be zoomed in or out.

Connect on start

Establishes whether when opening the Sm@rtClient view the connection to the HMI device is automatically created which is remote-controlled.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Connect on start".

Shared use

Define whether the HMI device can be used by several Sm@rtClient views under "Properties > Properties > General > View > Shared".

Shared use	
Enabled	HMI devices on which remote control is activated can access the remote HMI device and control the process. Only one HMI device can be active at a time in this case. A different HMI device can only assume control when there has been no activity on the active HMI device for a specified period of time.
Disabled	Only one HMI device can use the remote control at any given time. The activities can be followed on the other HMI devices. Depending on the settings on the Sm@rtServer the following options are available if another HMI device logs on: • The HMI device is rejected. • The active HMI device is disconnected and the new HMI device is connected.

Local cursor

If this property is set, then the cursor data is transferred separately.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Local cursor".

Display extended objects

If this property is set then there are additional fields for inputting the address and password. For the fields to be shown the "Connect on start" option is not activated.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Show enhanced objects".

Allow menu

If this property is set, then a shortcut menu to control the Sm@rtClient view is opened in Runtime.

When operating using the mouse, the left mouse key must remain depressed for a few seconds for the shortcut menu to open.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Allow Menu".

Connection type

The "Connection type" property establishes the expected transfer speed for the remote monitoring.

Set the connection type at "Connection type" under "Properties > Properties > General > Connection type" in the Inspector window.

Connection type	
LAN	Connection via network
Slow	Connection with a low transfer speed
Medium speed	Connection with a medium transfer speed
Modem	Connection via an analog modem
Very slow	Connection with a very low transfer speed

Scaling

If this property is set, then via "Client scale factor" and "Server scale" you can reduce or enlarge the Sm@rtClient view on the HMI device.

1. In the Inspector window, select "Properties > Properties > Scaling".
2. Select "Scaling > Scaling".
3. Enter the values for the scaling under "Client scale factor" and "Server scale factor".

Behavior during operation

If the program cannot resolve the dynamic address of a Sm@rtClient view after a screen change, the system connects to the configured server using the static address of the server. If a tag is now set using the dynamic address, you can make a second connection to this server. As a remedy preset the tags of the dynamic address for example by means of a script.

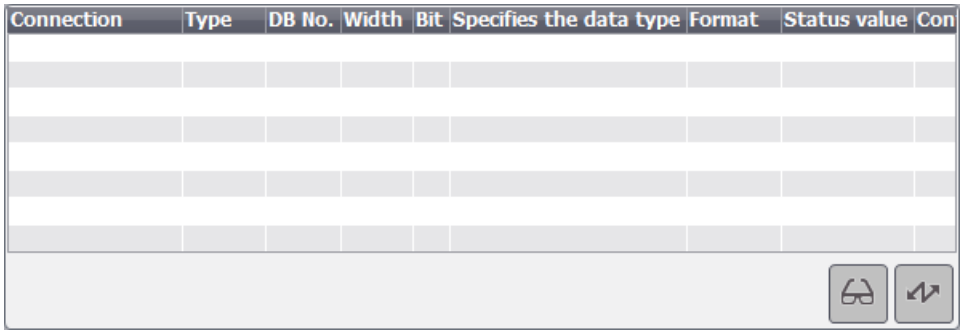
See also

Device dependency of the objects (Page 4088)

Status/Force

Application

The "Status/Force" object is used to configure an editor that will allow you to process single address areas of a SIMATIC S7 in runtime.



Note

The "Status/Force" object is enabled for the following controllers:

- SIMATIC S7-300
- SIMATIC S7-400

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- PLC type: Specifies the PLC type in the object for which the address area is output in runtime.
- Control elements: Specifies the controls of the object.
- Visible columns: Specifies the displayed columns in runtime.
- Columns moveable: Specifies whether the operator can change the sequence of columns in runtime.

Control elements

Set the control elements that you can use to control the "Status/Force" object in runtime at "Properties > Properties > Display" in the "Settings" area of the Inspector window.

	Function
	This button refreshes the display in the status value column.
	Use this button to accept the new value in the control value column. The control value is then written to the PLC.

Visible columns

The columns that are displayed in runtime are specified in the Inspector window in the "General" group in the "Visible columns" area.

Column	Description
"Connection"	The PLC of which the address areas are displayed.
"Type" "DB number" "Offset" "Bit"	The address area of the operand.
"Data type" "Format"	The data type of the operand.
"Status value"	The value that was read from the specified address of the operand.
"Control value"	The value written to the specified address of the operand.

Sequence of columns

The operator can use the "Column ordering" property to change the sequence of columns in runtime.

1. Select "Properties > Properties > Columns" in the Inspector window.
2. Activate "Properties of columns > Sequence of columns".

Display of the column headers and buttons

The layout of the "Status/Force" object is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style. This behavior only occurs during configuration. The column headers are displayed correctly in runtime.

If you change the layout, for example from "Windows Classic" to "Windows XP Style", the button in the "Status/Force" object may no longer be displayed. Change the size of the object to make the buttons in the engineering system visible again.

See also

Device dependency of the objects (Page 4088)

Symbol library

Application

The "Symbol library" object contains a large collection of ready-to-use icons. These icons are used to represent systems and plant areas in screens.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Select icon: Specifies which library object will be used.
- Fill style: Specifies the graphic design of the object.
- Flip: Specifies the flip type of the library object.

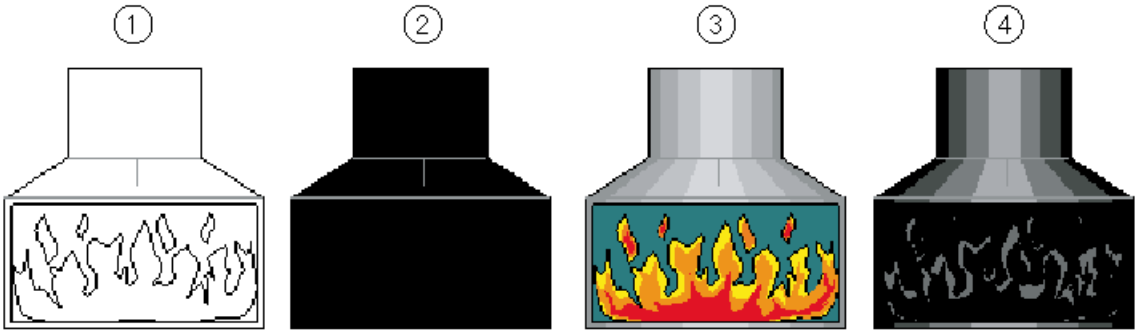
- Rotate: Specifies the angle around which the library object is rotated.
- Fixed aspect ratio Defines whether the aspect ratio is maintained if the size is changed.

Select symbol

Select the icon at "Properties > Properties > General" in the Inspector window.

Fill style

Specify the design of the library object at "Properties > Properties > Appearance > Style" in the Inspector window.



1	"Hollow"	The library object is displayed in outline.
2	"Solid"	Black lines remain as outlines. Elements of the icon with a different color are displayed as a main color.
3	"Original"	The screen object will not be changed.
4	"Shaded"	Black lines remain as outlines. Elements of the symbol in other colors are displayed as brightness levels of a main color.

At the TP 177B mono and OP 177B mono HMI devices the library object is displayed as an outline. "Hollow" is set as the default value for the fill style.

If you change the setting from "hollow" to "original" or "shaded" then the color of the display on the configuration computer will deviate from that on the HMI device. This deviation is caused by the different color resolutions. You may also use a graphic object from the "Graphics" object group. The graphic objects are structured by topic and by depth of color in the "WinCC graphics folder."

Flip and rotate

The content of the screen flips around the horizontal or vertical central axis of the icon. The icon can be flipped horizontally, vertically or simultaneously horizontally and vertically.

The screen content rotates around the central point of the icon. The symbol is rotated clockwise in increments of 90, 180, or 270 degrees.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select the mirroring mode at "Orientation > Mirror image".
3. Select the angle of rotation at "Orientation > Rotate".

Fixed aspect ratio

The smaller page of the library object defines the maximum size of the symbol. If you change the size of the library object unproportionally, the symbol is still scaled proportionally. Proceed as follows to configure a fixed aspect ratio:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Form > Fixed aspect ratio".

Behavior during operation

The possibility of operating the mouse is indicated in Runtime by the cursor symbol changing, depending on the configuration. Operation feedback, e.g. by means of a color change, does not take place.

See also

Device dependency of the objects (Page 4088)

Symbolic I/O field

Application

The "Symbolic I/O field" object can be used to configure a selection list for input and output of texts in Runtime.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Specifies the response of the object in Runtime.
- Text list: Specifies the text list that is linked to the object.
- Button for selection list: Specifies that the object has a button to open the selection list.

Note

Reports

In reports, symbolic I/O fields only output data. "Output" mode is preset. Properties for configuring the selection of graphics are not available, e.g. "button for selection list".

Mode

The response of the symbolic I/O field is specified in the Inspector window in "Properties > Properties > General > Type".

Mode	Description
"Output"	The symbolic I/O field is used to output values.
"Input"	The symbolic I/O field is used to input values.
"Input/output"	The symbolic I/O field is used for the input and output of values.
"Two states"	The symbolic I/O field is used only to output values and has a maximum of two states. The field switches between two predefined texts. This is used, for example, to visualize the two states of a valve: closed or open.

Note

The behavior possible for the symbolic I/O field depends on the Runtime.

Text list

In the Inspector window, you specify which text list is linked to the symbolic I/O field.

1. In the Inspector window, select "Properties > Properties > General".
2. Under "Contents" open the selection list for "Text list".
3. Select a text list.

Button for selection list

The "Button for selection list" property is used to display a button for opening the selection list.

1. Select "Properties > Properties > Layout" in the Inspector window.
2. Select "Response > Button for selection list".

Note

Basic Panels

The "Button for selection list" option is not available for Basic Panels.

Behavior during operation

The selection list of the symbolic I/O field displays an empty text line if a corresponding entry was not defined in the project. The active state is indicated on the HMI device by changing the color of contents of the symbolic I/O field.

Connecting tags and text lists in the text (Page 3958)

System diagnostics display

Introduction

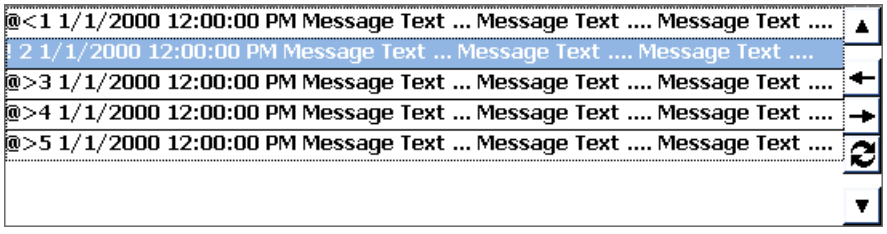
The system diagnostics view offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

Use

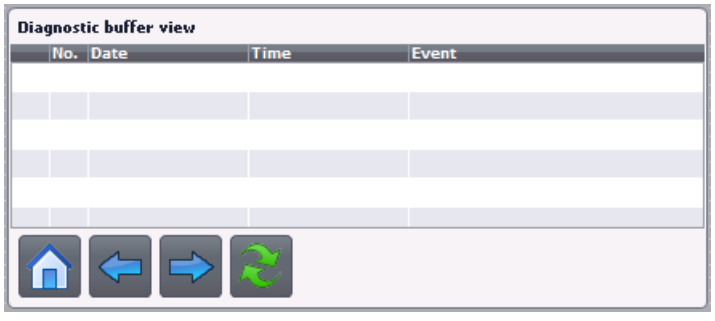
The system diagnostics view enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.

Views in the system diagnostics view

A simple system diagnostics view is available on Basic Panels with a device version prior to V13.



The advanced system diagnostics view is available on Basic Panels with a device version of V13 or later.



Three different views are available in the system diagnostics view.

- Device view
- Diagnostic buffer view
- Detail view

Device view

The device view of the system diagnostics view shows all the available connections in tabular form. Double-clicking a connection opens the detail view. The device view is only displayed if more than one connection has been created in the "Devices & Networks" editor.

Diagnostic buffer view

In the diagnostic buffer view, the current data from the diagnostic buffer is displayed.

Detail view

The detail view shows detailed information on the selected connection. You cannot sort error texts in the detail view. The detail view is only available if there is an integrated connection to an S7 1200 or S7 1500.

Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Lines per entry: Specifies the number of lines that are shown for an entry.

Configuring the system diagnostics view

1. Drag-and-drop the system diagnostics view from the toolbox.
2. In the Inspector window, select "Properties > Layout".
3. Enter a number under "Lines per entry", i.e. 5.
4. Select an authorization for operation in "Properties > Properties > Security".

System diagnostics display (Page 4177)

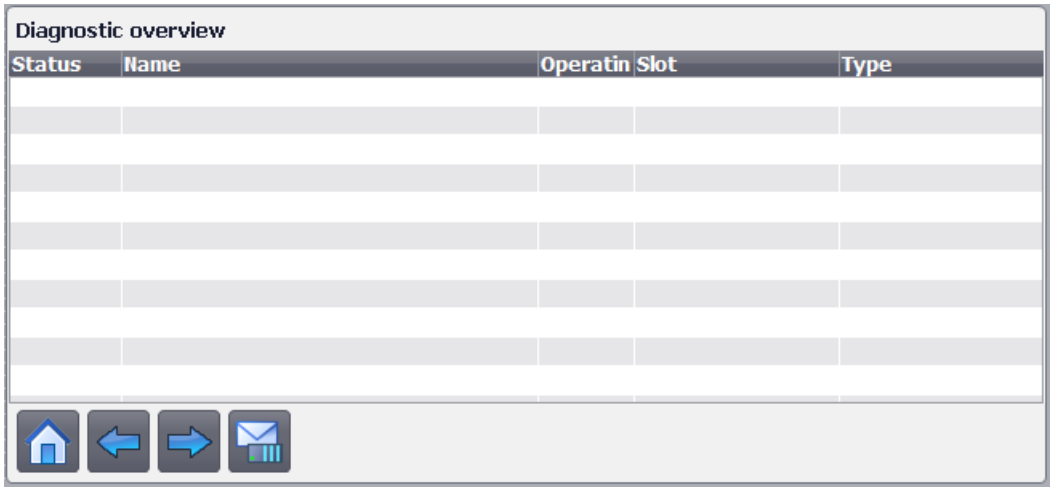
System diagnostics display

Introduction

The system diagnostics view offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

Use

The system diagnostics view enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.



Three different views are available in the system diagnostics view.

- Device view
- Detail view
- Diagnostic buffer view
- Matrix view (only for master systems, PROFIBUS)

Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Columns: Defines the elements of the device view and detail view.
- Show split view: Specifies that the device view and the detail view are shown simultaneously.

Configuring the system diagnostics view

1. Drag-and-drop the system diagnostics view from the toolbox.
2. In the Inspector window, select "Properties > Properties > Columns".
3. Select the columns that you require in the device view for Runtime, for example, Operating mode, Name, Slot.
4. Select the columns which you need in the detail view for runtime, e.g., Operating mode, Name, Address.
5. Select the columns that you require in the diagnostic buffer view, e.g., Status, Name, Rack.
6. Customize the column headers, if necessary.

7. Enter "IP" for "Address", for example.
   The column header "IP" is displayed in the device view in runtime.
8. Rename other elements if necessary.
9. Select an authorization for operation in "Properties > Properties > Security".

Showing device view and detail view in a single display

You can split the system diagnostics view and allow the device and detail view to be shown in the same window.

1. In the Inspector window, click "Properties > Properties > Layout".
2. Activate "Show split view".

Symbols in the system diagnostics view

Symbol	Function
	Device in operation
	Device cannot be accessed
	Errors in device
	Input/output data are not available
	Device deactivated
	Maintenance required
	Maintenance recommended
	Superimposed symbol Shows the subordinate status
	Current configuration
	Stop e.g. Update, Boot, Own initialization
	Stop

Device dependency of the objects (Page 4088)

System diagnostics window (Page 4180)

System diagnostics display (Page 4176)

System diagnostics window

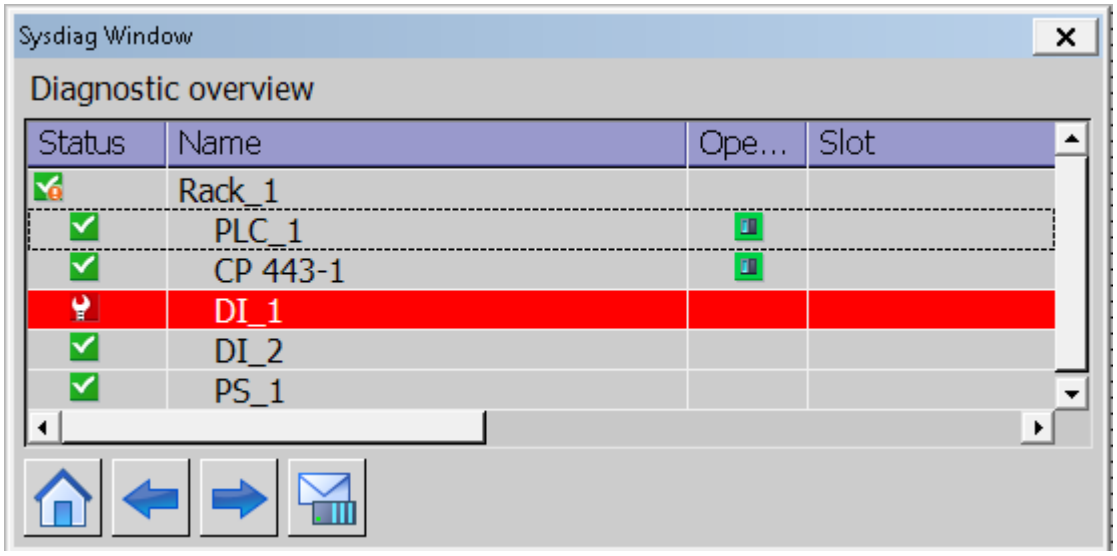
Introduction

The system diagnostics window offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

The system diagnostics window is only available in the global screen.

Use

The system diagnostics window enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.



Three different views are available in the system diagnostics window.

- Device view
- Detail view
- Diagnostic buffer view
- Matrix view (only for master systems, PROFIBUS)

Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Columns: Defines the elements of the device view and detail view.
- Table headers: Specifies the table headers of the view.
- Window: Specifies whether the system diagnostics window can be closed, for example.

Configuring the system diagnostics window

1. Drag and drop the system diagnostics view from the toolbox into the global screen.
2. In the Inspector window, select "Properties > Properties > Columns".
3. Select the columns that you require in the device view for Runtime, e.g., Operating mode, Name, Slot.
4. Select the columns that you require in the detail view for Runtime, e.g., Operating mode, Name, Plant designation.
5. To change a column header, click in the field and (for example) enter "IP" for "Address". The column header "IP" is displayed in the device view in runtime.
6. Rename other elements if necessary.
7. To be able to close the system diagnostics window in runtime, select "Properties > Properties > Window > Closable" in the Inspector window.

Icons in the system diagnostics window

Button	Function
	Device in operation
	Device cannot be accessed
	Errors in device
	Device deactivated
	Input/output data are not available
	Maintenance required
	Maintenance recommended
	Superimposed symbol Shows the subordinate status
	Current configuration
	Stop e.g. Update, Boot, Own initialization
	Stop

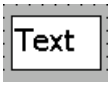
Device dependency of the objects (Page 4088)

Text field

Application

The "Text field" is a closed object which you can fill with a color.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Text: Specifies the text for the text field.
- Size of text field: Defines whether the size of the object is adapted to the space required by the largest list entry.

Text

Specify the text for the text field in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a text.
   For texts over several lines you can set a line break by pressing the key combination <Shift + Enter>.

Size of text field

In the Inspector window, you can define whether the size of the object is adapted to the space required by the largest list entry.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Resize > Fit to contents".

See also

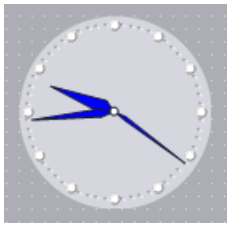
Device dependency of the objects (Page 4088)

Connecting tags and text lists in the text (Page 3958)

Clock

Application

The "Clock" object displays the date and time.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Analog display: Specifies whether the clock is shown as an analog clock or digital clock.
- Display clock dial: Specifies whether hour marks of the analog clock will be displayed.
- Width and length of hands: Specifies the width and length of the hands.

Analog display

In the Inspector window you can specify whether the clock is displayed as an analog or digital clock. The digital clock shows both the time and the date. The display format depends on the language set on the HMI device.

1. In the Inspector window, select "Properties > Properties > General":
2. Activate "Analog".

Display dial

In the Inspector window you can specify whether hour marks will be displayed.

1. In the Inspector window, select "Properties > Properties > General":
2. Activate "Analog".
3. Activate "Show dial".

Width and length of hands

The width of the second hand, minute hand and hour hand is set for the analog display.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter values for "width" and "length".
   The values for the length are interpreted as a percentage of the size of the clock. The value for the length of the second hand influences the radius of the dial at the same time.

Device dependency of the objects (Page 4088)

Effective range name

Use

The "Effective range name" object is a operator control for some SIMATIC Mobile Panels. The "Effective range name" object shows the names of the effective range in which the HMI device is located and also the logon status.

Layout

Symbol	Meaning	Description	Logon status
	Acknowledgement button has no effect	Within the "MixingAxisControl" effective range	It is not possible to log on to the effective range
	Acknowledgement button functions	Within the "MixingAxisControl" effective range	Logged on to effective range
	Acknowledgement button has no effect	Within the "MixingAxisControl" effective range	Logon to the effective range is rejected because a different HMI device is already logged on. Note: When using the "Override" mode: Although no other HMI device is still logged on to the effective range, logon is rejected because the override switch is still set.
	Acknowledgement button has no effect	Outside of each effective range	Note: You can only log on within the effective range

In the Inspector window "Properties > Properties > Security", assign an authorization to log on to a machine in runtime.

Logon requirements

- The HMI device is located within the effective range.
- No HMI device is logged on to this effective range.

Logon procedure

1. Click on the "Effective range name" object.
   The "Effective range logon" dialog box opens.
2. Read the ID from the machine or plant to be operated.
3. Enter the ID you read.
4. Confirm your entries by clicking "OK".

Result

If the ID and effective range match, the HMI device is logged on to the effective range. Successful logon is signaled by an icon on green background. No other HMI device can log on to this effective range.

Requirement for logging off

The HMI device is logged on to this effective range.

Logoff procedure

Before you leave the effective range or runtime, you must log off from the effective range first. If you leave the effective range without logging off, a warning appears.

1. Click on the "Effective range name" object. The "Effective range logoff" dialog box opens.
2. Confirm logoff with "Yes".

Result

The HMI device is no longer logged into the effective range. Other HMI devices can now log on to this effective range.

Note

Do not deactivate the "Override" mode again unless you logon a different HMI device.

Zone signal (Page 4193)

Configuring the effective range name (Page 5973)

Effective range name (RFID)

Use

The "Effective range name (RFID)" object is a operator control for some SIMATIC Mobile Panels. The "Effective range name (RFID)" object shows the name of the effective range (RFID) in which the HMI device is located and also the logon status.

Note

RFID tags in the plant area

RFID tags may only be attached in demarcated areas which are secured by additional protective measures, e.g. protective fencing.

Layout

Symbol	Meaning	Description	Logon status
	Acknowledgement button has no effect	Within the effective range (RFID) "MixingAxisControl"	It is not possible to log on to the effective range (RFID)
	Acknowledgement button functions	Within the effective range (RFID) "MixingAxisControl"	Logon to effective range (RFID) running
	Acknowledgement button functions	Within the effective range (RFID) "MixingAxisControl"	Logged on to the effective range (RFID)

In the "Properties > Properties > Security" category of the Inspector window, you can assign an authorization for the user group that logs on to the effective range (RFID) during runtime.

Logon requirements

- The HMI device is located within the effective range (RFID).
- The machine is demarcated by additional protective measures.
- No HMI device is logged on to this effective range (RFID).

Logon procedure

1. Click on the "Effective range name (RFID)" object.
   The "Effective range logon" dialog box opens.
2. Read the ID from the machine or plant to be operated.

3. Enter the ID you read.
4. Confirm your entries by clicking "OK".

Result

If the ID and effective range (RFID) match, the HMI device is logged on to the machine. Successful logon is signaled by an icon on green background. No other HMI device can log on to this effective range (RFID) or the machine.

Logoff requirements

The HMI device is logged on to this effective range (RFID).

Logoff procedure

Before you exit the effective range (RFID) or runtime, you must first log off from the effective range (RFID). If you exit the effective range (RFID) without logging off, a local rampdown is executed.

1. Click on the "Effective range name (RFID)" object. The "Effective range (RFID) - logoff" dialog box opens.
2. Confirm logoff with "Yes".

Result

The HMI device is no longer logged into the effective range (RFID) or machine. Other HMI devices can now log on to this effective range (RFID).

Effective range signal

Application

The "Effective range signal" object is a control element for some SIMATIC Mobile Panels. The "Effective range signal" object indicates how accurately the Mobile Panel Wireless is positioned within an effective range.

Layout

Symbol	Description
	Within an effective range
	When leaving an effective range When entering an effective range
	Outside of each effective range
	Override function is activated: Within a special security range of the effective range

The "Effective range name" object indicates which effective range this concerns.

Override function

An effective range, e.g. "robots" is formed outwardly through transponders. However, within a special protection zone, e.g. "robot cells", the effective range is not formed by transponders, but by alternative restrictions e.g. by railings and a door.

The operator initially logs on to the effective range. An operator who enters the restricted and secure zone "robot cells" must press an additional switch to activate the override function:

- The effective range is allocated and can no longer be established by the transponder.
- Therefore, the quality does not play a role and is no longer displayed.
- The HMI device remains logged into the effective range.
- Other HMI devices can no longer logon to this effective range.

Calculating the signal quality

The quality within an effective range depends, as follows, on the measured distance:

- In the center of the effective range the quality is 100%.
- On the transponder and on the border of the effective range, the quality is 0%.

Operation

The object is for display only and cannot be controlled by the operator.

Zone signal (Page 4193)

Configuring additional Mobile Wireless objects (Page 5974)

WLAN reception

Application

The "WLAN reception" object is a control element for some SIMATIC Mobile Panels. The "WLAN reception" object displays the signal strength of the WLAN wireless connection. In addition, the signal strength is measured and displayed by means of 5 bars.

Layout

Symbol	Meaning	Signal strength
	No wireless connection	No signal
	Very poor wireless connection	=<20 %
	Poor wireless connection	>20 % =<40 %
	Wireless connection OK	>40 % =<60 %
	Good wireless connection	>60 % =<80 %
	Very good wireless connection	>80 %

Operation

The object is for display only and cannot be controlled by the operator.

Zone name (Page 4192)

Zone signal (Page 4193)

Configuring additional Mobile Wireless objects (Page 5974)

Gauge

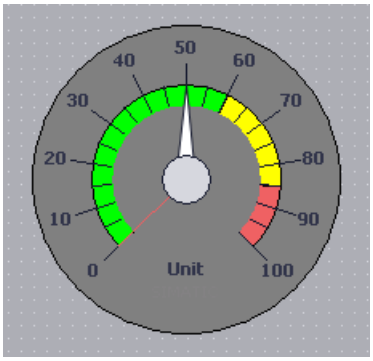
Application

The "Gauge" object shows numeric values in the form of an analog gauge. For example, a glance in Runtime is enough to note that the boiler pressure is in the normal range.

Note

The gauge is for display only and cannot be controlled by the operator.

Configure system functions that are performed at value changes in the tag properties at the "Value change" event and not at the "Change" event of the gauge. If your project is to comply with Good Manufacturing Practices, and the system function performs a GMP-relevant action. e.g. increasing a GMP-relevant tag, every value change of the tag used at the gauge is interpreted as a user action.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Display peak value pointer: Specifies whether the actual measurement range is indicated with a slave pointer.
- Maximum Value and Minimum Value: Specifies the top and bottom values of the scale.
- Start value of the danger range and start value of the warning range: Specifies the scale value from which the danger range and the warning range start.
- Display normal range: Specifies whether the normal range is shown in color on the scale.
- Color of individual ranges: Different operating modes, such as normal range, warning range and danger range, are shown in different colors so that the operator can distinguish them easily.

Display peak value

The "Display peak value" property can be used to activate a marker function for the maximum and minimum pointer movement in Runtime. The actual measurement range is shown with a slave pointer.

1. In the Inspector window, activate "Properties > Properties > Appearance > Show peak values".

Maximum Value and Minimum Value

You can set the top and bottom end values of the scale in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a number under "Scale > Maximum value" and at "Minimum value".
   If you select a tag as the end value of the scale, the number will be no longer available.

Note

Ensure that the minimum value is always less than the maximum value, especially if you make the minimum value or maximum value dynamic through a tag. If the minimum value is greater than the maximum value, no adjustment is made to the scale end values.

Start value of the danger range and start value of the warning range

Define the scale value at which the danger range and the warning range start in the Inspector window.

1. Click "Properties > Properties > Areas" in the Inspector window.
2. Input the start value at "start value of danger range" and "start value of warning range".
3. Select "start value of danger range" and "start value of warning range" to display the ranges on the scale.

Normal range visible

In the Inspector window, define whether to show the normal range in color.

1. Click "Properties > Properties > Areas" in the Inspector window.
2. Select "Normal".

Color of individual ranges

You can display the normal range, the danger range and the warning range in different colors. Define the color in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Areas".
2. Select a color from the color palette for the three areas.

Note

The following restrictions apply for HMI devices with Windows CE up to version 5.0:

- The three ranges (normal / warning / danger) are not visualized in different colors in Runtime.

See also

Device dependency of the objects (Page 4088)

Zone name

Application

The "Zone name" object is a control element for some SIMATIC Mobile Panels. The "Zone name" object shows the names of the zone in which the HMI device is located.

Layout

Symbol	Meaning	Description
	The "On entry" and "On exit" events of the zone and the zone ID can be used in the configuration.	Within the "MixingPlant" zone
	–	Outside of each zone

Procedure for "On entry" event

1. In the "Zones" or "Zones and effective ranges" editor, configure the function "ActivateScreen" on the "On entry" event.

Procedure with zone ID

1. Select an internal tag as the "Zone ID / Connection point ID" in the "Runtime settings > General" editor.
2. Animate the visibility of an object, e.g. "I/O field" via the internal tag.

Operation

The object is for display only and cannot be operated.

See also

Effective range name (Page 4184)

Effective range signal (Page 4187)

WLAN reception (Page 4189)

Zone signal (Page 4193)

Zone signal

Application

The "Zone signal" object is a control element for some SIMATIC Mobile Panels. The "Zone signal" object indicates how well the Mobile Panel is still in a zone. Compared to the "WLAN reception" object, it is not the signal strength that is measured, it is calculated from the distance.

Layout

Symbol	Meaning	Quality
	Within one zone	>=15 %
	When leaving a zone When entering a zone	<15 % and >0 %
	Outside of each zone	=0 %

The "Zone name" object indicates which zone this concerns.

Calculating the signal quality

The quality of the signal within a zone depends, as follows, on the measured distance:

- In the centre of the zone the quality is 100%.
- To the rear towards the transponder and to the front away from the transponder, the quality starts to diminish linearly.
- On the transponder and on the border of the zone, the quality is 0%.

Operation

The object is for display only and cannot be operated.

12.1.9 Configuring screen navigation

12.1.9.1 Basics on screen navigation

Types of navigation for the screen change

For a production process consisting of multiple subprocesses, you will configure multiple screens. You have the following options to enable the operator to switch from one screen to the next in Runtime:

- Assign buttons to screen changes
- Configuring screen changes at local function keys

Procedure

Before you create a screen change, define the plant structure and derive from it the screen changes that you want to configure.

Create the start screen under "Runtime Settings > General > Start screen".

See also

Screen basics (Page 3889)

Assigning screen change to function key (Page 4196)

Assigning screen change to button (Page 4195)

12.1.9.2 Assigning screen change to button

Introduction

Configure a button in the screen to switch between the screens on the HMI device during operation.

Note

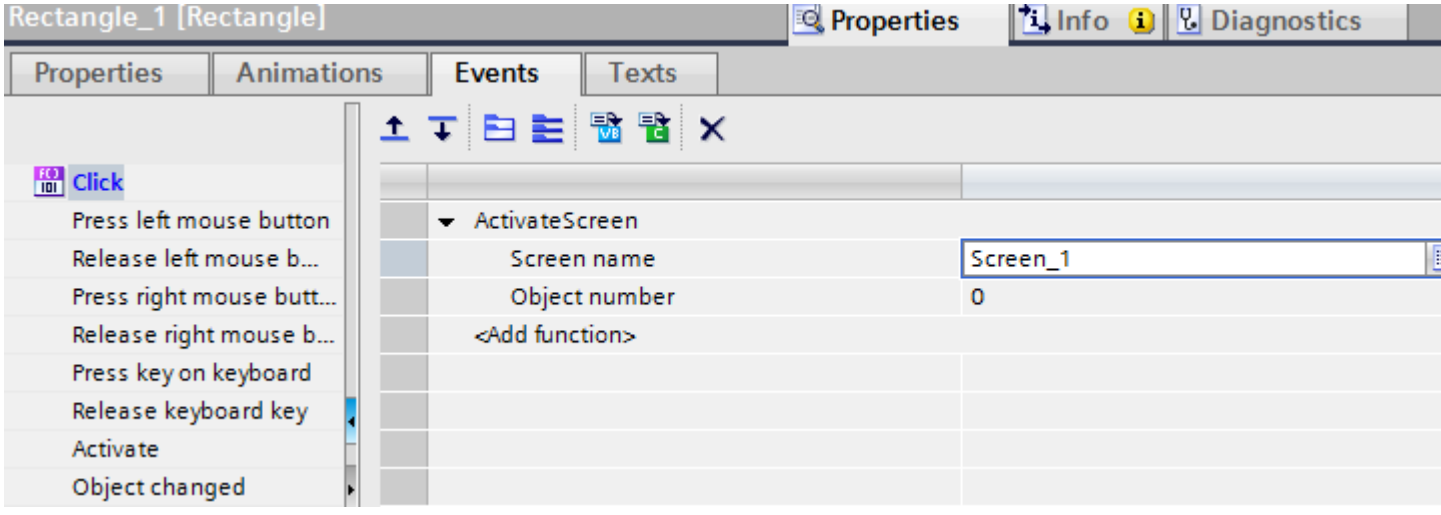
If you have set the "Visibility" of animations to "Hidden" in the Inspector window of a screen, this screen cannot be called up in Runtime.

Requirements

- You have created the project.
- You have created the "Screen_2" screen.
- "Screen_1" is created.

Procedure

1. Double-click "Screen_1" in the project navigation. The screen is displayed in the work area.
2. Move "Screen_2" from the project tree to the open screen by drag&drop.
   A button with the name "Screen_1" is inserted.
3. In the Inspector window, select "Properties > Events > Click".
   The "ActivateScreen" system function is displayed in the "Function list".



4. At the "Object number" attribute, define, if required, the tab sequence number of the object on which the focus is to be set after a screen change. You can also specify a tag that contains the object number.

Alternative procedure

1. Move a button from the "Tools" task card to "Screen2" by drag&drop.
2. In the Inspector window, select "Properties > Events > Click".
3. Select the "ActivateScreen" system function.
4. Select "Screen_2" for the "Screen number".

Result

The operator goes to "Screen_1 with the button in Runtime. If you have specified an object number, the object with this object number has the focus following a screen change.

See also

Basics on screen navigation (Page 4194)

12.1.9.3 Assigning screen change to function key

Introduction

Configure a screen change function key in the screen to switch between the screens on the HMI device during operation.

Note

If you have set the "Visibility" of animations to "Hidden" in the inspector window of a screen, this screen cannot be called up in Runtime.

Requirements

- You have created a project.
- You have created the "Screen_2" screen.
- You have created the "Screen_1" screen.

Procedure

1. Double click "Screen_1" in the project tree. The screen is displayed in the work area.
2. Move "Screen_2" from the project tree to a function key, e.g. "F2".
   The configured function key displays a yellow triangle.
3. Click "Properties > Events > Press key" in the inspector window.
   The "ActivateScreen" system function is displayed.

Result

The operator goes to the specified "Screen_2" with function key "F2" in Runtime.

Basics on screen navigation (Page 4194)

12.2 Working with Tags

12.2.1 Basics

12.2.1.1 Basics of tags

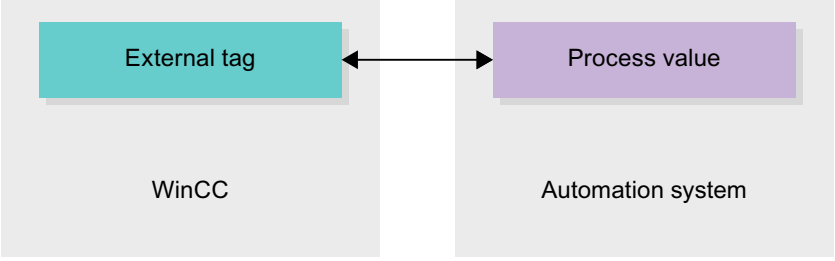
Introduction

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

The external tags form the link between WinCC and the automation systems. The values of external tags correspond to the process values from the memory of an automation system. The value of an external tag is determined by reading the process value from the memory of the automation system. It is also possible to rewrite a process value in the memory of the automation system.



Internal tags do not have a process link and only convey values within the WinCC. The tag values are only available as long as runtime is running.

Tags in WinCC

For external tags, the properties of the tag are used to define the connection that the WinCC uses to communicate with the automation system and form of data exchange.

Tags that are not supplied with values by the process - the internal tags - are not connected to the automation system. In the tag's "Connection" property, this is identified by the "Internal tag" entry.

You can create tags in different tag tables for greater clarity. You then directly access the individual tag tables in the "HMI tags" node in the project tree. The tags from all tag tables can be displayed with the help of the table "Show all tags".

With structures you bundle a number of different tags that form one logical unit. Structures are project-associated data and are available for all HMI devices of the project. You use the "Types" editor in the project library to create and edit a structure.

12.2.1.2 Overview of HMI tag tables

Introduction

HMI tag tables contain the definitions of the HMI tags that apply across all devices. A tag table is created automatically for each HMI device created in the project.

In the project tree there is an "HMI tags" folder for each HMI device. The following tables can be contained in this folder:

- Default tag table
- User-defined tag tables
- Table of all tags

In the project tree you can create additional tag tables in the HMI tags folder and use these to sort and group tags and constants. You can move tags to a different tag table using a drag-and-drop operation or with the help of the "Tag table" field. Activate the "Tags table" field using the shortcut menu of the column headings.

Default tag table

There is one default tag table for each HMI device of the project. It cannot be deleted or moved. The default tag table contains HMI tags and, depending on the HMI device, also system tags. You can declare all HMI tags in the standard tags table or, as necessary, additional user-defined tables of tags.

User-defined tag tables

You can create multiple user-defined tag tables for each HMI device in order to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. To group tag tables, create additional subfolders in the HMI tags folder.

All tags

The "All tags" table shows an overview of all HMI tags and system tags of the HMI device in question. This table cannot be deleted, renamed or moved. This table also contains the "Tags table" column, which indicates the tag table of where a tag is included. Using the "Tags table" field, the assignment of a tag to a tags table can be changed.

With devices for Runtime Professional, the table "All tags" contain an additional tab "System tags". The system tags are created by the system and used for internal management of the project. The names of the system tags begin with the "@" character. System tags cannot be deleted or renamed. You can evaluate the value of a system tag, but cannot modify it.

Additional tables

The following tables are also available in an HMI tag table:

- Discrete alarms
- Analog alarms
- Logging tags

With the help of these tables you configure alarms and logging tags for the currently selected HMI tag.

Discrete alarms table

In the "Discrete alarms" table, you configure discrete alarms to the HMI tag selected in the HMI tag table. When you configure a discrete alarm, multiple selection in the HMI tag table is not possible. You configure the discrete alarms for each HMI tag separately.

Analog alarms table

In the "Analog alarms" table, you configure analog alarms to the HMI tag selected in the HMI tag table. When you configure an analog alarm, multiple selection in the HMI tag table is not possible. You configure the analog alarms for each HMI tag separately.

Logging tags table

In the "Logging tags" table, you configure logging tags to the HMI tag selected in the HMI tag table. When you configure a logging tag, multiple selection in the HMI tag table is not possible. You configure the logging tags for each HMI tag separately. The "Logging tags" table is only available if the HMI device used supports logging.
If WinCC Runtime Professional is used, you can also assign several log tags to a tag. With the other HMI devices, you can only assign one log tag to a tag.

See also

Basics of tags (Page 4197)

12.2.1.3 External tags

Introduction

External tags allow communication (data exchange) between the components of an automation system, for example, between an HMI device and a PLC.

Principle

An external tag is the image of a defined memory location in the PLC. You have read and write access to this storage location from both the HMI device and from the PLC.

Since external tags are the image of a storage location in the PLC, the applicable data types depend on the PLC which is connected to the HMI device.

If you write a PLC control program in STEP 7, the PLC tags created in the control program will be added to the PLC tag table. If you want to connect an external tag to a PLC tag, access the PLC tags directly via the PLC tag table and connect them to the external tag.

Data types

All the data types which are available at the connected PLC are available at an external tag in WinCC. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

See "Auto-Hotspot" for additional information.

Note

As well as external tags, area pointers are also available for communication between the HMI device and PLC. You can set up and enable the area indicators in the "Connections" editor.

Central tag management in STEP 7

You can connect also connect DB instances of user-defined PLC data types (UDT) to the HMI tags.

The PLC data type and the corresponding DB instances are created and updated centrally in STEP 7. In WinCC, you can use the following sources as PLC tag (DB instances):

- Data block elements that use a UDT as data type
- Data block instances of a UDT

The data type is taken from STEP 7 and is not converted to an HMI data type. The access mode is always "Symbolic access". Depending on the release for WinCC in STEP 7, elements and structured elements of the PLC data type are applied to WinCC. Elements of a structured UDT are applied and displayed in the PLC tag table if the instance-specific properties "Visible in HMI" and "Accessible from HMI" have been set.

Note

Accessing PLC data types

Access to PLC data types is available only in conjunction with SIMATIC S7-1200 or S7-1500.

Synchronization with PLC tags

A variety of options for synchronizing external tags with the PLC tags are available in the Runtime settings under "Settings for tags".

When you perform synchronization, you have the option of automatically applying the tag names of the PLC to external tags and reconnecting the existing tags.

The generated tag name is derived from the position of the data value in the hierarchical structure of the data block.

Update of tag values

For external tags, the current tag values are transmitted in Runtime via the communication connection between WinCC and the connected automation systems and then saved in the Runtime memory. Next, the tag value will be updated to the set cycle time. For use in the Runtime project, WinCC accesses tag values in the Runtime memory that were read from the PLC at the previous scan cycle checkpoint. As a result, the value in the PLC can already change whilst the value from the Runtime memory is being processed.

Note

PLC array elements in conjunction with S7-1200 or S7-1500

The index of the PLC array elements can begin with any number. In WinCC, indexing always starts with 0.

A PLC tag "Array [1..3] of Int", for example, is mapped to "Array [0..2] of Int" in WinCC.

When you access an array in a script, pay attention to the correct indexing.

See also

Basics of tags (Page 4197)

12.2.1.4 Addressing external tags

Introduction

The options for addressing external tags depend on the type of connection between WinCC and the PLC in question. A distinction must be made between the following connection types:

- Integrated connection
  Connections of devices which are within a project and were created with the "Devices & Networks" editor are referred to as integrated connections.
- Non-integrated connection
  Connections of devices which were created with the "Connections" editor are referred to as non-integrated connections. It is not necessary that all of the devices be within a single project.

The connection type can also be recognized by its icon.

	Integrated connection
	Non-integrated connection

You can find additional information in the section "Basics of communication (Page 5996)".

Addressing with integrated connections

An integrated connection offers the advantage that you can address a tag both symbolically and absolutely.

For symbolic addressing, you select the PLC tag via its name and connect it to the HMI tag. The valid data type for the HMI tag is automatically selected by the system. You have to distinguish between the following cases when you address elements in data blocks:

Symbolic addressing of data blocks with optimized access and standard access:

During the symbolic addressing of a data block with optimized access and standard access, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change. You do not need to compile the connected data block or the WinCC project for this step.
For data blocks with optimized access, only symbolic addressing is available.

For symbolic addressing of elements in a data block, you only need to recompile and reload the WinCC project in case of the following changes:

- If the name or the data type of the linked data block element or global PLC tag has changed.
- If the name or the data type of the higher level structure node of a linked element in the data block element or global PLC tag has changed.
- If the name of the connected data block has changed.

Symbolic addressing is currently available with the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Symbolic addressing is also available if you have an integrated link.

You can also use absolute addressing with an integrated connection. You have to use absolute addressing for PLC tags from a SIMATIC S7 300/400 PLC. If you have connected an HMI tag with a PLC tag and the address of the PLC tag changes, you only have to recompile the control program to update the new address in WinCC. Then you recompile the WinCC project and load it onto the HMI device.

In WinCC, symbolic addressing is the default method. To change the default setting, select the menu command "Options > Settings". Select "Visualization > Tags" in the "Settings" dialog. If required, disable the "Symbolic access" option.

The availability of an integrated connection depends on the PLC used. The following table shows the availability:

PLC	Integrated connection	Comments
S7 300/400	Yes	The linking of tags is not checked in Runtime. If the tag address changes in the PLC and the HMI device is not compiled again and loaded, the change is not registered in runtime.
S7 1200	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.
S7-1500	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.

Create an integrated connection in the "Devices & Networks" editor. If the PLC is contained in the project and integrated connections are supported, you can then also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection with absolute addressing. Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to make the change in WinCC. The tag connection cannot be checked for validity in Runtime, an error message is not issued.

A non-integrated connection is available for all supported PLCs.

Symbolic addressing is not available in a non-integrated connection.

With a non-integrated connection, the control program does not need to be part of the WinCC project. You can perform the configuration of the PLC and the WinCC project independently of each other. For configuration in WinCC, only the addresses used in the PLC and their function have to be known.

Basics of tags (Page 4197)

12.2.1.5 Internal Tags

Introduction

Internal tags do not have any connection to the PLC. Internal tags transport values within the HMI device. The tag values are only available as long as runtime is running.

Principle

Internal tags are stored in the memory of the HMI device. Therefore, only this HMI device has read and write access to the internal tags. You can create internal tags to perform local calculations, for example.

You can use the HMI data types for internal tags. Availability depends on the HMI device being used.

The following HMI data types are available:

HMI data type	Data format
Array	One-dimensional array
Bool	Binary tag
DateTime	Date/time format
DInt	Signed 32-bit value
Int	Signed 16-bit value
LReal	Floating-point number 64-bit IEEE 754
Real	Floating-point number 32-bit IEEE 754
SInt	Signed 8-bit value
UDnt	Unsigned 32-bit value
UInt	Unsigned 16-bit value
USInt	Unsigned 8-bit value
WString	Text tag, 16-bit character set

See also

Basics of tags (Page 4197)

12.2.1.6 User-defined PLC data types (UDT)

Overview

You can connect with the HMI tags and DB instances of user-defined PLC data types (UDT).

The PLC data type and the corresponding DB instances are created and updated centrally in STEP 7. In WinCC, you can use the following sources as PLC tag (DB instances):

- Data block elements that use a UDT as data type
- Instance data blocks of a UDT

The data type is taken from STEP 7 and is not converted into an HMI data type. The access type is always "Symbolic access".

Elements of a PLC data type

You have access to the following elements in WinCC with a structured PLC data type:

- Elements that have been released for WinCC in STEP 7.
- Elements whose data types are supported in WinCC.

Note

Invalid elements of a PLC data type in WinCC

Invalid elements generate an error in WinCC.

If you disable the "Accessible from HMI" option for the corresponding elements of the associated PLC data type in STEP 7, these elements are excluded in WinCC.

Naming conventions

The following characters are invalid in the name of the PLC data type and generate an error in WinCC:

- Dot: "."
- Square brackets: "(" and ")"

Properties

The properties of the PLC data type and its elements are adopted in WinCC. Depending on the data type used, the properties are read-only or can be written to in WinCC.

If you change the connection of the PLC data type in WinCC, all elements of the PLC data type are deleted and the properties of the newly connected PLC tag are used.

In WinCC, you have access to STEP 7 comments on elements of the PLC data type.

You have limited access to properties in WinCC for the following elements of PLC data types:

- Elements of the data type "Struct"
- PLC data type
- Multidimensional arrays
- Array of complex data types except "DTL"

Mapping of the data type "DTL"

If a PLC data type contains elements of the data type "DTL", these elements are mapped in WinCC without lower-level elements. The data type "DTL" turns into "DateTime" in WinCC.

12.2.2 Working with Tags

12.2.2.1 Creating tags

Creating external tags

Introduction

You can access an address in the PLC via a PLC tag using an external tag. The following options are available for addressing:

- Symbolic addressing
- Absolute Addressing

You can find further details on symbolic addressing in section "Addressing external tags (Page 4202)". If possible, use symbolic addressing when configuring a tag. You create tags either in the standard tag table or in a tag table you defined yourself.

Requirement

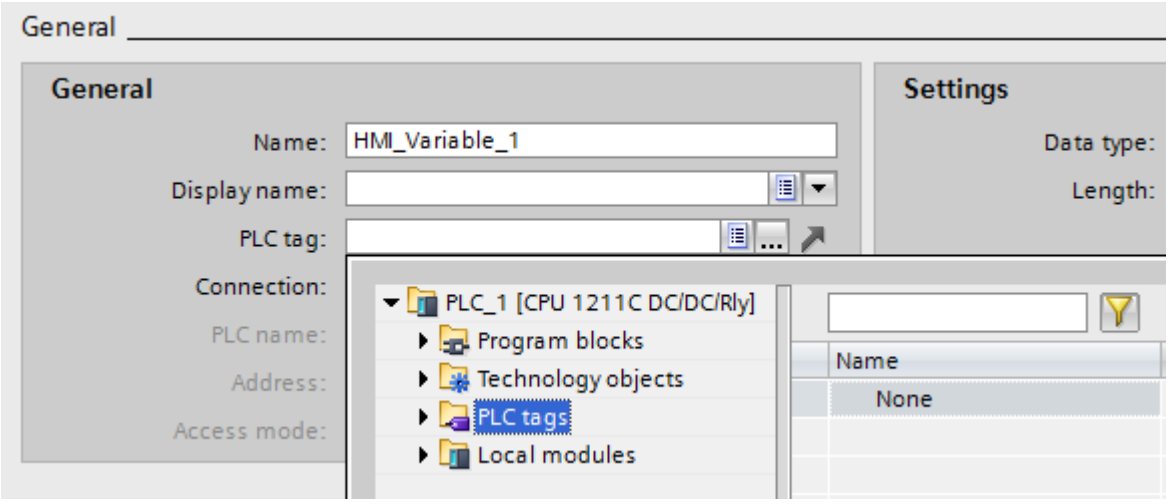
- You have opened the project.
- A connection to the PLC is configured.
- The Inspector window is open.

Procedure

To create an external tag, proceed as follows:

1. Open the "HMI tags" folder in the project tree and double-click the standard tag table. The tag table open.
   Alternatively, create a new tag table and then open it.
2. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
3. Select the "Properties > Properties >General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field. The tag name must be unique throughout the device.
4. If required, select the "Display name" field to enter a name to be displayed in Runtime. The name to be displayed is language-specific and can be translated for the required Runtime languages. The display name is available for Basic Panels, Panels and Runtime Advanced.
5. Select the connection to the required PLC in the "Connection" box. If the connection you require is not displayed, you must first create the connection to the PLC. You create the connection to a SIMATIC S7 PLC in the "Devices & Networks" editor. You create the connection to external PLCs in the "Connections" editor.
   If the project contains the PLC and supports integrated connections, you can also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

6. If you are working with an integrated connection, click the ... button in the "PLC tag" field and select an already created PLC tag in the object list. Click the ✓ button to confirm the selection.



7. If you are working with a non-integrated connection, enter the address from the PLC in the "Address" field. The "PLC tag" field remains empty.
8. Configure the other properties of the tag in the inspector window.

You can also configure all tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

You can also create tags alternatively directly at the application point, e.g. on an I/O field. To do this, click the Add new button in the object list. You then configure the new tag in the Inspector window.

Result

An external tag has been created and linked to a PLC tag or an address in the PLC.

Alternative procedure

You can also create external HMI tags by dragging and dropping data block elements or global PLC tags in an HMI tag table.

Basics of tags (Page 4197)

Addressing external tags (Page 4202)

Manage tags (Page 4211)

Tag Limits (Page 4218)

Indirect addressing of tags (Page 4232)

Creating internal tags

Introduction

You must at least set the name and data type for internal tags. Select the "Internal tag" item, rather than a connection to a PLC.

For documentation purposes, it is a good idea to enter a comment for every tag.

Requirement

You have opened the project.

Procedure

1. Open the "HMI tags" folder in the project tree and double-click the entry "Standard tag table". The tag table opens.
   Alternatively, create and then open a new tag table.
2. Double-click "Add" in the "Name" column of the tag table. A new tag is created.
3. If the Inspector window is not open, select the "Inspector window" option in the "View" menu.
4. Select the "Properties > Properties >General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field. This tag name must be unique throughout the project.
5. If required, select the "Display name" field to enter a name to be displayed in Runtime. The name to be displayed is language-specific and can be translated for the required Runtime languages. The display name is available for Basic Panels, Panels and Runtime Advanced.
6. Select "Internal tag" as the connection in the "Connection" field.
7. Select the required data type in the "Data type" field.
8. In the "Length" field, you must specify the maximum number of characters to be stored in the tag according to the selected data type. The length is automatically defined by the data type for numerical tags.
9. As an option, you can enter a comment regarding the use of the tag. To do so, click "Properties > Properties > Comment" in the Inspector window and enter a text.

You can also configure all tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

You can a ags alternatively directly at the application point, e.g. on an I/O field. Click the 
button in the object list. You can then configure the new tag in the Properties window that opens.

Result

An internal tag is created. You can now use this in your project.

In additional steps you can configure the tag, for example, by setting the start value and limits.

See also

Creating external tags (Page 4207)

Creating multiple tags

Introduction

In a tag table, you create additional identical tags by automatically filling the rows of the table below a tag.

The tag names are incremented automatically when filling in automatically.

You can also use the auto fill function to fill table cells below a tag with a single tag property and thus modify the corresponding tags.

If you apply the automatic filling in to already filled cells of a tab table, you will be asked whether you want to overwrite the cells or insert new tags.

If you do not want to overwrite already configured tags, activate insert mode. Activate insert mode by keeping the <Ctrl> key pressed during insertion. Already existing entries in the tag table are moved down if insert mode is activated.

Requirement

- You have opened the project.
- A tag table is open.
- The tag which is to serve as a template for other tags is configured.

Procedure

1. 
d as
ins
ttom
ross.
2. o fill
3. 
Result

Depending on which cells were selected, the function may automatically fill individual properties or create new tags.

See also

Creating external tags (Page 4207)

12.2.2.2 Editing tags

Manage tags

Introduction

You can always rename, copy or delete tags.

When a tag is renamed, the new name must be unique for the whole device.

If you use the "Copy" command to copy a tag to the clipboard, the objects and references linked to the tag are copied as well.

If you use the "Insert" command to add a tag to another device, the tag will be added without the connected references. Only the object name of the reference will be inserted. If a reference of the same name and valid properties exists in the target system, the existing reference will then be connected to the copied tag.

If you copy a tag, some of the objects linked to the tag are copied as well. The following objects are copied:

- Logging tags
- Cycles
- Alarms

If you add the copied tag to another device, the tag is added together with the linked objects.

Requirement

- The tag which you wish to rename, copy or delete must exist.
- The tag table containing the tag is open.

Renaming tags

1. In the "Name" field, select the tag in the tag table.
2. Select "Rename" from the shortcut menu.
3. Type in a new name.
   The tag appears under its new name.

Copying tags

1. Mark one or more tags in the tags table.
2. Select "Copy" from the shortcut menu.
3. Click on the point at which you want to insert the tag. For example, click another tag table in the same device or the tag table in a second device.
4. Select "Paste" from the shortcut menu. The tag is inserted as described above.

Deleting a tag

1. Select one or more tags in the tag table.
2. Select the "Cross-reference" command from the "Tools" menu. In the "Cross-reference" editor, check to see where the tags are used. In this manner, you can see what impact the deletion of the tag will have on your project.
3. Select "Delete" in the pop-up menu of the tag.
   All marked tags will be deleted.

Export and import of tags

WinCC gives you the option to export and import tags. With Export and Import, you have the option to export tags from one project and import them into another project. There is also the option to create larger numbers of tags outside of WinCC, edit them and subsequently import into any WinCC project. For further details, refer to Auto-Hotspot.

Synchronizing tags (Page 4216)

Creating external tags (Page 4207)

Edit tags

Introduction

You can modify tags at any time to adapt them to changed requirements in the project.

Edit tags

You have the following options to change the configuration of a tag:

- You open the tag table in which the tag is contained.
- Open the tag table "Show all tags".
- You open the Inspector window of a tag with the "Edit" button in the object selection on the display and operating object.

In the tag tables, you can perform such tasks as comparing and adjusting the properties of multiple tags or sorting the tags by their properties.

You can change the properties either directly in the table or in the Inspector window.

If you change a tag property and this change causes a conflict with another property, it will be highlighted in color to draw your attention to this fact. If you link the tag with another controller, for example, which does not support the set data type, this property is highlighted in color.

See also

Manage tags (Page 4211)

Configuring multiple tags simultaneously

Introduction

In WinCC, you can assign the same properties to multiple tags in a single operation. This facilitates efficient programming.

Requirement

- You created the tags you want to configure.
- The tag table is open.
- The Inspector window is open.

Procedure

1. In the tag table, select all the tags that you want to configure at the same time.
   If the selected property is identical for all the tags, the setting for this property will appear in the Inspector window. The associated field will remain blank otherwise.
2. You can define the shared properties in the Inspector window or directly in the tag table.

if you change a property commonly on several tags, only this one property is changed. The other properties of the tag remain unchanged.

Result

All marked tags will be reconfigured.

To edit tag properties which differ from one tag to the other, simply clear the multiple selection.

See also

Manage tags (Page 4211)

Using multiple tags simultaneously in a screen

Introduction

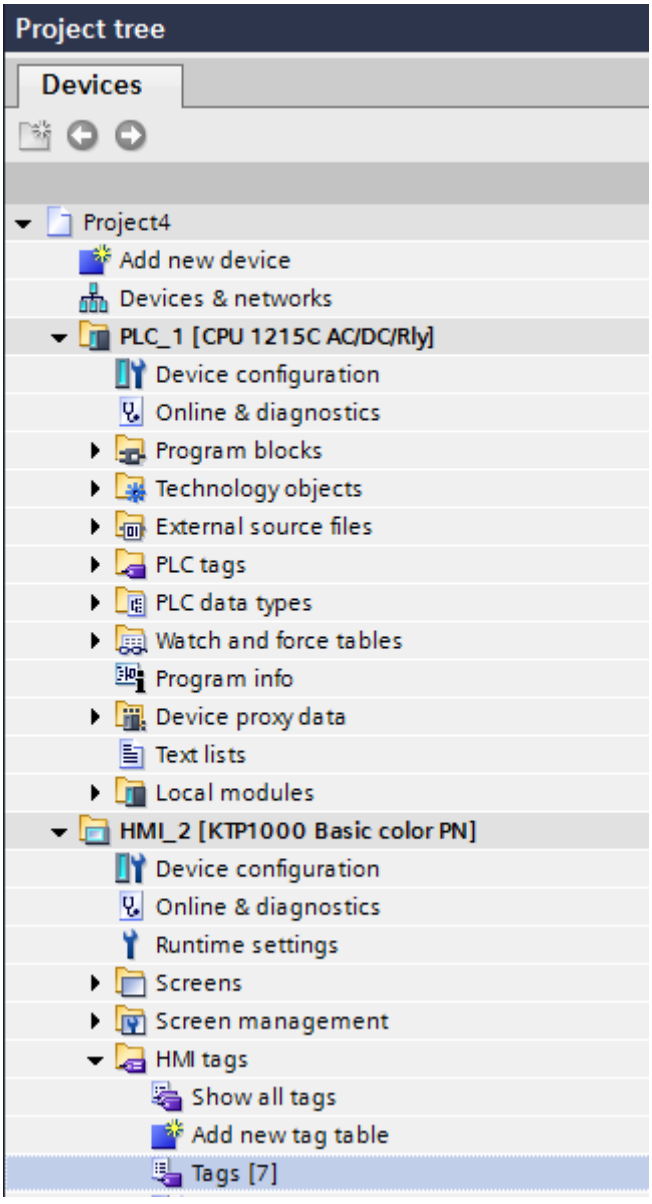
In WinCC, you can create multiple I/O fields that are linked with tags in one screen in a single operation. This facilitates efficient programming.

Requirement

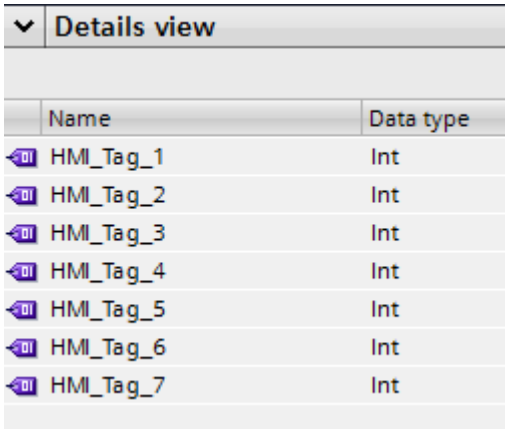
- Several tags are set up.
- A screen is open.

Procedure

1. In the project tree, select the required tag table under "HMI tags".



2. Select the detail view at the bottom of the project tree. The detail view shows the tags that exist in the selected tag group.



3. Mark the tags in the detail window.
4. Drag the tags to the screen. For each tag, this creates an I/O field that is connected to the tag.

Note

When you move a PLC tag from the detail window to the work area by drag&drop, a network and a connection are created additionally in the "Devices & Networks" editor.

See also

Manage tags (Page 4211)

Synchronizing tags

Introduction

To synchronize the PLC and HMI tags, WinCC offers the following options:

- Synchronizing tags with or without name matching between PLC and WinCC
  The following options are available for this:
- Link tags with addresses in the PLC
  This procedure is suitable, for example, if changes were made to the connection between the HMI device and the PLC and the tag connections were lost. The function can also be used if you have configured the control program and HMI project separately.

Requirement

- External HMI tags have been created.
- PLC tags have been created.
- An HMI connection to a PLC in the project has been established.

Procedure

To synchronize HMI tags with PLC tags, follow these steps:

1. In the project tree, select the directory that contains the tags in question.
2. Select "Connect HMI tags to matching PLC tags" from the shortcut menu.
   A dialog opens.

3. Select the option you want to use.
   If you want to synchronize the tags without name matching, disable "Replace WinCC tag name with PLC tag name".
   If you want to connect HMI tags new with absolute access, select "Data type and absolute address match".
4. Confirm with "Synchronize".
   The system searches for a suitable PLC tag according to the selected option.

Result

The external HMI tags are synchronized with the PLC tags.

If you have selected the option "Data type and absolute address match", the tag connection is established as soon as a suitable PLC tag is found.

If you have selected a different option, the WinCC tags are updated accordingly and the PLC tag names are applied in WinCC.

Manage tags (Page 4211)

12.2.2.3 Configuring Tags

Tag Configuration Basics

Tag Limits

Introduction

You can restrict the value range with limits for numerical tags.

Principle

You can specify a value range defined by a high limit and a low limit for numerical tags.

If the operator enters a value for the tag that is outside the configured value range, the input is rejected. The value is not accepted. You configure a function list when configuring for Runtime Advanced and Panels. When the tag value leaves the value range, the function list is processed.

Note

If you want to output an analog alarm when a limit is violated, configure the respective tag in the "Analog alarms" tab. You can also configure the analog alarm in the "HMI alarms" editor. The values for output of an analog alarm depend on the configured tag limits.

Application example

Use the limits to warn the operator when the value of a tag enters a critical range, for example.

Configuring address multiplexing with symbolic addressing (Page 4229)

Creating external tags (Page 4207)

Defining Limits for a Tag

Introduction

For numerical tags, you can specify a value range by defining a low and high limit.

For Runtime Advanced and Panels you can configure the system to process a function list whenever a tag value drops below or exceeds its configured value range.

Requirement

- The tag for which you want to set the limits is created.
- The Inspector window with the properties for this tag is open.

Procedure

To define limits for a tag, proceed as follows:

1. In the Inspector window select "Properties > Properties > Limits." If you want to define one of the limits as a constant value, select "Constant" using the button. Enter a number in the relevant field.
   If you want to define one of the limits as a tag value, select "HMI tag" using the button. Use the object list to define the tag for the limit.
2. To set additional limits for the tag, repeat step 1 with the appropriate settings.

Alternative procedure

You can also configure the high and low limit directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Configuring a function list for Runtime Advanced and Panels

When you configure Runtime Advanced and Panels, you can have a function list called up if a high or low limit is violated.

1. If you want to start a function list when the value drops below the value range, click "Properties > Events > Minimum violated" in the Inspector window. Create a function list in this dialog.
2. If you want to start a function list when the value exceeds the value range, click "Properties > Events > Maximum violated" in the Inspector window. Create a function list in this dialog.

Result

You have set a value range defined by a high and low limit for the selected tag. If the value range is exceeded or undershot, a function list may be carried out.

See also

Tag Limits (Page 4218)

Start value of a tag

Value of a tag at start of Runtime

You can configure a start value for numeric tags and tags for date/time values. The tag will be preset to this value when Runtime starts. In this way, you can ensure that the tag has a defined status when Runtime starts.

For external tags, the start value will be displayed on the HMI device until it is overwritten by the PLC or by input.

If no start value was configured, the tag contains the value "0" when starting Runtime.

In WinCC Runtime Professional you can enter a tag value in place of the start value on a tag with the "String" data type. The tag value is saved in the "Project texts" editor and is multilingual. After the text has been translated, it is displayed in Runtime as a language-dependent start value.

Application example

You can assign a default value to an I/O field. Enter the desired default value as start value for the tag that is linked to the I/O field.

See also

Tag Limits (Page 4218)

Defining the start value of a tag

Introduction

In WinCC you can configure a start value for a numeric tag and a tag for date/time values which this adopts at Runtime start.

Requirement

- You have created the tag for which you want to define a start value.
- The Inspector window with the tag properties is open.

Procedure

To configure a start value, proceed as follows:

1. In the Inspector window select "Properties > Properties > Values."
2. Enter the desired "Start value."

Alternative procedure

You can also configure the start value directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Result

The start value you selected for the tag is transferred to the project.

See also

Tag Limits (Page 4218)

Updating the Tag Value in Runtime

Introduction

Tags contain process values which change while Runtime is running. Value changes are handled differently at internal and external tags.

Principle

When Runtime starts, the value of a tag is equal to its start value. Tag values change in Runtime.

In Runtime, you have the following options for changing the value of a tag:

- A value change in an external tag in the PLC.
- By input, for example, in an I/O field.
- By running a system function, such as "SetValue."
- A value assignment in a script.

Updating the Value of External Tags

The value of an external tag is updated as follows:

- Cyclic in operation
  If you select the "Cyclic in operation" acquisition mode, the tag is updated in Runtime while it is displayed in a screen or is logged. The acquisition cycle determines the update cycle for tag value updates on the HMI device. You can either choose a default acquisition cycle or define a user-specific cycle.
- Cyclic continuous
  If you select the "Cyclic continuous" acquisition mode, the tag will be updated continuously in Runtime, even if it is not in the currently-open screen. This setting is activated for tags that are configured to trigger a function list when their value changes, for example.
  Only use the "Cyclic continuous" setting for tags that must truly be updated. Frequent read operations increase communication load.
- On demand
  If you select the "On demand" acquisition mode, the tag is not updated cyclically. It will only be updated on demand using the "UpdateTag" system function, for example, or by a script.

See also

Tag Limits (Page 4218)

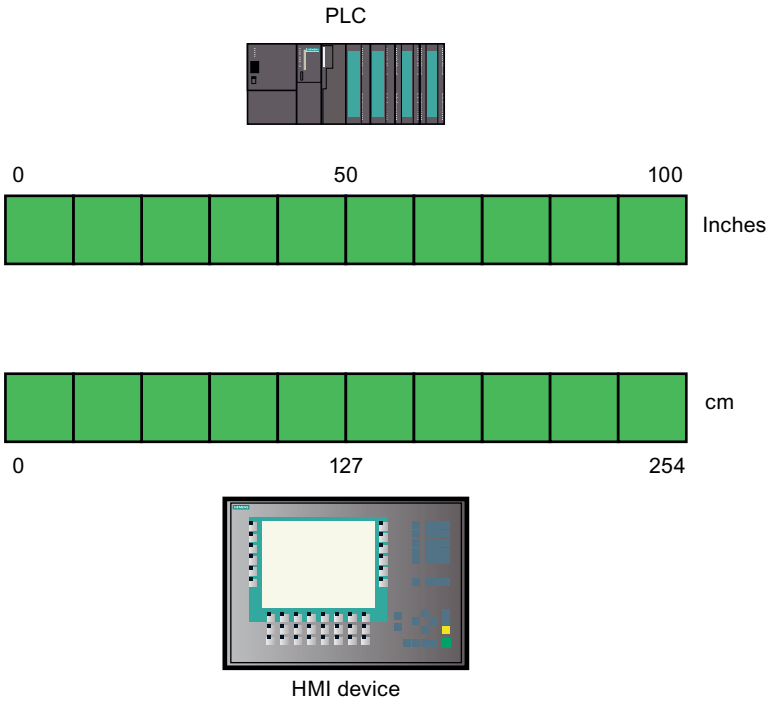
Linear scaling of a tag

Introduction

Numeric data types can be processed with linear scaling. The process values in the PLC for an external tag can be mapped onto a specific value range in the project.

Principle

To apply linear scaling to a tag, you must specify one value range on the HMI device and one on the PLC. The value ranges will be mapped to each other linearly.



As soon as data from the HMI device is written to an external tag, it will be automatically mapped to the value range of the PLC. As soon as data from the HMI device is read from the external tag, a corresponding transformation will be performed in the other direction.

Note

You can also use the system functions "LinearScaling" and "InvertLinearScaling" to automatically convert process values.

Application example

The user enters length dimensions in centimeters but the PLC is expecting inches. The entered values are automatically converted before they are forwarded to the controller. Using linear scaling, the value range [0 to 100] on the PLC can be mapped onto the value range [0 to 254] on the HMI device.

See also

Tag Limits (Page 4218)

Applying linear scaling to a tag

Introduction

To apply linear scaling to a tag, you must specify one value range on the HMI device and one on the PLC. The value ranges will be mapped to each other linearly.

Requirement

- The external tag to which linear scaling is to be applied must exist.
- The Inspector window with the properties for this tag is open.

Procedure

To apply linear scaling to a tag, follow these steps:

1. In the Inspector window select "Properties > Properties > Linear scaling."
2. Click on "Enable" to switch on linear scaling.
   Using this option, you can temporarily switch off linear scaling for testing purposes, for example. Settings which were made earlier for linear scaling remain unchanged.
3. In the "PLC" area, enter the start and end values of the value range to be applied to the process values on the PLC.
4. In the "HMI device" area, enter the end and start values of the value range to be applied to the process values on the HMI device.

Result

In Runtime the data will be automatically mapped from one value range to the other.

Note

You can also use the "LinearScaling" and "InvertLinearScaling" system functions to automatically convert process values.

See also

Tag Limits (Page 4218)

Connecting a tag to another PLC

Introduction

In WinCC, you can change the PLC connection of a tag at any time. This is needed when you change the configuration of your plant, for example.

Depending on the PLC selected, you may need to modify the configuration of the tag. The tag properties which must be changed will be highlighted in color.

Requirement

- The external tag, whose connection you wish to change, must already exist.
- The connection to the PLC must already exist.
- The Properties window for this tag is open.

Procedure

To change the PLC connection of a tag, proceed as follows:

1. In the Inspector window select "Properties > Properties > General."
2. Select the new connection in the "Connection" field.
   The tag properties that you must change will be highlighted in color in the tag table and in the Inspector window.
3. Change all highlighted properties of the tag to suit the requirements of the new PLC.

Result

The external tag is connected to the new PLC.

See also

Tag Limits (Page 4218)

Address multiplexing

Introduction

Using address multiplexing, you can use a single tag to access a multitude of memory locations within the PLC's address range. You read and write to the addresses without defining a tag for each individual address.

Multiplexing with absolute addressing

When using multiplexing with absolute addressing, you configure tags as placeholders for the address in the PLC to be addressed.

If you want to access, for example, an address of the format "%DBx.DBWy", the expression for multiplexing is as follows:

"%DB[HMITag1].DBW[HMITag2]"

In Runtime, you supply the tag "HMITag1" with the required value for the data block you want to address.

In Runtime, you supply the tag "HMITag2" with the required address from the data block.

Tags are supplied with values, for example, with the help of values from the PLC or via a script.

Multiplexing with absolute addresses is supported for the following PLCs and communication drivers.

- SIMATIC S7-300/400
- SIMATIC S7-1200
- SIMATIC S7-1500

Multiplexing with absolute addresses is not available for data blocks with optimized access.

Multiplexing with symbolic addressing

When multiplexing with symbolic addressing, you access an array element of an array tag in a data block of the connected PLC by means of a multiplex tag and an index tag. The multiplex tag contains the symbolic address of the data block which you want to access. The symbolic address also contains the index tag via which you access the index of the array tag.

If you want to access, for example, the array tag "Arraytag_1" in the data block "Datablock_1", the expression for symbolic addressing is as follows:

"Datablock_1.Arraytag_1["HMITag_1"]

You control the access to the index of the array elements with the HMI-Variable "HMITag_1". In Runtime, you supply the tag with the index of the array element that you want to access.

Multiplexing with symbolic addressing is only available if the following components support symbolic addressing:

- the HMI device
- PLC
- Communication driver

Symbolic addressing is supported by communication drivers:

- SIMATIC S7-1200
- SIMATIC S7-1500

See also

Tag Limits (Page 4218)

Configuring address multiplexing with absolute addressing

Introduction

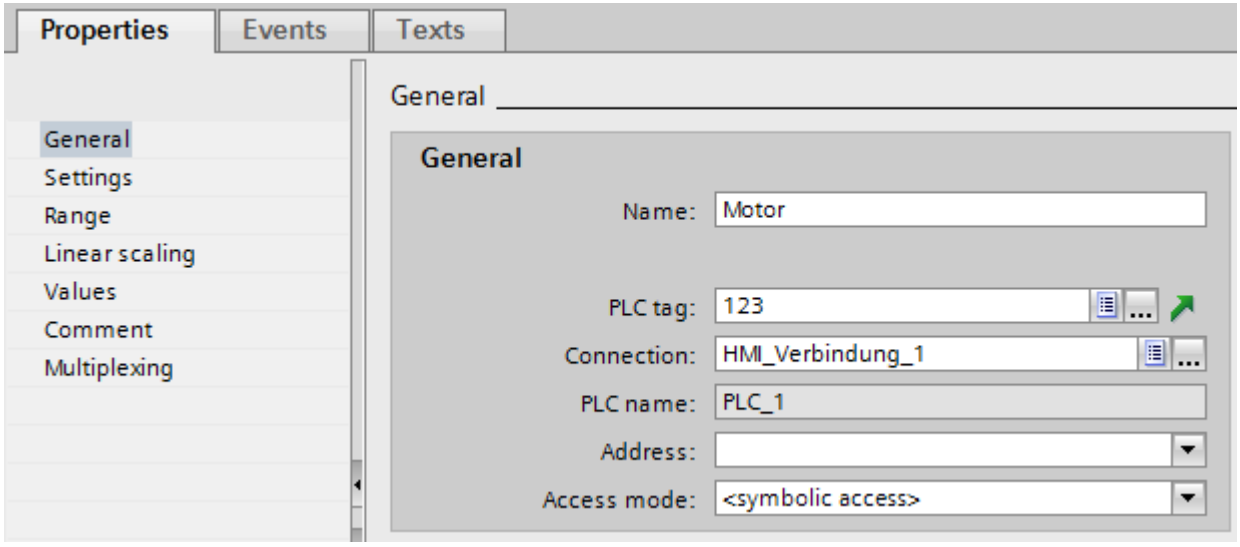
When using address multiplexing, you can efficiently access different addresses in the PLC with the help of a small number of tags. Instead of the absolute address in the PLC, you use tags in order to be able to change the address in Runtime.

Requirement

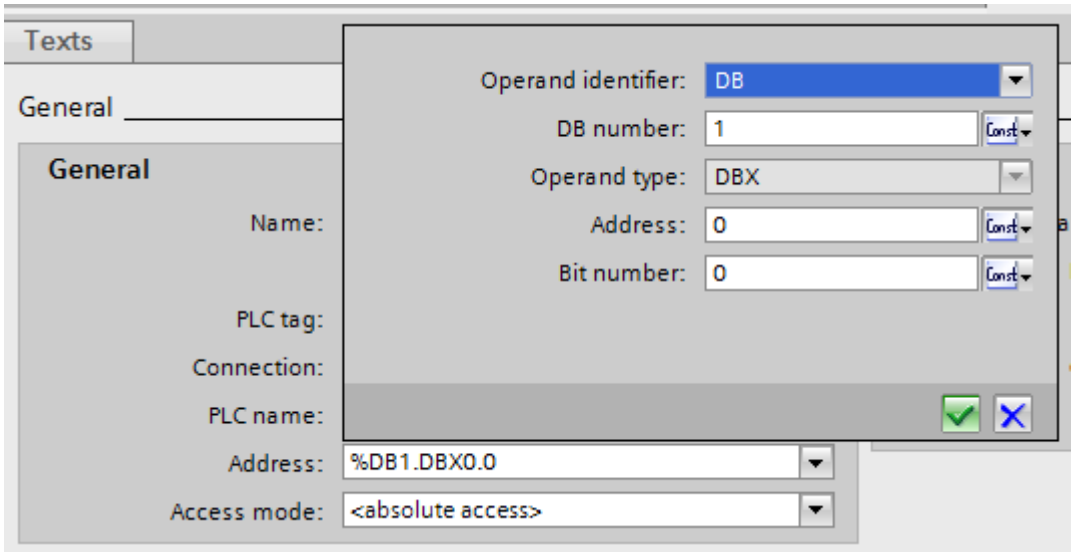
- The tag for address multiplexing is created and connected to the PLC.
- The Properties window for this tag is open.

Procedure

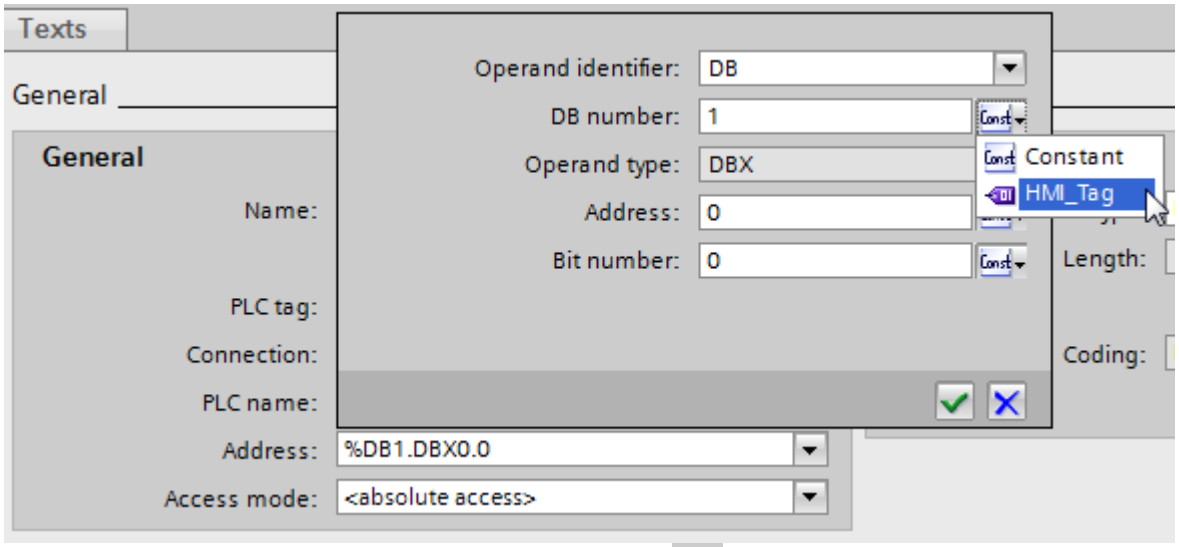
1. Select the tag for address multiplexing in the tag table, and select "Properties > Properties > General" in the Inspector window. The general properties of the tag are displayed.



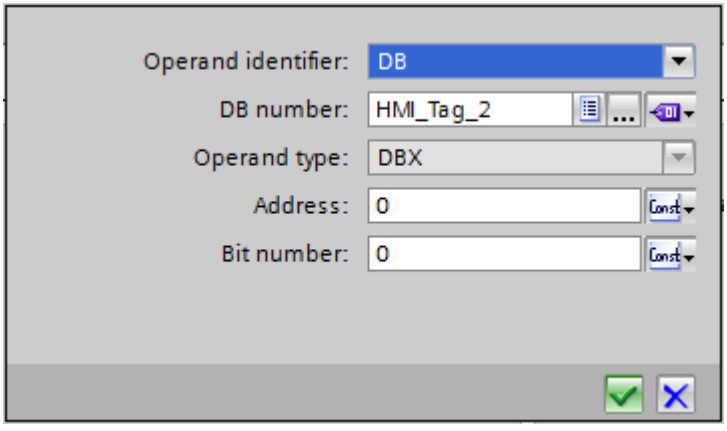
2. Select the "Int" data type for this example.
3. Select the access type "Absolute addressing".
4. Click the selection button in the "Address" field. The address dialog opens.



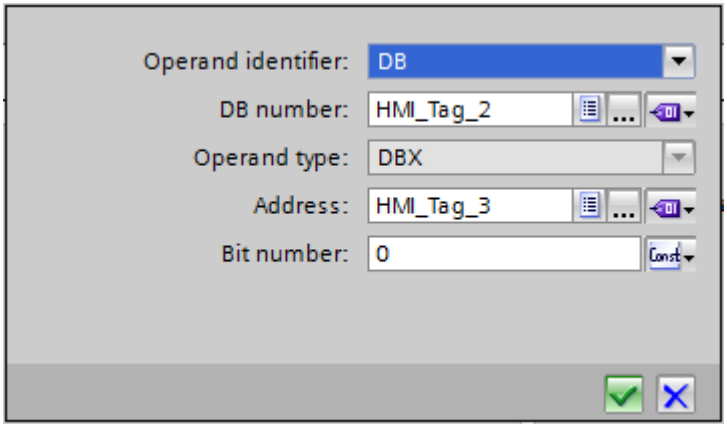
5. Click the selection button in the "DB number" field and select the entry "HMI tag".



6. In the "DB number" field, click the ... button and select a tag for the DB number in the object list. Or create a new tag with the help of the object list. Accept the tag by clicking the button.



7. Repeat steps 3 and 4 for the "Address" field and configure a further tag for calling the address area in the data block.



The selection options in the Address dialog depend on the selected data type of the multiplex tag. The Address dialog offers only address settings that can be configured with the selected data type.

Result

In runtime, the multiplex tag is used to access the memory location corresponding to the address currently found in the tag. You control access to the data block with the tag in the DB number field. You control access to the address in the selected data block with the tag in the "Address" field.

Note

The value in the memory location will only be read at the next update cycle for the addressed tag.

If, for example, you use a multiplex tag in a script, do not attempt to access contents of the memory location directly after changing it.

Tag Limits (Page 4218)

Configuring address multiplexing with symbolic addressing

Introduction

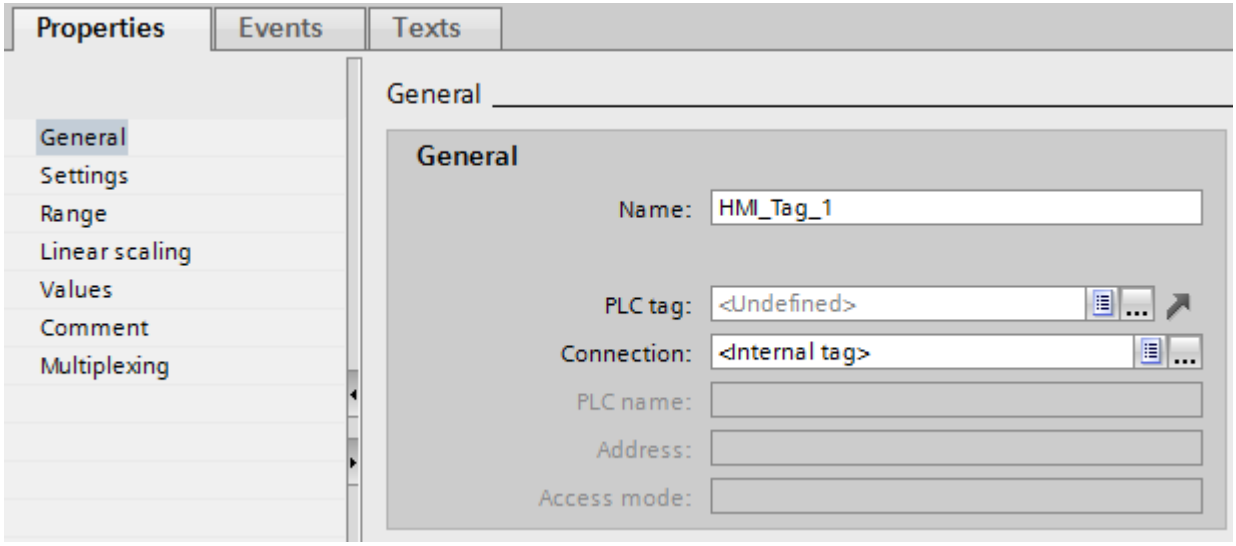
When using address multiplexing, you can efficiently access different addresses in the PLC with the help of a small number of tags. Instead of the symbolic address in the PLC, you use tags in order to be able to change the address in Runtime.

Requirement

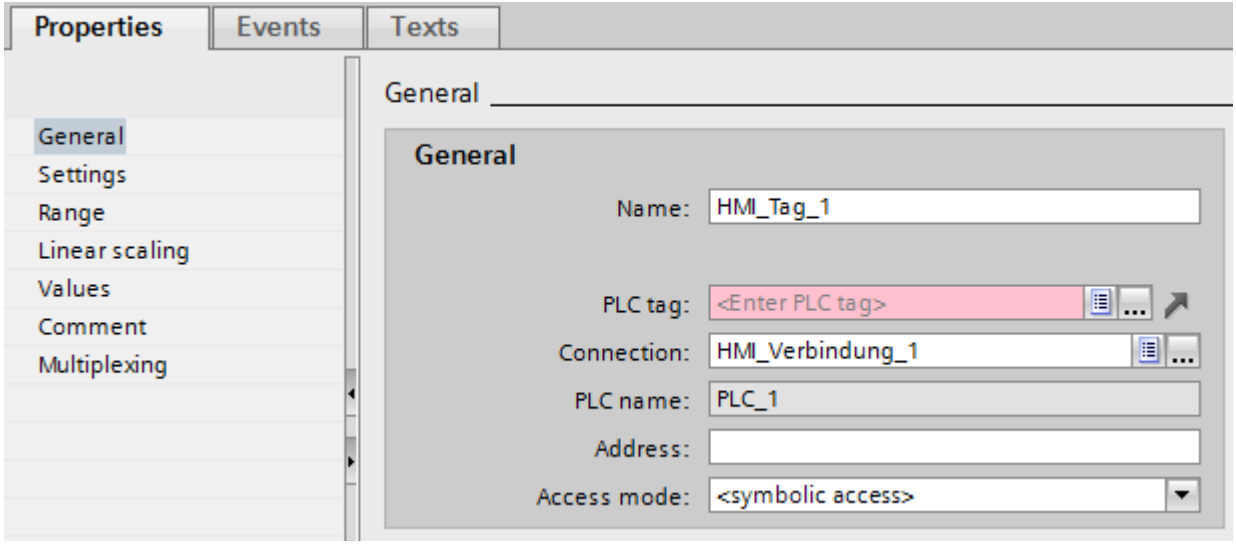
- The tag for address multiplexing is created.
- The Properties window for this tag is open.
- A data block with an array tag is created in the connected PLC.
- The data block was compiled.

Procedure

1. Select the tag for address multiplexing in the tag table, and select "Properties > Properties > General" in the Inspector window. The general properties of the tag are displayed.

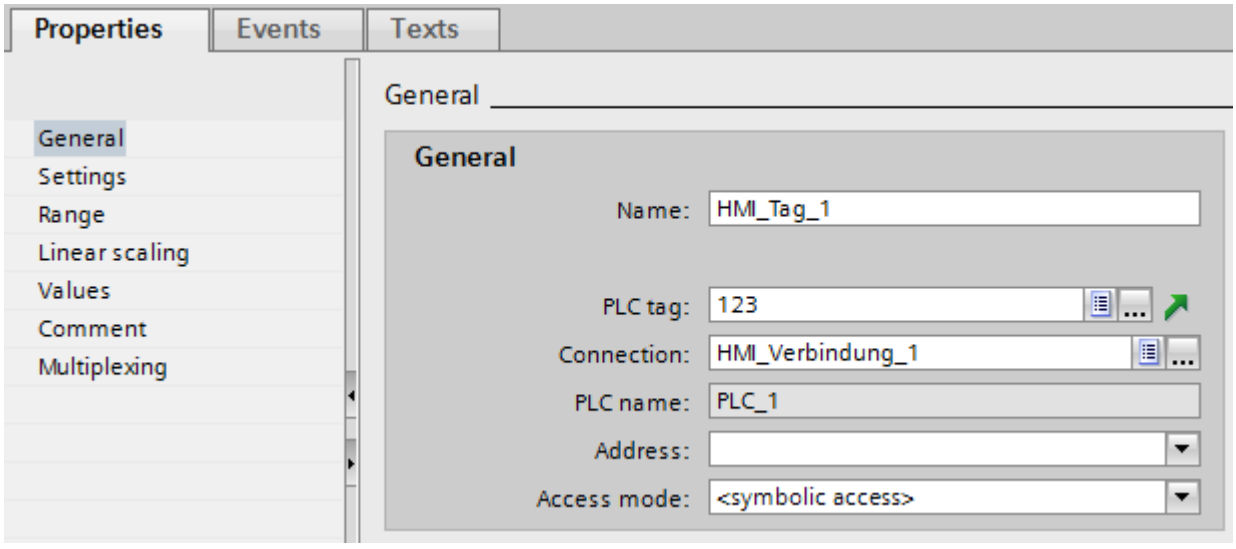


2. Select the connection to the PLC via the "Connection" field.

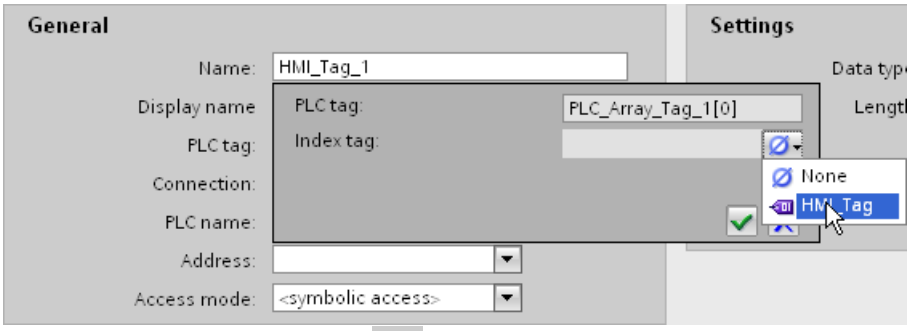


3. Select the access type "Symbolic access".

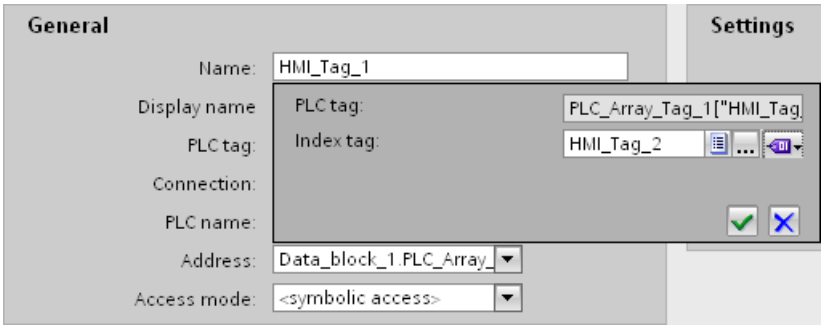
4. Navigate to the data block of the PLC via the "PLC tag" field and select an array element of the array tag.



5. Click the selection button in the "Address" field. The address dialog opens.
6. Click the selection button in the "Index tag" field and select the entry "HMI tag".



7. In the "Index tag" field, click the ... button and select a tag for the array index in the object list. Or create a new tag with the help of the object list. Accept the tag by clicking the button.



Result

In Runtime, the array element whose index value is contained in the index tag is accessed.

See also

Indirect addressing of tags (Page 4232)

Tag Limits (Page 4218)

Special configuration options

Indirect addressing of tags

Principle

In multiplexes, a type of indirect addressing, the tag used is first determined at runtime. A list of tags is defined for the multiplex tag. The relevant tag is selected from the list of tags in runtime. The selection of the tag depends on the value of the index tag.

In Runtime, the system first reads the value of the index tag. Then the tag which is specified in the corresponding place in the tag list is accessed.

Application example

Using indirect addressing, you could configure the following scenario:

The operator selects one of several machines from a selection list. Depending on the operator's selection, data from the selected machine will be displayed in an output field.

To configure such a scenario, configure the index tag for a symbolic I/O field. Configure the multiplex tag at an I/O field. Configure the tag list of the multiplex tag to reflect the structure of the selection list.

If the operator selects another machine, the value of the index tag will change. The selection field then displays the content of the tag that is pointed to in the tag list in the multiplex tag by the new index value.

Basics of tags (Page 4197)

Configuring address multiplexing with symbolic addressing (Page 4229)

Creating external tags (Page 4207)

Addressing tags indirectly

Introduction

With indirect addressing, the tag used is first determined at runtime. Instead of a single tag, a list of tags is defined. The list entries consist of an index value and the name of the tag to be used. Using an index tag, you can control which entry in the tag list will be accessed.

Requirement

- The tag which you wish to address indirectly must already exist.
- The index tag must exist.
- The tags which will be contained in the tag list must already exist.
- The Inspector window with the tag properties is open.

Procedure

To address tags indirectly, proceed as follows:

1. In the Inspector window select "Properties > Properties > Multiplexing".
2. Select the "Multiplexing" option to activate indirect addressing.
   Using this option, you can temporarily switch off indirect addressing for testing purposes, for example. Settings which were made earlier for indirect addressing remain unchanged.
3. Select an "Index tag" or define a new tag using the object list.
4. Click the first entry in the "Tags" column in the tag list.
5. Select a tag as a list entry or define a new tag using the object list.
   The entry in the "Index" column will be generated automatically.
6. Repeat step 5 for all tags that you wish to add to the tag list.
7. If necessary, you can use drag-and-drop to change the order of the entries in the list.

Result

In runtime, the system will dynamically access the tag in the tag list which has the same index value as the value currently in the index tag.

See also

Indirect addressing of tags (Page 4232)

Using tags to trigger functions

Introduction

You can use the values of variables as the triggering event for an action in runtime. To start an action in Runtime, configure a function list for a tag. Include one or more system functions or VB scripts in the function list. The function list is processed when the configured event occurs.

The following events are available for a tag:

- Change in value of the tag
  Function list processing is triggered by each change in the value of the variable.
  When the tag is defined as an array tag, the function list is processed whenever an array element changes.
- Violation of the tag's high limit
  The function list is processed when the high limit is violated.
- Violation of the tag's low limit
  The function list is processed when the low limit is violated.

Requirement

- The tag whose value you wish to use as an event already exists.
- The Inspector window with the properties for this tag is open.

Procedure

To configure a tag with a function list, proceed as follows:

1. Under "Properties > Events >" in the Inspector window, select the event for which you want to create a function list.
   The function list associated with the selected event is shown.
2. Click "<Add function>". The second table column contains a selection button.
3. Click the selection button and select a system function.
4. Define the parameter values.

Alternatively, select a script to run in the function list, rather than a system function. The "VB scripts" entry is only displayed if there is a script available in the project.

Result

If the configured event occurs in Runtime, the function list or the script is processed.

See also

Indirect addressing of tags (Page 4232)

Defining the acquisition cycle for a tag

Introduction

The value of an external tag can be changed in Runtime by the PLC to which the tag is linked. To ensure that the HMI device is informed of any changes in tag values by the PLC, the values must be updated on the HMI. The value is updated at regular intervals while the tag is displayed in the process screen or is logged. The interval for regular updates is set with the acquisition cycle. The update can also be made continuous.

Requirement

- You have created the tag for which you want to define an acquisition cycle.
- The Inspector window with the tag properties is open.

Procedure

To configure an acquisition cycle for a tag, follow these steps:

1. In the Inspector window select "Properties > Properties > General."
2. If you want to update the tag at regular intervals as long as it is being displayed on the screen or logged, select "Cyclic in operation" as the acquisition mode.
   Or:
   If you want to update the tag at regular intervals even though it is not being displayed on the screen or logged, select "Cyclic continuous" as the acquisition mode.
   The "Cyclic continuous" setting is selected for a tag, for example, that has a function list configured for a change of its value and that is not directly visible in a screen.
3. Select the required cycle time in the "Acquisition cycle" field or define a new acquisition cycle using the object list.

Alternatively, you can configure the acquisition cycle directly in the work area of the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Note

Only use the "Cyclic continuous" acquisition mode for tags that really have to be continuously updated. Frequent read operations generate a heavy communication load.

Result

The configured tag is updated in Runtime with the selected acquisition cycle.

Indirect addressing of tags (Page 4232)

12.2.3 Working with arrays

12.2.3.1 Basics on arrays

Definition

Array data of a uniform data type is successively arranged and is addressed within the address space to allow access to these data by means of an index. The individual array elements are addressed by means of an integer index. Each array element is assigned the same properties which are configured at the array tag.

Default tag table

Name	Tag table	Data type	Connection
HMI_Tag_1	Default tag table	Array [0..4] of Int	<Internal tag>
[0]	Default tag table	Int	<Internal tag>
[1]	Default tag table	Int	<Internal tag>
[2]	Default tag table	Int	<Internal tag>
[3]	Default tag table	Int	<Internal tag>
[4]	Default tag table	Int	<Internal tag>

Advantages

You can configure numerous array elements with the same properties all at once with a single array tag. You can then use each array element as any other tag in your configuration.

Restrictions

The following restrictions apply to the use of arrays:

- An array may contain only one dimension.
- The lower index of an array must begin with "0".

Application examples

Array tags can be used in the following situations:

- To group process values in profile trends: You map process values to trends which are acquired at different points in time, for example.
- To access specific values which are grouped in trends: For example, display all recorded values of the profile trend by gradually increasing the index tag.
- To configure discrete alarms with successive bit number.
- To save the complete machine data records in a recipe.

License rule for runtime

An array tag is counted in WinCC Runtime as 1 PowerTag, regardless of the number of array elements.

Special features

Warning

Increased system load and performance losses

Read or write access to a single array element always includes read or write access to all array elements of the array tag. Transfer of the data of large arrays from and to the PLC usually takes longer compared to the transfer of a basic data type. This may cause communication overload and disruption as a result.

Example:

- An array tag which consists of 100 array elements of data type "Real" was configured.
- If an array element with a length of 4 bytes changes, 100 x 4 bytes are written to the PLC.

Use in scripts

To maintain performance, always use internal arrays to change arrays in scripts.

1. Copy the PLC array to the internal array at the start of the script.
2. Load on data transfer to the PLC is avoided while the script processes the internal array.

Caution

Data inconsistency at array tags

If the value of a single element must be changed in an array tag, the whole array is read, changed and rewritten as a complete array. Changes carried out in the meantime to other array elements in the PLC are overwritten during rewriting.

You should always prevent the HMI device and the PLC from concurrently writing values to the same array tag. Use synchronous transfer of recipe data records to synchronize an array tag with the PLC.

12.2.3.2 Creating array tags

Introduction

Create an array tag to configure a large number of tags of the same data type. The array elements are saved to a consecutive address space.

You can create an array tag as an internal tag or as an external tag.

If you want to create an array tag as an external tag, first configure an array tag in a data block of the connected PLC. You then connect the array tag to an HMI tag.

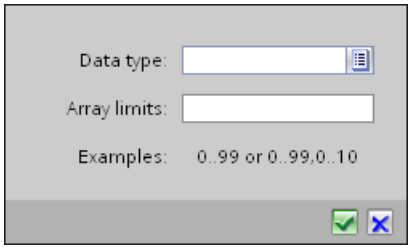
Requirement

- The HMI tag table is open.

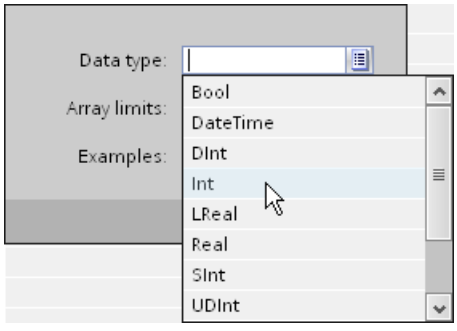
Procedure

To create an array tag, follow these steps:

1. Double click <Add> in the "Name" column of the HMI tag table.
   A new HMI tag is created.
2. Click in the Data type column and select the "Array" data type.
3. Click in the data type column. The dialog box for configuring the array is opened.



4. Select the desired data type for the array tag in the "Date type" field.



5. Define the number of array elements in the "Array limits" field. The lower limit must begin with "0".
6. Click . The settings for the array are saved.
7. Save the project.

Result

An array tag is created. The properties of the array elements are inherited from the parent array tag.

See also

Basics on arrays (Page 4236)

12.2.3.3 Examples of arrays

Introduction

Array tags combine a number of tags, e.g. 100 array elements. You use array tags as complete arrays in the following places:

- In the "Alarms" editor
- In the "Recipes" editor
- For address multiplexing
- In the trend view

You use individual array elements everywhere in the configuration like HMI tags.

Examples

You can configure an array tag with the corresponding number of array elements to handle multiple tags of the same data type.

- The individual array elements can be accessed indirectly by means of a multiplex index tag, for example.
- Use these index tags to operate and monitor the array elements.

Basics on arrays (Page 4236)

12.2.4 Working with user data types

12.2.4.1 Basics on user data types

Introduction

With user data types you bundle a number of different tags that form one logical unit. You create a user data type as a type and use instances of this type in the project. User data types are project-associated data and are available for all HMI devices of the project.

User data types differ in their association to a family of devices. User data types are available for the following families of devices:

- WinCC Runtime Advanced and Panels
- WinCC Runtime Professional

WinCC also supports the connection of PLC data types (UDTs) and user data types to HMITags.

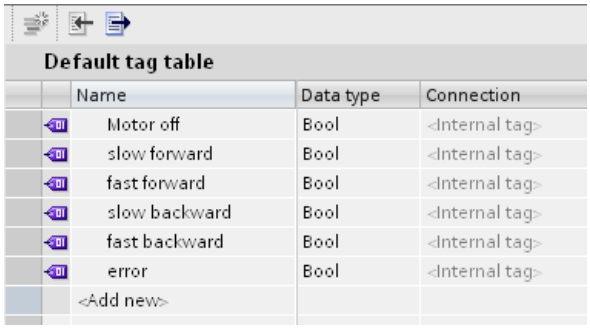
User data types also differ in their applicability with a specific communication driver. User data types are available for the following communication drivers:

- SIMATIC S7-300/400
- SIMATIC S7-1200
- SIMATIC S7-1500

Create user data types and user data type elements in the project library.

Principle

For example, the different conditions of a motor can be described using 6 unique Boolean tags.



Default tag table

	Name	Data type	Connection
	Motor off	Bool	<Internal tag>
	slow forward	Bool	<Internal tag>
	fast forward	Bool	<Internal tag>
	slow backward	Bool	<Internal tag>
	fast backward	Bool	<Internal tag>
	error	Bool	<Internal tag>
	<Add new>		

If the overall condition should be described with a single tag, this tag can be created based on a user data type. For each of the individual Boolean tags you create a user data type element in the user data type.

This user data type can then be assigned complete to a faceplate for the motor. The created and released version of user data type is displayed at the tag in the "Data type" selection field.

The configured properties of a user data type are used in the instances of the user data type. If required, you change individual properties directly at the point of use, e.g. at a tag. Changing a property at the tag does not affect the user data type created.

Notice

Availability of user data types

The connection of user data types to faceplates is only supported in WinCC Runtime Advanced and Panels.

License regulation in Runtime

If you use external tags of the "User data type" data type in a faceplate instance, each user data type element is counted as a tag in Runtime.

Example

You have created two screens in the "Screens" editor: Screen_1 and Screen_2.

3 instances of a faceplate type are inserted in Screen_1. 4 instances of a faceplate type are inserted in Screen_2.

Each faceplate instance is connected to an external tag of the "User data type" data type. The user data type includes 10 user data type elements.

Screen 1: 3 faceplate instances * 10 user data type elements corresponds to 30 external tags = 30 PowerTags.

Screen 2: 4 faceplate instances * 10 user data type elements corresponds to 40 external tags = 40 PowerTags.

In Runtime, 70 PowerTags are counted together for both screens. This also applies to the user data type elements that are not required.

Creating tags with a user data type data type (Page 4245)

Managing versions of user data types (Page 4244)

Creating user data type elements (Page 4243)

Creating a user data type (Page 4241)

12.2.4.2 Creating a user data type

Introduction

You create a user data type in the project library.

Requirement

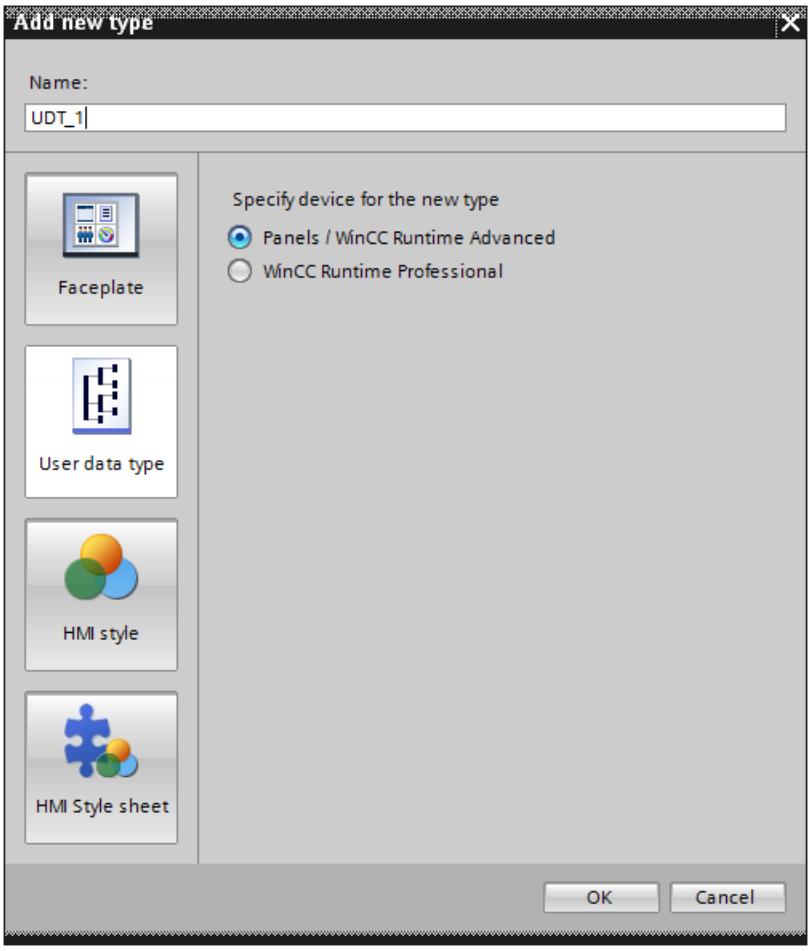
- A project is open.
- The "Libraries" task card is displayed or the library view is open.

Procedure

To create a user data type, follow these steps:

1. Click the "Libraries" task card.
2. Double-click the "Project library" item. The folder structure of the project library is open.

3. Click the "Create new type" button.
   A dialog opens.



4. Click the "HMI UDT" button in the dialog.
5. In the "Specify device for the new type" area select the HMI device on which the user data type is used.
6. Enter a descriptive name in the "Name" field.
7. Click "OK" to apply your settings. The user data type is created. The library view opens.

Result

A user data type with the configured properties is created. Version 0.0.1 of the user data type is created and receives the status "in progress".

Create the required user data type elements in the next step.

Before you use the version of user data types, for example at a tag, the version must be released.

See also

Basics on user data types (Page 4239)

Managing versions of user data types (Page 4244)

12.2.4.3 Creating user data type elements

Introduction

You define user data type elements in the library view. You add or delete elements in the "HMI user data types" table in the work area.

Requirement

- The library view is open.
- A user data type is created and opened in the editor.

Procedure

1. Select a communication driver for the user data type.

- If you select the <Internal communication> entry, you can only assign the user data type to the internal tags as the data type.
- If a connection to a PLC is selected as the communication driver, the user data type can only be assigned to tags with a connection to this PLC as the data type.
- The communication type set applies to all user data type elements of a user data type. In a user data type for the"WinCC Runtime Professional" family of devices, you can define for each user data type element whether the configured driver is used for control or internal communication.

1. Double-click "Add" in the "Name" column of the table. A new user data type element is added to the user data type.
2. Assign a name.
3. Select the required data type in the "Data Type" field.
4. Create as many user data type elements as you need.
5. You configure the user data type elements in the "Properties" group in the Inspector window.

Alternatively, you can configure the properties of the user data type elements directly in the table. To view hidden columns, activate the column titles using the shortcut menu.

Result

You have added elements to version 0.0.1 of the user data type. The version 0.0.1 has the status "in progress".

To use the version in the project, release the version in the next step.

See also

Basics on user data types (Page 4239)

12.2.4.4 Managing versions of user data types

Introduction

All user data types have at least one version. When a user data type is created, a version is created at the same time and this version has the status "in progress". You can edit the user data type in this status as required. When the editing is complete, you release the version of the user data type.

Requirement

- You have created a user data type.
- The user data type has the version 0.0.1. and the status "In progress".
- The "Libraries" task card or the library view is open.

Releasing a version

1. Select the version 0.0.1 of the user data type in the project library.
2. Select "Release version" in the shortcut menu.
   A dialog opens.
3. If necessary, change the properties of the version:
   - Enter a name for the type in the "Name" field.
   - In the "Version" field, define a main and an intermediate version number for the version to be released.
   - To clean up version management of the type, enable "Delete unused type versions from the library".

You have released version 0.0.1 of the user data type.

Editing a version

1. Select, for example, the released version 0.0.1 of a user data type in the project library.
2. Select "Edit type" in the shortcut menu.

The library view opens. The new version 0.0.2 of the user data type is created.

The version has the status "in progress".

Restoring the last version of a user data type

The last released version of the user data type is version 0.0.2.

You edit the user data type. A new version of the user data type, 0.0.3, is generated and receives the status "In progress".

1. Select the version of the user data type in the project library.
2. Select "Discard changes and restore version" in the shortcut menu.

Alternatively

1. If you have opened a version for editing, click "Discard changes and restore version" in the toolbar.
   The version is deleted.

All changes to the user data type since the last release operation are discarded. The user data type is released again and has version 0.0.2.

Deleting user data type

If you delete a user data type, all instances and master copies of this user data type are deleted as well. The same is true for HMI tags that use an HMI user data type.

To delete a user data type, follow these steps:

1. In the project library, under "Types", select the user data type you want to delete.
2. Select "Delete" from the shortcut menu.

See also

Basics on user data types (Page 4239)

Creating a user data type (Page 4241)

12.2.4.5 Creating tags with a user data type data type

Introduction

When a tag is created, you assign the version of user data type as a data type. In the "Tag" editor you can create internal tags or tags with a link to a PLC. A tag has access to all user data type versions that use the same communication driver as the tag itself.
In connection with a PLC, a user data type can only be used if the absolute addressing is selected.

Requirement

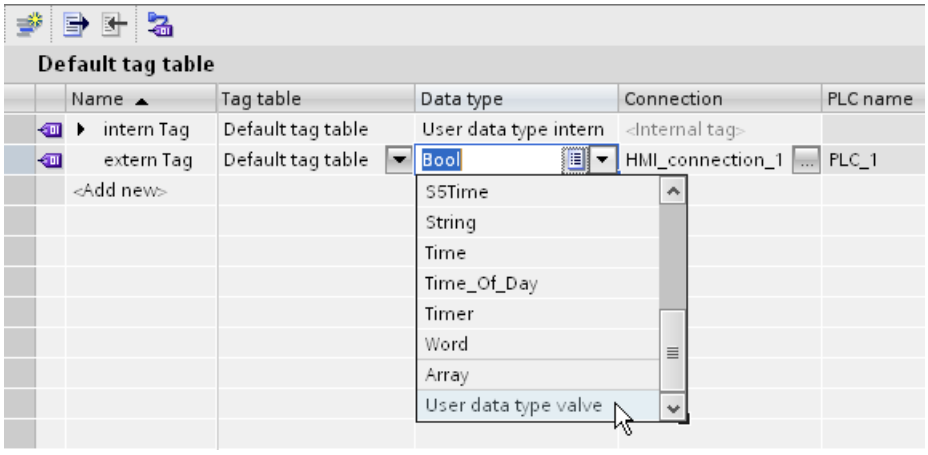
- A user data type with a user data type element is created.
- The user data type is enabled.
- The tag table is open.
- The Inspector window with the tag properties is open.

Procedure

To create a tag of the "User data type" data type, follow these steps:

1. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
2. In the Inspector window select "Properties > Properties > General".
3. Enter a unique tag name in the "Name" field.
4. Select the connection to the required PLC in the "Connection" box.
5. Select the desired version of the user data type in the "Data type" field.
   The selected connection determines which user data types will be displayed.
   For internal tags, only user data type versions of the <Internal user data type> type are available.

   For tags with a connection to a PLC, only those user data types that have a link to a PLC can be accessed.



6. Enter the address of the PLC that you want to access with the external tags in the "Address" field of the "Settings" area. The specified address must always point to the start data bit, for example, <DB1.DBX0.0>.

Result

You have created a tag of the "User data type" data type. In additional steps you can configure the tag, for example, by setting the start value and limits.

With tags of the "User data type" data type, you can connect the dynamic properties of a faceplate instance, which then supplies these properties with values in Runtime.

If you wish to change the properties of a user data type tag, you must change the properties of the user data type element.

Properties such as "Start value", "Use substitute value" or " Linear scaling" can be changed in the employed instances of the user data type.

Basics on user data types (Page 4239)

12.2.5 Working with cycles

12.2.5.1 Cycle basics

Introduction

Cycles are used to control actions that regularly occur in runtime. Common applications are the acquisition cycle, the logging cycle and the update cycle. You can also define your own cycles in addition to those already provided in WinCC.

Principle

In Runtime, actions that are performed regularly are controlled by cycles. Typical applications for cycles:

- Acquisition of external tags
  The acquisition cycle determines when the HMI device will read the process value of an external tag from the PLC. Set the acquisition cycle to suit the rate of change of the process values. The temperature of an oven, for example, changes much more slowly than the speed of an electrical drive.
  Do not set the acquisition cycle too low, since this will unnecessarily increase the communication load of the process.
- Logging process values
  The logging cycle determines when a process value is saved in the logging database. The logging cycle is always an integer multiple of the acquisition cycle.

The smallest possible value for the cycle depends on the HMI device that will be used in your project. For most HMIs, this value is 100 ms. The values of all other cycles are always an integer multiple of the smallest value.

If the cycles provided in WinCC do not meet the needs of your project, you can define your own cycles using the "Cycles" editor. User-defined cycles must always be an integer multiple of the smallest value.

Note

Device dependency

You cannot configure self-defined cycle times for Basic Panels.

Application example

You can use cycles for the following tasks:

- To regularly log a process.
- To draw attention to maintenance intervals.

See also

Basics of tags (Page 4197)

Defining cycles (Page 4248)

12.2.5.2 Defining cycles

Introduction

Use cycles to control actions that are run at regular intervals in Runtime. You can also define your own cycles in addition to those already provided in WinCC.

Requirement

You have opened the project.

Procedure

1. Double-click the "Cycles" entry in the project navigation.
   The "Cycles" editor opens.
2. In the "Name" column of the "Cycles" editor, double-click "Add".
   A new cycle time is created.
3. Enter a unique name in the "Name" field.
4. Select the desired cycle unit.

5. Select the desired value for the cycle time.
   The available selection of values varies depending on the cycle unit selected. The smallest possible value for the cycle depends on the HMI device that will be used in your project. For most HMIs, this value is 100 ms. The available values are always an integer multiple of this value.
6. As an option, you can enter a comment regarding the use of the cycle.

Result

The cycle you configured is created and beside the default cycles in WinCC for use during configuration.

Cycle basics (Page 4247)

12.2.6 Logging tags

12.2.6.1 Basic principles for data logging

Introduction

Data logging is used to collect, process and log process data from an industrial system.

When you analyze the logged process data, you can extract important business and technical information regarding the operational state of the system.

Application of the data logging

You can use data logging to analyze error statuses and to document the process. By analyzing data logs, you can extract the information necessary to allow you to optimize maintenance cycles, increase product quality and ensure that quality standards are met.

See also

Data logging (Page 4250)

Logging Tags (Page 4251)

Basics of tags (Page 4197)

12.2.6.2 Data logging in Runtime Advanced and Panels

Basics

Data logging

Introduction

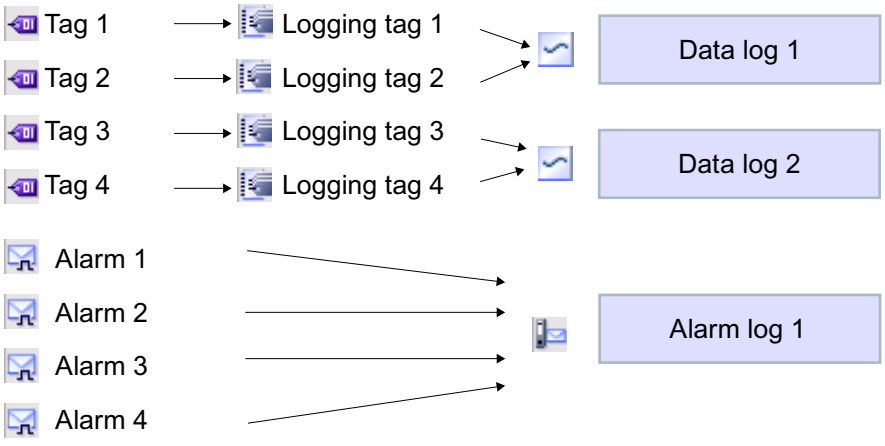
Data is information that is collected during the process and saved in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. You define tags for acquiring and editing the process values in WinCC.

External tags are used in WinCC to collect process values and to access a memory address in the connected automation system. Internal tags are not linked to any process and are only available at the associated HMI device.

Principle

The values of external and internal tags can be saved in data logs. Create a logging tag for every tag and specify the log in which it is saved.

Data logging is controlled via cycles and events. Logging cycles are used to ensure continuous acquisition and storage of the tag values. You can also trigger data logging in response to events, such as the change in value of a tag. Define these settings independently for each logging tag.



The tag values to be logged are compiled, processed and saved in the data log in Runtime. The HMI device you are using determines where the data log is saved. You can further process the saved data in other programs for analysis purposes, for example.

Logging methods

WinCC supports the following logging methods:

- Circular log
- Segmented circular log
- Circular log which sends a system alarm when it is full
- Circular log which executes system functions when it is full.

Outputting logged data

In runtime, you can output the logged tag values as trends in the process screens.

See also

Basic principles for data logging (Page 4249)

Storage locations of logs (Page 4420)

Working with Data Logs

Logging Tags

Introduction

In Runtime, you store tag values in logs. You can then analyze the logged data at a later date. You define the following conditions for logging a tag:

- The log tag, through which the values of the connected tag are logged.
- The data log in which the tag is stored.
- The cycle or the event with which the tag is stored.
- The value range within which the tag is stored.

Note

You use data logging mainly to log the values of external tags. You can also log the values of internal tags.

Principle

Several steps come together during data logging:

- Creating and configuring the data log
  When you create a data log, you define the following settings:
  - General settings, such as name, size and storage location
  - Runtime start characteristics
  - Behavior when the log is full
- Configuring the logging of tags
  For every log tag, specify a data log in which the values of the connected tags and other information are logged, such as the time of logging.
  When and how often the values of a log tag are logged are also defined. You have the following options:
  - "On demand":
    The tag values are logged by calling the "LogTag" system function.
  - "On change":
    The tag values are logged as soon as the HMI device detects a change in the value of the tag.
  - "Cyclic":
    The tag values are logged at regular intervals. You can supplement the default cycles in WinCC with your own cycles based on the default cycles. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
    You can also restrict the logging of values within or outside a tolerance band. In this way, the logging of values within a relevant range of values is restricted.

  Note the following points if you want to log a tag on demand:
  - Do not log this type of tag in a segmented circular log in which tags are logged in a continuous cycle or in response to changes.

  Background:
  - If logging takes place on demand only rarely, the log segment will be filled by cyclically-logged values, for example, and the next log segment will be created. If you then attempt to access the tag that was logged on demand, it will not be possible to display the tag since it is the current log segment that is accessed in Runtime. To remedy this, you should create a separate data log for tags that are logged only rarely.
- Further processing logged tag values
  You can analyze the logged tag values directly in your project, such as in a trend view, or in another user program, such as Excel.

Creating a data log

Introduction

Data logs are used to store values from external and internal tags in runtime. When you create a log, you must give it a name and define its size and storage location. In addition you can enter comments for each log.

Requirement

- A project is open.
- The Inspector window is open.

Procedure

To create a data log, proceed as follows:

1. Double-click on the "Historical Data" entry in the project tree.
   The editor for data logs and alarm logs opens.
2. Open the "Data logs" tab and double-click "Add" in the "Name" column of the "Data logs" editor.
   A new data log is created.
3. In the Inspector window select "Properties > Properties > General."
4. Enter a unique name for the log in the "Name" field.
5. Define the number of data records to be logged in each log in the "Number of data records per log" field.
   The size of a log is calculated as follows: The number of items * the length of each tag value to be logged.
   In the Inspector window, the maximum size that the log can reach if the currently selected number of data records is observed is displayed beneath the "Number of data records" input field.
6. In the "Storage location" field you select where the log entries are saved.
7. Depending on the selected "Storage location", you either select the "Path" or the "Name of the data source".
8. If necessary, enter a descriptive text in the "Comment" category to document your configuration.

Alternatively you can configure log properties directly in the "Data log" editor. To view hidden columns, activate the column titles using the shortcut menu.

Result

The data log is created.

You can now configure tags so that their values are stored in this log.

To continue the log configuration, perform the following steps:

- Define the restart characteristics of the log when Runtime is started.
- Define how the log should behave when it is full.
- Configure a function list for the "Overflow" event.

See also

Logging Tags (Page 4251)

Managing logging behavior when Runtime starts

Introduction

When you configure a log, you define the restart characteristics of the log when Runtime is started. You define whether the logging should start when Runtime starts in the log properties. You can also define whether an existing log will be continued or overwritten.

You define the restart characteristics separately for each log.

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

To configure the restart characteristics of a data log, proceed as follows:

1. Select the log for which you want to define the restart characteristics in the "Historical Data" editor.
2. In the Inspector window select "Properties > Properties > Restart behavior".
3. If you want logging to start when Runtime starts, enable the "Enable logging at runtime start" option in the "Logging" area.
   You can also start logging in Runtime using the "StartLogging" system function, for example.
4. Select the restart behavior of the log in the "Log handling at restart" area.
   - The logged values are deleted and logging is started again with the option "Reset log".
   - The option "Append data to existing log" is used to append the values to be logged to the existing log.

Alternatively you can configure the restart characteristics of a log directly in the "Historical Data" editor. To view hidden columns, activate the column titles using the shortcut menu.

Result

Logging will start in runtime according to your settings.

Controlling the Logging in relation to the Fill Level

Introduction

The size of a log is determined by the number of entries. You use the logging method to determine how the log responds when it is full.

Logging methods

The following logging methods are available:

-  Circular log
  When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approximately 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
-  Segmented circular log
  In a segmented circular log, multiple log segments of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.
-  Log that sends a system alarm when it is full
  When a defined level is reached, such as 90 %, a system alarm is triggered. When the log is 100% full, new tag values are not logged.
-  Log with level-dependent triggering of an event.
  When the log is completely full, the "Overflow" event is triggered. Configure a function list for the event that will be carried out when the "Overflow" event occurs. When the configured size of the log is reached, new tag values are not logged.
  The following system functions are available for further processing of full logs: For further details, refer to System functions for logs (Page 4259).

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

1. Select the log for which you want to define the logging method in the "Historical Data" editor.
2. Select "Properties > Properties > Logging method" in the Inspector window and select the required logging method.
3. If you have selected the "Segmented circular log" type, enter the number of log segments.
   If you selected a log with the "Display system alarm on" setting, specify the level as a percentage at which a system alarm is to be triggered.
   If you selected the "Trigger event" setting, configure the function list in the "Events" group.

Alternatively you can configure the logging method directly in the "Historical Data" editor table. To view hidden columns, activate the column titles using the shortcut menu.

The "Overflow" event is not available in the editor table. You must therefore configure the function list in the Inspector window.

Result

The selected log responds according to the settings in Runtime.

Logging Tags (Page 4251)

System functions for logs (Page 4259)

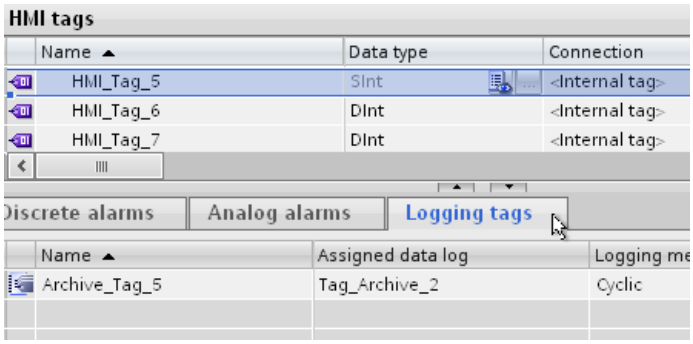
Logging process values

Introduction

You can save the process values of a tag in a data log in Runtime. You define the following conditions for logging a tag:

- The log tag, through which the values of the connected tag are logged.
- In which log the values are stored
- The conditions under which the values are stored
- If only process values for a certain range of values are stored

To log the tag values, assign a logging tag to an HMI tag. The logging tag is stored in the data log and logs the values of the connected HMI tag. You can configure logging tags directly in the "HMI tags" editor. The " HMI tags" editor contains the "Logging tags" editing table.



If the view of the "Logging tags" table is minimized, click the arrow button below the tag table.

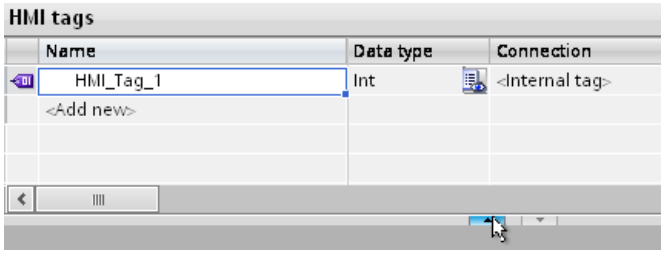


Figure 12-3 The "Logging tags" table is displayed.

Requirement

- The data log has been created.
- The tag for which you wish to configure the logging must already exist.
- The "Tags" editor is open.
- The "Logging tags" table is displayed.
- The Inspector window with the tag properties is open.

Procedure

To log process values in a tag, proceed as follows:

1. Select a tag in the tag table.
2. Double-click "Add" in the "Name" field in the "Logging tags" table.
   A new logging tag is created; it is given the same name as the associated HMI tag.
3. Select the data log in which the values of the tags are to be logged under "Properties > Properties > General" in the Inspector window.
4. Select "Properties > Properties > Logging type" in the Inspector window and select the log type for logging.
   - "Cyclic": The tag values are logged in accordance with the set logging cycle.
   - "On change": The tag values are logged, as soon as the operator device detects a change in value.
   - "On demand": The tag values are logged by calling the "LogTag" system function.

5. If you want to log tag values cyclically, select a cycle time in the "Logging cycle" area. Alternatively, you can define your own cycle using the object list. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
6. If you only want to log tag values outside or inside a defined value range, select "Properties > Properties > Deadband for logging" in the Inspector window. Define the values for the high and low limits.
   If you want to configure a dynamic limit, select "HMI tag" using the selection button. In the second field, select the tag that contains the limit.
   If you want to configure a fixed limit, select "Constant." Enter the limit value in the second field.
   If you want to leave a limit undefined, select "None".
7. Under "Scope", specify whether tag values are to be logged only if they are within the defined limits or only if they are outside the defined limits.

Alternatively, you can configure the logging of a tag directly in the "Logging tags" editor table. To view hidden columns, activate the column titles using the shortcut menu.

You can also fully configure a logging tag in the "Historical Data" editor.

Result

The process values of the configured tag are logged in Runtime according to the selected settings.

Note

To have the tag values actually logged in runtime, you must ensure that the data log is started. Logging can be started automatically at start up or by means of a system function. To automatically start the log, use the setting in the log Properties window.

Logging Tags (Page 4251)

Triggering a system function when log is full

Introduction

You can select a logging method that executes a function list as soon as the log is full.

Application example

You can use system functions, for example, to swap the data from a full log file out to another log before the full log is overwritten. You can then continue to process the transferred data in another program. Assign the "CopyLog" system function to the "Overflow" event accordingly.

Requirement

- A log with the "Trigger event" logging method is created.
- The "Data log" editor is open.
- The Inspector window with the data log properties is open.

Procedure

To configure a system function for the "Overflow" event, proceed as follows:

1. Select the required log in the table in the "Data Log" editor.
2. In the Inspector window select "Properties > Events > Overflow."
   The function list will open.
3. Double-click "Add function" and select the desired system function.
4. Configure the required parameters of the selected system function.

Result

During runtime, the function list will be executed as soon as the log is full.

Logging Tags (Page 4251)

System functions for logs

System functions

The following system functions are available for logging:

Function name	How it works
ArchiveLogFile	This function moves or copies a log to another storage location for long-term archiving. Use the system function if you want to move the Audit Trail, for example, from a local storage medium to the server. With Audit Trails, always use the "Move log (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.
LogTag	Saves the value of the given tags in the given data log. Use the system function to log a process values at a specific time.
StartLogging	Starts the logging process in the specified log. You can interrupt logging in Runtime by calling the "StopLogging" system function.
StopLogging	Stops the logging process in the specified log. To resume logging in Runtime, select the "StartLogging" system function.
ClearLog	Deletes all entries in the specified log.
StartNextLog	Stops the logging process in the specified log. Logging is continued in the log segment that has been configured for the given log.

Function name	How it works
CloseAllLogs	Closes all logs. The connection between WinCC and the log files or log database is terminated. You can use this system function, for example, to enable hot-swapping of the storage medium on the HMI device without exiting the Runtime software.
OpenAllLogs	Opens all logs to resume logging. The connection between WinCC and the log files or log database is restored.
CopyLog	Copies the contents of the specified log to another log.

Configuring a checksum for a log

Introduction

In a regulated project, you have the option of assigning a checksum to the log data of an data log or alarm log. This checksum can be used during plant operation to determine if the data of this log has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

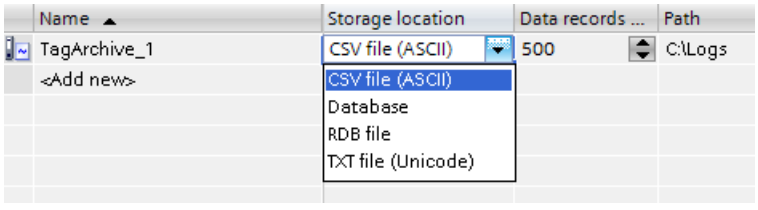
Requirement

- GMP compliant configuration is enabled.
- A data log or alarm log has been created.

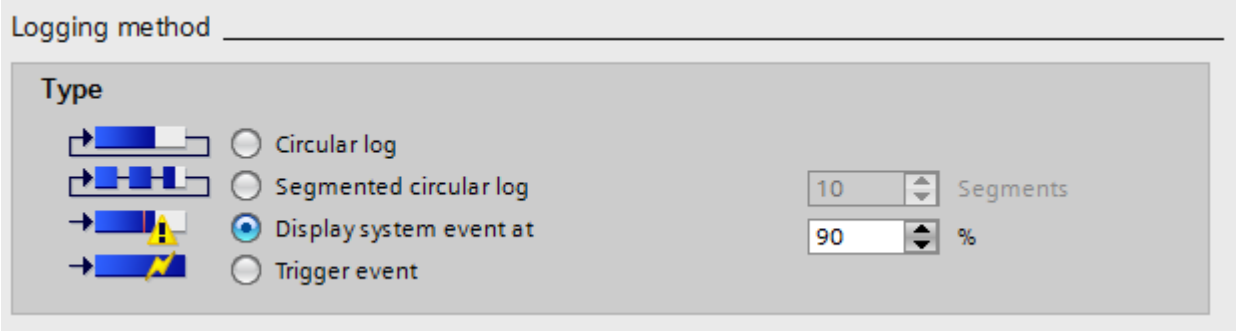
Procedure

Proceed as follows to configure a data log or alarm log for the use of a checksum:

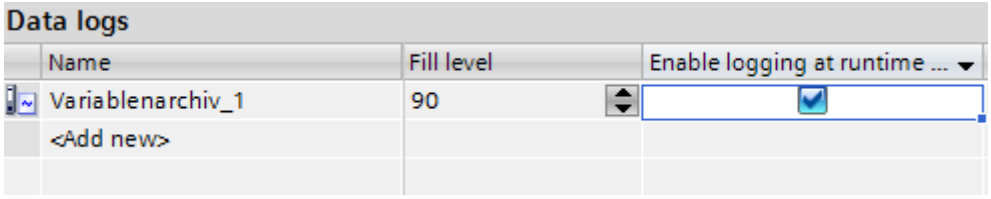
1. Open the data log or alarm log in the corresponding log editor.
2. In the "Storage location" box, select "File - CSV (ASCII)" or "File - TXT (Unicode)".



3. Under "Properties > Properties > Logging method" in the Inspector window , select the option "Display system event at" or "Trigger event".



4. In the editor table, activate the option "Enable logging at runtime start".
   Columns that are not displayed are activated with the shortcut menu of the column title.



5. Save the project.

Result

The log data of the log is assigned a checksum in runtime.

GMP-compliant configuration (Page 7043)

Evaluating the checksum of log data (Page 4261)

Evaluating the checksum of log data

Introduction

If you have configured a data log or alarm log with generation of a checksum, you can check if the log data has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

The DOS program "HmiCheckLogIntegrity" is available for checking the integrity of the log data.

The "HmiCheckLogIntegrity" program supports verification of the following files:

- Log files of alarm logs, data logs, and Audit in CSV format
- Log files of alarm logs, data logs, and Audit in TXT format
- Recipe data records in CSV format
- Recipe data records in TXT format

You can find the "HmiCheckLogIntegrity.exe" program in the installation directory of WinCC under the folder "WinCC Runtime Advanced", for example <C:\Program Files\Siemens \Automation WinCC Runtime Advanced>.

Note

Audit Trail and Log with Checksum

Before you update WinCC with a Service Pack or a new version, exit and save the Audit Trail or the logs using checksum. After WinCC is updated, the audit trail or logs will be continued with new files using checksum.

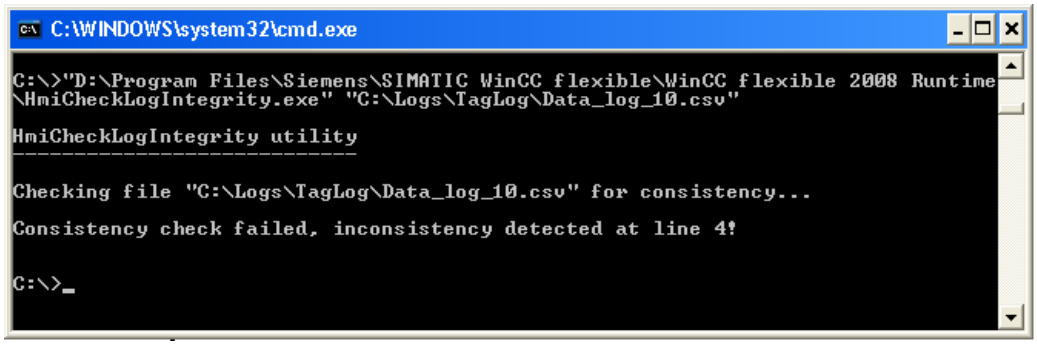
Make sure that the logs are started at a defined state with the new version.

Procedure

1. Copy the file to be checked from the HMI device to your configuration computer.
2. Open a command line prompt with "Start > Programs > Accessories > Command Prompt".
3. Enter the path to "HmiCheckLogIntegrity.exe" followed by a space in the command line prompt. After the space, enter the storage location of the file to be checked within quotation marks.

4. Press <Enter>.
5. The check is performed.
   When the checked data are consistent, the "Consistency check succeeded" message appears.

   When the checked data are inconsistent, the "Consistency check failed" message appears. Information about the first inconsistent line in the file is also displayed.



Note

If there are spaces in the path to the "HmiCheckLogIntegrity.exe" program, you need to specify the path in quotation marks.

You can also check the integrity of the log data with the AuditViewer.

Log response to language switching in runtime

Introduction

In the "Device Settings" editor, select the language to be used for writing to logs in runtime.

Requirements

- The languages used in your project are activated in the "Project languages" editor, for example, "German (Germany)" and "English (USA)" .

Procedure

1. Open the "Languages and fonts" editor.
2. Activate the runtime language, for example, "German (Germany)" and "English (USA)".
3. Set the "Language switch order":
   - German 0
   - English 1
     With "0", German is specified as the "Startup language".
4. Open the "Device settings" editor.
5. Select "Startup language" in the "Settings for Runtime" area.

Result

The project starts after it is transferred. German is specified as the "Startup language" with "Language switch order". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

The operator closes runtime. Due to the previously performed language switch, the next time the system starts the "startup language" is English. Since English is the startup language, the logs are now written in English.

The logging language remains English even when the language is switched again in runtime until runtime is closed once again.

If you use another option instead of "Startup language" to select the language, the logs are always written in the same language. This is true regardless of the language selected by the operator in runtime.

Direct access to the ODBC log database (Advanced)

Overview

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database to be used in WinCC as follows:

Select the database from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

In your configuration, specify the "Data source name" (DSN) instead of a directory name as storage path for log data. With the DSN, you are referencing the database and the storage location.

The entire functional scope of the database is available for additional processing and evaluation of log data.

Application

The data source sets up the connection to the database. Create the data source on the same PC on which the Runtime software is stored. Then enter the DSN configured on this PC when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

In addition, you can use the "StartProgram" system function to configure program calls, e.g. MS Access, on the HMI device. Runtime is not interrupted while you configure such calls.

Setting up the ODBC data source

Introduction

To store process values or alarms in the log database in Runtime, set up the ODBC data source.

Requirement

- A log database has been created.
  You create the log database using the SQL Enterprise Manager. You can find more detailed information on how to do this from Microsoft.

Procedure

To set up an ODBC data source, follow these steps:

1. In Control Panel, open "Administrative Tools" and select "Data Sources (ODBC)".
   The "ODBC Data Source Administrator" dialog is opened.
2. Click "User DSN > Add".
3. Select the "SQL-Server and click on "Finish".
4. In the dialog that follows, enter a name for the User DSN and the SQL-Server and click on "Next".
5. In the dialog that follows, define the logon procedure for the SQL database and click on "Next".
6. Activate "Change the default database to".

7. Select the database you have created and click on "Next".
8. In the dialog that follows, click "Finish".

Logging tags in the "Historical Data" editor

Configuring logging tags

Introduction

You can also create and edit logging tags in the "Historical Data" editor in WinCC. You also directly edit the properties of logging tags in the "Historical Data" editor.

Note

If you delete, move or copy in the "Historical Data" editor, the changes also take effect in the tag table.

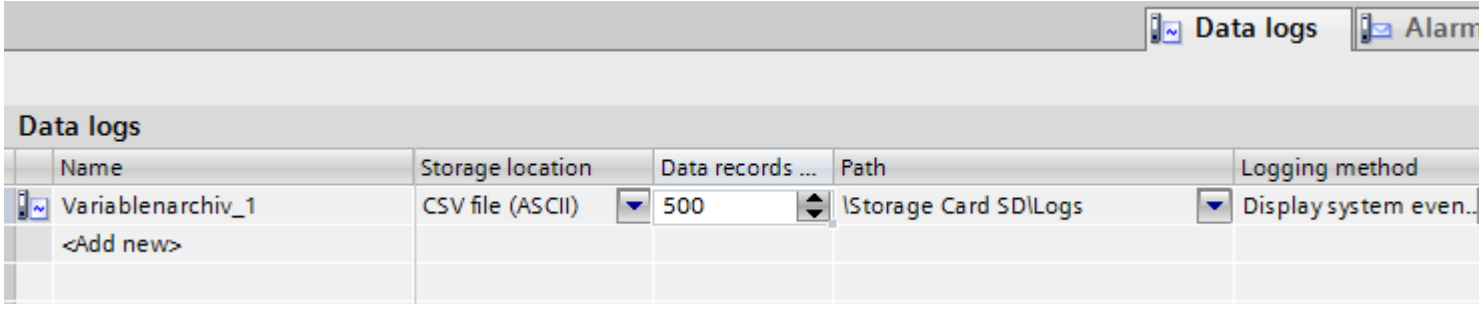
Requirement

- The "Data logs" tab is open in the "Historical Data" editor.
- A data log has been created.

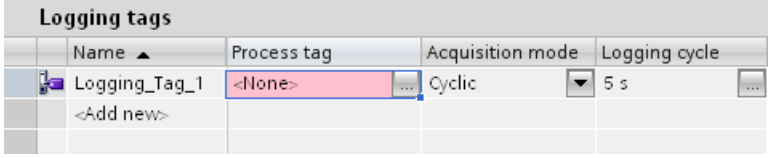
Procedure

Proceed as follows to configure a logging tag in the "Historical Data" editor:

1. Select an existing data log in the "Data logs" table of the editor.
   Alternatively, double-click on "Add..." in the "Name" column to create a new data log.

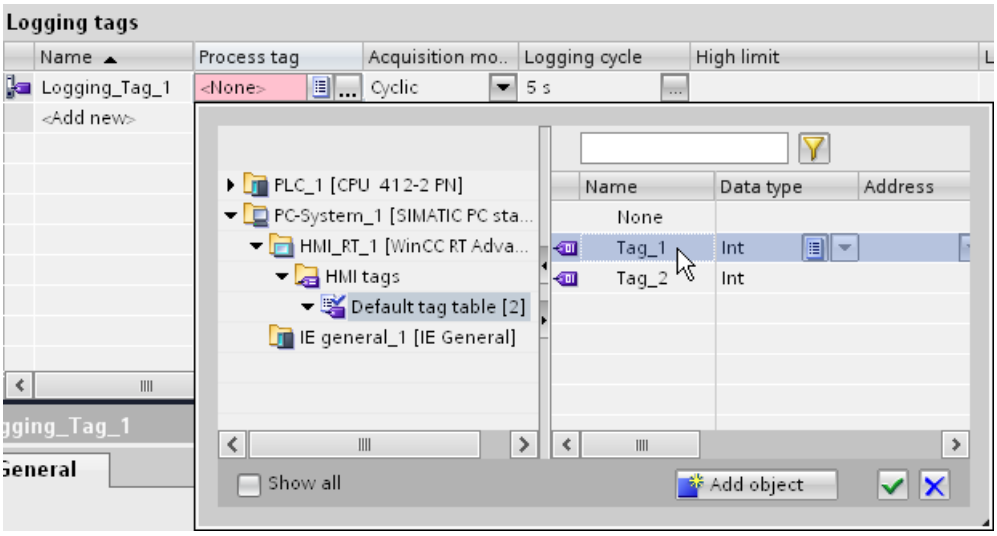


2. Double-click "Add ..." in the "Name" column of the editor "Logging tags" table.



3. Enter a unique name for the logging tag in the "Name" field.

4. In the "Process tag" field, click on the selection button and select the process tag for logging in the object list.



5. Select the desired trigger mode in the "Log type" field:
   - "Cyclic": The tag values are logged in accordance with the set logging cycle.
   - "On change": The tag values are logged, as soon as the operator device detects a change in value.
   - "On demand": The tag values are logged by calling the "LogTag" system function.
6. If you want to log tag values cyclically, select the desired cycle time in the "Logging cycle" area. Alternatively, you can define your own cycle using the object list. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
7. Configure additional parameters for logging in the table of the editor or in the Inspector window.

Result

The configured logging tag is created in the "Historical Data" editor and is also displayed in the tag table.

Logging Tags (Page 4251)

12.2.7 Displaying Tags

12.2.7.1 Displaying tags with Basic Panels

Outputting tag values in screens (Basic)

Introduction

In runtime you can output tag values in the screens of the operator device in the form of a trend. A trend is a graphic representation of the values that a tag takes during runtime. Use the "Trend display" graphic object to represent it. Process values for the trend display are loaded by the PLC from the ongoing process.

The values to be displayed are determined individually within a fixed, configurable cycle. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.

Displayed values

You will need to configure a trend view in a screen so that tag values are displayed on the HMI device. When configuring the trend view, specify which tag values are to be displayed.

You can control the updating of the trend display by defining the cycle time.

See also

Configuring trend display for values from the PLC (Basic) (Page 4268)

Basics of tags (Page 4197)

Configuring trend display for values from the PLC (Basic)

Introduction

You use a trend view to graphically represent values that a tag assumes during the process.

Requirement

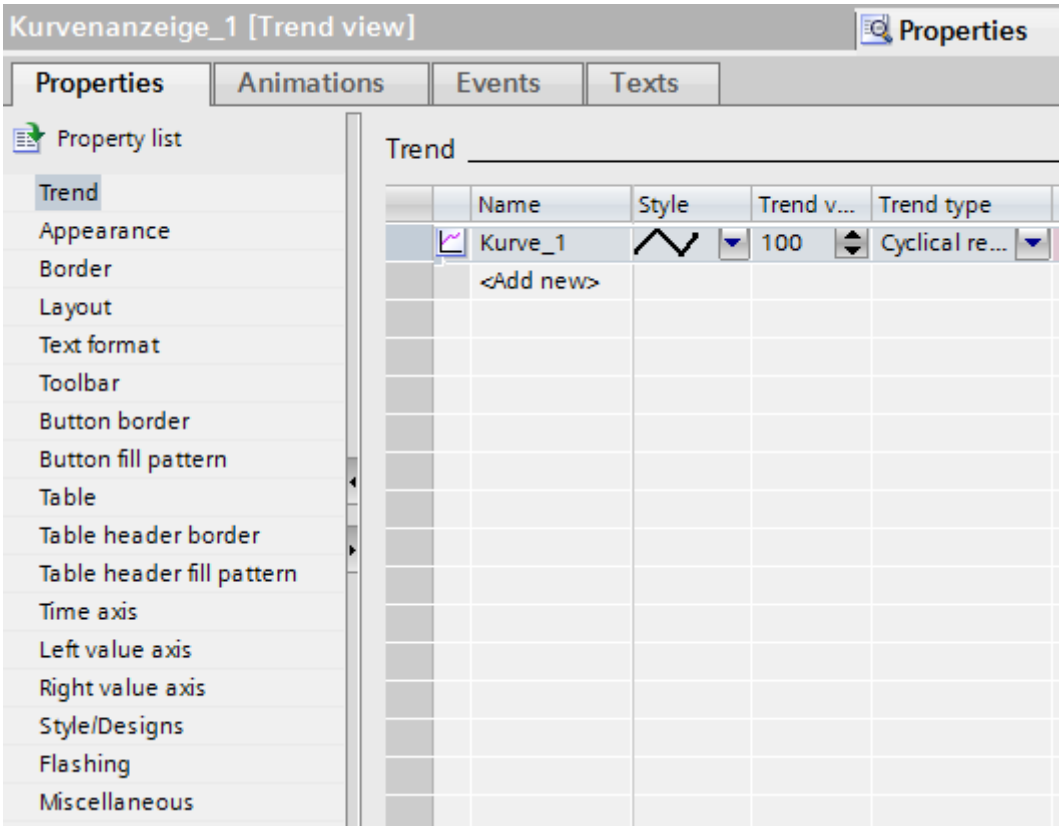
- A screen is open.
- The Inspector window with the trend view properties is open.

Procedure

To configure a trend view, follow these steps:

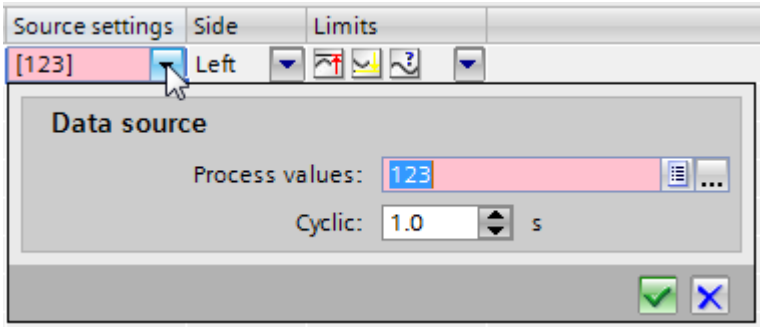
1. Add the "Trend view" object from the toolbox in the "Control" group to the screen.

2. Select the "Trend" category from the "Properties" group in the Inspector window and double-click "<Add>" in the "Name" column.



3. Assign a name to the trend in the "Name" column.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. Select the number of trend values in the "Trend values" column.

6. In the "Settings" column, use the selection button to open the "Data source" dialog and select the tags to supply the trend with values.
   Specify the cycle for reading the tags from the PLC.



7. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You set the column width and the position of the columns in the table header of the values table in active mode. In order to activate the trend view the zoom factor has to be set to 100 %.

Result

In runtime, the values of the selected tags are displayed in the configured trend view.

See also

Outputting tag values in screens (Basic) (Page 4268)

12.2.7.2 Displaying tags with Runtime Advanced and Panels

Trends

Introduction

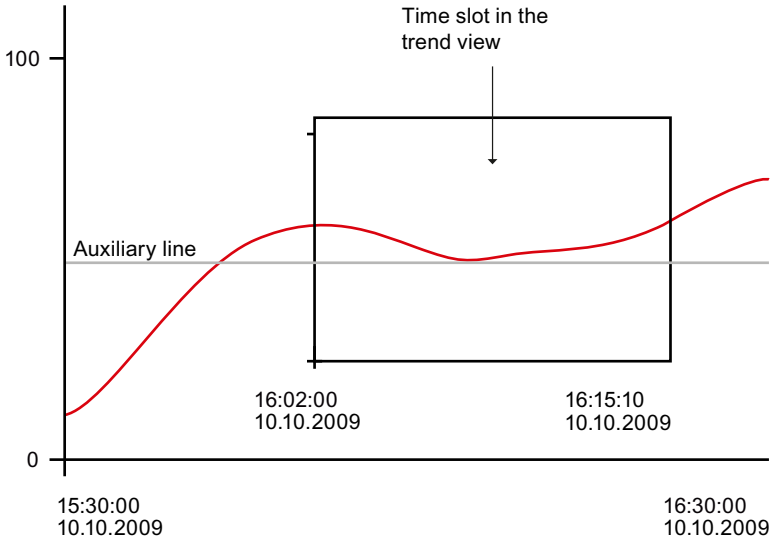
A trend is a graphic representation of the values that a tag takes during runtime. In order to display trends, configure a trend view in a screen of your project.

To configure the trend view, specify a trend type for the values to be displayed.

- Log: For displaying the logged values of a tag
- Cyclical real time: For time-triggered display of values
- Bit-triggered real time: For event-triggered display of values
- Bit-triggered buffer: For event-triggered display with buffered data acquisition

Displaying logged values

In Runtime, the trend view displays the values of a tag from a data log. The trend shows the logged values in a particular window in time. The operator can move the time window in Runtime to view the desired information from the log.



Pulse-triggered trends

The values to be displayed are determined individually with a definable time pattern. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.

Bit-triggered trends

The values to be displayed are event-driven by setting a defined bit in "Trend transfer" tags. The bit is reset after reading has been completed. Bit-triggered trends are useful for displaying fast-changing values, such as the injection pressure for producing plastic parts.

Bit-triggered trends with buffered data acquisition

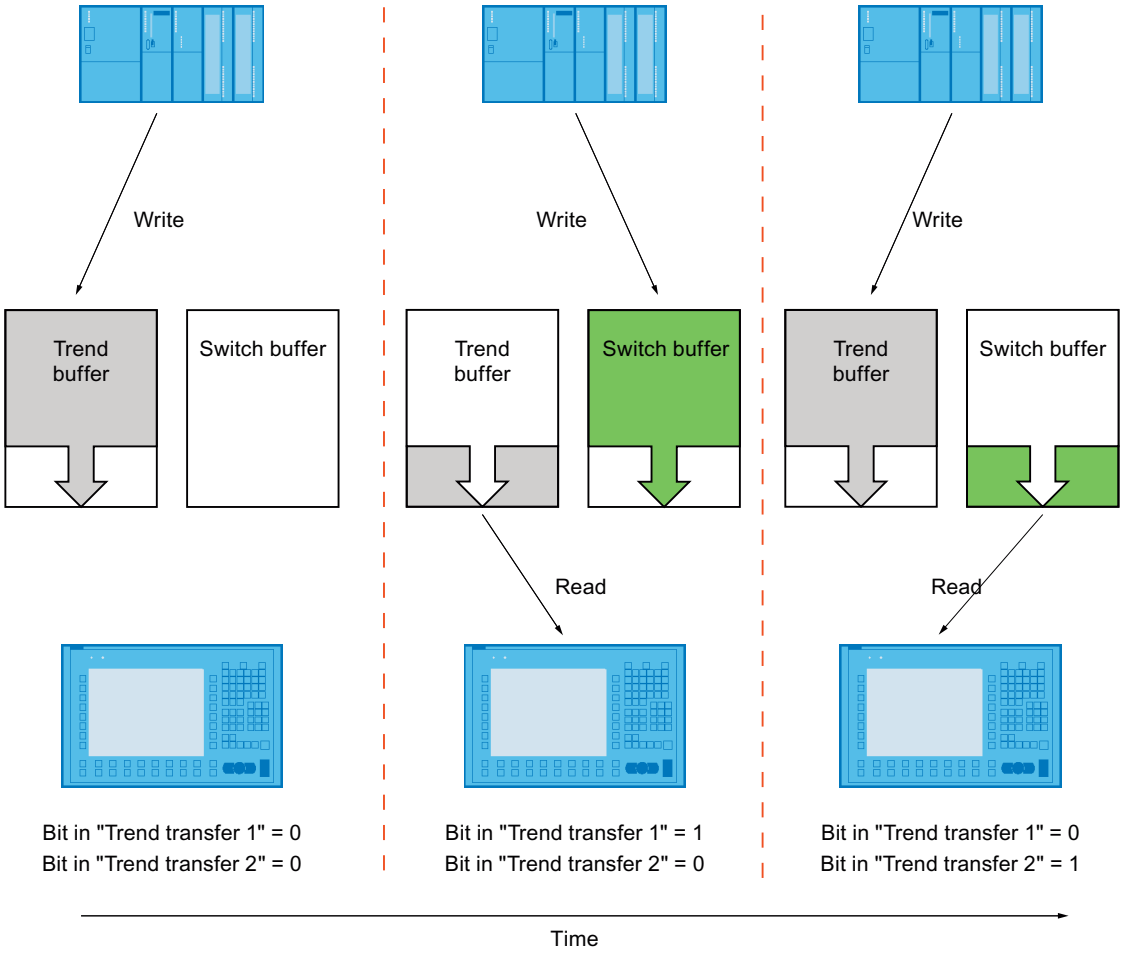
When you set buffered data acquisition, the values to be displayed are buffered in the PLC and read in bit-triggered as a block. These trends are suitable for displaying rapid changes when the course of the trend as a whole is interesting and not so much the individual values.

You configure a switch buffer in the PLC so it can continue to write the new values while the trend buffer is being read. The switch buffer ensures that the PLC does not overwrite values while the operator devices reads the values for the trend.

The switch between the trend buffer and the switch buffer functions as follows:

Whenever the bit assigned to the trend is set in the "Trend transfer 1" tag, all the values are read simultaneously from the trend buffer and are displayed as a trend on the HMI device. The bit in "Trend Transfer 1" is reset after reading has been completed.

While the operator device is reading the tag values from the trend buffer, the PLC writes the new tag values into the switch buffer. When the bit which is assigned to the trend is set in the "Trend transfer 2" tag , all the trend values are read from the switch buffer and displayed at the operator device. While the operating device is reading the switch buffer, the PLC writes again to the trend buffer.



Outputting tag values in screens

Introduction

In runtime you can output tag values in the screens of the operator device in the form of a trend. The process values are loaded by the PLC from the current process or from a log database.

Displayed values

You will need to configure a trend view in a screen so that tag values are displayed on the HMI device. When configuring the trend view, specify which tag values are to be displayed.

The following options are available:

- Current values from the PLC
  Writing of the trend is continued with individual values from the PLC. The following trigger types are available for display in real time:
  - Bit-triggered real time: The time of the update can be controlled by setting a bit. Bit-triggered trends are normally used to visualize rapidly changing values. One example might be the injection pressure in the production of plastic parts.
  - Cyclical real time: You control the update time with a cycle. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.
  - Bit-triggered buffer: The trend contains values that were stored in a buffer in the period between two reads from the PLC. Use this format pattern if the course of the trend as a whole is more interesting than the individual values.
- Logged tag values
  In runtime, the trend view displays the values of a tag from a data log. The following trigger type is available to display logged tag values:
  - Data log: The trend shows the logged values in a particular window in time. To obtain the requested information from the archive, the operator uses the corresponding operator controls in the screen or in the trend view.

Configuring trend displays for values from the PLC

Introduction

You use a trend view to graphically represent values that a tag assumes during the process.

Requirement

- A screen is open.

Procedure

To configure a trend view, follow these steps:

1. Add the "Trend view" object from the toolbox in the "Controls" group to the screen.
2. Select "Properties . Properties > Trend" in the Inspector window and double-click "Add" in the "Name" field. A new trend is created.
3. If required, enter a unique name for the trend in the "Name" field.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. Select the number of trend values in the "Trend values" column.

6. In the "Trend type" column, select the required trend type. The following entries are available:
   - "Bit-triggered real time"
   - "Cyclical real time"
   - "Bit-triggered buffer"
   - "Data log"
7. In the "Settings source" column, use the selection button to open the "Data source" dialog and select the tags to supply the trend with values.
   If you selected the "Cyclical real time" trend type, specify a cycle for reading the tags from the PLC.
   Only for bit-triggered trends:
   - Under "Bit", specify which bit of the "Trend request" tag and of the "Trend transfer" tags are to be assigned to the trend. Select a different value for each trend.
   - Enter a tag under "Trend request" which contains at least as many bits as trends are to be displayed in the trend view. The status of the bits of these tags specifies which trend is currently being displayed at the operator device.

   Only for the trend type "Bit-triggered real time":
   - Enter a tag under "Trend transfer" which contains at least as many bits as trends are to be displayed in the trend view. The status of the bits of these tags specifies for which trend values are to be read from the PLC.

   Only for the trend type "Bit-triggered buffer":
   - Enter a buffer tag for the switch buffer. The tags have to be of the same type and of the same length as the trend tag.
   - Enter a tag each under "Trend transfer 1" and "Trend transfer 2" which contains at least as many bits as trends are to be displayed in the trend view. The status of these tag bits specifies the trend for which values will be read from the PLC. "Trend transfer 1" controls reading from the trend buffer; "Trend transfer 2" controls reading from the switch buffer.
8. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You can set the column width and the position of the columns in active mode in the values table. In order to activate the trend view the zoom factor has to be set to 100 %.

Result

In runtime, the values of the selected tags are displayed in the configured trend view.

Configuring a trend view for a data log

Introduction

You can use a trend view to display logged tag values in Runtime. The trend view shows the logged tag values in a particular window in time. To obtain the requested information from the archive, the operator uses the corresponding operator controls in the screen or in the trend view.

Application example

At the end of a shift, for example, an operator wants information about the process carried out during the shift.

Requirement

- A data log has been created.
- A screen is open.
- The Inspector window with the trend view properties is open.

Procedure

To configure a trend view to display values from a data log, follow these steps:

1. Add the "Trend view" object from the toolbox in the "Controls" group to the screen.
2. Select "Properties . Properties > Trend" in the Inspector window and double-click "Add" in the "Name" field. A new trend is created.
3. If required, enter a unique name for the trend in the "Name" field.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. In the "Trend type" column, select the trend type "Data log".
6. In the "Settings" column, use the selection button to open the "Data source" dialog; select the data log and the tags to supply the trend with values.
7. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You can set the column width and the position of the columns in active mode in the values table. In order to activate the trend view the zoom factor has to be set to 100 %.

Result

In runtime, the logged values of the selected tags are displayed in the configured trend view.

The structure of a *.CSV file with tags

Introduction

In the *.csv (comma-separated value) file format, the "Name" and "Value" table columns of the entry are separated by semicolons. Each table row ends with a line break.

Example of a *.CSV file

The example shows a file with logged tag values:

"VarName";"TimeString";"VarValue";"Validity";"Time_ms"

"Var_107";"01.04.98 11:02:52";66,00;1;35886460322,81

"Var_108";"01.04.98 11:02:55 AM";60.00;1;35886460358.73

"Var_109";"01.04.98 11:02:57 AM";59.00;1;35886460381.22

Structure of a log file in *.csv format

The following values are entered in the individual columns of a log file:

Parameters	Description
VarName	Name of the tag from WinCC
Time string	Time stamp as a STRING, e.g. readable data format
VarValue	Value of the tag
Validity	Validity: 1 = value is valid 0 = an error occurred (e.g. interrupted connection)
Time_ms	Specify a time stamp as a decimal value (see below for conversion). Only needed to display the tag values in a trend.

Conversion of the time stamp decimal value

If the value needs to be processed using a different program, proceed as follows:

1. Divide Time_ms by 1,000,000.
   Example: : 36343476928:1 000 000 = 36343,476928
2. The whole number portion (36344) is the date calculated from 31.12.1899.
   Example: 36343 results in 02.07.1999
   You can now convert the time stamp value to days in Excel by assigning a corresponding format from the "Date" group to the cells, which contain the time stamp.
   Result: 37986 results in 31.12.2003
3. The value after the comma (0,476928) indicates the time:
   - Multiply the value (0.476928) by 24 to obtain the hours (11.446272).
   - Multiply the remainder (0.446272) by 60 results in the minutes (26.77632).
   - Multiply the remainder (0.77632) by 60 results in the seconds (46.5792).

   Result 11:26:46.579
   This conversion is supported by Microsoft Excel, for example.

Accessing the ODBC log database directly

Introduction

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database you want to use in WinCC from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

To store log data, specify the DSN, rather than a directory name during configuration. With the DSN, you are referencing the database and the storage location.

Application

The entire functional scope of the database is available for additional processing and evaluation of log data.

Principle

The data source establishes the connection to the database. You create the data source on the same computer that contains the Runtime software. Then enter the DSN configured here when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

With the "StartProgram" system function, you can also configure a program call (to MS Access, for example) on the HMI device. This does not interrupt Runtime.

12.3 Working with alarms

12.3.1 Basics

12.3.1.1 Alarm Logging in WinCC

Introduction

The alarm system allows you to display and record operating states and faults on the HMI device that are present or occur in a plant.

An alarm may have the following content:

No.	Time	Date	Alarm text	Status	Alarm class
5	12:50:24:590	24.02.2007	Boiler pressure above high limit.	Incoming Outgoing	Warning: Color Red

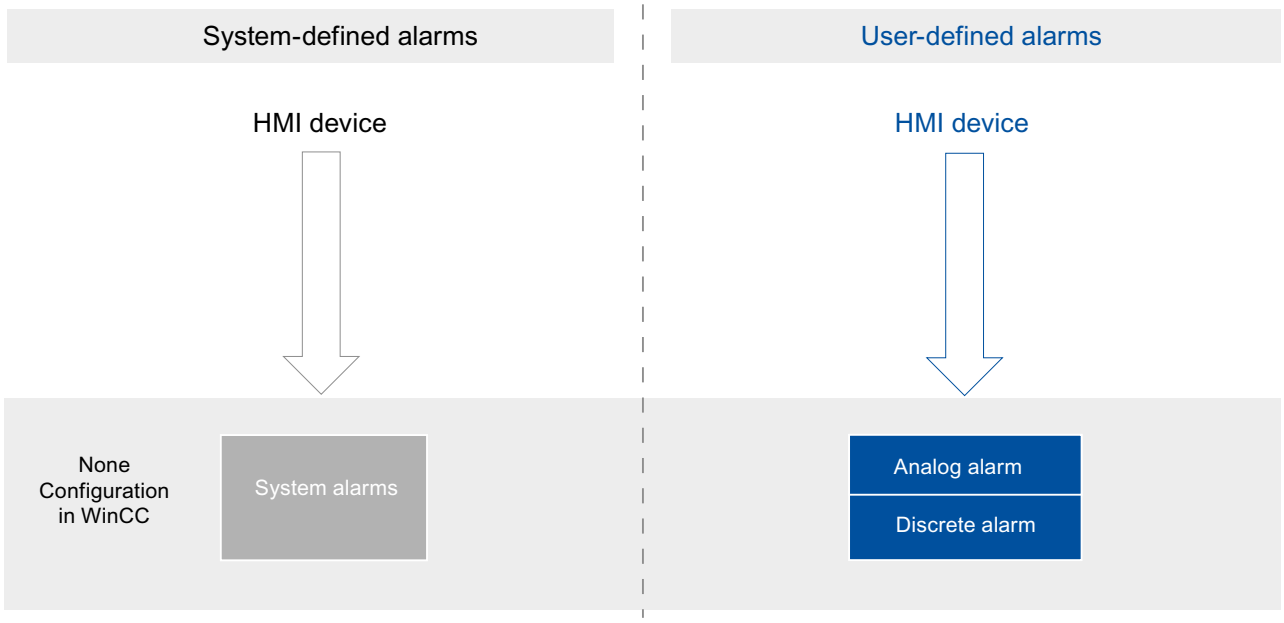
Alarm system in WinCC

The alarm system processes a variety of alarm types. The alarm procedures can be broken down into system-defined alarms and user-defined alarms:

- User-defined alarms are used to monitor the plant process.
- System-defined alarms monitor the HMI device.

The detected alarm events are displayed on the HMI device. Targeted access to the alarms combined with supplementary information about individual alarms ensures that faults are localized and cleared quickly. This reduces stoppages or even prevents them altogether.

The following figure shows the alarm system structure:



12.3.1.2 Alarm Logging in WinCC

Introduction

Alarm logging allows you to display and record operating states and faults on the HMI device that are present or occur in a plant.

An alarm may have the following content:

No.	Time of day	Date	Alarm text	Status	Alarm class
5	12:50:24 :590	24.02. 2007	Boiler pressure above high limit.	Incoming Outgoing	Warning: Color Red

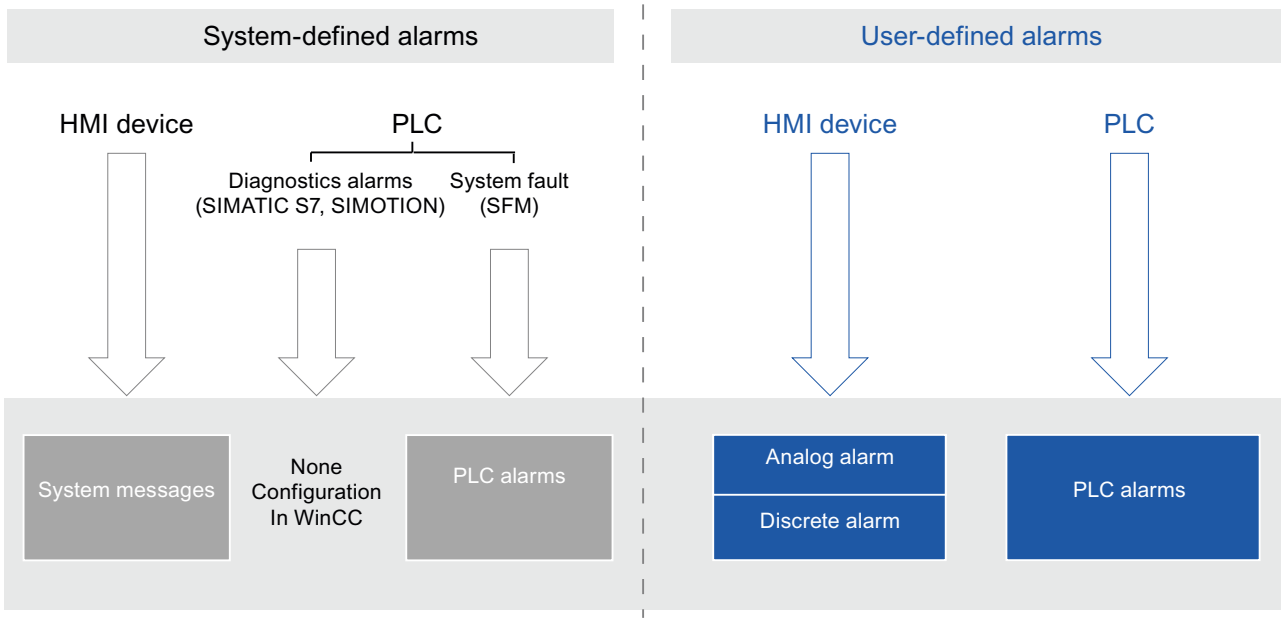
Alarm Logging in WinCC

Alarm logging processes various alarm procedures used by the PLC and the HMI device. The alarm procedures can be broken down into system-defined alarms and user-defined alarms:

- User-defined alarms serve to monitor the plant.
- System-defined alarms are used to monitor the HMI device or the PLC.

The detected alarm events are displayed on the HMI device. You can use the alarm logging system to log alarms from the ongoing process. Targeted access to the alarms combined with supplementary information about individual alarms ensures that faults are localized and cleared quickly. This reduces stoppages or even prevents them altogether.

The following figure shows the alarm logging structure:



12.3.1.3 Alarm Procedures

Overview of the alarm types

Introduction

The alarm types serve various purposes for monitoring the plant. The alarms from the individual alarm types are configured and triggered in different ways.

Select the relevant tab in the "HMI alarms" editor to configure alarms based on the individual alarm types.

Alarm types in WinCC

WinCC supports the following alarm types:

User-defined alarms

- **Analog alarms**
  - Analog alarms are used to monitor limit violations.
- **Discrete alarms**
  - Discrete alarms are used to monitor states.

System-defined alarms

- **System events**
  - System events belong to the HMI device and are imported into the project.
  - System events monitor the HMI device.

Overview of the alarm types

Introduction

The alarm types serve various purposes for monitoring the plant. The alarms from the individual alarm types are configured and triggered in different ways.

Select the relevant tab in the "HMI alarms" editor to configure alarms based on the individual alarm types.

Alarm types in WinCC

WinCC supports the following alarm types:

User-defined alarms

- **Analog alarms**
  - Analog alarms are used to monitor limit violations.
- **Discrete alarms**
  - Discrete alarms are used to monitor states.
- **Controller alarms**
  - You configure controller alarms in STEP 7.
  - You continue to process the controller alarms in WinCC.

  Note
  Device dependency
  The controller alarm is not supported on all HMI devices.

System-defined alarms

- **System-defined controller alarms**
  - System-defined controller alarms consist of diagnostic alarms (SIMATIC S7) and system errors (SFM)
  - System-defined controller alarms are used to monitor the PLC.

  Note
  Device dependency
  System-defined controller alarms are not supported on all HMI devices.
- **System events**
  - System events belong to the HMI device and are imported into the project.
  - System events monitor the HMI device.

User-defined alarms

Analog alarms

Description

Analog alarms signal limit violations during the process.

Example

The speed of the mixer in a fruit juice mixing plant must not be too high or too low. You can configure analog alarms to monitor the speed of the mixer. If the high or low limit for the speed of the mixer is violated, an alarm is output on the HMI device containing the following alarm text, for example: "Mixer speed is too low".

Discrete alarms

Description

Discrete alarms indicate a status in the current process.

Example

A fruit juice mixing plant consists of several tanks containing the ingredients. To ensure the correct mixing ratio of water, fruit concentrate, sugar, and flavoring, the valves in the intakes open and close at the right moment. This operation should be monitored.

You configure a suitable discrete alarm for all the valve states. If a valve on one of the four tanks opens or closes, an alarm is displayed, such as "Water valve closed".

The operator can thus monitor whether the plant is producing correctly.

PLC alarms

Example of an alarm

CPU operating mode switch to Stop

Description

The custom controller alarms are created by the control system engineer in STEP 7. The status values, such as time stamp and process values, are mapped in the controller alarm. If controller alarms are configured in STEP 7, accept them into the integrated WinCC operation as soon as a connection is established to the PLC.

In STEP 7, the controller alarm is assigned to an alarm class. You can import this alarm class with the controller alarm as a common alarm class.

Types of controller alarms

SIMATIC S7 supports different types of controller alarms. WinCC supports different types of controller alarms according to which Runtime is used.

Controller alarms for multiple HMI devices

If a PLC is connected to multiple HMI devices, the project engineer assigns display classes to the controller alarms in STEP7. The display classes determine the allocation to the HMI device. You can activate the display classes for your HMI device that are to be displayed on it. In this case, only the controller alarms from this display class will be displayed on the HMI device. Up to 17 display classes are possible.

See also

Editing controller alarms (Page 4310)

System-defined Alarms

System events

Examples for alarms

- "An online connection to the PLC is established."

Description

A system alarm indicates the status of the system, plus communication errors between the HMI device and system.

Under "Runtime settings > Alarms" you specify how long a system alarm is shown on the HMI device.

Support

The reference contains a list of the possible system events, along with the cause and possible remedies. If you contact online support because of a system alarm on the HMI device, you will need the alarm number and tags used in the system alarm.

System events

Examples of alarms

- "Overflow of the buffer for printing lines in text mode"
- "No printer is installed or a default printer has not been set up."

Description

A system event indicates the system status, including errors in the communication between the HMI device and system.

The system events depend on the HMI device.

You can load system events in the "HMI alarms" editor from a an *.xml file.

Support

The reference contains a list of the possible system events, along with the cause and possible remedies. When contacting Online Support because of a system event on the HMI device, you need the event number and tags used in the system event.

System-defined controller alarms

Example of an alarm

Valve open due to overpressure

Description

System-defined controller alarms are installed with STEP 7 and are only available if WinCC is operated in the STEP 7 environment.

WinCC processes system-defined controller alarms of the type "SIMATIC S7 diagnostic alarm".

S7 diagnostic alarms show states and events in the SIMATIC S7 controllers. You only have read access to S7 diagnostic alarms. They are assigned to the "Diagnostics" alarm class by the system. S7 diagnostic alarms are not acknowledged or reported. They are for signaling purposes only.

See also

Enabling system-defined controller alarms (Page 4311)

12.3.1.4 Alarm states

Introduction

An alarm assumes various alarm states in Runtime. The user analyzes and reports on the process execution with reference to the alarm states.

Note

Device dependency

Reporting and logging are not available for all HMI devices.

Description

Every alarm has an alarm status. The alarm states are made up of the following events:

- **Incoming**
  The condition for triggering an alarm is satisfied. The alarm is displayed, such as "Boiler pressure too high".
- **Outgoing**
  The condition for triggering an alarm is no longer satisfied. The alarm is no longer displayed as the boiler was vented.
- **Acknowledge**
  The operator acknowledges the alarm.

Alarms without acknowledgment

The following table shows the alarm states for alarms that do not have to be acknowledged:

Status	Description
Incoming	The condition for an alarm is satisfied.
Outgoing	The condition for an alarm is no longer satisfied.

Alarms with acknowledgment

The following table shows the alarm states for alarms that have to be acknowledged:

Status	Description
Incoming	The condition for an alarm is satisfied
Outgoing, not acknowledged	The condition for an alarm is no longer satisfied. The operator has not acknowledged the alarm.
Outgoing, and subsequently acknowledged	The condition for an alarm is no longer satisfied. The operator has acknowledged the alarm after this time.
Incoming, acknowledged	The condition for an alarm is satisfied. The operator has acknowledged the alarm.
Outgoing, but acknowledged first	The condition for an alarm is no longer satisfied. The operator acknowledged the alarm while the condition was still satisfied.

Each occurrence of these states can be displayed and logged on the HMI device and a protocol printed.

Note

The display text for the states of an alarm is language-specific and configuration-specific.

12.3.1.5 Alarm classes

Basics on alarm classes

Introduction

Many alarms occur in a plant. These are all of different importance. You can assign the alarms of your project to alarm classes to clearly show the user which of the alarms are most important.

Description

The alarm class defines how an alarm is displayed. The alarm class specifies if and how the user has to acknowledge alarms of this alarm class.

A new alarm class with mandatory acknowledgment is generated in WinCC.

Note

The choice of display modes for alarm classes depends on the options on your HMI device.

Examples of how to use alarm classes

- The alarm "Speed of fan 1 in upper tolerance range" has alarm class "Warnings". The alarm is displayed with a white background. The alarm does not have to be acknowledged.
- The alarm "Speed of fan 2 has exceeded upper warning range" is assigned to the "Errors" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until the user acknowledges it.

Using alarm classes

Use the following alarm classes to define the state machines and display of alarms for your project:

- Predefined alarm classes
  You cannot delete predefined alarm classes and edit them only to a limited extent. Predefined alarm classes have been created for each HMI device under "HMI alarms > Alarm classes".
- Custom alarm classes
  You can create new alarm classes under "HMI alarms > Alarm classes", configure how you want the alarms to be displayed, and define an acknowledgment model for alarms of this alarm class. The possible number of custom alarm classes depends on which runtime is used in your project.

See also

Predefined alarm classes (Page 4288)

Creating alarm classes (Page 4297)

Using project-wide alarm classes (Page 4298)

Basics on alarm classes

Introduction

Many alarms occur in a plant. These are all of different importance. You can assign the alarms of your project to alarm classes to clearly show the user which of the alarms are most important.

Description

The alarm class defines how an alarm is displayed. The alarm class specifies if and how the user has to acknowledge alarms of this alarm class.

A new alarm class with mandatory acknowledgment is generated in WinCC.

Note

The choice of display modes for alarm classes depends on the options on your HMI device.

Examples of how to use alarm classes

- The alarm "Speed of fan 1 in upper tolerance range" has alarm class "Warnings". The alarm is displayed with a white background. The alarm does not have to be acknowledged.
- The alarm "Speed of fan 2 has exceeded upper warning range" is assigned to the "Errors" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until the user acknowledges it.

Using alarm classes

Use the following alarm classes to define the state machines and display of alarms for your project:

- Predefined alarm classes
  You cannot delete predefined alarm classes and edit them only to a limited extent. Predefined alarm classes have been created for each HMI device under "HMI alarms > Alarm classes".
- Custom alarm classes
  You can create new alarm classes under "HMI alarms > Alarm classes", configure how you want the alarms to be displayed, and define an acknowledgment model for alarms of this alarm class. The possible number of custom alarm classes depends on which runtime is used in your project.
- Common alarm classes
  Common alarm classes are displayed under "Shared data > Alarm classes" in the project tree and can be used for the alarms of an HMI device. Common alarm classes originate in the alarm configuration of STEP 7. If needed, you can create additional common alarm classes in WinCC.

See also

Predefined alarm classes (Page 4288)

Creating alarm classes (Page 4297)

Using project-wide alarm classes (Page 4298)

Predefined alarm classes

Predefined alarm classes

The following alarm classes already created in WinCC for every HMI device:

Alarm classes for user-defined alarms

- "Warnings"
  The "Warnings" alarm class is designed to show irregular statuses and routines in the process. Users do not acknowledge alarms from this alarm class.
- "Errors"
  The "Errors" alarm class is intended to show critical or dangerous states or limit violations in the process. The user must acknowledge alarms from this alarm class.

Alarm classes for system-defined alarms

- "System"
  The "System" alarm class contains alarms that display states of the HMI device and the PLCs. Alarms of the "System" alarm class belong to the system alarms.
- "Diagnosis Events"
  The "Diagnosis Events" alarm class contains alarms that display states and events in SIMATIC S7 controllers. Users do not acknowledge alarms from this alarm class.

  Note

  Device dependency

  The "Diagnosis Events" alarm class is not available for all HMI devices.

- "Safety Warnings"
  The "Safety Warnings" alarm class contains alarms for fail-safe operation. Users do not acknowledge alarms from this alarm class. Alarms of the "Safety Warnings" alarm class belong to the system alarms.

  Note

  Device dependency

  The "Safety Warnings" alarm class is not available for all HMI devices.

Basics on alarm classes (Page 4287)

Creating alarm classes (Page 4297)

Using project-wide alarm classes (Page 4298)

12.3.1.6 Acknowledgement

Acknowledging alarms

Introduction

To make sure that an alarm was registered by the plant operator, configure this alarm so that it is displayed until acknowledged by the operator. Alarms that display critical or hazardous states in the process have to be acknowledged.

Description

The acknowledgment of an alarm is an event that is logged and reported. Acknowledging an alarm changes the alarm status from "Incoming" to "Acknowledged". When the operator acknowledges an alarm, the operator confirms that he or she has processed the status that triggered the alarm.

Note

HMI device dependency

Reporting and logging are not available for all HMI devices.

Triggering acknowledgment of an alarm

In Runtime, you trigger alarm acknowledgments in various ways:

- Acknowledgement by the authorized user at the HMI device
- Automatic acknowledgment by the system without operator action, e.g. by means of
  - Tags
  - PLC
  - System functions in function lists or scripts

  Note

  HMI device dependency

  Scripts are not available for all HMI devices.

Acknowledging alarms that belong together

To make the alarm system clearer and easier to use in Runtime, you can configure an alarm group. You can acknowledge all alarms belonging to this alarm group in a single pass.

Acknowledgment by the PLC

Discrete alarms will be automatically acknowledged by the PLC, if necessary. The acknowledgment is triggered by a bit in the "Acknowledgment tag PLC". You define the bit and tag at the configuration stage.

Acknowledgment of an alarm on the HMI device

In Runtime, the user acknowledges an alarm in one of the following ways, depending on the configuration:

- Using the acknowledgment button <ACK> on the HMI device
- Using the button in the alarm view
- Using configured function keys or buttons in screens

Note

Acknowledgment button <ACK> on the HMI device

To ensure that critical alarms are processed only by authorized users, protect the "ACK" button on the HMI devices, including the operating controls and display objects of the alarms. Use the appropriate operator authorization for this.

Note

HMI device dependency

The acknowledgement key <ACK> is not available on all HMI devices.

Reaction to the acknowledgment of alarms of an alarm group

- Alarm acknowledgment by the operator
  You acknowledge the alarm of an alarm group, for example, using the <ACK> acknowledgment key or a function key. All alarms of the alarm group are acknowledged.
- Alarm acknowledgment by the controller
  The controller sets a tag bit to acknowledge the alarm of an alarm group.
  The respective alarm is acknowledged.

Acknowledgement Model

Overview

You define the state machines for an alarm class. Alarms that are assigned to this alarm class will be acknowledged on the basis of these state machines. The following state machines are used in WinCC:

- Alarm without acknowledgment
  This alarm comes and goes without having to be acknowledged. There is no visible response from the system.
- Alarm with simple acknowledgment
  This alarm must be acknowledged as soon as the event that triggers the alarm occurs. The alarm remains pending until it is acknowledged.

12.3.1.7 Alarm groups

Introduction

Many alarms from different areas and processes occur in a plant. You can compile associated alarms into alarm groups.

Alarm groups

You can use the alarm groups to monitor the parts of the plant and to acknowledge the associated alarms together as required.

Alarm groups can contain alarms from different alarm classes. You only assign alarms that require acknowledgment to alarm groups.

Using alarm groups

It is a good idea to compile alarm groups for alarms such as the following:

- Alarms that are caused by the same fault.
- Alarms of the same type
- Alarms from a machine unit, such as "Fault in drive XY"
- Alarms from an associated part of the process, such as "Fault in cooling water supply"

Display in Runtime

In Runtime, the "Alarm group" column displays the number of the alarm group to which the alarm belongs.

See also

Configuring Alarm Groups (Page 4300)

12.3.1.8 Alarm number

Assigning alarm numbers

The system assigns unique alarm numbers within an alarm type.

Note

When adapting alarm numbers, observe the uniqueness of the alarm number within an alarm type.

12.3.2 Working with Alarms

12.3.2.1 Alarm components and properties

Overview

You configure the components of alarms in WinCC. The following table shows the basic components of alarms:

Alarm class	Alarm number	Time of day	Date	Alarm status	Alarm text	Alarm group	Tooltip	Trigger tag	Limit
Warn-ing	1	11:09 :14	06.08.2 007	IO	Maximum speed reached	2	This alarm is ...	speed_1	27
Sys-tem	110001	11:25 :58	06.08.2 007	I	Switch to "Online" mode	0	This alarm is ...	PLC-Varia-ble_1	–

Alarm class

Alarm classes, such as "Warnings" or "Errors". The alarm class defines the following for an alarm:

- State machine
- Appearance in Runtime (e.g. color)
- Logging

Note

Device dependency

Logging is not available for all HMI devices.

Alarm number

An alarm is identified by a unique alarm number. The alarm number is assigned by the system. You can change the alarm number to a sequential alarm number, if necessary, to identify alarms associated in your project.

Time and date

Every alarm has a time stamp that shows the time and date at which the alarm was triggered.

Alarm status

An alarm has the events "Incoming," "Outgoing," "Acknowledge." For each event, a new alarm is output with the current status of the alarm.

Alarm text

The alarm text describes the cause of the alarm.

The alarm text can contain output fields for current values. The values you can insert depend on the Runtime in use. The value is retained at the time at which the alarm status changes.

Alarm group

The alarm group bundles individual alarms.

Tooltip

You can configure a separate tooltip for each alarm; the user can display this tooltip in Runtime.

Trigger tag

Each alarm is assigned a tag as trigger. The alarm is output when this trigger tag meets the defined condition, e.g. when its state changes or it exceeds a limit.

Limit

Analog alarms indicate limit violations. Depending on the configuration, WinCC outputs the analog alarm as soon as the trigger tag exceeds or undershoots the limit value.

See also

Output of a tag value in the alarm text (Page 4307)

Alarm states (Page 4285)

Basics on alarm classes (Page 4287)

Alarm groups (Page 4292)

12.3.2.2 Configuring Alarms

Overview of alarm configuration tasks

Steps to configure alarms

Configuring alarms in WinCC involves the following steps:

1. Edit and create alarm classes
   You use the alarm class to define how an alarm will be displayed in runtime and to define the state machines for it.
2. Creating tags in the "HMI tags" editor
   - Configure the tags for your project.
   - You create range values for the tags.
3. Creating tags in the "HMI alarms " editor
   - Create custom alarms and assign these the tag to be monitored, alarm classes, alarm groups, and other properties.
   - You can also assign system functions or scripts to the alarm events.
4. Output of configured alarms
   To output configured alarms, configure an alarm view or an alarm window in the "Screens" editor.

Additional configuration tasks

Additional tasks may be necessary for configuring alarms, depending on the requirements of your project:

1. Creating alarm groups
   You assign the alarms of your project to alarm groups according to their association, such as by the cause of the problem (power failure) or source of the error (Motor 1).
2. Configuring Loop-In-Alarm
   A Loop-In-Alarm is configured in order to change to a screen containing relevant information on an alarm received.

Overview of alarm configuration tasks

Steps to configure alarms

Configuring alarms in WinCC involves the following steps:

1. Edit and create alarm classes
   You use the alarm class to define how an alarm will be displayed in runtime and to define the state machines for it.
2. Creating tags in the "HMI tags" editor
   - Configure the tags for your project.
   - You create range values for the tags.
1. Creating tags in the "HMI alarms " editor
   - Create custom alarms and assign these the tag to be monitored, alarm classes, alarm groups, and other properties.
   - You can also assign system functions or scripts to the alarm events.
2. Output of configured alarms
   To output configured alarms, configure an alarm view or an alarm window in the "Screens" editor.

Additional configuration tasks

Additional tasks may be necessary for configuring alarms, depending on the requirements of your project:

- Activating and editing system events
  You can import system events when you initially open the "System events" tab in the "HMI alarms" editor. On completion of the import, you can edit the system events.
- Activating and editing controller alarms
  For integrated operation of a project in STEP 7, specify the controller alarms to be displayed on your HMI device in the alarm settings.
- Creating alarm groups
  Assign the alarms of your project to alarm groups based on their relation, e.g. by error cause (e.g. "power failure"), or by error source (e.g. "Motor 1").
- Configuring Loop-In-Alarm
  Configure a Loop-In-Alarm in order to change to a screen that contains information about an incoming alarm.

Configuring Alarm Classes

Creating alarm class

Introduction

Cre
cla
You

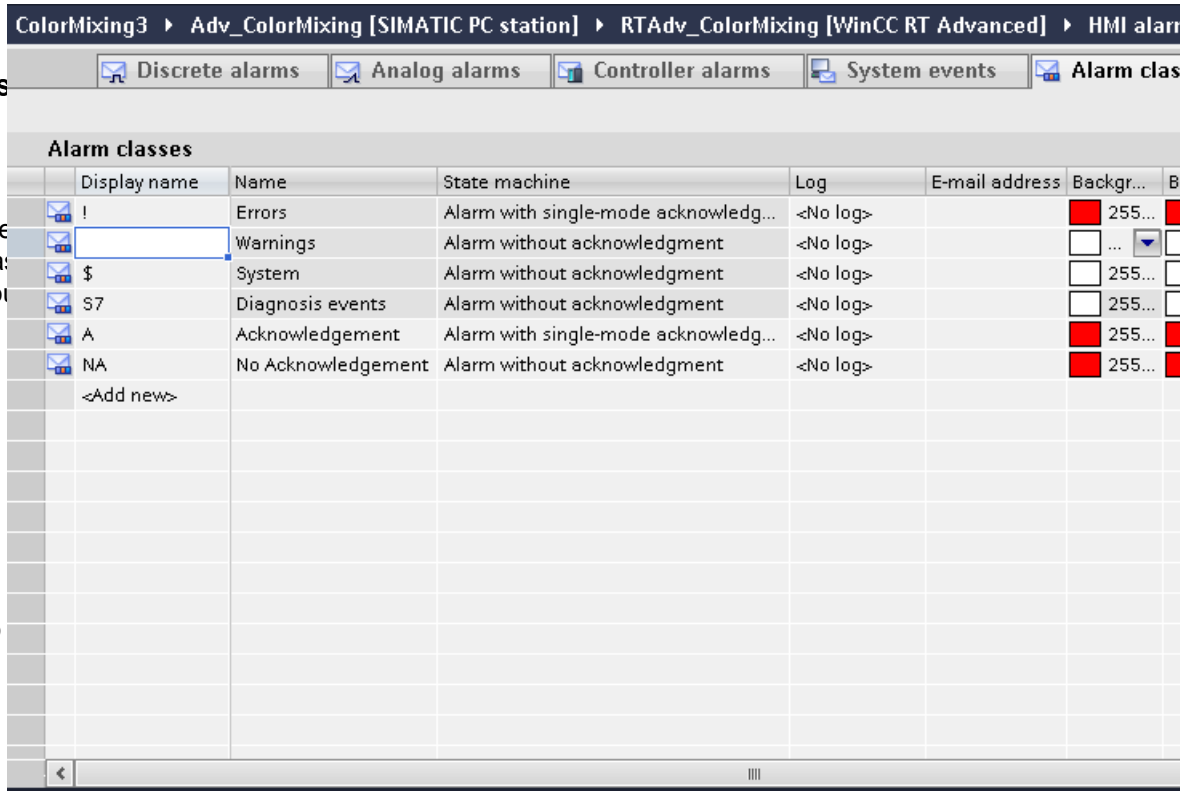
Requirement

-
-

Procedure

To

1.



1. Double-click "<Add>" in the table.
   A new alarm class is created. Each new alarm class is automatically assigned a static ID. The properties of the new alarm class are shown in the Inspector window.
2. Configure the alarm class under "Properties > Properties >General" in the Inspector window.
   - Enter a "Name" and the "Display name".
   - Depending on the HMI device, you can also activate logging, or automatic sending of e-mails.
3. Define the state machines for the alarm class under "Properties > Properties > Acknowledgment" in the Inspector window.
4. Change the default text under "Properties > Properties > Status texts" in the Inspector window.
   This text indicates the status of an alarm in Runtime.
5. Change the default colors under "Properties > Properties > Colors" in the Inspector window. Depending on the HMI device, also change the flashing characteristics.

These settings define how alarms from this alarm class are displayed in Runtime.

Note

To display the alarm classes in color in Runtime, the "Use alarm class colors" option must be activated. In the project navigation, enable "Runtime settings > Alarms > General > Use alarm class colors" accordingly. This option is selected in a new project in WinCC.

See also

Predefined alarm classes (Page 4288)

Basics on alarm classes (Page 4287)

Using project-wide alarm classes

Introduction

Project-wide alarm classes are displayed under "Shared data > Alarm classes" in the project navigation. Create additional common alarm classes in WinCC.

Controller alarms are assigned to common alarm classes. If you work with controller alarms, common alarm classes are automatically loaded in WinCC.

Requirements

- You have created a project.

Creating project-wide alarm class

To create a project-wide alarm class, proceed as follows:

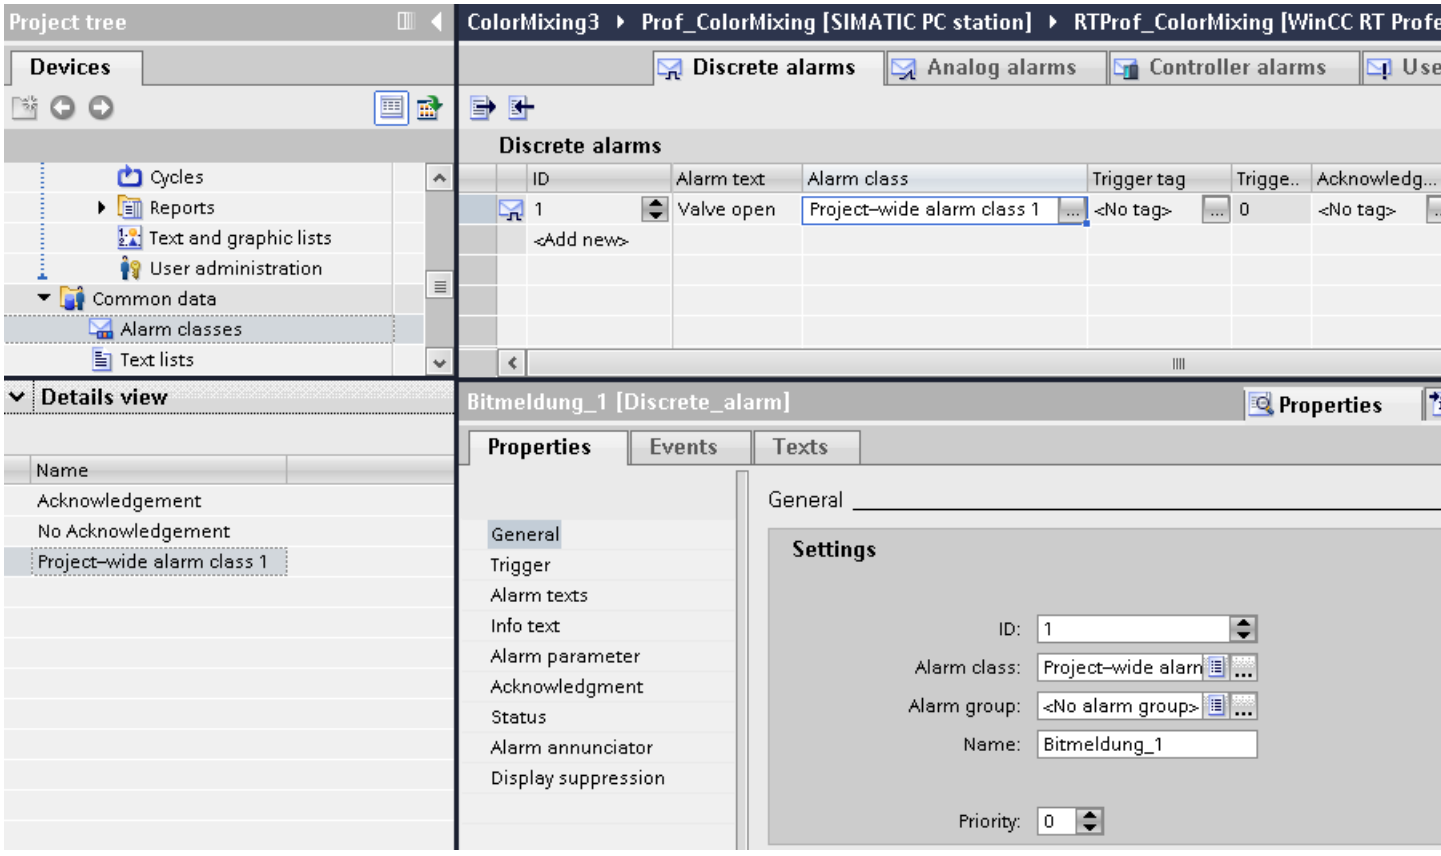
1. Double-click "Shared data > Alarm classes" in the project navigation.
   The "Project-wide message classes" editor opens in the work area.
2. To create a project-wide message class, double-click in the first empty line of the table editor.
3. Specify the name and display name of the alarm class.
4. Select "With acknowledgment" if the alarm class requires acknowledgment.

Assign alarms to a common alarm class

Proceed as follows to assign an analog or discrete alarm to a common alarm class:

1. In the "HMI alarms" editor, select the alarm that you want to assign to the common alarm class.
2. Click "General" in the Inspector window.
3. Click "Shared data > Alarm classes" in the project navigation.
4. Select the common alarm class in the detail view.

5. Drag-and-drop the alarm class to the "Alarm class" selection box or "Alarm class" column in the work area of the Inspector window of the alarm.



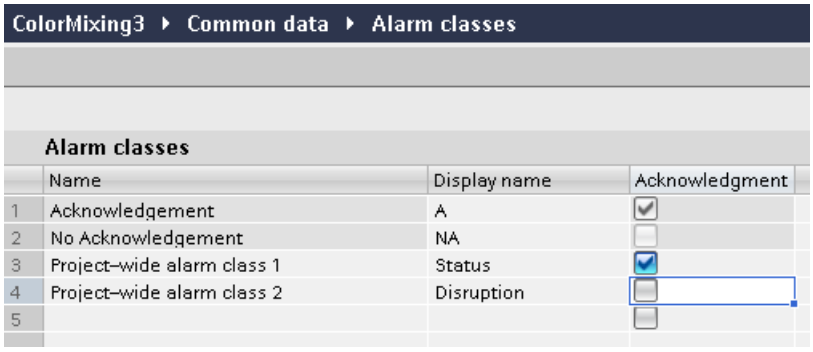
The system creates a new alarm class that is linked to the common alarm class. The new name of the common alarm class is displayed in the "Alarm class" area of the Inspector window of the alarm. The display name of the common alarm class is activated for the alarm class in your project.

6. Click the "Alarm Class" tab.
7. Check to see whether the display name of the common alarm class is displayed in WinCC.
8. You can change the object name of the alarm class.

Alternative procedure

To assign an alarm to a common alarm class, proceed as follows:

1. Click the "Alarm Classes" tab.
   The alarm classes are displayed.
2. Click "Shared data > Alarm classes" in the project navigation. The following table shows the common alarm classes:



3. Select the common alarm class in the detail view.
4. Drag-and-drop the alarm class to the "Alarm classes" tab of the "HMI alarms" editor
   The system creates a new alarm class that is linked to the common alarm class. The new name of the new alarm class in your project is displayed in the "Alarm class" tab.
5. Open the tab with the alarm procedure for the required alarm.
6. Under "General" in the Inspector window, select the alarm and the alarm class linked to the common alarm class.

Note

Deleting a common alarm class

If you delete a common alarm class, the linked alarm class is maintained. If necessary, link the alarm class with another common alarm class or use it as WinCC alarm class.

See also

Predefined alarm classes (Page 4288)

Basics on alarm classes (Page 4287)

Configuring Alarm Groups

Introduction

Create alarm groups on the "Alarm Groups" tab in the "HMI alarms" editor. An alarm group is a compilation of single alarms. You assign alarms in an alarm group by association, such as cause of the problem or source of the error. If you acknowledge an alarm from this alarm group in Runtime, all other alarms in the alarm group are acknowledged automatically.

Requirement

- You have created a project.
-
-

Creating a new alarm

1. 
2. In the work area of the table, double-click "<Add>" in the first free row.
   A new alarm group is created.
3. You can overwrite the proposed "Name".

Result

An alarm group is created. For the group acknowledgment of alarms in Runtime, assign the associated alarms that require acknowledgment to an alarm group.

Configuring discrete alarms

Introduction

Discrete alarms triggered by the PLC indicate status changes in a plant. They indicate the opened or closed state of a valve, for example.

The following sections describes the configuration procedures in the "HMI alarms" editor. You can also configure discrete alarms in the "HMI tags" editor.

Requirements

- The "HMI alarms" editor is open.
- The Inspector window is open.
- You have created the required alarm classes and alarm groups.

Procedure

To configure a discrete alarm, proceed as follows:

1. Open the "Discrete alarms" tab.
2. To create a new discrete alarm, double-click in the work area on "<Add>".
   A new discrete alarm is created.

3. To configure the alarm, select "Properties > Properties >General" in the Inspector window:
   - Enter an alarm text as event text.
     Use the functions of the shortcut menu to format the text on a character-by-character basis, or to insert output fields for HMI tags, or texts from the text lists.
   - You can renumber the alarm.
   - Select the alarm class and the alarm group, if necessary.
4. In the Inspector window, select the tag and the bit that triggers the alarm under "Properties > Properties > Trigger". Note the following information:
   - Use the data types "Int" or "UInt" to select an HMI tag.
   - When you select a PLC tag, use the data types "Int" or "Word". The input and output area of a PLC tag is unsuitable as trigger.
   - Use trigger tag bits only for alarms.
   - Do not use trigger tags for anything else.
   - If you want to acknowledge the alarm via the PLC, use this tag also as PLC acknowledgment tag.

Note

Note the method used to count bits in the utilized PLC when specifying the bit. For more information, refer to the "Communication" section in the PLC Online Help.

Note

If the object does not yet exist in the selection list, create it directly in the object list and change its properties later.

Status-dependent alarm texts

To display a different text independent of the alarm status, link a text list to the alarm text. You control the text list with a tag.

Additional settings for discrete alarms

Creating a tooltip

To configure a tooltip for the alarm, follow these steps:

- Enter your text under "Properties > Properties > Tooltip".

Configuring event-driven tasks

To configure event-driven tasks, such as a loop-in alarm, follow these steps:

1. Select the discrete alarm.
2. Select "Properties > Events" in the Inspector window and configure a new function list for the relevant event.

See also

Configuring trigger for alarm acknowledgment (Page 4334)

Output of a tag value in the alarm text (Page 4307)

Formatting alarm text (Page 4306)

Configuring loop-in alarm (Page 4311)

Configuring analog alarms

Introduction

Analog alarms indicate limit violations. For example, if the speed of a motor drops below a certain value, an analog alarm is triggered.

Requirements

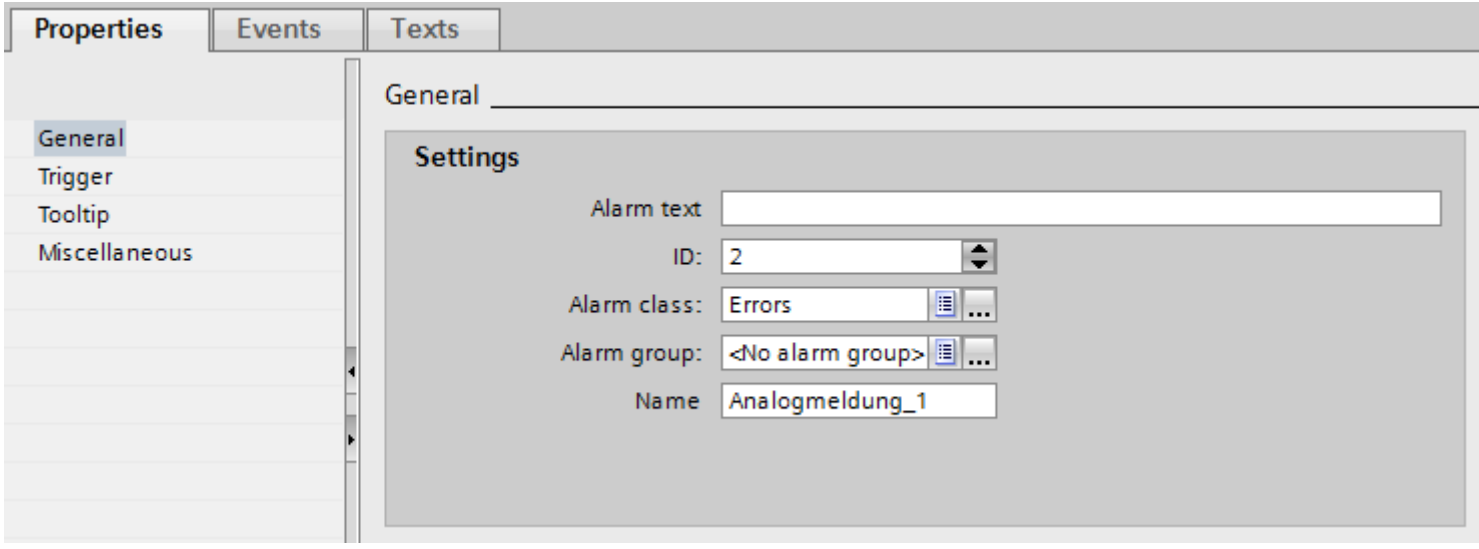
- The "HMI alarms" editor is open.
- The Inspector window is open.
- You have created the required alarm classes and alarm groups.

Procedure

To configure an analog alarm, proceed as follows:

1. Click the "Analog alarms" tab.
2. To create a new analog alarm, double-click in the table on "<Add>".
   A new analog alarm is created.

3. To configure the alarm, select "Properties > Properties >General" in the Inspector window:
   - Enter an alarm text as event text.
     Format the text character-for-character using the shortcut menu.
     Using the shortcut menu, you can insert output fields for HMI tags, or text from text lists.
   - You can renumber the alarm.
   - Select the alarm class and the alarm group, if necessary.



4. Configure the tag that triggers the alarm under "Properties > Properties > Trigger > Settings".
   Do not use trigger tags for anything else.

Configure limit values for an analog alarm

1. In the Inspector window, click the Const button under "Properties > Properties > Trigger > Limit > Value".
   - To use a constant as limit value, select "Constant".
     Enter the required limit value.
   - To use a tag as limit value, select "HMI tag".
     The ... button appears. Use this button to select the tag you want to use.

   Note

   If the required tag does not exist in the selection list yet, create it in the object list and change its properties later.

2. Select the mode:
   - "Higher": The alarm is triggered when the limit is exceeded.
   - "Lower": The alarm is triggered when the limit is undershot.

Optional settings for analog alarms

Setting the delay time

To set the delay time, proceed as follows:

- Enter a time period in the Inspector window under "Properties > Properties> Trigger > Settings > Delay".
  The alarm is only triggered when the trigger condition is still present after the delay time has elapsed.

Setting the deadband

Note

If a process value fluctuates around the limit, the alarm associated with this fault may be triggered multiple times. To prevent this from happening, configure a deadband or delay time.

To enter the deadband, follow these steps:

1. Under "Properties > Properties> Trigger > Deadband > Mode", select the change in alarm status for which the deadband is to be taken into account.
2. Enter a constant value under "Value".
3. To define the deadband value as a percentage of the limit, set the "in %" check box.

Automatic reporting

To print the alarms continuously:

- Select the "Activate" option under "Properties > Properties > Miscellaneous > Report."

Note

Device dependency

Reporting is not available for all HMI devices.

Creating a tooltip

To configure a tooltip for the alarm, follow these steps:

- Select "Properties > Properties > Tooltip" in the Inspector window and enter your text.

Configuring event-driven tasks

To configure event-driven tasks, such as a loop-in alarm, follow these steps:

1. Select the analog alarm.
2. Select "Properties > Events" in the Inspector window and configure a new function list for the relevant event.

See also

Configuring trigger for alarm acknowledgment (Page 4334)

Output of a tag value in the alarm text (Page 4307)

Formatting alarm text (Page 4306)

Configuring loop-in alarm (Page 4311)

Formatting alarm text

Requirement

- The "HMI alarms" editor is open.
- An alarm has been created.

Procedure

To format an alarm text, proceed as follows:

1. Select the alarm to edit.
2. In the Inspector window, select the characters to format under "Properties > Properties > General > Alarm text".
3. Select the formatting from the shortcut menu, e.g. "Underscored" or "Uppercase".

Note

It is not possible to underline tags and text list entries.

Result

The selected characters are displayed in Runtime with the selected formatting.

Removing format settings

To remove all text formats, proceed as follows:

1. In the Inspector window, select the characters whose formatting you want to remove in the alarm text.
2. Select "Delete formatting characters" from the shortcut menu.

Result

The selected characters are displayed in unformatted notation in Runtime.

Output of a tag value in the alarm text

Introduction

In WinCC, you can insert output fields into the alarm text which display the content of tags.

Requirements

- The "HMI alarms" editor is open.
- The alarm is selected.

Output of a tag value in the alarm text

To insert an output field for a tag value in the alarm text, proceed as follows:

1. Place the cursor onto the required position in the event text.
2. Select "Insert tag output field" in the shortcut menu.
3. Open the object list under "Tag" and select a tag.
   You can also create the tag in the object list.
4. Under "Format", specify the length of the output field and the format for tag value output in the alarm text.
   Configure an output field of sufficient size. Otherwise, the tag content is not output to the full extent in the alarm.
5. Click  to save your entries.

WinCC inserts a placeholder for the output field into the alarm text: "<tag: n, [tag name]>" whereby n = text string length.

Editing output field properties

To edit the properties of an output field, proceed as follows:

- Double-click on the output field in the alarm text and edit the settings.

Deleting an output field from the alarm text

To delete an output field from the alarm text, proceed as follows:

- Select the output field in the alarm text and then select the "Delete" command from the shortcut menu.

Note

The sequence of the tag output fields in the alarm text depends on the language. The sequence of the Runtime language is used for logging alarms to a CSV log file.

Changing the tag of an output field in one language causes the modified output field to appear at the end of the alarm text in all other languages. This changes the sequence of the output fields in the log.

Device dependency

Logging is not available for all HMI devices.

Output of texts from a text list in an alarm

Introduction

Text lists are used to create dynamic alarm texts. For example, you can configure the output of both states of a discrete alarm in an alarm text.

Insert a corresponding output field in the alarm text and specify the tag that returns the search key for the text list.

Requirements

- A text list is created.
- The "HMI alarms" editor is open
- The alarm is selected

Output of a text list value in an alarm text

To insert an output field for a value from a text list in the alarm text, proceed as follows:

1. Place the cursor at the required position in the alarm text.
2. Select "Insert text list output field" command from the shortcut menu.
3. Select the text list under "Text list".
4. Open the object list under "Tag" and select the tag that returns the search key for the text list.
   You can also create the tag in the object list.
5. Define the length of the output field under "Format".
   Configure an output field of sufficient size so that the complete text from the text list is displayed in the alarm.
6. Click on the  icon to save your entries.
   WinCC inserts a placeholder for the output field into the alarm text:
   ""<textlist: n, [textlist name]>" whereby n = text string length.

Editing output field properties

To edit the properties of an output field, proceed as follows:

- Double-click on the output field in the alarm text and edit the settings.

Deleting text list from the alarm text

To delete an output field from the alarm text, proceed as follows:

- Select the output field in the alarm text and then select the "Delete" command from the shortcut menu.

Editing System Events

Editing system events

When you open the "System events" tab in the "HMI alarms" editor, WinCC prompts you to import or update the system events. Import the system events and specify the display period. You cannot delete or create new system events. You can only edit the alarm text with system events.

Requirements

- You have imported the system events.

Specifying the display period

To determine the display period, proceed as follows:

1. Double-click "Runtime settings" in the project navigation.
2. Enter a value under "Alarms > System events > Display period".
   This value specifies a time in seconds during which the system events are displayed on the HMI device. If you want to display system events permanently, enter "0".

Changing the alarm text

To change the alarm text of a system event, follow these steps:

1. Open the "HMI alarms" editor and then click the "System events" tab.
2. Select the system event that you want to edit.
1. Change the alarm text under "Properties > Properties > Properties > General" in the Inspector window.

Note

If you change an alarm text for a system event that contains a placeholder, leave the number of placeholders unchanged. A placeholder may be a "%1".

Configuring event-driven tasks

The "Incoming" event is available for certain system events, depending on the HMI device. To configure event-driven tasks, proceed as follows:

1. Select the system event.

2. Select "Properties > Properties > Incoming" in the inspector window and configure a function list.

Editing controller alarms

Introduction

Controller alarms are configured in STEP 7. Controller alarms are available in WinCC running in a STEP 7 environment.

In WinCC you only edit the properties of controller alarms that are specific to an HMI device. Different properties of a controller alarm can be edited, depending on the HMI device and PLC.

You can filter the displayed controller alarms for your project using the display classes that were configured on the PLC for controller alarms.

Requirements

- The connection was established to the PLC.
- Alarms were configured in STEP 7.

Editing controller alarms

Proceed as follows to edit controller alarms:

1. Double-click "HMI alarms" in the project navigation.
   The "HMI alarms" editor is opened.
2. Open the "Controller alarms" tab.
3. Select the alarm that you want to change in the work area.
4. Make your changes. Depending on the HMI device, it may not be possible to display or enable some of the controller alarm properties.

Editing SIMATIC S7 alarms

You can edit these controller alarms in the STEP 7 alarm configuration system. To do this, proceed as follows:

1. Select the alarm that you want to change in the work area.
2. Select "Open in alarm editor of the PLC" from the shortcut menu.
   The STEP 7 alarm configuration system is opened.
3. Make your changes.

Filtering the controller alarm using display classes

To filter controller alarms by display classes, proceed as follows:

1. Click "Runtime settings > Alarms" in the project navigation under your HMI device.
   One or several connections to a PLC are shown in "Contoller alarms".
2. Select the display classes whose controller alarms you want to display for the connection.

Result

Only those controller alarms whose display class you have enabled for your HMI device will be displayed on the "Controller alarms" tab of the "HMI alarms" editor.

See also

PLC alarms (Page 4283)

Enabling system-defined controller alarms

Enabling system-defined controller alarms

To activate system-defined controller alarms for your HMI device, proceed as follows:

1. Select "Runtime settings > Alarms" in the project navigation.
   The alarm settings open.
2. Under "System events" activate the system-defined controller alarms.
3. To display the system events with alarm text, activate "With text".
4. To display these alarms in Runtime, configure an alarm view that displays alarms from the "Diagnosis Events" alarm class.

Note

For HMI devices with small display units, specify to display only the alarm number for system-defined controller alarms.

See also

System-defined controller alarms (Page 4285)

Configuring loop-in alarm

Introduction

A Loop-In-Alarm is configured in order to change to a screen containing relevant information on an alarm received.

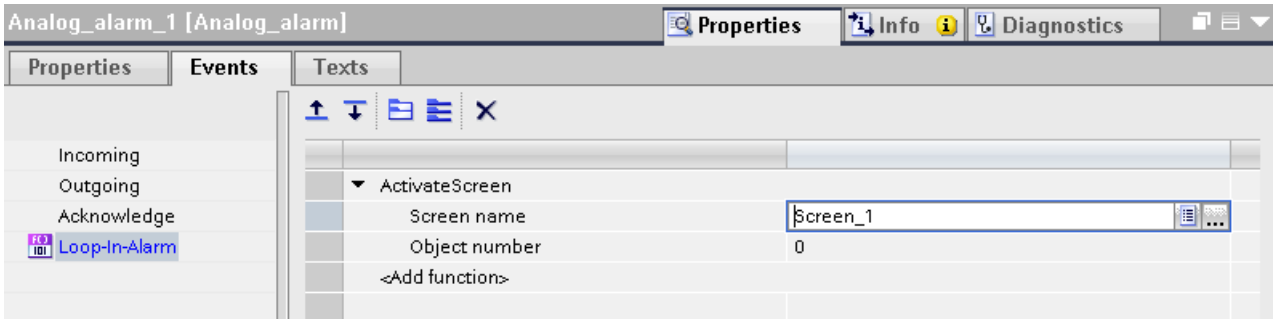
Requirement

- The screen called by the Loop-In-Alarm has been created.
- The "HMI alarms" editor is open.

Procedure

To configure a Loop-In-Alarm for an alarm, proceed as follows:

1. Click the tab that contains the alarm for which you want to configure the Loop-In-Alarm.
2. Select the alarm.
3. In the Inspector window, select "Properties > Events > Loop-In-Alarm".
4. Select the "ActivateScreen" system function.
5. Select the screen called by the Loop-In-Alarm as parameter.



Note

To configure the Loop-In-Alarm for an alarm view with an "alarm line" format, use a button with the following system functions:

- "EditAlarm" for HMI devices with keys
- "AlarmViewEditAlarm" for HMI devices without keys

The system functions trigger the "Loop-In-Alarm" event. The alarm line has no buttons.

Result

If you click on the "Loop-In-Alarm" button of the alarm view in Runtime, a screen is opened with information on the selected alarm.

See also

Configuring discrete alarms (Page 4301)

Configuring analog alarms (Page 4303)

Alarms in the "HMI tags" Editor

Configuring discrete alarms

Introduction

In WinCC, you can create and edit discrete and analog alarms, including the trigger tags, in the "HMI tags" editor.

Note

If you delete, move or copy objects in the "HMI tags" editor, the changes also take effect in the "HMI alarms" editor.

Requirements

The "HMI tags" editor is open.

Procedure

To configure a discrete alarm, proceed as follows:

1. To create a tag, click on "<Add>" in the table at the top of the work area.
   A new tag is created.
2. Configure an internal or external tag as required.
   - Use the data types "Int" or "UInt" to select an HMI tag.
   - When you select a PLC tag, use the data types "Int" or "Word". The input and output area of a PLC tag is unsuitable as trigger.
3. Select the tag at the top of the work area.
4. Click on "<Add>" in the table on the "Discrete alarms" tab at the bottom of the work area.
   A new discrete alarm is created for the tag. If you have selected the incorrect data type, the tag will be marked in the discrete alarm.
5. Configure the discrete alarm in the Inspector window:
   - Enter the alarm text under "Properties > Properties > General > Alarm text".
     You can also insert output fields into the alarm text.
   - Select an alarm class.
   - Select the trigger bit of the tag that triggers the discrete alarm under "Properties > Trigger".
6. You can create additional discrete alarms to monitor the tags.

   Note

   A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.

Result

The configured discrete alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.

Configuring analog alarms

Introduction

In WinCC, create the discrete and analog alarms, including the trigger tags, in the "HMI tags" editor. You can also edit the alarms as in the "HMI alarms" editor. You can create up to two range values for a tag. You monitor these limits with analog alarms.

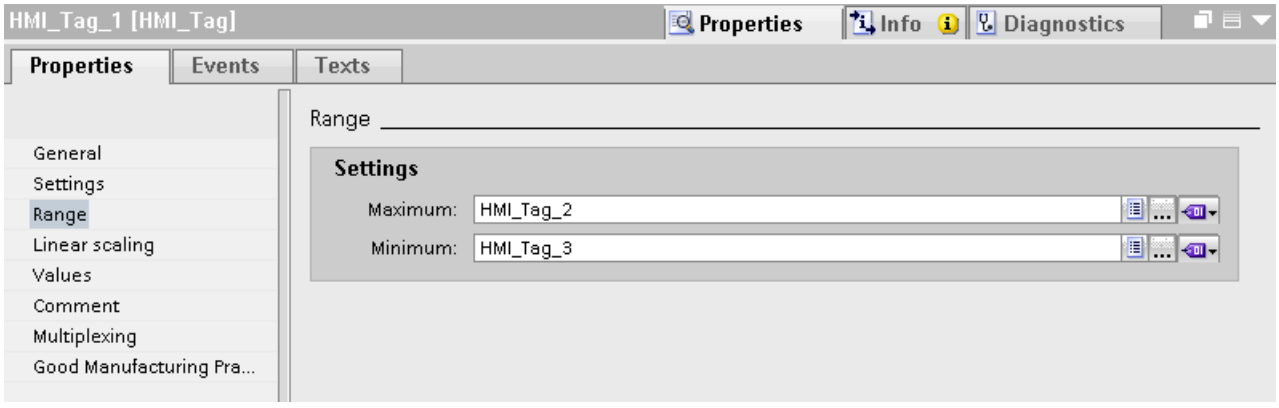
Requirements

The "HMI tags" editor is open.

Procedure

To configure an analog alarm in the "HMI tags" editor, proceed as follows:

1. To create a tag, click on "<Add>" in the table at the top of the work area.
   A new tag is created.
2. Configure an internal or external tag as required.
3. In the Inspector window, configure the range values of the tags under "Properties > Properties > Range":
   – Select whether to use a "Constant" or an "HMI tag" as limit value for your range values. The object list opens when you select "HMI tag". Select the tag you want to use.



1. Click the "Analog Alarms" tab at the bottom of the work area.
   Create an analog alarm for both range values.
2. Select an analog alarm and configure it in the Inspector window:
   – Enter the alarm text under "Properties > Properties > General > Alarm text".
   – You can also insert output fields into the alarm text.
   – You can change the default alarm class.
3. Configure the analog alarms as in the "HMI alarms" editor.
4. Complete the configuration of all analog alarms.

Note

A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.

Result

The configured analog alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.

12.3.2.3 Configuring the Outputting of Alarms

Overview of configuring alarm output

Steps to complete when configuring alarm output

You configure the alarm output in WinCC in the following steps:

1. Create alarm view
   Use the display and control objects in the "Screens" editor to display alarms in Runtime. You can also configure an alarm view for logged alarms.
2. Configure acknowledgment
   In the "Screens" editor, you can set the operator action that will trigger the acknowledgment.
3. Configure reporting
   You can create reports in the "Reports" editor to print alarms in Runtime. In the "Scheduler", "Screens", "HMI alarms" or "HMI tags" editors, you define when and how the printing of a report is triggered.

Note

Device dependency

Reporting and logging are not available for all HMI devices.

Additional configuration tasks

Additional tasks may be necessary for configuring alarm views, depending on the requirements of your project:

1. Setting up authorizations
   To make sure only authorized operators process the alarms, assign authorizations for the alarm view and the function keys of the HMI device.
2. Configuring the filtering of the alarm view
   You configure the filtering of the alarms in Runtime in the "Screens" editor. You can also configure alarm views that only display selected alarms.
3. Configure operator input alarms
   Configure the operator input alarms on the operator controls of the HMI device in the "Screens" editor. A preconfigured operator input alarm is output for an operator action. An operator input is, e.g. the acknowledgment of an alarm.

Displaying alarms

Options for displaying alarms on the HMI device

WinCC offers the following options for displaying alarms on the HMI device:

- Alarm view
  The alarm view is configured in a screen. More than one alarm can be displayed simultaneously, depending on the configured size. You can configure multiple alarm views with different contents.
- Alarm window
  The Alarm window is configured in the "Global screen" editor. The alarm window can display multiple alarms at the same time, depending on the configured size. An event can trigger closing and reopening of the alarm window. To hide it during configuration, create an alarm window on its own level.

Additional signals

- Alarm indicator
  The alarm indicator is a configurable, graphical icon. When an alarm comes in, the alarm indicator is displayed on the HMI device. You configure the alarm indicator in the "Global screen" editor.
  The alarm indicator has two states:
  - Flashing: At least one alarm that requires acknowledgment is pending.
  - Static: The alarms are acknowledged but at least one of them has not gone out yet. The alarm indicator also displays the number of pending alarms according to the HMI device.
- E-mail notification
  To inform someone other than the operator, such as an engineer, when an alarm with a specific alarm class arrives, assign the alarm class to an e-mail address.

  Note

  Device dependency

  E-mail notification is not available for all HMI devices.

- System functions
  You can configure a list of functions for the event associated with an alarm. These functions must be executed in Runtime when the event occurs.
  Use system functions for alarms in WinCC to control the alarm view or the alarm window other than via the toolbar.

Displaying the predefined alarm classes in Runtime

The following table shows the symbols used to display the predefined alarm classes in the alarm view:

Alarm class	Displayed icon
"Diagnosis Events"	S7
"Errors"	!
"System"	$
"Warnings"	<No symbol>

Configuring alarm filtering (Page 4327)

Displaying Logged Alarms (Page 4330)

System functions for alarms (Page 4364)

Configuring an alarm view

Configuring an alarm view for active alarms

Introduction

Current alarms are displayed in Runtime in an alarm view or alarm window.

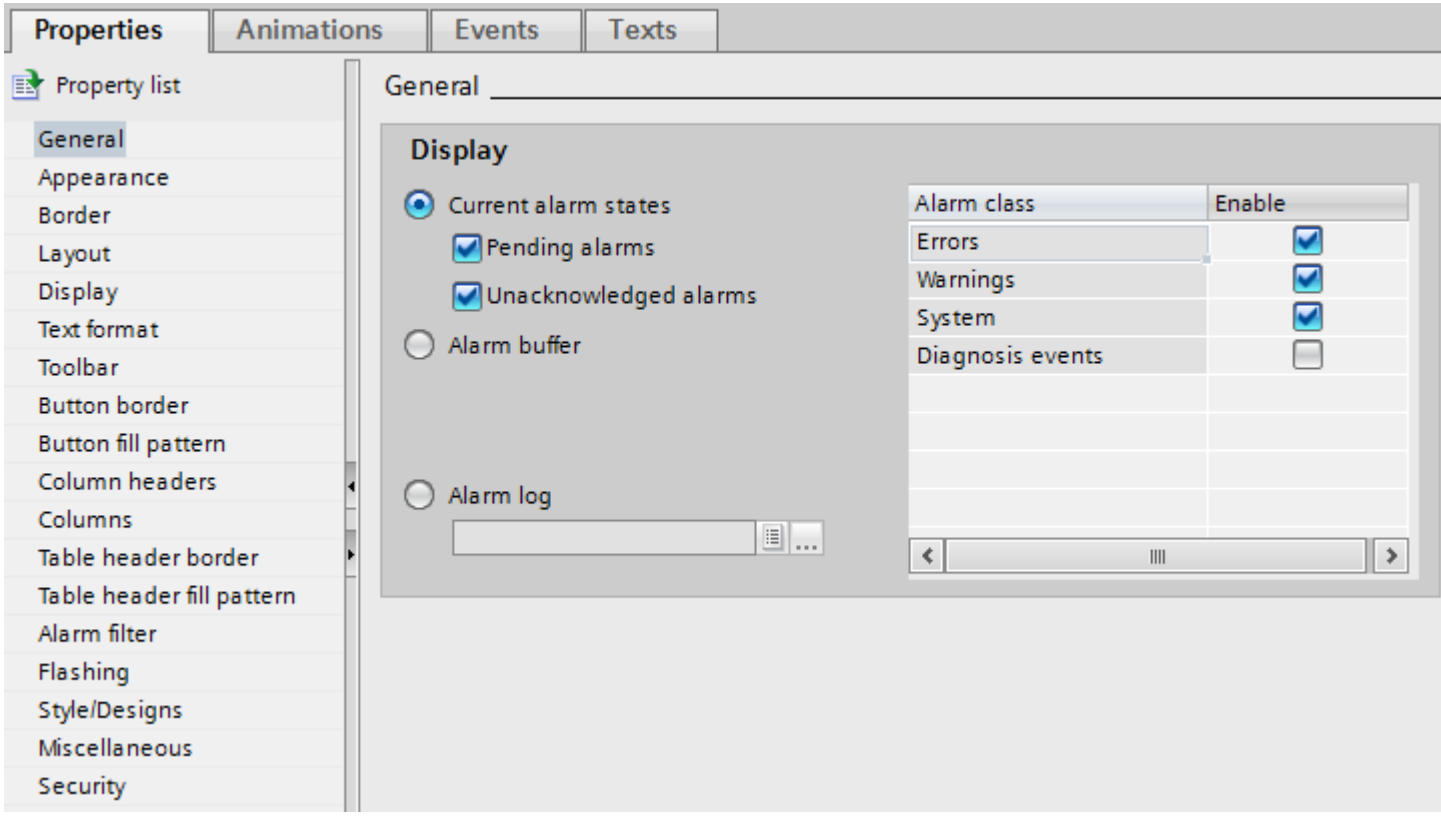
Requirement

- A screen is open in the "Screen" editor.
- The "Tools" task card is open.

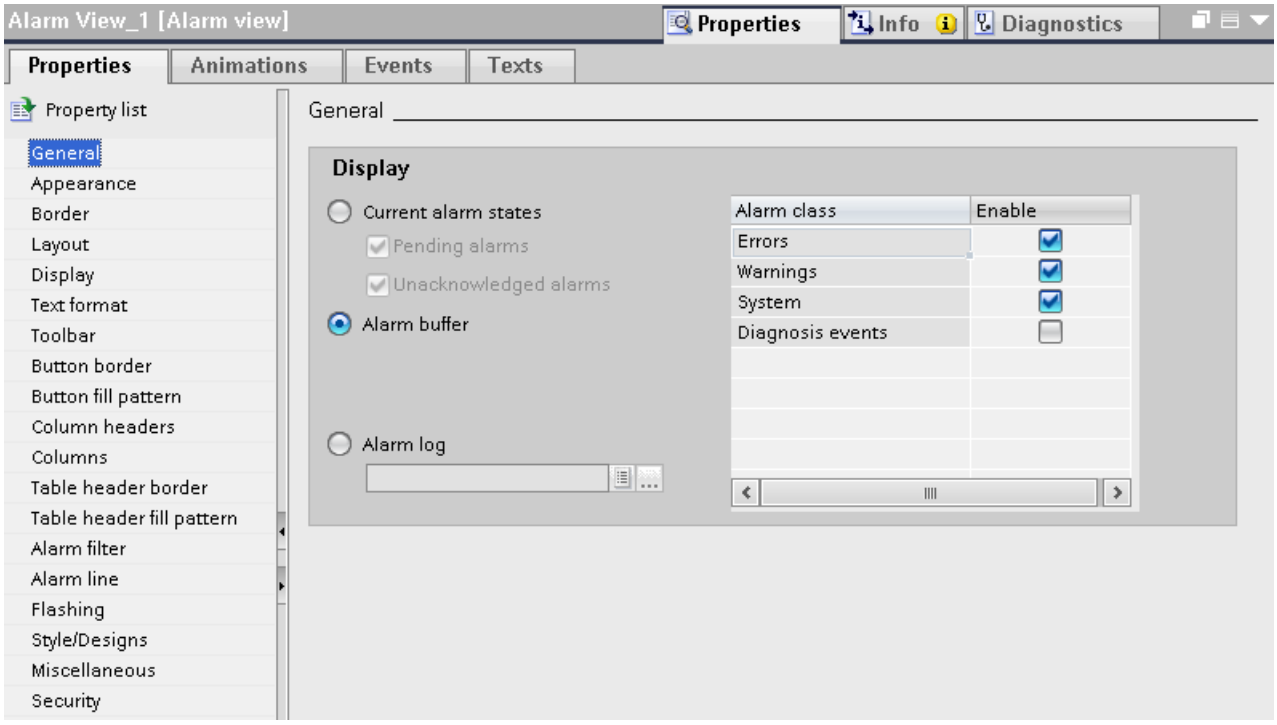
Configuring alarms for the alarm view

To specify the alarms that will be shown in the alarm view, proceed as follows:

1. Insert an "Alarm view" object from the "Tools" task card into the screen.
2. Select the alarm view.
   - In the Inspector window, select "Properties > Properties > General > View > Current alarm states".
     Set whether to display alarms with and/or without mandatory acknowledgment.



– To display all alarms in the alarm buffer, enable "Alarm buffer".

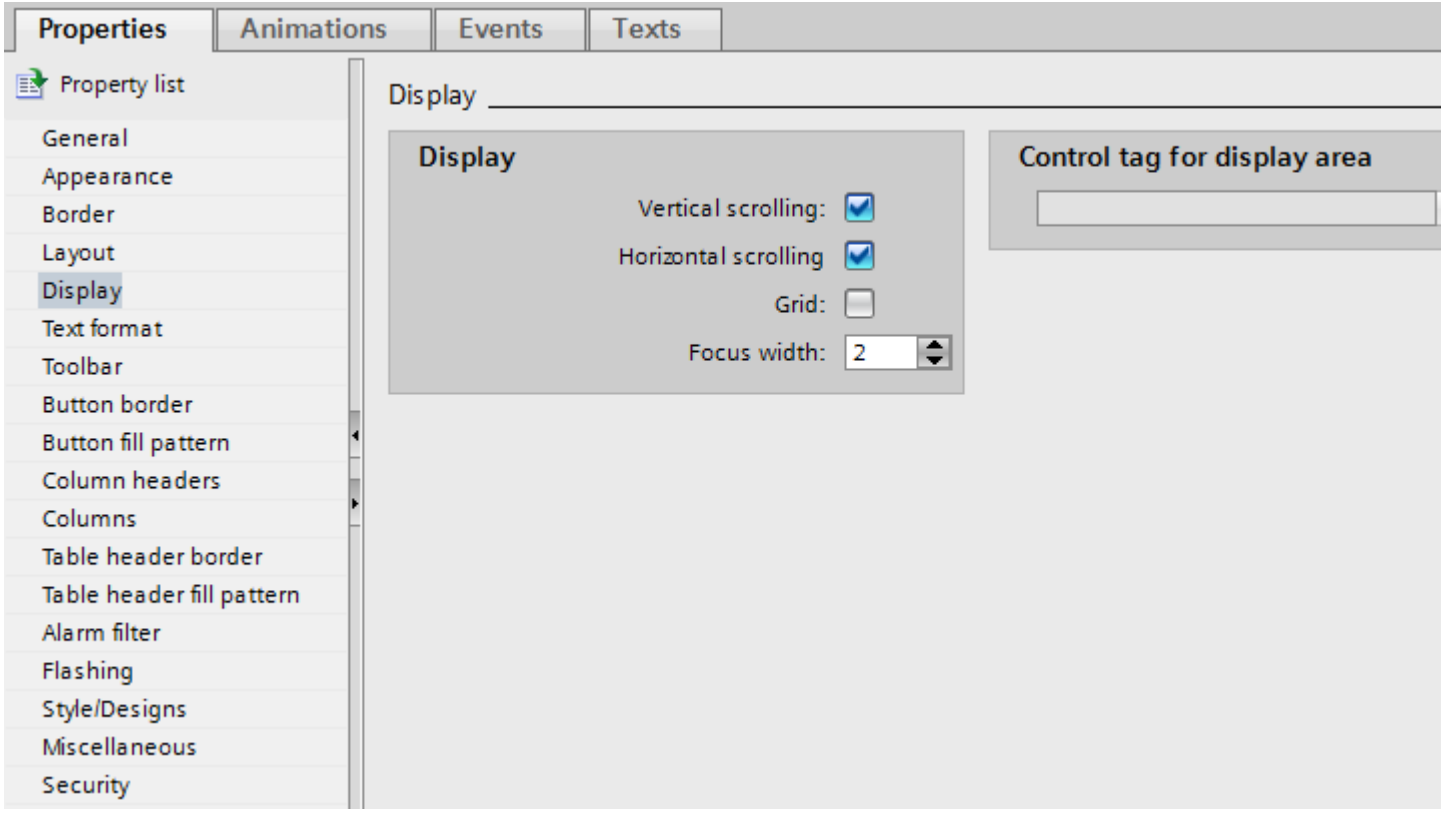


3. In the table, activate the alarm classes to be displayed in the alarm view.
4. Under ""Properties > Properties > View > Control tag for display area", define the tag that returns the date as of which the alarms will be displayed.

Note

Device dependency

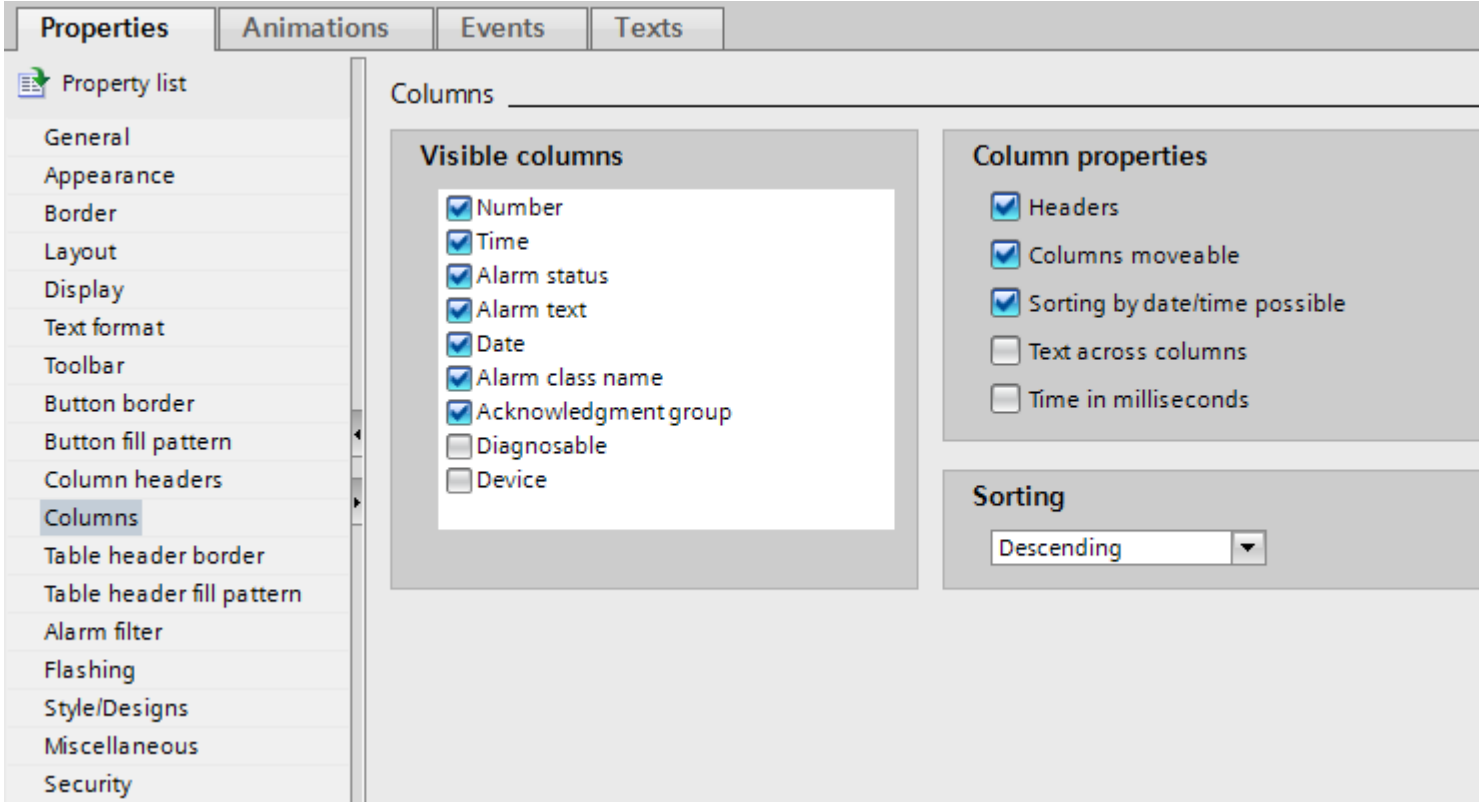
The "Control tag for display area" property is not available for all HMI devices.



Configuring the layout of the alarm view

To specify how the alarms are shown in the alarm view, proceed as follows.

1. Under "Properties > Properties > Layout > Settings > Lines per alarm" in the Inspection window, specify the number of lines to display for each alarm.
2. In "Properties > Properties > View", select the control elements that are available on the HMI device.
3. Configure the columns under "Properties > Properties > Columns":
   - Under "Visible columns" select the columns to be output in the alarm view.
   - Under "Properties Column", define the properties of the columns.
   - Under "Sort", select the sorting order of the alarms.



Note

Select the "Edit" command in the shortcut menu for the alarm view to activate the alarm view. You can set the column width and position in active mode. To enable the alarm view, set the zoom factor to 100 %.

The alarm view is deactivated as soon as you deselect the object in the screen.

Result

Alarms of various alarm classes are output in the alarm view during runtime.

See also

Creating alarm classes (Page 4297)

Configuring an alarm window (Page 4325)

Configuring an alarm view for the S7 diagnostic alarms

Introduction

To display S7 diagnostic alarms, configure an alarm view or alarm window for the predefined "Diagnosis Events alarm class. Activate the diagnostic alarms accordingly in the Runtime settings of your HMI device.

Note

HMI device dependency

The "Diagnosis Events" alarm class is not available for all HMI devices.

Requirements

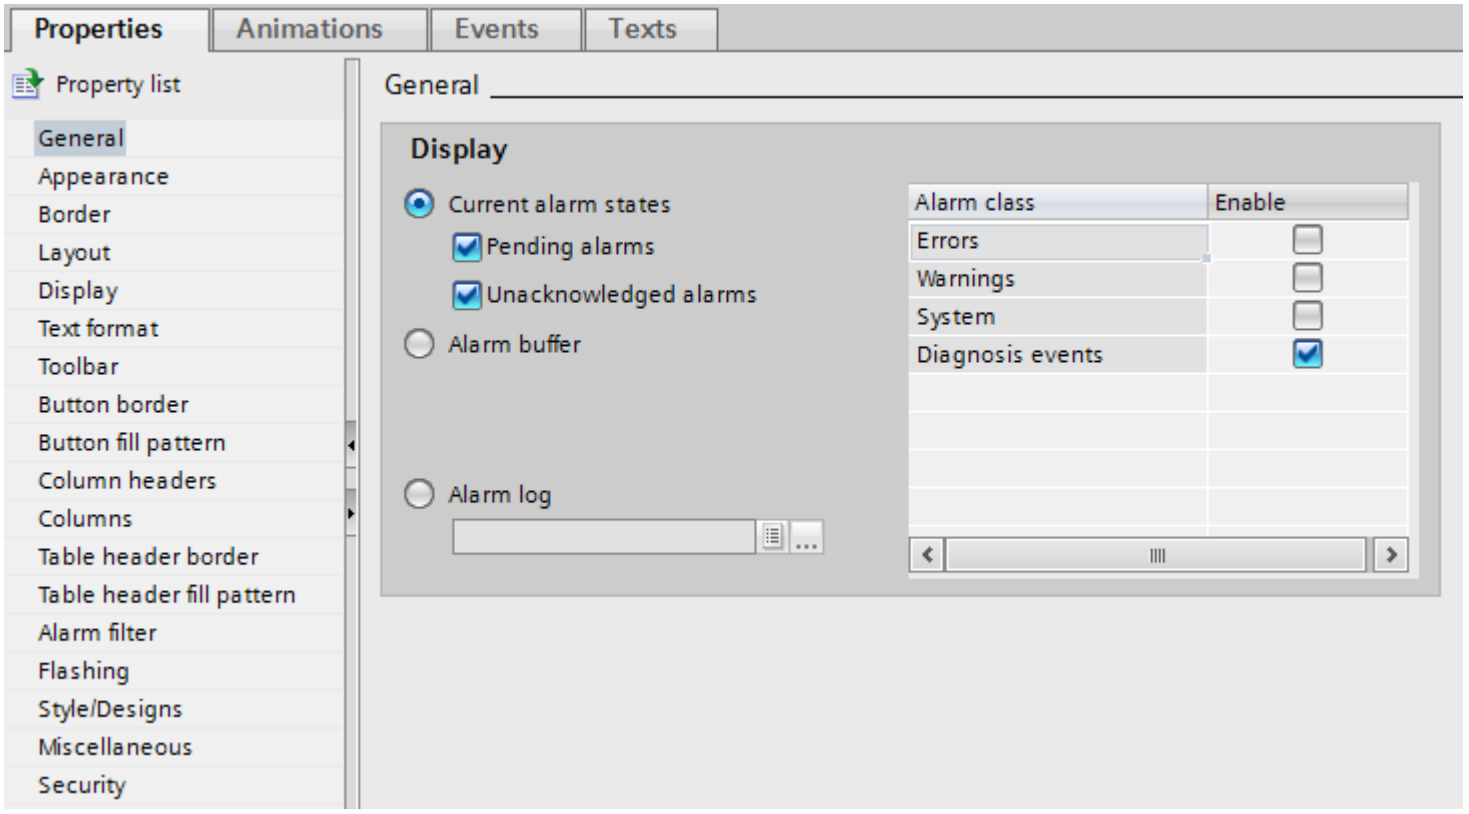
- An alarm view or alarm window is configured in the "Screens" editor
- A connection to the PLC is set up.

Configuring the display of S7 diagnostic alarms

To configure the display of S7 diagnostic alarms, follow these steps:

1. Select "Runtime settings > Alarms > System events > S7 diagnostics alarms" in the project navigation.
2. To display the S7 diagnostics alarms with text, activate "With text".
3. Open the screen with the alarm view and select the alarm view.

4. In the Inspector window, select "Properties > Properties > General > Display > Alarm class "Diagnosis Events".



5. Continue to configure the alarm view as for the display of current alarms.

Result

In Runtime the alarm view displays the S7 diagnostic alarms of the controller.

Configuring an alarm view for logged alarms

Introduction

In Runtime, logged alarms are displayed in an alarm view or alarm window.

Requirements

- An alarm view or alarm window is configured in the "Screens" editor
- An alarm log was created in the "Log" editor.
- The alarms are assigned the "loggable" attribute in the "HMI alarms" editor.

Configuring an alarm view for logged alarms

To configure an alarm view for logged alarms, proceed as follows:

1. Open the screen with the alarm view and select the alarm view.
2. In the Inspector window, select "Properties > Properties > General > Alarm log".
3. Click the "...." button and select the alarm log.
4. Continue to configure the alarm view as for the display of current alarms.

Result

In Runtime, the logged alarms are output in the alarm view.

Configuring an alarm window

Introduction

The alarm window displays current alarms. The alarm window is configured in the "Global screen" editor. The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged. The HMI device can still be used, even if alarms are pending and displayed. An alarm window is displayed and configured like an alarm view.

To hide an alarm window during configuration, create it on its own level.

Requirement

- The "Global Screen" editor is open.
- The "Tools" task card is displayed.
- The Inspector window is open.

Procedure

Proceed as follows to configure an alarm window:

1. Insert an "Alarm window" object from the "Tools" task card into the global screen.
2. Configure the alarm window like an alarm view.
3. Under "Properties > Properties > Mode > Window" in the Inspector window, select how the alarm window reacts and is operated in Runtime.
   - Activate "Modal" if the alarm window is to retain the focus in Runtime after a screen change.
     This option is important, as switching back and forth between the screen and different windows with <Ctrl+TAB> is not supported.

Result

During runtime, the alarms of the selected alarm class are displayed in the alarm window.

See also

Configuring an alarm view for active alarms (Page 4318)

Creating alarm classes (Page 4297)

Configuring an alarm indicator

Introduction

The alarm indicator uses a warning triangle to indicate that alarms are pending or require acknowledgment. If an alarm of the configured alarm class occurs, the alarm indicator is displayed.

The alarm indicator has two states:

- Flashing: At least one alarm that requires acknowledgment is pending.
- Static: At least one of the acknowledged alarms has not gone out yet.

During configuration, specify whether Runtime has to open an alarm window when you operate the alarm indicator.

Requirement

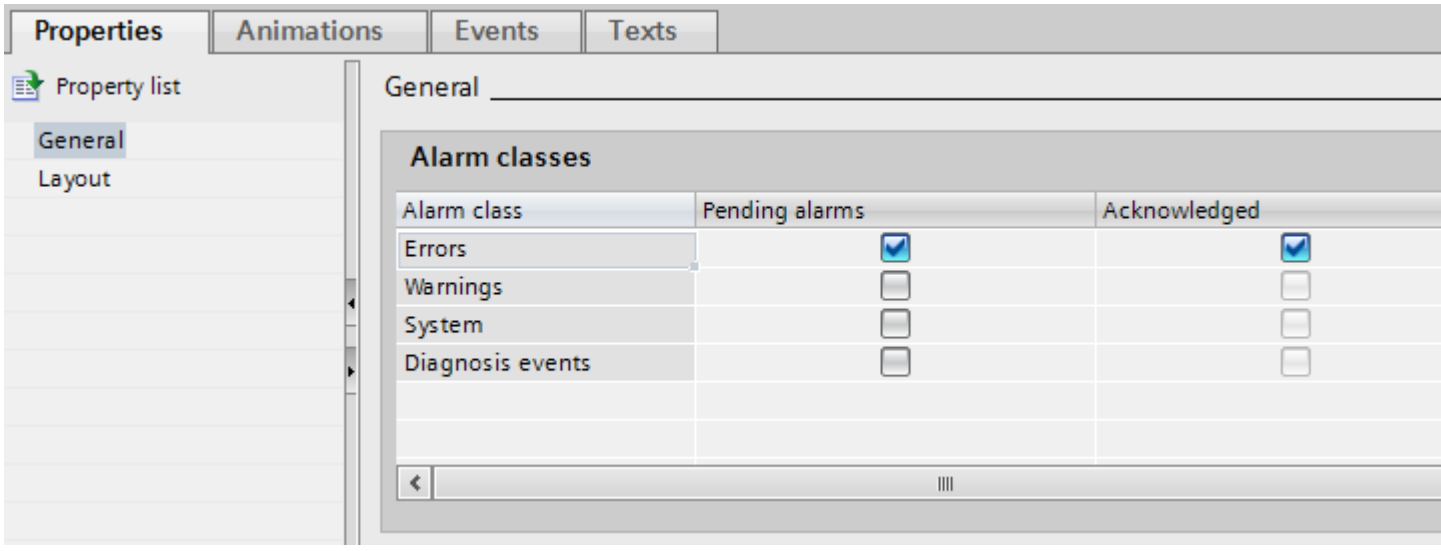
- The "Global Screen" editor is open.
- The "Tools" task card is open.
- The Inspector window is open.

Procedure

Proceed as follows to configure the alarm indicator:

1. Insert the "Alarm view" object from the "Tools" task card into the work area.
2. Select the alarm indicator.

3. Under "Properties > Properties > General" in the Inspector window, select the alarm classes to be displayed by the alarm view.
   Specify whether to display pending and/or acknowledged alarms in the alarm view.



4. Under "Properties > Event", assign the system function "ShowAlarmWindow" to an event of the alarm view.

Note

If you have configured a permanent window in the screen or template, do not position the alarm window and alarm view in the vicinity of the permanent window. Otherwise, the alarm window and the alarm view will not be displayed in Runtime. However, the permanent window is not visible in the "Global screen" editor.

Result

The alarm view is displayed if alarms from the selected alarm class are pending or need to be acknowledged in Runtime. The alarm window opens when the user operates the alarm view.

Configuring alarm filtering

Introduction

You can filter the display of alarms in the enhanced alarm view. The criterion is always a character string. There are two ways to filter the alarm view:

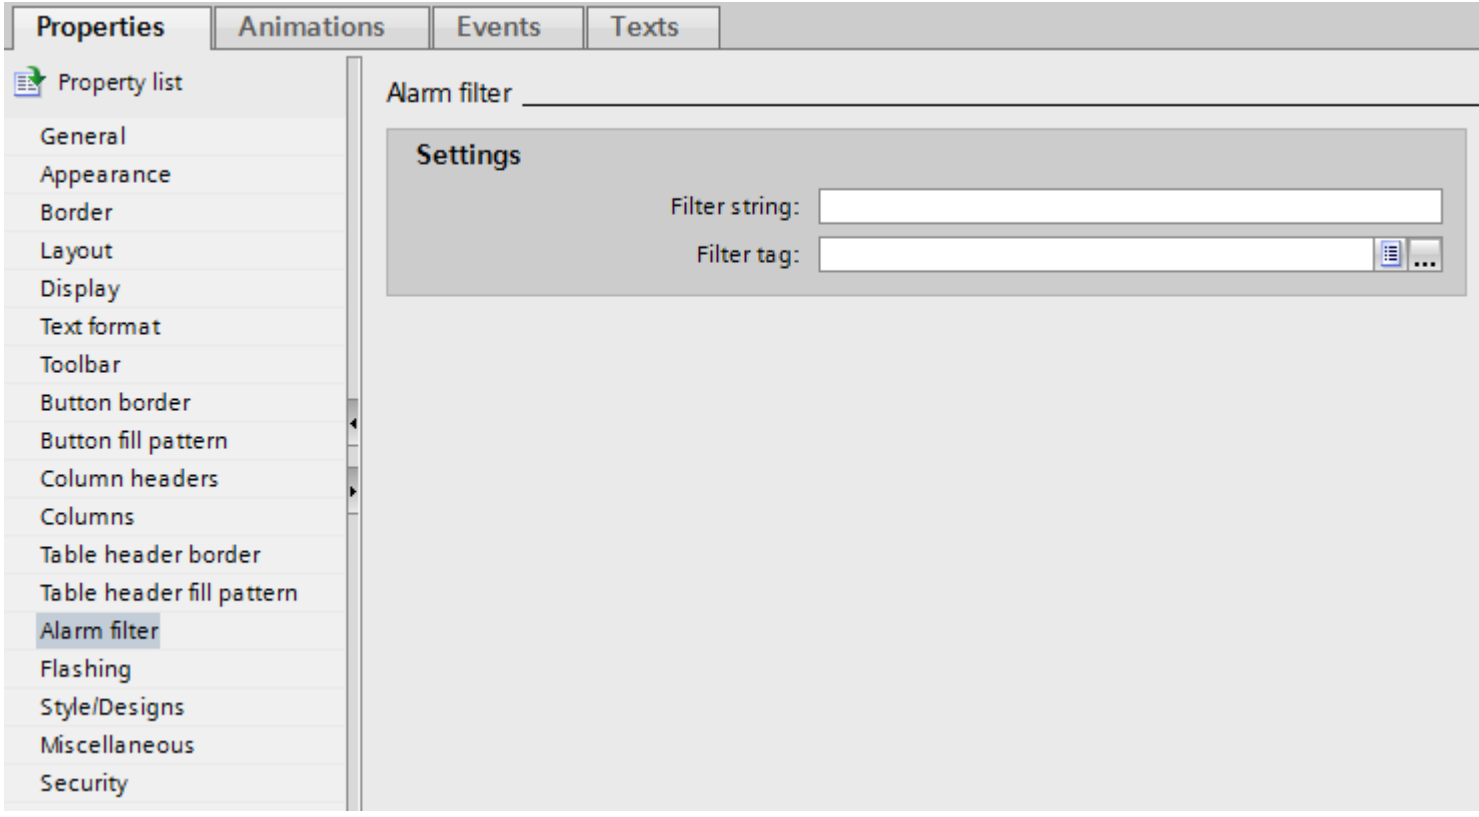
- A fixed criterion is configured in WinCC.
  In Runtime, all alarms that contain the complete character string in the alarm text are displayed.
- You filter the alarm view in Runtime.
  In Runtime, a filter tag sets the relevant character string in the alarm view by means of an I/O field, e.g. as described below.
  The filter affects the display in the alarm view. All alarms in the alarm buffer are retained.

Requirement

- The alarm view has been configured.
- The screen with the alarm view is open.
- The Inspector window is open.

Configuring filters for a fixed character string

1. Select the alarm view.
2. In the Inspector window, select "Properties > Properties > Alarm filter".
3. Enter a filter string in "Filter string".



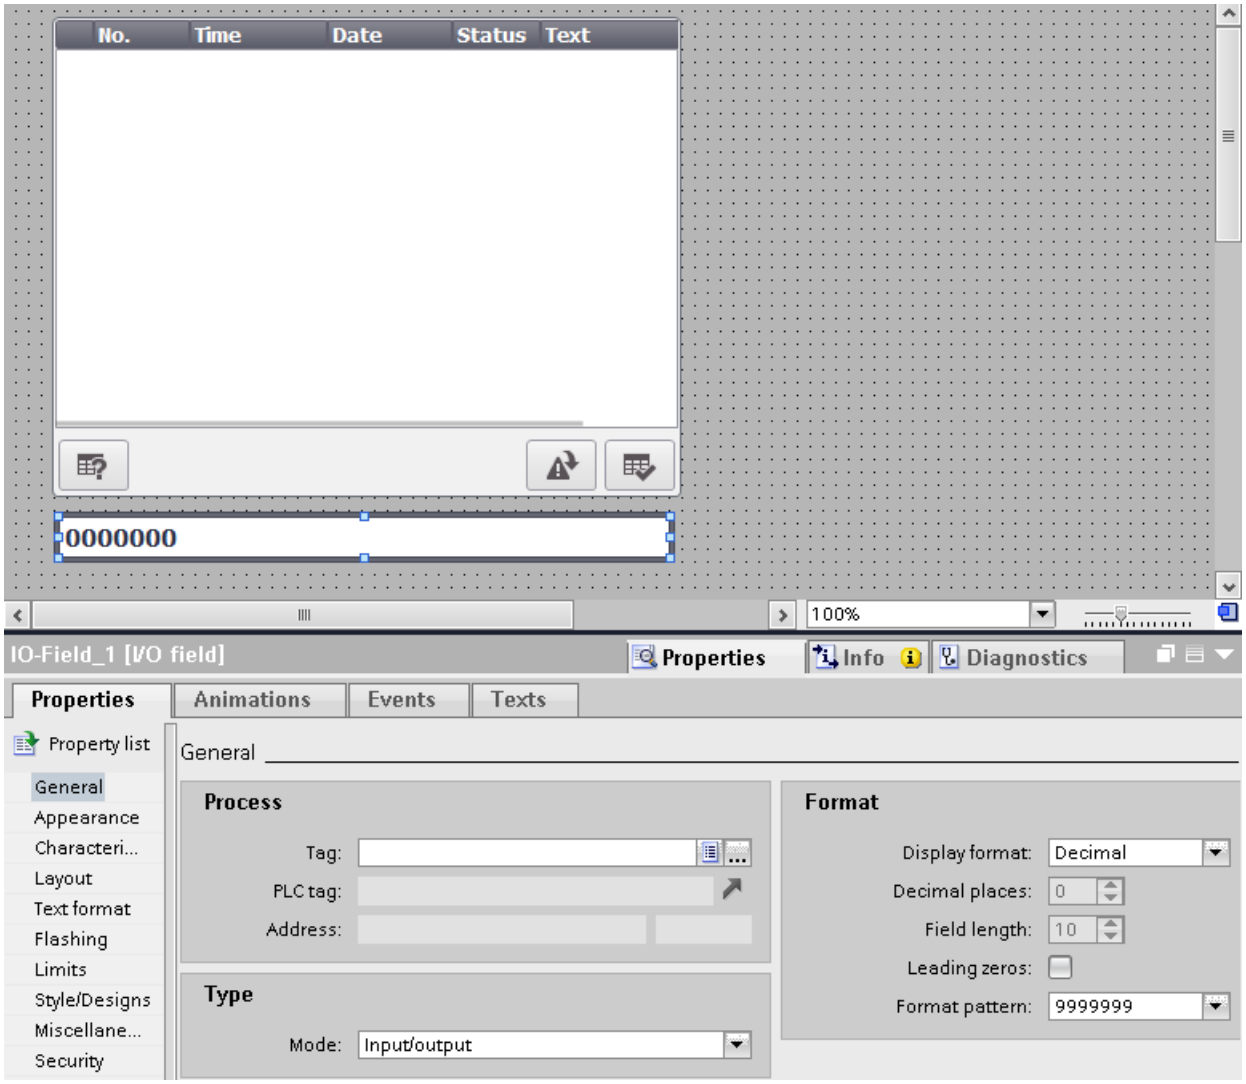
Result

Only those alarms are displayed in Runtime that contain the complete character string from the filter in the alarm text.

Configuring filters for a variable character string

1. Select the alarm view.
2. In the Inspector window, select "Properties > Properties > Filter".

3. Select a tag from "Filter tag". The tag must be of the "String" type.
4. In the screen, configure an I/O field for entering the filter string in Runtime.
   - In the Inspector window, select "Properties > Properties > General > Format > Display format > String".
   - To link the I/O field to the alarm view, select "Process" to set the filter tag you selected for the alarm view.



Result

If you enter a string in the I/O field in Runtime, the alarm view only displays alarms that contain the complete string in their alarm text.

If a permanently configured character string and a filter tag were configured, the alarms will be filtered in Runtime according to the content of the filter tag. If the filter tag is blank, the permanently configured character string is used as the filter.

Note

Filtering is not possible for the following alarm views:

- Simple alarm view
- Alarm line
- Alarm window
- Alarm view for logged alarms

Displaying Logged Alarms

Introduction

You display logged alarms in Runtime in an alarm view. The alarm view shows the content of an alarm log.

Application

For example, you want to view information about the process at the end of a shift.

Requirements

- An alarm log has been created.
- A screen is open.
- The Inspector window is open.

Procedure

Proceed as follows to configure an alarm view to output an alarm log:

1. Configure an alarm view in a screen.
2. Under "Properties > Properties > General > Display > Alarm log"" in the Inspector window, select the required alarm log.
   You can always create a new alarm log.

Result

During runtime, the alarms logged in the selected alarm log appear in the Alarm view.

Note

In runtime, the alarm texts logged are not displayed but rather the alarm texts in the current project. The logged alarm texts are only intended for external evaluation of the log file.

If the alarm log displayed was configured differently, the alarm texts displayed may not correspond with those logged.

Reporting Alarms

Overview

WinCC can report on all alarms that occur in the system. The following options are available:

- Output an alarm sequence report
  In Runtime, the standard printer of the HMI device will continuously print each alarm and any changes in its status.
- Output of an alarm report
  You configure an alarm report in the "Reports" editor and specify when it is output in Runtime:
  - For event-driven output, configure an object that is assigned the "PrintReport" system function. The object can be a button or tag.
  - For time-driven output, create a "Print job" in the scheduler. Assign an alarm report to the job.

    Note

    In the alarm report, specify whether to output current or logged alarms.

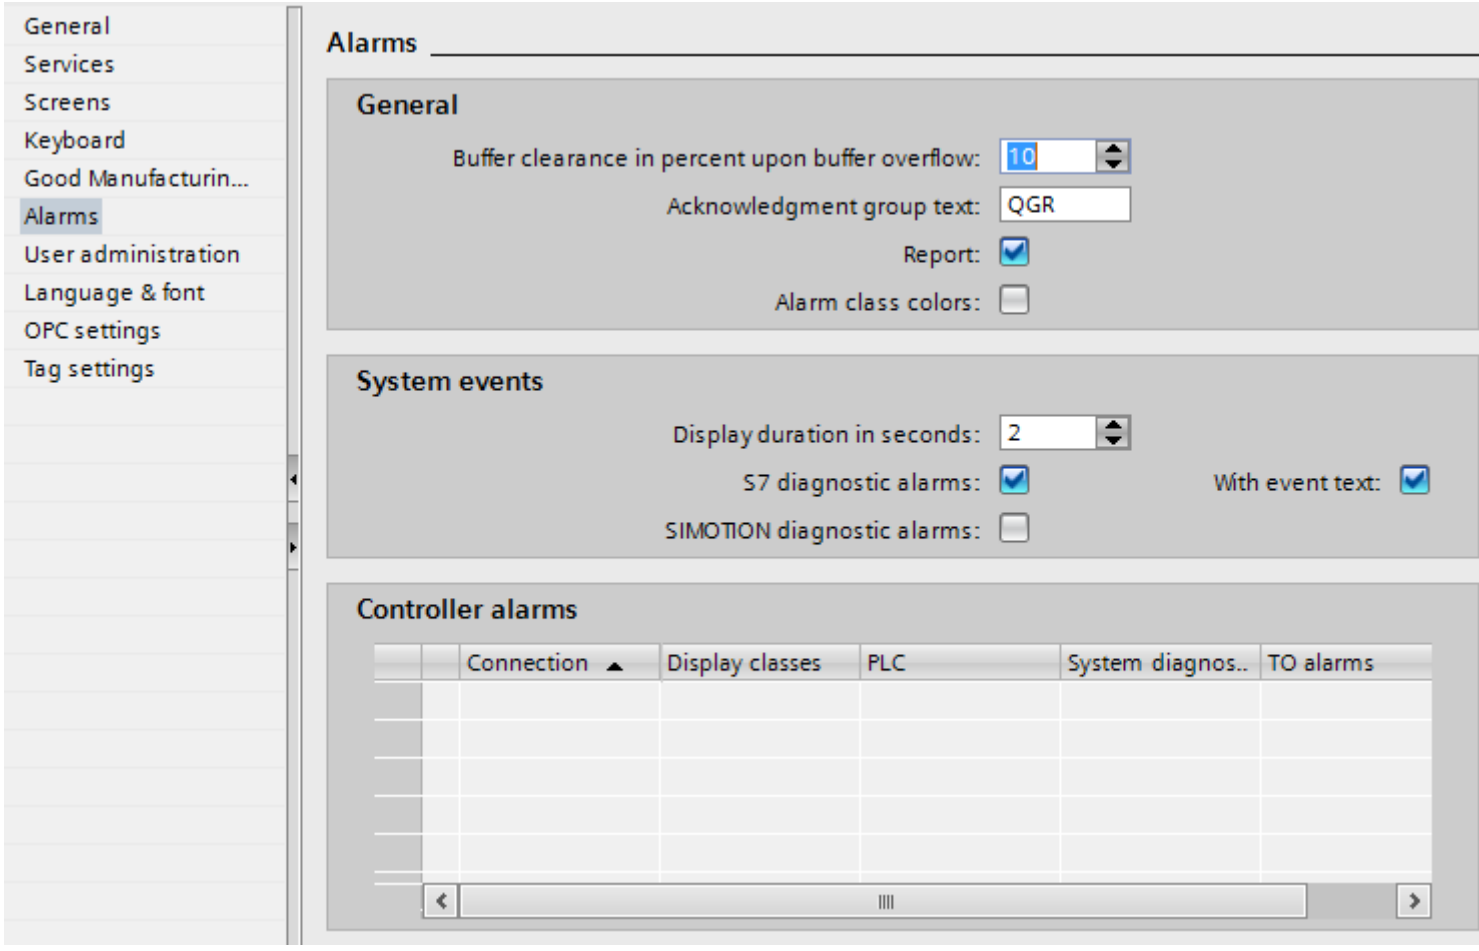
Requirements

- A printer was configured on the HMI device.

Activating continuous alarm reporting

To activate continuous reporting of alarms, follow these steps:

1. Double-click "Runtime settings" in the project navigation.
2. Select "Alarms > General > Report".



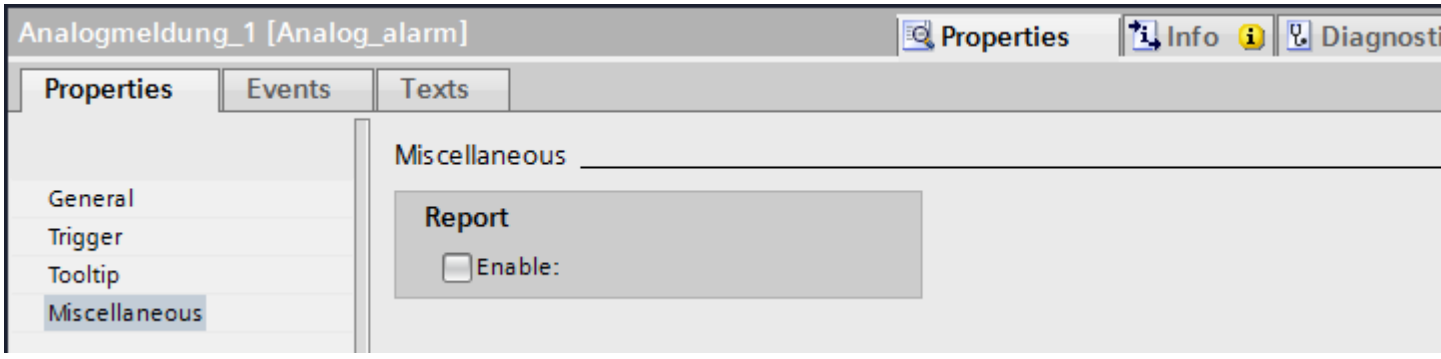
Result

The latest alarms are output at the printer of the HMI device.

Excluding an alarm from reporting

To exclude specific alarms from reporting, proceed as follows:

1. Open the "HMI alarms" editor.
2. Select the alarm to exclude from reporting on the tab of the selected alarm type.
3. In the Inspector window, disable "Properties > Properties > Miscellaneous > Report".



Result

WinCC does not output these alarms currently on the connected printer.

Working with reports (Page 4496)

12.3.2.4 Acknowledging alarms

Configuring alarm acknowledgment by means of alarm class

Introduction

To configure an alarm with alarm acknowledgment, assign it to an alarm class with the "Alarm with single acknowledgment" state machine.

Requirement

- The "HMI alarms" editor is open.
- The required alarm class has been created.
- The required alarm has been created.

Selecting the state machines for an alarm class

The state machine for a predefined alarm class has already been set. You can only set the state machines for user-defined alarm classes. Proceed as follows:

1. In the "HMI alarms" editor, click the "Alarm class" tab and select the alarm class.
2. Select the required acknowledgment model under "Properties > Properties > Acknowledgment" in the Inspector window.

Assign alarms to an alarm class requiring acknowledgment

Proceed as follows to assign an alarm to an alarm class requiring acknowledgment.

1. In the "HMI alarms" editor, click the tab for the alarm type and select the alarm.
2. Under "Properties > Properties > General" in the Inspector window, select the alarm class of the alarm.

Result

The alarm will not disappear in Runtime until it is acknowledged by the operator.

Configuring trigger for alarm acknowledgment

Introduction

You always specify the acknowledgment requirement for an alarm using the alarm class. Then the operator acknowledges the alarm using the "ACK" function key of the HMI device or the "Acknowledgment" button of the alarm view.

The following options are also available to trigger acknowledgment:

- Configuring a button to acknowledge an alarm
- Acknowledgment of a Discrete Alarm by the PLC

Requirements

- The "HMI alarms" editor is open.
- The required alarm class has been created.
- The required alarm has been created.
- An alarm view and a button are created in the "Screens" editor.

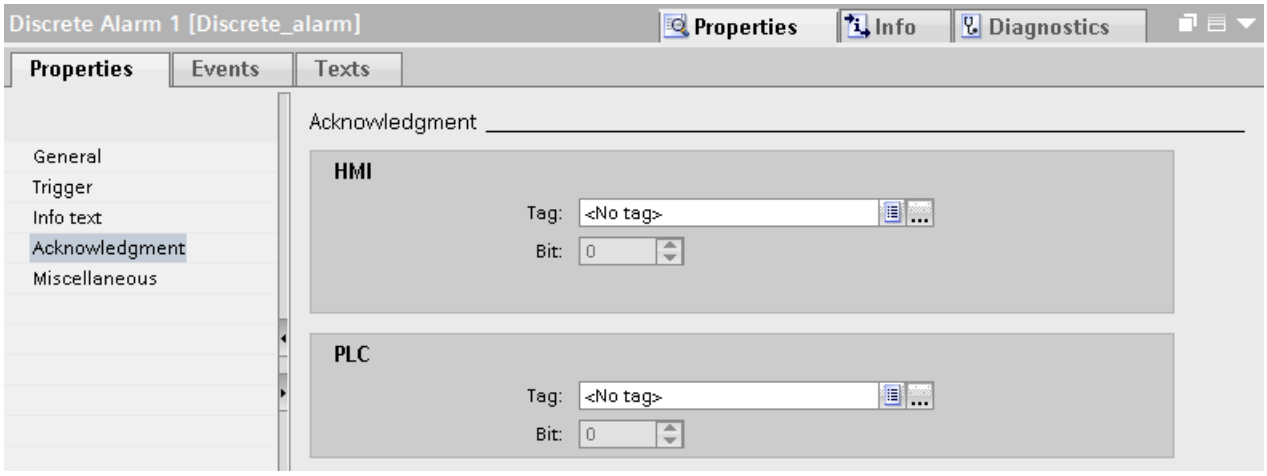
Configuring a button to acknowledge an alarm

To configure a button for acknowledging an alarm, proceed as follows:

1. Select the button in the "Screens" editor.
2. Under "Properties > Events" in the Inspector window, assign the "AlarmViewAcknowledgeAlarm" system function to the "Click" event.
3. Select the alarm view as parameter.

Acknowledgment of a Discrete Alarm by the PLC

1. In the "HMI alarms" editor, click the "Discrete alarm" tab and select the discrete alarm.
2. In the Inspector window, select the tag and the bit that acknowledges the PLC alarm under "Properties > Properties > Acknowledgment > PLC".



Acknowledging alarms in an alarm group

The various acknowledgment options have the following effect in alarm groups:

- Operator acknowledges the alarm
  You acknowledge the alarm of an alarm group, for example, using the <ACK> acknowledgment key or a function key. All alarms of the alarm group are acknowledged.
- The PLC acknowledges the alarm
  The alarm of an alarm group is acknowledged by setting a bit in the tag.
  Only the alarm to be acknowledged is acknowledged.

Sending alarm acknowledgments to the PLC

Requirement

- The "HMI alarms" editor is open.
- The required alarm has been created and assigned to an alarm class requiring acknowledgment.

Note

You cannot send the acknowledgment of analog alarms to the PLC.

Sending alarm acknowledgments to the PLC

To configure that acknowledgment of an alarm is sent to the PLC, follow these steps:

1. In the "HMI alarms" editor, click the "Discrete alarm" tab and select the discrete alarm.
2. In the Inspector window, select "Properties > Properties > Acknowledgment".
3. Under "HMI", select the tag and the bit set by the alarm acknowledgment function.

Note

The HMI device and PLC only have read access to the acknowledgment tag memory area.

Result

If the operator acknowledges the alarm in Runtime, the operating step is forwarded to the PLC.

12.3.2.5 Configuring alarm buffer overflow

Introduction

The size of the alarm buffer depends on the type of HMI device. In WinCC, specify the percentage of the alarm buffer to be deleted on alarm buffer overflow.

Requirements

- You have created a project.

Procedure

To configure the response to an alarm buffer overflow, follow these steps:

1. Double-click "Runtime settings" in the project navigation under your HMI device.
2. Under "Alarms > General > Buffer clearance in percent upon buffer overflow", enter a value between 1 and 100.
   This value specifies the percentage of the alarm buffer that is deleted on alarm buffer overflow.

Result

If data in the alarm buffer exceeds the resources of alarm buffer memory, the configured percentage of data will be deleted from the oldest alarms in the alarm buffer.

Note

You cannot check the alarm buffer overflow separately by alarm method. You can use the "ClearAlarmBuffer" system function to delete specific alarms of specific alarm classes from the alarm buffer.

Alarm Logging Basics (Page 4337)

12.3.3 Logging Alarms

12.3.3.1 Alarm Logging Basics

Introduction

An alarm log is used to record project alarms.

Note

Alarm logging is not available for every HMI device.

Configuration steps

To log an alarm, follow these configuration steps:

1. Creating an alarm log
   You define the following properties for the alarm log:
   - Logging method
     Behavior of the log when reaching a specific fill level
   - Storage location and file format
   - Log size
   - Runtime start characteristics
2. Assigning an alarm log to an alarm class
   You can log the alarms from multiple alarm classes in an alarm log.
3. Assigning an alarm to a loggable alarm class
4. Configure display of logged alarms in an alarm view

Content of the alarm log

All states are logged for configured alarms. The following three entries, for example, are stored in the log for an alarm that requires acknowledgment:

- 04.08.2007 10:00:25:520, analog alarm, ID5, **K**, error, fill level exceeded by 10%
- 04.08.2007 10:01:20:442, analog alarm, ID5, **Q**, error, fill level exceeded by 10%
- 04.08.2007 10:01:30:112, analog alarm, ID5, **G**, error, fill level exceeded by 10%

In the example, the alarm states are identified by the following letters:

K = Incoming

Q = Acknowledged

G = Outgoing

All data belonging to an alarm is stored in the alarm log, including configuration data such as the alarm class, time stamp, and alarm text.

The potential number of logged alarms depends on the data medium used. You can further process the logged alarms in other programs for analysis purposes, for example.

Note

Alarm text and point of error are only logged if you have configured such a setting in the log properties.

Logged alarms that contain alarm text and the point of error exceed the estimated size of the configured alarms. Check to see whether the specified storage location still has sufficient space.

Note

The time stamp of a logged alarm is always specified in standard UTC format (Universal Time Coordinated).

Logging methods

The logging method determines how the alarm log responds when the configured size is reached. WinCC supports the following logging methods:

- Circular log
  When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approximately 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
- Segmented circular log
  In a segmented circular log, multiple single logs of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.
- Log with level-dependent system alarm
  When a defined level is reached, such as 90 %, a system alarm is triggered. When the configured size of the log has been reached, new alarm events are not logged.
- Log with level-dependent execution of system functions
  When the log is completely full, the "Overflow" event is triggered. You configure a function list for the event.
  When the configured size of the log has been reached, new alarm events are not logged.

Displaying logged data

On the HMI device, the logged data is displayed in an alarm view that is configured for this purpose.

Checksums for logs in regulated projects (Page 4348)

Configuring alarm buffer overflow (Page 4336)

12.3.3.2 Creating an alarm log

Introduction

In Runtime, you save alarms to the alarm logs. Specify the alarm log in the alarm class. An alarm log contains the alarms of several alarm classes. Create the alarm log in the "Logs" editor. When creating an alarm log, define the following parameters:

- Name
- Size
- Storage location
- Runtime start characteristics
- Log type
- Advanced content
- Checksum

You can also enter comments for each log.

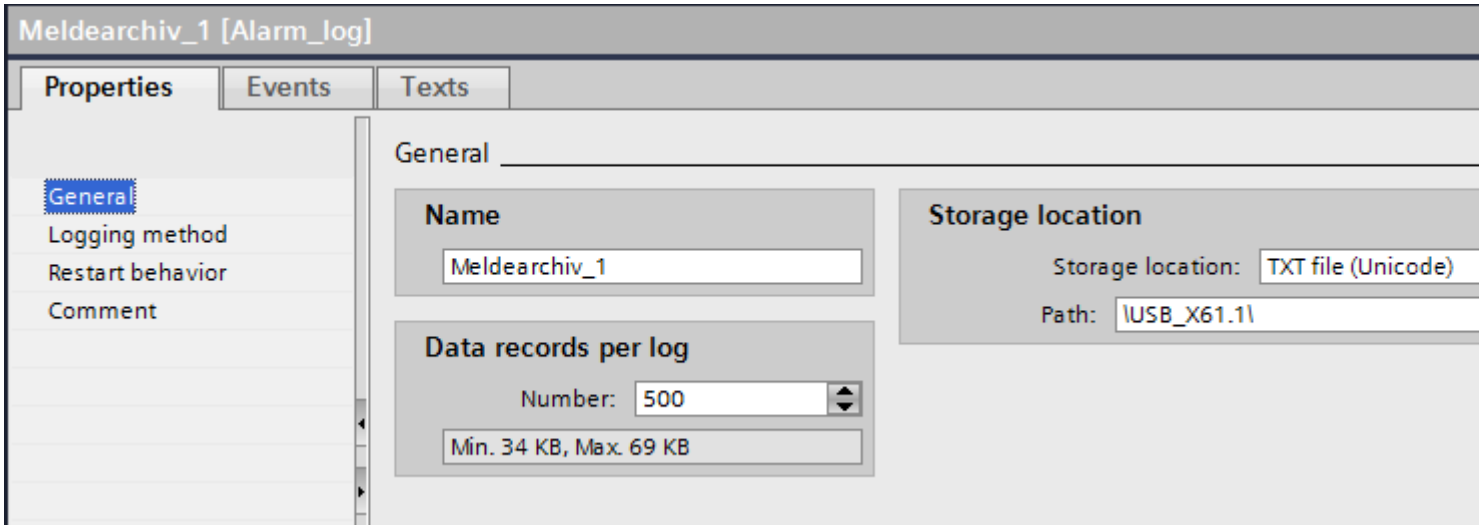
Requirement

- The "Alarm log" tab is open in the "Log" editor.
- The Inspector window is open.

Procedure

To create an alarm log, proceed as follows:

1. Double-click "<Add>" in the table.
   A new alarm log is created.
2. Under "Properties > Properties > General" in the Inspector window, enter a unique name for the alarm log.



3. Under "Number of data records per log", define the number of alarms to be saved to a log file.
   The approximate space required on the storage medium is displayed. Memory space requirements will increase accordingly if you log alarm texts with tag values.
4. In the "Storage location" field you select where the log entries are saved.
5. Depending on the selected "Storage location", you either select the "Path" or the "Name of the data source".

6. To determine if audit trail data were changed at a later time, activate "Properties > Properties > General > Checksum".

   Note
   Device dependency

   The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

7. If necessary, enter a descriptive text in the "Comment" category to document your configuration.

Result

The alarm log is created. You can assign one or several alarm classes to this alarm log.

See also

Managing logging behavior when Runtime starts (Page 4349)

Controlling the Logging in relation to the Fill Level (Page 4350)

12.3.3.3 Logging Alarms

Overview

To log alarms, follow these steps:

- Create an alarm log.
- Assign the created alarm log to an alarm class.
- Assign the alarm class with the created alarm log to an alarm.
- In the Runtime settings specify the language in which you want to write the logs.
- You evaluate logged alarms.
  You can analyze the logged alarms directly in your WinCC project, such as in an alarm view, or in another user program, such as Microsoft Excel.

  Note
  Tag fields in the alarm text

  The sequence of tag fields in the alarm text is language dependent. The sequence of the Runtime language is used for logging alarms to a "*.csv" log file.

  Changing the tag of an output field in one language causes the modified output field to appear at the end of the alarm text in all other languages. This means the sequence of the output fields in the log file can change.

Requirements

- You have created an alarm log.
- The "HMI alarms" editor is open.

Assigning an alarm log to an alarm class

To assign the alarm log to an alarm class, proceed as follows:

1. Open the "Alarm classes" tab in the "HMI alarms" editor.
2. Select the required alarm class.
3. Under "Properties > Properties > General > Log" in the Inspector window, select the alarm log.

Assign alarm to an alarm class

To assign an alarm to the alarm class, proceed as follows:

1. In the "HMI alarms" editor, open the "Analog alarms" tab, or the "Discrete alarms" tab.
2. Select the required alarm.
3. Under "Properties > Properties > General > Alarm class" in the Inspection window, select the alarm class for which the alarm log was configured.

Result

The alarm is saved to the configured alarm log.

12.3.3.4 Configuring an alarm view for logged alarms

Introduction

In Runtime, logged alarms are displayed in an alarm view or alarm window.

Requirements

- An alarm view or alarm window is configured in the "Screens" editor
- An alarm log was created in the "Log" editor.
- The alarms are assigned the "loggable" attribute in the "HMI alarms" editor.

Configuring an alarm view for logged alarms

To configure an alarm view for logged alarms, proceed as follows:

1. Open the screen with the alarm view and select the alarm view.
2. In the Inspector window, select "Properties > Properties > General > Alarm log".

3. Click the "...." button and select the alarm log.
4. Continue to configure the alarm view as for the display of current alarms.

Result

In Runtime, the logged alarms are output in the alarm view.

12.3.3.5 Direct access to the ODBC log database

Overview

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database to be used in WinCC as follows:

Select the database from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

In your configuration, specify the "Data source name" (DSN) instead of a directory name as storage path for log data. With the DSN, you are referencing the database and the storage location.

The entire functional scope of the database is available for additional processing and evaluation of log data.

Application

The data source sets up the connection to the database. Create the data source on the same PC on which the Runtime software is stored. Then enter the DSN configured on this PC when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

In addition, you can use the "StartProgram" system function to configure program calls, e.g. MS Access, on the HMI device. Runtime is not interrupted while you configure such calls.

12.3.3.6 Setting up the ODBC data source

Introduction

To store process values or alarms in the log database in Runtime, set up the ODBC data source.

Requirement

- A log database has been created.
  You create the log database using the SQL Enterprise Manager. You can find more detailed information on how to do this from Microsoft.

Procedure

To set up an ODBC data source, follow these steps:

1. In Control Panel, open "Administrative Tools" and select "Data Sources (ODBC)". The "ODBC Data Source Administrator" dialog is opened.
2. Click "User DSN > Add".
3. Select the "SQL-Server and click on "Finish".
4. In the dialog that follows, enter a name for the User DSN and the SQL-Server and click on "Next".
5. In the dialog that follows, define the logon procedure for the SQL database and click on "Next".
6. Activate "Change the default database to".
7. Select the database you have created and click on "Next".
8. In the dialog that follows, click "Finish".

12.3.3.7 Configuring a checksum for a log

Introduction

In a regulated project, you have the option of assigning a checksum to the log data of an data log or alarm log. This checksum can be used during plant operation to determine if the data of this log has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

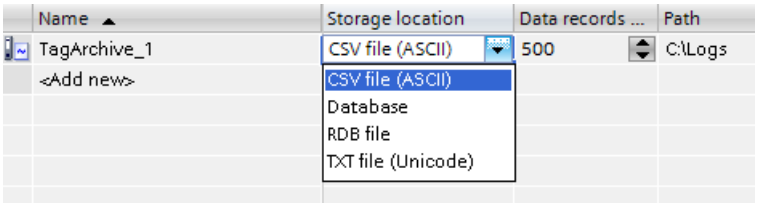
Requirement

- GMP compliant configuration is enabled.
- A data log or alarm log has been created.

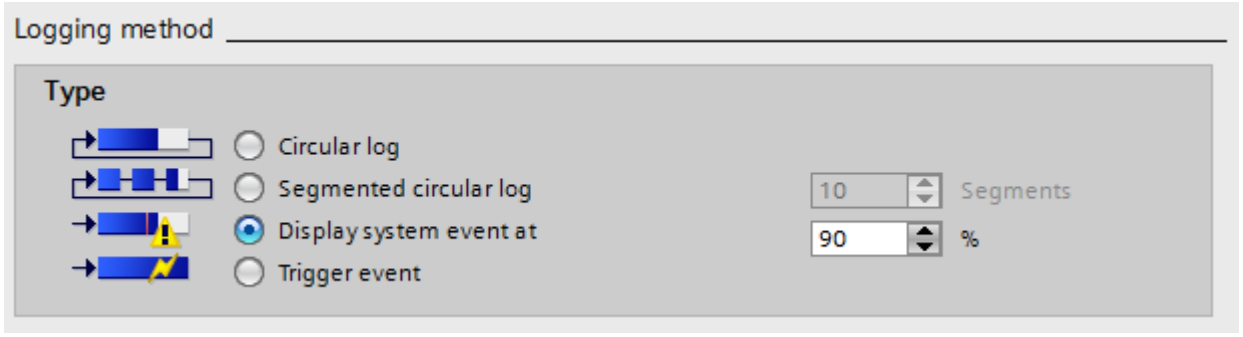
Procedure

Proceed as follows to configure a data log or alarm log for the use of a checksum:

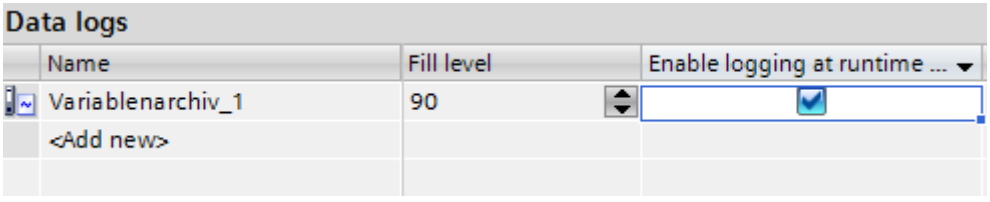
1. Open the data log or alarm log in the corresponding log editor.
2. In the "Storage location" box, select "File - CSV (ASCII)" or "File - TXT (Unicode)".



3. Under "Properties > Properties > Logging method" in the Inspector window , select the option "Display system event at" or "Trigger event".



4. In the editor table, activate the option "Enable logging at runtime start".
   Columns that are not displayed are activated with the shortcut menu of the column title.



5. Save the project.

Result

The log data of the log is assigned a checksum in runtime.

See also

GMP-compliant configuration (Page 7043)

Enabling GMP compliant configuration (Page 7046)

Checksums for logs in regulated projects (Page 4348)

12.3.3.8 Evaluating the checksum of log data

Introduction

If you have configured a data log or alarm log with generation of a checksum, you can check if the log data has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

The DOS program "HmiCheckLogIntegrity" is available for checking the integrity of the log data.

The "HmiCheckLogIntegrity" program supports verification of the following files:

- Log files of alarm logs, data logs, and Audit in CSV format
- Log files of alarm logs, data logs, and Audit in TXT format
- Recipe data records in CSV format
- Recipe data records in TXT format

You can find the "HmiCheckLogIntegrity.exe" program in the installation directory of WinCC under the folder "WinCC Runtime Advanced", for example <C:\Program Files\Siemens \Automation WinCC Runtime Advanced>.

Note

Audit Trail and Log with Checksum

Before you update WinCC with a Service Pack or a new version, exit and save the Audit Trail or the logs using checksum. After WinCC is updated, the audit trail or logs will be continued with new files using checksum.

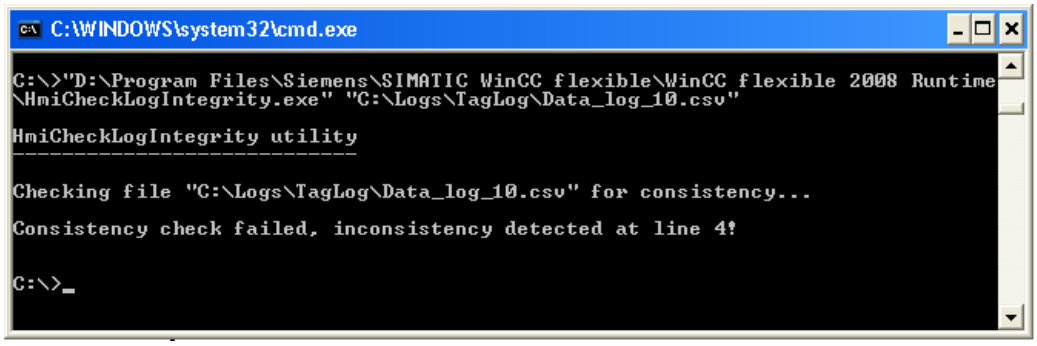
Make sure that the logs are started at a defined state with the new version.

Procedure

1. Copy the file to be checked from the HMI device to your configuration computer.
2. Open a command line prompt with "Start > Programs > Accessories > Command Prompt".
3. Enter the path to "HmiCheckLogIntegrity.exe" followed by a space in the command line prompt. After the space, enter the storage location of the file to be checked within quotation marks.

4. Press <Enter>.
5. The check is performed.
   When the checked data are consistent, the "Consistency check succeeded" message appears.

   When the checked data are inconsistent, the "Consistency check failed" message appears. Information about the first inconsistent line in the file is also displayed.



Note

If there are spaces in the path to the "HmiCheckLogIntegrity.exe" program, you need to specify the path in quotation marks.

You can also check the integrity of the log data with the AuditViewer.

See also

Enabling GMP compliant configuration (Page 7046)

Evaluating Audit Trails in AuditViewer (Page 7063)

Checksums for logs in regulated projects (Page 4348)

12.3.3.9 Checksums for logs in regulated projects

Checksums in regulated projects

With WinCC you configure regulated projects as required by FDA guidelines, if necessary. Use the "Audit" option to create regulated projects.

In regulated projects you supply a checksum for the logged data of an alarm log. The operator will use this checksum during operation of the plant to see if the data of an alarm log have been changed.

For the checksum to be clear, it starts with the first line of an alarm log and integrates the previous lines when continuously generating the checksum. This means a checksum can only be generated for the following logs:

- Log that sends a system alarm when it is full
- Log with execution of system functions when log is full.

Generation of a checksum is also available for alarm logs that are saved as files of the "*.csv" or "*.txt" (Unicode) format.

If you want to continue an existing log without checksum as one with checksum, a backup copy of the existing log is created in the "*.keep" file format. A new log with checksums is created.

To maintain the validity of checksums, the following limitations apply when using the system function "CopyLog":

- You cannot copy a log without checksums into a log with checksums.
- You cannot copy a log with checksums into a log without checksums.

See also

Alarm Logging Basics (Page 4337)

Configuring a checksum for a log (Page 4344)

Evaluating the checksum of log data (Page 4346)

12.3.3.10 Log response to language switching in runtime

Introduction

In the Runtime settings of your HMI device, select the language to be used for writing to logs in runtime.

Requirement

- The languages used in your project are activated in the "Project languages" editor, for example, "German (Germany)" and "English (USA)" .

Procedure

To determine the startup language, follow these steps:

1. Select "Runtime settings > Language and fonts" in the project navigation.
2. Activate the runtime language, for example, "German (Germany)" and "English (USA)".
3. Set the "Language switch order". Use 0 to determine the startup language, for example:
   - German 0.
   - English 1
     With "0", German is specified as the "Startup language".
4. Select "Runtime settings > General" in the project navigation.
5. Select the "Logs > Logging language > Startup language".

Result

The project starts after it is transferred. German is specified as the "Startup language" with "Language switch order". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

The operator closes runtime. Due to the previously performed language switch, the next time the system starts the "startup language" is English. Since English is the startup language, the logs are now written in English.

The logging language remains English even when the language is switched again in runtime until runtime is closed once again.

If you use another option instead of "Startup language" to select the language, the logs are always written in the same language. This is true regardless of the language selected by the operator in runtime.

12.3.3.11 Managing logging behavior when Runtime starts

Introduction

When you configure a log, you define the restart characteristics of the log when Runtime is started. You define whether the logging should start when Runtime starts in the log properties. You can also define whether an existing log will be continued or overwritten.

You define the restart characteristics separately for each log.

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

To configure the restart characteristics of a data log, proceed as follows:

1. Select the log for which you want to define the restart characteristics in the "Historical Data" editor.
2. In the Inspector window select "Properties > Properties > Restart behavior".
3. If you want logging to start when Runtime starts, enable the "Enable logging at runtime start" option in the "Logging" area.
   You can also start logging in Runtime using the "StartLogging" system function, for example.
4. Select the restart behavior of the log in the "Log handling at restart" area.
   - The logged values are deleted and logging is started again with the option "Reset log".
   - The option "Append data to existing log" is used to append the values to be logged to the existing log.

Alternatively you can configure the restart characteristics of a log directly in the "Historical Data" editor. To view hidden columns, activate the column titles using the shortcut menu.

Result

Logging will start in runtime according to your settings.

12.3.3.12 Controlling the Logging in relation to the Fill Level

Introduction

The size of a log is determined by the number of entries. You use the logging method to determine how the log responds when it is full.

Logging methods

The following logging methods are available:

-  Circular log
  When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approximately 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
-  Segmented circular log
  In a segmented circular log, multiple log segments of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.

-  Log that sends a system alarm when it is full
  When a defined level is reached, such as 90 %, a system alarm is triggered. When the log is 100% full, new tag values are not logged.
-  Log with level-dependent triggering of an event.
  When the log is completely full, the "Overflow" event is triggered. Configure a function list for the event that will be carried out when the "Overflow" event occurs. When the configured size of the log is reached, new tag values are not logged.
  The following system functions are available for further processing of full logs: For further details, refer to Auto-Hotspot.

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

1. Select the log for which you want to define the logging method in the "Historical Data" editor.
2. Select "Properties > Properties > Logging method" in the Inspector window and select the required logging method.
3. If you have selected the "Segmented circular log" type, enter the number of log segments.
   If you selected a log with the "Display system alarm on" setting, specify the level as a percentage at which a system alarm is to be triggered.
   If you selected the "Trigger event" setting, configure the function list in the "Events" group.

Alternatively you can configure the logging method directly in the "Historical Data" editor table. To view hidden columns, activate the column titles using the shortcut menu.

The "Overflow" event is not available in the editor table. You must therefore configure the function list in the Inspector window.

Result

The selected log responds according to the settings in Runtime.

12.3.4 Using Alarms in Runtime

12.3.4.1 Alarms in Runtime

Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge
- Loop-in-alarm

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Location of fault
- Status
- Alarm class
- Alarm number
- Alarm group

Alarm classes

Alarms are assigned to various alarm classes.

- "Warnings"
  Alarms of this class usually indicate states of a plant such as "Motor switched on". Alarms in this class do not require acknowledgement.
- "Errors"
  Alarms in this class must always be acknowledged. Error alarms normally indicate critical errors within the plant such as "Motor temperature too high".
- "System"
  System alarms indicate states or events which occur on the HMI device.
  System alarms provide information on occurrences such as operator errors or communication faults.
- Custom alarm classes
  The properties of this alarm class must be defined in the configuration.

Alarm buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

Alarm view

The alarm view shows selected alarms or alarm events from the alarm buffer. Whether alarm events have to be acknowledged or not is specified in your configuration.

Alarm window

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active.

You can configure the order in which the alarms are displayed. You can choose to display the alarms in ascending or descending order of their occurrence. The alarm window can also be set to indicate the exact location of the fault, including the date and time of the alarm event. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string will be shown.

Alarm indicator

The alarm indicator is a graphic symbol that is displayed on the screen when an alarm of the specified alarm class is activated.

The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

12.3.4.2 Alarms in Runtime

Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Location of fault
- Status
- Alarm class
- Alarm number
- Alarm group

Alarm classes

Alarms are assigned to various alarm classes.

- "Warnings"
  Alarms of this class usually indicate states of a plant such as "Motor switched on". Alarms in this alarm class do not require acknowledgment.
- "Errors"
  Alarms in this class must always be acknowledged. Error alarms normally indicate critical errors within the plant such as "Motor temperature too high".
- "System"
  System alarms indicate states or events which occur on the HMI device.
  System alarms provide information on occurrences such as operator errors or communication faults.
- "Diagnosis Events"
  SIMATIC diagnostic alarms show states and events in the SIMATIC S7 controller.
- "Safety Warnings"
  The "Safety Warnings" alarm class shows alarms for fail-safe operation. Users do not acknowledge alarms from this alarm class.
- STEP 7 alarm classes
  The alarm classes configured in STEP 7 are also available to the HMI device.
- Custom alarm classes
  The properties of this alarm class are defined in the configuration.

Alarm buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

Alarm report

When alarm logging is enabled in the project, alarms are output directly to the printer.

You can set the logging function separately for each alarm. Printing of such an alarm is initiated when the "incoming" and "outgoing" alarm events are generated.

The output of alarms of the "System" alarm class to a printer must be initiated by means of the corresponding alarm buffer. This outputs the content of the alarm buffer to the printer. To be able to initiate this print function, you need to configure an operating element in the project.

Alarm log

Alarm events are stored in an alarm log, provided this log file is configured. The capacity of the log file is limited by the storage medium and system limits.

Alarm view

The alarm view shows selected alarms or events from the alarm buffer or alarm log. Whether alarm events have to be acknowledged or not is specified in your configuration. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string in their alarm text are shown.

Alarm window

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged.

You can configure the order in which the alarms are displayed. At the first position, the current, or the oldest alarm will be displayed. The alarm window can also be set to indicate the exact location of the fault, including the date and time of the alarm event. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string in their alarm text are shown.

Alarm indicator

The alarm indicator is a graphic symbol that is displayed on the screen when an alarm of the specified alarm class is activated.

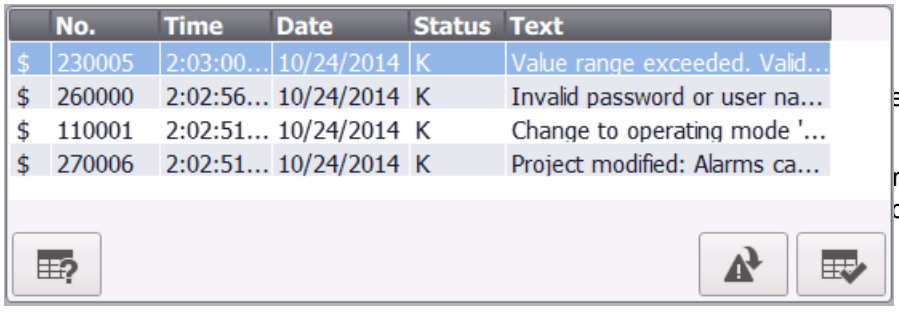
The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

12.3.4.3 Using the Alarm Window or Alarm View

Alarm window, alarm view in Runtime

Application



evice. The layout

ration the alarm

ctive. Depending

Layout

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed. If a filter is configured, only alarms that contain a specific string in the alarm text will be displayed.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Symbol	Alarm class
!	"Errors"
Empty	"Warnings"
depends on the configuration	Custom alarm classes
$	"System"
S7	"Diagnosis Event"
!!	"Safety Warnings"

Operation

You use the alarm view as follows, depending on how it is configured:

- Change the order of the columns.
- Change the order in which the alarms are displayed.
- Acknowledging alarms
- Editing alarms

Operator controls

The buttons have the following functions:

Button	Function
	Displaying a tooltip for an alarm
	Loop-In-Alarm Changes to the screen that contains information about the error event
	Acknowledge alarm

Operation behavior

Linked alarm window for touch panels

When configuring the alarm window for keyboard units, enable the "Connected" (modal) property under "Properties > Mode". This ensures that the alarm window does not defocus during screen changes. Switching back and forth between the screen and different windows with <Ctrl+TAB> is not supported. If the linked alarm window has the focus, then the buttons

in the screen behind it cannot be operated. The functions configured on a function key are carried out.

Changing the order of the displayed alarms

When you click on the column, first of all alarms requiring acknowledgment are sorted according to date and time. Then those alarms that do not require acknowledgment are sorted according to date and time.

Using the Alarm Window, Alarm View

Introduction

As an alternative to using the mouse, you can operate the alarm view and the alarm window using the <TAB> key on your HMI device. This allows you to select the button and the most recently selected alarm in the alarm view. Depending on the configuration, you can also operate the alarm view via the function keys.

Operation using the mouse

1. Select the alarm to be edited.
2. Click the button whose function you want to run.

Operation using the keyboard

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the button whose function you wish to use is selected.
4. Press <Enter>.

Change the order of the columns

1. Select the column header, such as the "Date" column header.
2. While holding down the mouse button, drag the column header to the column header "Time". The "Date" column is in front of the "Time" column.

Change the sorting

You can sort the list according to date or time.

1. Click on the corresponding column header.
   The list is sorted in descending or ascending order according to this criterion.
2. Click the same column header again to reverse the sort order.

Acknowledge alarm

1. Click on the alarm to be edited.
2. Click the  button.

Loop-In-Alarm trigger

1. Click on the alarm to be edited.
2. Click the  button.
   The screen containing information about the alarm is displayed.

Note

If you trigger a Loop-In-Alarm during an unacknowledged alarm, it is acknowledged automatically.

Displaying configured tooltip

1. Click on the alarm concerned.
2. Click the  button.
   The tooltip configured for the alarm is displayed.

12.3.4.4 Using the Simple Alarm Window, Alarm View

Basic alarm view, alarm window in Runtime

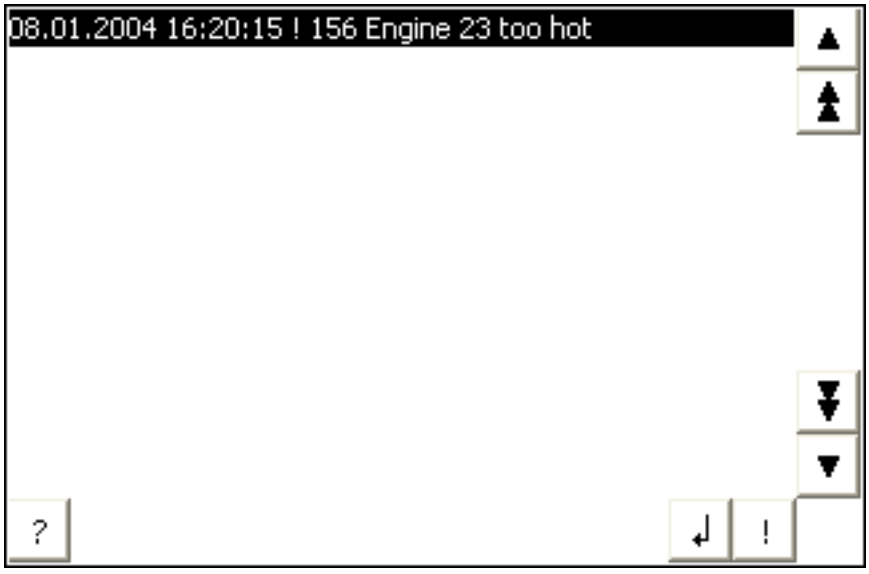
Application

The simple alarm view shows selected alarms or alarm events from the alarm buffer. The layout and operation of the simple alarm window correspond to that of the simple alarm view.

Note

The "Single alarm view" object is not assigned dynamic functions by means of scripting.

In the Engineering System, for example, dynamize the visibility of an object in the "Animations" tab of the Inspector window. In Runtime, the "Simple alarm view" does not support animations. If you configured an animation and, for example, run a consistency check on the project, an error alarm is displayed in the output window.



Layout

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Icon	Alarm class
!	"Errors"
empty	"Warnings"
depends on the configuration	Custom alarm classes
$	"System"

Operation

You use the alarm view as follows, depending on how it is configured:

- Acknowledging alarms
- Editing alarms

Control elements

The buttons have the following functions:

Button	Function
!	Acknowledge alarm
↲	Loop-In-Alarm Changes to the screen that contains information about the error event

Button	Function
?	Displaying a tooltip for an alarm
▶	Displays the full text of the selected alarm in a separate window, namely the alarm text window In the alarm text window, you can view alarm texts that exceed the space available in the Alarm view. Close the alarm text window with the ✕ button.
▲	Scrolls one alarm up.
⏫	Scrolls one page up in the alarm view.
⏬	Scrolls one page down in the alarm view.
▼	Scrolls one alarm down.

Format of the control elements

The display of the buttons for using the simple alarm view depends on the configured size. You should therefore check on the HMI device whether all the required buttons are available.

Basic alarm view, using the alarm window

Introduction

As an alternative to using the mouse, you can operate the simple alarm view using the <TAB> key on your HMI device. This allows you to select the button and the most recently selected alarm in the alarm view. Depending on the configuration, you can also operate the alarm view via the function keys.

Operation using the mouse

1. Select the alarm to be edited.
2. Click the button whose function you want to run.

Operation using the keyboard

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the button whose function you wish to use is selected.
4. Press <Enter>.

Acknowledge alarm

1. Select the alarm to be acknowledged.
2. Click the ! button.

Loop-In-Alarm trigger

1. Select the alarm to be edited.
2. Click the ↲ button.
   The screen containing information about the alarm is displayed.

Calling the infotext

1. Select the alarm to be edited.
2. Click the ? button.
3. To close the window for displaying the operator note, press the × button or use the key combination <Alt+F4>.

12.3.4.5 Using the Alarm Indicator

Alarm indicator in Runtime

Application

The alarm indicator is displayed if alarms of the specified alarm class are pending or require acknowledgment.

Layout

The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

Operation

Depending on the configuration, when operating the alarm indicator an alarm window is opened. The icons from the symbol library can only be operated with a mouse or touch screen.

Note

Device dependency

Operation with mouse is not available for all HMI devices.

Operating the alarm indicator using the mouse

Operation using the mouse

1. Click on the alarm indicator with the mouse pointer. Depending on the configuration, the Alarm window is open.
2. Click  to close the alarm window. The Alarm window can be opened again by clicking on the alarm indicator.

12.3.4.6 Acknowledging alarms

Introduction

You can acknowledge alarms in Runtime according to your project configuration settings. You can acknowledge alarms as follows:

- Using the display and control object buttons
- Using the "ACK" key on your HMI device
- Using individually-configured function keys or buttons

If an operator authorization is configured for an individual control, the alarms can only be acknowledged by authorized users.

To automatically acknowledge alarms in Runtime, use the system functions and scripts, plus the "Acknowledgment by the PLC" option.

Note

Device dependency

Scripts are not available for all HMI devices.

Acknowledgment variants

You acknowledge individual alarms or multiple alarms together in Runtime. They are distinguished as follows:

- Single acknowledgment
  Acknowledgment of an alarm using a button or a function key.
- Acknowledge alarm groups
  Acknowledgment of all the alarms of an alarm group using a button or a function key.

Requirement

- An alarm is displayed on the HMI device.

Procedure

To acknowledge an alarm, proceed as follows:

1. Select the alarm.
2. If you are using an alarm view or an alarm window, click the  button.
3. If you are using a simple alarm view or a simple alarm window, click the  button.
4. Press the "ACK" button on your HMI device to acknowledge an alarm in an alarm line.

Note

Device dependency

The extended alarm view or alarm window and the alarm line are not available for all HMI devices.

Result

The alarm status changes to "Acknowledged". If the condition for triggering an alarm no longer applies, the alarm status also changes to "Outgoing", and it is no longer displayed on the HMI device.

12.3.4.7 Filtering Alarms

Introduction

The alarm view in Runtime does not contain a control element for entering filter criteria. To provide this functionality, configure an I/O field using the "Screens" editor.

Requirements

- A filter has been configured for the alarm view.
- An I/O field for entering the criterion is displayed.
- Alarms are displayed in Runtime.

Enable filter

1. Enter the filter string in the I/O field.
2. Confirm your input.
   The alarm view displays only those alarms that are contained in the specified character string. Thereby this distinguishes between upper and lower case letters.

Disable filter

1. Delete the string from the I/O field that is used to filter the alarm view.
2. Confirm your input.
   All alarms are displayed in the alarm view once more.

12.3.5 Reference

12.3.5.1 System functions for alarms

System functions

System functions are predefined functions you can use to implement many tasks in runtime, even with no programming knowledge. You use system functions in a function list or in a script.

Note
Device dependency

Scripts are not available for all HMI devices.

The table shows all the system functions available for displaying and editing alarms.

System function	Effect
EditAlarm	Triggers the Loop-In-Alarm event for all selected alarms.
ClearAlarmBuffer	Deletes alarms from the alarm buffer on the HMI device.
ClearAlarmBufferProtoolLegacy	Function such as "ClearAlarmBuffer". This system function has been retained to ensure compatibility and uses the old ProTool numbering.
AlarmViewUpdate	Updates the alarm view.
AlarmViewEditAlarm	Triggers the event Loop-In-Alarm for all alarms selected in the specified alarm view.
AlarmViewAcknowledgeAlarm	Acknowledges the alarms that are selected in the specified alarm view.
AlarmViewShowOperatorNotes	Displays the configured tooltip for the alarm selected in the specified alarm view.
AcknowledgeAlarm	Acknowledges all selected alarms.
SetAlarmReportMode	Switches the automatic reporting of alarms on the printer on or off.
ShowAlarmWindow	Hides or shows the alarm window on the HMI device.
ShowSystemEvent	Displays the value of the delivered parameter as a system event on the HMI device.

Note

Device dependency

The following system functions are not available for all HMI devices:

- SetAlarmReportMode
- AlarmViewUpdate
- ShowSystemEvent

12.3.5.2 Alarm events

Alarm events and their display and control objects

In Runtime, the following alarm events are triggered by their display and control objects. You can configure a function list for every event.

Object	Configurable events
Alarms	Incoming Outgoing Acknowledge Loop-In-Alarm
Alarm view	Enabling Disable Selection changed
Alarm indicator	Click Click when flashing

Note

Device dependency

The following events in the alarm view are not available for all HMI devices:

- Enabling
- Disable
- Selection changed
- Click
- Click when flashing

12.3.5.3 System functions for logs

System functions

The following system functions are available for logging:

Function name	Function method
ArchiveLogFile	This function moves or copies a log to another storage location for long-term archiving. Use the system function, for example, to move the audit trail from a local storage medium to the server. When handling audit trails, always use the "Move log (hmiMove)" mode in order to avoid noncompliance with FDA guidelines as a result of redundant data storage.
LogTag	Saves the value of the given tags in the given data log. Use the system function to log a process values at a specific time.
StartLogging	Starts the logging process in the specified log. You can interrupt logging in Runtime by calling the "StopLogging" system function.
StopLogging	Stops the logging process in the specified log. To resume logging in Runtime, select the "StartLogging" system function.
ClearLog	Deletes all entries in the specified log.
StartNextLog	Stops the logging process in the specified log. Logging is continued in the sequential log that has been configured for the specified log file.
CloseAllLogs	Closes all logs. The connection between WinCC and the log files or log database is terminated. You can use this system function, for example, to enable hot-swapping of the storage medium on the HMI device without exiting the Runtime software.
OpenAllLogs	Opens all logs to resume logging. The connection between WinCC and the log files or log database is recovered.
CopyLog	Copies the contents of the specified log to another log.

12.3.5.4 Structure of *.csv files that contain alarms

Introduction

You can save an alarm log as a file in "*.csv" format. CSV stands for **C**omma **S**eparated **V**alue. In this format, the table columns that contain the names and the value of the entry are separated by semicolons. Each table row terminates with a line break.

Example of a log file in *.csv format

This example shows a file with logged alarms:

"Time_ms";"MsgProc";"StateAfter";"MsgClass";"MsgNumber";"Var1";...;"Var8";"TimeString";"MsgText";"PLC"37986550590,27;1;1;3;110001;"";...;"";"30.06.99 13:12:51";"Change to operating mode 'online'";37986550682,87;1;1;3;140010;"";...;"";"30.06.99 13:12:59";"Connection established: PLC_1, Station 2, Rack 0, Position 2";

Structure of a log file in *.csv format

The following values are entered in the log file columns:

Parameters	Description
Time_ms	Specify a time stamp as a decimal value (see below for conversion)
Msg_Proc	Alarm procedures: 0 = Unknown alarm procedure 1 = System event 2 = Alarm bit procedure (operating alarms) 3 = Alarm number procedure ALARM_S 4 = Diagnostic event 7 = Analog alarm procedure 100 = Alarm bit procedure (fault alarms)
State after	Alarm event: 0 = Incoming/Outgoing 1 = Incoming 2 = Incoming/Acknowledged/Outgoing 3 = Incoming/Acknowledged 4 = All alarms in the PLC were deleted with SFC106 or after PLC STOP/RUN an alarm is pending 6 = Incoming/Outgoing/Acknowledged
Msg_Class	Alarm class: 0 = No alarm class 1 = "Errors" 2 = "Warnings" 3 = "System" 4 = "Diagnostic Events" 64 ... = user-configured alarm classes
Msg Number	Alarm number
Var1 to Var8	Value of the trigger tag as a STRING
Time string	Time stamp, as STRING in legible data format
Msg text	Alarm in a readable STRING
PLC	Alarm localization (relevant PLC)

Conversion of the time stamp decimal value

To further process the time stamp value using a different program, proceed as follows:

1. Divide Time_ms by 1,000,000.
   Example: 37986476928 : 1,000,000 = 37986.476928
2. The whole number portion (37986) is the date calculated from 12/31/1899.
   In Excel you can now convert the time stamp into days. To do this, assign to the cell that contains the time stamp, a respective format form the "Date" group.
   Result: 37986 results in 12/31/2003
3. The value after the point (0.476928) indicates the time:
   - Multiply the value (0.476928) by 24 to obtain the hours (11.446272).
   - Multiply the remainder (0.446272) by 60 results in the minutes (26.77632).
   - Multiply the remainder (0.77632) by 60 results in the seconds (46.5792).

   Result 11:26:46.579
   This conversion is supported by Microsoft Excel, for example.

12.3.5.5 System events

Basics on system events

System events

System events on the HMI device provide information about internal states of the HMI device and PLC.

The following overview illustrates when a system event occurs and how to eliminate the cause of error.

Note

HMI device dependency

Some of the system events described in this section apply to the individual HMI devices based on their scope of functions.

Note

System events are output in an alarm view. System events are output in the language currently set on your HMI device.

System event parameters

System events may contain encrypted parameters. The parameters are of relevance when troubleshooting because they provide a reference to the source code of the Runtime software. These parameters are output after the "Error code:" text.

10000 - Printer alarms

Meaning of the system alarms

All system alarms that can be displayed are listed below.

Table 12-2 10000 - Printer alarms

Number	Effect/cause	Remedy
10000	The print job could not be started or was canceled due to an unknown error. Faulty printer setup. Or: No authorization is available for accessing the network printer. Power supply failure during data transfer.	Check the printer settings, cable connections and the power supply. Set up the printer once again. Obtain a network printer authorization. If the error persists, contact the Hotline!
10001	No printer is installed or a default printer has not been set up.	Install a printer and/or select it as the default printer.
10002	Overflow of the graphics buffer for printing. Up to two graphics are buffered.	Allow sufficient intervals between successive print jobs.
10003	Graphics can now be buffered again.	--
10004	Overflow of the buffer for printing lines in text mode (e.g. alarms). Up to 1000 lines are buffered.	Allow sufficient intervals between successive print jobs.
10005	Text lines can now be buffered again.	--
10006	The Windows printing system reports an error. Refer to the output text and the error ID to determine the possible causes. Nothing is printed or the print is faulty.	Repeat the action if necessary.

20000 - Global script alarms

Meaning of the system events

All system events that can be displayed are listed below. The system events are divided into different ranges.

Table 12-3 20000 - Global script alarms

Number	Effect/causes	Remedy
20010	An error has occurred in the specified script line. Execution of the script was therefore aborted. Note the system event that may have occurred prior to this.	Select the specified script line in the configuration. Ensure that the tags used are of the allowed types. For system functions, verify the correct number of parameters and the parameter types.
20011	An error has occurred in a script that was called by the specified script. Execution of the script was therefore aborted in the called script. Note the system event that may have occurred prior to this.	In the configuration, select the script that has been called directly or indirectly by the specified script. Ensure that the tags used are of the allowed types. For system functions, verify the correct number of parameters and the parameter types.
20012	Inconsistent configuration data. The script could therefore not be generated.	Recompile the configuration data.
20013	Incorrect installation of the scripting component of WinCC Runtime. Therefore, no scripts can be executed.	Reinstall WinCC Runtime on your PC. Recompile your project using the "Compile > Software (compile all)" command from the context-sensitive menu and then download the project to the HMI device.
20014	The system function returns a value that is not written in any return tag.	Select the specified script in the configuration. Check whether the script name has been assigned a value.
20015	Too many successive scripts have been triggered in short intervals. When more than 20 scripts are queued for processing, any subsequent scripts are rejected. In this case, the script indicated in the alarm is not executed.	Check what is triggering the scripts. Extend the times, e.g. the acquisition cycle of the tag initiating the script.

30000 - Alarms errors when using system functions

Meaning of the system events

All system events that can be displayed are listed below. The system events are divided into different ranges.

Table 12-4 30000 - Alarms errors when using system functions

Number	Effect/causes	Remedy
30010	The tag could not accept the function result, e.g. when it has exceeded the value range.	Check the tag types of the system function parameters.
30011	A system function could not be executed because the function was assigned an invalid value or type in the parameter.	Check the parameter value and tag type of the invalid parameter. If a tag is used as a parameter, check its value.
30012	A system function could not be executed because the function was assigned an invalid value or type in the parameter.	Check the parameter value and tag type of the invalid parameter. If a tag is used as a parameter, check its value.

40000 - Linear scaling alarms

Meaning of the system alarms

All system alarms that can be displayed are listed below. The system alarms are divided into different ranges:

Table 12-5 40000 - Linear scaling alarms

Number	Effect/causes	Remedy
40010	The system function could not be executed since the parameters could not be converted to a common tag type.	Check the parameter types in the configuration.
40011	The system function could not be executed since the parameters could not be converted to a common tag type.	Check the parameter types in the configuration.

50000 - Data server alarms

Meaning of the system alarms

All system alarms that can be displayed are listed below. The system alarms are divided into different ranges:

Table 12-6 50000 - Data server alarms

Number	Effect/causes	Remedy
50000	The HMI device is receiving data faster than it is capable of processing. Therefore, no further data is accepted until all current data have been processed. Data exchange then resumes.	--
50001	Data exchange has been resumed.	--

60000 - Win32 function alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-7 60000 - Win32 function alarms

Number	Effect/causes	Remedy
60000	This alarm is generated by the "ShowSystemEvent" system function. The text to be displayed is transferred to the function as a parameter.	--
60010	The file could not be copied in the direction defined because one of the two files is currently open or the source/target path is not available. It is possible that the Windows user has no access rights to one of the two files.	Restart the system function or check the paths of the source/target files. Under Windows: Users executing WinCC Runtime must be granted access to the files.
60011	An attempt was made to copy a file to itself. It is possible that the Windows user has no access rights to one of the two files.	Check the path of the source/target file. In Windows with NTFS: Users executing WinCC Runtime must be granted access to the files.

70000 - Win32 function alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-8 70000 - Win32 function alarms

Number	Effect/causes	Remedy
70010	The application could not be started because it could not be found in the path specified or there is insufficient memory space.	Check whether the application exists in the specified path or close other applications.
70011	The system time could not be modified. The error message only appears in connection with area pointer "Date/time PLC". Possible causes: • An invalid time was transferred in the job mailbox. • The Windows user has no right to modify the system time. If the first parameter in the system event is displayed with the value 13, the second parameter indicates the byte containing the incorrect value.	Check the time that is to be set. Under Windows: Users running WinCC Runtime must be granted the right to set the system time of the operating system.
70012	Error when executing the system function "StopRuntime" with the "Runtime and operating system" option. Windows and WinCC Runtime are not closed. The error may have been generated because other programs cannot be closed.	Close all programs currently running. Now close Windows.
70013	The system time could not be modified because an invalid value was entered. Incorrect separators may have been used.	Check the time which is to be set.

Number	Effect/causes	Remedy
70014	The system time could not be modified. Possible causes: • An invalid time was transferred. • The Windows user has no right to modify the system time. Windows rejects the setting request.	Check the time that is to be set. Under Windows: Users running WinCC Runtime must be granted the right to set the system time of the operating system.
70015	The system time could not be read because Windows rejects the reading function.	--
70016	An attempt was made to select a screen by means of a system function or job. This is not possible because the configured screen number does not exist. Or: A screen could not be generated due to insufficient system memory. Or: The screen is blocked. Or: Screen call has not been executed correctly.	Check the screen number in the system function or job against the screen numbers configured. Assign the number to a screen if necessary. Check the details for the screen call and whether the screen is blocked for specific users.
70017	Date/time is not read from the area pointer because the address set in the PLC is either not available or has not been set up.	Change the address or set up the address in the PLC.
70018	Acknowledgment that the password list has been successfully imported.	--
70019	Acknowledgment that the password list has been successfully exported.	--
70020	Acknowledgment for activation of alarm reporting.	--
70021	Acknowledgment for deactivation of alarm reporting.	--
70022	Acknowledgment to starting the Import Password List action.	--
70023	Acknowledgment to starting the Export Password List action.	--
70024	The tag value range was exceeded during system function execution. No calculation of the system function.	Check and correct the calculation.
70025	The tag value range was exceeded during system function execution. No calculation of the system function.	Check and correct the calculation.
70026	No other screens are stored in the internal screen memory. No other screens can be selected.	--
70027	The backup of the RAM file system has been started.	--
70028	RAM file system backup is complete. The files from the RAM have been copied to the Flash memory. Following a restart, these saved files are copied back to the RAM file system.	--
70029	Backup of the RAM file system has failed. No backup copy of the RAM file system has been made.	Check the settings in the "Control Panel > OP" dialog and save the RAM file system using the "Save Files" button in the "Persistent Storage" tab.
70030	The parameters configured for the system function are faulty. The connection to the new PLC was not established.	Compare the parameters configured for the system function with the parameters configured for the PLCs and correct them as necessary.

Number	Effect/causes	Remedy
70031	The PLC configured in the system function is not an S7 PLC. The connection to the new PLC has not been established.	Compare the S7 PLC name parameter configured for the system function with the parameters configured for the PLC and correct them as necessary.
70032	The object configured with this number in the tab sequence is not available in the selected screen. The screen changes but the focus is set to the first object.	Check the number of the tab sequence and correct it if necessary.
70033	An e-mail could not be sent because a TCP/IP connection to the SMTP server no longer exists. This system event is only generated at the first failed attempt. All subsequent unsuccessful attempts to send an e-mail will no longer generate a system event. The event is only generated again if an e-mail has been successfully sent in the meantime. The central e-mail component in WinCC Runtime attempts to connect to the SMTP server at regular intervals (1 minute) in order to transmit the remaining e-mails.	Check the network connection to the SMTP server and re-establish it if necessary.
70034	Following a disruption, the TCP/IP connection to the SMTP server was successfully re-established. The queued e-mails are then sent.	--
70036	No SMTP server for sending e-mails is configured. An attempt to connect to an SMTP server therefore fails and it is not possible to send e-mails. WinCC Runtime generates the system event at the first attempt to send an e-mail.	Configure an SMTP server: In the WinCC Engineering System using "Device settings > Device settings" In the Windows CE operating system using "Control Panel > Internet Settings > E-mail > SMTP Server"
70037	An e-mail could not be sent for unknown reasons. The contents of the e-mail are discarded.	Check the e-mail parameters (recipient etc.).
70038	The SMTP server has rejected the sending or forwarding of an e-mail because the domain of the recipient is unknown to the server or because the SMTP server requires authentication. The contents of the e-mail are discarded.	Check the domain of the recipient address or disable the authentication on the SMTP server if possible. SMTP authentication is currently not used in WinCC Runtime.
70039	The syntax of the e-mail address is incorrect or contains invalid characters. The contents of the e-mail are discarded.	Check the e-mail address of the recipient.
70040	The syntax of the e-mail address is incorrect or contains illegal characters.	--
70041	The import of the user management has been aborted due to an error. Nothing has been imported.	Check your user administration or download it again to the panel.
70042	The range of values of the tag was exceeded while executing the system function. The system function was not calculated.	Check and correct the calculation.
70043	The range of values of the tag was exceeded while executing the system function. The system function was not calculated.	Check and correct the calculation.
70044	An error occurred while sending the e-mails. The e-mails were not sent.	Check the SMTP settings and the error message in the system event.

Number	Effect/causes	Remedy
70045	Cannot load a file required for encrypting the e-mail.	Update the operating system and Runtime.
70046	The server does not support encryption.	Select an SMTP server that supports encryption.
70047	The SSL versions of the HMI device and SMTP server may not be compatible.	Contact your network administrator or the operator of the SMTP server.

80000 - Log alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-9 80000 - Log alarms

Number	Effect/causes	Remedy
80001	The log specified is filled to the size defined (in percent) and must be stored elsewhere.	You swap out the file or table by executing a ‘move’ or ‘copy’ function.
80002	A line is missing in the specified log.	--
80003	The copying process for logging was not successful. In this case, it is advisable to check any subsequent system events, too.	--
80006	Since logging is not possible, this causes a permanent loss of the functionality.	In the case of databases, check whether the corresponding data source exists and start up the system again.
80009	A copying action has been completed successfully.	--
80010	An incorrect storage location was entered in WinCC and causes permanent loss of functionality.	Configure the storage location for the respective log again and restart the system when the full functionality is required.
80012	Log entries are stored in a buffer. If the values are read to the buffer faster than they can be physically written (using a hard disk, for example), overloading may occur and recording is then stopped.	Archive fewer values. Or: Increase the logging cycle.
80013	The overload status no longer exists. Archiving resumes the recording of all values.	--
80014	The same action was triggered twice in quick succession. Since the process is already in operation, the action is only carried out once.	--
80015	This system event is used to report DOS or database errors to the user.	--
80016	The logs are separated by system function "CloseAllLogs" and the incoming entries exceed the defined buffer size. All buffer entries are deleted.	Reconnect the logs.
80017	The number of incoming entries cause a buffer overflow. This can be caused, for example, by several copying actions being activated at the same time. All copy jobs in the buffer are deleted.	Stop the copy action.

Number	Effect/causes	Remedy
80019	The connection between WinCC and all log files was shut down, for example, after execution of the "CloseAllLogs" system function. Entries are written to the buffer and written to the logs when the connection is recovered. There is no connection to the storage location and the storage medium can be changed.	--
80020	The maximum number of simultaneously copy operations has been exceeded. Copying is not executed.	Wait until the current copying actions have been completed, then restart the last copy action.
80021	An attempt was made to delete a log which is still busy with a copy action. Deletion has not been executed.	Wait until the current copying actions have been completed, then restart the last action.
80022	An attempt was made to use system function "StartSequenceLog" to start a sequence log for a log which is not configured as sequence log. No sequence log file is created.	In the project, check • whether the "StartSequenceLog" system function was properly configured. • if the tag parameters are properly provided with data on the HMI device.
80023	An attempt was made to copy a log to itself. The log is not copied.	In the project, check • whether the "CopyLog" system function was properly configured. • if the tag parameters are properly provided with data on the HMI device.
80024	In your configuration, you specified that the "CopyLog" system function should not allow copying if the destination log already contains data ("Mode" parameter). The log is not copied.	Edit the "CopyLog" system function in your configuration, if necessary. Before you initiate the system function, delete the destination log file.
80025	You have canceled the copy operation. Data written up to this point are retained. The target log file (if configured) was not deleted. The cancellation is reported by an error entry RT_ERR at the end of the target log.	--
80026	This alarm is output after all logs are initialized. Values are written to the logs from then on. No entries are written to the logs before this time has expired, irrespective of the active state of WinCC Runtime.	--
80027	The internal Flash memory has been specified as the storage location for a log. This is not permissible. No values are written to this log and the log file is not created.	Configure "Storage Card" or network path as the storage location.
80028	The alarm serves as status report indicating that the logs are currently being initialized. No values are logged until the alarm 80026 is output.	--
80029	The number of logs specified in the alarm could not be initialized. Initialization of logs was finished. The faulty log files are not available for logging jobs.	Evaluate the additional system events related to this alarm. Check the configuration, the ODBC (Open Database Connectivity), and the specified drive.
80030	The structure of the existing log file does not match the expected structure. Logging is stopped for this log.	Delete the existing log data manually, in advance.
80031	The log in CSV format is corrupted. The log cannot be used.	Delete the faulty file.

Number	Effect/causes	Remedy
80032	Logs can be configured with events. These are triggered as soon as the log is full. Assuming WinCC Runtime is started and the log is already full, the event would never be triggered. The specified log is full and no longer accepts data.	Close WinCC Runtime, delete the log, and restart WinCC Runtime. Or: Configure a button which contains the same actions as the event and press it.
80033	"System Defined" is set in the data log file as the data source name. This causes an error. No data is written to the database logs, whereas the logging to the CSV logs works.	Reinstall SQL Sever 2005 Express.
80034	An error has occurred in the initialization of the logs. An attempt has been made to create the tables as a backup. This action was successful. A backup copy of the tables of the corrupted log file was generated and the cleared log restarted.	No action is necessary. However, it is recommended to save the backup files or delete them in order to make the space available again.
80035	An error has occurred in the initialization of the logs. An attempt has been made to create backups of the tables and this has failed. No logging or backup has been performed.	It is recommended to save the backups or to delete them in order to release memory.
80044	The export of a log was interrupted because Runtime was closed or due to a power failure. At the restart of Runtime, it was detected that the export must be resumed.	The export resumes automatically.
80045	The export of a log was interrupted due to an error in the connection to the server or at the server itself.	The export is repeated automatically. Check: • The connection to the server. • If the server is running. • If there is enough free space on the server.
80046	The destination file or the associated directory could not be created on the server.	Check whether there is enough space on the server and it you have permission to create the log file.
80047	The log could not be read while exporting it.	Check whether the storage medium is correctly inserted.
80049	The log could not be renamed while preparing to export it. The job can not be completed."	Check whether the storage medium is correctly inserted and if there is sufficient space on the medium.
80050	The log which shall be exported is not closed. The job can not be completed.	Make sure to call the "CloseAllLogs" system function before using the "ExportLog" system function. Change the configuration as required.
80051	The log to be copied contains an invalid checksum. The log was not copied.	Select a log with a valid checksum. The selected log may have been manipulated.
80052	The log cannot be read.	Check the log and the specified path.
80053	The closed log cannot be read.	Open the log.

90000 - FDA alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-10 90000 - FDA alarms

Number	Effect/causes	Remedy
90024	No operator actions can be logged due to lack of space on the storage medium for log. The operator action will therefore not be executed.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90025	No user actions can be logged because of error state of the archive. Therefore the user action will not be executed.	Check whether the storage medium is correctly inserted.
90026	No operator actions can be logged because the log is closed. The operator action will therefore not be executed.	Before further operator actions are carried out, the log must be reopened with the help of system function "OpenAllLogs". Change the configuration as required.
90028	The password you entered is incorrect.	Enter the correct password.
90029	Runtime was closed during ongoing operation (perhaps due to a power failure) or a storage medium in use is incompatible with Audit Trail. An Audit Trail is not suitable if it belongs to another project or has already been logged. It could also be that archiving was not stopped before automatic execution of the "CloseAllArchives" function was started (e.g. by the task scheduler).	Ensure that you are using the correct storage medium.
90030	Runtime was closed during ongoing operation (perhaps due to a power failure).	--
90031	Runtime was closed during ongoing operation (perhaps due to a power failure).	--
90032	Running out of space on the storage medium for log.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90033	No more space on the storage medium for log. As of now, no more operator actions requiring logging will be executed.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90039	You do not have the necessary authorization to perform this action.	Adapt or upgrade your authorizations.
90040	Audit Trail is switched off because of a forced user action.	Reactivate the "Audit Trail" with the help of system function "StartLog".
90041	A user action which has to be logged has been executed without a logged on user.	A user action requiring logging should only be possible with permission. Change the configuration by setting a required authorization for the input object.
90044	A user action which has to be confirmed was blocked, because there is another user action pending.	Repeat the user action if necessary.
90048	The Audit Trail cannot be printed while data relevant to the audit is being logged.	Stop logging by calling system function "StopLogging".
90049	Access to required file is not possible.	Check the network connection or the storage medium.
90056	The recipe was not imported because the file contains no checksum.	Select a file with a checksum. You can also disable checksum verification by calling system function "ImportDataRecords".
90057	The recipe was not imported because the file contains an invalid checksum. The selected file may have been manipulated.	Select a file with a valid checksum.

110000 - Offline function alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-11 110000 - Offline function alarms

Number	Effect/causes	Remedy
110000	The operating mode was changed. "Offline" mode is now set.	--
110001	The operating mode was changed. "Online" mode is now set.	--
110002	The operating mode was not changed.	Check the connection to the PLCs. Check whether the address range for the “Coordination" area pointer is present in the PLC.
110003	The operating mode of the specified PLC was changed by the "SetConnectionMode" system function. The "offline" operating mode is now set.	--
110004	The operating mode of the specified PLC was changed by the "SetConnectionMode" system function. The "online" operating mode is now set.	--
110005	An attempt was made to use the "SetConnectionMode" system function to set the specified PLC to "online" mode, although the entire system is in "offline" mode. This changeover is not allowed. The PLC remains in "offline" mode.	Switch the complete system to "online" mode and repeat execution of the system function.
110006	The content of the "project ID" area pointer does not match the project ID configured in WinCC. The WinCC Runtime is therefore terminated.	Check: • the project ID entered on the PLC. • the project ID entered in WinCC.

120000 - Trend alarms

Meaning of the system alarms

All system alarms that can be displayed are listed below.

Table 12-12 120000 - Trend alarms

Number	Effect/causes	Remedy
120000	The trend is not displayed because you configured an incorrect axis to the trend or an incorrect trend.	Change the configuration.
120001	The trend is not displayed because you configured an incorrect axis to the trend or an incorrect trend.	Change the configuration.
120002	The trend is not displayed because the tag assigned attempts to access an invalid PLC address.	Check whether the data area for the tag exists in the PLC, the configured address is correct and the value range for the tag is correct.

130000 - System information alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-13 130000 - System information alarms

Number	Effect/causes	Remedy
130000	The action was not executed.	Close all other programs. Delete files no longer required from the hard disk.
130001	The action was not executed.	Delete files no longer required from the hard disk.
130002	The action was not executed.	Close all other programs. Delete files no longer required from the hard disk.
130003	No data medium found. The operation is canceled.	Check the following conditions, for example: • Access to the correct data carrier? • Is a data carrier inserted?
130004	The data carrier is write-protected. The operation is canceled.	Check whether the correct data medium is being accessed. Remove the write-protection if necessary.
130005	The file is read only. The operation is canceled.	Check whether the correct file is being accessed. Change the file attributes.
130006	No access to the file. The operation is canceled.	Check the following conditions, for example: • Is the correct file being accessed? • Does the file exist? • Is another action preventing concurrent access to the file?
130007	The network connection is interrupted. Records cannot be saved or read via the network connection.	Check the network connection and eliminate the cause of error.
130008	No storage card available. The specified records cannot be saved to or read from Storage Card.	Insert the storage card.
130009	The specified folder does not exist on the storage card. The files stored in this directory are not backed up after switching off the HMI device.	Insert the storage card.
130010	The maximum nesting depth can be exhausted when, for example, value changes in a script initiate the call of an infinite number of further scripts. The configured functionality is not provided.	Check the configuration.
130013	No storage card available. The specified records cannot be saved to or read from Storage Card.	Insert the storage card.

140000 - Connection alarms: Connection + device

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-14 140000 - Connection alarms: Connection + device

Number	Effect/causes	Remedy
140000	An online connection to the PLC is established.	--
140001	The online connection to the PLC was shut down.	--
140003	No tag update or write operations are executed.	Check whether the connection is up and the PLC is switched on. In the Control Panel, check the set parameters using the "Set PG/PC interface" function. Restart the system.
140004	No tag update or write operations are executed due to an incorrect access point, or incorrect module configuration.	Check the connection and whether the PLC is switched on. Check the access point or the module configuration (MPI, PPI, PROFIBUS) in the Control Panel with "Set PG/PC interface". Restart the system.
140005	No tag update or write operations are executed due to an incorrect HMI device address (possibly too high).	Use a different address for the HMI device. Check the connection and whether the PLC is switched on. Check the parameters set in the "Set PG/PC interface" dialog of the Control Panel. Restart the system.
140006	No tag update or write operations are executed due to an incorrect baud rate setting.	Select a different baud rate in WinCC (according to module, profile, communication peer, etc.).
140007	An incorrect bus profile prevents tag updates or write operations (see %1). The following parameters could not be written to the registry database: 1: Tslot 2: Tqui 3: Tset 4: MinTsdr 5: MaxTsdr 6: Trdy 7: Tid1 8: Tid2 9: Gap Factor 10: Retry Limit	Check the custom bus profile. Check the connection and whether the PLC is switched on. Check the parameters set in the "Set PG/PC interface" dialog of the Control Panel. Restart the system.

Number	Effect/causes	Remedy
140008	An incorrect baud rate prevents tag updates or write operations. The following parameters could not be written to the registry database: 0: General error 1: Wrong version 2: Profile cannot be written to the registry database. 3: The subnet type cannot be written to the registry database. 4: The Target Rotation Time cannot be written to the registry database. 5: Incorrect Highest Station Address (HSA).	Check whether the connection is up and the PLC is switched on. In the Control Panel, check the set parameters using the "Set PG/PC interface" function. Restart the system.
140009	No tag updates or write operations because the S7 communication module was not found.	To reinstall the module, open the Control Panel and select "Set PG/PC interface".
140010	No S7 communication partner found because the PLC is shut down. DP/T: The option "PG/PC is the only master" is not set in the Control Panel under "Set PG/PC interface".	Switch on the PLC. DP/T: If only one master is connected to the network, disable "PG/PC is the only master" in "Set PG/PC interface". If several masters are connected to the network, enable these. Do not change any settings, for this will cause bus errors.
140011	No tag updates or write operations because communication is down.	Check the connection and whether the communication partner is switched on.
140012	Initialization error (e.g. if WinCC Runtime was closed in Task Manager). Or: Another application (e.g. STEP 7) with different bus parameters is active and the driver cannot be started with the new bus parameters (baud rate, for example).	Restart the HMI device. Or: Start WinCC Runtime and then start your other applications.
140013	The MPI cable is disconnected and, therefore, there is no power supply.	Check the connections.
140014	The configured bus address is in use by another application.	Change the HMI device address in the PLC configuration.
140015	Incorrect baud rate Or: Incorrect bus parameters (e.g. HSA) Or: OP address > HSA or: Incorrect interrupt vector (interrupt not registered by the driver)	Correct the parameters.
140016	The hardware does not support the configured interrupt.	Change the interrupt number.
140017	The set interrupt is in use by another driver.	Change the interrupt number.
140018	SIMOTION Scout disabled the consistency check. Only a corresponding note appears.	In SIMOTION Scout, reactivate the consistency check and once again download the project to the PLC.
140019	SIMOTION Scout is downloading a new project to the PLC. Connection to the PLC is canceled.	Wait until the end of the reconfiguration.
140020	Mismatch of the PLC and project (FWX file) versions. The connection to the PLC is canceled.	The following remedies are available: Download the current version to the PLC using SIMOTION Scout. Recompile the project using WinCC ES, close WinCC Runtime, and restart with the new configuration.

Number	Effect/causes	Remedy
140021	Setup of the connection to the PLC failed. Incorrect configuration of the "Access password" for the connection to the PLC.	Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC. Assign the correct password. The "Password" for the connection to the PLC is assigned in the "Security" area of the PLC properties.
140022	Setup of the connection to the PLC failed. Incorrect configuration of the access password for the connection to the PLC.	Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC. The "Password" for the connection to the PLC is assigned in the "Security" area of the PLC properties.
140023	Error during time synchronization: Unable to read system time of PLC %1.	Check whether the PLC is switched on. Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC.
140025	Setup of the connection to the PLC failed. The access password of the PLC is disabled in the PLC display.	Enable the access password in the PLC display.

160000 - Connection alarms: OPC: Connection

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-15 160000 - Connection alarms: OPC: Connection

Number	Effect/causes	Remedy
160000	No more data is read or written. Possible causes: • The cable connection is interrupted. • The PLC does not respond or has failed, etc. • The wrong port is used for the connection. • System overload	Check whether the cable is plugged in and the PLC is OK, and whether the correct port is used. Restart the system if the system event persists.
160001	The connection is recovered because the cause of the interruption has been eliminated.	--
160010	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check access rights.
160011	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check the following conditions, for example: • Correct server name? • Correct station name? • Is the server registered?

Number	Effect/causes	Remedy
160012	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check the following conditions, for example: • Correct server name? • Correct station name? • Is the server registered? Note for advanced users: Interpret the value from HRESULT.
160013	The specified server was started as InProc server. This has not been released and may lead to undefined behavior because the server is running in the same process area as WinCC Runtime.	Configure the server as OutProc Server or Local Server.
160014	Only one OPC server project can be started on a PC/MP. An alarm is output after an attempt was made to start a second project. The second project has no OPC server functionality and cannot be located as an OPC server by external sources.	Do not start a second project with OPC server functionality on the computer.

170000 - S7 dialog alarms

Meaning of the system alarms

All system alarms that can be displayed are listed below.

Table 12-16 170000 - S7 dialog alarms

Number	Effect/causes	Remedy
170000	S7 diagnostics events are not indicated because it is not possible to log on to the S7 diagnostics functions at this device. The service is not supported.	--
170001	The S7 diagnostics buffer cannot be viewed because communication with the PLC is shut down.	Set the PLC to online mode.
170002	The S7 diagnostics buffer cannot be viewed because reading of the diagnostics buffer (SSL) was canceled with error.	--
170003	An S7 diagnostics event cannot be visualized. The system returns internal error %2.	--
170004	An S7 diagnostics event cannot be visualized. The system returns an internal error of error class %2, error number %3.	--
170007	It is not possible to read the S7 diagnostics buffer (SSL) because this operation was canceled with an internal error of class %2 and error code %3.	--

180000 - General alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-17 180000 - General alarms

Number	Effect/causes	Remedy
180000	A component/OCX received configuration data with a version ID which is not supported.	Install a newer component.
180001	System overload because too many actions are running in parallel. Certain actions can be executed, while others are discarded.	Several remedies are available: • Generate alarms at a slower rate (polling). • Initiate scripts and functions at greater intervals. If the alarm appears more frequently: Restart the HMI device.
180002	The screen keyboard could not be activated. Possible causes: "TouchInputPC.exe" was not registered due to faulty Setup.	Reinstall WinCC Runtime.

190000 - Tag alarms

Meaning of the system events

All system events that can be displayed are listed below.

Table 12-18 190000 - Tag alarms

Number	Effect/causes	Remedy
190000	It is possible that the tag is not updated.	--
190001	The tag is updated after the cause of the last error state has been eliminated (recovery of normal operation).	--
190002	The tag is not updated because communication with the PLC is down.	Select system function "SetOnline" to enable communication.
190004	The tag is not updated because the address configured for this tag does not exist.	Check the configuration.
190005	The tag is not updated because the configured PLC type does not exist for this tag.	Check the configuration.
190006	The tag is not updated because it is not possible to map the PLC type in the data type of the tag.	Check the configuration.
190007	The tag value is not modified because the connection to the PLC is interrupted or the tag is offline.	Set online mode or reconnect to the PLC.

Number	Effect/causes	Remedy
190008	The configured tag limits were violated due to one of the following events: • Value input • System function • Script	Observe the configured or current tag limits.
190009	An attempt was made to assign this tag a value that is outside the valid range of values for this data type. For example, input of the value 260 for a byte tag, or input of the value -3 for an unsigned word tag.	Observe the range of values for the data type of the tags.
190010	The rate at which values are written to the tag is too high (e.g. initiated in a script loop). Values will be lost because buffer capacity is limited to 100 operations.	The following remedies are available: • Extend the interval between multiple write actions. • Do not use an array tag longer than 6 words when configuring an acknowledgment on the HMI device using "HMI acknowledgment tag".
190011	Possible cause 1: The value entered could not be written to the configured PLC tag because the high or low limit was exceeded. The system discarded the entry and restored the original value. Possible cause 2: The connection to the PLC was interrupted.	Note that the value entered must be within the range of values of the control tag. Check the connection to the PLC.
190012	It is not possible to convert a value from a source format to a target format, for example: An attempt is being made to write a counter value that is outside the valid, PLC-specific range of values. A tag of the type Integer should be assigned a value of the type string.	Check the range of values, or the data type of the tag.
190013	You entered a string that exceeds the tag length. The string is truncated automatically to a valid length.	Always enter strings that do not exceed the valid tag length.

190100 - Area pointer alarms

190100 - Area pointer alarms

Number	Effect/causes	Remedy
190100	The area pointer is not updated because the address configured for this pointer does not exist. Type 1 Warnings 2 Errors 3 PLC acknowledgment 4 HMI device acknowledgment 5 LED image 6 Trend request 7 Trend transfer 1 8 Trend transfer 2 No.: Consecutive number displayed in WinCC ES.	Check the configuration.
190101	The area pointer is not updated because it is not possible to map the PLC type to the area pointer type. Parameter type and no.: see alarm 190100	--
190102	The area pointer is updated after the cause of the last error state has been eliminated (recovery of normal operation). Parameter type and no.: See alarm 190100.	--

200000 - PLC coordination alarms

200000 - PLC coordination alarms

Number	Effect/causes	Remedy
200000	Coordination is not executed because the address configured in the PLC does not exist/is not set.	Change the address or set up the address in the PLC.
200001	Coordination is canceled because the write access to the address configured in the PLC is not possible.	Change the address or set the address in the PLC at an area which allows write access.
200002	Coordination is not carried out at the moment because the address format of the area pointer does not match the internal storage format.	Internal error
200003	Coordination can be executed again because the last error state is eliminated (return to normal operation).	--
200004	The coordination may not be executed.	--
200005	No more data is read or written. Possible causes: • The cable is defective. • The PLC does not respond, is defective, etc. • System overload	Ensure that the cable is plugged in and the PLC is operational. Restart the system if the system alarm persists.

210000 - PLC job alarms

210000 - PLC job alarms

Number	Effect/causes	Remedy
210000	Jobs are not processed because the configured address does not exist/has not been set up in the PLC.	Change the address or set up the address in the PLC.
210001	Jobs are not processed because read/write access to the configured address is not possible in the PLC.	Change the address, or set up the address in a PLC area at which read/write access is possible.
210002	Jobs are not executed because the address format of the area pointer does not match the internal storage format.	Internal error
210003	The job buffer is processed again because the last error status has been eliminated (recovery of normal operation).	--
210004	The job buffer is possibly not going to be processed.	--
210005	A job mailbox with invalid number was initiated.	Check the PLC program.
210006	An error occurred while executing the job mailbox. As a result, the control job is not executed. Observe the next/previous system event.	Check the parameters of the control job. Recompile the configuration data.

220000 - WinCC communication driver alarms

220000 - WinCC communication driver alarms

Number	Effect/causes	Remedy
220001	The tag is not downloaded because write access to data type Bool/Bit is not supported by the sublevel communication driver/HMI device.	Change the configuration.
220002	The tag is not downloaded because write access to data type Byte is not supported by the sublevel communication driver/HMI device.	Change the configuration.
220003	The communication driver cannot be loaded as it is possibly not installed.	Install the driver by reinstalling WinCC Runtime.
220004	Communication is down and no update data is transferred because the cable is not connected or defective etc.	Check the connection.
220005	Communication is up.	--
220006	The connection between the specified PLC and the specified port is active.	--

Number	Effect/causes	Remedy
220007	The connection to the specified PLC is interrupted at the specified port.	Check the following: • Is the cable plugged in? • Is the PLC OK? • Is the right port being used? • Is your configuration OK (port parameters, protocol settings, PLC address)? Restart the system if the system event persists.
220008	The communication driver cannot access or open the specified port. This port might be in use by another application, or a port that does not exist on the target device is being used. No communication with the PLC.	Close all applications that access the port and restart the computer. Use another port that exists in the system.

230000 - Screen object alarms

230000 - Screen object alarms

Number	Effect/causes	Remedy
230000	The value entered could not be used. The system discards this entry and restores the previous value. Possible causes: • The range of values is exceeded. • You entered invalid characters • The valid maximum number of users has been exceeded.	Enter a practical value, or delete a user that is no longer required.
230002	The user currently logged on does not have the necessary authorization, so the system discards the entry and restores the previous value.	Log on as user with appropriate authorization.
230003	Change to the specified screen failed because this screen is not available/configured. The current screen remains selected.	Configure the screen and check the selection function.
230005	The range of values of the tag has been exceeded in the I/O field. The original tag value is retained.	Observe the range of values for the tag when entering a value.
230100	During navigation in the Web browser, the system returned a message which may be of interest to the user. The Web browser continues to run but may not (fully) show the new page.	Navigate to another page.
230200	The HTTP channel connection was interrupted due to an error. This error is explained in detail by another system event. Data is no longer exchanged.	Check the network connection. Check the server configuration.
230201	The HTTP channel connection is set up. Data is exchanged.	--

Number	Effect/causes	Remedy
230202	WININET.DLL has detected an error. Usually, this error occurs if it is not possible to connect to the server, or the server denies a connection because the client lacks proper authorization. An unknown server certificate may also be the cause if the connection is encrypted by means of SSL. The alarm text provides details. This text is always in the language of the Windows installation because it is returned by the Windows OS. Process values are no longer exchanged. The part of the alarm returned by the Windows OS might not be displayed, e.g. "An error has occurred". WININET.DLL returns the following error: Number: 12055 Text:HTTP: <no error text available>."	Depending on the cause: When an attempt to connect fails, or a timeout occurs: • Check the network connection and the network. • Check the server address. • Check whether the WebServer is actually running on the target station. Incorrect authorization: • The configured user name and/or password do not match the entries on the server. Set consistent data. If the server certificate is rejected: Certificate signed by an unknown CA ( ): • Ignore this point, or install a certificate that has been signed with one of the root certificates known to the client station. The date of the certificate is invalid: • Ignore this point, or install a certificate with valid date on the server. Invalid CN (Common Name or Computer Name): • Ignore this point, or install a certificate with a name that corresponds to the server address.
230203	Although a connection can be made to the server, the HTTP server refused to connect. Possible causes: • WinCC Runtime does not run on the server • The HTTP channel is not supported (503 Service unavailable). Other errors can only occur if the Webserver does not support the HTTP channel. The language of the alarm text depends on the Webserver. Data is not exchanged.	On 503 Service unavailable error: Check whether WinCC Runtime is running on the server and whether the HTTP channel is supported.
230301	Internal error. An English text explains the error in more detail. The error may be caused by insufficient memory. OCX does not work.	--
230302	The name of the remote server cannot be resolved. An attempt to connect has failed.	Check the configured server address. Check whether the DNS service is available on the network.
230303	The remote server is not running on the addressed computer. incorrect server address. An attempt to connect has failed.	Check the configured server address. Check whether the remote server is running on the target computer.
230304	The remote server on the addressed computer is incompatible with VNCOCX. An attempt to connect failed.	Use a compatible remote server.

Number	Effect/causes	Remedy
230305	Authentication has failed due to incorrect password. An attempt to connect failed.	Configure the correct password.
230306	Error in the connection to the remote server. This may occur as a result of network problems. An attempt to connect failed.	Check whether the network cable is plugged in, or whether there are network problems.
230307	The connection to the remote server was shut down. Possible causes: • The remote server was shut down • The user instructed the server to close all connections. The connection is cancelled.	--
230308	This alarm provides information on the connection status. An attempt is made to connect.	--

240000 - Authorization alarms

240000 - Authorization alarms

Number	Effect/causes	Remedy
240000	WinCC Runtime is running in demo mode. You have no authorization, or your authorization is corrupted.	Install the authorization.
240001	WinCC Runtime is running in demo mode. You configured too many tags for the installed version.	Load an adequate authorization / powerpack.
240002	WinCC Runtime is running with time-limited emergency authorization.	Restore the full authorization.
240004	Error when reading the emergency authorization. WinCC Runtime is running in demo mode.	Restart WinCC Runtime. Install or repair the authorization (see Commissioning Instructions for Software Protection).
240005	Automation License Manager has detected an internal system error. Possible causes: • Corrupted file • Faulty installation • No free memory space for Automation License Manager, or similar.	Restart the HMI device/PC. If this procedure does not solve the problem, remove and then reinstall Automation License Manager.

250000 - S7 Status/Force alarms

250000 - S7 Status/Force alarms

Number	Effect/causes	Remedy
250000	The tag in the specified line in "Status Force" is not updated because the address configured for this tag is not available.	Check the set address and then verify that the address is set up in the PLC.
250001	The tag in the specified line in "Status Force" is not updated because the PLC type configured for this tag does not exist.	Check the set address.
250002	The tag in the specified line in "Status Force" is not updated because it is not possible to map the PLC type in the tag type.	Check the set address.
250003	An attempt to connect to the PLC failed. The tags are not updated.	Check the connection to the PLC. Check that the PLC is switched on and is online.

260000 - Password system alarms

260000 - Password system alarms

Number	Effect/causes	Remedy
260000	An unknown user or an unknown password has been entered in the system. The current user is logged off from the system.	Log on to the system as a user with a valid password.
260001	The logged in user does not have sufficient authorization to execute the protected functions on the system.	Log on to the system as a user with sufficient authorization.
260002	This alarm output when the "TrackUserChange" system function is triggered.	--
260003	The user has logged off from the system.	--
260004	The user name entered into the user view already exists in the user management.	Select another user name because user names have to be unique in the user management.
260005	The entry is discarded.	Enter a shorter user name.
260006	The entry is discarded.	Use a shorter or longer password.
260007	The logoff time entered is outside the valid range from 0 to 60 minutes. The new value entered is discarded and the original value is retained.	Enter a logon timeout value between 0 and 60 minutes.
260008	An attempt was made in WinCC to read a PTProRun.pwl file created with ProTool V 6.0. Reading of the file was canceled due to incompatibility of the format.	--
260009	You have attempted to delete the user "Administrator" or "PLC User". These users are fixed components of the user management and cannot be deleted.	If you need to delete a user, because perhaps you have exceeded the maximum number permitted, delete another user.

Number	Effect/causes	Remedy
260012	The password entries in the "Change Password" dialog and in the confirmation field do not match. The password is not changed. User will be logged off.	You have to log on to the system again. Then enter the identical password twice to be able to change the password.
260013	The password entered in the "Change Password" dialog is invalid because it is already in use. The password is not changed. User will be logged off.	You have to log on to the system again. Then enter a new password that has not been used before.
260014	You have tried to log on with an incorrect password three times in a row. You will be locked out and assigned to group no. 0.	You can log on to the system with your correct password. Only an administrator can change the assignment to a group.
260024	The password you entered does not meet the necessary security guidelines.	Enter a password that contains at least one number.
260025	The password you entered does not meet the necessary security guidelines.	Enter a password that comprises at least three characters.
260028	Upon system start-up, an attempt to log on, or when trying to change the password of a SIMATIC log-on user, the system attempts to access the SIMATIC Logon Server. If attempting to log on, the new user is not logged in. If a different user was logged on before, then this user is logged off.	Check the connection to the SIMATIC Logon Server and its configuration; for example: 1. Port number 2. IP address 3. Server name 4. Functional transfer cable Or use a local user.
260030	The SIMATIC Logon user could not change his password on the SIMATIC Logon Server. The new password is possibly noncompliant with password rules set on the server, or the user is not authorized to change his password. The old password remains and the user is logged off.	Log in again and choose a different password. Check the password rules on the SIMATIC Logon Server.
260033	The action change password or log on user could not be carried out.	Check the connection to the SIMATIC Logon Server and its configuration; for example: 1. Port number 2. IP address 3. Server name 4. Functional transfer cable Or use a local user.
260034	The last logon operation has not yet ended. A user action or a logon dialog can therefore not be called. The logon dialog is not opened. The user action is not executed.	Wait until the logon operation is complete.
260035	The last attempt to change the password was not completed. A user action or a logon dialog can therefore not be called. The logon dialog is not opened. The user action is not executed.	Wait until the procedure is complete.

Number	Effect/causes	Remedy
260036	There are insufficient licenses on the SIMATIC Logon Sever. The logon is not authorized.	Check the licensing on the SIMATIC Logon Server.
260037	There is no license on the SIMATIC Logon Sever. A logon is not possible. It is not possible to log on via the SIMATIC Logon Server, only via a local user.	Check the licensing on the SIMATIC Logon Server.
260040	The system attempts to access the SIMATIC Logon Server upon system start-up or when trying to change the password. If attempting to log on, the new user is not logged in. If a different user was logged on before, then this user is logged off.	Check connection to the domain and its configuration in the Runtime security settings editor. Or use a local user.
260043	It was not possible to log the user on to the SIMATIC Logon Server. The user name or the password could be incorrect or the user does not have sufficient rights to log on. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Try again. If necessary, check the password data on the SIMATIC Logon Server.
260044	It was not possible to log the user on to the SIMATIC Logon Server as his account is blocked. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Check the user data on the SIMATIC Logon Server.
260045	The SIMATIC Logon user is not associated to any or several groups. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Check user data on the SIMATIC Logon Server and the configuration in your WinCC project. A user may only be assigned to one group.

270000 - System alarms

270000 - System Alarms

Number	Effect/causes	Remedy
270000	The alarm does not indicate the tag because it is accessing an invalid address in the PLC.	Check whether the data area for the tag exists on the PLC, whether the configured address is correct, and whether the value range for the tag is correct.
270001	There is a device-specific limit as to how many alarms may be queued for viewing (see the operating instructions). This limit has been exceeded. The view no longer contains all the alarms. However, all alarms are written to the alarm buffer.	--
270002	The view shows alarms of a log for which there is no data in the current project. Placeholders are output for the alarms.	Delete old log data, if necessary.

Number	Effect/causes	Remedy
270003	The service cannot be set up because too many devices want to access this service. A maximum of four devices can execute this action.	Reduce the number of HMI devices which want to use the service.
270004	Access to the persistent alarm buffer is not possible. Alarms cannot be restored or backed up.	If the problems persist at the next restart, contact Customer Support (delete Flash).
270005	Persistent alarm buffer corrupted: Alarms cannot be restored.	If the problems persist at the next restart, contact Customer Support (delete Flash).
270006	Project modified: Alarms cannot be restored from the persistent alarm buffer.	The project was compiled and downloaded again to the HMI device. The error should no longer occur at the next restart of the HMI device.
270007	A configuration problem is preventing you from the restoring the data (e.g. a DLL was deleted, or unknown directory).	Update the operating system and download your project again to the HMI device.

290000 - Recipe system alarms

290000 - Recipe system alarms

Number	Effect/causes	Remedy
290000	The recipe tag could not be read or written. It is assigned the start value. The alarm can be entered in the alarm buffer for up to four more faulty tags. After that, alarm 290003 is output.	Check the configuration to see whether the address has been set up in the PLC.
290001	An attempt was made to assign the recipe tag a value that is outside the valid range of values for this type. The alarm can be entered in the alarm buffer for up to four more faulty tags if necessary. After that, alarm 290004 is output.	Observe the range of values for the tag type.
290002	It is not possible to convert a value from a source format to a target format. The alarm can be entered in the alarm buffer for up to four more faulty recipe tags if necessary. After that, alarm 290005 is output.	Check the range of values or type of the tag.
290003	This alarm is output after alarm 290000 was triggered more than five times. In this case, no further separate alarms are generated.	Check the configuration to see whether the tag addresses have been set up in the PLC.
290004	This alarm is output after alarm 290001 was triggered more than five times. In this case, no further separate alarms are generated.	Observe the range of values for the tag type.
290005	This alarm is output after alarm 290002 was triggered more than five times. In this case, no further separate alarms are generated.	Check the range of values or type of the tag.

Number	Effect/causes	Remedy
290006	The limits configured for the tag have been exceeded by the values entered.	Observe the configured or current tag limits.
290007	There is a difference between the source and target structure in the recipe currently being processed. The target structure contains an additional recipe tag that is not available in the source structure. The recipe tag specified is assigned its start value.	Insert the specified recipe tag into the source structure.
290008	There is a difference between the source and target structure in the recipe currently being processed.The source structure contains an additional recipe tag that is not available in the target structure and cannot be assigned. The value is discarded.	Remove the specified recipe tag in the specified recipe from the project.
290010	The storage location configured for the recipe is invalid. Possible causes: Invalid characters, write protection, data carrier out of space or not available.	Check the configured storage location.
290011	A data record of the specified number does not exist.	Check the source for the number (constant or tag value).
290012	A recipe of the specified number does not exist.	Check the source for the number (constant or tag value).
290013	An attempt was made to save a data record under a data record number that already exists. The operation is not executed.	The following remedies are available: • Check the source for the number (constant or tag value). • First, delete the data record. • Modify the "Overwrite" function parameter.
290014	The specified import file was not found.	Check the following: • The file name • Ensure that the file is in the specified directory.
290020	Check back to verify that the download of data records from the HMI device to the PLC has started.	--
290021	Check back to verify that the download of records from the HMI device to the PLC was completed.	--
290022	Check back to indicate that the download of data records from the HMI device to the PLC was canceled due to an error.	Check the following conditions in the configuration: • Are the tag addresses configured in the PLC? • Does the recipe number exist? • Does the data record number exist? • Is the "Overwrite" function parameter set?
290023	Check back to verify that the download of data records from the PLC to the HMI device has started.	--

Number	Effect/causes	Remedy
290024	Check back to verify that the download of data records from the PLC to the HMI device was completed.	---
290025	Check back to indicate that the download of data records from the PLC to the HMI device was canceled due to an error.	Check the following conditions in the configuration: • Are the tag addresses configured in the PLC? • Does the recipe number exist? • Does the data record number exist? • Is the "Overwrite" function parameter set?
290026	An attempt was made to read/write a data record that is not free at present. This error can occur if recipes were configured for download with synchronization.	Set the mailbox status to zero.
290027	Unable to connect to the PLC at present. As a result, the data record cannot be read or written. Possible causes: No hardware connection to the PLC (no cable plugged in, cable is defect), or the PLC is switched off.	Check the connection to the PLC.
290030	This alarm is output after you selected screen which contains a recipe view in which a data record is already selected.	Reload the data record from the storage location, or retain the current values.
290031	While saving, it was detected that a data record with the specified number already exists.	Overwrite the data record, or cancel the action.
290032	During the export of data records, a file with the specified name was found.	Overwrite the file, or cancel the process.
290033	Confirmation prompt before deleting data records.	--
290040	A data record error with error code %1 that cannot be described in more detail occurred. The action is canceled. It is possible that the mailbox was not installed correctly on the PLC.	Check the storage location, the data record, the "Data record" area pointer, and the connection to the PLC. Restart the action after a short waiting time. If the error persists, contact Customer Support. Forward the relevant error code to Customer Support.
290041	A data record or file cannot be saved because the storage location is out of sufficient space.	Delete files no longer required.
290042	An attempt was made to execute several recipe actions simultaneously. The last action is not executed.	Retrigger the action after a short waiting time.
290043	Confirmation prompt before saving data records.	--
290044	The database for the recipe was corrupted and will be deleted.	--
290050	A check back indicates that the export of data records was started.	--
290051	A check back indicates successful completion of the export of data records.	--
290052	A check back indicates that the export of data records was canceled due to an error.	Ensure that the structure of the data records at the storage location and the current recipe structure on the HMI device are identical.
290053	A check back indicates that the import of records was started.	--

Number	Effect/causes	Remedy
290054	A check back indicates successful completion of the import of data records.	--
290055	A check back indicates that the import of data records was canceled due to an error.	Ensure that the structure of the data records at the storage location and the current recipe structure on the HMI device are identical.
290056	Error when reading/writing the value in the specified row/column. The action was canceled.	Check the specified row/column.
290057	The tags of the recipe specified were toggled from "offline" to "online" mode. Each change of a tag in this recipe is now immediately transferred to the PLC.	--
290058	The tags of the specified recipe were toggled from "online" to "offline" mode. Modifications to tags in this recipe are no longer immediately transferred to the PLC but must be transferred there explicitly by downloading a data record.	--
290059	A check back indicates that the specified record was successfully saved.	--
290060	A check back indicates that the specified data record memory was cleared.	--
290061	A check back indicates that deletion of the data record memory was canceled due to an error.	--
290062	The data record number exceeds the maximum of 65536. This data record cannot be created.	Select another number.
290063	This occurs when you execute system function "ExportDataRecords" while the "Overwrite" parameter is set to "No". An attempt was made to save a recipe under a file name that already exists. The export is canceled.	Check the parameters of the "ExportDataRecords" system function.
290064	A check back indicates that the deletion of data records was started.	--
290065	A check back indicates successful completion of the deletion of data records.	--
290066	Confirmation prompt before deleting data records.	--
290068	Confirmation prompt for deletion of all recipe data records.	--
290069	Confirmation prompt for deletion of all recipe data records.	--
290070	The data record specified was not found in the import file.	Check the source of the data record number, or the data record name (constant, or tag value).
290071	When the editing data record values, you entered a value that is below the low limit of the recipe tag. The entry is discarded.	Enter a value within the recipe tag limits.

Number	Effect/causes	Remedy
290072	When editing data record values, you entered a value that exceeds the high limit of the recipe tag. The entry is discarded.	Enter a value within the recipe tag limits.
290073	An action (e.g. saving a record) failed for an unknown reason. The error corresponds to status alarm IDS_OUT_CMD_EXE_ERR in the large recipe view.	--
290074	While saving, a data record with the specified number but with different name was found.	Overwrite the record, change the record number or cancel the action.
290075	A data record of this name already exists. The data record is not saved.	Select a different data record name.
290110	The default values could not be set due to an error.	--
290111	The recipes subsystem cannot be used. Recipe views have no content and recipe-specific functions will not be executed. Possible causes: • Error when loading the recipes. • The recipe structure was changed in the ES. The recipes were not included in the latest project download. This means that the new configuration data no longer matches the old recipes on the device.	Download the project to the device again, including the recipes (the corresponding check box in the download dialog must be check marked).

300000 - Alarm_S alarms

300000 - Alarm_S alarms

Number	Effect/causes	Remedy
300000	Faulty configuration of process monitoring (e.g. using PDiag or S7 Graph): More alarms are queued than specified in the specifications of the CPU. No further ALARM_S alarms can be managed by the PLC and reported to the HMI devices.	Change the PLC configuration.
300001	ALARM_S is not registered on this PLC.	Select a controller that supports the ALARM_S service.

310000 - Reporting alarms

310000 - Reporting alarms

Number	Effect/causes	Remedy
310000	An attempt is being made to print too many reports in parallel. Only one log file can be output to the printer at a given time; the print job is therefore rejected.	Wait until the previous active log was printed. Repeat the print job if necessary.
310001	An error occurred on triggering the printer. The report is either not printed or printed with errors.	Evaluate the additional system alarms related to this alarm. Repeat the print job if necessary.

330000 - Interaction alarms

330000 - Interaction alarms

Number	Effect/causes	Remedy
330022	Too many open dialogs on the HMI device.	Close all dialogs you do not require on the HMI device.

350000 - PROFIsafe alarms

350000 - PROFIsafe alarms

Number	Effect/causes	Remedy
350000	PROFIsafe packets were not received within the specified time. There is a communication problem with the F-CPU. RT is terminated.	Check the WLAN connection.
350001	PROFIsafe packets were not received within the specified time. There is a communication problem with the F-CPU. The PROFIsafe connection is set up again.	Check the WLAN connection.
350002	Internal error. Runtime is terminated.	Internal error
350003	Check back for indicating the connection setup to the F-CPU. The Emergency-Off buttons are active immediately.	--

Number	Effect/causes	Remedy
350004	PROFIsafe communication was set up and the connection was shut down. Runtime can be terminated. The Emergency-Off buttons are deactivated immediately.	--
350005	Incorrect address configured for the F-Device. A PROFIsafe connection cannot be set up.	Check and modify the address of the F-Device in WinCC ES.
350006	The project was started. At the start of the project, check the proper function of the ACK buttons.	Press the two ACK buttons successively in the "Acknowledge" and "Panic" positions.
350008	You configured an incorrect number of failsafe buttons. A PROFIsafe connection cannot be set up.	Modify the number of failsafe buttons in the project.
350009	The device is in Override mode. It may no longer be possible to detect the location because transponder detection fails.	Exit the override mode.
350010	Internal error: The device has no failsafe buttons.	Return the device to Siemens. Worldwide contact partners

12.3.6 Configuring system diagnostics

12.3.6.1 System diagnostics basics

Introduction

You use system diagnostics to detect problems and errors in any part of your plant. WinCC has two display and operating elements for quick error localization.

System diagnostics view

The alarm view shows the status of a PLC while the system diagnostics view gives you an overview of all devices available in your plant: You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

System diagnostics window

The system diagnostics window is an operating and display element that you can only use in the global screen.

The functions of the system diagnostics window are no different than those of the system diagnostics view. Because the system diagnostics window is configured in the global screen, you can, for example, also specify if the object is closable in Runtime.

Note

System diagnostics on Basic Panels

The "System--Diagnostics window" object is not available for Basic Panels.

See also

System diagnostics views (Page 4402)

12.3.6.2 System diagnostics views

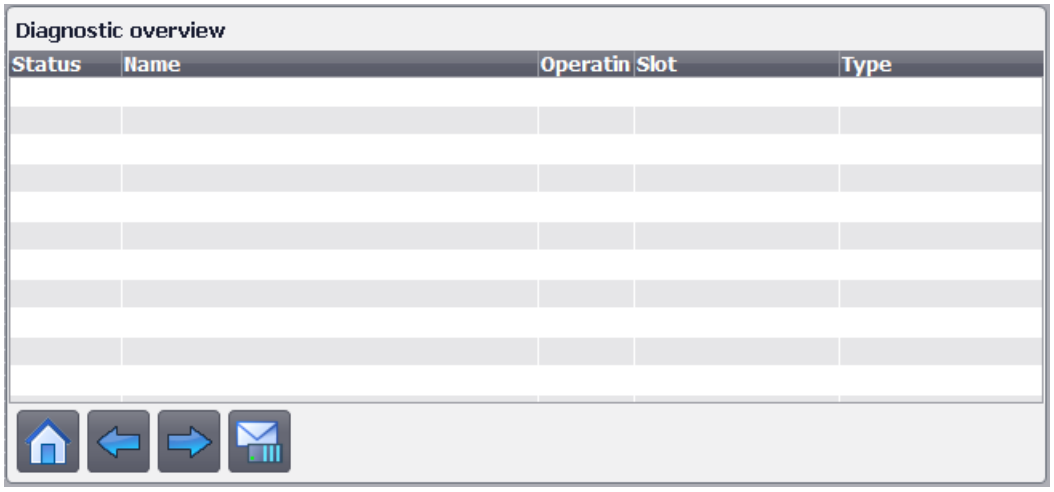
Introduction

There are four different views available in the system diagnostics view and the system diagnostics window.

- Device view
- Diagnostic buffer view
- Detail view
- Matrix view (for master systems, PROFIBUS, PROFINET only)

Device view

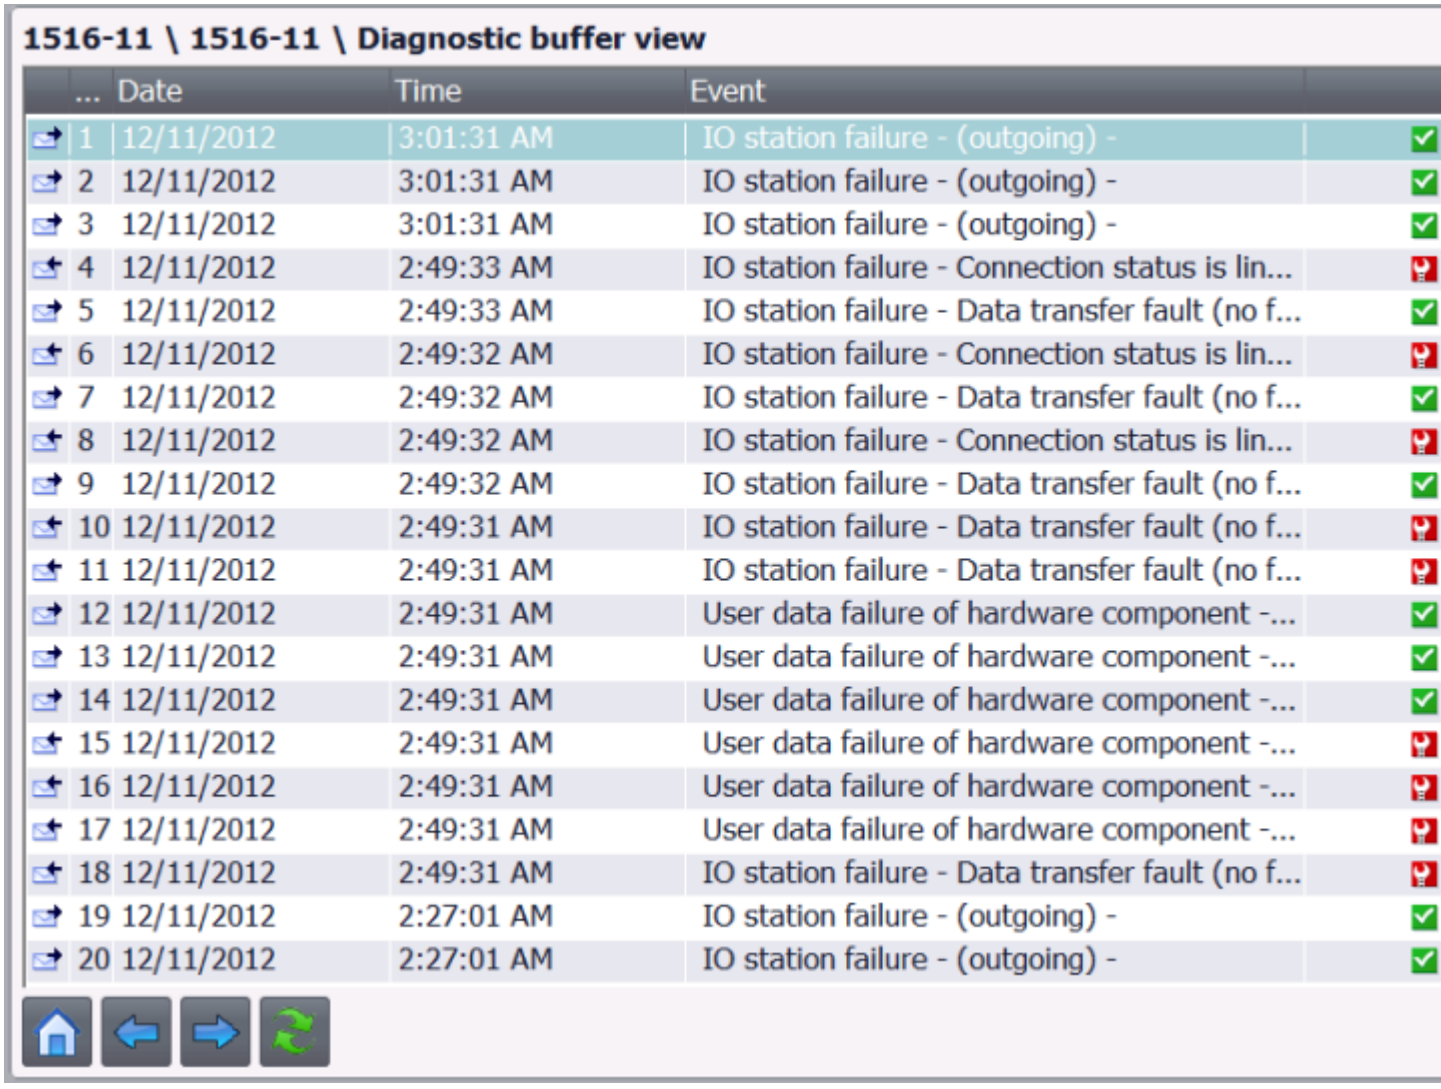
The device view shows all the available devices of a layer in a table. Double-clicking on a device opens either the child devices or the detail view. Symbols in the first column provide information about the current status of the device.



Diagnostic buffer view

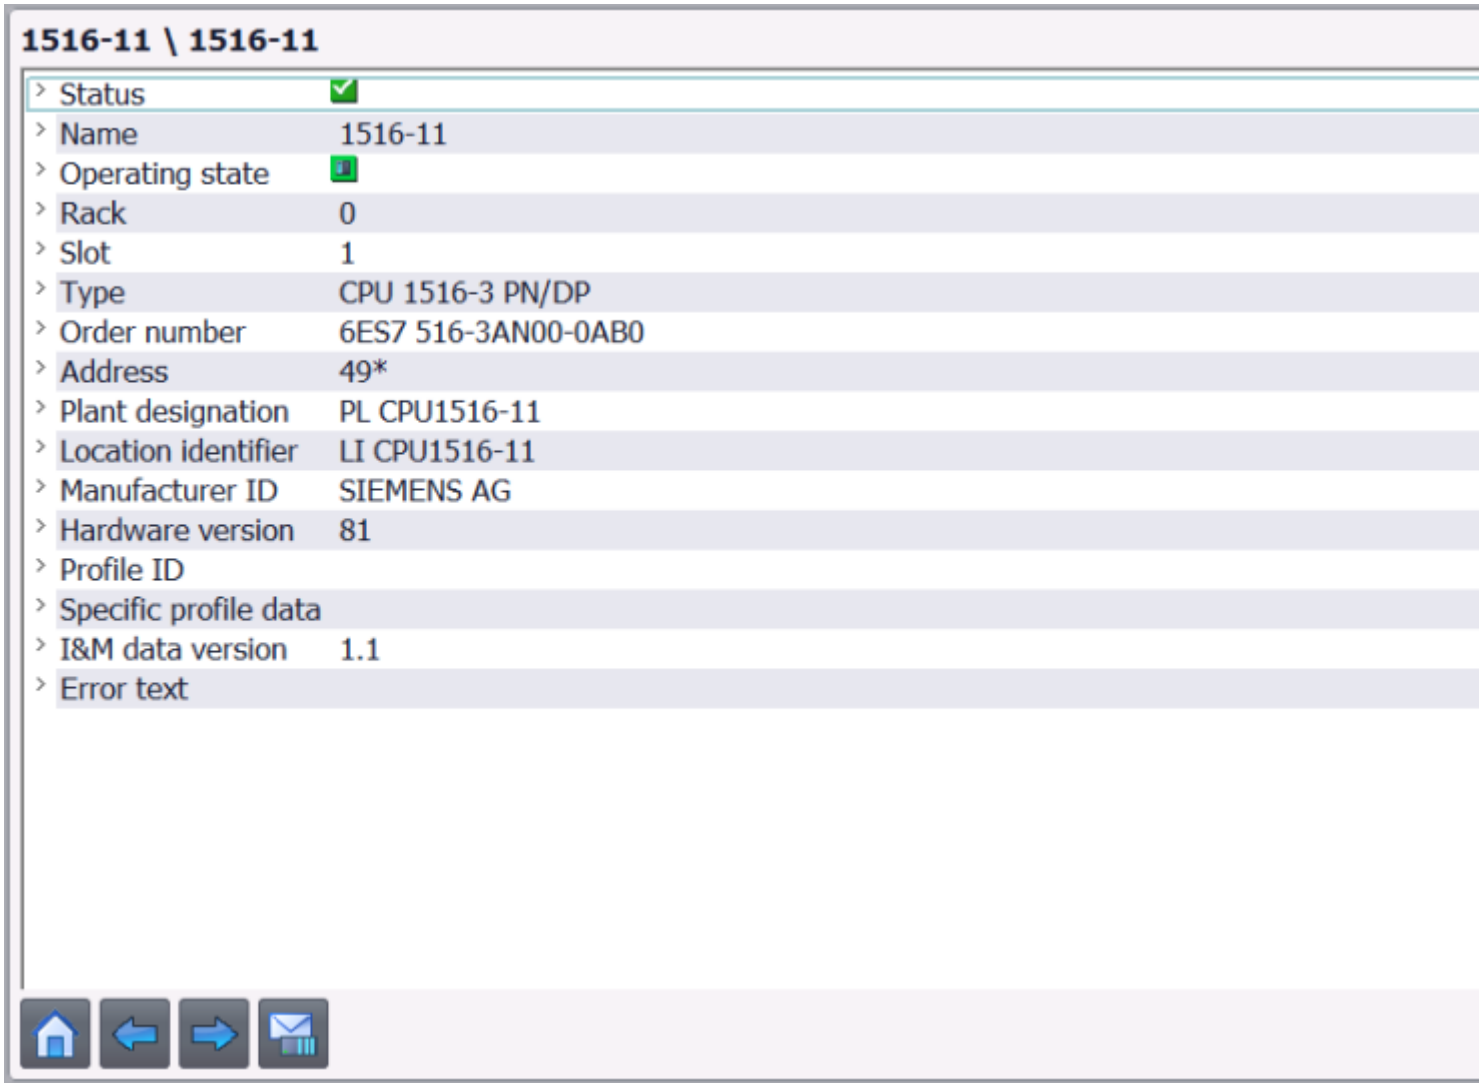
In the diagnostic buffer view, the current data from the diagnostic buffer of the device is displayed. The diagnostic buffer view can only be called up in the device view.

To update the diagnostic buffer view, you click  .



Detail view

The detail view gives detailed information about the selected device and the pending errors. Check whether the data is correct in the detail view. You cannot sort error texts in the detail view.



Note

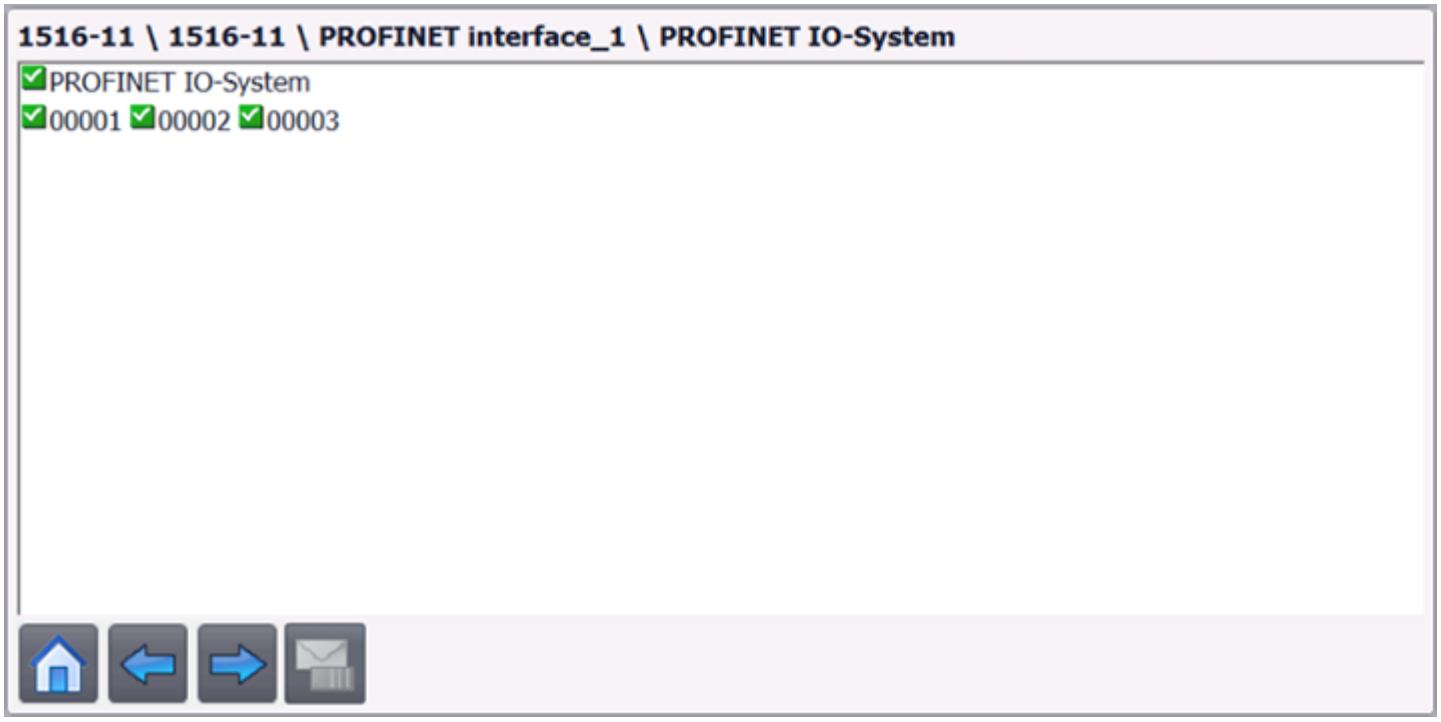
Contents of the detail view

The contents of the detail view are only available for integrated connections with S7 1200 and S7 1500 PLCs.

Matrix view

The matrix view is only available for master systems. In the matrix view you can see the status of the subdevices of the master system.

- In PROFIBUS, the numbers assigned by PROFIBUS are used as identification (DP station number).
- The IO devices are numbered consecutively beginning with 1 in PROFINET.



Navigation buttons

Button	Key	Function
	Enter key	Opens the child devices or the detail view if there are no child devices.
	Esc key	Opens the parent device or the device view if there is no parent device.
	Home key	Opens the device view.
	Configured function key, e.g. F1.	Opens the diagnostic buffer view. Only visible in the device view.
	Configured function key, e.g. F2.	Updates the diagnostic buffer view.

Note

Navigation in the matrix view of Comfort Panels with function keys

The Shift key is additionally used to select PNIO or PROFIBUS slaves in the matrix view.

Language switching in runtime

Switch over the language in runtime before you open the details view.

If you switch over the runtime language while the details view is opened, you change back to the diagnostic buffer view.

Open the details view again. The selected runtime language is now displayed correctly.

System diagnostics basics (Page 4401)

12.3.6.3 Basic Panel basics

System diagnostics basics

Introduction

Using system diagnostics, you can display the messages from the diagnostic buffer of all integrated connections.

System diagnostics view

The system diagnostics display is an operating and display object that you use in a screen.

You navigate directly to the cause of the error and the associated connection. You have access to all integrated connections that you have configured in the "Devices & networks" editor.

System diagnostics views

Introduction

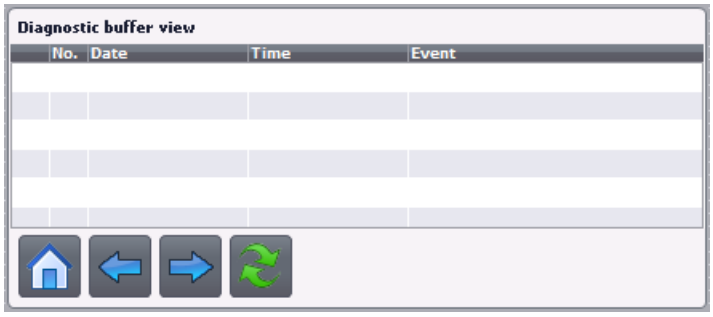
Three different views are available in the simple system diagnostic view.

- Device view
- Diagnostic buffer view
- Detail view

Device view

The device view is only displayed if more than one integrated connection has been configured.

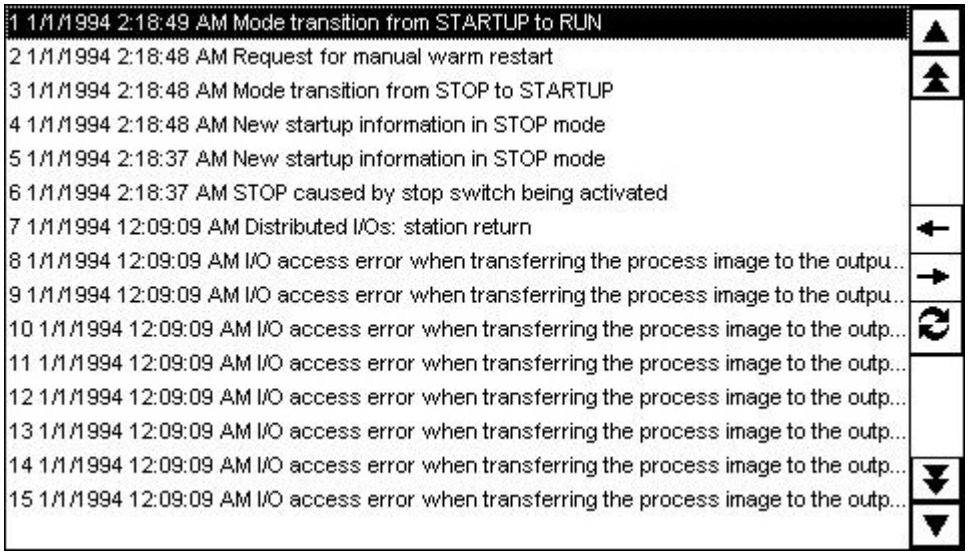
The device view shows all available connections in a table. Double-clicking a connection opens the diagnostic buffer view.



Diagnostic buffer view

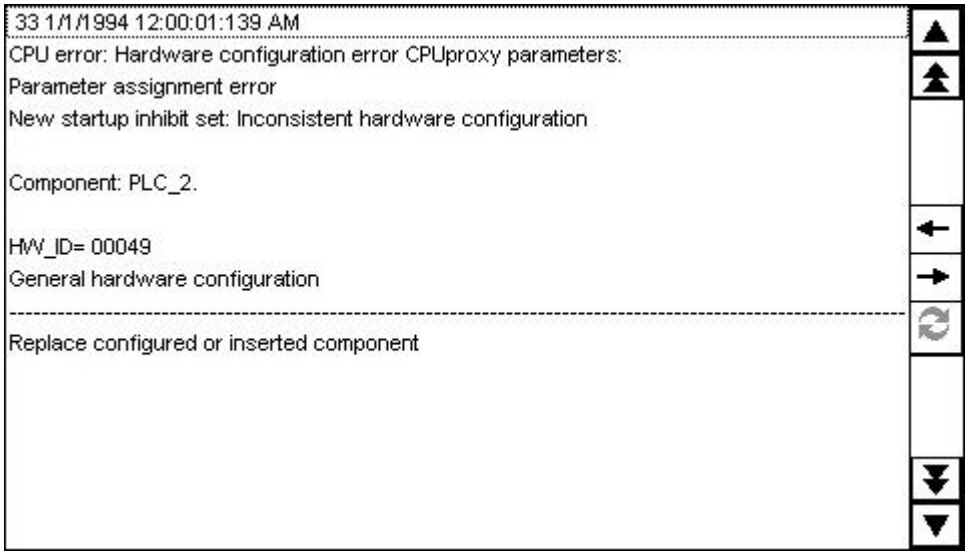
The diagnostic buffer view shows the current data from the diagnostic buffer.

To update the diagnostic buffer view, you click .



Detail view

The detail view gives detailed information about the selected connection and any pending errors. Check whether the data is correct in the detail view.



Note

Contents of the detail view

The contents of the detail view are only available for integrated connections with S7 1200 and S7 1500 PLCs.

Navigation buttons

Button	Key	Function
	Enter key	In the device view: Opens the diagnostic buffer view of the selected device. In the diagnostic buffer view: Opens the detail view.
	Esc key	In the diagnostic buffer view: Opens the device view. In the detail view: Opens the diagnostic buffer view.
	Configured function key, e.g. F1.	Updates the diagnostic buffer view.

12.3.6.4 Configuring system diagnostics objects

Enabling system diagnostics in the PLC

Introduction

During communication with the SIMATIC S7-1500 and SIMATIC S7-1200 PLCs, system diagnostics is automatically activated.

For other PLCs, the following settings must be implemented in the PLC to enable the PLC to transfer error messages to the system diagnostics view.

Requirements

- A PLC such as SIMATIC S7-300/400 or ET 200 has been created.
- The "Devices & Networks" editor is open in the "Device view".

Procedure

1. Select the PLC in the selection list.
2. Click on the PLC and select "Properties" in the shortcut menu. The properties of the PLC are displayed in the Inspector window.
3. Select "Properties > General > System diagnostics" in the Inspector window.
4. Enable "Activate system diagnostics for this CPU".
5. Select the PLC and then "Compile > Hardware configuration" in the shortcut menu.

Result

The settings will be effective following the next compilation. The PLC can now transfer error messages to the system diagnostics display.

Adding a system diagnostics indicator

Introduction

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your system.

If an error occurs, the appearance of the object changes. The library object can display two states:

- No error

- Error

Requirement

- The "Libraries" task card is opened.
- The global library "Buttons and Switches > Master copies > DiagnosticsButtons" is open.
- A screen is open.
- A system diagnostics window has been created in the global screen.

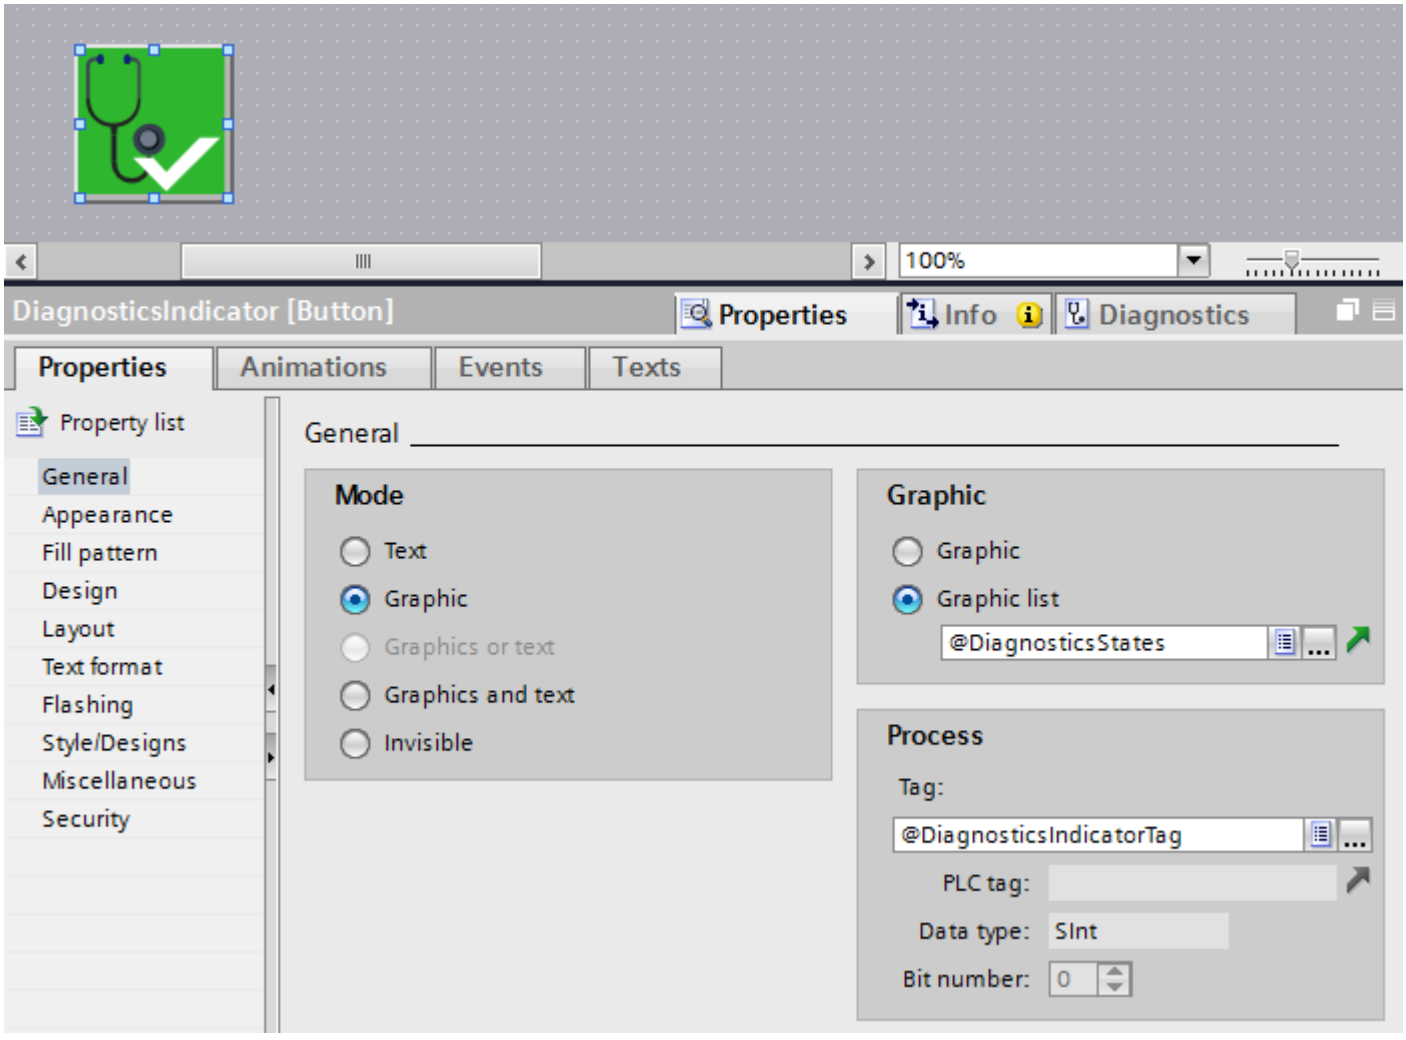
Procedure

1. Select the "DiagnosticsIndicator" object in the library.

   Note
   System diagnostics indicator for different device types

   When selecting the object ensure that you use the correct object for the device type used in the project.

2. Drag-and-drop the library object to the position in the work area where you want to insert the object.
   The library object is inserted.



3. Select the library object.
4. Click "Properties > Events" in the Inspector window.
   The system function "ShowSystemDiagnosticsWindow" is preset for the event "Click".

Result

The status diagnostics indicator has been added to the project and connected with the system diagnostics window.

The system diagnostics indicator changes its appearance if an error message is output in Runtime. The system diagnostics window opens when you click on the system diagnostics indicator. The system diagnostics window shows the detail view of the affected device.

Configuring access protection for the system diagnostics window

Configure access protection for the system diagnostics indicator to prevent unauthorized access to the system diagnostics window.

1. Select the "DiagnosticsIndicator" object in the screen.
2. Select an authorization in "Properties > Properties > Security in Runtime" in the Inspector window.

A logon dialog opens when you click on the system diagnostics indicator in Runtime. The system diagnostics window does not open unless you have the required authorization.

Configuring a system diagnostics window in the global screen

Introduction

The system diagnostics window gives you an overview of all devices available in your plant. The system diagnostics window operates like the system diagnostics view, but it is only available in the global screen.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- A Comfort Panel or WinCC RT Advanced has been created.
- The global screen is open.
- The Inspector window is open.

Procedure

1. Double-click the "System diagnostics window" object in the "Tools" task card. The object is added to the global screen.
2. Select "Properties > Properties > Columns > Devices/Detail view" in the Inspector window.
3. Enable the columns that you require in the device view for Runtime, for example: status, name, address.
4. Enable the properties which you require in the detail view for Runtime, for example: status, name, plant designation.

5. Activate the columns that you require in the diagnostic buffer view, for example, status, name.
6. Customize the column headers, if necessary.
7. Enable "Properties >Properties > Layout > Column settings > Columns moveable" to move the columns in Runtime.
8. Enable "Properties > Properties > Window > Closable" to allow the system diagnostics window to be closed in Runtime.

Result

The system diagnostics window has been added to the global screen. The system diagnostics window will respond to error messages in the plant and display the device affected.

Configure a system diagnostics indicator in a screen to open the system diagnostics window.

Configuring button as system diagnostics indicator

Introduction

Instead of using the object "DiagnosticsIndicator" from the library, you can configure a button, for example, to indicate errors in your plant.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- The "Tools" task card is open.
- A bit graphics list has been created with two different graphics for the statuses.
- A screen is open.
- You have created a system diagnostics view.

Procedure

1. Double-click the "Button" object in the "Tools" task card. A button will be added to the screen.
2. In the Inspector window, select "Properties > Properties > General > Mode > Graphic".
3. Select the bit graphics list under "Graphic > Graphics list".
4. Select the "@DiagnosticsIndicatorTag" tag under "Properties > Properties > General > Tag" in the Inspector window.

Configuring system function to the button

1. Click "Properties > Events" in the Inspector window.
2. Select the "Click" event.

3. Click on "Add function" in the table.
4. Select the "ActivateSystemDiagnosticsView" system function.
5. Select the system diagnostics view.

Result

You have now configured a button which will respond to error messages from the PLC. The button changes its appearance if an error message is output in Runtime.

The button has two states:

- Error
  The system diagnostics view opens when you click the button. The system diagnostics view shows the detail view of the device concerned.
- No error
  The system diagnostics view opens when you click the button. The system diagnostics view shows the device view.

Configuring the system diagnostic view

Introduction

You add a system diagnostics view to your project to get an overview of all devices available in your plant.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- A Comfort Panel or WinCC RT Advanced has been created.
- You have created a screen.
- The Inspector window is open.

Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. Select "Properties > Properties > Columns > Devices/Detail view" in the Inspector window.
3. Activate the columns that you require in the device view for Runtime, e.g. Status, Name, Slot.
4. Activate the columns that you require in the detail view for Runtime, e.g. Status, Name, Plant designation.
5. Activate the columns that you require in the diagnostic buffer view, for example, Status, Name.

6. Enable "Properties >Properties > Layout > Column settings > Columns moveable" to move the columns in Runtime.
7. You can change the column headers under "Properties > Properties > Column headers", if necessary.

Result

The system diagnostics view has been added to the screen. Error for the entire plant are now displayed in the system diagnostics view in Runtime.

Configuring the system diagnostic view

Introduction

For an overview of all integrated connections, you insert a system diagnostics view in your project.

Requirements

- A PLC has been created.
- A Basic Panel has been created.
- An integrated connection has been created in the "Devices & Networks" editor.
- You have created a screen.
- The Inspector window is open.

Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. In the Inspector window, select "Properties > Layout".
3. Enter a number under "Lines per entry", i.e. 5.

Result

The system diagnostics view has been added to the screen.

To obtain the latest alarms, update the diagnostic buffer.

Splitting the view in system diagnostics view

Introduction

The system diagnostics view also offers a split view of the display. You have the option to see the devices and the associated details at a glance.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- An HMI device has been created, for example, a Comfort Panel.
- You have created a screen.
- The Inspector window is open.

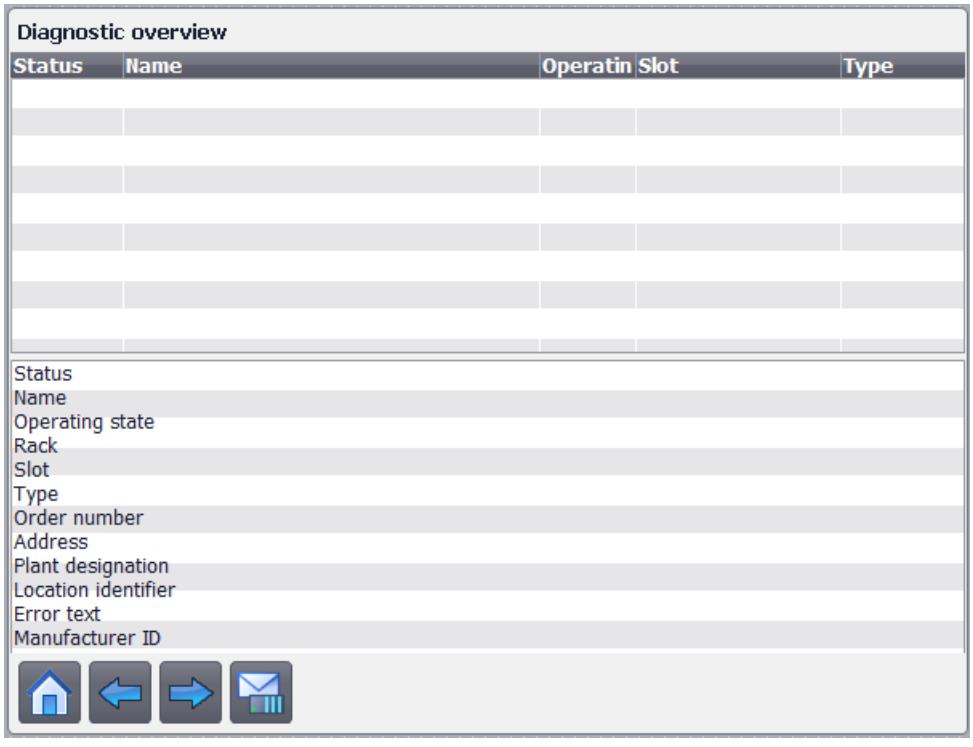
Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. In the Inspector window, click "Properties > Properties > Layout".
3. Activate "Show split view".
4. Activate "Sizing > Auto-size"
5. You may also change the number of lines for the "Device view" and the "Detail view" if required.

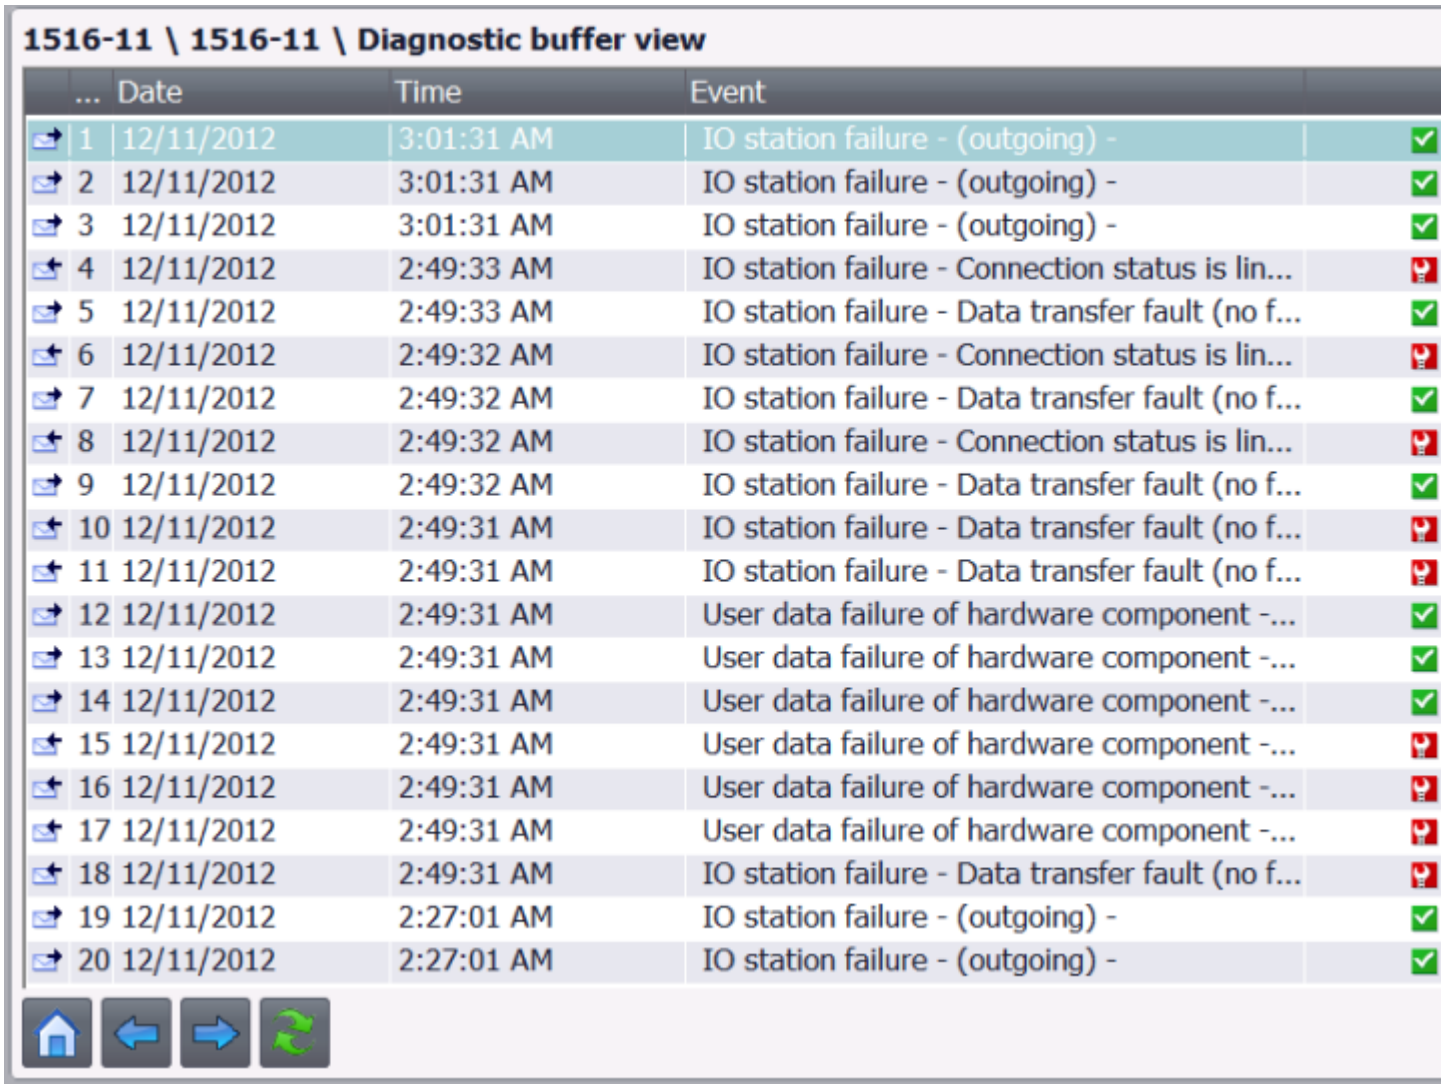
Result

The system diagnostics view has been added to the screen. The system diagnostics view is split into two areas.

The top area shows the device view. The bottom view shows the detail view.



If you open the diagnostic buffer view, the top area displays an overview of the diagnostic buffer and the bottom area displays the details.



Note

Contents of the detail view

The contents of the detail view are only available for integrated connections with S7 1200 and S7 1500 PLCs.

12.4 Working with logs

12.4.1 Working with logs for Runtime Advanced and Panels

12.4.1.1 Log Basics

Introduction

WinCC provides the following types of log for logging process data for HMI Runtime:

- Data logs
- Alarm logs

A data log is used to log process data from an industrial plant.

An alarm log is used to log alarms that occur in the monitored process.

Principle

The two types of log both have roughly the same structure and largely work in the same way. They are very clear and easy to configure. With both types of log you define the same properties for the log. The same logging methods are also available for both types of log.

The following logging methods are available:

- Circular log
  If a circular log is totally full, the oldest entries are overwritten.
- Segmented circular log
  In a segmented circular log, multiple single logs of the same size are filled in succession. When all log segments are filled, the oldest log segment is overwritten.
- Log with level-dependent system alarm
  A system alarm is triggered when a defined level is reached.
- Log with level-dependent triggering of an event
  The "Overflow" event is triggered when the log is full. The "Overflow" event triggers a system function.

12.4.1.2 Properties of Logs

Introduction

You define the properties of a data log in the "Data logs" editor.

You define the properties of an alarm log in the "Alarm log" editor.

The properties of the data log and alarm log are configured in the same way. You configure the properties either directly in the table of the respective editor or in the log properties of the Inspector window.

General properties

- Name
  You can assign any name to the log. The name must contain at least one letter or one number.
- Storage location
  The storage location specifies where the log is saved. The HMI device determines which storage locations are available.
- Size
  The size of a log depends on the type of log and the selected settings.
  - Size of a data log
    The size of a data log is calculated as follows:
    The number of items * the length of each tag value to be logged.
    In the "Properties" window, the maximum size that the log accepts for retention of the currently selected number of data records is displayed in the input field "Number of data records". The maximum log size is limited by the volume of the storage medium.
  - Size of an alarm log
    The size of an alarm log is calculated from the number of data records and the approximate size of an entry. The size of an entry depends on whether the alarm text and the associated tag values are to be logged as well.
- Restart characteristics
  Under Restart characteristics you can specify that the logging starts when Runtime starts. Check the "Enable logging at runtime start" check box.
  You can also control the behavior when Runtime starts. Enable "Reset log" if you want to overwrite existing logged data with the new data. Select the "Append data to existing log" option if you want to retain the existing logged data. This setting adds the data to be logged to an existing log.

See "Auto-Hotspot" and "Auto-Hotspot" for more details.

Note

You can use system functions to control the restarting of a log in Runtime.

Automatic log entries

In Runtime, the following log entries are created as standard:

Entry	File format	Log type	Meaning
RT_DIS	Any	Data log	Indicates that the connection to the log was interrupted at this point in time. (A bold line is shown in the trend view for this time period.)
RT_OFF	Any	Data log	Indicates that Runtime was shut down at this point in time. (No line is shown in the trend view for this time period.)

Entry	File format	Log type	Meaning
RT_ERR	Any	Data log Alarm log AuditTrail[1]	Indicates in the destination log that a copy operation was not successful or was interrupted. (The log copy was not fully created.)
$RT_COUNT	*.CSV *. TXT	Data log Alarm log AuditTrail[1]	This entry was created at the end of the log and serves to increase the system performance when Runtime starts.

[1] The "AuditTrail" logging method is not available for all HMI devices.

See also

Storage locations of logs (Page 4420)

12.4.1.3 Storage locations of logs

Storage location of a log

When you configure a log in WinCC, the available storage locations depend on the HMI device you are using.

HMI devices	Supported logs			Supported storage locations	Supported storage locations
	Alarms	Tags	Audit Trail		
Basic Panels[1]	No	No	No	-	-
Basic Panels 2nd Generation[2]	Yes	Yes	No	a TXT file (Unicode)	USB memory (at USB port)
Panels[3]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (SD) Network drive
Comfort Panels[4]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (SD) Storage card (USB) Network drive
Multi Panels[5]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (MMC) Storage card (USB) Network drive
Mobile Panels[6]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (MMC) Storage card (USB) Network drive

HMI devices	Supported logs			Supported storage locations	Supported storage locations
	Alarms	Tags	Audit Trail		
• Mobile Panels 2nd Generation[7]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (SD) USB memory (at USB port) Network drive
PC systems with Runtime Advanced	Yes	Yes	Yes	a CSV file (ASCII) Database RDB file a TXT file (Unicode)	Local file system Network drive

1 KP 300, KP 400, KTP 1000, TP 1500

2 KTP 400, KTP 700, KTP 900, KTP 1200

3 TP 277 and OP 277 only

4 All HMI devices from the device list

5 MP 277 and MP 377 only

6 Mobile Panel 277 only

7 KTP 400 Mobile, KTP 700 Mobile, KTP 900 Mobile - including fail-safe versions

Note

Logging on network drives

Do not log alarms, tags and Audit Trail directly on a network drive. Power supply can be interrupted at any time. This means there is no guarantee for a reliable operation of logs and audit trails.

Save the logs on your local hard drive or a local storage card. Use the system function "ArchiveLogFile" to save the logs long-term on a network drive. This step ensures reliable operation.

Syntax examples for storage locations

Storage card storage location:

- <\Storage Card MMC\My_Archives\TagLogs>: Saves the log on the storage card MMC in the subdirectory "My_Archives\TagLogs".

Local file system storage location:

- <C:\My_File_Folder\My_Archives\Machine_1>: Saves the log on the local hard disk drive C: in the subdirectory "My_File_Folder\My_Archives\Machine_1"

Network drive storage location:

- <\\ArchiveServer\My_File_Folder\My_Archives\Machine_1>: Saves the log on the "ArchiveServer" in the subdirectory "My_File_Folder\My_Archives\Machine_1".

Naming conventions

Note

The log names must be unambiguous in a project. The name of a log must always be unique, regardless of whether different storage locations are selected for the log.

Note

The characters which can be used in the name of the data source depend on the storage location.

The characters \ / * ? : " < > | are not permitted for the following storage locations:

- File - RDB
- File - CSV (ASCII)
- File - TXT (Unicode)

If the "Database" storage location is used, the following characters may be used: a-z A-Z 0-9 _ @ # $

The characters _ @ # $ cannot be used as the first character of a name.

File - CSV (ASCII)

Data is saved to a CSV file in standard ASCII format.

If you want to read or evaluate logged data without using WinCC Runtime, use the "CSV file" storage location.

Note

Double quotation marks or multiple characters are not permitted as list separators for the "CSV file" storage location. You can find the settings for list separators under "Start > Settings > Control Panel > Regional and Language Options".

File - TXT (Unicode)

Data is stored in Unicode.

This file format supports all characters that can be used in WinCC and WinCC Runtime. For editing, you will need software that can save files in Unicode, such as Notepad.

Note

Use "File - TXT (Unicode)" as the storage location to log Asian languages.

File - RDB

Data is saved with quick access in a proprietary database.

If you require maximum read performance in Runtime, use the "RDB file" storage location.

Database

Data is saved to a database which is set up for ODBC access by the PC administrator.

Log with checksum (Audit Trail)

The following files are generated under special circumstances:

***.keep**

1. If a log is started without checksum and will be continued with a checksum.
2. If you update WinCC with a service pack or a new version and the Audit Trail or the log is continued with the checksum.

The content of the keep file will remain the same when compared with the original csv file or txt file.

***.bak**

If WinCC Runtime has determined a serious, irregular problem in the file.

Data logging (Page 4250)

Properties of Logs (Page 4418)

12.5 Working with recipes

12.5.1 Basics

12.5.1.1 Definition and applications

Introduction

Recipes are collections of related data, for example, machine parameterizations or production data.

Note

Restrictions for recipes

Recipes are not available on the HMI device OP 73:

Examples:

- Machine parameter settings that are needed to convert production to a different product variant.
- Product components that result in different compositions for different end products.

A recipe has a fixed data structure. The structure of a recipe is defined during configuration. A recipe contains recipe data records. These differ in terms of their values, but not their structure.

Recipes are stored on the HMI device or on an external storage medium. Recipe data records are always transferred complete and in a single pass between the HMI device and the PLC. In addition, production data can be imported in runtime, in the form of a CSV file.

Note

Restrictions for Import / Export

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

Using recipes

Recipes can be used in the following situations:

- Manual production
  You select the required recipe data and display it on the HMI device. You modify the recipe data as required and save it on the HMI device. You transfer the recipe data to the PLC.
- Automatic production
  The control program starts transfer of the recipe data between the PLC and HMI device. You can also start the transfer from the HMI device. Production is then implemented automatically. It is not essential to display or modify the data.
- Teach-in mode
  You optimize production data that was optimized manually on the system, e.g. axis positions or filling volumes. The values thus determined are transferred to the HMI device and saved in a recipe data record. You can then transfer the saved recipe data back to the PLC at a later date.

Entering and modifying the recipe data

You enter the data in the individual recipe data records and modify it as required. The following options are available:

- Data entry during configuration
  If the production data exists already, you enter the data in the "Recipes" editor during recipe configuration.
- Entering the data in Runtime
  If you have to frequently modify production data, you can do this directly in Runtime as follows:
  - Enter the data directly on the HMI device.
  - Set the parameters directly on the machine. You then transfer the data from the PLC to the HMI device and save it in the recipe.

12.5.1.2 Examples for using recipes

Recipes are used in the manufacturing industry and mechanical engineering, for example. The following recipes show typical applications which you can implement with the recipe function of WinCC:

- Machine parameter assignment
  One field of application for recipes is the assignment of machine parameters in the manufacturing industry: A machine cuts wooden boards to a certain size and drills holes. The guide rails and drill have to be moved to new positions according to the board size. The required position data are stored as data records in a recipe. You reassign the machine parameters using "Teach in" mode if, for example, a new board size is to be processed. You transfer the new position data directly from the PLC to the HMI device and save it as a new data record.
- Batch production
  Batch production in the food processing industry represents another field of application for recipes: A filling station in a fruit juice plant produces juice, nectar, and fruit drinks in a variety of flavors. The ingredients are always the same, differing only in their mixing ratios. Each flavor corresponds to a recipe. Each mixing ratio corresponds to a data record. All of the required data for a mixing ratio can be transferred to the machine control at the touch of a button.

12.5.1.3 Recipe structure

Introduction

The basic structure of a recipe is illustrated with reference to the filling station in a fruit juice plant.

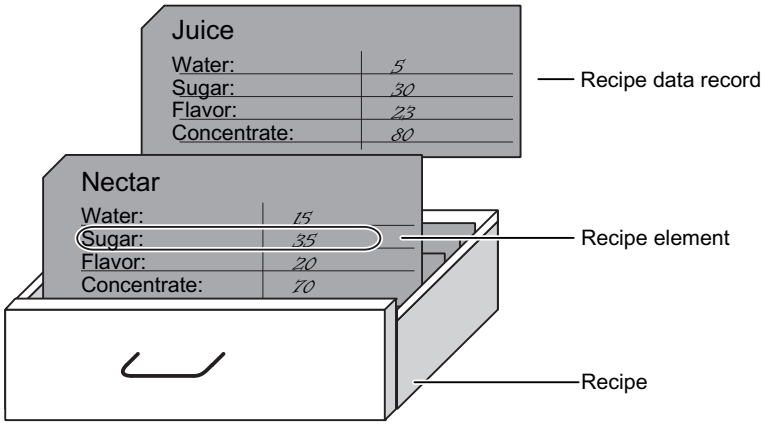
There may be several different recipes in an HMI device. A recipe can be compared to an index card box that contains several index cards. The index card box contains several variants for manufacturing a product family. All the data for each manufacturing variant is contained on a single index card.

Example:

In a soft drinks production plant, a recipe is needed for different flavors. Drink variants include fruit juice drink, juice and nectar.

Recipe

The recipe contains all the recipe data records for the different drink variants.



Recipe data records

Each index card represents a recipe data record needed to manufacture a product variant.

Recipe entries

Each index card in a drawer has the same structure. All the index cards contain fields for the different ingredients. Each field corresponds to a recipe entry. All the records of a recipe thus contain the same entries. The records differ, however, in the value of the individual entries.

Example:

All the drinks contain the following ingredients:

- Water
- Concentrate
- Sugar
- Flavoring

The records for juice drink, fruit juice or nectar differ, however, in the quantity of sugar used in production.

12.5.1.4 Display of recipes

Introduction

You can display recipes in the following ways:

- Recipe view
- Recipe screen

Input in the recipe view and recipe screen

You change the values of a recipe in the recipe screen or recipe view and thus modify the manufacturing process or a machine.

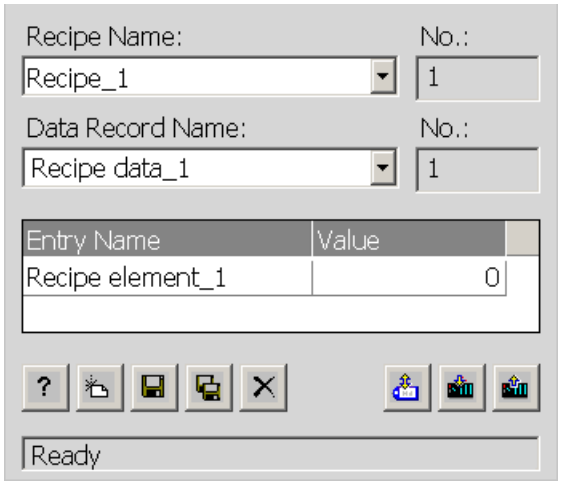
The recipe view and recipe screen can perform the same functions when using recipes. They differ in the following respects:

- Display options
- Operation
- Possibility of transferring data between the PLC and the HMI device

Recipe view

The recipe view is suitable for viewing simple recipes.

The recipe view is an off-the-shelf WinCC display and operator control object for managing recipe data records. The recipe view is always part of a screen. The recipe view shows recipe data records in tabular form. You adapt the appearance and the possible operations to suit your specific needs.

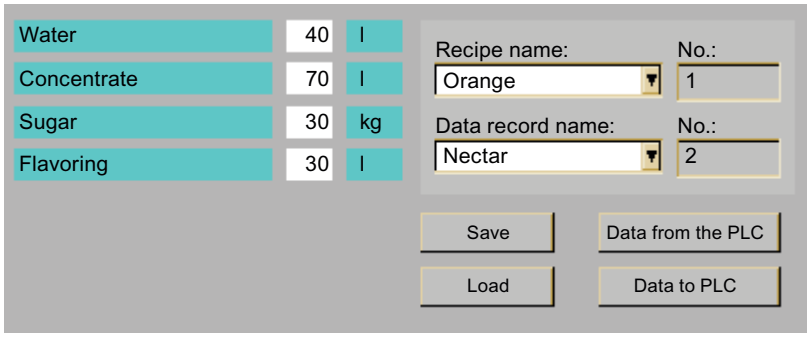


If you are editing recipes with a recipe view in your project, the values are saved in recipe data records. The values are not transferred between the HMI device and PLC until you use the relevant operator control object.

Recipe screen

The recipe screen is an individual screen that contains:

- Input fields for recipe variables
- Operator control objects for using the recipes, e.g. "SaveDataRecord"



The recipe screen is suitable in the following situations:

- Large recipes
- Allocation of recipe fields to the graphic display of the relevant plant area
- Breakdown of the recipe data into several screens

Note

The values of recipe variables are transferred between the PLC and recipe screen at the following times depending on the configuration:

- Immediately after modification
- When a relevant operator control object is used

Synchronizing recipe view and recipe screen

There may be differences in Runtime between the values displayed in the recipe view and the values saved in the associated tags when you edit recipes in both a recipe view and a recipe screen. To prevent this, you must synchronize the recipe data record values with the values of the recipe tags.

A complete recipe data record will always be saved or synchronized.

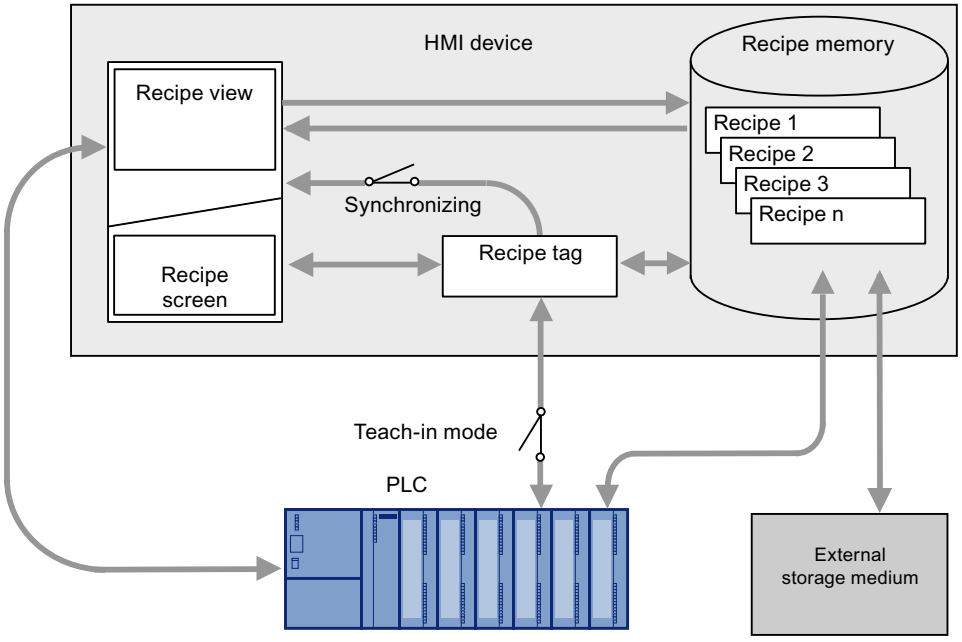
Note

Recipe tags can only be synchronized in the advanced recipe view. Synchronization only takes place if the "Synchronize recipe view and recipe tags" setting is activated for the recipe.

12.5.1.5 Transferring recipe data records

Flow of data in recipes

The following picture illustrates the flow of data in recipes:



Interaction between the components

There is interaction between the following components at runtime:

- Recipe view / recipe screen
  On the HMI device, recipes are displayed and edited in the recipe view or in a recipe screen:
  - The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
  - The values of the recipe tags are displayed and edited in the recipe screen.

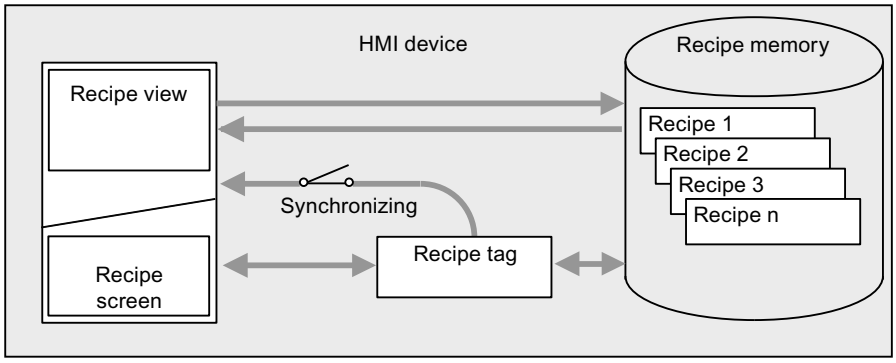
  You synchronize the values displayed in the recipe view with the values of recipe tags according to the configuration.
- HMI device recipe memory
  Recipes are saved in the form of recipe data records in the HMI device's recipe memory.
- Recipe tags
  The recipe tags contain recipe data. When you edit recipes in a recipe screen, the recipe values are stored in recipe tags. The point at which the values of the recipe tags are exchanged with the PLC depends on the configuration.

Note

You can synchronize the recipe tags with the recipe data records so that the same values are saved in both.

Loading and saving recipe data

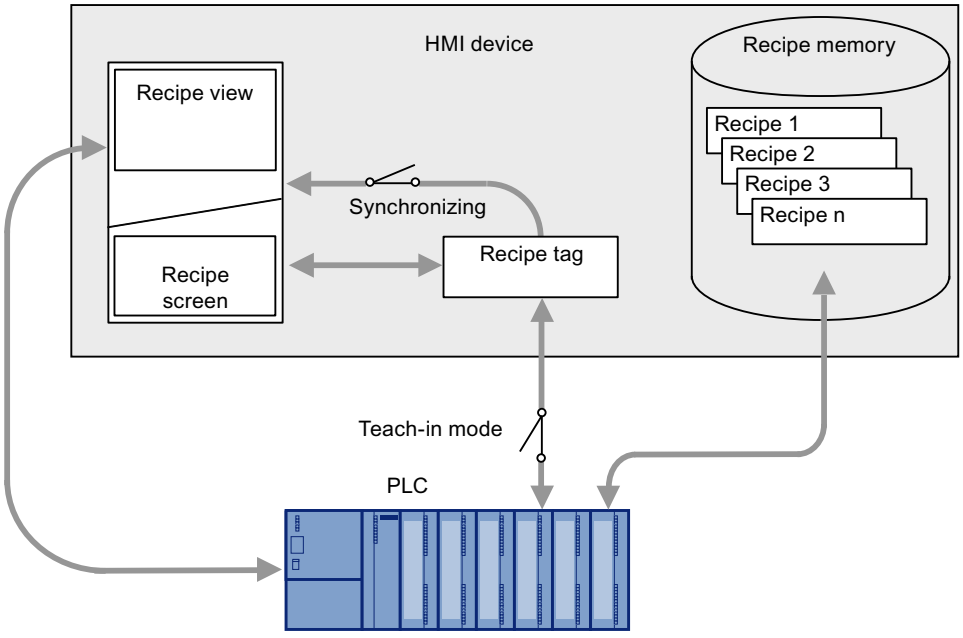
Complete recipe data records are loaded from or saved to the recipe memory on the HMI device in the recipe view.



The values of the recipe data record are loaded from the recipe memory to the recipe tags in the recipe screen. When they are saved, the values of the recipe tags are saved to a recipe data record in the recipe memory.

Transferring the recipe values between the HMI device and the PLC

Complete recipe data records are transferred between the recipe view and PLC.



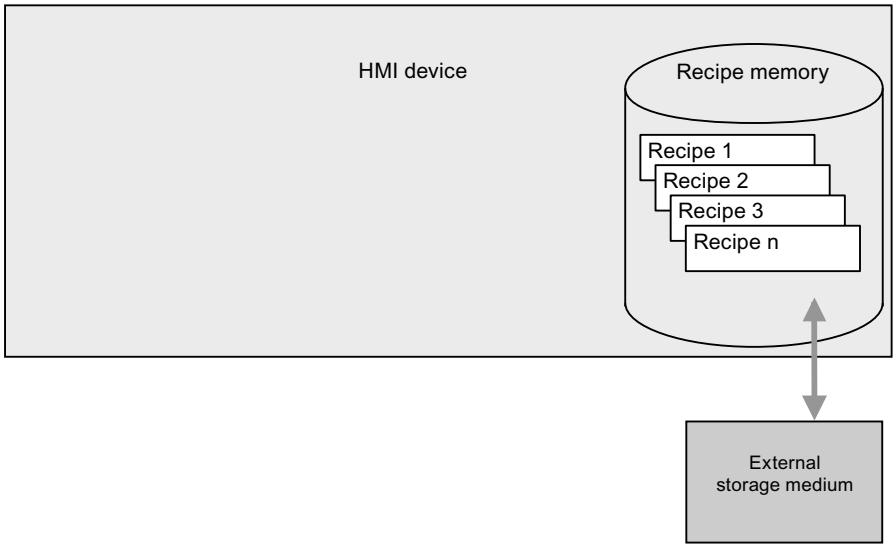
The following transfers are possible between the recipe screen and PLC, depending on the configuration:

- Transferring recipe data records between recipe view and recipe tags
- Immediate transfer of individual modified values between the recipe tags and PLC. The following settings are needed in the recipe in order to do this:
  - "Synchronizing recipe view and recipe tags" is activated.
  - "Manual transfer of individual modified values (teach-in mode)" is deactivated.

Recipe data records can be transferred directly between the HMI device and PLC. In these situations, the display on the HMI device is not essential.

Exporting and importing recipe data records

Recipe data records are exported from the HMI device recipe memory and are saved to a CSV file on the external storage medium. The records can be reimported from the storage medium to the recipe memory.



The following external storage media may be used, depending on the HMI device:

- No storage medium, for example, for basic panels
- Memory card
- USB stick
- Hard disk

12.5.1.6 Configuration of recipes

Introduction

Recipes are configured differently according to the intended use:

- If you are editing recipes with a recipe view in your project, the values are only saved in recipe data records.
- If you are editing recipes in a recipe screen in your project, the values are saved in recipe tags.

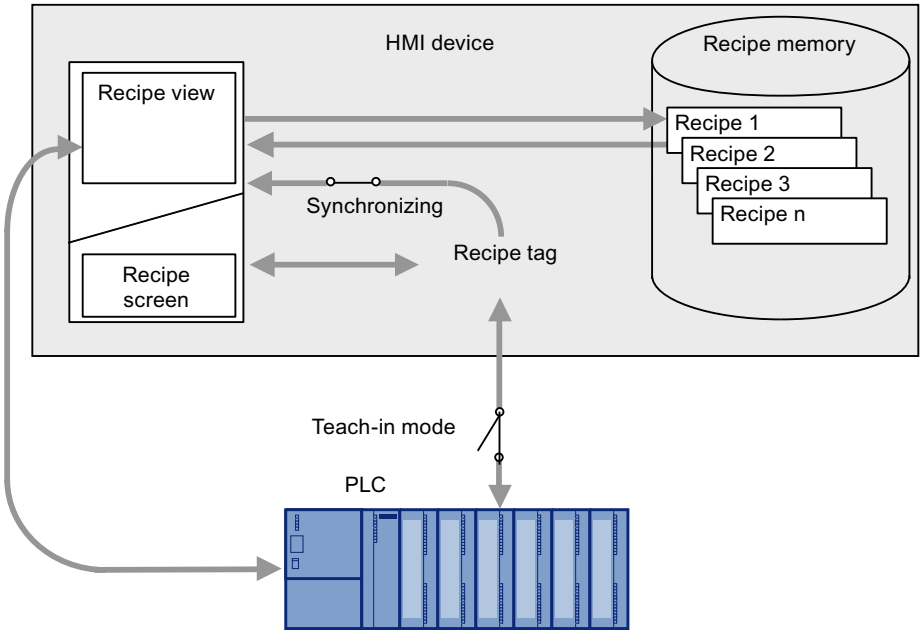
The following possible settings determine how the recipe data records, recipe tags and PLC all interact.

"Synchronizing recipe view and recipe tags" deactivated

The data in a data record is only displayed and can only be edited in the recipe view. If you use data outside the recipe view, they are not synchronized with the recipe view.

"Synchronizing recipe view and recipe tags" activated

There may be differences in Runtime between the values displayed in the recipe view and the values saved in the associated tags when you edit recipes in both a recipe view and a recipe screen. To prevent this, you must synchronize the recipe data record values with the values of the recipe tags.



Note

Recipe tags can only be synchronized in the advanced recipe view.

The values of the recipe view and the associated recipe tags are not synchronized automatically. The recipe tags and the recipe view are not synchronized until you use the operating element with the "RecipeViewSynchronizeDataRecordWithTags" function.

"Synchronize recipe view and recipe tags" activated and "Manual transfer of individual modified values (teach-in mode)" activated

With this setting, modified recipe values are not synchronized immediately between the recipe tags in the recipe screen of the HMI device,and PLC.

There must be an operating element with the "SetDataRecordToPLC" and "GetDataRecordFromPLC" functions present in order to synchronize the values.

If recipe values are changed in the controller, the modified values are displayed immediately in the recipe screen if you use the operating element with the "GetDataRecordFromPLC" function.

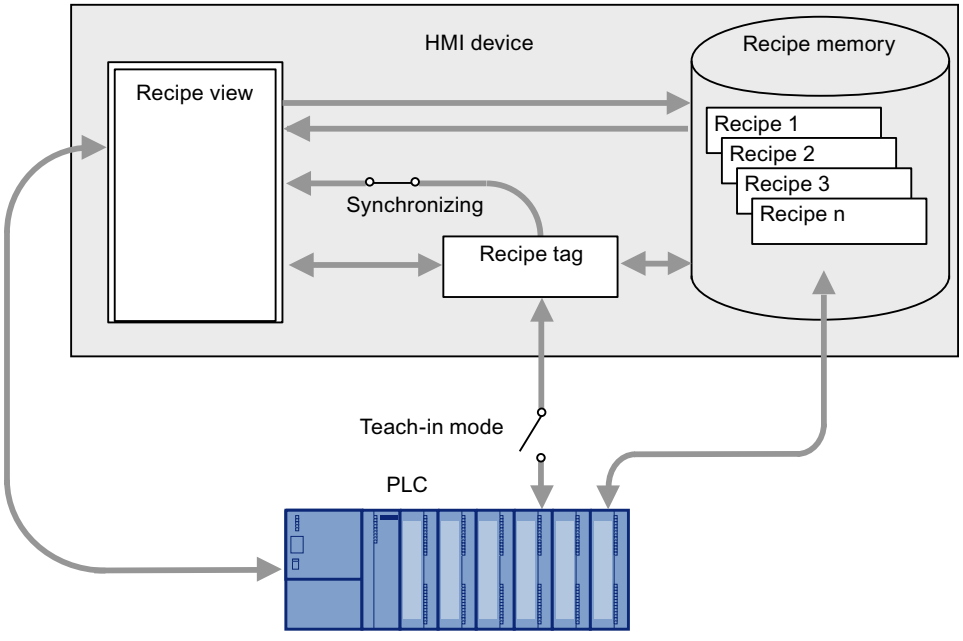
"Synchronize recipe view and recipe tags" activated and "Manual transfer of individual modified values (teach-in mode)" deactivated

With this setting, modified recipe values are synchronized immediately between the recipe tags on the HMI device and PLC.

When you change recipe values in the recipe screen, these changes are applied immediately by the PLC and immediately influence the process.

If recipe values are changed in the PLC, the changed values are displayed immediately in the recipe screen.

12.5.1.7 Special features of some devices



Basic panels, OP 77A, TP 177A and TP 177A (Portrait) respond differently to the other HMI devices in the following respects:

- Only the simple recipe view is supported.
- Recipe tags are always synchronized with the recipe view (see figure above): When the operator changes a value of the recipe element in recipe view, the value of the associated recipe tag will also change.
- Recipe tags are not automatically transferred between the PLC and HMI device when they are modified. Recipe tags are always transferred manually in teach-in mode.
  There must be an operator control object with the "SetDataRecordToPLC" and "GetDataRecordFromPLC" functions present in order to synchronize the values with the PLC.

Note

Restrictions for recipe tags

Generally, in Basic Panels and OP77A, TP177A (Portrait) recipe tags cannot be used, except in a recipe.

Note

Restrictions for Import / Export

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

Notice

Data loss with several recipe views in the screen

Applies only to Basic Panels, OP73, OP77A, TP177A and TP177A (Portrait): If two or more recipe views show the same recipe in a screen, you have a conflict when accessing the data.

The result is data loss and unpredictable status of recipe data.

Make sure the operators do not select and edit the same recipe in different recipe views.

- Display only one recipe in a recipe view.
- Display a different recipe in each recipe view.

Interaction between the components

There is interaction between the following components at runtime:

- Recipe view
  Recipes are displayed and edited in the recipe view on the HMI device.
  The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
- HMI device recipe memory
  Recipes are saved in the form of recipe data records in the HMI device's recipe memory.
- Recipe tags
  The recipe tags contain the values of recipe elements.

12.5.1.8 Synchronization of recipe data records with the PLC

Overview

When recipe data records are transferred between the HMI device and PLC, both communication peers access common communication areas on the other peer.

Recipe data records are always transferred directly. The values of the tags are written directly to or read directly from the configured addresses without being placed on the clipboard.

Data transfer types

There are two ways to transfer recipe data records between the HMI device and PLC:

- Transfer without coordination
- Coordinated transfer via the "Data record" area pointer.

Note

Coordinated transfer

Transfer with coordinated transfer is used to prevent the uncontrolled overwriting of data in either direction in your control program.

Requirements for coordinated transfer

The following requirements apply to coordinated transfer:

- The "Data record" area pointer must be set up for the required connection in the "Communication > Connections" editor.
- In the properties of the recipe "Coordinated transfer of data records" is activated.
- The connection to the PLC is specified in the properties of the recipe with which the HMI device coordinates the transfer.

Coordinated transfer

In the case of coordinated transfer, both the PLC and the HMI device set the status bits in the shared data compartment.

Coordinated transfer of recipe data records can be a useful solution in the following cases:

- The PLC is the "active partner" for the transfer of recipe data records.
- The PLC evaluates information about the recipe number and name, as well as the recipe data record number and name.
- The transfer of recipe data records is started by the following PLC jobs:
  - "Set_data_record_in_PLC"
  - "Get_data_record_from_PLC"

12.5.1.9 "Recipes" editor

Introduction

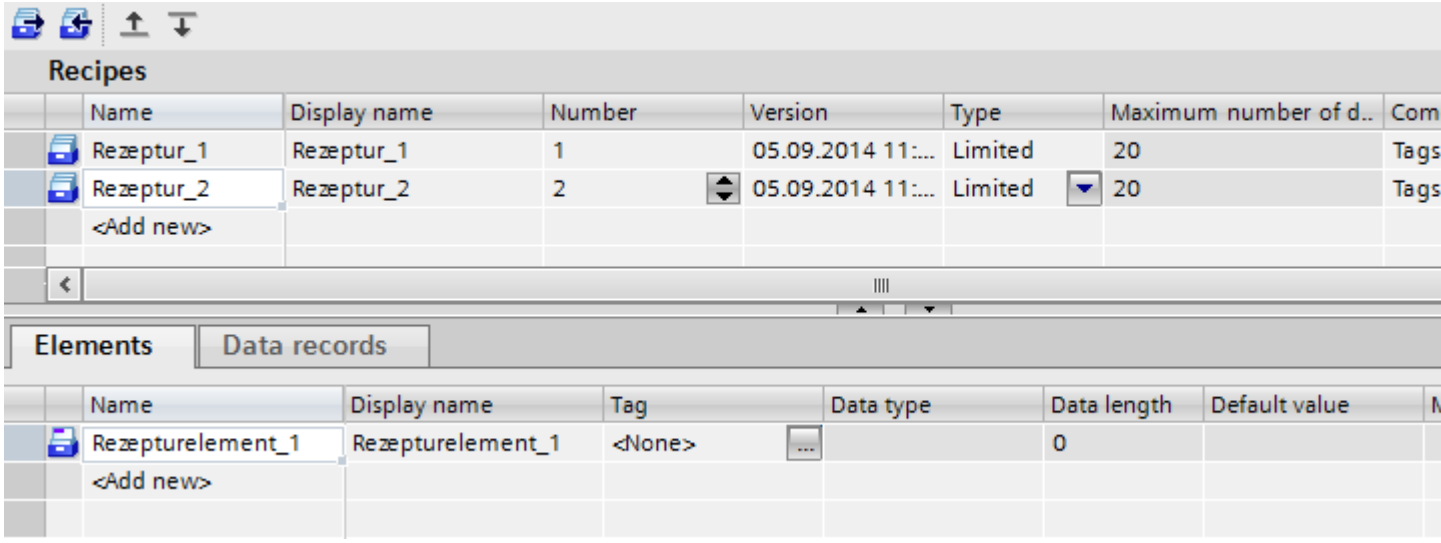
You can create, configure and edit recipes, recipe entries and recipe data records in the "Recipes" editor. The "Recipes" editor also allows you to enter values in recipe data records.

Structure of the "Recipes" editor

You create recipes in the top part of the table editor. You can also configure them there or in the Inspector window.

The bottom part of the table editor has the following tabs:

- Elements
  Define the recipe elements of the selected recipe using the table cells provided here. You can move recipe elements within the table with the shortcut menu commands, "Up" and "Down".
- Data records
  Define the values of the data records of the selected recipe using the table cells provided here.



You can then configure the selected recipe, the recipe element or the recipe data record in the Inspector window. You will find further notes on configuring the components of a recipe under "Configuring Recipes".

Recipe settings

The following settings are available for recipes:

Setting	Description
Name of the recipe	This is a unique identification for the recipe within the HMI device.
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign descriptive names or designations which the operator can associate directly with a recipe, e.g. "fruit juice drink".
Recipe number	This is a unique identification for the recipe within the HMI device.
Version	Information about the recipe. The date and time of the last change to the recipe is set by default.
Path	Defines the storage location for recipes. The recipes are stored as a file.
Size type [fixed]	The recipe data records are limited to a predetermined number by default.
Number of data records [fixed]	Maximum number of data records in a recipe in Runtime. The number is limited by the recipe memory of the HMI device.
Communication type [fixed]	The recipe data records are written directly to the addresses of the recipe tags and read from there.
Tooltip	Tooltip for the recipe which is shown to the operator in Runtime.

Note

Path

The storage location depends on the storage media available on the HMI device.

Basic Panels and OP77A, TP177A (Portrait)

These HMI devices have no external memory. Recipes are always saved in the internal Flash memory. The "Path" setting is therefore not available.

Recipe element settings

You can make the following settings on the "Elements" tab:

Setting	Description
Name of the recipe element	Identifies a recipe element uniquely within the recipe. Enter meaningful names or labels that you can allocate uniquely, such as axis labels on a machine or ingredients such as "Flavoring".
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign meaningful names or designations which the operator can associate directly, e.g. "fruit juice flavoring".
Recipe tag	An assigned tag in Runtime stores the current value of the recipe element in the recipe data record.
Data type	Data type of the recipe tag.
Data length [fixed]	Data length of the recipe tag, depending on the data type.
Text list	Text is assigned to a value or range of values in a text list. You can display this text in an output field, for example. The assigned recipe tag must have the data type of a number. The tag value must be within the range of values of the text list.
Default value	This is used as the default entry when you create a new recipe data record.
Minimum value [fixed]	The smallest representable value of a number-based recipe tag, depending on the type of data.
Maximum value [fixed]	The largest representable value of a number-based recipe tag, depending on the type of data.
Decimal places	Determines how many places a decimal number is rounded to, e.g. 3 decimal places and vice versa by what power of ten an integer value is multiplied, e.g. 1,000.
Tooltip	Tooltip about the recipe element which is shown to the operator in Runtime.

Recipe data record settings

You can make the following settings on the "Data records" tab:

Setting	Description
Name of the recipe data record	Identifies a recipe data record uniquely within the recipe.
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign meaningful names or product numbers which the operator can associate directly with a product, e.g. "yellow fruit juice E231".
Recipe data record number	Identifies a recipe data record uniquely within the recipe.
Recipe elements 1 to n	You can store various values for each recipe element even during configuration. Together with the values of the other recipe elements, a value always forms a recipe data record. You can store multiple recipe data records. If enabled in the transfer settings, the recipe data records are transferred to the HMI device when downloading the project and existing data records on the HMI device are overwritten.
Comment	Comment about the recipe data record

12.5.2 Displaying and Editing Recipes in Runtime

12.5.2.1 Recipe screen and recipe view

You can display and edit recipes on the HMI device with a recipe view or recipe screen.

Recipe view

The recipe view is an off-the-shelf WinCC display and operator control object.

The recipe view is available in the following views:

- As anvanced recipe view
- As simple recipe view

Note
Availability

In basic panels and OP77A, TP177A, only the simple recipe view is available.

Recipe screen

The recipe screen contains an individual screen form for entering the recipes. The screen form contains I/O fields and other display and operator control objects. The recipe functionality is implemented with system functions, e.g. for saving recipe data records.

Note

Availability

In basic panels and OP73, OP77A, TP177A (Portrait), the recipe screens are not available.

12.5.2.2 Simple recipe view

Recipe view

The simple recipe view is a ready-made display element and operator control that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The displayed buttons and information in the columns are adjustable.

The values displayed or entered in the recipe view are saved in recipe data records. The displayed recipe data record can be written into the PLC by buttons or values can be read in from the PLC.

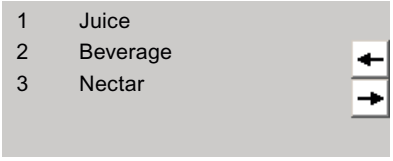
Layout of the display

The simple recipe view consists of three areas:

- Recipe list
- Data record list
- Element list

In the simple recipe view, each area is shown separately on the HMI device. Depending on the configuration, the simple recipe view starts with the recipe list.

The figure below shows an example of the data record list.



Display of values

Note

Processed recipe data record is changed in the background

Only applies for Basic Panels: if an operator has changed a recipe data record and a PLC job wants to read or write any recipe data record of this recipe, the PLC job is stopped and a system alarm is output. On the other hand, the changed value is displayed immediately if only the PLC job and no operator has changed recipe data.

Does not apply for Basic Panels: If an operator has changed a recipe data record and a PLC job has changed the values of the recipe data record concerned, the recipe view is not updated automatically. To update the recipe view, reselect the respective recipe data record.

12.5.2.3 Configuration options of the simple recipe view

The response of the simple recipe view can be defined in the recipe view inspector window.

Note

Validity

Some devices, for example basic panels, only support the simple recipe view.

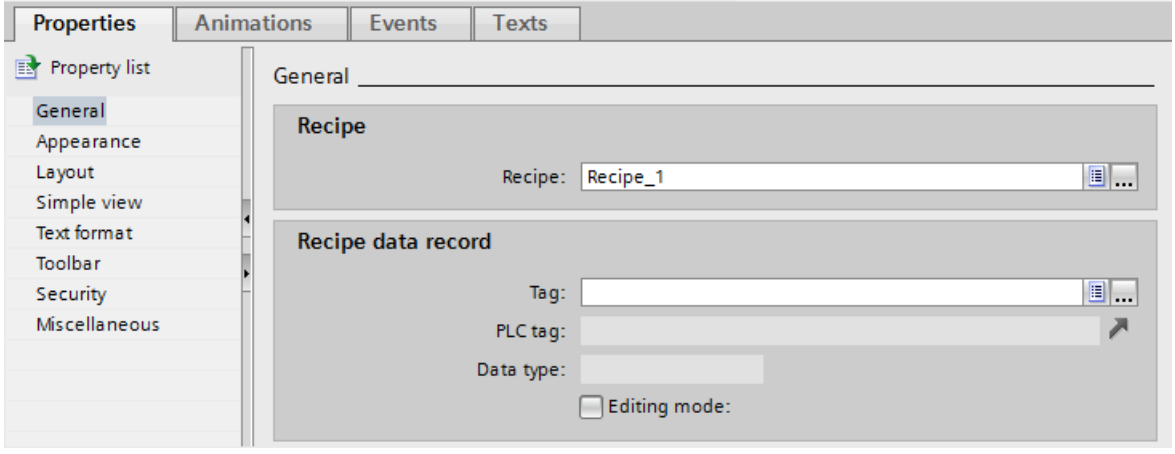
For all other devices, observe the following:

- In the Inspector window, under "Properties > Display > Mode", select "Simple view" as "View type".
- The "Properties > Simple view" area contains additional properties only applicable to the simple recipe view.
- All other properties are also applicable to the advanced recipe view.

Displaying recipe data record values only

To display the recipe data in a recipe view for checking only, proceed as follows:

1. Deselect "Edit mode" in the "General" group.



You cannot create, rename, edit or delete recipe data.

Writing a recipe data record number or name to a tag

A tag to each recipe data record can be configured in the advanced recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe data record is stored in the tag. Conversely, the tag can also be used to select a recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

Proceed as follows:

1. Enter a tag of the "Int" type in the field "Tag", under "Properties > General > Recipe data record".

The number of the recipe data record is stored in a tag.

Configuring an event on the recipe view

Note

Events and buttons

The "Events" register is faded out when a minimum of one button is enabled.

To configure an event for the recipe view, proceed as follows:

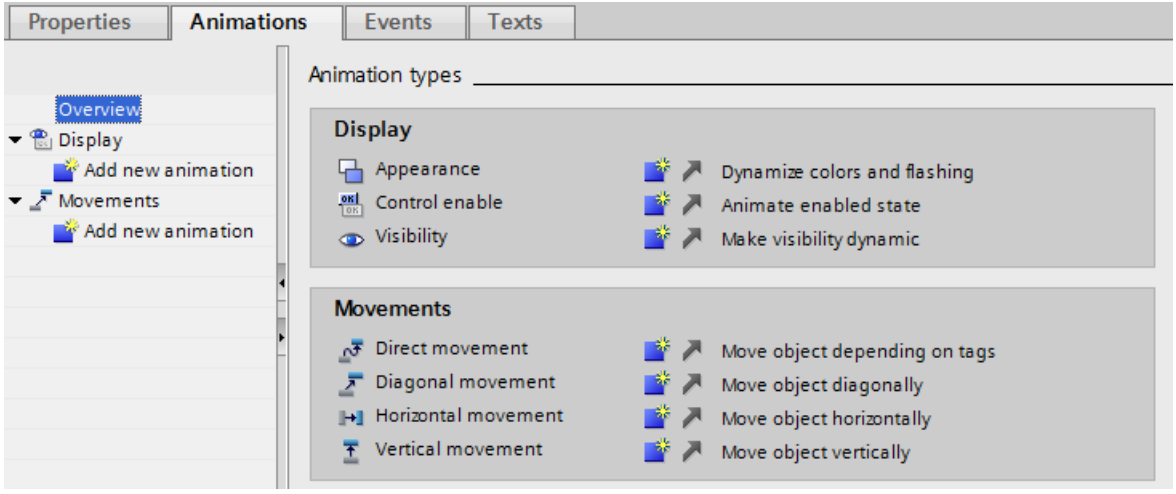
1. Select the recipe view that was added to the screen in the "Screens" editor.
   The properties of the recipe view are shown in the Inspector window.
2. Deactivate all buttons under "Properties > Toolbar" and "Properties > Simple view".
3. In the Inspector window, under "Properties > Events", click the event to be configured, e.g. "Enable".
4. Configure a function list for the event.

The function list is processed when the operator enables the recipe view.

Animation properties of the recipe view

To configure an animation of a recipe view, proceed as follows:

1. Select the recipe view that was added to the screen in the "Screens" editor. The properties of the recipe view are shown in the Inspector window.
2. Click under "Properties > Animations" in the Inspector window.



3. Link a tag to one or more of the following properties.
   - X-Position and y-Position
   - Design: Colors, flashing
   - Operability
   - Visibility
     In the "Animations> Overview" area, all animations are summarized in tabular form. Under "Animations> Tag links > Tag linkage", as well as visibility and position a tag can also be linked to height and width.

Note

Animations and buttons

If all buttons are not disabled, an error message appears whilst compiling the project for windows-CE HMI devices.

Constraints on the simple recipe view

The following functions are not possible in the simple recipe view:

- Synchronizing recipe view and recipe tags
- Writing a recipe number / name to a tag
- Display status bar
- Display data record number
- Display label
- Display table

12.5.2.4 Advanced recipe view

Recipe view

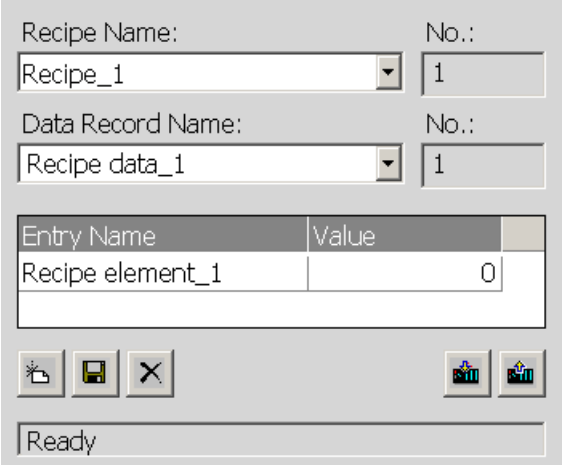
The advanced recipe view is an off-the-shelf display and operator control object that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The buttons, headers and information displayed in the columns are variable.

The values displayed or entered in the recipe view are saved in recipe data records.

Layout of the display

The picture below contains an example of the advanced recipe view:



Display of values

Note

Changing the recipe data record in the background

Applies to the processing of a recipe data record:
If values of the corresponding recipe data record are changed by a control job, the recipe view is not updated automatically.

To update the recipe view, reselect the respective recipe data record.

12.5.2.5 Configuration options of the advanced recipe view

The response of the advanced recipe view in the recipe view inspector window can be determined.

Note

Validity

The following description also applies to the advanced recipe view. In the Inspector window, under "Properties > Display > Mode", select "Advanced view" as "View type".

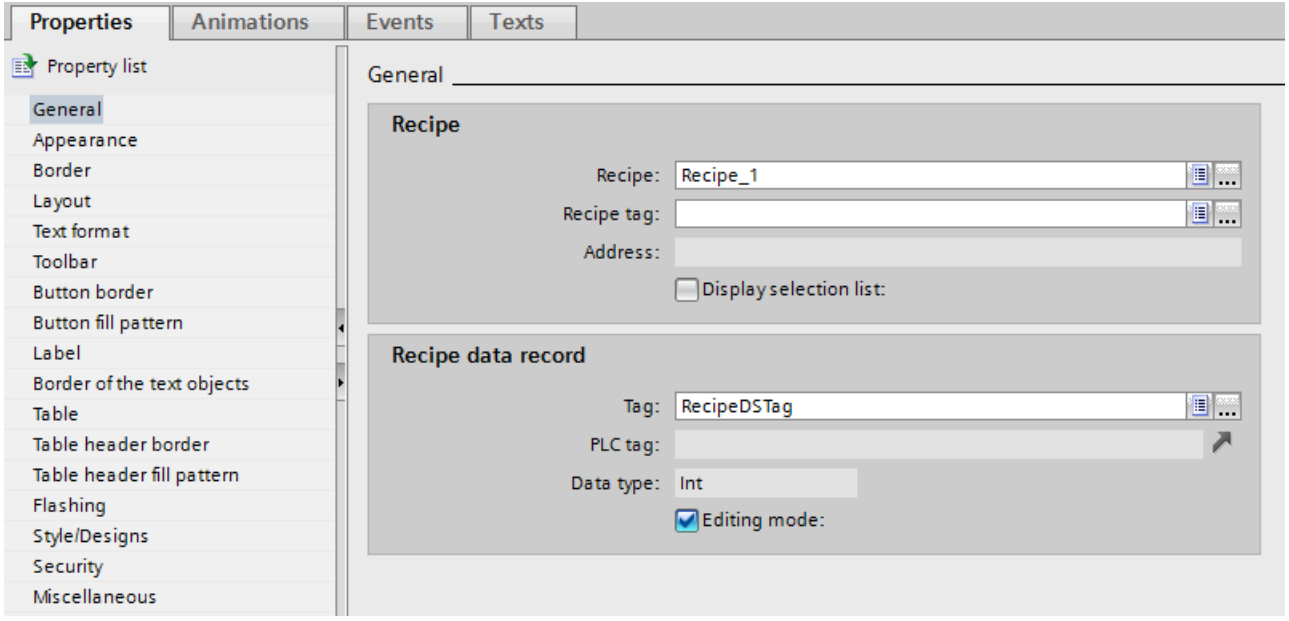
All properties described for the simple recipe view are also applicable in the advanced recipe view, except "Properties > Simple view". The "Simple view" area contains additional properties only applicable to the simple recipe view.

Basic Panels, OP77A and TP177A (Portrait) do not support any advanced recipe view.

Displaying a recipe

To allow access to the recipe data records of a specific recipe only in a screen, proceed as follows:

1. Enter the recipe or select an existing recipe in the "Recipe" field, under "Properties > General".
2. When a recipe is entered in the "Recipe" field, you will have to enable the "Selection list" if you want to display the recipe name in Runtime.



The selected recipe appears in the recipe view.

Writing a recipe number or name and recipe data record number or name to a tag

Both the recipe and the recipe data record can each be configured to a tag in the recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe or recipe data record is stored in the tag. Conversely, the tag can be used to select the recipe or recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

Proceed as follows:

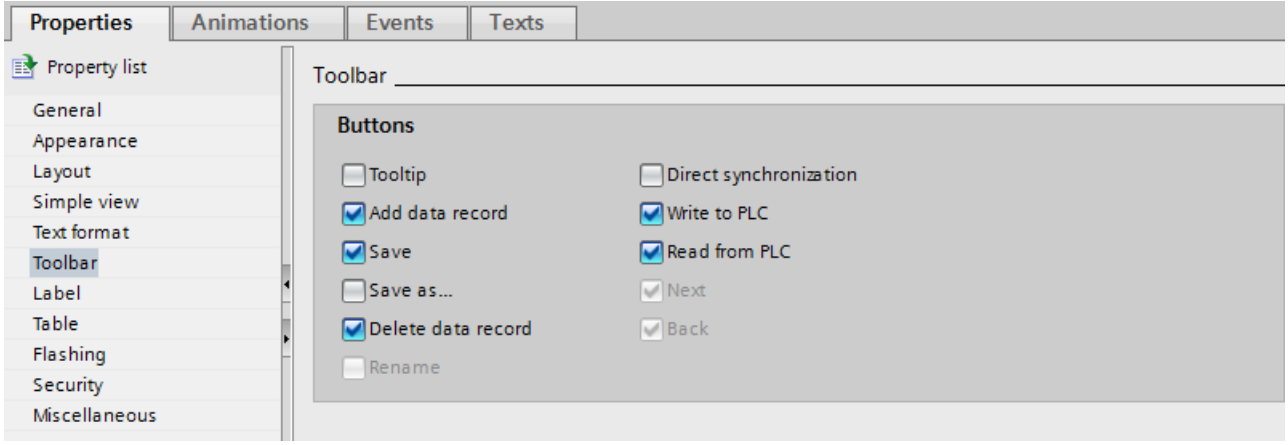
1. Enter a tag of the "String" type in the field "Recipe tag", under "Properties > General > Recipe".
2. Enter a tag of the "Int" type in the field "Tag", under "Properties > General > Recipe data record".

The name of the recipe and the number of the recipe data record are each stored in a tag.

Using the recipe view as a drop-down list

To use the recipe view as a selection field for recipes and recipe data records in a recipe screen, proceed as follows:

1. Select the tag for the recipe name under "General > Recipe > Recipe tag".
2. Select the tag for the recipe data record name under "General > Recipe data record >Tag".
3. Disable the "Edit mode". You cannot create, rename, edit or delete recipe data.
4. In order to select recipes, enable "Show selection list" and make sure that no recipe is selected under "Properties > General > Recipe".
5. Deactivate all buttons under "Properties > Toolbar".



Configuring an event on the recipe view

To configure an event on the recipe view, proceed as follows:

1. Select the recipe view that was added to the screen in the "Screens" editor.
   The properties of the recipe view are shown in the Inspector window.
2. In the Inspector window, click the event you want to configure under "Properties > Events".
3. Configure a function list for the selected event.

The function list is processed when the configured event occurs.

12.5.2.6 Advanced recipe view (as of V13)

Recipe view

The advanced recipe view is an off-the-shelf display and operator control object that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The buttons, headers and information displayed in the columns are variable.

The values displayed or entered in the recipe view are saved in recipe data records.

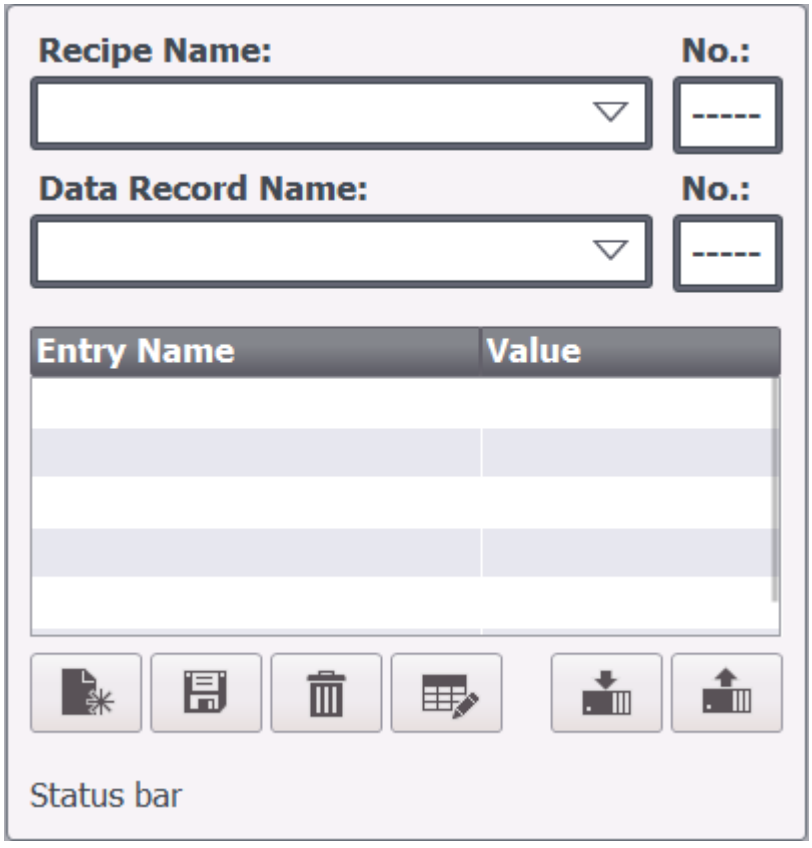
Note

Device dependency of the "Advanced recipe view" object

The "Advanced recipe view" object is available on the HMI devices Basic Panels 2nd Generation, Comfort Panels, Mobile Panels with the device version V13.

Layout of the display

The figure below shows an example of the advanced recipe view:



Show value

Note

Changing the recipe data record in the background

Applies to the processing of a recipe data record:
If values of the corresponding recipe data record are changed by a job mailbox, the recipe view is not updated automatically.

To update the recipe view, you must select the respective recipe data record again.

See also

Example of creating a recipe (Page 4485)

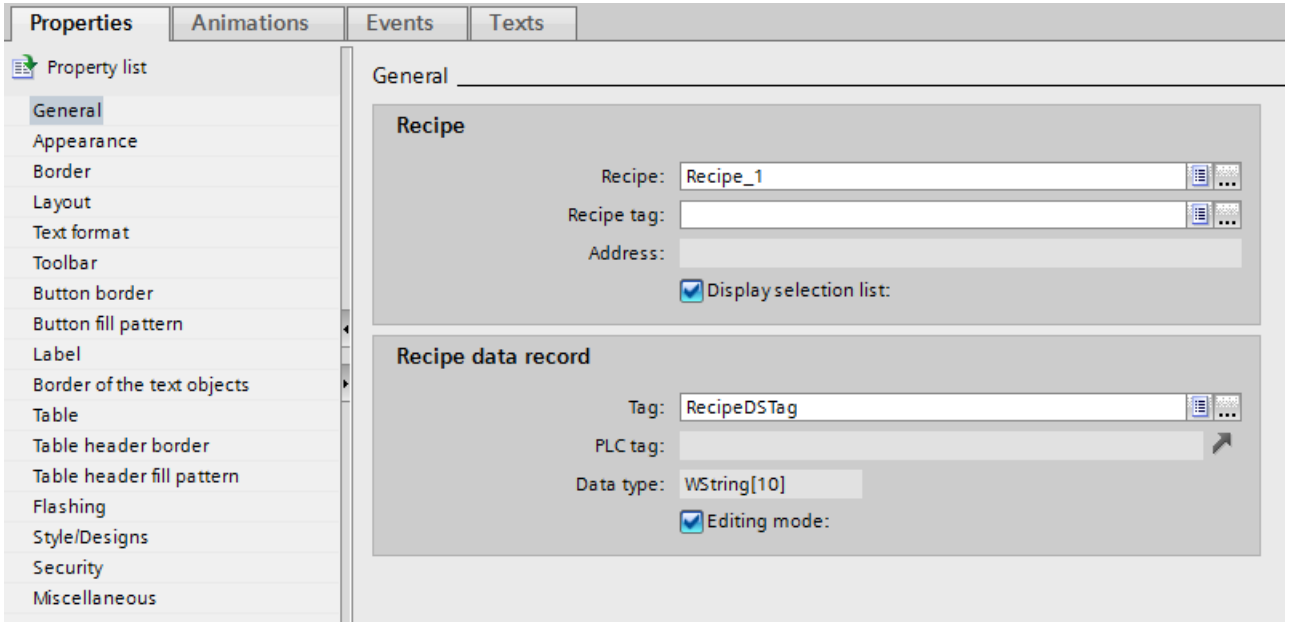
12.5.2.7 Configuration options of the advanced recipe view (V13 or higher)

You can specify the behavior of the advanced recipe view in the Inspector window of the recipe view.

Displaying a recipe

To only allow access to the recipe data records of a specific recipe in a screen, follow these steps:

1. Enter the required recipe or select an existing recipe in the "Recipe" field under "Properties > General".
2. When a recipe is entered in the "Recipe" field, you have to select "Display selection list" if you want to display the recipe name in Runtime.



The selected recipe appears in the recipe view.

Writing a recipe number or name and recipe data record number or name to a tag

Both the recipe and the recipe data record can each be configured to a tag in the recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe or recipe data record is stored in the tag. Conversely, the tag can be used to select the recipe or recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

To do this, follow these steps:

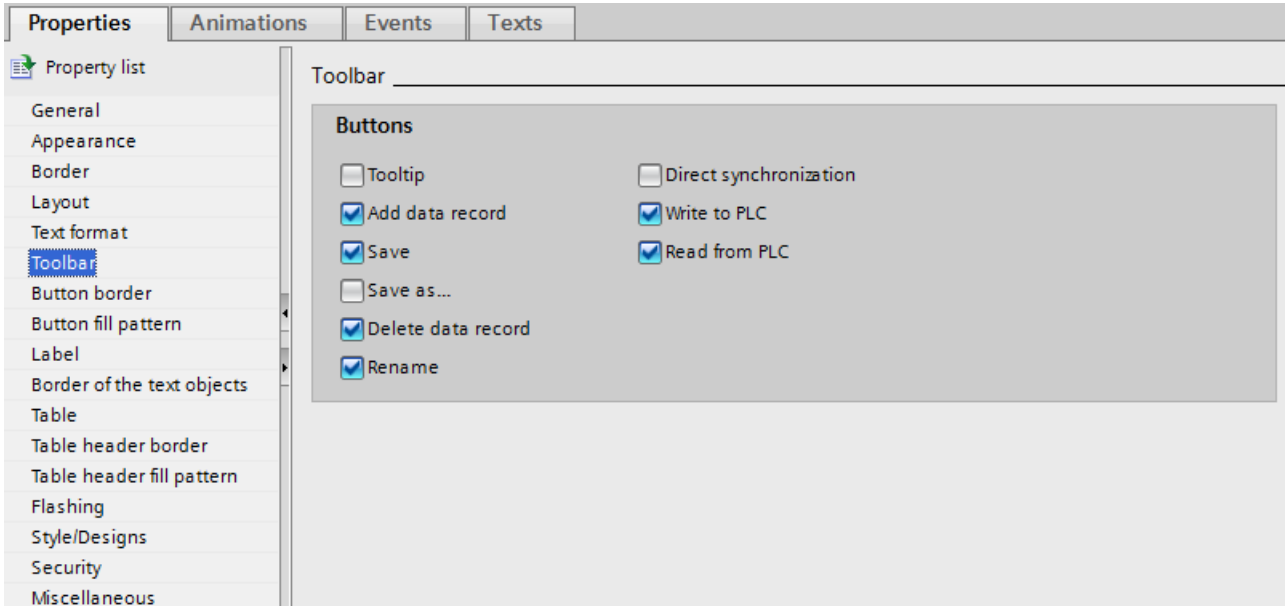
1. Enter a tag of the "String" type in the "Recipe tag" field under "Properties > General > Recipe".
2. Enter a tag of the "Int" type in the "Tag" field under "Properties > General > Recipe data record".

The name of the recipe and the number of the recipe data record are each stored in a tag.

Using the recipe view as selection field

To use the recipe view as a selection field for recipes and recipe data records in a recipe screen, follow these steps:

1. Select the tag for the recipe name under "General > Recipe > Recipe tag".
2. Select the tag for the recipe data record name under "General > Recipe data record >Tag".
3. Disable the "Editing mode". You cannot create, rename, edit or delete recipe data.
4. In order to select recipes, enable "Display selection list" and make sure that no recipe is selected under "Properties > General > Recipe".
5. Deactivate all buttons under "Properties > Toolbar".



Configuring an event on the recipe view

To configure an event on the recipe view, follow these steps:

1. Select the recipe view that was added to the screen in the "Screens" editor.
   The properties of the recipe view are displayed in the Inspector window.
2. In the Inspector window, click the event you want to configure under "Properties > Events".
3. Configure a function list for the selected event.

The function list is processed when the configured event occurs.

See also

Example of creating a recipe (Page 4485)

12.5.2.8 Response of the recipe view in Runtime

Screen change

If you change to another screen and have not yet saved changes to the recipe data in the recipe view, you will be prompted to save the recipe data. The recipe name and the name of the recipe data record are displayed to show which recipe data have not been saved yet.

Create, change, copy or delete recipe data records

If you attempt to create a new recipe data record and a recipe data record already exists, a system alarm will appear on screen.

Operating the recipe view with function keys

The Recipe view can be operated with function keys, e.g. if the HMI device does not have touch functionality. You can assign functions such as "SaveDataRecord" to the function keys on the HMI device.

Display after import of recipe data

Note

Availability

Import and export of recipe data is not available for Basic Panels and OP77A, TP177A (Portrait).

If you open the recipe view during the import of recipe data, only the recipe data that is already completely imported will be displayed. The recipe view is not automatically updated with a data import. In order to have a complete view of all the recipe data, do not open the recipe view until the system prompts you that the recipe data has been imported successfully. Alternatively, update the recipe view after successful completion of the import procedure.

Updating tag for recipes and recipe data records

Note

Availability

Tags for recipes and recipe data records are not available for Basic Panels and OP77A, TP177A (Portrait).

The current recipe data record or its number can be saved to a tag, depending on the configuration. The tag will be updated under the following conditions:

- The recipe data record has been loaded.
- The screen with the recipe view was not exited during loading.

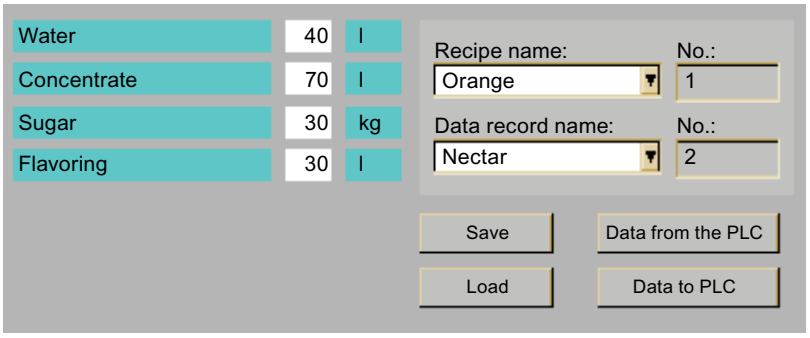
This operation may take some time.

12.5.2.9 Basics on the recipe screen

Introduction

The recipe screen contains an individual screen form for entering the recipes. The screen form contains I/O fields and other display and operator control objects. The recipe functionality is implemented with system functions, e.g. for saving recipe data records.

The picture below contains an example of a recipe screen:



Note

Availability of recipe screens

Basic Panels and OP73A, OP77A, TP177A (Portrait) do not support any recipe screens.

Principle

Configuring a recipe screen allows you to customize the display. You can spread large recipes over several screens according to topic and display them clearly using features such as graphical display and operator control objects.

- Spreading recipes over several screens according to topic
  - You can distribute recipe data records with multiple entries across several screens. For example, for each plant area you can configure a screen containing the associated screen forms for the recipe data records.

  Spreading recipes over several screens is useful for HMI devices with small displays as they avoid having to scroll through tables in Runtime.
- Visual machine simulation
  You can visually simulate your machine in a screen using graphical screen objects. This enables you to display parameter settings more clearly by positioning I/O fields immediately next to machine elements such as axes or guide rails. which produces a direct relationship between the values and the machine.

Synchronizing recipe values

To enter recipe data record values outside the advanced recipe view in the configured I/O fields, activate "Synchronize recipe view and recipe tags" under "Properties > Synchronization" in the recipe properties.

The "Synchronize recipe view and recipe tags" option is not available for the simple recipe view.

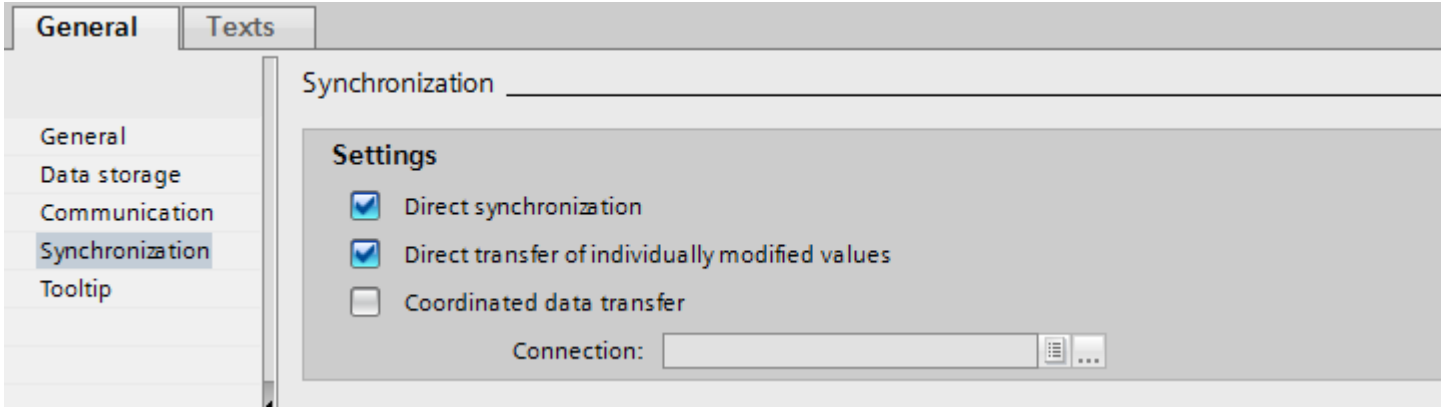


Figure 12-4 Recipes_Synchronization_Advanced

Transferring recipe values automatically

If the entered recipe values must be immediately transferred to the connected PLC in Runtime, deactivate "Manual transfer of individual modified values (teach-in mode)" under "Properties > Options".

Configure the "SetRecipeTags" system function if you want to enable and disable the immediate transfer of entered recipe values in Runtime.

System functions

The following system functions are available for operator control of a recipe screen:

- ImportDataRecords
- ExportDataRecords
- LoadDataRecord
- SaveDataRecord
- SetDataRecordTagsToPLC
- GetDataRecordTagsFromPLC

The following system functions are available for operator control of the recipe view when it is being used in the recipe screen:

- RecipeViewSaveDataRecord
- RecipeViewSaveAsDataRecord
- RecipeViewSynchronizeDataRecordWithTags

- RecipeViewDeleteDataRecord
- RecipeViewNewDataRecord
- RecipeViewGetDataRecordFromPLC
- RecipeViewRenameDataRecord (for simple recipe view only)
- RecipeViewShowOperatorNotes
- RecipeViewMenu (for simple recipe view only)
- RecipeViewOpen (for simple recipe view only)
- RecipeViewBack (for simple recipe view only)

The system functions for loading, saving and transferring recipe data records and recipes are located in the "Recipes" group.

12.5.3 Configuring Recipes

12.5.3.1 General configuration procedure

Carry out the following configuration steps when you create a new recipe:

Step	Description
1	Define the structure of the recipe.
2	Create tags according to the recipe structure. Assign process names to these tags.
3	Create the recipe.
4	Enter the required properties for the recipe: • Language-dependent view name of the recipe • "Coordinated transfer of data records" option Not for Basic Panels: • Recipe storage location • "Synchronize recipe view and recipe tags" option • "Manual transfer of individual modified values (teach-in mode)" option
5	Create the recipe elements and enter the required properties: • Language-dependent view name of the recipe elements • Tag binding of the recipe elements • Standard values and decimal places (power of ten) for the recipe elements
6	Create the recipe data records. Enter the language-specific display names for the recipe data records.
7	Configure a screen with recipe view or a recipe screen.

Note

Basic Panels and OP77A, TP177A (Portrait)

The selection of the storage location is not available for these devices. The recipes are always saved in the internal Flash memory.

Recipe tags cannot be used outside a recipe, e.g. not in I/O fields, not in alarms as trigger tags, not in systems functions as parameters, etc.

Note

Restrictions recipe view and recipe image

Only the simple recipe view is available in Basic Panels and OP77A, TP177A. Recipe images are not available in Basic Panels and OP73, OP77A, TP177A (Portrait).

12.5.3.2 Creating and Editing Recipes

Creating a new recipe

Introduction

To create a complete recipe, start by creating a new recipe, assign the corresponding recipe elements and then define the associated values in a recipe data record.

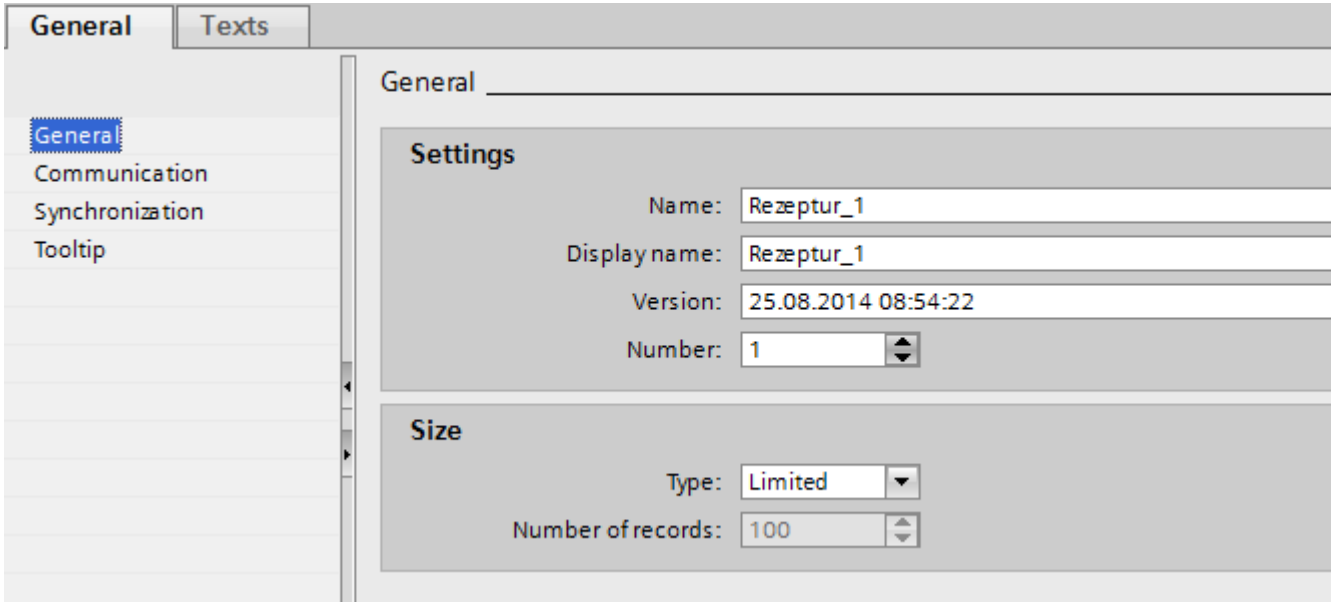
Requirement

- The tags for the recipe have been created.
- The "Recipes" editor is open.

Create recipe

Create a recipe as follows:

1. Click "Add" in the first free row of the table in the "Recipes" editor.
   The new recipe is created and displayed on a line.



2. Enter a descriptive name for the recipe under "Name" in the "General" area.
   This name identifies the recipe unambiguously within the project.
3. Select "Display name" to enter the language-specific name to be displayed in runtime.
4. Select a recipe number in "Number".
   The number identifies the recipe unambiguously within the HMI device.
   The recipe is automatically assigned a version that indicates the date and time of the last change. As an alternative, you can enter specific information relating to the recipe.
5. Specify the storage location for recipe data records in "Data medium". The options offered depend on the specific HMI device used.

   Note

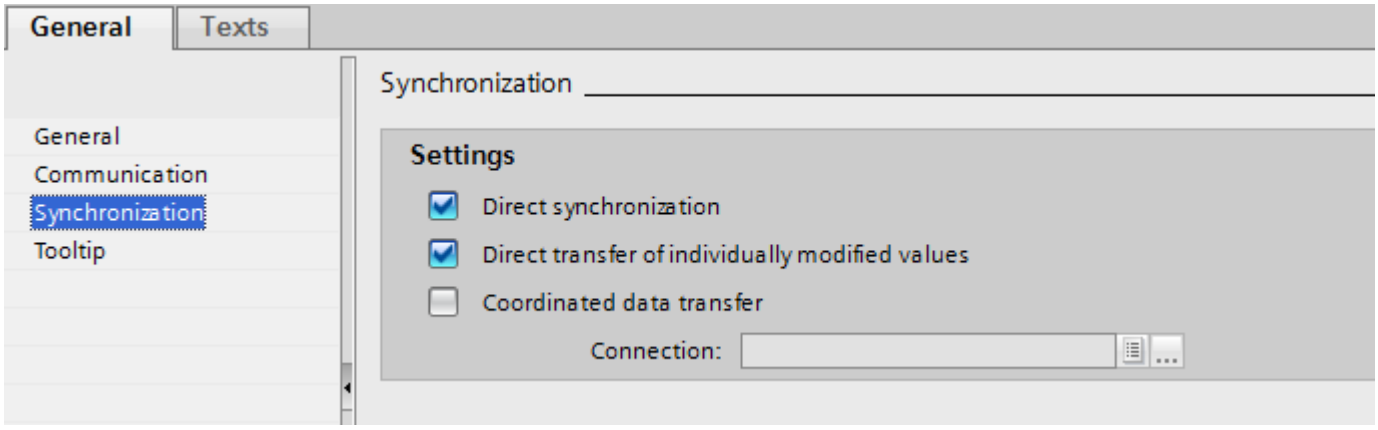
   Basic Panels and OP77A, TP177A (Portrait)

   The selection of the storage location is not available for these devices. The recipes are always saved in the internal Flash memory.

   Recipe tags cannot be used outside a recipe, e.g. not in I/O fields, not in alarms as trigger tags, not in systems functions as parameters, etc.

6. Enter a tooltip that is shown to the operator in runtime.

7. To compare recipe tags which are configured in I/O fields with the recipe view in Runtime, activate "Synchronize recipe view and recipe tags" in the Inspector window under "Properties > Synchronization".



Note

Basic Panels and OP77A, TP177A (Portrait)

Because the recipe tags cannot be additionally used in I/O fields in screens for Basic Panels, the "Synchronize recipe view and recipe tags" is not available; you will also not be able to use the "Manual transfer of individual modified values (teach-in mode)" option.

8. Deactivate "Manual transfer of individual modified values (teach-in mode)" to specify that the recipe tags are automatically transferred to the PLC when editing the I/O fields.
9. Activate "Coordinated transfer of data records" to monitor the transfer of recipe data in Runtime using area pointers.
10. Select the appropriate connection to the PLC for coordinated transfer under "Synchronize with".

Create recipe element

To create recipe elements, proceed as follows:

1. Click the "Elements" tab.
2. Click "Add" in the first free line of the table editor.
   A new recipe element is created.
3. Enter a descriptive name for the element under "Name".
   The name identifies the element uniquely within the recipe.
4. Enter a language-specific display name for the element under "Display name".
   The display name appears in the recipe view, for example, in runtime.

5. Select the tag you want to link to the recipe element under "Tag".
   The value of the recipe data element is saved in Runtime in this tag, which is stored in a recipe data record.

	Name	Display name	Tag	Data type	Data length	Default value	Mini
	Rezepturelement_1	Rezepturelement_1	RecipeDSTag	Int	2	0	-327
	<Add new>						

6. Enter a tooltip.
   The tooltip is shown to the operator in Runtime.
7. Under "Default value", enter the value that you want to use as the default entry when you create a new recipe data record.
8. To assign text to a value or range of values, select the relevant text list here. The assigned recipe tag must have the data type of a number. The tag value must be within the range of values of the text list.
   The text stored in the text list is displayed in an output field, for example, in Runtime.
9. Determine exactly how many places a decimal number is rounded to in the "Decimal places" column, e.g. 3 decimal places and vice versa by what power of ten an integer value is multiplied, e.g. 1,000.
   Examples for 3 decimal places: Entering "5" for a recipe element with the "Integer" data type gives the value "5000". Entering "5.6789" for a recipe element with the "Real" data type gives the value "5.679".
10. Create as many recipe entries as needed for the recipe. The maximum number of recipe entries possible depends on the HMI device being used.

	Name	Display name	Tag	Data type	Data length	Default value	Mini
	Rezepturelement_1	Rezepturelement_1	RecipeDSTag	Int	2	0	-327
	Rezepturelement_2	Rezepturelement_1	RecipeDSTag1	Int	2	0	-327
	Rezepturelement_3	Rezepturelement_1	RecipeDSTag2	Int	2	0	-327
	Rezepturelement_4	Rezepturelement_1	RecipeDSTag3	Int	2	0	-327

Create recipe data record with known recipe values

To create recipe elements, proceed as follows:

1. Click the "Data records" tab.
2. Click "Add" in the first free line of the table editor.
   A new recipe data record is created. The recipe data record has a separate column for every recipe element created in the recipe.

Elements | Data records

Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
Recipe_data_record_1	Recipe_data_record_1	1	0	0	0	0	
<Add new>							

3. Enter a descriptive name under "Name".
   The name identifies the data record uniquely within the recipe.
4. Enter a language-specific name under "Display name".
   The display name appears in the recipe view, for example, in runtime.
5. Enter a recipe data record number under "Number".
   The recipe data record number identifies the recipe data record uniquely within the recipe.
6. If you already know the recipe values at the configuration stage, you can enter the relevant value for each recipe element.

Elements | Data records

Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
Beverage	Beverage	1	30	70	45	600	
<Add new>							

7. Create as many data records as you need for the recipe.

Elements | Data records

Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
Beverage	Beverage	1	30	70	45	600	
Nectar	Nectar	2	50	50	10	300	
Juice	Juice	3	5	95	3	100	
<Add new>							

Enter the values in runtime

The following options are available for entering values in the recipe data records at runtime:

- Transfer data directly from the PLC (Teach-in mode)
- Import of values from a CSV file
- Input values on the HMI device

Note
Basic Panels and OP77A, TP177A (Portrait)

The import of values is not available for these devices.

Result

The complete recipe is configured.

Recipe data records with date or time stamp

If you use date or time data, make sure that the system setting for time and date on the configuring computer match those on the target system. Example: You load a recipe data record on the target system at 13:55 in which 14 h is stored as the processing time. If it is already 14:05 on the target computer, the recipe will not be processed. If an operator processes the recipe, change information will not written back correctly into the database.

After loading to the target system, check the recipes with date or time stamps on the target system.

Editing a recipe

Purpose

You want to modify, extend or delete parts of a recipe.

Requirement

- You have created at least one recipe.
- The "Recipes" editor is open.

Changing recipe settings

To change the recipe settings, proceed as follows:

1. Select the recipe that you want to change in the "Recipes" editor.
   The Inspector window opens.
2. Change the recipe configuration in the Inspector window.

You change recipe elements and recipe data records in the same way.

Change recipe values

To change recipe values, proceed as follows:

1. Select the recipe whose values you want to change.
2. Click the "Data records" tab.
3. Enter the new values in the value columns.

Adding a recipe element

To add more recipe elements to a recipe, proceed as follows:

1. Select the recipe to which you want to add more elements in the "Recipes" editor.
2. Click the "Elements" tab.
3. Click "Add" in the first free line.
   The recipe element is created.
4. Configure the recipe element.

You add recipe data records in the same way.

Managing recipes

Requirement

- You have created a recipe with recipe elements and recipe data record.
- The "Recipes" editor is open.

Renaming recipes

We distinguish between internal names and display names for recipes, recipe entries and recipe data records.

To rename recipe elements, proceed as follows:

1. Select the recipe that you want to rename.
   The Inspector window opens.
2. Select the "Rename" command from the shortcut menu.
3. Enter the new name.
   You rename recipe elements and recipe data records on the relevant tab in the same way.

Note

The view names in the "Recipes" editor can also be renamed under "Languages & Resources > Project Texts". This possibility is useful when you have already configured in several languages for example.

Copying and pasting recipes

To copy and paste recipes, proceed as follows:

1. Select the recipe that you want to copy.
2. Select the "Copy" command from the shortcut menu.
3. Select the "Paste" command from the shortcut menu in the first free table row.

The copied recipe is pasted into the table. The recipe elements and recipe data records are also copied in the appropriate tab with the recipe.

You also copy the recipe elements and recipe data records on the appropriate tab in the same way.

If a recipe data record of the same name already exists, the name of the copied recipe data record is extended by one digit. This ensures that the name is unique. Recipe data records can only be copied or pasted within the same recipe.

Deleting a recipe

To delete a recipe, proceed as follows:

1. Select the recipe that you want to delete.
2. Select the "Delete" command from the shortcut menu.
   The recipe is deleted.

You delete recipe elements and recipe data records on the relevant tab in the same way.

Note

When a recipe is deleted, the recipe data records contained in the recipe are also deleted.

Note

When you delete a recipe element, the associated values in the recipe data records are also deleted. The assigned tags are retained.

12.5.3.3 Configuring the display of recipes

Configuring the simple recipe view

Requirement

- The recipe has been created.
- The "Screens" editor is open.
- The screen has been created and opened.

Notice

Data loss with several recipe views in the screen

Applies only to Basic Panels, OP73, OP77A, TP177A and TP177A (Portrait): If two or more recipe views show the same recipe in a screen, you have a conflict when accessing the data.

The result is data loss and unpredictable status of recipe data.

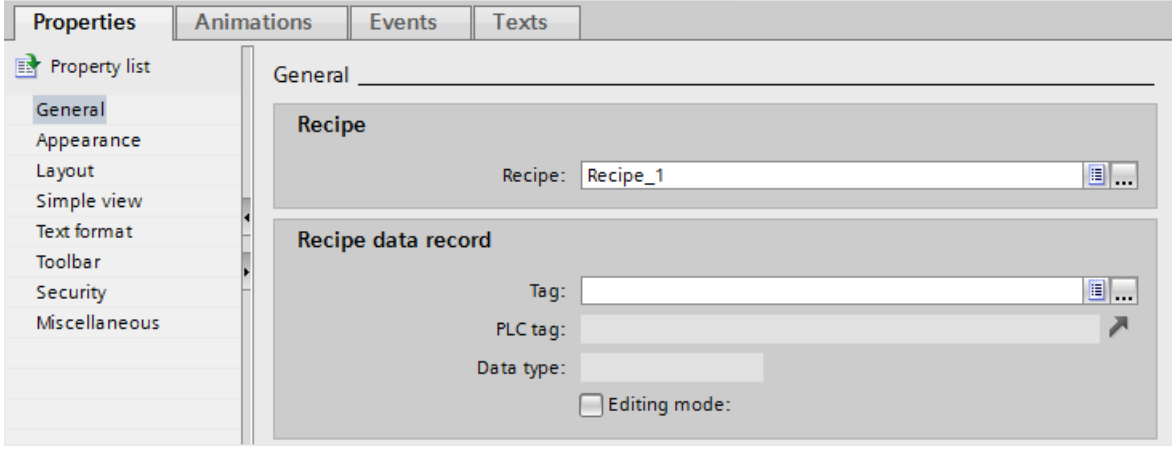
Make sure the operators do not select and edit the same recipe in different recipe views.

- Display only one recipe in a recipe view.
- Display a different recipe in each recipe view.

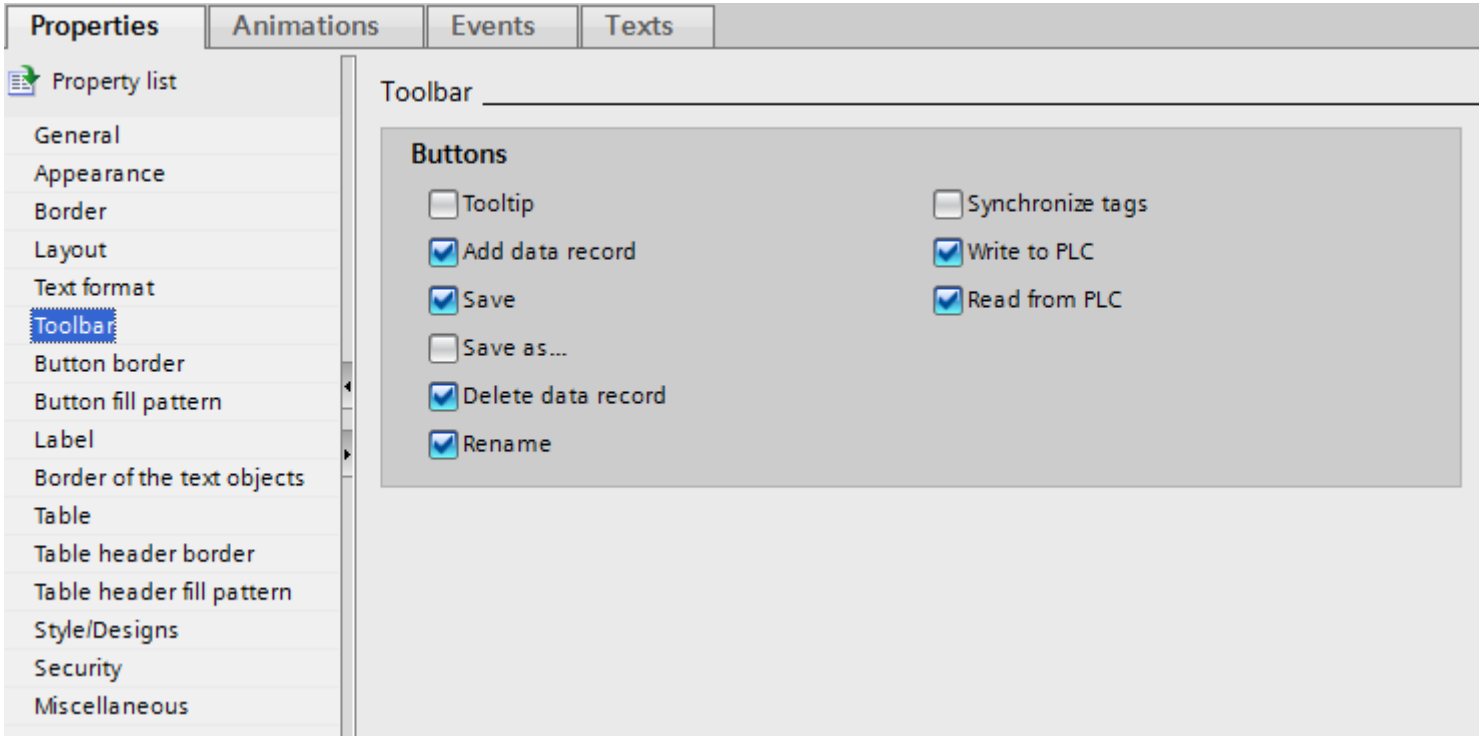
Procedure

To configure a simple recipe view, proceed as follows:

1. Paste the recipe view into the screen. You will find the recipe view under "Controls" in the "Tools" task card.
2. Only in devices which also support the extended recipe view: Activate "Simple view" under "Properties > Display > Mode".
3. If you want to display only the recipe data records of a specific recipe in the recipe view, select the specific recipe under "Properties > General > Recipe".



4. If you only want to display the recipe data in the recipe view, deactivate "Processing mode" in the "Recipe data record" area.
5. You can define additional options for the recipe view under "Properties > Appearance" and "Properties > Layout".
6. Under "Properties" > Toolbar" specify which menu commands are available in the recipe view in Runtime.



Result

The simple recipe view is configured. You can use the recipe view to display and edit recipe data during runtime.

Deactivation of the editing mode in "Properties > Properties > General" has no impact on the toolbar icons. The buttons activated under "Properties > Toolbar" can still be used even if editing mode is disabled.

Configuring the Advanced Recipe View

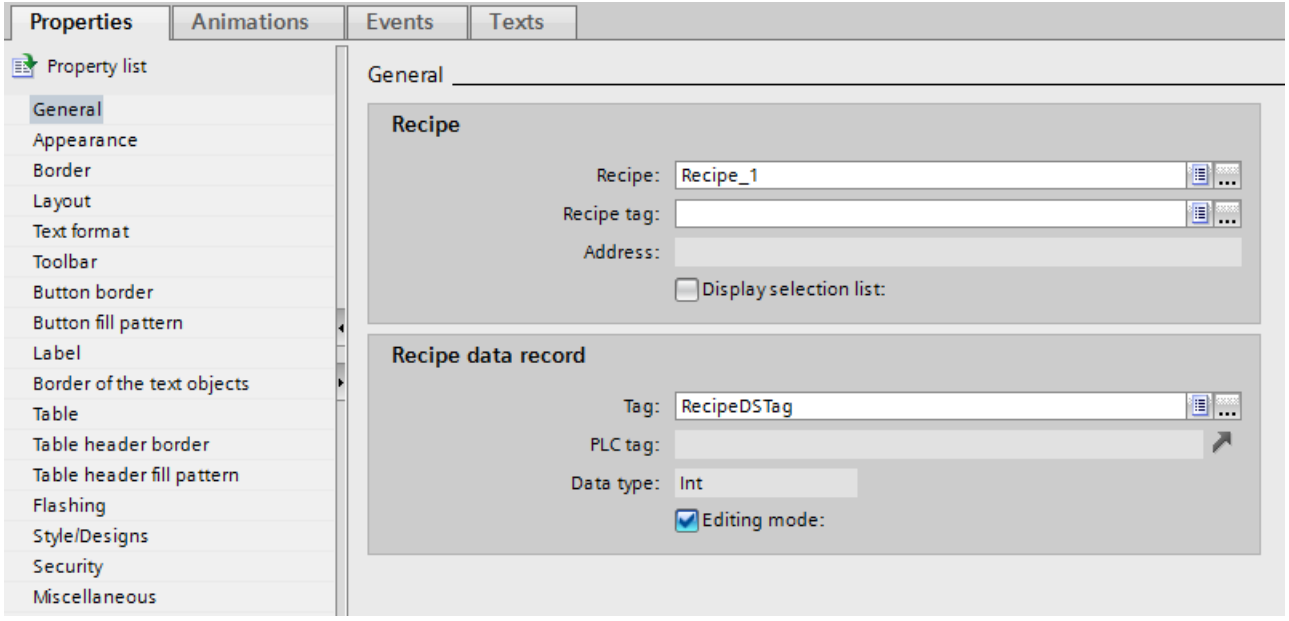
Requirement

- The recipe has been created.
- The "Screens" editor is open.
- The screen has been created and opened.

Procedure

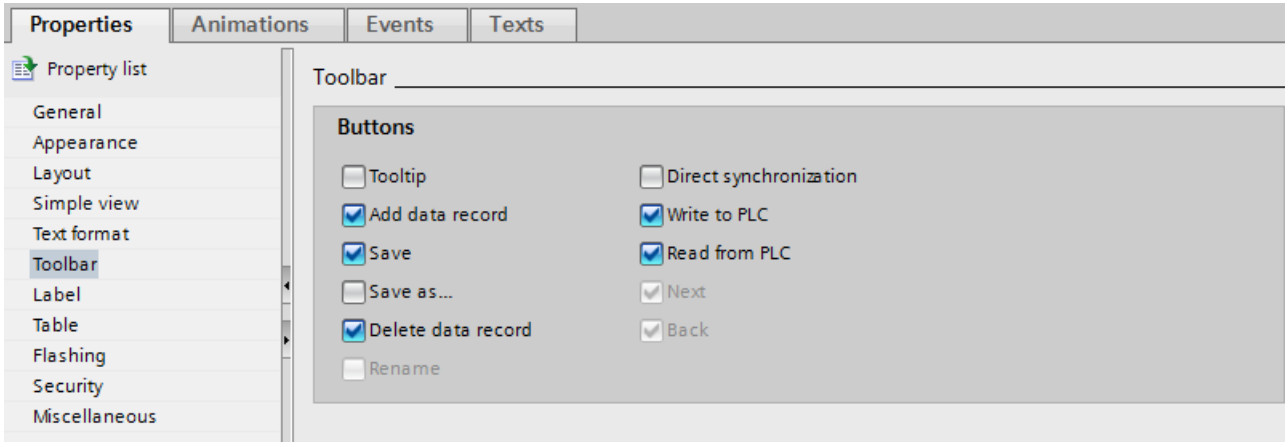
To configure an advanced recipe view, proceed as follows:

1. Paste the recipe view into the screen. The recipe view is found in the task card "Tools" > "Controls".
2. Select "Properties > Display > Mode > Advanced view" in the Inspector window.



3. Select the required settings from the "General" group in the Inspector window.
   - If you want to display only the recipe data records for a particular recipe in the recipe view, select the recipe under "Recipe" in the "Recipes" area.
   - If you want to save the recipe name or the recipe number in a tag, select the tag under "Recipe tag" in the "Recipe" area.
   - If you want to save the recipe data record name or number in a tag, select the tag under "Tag" in the "Recipe data record" area.
   - If you only want to display the recipe data in the recipe view, deselect "Edit mode".
   - If you only want to use the recipe view to select recipes, disable "Display table" under "Properties > Table".
4. You can define additional options for the recipe view under "Properties > Appearance" and "Properties > Layout".

5. If you want to change the label in the recipe view, enter a suitable text under "Properties" > "Label".
6. Under "Properties" > Toolbar" specify which buttons are available in the recipe view in Runtime.



Note

If you select the "Edit" command in the context menu of the recipe view, the recipe view becomes active. To activate the recipe view, the zoom factor must be set to 100%.

You can set the column width and the position of the "Entry name" and "Value" columns in active mode.

Result

The recipe view is configured. You can use the recipe view to display and edit recipe data during runtime.

Deactivation of the editing mode in "Properties > Properties > General" has no impact on the toolbar icons. The buttons you activated in "Properties > Toolbar" can still be used even if editing mode is disabled.

Configuring a recipe screen

Introduction

The recipe screen is a screen in which you configure a customized screen form in the "Screens" editor. You create the screen form from input/output fields and other display and operator control objects. System functions are used to configure the recipe functionality, such as saving recipe data records.

Note

Availability

Recipe screens cannot be created for basic panels and OP73, OP77A and TP177A (Portrait).

Application

You can spread recipe data records containing lots of entries across several screens. For example, for each plant you can configure a screen containing the associated screen forms for the recipe data records.

You can visually simulate your machine in a screen using graphical screen objects. This enables you to display parameter settings more clearly by positioning I/O fields immediately next to machine elements, such as axes or guide rails. You can use this to produce a direct reference between the values and the machine.

Requirement

- You have created the recipe.
- The "Screens" editor is open.

Procedure

To configure a recipe screen, proceed as follows:

1. Configure the screen and create the I/O fields for the input mask of the recipe.
   You can create multiple screens to suit the size and complexity of the recipe.
2. Configure the I/O fields with the tags you have linked to the recipe element.
3. Configure I/O fields for selecting recipes and recipe data records.

Alternatively:

1. Configure a recipe view as a selection list for recipe data records and recipes.
2. Hide the buttons that are not required in the recipe view.
3. Configure the system functions for editing recipe data records on the configured control elements.
   Control elements are configured buttons in the screen or function keys on the HMI device.
   You will find the system functions for editing recipe data records under "Recipes" and "Keyboard operation for screen objects".

Result

The recipe screen is created.

12.5.3.4 Importing recipes into the configuration and exporting them

Introduction

You can export recipes as a CSV file and import them again into the configuration.

Application case

Recipe data is exported for long-term storage and backup on a computer.

In order to unify and distribute recipe data, export the recipe data to an HMI device. Change the CSV file in Microsoft Excel and import the CSV file to all HMI devices that require the same recipe data.

You want to exchange recipe data between different projects. You change the recipe data in Runtime. To transfer the modified recipe data to WinCC ES, export the recipe data records in Runtime and copy the CSV file to the configuring computer. There you import the CSV file containing the recipe data records into the recipe. And in the opposite direction, you transfer the modified recipe data records to the HMI device in WinCC ES in Runtime.

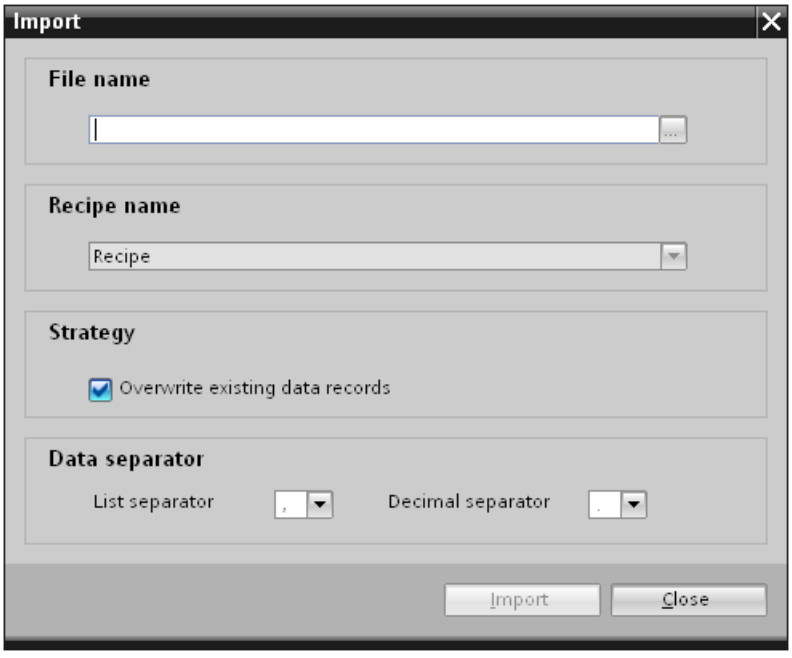
Requirement

- You have created the recipe.
- The structures of the exported CSV file and the recipe in WinCC ES match; name, number and data type of the recipe elements are identical.
- The "Recipes" editor is open.

Importing CSV files

To import recipe data records into a recipe, proceed as follows:

1. Select the row which contains the desired recipe in the "Recipes" tab.
2. Select the "Import recipe data" command from the shortcut menu.
   The "Import" dialog box opens.



3. To select the desired CSV file, go to "File name".
4. Under "Strategy", specify whether a recipe data record with the same recipe number in WinCC ES should be overwritten.

5. Specify the list separator and decimal separator under "Data separation". The list separator separates individual recipe elements in the CSV file. The decimal separator separates integers and decimal places.

   Note

   Use the same list separator for import as in the CSV file for export.

6. Click "Import" to start the operation.

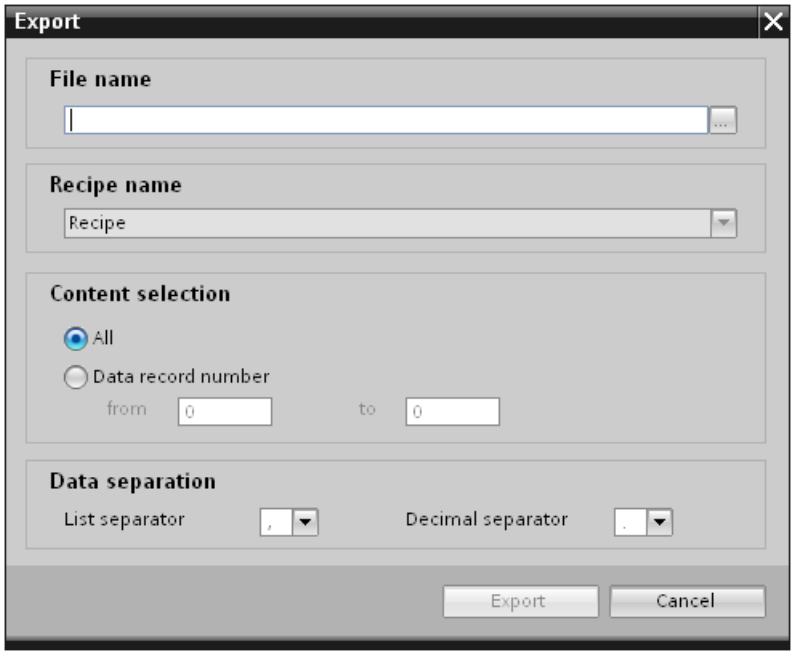
Result

The recipe will be amended by recipe data records from the CSV file that have not yet been entered. If the option is selected, existing recipe data records will be overwritten.

An error message is shown in the "Info" of the Inspector window if the structure of the recipe does not match the structure of the CSV file.

Exporting CSV files

1. Select the row which contains the recipe to export in the "Recipes" tab.
2. Select the "Export recipe data" command from the shortcut menu.
   The "Export" dialog box opens.



3. Under "File name", specify the path of the CSV file.
4. Select all recipe data records under "Selection content", or restrict the selection to specific record numbers of the recipe data.

5. Specify the list separator and decimal separator under "Data separation". The list separator separates individual recipe elements in the CSV file. The decimal separator separates integers and decimal places.
6. Click "Export" to start the operation.

Result

The configuration is exported as a CSV file.

12.5.4 Using Recipes in Runtime

12.5.4.1 Simple recipe view

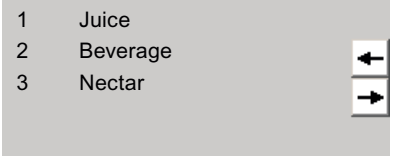
Description of the simple recipe view

Layout

The simple recipe view consists of the following display areas:

- Recipe list
- Data record list
- Element list

This application is illustrated below:



In the simple recipe view, each area is shown separately on the HMI device. You can use the shortcut menu to operate each of these display areas.

The simple recipe view always begins with the recipe list.

Operation

You have the following options for using the simple recipe view, according to the configuration:

- Create, change, copy or delete recipe data records
- Read recipe data records from the PLC or transfer to the PLC

Using the display area and shortcut menu

Toggle between the display areas and the shortcut menus to operate the simple recipe views.

The table below shows the operation of the display area.

Button	Key	Function
	<Enter>	The next lowest display area is opened, i.e. the data record list or the element list.
←	<Esc>	The previous display area opens.
	<INS>	Creates a new data record for the selected recipe if the list of recipes or recipe data records is displayed. Then changes to the list of recipe element. Requirement: "Properties >General > Processing mode" is activated. The button can be simulated with the "Key SimulateSystem-Key" function even on devices without keys.
	<DEL>	Deletes the selected recipe data record in the list of recipe data records. Requirement: "Properties >General > Processing mode" is activated.
	<Up>/<Down>	Selects the previous/next entry.
	<Pg Up>/<Pg Down>	Moves the display up or down one page.
	<Home>/<End>	Selects the first/last entry. The first/last entry is selected.

The table below shows the operation of the shortcut menu:

Button	Key	Function
→	<Right>	The shortcut menu of the display area opens.
←	<Esc>	The menu is closed. The display area opens.
	Input of the number of the menu command	The menu command is executed.

Shortcut menus of the simple recipe view

You can click the → button in each display area to call up a selection of commands. The command selection lists those commands that are available in the current display area. A number is assigned to each command. The command is executed when you enter this number. Alternatively select the command and press the <Return> key.

Shortcut menus in the recipe list

Menu command	Function
New	A new recipe data record is created for the selected recipe. If a start value is configured, it is displayed in the input field.
Display tooltip	The tooltip configured for the recipe is displayed.
Open	The record list of the selected recipe opens.

Shortcut menus of the recipe data record list

Menu command	Function
New	Creates a new recipe data record. If a start value is configured, it is displayed in the input field.
Deleting	The displayed record is deleted.
Save as	The selected data record is saved under a different name. A dialog box opens where you can enter the name.
Rename	Renames the selected data record. A dialog box opens where you can enter the name.
Open	The element list of the selected data record opens.
Previous	The recipe list opens.

Shortcut menus of the recipe element list

Menu command	Function
Save	The selected data record with the recipe element is saved.
To PLC	The displayed values of the selected data record are transferred from the HMI device to the PLC.
From PLC	The recipe values from the PLC are displayed in the recipe view of the HMI device.
Save as	The data record is saved under a new name. A dialog box opens where you can enter the name.
Display tooltip	The tooltip configured for the recipe element is displayed.
Rename	The selected recipe element is renamed. A dialog box opens where you can enter the name.
Previous	The data record list opens.

Shortcut menus in the data record list

Note

HMI device dependency

The following menu commands are configured in Basic Panels and in OP 77A, TP 177A, TP 177A (Portrait) and TB 177B.

Menu command	Function
To PLC	The displayed values of the selected data record are transferred from the HMI device to the PLC.
From PLC	The recipe values from the PLC are displayed in the recipe view of the HMI device.

Using the simple recipe view

Controlling the simple recipe view with mouse or touchpad

To control the simple recipe view with mouse or touchpad, proceed as follows:

1. Select the desired recipe from the recipe view.
2. Click the → button.
   The shortcut menu is opened.
3. Select the desired menu command.
   The menu command is executed.

Controlling the simple recipe view with the keyboard

To control the simple recipe view with the keyboard, proceed as follows:

1. Press the <Tab> key until the simple recipe view is selected.
2. Select the desired recipe with the cursor keys.
3. Press <Right>.
   The shortcut menu is opened.
4. Press the <Down> key until the desired menu command is selected.
5. Press <Enter> to confirm the command.

Key shortcuts for the simple recipe view

The following key shortcuts are activated for the simple recipe view in Runtime if "Activate keyboard operation" is enabled in the ES.

Key shortcut	Effect	Menu command
<Insert>	Generates a new recipe data record	New
<Del>	Deletes the recipe data record displayed.	Delete

Managing recipe data records

Recipe data record administration

You have the following options for managing the simple recipe view, according to the configuration:

- Creating new recipe data records
- Copy recipe data records
- Edit recipe data records
- Delete recipe data records

Creating new recipe data records

To create a new recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to create a new recipe data record.
2. Select the "New" command from the shortcut menu for the recipe list.
   A new data record with the next available number will be created.
   The element list of the new recipe data record opens.
3. Enter values for the elements of the recipe data record.
   The configuration data may already contain default values for the recipe data record.
4. Select the "Save" command from the shortcut menu for the element list.
   The dialog "Save as" opens.
5. Enter the name and number of the recipe data record.
6. Click the "OK" button.

Result

The new recipe data records will be saved to the selected recipe. If the recipe data records already exists, a system event will be output to the screen.

Copying a recipe data record

To copy a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to copy an existing recipe data record.
2. On the HMI device, select the recipe data record of which you want to save a copy.
3. Select the "Save As" command from the shortcut menu for the data record list.
   The dialog "Save as" opens. The recipe data record is automatically given the next free recipe data record number.
4. Under name, enter the name of the record.
5. Click the "OK" button.

Result

The recipe data record is stored under the new name.

Modify recipe data record

To change a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to edit an existing recipe data record.
2. Select the recipe data record that you want to edit on the HMI device.
3. Select the recipe data record.
   The element list of the recipe data record is displayed.
4. Replace the old values with new ones.
5. Select the "Save" command from the shortcut menu for the element list.

Result

The modified values are applied to the recipe data record.

Deleting a recipe data record

To delete a recipe data record, proceed as follows:

1. Select the recipe on the HMI device from which you want to delete an existing recipe data record.
2. Select the recipe data record that you want to delete on the HMI device.
3. Select the "Delete" command from the shortcut menu for the data record list.
4. Confirm this security prompt to delete the data record.

Result

The recipe data record is deleted.

Read recipe data record from PLC

Introduction

In Runtime, you can change values directly in the plant that are also stored in recipes in the HMI device. This applies if a valve was opened further directly in the plant than was specified in the recipe. The values of the recipe data records saved in the HMI device possibly no longer match the values in the PLC.

You can read the values of the recipe tags from the PLC and write them to a recipe data record.

The read values are written to the recipe data record that is currently displayed on the HMI device.

Procedure

To read a recipe data record from the PLC, proceed as follows:

1. Open the recipe on the HMI device.
   The data record list opens.
2. Select the element list of the recipe data record to which you want to apply the values from the PLC.
3. Select the "From PLC" command from the shortcut menu for the element list.
   The values are read from the PLC and displayed in the current recipe data record.
4. If you want to save the values, select the "Save" or "Save As" command.

Result

The values are read from the PLC, visualized on the HMI device and saved to the recipe data record.

Note

Basic Panels

With Basic Panels, the "From PLC" menu command can also be configured for the data record list. In this case, you can also select the "From PLC" menu command in the data record list.

Transferring a recipe data record to the PLC

Introduction

For the values of a data record that was changed in the recipe view to take effect, you must transfer the values to the PLC.

The values displayed in the recipe view are always transferred to the PLC.

Procedure

To transfer a recipe data record to the PLC, proceed as follows:

1. Open the recipe you want to use.
   The data record list opens.
2. Select the element list of the recipe data record whose values you want to transfer to the PLC.
3. Select the "To PLC" command from the shortcut menu for the element list.

Result

The values of the recipe data record are transferred to the PLC.

Note

Basic Panels

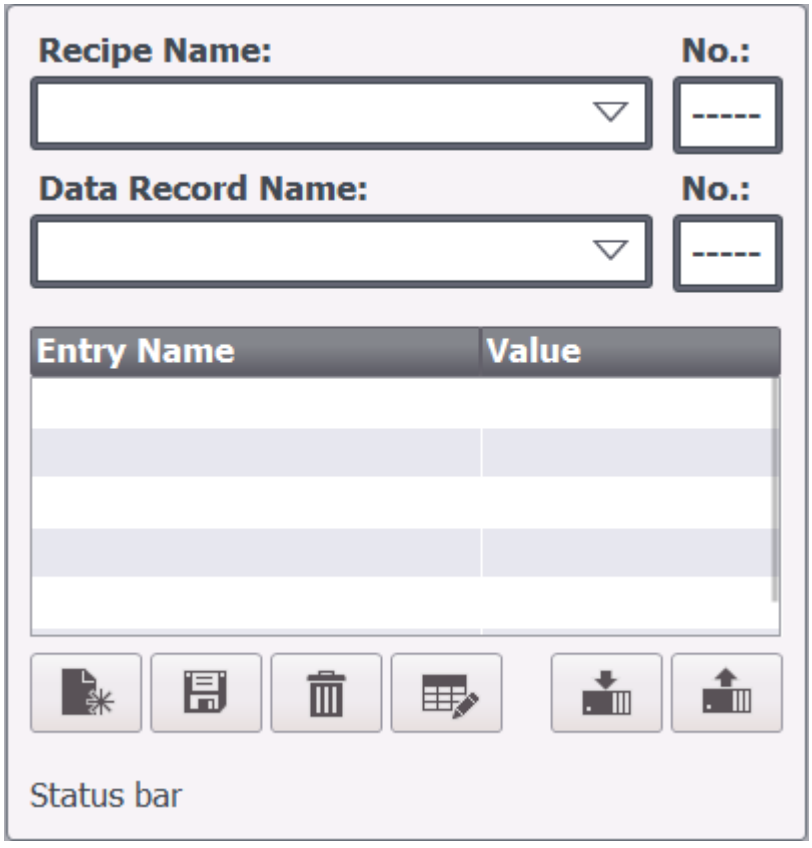
With Basic Panels, the "From PLC" menu command can also be configured for the data record list. In this case, you can also select the "From PLC" menu command in the data record list.

12.5.4.2 Advanced recipe view

Description of the advanced recipe view

Application

The recipe view is used to display, edit and manage data records.



Operation

Depending on the configuration you can:

- Create, change, copy or delete recipe data records
- Synchronizing recipe data records with the associated recipe tags
- Read recipe data records from or transfer to the PLC

Operating elements

The following operating elements can be configured in the recipe view:

Operating element	Key combination	Function
		The configured tooltip is displayed.
	<Ctrl+Space Bar>	Creates a new recipe data record. If a start value is configured, it is shown in the input field.
	<Ctrl+Enter>	Saves the displayed values of the recipe data record. The storage location is predefined by the project.
	<Ctrl+*>	The recipe data record is saved under a different name regardless of the recipe view. A dialog box opens where you can enter the name.
	<Ctrl+Del>	The displayed recipe data record is deleted.
	<Ctrl+=>	The system always updates the current value of the recipe view with the up-to-date recipe tag value. When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag. "Synchronize recipe view and recipe tags" must be activated in the recipe properties before this function can be used.
	<Ctrl+Down>	The values of the set recipe data record displayed in the recipe view are transferred to the PLC.
	<Ctrl+Up>	The recipe values from the PLC are displayed in the recipe view.

Using the advanced recipe view

Introduction

You can control the recipe view using both mouse or touchpad or with the keyboard.

Controlling the recipe view with mouse or touchpad

To control the recipe view with mouse or touchpad, proceed as follows:

1. Select the recipe you want to use.
   The records for the recipe are displayed.
2. Click on the data record you wish to edit.
3. Click the button whose function you want to run.

Controlling the recipe view with the keyboard

To control the recipe view with the keyboard, proceed as follows:

1. Press the <Tab> key until the cursor reaches the field for selecting the recipe.
2. Press <Enter>.
   The drop-down list box for the recipes opens.
3. Select a recipe. You navigate between the next or previous entry in the list by using the cursor keys <Left>, <Right>, <Up> and <Down>.
4. Select a data record.
5. Press the <Tab> key until the operator control object you wish to use is selected.

Alternatively you can control the recipe view using certain key combinations.

Key shortcuts for the advanced recipe view

The following key shortcuts are activated for the advanced recipe view in Runtime if "Activate keyboard operation" is enabled in the ES.

Keys shortcut	Effect	Menu command	Button
<Ctrl+Space>	Generates a new recipe data record. Any configured start value is displayed in the input field.	Add data record	
<Ctrl+Del>	Deletes the recipe data record displayed.	Delete data record"	
<Ctrl+Enter>	Saves the modified record with its current name.	Save	
<Ctrl+*>	Saves the modified record with a new name.	Save as	
<Ctrl+=>	Compares the values of the selected data record with the values on the PLC. Any value in the recipe view which is more recent compared to the current recipe tag value is written to the recipe tag. This function is only available if enabled in the ES.	Synchronizing recipe view and recipe tags	
<Ctrl+Down>	Sends the current value to the PLC.	Write to PLC	
<Ctrl+Up>	Reads the current value from the PLC.	Read from PLC	

Managing recipe data records

Administration of recipe data records

You have the following options for managing recipe data records, according to the configuration:

- Create new recipe data records
- Copy recipe data records

- Edit recipe data records
- Delete recipe data records

Creating new recipe data records

To create a new recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to create a new recipe data record.
2. Click the  button or press the <Ctrl + Spacebar> keys.
   A new recipe data record with the next available number is created.
   If you change the new data record number to an existing data record number, the existing data record is overwritten.
3. Enter values for the elements of the data record.
   The elements of the recipe data record can be assigned default values depending on the configuration.
4. Click the  button or press the <Ctrl + *> keys.
   The dialog "Save as" opens.
5. Enter a name for the data record.
6. Click on "OK" to confirm your input.
   The data record is saved under the new name.
   If the recipe data record already exists, a dialog is opened. In this dialog, specify whether the existing data record is to be overwritten.

Result

The new recipe data records will be saved to the selected recipe. If the recipe data records already exists, a system alarm will be output to the screen.

Copying a recipe data record

To copy a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to copy an existing recipe data record.
2. Select the recipe data record that you want to copy on the HMI device.
3. Click the  button in the recipe view or press the <Ctrl + *> keys.
   The dialog "Save as" opens.
4. Enter a name for the data record.
5. Click on "OK" to confirm your input.

Result

The recipe data record is stored under the new name.

Modify recipe data record

To change a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to edit an existing recipe data record.
2. Select the recipe data record that you want to edit on the HMI device.
3. Replace the old values with new ones.
4. Click the  button in the recipe view or press the <Ctrl + Enter> keys.

Result

The modified values are applied to the recipe data record.

Delete recipe data record

To delete a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to delete an existing recipe data record.
2. Select the recipe data record that you want to delete on the HMI device.
3. Click the  button in the recipe view or press the <Ctrl + Del> keys.

Result

The recipe data record is deleted.

Synchronizing recipe data record

Introduction

Differences between the following values may occur during runtime:

- The values displayed in the recipe view
- The actual values of the recipe tags

Depending on the configuration, the values displayed in the recipe view are synchronized with the recipe tags. Synchronization encompasses all tags of a recipe data record.

Note

Changed tag name

The tag and the value of the recipe data record cannot be associated if you have renamed the tag you want to synchronize. The tags in question are not synchronized.

Note

Recipe tags can only be synchronized in the advanced recipe view.

Requirement

- A recipe data record is displayed in the recipe view.
- The values of recipe tags were modified by teaching, for example.

Procedure

To synchronize a recipe data record, proceed as follows:

1. Click the  button in the recipe view or press the <Ctrl + => keys.

Result

The system always updates the current value of the recipe view with the up-to-date recipe tag value.

When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag.

Read recipe data record from PLC

Introduction

In Runtime, you can change values directly in the plant which are also stored in recipes in the HMI device. This applies if a valve was opened further directly in the plant than was specified in the recipe. The values of the recipe data records saved in the HMI device possibly no longer match the values in the PLC.

You can read the values of the recipe tags from the PLC and write them to a recipe data record.

The read values are written to the recipe data record that is currently displayed on the HMI device.

Procedure

To read a recipe data record from the PLC, proceed as follows:

1. Select the recipe on the HMI device.
2. On the HMI device, select the recipe data record of which you want to fetch the values from the PLC.
3. Click the  button in the recipe view or press the <Ctrl + Up> keys.

Result

The values are read from the PLC and displayed on the HMI device.

Transferring recipe data records to the PLC

Introduction

For the values of a data record that was changed in the recipe view to take effect, you must transfer the values to the PLC.

The values displayed in the recipe view are always transferred to the PLC.

Procedure

To transfer a recipe data record to the PLC, proceed as follows:

1. Select the recipe on the HMI device.
2. On the HMI device, select the recipe data record of which you want to transfer the values to PLC.
3. Click the  button in the recipe view, or press the <CTRL+DOWN> shortcut key.

Result

The values of the recipe data record are transferred to the PLC.

12.5.4.3 Exporting and importing recipe data records

Introduction

Depending on configuration and the HMI device, either export recipe data records to a CSV file, e.g. for editing in MS Excel, or import these from a CSV file. The extent to which you can influence these processes is determined by the project configuration.

Note

Restrictions for Import / Export

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

A list separator is used to separate the data records during importing and exporting.

Note

The list separator used as the default depends on the setting for formats and numbers in the operating system. Select "Start > Settings > Control Panel > Regional and Language Options". If you want to import or export recipe data records, do not use this list separator in the display name of the recipe data records.

The following fields can be configured on the user interface, for example, in order to use the export/import function:

- Selection field for the recipe
- Selection field for the recipe data record
- Operating element with the "ExportDataRecords" functionality
- Operating element with the "ImportDataRecords" functionality

Export recipe data record

To export a recipe data record, proceed as follows:

1. Select the relevant recipe and recipe data record from the selection boxes.
2. Click the control element with the "ExportDataRecords" functionality.

Result

The recipe data record are exported to a CSV file.

Note

New data records created in runtime can be exported to an external file.

Importing recipe data records

To import a recipe data record, proceed as follows:

1. Select the relevant recipe and recipe data record from the selection boxes.
2. Click the control element with the "ImportDataRecords" functionality.

Result

The recipe data record are imported.

12.5.4.4 Reactions to modifications of the recipe structure

Introduction

Different recipe structures can occur in the following situations:

- In the event of changes during commissioning
- When work is carried out on the machine by the machine manufacturer (retrofit)
- When CSV files are imported, the structure of the CSV file can differ from the recipe structure.

Nevertheless, you can still use any recipe data records already created.

Notice

When a tag is renamed, the assignment is lost.

Effects

Handle any structural differences as follows:

- If the old recipe data record or the CSV file contains additional values, these values will be discarded.
- If the old recipe data record or the CSV file contains values of the wrong data type, the configured default value will be used in the recipe data record.
  Example: The recipe data record contains values that show the tank contents and were input as floating point numbers. However, the corresponding recipe tag expects an integer value. In this case, the system discards the transferred value and the configured default value is used.
- If the old recipe data record or the CSV file contains too few values, the configured default value will also be used in the recipe data record.

12.5.5 Examples

12.5.5.1 Example of creating a recipe

Task

In this example, you create three recipes for a fruit juice mixing machine. The fruit juice mixing machine produces drinks with "orange", "apple" and "tropical" flavors. You create a recipe for each flavor.

Each recipe contains a recipe data record for the following mixing ratios:

- Beverage
- Nectar
- Juice

Settings

The settings relate to an HMI device which is connected to a SIMATIC S7-300 or SIMATIC S7-400.

In this example, you will need the following tags, recipes, recipe entries and recipe data records:

Tags:

Name	PLC connection	Address	Type
Liter water	Yes	DB 120, DBW 0	Integer
Liter concentrate	Yes	DB 120, DBW 4	Integer
Kilo sugar	Yes	DB 120, DBW 8	Integer
Gram flavoring	Yes	DB 120, DBW 12	Integer

Recipes:

- Orange
- Apple
- Tropical

Recipe entries:

Recipe element	Associated tag
Liter water	Liter water
Liter concentrate	Liter concentrate
Kilo sugar	Kilo sugar
Gram flavoring	Gram flavoring

Recipe data records for drink, nectar and juice:

Data record name	Liter water	Liter concentrate	Kilo sugar	Gram flavoring
Beverage	30	70	45	600
Nectar	50	50	10	300
Juice	5	95	3	100

Procedure

To create a recipe, proceed as follows:

1. Create the following tags with the settings specified above: "LiterWater", "LiterConcentrate", "KiloSugar" and "GramFlavoring".
2. Create the "Orange", "Apple" and "Tropical" recipes with the settings indicated above. Create the recipe entries in each recipe.

Elements | Data records

Name	Display name	Tag	Data type	Data length	Default value
Rezepturelement_1	Rezepturelement_1	RecipeDSTag	Int	2	0
Rezepturelement_2	Rezepturelement_1	RecipeDSTag1	Int	2	0
Rezepturelement_3	Rezepturelement_1	RecipeDSTag2	Int	2	0
Rezepturelement_4	Rezepturelement_1	RecipeDSTag3	Int	2	0

3. Not for Basic Panels: Configure each recipe so that you can synchronize the recipe data records between the recipe screen and recipe view. The values of the recipe tags should not be transferred automatically to the PLC.
   You will have to make the following settings in the Properties dialog for the recipe concerned: Under "Properties > Options":
   - Activate the "Synchronize recipe view and recipe tags" option.
   - Activate the "Manual transfer of individual modified values (teach-in mode)" option.
4. Create the data records indicated above in each recipe. Enter the values indicated above in each of the data records.

Elements | Data records

Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
Beverage	Beverage	1	30	70	45	600	
Nectar	Nectar	2	50	50	10	300	
Juice	Juice	3	5	95	3	100	
<Add new>							

Result

The "Orange", "Apple" and "Tropical" recipes have been created.

See also

Advanced recipe view (as of V13) (Page 4447)

Configuration options of the advanced recipe view (V13 or higher) (Page 4448)

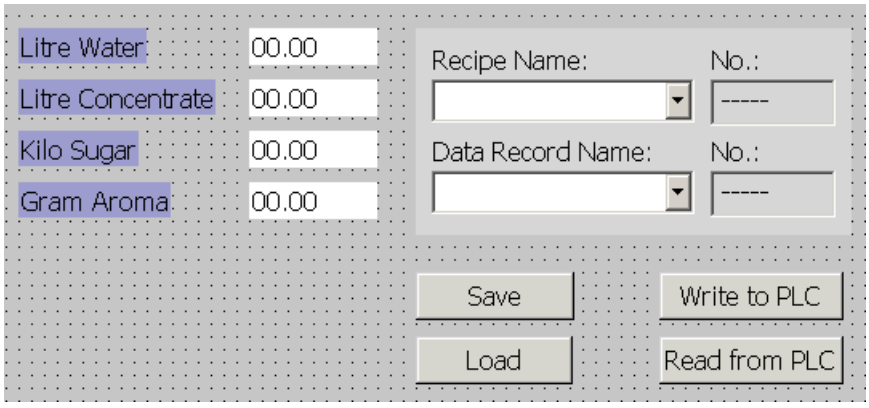
12.5.5.2 Example of configuring a recipe screen

Task

In this example, you create a recipe screen for the visualization of values of the fruit juice mixing machine. You use a recipe view to select the recipes and their associated recipe data records.

You should be able to use the following functions with the buttons:

- "Load" Button
  The selected recipe data record is loaded from the recipe memory on the HMI device and displayed in the recipe screen.
- "Save" Button
  The displayed recipe tags are saved in the recipe memory of the HMI device.
- "Data to PLC" button
  The displayed tags are transferred to the PLC.
- "Data from PLC" button
  The current recipe data record in the PLC is transferred to the recipe variables and displayed on the HMI device.



Requirement

- The "Creating a recipe" sample application has been carried out.
- You have created and opened the "Fruit juice mixing plant" screen.

Settings

In this example, you need the following tags and buttons with the indicated settings:

Tags:

Name	PLC connection	Type
RecipeNumber	No	Integer
Data record number	No	Integer

Buttons:

Labeling	Configured event	System function
Load	Click	LoadDataRecord
Save	Click	SaveDataRecord
Data to PLC	Click	SetDataRecordTagsToPLC
Data from PLC	Click	GetDataRecordTagsFromPLC

Procedure

To configure a recipe screen, proceed as follows:

1. Drag-and-drop the "Liter water", "Liter concentrate", "Kilo sugar" and "Gram flavoring" tags from the object view to the "Fruit juice mixing machine" process screen.
   Four IO fields are created and linked by the specified tags.
2. Add a recipe view containing selection fields for the recipe name and data record name only.
   Make the following settings in the Inspector window for the recipe view:
   - Select the "Advanced view" display type under "General".
   - Deselect "Edit mode" under "Properties > General" and "Display table" under "Properties > Table".
   - Connect the "Recipe tag" field to the "RecipeNumber" tag.
   - Connect the "Tag" field to the "DataRecordNumber" tag.
   - Disable all the buttons under "Properties > Buttons".
3. Assign the above settings to four buttons. Transfer each "Recipe number" and "Data record number" tag as a parameter for the recipe number and recipe data record number.

Result

You can select the recipe and the associated recipe data record from the recipe view and modify the recipe values at runtime. You can load, save and transfer the recipe data records using the buttons.

12.5.5.3 Scenario for Entering Recipe Data Records in Runtime

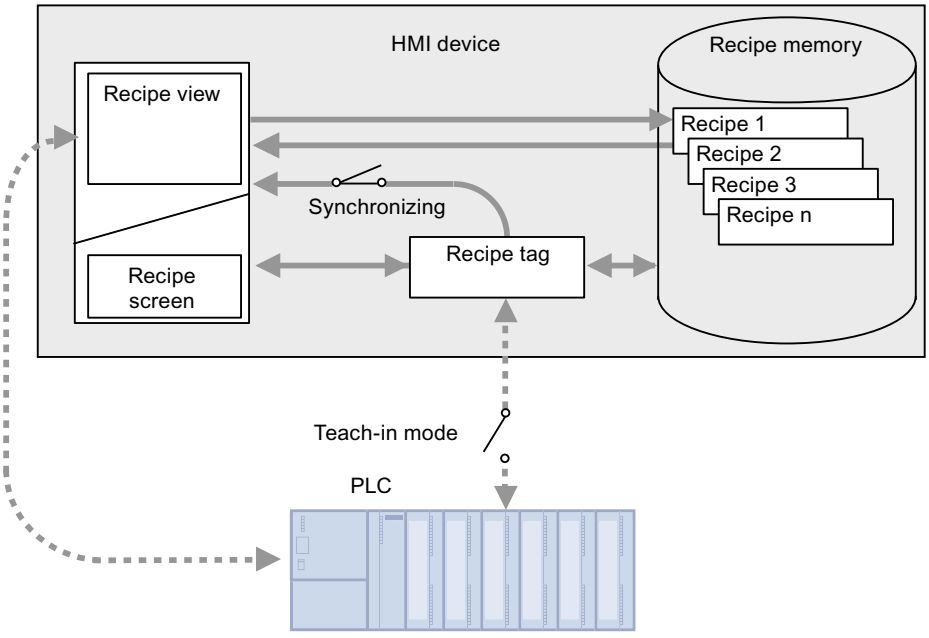
Objective

You want to enter production data on the HMI device without disturbing the process that is currently underway. Therefore, the production data should not be transferred to the PLC.

Requirement

- The recipe has been created.
- The recipe has the following settings:
  - "Synchronizing recipe view and recipe tags" is activated or deactivated.
  - If "Synchronize recipe view and recipe tags" is activated, "Manual transfer of individual modified values (teach-in mode)" has to be activated.
    This will prevent the recipe tags being transferred automatically between the HMI device and PLC.
- A recipe screen or a screen with recipe view is available.
- There is an operating element for saving the recipe data records.

Sequence



1. Enter the production data in the recipe view or recipe screen.
2. Save the modified recipe data record.

Transfer the recipe data to the PLC

The configuration may provide operating elements for transferring recipe data to the PLC.

12.5.5.4 Scenario for a manual production sequence

Objective

A reading device connected to the PLC reads a bar code on the work piece to be processed. The recipe data record names correspond to the respective bar code names. This will enable the PLC to load the necessary recipe data record from the storage medium of the HMI device. The recipe data record is displayed for inspection on screen.

You want to be able to correct the transferred production data online, if necessary.

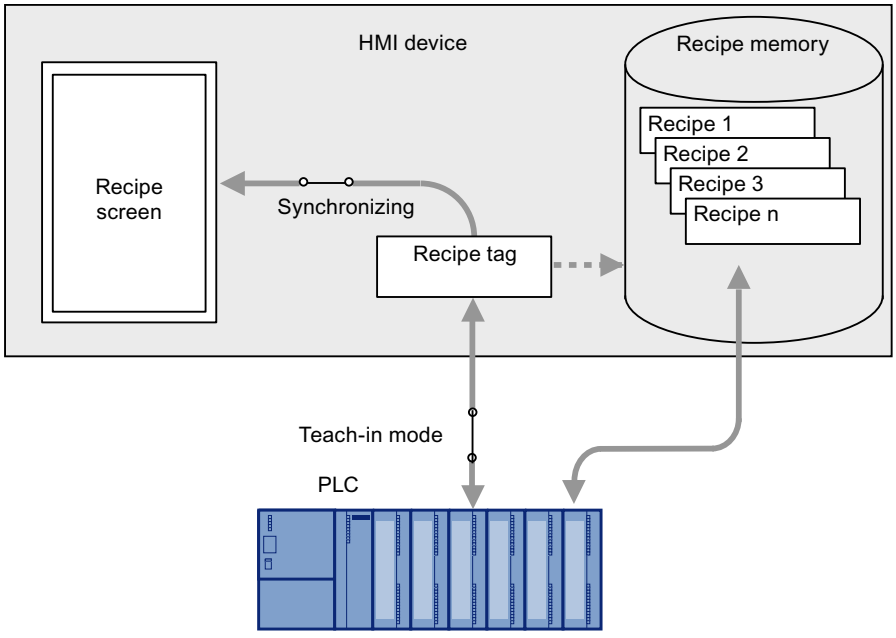
Requirement

- You have created the recipe.
- The recipe has the following settings:
  - "Synchronizing recipe view and recipe tags" is activated.
  - "Manual transfer of individual modified values (teach-in mode)" is deactivated.

  Note

  The changes are immediately transferred to the PLC
- There is a recipe screen available.
  There may also be an operating element for saving the recipe data records in the recipe screen.

Sequence



Behavior when the recipe view is used

If the recipe view is used, it is not possible to transfer changes immediately. You must use the operating element to transfer the recipe data record to the PLC.

12.5.5.5 Scenario for an Automatic Production Sequence

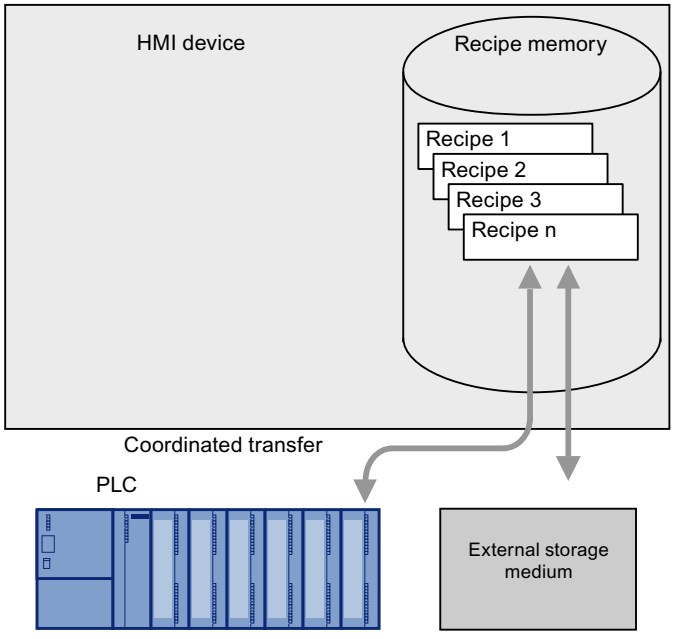
Objective

You want production to be executed automatically. The production data is to be transferred directly to the PLC, either from the recipe memory in the HMI device or from an external storage medium. The screen display is not necessary.

Requirement

- You have created the recipe.
- The recipe has the following settings:
  - "Coordinated transfer of data records" is activated.
    The production data is transferred to the PLC, so a coordinated transfer with the PLC in necessary to prevent the data from being accidentally overwritten.

Sequence



Implementation

You can control the flow of data in the following ways:

- The control program controls the automatic transfer via control jobs or via WinCC system functions, if necessary.
  The sequence is controlled via the status information in the mailbox and via return values from the functions used.
- One or more scripts control the automatic transfer via WinCC system functions.
  The sequence can be checked using the values returned by the functions used.

You can implement the automatic production sequence with available system functions:

- "ImportDataRecords"
  This function loads data records from a *.CSV file into the recipe memory of the HMI device.
- "SetDataRecordToPLC"
  This function transfers a data record from the HMI device's recipe memory to the PLC.

12.6 Working with reports

12.6.1 Basics

12.6.1.1 Reports

Introduction

Reports are used to record process data and processed production cycles. You have the opportunity, for example, to create regular shift reports, output batch data, or record the production process for quality control (QC).

Creating reports

A report is created and edited in the "Reports" editor. In this editor, you configure the following report items:

- Formal appearance
  Specify the formal layout of the report in the Inspector window. In this window, for example, you specify the page format, page margins, title page, back page, headers, or footers for the report.
- Contents
  In the work area, specify the content of the report, for example, the alarms of a shift. To this purpose you insert the corresponding objects into the report.

The modular structure lets you configure reports that suit all of your applications.

Note

The "Reports" editor is not available at HMI devices that do not support reporting.

Report output

In runtime, the configured reports are printed on the default printer of the HMI device.

Reports are output to the printer in graphic mode. The use of a serial printer is not recommended because of the accumulated data volume.

In runtime, report output is event or time-controlled.

- Time-controlled: Automatic print at specific dates, times or intervals.
- Event-driven: Printing is initiated by specific events, e.g. click on a button, or when a limit is exceeded.

For proper output, the printer must support the paper format and page layout of the report.

Note

The value of a tag in the report is read and output at the moment of printing. A substantial period of time may elapse between printing out the first and the last page of a report consisting of several pages. This may lead to the same tag being output with a different value on the last page than on the first page.

Printing reports (Page 4516)

Audit report (Page 4516)

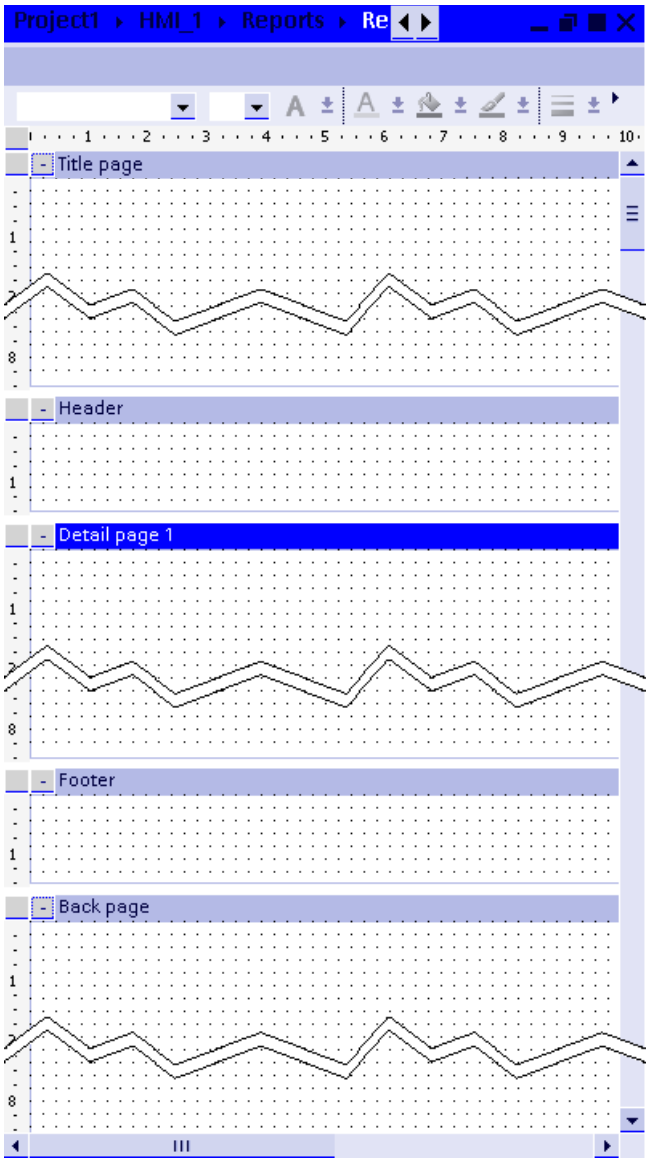
12.6.1.2 Structure of reports

Introduction

A report in WinCC consists of several sections that can be enabled or disabled, as required.

Sections of a report

The following figure shows an example of the different sections of a report in the "Reports" editor.



Title page and back page

The title page contains important information about the report content. The back page is used, for example, as Impressum, on which you provide contact information of shift managers or service technicians. The title page and back page are output separately on a single page. Each of them consist of exactly one page and page breaks are not used.

Detail page

Configure the output of runtime data such as recipe or alarm reports on the detail pages of the report.

Use the shortcut menu on the detail page to insert additional detail pages or change their order.

Header and footer

The header and footer are output on each detail page of the report. You typically insert the page numbers or the date in the header or footer.

See also

Reports (Page 4493)

Principles for preparation of reports (Page 4496)

12.6.2 Working with reports

12.6.2.1 Creating reports

Principles for preparation of reports

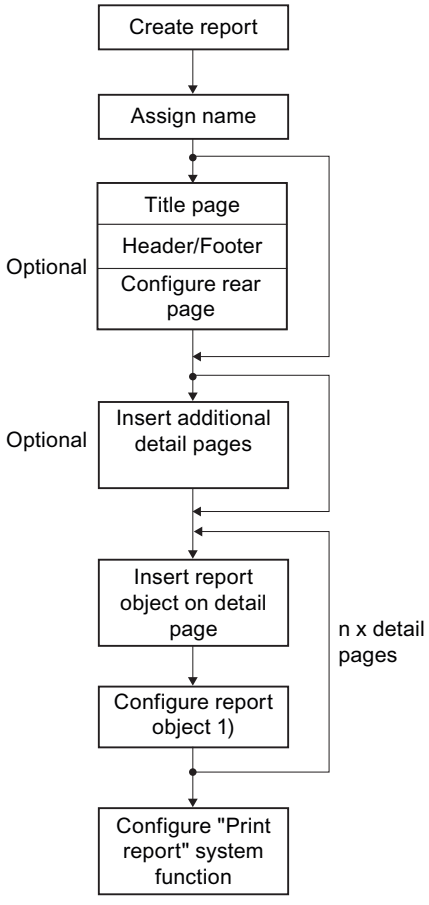
Introduction

A report in WinCC consists of several sections that can be enabled or disabled, as required.

- Title page
- Back page
- Detail pages
- Headers and footers for the detail pages

Procedure

The following figure shows the general procedure for creating a report:



1) Settings depend on the report object used.

Tools for the design of reports

The tools that you can use to design reports are available in the "Tools" task card.

- For *graphic design* insert "basic objects", "elements" and "graphics" in the different sections of the report. For example, for a Logo in the header, separation lines and a page number in the footer.
- Using the "Controls" in the detail pages, configure the *output of runtime data*.

Note

The "Screens" editor provides many objects for designing a report – however, with restricted functionality. Data input properties are not available. The I/O fields in the reports, for example, serve only to output data.

Position and size of objects

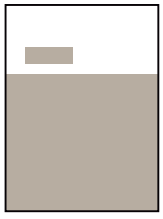
Insert the objects at the position where you want them to be output in the report. The objects are output in their configured size and with the following special features:

On the detail pages, configure "recipe reports" or "alarm reports" that serve to output runtime data in tabular format.

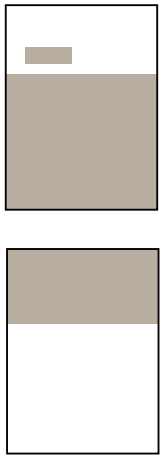
- The *width* of the table is set up automatically to fit the width of the detail page. You cannot modify the width.
- WinCC automatically wraps the *height* of the table to fit the data content for output in the report. The table can be continued on the next page.
  In the detail page, WinCC automatically extends tables of dynamic length to the bottom margin.

The following figure shows an example of a detail page in the report and its output in Runtime:

Detail page in the report



Report output in Runtime



Additional detail pages

Use the shortcut menu on the detail page to insert additional detail pages or change their order.

See also

Objects in reports (Page 4516)

Structure of reports (Page 4494)

Administration of detail pages (Page 4500)

Create a report

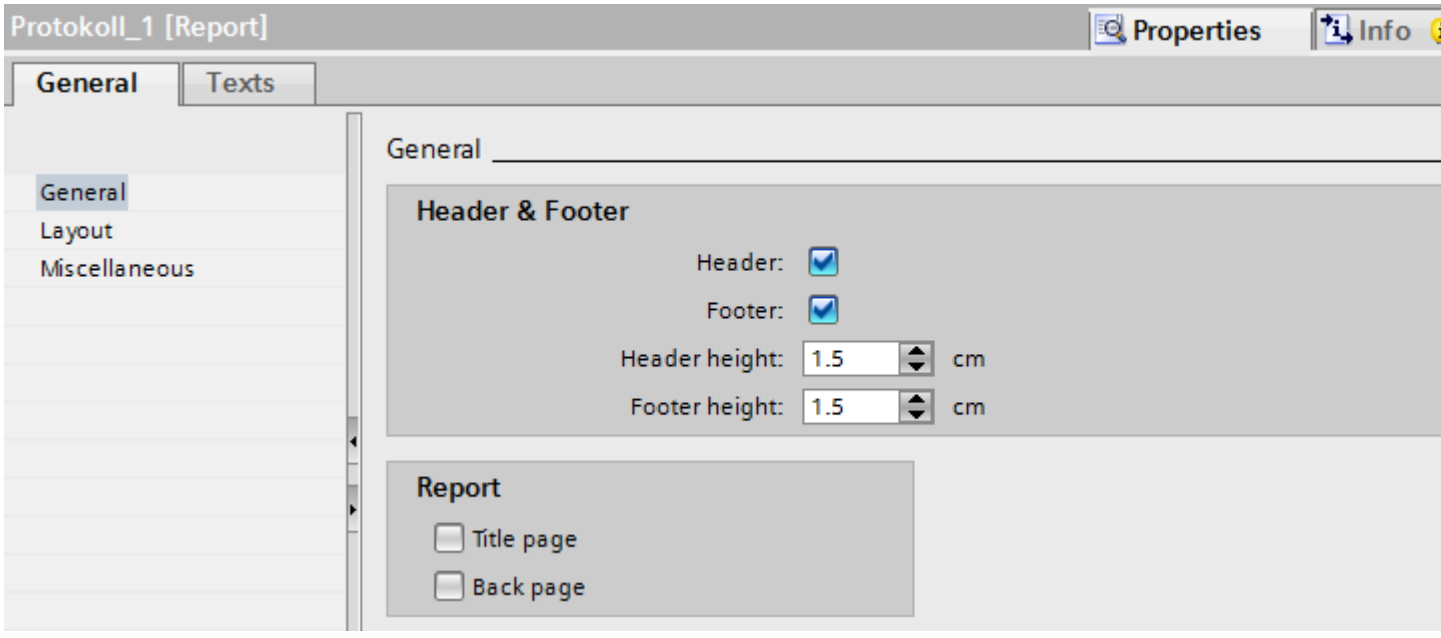
Requirement

A project with an HMI device is open.

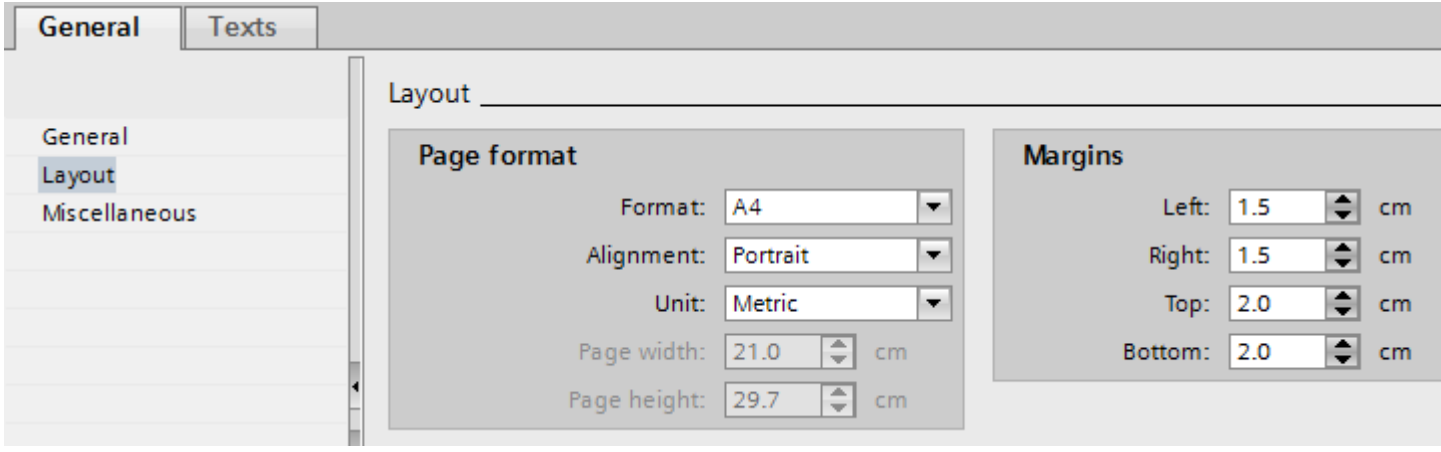
Procedure

To create a report, proceed as follows:

1. Double-click "Add new report" under "Reports" in the project navigation.
   A new blank report is displayed in the "Reports" editor.
2. Select the "Report properties" command in the shortcut menu of the report.
3. In the "Properties > Properties > General" area of the Inspector window, specify whether you want to configure the "Title page", "Back page", "Header" and "Footer" in the report.
   The report sections are updated accordingly.



4. Configure the format, the page layout, and the page margins of the report under "Properties > Properties > Layout."



5. Enter a meaningful report name under "Properties > Properties > Miscellaneous."

6. Design the report sections as required.
   Drag and drop the necessary basic objects, elements, graphic images and controls from the "Tools" task card to the required position.
   Alternatively, you can also copy or move objects already configured from a screen to the report.
7. Configure the objects in the Inspector window:

See also

Objects in reports (Page 4516)

Administration of detail pages

Adding a detail page

1. Open the shortcut menu of a detail page.
2. Select the command "Pages > Insert page before" or "Pages > Insert page after."
   Depending on the selected command, the new detail page is inserted either before or after the existing detail page.

Deleting a detail page

1. Open the shortcut menu of the detail page that you want to remove.
2. Select the command "Pages > Delete detail page".
   The detail page is deleted.

Sorting detail pages

1. Open the shortcut menu of the detail page that you want to move.
2. Select the "Pages > Move one page up" or "Pages > Move one page down" command.
   Depending on the selected command, the detail page is moved either upward or downward.

Showing and hiding sections

1. To show or hide a specific section, click on the plus or minus sign in the title bar of the section in the working area.
2. If you want to show or hide all sections of a report, select the command "Show all pages" or "Hide all pages" in the report shortcut menu.

See also

Structure of reports (Page 4494)

Principles for preparation of reports (Page 4496)

12.6.2.2 Printing reports

Introduction

In Runtime, report output is event-driven or time-driven.

Event-driven output

The report is output after an event was generated.

Examples:

- A tag value changes or exceeds a limit.
- Alarm is incoming, outgoing or acknowledged
- Action by the operator, for example, clicking a button

Time-driven output

The report is output automatically.

Examples:

- Once at a specified date, e.g. on December 31, 2010
- At intervals, e.g. daily at 8 am, or on Mondays at 6 pm

Configuration steps

Configuring event-driven output:

- An event is configured on a button or tag with the "PrintReport" system function.

Configuring time-driven output:

- In the scheduled tasks, configure a "Print job" task and assign it to the desired report. In the task properties, specify the time and frequency of report output.

Output in Runtime

On the control panel of the HMI device, the report is output to the printer that is specified as the default printer.

The default printer enabled for a HMI device can be found in the "Printer list". For further information about the "Printer list", refer to the Internet page of Siemens Customer Support and the Article ID "11376409".

Planning jobs (Page 5985)

Printing reports (Page 4516)

12.6.2.3 Working with objects

Inserting an object

Introduction

In the "Screens" or "Reports" editor, insert the objects to the "Toolbox" task card. Use the mouse to drag the objects into the work area. You either keep the objects in their original size, or scale them up or down when you paste them.

In addition, you can copy or move objects via the clipboard from one editor to another, for example to transfer a screen object to a report. Alternatively, you can also use the mouse instead of the clipboard for copying and moving:

- Copying: <Ctrl + Drag&Drop>
- Moving: Drag&drop

Note

Basic Panels

The "Reports" editor is not available for Basic Panels.

Requirement

The "Tools" task card is open.

Inserting objects in their standard size

1. In the "Toolbox" task card, select the desired graphic object or the desired graphic in the WinCC graphics folder.
   When you move the cursor across the work area, it turns into a crosshair with an appended object icon.
2. Click the location in the work area where you want to insert the object or graphic.
   The object is inserted with its standard size at the desired position in the work area.

Alternatively, double-click the object in the "Toolbox" task card.

Copying an object

1. Select the desired object.
2. Select "Copy" in the shortcut menu.
3. Click the desired location and select "Paste" in the shortcut menu.

WinCC inserts a copy of the object at the desired location. You can only change the properties that are appropriate for the relevant context.

Example: In the "Screens" editor, you can set for I/O fields and the mode for input and output. In the "Reports" editor, the mode is set to "Output".

Original and copy are not interconnected and are configured independently from one another.

Inserting lines

1. Select the desired graphic object in the "Tools" task card.
2. Click on a location in the work area. A line in the standard size is inserted.

Inserting a polygon or polyline

1. Select the desired object "Polyline" or "Polygon" in the "Tools" task card.
2. Click on a location in the work area. This fixes the starting point of the object.
3. Click another location in the work area. A corner point is set.
4. For every additional corner point, click on the corresponding location in the work area.
5. Double-click on a location in the work area. The last corner point is set.
   This fixes all the points of the polygon or polyline.

Note

Basic Panels

The "Polyline" and "Polygon" objects are not available for Basic Panels.

Note

If you want to insert several objects of the same type, use the "Stamp" function. This avoids having to reselect the object in the "Tools" task card every time before inserting it. To do so, select the  icon in the toolbar of the "Tools" task card.

See also

Deleting an object (Page 4503)

Inserting multiple objects of the same type (stamping tool) (Page 4504)

Positioning objects (Page 4505)

Resizing objects (Page 4508)

Moving an object forwards or backwards (Page 4507)

Flipping objects (Page 4515)

Reports (Page 4493)

Deleting an object

Introduction

You can delete objects individually or with a multiple selection.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to delete.
   To delete multiple objects, keep the <Shift> key pressed and select the objects to be deleted one after the other. Alternatively, drag and maximize an area around the desired objects with the mouse.
2. Select "Delete" from the shortcut menu.

Result

The selected objects are deleted.

Inserting multiple objects of the same type (stamping tool)

Introduction

WinCC offers the possibility to "stamp" several objects of the same type directly one after the other, i.e. paste without having to reselect the object every time. In addition you have the possibility of multiplying an object that has already been inserted.

Requirement

The "Tools" task card is open.

Inserting several objects of one type

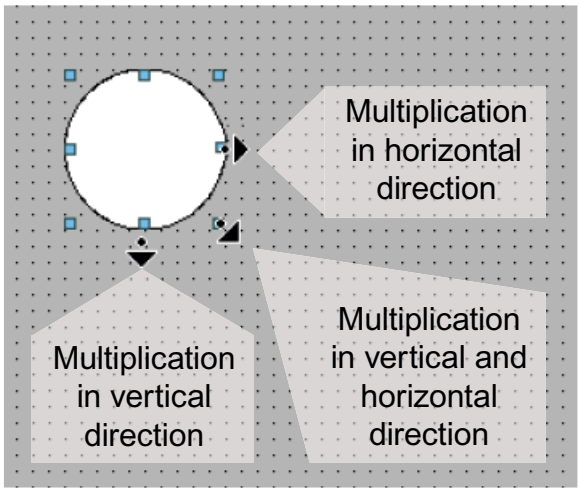
1. Select the object that you want to insert in the "Tools" task card.
2. Click the  icon in the toolbar of the "Tools" task card.
   The "Stamp" function is activated.
3. To insert the object with its standard size, click the relevant insertion position in the work area.
   To insert the object with another size, position the mouse pointer at the desired location in the work area. Press the left mouse button and drag the object to the required size.
   The object is inserted in the work area as soon as you release the mouse button.
4. Repeat step 3 to insert further objects of the same type.
5. Click the  icon again.
   The "Stamp" function is deactivated.

Note

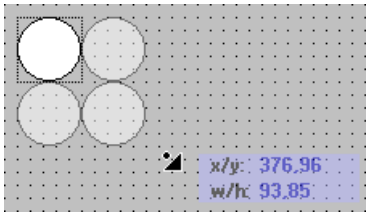
You can copy existing objects using the drag-and-drop +<CTRL> function. The existing object is not moved in this case. You paste a copy of this object into the new position instead.

Inserting and multiplying an object

1. Insert the desired object from the "Tools" task card.
2. Press the <Ctrl> key and position the cursor on one of the handles displayed in the figure shown below.



3. Drag the handles to the right and/or down while keeping the left mouse button pressed.
4. The object is multiplied depending on available space if you keep moving the cursor.



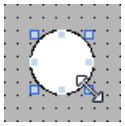
Result

You have pasted and stamped an object in a screen.

Positioning objects

Introduction

When you select an object, it is enclosed by a rectangle with resizing handles. This rectangle is the rectangle which surrounds the object. The position of an object is defined by the coordinates of the top left corner of the rectangle surrounding the object.



Note

If the position is outside the work area the object is not displayed in Runtime.

Position and align

You have the possibility of having a grid displayed in the work area. You have three options for easier positioning of objects:

- "Snap to grid" When you resposition objects, they are automatically snapped and pasted to the grid. If you hold down the <Alt> key, the object is no longer snapped to the grid.
- "Snap to objects" When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.
- "None": You position the objects in any position.

You activate and deactivate the grid and options as follows:

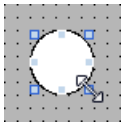
- In the "Options > Settings > Visualization > Screens" menu
- In the "Layout > Grid" task card

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to move.
   The selected object is framed by a rectangle with resizing handles.



2. Left-click the object and keep the mouse button pressed.
3. Move the mouse pointer onto the new position.
   The contour of the object moves with the mouse and displays the new position for the object.

   The object initially remains at its original position.
4. Now release the mouse button.
   The object is moved into the position indicated by the contour of the selection rectangle.

Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the X and Y values for the position under "Position & Size".

Result

The object appears at its new position.

See also

Rotating objects (Page 4513)

Moving an object forwards or backwards

Introduction

You can use the "Order" functions in the shortcut menu of a selected object or in the toolbar to move a selected object in front of or behind other objects within an object layer.

Note

ActiveX controls are always positioned in front of an object layer (.NET property).

Requirement

You have opened a screen which contains a layer with multiple objects.

Procedure

1. Select the object you want to move forward or backward.
2. Select the "Sort" command and one of the following commands from the shortcut menu:

Icon	Description
	Moves the selected object before all the other objects of the same layer
	Moves the selected object to the lowest position in the same layer
	Moves the selected object up by one position
	Moves the selected object down by one position

Alternative procedure

1. Open the "Layers" palette of the "Layout" task card.
2. Navigate to the required object.

3. Hold down the mouse button, and drag the object in the tree topology to the required position in the layer.
4. Now release the mouse button.

Result

The object is moved up or down.

See also

Inserting an object (Page 4502)

Resizing objects

Introduction

When you select an object, it is enclosed by a rectangle with handles. You have the following options of resizing an object:

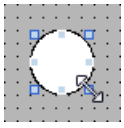
- Drag the handles using the mouse.
- Modify the "Size" property in the Inspector window.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to resize.
   The selection rectangle appears. The following figure shows a selected object:



2. Drag a resizing contact of the rectangle to a new position.
   The size of the object changes.
   - The size of the object is aligned to the grid pattern, provided the "Snap to grid" function is set.
   - Press <ALT> to disable this function while you drag the object.
     In order to scale the object proportionally, keep the <Shift> key pressed while changing the size with the mouse.

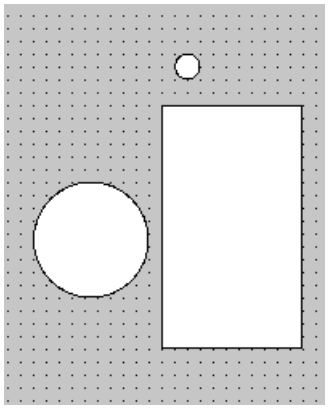
Alternative procedure

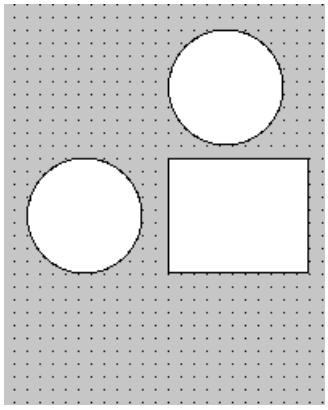
1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the size of the object under "Position & Size".

Harmonizing the object size

1. Select the objects.
2. Now, click one of the following buttons:  or  or 
   The size of the selected objects is matched to each other.

The following screen shows how the selected objects are adapted to the height of the reference object:





Icon	Description
	Aligns the selected objects to the width of the reference object.
	Aligns the selected objects to the height of the reference object.
	Aligns the selected objects to the width and height of the reference object.

Result

The object now appears with its new size.

Selecting multiple objects

Introduction

Select all objects you want to align with each other or to change global properties. This procedure is called "multiple selection."

The Inspector window shows all the properties of the selected objects.

You now have several options of selecting multiple objects:

- Draw a selection frame around the objects.
- Hold down the <Shift> key, and click the required objects.

Selection frame of a multiple selection

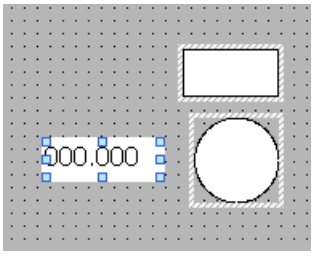
The selection frame surrounds all objects of a multiple selection. The selection frame is comparable with the rectangle that surrounds an individual object.

The selection frame is not visible. When you have made your multiple selection, the following frame is displayed:

- The reference object is indicated by the rectangle around it.
- The other selected objects are indicated by a dashed-line frame.

Specifying a reference object

The reference object is the object upon which the other objects are oriented. The reference object is framed by a rectangle with handles. The following figure shows a reference object with two other selected objects:



You have the following options to specify the reference object:

- Select the objects via multiple selection. The object selected first is then the reference object.
- Draw a selection frame around the objects. The reference object compiled automatically. If you wish to specify a different object within the selection as the reference object, click on the desired object. This action does not cancel your multiple selection.

Requirement

You have opened the work area containing at least two objects.

Selecting multiple objects with a selection frame

1. Position the mouse pointer in the work area close to one of the objects to be selected.
2. Hold down the mouse button, and draw a selection frame around the objects to be selected.

Or:

1. Hold down the <Shift> key.
2. Click the relevant objects, working in succession.
   All the selected objects are identified by frames.
   The object selected first is identified as reference object.

Note

To remove an object from the multiple selection, press <SHIFT>, hold it down and then click the relevant object once again.

Result

Multiple objects are selected. One of those is identified as the reference object. You can now perform the following steps:

- Changing the object properties of all the objects
- Resizing all the objects by the same ratio, by dragging the selection frame to increase or reduce the size
- Moving all the objects in one group
- Aligning the objects to the reference object

Repositioning and resizing multiple objects

Possible modifications

After you have selected multiple objects, you edit them:

- Shift using the mouse
  - To change the absolute position of the marked objects, position the mouse pointer over an object, and shift the multiple selection with the mouse button pressed.
  - To resize all the objects by the same ratio, grab the resizing handles of the reference object.
- Move over the work area with the icons of the toolbar
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects
- Moving with the shortcut menu commands of the work area
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects

Aligning objects

Procedure

1. Select the objects via multiple selection.
2. Specify an object as the reference object.
3. Select the desired command in the toolbar or the shortcut menu - see table below.
   The selected objects will be aligned.

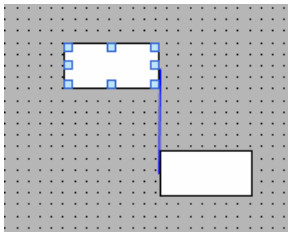
Aligning objects flush

The selected objects will be aligned flush to the reference object.

Icon	Description
	Aligns the selected objects to the left edge of the reference object.
	Aligns the selected objects to the vertical center axis of the reference object.
	Aligns the selected objects to the right edge of the reference object.
	Aligns the selected objects to the upper edge of the reference object.
	Aligns the selected objects to the horizontal center axis of the reference object.
	Aligns the selected objects to the lower edge of the reference object.
	Centers the selected objects to the center points of the reference object.
	Centers the selected objects vertically in the screen.

Snap to object

When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.



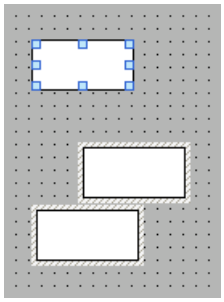
If you are working with the keyboard, press the Alt key. When you move the selected object with the arrow keys, the next anchor point is displayed.

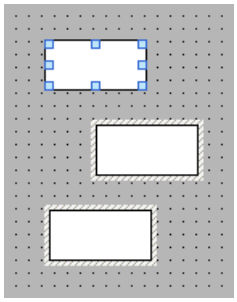
Distributing objects evenly

You need at least three selected objects. A reference object is not required.

1. Select the objects.
2. Click one of the buttons "Distribute horizontally equal" or "Distribute vertically equal".
   The selected objects are distributed at equal distances.

The following screen shows how you align the vertical spacing of the selected objects:





Icon	Description
	Aligns the horizontal distance between the objects. The position of the objects on the extreme left and right side remains unchanged. All other objects are distributed evenly between them.
	Aligns the vertical distance between the objects. The position of the objects at the extreme top and bottom (right and left) remains unchanged. All other objects are distributed evenly between them.

Rotating objects

Introduction

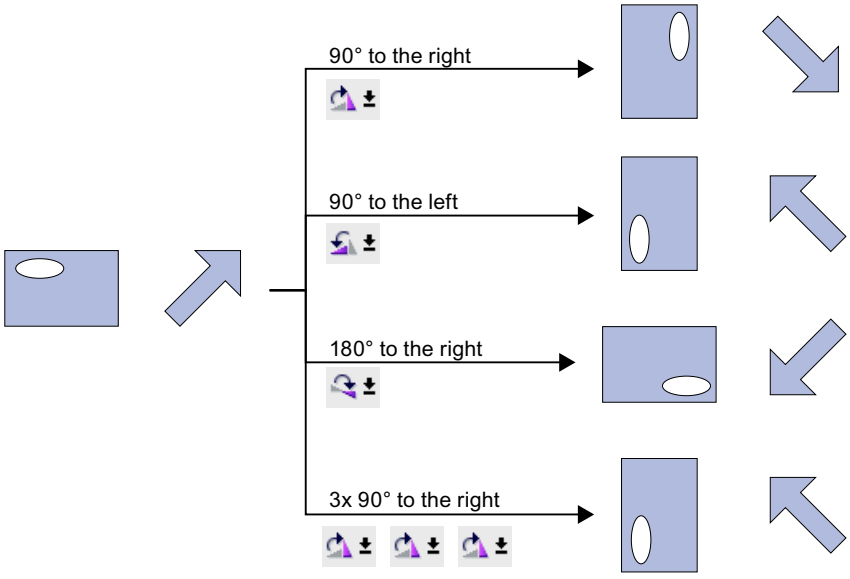
You can rotate a suitable object clockwise or counterclockwise around its center axis in steps of 90°.

Note

Not all the objects can be rotated. Some objects that can be rotated in screens cannot be rotated in reports.

You can also rotate multiple objects using the multiple selection function. Certain WinCC objects such as buttons cannot be rotated.

The alignment of elements in an object will change in a rotated object. The following figure shows how a rectangle and an ellipse behave under the different commands for rotating an object:



Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to rotate.
2. Click one of the following toolbar icons:
   , to rotate the object clockwise around its center point. The angle of rotation is 90°.
   , to rotate the object counterclockwise around its center point. The angle of rotation is 90°.
   , to rotate the object clockwise by 180°.

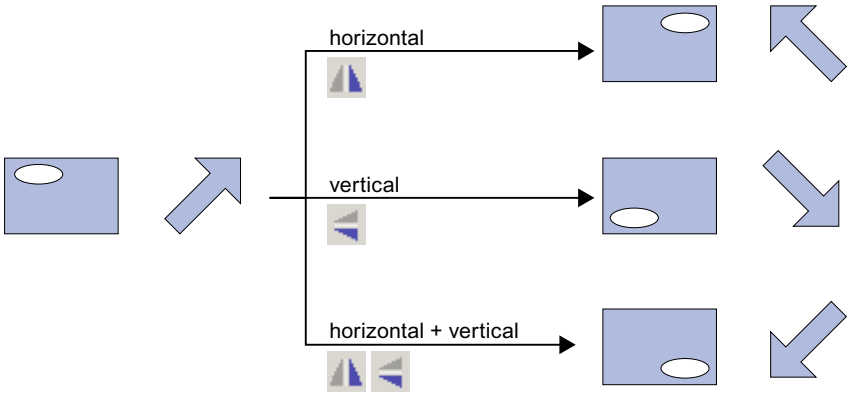
Result

The object is shown at its new angle.

Flipping objects

Introduction

You can flip an object along its vertical or horizontal center axis. The alignment of elements in an object will change when you flip an object. The following figure shows how a rectangle and an ellipse behave under the different commands for flipping an object.



Requirement

You have opened a screen which contains at least one object.

Procedure

1. Select the object that you want to flip.
2. Click the "Flip" command in the shortcut menu and select one of the options displayed:
   - , to flip the selected object along its vertical center axis.
   - , to flip the selected object along its horizontal center axis.

Result

The object is shown at its flipped position.

12.6.3 Operation in Runtime

12.6.3.1 Printing reports

Printing a report in Runtime

If you have configured an object with the "PrintReport" system function, the operator can print out a report in Runtime. To do this, the operator uses the "Print report" button on a screen. The operator can set or change further settings for the report. The report is output to the default printer.

Printing reports (Page 4501)

Principles for preparation of reports (Page 4496)

Reports (Page 4493)

12.6.4 Objects in reports

12.6.4.1 Audit report

Application

With the audit report, the content of the audit trail of a HMI device is output as a report.

RecordID	Timestamp	DeltaToUTC	UserID
0	18.11.2007 23:00 ObjectID: Application Description: This is an example description. It may not be cut and will be printed out completely.	-1:00	System

Requirements

The "audit report" object is available only if the following requirements are met:

- The HMI device supports a GMP-compliant configuration.
- GMP-compliant configuration is active in the Runtime settings of the HMI device.

Note that operator actions and system operations are only recorded if a corresponding log is configured.

Layout

In the Inspector window the position, shape, style, color and font types of the object are customized. In particular, the following can be adjusted:

- Visibility of the comment

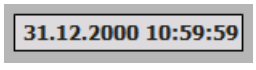
12.6.4.2 Date/time field

Application

The "Date/time field" object shows the system time of the HMI device or the date and / or time of a connected tag. The layout depends on the language setting on the HMI device.



Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. In the "Properties > Properties > General" dialog, you can adapt the following properties in particular:

- Long date/time format: This setting defines the format displayed for the data and / or time.
- System time: Specifies whether to use the system time of the HMI device, or the data and / or time of a connected tag.

Long date/time format

Option	Description
"Enabled"	Date and / or time is fully displayed, for example "Sunday, December 31, 2000 10:59:59 AM"
"Disabled"	Date and / or time is displayed in abbreviated form, e.g. "12/31/2000 10:59:59 AM"

System time

Option	Description
"Enabled"	The system time of the HMI device is displayed
"Disabled"	The date and / or time of the connected tag is displayed Select a tag of the "DateTime" data type, e.g. an internal tag. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

Audit report (Page 4516)

12.6.4.3 I/O field

Application

The "I/O field" object is used to enter process values.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Display format: Specifies the format in which the values in the I/O field are output.

Note

The "I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

Display format

The "display format" for the output of values is specified in "Properties > Properties > General > Format", in the Inspector window.

Layout	
"Binary"	Output of values in binary form
"Date" *	Output of date specifications. The format depends on the language setting on the HMI device.
"Date/time" *	Output of date and time specifications. The format depends on the language setting on the HMI device.
"Decimal" *	Output of values in decimal form.
"Hexadecimal"	Output of values in hexadecimal form.
"Time" *	Output of time specifications. The format depends on the language setting on the HMI device.
"Character string"	Output of strings.
*: not in Runtime Professional	

Avoid overlaps with output fields

If several I/O fields are configured as output fields with a transparent background in a report, these I/O fields may overlap. The transparent part of the one field covers the digits of the other field. This may cause display problems in the report. In order to avoid such overlaps, set the margins of the I/O fields to zero in the object properties under "Properties > Properties > Appearance". Activate "Properties > Properties > Layout > Fit object to contents."

Audit report (Page 4516)

12.6.4.4 Graphic view

application

The "Graphic view" object is used to display graphics.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Graphic: Specifies the graphic file that is displayed in the object.
- Stretch graphic: Specifies the automatic size stretching for objects with graphics.

Inserting graphics

The following graphic format is used in the "Graphic view" object: *.bmp, *.tif, *.png, *.ico, *.emf, *.wmf, *.gif, *.jpg or *.jpeg. You may also use graphics as OLE objects in the Graphic view .

1. In the Inspector window, select "Properties > Properties > General":
2. Select the graphic you want to add in the drop-down list under "Graphic".
   The graphic preview is shown in the right pane.
3. Click "Assign" to insert the graphic in the Graphic view .

Stretch graphic

Whether a graphic displayed in a Graphic view is stretched to the size of the Graphic view in runtime is specified in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select one of the following options from the "Fit to size" area:
   - Fit object size to content
   - Fit content to object size

See also

Audit report (Page 4516)

12.6.4.5 Graphic I/O field

Application

With the "Graphic I/O field" object, the graphics of a graphics list are displayed, depending on the tag value. In the Inspector window, the tag and graphics list are configured, under "Properties > Properties > General":

Note

The "Graphic I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

Layout

Customize settings for color, frame, position and object size in the inspector window. In particular, the "Fit to size" is defined by specifying whether the object is adjusted to the graphics during output in the report or the graphic is adjusted in the object.

See also

Create a report (Page 4498)

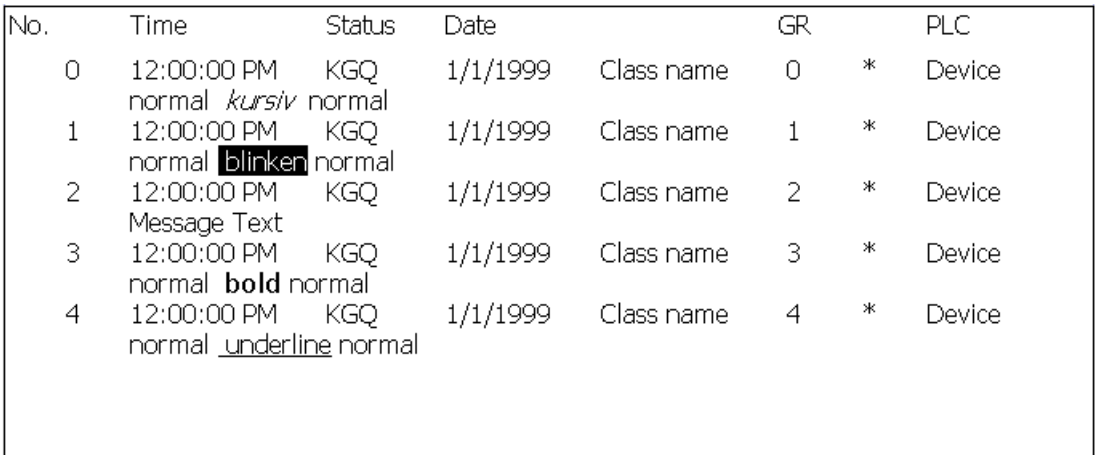
Audit report (Page 4516)

Objects in reports (Page 4516)

12.6.4.6 Alarm report

Application

Use the "Alarm report" object to output alarms of the selected alarm classes from the alarm buffer or alarm log to the report.



Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Source
- Alarm classes
- Time range
- Additional settings for the display
- Visible columns

Specifying the source

Under "Properties > Properties > General > Settings > Source", specify whether to display alarms from the alarm buffer, or from the alarm log. Select the alarm log in the "Alarm log" dialog.

Note

The "Alarm log" source is only available if the HMI device supports logs.

Specifying alarm classes

Under "Properties > Properties > General > Alarm classes, enable the alarm classes for the alarms output to the report.

Specifying the time range

If you want to restrict alarm output to a specific time range, select the start and end tags for the time range in the "Properties > Properties > General > Time range" dialog. The tag must be of the "DateTime" type.

Additional settings for the display

Under "Properties > Properties > General > Settings, specify the following settings for the display in the alarm report:

- Under "Sorting", specify whether to start the display with the oldest or most recent alarm.
- Under "Lines per entry", specify the number of lines to be available for each alarm. The required number of lines depends on the following factors:
  - Number and width of the selected columns for the output
  - Font size used
  - Paper format of the printer
- Select "Visible heading" to enable the display of column headers.
- Select "Display milliseconds" to enable the display of milliseconds for time data.

Visible columns

Under ""Properties > Properties > Layout > Visible columns", enable the columns to be displayed in the alarm report.

See also

Create a report (Page 4498)

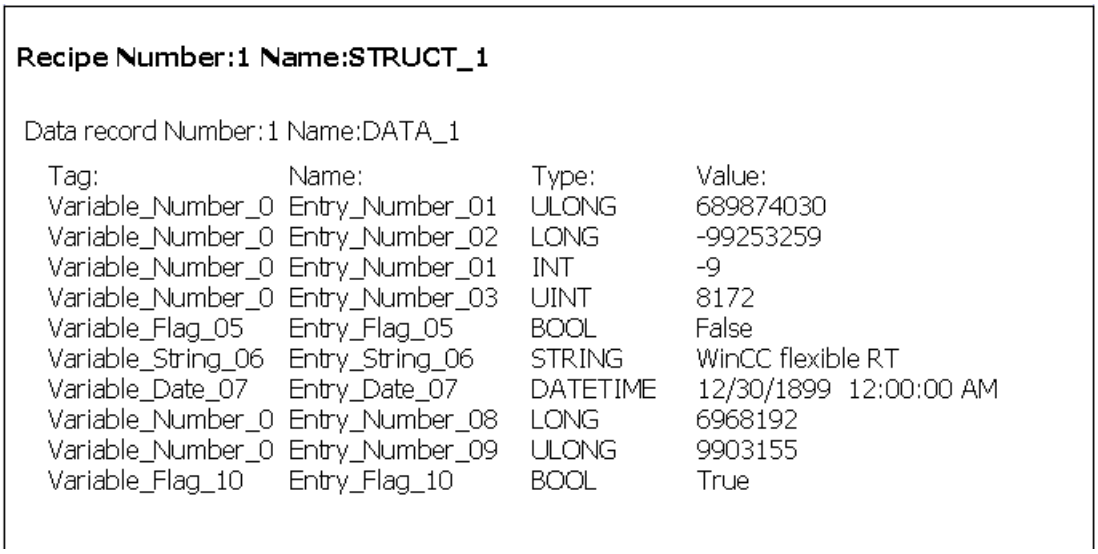
Principles for preparation of reports (Page 4496)

Audit report (Page 4516)

12.6.4.7 Recipe report

application

Use the "Recipe report" object to output the elements of recipe data records in the report.



Recipe Number:1 Name:STRUCT_1

Data record Number:1 Name:DATA_1

Tag:	Name:	Type:	Value:
Variable_Number_0	Entry_Number_01	ULONG	689874030
Variable_Number_0	Entry_Number_02	LONG	-99253259
Variable_Number_0	Entry_Number_01	INT	-9
Variable_Number_0	Entry_Number_03	UINT	8172
Variable_Flag_05	Entry_Flag_05	BOOL	False
Variable_String_06	Entry_String_06	STRING	WinCC flexible RT
Variable_Date_07	Entry_Date_07	DATETIME	12/30/1899 12:00:00 AM
Variable_Number_0	Entry_Number_08	LONG	6968192
Variable_Number_0	Entry_Number_09	ULONG	9903155
Variable_Flag_10	Entry_Flag_10	BOOL	True

Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Recipe
- Data record
- Format
- Visible entries

Selecting a recipe

Specify the recipes to be output in the recipe report under "Properties > Properties > General > Recipe". You can define the recipes based on their recipe name, or on a range of recipe numbers. Under "First recipe" and "Last recipe", enter a value or select a tag.

You can also choose to display all recipes.

Selecting a data record

Under "Properties > Properties > General > Data record", specify which data records of the selected recipes are to be output in the recipe report. You can define the data records based on the data record name, or on a range of data record numbers. Under "First recipe" and "Last recipe", enter a value or select a tag.

You can also choose to display all data records of the selected recipes.

Format

In the "Format" field of the "Properties > Properties > Layout > Settings" dialog, specify whether to output the data records as a table in column format or line report format.

WinCC updates the preview in the detail page accordingly.

Visible entries

Under ""Properties > Properties > Layout > Visible entries", enable the columns to be displayed in the recipe report. Select "Show headings" to enable the display of column headers.

See also

Create a report (Page 4498)

Principles for preparation of reports (Page 4496)

Audit report (Page 4516)

12.6.4.8 Page number

application

Use the "Page number" object to output the current page number in the report.

Layout

In the inspector window, change the settings for color, font, position and object size. In particular, specify "Size adaptation":

Fit to size

Under "Properties > Properties > Layout > Fit to size", the "Fit object to content" option is used to specify whether WinCC adjusts to the object size of the field content:

- Enabled "Fit object to contents" option:
  WinCC automatically adjusts the size of the object to the configured format. The font size and field length are defined under "Properties > Properties > General > Text".
  The object can be moved in the working area, however, the size cannot be changed. During report output, the entire field content is output at the time of report output.
- Disabled "Fit object to contents" option:
  Customize the field size by yourself. WinCC does not resize the field for report output. It can be possible that not all content of the field is output in the report. Therefore, configure a field of sufficient size.

See also

Create a report (Page 4498)

Principles for preparation of reports (Page 4496)

Audit report (Page 4516)

12.6.4.9 Symbolic I/O field

application

With the "Symbolic I/O field" object, the content of a text list in reports is displayed, depending on the tag value. In the inspector window, the tag and text list is configured under "Properties > Properties > General":

Layout

In the inspector window, change the settings for color, frame, font, position and object size. In particular, the "Fit to size" is defined, by specifying whether the object size is adjusted to the text during output in the report or not.

Note

The "Symbolic I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

See also

Create a report (Page 4498)

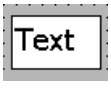
Principles for preparation of reports (Page 4496)

Audit report (Page 4516)

12.6.4.10 Text field

Application

The "Text field" is a closed object which you can fill with a color.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Text: Specifies the text for the text field.
- Size of text field: Defines whether the size of the object is adapted to the space required by the largest list entry.

Text

Specify the text for the text field in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a text.
   For texts over several lines you can set a line break by pressing the key combination <Shift + Enter>.

Size of text field

In the Inspector window, you can define whether the size of the object is adapted to the space required by the largest list entry.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Resize > Fit to contents".

Audit report (Page 4516)

12.7 Configuring user administration

12.7.1 Field of application of the user administration

Principle

The access protection controls access to data and functions in Runtime. This feature protects your applications against unauthorized operation. Safety-related operations are already limited to specific user groups when a project is being created. To this purpose you set up users and user groups that you equip with characteristic access rights, so-called authorizations. You then configure the authorizations required for operation of safety-related objects. Operators only have access, for example, to specific operator controls. Commissioners, for example, have unlimited access in Runtime.

Definition

You administer users, user groups and authorizations centrally in the user administration of WinCC. You transfer users and user groups together with the project to the HMI device. The users and passwords are managed on the HMI device in the User view.

Application example

You configure the "Service" authorization so that only service technicians have access to the configuration parameters. You assign the authorization to the "Service technician" user group. This allows all members of this group to set the protected configuration parameters.

Notice

Access protection does not protect against incorrect operations. It is your job to ensure that only authorized personnel with appropriate training will design, commission, operate and maintain plants and machines.

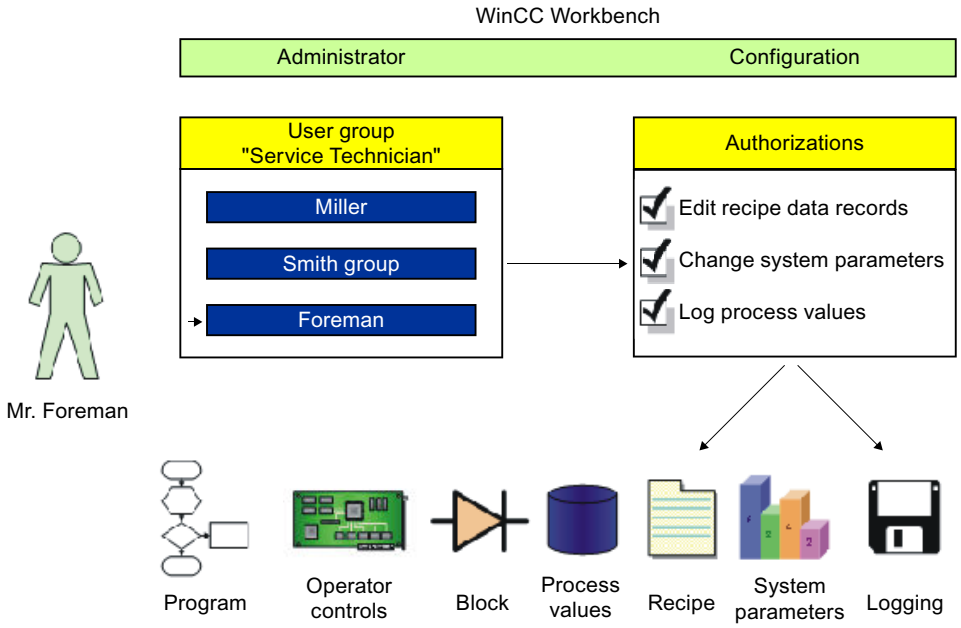
Access protection is not suitable for defining work routines and monitoring their observance.

12.7.2 Form of the user administration

Introduction

In case of a project in manufacturing engineering, the environment at the equipment manufacturer has to be differentiated from the environment at the end customer as plant operator.

The equipment manufacturer allows users, for example Mr. Foreman, a specific access within the application or HMI device. However, a user Foreman does not exist at the end customer. The machine manufacturer cannot know the end users and the tasks they have to perform for configuration. The final users are usually set after commissioning at the end customer.



Principle

To minimize the work required for management, authorizations are assigned via user groups and not directly to individual users.

A user group assembles configured authorizations according to common jobs. For example, all permissions required for a service job are collected in a "Service technician" group. When you create a user who should be responsible for servicing, you simply assign him to the "Service technician" group.

The user view enables user administration in Runtime. Use user view to create, delete and assign an authorization to users in Runtime.

The user administration separates the administration of the users from the configuration of the authorizations. This ensures flexibility at the access protection.

Defaults can be set for the user administration during the configuration phase in the Engineering System.

12.7.3 Basics

12.7.3.1 Users

Introduction

You can create users in the "Users" tab of the "User administration" editor and assign them to user groups. The "Users" tab is part of the user administration in WinCC.

Open

To open the "Users" tab, double-click "User administration" in the project window.

Work area

The users are managed in the work area:

- You create or delete users.
- You assign users to user groups.

Note

You can assign a user to exactly one user group.

Note

On an HMI device the number is limited to 100 users and one PLC user. This restriction does not apply to PCs. On a PC, the maximum number of users is restricted by the physical memory.

Inspector window

When you select a user, you can change the password in the "General" group. Under "Automatic logoff" you can specify if the user is to be automatically logged off by the HMI device when there is no operator activity after the specified time.

Backup and restore

The user data is encrypted and saved on the HMI device to protect it from loss due to power failure.

The users, passwords, group assignments and logoff times set up on the HMI device can be backed up and restored. This prevents you having to enter all of the data again on another HMI device.

Note

The currently valid user data is overwritten in the following cases:

- Depending on settings, upon a new download of the project
- Upon restore of a backed-up project
- Upon import of the user administration via an operator control. The newly downloaded or restored user data and passwords take effect immediately.

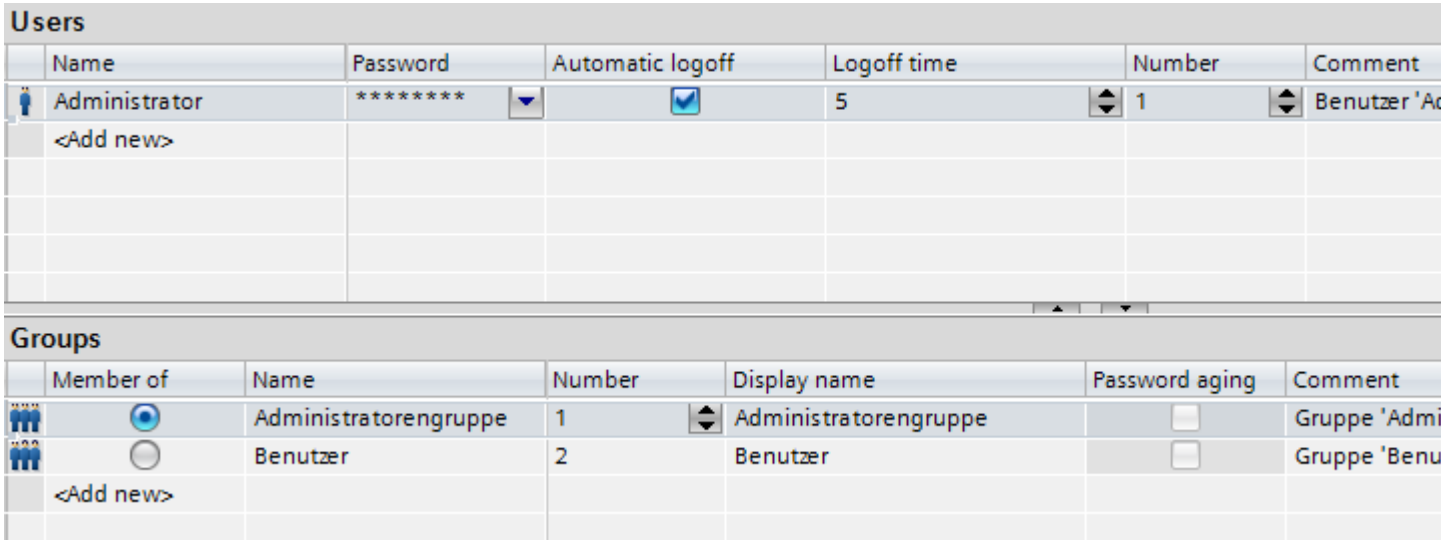
12.7.3.2 Users work area

Introduction

The "Users" work area lists the users and user groups in table form. You administrate the users and assign them to a user group.

Principle

The work area consists of the "Users" and "Groups" tables.



The "Users" table shows the existing users. When you select a user in this table, the "Groups" table shows the user group to which the user belongs.

Note

For the user "Administrator", the default password is "administrator". For security reasons, you should change the password of this user.

12.7.3.3 User groups

Introduction

You can create users and authorizations in the "User groups" tab of the "User Administration" editor. The "User groups" tab is part of the user administration in WinCC.

Open

Double-click the "User administration" in the project window. Open the "User groups" tab.

Work area

The user groups and authorizations are managed in the work area:

- You create new user groups and authorizations or delete them.
- You assign the authorizations to the user groups.

Inspector window

When a user group or an authorization is selected, you can edit the name in the "General" group. You can also enter a brief description in the "Comment" group.

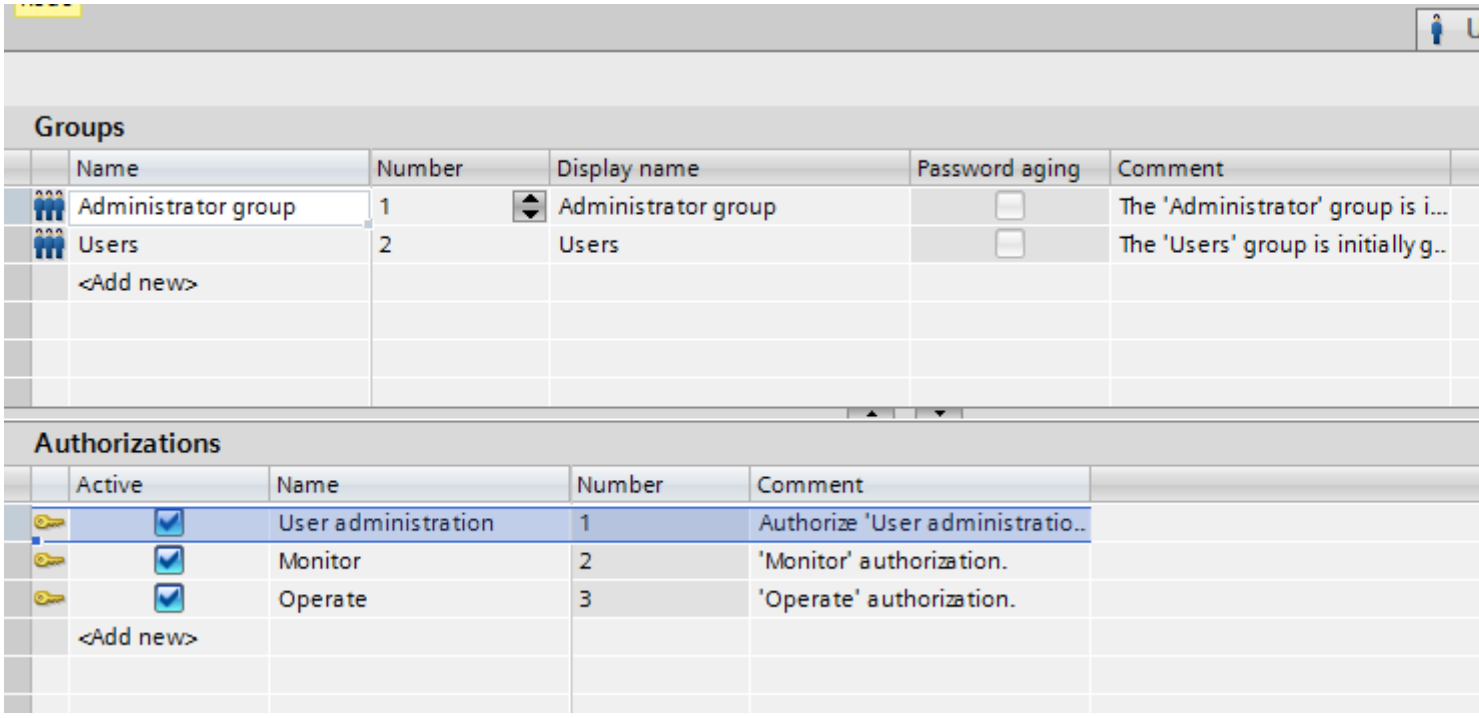
12.7.3.4 User groups work area

Introduction

The "User groups" work area shows a table of the groups and their authorizations. You administer the user groups and assign authorizations to them.

Principle

The work area consists of the "Groups" and "Authorizations" tables.



The "Groups" table shows the existing user groups. When you select a user group in this table, the "Active" column of the "Authorizations" table shows the authorizations which were assigned to the user group.

The number of the user group and of the authorization is assigned by the user administration. The designations and descriptions are assigned by you.

The number of predefined authorizations are fixed. Authorizations that you create can be freely edited. Ensure that the assigned numbers are unique.

12.7.3.5 Settings for the user administration

Introduction

In the "Runtime settings > User administration" editor, configure the security settings for users and their passwords in runtime.

Open

Double-click the "Runtime settings" editor in the project window. Click "User administration".

Work area

You carry out the settings for the validity of passwords in runtime in the work area. You determine the complexity of the password, for example.

Effects in Runtime

The security settings have the following effects in runtime, depending on the configuration.

- "General" group
  - "Enable limit for logon attempts" check box selected
    The number entered in the "Number of incorrect logon attempts" box defines the number of logon attempts a user is allowed before being assigned to the "Unauthorized" group.
    "Enable limit for logon attempts" check box not selected
    The user has an unlimited number of logon attempts in runtime.
  - "Number of incorrect logon attempts" field
    If you enter "4" in the field, for example, and the fourth logon attempt fails, the user is automatically assigned to the "Unauthorized" group.
    You can specify 1 to 9 attempts.
  - "Logon only with password" check box
    When the check box is selected, the user will be authenticated by the password. The user name is not required.
    To match users to passwords, you cannot configure passwords more than once.
- "Hierarchy level" group
  - "Group-specific rights for user administration" check box
    When this check box is selected, administrators only manage users whose group number is less than or equal to their own.
    For example, an administrator whose group number is 5 can only manage users whose group number is less than or equal to 5. This means that the administrator can assign users only to groups with a group number less than or equal to 5.

- "Password" group
  - "Enable password aging" checkbox selected
    The password expires after the number of days set in the "Validity of the password (days)" field.
    The "Password aging" column is selected in the "User groups" editor. This enables you to specify group-by-group, if the passwords should expire or if the password generations should be saved. Passwords never expire for groups for which password aging is not enabled.
  - "Prewarning time (days)" field
    The user is informed that the password will expire the specified number of days before the password expires.
  - "Password generations" field
    If the user changes the password, the new password must be different from the specified number of previous passwords. The number of password generations ranges from 1 to 5.
- "Password complexity" group
  - "Must include special characters" check box selected
    The user must enter a password containing at least one special character at any position.
  - "Must include number" check box selected
    The user must enter a password containing at least one number at any position.
  - "Minimum password length" field
    The user must enter a password with a minimum length, as specified in the "Minimum password length" field.
    The minimum length of the password is 3 characters.

12.7.3.6 Settings for the user administration

Introduction

In the "Runtime settings > User administration" editor, configure the security settings for users and their passwords in runtime.

Open

Double-click the "Runtime settings" editor in the project window. Click "User administration".

Work area

You carry out the settings for the validity of passwords in runtime in the work area. You determine the complexity of the password, for example.

Effects in Runtime

The security settings have the following effects in runtime, depending on the configuration.

- "General" group
  - "Change initial password" check box selected
    The user must change the administrator-assigned password when logging on for the first time.
  - "Change logoff time" checkbox selected
    Simple user rights are sufficient for changing the logoff time.
    The logoff time is the period after which the user administration automatically logs off a user when no operator activity is detected in the system.
    The logoff time for the SIMATIC Logon user corresponds to the logoff time of the default user "Administrator".
    Any user changes of the logoff time are logged in the Audit Trail.
  - "Enable limit for logon attempts" check box selected
    The number entered in the "Number of incorrect logon attempts" box defines the number of logon attempts a user is allowed before being assigned to the "Unauthorized" group.
    "Enable limit for logon attempts" check box not selected
    The user has an unlimited number of logon attempts in runtime.
  - "Number of incorrect logon attempts" field
    If you enter "4" in the field, for example, and the fourth logon attempt fails, the user is automatically assigned to the "Unauthorized" group.
    You can specify 1 to 9 attempts.
  - "Logon only with password" check box
    When the check box is selected, the user will be authenticated by the password. The user name is not required.
    To match users to passwords, you cannot configure passwords more than once.
- "Hierarchy level" group
  - "Group-specific rights for user administration" check box
    When this check box is selected, administrators only manage users whose group number is less than or equal to their own.
    For example, an administrator whose group number is 5 can only manage users whose group number is less than or equal to 5. This means that the administrator can assign users only to groups with a group number less than or equal to 5.

- "Password" group
  - "Enable password aging" checkbox selected
    The password expires after the number of days set in the "Validity of the password (days)" field.
    The "Password aging" column is selected in the "User groups" editor. This enables you to specify group-by-group, if the passwords should expire or if the password generations should be saved. Passwords never expire for groups for which password aging is not enabled.
  - "Prewarning time (days)" field
    The user is informed that the password will expire the specified number of days before the password expires.
  - "Password generations" field
    If the user changes the password, the new password must be different from the specified number of previous passwords. The number of password generations ranges from 1 to 5.
- "Password complexity" group
  - "Must include special characters" check box selected
    The user must enter a password containing at least one special character at any position.
  - "Must include number" check box selected
    The user must enter a password containing at least one number at any position.
  - "Minimum password length" field
    The user must enter a password with a minimum length, as specified in the "Minimum password length" field.
    The minimum length of the password is 3 characters.
- "SIMATIC Logon" group
  - "Activate SIMATIC Logon" check box selected
    A connection is established to the server. Authorization is performed via SIMATIC Logon.
  - "Encrypted transfer" checkbox selected
    The data is encrypted before it is transferred to the server.

12.7.4 Building up and structuring a user administration

12.7.4.1 Basics of user administration

Principle

This section addresses four target groups. The topics are organized correspondingly. The target groups serve as examples for different groups of persons who use the user administration.

1. Administrator OEM
2. Administrator RT

3. Planners
4. Operator

As Administrator OEM you create the user groups, users and authorizations for Runtime in the Engineering System of, for example, an equipment manufacturer.

As Administrator RT you administer users in Runtime by means of the "User view."

As the project engineer you assign the authorizations to the user groups in the Engineering System. In addition, you configure the authorizations for objects.

As Operator you log on in runtime. You can only access a protected object if you have the required authorization.

Note

The Administrator RT target group already exists in the Runtime user administration as the predefined user group "Administrator group." For a better understanding the predefined user groups and authorizations are not used below.

12.7.4.2 Administering users for Runtime

Creating an authorization

Introduction

You create an authorization and assign it to one or more user groups.

Requirements

The "User groups" work area is open.

Procedure

1. Double-click "Add" in the "Authorizations" table.
2. Enter "Stop runtime" as the name of the authorization.
3. Enter a brief description as the "Comment".

See also

Creating a user group (Page 4538)

Creating a user group

Introduction

User groups are created so that you do not have to assign an authorization to every single user. You create a user group, assign authorizations and then assign users to it.

Note

The name of the user group has to be unique within the project. Otherwise the input is not accepted.

Note

Using SIMATIC Logon

Ensure that the names of the user groups in Windows and WinCC are identical.

Requirements

The "User groups" work area is open.

Procedure

1. Double-click "Add" in the "Groups" table.
2. Enter "Operators" as the "Name" of the user group.
3. Change the "Number" of the user group as required.
4. Enter "Display name" of the "Operators" user group.
5. Enter a brief description as the "Comment".

In runtime, the user view shows the display name of the user group. The display name of the user group depends on the language. You can specify the name in several languages and switch between languages in runtime.

See also

Creating an authorization (Page 4537)

Example: Configuring a button with logon dialog box (Page 4559)

Example: Logging the logon and logoff events (Page 4560)

Assigning an authorization

Introduction

When you allocate an authorization to a user group, all assigned users have this authorization.

Requirements

- A "Stop runtime" authorization has been created.
- An "Operators" user group has been created.
- The "User groups" work area is open.

Procedure

1. Click on the "Operators" user group in the "Groups" table. The "Authorizations" table shows all authorizations.
2. Enable the "Stop runtime" authorization in the "Authorizations" table.

Note

The "Stop runtime" authorization is only a designation and does not have any relation to the function "StopRuntime". You have to establish this relation yourself. To do so, configure the "StopRuntime" system functions at a button and select "Stop runtime" as the "Authorization".

Creating users

Introduction

You create a user so that users can log on with their user names in runtime after loading to the device.

As an alternative, you can create and change users by means of the "User view" in Runtime.

In order for a created user to have authorizations you have to assign him to a user group and allocate authorizations to the user group.

The logon is successful when the user name entered during the logon matches a user in Runtime. In addition, the entered password must agree with the stored password of the user.

Note

Note that the entry is case-sensitive.

Requirements

The "Users" work area is open.

Procedure

1. Double-click "Add" in the "Users" table.
2. Enter "Foreman" as the user name.

   Note

   The user name must be unique within the project. Otherwise the input is not accepted.

   Note

   Do not use special characters such as / " § $ % ? when you enter a user name and a password. ' &.

3. Click the button in the "Password" column. A dialog box for entering the password is displayed.
4. Enter the password of the user.
5. To confirm the password enter it a second time in the lower field.
6. Close the dialog box using the icon.
7. If a user is to be logged off after a specific time period, activate "Automatic logoff".
8. Click in the "Logoff time" column. The preset value for "Logoff time" is 5 minutes.
9. Enter a brief description as the "Comment".

Assigning a user to a user group

Introduction

When you assign a user to a user group, the user has the authorizations of the user group.

Note

You have to assign a user to exactly one user group. The assignment is checked during the consistency check and generation of the project.

Requirements

- The user "Foreman" has been created.
- An "Operators" user group has been created.
- The "Users" work area is open.

Procedure

1. Click on the "Foreman" user in the "Users" table. The "Groups" table shows all user groups.
2. Activate the "Operators" user group in the "Groups" table.

Managing users

Introduction

In the work area, you can administer users and assign them to user groups.

Requirements

The "Users" work area is open.

Changing the user name

1. In the "Users" table, double-click the field in the "Name" column to change the user name.
2. Change the user name.
3. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the user name under "Properties > Properties > General" in the Inspector window.

Changing the password of the user

1. Click the button in the "Password" column of the "Users" table. A dialog for entering the password opens.
2. In the "Enter password" field, enter the new password.
3. Reenter the new password in the "Confirm password" field.
4. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the password under "Properties > Properties > General" in the Inspector window.

Displaying invisible columns

1. Position the mouse cursor on the title of the "Users" table.
2. Right-click to open the shortcut menu and enable the display of the "Logoff time" column, for example.

Changing the logoff time of the user

1. In the "Users" area, double-click on the field in the "Logoff time" column to change the logoff time.
2. Change the logoff time.
3. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the logoff time under "Properties > Properties > Automatic logoff" in the Inspector window.

Deleting a user

1. Select the line of the user to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

Note

Predefined users cannot be deleted.

Managing user groups

Introduction

In the workplace you administer user groups and assign authorizations for use in runtime.

Requirements

The "User groups" work area is open.

Changing the name of the user group

1. In the "Groups" table, double-click the field in the "Name" column to change the name of the user group.
2. Change the name of the user group.
3. Confirm your entry with <Return>.

Alternatively, select the user group in the work area. Change the name under "Properties > Properties > General" in the Inspector window.

Note

Predefined user groups cannot be deleted.

Displaying invisible columns

1. Position the mouse cursor on the title of the "Users" table.
2. Right-click to open the shortcut menu and enable the display of the "Display name" column, for example.

Changing the displayed name of the user group

1. In the "Groups" table, double-click the field in the "Display name" column to change the display name of the user group.
2. Change the displayed name of the user group.
3. Confirm your entry with <Return>.

Alternatively, select the user group in the work area. Change the display name under "Properties > Properties > General" in the Inspector window.

Deleting a user group

1. Mark the line of the user group to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

Note

Predefined user groups cannot be deleted.

Changing the name of the authorization

1. In the "Authorizations" table, double-click the field in the "Name" column to change the name of the authorization.
2. Change the name of the authorization.
3. Confirm your entry with <Return>.

Alternatively, select the authorization in the work area. Change the name under "Properties > Properties > General" in the Inspector window.

Deleting authorizations

1. Mark the line of the authorization to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

Note

Predefined authorizations cannot be deleted.

12.7.4.3 Managing users on the server

Central user administration using SIMATIC Logon

Introduction

To manage users and user groups for several applications or HMI devices, activate SIMATIC Logon.

Principle

SIMATIC Logon is a tool for system-wide user administration. If you use SIMATIC Logon, the users are centrally managed outside the application or HMI device.

You configure the user groups and their permissions as you usually do with the local user administration in WinCC. You assign identical names to the user groups on the server and in WinCC. Authorizations are assigned in runtime to a user group when the names are identical.

You do not have to create users in WinCC because they are taken dynamically from Windows user management during the logon process. The application or HMI device forwards each logon or password change to SIMATIC Logon for processing.

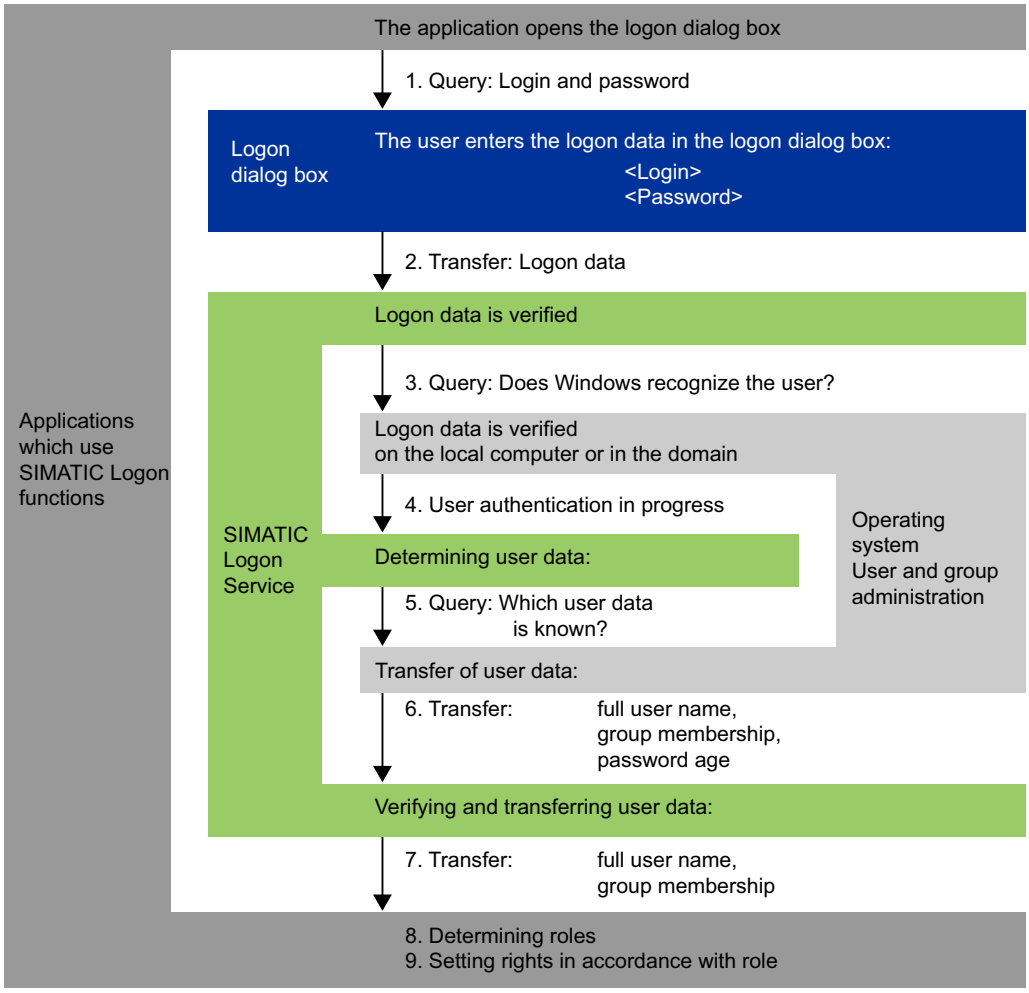
Note

SIMATIC Logon is a product requiring a license. For more information on SIMATIC Logon go to <http://support.automation.siemens.com>.

Enter the ID "34519648" in the search field and start searching. The "SIMATIC Logon - Electronic Signature" manual is available to download.

Log on process via SIMATIC Logon Service

The following diagram illustrates the process that runs automatically when a user logs onto Runtime.



Results: The user can implement the role functions.

Making settings on the server

Introduction

Perform the following steps on your sever to ensure correct operation of SIMATIC Logon.

Procedure

1. Install SIMATIC Logon Services.
2. Create the user group in the user administration of the operating system.

3. Create the users in the user administration of the operating system.

   Note

   Users of SIMATIC Logon must be members of a user group of the operating system. Members of a subgroup cannot be logged on.

4. Assign the new users to a group.
5. Transfer the licenses for each HMI device on the server.

Note

You can find more detailed information in the documentation supplied with SIMATIC Logon.

Note

The password policies stored on the server are valid if users are authorized by means of SIMATIC Logon.

Note

You can configure the logoff time for the SIMATIC Logon user with "Configure SIMATIC Logon" on the server.

You set the automatic logoff time identical for all users, regardless of the panels.

Logging on using SIMATIC Logon

Requirements

- User administration exists.
- The groups created in WinCC agree with the Windows groups on the server.
- There is a server with SIMATIC Logon Service installed.

Note

A user may only be a member of one user group in WinCC. When a user is a member of several user groups on the server, only one of these user groups can be made known in WinCC.

"Administrators" and "Users" are predefined groups in both Windows and WinCC. Any new user created in Windows is automatically a member of the "Users" group. A user will be a member of two groups if assigned to a new group, for example, to the "SL user" group.

Remove this user from the "Users" group of the operating system to enable logon of this user using SIMATIC Logon.

A system message in runtime always confirms the successful logon of a user on the server.

Note

When you use SIMATIC Logon to manage access to a panel or a device with WinCC Runtime Advanced, you must note that the characters '/' and '\' cannot be used in the names of Windows user groups or Windows users.

Procedure

1. Open the "Runtime settings > User administration" editor in the Project window.
2. Select "Enable SIMATIC Logon".
3. Select "Windows domain" or "Windows computer", depending on where you administer your users.
4. Enter the name or IP address of the SIMATIC Logon server in the "Server name" text box.

   Note

   Make sure your SIMATIC Logon Server always has the same IP address if you use IP addresses.

5. Enter the port number for TCP/IP communication in the "Port number" text box. The valid range of values lies between 1024 and 49151. The preset port number is "16389" and used by SIMATIC Logon as the default.
6. Enter the Windows domain or the logon server with the user data in the "Windows domain" text box.
   Enter the name of the sever to access users on the logon server.
   Enter the name of the domain if the logon sever is in a domain and you wish to access users of the domain.

   Note

   Local Windows users are not accepted when the logon server is in a domain.

7. Activate the "Encrypted transfer" check box in order to encrypt the data before sending it to the server.

Emergency user

If the server cannot be accessed, all local users that were created in WinCC user administration can also be used as emergency users.

Emergency users have the rights of the user group to which they were assigned.

Note

For additional information, refer to the included SIMATIC Logon documentation.

This documentation is available at: [SIMATIC Logon installation directory] \manuals

12.7.4.4 Administering users in Runtime

Users in runtime

Principle

You create users and user groups and assign authorizations to them. You configure objects with authorizations. After download to the HMI device, all objects which were configured with an authorization are protected against unauthorized access in Runtime.

User view

When you configure a user view in the Engineering System, you administer users in this user view following download to the HMI device.

Notice

Changes in the user view are effective immediately in Runtime. Changes in runtime are not updated in the engineering system. When downloading the user administration to the HMI device, all changes in the user view are overwritten after a security prompt and based on the settings.

Users who have a "User administration" authorization have unlimited access to the user view. This allows them to administer all users. Any other user has only limited access to the user view for self administration.

See also

User view (Page 4548)

User view

Purpose

You configure a user view in the engineering system to also administer the users in Runtime.

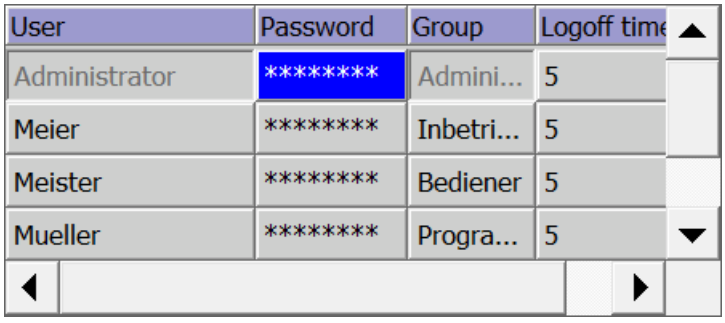
Structure

The user view shows the following in each line:

- The user
- The encrypted password
- The corresponding user group
- The logoff time

If no user is logged on, the user view is empty. The content of the individual fields is displayed after logon.

User view of an administrator



When an administrator is logged on, the user view shows all the users. The administrator changes the user name and the password. The administrator creates new users and assigns them to an existing user group.

User view of a user

When no administrator is logged on, the user view shows only the logged-on user. Users can change their own passwords and logoff time.

See also

Users in runtime (Page 4548)

Configuring a user view

Introduction

You configure a user view in the Engineering System to also administer users in Runtime.

Requirements

A screen has been created.

Procedure

1. Select the "User view" object from the "Controls" category in the toolbox.
2. Drag-and-drop the "User view" object into the screen.
3. Click on "Properties > Properties" in the Inspector window.
4. Specify the appearance of the "User view".
5. You can, for example, select " "Display mode > Fit to size > Fit object to contents".

Result

You have created a user view in the screen.

Creating users

Introduction

You create a user so that users can log on under their user name in runtime.

As an alternative, you can create users in the engineering system and download them to the HMI device.

The logon is successful only when the user name entered during the logon matches a user in runtime. In addition, the password entered at logon has to match that of the user.

Note

Note that the entry is case-sensitive.

Note

Do not use special characters such as / " § $ % ? when you enter a user name and a password. ' &.

You assign the user to a user group. The user then has the authorizations of the user group.

Note

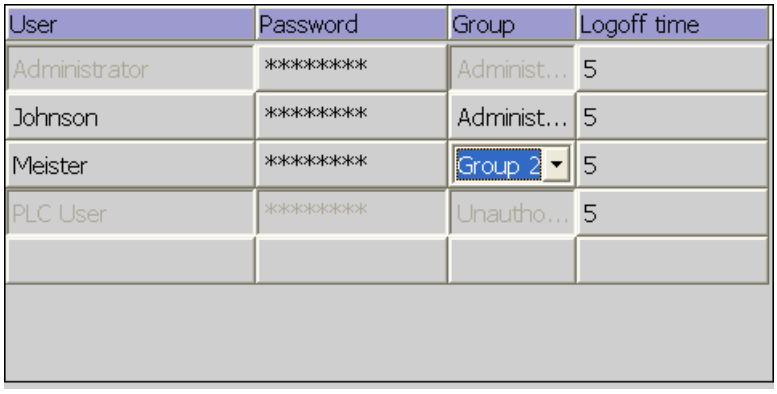
Runtime users must be assigned to a user group. The user group is created in the engineering system. The designation of the user group is language-dependent.

Requirements

- The user view is open.
- A "Group 2" user group has been created.

Procedure

1. Click "<New User>" in the user view. A dialog opens.
2. Enter "Foreman" as the user name.
3. Press the <Return> button.
4. Click "Password."
5. Enter the password of the user.
6. Press the <Return> button. The password is hidden.
7. Click in the "Group" column.
8. Select "Group 2" as the "Group".



9. Press the <Return> button.
10. Click in the "Logoff time" column.
11. Enter the time after which the user is logged off automatically.

Managing users in the user view

Introduction

If you have configured a user view in the engineering system, the users and user groups can be managed in runtime.

Notice

Changes in the user view are effective immediately in runtime. Changes in runtime are not updated in the engineering system. When downloading the user administration to the HMI device, all changes in the user view are overwritten after a security prompt and based on the settings.

Requirements

- Runtime is enabled.
- A complex user view has been created.

- The screen with the user view is open.
- You have the default "User administration" authorization.

Note

If you do not have a "User administration" authorization, you can only change your own password and your logoff time.

Changing the user name

1. Enter a new user name in the "Users" column in the user display.
2. Confirm your entry with <Return>.

Note

The user can then no longer log on with his previous password in runtime. If you delete the name and press <Return>, the user is deleted.

Changing the password of the user

Availability of complex user display in selected devices only.

1. Enter a new password in the "Password" column in the user display.
2. Confirm your entry with <Return>.

Note

The user can then no longer log on with his previous password in runtime.

If you delete the password in the complex user view and press <Return>, the user will be deleted.

Changing the logoff time of the user

1. Enter a new logoff time in the "Logoff time" column in the user display.
2. Confirm your entry with <Return>.

Deleting a user

1. Click the name of the user to be deleted.
2. Delete the name.
3. Press the <Return> button.

Note

The user can no longer log on in runtime.

Assigning a user to a different user group

1. Activate the user group field for the corresponding user.
2. Select a user group.
3. Confirm your selection with <Return>.

Unlock locked out users

Unlock locked out users

The check box "Activate limit for login attempts" is activated in the "Runtime settings > User administration".
The number 3 is entered in the field "Number of invalid login attempts".

If users have three failed attempts at login, e.g. by entering an incorrect password, they are assigned to the "Unauthorized" group. The user loses all authorizations. The user can still log on, but no longer has any authorizations. Only a user with administrator rights re-assigns the unauthorized user to a user group.

Exporting the user administration

Introduction

The users and user groups are transferred to the HMI device from the Engineering System. If you have configured a user view, you can administer the users at the HMI device via the user view.

If a user has access to several HMI devices, the same user and the same password must be configured on each HMI device. Create a standard for user administration of the different HMI devices. Export the users and passwords on an HMI device to a storage medium, such as a floppy, memory card or a network drive. You import the users and passwords from this storage medium at all the other HMI devices.

You program a function which exports the user data at a button.

The system function "ExportImportUserAdministration" is not available on all HMI devices.

Notice

When exporting, the user data are encrypted and written from the HMI device to the target file. The target file is overwritten

Requirements

- An HMI device has been created.
- A screen has been created.
- A button has been created in the screen.
- The Inspector window is open.

Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Click" in the Inspector window.
3. Click the entry "Add function" in the function list.
4. Select the "ExportImportUserAdministration" system function.
5. Select "Export" as the "Direction". When exporting, the target file is overwritten with the user data.
6. Enter the full path of the destination file as the "File name", for example "a:\test \usersview.txt".

Note

Ensure that the file name is written correctly. If the directory, for example "\test\", does not exist, it will be created without a prompt.

Importing the user administration

Introduction

If a user has access to several HMI devices, the same user and the same password must be configured on each HMI device. Create a standard for user administration of the different HMI devices. Export the users and passwords on an HMI device to a storage medium, such as a floppy, memory card or a network drive. You import the users and passwords from this storage medium at all the other HMI devices.

You configure a function which imports the user data at a command button.

The system function "ExportImportUserAdministration" is not available on all HMI devices.

Notice

When importing, the user data are read in from the source file and written into the HMI device. The users and passwords currently valid in the HMI device are overwritten. The imported users and passwords are valid immediately.

Requirements

- A screen has been created.
- A command button has been created in the screen.
- The Inspector window is open.

Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Click" in the Inspector window.

3. Click the entry "Add function" in the function list.
4. Select the "ExportImportUserAdministration" system function.
5. Select "Import" as the "Direction." When importing, the user data in the HMI device are overwritten.
6. Enter the full path of the source file as the "File name", for example "a:\test\usersview.txt".

Note

Ensure that the file name is written correctly. If the folder, for example "\test\", or the file does not exist, an error message will be displayed.

Logging on as a user

Introduction

As a rule you log-on as a user by means of a special button. The logon dialog box is displayed to this purpose.

The logon dialog box is displayed by default during access to a protected object if

- No user is logged on in Runtime.
- The logged-on user does not have the required authorization.

Note

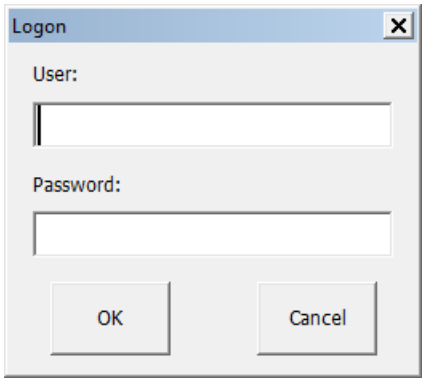
The system always opens the logon dialog on the OP 73, OP 77A, TP 177A and Basic Panels HMI devices when you press an access-protected button:

Requirements

- Under "Runtime settings > User administration" the
  - "Enable limit for logon attempts" check box has been selected.
  - The number 3 is entered in the field "Number of incorrect login attempts".
- The "ShowLogonDialog" system function is configured on a button called "Logon".

Procedure

1. Click the "Logon" button. The logon dialog box is displayed.



2. Enter your user name as it was specified in the user administration, for example "Foreman". If someone has logged on before you, the name of the user will be displayed.
3. Enter the corresponding password. The input is concealed.

   Note

   When entering the password, note that it is case sensitive.

4. Click "OK" to close the dialog box.

Logon was successful

If you have entered the user name "Foreman" and the entered password corresponds with the stored password, you are logged on as the user "Foreman" in Runtime. You have the authorizations of the user "Foreman".

When the user "Foreman" accesses a protected object such as the "Logging" button, access to this protected object will only be authorized if the user "Foreman" has the required authorization. The programmed function is executed immediately.

If you do not have the required authorization after the successful log-on, a corresponding error message is displayed. However, you remain logged on in Runtime.

Logon was unsuccessful

An error message is displayed.

In order to maintain security, you or the user logged-on before you no longer has any authorizations. However, access to unprotected objects remains possible. The user view does not, however, show any entries. The user view and the authorizations change after the next successful log-on.

If the third login attempt has failed, the user will be assigned to the "Unauthorized" group. For this reason, do not configure a user group with this display name.

If the "Log off" function is called up or the logoff time of the user has expired, the user is logged off.

12.7.4.5 Configuring access protection

Access protection

Introduction

You configure an authorization at an object in order to protect it against access. All logged-on users who have this authorization can then access the object. If a user does not have authorization to operate an object, the logon dialog is displayed automatically.

Note

Several system functions are available under "User administration" so that user, password, and user group can be edited, for example, in the PLC.

Configuring operating authorizations

Introduction

You configure the "Stop runtime" authorization on a button. Then only those users who have the appropriate authorization have access to this button, for example all the users of the "Operators" user group.

This ensures that access to the command button is protected. If a logged-on user who belongs to the "Operators" user group and has the required authorizations clicks the button, runtime is stopped.

An example describes in detail how to configure a command button with access protection.

Requirements

- The "Operators" user group has been created.
- The "Stop runtime" authorization has been created.
- A screen has been created and opened.
- The screen contains a button.

Procedure

1. Click the button in the screen.
2. Click "Properties > Properties > Security" in the Inspector window.
3. Select "Stop runtime" as the "Authorization".

4. In the Inspector window, select "Properties > Events > Click".
5. Select a system function from the function list, for example, "StopRuntime".

Note

The "Enable" and "Disable" events are only used to detect whether an object was selected or deselected. The events do not, however, trigger a password prompt.

Do not use the "Enable"or "Disable" event if you want to configure access protection at the function call of the object.

12.7.5 Reference

12.7.5.1 Objects with access protection

Introduction

The following objects can be configured with an authorization:

- Date/time field
- I/O field
- Graphic I/O field
- Recipe view
- Switch
- Button
- Symbolic I/O field
- System diagnostic view

12.7.5.2 Objects with access protection

Introduction

The following objects can be configured with an authorization:

- Date/time field
- I/O field
- f(x) trend view
- Graphic I/O field
- HTML Browser
- Alarm view

- Alarm window
- Recipe view
- Switch
- Button
- Slider
- Symbol library
- Symbolic I/O field
- System diagnostic view
- System diagnostic window

12.7.5.3 Default user groups and authorizations

Principle

The predefined user groups and authorizations have the following numbers:

User group	Number
"Administrator group"	1
"Users"	2

Authorization	Number
"User administration"	1
"Monitor"	2
"Operate"	3

12.7.6 Examples

12.7.6.1 Example: Configuring a button with logon dialog box

Task

In the following example, you configure the function "ShowLogonDialog" for a button. A different user can then log on in runtime when the shift changes, for example. In the process the user previously logged on is logged off.

Note

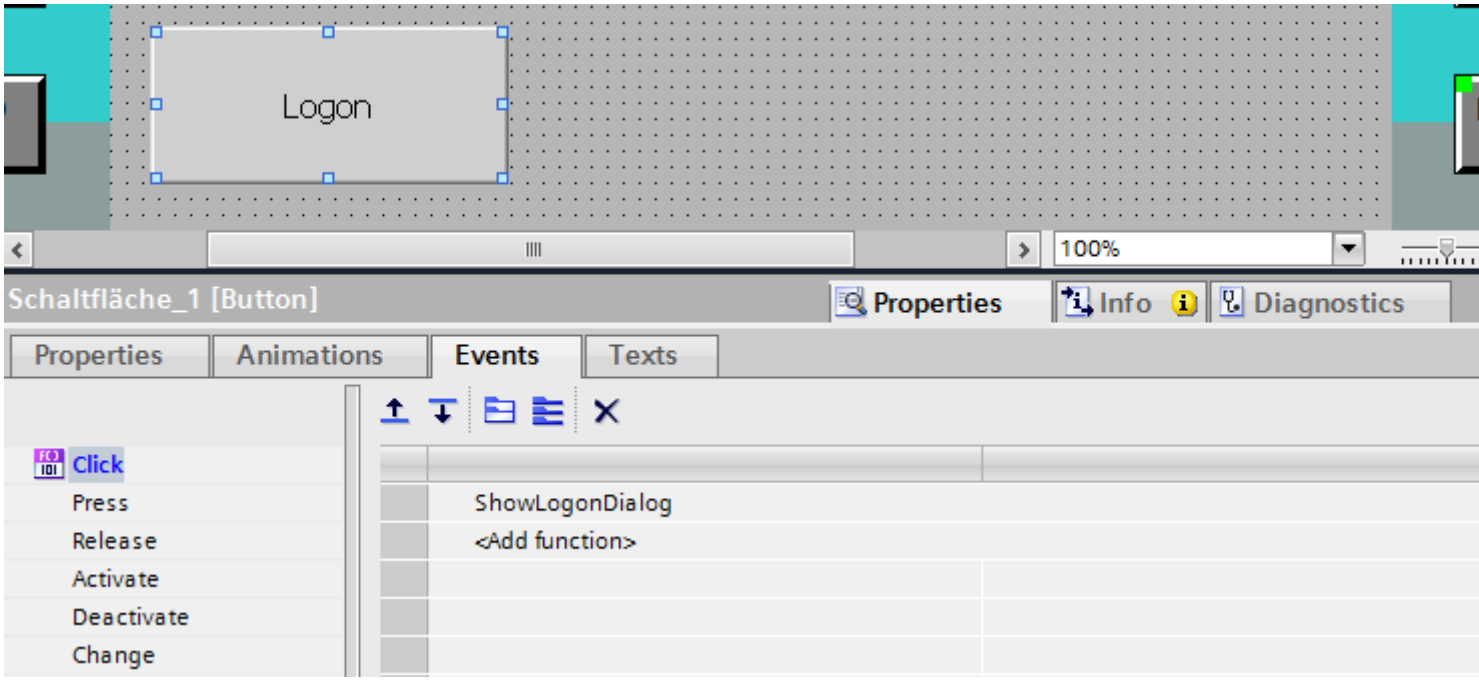
In runtime the logon dialog box is not displayed by default until you access a protected object. Either no user is logged on or the logged-on user does not have the required authorization.

Requirements

- A screen has been created.
- A button has been created in the screen.

Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Release" in the Inspector window.
3. Click the entry "Add function" in the "Function list" table.
4. Select the system function "ShowLogonDialog" from the "User administration" group.



Result

If the user clicks on the button in runtime, the function "ShowLogonDialog" is called up. When the function "ShowLogonDialog" is called up, the logon dialog box is displayed. The user logs on with his user name and password.

12.7.6.2 Example: Logging the logon and logoff events

Task

In the following example, you configure the function "TraceUserChange" to the event "User change".

Principle

The "TraceUserChange" function is called when a user logs on or off. When a function is called up, a system message with information about the corresponding user is output.

This system message can be archived. When archiving, the system message is provided with a date stamp and time stamp. This ensures that you can track which user was logged on at the HMI device at which time and for how long.

Requirements

- You have created an HMI device with Runtime Advanced.
- The Inspector window is open.

Procedure

1. Double-click the "Scheduler" in the Project view.
2. Double-click "Add" in the table of the tasks.
3. Enter "Logon-Protocol" as the "Name".
4. Select "User change" as the "Trigger".
5. Open "Properties > Events" in the Inspector window.
6. Click the entry "Add function" in the "Function list" table.
7. Select the "TraceUserChange" system function.

Result

A system message is output when a user logs on or logs off.

12.7.6.3 Example of a user administration

Example: Structure of user administration

Task

In the following example you set up a user administration for different users and user groups. The example orientates itself to a typical requirement profile from manufacturing engineering.

Principle

Completely different groups of persons are involved in a plant or project. Each group of persons protects its respective data and functions against access by others. For this purpose, users are created and assigned to a user group.

You can reproduce different views through user groups.

Example:

- Organizational view: Commissioners, Operators, Shift I, Shift II
- Technological view: Axis control, Tool changers, Plant North, Plant South

The following example orientates itself to the organizational view.

Every user group has characteristic requirements regarding access protection: A user group has operating authorizations for specific application cases. A programmer changes, for example, recipe data records.

In the example the users Miller, Group Smith and Foreman are created and assigned to different user groups.

Ms. Miller works as a programmer in the engineering system. The Group Smith are commissioners. Mr. Foreman is an operator.

Requirements

- A new project has been created.
- The "User administration" editor is open.

Procedures overview

Working with user administration has the following procedure in the example:

1. Creating authorizations The planner specifies which authorizations are required for access protection.
2. Configuring authorizations: The planner specifies which objects may be operated and which functions may be executed.
3. Creating user groups and allocating authorizations: The administrator creates the user groups together with the planner. The planner uses the authorizations to specify who may operate objects and change parameters.
4. Creating users and assigning them to a user group: The administrator administers the users.

Result

The aim is the following structure of the user administration of users, user groups and authorizations:

Users			User groups	Authorizations			
Miller	Smith	Foreman	Roles	Changing recipe records	Changing system parameters	Changing process parameters	Managing
			Administrator group				x
X			Programmer	X			
	X		Commissioning engineers	X	X	X	
		X	Operators	x			

The user "Foreman" who belongs to the "Operators" user group has access to the configured "To Recipe view" button.

Note

Alternatively, you can create several users as operators with different operating authorizations, for example, Operator Level 1, Operator Level 2.

Example: Creating and configuring authorizations

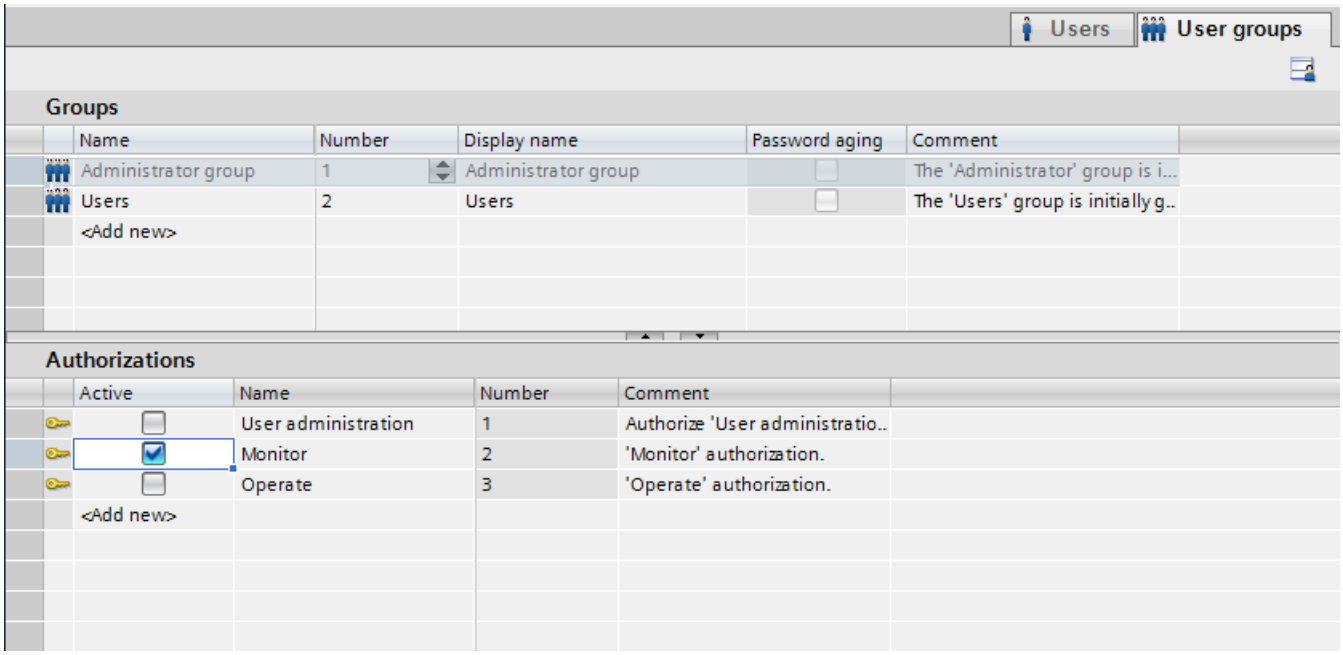
Task

The following example shows you how to create the authorizations

Procedure

1. Open the "User groups" work area.
2. Double-click "Add" in the "Authorizations" table.
3. Enter "Change recipe data records" as the "Name" of the authorization.
4. Repeat steps 2 and 3 to create additional authorizations: "Change system parameters", "Change process parameters".

Result



Example: Configuring a button with access protection

Task

In the following example you use a system function to create a button for a screen change. You protect the "To Recipe view" button against unauthorized operation. To do so, you configure the "Change recipe data records" authorization at the "To Recipe view" button.

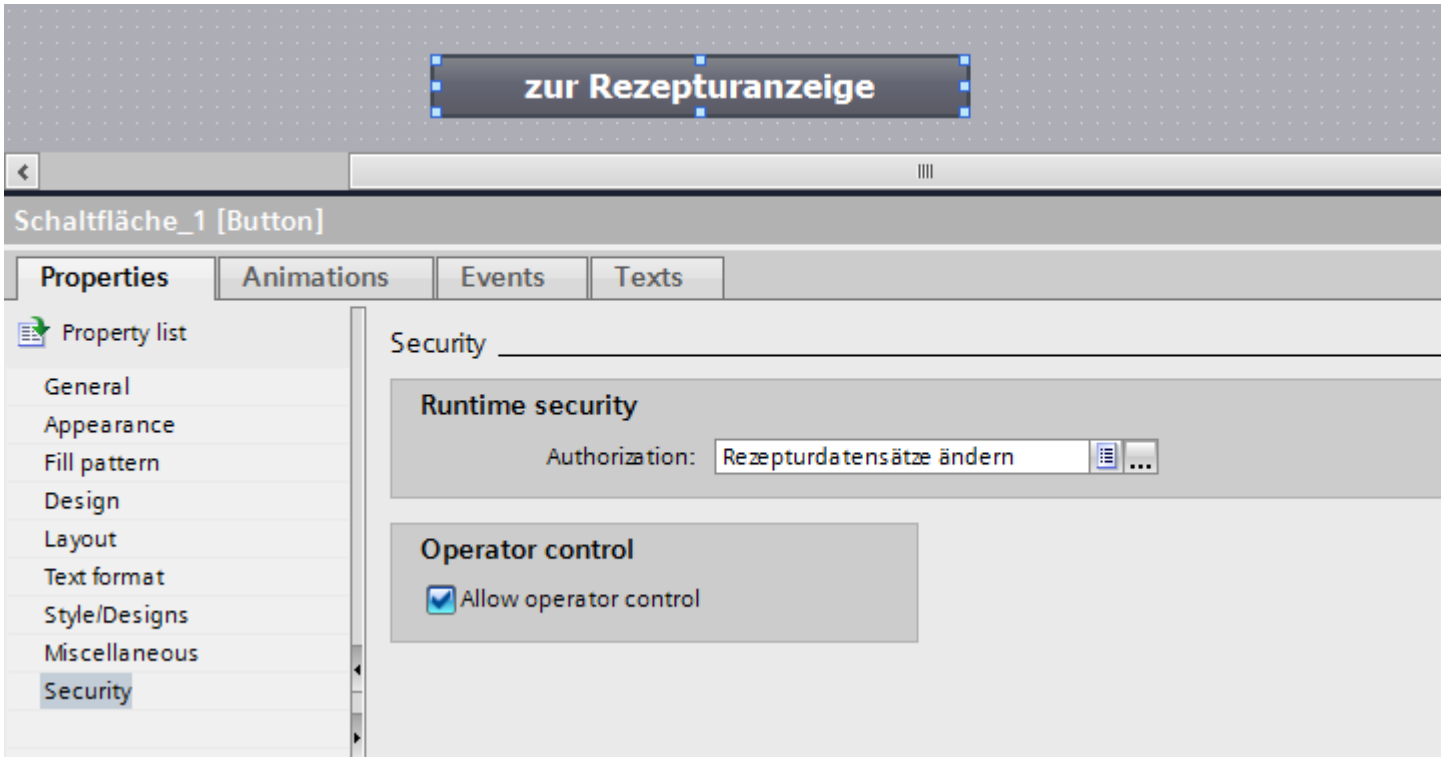
Requirements

- A "Change recipe data records" authorization has been created.
- A "Recipes" screen has been created.
- A "Start" screen has been created and opened.
- A button has been created and marked in the "Start" screen.

Procedure

1. Click "Properties > Properties > General" in the Inspector window.
2. Enter "To Recipe view" as the text.
3. Click "Properties > Events > Click" in the Inspector window.
4. Click the "Add function" entry in the first line of the "Function list" table.
5. Select the "ActivateScreen" system function in the "Screens" group.
6. Click the ... button in the "Screen name" field. A dialog box for selecting the screen opens.
7. Select the "Recipes" screen and use the  button to close the dialog box.
8. Click "Properties > Properties > Security" in the Inspector window.
9. Select "Change recipe data records" as the "Authorization."

Result



Access to the "To Recipe view" button is protected. If, for example, the user "Smith" clicks the button in Runtime, the function "Recipe view" screen is called up. Prerequisite is that the user "Smith" has logged on correctly and has the required authorization. The "Recipes" screen contains a recipe view and other screen objects.

If the logged-on user does not have the required authorization or if no user is logged on, the "Logon dialog box" is displayed.

Example: Creating user groups and assigning authorizations:

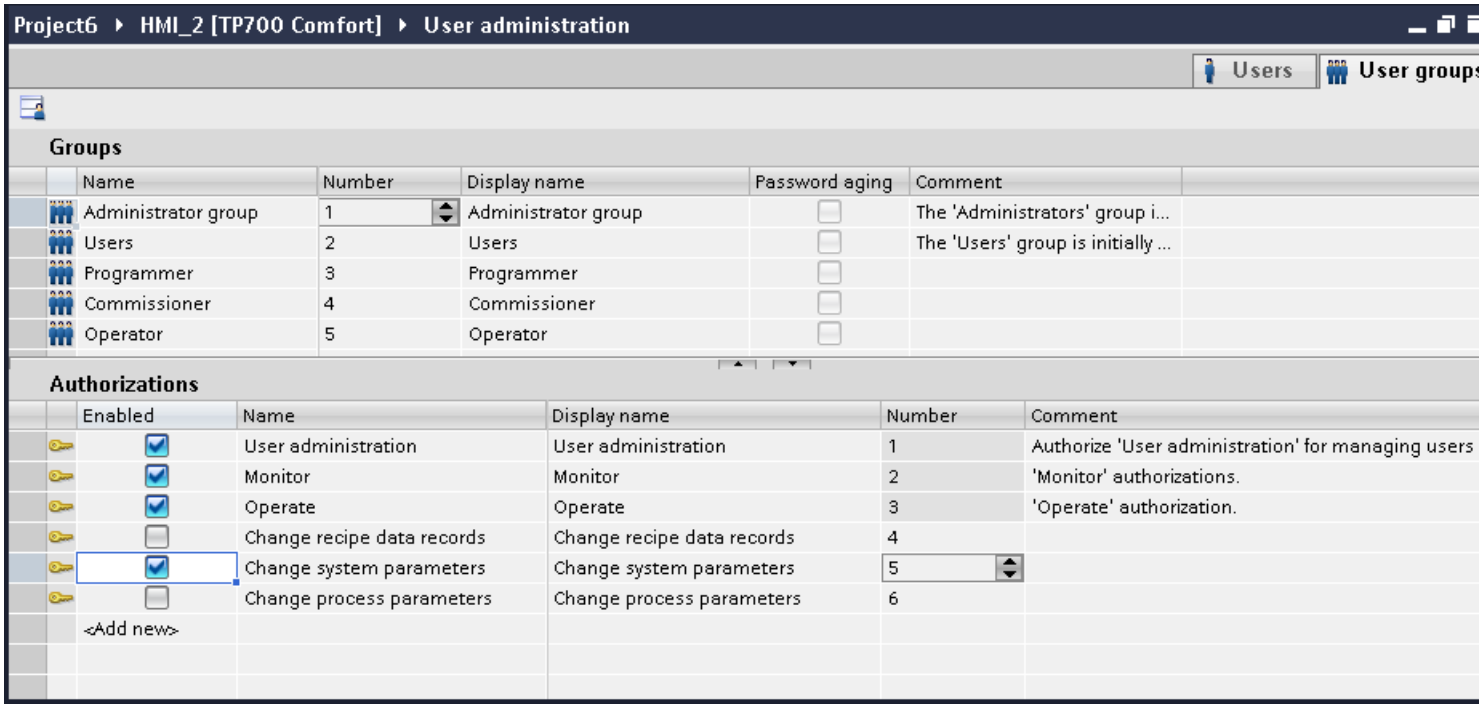
Task

In the following example you create the user groups and assign authorizations to them.

Procedure

1. Open the "User groups" work area.
2. Double-click "Add" in the "Groups" table.
3. Enter "Programmer" as the "Name".
4. Repeat steps 2 and 3 to create the "Commissioner" and "Operator" user groups.
5. Click "Administrator" in the "Groups" table.
6. Activate the "Change system parameters" authorization in the "Authorizations" table.

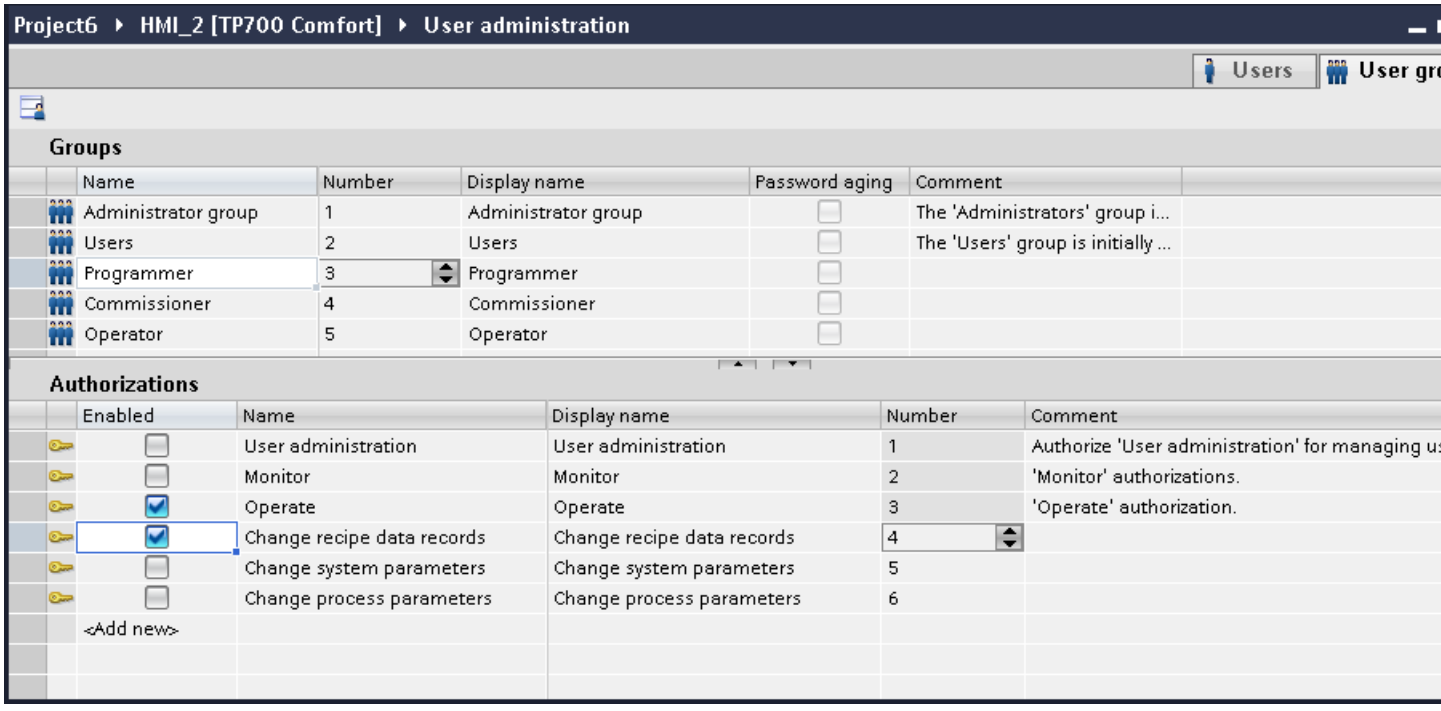
Interim result



Procedure

1. Click "Operator" in the "Groups" table.
2. Activate the "Change recipe data records" authorization in the "Authorizations" table.
3. Click "Commissioner" in the "Groups" table.
4. Activate the authorizations "Change recipe data records", "Change system parameters" and "Change process parameters" in the "Authorizations" table.
5. Click "Programmer" in the "Groups" table.
6. Activate the "Change recipe data records" authorization in the "Authorizations" table.

Result



Example: Creating users and assigning them to a user group

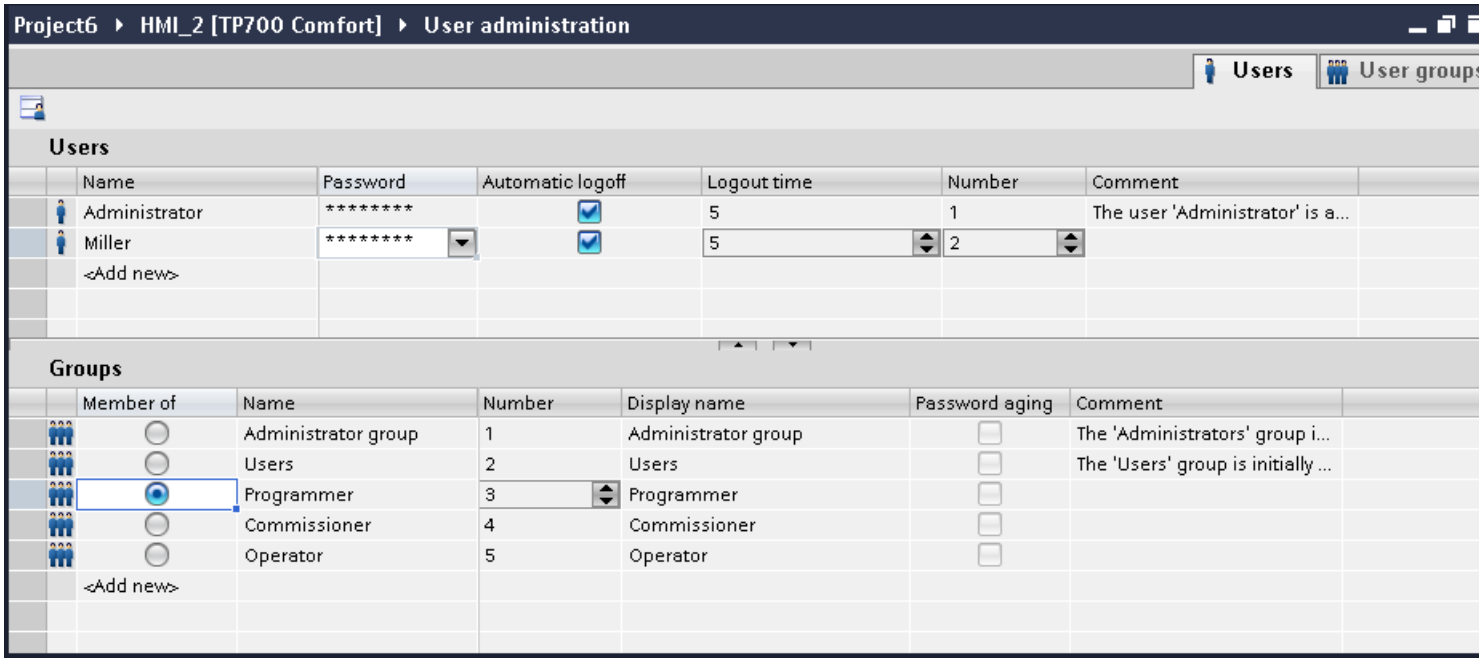
Task

In the following example you create the users and assign user groups to them. The users are sorted alphabetically immediately after the name has been entered.

Procedure

1. Open the "Users" work area.
2. Double-click "Add" in the "Users" table.
3. Enter "Miller" as the user name.
4. Click the button in the "Password" column. The dialog box for entering the password is displayed.
5. Enter "miller" as the password.
6. To confirm the password enter it a second time in the lower field.
7. Close the dialog box by using the icon.
8. Activate the "Programmer" user group in the "Groups" table.

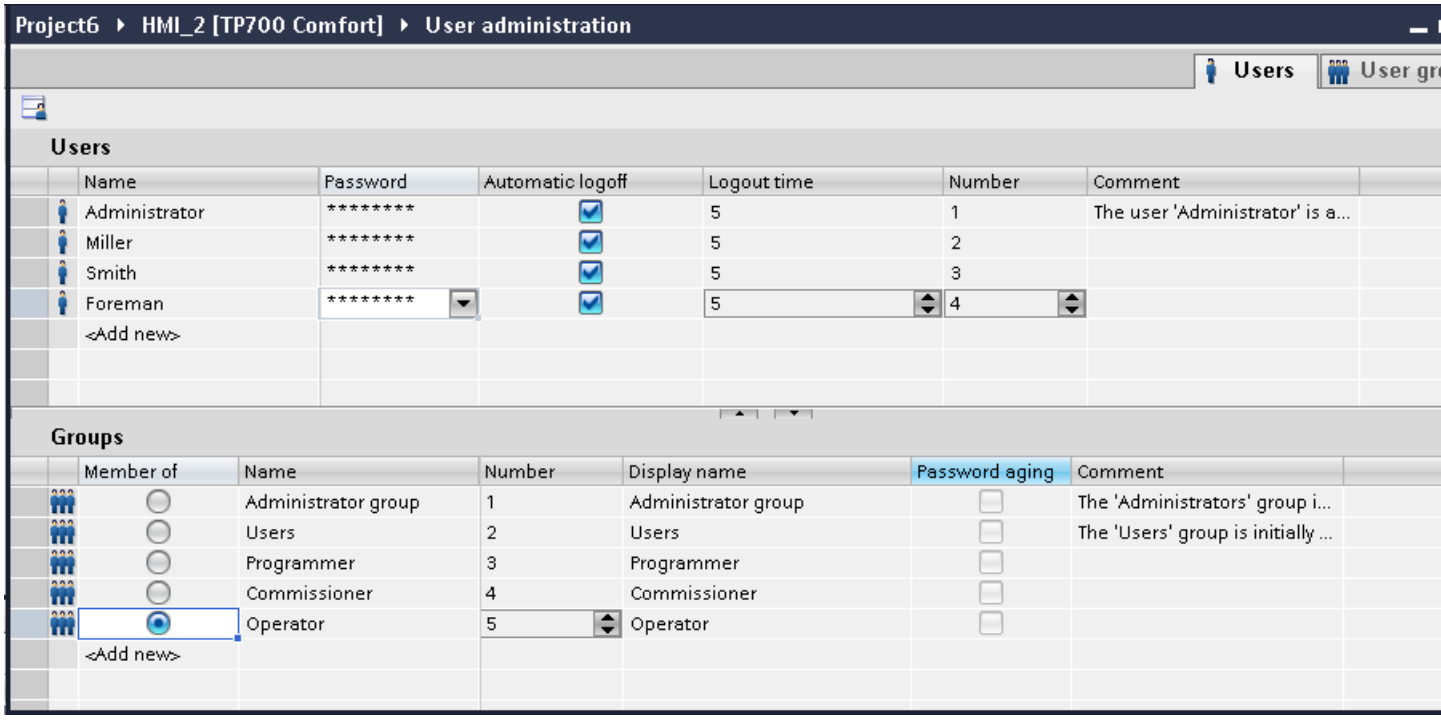
Interim result



Procedure

1. Double-click "Add" in the "Users" table.
2. Enter "Smith" as the user name.
3. Click the button in the "Password" column. The dialog box for entering the password is displayed.
4. Enter "smith" as the password.
5. To confirm the password enter it a second time in the lower field.
6. Close the dialog box by using the icon.
7. Activate the "Commissioner" user group in the "Groups" table.
8. Repeat steps 2 to 6 for the user "Foreman."
9. Activate the "Operators" user group in the "Groups" table.

Result



12.8 Working with system functions and Runtime scripting

12.8.1 Basics

12.8.1.1 Runtime scripting

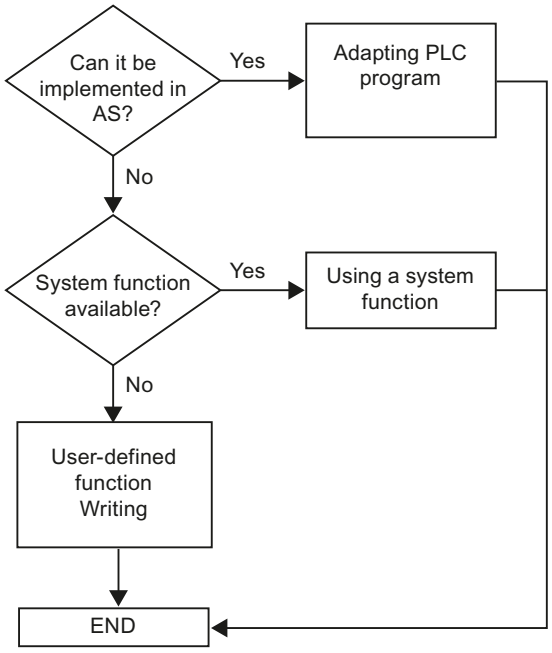
Term definition

The following terms are used in the documentation:

Term	
Runtime scripting	Generic term for all activities in user-defined functions.
Function	Generic term for system functions and user-defined functions.
System functions	System functions are all functions supplied with WinCC. The system functions are used either in function lists or user-defined functions.
User-defined functions	User-defined functions are functions written in the "Scripts" editor. For more precise specification, the term "User-defined VB function" is used in the documentation.
VBS / VBScript	Abbreviation for Visual Basic Script

Applying Runtime scripting

The following figure serves as a decision guide for programming tasks at hand:



12.8.1.2 System functions

Applications

You use system functions for the following:

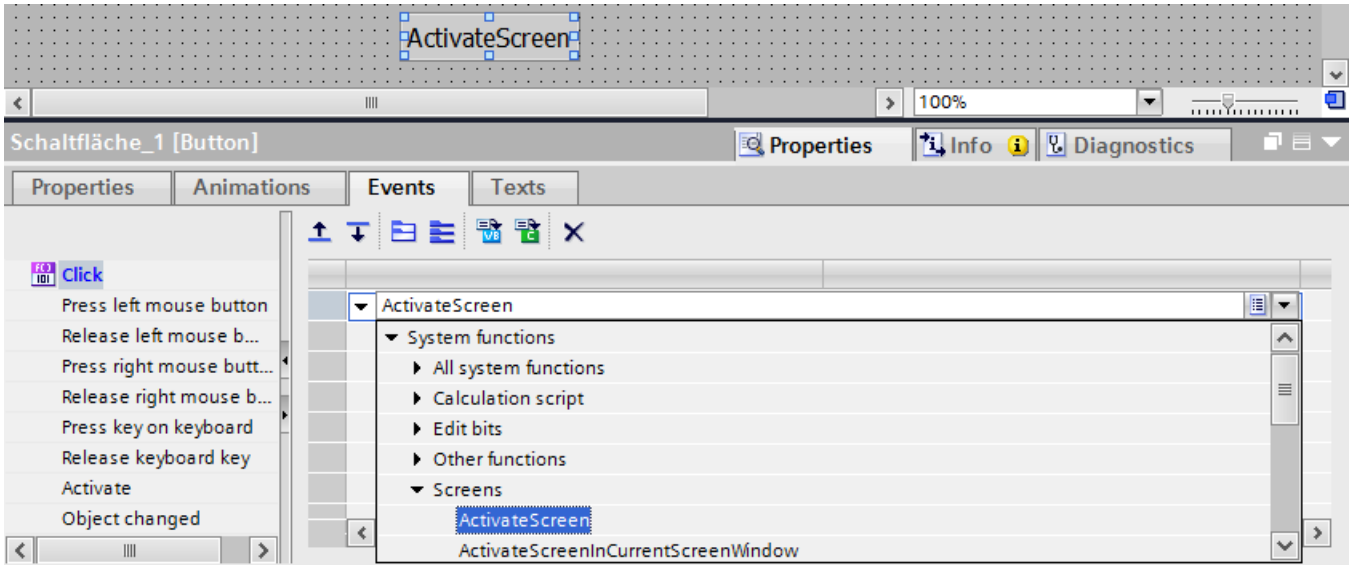
- Function lists
  A function list is executed from top to bottom in Runtime. If a function list includes system functions with longer runtime, these are processed asynchronously. For additional information, refer to "Runtime characteristics".
- User-defined functions
  If the HMI device supports customized functions, you use system functions in combination with instructions and conditions in the code of a customized function. In this way you execute a customized function depending on a specific system state. In addition, you can evaluate return values of system functions, for example. Depending on the return value, you then perform test functions, for example, that in turn affect the user-defined function flow.

Application examples of system functions

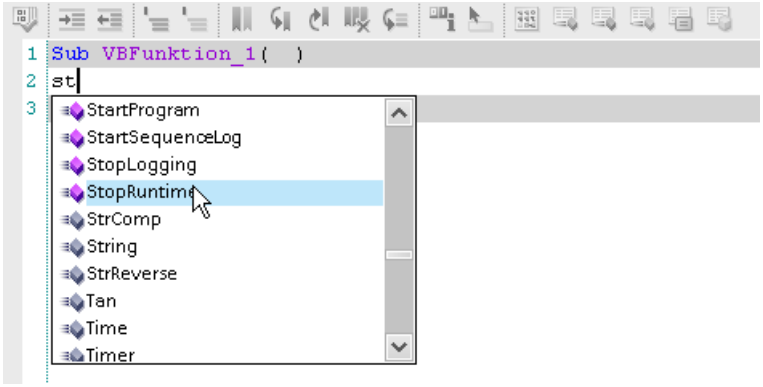
- Calculations, increase tag value by a defined or variable amount.
- Log function, e.g. to start a process value log.
- Settings, e.g. to switch the PLC or set a bit in the PLC.
- Alarms, e.g after changing the user.

Application

- Function list
  When configuring a function list, you select the system functions from a selection list that is sorted by categories:



- User-defined function
  If you are using a system function in a user-defined function, you choose it from a selection list. To open the selection list, use the key shortcut <Ctrl+Space> or click .



Language dependency

In the function list, the names of the system functions are dependent on the set project language. The functionality can then be recognized immediately by the project planner.

You use the English name of the system function in user-defined functions. You will find the English name of the system function in the reference.

Availability

Which system functions are available depends on the selected HMI device.

HMI device replacement

If you use system functions in a function list that are not available on the set HMI device, these system functions are marked in color.

If you use a system function in a user-defined function which is not available on the set HMI device, a warning is issued. In addition, the respective system function will be underlined with a wavy blue line.

See also

System functions for logs (Page 4259)

12.8.1.3 User-defined functions

Applications

You use customized functions for the following for example: :

- Configuring an extended function list
  In a customized function you have the option to have customized functions and system functions executed depending on conditions or executed repeatedly. You then add the customized function to a function list.
- Programming new functions
  Customized functions are only valid in the project in which they are defined. For user-defined functions you define transfer parameters and return values, for example, for conversion of values.

Properties of customized functions

A customized function has the following properties:

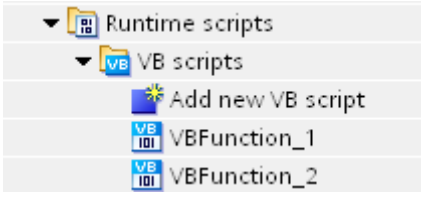
- Name
- Parameter (optional)
- Return value and type (optional)
- Can be modified centrally
- has no trigger. You have to call the customoized function explicitly, e.g. in a function list.
- behaves like a system function

Usage

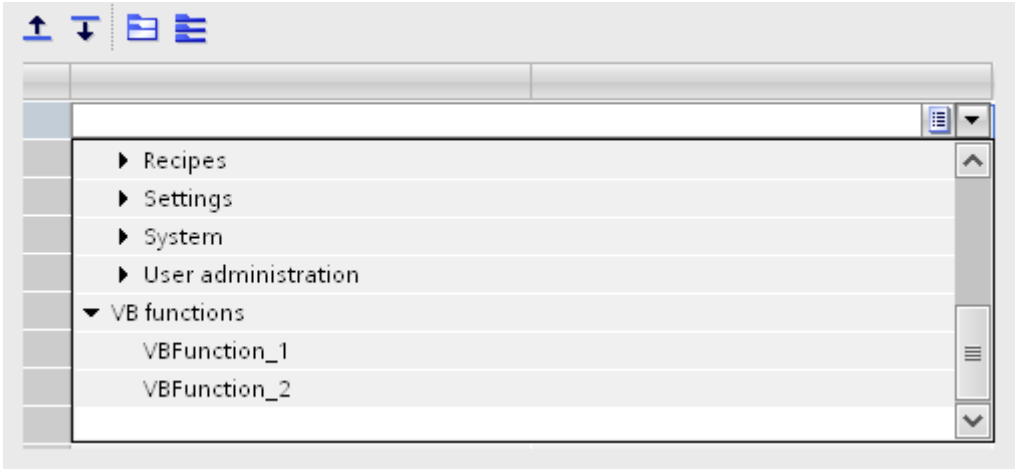
You create customized functions with the "Scripts" editor. See "Scripts" editor (Page 4578) for additional information.

Customized functions are saved in the project. To protect user-defined functions, set up know-how protection. See Auto-Hotspot for additional information.

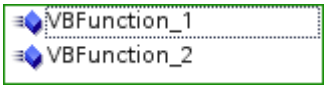
- Project tree
  The user-defined functions are listed in the project tree under "VB scripts".



- Function list
  The user-defined functions are listed in a function list under "VB functions".



- User-defined function
  If you are using a system function in a user-defined function, you choose it from a selection list. To open the selection list, use the key shortcut <Ctrl+Space> or click .



Recursion level

The recursion level in user-defined functions is limited by the stack size of the HMI device. If the number is exceeded, a system error message is output in Runtime. This means you should limit the number of recursions in a user-defined function.

12.8.2 Working with function lists

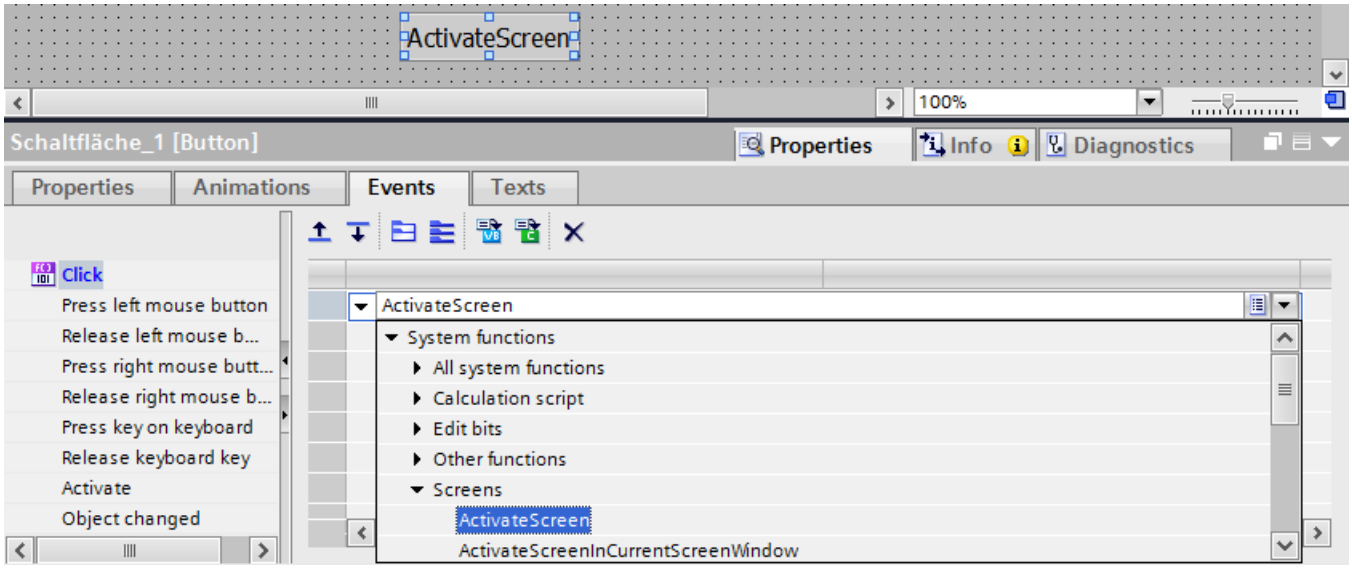
12.8.2.1 Basics of the function list

Introduction

A function list performs one or more system functions and user-defined functions when the configured event occurs.

Principle

The function list is configured for an event of an object, for example, for a screen object or a task. You can configure a function list precisely on every event. The events which are available depend on the selected object and the HMI device.



Events occur only when the project is in Runtime. Events include:

- Execution of a task
- Pressing of a button
- Acknowledging an alarm

Note

The choice of configurable system functions in a function list is dependent on the selected HMI device. For additional information, refer to "Availability for specific devices of system functions".

12.8.2.2 Properties of a function list

Status information

During configuration the project data is tested in the background.

With the following causes the function list is not executed in Runtime and the incorrect entries are marked red:

- At least one system function or one user-defined function is not completely supplied with parameters.
- At least one system function or one user-defined function is contained which is not supported by the selected HMI device, e.g. by changing the device type.

Processing of system functions and user-defined functions (WinCC Runtime Advanced and Panels)

A function list is executed from top to bottom in Runtime. If a function list includes system functions with longer runtime, these are processed asynchronously. You can find additional information about this in the sections "Calling system functions" and "Calling user-defined functions".

See also

Executing a function list in Runtime (Page 4600)

Processing sequence for user-defined functions and system functions (Page 4602)

12.8.2.3 Configuring a function list

Introduction

You configure a function list by selecting the system functions and customized functions from a drop-down list. The system functions are arranged in the selection list according to categories.

You only use customized functions of a programming language in a function list. Your selection of the first user-defined function determines whether user-defined VB functions or user-defined C functions can be selected in the function list. Which programming languages are available depends on the selected HMI device.

If you have created a user-defined VB function, for example, the user-defined function is available under the entry "VB functions".

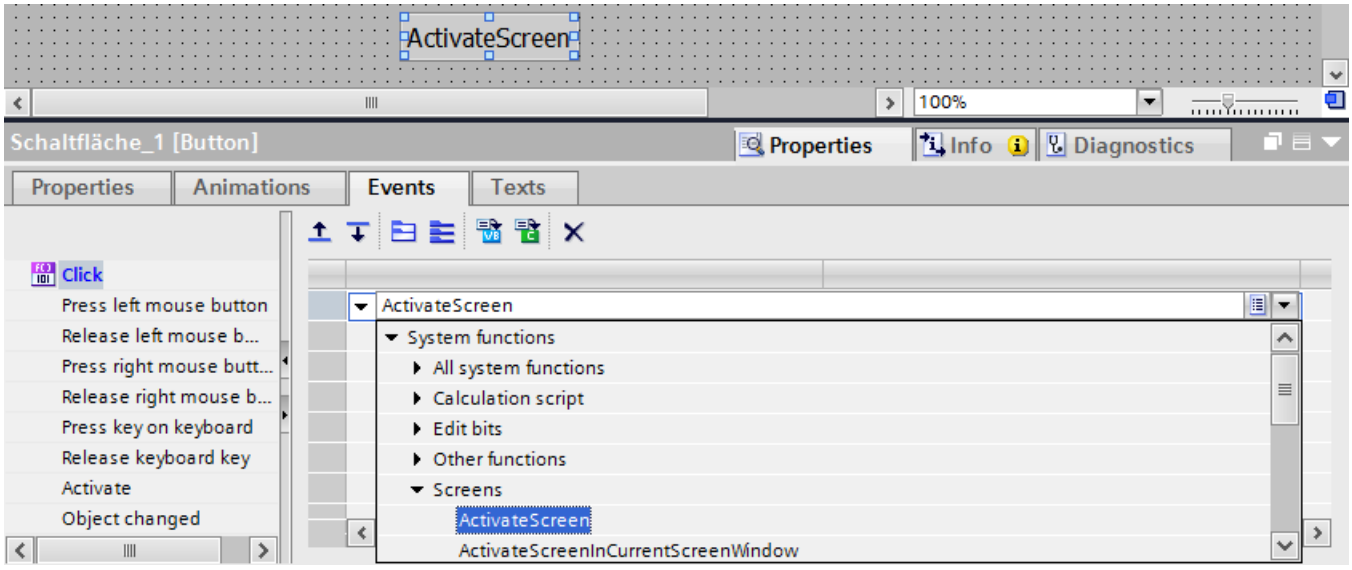
Requirement

Object has at least one configurable event.

Procedure

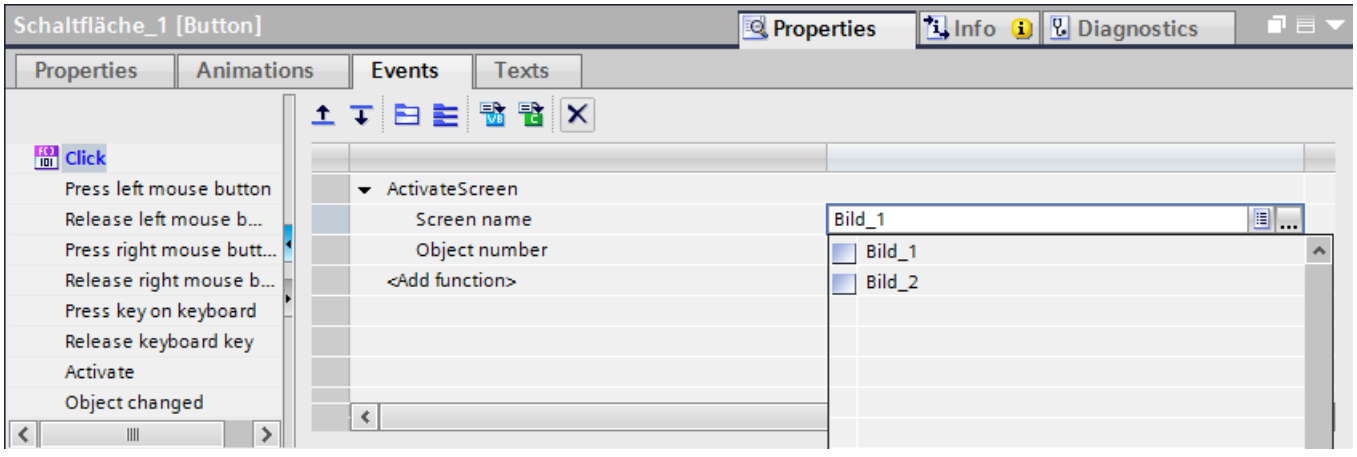
Proceed as follows to configure a function list:

1. Open the editor in which the object is located.
2. Select the object.
3. Click "Properties > Events" in the Inspector window. Choose the event for which you want to configure the function list.
4. Mark the "<Add function>" entry in the inspector window in the drop-down list.
5. Select the desired system function or the desired user-defined function from the selection list. You can also enter the name of the system function or the user-defined function.



The system function or the customized function is entered in the function list.

6. If the system function or the customized function has parameters, select the appropriate values for the parameters.



7. If you want to add other system functions or user-defined functions to the function list, repeat steps 4) to 6).

Result

The function list is configured. In addition, to the configured event, the status of the function list is displayed in the Inspector window. When the configured event occurs in Runtime, the function list is completed from top to bottom.

12.8.2.4 Editing a function list

Introduction

A function list can be edited as follows:

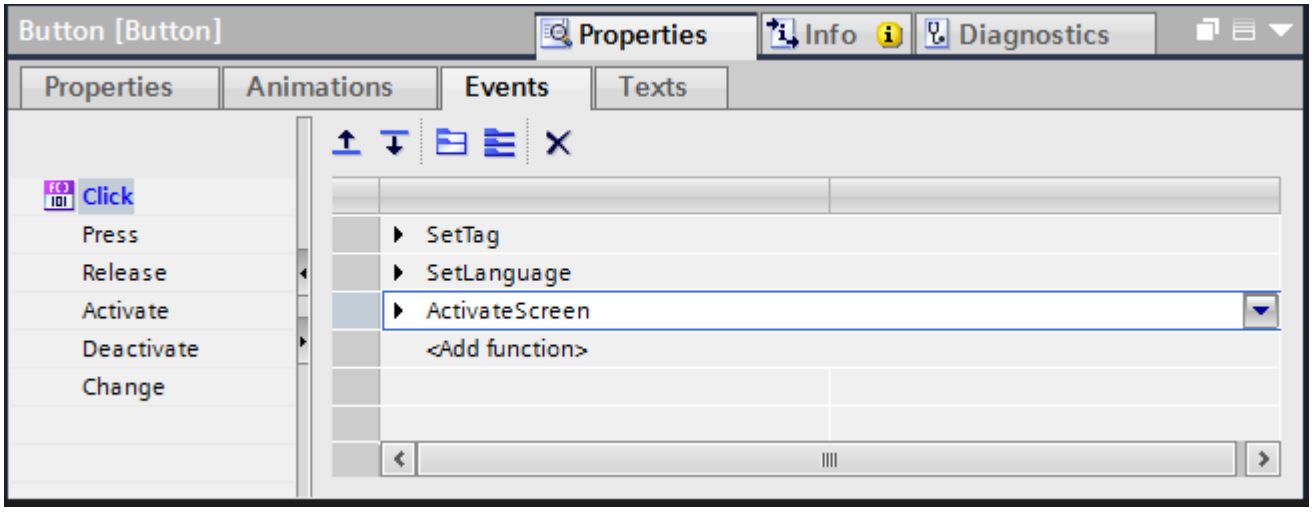
- Change the order of system functions and user-defined functions.
- Remove system functions or user-defined functions.

Requirement

The function list is configured and opened.

Changing the order of a system function or a customized function

1. Select the desired system function or customized function in the function list.
2. Then click the appropriate direction arrow in the inspector window until the system function or customized function is in the desired position.



Changing the order of several system functions and customized functions

1. Hold down the <Shift> key.
2. Click desired system functions or customized functions one after another with the mouse.
3. Move the selection to the desired position by drag&drop.

Removing a system function or customized function

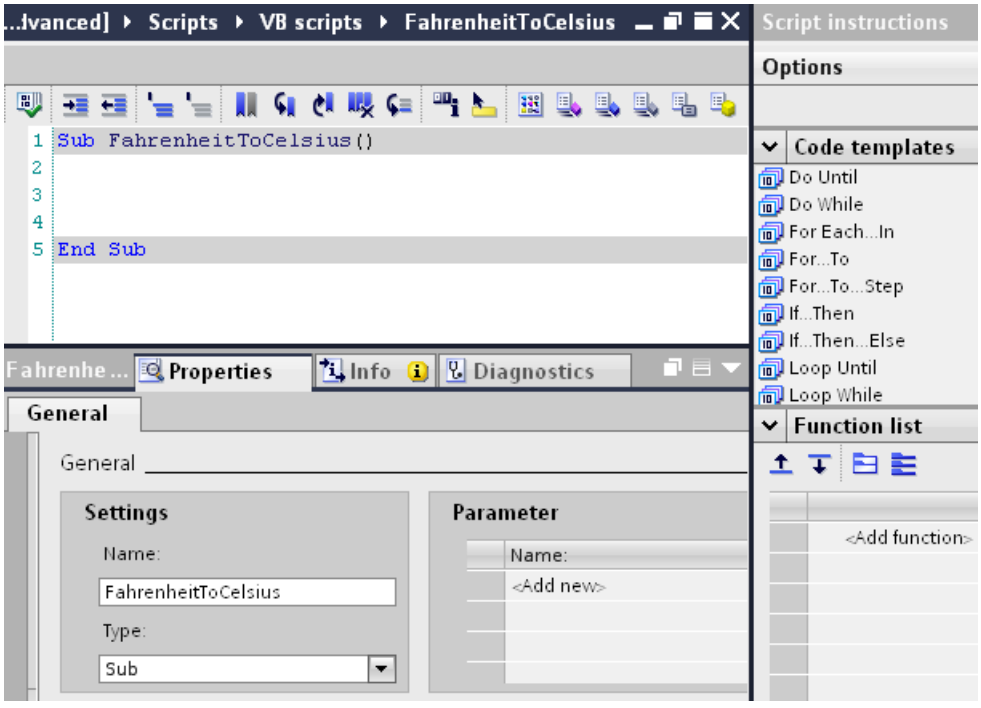
1. Select the desired system function or customized function in the function list.
2. Select "Delete" in the shortcut menu.

12.8.3 Working with user-defined VB functions

12.8.3.1 "Scripts" editor

Introduction

The "Scripts" editor supports you in the creating of user-defined functions with functionalities such as auto-completion and syntax highlighting. You can insert code templates for frequently used instructions with the "Instructions" task card for example.



Autocompletion and parameter entry

The "Scripts" editor provides you context-dependent programming support with autocompletion parameter entry support.

When you use system functions, the parameters of the function are shown as a tooltip.

<Ctrl+J>

The object list can be called context-specifically by using the shortcut <Ctrl+J>. Use the object list to supply values to system functions, methods, and properties: For example, you select screens, screen objects, tags, or colors. You transfer a selected object from the object list into the code by double-clicking it.

Note

Tags and screens can also be inserted using a drag-and-drop operation. Use, for example, drag-and-drop to assign values to parameters.

<Ctrl+Space>

With the key combination <Ctrl+Space> you call a list with the following contents:

- Constants and functions of the programming language used in the "Scripts" editor.
- User-defined functions
- System functions

"Instructions" task card

The "Instructions" task card contains the "Code templates" and "Function list" palettes.

- Code templates
  To insert frequently used instructions, double click the desired instruction in the "Code templates" palette. Replace the space holders with the used expressions.
- Function list
  In the function list you select the system functions and user-defined functions from a drop-down list. Proceed as for configuring a function list. To transfer the function list to the code, click the "Transfer" button. The function list is automatically converted into the correct syntax.

  Note

  Not all system functions are available in the "Scripts" editor. For additional information, refer to the reference.

Edit functions

Use the buttons of the toolbar "Advanced Edit" to make the code more readable by means of indentation and the use of comments.

Bookmarks help you keep an overview, even of many lines of code.

Further information regarding each button can be obtained in the accompanying direct help.

Synchronization of tags and objects

If you change tag names or object names in the project which you use in a user-defined function, the names are adapted automatically in the user-defined function.

If you change the tag name or object name in the function, the tag names or object names are not adapted in the project. An appropriate error message is output when executing the user-defined function.

Syntax highlighting

Keywords in the "Scripts" editor are highlighted using different colors. Unknown words are underlined with a red wavy line.

The table shows the preset colors for the most important keywords:

Color	Meaning	Example
Blue	Keyword	If, Then
Dark violet	Function	FahrenheitToCelsius
Chocolate	System function	SetTag
Orange	HMI tag	Tag_1
Green	Comment	'This is a comment'

Adapting display properties

When you have opened a user-defined function, you can customize the display properties in the editor. Select the "Options > Settings" menu command. Click "General > Text editors" in the "Settings" editor. For example, you can change the colors for syntax highlighting or adapt the indents for code in the work area.

See also

Create customized VB functions (Page 4585)

12.8.3.2 Access to HMI tags

Introduction

In user-defined VB functions, you have access to HMI tags which you have created in the project. Change or read the tag value with a user-defined VB function in Runtime.

In addition, you can create local tags as counters or buffers in the user-defined VB function. You must declare each tag to avoid errors due to misspelled tags.

HMI tags

The user-defined VB function accesses the tag value which is saved in Runtime memory. Next, the tag value will be updated to the set cycle time. The user-defined VB function first accesses the tag values which were read at the previous cycle time.

If the tag name matches the VBS name conventions in the project, you can use the HMI tag directly in the function.

```
'VBS_Example_03
```

```
If BeltDriveOilTemperature > 100 Then [instruction]
```

If the tag name in the project does not match the VBS name conventions, you must reference the HMI tag using the "SmartTags list". In the following example the tag name contains the "&" character that is not permitted in accordance with the VBS name conventions:

```
'VBS_Example_04
SmartTags("Test&Trial")= 2005
```

Local tags

You define local tags with the Dim instruction. You can only use local tags within user-defined VB functions. They therefore do not appear in the "HMI Tags" editor. You use a local tag in the user-defined VB function, for example, as a counter in a For instruction.

```
'VBS_Example_05
Dim intCount
For intCount = 1 To 10 [instruction] Next
```

Access to HMI tags with a dynamic name

The user-defined VB function accesses the tag value using the tag name. You can specify the tag name in such a way that the tag name is composed at the runtime of the user-defined function.

If you only call the user-defined VB function in a screen in which the HMI tag is also used elsewhere, for example in an I/O field, you should for performance reasons configure the HMI tag with "Cyclic in operation" acquisition mode.

If the user-defined VB function is accessed and the HMI tag is not being used in the screen currently displayed, configure the HMI tag with "Cyclic continuous" acquisition mode. This ensures that the current value of the tag is always available.

See also

SmartTags (Page 4981)

12.8.3.3 Access to objects

Introduction

The objects of the VBS object model with the appropriate properties and methods are available in user-defined VB functions.

The object properties can be read and changed in Runtime.

Referencing objects

In customized VB functions you reference the objects by the corresponding list. To identify the object, use its name or the position number within the list.

If you access the properties of an object more often, create an object reference. You can access object properties with and without object reference.

With the following instruction the first object is referenced in the "MainScreen":

```
'VBS_Example_01
Dim objObject
'Change to Screen "MainScreen"
HMIRuntime.BaseScreenName = "MainScreen"
Set objObject = HMIRuntime.Screens(1).ScreenItems(1)
```

With the following instruction an object is referenced by its name and an object property is changed. You must have created the object with this name in the screen.

```
'VBS_Example_02
Dim objCircle
HMIRuntime.BaseScreenName = "MainScreen"
Set objCircle = HMIRuntime.Screens(1).ScreenItems("Circle_01")
objCircle.BackColor = vbGreen
```

12.8.3.4 Calling system functions

Introduction

You can insert system functions in a user-defined VB function.

This can be done in the following ways:

- With <Ctrl+Space> or with 
- Direct input
- With the "Function list" palette

With <Ctrl+Space> or with 

Open the list of system functions with <Ctrl+Space> or with  and select the desired system function.

Direct input

You enter the system functions directly into the code. You use the English name of the system function. You can find the English name of the system function in the system function reference under "Syntax". The editing language setting is not taken into consideration.

References to objects, e.g. screens, connections and logs are transferred in inverted commas:

Calling system functions without return value in VBS

```
SetTag "Tag1",64
```

Calling system functions with return value in VBS

```
InverseLinearScaling "XValue","Tag1", 0, 1
```

With the "Function list" palette

Select the system functions from a selection list that is sorted by categories in the "Function list" palette. Proceed as for configuring a function list.

To transfer the list to the code, click the "Transfer" button. The list is automatically converted into the correct syntax.

HMI device replacement

The code of a customized function depends on the selected HMI device. If you use system functions in the customized function which are not supported by the selected HMI device, you receive an error message in the output window. You will find additional information under "Device dependency of system functions".

See also

Configuring a function list (Page 4575)

12.8.3.5 Calling user-defined VB functions

Introduction

You can only insert user-defined VB functions in a user-defined VB function.

This can be done in the following ways:

- With <Ctrl+Space> or with 
- Direct input
- With the "Function list" palette

With <Ctrl+Space> or with 

Open the list of user-defined VB functions with <Ctrl+Space> or with  and select the desired user-defined VB function.

Direct input

You enter the user-defined VB function directly into the code. References to objects, e.g. screens, connections and logs are transferred in inverted commas.

```
Function Average(ByVal Var1, ByVal Var2)
  Average = (Var1+Var2)*(1/2)
End Function
```

Calling user-defined VB functions without return value in VBS

```
Average 4,10
```

Calling user-defined VB functions with return value in VBS

```
Dim ValueA
ValueA = Average (4,10)
```

If you do not want to evaluate the return value, use the call as for a user-defined VB function without return value.

With the "Function list" palette

Select the desired user-defined VB function from a selection list in the "Function list" palette.

Proceed as for configuring a function list. You will find additional information under "Configuring a function list".

To transfer the list to the code, click the "Transfer" button. The list is automatically converted into the correct syntax.

12.8.3.6 Transfer and return of values in VBS

Transfer of a value

The following options are available for transferring parameters.

- "Call by Value" - ByVal
  ByVal transfers the parameter value. If you transfer a tag as a parameter, the tag value is transferred to the user-defined function when the user-defined function is executed.
- "Call by Reference" - ByRef
  ByRef transfers the address of the parameter. If you transfer a tag as a parameter, the tag address is transferred to the user-defined function when the user-defined function is executed.
  When user-defined functions and system functions are called in user-defined functions, the parameter is transferred as ByRef.

Return of a value

Return values can return the result of a calculation (e.g., average value of two numbers). But a return value can also give information about whether an instruction was executed correctly.

Therefore, the system functions that perform file operations such as "Delete" also have return values.

For a user-defined function to return a value, you must set the "Function" type. You assign the function name to the return value in the user-defined function:

```
1 Function Average( Value1 , Value2 )
2 'Check if Parameters are not numeric:
3 If IsNumeric (Value1) = False Then Value1 = 1
4 If IsNumeric (Value2) = False Then Value2 = 1
5 Average = (Value1+Value2)/2
6
7 End Function
```

To form an average value of two numbers, call the user-defined VB function Average and transfer the result to the HMI tag for example AverageValue.

- In a customized VB function

```
SmartTags("AverageValue") = Average ("4", "10")
```

- In the function list

Average	
Return value	AverageValue
Value1	10
Value2	4

You can output the value of the HMI tag AverageValue in an I/O field.

See also

Create customized VB functions (Page 4585)

12.8.3.7 Create customized VB functions

Introduction

When you create a customized VB function, you define the following settings:

- The name with which you call the user-defined VB function.
- The type of user-defined VB function.
- The parameters which are transferred to the user-defined VB function in Runtime.

Use only the following characters for the name:

- "A" to "Z"
- "a" to "z"
- "0" to "9"
- "_" as a separator

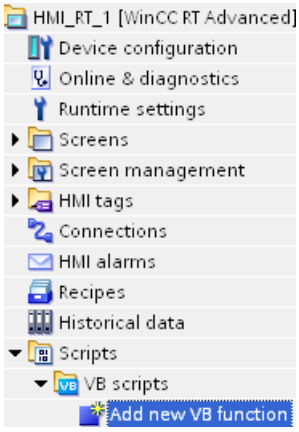
Note

When you change the parameters or the function type, the change is color marked at the application point, e.g. in the function list.

Procedure

To create a user-defined VB function, follow these steps:

1. Open "Scripts" in the project tree.
2. Double click "Add new VB function" in the project tree under "VB scripts".



The user-defined VB function is created as a new tab in the work area. The input mask for the configuration settings of the user-defined VB function opens in the Inspector window.

3. Configure the user-defined VB function in the Inspector window "Properties > General > General".
4. Enter a descriptive "Name" for the user-defined VB function.
5. Select the "Type" of the user-defined VB function.
   - "Function" have a return value.
   - "Sub" have no return value.

6. Click "<Add>" in the "Parameters" list to add parameters. Enter the parameter name and specify the parameter type.
   Further information can be found in "Transfer and return of values in VBS (Page 4584)".
   - "ByVal" transfers the parameter value.
   - "ByRef" transfers the address of the parameter.
7. Enter its code in the work area.
   You will find further information about this in ""Scripts" Editor" (Page 4578)".

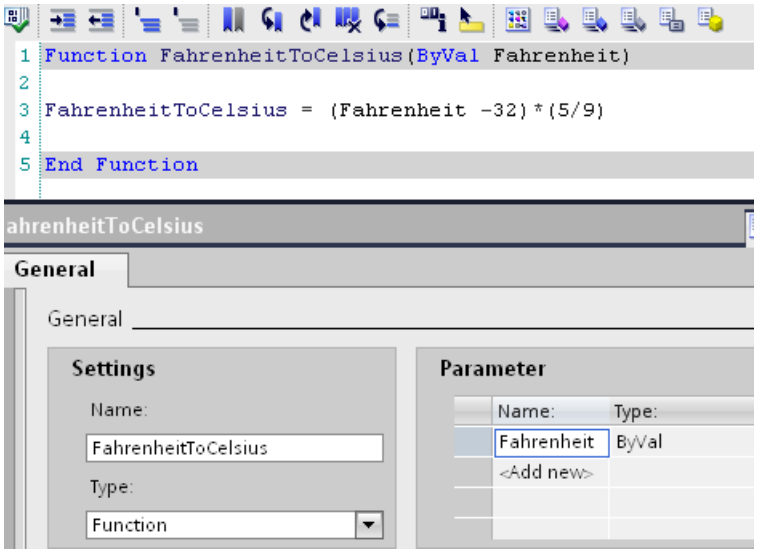
Result

The user-defined VB function has been created. The type, name, and function parameters are displayed in the title bar.

The start and end are inserted automatically when the user-defined function is created.

If you have protected the user-defined VB functions by a password, it is saved encrypted in the project. For additional information, refer to "Protecting user-defined functions".

The figure below shows a user-defined VB function which converts the temperature from "Fahrenheit" to "Degrees Celsius":



12.8.3.8 Testing the syntax of customized functions

Introduction

During programming, the code is tested in the background. Syntactical errors are marked with a wavy red line. The customized function is checked for correct syntax and valid object references.

Check the syntax in the "Scripts" editor to identify all the errors in the code and output the appropriate error messages. In this case, error messages generated by the script parser are output.

Use a separate debugger to check customized VB functions for logical programming errors.

Error types

The following error types are detected in the syntax test and output in the "output window":

- Unknown string (e.g., not a keyword)
- Assignment of value to a constant
- The name of a local tag created with the Dim instruction is already known, e.g.: as a parameter, object, or component of the object model
- Syntax error

Requirements

- Customized function is open.

Procedure

Proceed as follows to check the syntax:

1. Click  to start the syntax check.
   The syntax is checked. The result of the syntax check is displayed in the Inspector window under "Info > Compilation." Syntax errors are output with the line number.
2. Correct the errors in the customized function if necessary.

Special consideration in the syntax checking of customized functions

Customized functions are not interpreted until in Runtime. When an HMI device is being compiled, the system checks its user-defined functions for correct syntax. However, runtime errors may occur in certain circumstances.

See also

Configuring a function list (Page 4575)

12.8.3.9 Renaming customized VB functions

Renaming a user-defined VB function in the project tree

Proceed as follows to rename a user-defined VB function in the project tree:

1. Select the desired user-defined VB function in the project tree.
2. Select the "Rename" (F2) command in the shortcut menu of the user-defined VB function.
3. Enter a new name for the user-defined VB function.

Renaming a user-defined VB function in the Inspector window

Proceed as follows to rename a user-defined VB function in the Inspector window:

1. Open the user-defined VB function in the "Scripts" editor.
2. In the Inspector window, click "Properties > Properties > General".
3. Enter the new function name.

Result

The user-defined VB function is renamed. The application points are adapted automatically.

12.8.3.10 Executing customized VB functions

Introduction

In WinCC you have the following options to execute a customized function:

- Function list
- Customized VB function

Calling a customized VB function in a function list

1. Add the user-defined VB function to a function list like a system function. You will find the customized VB functions in the drop-down list under "VB functions". You will find further information in "Configuring a function list (Page 4575)".
2. If the VB function has parameters, supply the parameters with static values or HMI tags.
3. If the VB function has a return value, select an HMI tag. The value to be processed is transferred to the HMI tag.

Calling a customized VB function in a customized VB function

1. Open the user-defined VB function in which you want to call the user-defined VB function.
2. Call the customized VB function in the syntax of the programming language. You will find further information in "Calling user-defined VB functions (Page 4583)".
3. If the VB function has a return value, assign an expression, e.g. a local tag, to the VB function.

See also

Configuring a function list (Page 4575)

Calling system functions (Page 4582)

Calling user-defined VB functions (Page 4583)

12.8.3.11 Protecting user-defined functions

Setting up know-how protection

Procedure

To set up know-how protection for user-defined functions, follow these steps:

1. Select the user-defined function without know-how protection that you want to protect.
2. Select the command "Know-how protection" in the "Edit" menu.
   The "Know-how protection" dialog will open.
3. Click "Define".
   The "Define password" dialog box opens.
4. Enter a password in the "New" field.
5. Enter the same password in the "Confirm" field.
6. Confirm your entries with "OK".
7. Close the "Know-how protection" dialog by clicking on "OK".

Result

The user-defined function receives know-how protection. User-defined functions with know-how protection are marked with a lock in the project tree. The password entered is valid for all user-defined functions selected.

Opening user-defined functions with know-how protection

You can only open multiple user-defined functions with know-how protection at once if they are protected with the same password.

Procedure

To create a user-defined function with know-how protection, follow these steps:

1. Double-click the user-defined function you want to open.
   The "Access protection" dialog will open.
2. Enter the password for the user-defined function with know-how protection.
3. Confirm your entry with "OK".

Result

The user-defined function with know-how protection will open provided you have entered the correct password. However, the function will remain know-how protected.

Once you have opened the user-defined function, you can edit it for as long as the user-defined function or TIA portal is open. You must enter the password again the next time you open the user-defined function. If you close the "Access protection" dialog with "Cancel" or "Close", the

user-defined function is opened but the code is not displayed. You cannot edit the user-defined function.

Removing know-how protection

Procedure

To remove the know-how protection of a user-defined function, follow these steps:

1. Select the user-defined function for which you want to remove know-how protection.

   Note

   To remove know-how protection for several user-defined functions at once, all selected user-defined functions must have the same password.

2. Select the command "Know-how protection" in the "Edit" menu.
   The "Know-how protection" dialog will open.
3. Deactivate the check box "Hide code (know-how protection)".
4. Enter the password.
5. Confirm your entries with "OK".

Result

Know-how protection will be disabled for the selected user-defined function.

Changing a password

Procedure

To change the password, follow these steps:

1. Select the user-defined function with know-how protection for which you want to change the password.

   Note

   To change the password for several user-defined functions at once, all selected user-defined functions must have the same password.

2. Select the command "Know-how protection" in the "Edit" menu.
   The "Know-how protection" dialog will open.
3. Click the "Change" button.
4. Enter the old password in the "Old" field.
5. Enter the new password in the "New" field.
6. Enter the new password again in the "Confirm" field.

7. Confirm your entries with "OK".
8. Close the "Know-how protection" dialog by clicking on "OK".

12.8.4 Debugging user-defined VB functions

12.8.4.1 Debugging user-defined VB functions

Introduction

Debugging allows you to test the user-defined VB functions for logical programming errors in Runtime. For example, you can test whether the proper values were transferred to the tags, and whether cancellation terms are realized correctly.

The following VBScript-capable debuggers have been tested and approved:

- "Microsoft Script Debugger"
- "Microsoft Script Editor": The debugger is included in Microsoft Office XP.

"Microsoft Script Debugger" provides the following functionality:

- Viewing the source code of the function you are debugging
- Checking the step-by-step execution of the functions
- Viewing and editing tags and property values

Note

Difference with regard to VBScript for Windows and Windows CE

The debugger checks the syntax for VBScript for Windows. If the function contains a VBScript function for Windows CE, a corresponding error message is output. Some VBScript functions are different, e.g., CreateObject. You can find a list of these VBScript functions under "VBScript for Windows CE (Page 4952)".

Microsoft Script Debugger

If you want to use the Microsoft Script Debugger for debugging, the English version "scd10en.exe" must be used. The German version "scd10de.exe" may not be installed.

"Microsoft Script Debugger" provides the following functionality:

- Viewing the source code of the function you are debugging
- Checking the step-by-step execution of the functions
- Viewing and editing tags and property values

Note

For tips and tricks on debugging, common sources of errors, and additional information, refer to the online help for the Microsoft Script Debugger.

The Microsoft Script Debugger is located in the Microsoft Download Center under the following URL:

- http://www.microsoft.com/downloads/Search.aspx?displaylang=en833a6a92-961e-4ce1-9069-528d22605127

Use the "Search" field to search for "Script Debugger" and select the required download.

Basic procedure

The debugger is only intended for identifying error locations in the user-defined VB function. For this purpose, for example, you use break points or execute the user-defined VB function step-by-step. For detailed information, refer to the documentation of the debugger you are using. In order to correct errors, you change to the "Scripts" editor in WinCC. After having recompiled and reloaded the script, you test the user-defined VB function once again using the debugger.

Note

Your code is displayed in the debugger, but is write-protected. You cannot edit the code directly in the debugger; you can only test the required changes.

Error types

The following error types are distinguished when debugging:

- Logical error
  A logical error occurs when the event you are expecting does not take place, e.g., because a condition was checked incorrectly. To debug logical errors, you go through the user-defined VB function step by step. This way, you identify the portion of the user-defined VB function that is not working.
- Runtime error
  A runtime error is generated if an attempt is made to execute an invalid or faulty instruction, e.g., if a tag is not defined.
  To intercept runtime errors, use the "On Error Resume Next" instruction in the user-defined VB function. With this instruction, the next instruction is executed after a runtime error. You check the error code with the Err object in the next line. To stop the handling of runtime errors in the user-defined VB function again, use the "On Error Goto 0" instruction.
  Example for error handling

```
Sub OnClick(ByVal Item)
'VBS27
  Dim objScreenItem
'
  'Activation of errorhandling:
  On Error Resume Next
  For Each objScreenItem In ScreenItems
    If "HMIRectangle" = objScreenItem.Type Then
    '
      '=== Property "RoundCornerHeight" only available for RoundRectangle
      objScreenItem.RoundCornerHeight = objScreenItem.RoundCornerHeight * 2
      If 0 <> Err.Number Then
        HMIRuntime.Trace objScreenItem.Name & ": no RoundedRectangle" & vbCrLf
        '
        'Delete error message
        Err.Clear
      End If
    End If
  Next
  On Error Goto 0  'Deactivation of errorhandling
End Sub
```

Screen change while debugging

If you change to another screen while debugging, the user-defined VB function of the previous screen stays open but is no longer valid. The debugger could return invalid error messages in this case, as the objects called will no longer exist after the screen change.

12.8.4.2 Integrating the Debugger

Installing a script debugger for WinCC

A VBScript-capable debugger must be installed to search for errors in user-defined VB functions.

The following VBScript-capable debuggers have been tested and released:

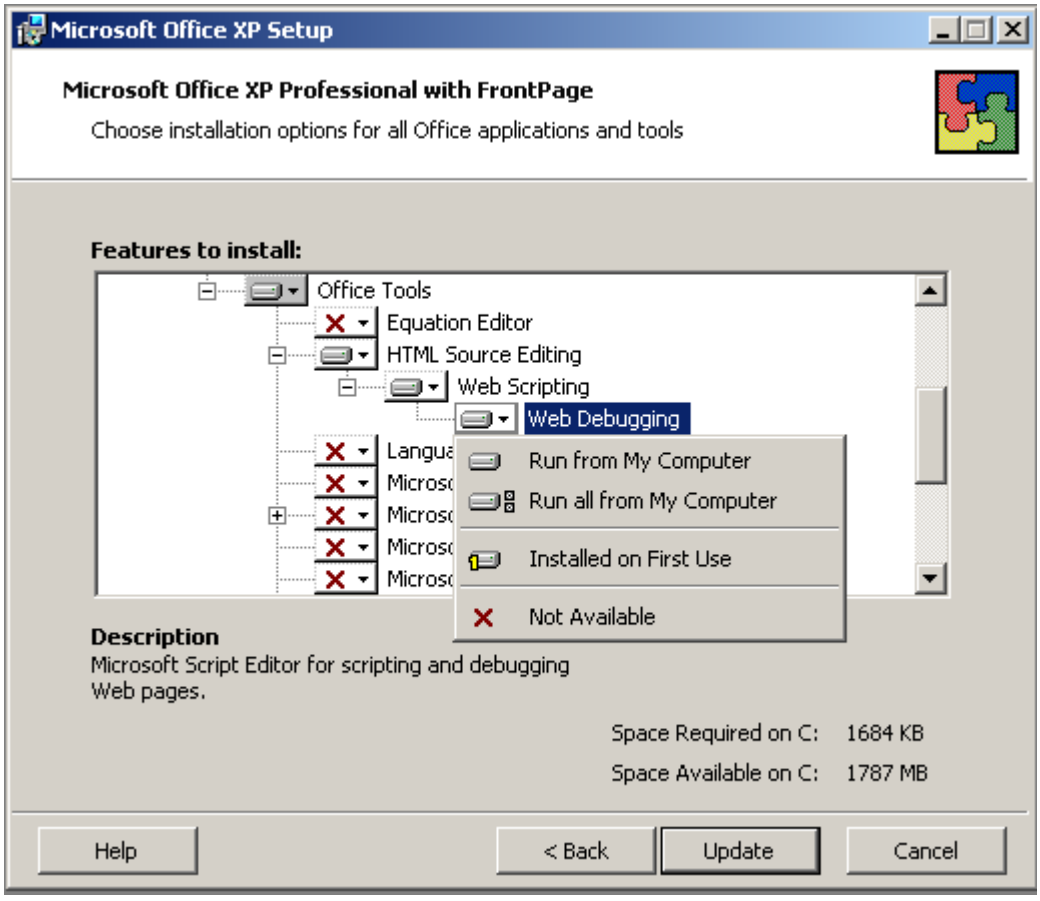
- Microsoft Script Editor by Office XP
- Microsoft Script Debugger: The English version "scd10en.exe" must be used. The German version "scd10de.exe" may not be installed.

An installed debugger is started as follows:

- If a runtime error occurs during execution
- Via "Online > Simulate Runtime > With script debugger"

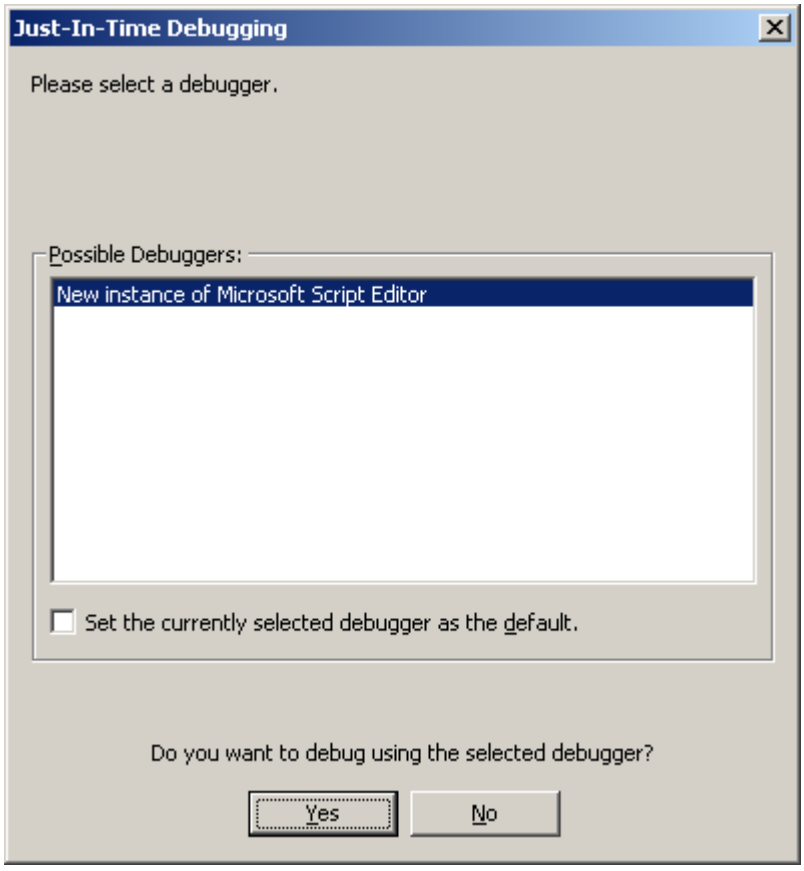
Microsoft Script Editor

The Microsoft Office XP component "Microsoft Script Editor" contains a Script Debugger. If the default configuration was installed by Microsoft Office Setup, the "Microsoft Script Editor" component is not installed until called the first time ("Installed on First Use"). If you wish to explicitly install these components, you must specify it in the Microsoft Office setup. Select the component selection menu, click"Web Debugging" component and then select the "Run from My Computer" option.

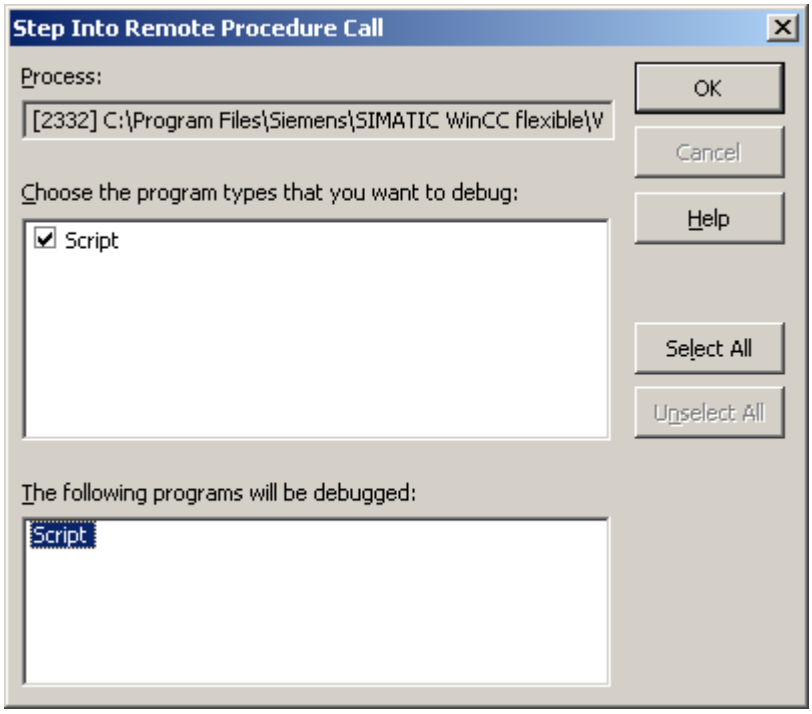


If a project is activated in WinCC via "Online > Simulate Runtime > With script debugger", a dialog containing the list of available script debuggers appears when the first user-defined function is run.

Other installed script debuggers such as "Microsoft Visual Interdev" or "Microsoft Visual Studio .NET" may also appear in the list. Select "Microsoft Script Editor" and confirm your selection with "Yes".



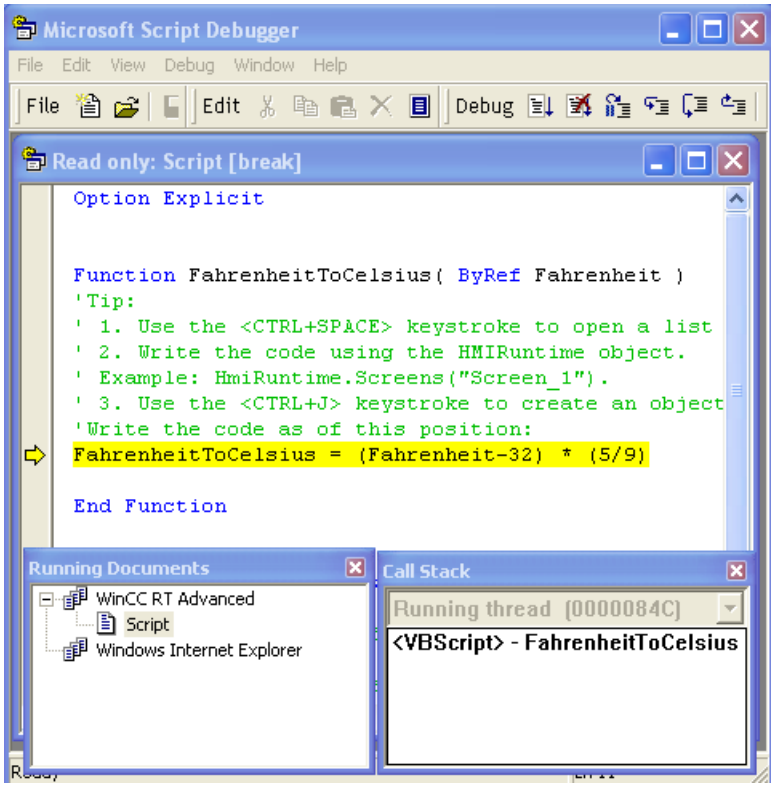
Activate the "Script" program object in the "Step Into Remote Procedure Call" dialog and confirm your selection with "OK".



The "Microsoft Script Editor" is launched. The execution pauses at the first line of the first function.

Microsoft Script Debugger

If a script debugger is not available, download "Microsoft Script Debugger" (scd10en.exe) free of charge from Microsoft (www.microsoft.com). It will be started automatically in WinCC once it is installed.



Note

The "Microsoft Script Debugger" can no longer be called or installed when another VBScript-capable script debugger is available on your computer.

12.8.4.3 Registering Microsoft Script Debugger

Introduction

Under Windows 7 / Windows 8, the Microsoft Script Debugger starts in the simulation only after it has been automatically entered once in the registry as the default script debugger.

Requirement

- Microsoft Script Debugger is installed on the configuration PC.
- You have administrator rights on the configuration PC.

Procedure

1. Open a command prompt with "Start > Run > cmd".
2. Enter the command: [File path]/Regserver, e.g.: "c:\Program Files\Microsoft Script Debugger\msscrdbg.exe/Regserver".

Once the Microsoft Script Debugger has been successfully registered as the default script debugger, you will see the following entries in the registry:

- "HKEY_CLASSES_ROOT\CLSID\{834128A2-51F4-11D0-8F20-00805F2CD064}]
  (Default)="ScriptDebugSvc Class"
  "AppID"="{A87F84D0-7A74-11D0-B216-080000185165}"
- [HKEY_CLASSES_ROOT\CLSID
  \{834128A2-51F4-11D0-8F20-00805F2CD064}\LocalServer32]
  (Default)="c:\\Program Files\\Microsoft Script Debugger\\msscrdbg.exe"
- [HKEY_CLASSES_ROOT\CLSID\{834128A2-51F4-11D0-8F20-00805F2CD064}\ProgID]
  (Default)="ScriptDebugSvc.ScriptDebugSvc.1"
- [HKEY_CLASSES_ROOT\CLSID
  \{834128A2-51F4-11D0-8F2000805F2CD064}\VersionIndependentProgID]
  (Default)="ScriptDebugSvc.ScriptDebugSvc"

The "LocalServer32" file path must point to the installation folder of Microsoft Script Debugger. If you have installed Microsoft Script Debugger in a different folder, adapt the path information.

Result

You have registered the Microsoft Script Debugger as the default script debugger. The Microsoft Script Debugger now starts automatically when Runtime is started.

12.8.4.4 Starting and stopping the debugger

Requirement

- VBScript-capable debugger (e.g., MS Script Debugger) and WinCC Runtime are installed on the configuration PC.
- Project is open.

Starting the debugger

To start the debugger, proceed as follows:

1. Select the HMI device and then select the "Online > Simulation > With script debugger" menu command.
   The Runtime software searches for debuggers installed on the configuration PC.
2. If several debuggers are found click on the one required.

Or:

1. Click "Start > Run".
2. Enter the following command: "HmiRtm /ScriptDebug /<ProjectFile>".
   Further information about the project file can be found in "Starting Runtime Advanced and Panels (Page 6953)".

Or:

1. Select the "debug" command in the project file shortcut menu in the Windows Explorer.

Result

The debugger is connected automatically with the runtime software.

Stopping the debugger

The debugger is not closed automatically when you close the Runtime software. Therefore, close the debugger separately.

12.8.5 Runtime behavior in Runtime

12.8.5.1 Executing a function list in Runtime

Principle

A function list is executed from top to bottom in Runtime. A distinction is made between synchronous and asynchronous execution, so that no waiting periods ensue during execution. The distinction is made by the system by evaluating the different runtimes of the system functions. User-defined functions are always executed synchronously independent of the runtime. If a system function returns an error status, the execution of the function list is cancelled.

Synchronous execution

During synchronous execution, the system functions in a function list are executed one after the other. The previous system function must be finished before the next system function can be executed.

Asynchronous execution

System functions that perform file operations such as saving and reading have a longer runtime than system functions that, for example, set a tag value.

Therefore, system functions with longer runtimes are executed asynchronously. For example, while a system function is writing a recipe data record to a storage medium, the next system function is already being executed. Due to the parallel execution of system functions, waiting periods at the HMI device are avoided.

12.8.5.2 Executing user-defined functions in Runtime

Principle

Only one user-defined function at a time is executed in Runtime. If several user-defined functions are waiting to be executed, they are lined up in a queue and executed one after the other.

Note

A loop in a user-defined function therefore blocks the execution of the other functions in the queue even if the functions were initiated asynchronously.

WinCC supports a maximum nesting depth of eight user-defined functions. Note that the nesting depth is not checked.

Note

If a user-defined function is configured for the "Runtime stop" event, the only system functions that may be used in this user-defined function are those which are available at the "Runtime stop" event.

Ensure that the ending of the Runtime is not interfered with by the execution of the user-defined function.

Note

Configuration of user-defined functions

During configuration make sure that not too many user-defined functions are activated at the same time. Avoid a continuous system load of 100%.

User-defined functions are processed at a lower priority so as not to interfere with the display of values and operability. If system utilization is extreme, the user-defined functions to be executed are therefore first only reserved for execution. The maximum size of the reservation list is dependent on the HMI device and is limited by the maximum permitted number of user-defined functions. For additional information, see the performance features. If more user-defined functions are activated at one time than can be reserved, excess calls are discarded and a system alarm displayed.

HMI device changeover

If you use system functions in a customized function which are not available on the set HMI device, you get a warning. In addition, the corresponding system function in the user-defined function will be underlined with a wavy blue line.

See also

Runtime Stop (Page 4855)

12.8.5.3 Processing sequence for user-defined functions and system functions

Warning

Adherence to the expected processing sequence for user-defined functions and system functions in Runtime cannot always be guaranteed. This fact may lead to unexpected operating states.

Please note the following description in which the correlations are explained. Instructions for a solution are available under "Remedy".

Use of user-defined functions for events

It is not always possible to adhere to the processing sequence for user-defined functions and system functions expected in the configuration, for example, when the processing of a user-defined function lasts beyond the trigger time of a subsequent event. In this case, system functions that are configured for the following event may be executed before the system functions that were configured with the user-defined function for the same event.

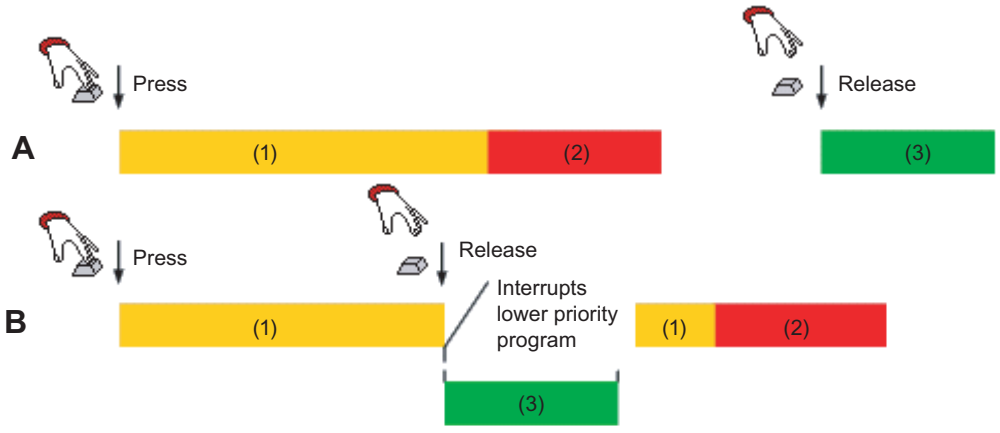
Background

User-defined functions are arranged in a low-priority queue. The queue is processed in sequence. If system functions and user-defined functions are configured for an event, all system functions and user-defined functions configured for this event are executed in this queue.

Example

On a button, you have configured:

	Event	Functions
	Press	User-defined function (1) SetBit(Tag) (2)
	Release	ResetBit(Tag) (3)



(1) Execution time of the user-defined function

(2) Execution time of system function SetBit(Tag)

(3) Execution time of system function ResetBit(Tag)

A: Expected execution of the user-defined function and system functions in the configuration.

When you press the button, user-defined function (1) and then system function SetBit(Tag) (2) are executed. When you release the key, system function ResetBit(Tag) (3) is then executed.

B: Processing of the user-defined function is not yet complete when you release the key.

When you press the key, the user-defined function (1) is then executed. The execution of the user-defined function (1) is not yet complete and you have already released the key. System function ResetBit(Tag) (3) interrupts the execution of the function. In this case, system function ResetBit(Tag) (3) is executed before system function SetBit(Tag) (2). As a result, the bit remains placed.

System function "SetBitWhileKeyPressed" shows the same behavior, if the system function is configured together with user-defined functions.

Remedy

The processing sequence of the previous Example A is adhered to, if you additionally configure a user-defined function for the "Release" event. The user-defined function does not require functionality for this purpose.

	Event	Functions
	Press	User-defined function (1) SetBit(Tag) (2)
	Release	User-defined function_2 (3) ResetBit(Tag) (4)

Note

Make sure that the user-defined function queue does not overflow; otherwise the system function for the following event may not be executed.

An overflow is recognizable by "Overload: Script <name> is rejected" or "Adherence to the expected processing order for user-defined functions and system functions in Runtime cannot always be ensured".

12.8.5.4 Making object properties dynamic in Runtime

Introduction

You can use user-defined functions to access object properties of screen objects as well as tags in Runtime. If you use a user-defined function to change values of object properties, this will not affect the project data.

Changes to object properties

If you use a user-defined function in Runtime to change an object property of a screen element, this change will only remain effective while the screen is active. If you change to the screen, or reload the screen, the configured object properties are displayed once more.

Language switching

If you switch the language in Runtime, the foreign language labels are loaded from the project data. If you use a user-defined function to change texts, the texts changed by the user-defined function are overwritten again.

12.8.6 Examples

12.8.6.1 Example: Converting Fahrenheit into degrees Celsius

Scheduled task

In this example, create a user-defined VB function which converts the values of a temperature sensor from Fahrenheit to degrees Celsius. The temperature is displayed in an output field on the HMI device.

Settings

For the example you need two HMI tags and a user-defined VB function with the following settings:

HMI tags:

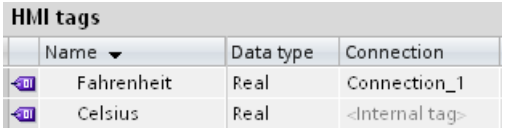
Name	PLC connection	Type
Fahrenheit	Yes	Real
Centigrade	No	Real

User-defined VB function:

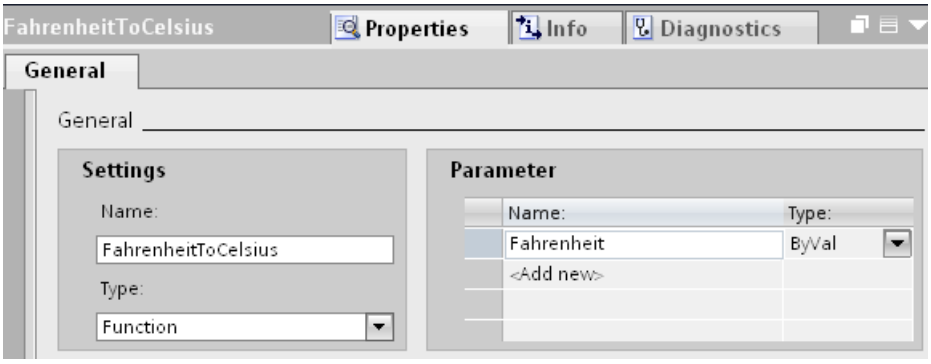
Name	Type	Parameters
FahrenheitToCelsius	Function	Fahrenheit

Procedure

1. Create the two HMI-tags "Fahrenheit" and "Celsius" with the settings named above.

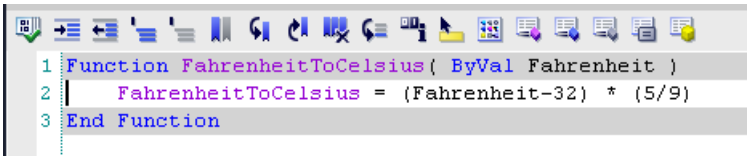


2. Create the user-defined VB function "FahrenheitToCelsius" with the settings given above.



3. Write the following VBS code:

```
FahrenheitToCelsius = (Fahrenheit-32) * (5/9)
```



Interim result

The HMI tags and the VB user-defined function are created.

Procedure

1. Open the "HMI Tag"editor and click on the "Fahrenheit" tag.
2. Click the "Properties > Events" tab in the Inspector window. Select the "Value change" event.

3. Configure the user-defined VB function "FahrenheitToCelsius" to the "Value change" event.
4. Select the tag "Fahrenheit" for the parameter "Fahrenheit".
5. Select the HMI-tag "Celsius" for the return value "Fahrenheit to Celsius".
6. Configure an output field in a screen and connect it with the tag "Celsius".

Alternative procedure

Instead of using a user-defined VB function of the "Function" type, you can also use the "Sub" type. In this case, assign the converted value directly to the HMI-tag "Celsius".

```
SmartTags("Celsius") = (Fahrenheit-32) * (5/9)
```

In this case the return value of the user-defined VB function is not applicable.

Result

When the tag value of "Fahrenheit" changes in Runtime, the user-defined VB function "Fahrenheit to Celsius" is performed. The converted temperature value is returned to the HMI-tag "Celsius" and displayed in the output field.

12.8.6.2 Example: Converting inches into meters

Scheduled task

In this example you create a user-defined VB function that converts the value of a length measuring system from inches into meters. The length in meters is displayed on the HMI device in an output field.

Settings

For the example you need two HMI tags and a user-defined VB function with the following settings:

HMI tags:

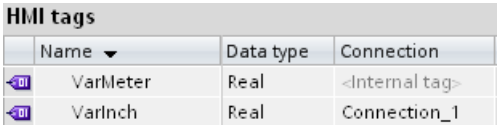
Name	PLC connection	Type
VarInch	Yes	Real
VarMeter	No	Real

Customized VB function

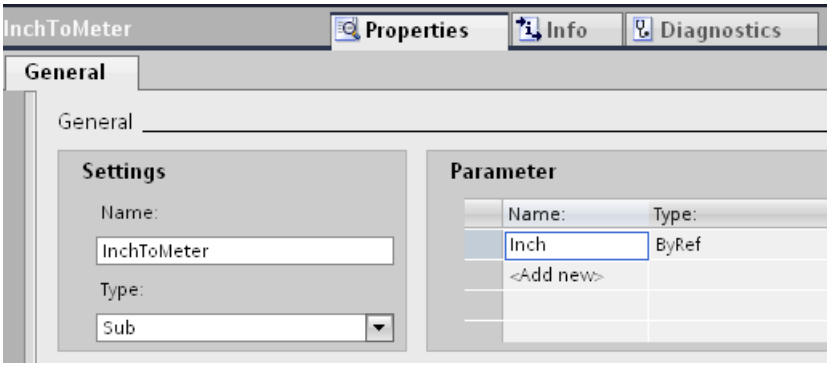
Name	Type	Parameters
InchToMeter	Sub	Inch

Procedure

1. Create the two HMI tags "VarInch" and "VarMeter" with the above settings.

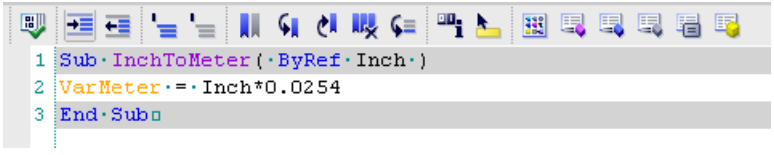


2. Create the user-defined VB function "InchToMeter" with the settings given above.



3. Write the following VBS code:

```
VarMeter = Inch*0.0254
```



Interim result

The tags and the user-defined VB function are created.

Procedure

1. Open the "HMI tags" editor and click the "VarInch" tag.
2. Click "Properties> Events" in the Inspector window. Select the "Value change" event.
3. Configure the user-defined VB function "InchToMeter" to the "Value change" event.
4. Select the "VarInch" HMI tag for the "Inch" parameter.
5. Configure an output field in a screen and connect it with the "VarMeter" HMI tag.

Result

When the tag value of "VarInch" changes in Runtime, the "InchToMeter" user-defined VB function is performed. The calculated value is written into the "VarMeter" HMI tag and displayed in the output field.

12.8.6.3 Example: Changing the operating mode on the HMI device with the current display

Scheduled task

In this example, you use the "SetDeviceMode" system function to switch between the "online" and "offline" modes on the HMI device. You also display the current set operating mode on the HMI device.

Requirements

A screen has been created.

Settings

For this example you require a HMI-tag and a text list with the following settings:

HMI tag:

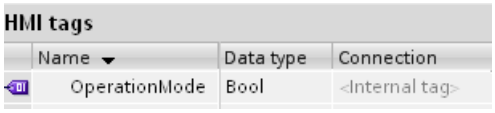
Name	PLC connection	Type
OperatingMode	No	Bool

Text list:

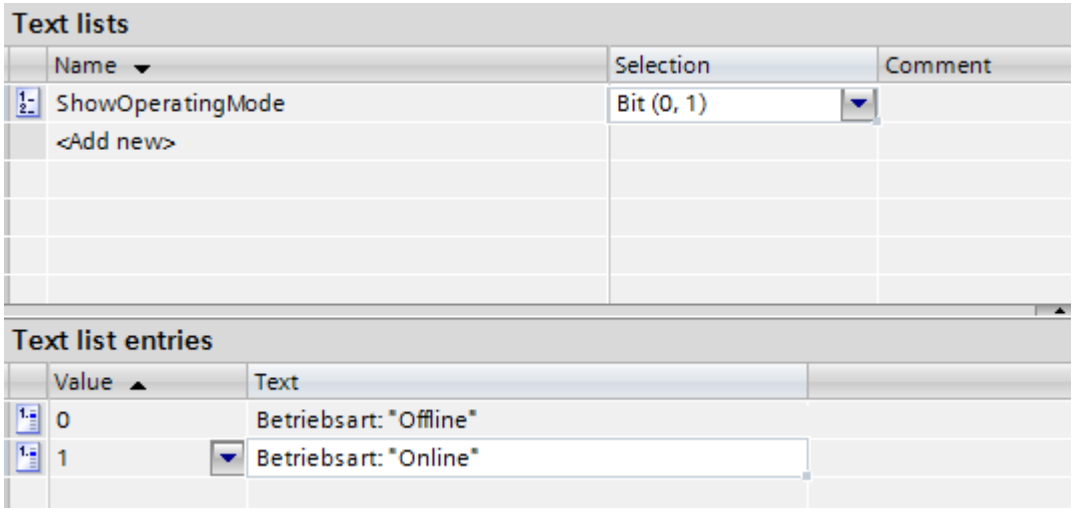
Name	Contains	Values
ShowOperatingMode	Bit (0/1)	1: Operating mode: "Online" 0: Operating mode: "Offline"

Procedure

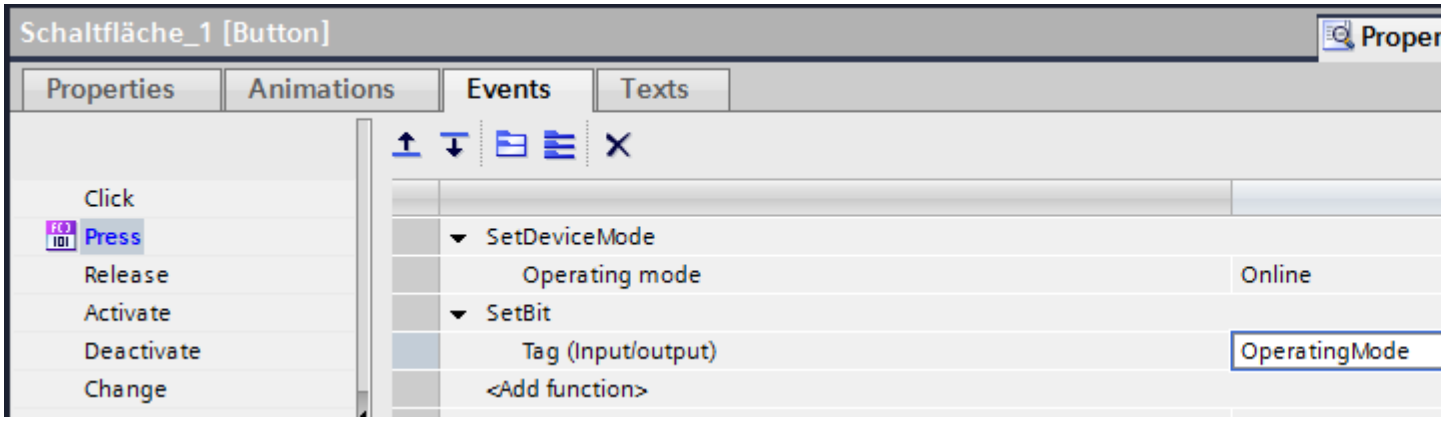
1. Create the "OperatingMode" HMI-tag indicated above.



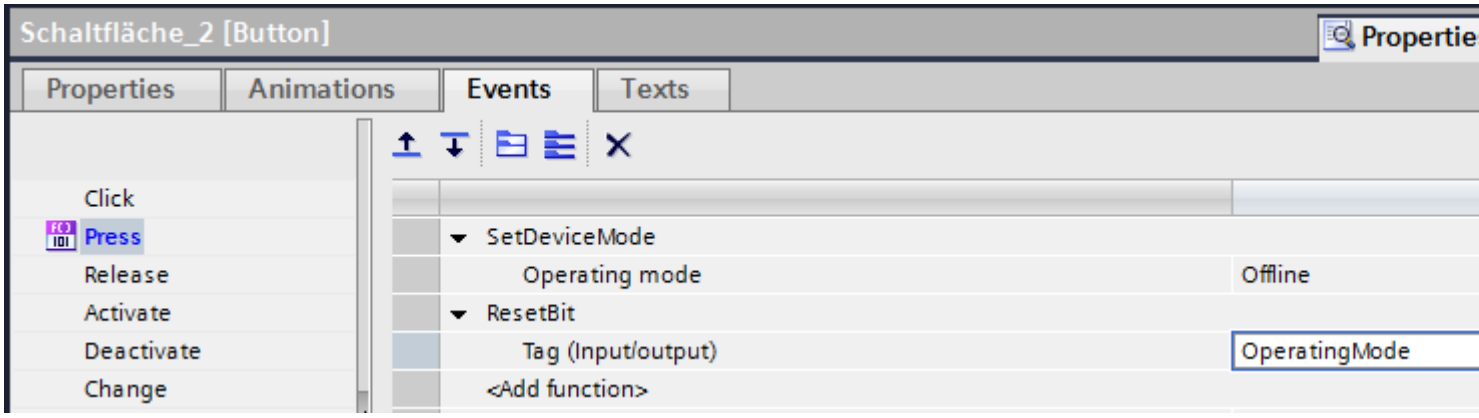
2. Create the "ShowOperatingMode" text list indicated above.



3. Open the screen and insert a button for which you configure the operating mode change to "online".
4. Click "Properties> Events" in the Inspector window. Select the "Press" event.
5. Configure the "SetDeviceMode" system function for the "Press" event. The system function is found in the selection list under "Settings".
6. For the "Mode" parameter, select the "Online" entry.
7. Configure the system function "SetBit" on the event "Press". The system function is found in the selection list under "Bit processing".
8. Select the HMI-tag "Operating mode" from the selection list for the parameter "Tag".



9. Add a button in the process screen for which you configure the operating mode change to "offline".
10. Repeat steps four to seven. For the "Mode" parameter, select the "Offline" entry. Configure the system function "ResetBit" in place of the system function "SetBit."



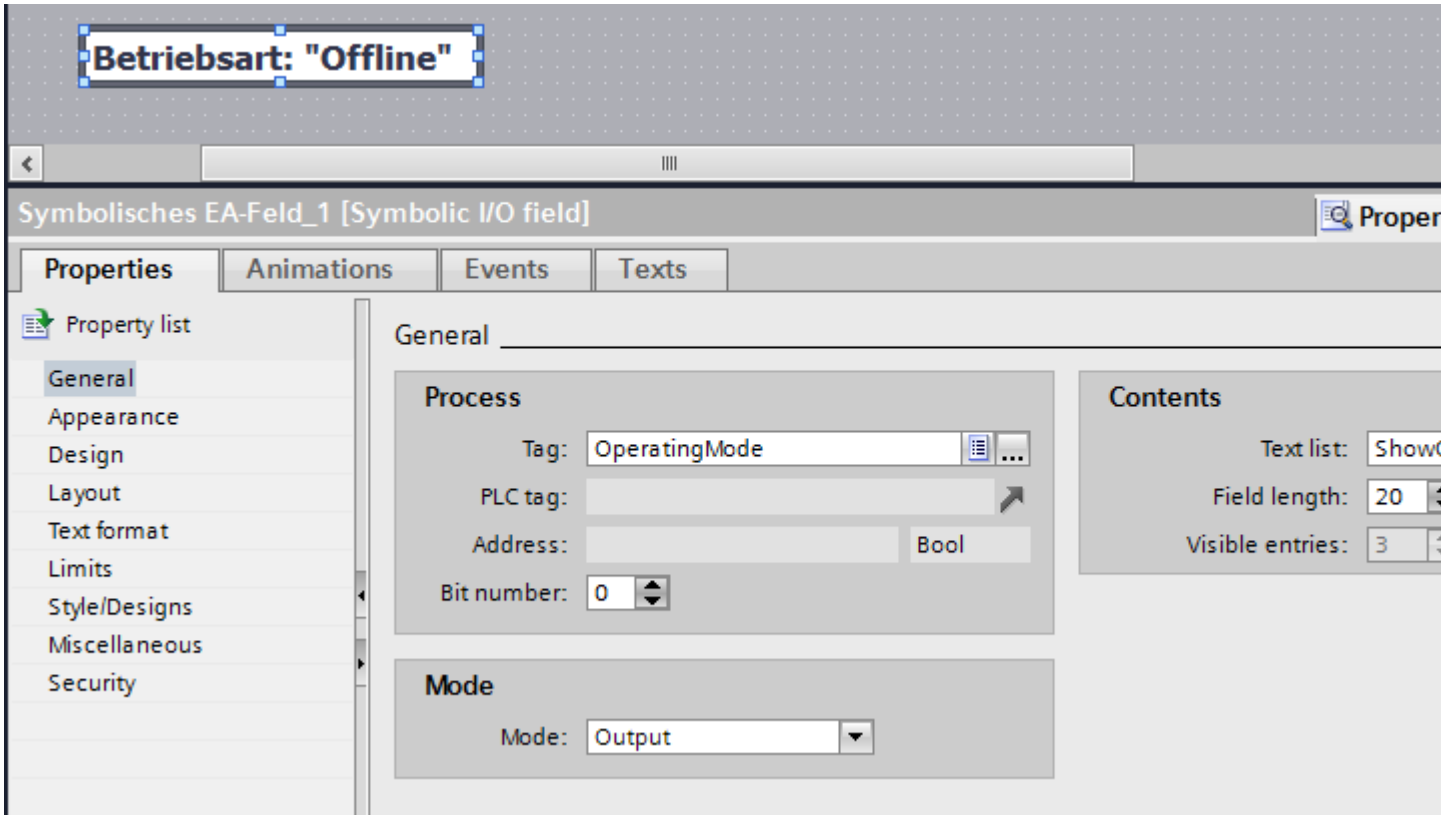
Interim result

You can toggle the operating mode of the HMI device with the two buttons in Runtime.

You want to display the current set operating mode in an output field on the HMI device.

Procedure

1. Create a "Symbolic I/O field" in the process image. Click "Properties > Properties" in the Inspector window.
2. Make the following settings in the "General" group:
   - Select "Output" as the "Mode".
   - Select the text list "Show operating mode" as "Text list".
   - Select "Operating mode" as "Tag".



Result

When you change the operating mode with the buttons, the currently set operating mode on the HMI device is always shown.

12.8.7 Reference

System functions for Runtime Advanced

Availability of system functions

The following table shows the availability of the system functions for WinCC RT Advanced.

Technical data subject to change.

Overview

	WinCC RT Advanced
User-defined functions	Yes
Logoff (Page 4657)	Yes
ActivateScreen (Page 4657)	Yes
ActivateScreenByNumber (Page 4659)	Yes
ActivateCleanScreen (Page 4660)	Yes
ActivatePreviousScreen (Page 4660)	Yes
UpdateTag (Page 4661)	Yes
AdjustContrast (Page 4662)	No
Logon (Page 4663)	Yes
ArchiveLogFile (Page 4663)	Yes
LogTag (Page 4665)	Yes
EditAlarm (Page 4666)	Yes

System functions

Logoff

Description

Logs off the current user on the HMI device.

Use in the function list

Logoff

Use in user-defined functions

Logoff

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

ActivateScreen

Description

Performs a screen change to the given screen.

Use the "ActivateScreenByNumber" system function to change from the root screen to the permanent window or vice versa.

Use in the function list

ActivateScreen (Screen name, Object number)

Use in user-defined functions

ActivateScreen (Screen_name, Object_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen name

Name of the screen to which you change.

Object number

The operator control element which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

Note

If the "Reach margin" event is assigned to the "ActivateScreen" system function, only the value "0" is valid for the "Object number" parameter. The active object is not defined by the object number, but rather by the X position it had prior to the screen change.

Example

The ActivateScreen function is used in the following program code to activate the "Screen_2" screen when you click a button.

```
{

// User defined code
// i.e. when pressing a button
ActivateScreen ("Screen_2", 0);
...
}
```

ActivateScreenByNumber (Page 4659)

Availability for specific devices of system functions (Page 4612)

ActivateScreenByNumber

Description

Performs a screen change to a screen depending on a tag value.

The screen is identified by its screen number.

Use in the function list

ActivateScreenByNumber (Screen number, Object number)

Use in user-defined functions

ActivateScreenByNumber (Screen_number, Object_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Screen number

Tag which contains the screen number of the destination screen.

When a change from the root screen to the permanent window is desired, "0" or "-1" is specified:

0 = Change from root screen to permanent window

-1 = Change from permanent window to root screen

Object number

The number of the screen object which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

See also

ActivateScreen (Page 4657)

Availability for specific devices of system functions (Page 4612)

ActivateCleanScreen

Description

Activates the clean screen on the HMI device. The display of the HMI device is disabled for the given time period.

When the display of the HMI device is deactivated, it can be cleaned without triggering touch functions by mistake.

Use in the function list

ActivateCleanScreen (Time period)

Use in user-defined functions

--

Parameters

Time period

Time period for which the display is disabled. The time remaining is displayed as a progress bar.

Value range in seconds from 10 through 300.

Note

The system function ActivateCleanScreen cannot be simulated.

See also

Logoff (Page 4656)

Availability for specific devices of system functions (Page 4612)

ActivatePreviousScreen

Description

Performs a screen change to the screen which was activated before the current screen. The screen change is not performed if no screen was activated beforehand.

The last 10 screens that were called up are saved. A system alarm is output when you change to a screen which is no longer saved.

Note

If you want to use the system function, the screen to which you change has to be used in the navigation structure.

Use in the function list

ActivatePreviousScreen

Use in user-defined functions

ActivatePreviousScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

UpdateTag

Description

Reads the current value of the tag with the specified Update ID from the PLC.

Use in the function list

UpdateTag (Update ID)

Use in user-defined functions

-

Parameters

Update ID

Update ID assigned to the tag that will be updated.

See also

Availability for specific devices of system functions (Page 4612)

Logoff (Page 4656)

AdjustContrast

Description

Changes the contrast of the display one level on the HMI device.

Use in the function list

AdjustContrast (Adjust)

Use in user-defined functions

-

Parameters

Adjust

Specifies how the contrast is changed:

0 (hmiDecrease) = Decrease: Decreases the contrast one level.

1 (hmiIncrease) = Increase: Increases the contrast one level.

Application example

Objective

One button each for increasing and decreasing the screen contrast is desired.

Notes on configuring

Configure two buttons and configure the "AdjustContrast" system function on the "Press" event. The parameters "Increase" and "Decrease" are allocated.

Procedure on HMI device

When one of the two buttons is pressed in runtime, the contrast is increased or decreased one level.

See also

Logoff (Page 4656)

Availability for specific devices of system functions (Page 4612)

Logon

Description

Logs on the current user on the HMI device.

Use in the function list

Logon (Password, User name)

Use in user-defined functions

Logon (Password, User_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Password

The tag from which the password for the user logging on is read.

If the user is logged on, the password in the tag is deleted.

User name

The tag from which the user name for the user logging on is read.

See also

Availability for specific devices of system functions (Page 4612)

ArchiveLogFile

Description

This system function moves or copies a log to another storage location for long-term logging.

With Audit Trails, always use the "Move" (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.

Prior to "ArchiveLogFile" always run the system function "CloseAllLogs".

After this system function, run the "OpenAllLogs" system function.

In "Copy log" mode, the logs are not reopened until the log has been successfully copied, or unless a timeout occurs during the copy process. In "Move log" mode, the logs to be moved are renamed and the new logs are opened immediately. To move the renamed logs, a job is submitted which attempts to move them every 300 seconds if the server cannot be reached. The job is also retained after Runtime is restarted until it is executed.

Use in the function list

ArchiveLogFile (Log type, Log, Directory name, Mode)

Use in user-defined functions

ArchiveLogFile (Log_type, Log, Directory_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (miAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log available for GMP compliant projects. Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log being archived.

Directory name

Path for saving the log.

Mode

0 (hmiCopy) = Copy log

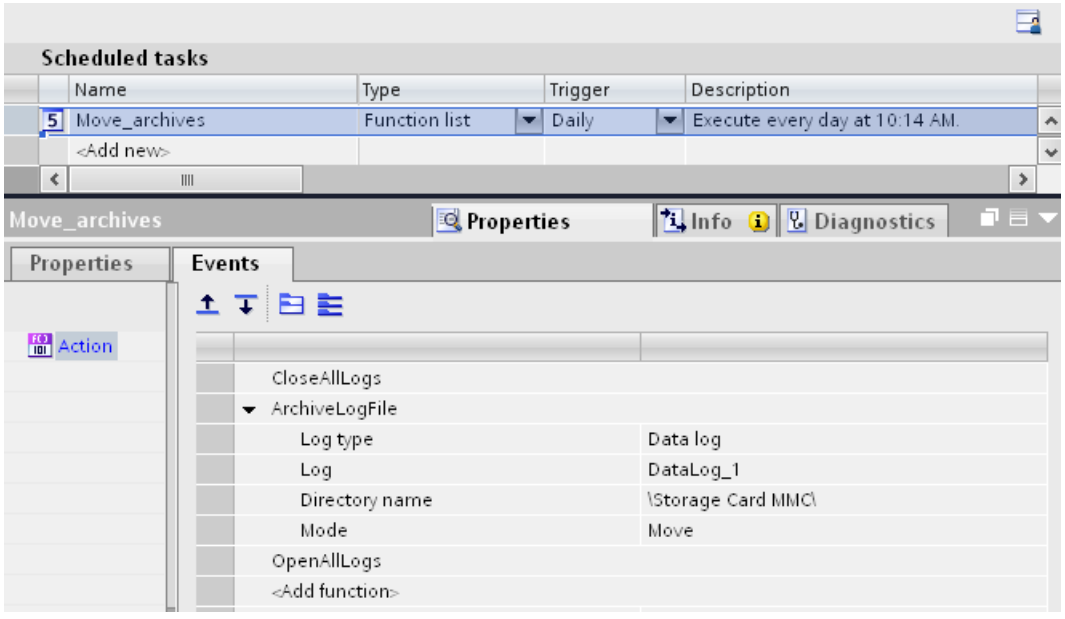
1 (hmiMove) = Move log

Application example

You want to move a log file from a local storage medium to the server in order to generate a backup copy of this file at cyclic intervals.

Notes on configuring

Set up a task in the scheduler which is executed at a specific time on a daily basis. Configure the following function list for the task:



Procedure on HMI device

- All log files will be closed.
- The log file you specified is moved to the server.
- All closed log files will be opened again.

See also

Availability for specific devices of system functions (Page 4612)

LogTag

Description

Saves the value of the given tags in the given data log.

This system function is used to archive a process value at a certain point in time.

Use in the function list

LogTag (Tag)

Use in user-defined functions

-

Parameters

Tag

The tag whose value is logged. The tag is stored in the log which is configured for the specified tag.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Basic Panels (Page 4612)

EditAlarm

Description

Triggers the "Edit" event for all selected alarms.

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

This system function can only be used for function keys.

Use in the function list

EditAlarm

Use in user-defined functions

EditAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

ScreenObjectCursorDown

Description

Results in a line-by-line, downward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display

Use in the function list

ScreenObjectCursorDown (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 4612)

ScreenObjectCursorUp

Description

Results in a line-by-line, upward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display

Use in the function list

ScreenObjectCursorUp (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 4612)

ScreenObjectCursorLeft

Description

Results in a line-by-line, cursor movement to the left in the specified screen object.

Use in the function list

ScreenObjectCursorLeft (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Basic Panels (Page 4612)

System functions for Basic Panels 2nd Generation (Page 4618)

System functions for Mobile Panels (Page 4643)

System functions for Runtime Advanced (Page 4651)

ScreenObjectCursorRight

Description

Results in a line-by-line, cursor movement to the right in the specified screen object.

Use in the function list

ScreenObjectCursorLeft (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Basic Panels (Page 4612)

System functions for Basic Panels 2nd Generation (Page 4618)

System functions for Panels (Page 4624)

System functions for Mobile Panels (Page 4643)

System functions for Runtime Advanced (Page 4651)

ScreenObjectPageDown

Description

Results in a page-by-page, downward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display

Use in the function list

ScreenObjectPageDown (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 4612)

ScreenObjectPageUp

Description

Results in a page-by-page, upward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display

Use in the function list

ScreenObjectPageUp (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 4612)

Encode

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

Use in the function list

Encode (Byte array, String, Coding)

Use in user-defined functions

Encode (Byte_array, String, Encoding)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The Byte array must be twice the size of the string length + 2. The Byte array must contain 242 array elements if the string has a length of 120 characters.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encode

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

See also

Availability for specific devices of system functions (Page 4612)

EncodeEx

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

By contrast to the Encode system function, you can define the Line break parameter. Using the Line break parameter you can delete line breaks or replace these with predefined characters.

Use in the function list

EncodeEx (Byte Array, String, Encode, Line break)

Use in user-defined functions

EncodeEx (Byte_array, String, Encoding, Line_break)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The byte array must be twice the size of the string length +2. If the string has a length of 120 characters, the byte array must contain 242 array elements.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encoding

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

Line break

All line breaks are either deleted or replaced with predefined characters. Do not replace line breaks if set as the default value.

0 (replace with "\r\n' (0x000D, 0x000A)) - the line break is replaced with "\r\n".

1 (replace with "\n' (0x000A)) - the line break is replaced with "\n".

2 (do not replace) - the line break is not replaced.

3 (remove line breaks) - the line breaks are removed.

See also

Availability for specific devices of system functions (Page 4612)

DirectKey

Description

Allows rapid operation of keys on an HMI device without having communication caused delays occur.

Use this system function, for example. to set bits in the I/O area of a SIMATIC S7 directly from the HMI device.

Note

If you have integrated WinCC in SIMATIC STEP 7 and have configured a DP area in SIMATIC STEP 7: When the button on which the system function was configured is activated, a bit is set in the IO area of the CPU. Releasing the button resets the bit.

Notes on configuring the system function

When a button is configured with the "DirectKey" system function, a fixed area of the touch display is reserved for DirectKey operation.

Screen objects that are above the button with the "DirectKey" system function in this area in runtime will hide the button visually. However, the screen objects do not interfere with the triggering of the "DirectKey" system function.

Note

If an external application, such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the "DirectKeyScreenNumber" function is no longer set and the keys or buttons which are assigned the "DirectKey" function no longer to trigger the associated bit in the PLC.

Warning

Triggering the "DirectKey" system function by mistake will endanger personnel or result in damage to the machine.

In order to avoid this danger, the following must be observed:

- When the process screen is configured, the button with the "DirectKey" system function must not be covered by a screen object.
- The dynamic positioning or display (release) of a screen object in relation to process values must not cover the button with the "DirectKey" system function in runtime.

Note

Please observe this guideline during configuration. Check also existing configurations and adjust them immediately.

In the following cases, the covering of a button with the "DirectKey" system function does not lead to the problems described above:

- Operation of the alarm window
- Operation of the Recipe view
- Cancellation of the screen saver
- Use of the screen keyboard
- Running the "ActivateCleanScreen" system function

Actions of DP direct-keys in offline operation

When the "ChangeConnection" system function is performed with the "Offline" parameter on the HMI device, the connection to the specified PLC is disconnected.

Note

Please note the following on the SIMATIC STEP 7 side as well as the WinCC side:

The DP DirectKeys are still active in this case. If you activate a button with the "DirectKey" system function in "Offline" operating mode or activate the DirectKey on a keyboard device, the corresponding bit is set in the PLC.

Use in the function list

DirectKey (Bit)

Use in user-defined functions

-

Parameters

Bit

Specifies the bit which is set. Depending on the HMI device, the bit numbers 0 to 31 or 0 to 39 are possible.

Application example

Objective

You want to set bits in the IO area of a SIMATIC S7 directly from the HMI device using a button.

Requirement

WinCC integrated in SIMATIC STEP 7 is installed.

During operation, the HMI device is coupled to a SIMATIC S7 through PROFIBUS-DP.

WinCC integrated was installed when you compiled your project.

The bit area for DirectKeys is determined in SIMATIC STEP 7. For configuration see the "Communication" user's manual.

Notes on configuring

Configure the button to be used as the DirectKey. Assign the "DirectKey" system function to the button. As a parameter, enter the number of the bit which is set when the key is pressed.

Procedure on HMI device

When the DirectKey is touched, the bit is set, and reset when the key is released or the screen is exited.

See also

Availability for specific devices of system functions (Page 4612)

DirectKeyScreenNumber

Description

Sets the bit within the given bit area of a DirectKey and transfers it to the S7 controller to which the HMI device is connected. This ensures unambiguous allocation of a control bit to screen number at all times.

Without the use of the system function, the S7 controller must distinguish the respective functionality by means of the screen number. This delays the updating of the screen number after a screen change.

Note

If an external application, such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. Nevertheless, the bit for the "DirectKeyScreenNumber" function is set and the keys or buttons with the configured "DirectKey" function continue to trigger the associated bit in the PLC.

Use in the function list

DirectKeyScreenNumber (Bit)

Use in user-defined functions

-

Parameters

Bit

Specifies the bit which is set. Depending on the HMI device, the bit numbers 0 to 31 or 0 to 39 are possible.

See also

Availability for specific devices of system functions (Page 4612)

PrintScreen

Description

Prints the screen currently being displayed on the HMI device from the printer which is connected to the HMI device.

Opened windows are also printed.

Note

The printer settings are taken over from the current settings in the Windows operation system.

Use in the function list

PrintScreen

Use in user-defined functions

PrintScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

PrintReport

Description

Prints the given report from the printer which is connected to the HMI device. The report is printed in the language which is set on the HMI device.

Note

If runtime is closed whilst log data are being printed using the system function, the report will cease to be supplied with data as soon as runtime stops.

Use in the function list

PrintReport (Report)

Use in user-defined functions

PrintReport (Report)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Report

Name of the report to be printed.

Note

If you have set up via the "Function list" dialog box a new report for the "PrintReport" function, when compiling, the following warning appears: "The report "Report_1" has no printed pages."

In order to remedy the warning, open the "Report_1" via the project view and recompile the project.

See also

Availability for specific devices of system functions (Page 4612)

NotifyUserAction

Description

This system function is used to log user actions that are not automatically logged in the audit trail. You can also use this system function to require the user to enter an acknowledgment or an electronic signature and a comment for the operator action. Requirement for the use of the system function is that the GMP-compliant configuration is activated under "Runtime settings".

If you use the "NotifyUserAction" system function in a function, the debugger may open if you cancel your input by clicking "Cancel". To compensate for this reaction, you can use the "On Error Resume Next" statement in a function. With this instruction, the next instruction is executed after a runtime error. If you use the "On Error Resume Next" statement, output of system events is also suppressed.

Use in the function list

NotifyUserAction (Confirmation type, Mandatory commenting, Category, Object name, Description)

Use in user-defined functions

NotifyUserAction (Confirmation_type, Mandatory_commenting, Category, Object_name, Description)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Confirmation type

Establishes how the action must be confirmed

0 = (None): No confirmation required, an entry is created in the audit trail

1 = (Acknowledgement): Acknowledgment, the user must acknowledge the action; an entry is created in the audit trail

2 = (Digital Signature): Electronic signature, a dialog window opens in which the user must enter his electronic signature - an entry is created in the audit trail

Mandatory commenting

Establishes if the user has to enter a comment. The comment is logged in the audit trail.

0 = (True): True; a dialog window opens in which the user must enter a comment

1 = (False): False; no mandatory commenting

Category

Category or class name of the modified object

Object name

Name of the modified object

Description

Text which describes the archiving user action.

See also

Availability for specific devices of system functions (Page 4612)

IncreaseFocusedValue

Description

Adds the given value to the value of the tag which is connected to the input field (drop-down list, graphic selection list, slider bar) which has the current focus.

This system function can only be used for function keys.

Use in the function list

IncreaseFocusedValue (Value)

Use in user-defined functions

-

Parameters

Value

The value which is added to the tag value.

See also

Availability for specific devices of system functions (Page 4612)

IncreaseTag

Description

Adds the given value to the value of the tags.

X = X + a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, help tags must be used. You can use the "SetTag" system function to assign the tag value to the auxiliary tags.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

IncreaseTag (Tag, Value)

Use in user-defined functions

IncreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the given value is added.

Value

The value that is added.

See also

Availability for specific devices of system functions (Page 4612)

SetTag (Page 4777)

ExportDataRecords

Description

Exports one or all data records of a recipe to a CSV file.

One file is created per recipe.

Use in the function list

ExportDataRecords (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecords (Recipe_number/name,Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

File name

Name of the CSV file to which the recipe data records are exported. Enter the storage location and the file extension (*.csv), for example, "C:\TEMP\Orange.csv", for Basic Panels "\USB_X61.1\Orange.csv".

Note

Storage of the CSV file

Does not apply for Basic Panels:

- If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<File name>".
- If you only enter one file name and no path, the file will be saved in a system directory, for example, "C:\Documents and Settings\[User]".
- When only one path for the export is specified, the file name is automatically created from the respective recipe name. It is a requirement that the folder "D:\Temp\", for example, has been created. If the folder "D:\Temp" has not been created, the folder name will be used as the prefix of the file name, Temp_Recipe names.csv.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

Does not apply for Basic Panels:

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

You want to export all data records using a key.

Notes on configuring

Configure the "ExportDataRecords" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv, for Basic Panels "\USB_X61.1\orange.csv"
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file. If the file already exists, it will be overwritten.

After exporting the data records, a system alarm is output.

See also

Availability for specific devices of system functions (Page 4612)

ExportDataRecordsWithChecksum

Description

Exports one or all data records of a recipe to a CSV file and generates a checksum for each line in the file.

One file is created per recipe.

Use in the function list

ExportDataRecordsWithChecksum (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecordsWithChecksum (Recipe_number/name, Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

File name

Name of the CSV file to which the recipe data records are exported. Enter the path and the file extension e.g. "C:\TEMP\Orange.CSV".

If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<File name>".

If you define only a file name without specifying a path, the file is saved to the directory from which Runtime was started. If write access to this directory is not enabled in the Windows 7 operating system, the file is saved to the "VirtualStore" folder of the user directory.

When only one path for the export is specified, the file name is automatically created from the respective recipe name. This requires, for example, that the directory "D:\Temp\" has been created. If the directory "D:\Temp" does not exist, the directory name is used as the prefix for the file name, Temp_Recipe names.csv.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

Using a key, you want to export all data records and assign a checksum.

Notes on configuring

Configure the "ExportDataRecordsWithChecksum" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file and assigned checksums. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

See also

Availability for specific devices of system functions (Page 4612)

ExportImportUserAdministration

Description

Exports all users of the user administration of the currently active project to the given file or imports the users from the given file into the currently active project.

Users, their passwords and rights are saved in the user administration.

All users are overwritten when importing. The imported users are valid immediately.

Use in the function list

ExportImportUserAdministration (File name, Direction)

Use in user-defined functions

ExportImportUserAdministration (File_name, Direction)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the file which contains the passwords or to which the passwords are written. Enter the file location and the file extension (*.txt), for example, "C:\TEMP\Passwords.txt".

Note

If a storage card is used as file location, specify the file location as follows: "\StorageCard\<File name>".

Direction

Specifies whether passwords are exported or imported:

0 (hmiExport) = Export: Passwords are exported.

1 (hmiImport) = Import: Passwords are imported.

Availability for specific devices of system functions (Page 4612)

GoToHome

Description

Executes the key function <Home> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToHome

Use in user-defined functions

GoToHome

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

GoToEnd

Description

Executes the key function <End> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToEnd

Use in user-defined functions

GoToEnd

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

SafelyRemoveHardware

Description

Checks whether there is read or write access to the external storage medium. If there is no access, the external storage medium can be removed without data loss.

Use in the function list

SafelyRemoveHardware(Path, Result)

Use in user-defined functions

SafelyRemoveHardware(Path, Result)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Path

Path of storage medium , e.g. \Storage Card USB\

Result

The tag in which the result is entered.

TRUE : The storage medium can be removed safely. A corresponding system alarm will be output.

FALSE : The storage medium cannot be removed safely. A corresponding system alarm will be output.

Availability for specific devices of system functions (Page 4612)

HTMLBrowserStop

Description

Performs the function "Stop" the HTML browser.

Use in the function list

HTMLBrowserStop (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Object name of the HTML browser in which the command is performed.

See also

Availability for specific devices of system functions (Page 4612)

HTMLBrowserScrollDown

Description

Scrolls down in the HTML browser.

Use in the function list

HTMLBrowserScrollDown (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Object name of the HTML browser in which the command is executed.

See also

HTMLBrowserRefresh

Description

Performs the function "Refresh" of the HTML browser.

Use in the function list

HTMLBrowserRefresh (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Object name of the HTML browser in which the command is performed.

See also

Availability for specific devices of system functions (Page 4612)

HTMLBrowserScrollUp

Description

Scrolls up in the HTML browser.

Use in the function list

HTMLBrowserScrollUp (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Object name of the HTML browser in which the command is executed.

See also

System functions for Runtime Advanced (Page 4651)

System functions for Comfort Panels (Page 4636)

System functions for Mobile Panels (Page 4643)

HTMLBrowserZoomIn

Description

Zooms in one zoom level in the HTML browser display.

Use in the function list

HTMLBrowserZooomIn (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Object name of the HTML browser in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

HTMLBrowserForward

Description

Performs the function "Forward" of the HTML browser.

Use in the function list

HTMLBrowserForward (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Object name of the HTML browser in which the command is performed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Comfort Panels (Page 4636)

HTMLBrowserBack

Description

Performs the "Back" function of the HTML browser.

Use in the function list

HTMLBrowserBack (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Object name of the HTML browser in which the command is performed.

See also

Availability for specific devices of system functions (Page 4612)

ImportDataRecords

Description

Imports one or all data records of a recipe from a CSV file.

When a path is specified, all records of the given directory are imported.

Use in the function list

ImportDataRecords (File name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ImportDataRecords (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

File name

Name of the CSV file from which the recipe data records are imported. Enter the storage location and the file extension (*.csv), for example, "C:\TEMP\Orange.csv", for Basic Panels "\USB_X61.1\Orange.csv".

Note

Does not apply for Basic Panels: If a storage card is used as file location, specify the file location as follows: "\StorageCard\<File name>".

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Configurable objects

Object	Event
Tag	Value change Upper limit exceeded Lower limit violated
Function key (global)	Release Press
Function key (local)	Release Press
Screen	Loaded Cleared
Screen object	Press Release Click Change (or toggle for switch) Switch on Switch off Enable Disable
Scheduler	Time expired

See also

Availability for specific devices of system functions (Page 4612)

ImportDataRecordsWithChecksum

Description

Imports one or all data records of a recipe from a CSV file with a checksum and verifies the checksum.

Use in the function list

ImportDataRecordsWithChecksum (File name, Data record number/name, Overwrite, Output status message, Processing status, verify checksum)

Use in user-defined functions

ImportDataRecordsWithChecksum (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status, Verify_Checksum)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the CSV file from which the recipe data records are imported. Enter the path and the file extension, for example, "C:\TEMP\Orange.CSV".

If a storage card is used as storage medium, specify the storage location as follows: "\StorageCard\<File name>".

If you specify a directory instead of an individual CSV file, all files in the specified directory will be imported.

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithConfirmation) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example to delay execution of other system functions, until this system function has been successfully completed.

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Verify checksum

Determines if the checksum should be verified during import:

0 (hmiFalse) = No: Checksum is not verified.

1 (hmiTrue) = Yes: Checksum is verified.

See also

Availability for specific devices of system functions (Page 4612)

InvertBit

Description

Inverts the value of the given tag of the "Bool" type:

- If the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

Use in the function list

InvertBit (Tag)

Use in user-defined functions

InvertBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag whose bit is set.

Example

The following program code inverts the value of the boolean tag b_value and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;

//Invert variable
invertBit(b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 4612)

InvertBitInTag

Description

Inverts a bit in the given tag:

- If the bit in the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the bit in the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "InvertBit" system function instead.

Use in the function list

InvertBitInTag (Tag, Bit)

Use in user-defined functions

InvertBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which the given bit is set.

Bit

The number of the bit that is set.

When this system function is used in a user-defined function, the bits in a tag are counted from right to left. The counting begins with 0.

Example

The following program code inverts a bit at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Invert bit in bitposition
InvertBitInTag (bvalue, bitposition);
//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 4612)

InvertLinearScaling

Description

Assigns a value to the tag X, which is calculated from the value of the given tag Y using the linear function X = (Y - b) / a.

The tags X and Y must not be identical. This system function is the inverse of the "LinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

InvertLinearScaling (X, Y, b, a)

Use in user-defined functions

InvertLinearScaling (X, Y, b, a)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

X

The tag which is assigned the value calculated from the linear equation.

Y

The tag that contains the value used for calculation.

b

The value which is subtracted.

a

The value through which is divided.

Example

The following program code assigns a value to the varX tag by means of the InverseLinearScaling function.

```
{
BYTE varX;
BYTE Yvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

//Inverse linear scaling
 InverseLinearScaling (varX, Yvalue, bvalue, avalue);

printf ("varX = %d\r\n, varX);
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

CalibrateTouchScreen

Description

Calls a program for calibrating the touch screen.

During the calibration process, there is a prompt to touch five positions on the screen display. Touch the screen display within 30 seconds, to confirm the calibration process. If the calibration is not completed within this time span, the calibration settings are discarded. The user prompt is in English.

Use this system function the first time you start the HMI device.

Use in the function list

CalibrateTouchScreen

Use in user-defined functions

CalibrateTouchScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Note

The CalibrateTouchScreen system function cannot be simulated.

See also

Availability for specific devices of system functions (Page 4612)

CopyLog

Description

Copies the contents of a log to another log. Tag values can only be copied to other data logs and alarms only to other alarm logs, however.

Note

If you copy a log using the "CopyLog" system function, it is possible that external applications will be unable to read certain country-specific special characters in the logged message text of the log copy. This does not apply to WinCC Runtime. WinCC Runtime can read the copied log files without errors.

Note

80% of the log entries are copied when copying the circular logs. 20% of entries are not copied because the space is reserved for buffer overflow by default.

Use in the function list

CopyLog (Log type, Destination log, Source log, Mode, Delete source log)

Use in user-defined functions

CopyLog (Log_type, Destination log, Source_log, Mode, Delete_source_log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Destination log

Name of the log into which the entries are copied (Destination log).

Source log

Name of the log from which the entries are copied (Source log).

Mode

Determines what is done with copied entries in the destination log:

0 (hmiOverwrite) = Overwrite: Existing entries are overwritten.

2 (hmiAppend) = Append: The entries are inserted at the end of the destination log. When the configured size of the log has been reached, the destination log is treated like a circular log.

Delete source log

Determines whether the source log is deleted after copying.

0 (hmiNo) = No: Is not deleted.

1 (hmiYes) = Yes: Is deleted.

See also

Storage locations of logs (Page 4420)

Availability for specific devices of system functions (Page 4612)

TrendViewScrollForward

Description

Scrolls forward one display width in the Trend view.

Use in the function list

TrendViewScrollForward (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which is scrolled forward.

See also

Availability for specific devices of system functions (Page 4612)

TrendViewScrollBack

Description

Scrolls back one display width in the trend view.

Use in the function list

TrendViewScrollBack (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which is scrolled back.

See also

Availability for specific devices of system functions (Page 4612)

TrendViewExtend

Description

Reduces the time period which is displayed in the trend view.

Use in the function list

TrendViewExtend (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the displayed time period is reduced.

See also

Availability for specific devices of system functions (Page 4612)

TrendViewCompress

Description

Increases the time period which is displayed in the trend view.

Use in the function list

TrendViewCompress (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the displayed time period is increased.

See also

Availability for specific devices of system functions (Page 4612)

TrendViewRulerLeft

Description

Moves the read-line backwards (to the left) in the trend view.

Note

In order to be able to move the read-line, the read-line must have been switched on. This is done using the "TrendViewSetRulerMode" system function.

Use in the function list

TrendViewRulerLeft (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the read-line is moved backwards.

See also

TrendViewSetRulerMode (Page 4708)

Availability for specific devices of system functions (Page 4612)

TrendViewRulerRight

Description

Moves the read-line forwards (to the right) in the trend view.

Note

In order to be able to move the read-line, the read-line must have been switched on. This is done using the "TrendViewSetRulerMode" system function.

Use in the function list

TrendViewRulerRight (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the read-line is moved forward.

See also

TrendViewSetRulerMode (Page 4708)

Availability for specific devices of system functions (Page 4612)

TrendViewSetRulerMode

Description

Hides or shows the read-line in the trend view. The read-line displays the Y value belonging to the X value.

Note

To ensure that the ruler is displayed, you have to activate the setting "Show ruler" in the trend view properties.

Use in the function list

TrendViewSetRulerMode (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the read-line is hidden or shown.

See also

TrendViewRulerRight (Page 4707)

TrendViewRulerLeft (Page 4706)

Availability for specific devices of system functions (Page 4612)

TrendViewStartStop

Description

Stops the trend recording or continues the trend recording in the trend view.

Use in the function list

TrendViewStartStop (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the recording of the trend is started or stopped.

See also

Availability for specific devices of system functions (Page 4612)

TrendViewBackToBeginning

Description

Scrolls back to the beginning of the display range in the trend view.

Use in the function list

TrendViewBackToBeginning (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which you scroll to the beginning of the display range.

See also

Availability for specific devices of system functions (Page 4612)

LoadDataRecord

Description

Loads the given recipe data record from the memory medium of the HMI device in the recipe tags. This system function is used, for example, to display a recipe data record in the recipe screen.

Activate the "Synchronize recipe view and recipe tags" option in the synchronization settings of the recipe. If this option is deactivated, the system function has no effect.

Use in the function list

LoadDataRecord (Recipe number/name, Data record number/name, Processing status)

Use in user-defined functions

LoadDataRecord (Recipe_number/name, Data_record_number/name, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which a recipe data record is loaded.

Data record number/name

Number or name of the recipe data record to be loaded.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

GetUserName

Description

Writes the user name of the user currently logged on to the HMI device in the given tag.

If the given tag has a control connection, the user name is also available in the PLC connection. This system function makes it possible, for example, to implement a user-dependent release of certain functionalities.

Use in the function list

GetUserName (Tag)

Use in user-defined functions

GetUserName (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the user name is written.

See also

Availability for specific devices of system functions (Page 4612)

GetDataRecordFromPLC

Description

Transfers the selected recipe data record from the PLC to the storage medium of the HMI device.

Use in the function list

GetDataRecordFromPLC (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

GetDataRecordFromPLC (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data records are transferred.

Data record number/name

Number or name of the recipe data record which is transferred from the PLC to the data medium of the HMI device.

Overwrite

Determines whether an existing recipe data record with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data record is not overwritten. The transfer process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data record is overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data record is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to transfer a data record from the PLC to the data medium of the HMI device using a key.

Notes on configuring

Configure the "GetDataRecordFromPLC" system function on the "Press" event for the desired key. Transfer the following parameters:

Recipe number/name = 1

Data record number/name = 1

Overwrite = 1

Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data record is transferred from the PLC.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated and the first data record of Recipe 1 is transferred from the PLC to the data medium of the HMI device. If the recipe data record already exists, it will be overwritten.

A system message is output after the transfer.

See also

Availability for specific devices of system functions (Page 4612)

GetDataRecordName

Description

Writes the name of the given recipe and recipe data record to the given tags.

Note

If the recipe or the recipe data record do not exist, wildcards ("###") are written to the tags.

Use in the function list

GetDataRecordName (Recipe number, Data record number, Recipe name, Data record name, Processing status)

Use in user-defined functions

GetDataRecordName (Recipe_number, Data_record_number, Recipe_name, Data_record_name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number

Number of the recipe whose name is written to the given tag.

Data record number

Number of the recipe data record whose name is written to the given tag.

Recipe name

The tag to which the recipe name is written. The tag must be of the STRING type.

Data record name

The tag to which the name of the recipe data record is written. The tag must be of the STRING type.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to output the names of the displayed recipes and the name of the displayed recipe data record on the HMI device.

Configure the following tags:

- "RecNumber" of type INTEGER
- "RecDataNumber" of type INTEGER
- "RecName" of type STRING
- "RecDataName" of type STRING

Configure a recipe view with the tags "RecNumber" for the recipe number and "RecDataNumber" for the data record number.

Configure the "GetDataRecordName" system function on the "Press" event for a button and pass the following parameters:

- Recipe number: RecNumber
- Data record number: RecDataNumber
- Recipe name: RecName
- Data record name: RecDataName

Configure two output fields and connect these to the "RecName" and "RecDataName" tags.

Select a recipe and a data record number from the recipe view. As soon as the button is activated, the system function is triggered and the name of the recipe and the recipe data record are displayed in both output fields.

See also

Availability for specific devices of system functions (Page 4612)

GetDataRecordTagsFromPLC

Description

Transfers the values of the recipe data record loaded in the PLC to the corresponding recipe tags.

This system function is used, for example, during teach-in mode on a machine.

Use in the function list

GetDataRecordTagsFromPLC (Recipe number/name, Processing status)

Use in user-defined functions

GetDataRecordTagsFromPLC (Recipe_number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe data record whose values are written from the PLC to the tags.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

GetGroupNumber

Description

Reads the number of the group to which the user logged on to the HMI device belongs, and writes it to the given tag.

Use in the function list

GetGroupNumber (Tag)

Use in user-defined functions

GetGroupNumber (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the number of the group is written.

See also

Availability for specific devices of system functions (Page 4612)

GetBrightness

Description

Reads the value of the brightness.

Use in the function list

GetBrightness (Brightness)

Use in user-defined functions

GetBrightness (Brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

The tag to which the value is written.

See also

Availability for specific devices of system functions (Page 4612)

GetPassword

Description

Writes the password of the user currently logged on to the HMI device in the given tag.

Note

Make sure that the value of the given tag is not displayed in another place in the project.

Note

The passwords of SIMATIC Logon users cannot be read.

Use in the function list

GetPassword (Tag)

Use in user-defined functions

GetPassword (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the password is written.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Runtime Advanced (Page 4651)

ReadPLCMode

Description

Evaluates the current state of the connected PLC.

The system function "ReadPLCMode" can only be configured for the following PLCs:

- SIMATIC S7-1200
- SIMATIC S7-1500

Use in the function list

ReadPLCMode (connection, mode)

Use in user-defined functions

GetPLCMode (Connection, Mode)

Parameters

Connection

Connection of PLC and HMI device.

Mode

Evaluates the mode of the connected PLC.
8: RUN = The PLC program is being executed.
4: STOP = The PLC program has been interrupted.
Select a suitable user variable for the evaluation.

LinearScaling

Description

Assigns a value to the tag Y, which is calculated from the value of the given tag X using the linear function Y= (a *X) + b.

The inverse of this function is the "InvertLinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

LinearScaling (Y, a, X, b)

Use in user-defined functions

LinearScaling (Y, a, X, b)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Y

The tag which is assigned the value calculated from the linear equation.

a

The value with which is multiplied.

X

The tag that contains the value used for calculation.

b

The value that is added.

Example

The following program code uses the LinearScaling function to assign a value to the Yvar tag.

```
{
BYTE Yvar;
BYTE Xvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

// linear scaling
 LinearScaling ( Yvar, avalue, Xvalue, bvalue);

printf ("Yvar = %d\r\n, Yvar);
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

ClearLog

Description

Deletes all data records in the given log.

Use in the function list

ClearLog (Log type, Log)

Use in user-defined functions

ClearLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log Available for GMP-compliant projects Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log from which all entries are deleted.

See also

Availability for specific devices of system functions (Page 4612)

DeleteDataRecord

Description

Deletes a recipe data record.

Several data records can be deleted from one or more recipes.

Use in the function list

DeleteDataRecord (Recipe number/name, Data record number/name, Confirmation, Output status message, Processing status)

Use in user-defined functions

DeleteDataRecord

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data records are deleted. "0" is specified if you want to delete recipe data records from all available recipes.

Data record number/name

Number or name of the recipe data record to be deleted. "0" is specified if you want to delete all recipe data records.

Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

ClearDataRecordMemory

Description

Deletes all recipes data records from the specified storage medium.

Use in the function list

ClearDataRecordMemory (Storage location, Confirmation, Output status message, Processing status)

Use in user-defined functions

ClearDataRecordMemory (Storage_location, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Storage location

Determines the storage location:

0 (hmiFlashMemory) = Flash memory: Internal flash memory of the HMI device

1 (hmiStorageCard) = Storage card

2 (hmiStorageCard2) = Storage card 2

3 (hmiStorageCard3) = Storage card MultiMediaCard

4 (hmiStorageCard4) = Storage card USB

Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

ClearAlarmBuffer

Description

Deletes alarms from the alarm buffer on the HMI device.

Note

Alarms which have not yet been acknowledged are also deleted.

Use in the function list

ClearAlarmBuffer (Alarm class number)

Use in user-defined functions

ClearAlarmBuffer (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Determines which alarms are to be deleted from the alarm buffer:

0 (hmiAll) = All alarms/events

1 (hmiAlarms) = Alarms of alarm class "Errors"

2 (hmiEvents) = Alarms of alarm class "Warnings"

3 (hmiSystem) = Alarms of alarm class "System"

4 (hmiS7Diagnosis) = Alarms of alarm class "Diagnosis Events"

Note

Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

See also

Availability for specific devices of system functions (Page 4612)

ClearAlarmBufferProTool

Description

The system function exists to ensure compatibility.

It has the same functionality as the "ClearAlarmBuffer" system function, but uses the old ProTool numbering.

Use in the function list

ClearAlarmBufferProTool (Alarm class number)

Use in user-defined functions

ClearAlarmBufferProtoolLegacy (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Alarm class number whose messages are to be deleted:

-1 (hmiAllProtoolLegacy) = All alarms/events

0 (hmiAlarmsProtoolLegacy) = Alarms of alarm class "Errors"

1 (hmiEventsProtoolLegacy) = Alarms of alarm class "Warnings"

2 (hmiSystemProtoolLegacy) = Alarms of alarm class "System"

3 (hmiS7DiagnosisProtoolLegacy) = Alarms of alarm class "Diagnosis Events"

Note

Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

See also

Availability for specific devices of system functions (Page 4612)

AlarmViewUpdate

Description

Updates the enhanced alarm view.

Use in the function list

AlarmViewUpdate (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view which is updated.

See also

Availability for specific devices of system functions (Page 4612)

AlarmViewLoopInAlarm

Description

Triggers the "Loop-in-Alarm" event for all alarms selected in the given alarm view.

This system function is used when the integrated button of the ActiveX control should not be used.

You can configure a system function for the "Loop-in-Alarm" event in turn. For example, it is possible to change to the process screen in which the alarm appeared.

Note

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

Use in the function list

AlarmViewLoopInAlarm (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view in which the event is triggered.

Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

See also

Availability for specific devices of system functions (Page 4612)

AlarmViewAcknowledgeAlarm

Description

Acknowledges the alarms selected in the given alarm view.

This system function is used when the integrated button of the ActiveX control should not be used.

Use in the function list

AlarmViewAcknowledgeAlarm (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view in which the event is triggered.

Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

See also

Availability for specific devices of system functions (Page 4612)

AlarmViewShowOperatorNotes

Description

Displays the configured tooltip of the alarm selected in the given alarm view.

Use in the function list

AlarmViewShowOperatorNotes (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view in which the event is triggered.

Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

See also

Availability for specific devices of system functions (Page 4612)

OpenAllLogs

Description

Reestablishes the connection between WinCC and the logs. Logging can be continued.

Note

Run the "StartLogging" system function in order to restart logging.

Use in the function list

OpenAllLogs

Use in user-defined functions

OpenAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. Logging will be continued in the specified log.

See also

Availability for specific devices of system functions (Page 4612)

OpenScreenKeyboard

Description

Hides or shows the screen keyboard.

The screen keyboard remains open until the screen keyboard is explicitly closed. In this way, the screen keyboard can also be used in other applications.

Use in the function list

OpenScreenKeyboard (Layout)

Use in user-defined functions

OpenScreenKeyboard (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Layout

Specifies whether the window is opened minimized or maximized with the screen keyboard:

0 (hmiScreenKeyboardMinimized) = Minimized

1 (hmiScreenKeyboardMaximized) = Maximized

See also

Availability for specific devices of system functions (Page 4612)

OpenFileBrowser

Description

Opens a file browser dialog.

Depending on the mode the user can select a file or a folder.

Use in the function list

OpenFileBrowser (Mask, Output Folder, File, Navigation Back, Navigation Up, New folder, Path, Status)

Use in user-defined functions

-

Parameters

Mask

Sets a mask for filtering the displayed files. This parameter is only evaluated in "File" mode. The filter criteria must be delimited by ; semicolon. Example: *.htm;*.html

Start folder

Specifies the folder with which the file selection dialog starts.

File

Specifies the mode in which the dialog is opened.

0 = folder search mode

1 = file search mode

Navigation Back

Specifies whether or not the "Back" button is activated. This button offers simple navigation to the last folder you opened.

Navigation Up

Specifies whether or not the "Up" button is activated. This button offers simple navigation to the parent folder.

New folder

Specifies whether or not the button can be used to create a new folder.

Path

Contains the path name of the last folder opened after you close the dialog.

Status

Returns information about the dialog closing mode

-1 = dialog was canceled

0 = dialog was closed with "OK".

OpenControlPanelDialog

Description

Opens a dialog that you can use to edit selected Control Panel settings.

This system function lets you set the following on the HMI device:

- Properties and value of the IP address
- User identification on the network
- WinCC Internet settings

Note

Project security

The "OpenControlPanelDialog" system function is used to bypass the SecureMode on the HMI device. Take the corresponding precautions to ensure the security of your project.

Use in the function list

OpenControlPanelDialog (Dialog)

Use in user-defined functions

-

Parameters

Dialog

Sets the Control Panel dialog to be opened.

- PROFINET_X1: Setting of the IP address and Ethernet parameters
- PROFINET_X3: Setting of the IP address and Ethernet parameters; only for Comfort Panel KP 1500, TP 1500; TP1900, TP2200
- WinCC Internet settings: Setting for Web Server, e-mail notification, provided the HMI device supports these functions
- Network ID: Setting for identification on the network, provided the HMI device supports these functions

See also

Availability for specific devices of system functions (Page 4612)

OpenCommandPrompt

Description

Opens a Windows system prompt.

This function is used, e.g., to copy files or to call up another application.

Use in the function list

OpenCommandPrompt

Use in user-defined functions

OpenCommandPrompt

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

OpenInternetExplorer

Description

Opens the Internet Explorer on the HMI device.

If the Internet Explorer is already open, it will be closed and reopened when you call the system function.

Note

The Internet Explorer saves data temporarily in the DRAM file system of the HMI device, e.g. the last web sites that were be called up.

This data can be saved using the "BackupRAMFileSystem" system function so that it is still available when the HMI device is restarted.

Use in the function list

OpenInternetExplorer (Start page)

Use in user-defined functions

OpenInternetExplorer (Start_page)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Start page

The page which is loaded when Internet Explorer is started, e.g. "www.siemens.com".

See also

Availability for specific devices of system functions (Page 4612)

OpenControlPanel

Description

Opens the window that displays the Windows CE control panel. You cannot use this system function on a PC.

This system function enables you to set the following on the Windows CE-based HMI device:

- Select printer
- Select transfer properties
- Configure screen saver
- Configure flash memory

Note

No backup or restore during Runtime

Backup and restore functions may only be executed if Runtime has been terminated. Otherwise, this could result in undesired effects, such as display errors.

Use in the function list

OpenControlPanel

Use in user-defined functions

OpenControlPanel

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

--

OpenTaskManager

Description

Shows the task manager.

The task manager allows changing to other open applications on the HMI device.

Note

The appearance of the task manager depends on the operating system installed.

Use in the function list

OpenTaskManager

Use in user-defined functions

OpenTaskManager

Can be used if the configured device supports user-defined scripts. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

PDFScrollDown

Description

Scrolls down in the PDF file in the PDF view.

Use in the function list

PDFScrollDown (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)
System functions for Mobile Panels (Page 4643)
System functions for Comfort Panels (Page 4636)

PDFScrollUp

Description

Scrolls up in the PDF file in the PDF view.

Use in the function list

PDFScrollUp (Screen object)

Use in user-defined functions

-

Parameters

Screen object
Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)
System functions for Mobile Panels (Page 4643)
System functions for Comfort Panels (Page 4636)
System functions for Runtime Advanced (Page 4651)

PDFFitToWidth

Description

Fits the display of the PDF file to the height of the PDF view window.

Use in the function list

PDFFitToWidth (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

System functions for Runtime Advanced (Page 4651)

PDFFitToHeight

Description

Fits the display of the PDF file to the height of the PDF view window.

Use in the function list

PDFFitToHeight (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

PDFGoToFirstPage

Description

Switches to the first page of the PDF file in the PDF view.

Use in the function list

PDFGoToFirstPage (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

System functions for Runtime Advanced (Page 4651)

PDFGoToLastPage

Description

Switches to the last page of the PDF file in the PDF view.

Use in the function list

PDFGoToLastPage (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

PDFGoToNextPage

Description

Switches to the next page of the PDF file in the PDF view.

Use in the function list

PDFGoToNextPage (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

System functions for Runtime Advanced (Page 4651)

PDFGoToPage

Description

Switches to the entered page of the PDF file in the PDF view.

Use in the function list

PDFGoToPage (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

PDFGoToPreviousPage

Description

Switches to the previous page of the PDF file in the PDF view.

Use in the function list

PDFGoToPreviousPage (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

PDFZoomIn

Description

Zooms in one zoom level in the display of the PDF file in the PDF view.

Use in the function list

PDFZoomIn (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

System functions for Runtime Advanced (Page 4651)

PDFZoomOut

Description

Zooms out one zoom level in the display of the PDF file in the PDF view.

Use in the function list

PDFZoomOut (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)
System functions for Mobile Panels (Page 4643)
System functions for Comfort Panels (Page 4636)
System functions for Runtime Advanced (Page 4651)

PDFScrollLeft

Description

Scrolls to the left in the PDF file in the PDF view.

Use in the function list

PDFScrollLeft (Screen object)

Use in user-defined functions

-

Parameters

Screen object
Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)
System functions for Mobile Panels (Page 4643)
System functions for Comfort Panels (Page 4636)
System functions for Runtime Advanced (Page 4651)

PDFScrollRight

Description

Scrolls to the right in the PDF file in the PDF view.

Use in the function list

PDFScrollRight (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

PDFZoomOriginal

Description

Switches the display of the PDF file in the PDF view to the original size.

Use in the function list

PDFZoomOriginal (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

See also

Availability for specific devices of system functions (Page 4612)

System functions for Mobile Panels (Page 4643)

System functions for Comfort Panels (Page 4636)

System functions for Runtime Advanced (Page 4651)

TerminatePROFIsafe

Description

Disconnects the PROFIsafe connection for fail-safe operation between a KTP Mobile Panel and the PLC.

After execution of the system function "TerminatePROFIsafe", the connector of the KTP Mobile Panel can be removed from the PLC without the system signaling an error.

Use in the function list

TerminatePROFIsafe

Use in user-defined functions

TerminatePROFIsafe

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

--

EstablishPROFIsafe

Description

Establishes the PROFIsafe connection for fail-safe operation between a KTP Mobile Panel and the PLC if the connection was previously disconnected by means of TerminatePROFIsafe.

Note

A connection for the PROFIsafe communication can only be established if ONLINE mode has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

Use in the function list

EstablishPROFIsafe

Use in user-defined functions

EstablishPROFIsafe

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

--

AcknowledgeAlarm

Description

Acknowledges all selected alarms.

This system function is used when the HMI device does not have an ACK key or when the integrated key of the alarm view should not be used.

This system function can only be used for function keys.

Use in the function list

AcknowledgeAlarm

Use in user-defined functions

AcknowledgeAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewNewDataRecord

Description

Creates a new data record in the given recipe view.

Use in the function list

RecipeViewNewDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the new recipe data record is created.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewGetDataRecordFromPLC

Description

Transfers the data record that is currently loaded in the PLC to the HMI device and displays it in the recipe view.

Use in the function list

RecipeViewGetDataRecordFromPLC (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the recipe data record from the PLC is displayed.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewClearDataRecord

Description

Deletes the data record which is currently displayed in the recipe view.

Use in the function list

RecipeViewClearDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the displayed recipe data record is deleted.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewMenu

Description

Opens the menu of the specified simple recipe view.

Only use this system function at a simple recipe view.

Use in the function list

RecipeViewMenu (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the menu is to be opened.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewOpen

Description

Displays the data record values in the given recipe view or changes to the next selection field. The system function has no effect if the selection field for the recipe data record values is displayed on the HMI device.

Operation sequence of the selection lists in runtime:

- Recipe name
- Data record name
- RecipeDataRecordValues

This system function is used when a simple recipe view has been configured. In the simple recipe view, only one selection list is displayed at a time on the HMI device. Use the "RecipeViewBack" system function to display the previous selection list.

Use in the function list

RecipeViewOpen (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewBack (Page 4750)

RecipeViewSetDataRecordToPLC

Description

Transfers the recipe data record which is currently displayed in the recipe view to the PLC.

Use in the function list

RecipeViewSetDataRecordToPLC (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view from which the recipe data record is transferred to the connected PLC.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewSaveDataRecord

Description

Saves the recipe data record which is currently displayed in the recipe view.

Use in the function list

RecipeViewSaveDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the recipe data record is saved.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewSaveAsDataRecord

Description

Saves the data record currently being displayed in the recipe view under a new name.

Use in the function list

RecipeViewSaveAsDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Saves the data record currently being displayed in the recipe view under a new name and/or new number.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewSynchronizeDataRecordWithTags

Description

Synchronizes the values of the data record which is currently displayed in the recipe view with their recipe tags. Only use this system function at an advanced recipe view.

During synchronization, all values of the data record are written to their recipe tags.

Use in the function list

RecipeViewSynchronizeDataRecordWithTags (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the values are synchronized with their tags.

Note

The OP 77A and TP 177A HMI devices do not support this function for the screen object.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewRenameDataRecord

Description

Renames the selected data record in the given recipe view.

Use in the function list

RecipeViewRenameDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the recipe data record is renamed.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewShowOperatorNotes

Description

Displays the configured tooltip of the specified recipe view.

Use in the function list

RecipeViewShowOperatorNotes (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view whose configured tooltip is displayed.

See also

Availability for specific devices of system functions (Page 4612)

RecipeViewBack

Description

Returns to the previous selection list in the given recipe view.

The system function has no effect if the selection field for the recipe is displayed on the HMI device. Operation sequence of the selection lists in runtime:

- Recipe name
- Data record name
- RecipeDataRecordValues

This system function is used when a simple recipe view has been configured. In the simple recipe view, only one selection list is displayed at a time on the HMI device. Use the "RecipeViewOpen" system function to display the recipe data record values or the next selection field.

Use in the function list

RecipeViewBack (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

ResetBit

Description

Sets the value of a "Bool" type tag to 0 (FALSE).

Use in the function list

ResetBit (Tag)

Use in user-defined functions

ResetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 0 (FALSE).

Example

The following program code resets the value of the boolean tag b_value to 0 by means of the ResetBit function and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 1;
BOOL b_saved = b_value;

//Reset bit
  ResetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

See also

ResetBitInTag (Page 4752)

Availability for specific devices of system functions (Page 4612)

ResetBitInTag

Description

Sets a bit in the specified tag to 0 (FALSE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "ResetBit" system function instead.

Use in the function list

ResetBitInTag (Tag, Bit)

Use in user-defined functions

ResetBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 0 (FALSE).

Bit

The number of the bit that is set to 0 (FALSE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Example

The following program code sets a bit at the specified bitposition in the bvalue tag to 0 and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
ResetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

Availability for specific devices of system functions (Page 4612)

ResetBit (Page 4750)

PressButton

Description

You configure the system function to the function keys of an HMI device. The system function "PressButton" triggers the function that is assigned to the event "PressKey" at the specified screen object.

Use this system function when you want to operate a button in a screen with a function key of the HMI device, for example.

Note

The "PressButton" and "ReleaseButton" system functions must always be configured together. If you configure the "PressButton" system function on the "Press key" event for a function key, the "ReleaseButton" system function is configured on the "Release" event for the same function key.

Use in the function list

PressButton (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object on which the event is triggered.

See also

Availability for specific devices of system functions (Page 4612)

ReleaseButton

Description

The system function can only be configured on the function keys of an HMI device and triggers the "Release button" event at the specified screen object.

Use this system function when you want to operate a button in a screen with a function key of the HMI device, for example.

Note

The "PressButton" and "ReleaseButton" system functions must always be configured together. If you configure the "PressButton" system function on the "Press key" event for a function key, then the "ReleaseButton" system function is configured on the "Release key" event for the same function key.

Use in the function list

ReleaseButton (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object on which the event is triggered.

See also

Availability for specific devices of system functions (Page 4612)

ShiftAndMask

Description

This system function converts the input bit pattern of the source tags into an output bit pattern of the target tags. This involves bit shifting and masking.

Note

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

Use in the function list

ShiftAndMask (Source tag, Target tag, Bits to shift, Bits to mask)

Use in user-defined functions

ShiftAndMask (Source_tag, Target_tag, Bits_to_shift, Bits_to_mask)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Source tag

The tag includes the input bit pattern. Integer-type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The actual value 72 is set at the 16-bit integer source tag: 0000000001001000.

Target tag

The output bit pattern is saved in the tag. Integer type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The shifted input bit pattern is multiplied by the bit mask, with bit-by-bit logical AND operation: 0000000000001001. The resultant decimal value "8" is saved to the target tag.

Please note the following:

- The source and target tags have the same number of bits.
- The number of bits to shift is less than the number of bits in the source tag and target tag.
- Bits to mask does not have more bits than the source tag and the target tag.

Bits to shift

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

Example: "Bits to shift" has the value "+3". The input bit pattern is shifted right by three bits when the system function is called: 0000000000001001.
Bits to the left are padded with "0". Three bits are truncated on the right. The new decimal value is "9".

Note

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

Bits to mask

An integer serves as bit mask. The bit pattern is used to multiply the shifted input bit pattern. Example: Integer "2478" with the bit pattern "0000100110101110".

You can enter the bit mask in three different ways:

- Hexadecimal: First enter the prefix "0h" or "0H", followed by an optional space for better readability. Then group the bit pattern in blocks of four (0000)(1001)(1010)(1110) and set each block in hexadecimal code: (0)(9)(A)(E). Only the characters 0-9, A-F, a-f are allowed: "0h 09AE".
- Binary: First enter the prefix "0b" or "0B", followed by an optional space for better readability. Then group the binary bit pattern into blocks of four 0000 1001 1010 1110 with spaces in between as a check. Only the characters "0" or "1" are allowed: "0b 0000 1001 1010 1110".
- Decimal: Enter the value "2478" directly, without a prefix.

See also

Availability for specific devices of system functions (Page 4612)

CloseAllLogs

Description

Disconnects the connection between WinCC and all logs.

Note

Before you close a log, the logging function must first be stopped in the log. Use the "StopLogging" system function.

Use in the function list

CloseAllLogs

Use in user-defined functions

CloseAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. The logging process will continue in the specified log.

See also

Availability for specific devices of system functions (Page 4612)

SetDataRecordToPLC

Description

Transfers the given recipe data record directly from the data medium of the HMI device to the PLC with which the HMI device is connected.

Note

The values of the recipe data record don't need to be displayed on the HMI device.

Use in the function list

SetDataRecordToPLC (Recipe number/name, Data record number/name, Output status message, Processing status)

Use in user-defined functions

SetDataRecordToPLC (Recipe_number/name, Data_record_number/name, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Data record number/name

Number or name of the recipe data record to be transferred to the PLC.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

SetDataRecordTagsToPLC

Description

Transfers the values of the recipe tags to the PLC. The recipe tags contain the values of the data record which is displayed on the HMI device.

Use in the function list

SetDataRecordTagsToPLC (Recipe number/name, Processing status)

Use in user-defined functions

SetDataRecordTagsToPLC (Recipe_ number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

PageDown

Description

Executes the key function <Pagedown> on the HMI device.

This system function can only be used for function keys.

Use in the function list

PageDown

Use in user-defined functions

PageDown

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

See also

Availability for specific devices of system functions (Page 4612)

PageUp

Description

Executes the key function <PageUp> on the HMI device.

This system function can only be used for function keys and tasks with a time trigger.

Use in the function list

PageUp

Use in user-defined functions

PageUp

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

See also

Availability for specific devices of system functions (Page 4612)

SendEMail

Description

Sends an e-mail from the HMI device to the given addressee.

This system function is used, for example, when, in the case of service, the alarm is to be passed on directly to the service technician.

Note

To send alarms as e-mails, the HMI system must have an e-mail client at its disposal.

Use in the function list

SendEMail (Address, Subject, Text, Return address)

Use in user-defined functions

SendEMail (Address, Subject, Text, Return_address)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Address

The e-mail address of the addressee.

Subject

The subject line of the e-mail.

Text

The text sent in the e-mail.

Return address

The e-mail address to which the addressee of this e-mail should send the reply.

See also

Availability for specific devices of system functions (Page 4612)

SetAcousticSignal

Description

Configures the acoustic feedback of touch screen operation on the HMI device.

Note

The configuration that was set at Switch off is reestablished when restarting the HMI device.

Use in the function list

SetAcousticSignal (Volume)

Use in user-defined functions

SetAcousticSignal (Volume)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Volume

Determines whether and how loud an acoustic signal is emitted:

-1 (hmiToggle) = Toggle: Toggles the emission of the acoustic signal as follows: Muted > Quiet > Loud.

0 (hmiMuted) = Mute: no acoustic signal

1 (hmiQuiet) = Quiet: quiet acoustic signal

2 (hmiLoud) = Loud: loud acoustic signal

See also

Availability for specific devices of system functions (Page 4612)

SetDisplayMode

Description

Changes the settings of the screen in which the runtime software runs.

The runtime software runs in full-screen mode as default. The Windows task switch is disabled.

Use in the function list

SetDisplayMode (Layout)

Use in user-defined functions

SetDisplayMode (Display mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines the settings for the screen in which the runtime software runs.

1 (hmiScreenFull): Full-screen: Title bar of the screen is not visible

2 (hmiScreenMaximized): Maximized

3 (hmiScreenRestore): Restore: The last used screen setting is used. This layout can only be used when the window is displayed minimized or maximized.

4 (hmiScreenMinimized): Minimized

5 (hmiScreenAutoAdjust): Automatic: The size of the window is set so that all screen objects in it will be visible.

6 (hmiScreenOnTop): Foreground; either the window appears in the foreground or the program icon associated with the window flashes on the taskbar depending on the Windows setting. The setting can be changed in the Windows configuration and applies to all Windows applications.

See also

Availability for specific devices of system functions (Page 4612)

SetDeviceMode

Description

Toggles the operating mode on the HMI device. The following types of operation are possible: "Online", "Offline" and "Loading".

Use in the function list

SetDeviceMode (Operating mode)

Use in user-defined functions

SetDeviceMode (Operating_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Operating mode

Determines the operating mode of the HMI device:

0 (hmiOnline) = Online: The connection to the PLC is established. The configured connection status is always set in this process. The states that were last used in Runtime are not considered.

1 (hmiOffline) = Offline: The connection to the PLC is disconnected.

2 (hmiTransfer) = load: A project can be transferred from the configuration computer to the HMI device.

Note

If you use a PC as an HMI device, the runtime software will be exited when you switch operating mode after "Load".

See also

Availability for specific devices of system functions (Page 4612)

SetConnectionMode (Page 4778)

SetBit

Description

Sets the value of a "Bool" type tag to 1 (TRUE).

Use in the function list

SetBit (Tag)

Use in user-defined functions

SetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 1 (TRUE).

Example

The following program code sets the value of the boolean tag b_value to 1 by means of the SetBit function and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;

//Set bit
  SetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

See also

Availability for specific devices of system functions (Page 4612)

SetBitInTag

Description

Sets a bit in the given tag to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

Use in the function list

SetBitInTag (Tag, Bit)

Use in user-defined functions

SetBitInTag(Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 1 (TRUE).

Bit

The number of the bit that is set to 1 (TRUE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Note

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an I/O field or assign the system function to a screen object, such as a button.

If you have configured a short event such as the activation of an alarm for the system function you can only access the actual process values by setting the tag for continuous reading.

Example

The following program code sets a bit to 1 at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
SetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

See also

SetBit (Page 4763)

Availability for specific devices of system functions (Page 4612)

SetBitWhileKeyPressed

Description

Sets the bit of the given tag to 1 (TRUE) as long as the user keeps the configured key pressed.

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC. You should only access tags of the BOOL type with this system function to avoid problems with overlapping access to the same tag.

Note

All functions on the event "Release" are performed immediately by means of a screen change configured for a key, even if the key is kept pressed.

If the "SetBitWhileKeyPressed" system function is configured for a function key, the bit will be reset immediately following a screen change. This action is necessary since the key assignments change after the screen change.

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

Use in the function list

SetBitWhileKeyPressed (Tag, Bit)

Use in user-defined functions

-

Parameters

Tag

The tag in which a bit is temporarily set to 1 (TRUE). Use only tags of the type BOOL, as far as allowed by the PLC.

Bit

The number of the bit that is temporarily set to 1 (TRUE).

Note

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an IO field, or assign the function to a screen element such as a button.

If you configured a short event such as the activation of an alarm for the function you can only access the actual process values by setting the tag for continuous reading.

SetBit (Page 4763)

Availability for specific devices of system functions (Page 4612)

SetBacklightColor

Description

Defines the background lighting of the button.

Note

The configuration that was set at Switch off is reestablished when restarting the HMI device.

Use in the function list

SetBacklightColor (Value)

Use in user-defined functions

-

Parameters

Value

Defines the background lighting of the button:

0 (hmiWhite) = White: No color

1 (hmiGreen) = Green: Green color

2 (hmiYellow) = Yellow: Yellow color

3 (hmiRed) = Red: Red color

See also

Availability for specific devices of system functions (Page 4612)

SetBrightness

Description

Determines the brightness of the display.

Note

The configuration that is set in the Control Panel / Start Center will be reestablished when you restart the HMI device.

For Basic Panels 2nd Generation, Mobile Panels and Comfort Panels:

The value for the system function "SetBrightness" can be set between 0% and 100%. The set value is transferred to the HMI device. The brightness settings on the HMI device can be viewed and edited in "Start Center > Settings > Display". The HMI devices support a brightness setting between 10% and 100%.

If the system function "SetBrightness" is assigned a value of 0%, the display of the HMI device is switched off by default in Runtime. If the operator touches the display, the display switches to the previous brightness setting.

If the system function "SetBrightness" is assigned a value between 1% and 10% and the operator opens the display settings in the Start Center, brightness is reset to 10%.

Use in the function list

SetBrightness (value)

Use in user-defined functions

SetBrightness (Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Value

New value for the brightness.

See also

Availability for specific devices of system functions (Page 4612)

SetScreenKeyboardMode

Description

Enables or disables the automatic display of the screen keyboard on the HMI device.

This system function is also used to prevent the display of the screen keyboard, e.g. because an external keyboard is connected to the HMI device.

Note

To enable the "SetScreenKeyboardMode" ("SetScreenKeyboardMode") system function on an HMI other than a Touch Panel device, set the "Use on-screen keyboard" check box in the "Runtime settings" dialog of the device settings.

Use in the function list

SetScreenKeyboardMode (Mode)

Use in user-defined functions

SetScreenKeyboardMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether the screen keyboard is hidden or shown:

0 (hmiOff) = Off: Screen keyboard is hidden

1 (hmiOn) = On: Screen keyboard is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes.

See also

Availability for specific devices of system functions (Page 4612)

SetPLCDateTime

Description

Changes the data and the time of the linked PLC

The system function "SetPLCDateTime" can only be configured for the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Use in the function list

SetPLCDateTime (connection, time)

Use in user-defined functions

SetPLCDateTime (Connection, Time)

Parameters

Connection

Connection of PLC and HMI device.

Time

Transfers the date and the time of the HMI device to the PLC. The PLC applies the date and the time of the HMI device.

SetPLCMode

Description

Switches the operating mode of the PLC to one of the following states:

- RUN
- STOP

The system function "SetPLCMode" can only be configured for the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Use in the function list

SetPLCMode (connection, mode)

Use in user-defined functions

SetPLCMode (Connection, Mode)

Parameters

Connection

Connection of PLC and HMI device.

Mode

Specifies the operating mode of the PLC:

RUN = the PLC is switched to the RUN state. The PLC program is executed.

STOP = the PLC is switched to the STOP state. The PLC program is interrupted.

SetAlarmReportMode

Description

Switches the automatic reporting of alarms on the printer on or off.

Use in the function list

SetAlarmReportMode (Mode)

Use in user-defined functions

SetAlarmReportMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether alarms are reported automatically on the printer:

0 (hmiDisablePrinting) = Reporting off: Alarms are not printed automatically.

1 (hmiEnablePrinting) = Reporting On: Alarms are printed automatically.

-1 (hmiToggle) = Toggle: Toggles between the two modes.

See also

Availability for specific devices of system functions (Page 4612)

SetRecipeTags

Description

Changes the status of the recipe tags from "Online" to "Offline" and vice versa.

This system function is used, for example, when recipe data record values are fine tuned when starting up a machine.

Use in the function list

SetRecipeTags (Recipe number/name, Status, Output status message, Processing status)

Use in user-defined functions

SetRecipeTags (Recipe_number/name, Status, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe in which the recipe data record is saved.

Status

Determines the status of the recipe tags:

0 (hmiOnline) = Online: Value changes of the recipe tags are transferred immediately to the PLC connected to the HMI device.

1 (hmiOffline) = Offline: Value changes to the recipe tags are only transferred to the PLC connected to the HMI device when, for example, the "SetDataRecordTagsToPLC" system function is executed.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

SetDaylightSavingTime

Description

The system function "SetDaylightSavingTime" changes the setting of the HMI device from daylight saving to standard time and vice versa.

Time settings will take place immediately following system function.

Note

The "SetDaylightSavingTime" system function does not support time zones without daylight saving time.

Note

Windows 7

The system function "SetDaylightSavingTime" is not supported for PC-based HMI devices under Windows 7.

Use in the function list

SetDaylightSavingTime(DaylightSavingTime)

Use in user-defined functions

SetDaylightSavingTime (Daylight_saving_time)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Daylight Saving Time

Determines whether Daylight Saving Time is set on the HMI device:

0 = Daylight Saving Time is not activated

1 = Daylight Saving Time is activated

See also

Availability for specific devices of system functions (Page 4612)

SetLanguage

Description

Toggles the language on the HMI device. All configured text and system events are displayed on the HMI device in the newly set language.

Use in the function list

SetLanguage (Language)

Use in user-defined functions

SetLanguage (Language)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Language

Determines which language is set on the HMI device. The following specifications are possible:

- -1 (hmiToggle) = Toggle: Changes to the next language. The sequence is determined during configuration in the "Project languages" editor.
- Number you have defined under "Languages and fonts" in the "Runtime Settings" editor. Changes to the language with the given number.
- Language you have defined under "Languages and fonts" in the "Runtime Settings" editor.
- Language abbreviation in accordance with the VBScript5 reference: This changes to the language corresponding to the specified language code, e.g. "de-DE" for German (Germany) or "en-US" for English (United States).
  An overview of the language abbreviations is available in the basic information of VBScript under the topic "Area diagram-ID (LCID) Diagram".

See also

Availability for specific devices of system functions (Page 4612)

SetAndGetBrightness

Description

Determines the brightness of the MP 377 Touch daylight readable display. The brightness value can be interpreted as absolute or relative to the current value.

Note

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

Use in the function list

SetAndGetBrightness (Brightness, Mode, Current value)

Use in user-defined functions

SetAndGetBrightness (Brightness, Mode, Actual brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

New value for the brightness.

Mode

Specifies if the new brightness value is set as absolute or relative to the current value.

Current value

Tag in which the current brightness value is stored.

See also

Availability for specific devices of system functions (Page 4612)

SetTag

Description

Assigns a new value to the given tag.

Note

This system function can be used to assign strings and numbers, depending on the type of tag.

Use in the function list

SetTag (Tag, Value)

Use in user-defined functions

SetTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag to which the given value is assigned.

Value

The value which the given tag is assigned.

Note

The "SetTag" system function is only executed after a connection has been established.

Example

The following program code uses the SetTag function to set the value of the gs_tag_bit tag to TRUE and saves the return value to the ok tag.

```
{
BOOL ok;
BOOL bvalue;

//Set the tag to true
ok = SetTag("gs_tag_bit", TRUE);
//error handling
if(ok)
{
  // succeeded
  printf ( "Function has run through.\r\n" );
bvalue = GetTagBit("gs_tag_bit");
  printf ("Value of gs_tag_bit: %d\r\n", bvalue);
}
else
{
  // failed
  printf ( "Error - function failed." );
}
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

SetConnectionMode

Description

Connects or disconnects the given connection.

Note

A connection to the PLC cannot be established until the operating mode ONLINE has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

Use in the function list

SetConnectionMode (Mode, Connection)

Use in user-defined functions

SetConnectionMode (Mode, Connection)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether a connection to the PLC is established or disconnected:

0 (hmiOnline) = Online: Connection is established.

1 (hmiOffline) = Offline: Connection is disconnected.

Connection

The PLC to which the HMI device is connected. You specify the name of the PLC in the connection editor.

Multiple use of the system function in a user-defined function

If you use the "SetConnectionMode" system function for different connections, it may be possible that not all system functions are executed correctly. Proceed as follows to prevent this situation:

1. Create a "BOOL" type tag with the start value "0".
2. Configure the "SetConnectionMode" system function on the "Value change" event of the HMI tags. If you want to disconnect three connections, for example, you must configure the system function three times.
3. In the user-defined function, apply the "InvertBit" system function to the HMI tag.

Application example

Two typical application examples for this system function are as follows:

- Test
  As long as no PLC is connected to the HMI device, no error messages will be output during the test on the HMI device. If the HMI device is connected to a PLC, the connection to the PLC can be established by pressing a key.
- Commissioning
  Several PLCs are to be configured for a system. At first, all PLCs except one are configured "Offline". After commissioning of the first PLC, the connection to each of the other PLCs is established by pressing a key. In this way, the other PLCs are started up one after another.

Availability for specific devices of system functions (Page 4612)

SetWebAccess

Description

Determines the access mode to the runtime application using the Internet.

Use in the function list

SetWebAccess (Access mode)

Use in user-defined functions

-

Parameters

Access mode

Determines the access mode to the runtime application:

-1 (hmiToggle) = Toggle: Toggles between the two modes.

0 (hmiReadOnly) = Read-only.

1 (hmiReadWrite) = Read-write.

See also

Availability for specific devices of system functions (Page 4612)

BackupRAMFileSystem

Description

Backs up the RAM file system in the memory medium of the HMI device.

After restarting the HMI device, the data is automatically reloaded in the RAM file system.

Applications such as the Internet Explorer save data (e.g. the last web sites called up) temporarily to the DRAM file system of the HMI device.

Use in the function list

BackupRAMFileSystem

Use in user-defined functions

BackupRAMFileSystem

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

SimulateSystemKey

Description

Simulates the behavior of a system key. Use this system function if a system key, such as the "ACK" key, "Input" key or the number pad is not available on the HMI device.

Use in the function list

SimulateSystemKey (System key)

Use in user-defined functions

-

Parameters

System key

System key whose behavior is to be simulated.

System key "+/-"

With the SimulateSystemKey system function, the system key "+/-" is only supported for the following HMI devices:

- KP300 Basic
- KP400 Basic
- KTP400 Basic mono PN
- KTP400 Basic color PN
- KTP400 Basic color PN Portrait
- KTP600 Basic mono PN
- KTP600 Basic color PN
- KTP600 Basic color DP

- KTP700 Basic PN / DP
- KTP900 Basic PN
- KTP1000 Basic PN
- KTP1000 Basic DP
- KTP1200 Basic PN / DP
- Comfort Panels

Use the system keys "+" and "-" separately for all other HMI devices.

See also

Availability for specific devices of system functions (Page 4612)

SimulateTag

Description

Simulates the behavior of tags and dynamic objects such as text lists, without having the HMI device connected to a PLC. You can, for example, configure the system function to the "Loaded" event of a screen.

This system function is used, for example, to demonstrate the functionality of a project.

Only tags of the data type Integer can be used for simulation. Tags of the data types Integer and Double Integer, however, can be used with OP 73, OP 77A, TP 177A.

Note

If you use the system function "SimulateTag" with a short cycle time on a Basic Panel, the HMI device may be overloaded.

Use in the function list

SimulateTag (Tag, Cycle, Maximum value, Minimum value, Value)

Use in user-defined functions

-

Parameter

Tag

The tag whose value is changed.

Cycle

The factor by which the basic cycle of 200 milliseconds is multiplied. The cycle defines when the tag value is changed by the specified value. Possible cycles between 1 and 32767.

Maximum value

The maximum value that the tag can assume during simulation. The maximum value must be greater than the minimum value but less than / equal to 32767.

Minimum value

The minimum value that the tag can assume during simulation. The minimum value must be lower than the maximum value but greater than / equal to -32768.

Value

The value by which the tag value is changed during each cycle. Possible values between -32768 and 32767.

- A positive value increases the tag value. When the maximum value is reached, the tag value is set to the minimum value after the next update cycle.
- A negative value reduces the tag value. When the minimum value is reached, the tag value is set to the maximum value after the next update cycle.

Availability for specific devices of system functions (Page 4612)

SmartClientViewRefresh

Description

Updates the contents displayed in the Sm@rtClient view.

Use in the function list

SmartClientViewRefresh (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

SmartClientViewReadOnlyOff

Description

Sets read-only access to "Off" in the Sm@rtClient view.

This setting allows a distant HMI device to be operated. The "SmartClientViewReadOnlyOn" system function is used to switch read-only access on again.

Use in the function list

SmartClientViewReadOnlyOff (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

SmartClientViewReadOnlyOn

Description

Sets read-only access to "On" in the Sm@rtClient view.

This setting allows a distant HMI device to be monitored only. The "SmartClientViewReadOnlyOff" system function is used to switch read-only access off again.

Use in the function list

SmartClientViewReadOnlyOn (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

SmartClientViewDisconnect

Description

Executes the "Disconnect" command in the Sm@rtClient view.

This system function is used when the integrated button of the screen object should not be used.

Use in the function list

SmartClientViewDisconnect (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

SmartClientViewConnect

Description

Executes the "Connect" command in the Sm@rtClient view.

This system function is used when the integrated button of the screen object should not be used. The Sm@rtClient view establishes a connection with the configured HMI device.

Use in the function list

SmartClientViewConnect (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

SmartClientViewLeave

Description

Exits the Sm@rtClient view and returns to operation of the HMI device.

The connection to the HMI device configured in the smart client view is retained.

Use in the function list

SmartClientViewLeave (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 4612)

SaveDataRecord

Description

Saves the current values of the recipe tags as data record to the memory medium of the HMI device.

This system function is used, for example, to save a recipe data record in the recipe screen.

Use in the function list

SaveDataRecord (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

SaveDataRecord (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe to which a recipe data record is saved.

Data record number/name

Number or name of the recipe data record to be saved. A new data record will be created if no record of this name or number was found in the recipe, independent of the value at the "Overwrite" parameter.

Overwrite

Specifies whether an existing data record is overwritten:

0 (hmiOverwriteForbidden) = No: The recipe data record is not overwritten, the data record is not saved.

1 (hmiOverwriteAlways) = Yes: The recipe data record is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: The recipe data record is overwritten only with confirmation by the user.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

StartLogging

Description

Starts the logging of data or alarms in the specified log. The function can also be applied to audit trails.

You can interrupt logging at runtime using the "StopLogging" system function.

Use in the function list

StartLogging (Log type, Log)

Use in user-defined functions

StartLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log which is started.

See also

Managing logging behavior when Runtime starts (Page 4254)

Availability for specific devices of system functions (Page 4612)

StartNextLog

Description

Stops the logging of data or alarms for the given log.

Logging is continued in the next log of the segmented circular log you configured for the specified log.

If you did not configure a segmented circular log for the specified log, the system function has no effect.

Use in the function list

StartNextLog (Log type, Log)

Use in user-defined functions

StartNextLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Log

Name of the log for which the logging is stopped and continued in the next log.

See also

Availability for specific devices of system functions (Page 4612)

StartProgram

Description

Starts the specified program on the HMI device.

The runtime software continues running in the background. Alarms continue to be output and data continues to be updated.

When the given application is exited, the screen which was active during the performance of the system function is displayed on the HMI device.

This system function is used, for example, to edit recipe data records in MS Excel on the HMI device.

Note

If Windows CE is installed on the HMI device, during the configuration it must be checked whether the desired application can be started with this system function.

This system function allows all applications to be started which can be started in the "Execute" dialog of Windows CE.

The application to be started must be installed on the HMI device.

Use in the function list

StartProgram (Program name, Program parameters, Layout, Wait for program to end)

Use in user-defined functions

StartProgram (Program_name, Program_parameters, Display_mode, Wait_for_program_to_end)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Program name

Name and path of the program which is started. Upper and lower case are taken into account in this parameter.

Note

If the path contains spaces, the program can only be started correctly if the path is specified in inverted commas, e.g. "C:\Program Files\START\start.exe".

Program parameters

The parameters you transfer at the start of the program, for example a file that is opened after the start of the program.

The description of the necessary parameters is found in the documentation of the program to be started.

Layout

Determines how the program window is displayed on the HMI device:

0 (hmiShowNormal) = Normal

1 (hmiShowMinimized) = Minimized

2 (hmiShowMaximized) = Maximized

3 (ShowMinimizedAndInactive) = Minimized and inactive

Wait for program to end

Determines whether there is a change back to the project after the called up program has ended:

0 (hmiNo) = No: No change to project

1 (hmiYes) = Yes: Change to project

Note

The "Wait for program to end" parameter is only available for Runtime Advanced and Panels.

See also

Availability for specific devices of system functions (Page 4612)

StatusForceGetValues

Description

Starts or stops the updating of values in the Status/Force display. The values are read from the PLC connected to the HMI device until the update is stopped.

Note

As long as the values are updated, no entries are possible in the input fields of the Status/Force display.

Use in the function list

StatusForceGetValues (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Status/Force display to which data from the PLC is written.

See also

Availability for specific devices of system functions (Page 4612)

StatusForceSetValues

Description

Writes the values from the Status/Force display to the PLC to which the HMI device is connected.

Use in the function list

StatusForceSetValues (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Status/Force display from which data is written to the PLC.

See also

Availability for specific devices of system functions (Page 4612)

ControlSmartServer

Description

Starts or stops the Sm@rtServer.

Use in the function list

ControlSmartServer (Mode)

Use in user-defined functions

ControlSmartServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Sm@rtServer is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: Sm@rtServer is stopped

1 (hmiStart) = Start: Sm@rtServer is started

See also

Availability for specific devices of system functions (Page 4612)

ControlWebServer

Description

Starts or stops the Web server.

Use in the function list

ControlWebServer (Mode)

Use in user-defined functions

ControlWebServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Web server is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: The Web server is stopped.

1 (hmiStart) = Start: The Web server is started.

See also

Availability for specific devices of system functions (Page 4612)

StopLogging

Description

Stops the logging of process values or alarms in the specified log. The function can also be applied to audit trails.

The "StartLogging" system function is used to resume logging at runtime.

Note

When logging is stopped, a connection between WinCC and the log files or log database still exists. Use the "CloseAllLogs" system function to disconnect this connection.

Use in the function list

StopLogging (Log type, Log)

Use in user-defined functions

StopLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log that is stopped.

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. The "Open Archive" button opens all logs and continues logging in the specified log.

See also

Availability for specific devices of system functions (Page 4612)

StopRuntime

Description

Exits the runtime software and thereby the project running on the HMI device.

Use in the function list

StopRuntime (Mode)

Use in user-defined functions

StopRuntime (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Mode

Determines whether the operating system is shut down after exiting runtime.

0 (hmiStopRuntime) = Runtime: Operating system is not shut down

1 (hmiStopRuntimeAndOperatingSystem) = Runtime and operating system: The operating system is shut down (not possible with WinCE)

Example

The following program code shuts down Runtime and the operating system.

```
{

//Stop runtime and shutdown
StopRuntime (hmiStopRuntimeAndOperationSystem);

}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

ActivateSystemDiagnosticsView

Description

Activates the system diagnostics view. The system diagnostics view shows the detail view of the device concerned.

Use in the function list

ActivateSystemDiagnosticsView (Screen name, Object name)

Use in user-defined functions

ActivateSystemDiagnosticsView (Screen_name, Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Screen name

Name of the screen contained in the system diagnostics view.

Object name

Object name of the system diagnostics view.

See also

Availability for specific devices of system functions (Page 4612)

SystemDiagnosticsViewRefreshPLCBuffer

Description

Refreshes the data from the diagnostics buffer of the PLC in the system diagnostics view.

Use in the function list

SystemDiagnosticsViewRefreshPLCBuffer (Object name)

Use in user-defined functions

-

Parameters

Object name

Name of the system diagnostics view.

SystemDiagnosticsViewDetailView

Description

The detail view returns detailed information about the selected connection and errors pending.

Use in the function list

SystemDiagnosticsViewDetailView (Object name)

Use in user-defined functions

-

Parameters

Object name

Name of the system diagnostics view that is switched to the detail view.

SystemDiagnosticsViewDiagnosticsBuffer

Description

Opens a view in a system diagnostics for displaying the current data of the diagnostics buffer.

Use in the function list

SystemDiagnosticsViewDiagnosticsBuffer (Object name)

Use in user-defined functions

-

Parameters

Object name

Name of the system diagnostics view that is switched to the detail view.

SystemDiagnosticsViewDeviceView

Description

Opens a view in a system diagnostics for displaying all available connections.

Use in the function list

SystemDiagnosticsViewDeviceView (Object name)

Use in user-defined functions

-

Parameters

Object name

Name of the system diagnostics view.

SystemDiagnosticsViewBack

Description

Changes in a system diagnostics to the higher-level view.

- The function opens the device view if the diagnostics buffer view is set in the system diagnostics view.
- The function opens the diagnostics buffer view if the detail view is displayed in the system diagnostics view.

Use in the function list

SystemDiagnosticsViewBack (Object name)

Use in user-defined functions

-

Parameters

Object name

Name of the system diagnostics view.

LookupText

Description

Identifies an entry from a text list. The result depends on the value and on the selected runtime language. The result is saved to a tag of data type "String".

Use in the function list

LookupText (Output text, Value, Language, Text list)

Use in user-defined functions

LookupText (Output_text, Index, Language, Text_list)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Output text

The tag to which the result is written.

Value

The tag that defines the value of the list entry.

Language

Defines the runtime language in which the list entry is identified.

- Runtime language
  Language code as per VBScript reference, for example, "de-DE" for German (Germany) or "en-US" for English (United States of America). The selection depends on the activated runtime languages.
- Tag
  The tag that contains the language. Enter the runtime language as decimal value of the country ID, for example, 1031 for German - Standard, 1033 for English - USA. Details are available in the VBScript basics, "Locale identifier (LCID) diagram".
- Integer
  The number that corresponds to the order of runtime languages for language switching. The selection depends on the activated runtime languages, for example, "0" for the language that appears when you first start runtime. You can find more information under the topic of "Languages in Runtime".

Text list

Defines the text list. The list entry is read from the text list.

See also

Availability for specific devices of system functions (Page 4612)

ResetTagToHandWheel

Description

Separates the tag that is connected with the operating element handwheel, and reconnects the handwheel with the global tags.

Use in the function list

ResetTagToHandWheel

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 4612)

SetTagToHandWheel

Description

Connect the tag with the operating device handwheel If the handwheel is operated, the tag value changes. The connection can be reset using the "ResetTagToHandWheel" system function.

Use in the function list

SetTagToHandWheel (Value)

Use in user-defined functions

-

Parameters

Value

Tag names which are connected to the operating device handwheel.

See also

Availability for specific devices of system functions (Page 4612)

TraceUserChange

Description

Outputs a system event that shows which user is currently logged in on the HMI device.

This system function can only be used in the Scheduler.

Use in the function list

TraceUserChange

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 4612)

DecreaseFocusedValue

Description

Subtracts the specified value from the value of the tag which is connected to the screen object and currently has the focus.

This system function can only be used for function keys.

Use in the function list

DecreaseFocusedValue (Value)

Use in user-defined functions

-

Parameters

Value

The value which is subtracted from the tag value.

See also

Availability for specific devices of system functions (Page 4612)

DecreaseTag

Description

Subtracts the given value from the tag value.

X = X - a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, auxiliary tags must be used. The auxiliary tags are assigned to the tag value with the "SetTag" system function.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

DecreaseTag (Tag, Value)

Use in user-defined functions

DecreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag from which the given value is subtracted.

Value

The value which is subtracted.

See also

Availability for specific devices of system functions (Page 4612)

ChangeConnection

Description

Disconnects the connection to the currently used PLC in use and establishes a connection to a PLC with another address. The newly connected PLC must belong to the same device class (S7-1200, S7-300, ...etc). With S7-1200, the use of the function is also only permitted for absolute addressing.

Note

When changing to another address, ensure that the address is not already being used by another HMI device.

The follows address types are supported:

- IP address
- MPI address

The follows PLC types are supported:

- SIMATIC S7 300/400
- SIMATIC S7-NC
- SIMOTION

Use in the function list

ChangeConnection (Connection, Address, Slot, Rack)

Use in user-defined functions

ChangeConnection (Connection, Address, Slot, Rack)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Connection

Name of the connection that is disconnected. The name is set during configuration, for example, in the "Connections" editor.

Address

MPI/PROFIBUS or IP address of the PLC to which the connection will be established.

Note

Set the address by means of a tag. The objects list displays the tags of all data types. Select only tags of the following data types:

- Ethernet connection: "String" data type
- MPI connection: "Int" data type

Slot

Slot of the PLC to which the connection will be established.

Rack

Rack of the PLC to which the connection will be established.

Application example

You want to operate one HMI device on several machines. Configure the necessary PLCs in the project, to which you want to change by pressing a key. When changing the PLC, the connection to the PLC in use is disconnected. Then the connection to the new PLC with other address parameters is reestablished. To access the values of the new PLC, configure the same tags for the PLC used.

The PLC which you have indicated when creating the project will be used as default.

1. Enter the name and address of the PLC in the "Connections" editor.
2. Configure a button in the process screen.
3. Configure the "ChangeConnection" system function on the "Press" event.
4. Enter the name of the connection and address of the PLC as parameters.

See also

Availability for specific devices of system functions (Page 4612)

ShowLogonDialog

Description

Opens a dialog on the HMI device with which the user can log on to the HMI device.

Use in the function list

ShowLogonDialog

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 4612)

ShowOperatorNotes

Application

Displays the tooltip configured for the selected object.

If the system function is configured on a function key, the tooltip for the screen object that currently has the focus is displayed. If a tooltip is configured for the screen itself, you can switch to this text by pressing <Enter> or by double-clicking on the help window.

If the system function is configured on a button, only the tooltip for the current screen is displayed. If a tooltip is configured on the button itself, initially only the tooltip for the button is displayed. You can press <Enter> or double-click on the help window to switch to the tooltip for the current screen.

Note

No other screen object can be used while the help window is open. To use the screen object, close the help window.

Closing the help window

You can close the help window in the following ways:

Using the keys:

- By pressing the <HELP> key again
- By pressing the <ESC> key

Using the touch screen:

- By pressing the button

Use in the function list

ShowOperatorNotes (Layout)

Use in user-defined functions

ShowOperatorNotes (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines whether the configured tooltip is hidden or shown:

0 (hmiOff) = Off: Configured tooltip is hidden

1 (hmiOn) = On: Configured tooltip is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 4612)

ShowAlarmWindow

Description

Hides or shows the alarm window on the HMI device.

Use in the function list

ShowAlarmWindow (Object name, Layout)

Use in user-defined functions

ShowAlarmWindow (Object_name, Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Object name

Name of the alarm view which is hidden or shown.

Layout

Determines whether the alarm window is hidden or shown:

0 (hmiOff) = Off: Alarm view is hidden

1 (hmiOn) = On: Alarm view is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 4612)

ShowPopupScreen

Description

Opens the pop-up-screen, for example, when a button is pressed.

You can enter a constant value or assign a tag as coordinates.
If the configured pop-up screen is not visible or only partially visible, the coordinates are set to 0.0.

Use in the function list

ShowPopupScreen (Screen object)

Use in user-defined functions

ShowPopupScreen (Name_of_the_screen, Coordinate_X, Coordinate_Y, Layout)

Parameters

Screen name

Specifies the name of the screen that appears in Runtime when a button is pressed.

X coordinate

Position of the screen in the current screen on the X axis

Y coordinate

Position of the screen in the current screen on the Y axis

Layout

Specifies the mode for the slide-in screen:

Switching

Off

On

See also

Availability for specific devices of system functions (Page 4612)

System functions for Runtime Advanced (Page 4651)

ShowSlideInScreen

Description

Calls the slide-in screen, for example, when operating a button.

Use in the function list

ShowSlideinScreen (screen name, mode)

Use in user-defined functions

ShowSlideInScreen (SlideInScreen_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen name

Specifies the slide-in screen that appears in Runtime when a button is pressed:

Slide-in screen top

Slide-in screen bottom

Slide-in screen left

Slide-in screen right

Mode

Specifies the mode for the slide-in screen:

Switching

Off

On

See also

Availability for specific devices of system functions (Page 4612)

System functions for Comfort Panels (Page 4636)

System functions for Mobile Panels (Page 4643)

System functions for Runtime Advanced (Page 4651)

ShowSoftwareVersion

Description

Hides or shows the version number of the runtime software.

Use this system function if during servicing, for example, you required the version of the runtime software used.

Use in the function list

ShowSoftwareVersion (Layout)

Use in user-defined functions

ShowSoftwareVersion (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Layout

Determines whether the version number is shown:

0 (hmiOff) = Off: Version number is not shown

1 (hmiOn) = On: Version number is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 4612)

ShowSystemDiagnosticsWindow

Description

Hides or shows the system diagnostic window on the HMI device. The system diagnostic view is only available in the global screen for Comfort Panels and for WinCC Runtime Advanced.

Use in the function list

ShowSystemDiagnosticsWindow (Screen object)

Use in user-defined functions

ShowSystemDiagnosticsWindow (Target_Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen object

Name of the system diagnostic window which is hidden or shown.

See also

Availability for specific devices of system functions (Page 4612)

ShowSystemAlarm

Description

Displays the value of the parameter passed as a system event to the HMI device.

Use in the function list

ShowSystemAlarm (Text/value)

Use in user-defined functions

ShowSystemAlarm (Text/value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Text/Value

The text or the value, which was output as a system alarm.

See also

Availability for specific devices of system functions (Page 4612)

Functions for WinAC MP

WinACMPUpdateControllerForStartAtBoot

Description

Reads whether WinAC MP is automatically started after startup of the HMI device. The LED display of the "StartAtBoot" button is updated.

Use in the function list

WinACMPUpdateControllerForStartAtBoot(Start at boot, Action)

Use in user-defined functions

-

Parameters

Start at boot

The tag that contains the value.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: LED display is gray. WinAC MP is not started on startup of the HMI device.

1 (SwitchOn) = On: LED display has the color "cyan". WinAC MP is started automatically on startup of the HMI device.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateKeySwitchSetting

Description

Updates the status display of the position of the mode selector switch.

Use in the function list

WinACMPUpdateKeySwitchSetting (Key switch, Action)

Use in user-defined functions

-

Parameters

Key switch

The tag that contains the value of the key switch:

0 (MRES) = MRES: PLC memory reset

1 (STOP) = STOP: STOP mode

3 (RUN) = RUN: RUN mode

Action

Determines whether the status display will be updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateBUSF1LED

Description

Updates the status display of the BUSF1 LED tag.

Use in the function list

WinACMPUpdateBUSF1LED(BUSF1, Action)

Use in user-defined functions

-

Parameters

BUSF1

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the BUSF1 LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateBUSF2LED

Description

Updates the status display of the BUSF2 LED tag.

Use in the function list

WinACMPUpdateBUSF2LED(BUSF2, Action)

Use in user-defined functions

-

Parameters

BUSF2

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the BUSF2 LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".

- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateAverageExecTime

Description

Updates the display of the average OB 1 execution time. The OB 1 execution time will be displayed in milliseconds.

Use in the function list

WinACMPUpdateAverageExecTime(Cycle time, Action)

Use in user-defined functions

-

Parameters

Cycle time

Tag that contains the value of the average OB 1 execution time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".

- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateAverageCycleTime

Description

Updates the display of the average cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateAverageCycleTime(Cycle time, Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the average cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".

- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateEXTFLED

Description

Updates the status display of the EXTF LED tag.

Use in the function list

WinACMPUpdateEXTFLED(EXTF, Action)

Use in user-defined functions

-

Parameters

EXTF

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the EXTF LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateHMIEnableTime

Description

Updates the value of the HMI Enable Time from WinAC MP (in ms).

Use in the function list

WinACMPUpdateHMIEnableTime(Enable Time, Action)

Use in user-defined functions

-

Parameters

HMI Enable time

The tag that contains the value of the HMI Enable Time.

Action

Determines whether the value is updated:

0 (SwitchOff) = Off: Value is not updated.

1 (SwitchOn) = On: Value is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateINTFLED

Description

Updates the status display of the INTF LED tag.

Use in the function list

WinACMPUpdateINTFLED(INTF, Action)

Use in user-defined functions

-

Parameters

INTF

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the INTF LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateLastCycleTime

Description

Updates the display of the last cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateLastCycleTime (Cycle time , Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the last cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateMaximumCycleTime

Description

Updates the display of the longest cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateMaximumCycleTime(Cycle time, Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the longest cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

WinACMPUpdateMinimumCycleTime

Description

Updates the display of the shortest cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateMinimumCycleTime (Cycle Time, Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the shortest cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: The display is not updated.

1 (SwitchOn) = On: The display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".

- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdatePowerLED

Description

Updates the status display ON/OFF of the Power LED tag.

Use in the function list

WinACMPUpdatePowerLED (Power, Action)

Use in user-defined functions

-

Parameters

Power

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Determines whether the status display ON/OFF is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateSleepTime

Description

Updates the value of the HMI Enable Time from WinAC MP (in ms).

Use in the function list

WinACMPUpdateSleepTime(SleepTime, Action)

Use in user-defined functions

-

Parameters

SleepTime

The tag that contains the value.

Action

Determines whether the value is updated:

0 (SwitchOff) = Off: Value is not updated.

1 (SwitchOn) = On: Value is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateRUNLED

Description

Updates the status display of the RUN LED tag.

Use in the function list

WinACMPUpdateRUNLED(RUN, Action)

Use in user-defined functions

-

Parameters

RUN

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the RUN LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPUpdateSTOPLED

Description

Updates the status display of the STOP LED tag.

Use in the function list

WinACMPUpdateSTOPLED (STOP, Action)

Use in user-defined functions

-

Parameters

STOP

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the STOP LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPArchive

Description

Saves the current STEP 7 user program, the current system configuration and the current values of the DBs in a log file.

Use in the function list

WinACMPArchive (File name)

Use in user-defined functions

-

Parameters

File name

Name of the log file in which the data is saved. Enter the file location and the file extension (*.wld), for example, "\flash\AddOn\WinACMP\Default.wld ".

See also

Availability for specific devices of system functions (Page 4612)

WinACMPGetStartMode

Description

Reads in the 'desired' operating state after startup of the HMI device of WinAC MP.

Use in the function list

WinACMPGetStartMode (Operating state, Update)

Use in user-defined functions

-

Parameters

Start mode

The tag that defines the value of the operating mode.

Action

Determines whether the operating mode is read out:

0 (SwitchOff) = Off: Operating mode is not read out.

1 (SwitchOn) = On: Operating mode is read out.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPGetVersion

Description

Reads out the value of the version number of WinAC MP.

Use in the function list

WinACMPGetVersion (Version, Action)

Use in user-defined functions

WinACMPGetVersion (Version, Action)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

Version

The tag that contains the value.

Action

Determines whether the version number is read out:

0 (SwitchOff) = Off: Version number is not read out.

1 (SwitchOn) = On: Version number is read out.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPClearCycleTimeBuffer

Description

Clears the cycle time data of the histogram.

Use in the function list

WinACMPClearCycleTimeBuffer

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 4612)

WinACMPSetStartAtBoot

Description

Determines whether or not WinAC MP is started automatically after startup of the HMI device.

Use in the function list

WinACMPSetStart at boot(Start at boot)

Use in user-defined functions

WinACMPSetStartAtBoot (Start at boot)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

StartAtBoot

Defines whether WinAC MP is started automatically.

0 (StartAtBootOff) = Off: WinAC MP is not started on startup of the HMI device.

1 (StartAtBootOn) = On: WinAC MP is started automatically on startup of the HMI device.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPSetKeySwitch

Description

Sets the mode selector switch to RUN or STOP and is also used for memory reset.

Use in the function list

WinACMPSetKeySwitch(Key switch)

Use in user-defined functions

-

Parameters

Key switch

Defines the position of the key switch:

0 (MRES) = MRES: PLC memory reset

1 (STOP) = STOP: STOP mode

3 (RUN) = RUN: RUN mode

See also

Availability for specific devices of system functions (Page 4612)

WinACMPSetHMIEnableTime

Description

Sets the value of the HMI Enable Time.

Use in the function list

WinACMPSetHMIEnableTime(Execution Time)

Use in user-defined functions

-

Parameters

HMI Enable time

The tag that contains the value.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPSetResetMethod

Description

Sets the restart method, either cold restart (CRST) or warm restart (WRST).

Use in the function list

WinACMPSetRestartMethod (Restart behavior)

Use in user-defined functions

-

Parameters

Restart characteristics

Defines the restart action:

0 (WarmRestart) = Warm restart: A warm restart is performed.

1 (ColdRestart) = Cold restart: A cold restart is performed.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPSetSleepTime

Description

Sets the value of the HMI Execution Time of WinAC MP.

Use in the function list

WinACMPSetSleeptime (SleepTime)

Use in user-defined functions

-

Parameters

Sleep time

The tag that contains the value.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPSetStartMode

Description

Sets the operating mode of WinAC MP after startup of the HMI device.

Use in the function list

WinACSetStartMode (Autostart)

Use in user-defined functions

WinACSetStartMode (Autostart)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

Action

Defines whether the Autostart function of WinAC MP is activated.

0 (AutoStartOff) = Off: After startup, WinAC MP remains in the STOP operating mode.

1 (AutoStartOn) = On: After startup, WinAC MP changes to the operating mode it was in before it was closed.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPStartHistogram

Description

Starts the cyclic sending of histogram values and updates the display. The histogram shows the percentual distribution of the measured cycle times.

Use in the function list

WinACMPStartHistogram (Update, Percentage, Cycle time, Y axis, ID)

Use in user-defined functions

-

Parameters

Action

Defines whether WinAC returns histogram values:

0 (SwitchOff) = Off: The cyclic sending of the histogram values is not started. The display is not updated.

1 (SwitchOn) = On: The cyclic sending of the histogram values is started. The display is updated.

Percent

Percentage of the cycles which are performed during the recorded cycle times.

Cycle time

Histogram of cycle times.

Y-axis bounds

Maximum value of Y axis

ID

Histogram ID

See also

Availability for specific devices of system functions (Page 4612)

WinACMPControl

Description

Starts or stops WinAC MP.

Use in the function list

WinACMPControl (WinAC)

Use in user-defined functions

-

Parameters

WinAC

Determines whether WinAC MP is started or stopped.

0 (ShutdownWinACMP) = Stop: WinAC MP is stopped.

1 (StartWinACMP) = Start: WinAC MP is started.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPStopHistogram

Description

Stops the cyclic sending of histogram data and deletes the history data.

Use in the function list

WinACMPStopHistogram (ID)

Use in user-defined functions

-

Parameters

ID

Histogram ID

See also

Availability for specific devices of system functions (Page 4612)

WinACMPRestore

Description

Loads the STEP 7 user program, the system configuration and the DBs from a log file.

Use in the function list

WinACMPRestore (File name)

Use in user-defined functions

-

Parameters

File name

Name of the log file in which the data is saved. Enter the file location and the log file, for example, ""\flash\AddOn\WinACMP\Default.wld ".

Events

Cleared

Description

Occurs when the active screen on the HMI device is cleared.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Activate

Description

Occurs when the user selects a display or operating object using the configured tab sequence.

Note

Note that the availability of the event depends on the HMI device and object type.

Note

If the user e.g. clicks a button with the mouse, the "Click" event is triggered. Users wishing to trigger the "Enable" event must select the button using the tab key.

The "Enable" event is only used to detect whether an object was selected. The event does not trigger a password prompt.

For this reason, do not use the "Enable" event if you want to configure access protection on the function call of the object.

Change

Description

Occurs if the status of a display and operator control object changes.

The status of an object changes if, for example, the user presses the key.

Note

Note that the availability of the event depends on the HMI device and object type.

Loaded

Description

Occurs when all configured display and operating objects are loaded in the active screen after a screen change.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Note

Enable a screen change to ensure that the connection with the control is established after switch-on.

Execute

Description

Occurs when the scheduled task has been executed.

Selection changed

Description

Occurs when the user changes the selection.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

On exceeding

Description

Occurs when the high limit of a tag is exceeded.

Note

Note that the availability of the event depends on the HMI device and object type.

On falling below

Description

Occurs when the low limit of a tag is undershot.

Note

Note that the availability of the event depends on the HMI device and object type.

When dialog is opened

Description

The event is triggered when a modal dialog opens.

Note

Please note that the availability of the event depends on the HMI device and object type.

When dialog is closed

Description

The event is triggered when a modal dialog closes.

Note

Please note that the availability of the event depends on the HMI device and object type.

User change

Description

Occurs when a user logs off at an HMI device or another user logs on at the HMI device.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Screen change

Description

Occurs when all configured display and operating objects are loaded in the screen after a screen change.

Use the "Loaded" event if you want to perform other system functions during a screen change to a certain screen.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Deactivate

Description

Occurs when the user takes the focus from a display and operating object.

A screen object can be disabled using the configured tab order or by performing another action with the mouse.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Note

System functions or user-defined functions on the "Deactivate" event of a screen are not executed when a screen is being closed.

The "Deactivate" event is only used to detect whether an object was deselected. The event does not trigger a password prompt.

For this reason, do not use the "Deactivate" event if you want to configure access protection on the function call of the object.

Double-click

Description

Occurs when the user double-clicks on an object from the symbol library.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Press

Description

Occurs when the user clicks on a button with the left mouse button, presses <RETURN> or <SPACE>.

Also occurs when the user right-clicks on an object of the symbol library.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

On Finish Input

Description

Triggered when you confirm input at an I/O field by pressing ENTER, or by mouse click, or by touch screen operation.

The "On Finish Input" event is also started if the value of a tag does not change, for example, if a value is exceeded, or if a user cancels the dialog to acknowledge a tag (Audit option package) that has to be acknowledged.

The event is not triggered, on the other hand, by user logon or by input fields configured with an authorization.

Note

Note that the availability of the event depends on the HMI device and object type.

Press ESC twice

Description

Occurs when the user presses the <ESC> key twice at the HMI device.

Note

Note that the availability of the event depends on the HMI device and object type.

Outgoing

Description

Occurs when an alarm is deactivated.

Note

Please note that the availability of the event depends on the HMI device and object type.

Incoming

Description

Occurs when an alarm is triggered and displayed in the alarm view.

Note

Please note that the availability of the event depends on the HMI device and object type.

Click

Description

Occurs if the user clicks a display and operating object with the mouse or touches the touch display with a finger.

In case you click the incorrect object, prevent processing of configured function list as follows:

- Move the mouse pointer away from the object while keeping the mouse button pressed. Release the mouse button as soon as the mouse pointer leaves the object. The function list will then not be processed.
- On touch displays, the display must be touched with the finger until a reaction occurs, e.g., a screen change.

  Note

  Please note that the availability of the event is dependent upon the HMI device and object type.

Click when flashing

Description

Occurs when the user clicks a flashing alarm indicator with the mouse or touches it with a finger.

Note

Note that the availability of the event depends on the HMI device and object type.

Loop-in alarm

Description

Occurs as soon as the user selects an alarm in the alarm view and then clicks on the "Loop-In-Alarm" button or double clicks on the alarm.

For the "Loop-In-Alarm" event, you configure system functions, such as a change to the screen in which the alarm occurred.

You cannot configure local scripts for the "Loop-In-Alarm" event in Runtime Professional.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Release

Description

Occurs when the user releases a button.

This even does not occur, as long as the button remains pressed.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Alarm buffer overflow

Description

Occurs when the configured size of the alarm buffer is reached.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Acknowledge

Description

Occurs when the user acknowledges an alarm.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Reach margin

Description

Occurs when the user reaches the beginning or the end of a scrollable area.

Note

Note that the availability of the event depends on the HMI device and object type.

Note

A user-defined function must not be configured for the "Boundary reached" event.

Configurable objects

The event can only be configured on the <Up> and <Down> keys, or on the keys on which you have configured the "ScreenObjectPageUp" or "ScreenObjectPageDown" system functions.

Runtime Stop

Description

Occurs when the user exits the Runtime software on the HMI device.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Note

A user-defined function must not be configured for the "Runtime stop" event.

Press key

Description

Occurs when the user presses a function key.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Release key

Description

Occurs when the user releases a function key.

Note

Note that the availability of the event depends on the HMI device and object type.

Overflow

Description

Occurs when the configured size of the log is reached. You use the log type "Trigger event".

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Switching

Description

Occurs when the user toggles a display and operating object, e.g. a switch from "ON" to "OFF".

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Switch OFF

Description

Occurs when the user moves the display and operating object "Switch" to the OFF position.

Note

Note that the availability of the event depends on the HMI device and object type.

Switch ON

Description

Occurs when the user moves the display and operating object "Switch" to the ON position.

Note

Note that the availability of the event depends on the HMI device and object type.

Low free storage space

Description

This event is triggered if the storage space available on the medium to which the Audit Trail is less than the configured minimum.

Free space critically low

Description

This event is triggered if the storage medium to which an Audit Trail is saved provides insufficient storage space due to hardware restrictions.

Value change

Description

Occurs when the value of a tag or the value of an array element changes.

The value change of a tag is triggered by the PLC or by the user, e.g. when a new value is entered. No event is output if a system function changes the value.

Note

Please note that the availability of the event depends on the HMI device and object type.

Time expired

Description

Occurs when the time configured in the scheduler expires.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

12.8.7.3 VB scripts

System functions

AcknowledgeAlarm

Description

Acknowledges all selected alarms.

This system function is used when the HMI device does not have an ACK key or when the integrated key of the alarm view should not be used.

This system function can only be used for function keys.

Use in the function list

AcknowledgeAlarm

Use in user-defined functions

AcknowledgeAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

ActivatePreviousScreen

Description

Performs a screen change to the screen which was activated before the current screen. The screen change is not performed if no screen was activated beforehand.

The last 10 screens that were called up are saved. A system alarm is output when you change to a screen which is no longer saved.

Note

If you want to use the system function, the screen to which you change has to be used in the navigation structure.

Use in the function list

ActivatePreviousScreen

Use in user-defined functions

ActivatePreviousScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

ActivateScreen

Description

Performs a screen change to the given screen.

Use the "ActivateScreenByNumber" system function to change from the root screen to the permanent window or vice versa.

Use in the function list

ActivateScreen (Screen name, Object number)

Use in user-defined functions

ActivateScreen (Screen_name, Object_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen name

Name of the screen to which you change.

Object number

The operator control element which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

Note

If the "Reach margin" event is assigned to the "ActivateScreen" system function, only the value "0" is valid for the "Object number" parameter. The active object is not defined by the object number, but rather by the X position it had prior to the screen change.

Example

The ActivateScreen function is used in the following program code to activate the "Screen_2" screen when you click a button.

```
{

// User defined code
// i.e. when pressing a button
ActivateScreen ("Screen_2", 0);
...
}
```

See also

Availability for specific devices of system functions (Page 4612)

ActivateScreenByNumber

Description

Performs a screen change to a screen depending on a tag value.

The screen is identified by its screen number.

Use in the function list

ActivateScreenByNumber (Screen number, Object number)

Use in user-defined functions

ActivateScreenByNumber (Screen_number, Object_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Screen number

Tag which contains the screen number of the destination screen.

When a change from the root screen to the permanent window is desired, "0" or "-1" is specified:

0 = Change from root screen to permanent window

-1 = Change from permanent window to root screen

Object number

The number of the screen object which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

See also

Availability for specific devices of system functions (Page 4612)

ActivateSystemDiagnosticsView

Description

Activates the system diagnostics view. The system diagnostics view shows the detail view of the device concerned.

Use in the function list

ActivateSystemDiagnosticsView (Screen name, Object name)

Use in user-defined functions

ActivateSystemDiagnosticsView (Screen_name, Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Screen name

Name of the screen contained in the system diagnostics view.

Object name

Object name of the system diagnostics view.

See also

Availability for specific devices of system functions (Page 4612)

ArchiveLogFile

Description

This system function moves or copies a log to another storage location for long-term logging.

With Audit Trails, always use the "Move" (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.

Prior to "ArchiveLogFile" always run the system function "CloseAllLogs".

After this system function, run the "OpenAllLogs" system function.

In "Copy log" mode, the logs are not reopened until the log has been successfully copied, or unless a timeout occurs during the copy process. In "Move log" mode, the logs to be moved are renamed and the new logs are opened immediately. To move the renamed logs, a job is submitted which attempts to move them every 300 seconds if the server cannot be reached. The job is also retained after Runtime is restarted until it is executed.

Use in the function list

ArchiveLogFile (Log type, Log, Directory name, Mode)

Use in user-defined functions

ArchiveLogFile (Log_type, Log, Directory_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (miAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log available for GMP compliant projects. Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log being archived.

Directory name

Path for saving the log.

Mode

0 (hmiCopy) = Copy log

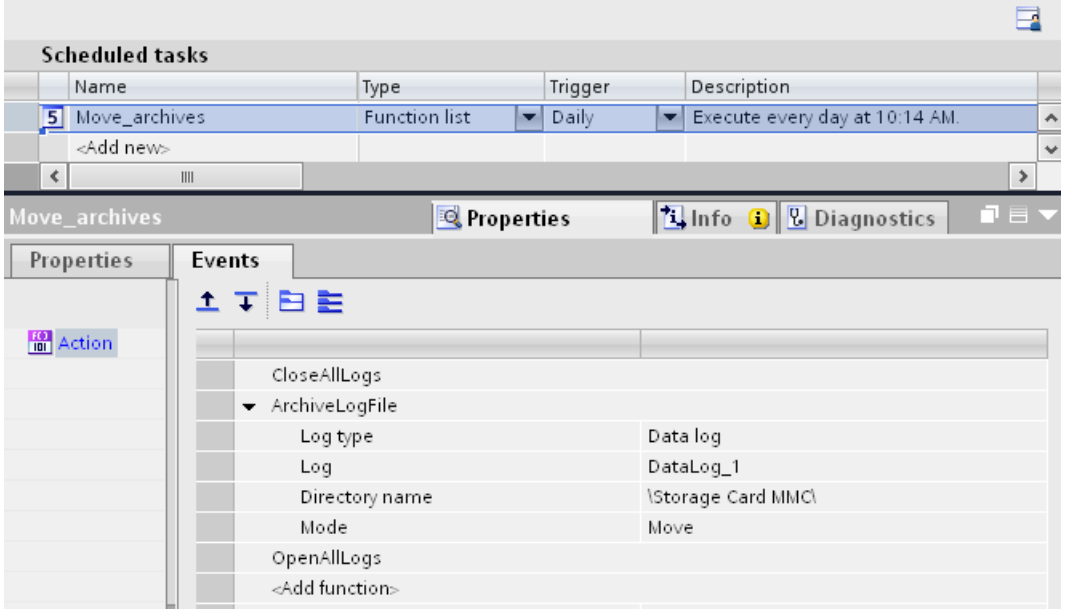
1 (hmiMove) = Move log

Application example

You want to move a log file from a local storage medium to the server in order to generate a backup copy of this file at cyclic intervals.

Notes on configuring

Set up a task in the scheduler which is executed at a specific time on a daily basis. Configure the following function list for the task:



Procedure on HMI device

- All log files will be closed.
- The log file you specified is moved to the server.
- All closed log files will be opened again.

See also

Availability for specific devices of system functions (Page 4612)

Back up RAM file system

Description

Backs up the RAM file system in the memory medium of the HMI device.

After restarting the HMI device, the data is automatically reloaded in the RAM file system.

Applications such as the Internet Explorer save data (e.g. the last web sites called up) temporarily to the DRAM file system of the HMI device.

Use in the function list

BackupRAMFileSystem

Use in user-defined functions

BackupRAMFileSystem

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

CalibrateTouchScreen

Description

Calls a program for calibrating the touch screen.

During the calibration process, there is a prompt to touch five positions on the screen display. Touch the screen display within 30 seconds, to confirm the calibration process. If the calibration

is not completed within this time span, the calibration settings are discarded. The user prompt is in English.

Use this system function the first time you start the HMI device.

Use in the function list

CalibrateTouchScreen

Use in user-defined functions

CalibrateTouchScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Note

The CalibrateTouchScreen system function cannot be simulated.

See also

Availability for specific devices of system functions (Page 4612)

ChangeConnection

Description

Disconnects the connection to the currently used PLC in use and establishes a connection to a PLC with another address. The newly connected PLC must belong to the same device class (S7-1200, S7-300, ...etc). With S7-1200, the use of the function is also only permitted for absolute addressing.

Note

When changing to another address, ensure that the address is not already being used by another HMI device.

The follows address types are supported:

- IP address
- MPI address

The follows PLC types are supported:

- SIMATIC S7 300/400
- SIMATIC S7-NC
- SIMOTION

Use in the function list

ChangeConnection (Connection, Address, Slot, Rack)

Use in user-defined functions

ChangeConnection (Connection, Address, Slot, Rack)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Connection

Name of the connection that is disconnected. The name is set during configuration, for example, in the "Connections" editor.

Address

MPI/PROFIBUS or IP address of the PLC to which the connection will be established.

Note

Set the address by means of a tag. The objects list displays the tags of all data types. Select only tags of the following data types:

- Ethernet connection: "String" data type
- MPI connection: "Int" data type

Slot

Slot of the PLC to which the connection will be established.

Rack

Rack of the PLC to which the connection will be established.

Application example

You want to operate one HMI device on several machines. Configure the necessary PLCs in the project, to which you want to change by pressing a key. When changing the PLC, the connection to the PLC in use is disconnected. Then the connection to the new PLC with other address parameters is reestablished. To access the values of the new PLC, configure the same tags for the PLC used.

The PLC which you have indicated when creating the project will be used as default.

1. Enter the name and address of the PLC in the "Connections" editor.
2. Configure a button in the process screen.
3. Configure the "ChangeConnection" system function on the "Press" event.
4. Enter the name of the connection and address of the PLC as parameters.

See also

Availability for specific devices of system functions (Page 4612)

ClearAlarmBuffer

Description

Deletes alarms from the alarm buffer on the HMI device.

Note

Alarms which have not yet been acknowledged are also deleted.

Use in the function list

ClearAlarmBuffer (Alarm class number)

Use in user-defined functions

ClearAlarmBuffer (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Determines which alarms are to be deleted from the alarm buffer:

0 (hmiAll) = All alarms/events

1 (hmiAlarms) = Alarms of alarm class "Errors"

2 (hmiEvents) = Alarms of alarm class "Warnings"

3 (hmiSystem) = Alarms of alarm class "System"

4 (hmiS7Diagnosis) = Alarms of alarm class "Diagnosis Events"

Note

Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

See also

Availability for specific devices of system functions (Page 4612)

ClearAlarmBufferProtool

Description

The system function exists to ensure compatibility.

It has the same functionality as the "ClearAlarmBuffer" system function, but uses the old ProTool numbering.

Use in the function list

ClearAlarmBufferProTool (Alarm class number)

Use in user-defined functions

ClearAlarmBufferProtoolLegacy (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Alarm class number whose messages are to be deleted:

-1 (hmiAllProtoolLegacy) = All alarms/events

0 (hmiAlarmsProtoolLegacy) = Alarms of alarm class "Errors"

1 (hmiEventsProtoolLegacy) = Alarms of alarm class "Warnings"

2 (hmiSystemProtoolLegacy) = Alarms of alarm class "System"

3 (hmiS7DiagnosisProtoolLegacy) = Alarms of alarm class "Diagnosis Events"

Note
Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

See also

Availability for specific devices of system functions (Page 4612)

ClearDataRecord

Description

Deletes a recipe data record.

Several data records can be deleted from one or more recipes.

Use in the function list

DeleteDataRecord (Recipe number/name, Data record number/name, Confirmation, Output status message, Processing status)

Use in user-defined functions

DeleteDataRecord

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data records are deleted. "0" is specified if you want to delete recipe data records from all available recipes.

Data record number/name

Number or name of the recipe data record to be deleted. "0" is specified if you want to delete all recipe data records.

Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

ClearDataRecordMemory

Description

Deletes all recipes data records from the specified storage medium.

Use in the function list

ClearDataRecordMemory (Storage location, Confirmation, Output status message, Processing status)

Use in user-defined functions

ClearDataRecordMemory (Storage_location, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Storage location

Determines the storage location:

0 (hmiFlashMemory) = Flash memory: Internal flash memory of the HMI device

1 (hmiStorageCard) = Storage card

2 (hmiStorageCard2) = Storage card 2

3 (hmiStorageCard3) = Storage card MultiMediaCard

4 (hmiStorageCard4) = Storage card USB

Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

ClearLog

Description

Deletes all data records in the given log.

Use in the function list

ClearLog (Log type, Log)

Use in user-defined functions

ClearLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log Available for GMP-compliant projects Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log from which all entries are deleted.

See also

Availability for specific devices of system functions (Page 4612)

CloseAllLogs

Description

Disconnects the connection between WinCC and all logs.

Note

Before you close a log, the logging function must first be stopped in the log. Use the "StopLogging" system function.

Use in the function list

CloseAllLogs

Use in user-defined functions

CloseAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. The logging process will continue in the specified log.

See also

Availability for specific devices of system functions (Page 4612)

ControlSmartServer

Description

Starts or stops the Sm@rtServer.

Use in the function list

ControlSmartServer (Mode)

Use in user-defined functions

ControlSmartServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Sm@rtServer is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: Sm@rtServer is stopped

1 (hmiStart) = Start: Sm@rtServer is started

See also

Availability for specific devices of system functions (Page 4612)

ControlWebServer

Description

Starts or stops the Web server.

Use in the function list

ControlWebServer (Mode)

Use in user-defined functions

ControlWebServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Web server is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: The Web server is stopped.

1 (hmiStart) = Start: The Web server is started.

See also

Availability for specific devices of system functions (Page 4612)

CopyLog

Description

Copies the contents of a log to another log. Tag values can only be copied to other data logs and alarms only to other alarm logs, however.

Note

If you copy a log using the "CopyLog" system function, it is possible that external applications will be unable to read certain country-specific special characters in the logged message text of the log copy. This does not apply to WinCC Runtime. WinCC Runtime can read the copied log files without errors.

Note

80% of the log entries are copied when copying the circular logs. 20% of entries are not copied because the space is reserved for buffer overflow by default.

Use in the function list

CopyLog (Log type, Destination log, Source log, Mode, Delete source log)

Use in user-defined functions

CopyLog (Log_type, Destination log, Source_log, Mode, Delete_source_log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Destination log

Name of the log into which the entries are copied (Destination log).

Source log

Name of the log from which the entries are copied (Source log).

Mode

Determines what is done with copied entries in the destination log:

0 (hmiOverwrite) = Overwrite: Existing entries are overwritten.

2 (hmiAppend) = Append: The entries are inserted at the end of the destination log. When the configured size of the log has been reached, the destination log is treated like a circular log.

Delete source log

Determines whether the source log is deleted after copying.

0 (hmiNo) = No: Is not deleted.

1 (hmiYes) = Yes: Is deleted.

See also

Availability for specific devices of system functions (Page 4612)

DecreaseTag

Description

Subtracts the given value from the tag value.

X = X - a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, auxiliary tags must be used. The auxiliary tags are assigned to the tag value with the "SetTag" system function.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

DecreaseTag (Tag, Value)

Use in user-defined functions

DecreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag from which the given value is subtracted.

Value

The value which is subtracted.

See also

Availability for specific devices of system functions (Page 4612)

EditAlarm

Description

Triggers the "Edit" event for all selected alarms.

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

This system function can only be used for function keys.

Use in the function list

EditAlarm

Use in user-defined functions

EditAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

Encode

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

Use in the function list

Encode (Byte array, String, Coding)

Use in user-defined functions

Encode (Byte_array, String, Encoding)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The Byte array must be twice the size of the string length + 2. The Byte array must contain 242 array elements if the string has a length of 120 characters.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encode

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

See also

Availability for specific devices of system functions (Page 4612)

EncodeEx

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

By contrast to the Encode system function, you can define the Line break parameter. Using the Line break parameter you can delete line breaks or replace these with predefined characters.

Use in the function list

EncodeEx (Byte Array, String, Encode, Line break)

Use in user-defined functions

EncodeEx (Byte_array, String, Encoding, Line_break)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The byte array must be twice the size of the string length +2. If the string has a length of 120 characters, the byte array must contain 242 array elements.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encoding

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

Line break

All line breaks are either deleted or replaced with predefined characters. Do not replace line breaks if set as the default value.

0 (replace with "\r\n' (0x000D, 0x000A)) - the line break is replaced with "\r\n".

1 (replace with "\n' (0x000A)) - the line break is replaced with "\n".

2 (do not replace) - the line break is not replaced.

3 (remove line breaks) - the line breaks are removed.

See also

Availability for specific devices of system functions (Page 4612)

EstablishPROFIsafe

Description

Establishes the PROFIsafe connection for fail-safe operation between a KTP Mobile Panel and the PLC if the connection was previously disconnected by means of TerminatePROFIsafe.

Note

A connection for the PROFIsafe communication can only be established if ONLINE mode has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

Use in the function list

EstablishPROFIsafe

Use in user-defined functions

EstablishPROFIsafe

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

--

ExportDataRecords

Description

Exports one or all data records of a recipe to a CSV file.

One file is created per recipe.

Use in the function list

ExportDataRecords (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecords (Recipe_number/name,Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

File name

Name of the CSV file to which the recipe data records are exported. Enter the storage location and the file extension (*.csv), for example, "C:\TEMP\Orange.csv", for Basic Panels "\USB_X61.1\Orange.csv".

Note

Storage of the CSV file

Does not apply for Basic Panels:

- If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<File name>".
- If you only enter one file name and no path, the file will be saved in a system directory, for example, "C:\Documents and Settings\[User]".
- When only one path for the export is specified, the file name is automatically created from the respective recipe name. It is a requirement that the folder "D:\Temp\", for example, has been created. If the folder "D:\Temp" has not been created, the folder name will be used as the prefix of the file name, Temp_Recipe names.csv.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

Does not apply for Basic Panels:

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

You want to export all data records using a key.

Notes on configuring

Configure the "ExportDataRecords" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv, for Basic Panels "\USB_X61.1\orange.csv"
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file. If the file already exists, it will be overwritten.

After exporting the data records, a system alarm is output.

See also

Availability for specific devices of system functions (Page 4612)

ExportDataRecordsWithChecksum

Description

Exports one or all data records of a recipe to a CSV file and generates a checksum for each line in the file.

One file is created per recipe.

Use in the function list

ExportDataRecordsWithChecksum (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecordsWithChecksum (Recipe_number/name, Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

File name

Name of the CSV file to which the recipe data records are exported. Enter the path and the file extension e.g. "C:\TEMP\Orange.CSV".

If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<File name>".

If you define only a file name without specifying a path, the file is saved to the directory from which Runtime was started. If write access to this directory is not enabled in the Windows 7 operating system, the file is saved to the "VirtualStore" folder of the user directory.

When only one path for the export is specified, the file name is automatically created from the respective recipe name. This requires, for example, that the directory "D:\Temp\" has been created. If the directory "D:\Temp" does not exist, the directory name is used as the prefix for the file name, Temp_Recipe names.csv.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

Using a key, you want to export all data records and assign a checksum.

Notes on configuring

Configure the "ExportDataRecordsWithChecksum" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file and assigned checksums. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

See also

Availability for specific devices of system functions (Page 4612)

ExportImportUserAdministration

Description

Exports all users of the user administration of the currently active project to the given file or imports the users from the given file into the currently active project.

Users, their passwords and rights are saved in the user administration.

All users are overwritten when importing. The imported users are valid immediately.

Use in the function list

ExportImportUserAdministration (File name, Direction)

Use in user-defined functions

ExportImportUserAdministration (File_name, Direction)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the file which contains the passwords or to which the passwords are written. Enter the file location and the file extension (*.txt), for example, "C:\TEMP\Passwords.txt".

Note

If a storage card is used as file location, specify the file location as follows: "\StorageCard\<File name>".

Direction

Specifies whether passwords are exported or imported:

0 (hmiExport) = Export: Passwords are exported.

1 (hmiImport) = Import: Passwords are imported.

See also

Availability for specific devices of system functions (Page 4612)

GetBrightness

Description

Reads the value of the brightness.

Use in the function list

GetBrightness (Brightness)

Use in user-defined functions

GetBrightness (Brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

The tag to which the value is written.

See also

Availability for specific devices of system functions (Page 4612)

GetDataRecordFromPLC

Description

Transfers the selected recipe data record from the PLC to the storage medium of the HMI device.

Use in the function list

GetDataRecordFromPLC (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

GetDataRecordFromPLC (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data records are transferred.

Data record number/name

Number or name of the recipe data record which is transferred from the PLC to the data medium of the HMI device.

Overwrite

Determines whether an existing recipe data record with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data record is not overwritten. The transfer process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data record is overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data record is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to transfer a data record from the PLC to the data medium of the HMI device using a key.

Notes on configuring

Configure the "GetDataRecordFromPLC" system function on the "Press" event for the desired key. Transfer the following parameters:

Recipe number/name = 1

Data record number/name = 1

Overwrite = 1

Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data record is transferred from the PLC.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated and the first data record of Recipe 1 is transferred from the PLC to the data medium of the HMI device. If the recipe data record already exists, it will be overwritten.

A system message is output after the transfer.

See also

Availability for specific devices of system functions (Page 4612)

GetDataRecordName

Description

Writes the name of the given recipe and recipe data record to the given tags.

Note

If the recipe or the recipe data record do not exist, wildcards ("###") are written to the tags.

Use in the function list

GetDataRecordName (Recipe number, Data record number, Recipe name, Data record name, Processing status)

Use in user-defined functions

GetDataRecordName (Recipe_number, Data_record_number, Recipe_name, Data_record_name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number

Number of the recipe whose name is written to the given tag.

Data record number

Number of the recipe data record whose name is written to the given tag.

Recipe name

The tag to which the recipe name is written. The tag must be of the STRING type.

Data record name

The tag to which the name of the recipe data record is written. The tag must be of the STRING type.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to output the names of the displayed recipes and the name of the displayed recipe data record on the HMI device.

Configure the following tags:

- "RecNumber" of type INTEGER
- "RecDataNumber" of type INTEGER
- "RecName" of type STRING
- "RecDataName" of type STRING

Configure a recipe view with the tags "RecNumber" for the recipe number and "RecDataNumber" for the data record number.

Configure the "GetDataRecordName" system function on the "Press" event for a button and pass the following parameters:

- Recipe number: RecNumber
- Data record number: RecDataNumber
- Recipe name: RecName
- Data record name: RecDataName

Configure two output fields and connect these to the "RecName" and "RecDataName" tags.

Select a recipe and a data record number from the recipe view. As soon as the button is activated, the system function is triggered and the name of the recipe and the recipe data record are displayed in both output fields.

See also

Availability for specific devices of system functions (Page 4612)

GetDataRecordTagsFromPLC

Description

Transfers the values of the recipe data record loaded in the PLC to the corresponding recipe tags.

This system function is used, for example, during teach-in mode on a machine.

Use in the function list

GetDataRecordTagsFromPLC (Recipe number/name, Processing status)

Use in user-defined functions

GetDataRecordTagsFromPLC (Recipe_number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe data record whose values are written from the PLC to the tags.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

GetGroupNumber

Description

Reads the number of the group to which the user logged on to the HMI device belongs, and writes it to the given tag.

Use in the function list

GetGroupNumber (Tag)

Use in user-defined functions

GetGroupNumber (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the number of the group is written.

See also

Availability for specific devices of system functions (Page 4612)

GetPassword

Description

Writes the password of the user currently logged on to the HMI device in the given tag.

Note

Make sure that the value of the given tag is not displayed in another place in the project.

Note

The passwords of SIMATIC Logon users cannot be read.

Use in the function list

GetPassword (Tag)

Use in user-defined functions

GetPassword (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the password is written.

See also

Availability for specific devices of system functions (Page 4612)

GetUserName

Description

Writes the user name of the user currently logged on to the HMI device in the given tag.

If the given tag has a control connection, the user name is also available in the PLC connection. This system function makes it possible, for example, to implement a user-dependent release of certain functionalities.

Use in the function list

GetUserName (Tag)

Use in user-defined functions

GetUserName (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the user name is written.

See also

Availability for specific devices of system functions (Page 4612)

GoToEnd

Description

Executes the key function <End> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToEnd

Use in user-defined functions

GoToEnd

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

GoToHome

Description

Executes the key function <Home> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToHome

Use in user-defined functions

GoToHome

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

ImportDataRecords

Description

Imports one or all data records of a recipe from a CSV file.

When a path is specified, all records of the given directory are imported.

Use in the function list

ImportDataRecords (File name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ImportDataRecords (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

File name

Name of the CSV file from which the recipe data records are imported. Enter the storage location and the file extension (*.csv), for example, "C:\TEMP\Orange.csv", for Basic Panels "\USB_X61.1\Orange.csv".

Note

Does not apply for Basic Panels: If a storage card is used as file location, specify the file location as follows: "\StorageCard\<File name>".

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Configurable objects

Object	Event
Tag	Value change Upper limit exceeded Lower limit violated
Function key (global)	Release Press
Function key (local)	Release Press
Screen	Loaded Cleared
Screen object	Press Release Click Change (or toggle for switch) Switch on Switch off Enable Disable
Scheduler	Time expired

See also

Availability for specific devices of system functions (Page 4612)

ImportDataRecordsWithChecksum

Description

Imports one or all data records of a recipe from a CSV file with a checksum and verifies the checksum.

Use in the function list

ImportDataRecordsWithChecksum (File name, Data record number/name, Overwrite, Output status message, Processing status, verify checksum)

Use in user-defined functions

ImportDataRecordsWithChecksum (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status, Verify_Checksum)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the CSV file from which the recipe data records are imported. Enter the path and the file extension, for example, "C:\TEMP\Orange.CSV".

If a storage card is used as storage medium, specify the storage location as follows: "\StorageCard\<File name>".

If you specify a directory instead of an individual CSV file, all files in the specified directory will be imported.

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithConfirmation) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example to delay execution of other system functions, until this system function has been successfully completed.

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Verify checksum

Determines if the checksum should be verified during import:

0 (hmiFalse) = No: Checksum is not verified.

1 (hmiTrue) = Yes: Checksum is verified.

See also

Availability for specific devices of system functions (Page 4612)

IncreaseTag

Description

Adds the given value to the value of the tags.

X = X + a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, help tags must be used. You can use the "SetTag" system function to assign the tag value to the auxiliary tags.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

IncreaseTag (Tag, Value)

Use in user-defined functions

IncreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the given value is added.

Value

The value that is added.

See also

Availability for specific devices of system functions (Page 4612)

InverseLinearScaling

Description

Assigns a value to the tag X, which is calculated from the value of the given tag Y using the linear function X = (Y - b) / a.

The tags X and Y must not be identical. This system function is the inverse of the "LinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

InvertLinearScaling (X, Y, b, a)

Use in user-defined functions

InvertLinearScaling (X, Y, b, a)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

X

The tag which is assigned the value calculated from the linear equation.

Y

The tag that contains the value used for calculation.

b

The value which is subtracted.

a

The value through which is divided.

Example

The following program code assigns a value to the varX tag by means of the InverseLinearScaling function.

```
{
BYTE varX;
BYTE Yvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

//Inverse linear scaling
 InverseLinearScaling (varX, Yvalue, bvalue, avalue);

printf ("varX = %d\r\n, varX);
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

InvertBit

Description

Inverts the value of the given tag of the "Bool" type:

- If the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

Use in the function list

InvertBit (Tag)

Use in user-defined functions

InvertBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag whose bit is set.

Example

The following program code inverts the value of the boolean tag b_value and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;

//Invert variable
invertBit(b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 4612)

InvertBitInTag

Description

Inverts a bit in the given tag:

- If the bit in the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the bit in the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "InvertBit" system function instead.

Use in the function list

InvertBitInTag (Tag, Bit)

Use in user-defined functions

InvertBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which the given bit is set.

Bit

The number of the bit that is set.

When this system function is used in a user-defined function, the bits in a tag are counted from right to left. The counting begins with 0.

Example

The following program code inverts a bit at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Invert bit in bitposition
InvertBitInTag (bvalue, bitposition);
//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 4612)

LinearScaling

Description

Assigns a value to the tag Y, which is calculated from the value of the given tag X using the linear function Y= (a *X) + b.

The inverse of this function is the "InvertLinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

LinearScaling (Y, a, X, b)

Use in user-defined functions

LinearScaling (Y, a, X, b)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Y

The tag which is assigned the value calculated from the linear equation.

a

The value with which is multiplied.

X

The tag that contains the value used for calculation.

b

The value that is added.

Example

The following program code uses the LinearScaling function to assign a value to the Yvar tag.

```
{
BYTE Yvar;
BYTE Xvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

// linear scaling
 LinearScaling ( Yvar, avalue, Xvalue, bvalue);

printf ("Yvar = %d\r\n, Yvar);
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

LoadDataRecord

Description

Loads the given recipe data record from the memory medium of the HMI device in the recipe tags. This system function is used, for example, to display a recipe data record in the recipe screen.

Activate the "Synchronize recipe view and recipe tags" option in the synchronization settings of the recipe. If this option is deactivated, the system function has no effect.

Use in the function list

LoadDataRecord (Recipe number/name, Data record number/name, Processing status)

Use in user-defined functions

LoadDataRecord (Recipe_number/name, Data_record_number/name, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which a recipe data record is loaded.

Data record number/name

Number or name of the recipe data record to be loaded.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

LogOff

Description

Logs off the current user on the HMI device.

Use in the function list

Logoff

Use in user-defined functions

Logoff

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

Logon

Description

Logs on the current user on the HMI device.

Use in the function list

Logon (Password, User name)

Use in user-defined functions

Logon (Password, User_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Password

The tag from which the password for the user logging on is read.

If the user is logged on, the password in the tag is deleted.

User name

The tag from which the user name for the user logging on is read.

See also

Availability for specific devices of system functions (Page 4612)

LookupText

Description

Identifies an entry from a text list. The result depends on the value and on the selected runtime language. The result is saved to a tag of data type "String".

Use in the function list

LookupText (Output text, Value, Language, Text list)

Use in user-defined functions

LookupText (Output_text, Index, Language, Text_list)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Output text

The tag to which the result is written.

Value

The tag that defines the value of the list entry.

Language

Defines the runtime language in which the list entry is identified.

- Runtime language
  Language code as per VBScript reference, for example, "de-DE" for German (Germany) or "en-US" for English (United States of America). The selection depends on the activated runtime languages.
- Tag
  The tag that contains the language. Enter the runtime language as decimal value of the country ID, for example, 1031 for German - Standard, 1033 for English - USA. Details are available in the VBScript basics, "Locale identifier (LCID) diagram".
- Integer
  The number that corresponds to the order of runtime languages for language switching. The selection depends on the activated runtime languages, for example, "0" for the language that appears when you first start runtime. You can find more information under the topic of "Languages in Runtime".

Text list

Defines the text list. The list entry is read from the text list.

See also

Availability for specific devices of system functions (Page 4612)

NotifyUserAction

Description

This system function is used to log user actions that are not automatically logged in the audit trail. You can also use this system function to require the user to enter an acknowledgment or an electronic signature and a comment for the operator action. Requirement for the use of the system function is that the GMP-compliant configuration is activated under "Runtime settings".

If you use the "NotifyUserAction" system function in a function, the debugger may open if you cancel your input by clicking "Cancel". To compensate for this reaction, you can use the "On Error Resume Next" statement in a function. With this instruction, the next instruction is executed after a runtime error. If you use the "On Error Resume Next" statement, output of system events is also suppressed.

Use in the function list

NotifyUserAction (Confirmation type, Mandatory commenting, Category, Object name, Description)

Use in user-defined functions

NotifyUserAction (Confirmation_type, Mandatory_commenting, Category, Object_name, Description)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Confirmation type

Establishes how the action must be confirmed

0 = (None): No confirmation required, an entry is created in the audit trail

1 = (Acknowledgement): Acknowledgment, the user must acknowledge the action; an entry is created in the audit trail

2 = (Digital Signature): Electronic signature, a dialog window opens in which the user must enter his electronic signature - an entry is created in the audit trail

Mandatory commenting

Establishes if the user has to enter a comment. The comment is logged in the audit trail.

0 = (True): True; a dialog window opens in which the user must enter a comment

1 = (False): False; no mandatory commenting

Category

Category or class name of the modified object

Object name

Name of the modified object

Description

Text which describes the archiving user action.

See also

Availability for specific devices of system functions (Page 4612)

OpenAllLogs

Description

Reestablishes the connection between WinCC and the logs. Logging can be continued.

Note

Run the "StartLogging" system function in order to restart logging.

Use in the function list

OpenAllLogs

Use in user-defined functions

OpenAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. Logging will be continued in the specified log.

See also

Availability for specific devices of system functions (Page 4612)

OpenCommandPrompt

Description

Opens a Windows system prompt.

This function is used, e.g., to copy files or to call up another application.

Use in the function list

OpenCommandPrompt

Use in user-defined functions

OpenCommandPrompt

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

OpenControlPanel

Description

Opens a dialog that you can use to edit selected Control Panel settings.

This system function lets you set the following on the HMI device:

- Properties and value of the IP address
- User identification on the network
- WinCC Internet settings

Note

Project security

The "OpenControlPanelDialog" system function is used to bypass the SecureMode on the HMI device. Take the corresponding precautions to ensure the security of your project.

Use in the function list

OpenControlPanelDialog (Dialog)

Use in user-defined functions

-

Parameters

Dialog

Sets the Control Panel dialog to be opened.

- PROFINET_X1: Setting of the IP address and Ethernet parameters
- PROFINET_X3: Setting of the IP address and Ethernet parameters; only for Comfort Panel KP 1500, TP 1500; TP1900, TP2200
- WinCC Internet settings: Setting for Web Server, e-mail notification, provided the HMI device supports these functions
- Network ID: Setting for identification on the network, provided the HMI device supports these functions

See also

Availability for specific devices of system functions (Page 4612)

OpenInternetExplorer

Description

Opens the Internet Explorer on the HMI device.

If the Internet Explorer is already open, it will be closed and reopened when you call the system function.

Note

The Internet Explorer saves data temporarily in the DRAM file system of the HMI device, e.g. the last web sites that were be called up.

This data can be saved using the "BackupRAMFileSystem" system function so that it is still available when the HMI device is restarted.

Use in the function list

OpenInternetExplorer (Start page)

Use in user-defined functions

OpenInternetExplorer (Start_page)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Start page

The page which is loaded when Internet Explorer is started, e.g. "www.siemens.com".

See also

Availability for specific devices of system functions (Page 4612)

OpenScreenKeyboard

Description

Hides or shows the screen keyboard.

The screen keyboard remains open until the screen keyboard is explicitly closed. In this way, the screen keyboard can also be used in other applications.

Use in the function list

OpenScreenKeyboard (Layout)

Use in user-defined functions

OpenScreenKeyboard (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Layout

Specifies whether the window is opened minimized or maximized with the screen keyboard:

0 (hmiScreenKeyboardMinimized) = Minimized

1 (hmiScreenKeyboardMaximized) = Maximized

See also

Availability for specific devices of system functions (Page 4612)

OpenTaskManager

Description

Shows the task manager.

The task manager allows changing to other open applications on the HMI device.

Note

The appearance of the task manager depends on the operating system installed.

Use in the function list

OpenTaskManager

Use in user-defined functions

OpenTaskManager

Can be used if the configured device supports user-defined scripts. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

PageDown

Description

Executes the key function <Pagedown> on the HMI device.

This system function can only be used for function keys.

Use in the function list

PageDown

Use in user-defined functions

PageDown

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

See also

Availability for specific devices of system functions (Page 4612)

PageUp

Description

Executes the key function <PageUp> on the HMI device.

This system function can only be used for function keys and tasks with a time trigger.

Use in the function list

PageUp

Use in user-defined functions

PageUp

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

See also

Availability for specific devices of system functions (Page 4612)

PrintReport

Description

Prints the given report from the printer which is connected to the HMI device. The report is printed in the language which is set on the HMI device.

Note

If runtime is closed whilst log data are being printed using the system function, the report will cease to be supplied with data as soon as runtime stops.

Use in the function list

PrintReport (Report)

Use in user-defined functions

PrintReport (Report)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Report

Name of the report to be printed.

Note

If you have set up via the "Function list" dialog box a new report for the "PrintReport" function, when compiling, the following warning appears: "The report "Report_1" has no printed pages."

In order to remedy the warning, open the "Report_1" via the project view and recompile the project.

See also

Availability for specific devices of system functions (Page 4612)

PrintScreen

Description

Prints the screen currently being displayed on the HMI device from the printer which is connected to the HMI device.

Opened windows are also printed.

Note

The printer settings are taken over from the current settings in the Windows operation system.

Use in the function list

PrintScreen

Use in user-defined functions

PrintScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 4612)

ResetBit

Description

Sets the value of a "Bool" type tag to 0 (FALSE).

Use in the function list

ResetBit (Tag)

Use in user-defined functions

ResetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 0 (FALSE).

Example

The following program code resets the value of the boolean tag b_value to 0 by means of the ResetBit function and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 1;
BOOL b_saved = b_value;

//Reset bit
  ResetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

See also

Availability for specific devices of system functions (Page 4612)

ResetBitInTag

Description

Sets a bit in the specified tag to 0 (FALSE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "ResetBit" system function instead.

Use in the function list

ResetBitInTag (Tag, Bit)

Use in user-defined functions

ResetBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 0 (FALSE).

Bit

The number of the bit that is set to 0 (FALSE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Example

The following program code sets a bit at the specified bitposition in the bvalue tag to 0 and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
ResetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 4612)

SafelyRemoveHardware

Description

Checks whether there is read or write access to the external storage medium. If there is no access, the external storage medium can be removed without data loss.

Use in the function list

SafelyRemoveHardware(Path, Result)

Use in user-defined functions

SafelyRemoveHardware(Path, Result)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Path

Path of storage medium , e.g. \Storage Card USB\

Result

The tag in which the result is entered.

TRUE : The storage medium can be removed safely. A corresponding system alarm will be output.

FALSE : The storage medium cannot be removed safely. A corresponding system alarm will be output.

See also

Availability for specific devices of system functions (Page 4612)

SaveDataRecord

Description

Saves the current values of the recipe tags as data record to the memory medium of the HMI device.

This system function is used, for example, to save a recipe data record in the recipe screen.

Use in the function list

SaveDataRecord (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

SaveDataRecord (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe to which a recipe data record is saved.

Data record number/name

Number or name of the recipe data record to be saved. A new data record will be created if no record of this name or number was found in the recipe, independent of the value at the "Overwrite" parameter.

Overwrite

Specifies whether an existing data record is overwritten:

0 (hmiOverwriteForbidden) = No: The recipe data record is not overwritten, the data record is not saved.

1 (hmiOverwriteAlways) = Yes: The recipe data record is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: The recipe data record is overwritten only with confirmation by the user.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

SendEMail

Description

Sends an e-mail from the HMI device to the given addressee.

This system function is used, for example, when, in the case of service, the alarm is to be passed on directly to the service technician.

Note

To send alarms as e-mails, the HMI system must have an e-mail client at its disposal.

Use in the function list

SendEMail (Address, Subject, Text, Return address)

Use in user-defined functions

SendEMail (Address, Subject, Text, Return_address)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Address

The e-mail address of the addressee.

Subject

The subject line of the e-mail.

Text

The text sent in the e-mail.

Return address

The e-mail address to which the addressee of this e-mail should send the reply.

See also

Availability for specific devices of system functions (Page 4612)

SetAcousticSignal

Description

Configures the acoustic feedback of touch screen operation on the HMI device.

Note

The configuration that was set at Switch off is reestablished when restarting the HMI device.

Use in the function list

SetAcousticSignal (Volume)

Use in user-defined functions

SetAcousticSignal (Volume)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Volume

Determines whether and how loud an acoustic signal is emitted:

-1 (hmiToggle) = Toggle: Toggles the emission of the acoustic signal as follows: Muted > Quiet > Loud.

0 (hmiMuted) = Mute: no acoustic signal

1 (hmiQuiet) = Quiet: quiet acoustic signal

2 (hmiLoud) = Loud: loud acoustic signal

See also

Availability for specific devices of system functions (Page 4612)

SetAlarmReportMode

Description

Switches the automatic reporting of alarms on the printer on or off.

Use in the function list

SetAlarmReportMode (Mode)

Use in user-defined functions

SetAlarmReportMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether alarms are reported automatically on the printer:

0 (hmiDisablePrinting) = Reporting off: Alarms are not printed automatically.

1 (hmiEnablePrinting) = Reporting On: Alarms are printed automatically.

-1 (hmiToggle) = Toggle: Toggles between the two modes.

See also

Availability for specific devices of system functions (Page 4612)

SetAndGetBrightness

Description

Determines the brightness of the MP 377 Touch daylight readable display. The brightness value can be interpreted as absolute or relative to the current value.

Note

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

Use in the function list

SetAndGetBrightness (Brightness, Mode, Current value)

Use in user-defined functions

SetAndGetBrightness (Brightness, Mode, Actual brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

New value for the brightness.

Mode

Specifies if the new brightness value is set as absolute or relative to the current value.

Current value

Tag in which the current brightness value is stored.

SetBit

Description

Sets the value of a "Bool" type tag to 1 (TRUE).

Use in the function list

SetBit (Tag)

Use in user-defined functions

SetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 1 (TRUE).

Example

The following program code sets the value of the boolean tag b_value to 1 by means of the SetBit function and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;

//Set bit
  SetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

See also

Availability for specific devices of system functions (Page 4612)

SetBitInTag

Description

Sets a bit in the given tag to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

Use in the function list

SetBitInTag (Tag, Bit)

Use in user-defined functions

SetBitInTag(Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 1 (TRUE).

Bit

The number of the bit that is set to 1 (TRUE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Note

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an I/O field or assign the system function to a screen object, such as a button.

If you have configured a short event such as the activation of an alarm for the system function you can only access the actual process values by setting the tag for continuous reading.

Example

The following program code sets a bit to 1 at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
SetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 4612)

SetBrightness

Description

Determines the brightness of the display.

Note

The configuration that is set in the Control Panel / Start Center will be reestablished when you restart the HMI device.

For Basic Panels 2nd Generation, Mobile Panels and Comfort Panels:

The value for the system function "SetBrightness" can be set between 0% and 100%. The set value is transferred to the HMI device. The brightness settings on the HMI device can be viewed and edited in "Start Center > Settings > Display". The HMI devices support a brightness setting between 10% and 100%.

If the system function "SetBrightness" is assigned a value of 0%, the display of the HMI device is switched off by default in Runtime. If the operator touches the display, the display switches to the previous brightness setting.

If the system function "SetBrightness" is assigned a value between 1% and 10% and the operator opens the display settings in the Start Center, brightness is reset to 10%.

Use in the function list

SetBrightness (value)

Use in user-defined functions

SetBrightness (Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Value

New value for the brightness.

See also

Availability for specific devices of system functions (Page 4612)

SetConnectionMode

Description

Connects or disconnects the given connection.

Note

A connection to the PLC cannot be established until the operating mode ONLINE has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

Use in the function list

SetConnectionMode (Mode, Connection)

Use in user-defined functions

SetConnectionMode (Mode, Connection)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether a connection to the PLC is established or disconnected:

0 (hmiOnline) = Online: Connection is established.

1 (hmiOffline) = Offline: Connection is disconnected.

Connection

The PLC to which the HMI device is connected. You specify the name of the PLC in the connection editor.

Multiple use of the system function in a user-defined function

If you use the "SetConnectionMode" system function for different connections, it may be possible that not all system functions are executed correctly. Proceed as follows to prevent this situation:

1. Create a "BOOL" type tag with the start value "0".
2. Configure the "SetConnectionMode" system function on the "Value change" event of the HMI tags. If you want to disconnect three connections, for example, you must configure the system function three times.
3. In the user-defined function, apply the "InvertBit" system function to the HMI tag.

Application example

Two typical application examples for this system function are as follows:

- Test
  As long as no PLC is connected to the HMI device, no error messages will be output during the test on the HMI device. If the HMI device is connected to a PLC, the connection to the PLC can be established by pressing a key.
- Commissioning
  Several PLCs are to be configured for a system. At first, all PLCs except one are configured "Offline". After commissioning of the first PLC, the connection to each of the other PLCs is established by pressing a key. In this way, the other PLCs are started up one after another.

See also

Availability for specific devices of system functions (Page 4612)

SetDataRecordTagsToPLC

Description

Transfers the values of the recipe tags to the PLC. The recipe tags contain the values of the data record which is displayed on the HMI device.

Use in the function list

SetDataRecordTagsToPLC (Recipe number/name, Processing status)

Use in user-defined functions

SetDataRecordTagsToPLC (Recipe_ number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

SetDataRecordToPLC

Description

Transfers the given recipe data record directly from the data medium of the HMI device to the PLC with which the HMI device is connected.

Note

The values of the recipe data record don't need to be displayed on the HMI device.

Use in the function list

SetDataRecordToPLC (Recipe number/name, Data record number/name, Output status message, Processing status)

Use in user-defined functions

SetDataRecordToPLC (Recipe_number/name, Data_record_number/name, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Data record number/name

Number or name of the recipe data record to be transferred to the PLC.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

SetDaylightSavingTime

Description

The system function "SetDaylightSavingTime" changes the setting of the HMI device from daylight saving to standard time and vice versa.

Time settings will take place immediately following system function.

Note

The "SetDaylightSavingTime" system function does not support time zones without daylight saving time.

Note

Windows 7

The system function "SetDaylightSavingTime" is not supported for PC-based HMI devices under Windows 7.

Use in the function list

SetDaylightSavingTime(DaylightSavingTime)

Use in user-defined functions

SetDaylightSavingTime (Daylight_saving_time)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Daylight Saving Time

Determines whether Daylight Saving Time is set on the HMI device:

0 = Daylight Saving Time is not activated

1 = Daylight Saving Time is activated

See also

Availability for specific devices of system functions (Page 4612)

SetDeviceMode

Description

Toggles the operating mode on the HMI device. The following types of operation are possible: "Online", "Offline" and "Loading".

Use in the function list

SetDeviceMode (Operating mode)

Use in user-defined functions

SetDeviceMode (Operating_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Operating mode

Determines the operating mode of the HMI device:

0 (hmiOnline) = Online: The connection to the PLC is established. The configured connection status is always set in this process. The states that were last used in Runtime are not considered.

1 (hmiOffline) = Offline: The connection to the PLC is disconnected.

2 (hmiTransfer) = load: A project can be transferred from the configuration computer to the HMI device.

Note

If you use a PC as an HMI device, the runtime software will be exited when you switch operating mode after "Load".

See also

Availability for specific devices of system functions (Page 4612)

SetDisplayMode

Description

Changes the settings of the screen in which the runtime software runs.

The runtime software runs in full-screen mode as default. The Windows task switch is disabled.

Use in the function list

SetDisplayMode (Layout)

Use in user-defined functions

SetDisplayMode (Display mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines the settings for the screen in which the runtime software runs.

1 (hmiScreenFull): Full-screen: Title bar of the screen is not visible

2 (hmiScreenMaximized): Maximized

3 (hmiScreenRestore): Restore: The last used screen setting is used. This layout can only be used when the window is displayed minimized or maximized.

4 (hmiScreenMinimized): Minimized

5 (hmiScreenAutoAdjust): Automatic: The size of the window is set so that all screen objects in it will be visible.

6 (hmiScreenOnTop): Foreground; either the window appears in the foreground or the program icon associated with the window flashes on the taskbar depending on the Windows setting. The setting can be changed in the Windows configuration and applies to all Windows applications.

See also

Availability for specific devices of system functions (Page 4612)

SetLanguage

Description

Toggles the language on the HMI device. All configured text and system events are displayed on the HMI device in the newly set language.

Use in the function list

SetLanguage (Language)

Use in user-defined functions

SetLanguage (Language)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Language

Determines which language is set on the HMI device. The following specifications are possible:

- -1 (hmiToggle) = Toggle: Changes to the next language. The sequence is determined during configuration in the "Project languages" editor.
- Number you have defined under "Languages and fonts" in the "Runtime Settings" editor. Changes to the language with the given number.
- Language you have defined under "Languages and fonts" in the "Runtime Settings" editor.
- Language abbreviation in accordance with the VBScript5 reference: This changes to the language corresponding to the specified language code, e.g. "de-DE" for German (Germany) or "en-US" for English (United States).
  An overview of the language abbreviations is available in the basic information of VBScript under the topic "Area diagram-ID (LCID) Diagram".

See also

Availability for specific devices of system functions (Page 4612)

SetPLCDateTime

Description

Changes the data and the time of the linked PLC

The system function "SetPLCDateTime" can only be configured for the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Use in the function list

SetPLCDateTime (connection, time)

Use in user-defined functions

SetPLCDateTime (Connection, Time)

Parameters

Connection

Connection of PLC and HMI device.

Time

Transfers the date and the time of the HMI device to the PLC. The PLC applies the date and the time of the HMI device.

SetRecipeTags

Description

Changes the status of the recipe tags from "Online" to "Offline" and vice versa.

This system function is used, for example, when recipe data record values are fine tuned when starting up a machine.

Use in the function list

SetRecipeTags (Recipe number/name, Status, Output status message, Processing status)

Use in user-defined functions

SetRecipeTags (Recipe_number/name, Status, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe in which the recipe data record is saved.

Status

Determines the status of the recipe tags:

0 (hmiOnline) = Online: Value changes of the recipe tags are transferred immediately to the PLC connected to the HMI device.

1 (hmiOffline) = Offline: Value changes to the recipe tags are only transferred to the PLC connected to the HMI device when, for example, the "SetDataRecordTagsToPLC" system function is executed.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 4612)

SetScreenKeyboardMode

Description

Enables or disables the automatic display of the screen keyboard on the HMI device.

This system function is also used to prevent the display of the screen keyboard, e.g. because an external keyboard is connected to the HMI device.

Note

To enable the "SetScreenKeyboardMode" ("SetScreenKeyboardMode") system function on an HMI other than a Touch Panel device, set the "Use on-screen keyboard" check box in the "Runtime settings" dialog of the device settings.

Use in the function list

SetScreenKeyboardMode (Mode)

Use in user-defined functions

SetScreenKeyboardMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether the screen keyboard is hidden or shown:

0 (hmiOff) = Off: Screen keyboard is hidden

1 (hmiOn) = On: Screen keyboard is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes.

See also

Availability for specific devices of system functions (Page 4612)

SetTag

Description

Assigns a new value to the given tag.

Note

This system function can be used to assign strings and numbers, depending on the type of tag.

Use in the function list

SetTag (Tag, Value)

Use in user-defined functions

SetTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag to which the given value is assigned.

Value

The value which the given tag is assigned.

Note

The "SetTag" system function is only executed after a connection has been established.

Example

The following program code uses the SetTag function to set the value of the gs_tag_bit tag to TRUE and saves the return value to the ok tag.

```
{
BOOL ok;
BOOL bvalue;

//Set the tag to true
ok = SetTag("gs_tag_bit", TRUE);
//error handling
if(ok)
{
  // succeeded
  printf ( "Function has run through.\r\n" );
bvalue = GetTagBit("gs_tag_bit");
  printf ("Value of gs_tag_bit: %d\r\n", bvalue);
}
else
{
  // failed
  printf ( "Error - function failed." );
}
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

ShiftAndMask

Description

This system function converts the input bit pattern of the source tags into an output bit pattern of the target tags. This involves bit shifting and masking.

Note

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

Use in the function list

ShiftAndMask (Source tag, Target tag, Bits to shift, Bits to mask)

Use in user-defined functions

ShiftAndMask (Source_tag, Target_tag, Bits_to_shift, Bits_to_mask)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Source tag

The tag includes the input bit pattern. Integer-type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The actual value 72 is set at the 16-bit integer source tag: 0000000001001000.

Target tag

The output bit pattern is saved in the tag. Integer type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The shifted input bit pattern is multiplied by the bit mask, with bit-by-bit logical AND operation: 0000000000001001. The resultant decimal value "8" is saved to the target tag.

Please note the following:

- The source and target tags have the same number of bits.
- The number of bits to shift is less than the number of bits in the source tag and target tag.
- Bits to mask does not have more bits than the source tag and the target tag.

Bits to shift

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

Example: "Bits to shift" has the value "+3". The input bit pattern is shifted right by three bits when the system function is called: 0000000000001001.
Bits to the left are padded with "0". Three bits are truncated on the right. The new decimal value is "9".

Note

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

Bits to mask

An integer serves as bit mask. The bit pattern is used to multiply the shifted input bit pattern.
Example: Integer "2478" with the bit pattern "0000100110101110".

You can enter the bit mask in three different ways:

- Hexadecimal: First enter the prefix "0h" or "0H", followed by an optional space for better readability. Then group the bit pattern in blocks of four (0000)(1001)(1010)(1110) and set each block in hexadecimal code: (0)(9)(A)(E). Only the characters 0-9, A-F, a-f are allowed: "0h 09AE".
- Binary: First enter the prefix "0b" or "0B", followed by an optional space for better readability. Then group the binary bit pattern into blocks of four 0000 1001 1010 1110 with spaces in between as a check. Only the characters "0" or "1" are allowed: "0b 0000 1001 1010 1110".
- Decimal: Enter the value "2478" directly, without a prefix.

See also

Availability for specific devices of system functions (Page 4612)

ShowAlarmWindow

Description

Hides or shows the alarm window on the HMI device.

Use in the function list

ShowAlarmWindow (Object name, Layout)

Use in user-defined functions

ShowAlarmWindow (Object_name, Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Object name

Name of the alarm view which is hidden or shown.

Layout

Determines whether the alarm window is hidden or shown:

0 (hmiOff) = Off: Alarm view is hidden

1 (hmiOn) = On: Alarm view is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 4612)

ShowOperatorNotes

Application

Displays the tooltip configured for the selected object.

If the system function is configured on a function key, the tooltip for the screen object that currently has the focus is displayed. If a tooltip is configured for the screen itself, you can switch to this text by pressing <Enter> or by double-clicking on the help window.

If the system function is configured on a button, only the tooltip for the current screen is displayed. If a tooltip is configured on the button itself, initially only the tooltip for the button is displayed. You can press <Enter> or double-click on the help window to switch to the tooltip for the current screen.

Note

No other screen object can be used while the help window is open. To use the screen object, close the help window.

Closing the help window

You can close the help window in the following ways:

Using the keys:

- By pressing the <HELP> key again
- By pressing the <ESC> key

Using the touch screen:

- By pressing the ❌ button

Use in the function list

ShowOperatorNotes (Layout)

Use in user-defined functions

ShowOperatorNotes (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines whether the configured tooltip is hidden or shown:

0 (hmiOff) = Off: Configured tooltip is hidden

1 (hmiOn) = On: Configured tooltip is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 4612)

ShowPopUpScreen

Description

Opens the pop-up-screen, for example, when a button is pressed.

You can enter a constant value or assign a tag as coordinates.
If the configured pop-up screen is not visible or only partially visible, the coordinates are set to 0.0.

Use in the function list

ShowPopupScreen (Screen object)

Use in user-defined functions

ShowPopupScreen (Name_of_the_screen, Coordinate_X, Coordinate_Y, Layout)

Parameters

Screen name

Specifies the name of the screen that appears in Runtime when a button is pressed.

X coordinate

Position of the screen in the current screen on the X axis

Y coordinate

Position of the screen in the current screen on the Y axis

Layout

Specifies the mode for the slide-in screen:

Switching

Off

On

ShowSlideInScreen

Description

Calls the slide-in screen, for example, when operating a button.

Use in the function list

ShowSlideinScreen (screen name, mode)

Use in user-defined functions

ShowSlideInScreen (SlideInScreen_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen name

Specifies the slide-in screen that appears in Runtime when a button is pressed:

Slide-in screen top

Slide-in screen bottom

Slide-in screen left

Slide-in screen right

Mode

Specifies the mode for the slide-in screen:

Switching

Off

On

ShowSoftwareVersion

Description

Hides or shows the version number of the runtime software.

Use this system function if during servicing, for example, you required the version of the runtime software used.

Use in the function list

ShowSoftwareVersion (Layout)

Use in user-defined functions

ShowSoftwareVersion (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Layout

Determines whether the version number is shown:

0 (hmiOff) = Off: Version number is not shown

1 (hmiOn) = On: Version number is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 4612)

ShowSystemAlarm

Description

Displays the value of the parameter passed as a system event to the HMI device.

Use in the function list

ShowSystemAlarm (Text/value)

Use in user-defined functions

ShowSystemAlarm (Text/value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Text/Value

The text or the value, which was output as a system alarm.

See also

Availability for specific devices of system functions (Page 4612)

ShowSystemDiagnosticsWindow

Description

Hides or shows the system diagnostic window on the HMI device. The system diagnostic view is only available in the global screen for Comfort Panels and for WinCC Runtime Advanced.

Use in the function list

ShowSystemDiagnosticsWindow (Screen object)

Use in user-defined functions

ShowSystemDiagnosticsWindow (Target_Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen object

Name of the system diagnostic window which is hidden or shown.

See also

Availability for specific devices of system functions (Page 4612)

StartLogging

Description

Starts the logging of data or alarms in the specified log. The function can also be applied to audit trails.

You can interrupt logging at runtime using the "StopLogging" system function.

Use in the function list

StartLogging (Log type, Log)

Use in user-defined functions

StartLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log which is started.

See also

Availability for specific devices of system functions (Page 4612)

StartNextLog

Description

Stops the logging of data or alarms for the given log.

Logging is continued in the next log of the segmented circular log you configured for the specified log.

If you did not configure a segmented circular log for the specified log, the system function has no effect.

Use in the function list

StartNextLog (Log type, Log)

Use in user-defined functions

StartNextLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Log

Name of the log for which the logging is stopped and continued in the next log.

See also

Availability for specific devices of system functions (Page 4612)

StartProgram

Description

Starts the specified program on the HMI device.

The runtime software continues running in the background. Alarms continue to be output and data continues to be updated.

When the given application is exited, the screen which was active during the performance of the system function is displayed on the HMI device.

This system function is used, for example, to edit recipe data records in MS Excel on the HMI device.

Note

If Windows CE is installed on the HMI device, during the configuration it must be checked whether the desired application can be started with this system function.

This system function allows all applications to be started which can be started in the "Execute" dialog of Windows CE.

The application to be started must be installed on the HMI device.

Use in the function list

StartProgram (Program name, Program parameters, Layout, Wait for program to end)

Use in user-defined functions

StartProgram (Program_name, Program_parameters, Display_mode, Wait_for_program_to_end)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Program name

Name and path of the program which is started. Upper and lower case are taken into account in this parameter.

Note

If the path contains spaces, the program can only be started correctly if the path is specified in inverted commas, e.g. "C:\Program Files\START\start.exe".

Program parameters

The parameters you transfer at the start of the program, for example a file that is opened after the start of the program.

The description of the necessary parameters is found in the documentation of the program to be started.

Layout

Determines how the program window is displayed on the HMI device:

0 (hmiShowNormal) = Normal

1 (hmiShowMinimized) = Minimized

2 (hmiShowMaximized) = Maximized

3 (ShowMinimizedAndInactive) = Minimized and inactive

Wait for program to end

Determines whether there is a change back to the project after the called up program has ended:

0 (hmiNo) = No: No change to project

1 (hmiYes) = Yes: Change to project

Note

The "Wait for program to end" parameter is only available for Runtime Advanced and Panels.

See also

Availability for specific devices of system functions (Page 4612)

StopLogging

Description

Stops the logging of process values or alarms in the specified log. The function can also be applied to audit trails.

The "StartLogging" system function is used to resume logging at runtime.

Note

When logging is stopped, a connection between WinCC and the log files or log database still exists. Use the "CloseAllLogs" system function to disconnect this connection.

Use in the function list

StopLogging (Log type, Log)

Use in user-defined functions

StopLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log that is stopped.

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. The "Open Archive" button opens all logs and continues logging in the specified log.

See also

Availability for specific devices of system functions (Page 4612)

StopRuntime

Description

Exits the runtime software and thereby the project running on the HMI device.

Use in the function list

StopRuntime (Mode)

Use in user-defined functions

StopRuntime (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Mode

Determines whether the operating system is shut down after exiting runtime.

0 (hmiStopRuntime) = Runtime: Operating system is not shut down

1 (hmiStopRuntimeAndOperatingSystem) = Runtime and operating system: The operating system is shut down (not possible with WinCE)

Example

The following program code shuts down Runtime and the operating system.

```
{

//Stop runtime and shutdown
StopRuntime (hmiStopRuntimeAndOperationSystem);

}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 4612)

TerminatePROFIsafe

Description

Disconnects the PROFIsafe connection for fail-safe operation between a KTP Mobile Panel and the PLC.

After execution of the system function "TerminatePROFIsafe", the connector of the KTP Mobile Panel can be removed from the PLC without the system signaling an error.

Use in the function list

TerminatePROFIsafe

Use in user-defined functions

TerminatePROFIsafe

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

--

WinACMPGetVersion

Description

Reads out the value of the version number of WinAC MP.

Use in the function list

WinACMPGetVersion (Version, Action)

Use in user-defined functions

WinACMPGetVersion (Version, Action)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

Version

The tag that contains the value.

Action

Determines whether the version number is read out:

0 (SwitchOff) = Off: Version number is not read out.

1 (SwitchOn) = On: Version number is read out.

See also

Availability for specific devices of system functions (Page 4612)

WinACMPSetStartAtBoot

Description

Determines whether or not WinAC MP is started automatically after startup of the HMI device.

Use in the function list

WinACMPSetStart at boot(Start at boot)

Use in user-defined functions

WinACMPSetStartAtBoot (Start at boot)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

StartAtBoot

Defines whether WinAC MP is started automatically.

0 (StartAtBootOff) = Off: WinAC MP is not started on startup of the HMI device.

1 (StartAtBootOn) = On: WinAC MP is started automatically on startup of the HMI device.

See also

Availability for specific devices of system functions (Page 4612)

WinACSetStartMode

Description

Sets the operating mode of WinAC MP after startup of the HMI device.

Use in the function list

WinACSetStartMode (Autostart)

Use in user-defined functions

WinACSetStartMode (Autostart)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

Action

Defines whether the Autostart function of WinAC MP is activated.

0 (AutoStartOff) = Off: After startup, WinAC MP remains in the STOP operating mode.

1 (AutoStartOn) = On: After startup, WinAC MP changes to the operating mode it was in before it was closed.

http://msdn.microsoft.com/en-us/goglobal/bb964664

VBScript for Windows CE

VBScript for Windows CE

Attr

Function

This property of the File control returns a number indicating the file mode that was used to open the file.

Syntax

file.Attr

Parameters

File

Reference to a File control.

Return values

The return values listed in the following table indicate the file access mode. If the return value is 0, the file is closed.

Constant	Value
None	0
fsModeInput	1
fsModeOutput	2
fsModeRandom	4
fsModeAppend	8
fsModeBinary	32

Remarks

The Attr property is read-only. Use the Open method of the File control to set the file mode.

Close

Function

This method closes an open File control.

Syntax

file.Close

Parameters

File

Name of a File control.

Return Values

None.

Remarks

Use the Open method to open a file.

CreateObject

Function

This function creates a reference to an Automation object.

Syntax

CreateObject (Object)

Parameters

Object

A string containing the ProgID of the object to create.

Return values

Returns a reference to an Automation object.

Remarks

Use CreateObject to create non-visible ActiveX controls at runtime. You cannot use CreateObject to create graphical objects such as a TreeView control or a ListView control. CreateObject produces objects that cannot respond to events. To produce objects that can respond to events, use the CreateObjectWithEvents function. The following table lists the ProgIDs for the ActiveX controls without events.

Control	ProgID
Microsoft CE File control 6.0	.file
Microsoft CE FileSystem control 6.0	.filesystem
Microsoft CE ImageList control 6.0	CEimageList.imagelistctrl

Example

```
Dim f, fwModeAppend
Set f = CreateObject("FileCtl.File")
fwModeAppend=8
f.Open "\Storage Card\testfile.txt", fwModeAppend
f.Close
```

Dir

Function

This method returns the name of a file, directory, or folder that matches a specified pattern or file attribute.

Syntax

File.Dir (Pathname,[Attributes])

Parameters

File

Reference to a FileSystem control.

Pathname

Optional. String expression that specifies a file name or path.

Attributes

Optional. Numeric expression whose sum specifies file attributes. If omitted, all files that match pathname are returned.

The following table describes the parameter settings of attributes.

Constant	Value	Description
fsAttrNormal	0	Normal
fsAttrReadOnly	1	Read only
fsAttrHidden	2	Hidden
fsAttrSystem	4	System file
fsAttrVolume	8	Volume label. If specified, all other attributes are ignored.
fsAttrDirectory	16	Directory or folder
fsAttrArchive	32	Logs

Return values

String. File name that matches pathname and attributes. Dir returns a zero-length string ("") if pathname is not found.

Remarks

Dir supports the use of multiple-character (*) and single-character (?) wildcards to specify multiple files. You must specify pathname the first time you call the Dir method. In addition, if you specify file attributes you must include pathname.
The Dir method returns the first file name that matches pathname. To get any additional file names that match pathname, call Dir again with no parameters. When no more file names match, Dir returns a zero-length string (" "). Once a zero-length string is returned, you must specify pathname in subsequent calls.

EOF

Function

This property returns True when the end of a file opened for random or sequential input is reached.

Syntax

File.EOF

Parameters

File

Reference to a File control.

Remarks

Use the EOF property to avoid the error generated by attempting to read past the end of a file.

The EOF property returns False until the end of the file has been reached. For files opened with a fsModeRandom or fsModeBinary file mode, EOF returns False until the last executed Get statement is unable to read an entire record.

For files opened with a fsModeBinary file mode, an attempt to read through the file using the Input function until EOF returns True generates an error. Use the LOF and LOC properties instead of EOF when reading binary files with Input, or use Get when using the EOF property. For files opened with a fsModeOutput file mode, EOF always returns True.

FileCopy

Function

This method copies an existing file to a new file.

Syntax

Filesystem.FileCopy PathName, NewPathName

Parameters

Filesystem

Reference to a FileSystem object.

PathName

String that contains the path and file name.

NewPathName

String that contains the file name and path of the new file.

Return Values

None.

Remarks

FileCopy returns an error if the new file does not exist.

FileLen

Function

This method returns a value specifying the length, in bytes, of a file.

Syntax

Filesystem.FileLen(pathname)

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file. The pathname can include a directory or folder.

Return Values

Returns the number of bytes in a file.

Remarks

If the specified file is open when the FileLen method is called, the value returned represents the size of the file immediately before it was opened.

FileDateTime

Function

This method returns a variant (Date) that indicates the date and time when a file was created or last modified.

Syntax

filesystem.FileDateTime(pathname)

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file name. The pathname can include a directory or folder.

Return Values

Returns the date the file was last modified.

Remarks

FileDateTime returns an error if the new file does not exist.

Get

Function

This method reads data from an open disk file into a variable.

Syntax

file.Get Data, [Recnumber]

Parameters

File

Reference to a File control.

Data

Required. Variant variable into which data is read.

Recnumber

Optional. Variant. Record number at which reading begins. For files opened in binary mode, Recnumber specifies the byte position.

Return Values

None

Remarks

Data read with the Get method usually is written to a file with the Put method. The first record or byte in a file is at position 1, the second record or byte is at position 2, and so on. If you omit Recnumber, the next record or byte following the last Get or Put method (or pointed to by the last Seek function) is read.

For files opened in Random mode, the following rules apply:

- If the length of the data being read is less than the length specified in the Len clause of the Open method, Get reads subsequent records on record-length boundaries. The space between the end of one record and the beginning of the next record is padded with the existing contents of the file buffer. Because the amount of padding data cannot be determined with any certainty, it is generally advisable to match the record length with the length of the data being read.
- If Data is a Variant of numeric type, Get reads 2 bytes identifying the VarType of the Variant and then reads the data that goes into the variable. For example, when reading a Variant of VarType 3, Get reads 6 bytes: 2 bytes identifying the Variant as VarType 3 (Long) and 4 bytes containing the Long data. The record length specified by the Len clause in the Open method must be at least 2 bytes greater than the actual number of bytes required to store the variable.
- You can use the Get method to read a Variant array from a disk, but you cannot use Get to read a scalar Variant containing an array. You also cannot use Get to read objects from a disk.
- If the variable being read into is a Variant of VarType 8 (String), Get reads 2 bytes identifying the VarType and 2 bytes indicating the length of the string. Then it reads the string data. The record length specified by the Len clause in the Open method must be at least 4 bytes greater than the actual length of the string.
- If the variable being read into is a dynamic array, Get reads a descriptor whose length equals 2 plus 8 times the number of dimensions, that is, 2 + 8 * NumberOfDimensions. The record length specified by the Len clause in the Open method must be greater than or equal to the sum of all the bytes required to read the array data and the array descriptor.

For files opened in Binary mode, the Len clause in the Open method has no effect. Get reads all variables from a disk contiguously; that is, with no padding between records.

GetAttr

Function

This method returns a number representing the attributes of a file, directory, or folder.

Syntax

filesystem.GetAttr(pathname)

Parameters

File system

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file name or directory or a folder name. The pathname can include the directory or folder.

Return values

Sum of attribute values. The following table shows the sums that can be returned.

Constant	Value	Description
vbNormal	0	Normal
VbReadOnly	1	Read only
VbHidden	2	Hidden
VbSystem	4	System
VbDirectory	16	Directory or folder
VbArchive	32	File has changed since last backup

Remarks

To determine which attributes are set, use the And operator to perform a bitwise comparison of the value returned by the GetAttr method and the value of the individual file attribute you want. If the result is not zero, that attribute is set for the named file.

Input

Function

This method returns a string containing characters from a file opened in Input or Binary mode.

Syntax

file.Input(number)

Parameters

File

Reference to a File control.

Number

Any valid numeric expression that specifies the number of characters to return.

Return Values

String containing characters read from file.

Remarks

Data read with the Input method usually is written to a file with the LinePrint or Put functions. Use this method only with files opened in Input or Binary mode.

Unlike the LineInputString method, the Input method returns all the characters it reads, including commas, carriage returns, line feeds, quotation marks, and leading spaces.

With files opened for Binary access, an attempt to read through the file using the Input method until the EOF function returns True generates an error. To avoid an error, use the LOF and Loc functions instead of EOF when reading binary files with the Input method or use Get when using the EOF function.

InputFields

Function

This method reads data from an open sequential file and returns a single dimension Variant array.

Syntax

file.InputFields(number)

Parameters

File

Reference to a File control.

Number

Number of comma-delimited fields to read from the file.

Return values

Array containing the fields read from the file.

Remarks

Data read with the InputFields method usually is written to a file with WriteFields. Use this method only with files opened in Input or Binary mode.

InputFields reads standard string or numeric data without modification. The following table shows how InputFields reads other input data.

Data	Value Assigned to Variable
Delimiting comma or blank line	Empty
#ZERO#	Zero
#TRUE# or #FALSE#	True or False
#yyyy-mm-dd hh:mm:ss#	The date and/or time represented by the expression

Double quotation marks ("") within input data are discarded.
If you reach the end of the file while you are inputting a data item, the input is terminated and an error occurs.

To correctly read data from a file into variables using InputFields, use the WriteFields method instead of the LinePrint method to write the data to the files. Using WriteFields ensures each separate data field is properly delimited.

InputB

Function

This method returns bytes from a file opened in Input or Binary mode.

Syntax

file.InputB(number)

Parameters

File

Reference to a File control.

Number

Any valid numeric expression that specifies the number of bytes to return.

Return Values

Array containing bytes read from file.

Remarks

Data read with the InputB method usually is written to a file with the LinePrint or Put functions. Use this method only with files opened in Input or Binary mode.

Kill

Function

This method deletes files from a disk.

Syntax

filesystem.Kill pathname

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

Required. String expression that specifies one or more file names to be deleted. The pathname can include the directory or folder.

Return Values

None.

Remarks

The Kill method supports the use of multiple-character (*) and single-character (?) wildcards to specify multiple files.
An error occurs if you try to use Kill to delete an open file.

LineInputString

Function

This method reads a single line from an open sequential file and assigns it to a string variable.

Syntax

file.LineInputString

Parameters

File

Reference to a File control.

Return Values

None.

Remarks

Data read with LineInputString usually is written from a file with LinePrint.
The LineInputString method reads from a file one character at a time until it encounters a carriage return (Chr(13)) or carriage return/line feed (Chr(13) + Chr(10)) sequence. Carriage return/line feed sequences are skipped rather than appended to the character string.

LinePrint

Function

This method writes a single line to an open sequential file.

Syntax

file.LinePrint output

Parameters

File

Reference to a File control.

Output

String expression to write to a file.

Return Values

None.

Remarks

Data written with LinePrint is usually read from a file with LineInputString.
A carriage return/line feed (Chr(13) + Chr(10)) sequence is appended to the end of the string.

Loc

Function

This property returns a number specifying the current read/write position.

Syntax

file.Loc

Parameters

File

Reference to a File control.

Remarks

For files opened with the fsModeRandom file mode, Loc returns the number of the last record read or written. For files opened with all other modes, Loc returns the position of the last byte read or written.

LOF

Function

This property returns a number representing the size, in bytes, of a file.

Syntax

file.LOF

Parameters

File

Reference to a File control.

Remarks

The LOF property can be used with the Loc property to guarantee that a read operation does not continue past the end of a file.

MkDir

Function

This method creates a new directory.

Syntax

filesystem.MkDir PathName

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

String expression that contains the directory name.

Return Values

None.

Remarks

MkDir generates an error if the directory already exists.

MoveFile

Function

This method renames an existing file or a directory, including all its subdirectories.

Syntax

filesystem.MoveFile PathName, NewPathName

Parameters

Filesystem

Reference to a FileSystem control.

PathName

String that contains the file name.

NewPathName

String that contains the file name to copy to.

Return Values

None.

Open

Function

This method opens a file in either the Input (1), Output (2), Random (4), Append (8), or Binary mode (32).

Syntax

file.Open pathname, mode, [access], [lock], [reclength]

Parameters

File

Reference to a File control.

Pathname

String expression that specifies a file name.

Mode

Specifies the file mode: Input (1), Output (2), Random (4) , Append (8), or Binary (32).

Access

Operation permitted on the open file: Read, Write, or ReadWrite [Default]. (1, 2, 3)

Lock

Operations permitted on the open file by other processes: Shared, LockRead, LockWrite [Default], and LockReadWrite. (1, 2, 3, 0)

Reclength

Number, in bytes, that is less than 32,767. For files opened for random access, this value is the record length. For sequential files, this value is the number of characters buffered.

Return Values

None.

Remarks

The reclength parameter is ignored if the mode is Binary. When opening a file in Random mode, you must specifiy a record size of greater than zero or an error will occur.

Put

Function

This method writes data from a variable to a disk file.

Syntax

file.Put data, [recnumber]

Parameters

Data

Required. Variant variable that contains data to be written to disk.

Recnumber

Optional. Variant (Long). Record number (Random mode files) or byte number (Binary mode files) at which writing begins.

Return Values

None.

Remarks

Data written with Put usually is read from a file with Get.
The first record or byte in a file is at position 1, the second record or byte is at position 2, and so on. If you omit recnumber, the next record or byte after the last Get or Put method or pointed to by the last Seek function is written.

For files opened in Random mode, the following rules apply:

- If the length of the data being written is less than the length specified in the Len clause of the Open method, Put writes subsequent records on record-length boundaries. The space between the end of one record and the beginning of the next record is padded with the existing contents of the file buffer. Because the amount of padding data cannot be determined with any certainty, it generally is a good idea to have the record length match the length of the data being written. If the length of the data being written is greater than the length specified in the Len clause of the Open method, an error occurs.
- If the variable being written is a Variant of a numeric type, Put writes 2 bytes identifying the VarType of the Variant and then writes the variable. For example, when writing a Variant of VarType 3, Put writes 6 bytes: 2 bytes identifying the Variant as VarType 3 (Long) and 4 bytes containing the Long data. The record length specified by the Len clause in the Open method must be at least 2 bytes greater than the actual number of bytes required to store the variable.

You can use the Put method to write a Variant array to disk, but you cannot use Put to write a scalar Variant containing an array to disk. You also cannot use Put to write objects to disk. If the variable being written is a Variant of VarType 8 (String), Put writes 2 bytes identifying the VarType and 2 bytes indicating the length of the string. It then writes the string data. The record length specified by the Len clause in the Open method must be at least 4 bytes greater than the actual length of the string.

If the variable being written is a dynamic array, Put writes a descriptor whose length equals 2 plus 8 times the number of dimensions, that is, 2 + 8 * NumberOfDimensions. The record length specified by the Len clause in the Open method must be greater than or equal to the sum of all the bytes required to write the array data and the array descriptor. For example, the following array declaration requires 118 bytes when the array is written to disk.

For files opened in Binary mode, the Len clause in the Open method has no effect. Put writes all variables to disk contiguously; that is, with no padding between records.

RmDir

Function

This method deletes an existing empty directory.

Syntax

filesystem.RmDir PathName

Parameters

Filesystem

Reference to a FileSystem control.

PathName

String that contains the directory name.

Return Values

None.

Remarks

The directory must be empty before it can be removed. You must specify a complete file path.

Seek

Function

This property returns and sets the next position in a file that will be read or written.

Syntax

file.Seek [= position]

Parameters

File

Reference to a File control.

Position

Numeric expression that specifies a position within a file.

Remarks

The Seek property specifies the next file position, whereas the Loc property specifies the current position. Seek always will be one more than Loc, except when a file is first opened and Seek and Loc are both 1.

Negative Seek or 0 causes an error.

SetAttr

Function

This method sets attribute data for a file.

Syntax

filesystem.SetAttr pathname, attributes

Parameters

File system

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file name.

Attributes

Required. Numeric expression whose sum specifies file attributes. The following table shows the parameter settings of attributes.

Constant	Value	Description
vbNormal	0	Normal (default)
vbReadOnly	1	Read only
vbHidden	2	Hidden
VbSystem	4	System file
VbArchive	32	File has changed since last backup

Return values

None.

Remarks

A run-time error occurs if you try to set the attributes of an open file.

WriteFields

Function

This method writes data to a sequential file.

Syntax

file.WriteFields [data]

Parameters

File

Reference to a File control.

Data

Variant or Variant array of numeric or string expressions to write to a file.

Prinzip

Return Values

None.

Remarks

Data written with WriteFields is usually read from a file with InputFields.
If you omit d ata, a blank line is printed to the file.

- Numeric data is always written using the period as the decimal separator.
- For Boolean data, either #TRUE# or #FALSE# is printed. The True and False keywords are not translated, regardless of locale.
- Date data is written to the file using the universal date format. When either the date or the time component is missing or is zero, only the component provided gets written to the file.
- Nothing is written to the file if Data is Empty. However, for Null data, #NULL# is written.
- If d ata is Null, #NULL# is written to the file.

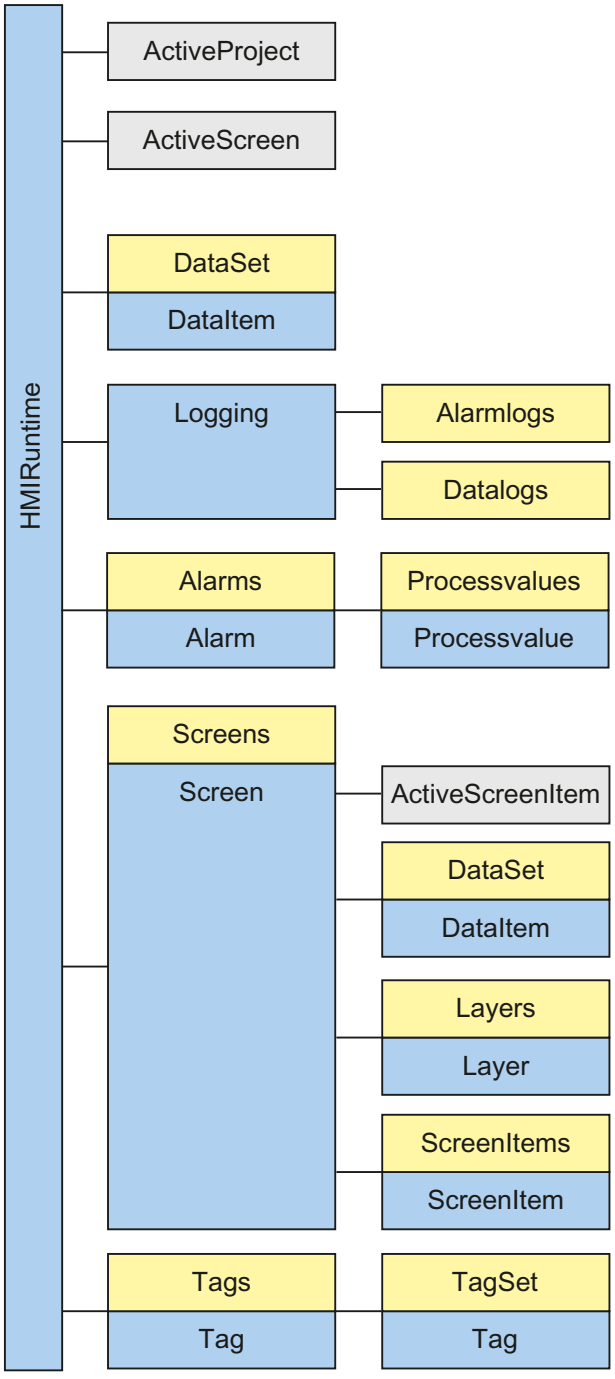
The WriteFields method inserts commas between items and quotation marks around strings as they are written to the file. You do not have to put explicit delimiters in the list. WriteFields inserts a newline character—that is, a carriage return/line feed (Chr(13) + Chr(10))—after it has written the final character in data to the file.

VBS object model

VBS object model

VBS object model in WinCC

The following screen shows the VBS object model in WinCC:



Use the WinCC object model of the graphic Runtime system to access objects and tags in Runtime.

Objects

Objects and lists are provided for access to all the objects in the graphic Runtime systems:

- Display and operating objects
- Screens
- Layers
- Tags

Properties

You can specifically change the display and operating elements and tags in Runtime via the properties of the individual objects. For example, you can enable a button with a click or trigger a color change by changing a tag value.

Methods

Methods which are applied to individual objects can be used to read out tag values for further processing or displaying alarms in Runtime.

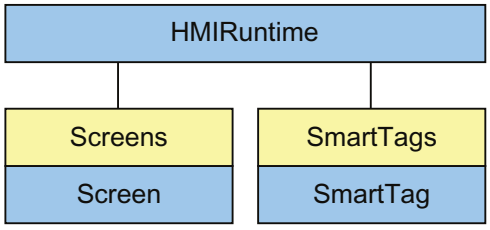
Objects

HMIRuntime

Description



Portrays the graphic runtime system.

The HMIRuntime object contains properties and methods which return the objects to the main layer, e.g. returns the ActiveScreen property of a screen object.

Application

You use the "HMIRuntime" object, e.g. as follows:

- Read or set the current Runtime language ("Language" property).
- Read name of current base screen or trigger a base screen change by setting a new screen name (property "BaseScreenName")
- Access tags (List "SmartTags")
- End runtime (Method "Stop")
- Output information on sequence tracing output (Method "Trace")
- Access the screens displayed during runtime (List "Screens")

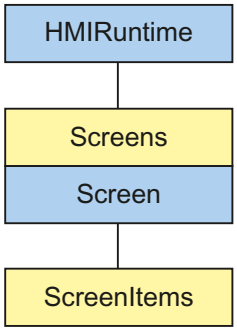
See also

ActiveScreen (Page 5227)

Screen (Page 4977)

Screen object (list)

Description



A list of screen objects.

The list contains the following two elements:

- The first element with the index 0 represents the permanent window.
- The second element with the index 1 represents the root screen.

Alternatively, the two elements can be addressed with their their names as follows:

- Permanent window: "Overview"
- Root screen: Name of the screen displayed in the root screen

If the named screen is not displayed, an error occurs during access.

Permanent window "Overview" is displayed in the objects list and in Auto complete.

Note

The alarm window and the alarm indicator are not contained in the screens list, even if they have the focus in Runtime.

Application

Use the screen property to return the screen list. In the following example, the background color is changed from black to green:

Use the object name as an index.

```
'VBS_Example_BackColor
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

Note

If you perform a screen change, the open references to the screen that is no longer available will become invalid. As a result, it is no longer possible to work with these references.

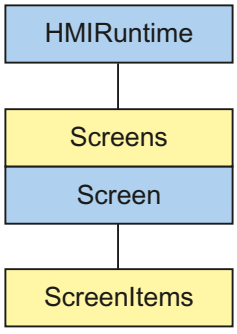
See also

Screen (Page 4977)

ScreenItems (Page 4980)

Screen

Description



Represents the process screen which is being displayed on the HMI device at the moment or the permanent window in runtime. The screen object is returned to you as a result of accessing the screen list.

The screen object also contains a list of all graphic objects in the screen that can be addressed through the list "ScreenItems".

Application

You can also use the screen object to do the following:

- Read the height and width of a screen (properties "Height" and "Width").
- Change the background color (property "BackColor").

Use the object name as an index.

In the following example, the background color is changed from black to green:

```
'VBS example background color
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

See also

ScreenItem (Page 4978)

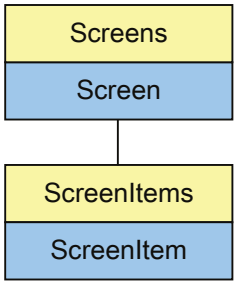
ScreenItems (Page 4980)

HMIRuntime (Page 4974)

Screen object (list) (Page 4975)

ScreenItem

Description



Represents an object in the specified screen. The ScreenItem object is an element of the ScreenItems list.

Application

You can use the ScreenItem object to access the properties of graphic objects within a screen, depending on certain events.

You use the "ScreenItem" object as follows, for example:

- "Visible" property
  Switch the visibility of an object on or off.
- "Height" and "Width" properties
  Query the width and height of an object.
- "Top" and "Left" properties
  Change the position of an object.
- "ObjectName" property
  Read the name of a graphic object
- "Parent" property
  Set a reference to the parent screen

Use the ScreenItems property to return an object to the screen. Use the object name as an index.

Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
'VBS_Example_ScreenItems

Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

Note

To save memory space in the HMI device, no object names are loaded during transfer of the project. If you still want to transfer object names, call up the Runtime settings for the respective HMI device in WinCC. You can change the setting under "General". The object name is required when the object should be accessed via the object name or for debugging a project.

The "ScreenItem" object has different properties depending on its features. The following properties are provided for every "ScreenItem" object:

- Enabled
- Height
- Left

- ObjectName
- Parent
- Top
- Type
- Visible
- Width

If a specific object type is addressed, further properties are added to the standard properties. The additional properties are provided in the descriptions of the individual object types.

See also

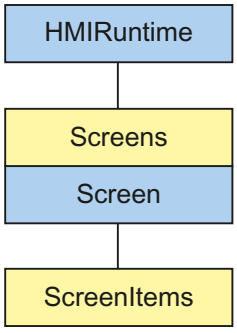
Screen (Page 4976)

Screen object (list) (Page 4975)

ScreenItems (Page 4980)

ScreenItems

Description



A list of screen item objects with all screen objects of the given process screen. The list has a parent property. This property provides a reference to the process screen in which the screen object is located.

Application

By means of the "ScreenItems" list you are able

- To edit or output all objects within the list (that is, all objects within a screen)
- To count the objects of a screen (property "Count").
- To work on a particular object in the list (method "Item").

Use the screen items property to return an object from the process screen. Use the object name as an index.

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

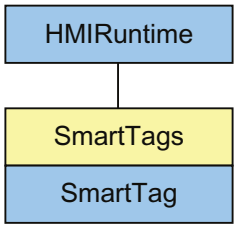
Screen (Page 4976)

HMIRuntime (Page 4974)

Screen object (list) (Page 4975)

SmartTags

Description



A list of SmartTag objects which represent all of the tags in WinCC Runtime.

Note

The SmartTags list has a limited range of functions. You can only use the tag names to access a SmartTag object. Access via the index or by using "For each" instruction is not supported.

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Application

Use the SmartTags list to return a SmartTag object. Use the tag name to reference the SmartTag object.

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

In Runtime Advanced and Panels you address the tag directly using its name. If the tag name corresponds to the VBS name conventions, you do not need to use the SmartTags list. Follow the example below:

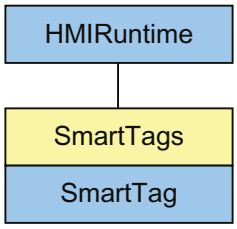
```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(AirPressure)
HMIRuntime.Trace strAirPressure
```

See also

Access to HMI tags (Page 4580)

SmartTag

Description



Represents the value of the specified process tag. The SmartTag object is an element of the SmartTag list.

Application

The SmartTag object provides read and write access to the value of the specified process tag. The SmartTag object does not return an object reference. Use the SmartTags list to return the value of a process tag. Use the tag name as an index.

Note

With the "SmartTags reads values from the cache" setting, values are read from the process image (cache) instead of directly from the controller.

The SmartTag object can also read values directly from the controller. However, you can then expect a substantially higher communication load between the HMI device and the controller.

Example

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Note

If you want to return the "TypeName" of a SmartTag object data type with the VBS function "TypeName", use the following syntax:

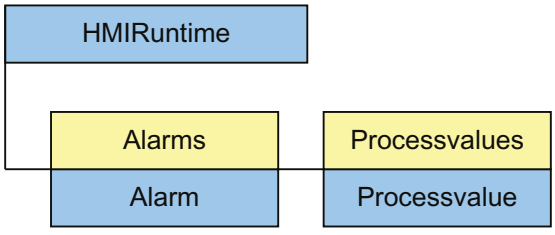
```
TypeName(SmartTags("FillLevel").value)
```

Use "SmartTags("<tag>")(index)" to access the value of an array element. Set the number of the desired array element for "index", for example, "SmartTags("AirPressure")(2)".

Objects

Alarm

Description



The alarm object is used to access the Alarms object list.

Note

The properties of the alarm object are not automatically updated when the values of the properties change.

See also

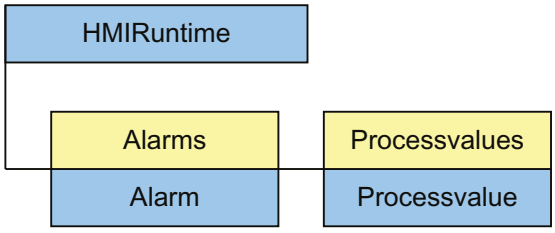
Alarms (list) (Page 4985)

HMIRuntime (Page 4994)

ProcessValue (Page 5456)

Alarms (list)

Description



Use the alarm object to trigger existing messages.

Usage

Using the "Alarms" list you can:

- Access a message in the list (Item method)
- Create a new alarm object (Create method)
- Read the alarm ID of the message (AlarmID attribute)
- Read the status of a message (State property)

- Read the time stamp of the message (Timestamp property)
- Generate an instance of the alarm object (Instance property)
- Read the name of the computer on which the message came (ComputerName property)
- Read or set the name of the user who triggered the message (UserName property)
- Read or set the name of the process value blocks (ProcessValues property)
- Read or set the message commentary (Comment property)
- Read or set the message server prefix (Context property)

Example

In the following example the alarm with the alarm number "1" configured in the "HMI alarms" editor is activated.

```
'VBS360
Dim MyAlarm
Set MyAlarm = HMIRuntime.Alarms(1)
MyAlarm.State = 5 'hmiAlarmStateCome + hmiAlarmStateComment
MyAlarm.Comment = "MyComment"
MyAlarm.UserName = "Hans-Peter"
MyAlarm.ProcessValues(1) = "Process Value 1"
MyAlarm.ProcessValues(4) = "Process Value 4"
MyAlarm.Create "MyApplication"
```

See also

AlarmID (Page 5235)

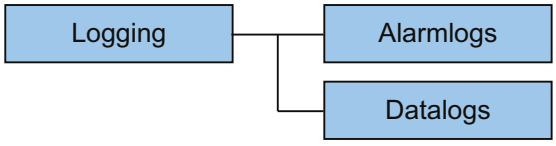
ProcessValue (Page 5456)

Alarm (Page 4983)

HMIRuntime (Page 4994)

AlarmLogs (list)

Description



You can use the object to reconnect swapped-out log segments of the alarm log to Runtime or to remove previously swapped-in log segments of the alarm log. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed.

If an error occurs during the operation with log segments, the applied method returns an error alarm.

Usage

- "Restore" method
  Previously swapped-out log segments of the alarm log are connected to Runtime.
- "Remove" method
  Previously swapped-in log segments of the alarm log are removed from the Runtime project.

Example

In the following example, log segments from the alarm log are swapped in and the return value is output as a trace.

```
'VBS187
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

See also

Restore (Page 5915)

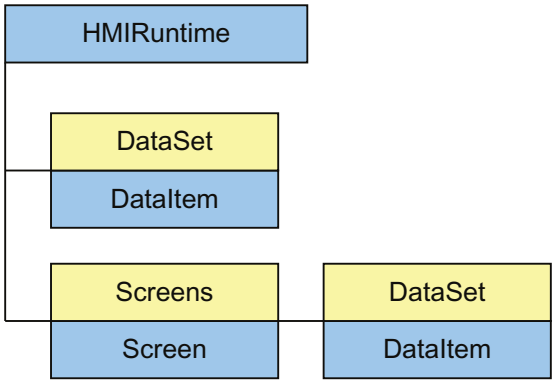
Remove (Page 5910)

DataLogs (list) (Page 4990)

Logging (Page 4999)

DataItem

Description



You can use the DataItem object to access the contents of the DataSet list. Values or object references are stored in the list as DataItem.

Access uses the name under which the value was added to the list. Single access using an index is not recommended since the index changes during adding or deleting of values. You can use the index to output the complete contents of the list. The output is in alphabetical order.

Note

For object references, ensure that the objects are capable of multi-threading.

Example

The example shows how the value of 'Motor1' is output as a trace.

```
'VBS163
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
```

The following example enumerates all DataItem objects of the DataSet list. Name and value are output as a trace.

```
'VBS164
Dim data
For Each data In HMIRuntime.DataSet
HMIRuntime.Trace data.Name & ": " & data.Value & vbNewLine
Next
```

Note

The value may not be output directly for objects.

DataSet (list) (Page 4991)

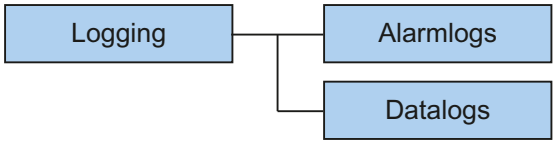
Value (Page 5640)

Name (Page 5426)

Screen object (list) (Page 5008)

DataLogs (list)

Description



You can use the object to reconnect swapped-out log segments of the data log to Runtime or to delete previously swapped-in log segments of the data log. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed. You also set the type of log ("Fast data log", "Slow data log", "Fast data log and Slow data log").

If an error occurs during the operation with log segments, the applied method returns an error alarm.

Usage

- "Restore" method
  Previously swapped out log segments of the data log are connected to Runtime.
- "Remove" method
  Previously swapped-in log segments of the data log are removed from the Runtime project.

Example

In the following example, log segments from the Fast data log are swapped in and the return value is output as a trace.

```
'VBS188
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1,1) & vbNewLine
```

See also

Restore (Page 5915)

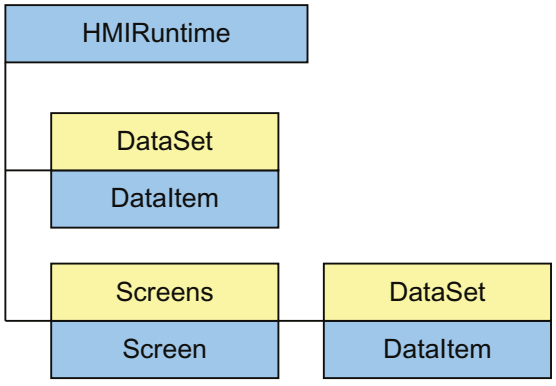
Remove (Page 5910)

AlarmLogs (list) (Page 4986)

Logging (Page 4999)

DataSet (list)

Description



Using the DataSet object, you can exchange data throughout several actions.

A DataSet object is global and defined by the screen object. You can can access the data from any VBS action.

You address the screen object according to the screen hierarchy . The DataSet object persists as long as the screen is displayed. The global object persists over the entire runtime time period.

Access uses the DataItem object.

Note

You cannot include objects with the types Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet in the DataSet list.

The DataSet object does not support any classes.

Usage

Use the "DataSet" list as follows:

- Enumeration
  Output or process all objects in the list
- "Count" property
  Output the number of elements contained
- "Item" method
  Work on a particular object in the list
- "Add" method
  Add an object to the list
- "Remove" method
  Remove a particular object from the list
- "RemoveAll" method
  Remove all objects from the list

Access to list elements is made as follows:

```
HMIRuntime.DataSet("Itemname")
```

For a picture-specific list, access is performed as follows:

```
HMIRuntime.Screens("Screenname").DataSet("Itemname")
```

You access the DataSet object of the screen as follows:

```
DataSet("Itemname")
```

If upon access the stated name does not exist in the list, VT_Empty is returned and an Exception is triggered.

Example

The example shows how a value can be entered in the list, read and removed from the list throughout various actions.

```
'VBS162
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet.Remove("motor1")
```

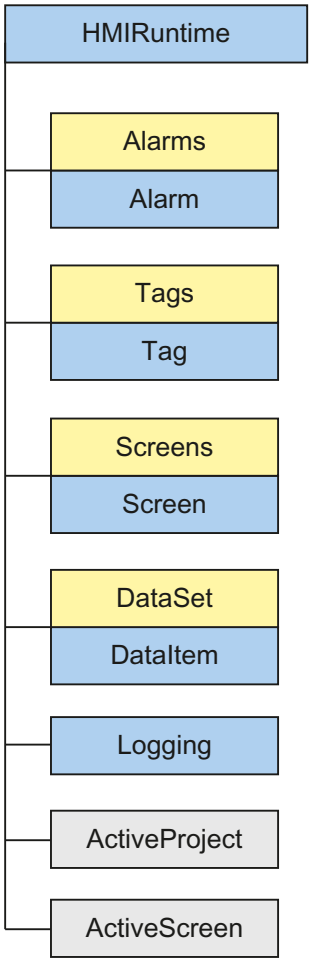
Screen object (list) (Page 5008)

HMIRuntime

Description



The HMIRuntime object represents the graphic Runtime environment.

Usage

You can use the "HMIRuntime" object as follows:

- "Language" property
  Read or set the current Runtime language
- "BaseScreenName" property
  Read or set the name of the current root screen
- "ActiveProject" property
  Read the path of the active Runtime project

- "Tags" property
  Accessing tags
- "DataSet" property
  Accessing tags in a list
- "Stop" method
  Stop Runtime
- "Trace" method
  Display messages in a diagnostics window

Example

The following command closes WinCC Runtime:

```
'VBS3
HMIRuntime.Stop
```

See also

DataItem (Page 4987)

Screen (Page 5001)

Screen object (list) (Page 5008)

ActiveScreen (Page 5228)

Item

Description

The Item object provides a reference to the current object.

Usage

Use the Item object, for example, to address the properties of the object currently selected in the screen.

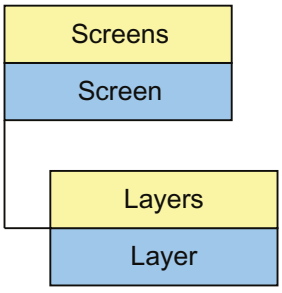
Example

In the following example, you set the background color of the object selected in the screen to red:

```
'VBS195
Item.BackColor = RGB(255,0,0)
```

Layer

Description



The Layer object returns the result of access to the layers list.

Parent object

Screen in which the screen layer is located

Usage

Depending on certain events, you can use the Layer object to obtain access to the properties of a complete layer to hide or display a layer with operating elements according to the operator authorization.

You can use the "Layer" object as follows:

- "Visible" property
  Activate or deactivate visibility of a layer
- "Name" property
  Read the name of a layer

Note

The layer property specifies the layer in which the object is located. The layer "0" is output as layer "0".

When accessed, the layers are counted up from 1 in VBS. Therefore, address level "1" with "Layers(2)".

Example

In the following example, Layer 1 is set to "invisible":

```
'VBS4
Layers(2).Visible = vbFalse
```

See also

Name (Page 5426)

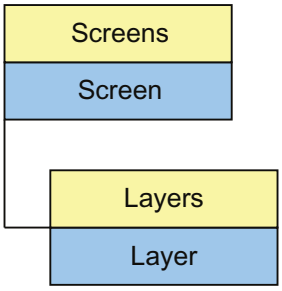
Layers (list) (Page 4998)

Screen (Page 5001)

Screen object (list) (Page 5008)

Layers (list)

Description



Use the layers list to access all 32 layers of the graphical Runtime system.

Parent object

Screen in which the screen layer is located

Usage

You use the "Layers" list as follows:

- "_NewEnum" property
  Process all layers in the list
- "Count" property
  Count all layers contained in the list
- "Item" method
  Process a layer from the list

The properties represent default properties and methods of a list and are not described in detail in the WinCC documentation.

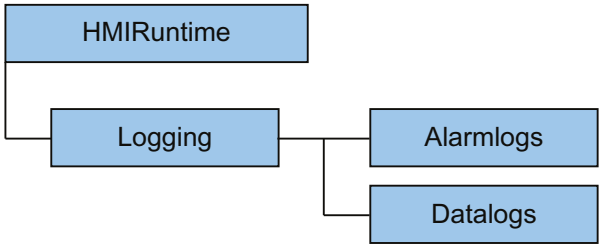
Logging

Description



You can use the object to reconnect swapped-out log segments to Runtime or to remove previously swapped-in log segments. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed.

If an error occurs during the operation with log segments, the applied method returns an error alarm.

Usage

- "Restore" method
  Previously swapped out log segments of the alarm log and the data log are connected to Runtime.
- "Remove" method
  Previously swapped-in log segments of the alarm log and data log are removed from the Runtime project.

Example

In the following example, log segments from the alarm log and data log are swapped in and the return value is output as a trace.

```
'VBS189
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

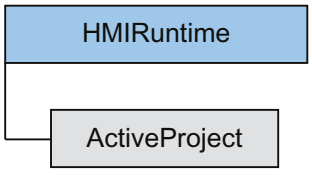
DataLogs (Page 5313)

AlarmLogs (Page 5236)

HMIRuntime (Page 4993)

Project

Description



Using the object, you can query information from the current Runtime project.

The project object is returned as the result of ActiveProject.

Usage

You can read the following using the "Project" object:

- The path of the current Runtime project ("Path" property)
- The name of the current Runtime project, without path or file extension ("Name" property)

Example

The following example returns name and path of the current Runtime project as a trace:

```
'VBS159
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

See also

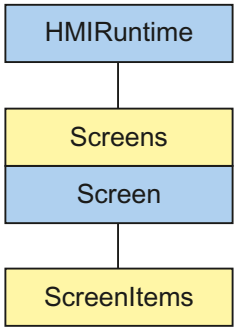
ActiveProject (Page 5226)

Name (Page 5426)

Path (Page 5450)

Screen

Description



Represents the screen which is being displayed on the HMI device at the moment or the permanent window in Runtime. The screen object is returned as a result of accessing the screen list.

The screen object also contains the following lists:

- You can address all the graphic objects in the addressed screen using the "ScreenItems" list.
- You can address all the layers in the addressed screen using the "Layers" object.

Application

You can use the screen object for the following actions, for example:

- "Width" and "Height" properties
  Reading the width and height of a screen
- "BackColor" property
  Changing the background color

Use the object name as an index.

Example

In the following example, the background color is changed from black to green:

```
'VBS_Example_BackColor
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

Parent object

Screen window in which the screen object is embedded.

If the screen object is the root screen, the parent object is not defined and set to zero.

Note

If you perform a screen change, the open references to screens that are no longer available will become invalid. As a result, it is no longer possible to work with these references.

Example

In the following example, the width of the first screen is increased by 20 pixels in Runtime:

```
'VBS7
Dim objScreen
Set objScreen = HMIRuntime.Screens(1)
MsgBox "Screen width before changing: " & objScreen.Width
objScreen.Width = objScreen.Width + 20
MsgBox "Screen width after changing: " & objScreen.Width
```

Notes on Cross References

All the screens you address with the standard formulation are automatically compiled by the CrossReference of WinCC and then listed in the screen properties.

```
HMIRuntime.BaseScreenName = "Screenname"
```

If you call screens with different formulations in the code, you make them known by the following section of the CrossReference:

```
' ' WINCC:SCREENNAME_SECTION_START
Const ScreenNameInAction = "ScreenName"
' WINCC:SCREENNAME_SECTION_END
The section can be inserted in VBS actions as often as required.
```

AccessPath (Page 5226)

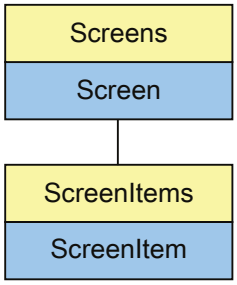
HMIRuntime (Page 4993)

ScreenItems (list) (Page 5006)

Screen object (list) (Page 5008)

ScreenItem

Description



Represents an object in the specified screen. The ScreenItem object is an element of the ScreenItems list.

Application

You can use the ScreenItem object to access the properties of graphic objects within a screen, depending on certain events.

You use the "ScreenItem" object as follows, for example:

- "Visible" property
  Switch the visibility of an object on or off.
- "Height" and "Width" properties
  Query the width and height of an object.
- "Top" and "Left" properties
  Change the position of an object.
- "ObjectName" property
  Read the name of a graphic object
- "Parent" property
  Set a reference to the parent screen

Use the ScreenItems property to return an object to the screen. Use the object name as an index.

Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
'VBS_Example_ScreenItems

Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

Note

To save memory space in the HMI device, no object names are loaded during transfer of the project. If you still want to transfer object names, call up the Runtime settings for the respective HMI device in WinCC. You can change the setting under "General". The object name is required when the object should be accessed via the object name or for debugging a project.

The "ScreenItem" object has different properties depending on its features. The following properties are provided for every "ScreenItem" object:

- Enabled
- Height
- Left
- ObjectName
- Parent
- Top
- Type
- Visible
- Width

If a specific object type is addressed, further properties are added to the standard properties. The additional properties are provided in the descriptions of the individual object types.

Activate (Page 5825)

Layer (Page 5384)

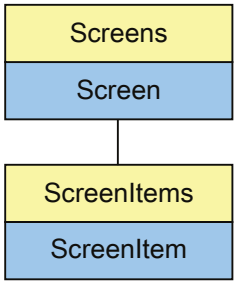
Screen (Page 5000)

ScreenItems (list) (Page 5006)

Screen object (list) (Page 5008)

ScreenItems (list)

Description



A list of ScreenItem objects with all screen objects of the specified screen. The list has a "Parent" property. This "Parent" property provides a reference to the screen in which the screen object is located.

Usage

You use the "ScreenItems" list as follows:

- To edit or output all objects within the list (that is, all objects within a screen)
- "Count" property
  Count the objects of a screen
- "Item" method
  Work on a particular object in the list

Use the screen items property to return an object from the screen. Use the object name as an index.

Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

Peculiarities of the ScreenItem object

If you embed an external control (ActiveX control or OLE object) in WinCC, the properties of the embedded control may have the same names as the general properties of the ScreenItem object. In this case, the ScreenItem properties take priority.

You can address the properties of the embedded controls, however, via the "object" property. The "object" property is only available in ActiveX controls and OLE objects.

Example:

```
'Control1 is an embedded ActiveX-Control with property "type"
'VBS196
Dim Control
Set Control=ScreenItems("Control1")
Control.object.type

'Control1 is a WinCC-Control
'VBS197
Dim Control
Set Control=ScreenItems("Control1")
Control.type
```

Example

In the following example, you output the name of the objects in the current screen in a message box:

```
Sub OnClick(ByVal Item)
'VBS6
Dim lngAnswer
Dim lngIndex
lngIndex = 1
For lngIndex = 1 To ScreenItems.Count
lngAnswer = MsgBox(ScreenItems(lngIndex).Objectname, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
End Sub
```

See also

Item (Page 5891)

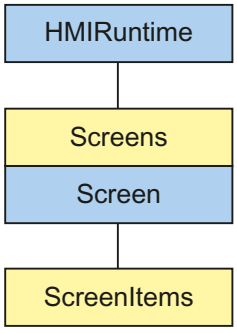
ScreenItem (Page 5003)

Screen (Page 5000)

Screen object (list) (Page 5008)

Screen object (list)

Description



Several screens can be opened simultaeously in WinCC Runtime by means of the screen window technique, whereby there is only one main screen. The "Screens" list allows access to all open screens in Runtime using the screen name. The screen list contains all hidden screens.

The access key required in the VBS environment in the HMIRuntime.Screens(<access key>) instruction must conform to the following syntax description:

```
[<Root screen name>.]<Screen window name>[:<Screen name>] ...
.<Screen window name>[:<Screen name>]
```

- The access key represents the screen hierarchy.
- You can omit the screen name at all locations in the key.
- The "AccessPath" property of the "Screen" object corresponds to the full access key.
- The root screen can be addressed via the "" access key.

Examples

The screens are addressed by specifying the hierarchy in the list. You can address the screens with or without using the screen names. In the following example, a "BaseScreenName" root screen is configured with a "ScreenWindow". The screen window contains a "ScreenName" screen.

Addressing using the screen name

```
'VBS8
Set objScreen = HMIRuntime.Screens("BaseScreenName.ScreenWindow:ScreenName")
```

Addressing without using the screen name

```
'VBS9
Set objScreen = HMIRuntime.Screens("ScreenWindow")
```

Referencing the root screen in various ways

```
'VBS10
Set objScreen = HMIRuntime.Screens(1)

'VBS11
Set objScreen = HMIRuntime.Screens("")

'VBS12
Set objScreen = HMIRuntime.Screens("BaseScreenName")
```

See also

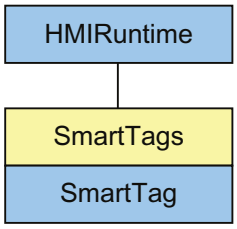
HMIRuntime (Page 4993)

Screen (Page 5000)

ScreenItem (Page 5003)

SmartTag

Description



Represents the value of the specified process tag. The SmartTag object is an element of the SmartTag list.

Application

The SmartTag object provides read and write access to the value of the specified process tag. The SmartTag object does not return an object reference. Use the SmartTags list to return the value of a process tag. Use the tag name as an index.

Note

With the "SmartTags reads values from the cache" setting, values are read from the process image (cache) instead of directly from the controller.

The SmartTag object can also read values directly from the controller. However, you can then expect a substantially higher communication load between the HMI device and the controller.

Example

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Note

If you want to return the "TypeName" of a SmartTag object data type with the VBS function "TypeName", use the following syntax:

```
TypeName(SmartTags("FillLevel").value)
```

Use "SmartTags("<tag>")(index)" to access the value of an array element. Set the number of the desired array element for "index", for example, "SmartTags("AirPressure")(2)".

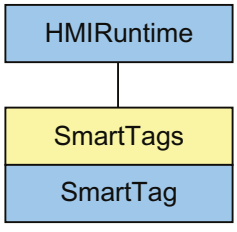
See also

HMIRuntime (Page 4993)

SmartTags (Page 5011)

SmartTags

Description



A list of SmartTag objects which represent all of the tags in WinCC Runtime.

Note

The SmartTags list has a limited range of functions. You can only use the tag names to access a SmartTag object. Access via the index or by using "For each" instruction is not supported.

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Application

Use the SmartTags list to return a SmartTag object. Use the tag name to reference the SmartTag object.

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

In Runtime Advanced and Panels you address the tag directly using its name. If the tag name corresponds to the VBS name conventions, you do not need to use the SmartTags list. Follow the example below:

```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(AirPressure)
HMIRuntime.Trace strAirPressure
```

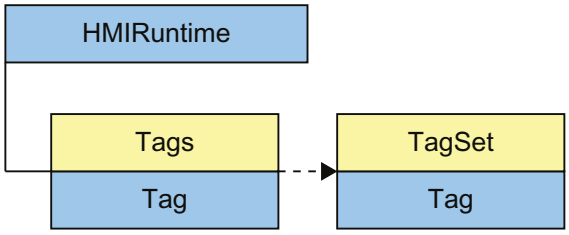
See also

HMIRuntime (Page 4993)

SmartTag (Page 5009)

Tag

Description



A tag object is returned via the "Tags" list. A tag object can be used to address all the properties and methods of a tag.

When creating a tag object, all the properties are initialized with the following values:

- Value = VT_EMPTY
- Name = Tag name
- QualityCode = BAD NON-SPECIFIC
- TimeStamp = 0
- LastError = 0
- ErrorDescription = " "

Note

A summary of possible Quality Codes can be found in WinCC Information System under key word "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

Usage

Use the "Tag" object as follows:

- "Name", "QualityCode", "TimeStamp", "LastError" and "ErrorDescription" properties
  Read information on the tag
- "Write" method, "Value" property
  Set a value for a tag
- "Read" method, "Value" property
  Read a value for a tag

Example

The following example reads the value in the "Tag1" tag:

```
'VBS13
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read()
MsgBox objTag.Value
```

Declaration of tags in WinCC

Always define internal tags in VB script using the "Dim" instruction in order to prevent writing tags wrongly.

When creating a new action, the "Option explicit" instruction is automatically entered in the declaration area and cannot be deleted.

Do not use the "Option explicit" statement in your code as it can lead to Runtime errors.

Example

The following example reads the declaration value in the "lngVar" VB Script tag:

```
'VBS14
Dim lngVar
lngVar = 5
MsgBox lngVar
```

Note

Tag names must not contain any special characters.

When creating a tag, ensure it does not contain a value (Value = VT_EMPTY). Initialize the tags after declaration with the corresponding value.

Notes on Cross References

All the pictures which are addressed with the standard formulation

```
HMIRuntime.Tags("Tagname")
```

are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

If you address tags with different formulations in the code, you can make them known by the following section of the CrossReference:

```
' ' WINCC:TAGNAME_SECTION_START
Const TagNameInAction = "TagName"
' WINCC:TAGNAME_SECTION_END
```

The section can be inserted in VBS actions as often as required.

Note

Composed tag names may not be recognized by the CrossReference.

Timestamp (Page 5556)

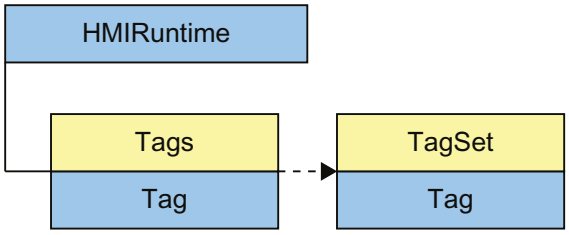
HMIRuntime (Page 4993)

Tags (list) (Page 5016)

TagSet (list) (Page 5017)

Tags (list)

Description



The "Tags" list enables access to tags in WinCC Runtime. The result of access to the "Tags" list is returned by an object of the type "Tag". The Tag object can be used to access all the tag properties and methods.

Note

"Tags" is a list with a restricted functional scope. The tags in the list cannot be accessed via the index but only by using the tag names. The standard methods get_Count and get_NewEnum cannot be used in the Tags list.

Application

Tags in the list are accessed via:

```
HMIRuntime.Tags("Tagname")
```

The Tags list is used to declare tags (tag objects) for read and write access. The appropriate HMI tags must exist in order for the write and read acccess to be executed without error.

You can address HMI tags directly in VBScript and set and read values. If you wish to inquire about additional tag properties, such as quality code or time stamp, or wish to execute error processing, you must address the tag through tags list. The tag object returned enables access to all tag properties and methods.

Using the "CreateTagSet" method, you may generate a TagSet object which allows simultaneous access to several tags.

Example

You use tag names when you set tags.

```
'VBS16
Dim objTag
Set objTag = HMIRuntime.Tags("Tagname")
If you only use the tag name, the "TagPrefix" property is assigned the values from the
current context (the current screen window).
```

See also

HMIRuntime (Page 4993)

Tag (Page 5012)

TagSet (list) (Page 5017)

TagSet (list)

Description

The "TagSet" object enables simultaneous access to several tags in one call. Simultaneous access demonstrates better performance and lower communication load than single access to multiple tags.

Usage

You can use the TagSet object as follows:

- "Add" method
  Add tags to the list
- "Item" method
  Access tag objects contained in the list and their properties
- "Write" method
  Write all tags of the list
- "Read" method
  Read all tags of the list
- "Remove" method
  Remove single tags from the list
- "RemoveAll" method
  Remove all tags from the list

Tags in the list are accessed via:

```
'VBS169
Dim myTags
myTags = HMIRuntime.Tags.CreateTagSet
myTags("Tagname")
```

In order to have error-free read/write access to tags (tag objects) of the list, the respective tags must exist in WinCC.

If a read/write access error has occurred, the method used will return an error message using the "LastError" and "ErrorDescription" properties.

Example

The following example shows how to generate a TagSet object, how to add tags, and how to write values.

```
'VBS168
'Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
'Add Tags to the Collection
group.Add "Motor1"
group.Add "Motor2"
'Set the Values of the Tags
group("Motor1").Value = 3
group("Motor2").Value = 9
'Write the Values to the DataManager
group.Write
```

ErrorDescription (Page 5327)

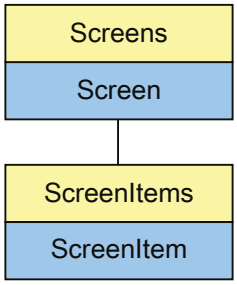
LastError (Page 5383)

Object types

Objects A-I

AlarmControl

Description



Represents the "Alarm view" object. The AlarmControl object is an element of the ScreenItems list.

Type identifier in VBS

HMIAlarmControl

Example

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS54
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 10
```

A	RT Advanced
P	RT Professional

Table 12-19 Properties

Properties	Read	Write	Description
Activate (Page 5739)	P	P	Specifies whether the data to be visualized is requested by the alarm server.
AlarmListType	P	P	Specifies the alarm classes to be reported in runtime.
AllServer	P	P	Sets the display of the alarms of all available servers.
ApplyProjectSettings (Page 5243)	P	P	Specifies whether the project settings from the "HMI alarms" editor are applied.
ApplyProjectSettingsForDesign-Mode	P	P	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 5247)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 5247)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.
AutoSelectionColors (Page 5248)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 5249)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
Blocks	P	P	Sets the alarm blocks.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
Caption (Page 5287)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 5289)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 5290)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 5290)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 5291)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 5291)	P	P	Specifies the top margin of the table cells.
Closeable (Page 5295)	P	P	Specifies that the control can be closed in runtime.
ColumnResize (Page 5299)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 5300)	P	P	Specifies the scroll bar type.
ColumnTitleAlignment (Page 5303)	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 5303)	P	P	Specifies whether the column title is displayed.
ControlDesignMode (Page 5507)	P	P	Specifies the design.
DefaultMsgFilterSQL	P	P	Specifies an SQL statement as default for alarm filters.

Properties	Read	Write	Description
DefaultSort	P	P	Specifies the sorting order.
DefaultSort2	P	P	Specifies the sorting order.
DefaultSort2Column	P	P	Specifies the sorting order.
DisplayOptions (Page 5318)	P	P	Specifies the alarms to be displayed.
DoubleClickAction (Page 5318)	P	P	Specifies the action to be executed in runtime by double-clicking an alarm row.
ExportDirectoryChangeable (Page 5328)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 5329)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 5330)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 5330)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 5331)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 5331)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 5332)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 5332)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 5333)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 5334)	P	P	Specifies whether the data export dialog is shown in runtime.
Filters	P	P	Specifies database criteria in SQL syntax.
Font (Page 5348)	P	P	Specifies or returns the font.
GridLineColor (Page 5356)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 5357)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HitlistColumnAdd (Page 5364) *	P	P	Transfers the selected alarm block from the list of available alarm blocks to the list of selected alarm blocks.
HitlistColumnCount (Page 5365) *	P	P	Sets the number of selected alarm blocks to be displayed in the hitlist in runtime.
HitlistColumnIndex (Page 5365)	P	P	References an alarm block that is selected for the hitlist.
HitlistColumnName (Page 5366) *	P	P	Displays the name of the alarm block of the hitlist that is referenced by means of the "HitlistColumnIndex" attribute.
HitlistColumnRemove (Page 5366) *	P	P	Cuts the marked alarm block from the list of selected alarm blocks and pastes it into the list of existing alarm blocks.
HitlistColumnRepos (Page 5367) *	P	P	Changes the sorting order of the alarm blocks. The "Up" and "Down" commands move the selected alarm block accordingly in the list.
HitlistColumnSort (Page 5367) *	P	P	Specifies the sorting order in the hitlist for the alarm block that is referenced in "MessageColumnIndex".
HitlistColumnSortIndex (Page 5368) *	P	P	Specifies the sorting order in the hitlist for the alarm block that is referenced in "HitlistColumnIndex".

Properties	Read	Write	Description
HitlistColumnVisible (Page 5368) *	P	P	The list displays the selected alarm blocks from the alarm list or hitlist that are to be used in the control in runtime.
HitListDefaultSort (Page 5369)	P	P	Sets the default sorting order in the table columns of the hitlist.
HitListMaxSourceItems (Page 5369)	P	P	Sets the maximum number of data records from the alarm log that are to be used to create the hit list.
HitListMaxSourceItemsWarn (Page 5370)	P	P	Sets the output of a warning on reaching the maximum number of data records that was specified in "HitlistMaxSourceItems".
HitListRelTime (Page 5371)	P	P	Sets a time range for the statistics.
HitListRelTimeFactor	P	P	Sets the time factor that is used in combination with the "HitlistRelativeTimeFactorType" to calculate the period for creating the hitlist statistics.
HitListRelTimeFactorType	P	P	Sets the time type that is used in combination with the "HitlistRelativeTimeFactor" to calculate the period for creating the hitlist statistics.
HorizontalGridLines (Page 5373)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 5375)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 5384)	P	P	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 5398)	P	P	Sets the color of the window separation lines.
LineWidth (Page 5400)	P	P	Specifies the line thickness of the selected object.
LongTermArchiveConsistency (Page 5403)	P	P	If "LongTimeArchiveConsistency" is set to "No", 1000 alarms will be displayed in the historical alarm list (long-term) on the single station, on the server, or on the client for each server or redundant server pair.
MessageBlockAlign (Page 5407) *	P	P	Sets the mode of alignment for the table contents of the selected alarm block.
MessageBlockAutoPrecisions (Page 5407) *	P	P	Enables automatic setting of the number of decimal places.
MessageBlockCaption (Page 5408) *	P	P	Specifies the caption of the column header in the alarm view for the selected alarm block.
MessageBlockCount (Page 5408)	P	P	Specifies the number of alarm blocks that are available for the alarm list and hitlist.
MessageBlockDateFormat (Page 5409) *	P	P	Specifies the date format for displaying the alarms.
MessageBlockExponentialFormat (Page 5409) *	P	P	Specifies the exponential notation for visualization of the values of a selected alarm block.
MessageBlockFlashOn (Page 5410) *	P	P	Enables flashing of the selected alarm block in runtime when an alarm appears.
MessageBlockHideText (Page 5410) *	P	P	Enables the textual display of the content of the selected alarm block.
MessageBlockHideTitleText (Page 5411) *	P	P	Specifies textual display of the caption of the selected alarm block.
MessageBlockId (Page 5411)	P	P	Specified assignment of ID number and alarm block in the alarm view.
MessageBlockIndex (Page 5411)	P	P	References an existing alarm block.
MessageBlockLeadingZeros (Page 5412) *	P	P	Enables the display of the selected alarm block with leading zeroes.

Properties	Read	Write	Description
MessageBlockLength (Page 5412) *	P	P	Specifies the length of the selected alarm block based on the number of characters.
MessageBlockName (Page 5413)	P	P	Displays the name of the selected alarm block.
MessageBlockPrecision (Page 5413) *	P	P	Specifies the number of decimal places for the values of the selected alarm block.
MessageBlockSelected (Page 5414) *	P	P	Existing alarm blocks are blocks that are available for use in the control in runtime for the alarm list or hitlist.
MessageBlockShowDate (Page 5414) *	P	P	Specifies whether to display both the date and time in the "Time" alarm block.
MessageBlockShowIcon (Page 5415) *	P	P	Enables the display of the content of the selected alarm block as icon.
MessageBlockShowTitleIcon (Page 5415) *	P	P	Specifies textual display of the caption of the selected alarm block.
MessageBlockTextId (Page 5416)	P	P	Specifies naming of the selected alarm block by means of a text ID that was taken from the text library.
MessageBlockTimeFormat (Page 5416) *	P	P	Specifies the format for the time or period used to display the alarms.
MessageColumnAdd (Page 5417) *	P	P	Adds the selected alarm block from the list of available alarm blocks to the list of selected alarm blocks.
MessageColumnCount (Page 5418) *	P	P	Specifies the number of alarm blocks to be displayed in the alarm list in runtime.
MessageColumnIndex (Page 5418)	P	P	References an alarm block selected for the alarm list.
MessageColumnName (Page 5419) *	P	P	Shows the name of the alarm block from the alarm list, which is referenced by means of the "MessageColumnIndex" property.
MessageColumnRemove (Page 5419) *	P	P	Cuts the marked alarm block from the list of selected alarm blocks and pastes it into the list of existing alarm blocks.
MessageColumnRepos (Page 5420) *	P	P	Changes the sorting order of the alarm blocks. The "Up" and "Down" commands move the selected alarm block accordingly in the list.
MessageColumnSort (Page 5420) *	P	P	Specifies the sorting order for the alarm block that is referenced in "MessageColumnIndex" .
MessageColumnSortIndex (Page 5421) *	P	P	Specifies the sorting order for the alarm block that is referenced in "MessageColumnIndex".
MessageColumnVisible (Page 5421) *	P	P	The list shows the selected alarm blocks of the alarm list or hitlist that are are used in the alarm view in runtime.
Moveable (Page 5425)	P	P	Specifies whether the window can be moved in runtime.
MsgFilterSQL (Page 5425)	P	P	Specifies one or several SQL statements for user-defined selection of the alarms.
Name (Page 5426)	P	P	Returns the object name as STRING.
OperatorAlarms	P	P	Specifies the operator message settings.
OperatorMessageId (Page 5435) *	P	P	Default assignment of the ID number and trigger event in the alarm view.
OperatorMessageIndex (Page 5436) *	P	P	References the operator message event.
OperatorMessageName (Page 5437) *	P	P	On alarm events, this displays the name that is referenced by means of "OperatorMessageIndex" for operator alarms.

Properties	Read	Write	Description
OperatorMessageNumber (Page 5437) *	P	P	Specify an alarm number for the operator message of the selected alarm event if you do not use the operator message of WinCC.
OperatorMessageSelected (Page 5438) *	P	P	Activate the alarm events of the list that trigger operator messages.
OperatorMessageSource1 (Page 5438) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 1" of the operator message configured in Source.
OperatorMessageSource10 (Page 5443) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 10" of the operator message configured in Source.
OperatorMessageSource2 (Page 5439) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 2" of the operator message configured in Source.
OperatorMessageSource3 (Page 5439) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 3" of the operator message configured in Source.
OperatorMessageSource4 (Page 5440) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 4" of the operator message configured in Source.
OperatorMessageSource5 (Page 5440) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 5" of the operator message configured in Source.
OperatorMessageSource6 (Page 5441) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 6" of the operator message configured in Source.
OperatorMessageSource7 (Page 5441) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 7" of the operator message configured in Source.
OperatorMessageSource8 (Page 5442) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 8" of the operator message configured in Source.
OperatorMessageSource9 (Page 5442) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 9" of the operator message configured in Source.
OperatorMessageSourceType1 (Page 5444) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType10 (Page 5448) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType2 (Page 5444) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType3 (Page 5445) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType4 (Page 5445) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType5 (Page 5446) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType6 (Page 5446) *	P	P	Specifies the format of the source content to be transferred.

Properties	Read	Write	Description
OperatorMessageSourceType7 (Page 5447) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType8 (Page 5447) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType9 (Page 5448) *	P	P	Specifies the format of the source content to be transferred.
PageMode (Page 5449)	P	P	Sets the page orientation (portrait / landscape).
PageModeMessageNumber (Page 5449)	P	P	Defines the number of alarm shown per page when paging the historical alarm list (long-term).
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 5465)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 5466)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistenceAuthorization (Page 5716)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 5467)	-	-	Specifies how online configurations of WinCC are retained.
SelectedCellColor (Page 5478)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 5479)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 5480)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 5481)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 5482)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 5482)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 5485)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 5486)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 5486)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 5487)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 5488)	P	P	Specifies the number of lines you can mark.
ServerNames (Page 5491)	P	P	Specifies the servers of a distributed system that form the data source for the alarm view.
ShowSortButton (Page 5500)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 5501)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 5501)	P	P	Specifies whether the sorting icon is displayed.
ShowTitle (Page 5504)	P	P	Specifies the representation of the control's window title.
Sizeable (Page 5506)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 5508)	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 5511)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 5512) *	P	P	Creates a new, user-defined status bar element.

Properties	Read	Write	Description
StatusbarElementAutoSize (Page 5512) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 5513) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 5514) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 5514) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 5515)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 5516) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 5516) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 5517) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 5517)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 5518) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 5518) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined element.
StatusbarElementVisible (Page 5519) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 5519) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 5520)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 5521)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 5521)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 5522)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 5523)	P	P	Specifies whether the status bar of the control is displayed.
TableColor	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2	P	P	Specifies the background color of "Row color 2".
TableForeColor	P	P	Specifies the font color of "Row color".
TableForeColor2	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 5540)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor	P	P	Specifies the color of the dark side of shading.
TitleForeColor	P	P	Specifies the font color of the table header for the selected status.

Properties	Read	Write	Description
TitleGridLineColor	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor	P	P	Specifies the color of the bright side of shading.
TitleSort	P	P	Specifies how sorting by column title is triggered.
TitleStyle	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment	P	P	Specifies or returns the position of the toolbar.
ToolbarBackColor	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex	P	P	References a button function.
ToolbarButtonLocked *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName *	P	P	Shows the name of the selected button function.
ToolbarButtonPasswordLevel *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove *	P	P	Removes the selected button function from the list.
ToolbarButtonRename *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
UseMessageColor (Page 5630)	P	P	Specifies whether scrolling is enabled.
UseSelectedTitleColor (Page 5630)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 5631)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 5644)	P	P	Specifies whether vertical separation lines are displayed.

Properties	Read	Write	Description
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-20 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5832)	P, A	Executes the "Connect backup" button function of the control.
CopyRows (Page 5833)	P	Executes the "Copy rows" button function of the control.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5837)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 5838)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetHistlistColumnCollection (Page 5841)	P	Returns the list of all column objects of the alarm view hitlist as "ICCAxCollection" type.
GetHitlistColumn (Page 5842)	P	Returns the column object of the alarm view hitlist designated by name or index as "ICCAxMessageColumn" type.
GetMessageBlock (Page 5843)	P	Returns the alarm block object of the alarm view designated by name or index as "ICCAxMessageBlock" type.
GetMessageBlockCollection (Page 5844)	P	Returns the list of all alarm block objects of the alarm view as "ICCAxCollection" type.
GetMessageColumn (Page 5846)	P	Returns the column object of the alarm view designated by name or index as "ICCAxMessageColumn" type.
GetOperatorMessage (Page 5847)	P	Returns the operator message object of the alarm view designated by name or index as "ICCAxOperatorMessage" type.
GetMessageColumnCollection (Page 5848)	P	Returns the list of all column objects of the message view as "ICCAxCollection" type.
GetOperatorMessageCollection (Page 5849)	P	Returns the list of all operator message objects of the alarm view as "ICCAxCollection" type.
GetRow (Page 5850)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 5851)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 5858)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5859)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusbarElement (Page 5865)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5866)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.

Methods	Valid	Description
GetToolbarButton (Page 5873)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 5874)	P, A	Returns the list of all button functions of the control toolbar as "ICCAx-Collection" type.
HideAlarm (Page 5890)	P	Executes the "Hide alarm" button function of the alarm view.
LockAlarm (Page 5893)	P	Executes the "Disable alarm" button function of the alarm view.
LoopInAlarm (Page 5893)	P	Executes the "Loop in alarm" button function of the alarm view.
MoveToFirstLine (Page 5895)	P	Executes the "First alarm" button function of the alarm view.
MoveToFirstPage (Page 5895)	P	Executes the "First page" button function of the alarm view.
MoveToLastLine (Page 5896)	P	Executes the "Last alarm" button function of the alarm view.
MoveToLastPage (Page 5897)	P	Executes the "Last page" button function of the alarm view.
MoveToNextLine (Page 5898)	P	Executes the "Next alarm" button function of the alarm view.
MoveToNextPage (Page 5898)	P	Executes the "Next page" button function of the alarm view.
MoveToPreviousLine (Page 5899)	P	Executes the "Previous alarm" button function of the alarm view.
MoveToPreviousPage (Page 5900)	P	Executes the "Previous page" button function of the alarm view.
Print (Page 5903)	P, A	Executes the "Print" button function of the control.
QuitHorn (Page 5904)	P	Executes the "Acknowledge central alarm generator" button function of the alarm view.
QuitSelected (Page 5904)	P	Executes the "Single acknowledgment" button function of the alarm view.
QuitVisible (Page 5905)	P	Executes the "Group acknowledgment" button function of the alarm view.
SelectAll (Page 5918)	P	Selects all rows in a table-based control.
SelectRow (Page 5919)	P	Selects a specific row in a table-based control.
ShowComment (Page 5921)	P	Executes the "Comment dialog" button function of the recipe view.
ShowDisplayOptionsDialog (Page 5922)	P	Executes the "Display options dialog" button function of the alarm view.
ShowEmergencyQuitDialog (Page 5922)	P	Executes the "Single acknowledgment" button function of the alarm view.
ShowHelp (Page 5923)	P, A	Executes the "Help" button function of the control.
ShowHideList (Page 5923)	P	Executes the "List of alarm to hide" button function of the alarm view.
ShowHitList (Page 5924)	P	Executes the "Hitlist" button function of the alarm view.
ShowInfoText (Page 5924)	P	Executes the "About dialog" button function of the alarm view.
ShowLockDialog (Page 5925)	P	Executes the "Lock dialog" button function of the alarm view.
ShowLockList (Page 5925)	P	Executes the "Lock list" button function of the alarm view.
ShowLongTermArchiveList (Page 5926)	P	Executes the "Historical alarm list (long-term)" button function of the alarm view.
ShowMessageList (Page 5926)	P	Executes the "Alarm list" button function of the alarm view.
ShowPropertyDialog (Page 5927)	P, A	Executes the "Configuration dialog" button function of the control.
ShowSelectionDialog (Page 5929)	P	Executes the "Selection dialog" button function of the alarm view.
ShowShortTermArchiveList (Page 5930)	P	Executes the "Historical alarm list (short-term)" button function of the alarm view.
ShowSortDialog (Page 5931)	P	Executes the "Sorting dialog" button function of the alarm view.
ShowTimebaseDialog (Page 5932)	P	Executes the "Timebase dialog" button function of the alarm view.
UnhideAlarm (Page 5935)	P	Executes the "Unhide alarm" button function of the alarm view.
UnlockAlarm (Page 5935)	P	Executes the "Unlock alarm" button function of the alarm view.

Methods	Valid	Description
UnselectAll (Page 5936)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5936)	P	Removes the selections from a specific cell of a table-based control.

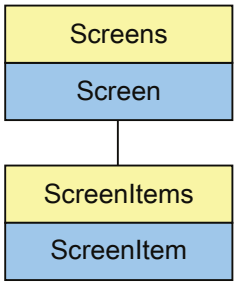
AlarmView

Description



Represents the "Alarm view" object. The MessageView object is an element of the ScreenItems list.

If you change the settings for this object with a user-defined function, the changed settings are retained even after the screen is called again.

Note

The object "Simple AlarmView" cannot be dynamized with a user-defined function.

Table 12-21 Properties

Properties	Read	Write	Description
AlarmAreaHeight **			
AlarmAreaWidth **			
AlarmClasses	-	-	Specifies the alarm classes to be reported in runtime.
AlarmLog	-	-	Specifies the alarm types to be displayed in the alarm view.
AlarmSource	-	-	Specifies that alarms should be displayed.
Authorization (Page 5245)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor	A	A	Specifies the background color of the selected object.
ButtonBarElements **			Specifies that the buttons will be displayed.
ButtonBarStyle	-	-	
Columns	-	-	Specifies the columns to be displayed.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
ColumnTextAckGroup	-	-	Specifies the header for the "AckGroup" column.
ColumnTextAlarmState	-	-	Specifies the header for the "State" column.
ColumnTextAlarmText	-	-	Specifies the header for the "Text" column.
ColumnTextClassName	-	-	Specifies the header for the "Class Name" column.
ColumnTextDate	-	-	Specifies the header for the "Date" column.
ColumnTextDevice	-	-	Specifies the header for the "Device" column.
ColumnTextDiagnosable	-	-	Specifies the header for the "Diagnosable" column.
ColumnTextNumber	-	-	Specifies the header for the "Number" column.
ColumnTextTime	-	-	Specifies the header of the "Time" column.
CountOfLinesPerAlarms	-	-	
CountOfVisibleAlarms	-	-	
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
FilterTag **			Specifies a tag of the string type for filtering alarm texts.
FilterText **			Specifies the text for filtering the alarm text.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth	A	A	Specifies the border width of the specified object when the object is in focus.
ForeColor	-	-	Specifies the font color of the text for the selected object.
GridlineColor	A	A	Specifies the color for the grid lines.

Properties	Read	Write	Description
Height (Page 5358)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalScrollingEnabled	-	-	
IsRunningUnderCE *	-	-	
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
LineAlarmView **			
Name (Page 5426)	A	A	Returns the object name as STRING.
PreferredUseOnAck	-	-	
S7Device	-	-	
SecurityForSimpleViewEnabled **			
SelectionBackColor (Page 5484)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 5485)	A	A	Specifies the foreground color of the selected cells.
SeparateLineForAlarmText	-	-	
ShowAcknowledgeButton	-	-	
ShowAlarmsFromDate (Page 5492)	A	A	Specifies that only those message events are displayed that are saved in this tag.
ShowAlarmsToAcknowledge	-	-	Specifies that unacknowledged alarms should be displayed.
ShowColumnHeaders	-	-	
ShowHelpButton	-	-	
ShowHorizontalGridlines	-	-	
ShowLoopInAlarmButton	-	-	Specifies that the "Loop-In-Alarm" button will be displayed.
ShowMilliseconds	-	-	Display time in milliseconds.
ShowPendingAlarms	-	-	
SortByTimeDirection (Page 5508)	-	-	Specifies whether the last incoming alarm is displayed at the top of the "AlarmControl" object.
SortByTimeEnabled (Page 5722)	A	A	Specifies whether the sorting order of alarms based on the time in the "AlarmControl" object can be changed.
TableBackColor (Page 5525)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor	A	A	Specifies the font color of "Row color".
TableHeaderBackColor (Page 5529)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 5530)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
VerticalScrollbarEnabled	-	-	
VerticalScrollingEnabled	-	-	
ViewType	-	-	Specifies the alarm view type.
ViewTypeForSaveStream **			Specifies the display type for the Save Stream.

Properties	Read	Write	Description
Visible (Page 5645) *	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES, ** no relevant information available

Table 12-23 Properties

Properties	Read	Write	Description
AlarmLowerLimit (Page 5236)	P	P	Specifies the low limit at which the interrupt is triggered.
AlarmLowerLimitColor (Page 5237)	P	P	Specifies the bar color of the "AlarmLowerLimit" limit.
AlarmLowerLimitEnabled (Page 5237)	P	P	Specifies whether the "AlarmLowerLimit" limit is monitored.
AlarmLowerLimitRelative (Page 5238)	P	P	Specifies whether the low limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.
AlarmUpperLimit (Page 5238)	P	P	Specifies the high limit that triggers the interrupt.
AlarmUpperLimitColor (Page 5239)	P	P	Specifies the bar color of the "AlarmUpperLimit" limit.

Properties	Read	Write	Description
AlarmUpperLimitEnabled (Page 5240)	P	P	Specifies whether the "AlarmUpperLimit" limit is monitored.
AlarmUpperLimitRelative (Page 5240)	P	P	Specifies whether the high limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
AverageLast15Values	P	P	Specifies that the average of the last 15 values is shown.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256) *	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257) *	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258) *	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258) *	P	P	Specifies the flash rate of the background for the selected object.
BarBackColor (Page 5259)	P, A	P, A	Specifies the color of the bar background for the selected object.
BarBackFillStyle (Page 5260)	P	P	Specifies the fill style for the bar.
BarBackFlashingColorOff	-	-	Specifies the border background color of the object for the "OFF" state.
BarBackFlashingColorOn	-	-	Specifies the border background color of the object for the "ON" state.
BarBackFlashingEnabled	-	-	
BarBackFlashingRate	-	-	Specifies the flash rate of the background.
BarEdgeStyle	-	-	Specifies the style of the border line.
BarOrientation	P	P	Specifies the alignment of the bar.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D	-	-	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
ColorChangeHysteresis (Page 5297)	P	P	Specifies the hysteresis as a percentage of the display value.
ColorChangeHysteresisEnabled (Page 5297)	P	P	Specifies whether the object is displayed with hysteresis.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
CountDivisions (Page 5308)	P	P	Specifies the number of segments into which the bar will be split by means of the large scale tick marks.

Properties	Read	Write	Description
CountSubDivisions (Page 5308)	A	A	Specifies the number of scale tick marks between two main tick marks of the "Bar" object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	P	P	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342) *	-	-	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 5344) *	-	-	Specifies the flash rate of the border line for the selected object.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
ForeColor (Page 5353)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
IntegerDigits (Page 5378)	P	P, A	Specifies the number of digits to the left of the decimal point (0 to 20).
LargeTickLabelingStep	-	-	Specifies which scale sections are labeled.
LargeTicksBold (Page 5381)	P	P	Specifies whether the long tick marks of a scale are shown in bold.
LargeTicksSize (Page 5381)	P	P	Specifies the length of the long tick marks of a scale.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
Limit4LowerLimit (Page 5389)	P	P	Specifies the low limit for "Reserve4".
Limit4LowerLimitColor (Page 5390)	P	P	Specifies the color for the "Reserve4" low limit.
Limit4LowerLimitEnabled (Page 5390)	P	P	Specifies whether the "Reserve4" low limit is monitored.
Limit4LowerLimitRelative (Page 5391)	P	P	Specifies whether the "Reserve4" low limit is evaluated as a percentage or an absolute value.
Limit4UpperLimit (Page 5392)	P	P	Specifies the high limit for "Reserve4".
Limit4UpperLimitColor (Page 5392)	P	P	Specifies the color for the "Reserve4" high limit.
Limit4UpperLimitEnabled (Page 5393)	P	P	Specifies whether the "Reserve4" high limit is monitored.
Limit4UpperLimitRelative (Page 5393)	P	P	Specifies whether the "Reserve4" high limit is evaluated as a percentage or an absolute value.
Limit5LowerLimit (Page 5394)	P	P	Specifies the low limit for "Reserve5".

Properties	Read	Write	Description
Limit5LowerLimitColor (Page 5394)	P	P	Sets the color for the "Reserve5" low limit.
Limit5LowerLimitEnabled (Page 5395)	P	P	Specifies whether the "Reserve5" low limit is monitored.
Limit5LowerLimitRelative (Page 5396)	P	P	Specifies whether the "Reserve5" low limit is evaluated as a percentage or an absolute value.
Limit5UpperLimit (Page 5396)	P	P	Specifies the high limit for "Reserve5".
Limit5UpperLimitColor (Page 5397)	P	P	Specifies the color for the "Reserve5" high limit.
Limit5UpperLimitEnabled (Page 5397)	P	P	Specifies whether the "Reserve5" high limit is monitored.
Limit5UpperLimitRelative (Page 5398)	P	P	Specifies whether the "Reserve5" high limit is evaluated as a percentage or an absolute value.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line ends.
MaximumValue (Page 5406)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 5422)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
Precision (Page 5455)	P	P	Specifies the number of decimal places (0 to 20).
ProcessValue (Page 5456)	P, A	P, A	Specifies the default for the value to be displayed.
ScaleColor (Page 5469)	P, A	P, A	Specifies the color of the scale of the selected object.
ScaleGradation (Page 5469)	P, A	P, A	Specifies the distance between two large tick marks of the scale.
ScaleLabelFieldLength *	-	-	Distance to the position of the axis label.
ScaleLabelingDoubleLined	-	-	Specifies that the horizontal bar orientation of the scale has two lines.
ScalePosition (Page 5470)	P	P	Specifies the position of the scale of the selected object.
ScaleStart	-	-	Specifies the minimum of the scale.
ScalingType (Page 5474)	P	P	Specifies the type of bar scaling.
SegmentColoring (Page 5477)	P, A	P, A	Specifies the type of color change to be displayed in the "Bar" object if limits are exceeded.
ShowBadTagState (Page 5493)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowLargeTicksOnly (Page 5496)	P	P	Specifies or returns the length of axis sections in pixels.
ShowLimitLines	-	-	Specifies the display of a line at the limits.
ShowLimitMarkers (Page 5496)	P	P	Specifies whether the limit values are shown as a scale value.
ShowScale (Page 5499)	P	P	Specifies whether the values are also shown in a scale.
ShowSignForPositiveLabel	-	-	Specifies that a "+" is displayed for positive labels.
ShowTickLabels (Page 5503)	-	-	Specifies whether the label is shown in the scale.
ShowTrendIndicator (Page 5506)	P	P	Specifies whether the trend (rising or falling) of the measured value to be monitored is indicated by means of a small arrow.
StartValue (Page 5510)	P	P	Specifies the zero point value for the scale display.
ToleranceLowerLimit (Page 5563)	P	P	Specifies whether the "ToleranceLowerLimit" limit is monitored.
ToleranceLowerLimitColor (Page 5564)	P	P	Specifies the color for the "ToleranceLowerLimit" low limit.

Properties	Read	Write	Description
ToleranceLowerLimitEnabled (Page 5565)	P	P	Specifies whether the "ToleranceLowerLimit" limit is monitored.
ToleranceUpperLimit (Page 5566)	P	P	Specifies whether the "ToleranceUpperLimit" limit is monitored.
ToleranceUpperLimitColor (Page 5566)	P	P	Specifies the color for the "ToleranceUpperLimit" high limit.
ToleranceUpperLimitEnabled (Page 5567)	P	P	Specifies whether the "ToleranceUpperLimit" limit is monitored.
ToleranceUpperLimitRelative (Page 5567)	P	P	Specifies whether the "ToleranceHigh" low limit is evaluated as a percentage or an absolute value.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
TrendIndicatorColor (Page 5595)	P	P	Specifies the color for the trend view.
Unit (Page 5622)	P, A	P, A	Specifies the unit of measurement in the "IOField" object.
UseAutoScaling	-	-	Specifies auto-scaling.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseExponentialFormat (Page 5629)	P	P	Specifies whether the numbers are displayed with exponentials (e.g. "1.00e+000").
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
WarningLowerLimit (Page 5648)	P	P	Specifies the "WarningLowerLimit" low limit.
WarningLowerLimitColor (Page 5649)	P	P	Specifies the color for the "WarningLowerLimit" low limit.
WarningLowerLimitEnabled (Page 5650)	P	P	Specifies whether the "WarningLowerLimit" limit is monitored.
WarningLowerLimitRelative (Page 5650)	P	P	Specifies whether the "WarningLowerLimit" low limit is evaluated as a percentage or an absolute value.
WarningUpperLimit (Page 5653)	P	P	Specifies the "WarningUpperLimit" high limit.
WarningUpperLimitColor (Page 5653)	P	P	Specifies the color for the "WarningUpperLimit" high limit.
WarningUpperLimitEnabled (Page 5654)	P	P	Specifies whether the "WarningUpperLimit" limit is monitored.
WarningUpperLimitRelative (Page 5654)	P	P	Specifies whether the "WarningUpperLimit" high limit is evaluated as a percentage or an absolute value.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
ZeroPoint (Page 5678)	P	P	Specifies the position of the zero point as a percentage of the bar height.

* not visible in the ES

Table 12-24 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-27 Properties

Properties	Read	Write	Description
AdaptBorder (Page 5232)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.

Properties	Read	Write	Description
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BitNumber (Page 5264)	-	-	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderBrightColor3D (Page 5268)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderShadeColor3D (Page 5277)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 5281)	P	P	Specifies the width of the border for 3D display of the selected object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	P	P	Specifies the line style of the selected object.
Enabled (Page 5323)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.

Properties	Read	Write	Description
FocusColor (Page 5346)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 5347)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 5353)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 5372)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
HotKey (Page 5374)	-	-	Specifies the hotkey.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line ends.
Mode (Page 5424)	P	P	Specifies the field type of the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
PictureAlignment (Page 5451)	P	P	Specifies or returns the display type of the background image in the process picture.
PictureList	-	-	Specifies the graphic list that supplies the object with values.
PictureOff (Page 5452)	P	P	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 5453)	P	P	Specifies the screen to be displayed in the "On" state.
Pressed (Page 5455)	P	P	Specifies whether the selected object is displayed in a pressed state.
ProcessValue	-	-	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 5524)	P	P	Specifies the display style for the object:
TextList (Page 5534)	-	-	A list that contains the assignments between the output value and the output text to be actually output.
TextOff (Page 5534)	P, A	P, A	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn	A	A	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 5536)	P	P	Specifies the text orientation of the selected object.
Toggle (Page 5562)	P	P	Specifies whether the selected object engages after it has been operated in runtime.
ToolTipText (Page 5581)	P	P, A	Specifies the tooltip text.

Properties	Read	Write	Description
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColorPictureOff (Page 5588)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOn (Page 5589)	P	P	Specifies the color to be set to "transparent" for the "On" state of the assigned bitmap object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColorPicture-Off (Page 5633)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOff" property is used for the "Off" state.
UseTransparentColorPictur-eOn (Page 5633)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOn" property is used for the "On" state.
VerticalAlignment (Page 5643)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowsStyle (Page 5659)	P	P	Specifies whether the object is displayed in the general Windows style.

Table 12-28 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-31 Properties

Properties	Read	Write	Description
AdaptBorder (Page 5232)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
CheckmarkAlignment (Page 5294)	P	P	Specifies whether the fields are right aligned.
CheckmarkCount (Page 5294)	P	P	Specifies the number of fields.
CornerStyle (Page 5306)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.

Properties	Read	Write	Description
EdgeStyle (Page 5320)	-	-	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 5353)	P	P	Specifies the font color of the text for the selected object.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 5372)	P	P	Specifies the horizontal alignment of the text within the selected object.
Index (Page 5375)	P	P	Specifies the background for grid control elements.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	-	-	Specifies the shape of the line ends.
LogOperation (Page 5403)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Name (Page 5426)	P	P	Returns the object name as STRING.
ProcessValue (Page 5456)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 5493)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
Text (Page 5533)	P	P	Specifies the label for the text field.
TextOrientation (Page 5536)	P	P	Specifies the text orientation of the selected object.
Texts	-	-	Specifies the texts for the check boxes.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.

Properties	Read	Write	Description
VerticalAlignment (Page 5643)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-32 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-33 Properties

Properties	Read	Write	Description
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P, A	P, A	Defines the fill pattern of the specified object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 5280)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	A	A	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.

Properties	Read	Write	Description
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
Radius	P	P, A	Specifies the radius of the selected object "Circle".
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-34 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Properties	Read	Write	Description
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.

Properties	Read	Write	Description
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle	P	P	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
EndAngle (Page 5325)	P	P	Specifies the angle at which the end point of the selected object deviates from the zero position (0°).
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
Name (Page 5426)	P	-	Returns the object name as STRING.
Radius	P	P	Specifies the radius of the selected object "Circle".
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
StartAngle (Page 5509)	P	P	Specifies the SQL statement.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.

Properties	Read	Write	Description
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-36 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.

Table 12-39 Properties

Properties	Read	Write	Description
Analog (Page 5241)	P	P	Specifies whether the clock is displayed as an analog clock.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
DialColor (Page 5314)	P, A	P, A	Specifies the color of the dial in the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 5348)	-	-	Specifies or returns the font.

Properties	Read	Write	Description
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HourNeedleHeight (Page 5374)	P, A	P, A	Specifies the length of the hour hand in the "Clock" object.
HourNeedleWidth (Page 5374)	P, A	P, A	Specifies the width of the hour hand in the "Clock" object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LockSquaredExtent (Page 5402)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
MinuteNeedleHeight (Page 5423)	P, A	P, A	Specifies the length of the minute hand in the "Clock" object.
MinuteNeedleWidth (Page 5423)	P, A	P, A	Specifies the width of the minute hand in the "Clock" object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
NeedleBorderColor (Page 5428)	P, A	P, A	Specifies the name of the data source.
NeedleColor (Page 5429)	P, A	P, A	Specifies the hand color in the "Clock" object.
NeedleFillStyle (Page 5430)	P	P	Specifies the fill style for the clock hand.
Picture (Page 5451)	-	-	Specifies the screen to be displayed in the graphics object in runtime.
SecondNeedleHeight (Page 5476)	P, A	P, A	Specifies the length of the seconds hand in the "Clock" object.
SecondNeedleWidth (Page 5477)	P, A	P, A	Specifies the width of the seconds hand in the "Clock" object.
ShowFocusRectangle (Page 5496)	P	P	Specifies whether the button receives a selection border when it is activated in runtime.
ShowTicks (Page 5504)	P, A	P, A	Specifies whether the tick marks are displayed in the scale of the object.
TicksColor (Page 5537)	P, A	P, A	Specifies the scale display.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-40 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-41 Properties

Properties	Read	Write	Description
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BorderEndStyle (Page 5270)	P	P	Specifies the type of line ends for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
Color (Page 5296)	P	P	Specifies the line color of the selected object.
ConnectionType (Page 5304)	P	P	Specifies the type of connector. You can select one of two connection types.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
EndStyle (Page 5326)	-	-	Specifies how the line end of the selected object is displayed.
FirstConnectedObjectIndex (Page 5339)	P	P	Specifies the index number of the upper connector point.
FirstConnectedObjectName (Page 5339)	P	P	Specifies the name of the object that is docked to the upper connector point.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
LastConnectedObjectIndex (Page 5382)	P	P	Specifies the index number of the connection point to the last connected object.
LastConnectedObjectName (Page 5382)	P	P	Specifies the name of the object that is docked to the lower connector point.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
LineWidth (Page 5400)	P	P	Specifies the line thickness of the selected object.
Name (Page 5426)	P	P	Returns the object name as STRING.
Points *	-	-	Specifies the corner points.
StartStyle	-	-	Specifies how the line start of the selected object is displayed.

Properties	Read	Write	Description
Style (Page 5523)	P	P	Specifies the line style of the selected object.
SwapFirstWithLastConnection (Page 5524)	P	P	Specifies whether the text in the object is shown horizontally.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies that the font size from the data source should be used.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Properties	Read	Write	Description
Authorization (Page 5245)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor	A	A	Specifies the background color of the selected object.
BackFillStyle	-	-	Defines the fill pattern of the specified object.
BorderBackColor (Page 5266) *	-	-	Specifies the background color of the broken border line for the selected object.
BorderColor	A	A	Specifies the line color of the object.

Properties	Read	Write	Description
BorderStyle3D (Page 5279)	A	A	Specifies whether the object has a 3D border shading.
DisplaySystemTime	-	-	Specifies that the system time is displayed.
EdgeStyle	-	-	Specifies the line style of the selected object.
Enabled	A	A	Specifies whether the selected object can be operated in runtime.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 5348) *	-	-	Specifies or returns the font.
ForeColor	A	A	Specifies the font color of the text for the selected object.
Format	-	-	Specifies that the format of the text block is displayed.
Height (Page 5358)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 5362)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment	A	A	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	A	A	Specifies the value of the X coordinate of the object.
LineWrap *	-	-	Specifies the line break within the object.
LongDateTimeFormat	-	-	Specifies that the date and time are displayed in long format.
Mode (Page 5424)	-	-	Specifies the field type of the selected object.
Name (Page 5426)	A	-	Returns the object name as STRING.
ProcessValue (Page 5456)	A	A	Specifies the default for the value to be displayed.
ShowDate	-	-	Specifies that the date is to be displayed.
ShowTime	-	-	Specifies that only the time is displayed.
Top (Page 5582)	A	A	Specifies the value of the Y coordinate of the object.
VerticalAlignment (Page 5643)	A	A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645) *	A	A	Specifies whether the selected object is visible.
Width (Page 5655)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Properties	Read	Write	Description
Alarm (Page 5234)	P	P	Specifies the limit for the memory space view from which an alarm is output.
AlarmColor (Page 5235)	P	P	Specifies the alarm types to be displayed in the alarm view.
Drive (Page 5320)	P	P	Specifies the characters of the drive that is to be monitored.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
Free (Page 5354)	P	P	Returns the size of the free memory space.
FreePercent (Page 5355)	P	P	Returns the measured values for the free disk space as a percentage.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Interval (Page 5378)	P	P	Specifies the time interval for updating the displayed measured values.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
Name (Page 5426)	P	-	Returns the object name as STRING.
NormalColor	P	P	Specifies the color of the object in the normal range.
Tolerance (Page 5562)	P	P	Specifies the limit for the storage space display as of which a deviation will be reported.
ToleranceColor (Page 5563)	P	P	Specifies the colors in which the bars of the memory space display are shown as soon as the tolerance range is exceeded.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
Total (Page 5585)	P	P	Returns the storage capacity.
Used (Page 5625)	P	P	Specifies whether scrolling is enabled.
UsedPercent (Page 5628)	P	P	Returns the measured values for the occupied memory space as a percentage.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Warning (Page 5647)	P	P	Specifies the limit for the memory space view from which a warning is output.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

See also

Screen object (list) (Page 5007)

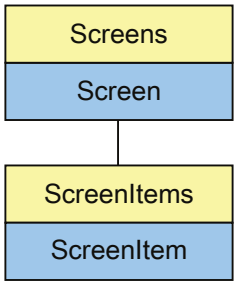
ForeignControl

Description



Object Type of ScreenItem Object. Represents the graphic object "Control"

The control object type always assumes the properties of the control type selected. In the case of controls provided by WinCC, the properties are indicated under the description of the corresponding control.

In the case of controls from external suppliers, the control properties are supplied and thus not a part of this description. However, the control properties can be queried using the "Item" property.

Type Identifier in VBS

Special WinCC type descriptions or version-independent ProgID

Use

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS36
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 10
```

Special feature

The controls provided by WinCC return a special ID as the type. It can be found under the topic "Type Identification in VBS" in the individual descriptions of the WinCC controls.

Access to specific properties instead of event parameters of the third-party controls

The parameter list of an event with third-party control is not read in WinCC. To have access to custom parameters of control events, you need to implement properties in the control instead of parameters.

The following code example shows the source code of the "UserControlTestModify" control, in which the "Title" and "Description" properties are defined instead of parameters.

```
public partial class UserControlTestModify : UserControl
    {
        public event MyEventHandler MyEvent = null;

        public string Title
        {
            get;
            private set;
        }

        public string Description
        {
            get;
            set;
        }

        public UserControlTestModify()
        {
            InitializeComponent();
        }
        private void OnMyEvent(Exception e)
        {
            if (this.MyEvent!= null)
            {
               //  Place place data in Properties before invoking event.
                Title = "title";
                Description = "description"; ";
                this.MyEvent.Invoke();
            }
        }

        private void button1_Click(object sender, EventArgs e)
        {
            this.OnMyEvent (null);
        }
    }
```

The specific properties of a third-party control are not displayed in WinCC with IntelliSense.

The following example shows how to access the specific "Title" property of the third-party control "FControl" in WinCC :

```
HMIRuntime.Screens("StartScreen").ScreenItems("FControl").Title = "MyForeignControl"
```

ProgID and UserfriendlyName of third-party controls

The version-independent ProgID is returned as the type if non-WinCC controls are used.

It is possible to determine the version-dependent ProgID or "UserfriendlyName" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS37
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the UserFriendlyName as follows:

```
'VBS38
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property. Address the properties of an external control supplier as follows:

```
Control.object.type
```

The properties of the ScreenItem object are used in the case of identical names, if you use the following form:

```
Control.type
```

Table 12-55 Properties

Properties	Read	Write	Description
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
Height (Page 5358)	P	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
ObjectName (Page 5706)	P	-	Returns the object name as STRING.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.

Properties	Read	Write	Description
Type (Page 5809)	P	-	Returns the type of the specified object as STRING.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-56 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5832)	P, A	Executes the "Connect backup" button function of the control.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5837)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 5838)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetStatusbarElement (Page 5865)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5866)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 5873)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 5874)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetTrend (Page 5876)	P, A	Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.
GetTrendCollection (Page 5877)	P, A	Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.
GetTrendWindow (Page 5878)	P, A	Returns the trend window object of the f(t) or f(x) trend view designated by name or index as "ICCAxTrendWindow" type.
GetTrendWindowCollection (Page 5879)	P, A	Returns the list of all trend window objects of the f(t) or f(x) trend views as "ICCAxCollection" type.
GetXAxis (Page 5885)	P, A	Returns the X axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.
GetXAxisCollection (Page 5886)	P, A	Returns the list of all X axis objects of the f(x) trend view as "ICCAxCollection" type.
GetYAxis (Page 5888)	P, A	Returns the Y axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.
GetYAxisCollection (Page 5889)	P, A	Returns the list of all Y axis objects of the f(x) trend view as "ICCAxCollection" type.
MoveAxis (Page 5894)	P, A	Executes the "Move axes area" button function of the f(t) and f(x) trend views.
NextTrend (Page 5901)	P, A	Executes the "Next trend" button function of the f(t) and f(x) trend views.
OneToOneView (Page 5901)	P, A	Executes the "Original view" button function of the f(t) and f(x) trend views.

Methods	Valid	Description
PreviousTrend (Page 5903)	P, A	Executes the "Previous trend" button function of the f(t) and f(x) trend views.
Print (Page 5903)	P, A	Executes the "Print" button function of the control.
ShowHelp (Page 5923)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5927)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 5931)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 5932)	P, A	Executes the "Select time range" button function of the control.
ShowTrendSelection (Page 5933)	P, A	Executes the "Select trends" button function of the f(t) and f(x) trend views.
StartStopUpdate (Page 5933)	P, A	Executes the "Start" or "Stop" button function of the control.
ZoomArea (Page 5940)	P, A	Executes the "Zoom area" button function of the f(t) and f(x) trend views.
ZoomInOut (Page 5941)	P, A	Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.
ZoomInOutX (Page 5942)	P, A	Executes the "Zoom X axis +/-" button function of the f(x) trend view.
ZoomInOutY (Page 5943)	P, A	Executes the "Zoom Y axis +/-" button function of the f(x) trend view.
ZoomMove (Page 5943)	P, A	Executes the "Move trend area" button function of the f(t) and f(x) trend views.

Table 12-57 Properties

Properties	Read	Write	Description
AngleMax (Page 5242)	P, A	P, A	Specifies the angle for the scale end of the "Gauge" object.
AngleMin (Page 5242)	P, A	P, A	Specifies the angle for the scale start of the "Gauge" object.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackPicture	-	-	Specifies a graphic for the background.
BorderInnerStyle3D (Page 5275)	P	P	Specifies the representation of the inner part of the object border.
BorderOuterStyle3D (Page 5276)	P	P	Specifies the representation of the outer part of the object border.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 5281)	P	P	Specifies the width of the border for 3D display of the selected object.
CaptionColor (Page 5288)	P, A	P, A	Specifies the color of the text that is displayed in the header of the selected object.
CaptionFont	-	-	Specifies the character set for the caption.
CaptionText (Page 5288)	P, A	P, A	Specifies the text that is displayed in the header of the selected object.
CaptionTop (Page 5289)	P	P	Specifies the distance of the instrument label from the top edge of the selected object.
CenterColor (Page 5292)	P, A	P, A	Sets the color for the center point of the "Gauge" object.
CenterSize (Page 5293)	P	P	Sets the diameter of the round scale center point.
DangerRangeColor (Page 5311)	P, A	P, A	Sets the color of the danger range on the scale of the "Gauge" object.
DangerRangeStart (Page 5311)	P, A	P, A	Specifies the scale value at which the danger range of the "Gauge" object begins.
DangerRangeVisible (Page 5312)	P, A	P, A	Specifies whether the danger range is displayed in the scale of the "Gauge" object. {
DialColor (Page 5314)	P, A	P, A	Specifies the color of the dial in the selected object.
DialFillStyle (Page 5315)	P	P	Specifies the type of background for the selected object.
DialPicture	-	-	Specifies a graphic for the dial.
DialSize (Page 5315)	P	P	Specifies the diameter of the scale disc based on the smaller value of the "Width" and "Height" geometry attributes.

Properties	Read	Write	Description
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in run-time.
Flashing *	-	-	Specifies that the text block flashes.
Gradation (Page 5355)	P, A	P, A	Specifies the value difference between two main tick marks of the "Gauge" object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LockSquaredExtent (Page 5402)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
MaximumValue (Page 5406)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 5422)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
NormalRangeColor (Page 5430)	P, A	P, A	Specifies the color of the normal range on the scale of the "Gauge" object. "
NormalRangeVisible (Page 5431)	P, A	P, A	Specifies whether the normal range in the scale of the "Gauge" object will be displayed.
PointerColor (Page 5454)	P, A	P, A	Specifies the pointer color of the "Gauge" object.
ProcessValue (Page 5456)	P, A	P, A	Specifies the default for the value to be displayed.
ScaleLabelColor (Page 5470)	P, A	P, A	Specifies the color of the label for the scale tick marks of the "Gauge" object.
ScaleLabelFont	-	-	Specifies the font of the scale label.
ScaleTickColor (Page 5471)	P, A	P, A	Specifies the color of the scale tick marks of the "Gauge" object.
ScaleTickLabelPosition (Page 5472)	P	P	Specifies the diameter of the imaginary circle on which the scale tick label is location.
ScaleTickLength (Page 5472)	P	P	Specifies the length of the main scale ticks.
ScaleTickPosition (Page 5473)	P	P	Specifies the diameter of the assumed circle on which the scale divisions are located.
ShowDecimalPoint (Page 5494)	P	P	Specifies whether the scale is labeled with decimal figures (decimal point and one decimal place) or with whole integers.
ShowPeakValuePointer (Page 5497)	P, A	P, A	Specifies whether a slave pointer will be used for the selected object.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UnitColor (Page 5623)	P, A	P, A	Specifies the text color for the label of the measurement unit in the "Gauge" object.
UnitFont	-	-	Specifies the font for the unit.
UnitText (Page 5623)	P, A	P, A	Specifies the text for the measurement unit of the selected object.
UnitTop (Page 5624)	P	P	Specifies the distance of the measurement unit from the upper edge of the selected object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.

Properties	Read	Write	Description
WarningRangeColor (Page 5651)	P, A	P, A	Specifies the color of the warning range on the scale of the "Gauge" object.
WarningRangeStart (Page 5651)	P, A	P, A	Specifies the scale value from which the warning range of the "Gauge" object begins.
WarningRangeVisible (Page 5652)	P, A	P, A	Specifies whether the warning range is displayed in the scale of the "Gauge" object.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-59 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 5224)	-	-	Sets the color of the specified object for the "High limit violated" event.
AdaptPicture	-	-	Specifies that the size of the object is automatically adjusted in runtime.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
AutoSizing	-	-	Specifies that the size of the object should be automatically adapted to the content.
BackColor (Page 5251)	A	A	Specifies the background color of the selected object.
BelowLowerLimitColor (Page 5263)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BitNumber (Page 5264)	-	-	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	P	P	Specifies the line style of the selected object.
Enabled (Page 5323)	P, A	P, A	Specifies whether the selected object can be operated in run-time.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
FlashTransparentColor (Page 5345)	P	P	Specifies the color of the bitmap object of a flashing graphic that is set to "transparent".
FocusColor (Page 5346)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 5347)	A	A	Specifies the border width of the specified object when the object is in focus.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line ends.
Mode (Page 5424)	-	-	Specifies the field type of the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
PictureList	-	-	Specifies the graphic list that supplies the object with values.
PictureOff (Page 5452)	-	-	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 5453)	-	-	Specifies the screen to be displayed in the "On" state.
ProcessValue (Page 5456)	P	P	Specifies the default for the value to be displayed.
ScrollBarOrientation	-	-	Specifies the orientation of the scroll bar.
ShowScrollBar	-	-	Specifies the scroll bar type.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColor (Page 5587)	P, A	P, A	Specifies which color of the allocated graphic (*.bmp, *dib) of the specified object is set to "transparent".
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseFlashTransparentColor (Page 5629)	P	P	Specifies whether the color of the bitmap object of a flashing graphic is set to "transparent".
UseTransparentColor (Page 5632)	P, A	P, A	Specifies whether the color defined with the property "TransparentColor" is shown as transparent for the selected object.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-60 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	P	P	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.

Properties	Read	Write	Description
Flashing	-	-	Specifies that the text block flashes.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line ends.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
Picture (Page 5451)	P	P	Specifies the screen to be displayed in the graphics object in runtime.
RelativeFillLevel (Page 5461)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 5495)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColor (Page 5587)	P, A	P, A	Specifies which color of the allocated graphic (*.bmp, *dib) of the specified object is set to "transparent".
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColor (Page 5632)	P, A	P, A	Specifies whether the color defined with the property "TransparentColor" is shown as transparent for the selected object.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-62 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-67 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 5224)	-	-	Sets the color of the specified object for the "High limit violated" event.
AcceptOnExit (Page 5225)	P	P	Specifies whether the input field is confirmed automatically when it is left.
AcceptOnFull (Page 5225)	P	P	Specifies whether the input field will be left and confirmed automatically when the defined number of values has been entered.

Properties	Read	Write	Description
AdaptBorder (Page 5232)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
AskOperationMotive (Page 5244)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 5263)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
ClearOnError (Page 5295)	P	P	Specifies whether an invalid input in this object is deleted automatically.
ClearOnFocus (Page 5295)	P	P	Specifies whether the field entry is deleted as soon as the I/O field is activated.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
CursorControl (Page 5310)	P	P	Specifies whether the mouse cursor jumps to the next field of the TAB sequence after leaving a field.
DataFormat (Page 5312)	P	P	Returns the data type of the IOField object.
EdgeStyle (Page 5320)	A	A	Specifies the line style of the selected object.
EditOnFocus (Page 5322)	P	P	Specifies whether data input is immediately possible if the input field is selected using the "Tab" key.
Enabled (Page 5323)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FieldLength (Page 5335)	–	-	Specifies that the "Field length string" field is read-only.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.

Properties	Read	Write	Description
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 5353)	P, A	P, A	Specifies the font color of the text for the selected object.
FormatPattern (Page 5354)	P	P	Specifies the format of the output value.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HiddenInput (Page 5363)	P	P	Specifies whether the input value or a * for each character is shown during the input.
HorizontalAlignment (Page 5372)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
InputValue (Page 5377)	P	P	Defines the value entered by the user in the IO field.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	A	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
LogOperation (Page 5403)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
LowerLimit (Page 5404)	P	P	Specifies the low limit for input values.
Mode (Page 5424)	P	P	Specifies the field type of the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
ProcessValue (Page 5456)	P, A	P, A	Specifies the default for the value to be displayed.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
ShiftDecimalPoint (Page 5492)	-	-	Specifies that the "Shift decimal point" field is read-only.
ShowBadTagState (Page 5493)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowLeadingZeros	-	-	Specifies that leading zeros should be displayed.
TextOrientation (Page 5536)	P	P	Specifies the text orientation of the selected object.

Properties	Read	Write	Description
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
Unit (Page 5622)	P	P	Specifies the unit of measurement in the "IOField" object.
UpperLimit (Page 5624)	P	P	Specifies the high limit for input values.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTagLimitColors	P	P	Specifies whether the configured colors are used when limits are violated.
VerticalAlignment (Page 5643)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-68 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

BackColor (Page 5251)	P, A	P, A	Specifies the background color of the selected object.
BorderEndStyle (Page 5270)	P, A	P, A	Specifies the type of line ends for the selected object.
BorderStyle (Page 5278)	P, A	P, A	Specifies the type of line ends for the selected object.

Properties	Read	Write	Description
Color (Page 5296)	P, A	P, A	Specifies the line color of the selected object.
CornerStyle (Page 5306)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
EndLeft	-	-	Specifies the X position of the end point.
EndStyle (Page 5326)	P, A	P, A	Specifies how the line end of the selected object is displayed.
EndTop	-	-	Sets the Y position of the end point.
FillStyle	A	A	Defines the fill pattern of the specified object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
LineWidth (Page 5400)	P, A	P, A	Specifies the line thickness of the selected object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
RotationAngle (Page 5463)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 5463)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 5464)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
StartLeft	-	-	Specifies the X position of the starting point.
StartStyle	A	A	Specifies how the line start of the selected object is displayed.
StartTop (Page 5510)	-	-	Specifies the vertical distance in pixels between the start point and the top edge of the screen.
Style (Page 5523)	P, A	P, A	Specifies the line style of the selected object.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-70 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 12-73 Properties

Properties	Read	Write	Description
AspectRatio	P	P	Specifies whether the aspect ratio is maintained when the size is changed.
AutoStart	P	P	Specifies that the Media Player should start automatically.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FileName	P, A	P, A	Specifies the name of the file to be loaded.
Height (Page 5358)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P, A	P, A	Specifies the value of the X coordinate of the object.
Name (Page 5426)	P, A	-	Returns the object name as STRING.
PictureSizeMode	P	P	Specifies that the status bar is displayed.
PlayCount	A	A	Plays the files several times.
PlayEndless	P	P	Specifies that the media file should play endlessly.
PopupMenuEnabled	P	P	Specifies that the shortcut menu can be used.
ShowControls	P, A	P, A	Specifies that a toolbar is displayed.
ShowFeatureBackward	P	P	Specifies that the "Backward" button is displayed in runtime.
ShowFeatureForward	P	P	Specifies that the "Forward" button is displayed in runtime.
ShowFeatureFullScreen	P	P	Specifies that the Media Player can be displayed as a full screen.
ShowFeaturePause	P	P	Specifies that the Media Player can be displayed as a full screen
ShowFeaturePlay	P	P	Specifies that the "Play" button is displayed in runtime.
ShowFeatureStop	P	P	Specifies that the "Stop" button is displayed in runtime.
ShowFeatureVolume	P	P	Sets the volume.
ShowStatusBar (Page 5502)	A	A	Specifies whether the status bar is shown.
ShowTracker	A	A	Specifies that the tracker is displayed.
StepSeconds	P	P	Specifies a time in seconds that is to be skipped when the "Forward" or "Backward" button is pressed.
Top (Page 5582)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-74 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 5353)	P	P	Specifies the font color of the text for the selected object.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 5372)	P	P	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	P	P	Specifies the shape of the line end.
Name (Page 5426)	P	-	Returns the object name as STRING.

Properties	Read	Write	Description
Text (Page 5533)	P	P	Specifies the label for the text field.
ToolTipText (Page 5581)	P	P	Specifies the tooltip text.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 5585)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 5625)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 5627)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 12-76 Methods

Methods	Validity	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
GetSelectionText	??	
SetSelection	??

Table 12-79 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode (Page 5243)	-	-	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 5247)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 5247)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.

Properties	Read	Write	Description
AutoSelectionColors (Page 5248)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 5249)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
Caption (Page 5287)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 5289)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 5290)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 5290)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 5291)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 5291)	P	P	Specifies the top margin of the table cells.
Closeable (Page 5295)	P	P	Specifies that the control can be closed in runtime.
ColumnResize (Page 5299)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 5300)	P	P	Specifies the scroll bar type.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 5303)	P	P	Specifies whether the column header is displayed.
ControlDesignMode (Page 5507)	P	P	Specifies the design.
EnableEdit (Page 5324)	P	P	Specifies whether the data shown can be edited in Runtime.
ExportDirectoryChangeable (Page 5328)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 5329)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 5330)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 5330)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 5331)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 5331)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 5332)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 5332)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 5333)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 5334)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 5348)	-	-	Specifies or returns the font.
GridLineColor (Page 5356)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 5357)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 5358)	P	-	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 5373)	P	P	Specifies whether horizontal separation lines are displayed.

Properties	Read	Write	Description
IconSpace (Page 5375)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 5398)	P	P	Sets the color of the window separation lines.
LineWidth (Page 5400)	P	P	Specifies the line thickness of the selected object.
LoadDataImmediately (Page 5401)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
Moveable (Page 5425)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 5426)	P	-	Returns the object name as STRING.
Online (Page 5434)	P	P	Specifies the name of the data source.
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 5465)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 5466)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencePasswordLevel (Page 5716)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 5467)	-	-	Specifies how online configurations of WinCC are retained.
SelectedCellColor (Page 5478)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 5479)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 5480)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 5481)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 5482)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 5482)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 5485)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 5486)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 5486)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 5487)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 5488)	P	P	Specifies the number of lines you can mark.
ShowSortButton (Page 5500)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 5501)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 5501)	P	P	Specifies whether the sorting icon is displayed.
ShowTitle (Page 5504)	P	P	Specifies the layout of the control window's header.
Sizeable (Page 5506)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 5508)	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 5511)	P	P	Specifies the background color of the status bar.

Properties	Read	Write	Description
StatusbarElementAdd (Page 5512) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 5512) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 5513) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 5514) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 5514) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 5515)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 5516) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 5516) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 5517) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 5517)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 5518) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 5518) *	P	P	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 5519) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 5519) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 5520)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 5521)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 5521)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 5522)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 5523)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 5526)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 5526)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 5527)	P	P	
TableForeColor2 (Page 5528)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 5540)	P	P	Sets the time zone that forms the basis for the display of time values.
TimeColumnActualize (Page 5541) *	P	P	Specifies whether the values of the selected column are updated.
TimeColumnAdd (Page 5542) *	P	P	Creates a new time column.
TimeColumnAlign (Page 5542) *	P	P	Specifies how the selected time column is aligned.

Properties	Read	Write	Description
TimeColumnBackColor (Page 5543) *	P	P	Specifies the background color of the time column selected.
TimeColumnBeginTime (Page 5544) *	P	P	Specifies the starting time of the time range for a selected time column.
TimeColumnCaption (Page 5544) *	P	P	Specifies the label of the time column.
TimeColumnCount (Page 5545) *	P	P	Specifies the number of configured time columns.
TimeColumnDateFormat (Page 5545) *	P	P	Specifies which date format is used to display the selected time column.
TimeColumnEndTime (Page 5546) *	P	P	Specifies the end point of the time range for the selected time column.
TimeColumnForeColor (Page 5546) *	P	P	Specifies the font color of the time column selected.
TimeColumnHideText (Page 5547) *	P	P	Sets text format for displaying the content of a time column.
TimeColumnHideTitleText (Page 5547) *	P	P	Sets text format for displaying the time column header.
TimeColumnIndex (Page 5548)	P	P	References a configured time column.
TimeColumnLength (Page 5548) *	P	P	Specifies the width of a selected time column.
TimeColumnMeasurePoints (Page 5548) *	P	P	Specifies the number of measuring points to be displayed in the selected time column.
TimeColumnName (Page 5549) *	P	P	Specifies the name of the selected time column.
TimeColumnRangeType (Page 5549) *	P	P	Specifies the time range used for the selected time column.
TimeColumnRemove (Page 5550) *	P	P	Removes the selected time column from the list.
TimeColumnRename (Page 5550) *	P	P	Renames the time column that is referenced by means of the "TimeColumnIndex" property.
TimeColumnRepos (Page 5551) *	P	P	Changes the sorting order of the time columns, including the corresponding value columns.
TimeColumnShowDate (Page 5551) *	P	P	Specifies whether the selected time column is displayed with date and time.
TimeColumnShowIcon (Page 5552) *	P	P	Specifies whether the contents of the time column are shown as an icon.
TimeColumnShowTitleIcon (Page 5552) *	P	P	Specifies whether the values of the selected column are updated.
TimeColumnSort (Page 5553) *	P	P	Specifies how the time column referenced in "TimeColumnIndex" is sorted.
TimeColumnSortIndex (Page 5553) *	P	P	Specifies the sorting order of the time column referenced in "TimeColumnIndex".
TimeColumnTimeFormat (Page 5554) *	P	P	Defines the time format used to display a selected time column.
TimeColumnTimeRangeBase (Page 5554) *	P	P	Specifies the unit of time for calculating the time range.
TimeColumnTimeRangeFactor (Page 5555) *	P	P	Specifies the factor for calculating the time range.
TimeColumnUseValueColumnColors (Page 5555) *	P	P	Specifiess whether the selected time column is displayed in the value column colors.
TimeColumnVisible (Page 5556) *	P	P	The list shows the time columns you have created.
TimeStepBase	P	P	A time range is set via a base and a factor.
TimeStepFactor	P	P	A time range is set via a base and a factor.
TitleColor	P	P	Specifies the color of the header.

Properties	Read	Write	Description
TitleCut (Page 5557)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 5558)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 5559)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 5559)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 5560)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 5561)	P	P	Specifies how sorting by column header is triggered.
TitleStyle (Page 5561)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 5568)	P	P	Specifies or returns the position of the toolbar.
ToolbarBackColor (Page 5568)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 5569) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 5570) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 5570) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 5571) *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 5572) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 5572) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 5573) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 5573)	P	P	References a button function.
ToolbarButtonLocked (Page 5574) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 5575) *	P	P	Shows the name of the selected button function.
ToolbarButtonPasswordLevel (Page 5575) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 5576) *	P	P	Removes the selected button function from the list.
ToolbarButtonRename (Page 5576) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 5577) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 5577) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 5578) *	P	P	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 5579)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 5579)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 5580)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 5580)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.

Properties	Read	Write	Description
UseColumnBackColor	P	P	Specifies whether scrolling is enabled.
UseColumnForeColor	P	P	Specifies the font used for printing.
UseSelectedTitleColor (Page 5630)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 5631)	P	P	Specifies whether a second row color is used for the representation of the table.
ValueColumnAdd *	P	P	Adds a value column.
ValueColumnAlign *	P	P	Specifies the alignment of a column.
ValueColumnAutoPrecisions *	P	P	Specifies whether the number of decimal places to be displayed is determined automatically.
ValueColumnBackColor *	P	P	Specifies the background color.
ValueColumnCaption *	P	P	Specifies a header.
ValueColumnCount *	P	P	Displays the number of value columns.
ValueColumnExponentialFormat *	P	P	Specifies that exponential notation is used in a column.
ValueColumnForeColor *	P	P	Specifies the foreground color for a value column.
ValueColumnHideText *	P	P	Specifies whether the text is displayed.
ValueColumnHideTitleText *	P	P	Specifies whether the text is displayed.
ValueColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ValueColumnLength *	P	P	Specifies the number of displayed characters.
ValueColumnName *	P	P	Specifies the name of a column.
ValueColumnPrecisions *	P	P	Specifies the number of decimal places.
ValueColumnProvider *	P	P	
ValueColumnProviderCLSID *	P	P	Specifies the provider CLSID of the data for a column.
ValueColumnRemove *	P	P	Deletes a value column.
ValueColumnRename *	P	P	Renames a value column.
ValueColumnRepos *	P	P	Specifies that a value column is repositioned.
ValueColumnSelectTagName *	P	P	Specifies a tag.
ValueColumnShowIcon *	P	P	Specifies whether an icon is shown.
ValueColumnShowTitleIcon *	P	P	Specifies whether an icon is shown in the title.
ValueColumnSort *	P	P	Specifies the sorting type of a column.
ValueColumnSortIndex *	P	P	Specifies the sorting order.
ValueColumnTagName *	P	P	Specifies the names of the tags whose values are displayed in a column.
ValueColumnTimeColumn *	P	P	Specifies the corresponding time column.
ValueColumnVisible *	P	P	Specifies the visibility of a value column.
VerticalGridLines (Page 5644)	P	P	Specifies whether vertical separation lines are displayed.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	-	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-80 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5832)	P	Executes the "Connect backup" button function of the control.
CalculateStatistic (Page 5832)	P	Executes the "Calculate statistics" button function of the f(t) trend view and table view.
CopyRows (Page 5833)	P	Executes the "Copy rows" button function of the control.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5837)	P, A	Executes the "Disconnect backup" button function of the control.
Edit (Page 5838)	P	Executes the "Edit" button function of the table view.
Export (Page 5838)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRow (Page 5850)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 5851)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 5858)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5859)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusbarElement (Page 5865)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5866)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetTimeColumn (Page 5871)	P	Returns the time column object of the table view designated by name or index as "ICCAxTime Column" type.
GetTimeColumnCollection (Page 5872)	P	Returns the list of all time column objects of the table view as "ICCAxCollection" type.
GetToolbarButton (Page 5873)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 5874)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetValueColumn (Page 5883)	P	Returns the value column object of the f(t) trend view designated by name or index as "ICCAxValueColumn" type.
GetValueColumnCollection (Page 5884)	P	Returns the list of all value column objects of the f(t) trend view as "ICCAxCollection" type.
MoveToFirst (Page 5894)	P	Executes the "First line" button function of the control.
MoveToLast (Page 5896)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 5897)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 5899)	P	Executes the "Previous data record" button function of the control.
NextColumn (Page 5900)	P	Executes the "Next column" button function of the table view.
PreviousColumn (Page 5902)	P	Executes the "Previous column" button function of the table view.
Print (Page 5903)	P, A	Executes the "Print" button function of the control.
SelectAll (Page 5918)	P	Selects all rows in a table-based control.
SelectRow (Page 5919)	P	Selects a specific row in a table-based control.

Methods	Valid	Description
SelectStatisticArea (Page 5918)	P	Executes the "Set statistics range" button function of the table view.
ShowColumnSelection (Page 5921)	P	Executes the "Select columns" button function of the table view.
ShowHelp (Page 5923)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5927)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 5931)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 5932)	P, A	Executes the "Select time range" button function of the control.
StartStopUpdate (Page 5933)	P, A	Executes the "Start" or "Stop" button function of the control.
UnselectAll (Page 5936)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5936)	P	Removes the selections from a specific cell of a table-based control.

Table 12-81 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode (Page 5243)	-	-	Specifies that the project settings are used for the design.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
Caption (Page 5287)	P	P	Specifies the text that is displayed in the header of the selected object.
Closeable (Page 5295)	P	P	Specifies that the control can be closed in runtime.
ConnectTrendWindows (Page 5304)	P	P	Specifies whether the configured trend views are connected.
ControlDesignMode (Page 5507)	P	P	Specifies the design.
ExportDirectoryChangeable (Page 5328)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 5329)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 5330)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 5330)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 5331)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 5331)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 5332)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 5332)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 5333)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 5334)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 5348)	-	-	Specifies or returns the font.
GraphDirection (Page 5356)	P	P	Specifies at which border of the trend window the current values are displayed.
Height (Page 5358)	P	-	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 5398)	P	P	Sets the color of the window separation lines.

Properties	Read	Write	Description
LineWidth	P	P	Specifies the line thickness of the selected object.
LoadDataImmediately (Page 5401)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
Moveable (Page 5425)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 5426)	P	-	Returns the object name as STRING.
Online (Page 5434)	P	P	Specifies the name of the data source.
PercentageAxis	P	P	Specifies that an axis with percentage scaling is shown.
PercentageAxisAlign	P	P	
PercentageAxisColor	P	P	Specifies the color of the percentage axis.
PrintJob	P	P	Specifies a print job
RTPersistence (Page 5466)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencPasswordLevel (Page 5716)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 5467)	-	-	Specifies how online configurations of WinCC are retained.
ShowRuler (Page 5498)	P	P	Specifies whether a scale gradation (auxiliary line) is shown for the axis label of the "OnlineTrendControl" object.
ShowRulerInAxis (Page 5499)	P	P	Specifies whether rulers are also displayed in the time axes.
ShowScrollbars (Page 5500)	P	P	Specifies the scroll bar type.
ShowStatisticRuler	P	P	Specifies the SQL statement.
ShowTitle (Page 5504)	P	P	Specifies the layout of the control window's header.
ShowTrendIcon (Page 5505)	P	P	Specifies whether an icon is displayed below the value axes.
Sizeable (Page 5506)	P	P	Specifies that the size of an object can be changed in runtime.
StatusbarBackColor (Page 5511)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 5512) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 5512) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 5513) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 5514) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 5514) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 5515)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 5516) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 5516) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 5517) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 5517)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 5518) *	P	P	Specifies the tooltip text for the user-defined status bar element.

Properties	Read	Write	Description
StatusbarElementUserDefined (Page 5518) *	P	P	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 5519) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 5519) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 5520)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 5521)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 5521)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 5522)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 5523)	P	P	Specifies whether the status bar of the control is displayed.
TimeAxes	-	-	Specifies the settings for the time axes.
TimeAxisActualize *	P	P	
TimeAxisAdd *	P	P	Inserts an axis.
TimeAxisAlignment *	P	P	Specifies the alignment of an axis.
TimeAxisBeginTime (Page 5538) *	P	P	Specifies the starting time for the display of the selected trend.
TimeAxisColor *	P	P	Specifies the color of an axis.
TimeAxisCount *	P	P	Displays the number of time axes.
TimeAxisDateFormat *	P	P	Specifies the date format.
TimeAxisEndTime (Page 5539) *	P	P	Specifies the end time for the display of the selected trend.
TimeAxisIndex	P	P	The index specifies on which axis other properties, e.g. initial value are based.
TimeAxisInTrendColor *	P	P	Specifies that the color of the trend is used for an axis.
TimeAxisLabel (Page 5539) *	P	P	Specifies the header for the time axis. Whether or not the information is evaluated depends on the "ConfigureTimeAxis(i)" property.
TimeAxisMeasurePoints *	P	P	Specifies the measuring points.
TimeAxisName *	P	P	Specifies the name of an axis.
TimeAxisRangeType *	P	P	Specifies the type of time range.
TimeAxisRemove *	P	P	Deletes a time axis
TimeAxisRename *	P	P	Renames a time axis.
TimeAxisRepos *	P	P	Specifies that the time axis is repositioned
TimeAxisShowDate *	P	P	Specifies that the date is to be displayed.
TimeAxisTimeFormat (Page 5540) *	P	P	Specifies the time format.
TimeAxisTimeRangeBase *	P	P	A time range is set via a base and a factor.
TimeAxisTimeRangeFactor *	P	P	A time range is set via a base and a factor.
TimeAxisTrendWindow *	P	P	Specifies the trend view.
TimeAxisVisible *	P	P	Specifies that the time axis is visible.
TimeBase (Page 5540)	P	P	Sets the time zone that forms the basis for the display of time values.
ToolbarAlignment (Page 5568)	P	P	Specifies or returns the position of the toolbar.

Properties	Read	Write	Description
ToolbarBackColor (Page 5568)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 5569) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 5570) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 5570) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 5571) *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 5572) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 5572) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 5573) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 5573)	P	P	References a button function.
ToolbarButtonLocked (Page 5574) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 5575) *	P	P	Shows the name of the selected button function.
ToolbarButtonPasswordLevel (Page 5575) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 5576) *	P	P	Removes the selected button function from the list.
ToolbarButtonRename (Page 5576) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 5577) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 5577) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 5578) *	P	P	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 5579)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 5579)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 5580)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 5580)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 5582)	P	P	Specifies the value of the Y coordinate of the object.
TrendAdd (Page 5590) *	P	P	Creates a new trend.
TrendAutoRangeBeginTagName *	P	P	Specifies a tag that defines the initial value.
TrendAutoRangeBeginValue *	P	P	Specifies the initial value for the automatically adjusted display range.
TrendAutoRangeEndTagName *	P	P	Specifies a tag that defines the end value.
TrendAutoRangeEndValue *	P	P	Specifies a tag that defines the end value.
TrendAutoRangeSource *	P	P	Specifies the source of the display range.
TrendColor *	P	P	Specifies or returns the trend view color.
TrendCount (Page 5591) *	P	P	Specifies the number of configured trends.

Properties	Read	Write	Description
TrendExtendedColorSet (Page 5592) *	P	P	Specifies whether you can configure the point color and the fill color and whether the colors are shown in runtime.
TrendFill (Page 5593) *	P	P	Specifies whether the area below the trend is shown filled.
TrendFillColor (Page 5593) *	P	P	Sets the fill color of the trend.
TrendIndex (Page 5594)	P	P	References a configured trend.
TrendLabel (Page 5595) *	P	P	Specifies the label of the selected trend.
TrendLineStyle (Page 5596) *	P	P	Specifies which line type is used for display of the trend.
TrendLineType (Page 5596) *	P	P	Specifies how the trend is displayed.
TrendLineWidth (Page 5597) *	P	P	Specifies the line thickness of the line displayed.
TrendLowerLimit (Page 5597) *	P	P	Specifies the low limit of a tag.
TrendLowerLimitColor (Page 5598) *	P	P	Specifies the color which indicates tag values below the value of "TrendLowerLimit".
TrendLowerLimitColoring (Page 5598) *	P	P	Specifies whether the selection frame is shown with the color defined by the system.
TrendName (Page 5599) *	P	P	Displays the name of the selected trend.
TrendPointColor (Page 5600) *	P	P	Specifies the color of trend points.
TrendPointStyle (Page 5600) *	P	P	Specifies how the points are displayed on the trend.
TrendPointWidth (Page 5601) *	P	P	Specifies the point width in pixels.
TrendProvider (Page 5601) *	P	P	Specifies the data supply for the selected trend.
TrendProviderCLSID *	P	P	Specifies the provider CLSID of the data for a trend.
TrendRemove (Page 5603) *	P	P	Removes selected trends from the list.
TrendRename (Page 5603) *	P	P	Renames the trend that is referenced by means of the "TrendIndex" property.
TrendRepos (Page 5604) *	P	P	Repositions the selected trend in the sequence in the trend window.
TrendSelectTagName *	P	P	Specifies a tag.
TrendTagName *	P	P	Specifies the name of the tag for the Y direction.
TrendTimeAxis *	P	P	Specifies the time axis.
TrendTrendWindow (Page 5607) *	P	P	Specifies the trend window in which the selected trend is shown.
TrendUncertainColor (Page 5608) *	P	P	Values have an uncertain status if the initial value is unknown after Runtime has been activated, or if a substitute value is used.
TrendUncertainColoring (Page 5608) *	P	P	Values have an uncertain status if the initial value is unknown after Runtime has been activated, or if a substitute value is used.
TrendUpperLimit (Page 5609) *	P	P	Specifies the high limit of a tag. If the tag drops below the value of "TrendLowerLimit", the values are marked with the color set in "TrendUpperLimitColor".
TrendUpperLimitColor (Page 5609) *	P	P	Specifies the color which indicates tag values below the value of "TrendLowerLimit".
TrendUpperLimitColoring (Page 5610) *	P	P	Specifies whether the selection frame is shown with the color defined by the system.
TrendValueAxis *	P	P	Specifies the value axis.
TrendVisible (Page 5610) *	P	P	The list contains all the trends that you have created.
TrendWindowAdd (Page 5611) *	P	P	Creates a new trend view.

Properties	Read	Write	Description
TrendWindowCoarseGrid (Page 5611) *	P	P	Specifies whether grid lines are displayed for the main scaling.
TrendWindowCoarseGridColor (Page 5612) *	P	P	Specifies the color of the grid lines for the main scaling.
TrendWindowCount *	P	P	Displays the number of trend views.
TrendWindowFineGrid (Page 5613) *	P	P	Specifies whether grid lines are displayed for the secondary scaling.
TrendWindowFineGridColor (Page 5613) *	P	P	Specifies the grid color of the main scaling.
TrendWindowForegroundTrendGrid (Page 5614) *	P	P	Specifies whether only the grid lines for the foreground trend are displayed in the selected trend window.
TrendWindowGridInTrendColor (Page 5614) *	P	P	Specifies whether the grid lines for the main scaling are displayed in the trend color.
TrendWindowHorizontalGrid (Page 5615) *	P	P	Specifies whether the horizontal grid lines are shown.
TrendWindowIndex (Page 5615)	P	P	References a configured trend window.
TrendWindowName (Page 5616) *	P	P	Specifies the name of the selected trend window.
TrendWindowRemove (Page 5616) *	P	P	Removes the selected trend view from the list.
TrendWindowRename (Page 5616) *	P	P	Changes the name of the trend window which is referenced by the "TrendWindowIndex" property.
TrendWindowRepos (Page 5617) *	P	P	Changes the order of the trend view.
TrendWindowRulerColor (Page 5617) *	P	P	Specifies the ruler color.
TrendWindowRulerLayer (Page 5618) *	P	P	Specifies the display layer of the ruler in the trend view.
TrendWindowRulerStyle (Page 5619) *	P	P	Specifies the representation of the ruler.
TrendWindowRulerWidth (Page 5619) *	P	P	Specifies the ruler width in pixels.
TrendWindows	-	-	Specifies the settings for trend views.
TrendWindowSpacePortion (Page 5620) *	P	P	Specifies the proportion of the selected trend window for display in the control.
TrendWindowStatisticRulerColor *	P	P	Specifies the color of the statistics ruler.
TrendWindowStatisticRulerStyle *	P	P	Specifies the style of the statistics ruler.
TrendWindowStatisticRulerWidth *	P	P	Specifies the width of the statistics ruler.
TrendWindowVerticalGrid (Page 5620) *	P	P	Specifies whether the vertical grid lines are displayed.
TrendWindowVisible (Page 5621) *	P	P	The list contains the trend views that you have created.
UseTrendNameAsLabel (Page 5634)	P	P	Specifies whether the "Name" or "Label" property is used as a designation for the trend in runtime.
ValueAxes	-	-	Specifies the settings for the value axes.
ValueAxisAdd *	P	P	Inserts an axis.
ValueAxisAlignment *	P	P	Specifies the alignment of an axis.
ValueAxisAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
ValueAxisAutoRange *	P	P	Specifies that the value range is determined automatically.

Properties	Read	Write	Description
ValueAxisBeginValue *	P	P	Specifies the initial value of an axis.
ValueAxisColor *	P	P	Specifies the color of a value axis.
ValueAxisCount *	P	P	Shows the number of value axes.
ValueAxisEndValue *	P	P	Specifies the end value of an axis.
ValueAxisExponentialFormat *	P	P	Specifies that the label of an axis uses exponential notation.
ValueAxisIndex	P	P	The index specifies on which axis other properties, e.g. initial value are based.
ValueAxisInTrendColor *	P	P	Specifies that the color of the trend is used for an axis.
ValueAxisLabel (Page 5641) *	P	P	Specifies the label of the value axis.
ValueAxisName *	P	P	Specifies the name of an axis.
ValueAxisPrecisions *	P	P	Specifies the number of displayed decimal places.
ValueAxisRemove *	P	P	Renames an axis.
ValueAxisRename *	P	P	Renames an axis.
ValueAxisRepos *	P	P	Specifies that the value axis is repositioned.
ValueAxisScalingType (Page 5642) *	P	P	Specifies the type of axis scaling.
ValueAxisTrendWindow *	P	P	Specifies the trend view.
ValueAxisVisible *	P	P	Specifies whether a value axis is visible.
Visible (Page 5645)	P	P	Specifies whether the selected object is visible.
Width (Page 5655)	P	-	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 12-82 Methods

Methods	Valid	Description
Activate (Page 5825)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5828)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5832)	P, A	Executes the "Connect backup" button function of the control.
CalculateStatistic (Page 5832)	P	Executes the "Calculate statistics" button function of the f(t) trend view and table view.
DeactivateDynamic (Page 5835)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5837)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 5838)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRulerData (Page 5857)	P	Returns the value of the called trend at the ruler position.
GetStatusbarElement (Page 5865)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5872)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetTimeAxis (Page 5868)	P	Returns the time axis object of the f(t) trend view designated by name or index as "ICCAxTimeAxis" type.
GetTimeAxisCollection (Page 5869)	P	Returns the list of all time axis objects of the f(t) trend view as "ICCAxCollection" type.

Methods	Valid	Description
GetToolbarButton (Page 5873)	P	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 5874)	P	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetTrend (Page 5876)	P, A	Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.
GetTrendCollection (Page 5877)	P, A	Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.
GetTrendWindow (Page 5878)	P, A	Returns the trend window object of the f(t) or f(x) trend view designated by name or index as "ICCAxTrendWindow" type.
GetTrendWindowCollection (Page 5879)	P, A	Returns the list of all trend window objects of the f(t) or f(x) trend views as "ICCAxCollection" type.
GetValueAxis (Page 5880)	P	Returns the value axis object of the f(t) trend view designated by name or index as "ICCAxValueAxis" type.
GetValueAxisCollection (Page 5881)	P	Returns the list of all value axis objects of the f(t) trend view as "ICCAxCollection" type.
MoveAxis (Page 5894)	P, A	Executes the "Move axes area" button function of the f(t) and f(x) trend views.
MoveToFirst (Page 5894)	P	Executes the "First line" button function of the control.
MoveToLast (Page 5896)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 5897)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 5899)	P	Executes the "Previous data record" button function of the control.
NextTrend (Page 5901)	P, A	Executes the "Next trend" button function of the f(t) and f(x) trend views.
OneToOneView (Page 5901)	P, A	Executes the "Original view" button function of the f(t) and f(x) trend views.
PreviousTrend (Page 5903)	P, A	Executes the "Previous trend" button function of the f(t) and f(x) trend views.
Print (Page 5903)	P, A	Executes the "Print" button function of the control.
ShowHelp (Page 5923)	P, A	Executes the "Help" button function of the control.
ShowPercentageAxis (Page 5927)	P	Executes the "Relative axis" button function of the f(t) trend view.
ShowPropertyDialog (Page 5927)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 5931)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 5932)	P, A	Executes the "Select time range" button function of the control.
ShowTrendSelection (Page 5933)	P, A	Executes the "Select trends" button function of the f(t) and f(x) trend views.
StartStopUpdate (Page 5933)	P, A	Executes the "Start" or "Stop" button function of the control.
ZoomArea (Page 5940)	P, A	Executes the "Zoom area" button function of the f(t) and f(x) trend views.
ZoomInOut (Page 5941)	P, A	Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.
ZoomInOutTime (Page 5941)	P	Executes the "Zoom time axis +/-" button function of the f(t) trend view.
ZoomInOutValues (Page 5942)	P	Executes the "Zoom value axis +/-" button function of the f(t) trend view.
ZoomMove (Page 5943)	P, A	Executes the "Move trend area" button function of the f(t) and f(x) trend views.

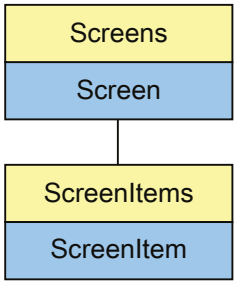
OptionGroup

Description



Represents the "Option button" object. The OptionGroup object is an element of the ScreenItems list.

Type identifier in VBS

HMIOptionGroup

Abbreviation	Validity
Pa	Panels
A	Runtime Advanced
P	Runtime Professional

Table 12-83 Properties

Properties	Read	Write	Description
AdaptBorder (Page 5232)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 5245)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 5251)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 5254)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 5256)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 5257)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 5258)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 5258)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 5266)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 5268)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 5271)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 5272)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 5273)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 5274)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 5278)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 5280)	P	P	Specifies the line thickness of the object.
CheckmarkAlignment (Page 5294)	P	P	Specifies whether the fields are right aligned.
CheckmarkCount (Page 5294)	P	P	Specifies the number of fields.
CornerStyle (Page 5306)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 5319)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 5320)	-	-	Specifies the line style of the selected object.
Enabled (Page 5323)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 5336)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 5340)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 5342)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 5343)	P	P	Specifies whether the border line of the selected object flashes in runtime.

Properties	Read	Write	Description
FlashingRate (Page 5344)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 5348)	-	-	Specifies or returns the font.
FontBold (Page 5349)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 5350)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 5351)	P	P	Specifies the font of the selected object.
FontSize (Page 5351)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 5352)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 5353)	P	P	Specifies the font color of the text for the selected object.
Height (Page 5358)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 5372)	P	P	Specifies the horizontal alignment of the text within the selected object.
Index (Page 5375)	P	P	Specifies the background for grid control elements.
Layer (Page 5384)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 5388)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 5399)	-	-	Specifies the shape of the line ends.
