**Syntax**`ControlBarTextBox.Margin`**See also**[ControlBarTextBox \(Page 4342\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin \(Page 4351\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarTextBox.Margin \(Page 4351\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarTextBox.Margin \(Page 4351\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarTextBox.Margin \(Page 4351\)](#)**ControlBarTextBox.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MaximumHeight`

**See also**

ControlBarTextBox (Page 4342)

**ControlBarTextBox.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MaximumWidth`

**See also**

ControlBarTextBox (Page 4342)

**ControlBarTextBox.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MinimumHeight`**See also**

ControlBarTextBox (Page 4342)

**ControlBarTextBox.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MinimumWidth`**See also**

ControlBarTextBox (Page 4342)

**ControlBarTextBox.Operability****Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarTextBox.Operability`

### See also

[ControlBarTextBox \(Page 4342\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 4342\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarTextBox.Padding (Page 4356)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarTextBox.Padding (Page 4356)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 4356\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 4356\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.ReadOnly
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

## See also

[ControlBarTextBox](#) (Page 4342)

## ControlBarTextBox.Width

### Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Width
```

## See also

[ControlBarTextBox](#) (Page 4342)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateBackColor`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BackColor
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Badge
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BorderColor`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BorderWidth`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

ControlBarToggleSwitch.Content (Page 4369)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarToggleSwitch.Content (Page 4369)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.HorizontalTextAlignment
```

### See also

ControlBarToggleSwitch.Content (Page 4369)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Content.Spacing
```

### See also

ControlBarToggleSwitch.Content (Page 4369)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 4369\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarToggleSwitch.Content (Page 4369)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarToggleSwitch.Content (Page 4369)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 4369\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.CustomID`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Enabled
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Graphic`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Height`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

```
Button.HotKey
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

## See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Mapping`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the switch.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Margin`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

`ControlBarToggleSwitch.Margin` (Page 4380)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

`ControlBarToggleSwitch.Margin` (Page 4380)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarToggleSwitch.Margin \(Page 4380\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarToggleSwitch.Margin \(Page 4380\)](#)

**ControlBarToggleSwitch.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumHeight`**See also**

ControlBarToggleSwitch (Page 4362)

**ControlBarToggleSwitch.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumWidth`**See also**

ControlBarToggleSwitch (Page 4362)

**ControlBarToggleSwitch.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumHeight`

**See also**

ControlBarToggleSwitch (Page 4362)

**ControlBarToggleSwitch.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumWidth`

**See also**

ControlBarToggleSwitch (Page 4362)

**ControlBarToggleSwitch.Operability**

**Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarToggleSwitch.Padding \(Page 4385\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarToggleSwitch.Padding \(Page 4385\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 4385\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 4385\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ToolTipText
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Visible
```

### See also

ControlBarToggleSwitch (Page 4362)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Width`

### See also

[ControlBarToggleSwitch \(Page 4362\)](#)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.Enabled`

### See also

[OverviewParameterControl.ToolBar \(Page 4257\)](#)

## ToolBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
ToolBar.Font
```

### See also

OverviewParameterControl.ToolBar (Page 4257)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

ToolBar.Font (Page 4391)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

ToolBar.Font (Page 4391)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

ToolBar.Font (Page 4391)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ToolBar.Font (Page 4391)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

## See also

ToolBar.Font (Page 4391)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

## See also

ToolBar.Font (Page 4391)

## ToolBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ToolBar.Margin`**See also**

OverviewParameterControl.ToolBar (Page 4257)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

ToolBar.Margin (Page 4394)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ToolBar.Margin \(Page 4394\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ToolBar.Margin \(Page 4394\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ToolBar.Margin \(Page 4394\)](#)**ToolBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ToolBar.Padding`**See also**[OverviewParameterControl.ToolBar \(Page 4257\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ToolBar.Padding \(Page 4397\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ToolBar.Padding \(Page 4397\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ToolBar.Padding \(Page 4397\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ToolBar.Padding \(Page 4397\)](#)**ToolBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.ShowToolTips`

**See also**

OverviewParameterControl.ToolBar (Page 4257)

**ToolBar.UseHotKeys**

**Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.UseHotKeys`

**See also**

OverviewParameterControl.ToolBar (Page 4257)

**ToolBar.Visible**

**Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.Visible`**See also**

OverviewParameterControl.ToolBar (Page 4257)

**OverviewParameterControl.Top****Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`OverviewParameterControl.Top`**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl.Visible****Description**

The "Visible" property specifies whether the parameter overview is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`OverviewParameterControl.Visible`

**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`OverviewParameterControl.Width`

**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl.WindowFlags**

**Description**

The "WindowFlags" property specifies the window configuration of the parameter overview.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

OverviewParameterControl.WindowFlags

**Example**

Adapting the "windowFlags" tag depending on the window configuration:

**Copy code**

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the parameter overview.

### Syntax

```
OverviewParameterControl.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the parameter overview.

### Syntax

```
OverviewParameterControl.FireCommand(commandId, custom)
```

### Parameters

#### **commandId**

Type: Int32

ID of the element of the toolbar or information bar

#### **custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## Return value

--

## See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
OverviewParameterControl.PropertyFlashing(propertyName, enable[,  
value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl\_OnActivated()**

**Description**

The "OnActivated" event occurs when a parameter overview receives the focus:

- A parameter overview is selected via the configured tab sequence.
- A parameter overview that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
OverviewParameterControl_OnActivated(item)
```

**Context**

**item**

Type: Object

Parameter overview for which the event occurs.

**See also**

OverviewParameterControl (Page 4171)

## OverviewParameterControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the parameter overview.

### Syntax

```
OverviewParameterControl_OnCommandFired(item, commandId, custom)
```

### Context

**item**

Type: Object

Parameter overview for which the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the parameter overview loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

`OverviewParameterControl_OnDeactivated(item)`

### Context

**item**

Type: Object

Parameter overview for which the event occurs.

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a parameter overview has been successfully initialized and the data connection to the PLC has been established.

### Syntax

`OverviewParameterControl_OnInitialized(item)`

### Context

**item**

Type: Object

Parameter overview for which the event occurs.

### See also

OverviewParameterControl (Page 4171)

## Polygon

### Description

The "Polygon" object represents a polygon in runtime.

### Object type

HmiPolygon

## Properties

The "Polygon" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the polygon.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the polygon can be operated in runtime.
- **FillDirection**  
Specifies the direction from which the polygon is filled.
- **FillLevel**  
Specifies the fill of the polygon in percent.
- **Height**  
Specifies the height.
- **JoinType**  
Specifies the corner style of the polygon
- **Layer**  
Returns the layer of the screen in which the polygon is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the polygon.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the polygon is operable.

- **Parent**  
Returns the higher-level screen object.
- **Points**  
Specifies the coordinates of the polygon points.
- **RequireExplicitUnlock**  
Returns whether the polygon is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the polygon rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**  
Specifies whether the fill level is displayed.
- **ShowFocusVisual**  
Specifies whether the polygon is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the polygon.
- **TabIndex**  
Returns the position of the polygon in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the polygon is visible.
- **Width**  
Specifies the width.

## Methods

The "Polygon" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the polygon.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Polygon" object has the following events:

- **OnActivated()**  
Occurs when a polygon receives focus.
- **OnContextTapped()**  
Occurs when a polygon is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a polygon loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the polygon is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the polygon is in focus.
- **OnTapped()**  
Occurs when a polygon is left-clicked or short-touched.

## Polygon.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`Polygon.AlternateBackColor`

### See also

[Polygon \(Page 4408\)](#)

## Polygon.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Polygon.AlternateBorderColor`

**See also**

Polygon (Page 4408)

**Polygon.Authorization**

**Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`Polygon.Authorization`

**See also**

Polygon (Page 4408)

**Polygon.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Polygon.BackColor`**See also**

Polygon (Page 4408)

**Polygon.BackFillPattern****Description**

The "BackFillPattern" property specifies the pattern of the background or the fill.

**Type**

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

**Access**

Read-write

**Syntax**

`Polygon.BackFillPattern`

**See also**

Polygon (Page 4408)

**Polygon.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Polygon.BorderColor`

**See also**

Polygon (Page 4408)

**Polygon.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
Polygon.BorderWidth
```

**See also**

Polygon (Page 4408)

**Polygon.CurrentQuality****Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the polygon.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

```
Polygon.CurrentQuality
```

**See also**

Polygon (Page 4408)

**Polygon.DashType****Description**

The "DashType" property specifies the stroke type of the border or line.

## Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

## Access

Read-write

## Syntax

`Polygon.DashType`

## See also

[Polygon \(Page 4408\)](#)

## Polygon.Enabled

### Description

The "Enabled" property specifies whether the polygon can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`Polygon.Enabled`

### See also

[Polygon \(Page 4408\)](#)

## Polygon.FillDirection

### Description

The "FillDirection" property specifies the direction from which the polygon is filled.

### Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

### Access

Read-write

### Syntax

`Polygon.FillDirection`

### See also

[Polygon \(Page 4408\)](#)

## Polygon.FillLevel

### Description

The "FillLevel" property specifies the fill level of the polygons in percent.

### Type

UInt8

### Access

Read-write

### Syntax

`Polygon.FillLevel`

**See also**

Polygon (Page 4408)

**Polygon.Height**

**Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Polygon.Height`

**See also**

Polygon (Page 4408)

**Polygon.JoinType**

**Description**

The "JoinType" property specifies the corner style of the polygon.

**Type**

Int32, HmiLineJoinType

Specifies the corner style:

- Round (0): Round
- Bevel (4096): Smooth
- Miter (8192): Miter

**Access**

Read-write

**Syntax**`Polygon.JoinType`**See also**

Polygon (Page 4408)

**Polygon.Layer****Description**

The "Layer" property returns the layer of the screen in which the polygon is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**`Polygon.Layer`**See also**

Polygon (Page 4408)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MaximumZoom`

**See also**

Polygon.Layer (Page 4419)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

Polygon.Layer (Page 4419)

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

Polygon.Layer (Page 4419)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

Polygon.Layer (Page 4419)

**Polygon.Left****Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`Polygon.Left`

### See also

Polygon (Page 4408)

## Polygon.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Polygon.Margin`

### See also

Polygon (Page 4408)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

**See also**

Polygon.Margin (Page 4422)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

Polygon.Margin (Page 4422)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

Polygon.Margin (Page 4422)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

Polygon.Margin (Page 4422)

**Polygon.Name**

**Description**

The "Name" property returns the name of the polygon.

**Type**

String

**Access**

Read-only

**Syntax**

Polygon.Name

**See also**

Polygon (Page 4408)

**Polygon.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

**Type**

Float

**Access**

Read-write

**Syntax**

`Polygon.Opacity`

**See also**

Polygon (Page 4408)

**Polygon.Operability****Description**

The "Operability" property returns whether the polygon is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`Polygon.Operability`

**See also**

Polygon (Page 4408)

**Polygon.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`Polygon.Parent`

**See also**

Polygon (Page 4408)

Screen Items (Page 1742)

**Screen Items**

**Description**

Screen Items (Page 1742)

**Polygon.Points**

**Description**

The "Points" property specifies the coordinates of the polygon points.

**Type**

Variant

**Access**

Read-write

**Syntax**

Polygon.Points

**Example**

Output the coordinates of the polygon "Polygon\_1" with 3 points via debug output in runtime:

**Copy code**

```
const p = Screen.Items('Polygon_1').Points;  
HMIRuntime.Trace("x1=" + p[0] + ", y1=" + p[1] + ", x2=" + p[2] + ", y2=" + p[3] + ", x3=" + p[4] + ", y3=" + p[5]);
```

**See also**[Polygon \(Page 4408\)](#)**Polygon.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the polygon can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

Polygon.RequireExplicitUnlock

**See also**[Polygon \(Page 4408\)](#)

## Polygon.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`Polygon.RotationAngle`

### See also

[Polygon \(Page 4408\)](#)

[Polygon.RotationCenterPlacement \(Page 4428\)](#)

[Polygon.RotationCenterX \(Page 4429\)](#)

[Polygon.RotationCenterY \(Page 4430\)](#)

## Polygon.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the polygon rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- `AbsoluteFromCenter (0)`: Absolute distance from the object center in DIU (Device Independent Unit).
- `NormedFromCenter (1)`: Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- `AbsoluteToContainer (2)`: Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

**Access**

Read-write

**Syntax**`Polygon.RotationCenterPlacement`**See also**[Polygon \(Page 4408\)](#)[Polygon.RotationAngle \(Page 4428\)](#)[Polygon.RotationCenterX \(Page 4429\)](#)[Polygon.RotationCenterY \(Page 4430\)](#)**Polygon.RotationCenterX****Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`Polygon.RotationCenterX`**See also**[Polygon \(Page 4408\)](#)[Polygon.RotationAngle \(Page 4428\)](#)[Polygon.RotationCenterPlacement \(Page 4428\)](#)[Polygon.RotationCenterY \(Page 4430\)](#)

## Polygon.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`Polygon.RotationCenterY`

### See also

[Polygon \(Page 4408\)](#)

[Polygon.RotationAngle \(Page 4428\)](#)

[Polygon.RotationCenterPlacement \(Page 4428\)](#)

[Polygon.RotationCenterX \(Page 4429\)](#)

## Polygon.ShowFillLevel

### Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`Polygon.ShowFillLevel`

**See also**

Polygon (Page 4408)

**Polygon.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the polygon is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Polygon.ShowFocusVisual`

**See also**

Polygon (Page 4408)

**Polygon.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the polygon.

**Type**

String

**Access**

Read-only

**Syntax**

`Polygon.StyleItemClass`

**See also**

Polygon (Page 4408)

## Polygon.TabIndex

### Description

The "TabIndex" property returns the position of the polygon in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`Polygon.TabIndex`

### See also

Polygon (Page 4408)

## Polygon.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`Polygon.ToolTipText`

### See also

Polygon (Page 4408)

## Polygon.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Polygon.Top`

### See also

[Polygon \(Page 4408\)](#)

## Polygon.Visible

### Description

The "Visible" property specifies whether the polygon is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Polygon.Visible`

### See also

[Polygon \(Page 4408\)](#)

## Polygon.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Polygon.Width`

### See also

Polygon (Page 4408)

## Polygon.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the polygon.

### Syntax

`Polygon.CheckAuthorization()`

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

Polygon (Page 4408)

## Polygon.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Polygon.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Polygon (Page 4408)

**Polygon\_OnActivated()**

**Description**

The "OnActivated" event occurs when a polygon receives focus:

- A polygon is selected via the configured tab sequence.
- A polygon that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

`Polygon_OnActivated(item)`

**Context**

**item**

Type: Object

Polygon where the event occurs.

## See also

Polygon (Page 4408)

## Polygon\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A polygon is right-clicked.
- A polygon is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Polygon_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Polygon where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Polygon (Page 4408)

**Polygon\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when the polygon loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

`Polygon_OnDeactivated(item)`

**Context**

**item**

Type: Object

Polygon where the event occurs.

## See also

Polygon (Page 4408)

## Polygon\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the polygon is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Polygon_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Polygon where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Polygon (Page 4408)

## Polygon\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the polygon is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Polygon_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Polygon where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Polygon (Page 4408)

## Polygon\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A polygon is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a polygon has the focus.
- A polygon is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Polygon_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Polygon where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Polygon (Page 4408)

**Polyline**

**Description**

The "Polyline" object represents a polyline in runtime.

## Object type

HmiPolyline

## Properties

The "Polyline" object has the following properties:

- **AlternateLineColor**  
Specifies the second line color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **CapType**  
Specifies the shape of the line ends.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the polyline.
- **DashType**  
Specifies the stroke style of the polyline.
- **Enabled**  
Specifies whether the polyline can be operated in runtime.
- **EndType**  
Specifies the type of line end.
- **Height**  
Specifies the height.
- **JoinType**  
Specifies the corner style of the polyline.
- **Layer**  
Returns the layer of the screen in which the polyline is located.
- **Left**  
Specifies the value of the X coordinate.
- **LineColor**  
Specifies the line color.
- **LineWidth**  
Specifies the line thickness.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the polyline.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the polyline is operable.
- **Parent**  
Returns the higher-level screen object.

- **Points**  
Specifies the coordinates of the polyline points.
- **RequireExplicitUnlock**  
Returns whether the polyline is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the polyline rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the polyline is highlighted when in focus.
- **StartType**  
Specifies the type of line start.
- **StyleItemClass**  
Returns the style which is applied to the polyline.
- **TabIndex**  
Returns the position of the polyline in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the polyline is visible.
- **Width**  
Specifies the width.

## Methods

The "Polyline" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the polyline.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Polyline" object has the following events:

- **OnActivated()**  
Occurs when a polyline receives focus.
- **OnContextTapped()**  
Occurs when a polyline is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a polyline loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the polyline is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the polyline is in focus.
- **OnTapped()**  
Occurs when a polyline is left-clicked or short-touched.

## Polyline.AlternateLineColor

### Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
Polyline.AlternateLineColor
```

### See also

[Polyline \(Page 4442\)](#)

## Polyline.Authorization

### Description

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`Polyline.Authorization`

**See also**

Polyline (Page 4442)

**Polyline.CapType**

**Description**

The "CapType" property specifies the shape of the line ends.

**Type**

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

**Access**

Read-write

**Syntax**

`Polyline.CapType`

**See also**

Polyline (Page 4442)

## Polyline.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the polyline.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

```
Polyline.CurrentQuality
```

### See also

Polyline (Page 4442)

## Polyline.DashType

### Description

The "DashType" property specifies the stroke style of the polyline.

### Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted

- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

### Access

Read-write

### Syntax

`Polyline.DashType`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.Enabled

### Description

The "Enabled" property specifies whether the polyline can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`Polyline.Enabled`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.EndType

### Description

The "EndType" property specifies the line end type.

### Type

Int32, HmiLineEndType

Specifies the line end type:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

**Access**

Read-write

**Syntax**

`Polyline.EndType`

**See also**

[Polyline \(Page 4442\)](#)

**Polyline.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Polyline.Height`

**See also**

[Polyline \(Page 4442\)](#)

## Polyline.JoinType

### Description

The "JoinType" property specifies the corner style of the polyline.

### Type

Int32, HmiLineJoinType

Specifies the corner style:

- Round (0): Round
- Bevel (4096): Smooth
- Miter (8192): Miter

### Access

Read-write

### Syntax

`Polyline.JoinType`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.Layer

### Description

The "Layer" property returns the layer of the screen in which the polyline is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Polyline.Layer`

**See also**

[Polyline \(Page 4442\)](#)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Layer.MaximumZoom
```

**See also**

[Polyline.Layer \(Page 4450\)](#)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Layer.MinimumZoom
```

**See also**

[Polyline.Layer \(Page 4450\)](#)

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

[Polyline.Layer \(Page 4450\)](#)

**Layer.Visible**

**Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[Polyline.Layer \(Page 4450\)](#)

**Polyline.Left****Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`Polyline.Left`

**See also**

[Polyline \(Page 4442\)](#)

**Polyline.LineColor****Description**

The "LineColor" property specifies the line color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Polyline.LineColor`

**See also**

[Polyline \(Page 4442\)](#)

## Polyline.LineWidth

### Description

The "LineWidth" property specifies the line thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`Polyline.LineWidth`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Polyline.Margin`

### See also

[Polyline \(Page 4442\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Bottom

### See also

Polyline.Margin (Page 4454)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

Polyline.Margin (Page 4454)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Polyline.Margin \(Page 4454\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[Polyline.Margin \(Page 4454\)](#)

**Polyline.Name****Description**

The "Name" property returns the name of the polyline.

**Type**

String

**Access**

Read-only

**Syntax**

`Polyline.Name`

**See also**

[Polyline \(Page 4442\)](#)

**Polyline.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

**Type**

Float

**Access**

Read-write

**Syntax**

`Polyline.Opacity`

**See also**

[Polyline \(Page 4442\)](#)

## Polyline.Operability

### Description

The property "Operability" returns whether the polyline is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Polyline.Operability`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`Polyline.Parent`

**See also**

[Polyline \(Page 4442\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**Polyline.Points****Description**

The "Points" polyline specifies the coordinates of the points of the polyline.

**Type**

Variant

**Access**

Read-write

**Syntax**

`Polyline.Points`

**Example**

Output the coordinates of the polyline "Polyline\_1" with 3 points via debug output in runtime:

**Copy code**

```
const p = Screen.Items('Polyline_1').Points;  
HMIRuntime.Trace("x1=" + p[0] + ", y1=" + p[1] + ", x2=" + p[2] + ", y2=" + p[3] + ", x3=" +  
p[4] + ", y3=" + p[5]);
```

**See also**

[Polyline \(Page 4442\)](#)

## **Polyline.RequireExplicitUnlock**

### **Description**

The "RequireExplicitUnlock" property returns whether the polyline can only be operated while the associated button is being pressed.

### **Type**

Bool

### **Access**

Read-only

### **Syntax**

`Polyline.RequireExplicitUnlock`

### **See also**

[Polyline \(Page 4442\)](#)

## **Polyline.RotationAngle**

### **Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

### **Type**

Int16

### **Access**

Read-write

### **Syntax**

`Polyline.RotationAngle`

### **See also**

[Polyline \(Page 4442\)](#)

[Polyline.RotationCenterPlacement \(Page 4461\)](#)

[Polyline.RotationCenterX \(Page 4461\)](#)

[Polyline.RotationCenterY \(Page 4462\)](#)

## **Polyline.RotationCenterPlacement**

### **Description**

The "RotationCenterPlacement" property sets the reference point around which the polyline rotates.

### **Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- **AbsoluteFromCenter (0):** Absolute distance from the object center in DIU (Device Independent Unit).
- **NormedFromCenter (1):** Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- **AbsoluteToContainer (2):** Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### **Access**

Read-write

### **Syntax**

```
Polyline.RotationCenterPlacement
```

### **See also**

[Polyline \(Page 4442\)](#)

[Polyline.RotationAngle \(Page 4460\)](#)

[Polyline.RotationCenterX \(Page 4461\)](#)

[Polyline.RotationCenterY \(Page 4462\)](#)

## **Polyline.RotationCenterX**

### **Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`Polyline.RotationCenterX`

**See also**

- Polyline (Page 4442)
- Polyline.RotationAngle (Page 4460)
- Polyline.RotationCenterPlacement (Page 4461)
- Polyline.RotationCenterY (Page 4462)

**Polyline.RotationCenterY**

**Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`Polyline.RotationCenterY`

**See also**

- Polyline (Page 4442)
- Polyline.RotationAngle (Page 4460)
- Polyline.RotationCenterPlacement (Page 4461)
- Polyline.RotationCenterX (Page 4461)

## Polyline.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the polyline is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
Polyline.ShowFocusVisual
```

### See also

Polyline (Page 4442)

## Polyline.StartType

### Description

The "StartType" property specifies the type of line start.

### Type

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

### Access

Read-write

### Syntax

`Polyline.StartType`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the polyline.

### Type

String

### Access

Read-only

### Syntax

`Polyline.StyleItemClass`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.TabIndex

### Description

The "TabIndex" property returns the position of the polyline in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`Polyline.TabIndex`

**See also**

Polyline (Page 4442)

**Polyline.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`Polyline.ToolTipText`

**See also**

Polyline (Page 4442)

**Polyline.Top****Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`Polyline.Top`

**See also**

Polyline (Page 4442)

## Polyline.Visible

### Description

The "Visible" property specifies whether the polyline is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Polyline.Visible`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Polyline.Width`

### See also

[Polyline \(Page 4442\)](#)

## Polyline.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the polyline.

### Syntax

```
Polyline.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[Polyline \(Page 4442\)](#)

## Polyline.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Polyline.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

Polyline (Page 4442)

## Polyline\_OnActivated()

### Description

The "OnActivated" event occurs when a polyline receives focus:

- A polyline is selected via the configured tab sequence.
- A polyline that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Polyline_OnActivated(item)
```

### Context

**item**

Type: Object

Polyline where the event occurs.

### See also

Polyline (Page 4442)

## Polyline\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A polyline is right-clicked.
- A polyline is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Polyline_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Polyline where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Polyline (Page 4442)

**Polyline\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when a polyline loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
Polyline_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Polyline where the event occurs.

**See also**

Polyline (Page 4442)

**Polyline\_OnKeyDown()****Description**

The "OnKeyDown" event occurs when a key is pressed while the polyline is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
Polyline_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Polyline where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Polyline (Page 4442)

## Polyline\_OnKeyUp()

## Description

The "OnKeyUp" event occurs when a key is released while the polyline is in focus.

## Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
Polyline_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

Polyline where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**[Polyline \(Page 4442\)](#)

## Polyline\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A polyline is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a polyline has the focus.
- A polyline is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Polyline_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Polyline where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Polyline (Page 4442)

## **PopupScreenWindow**

### **Description**

The "PopupScreenWindow" object represents a popup screen window.

### **Object type**

HMIPopupScreenWindow

## Properties

The "PopupScreenWindow" object has the following properties:

- **Adaption**  
Specifies how the window size adapts.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the popup screen window.
- **CurrentScreen**  
Returns the screen of the current popup screen window.
- **CurrentZoomFactor**  
Specifies the zoom factor which is applied to the displayed screen.
- **Enabled**  
Specifies whether the popup screen window can be operated in runtime.
- **Height**  
Specifies the height.
- **HorizontalScrollBarPosition**  
Specifies the horizontal alignment for the scroll bar.
- **HorizontalScrollBarVisibility**  
Specifies the setting for the horizontal scroll bar of the window.
- **Icon**  
Specifies the icon.
- **IsModal**  
Returns whether the popup screen window is modal.
- **InteractiveZooming**  
Specifies whether zooming is supported.
- **Layer**  
Returns the layer of the screen where the popup screen window is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin of the popup screen window.
- **Monitor**  
Returns the monitor on which the popup screen window is displayed.
- **Name**  
Returns the name of the popup screen window .
- **Parent**  
Returns the parent screen object (Parent container).
- **Path**  
Returns the absolute object path of the popup screen window.

- **RenderingTemplate**  
Returns the name of the template from which the object was created.
- **Screen**  
Specifies the name of the screen contained in the pop-up screen window.
- **ScreenName**  
Returns the screen name.
- **ScreenNumber**  
Returns the screen number.
- **ShowFocusVisual**  
Specifies whether the popup screen window is highlighted when in focus.
- **StartupPosition**  
Specifies the position of the popup screen window at runtime start.
- **StyleItemClass**  
Returns the style applied to the popup screen window.
- **System**  
Specifies the server prefix.
- **TabIndex**  
Returns the position of the screen window in the tab sequence.
- **TabIntoWindow**  
Specifies that the configured tab sequence of the displayed screen is resumed on activation via the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **VerticalScrollBarPosition**  
Specifies the vertical alignment for the scroll bar.
- **VerticalScrollBarVisibility**  
Specifies the setting for the vertical scroll bar of the window.
- **Visible**  
Specifies whether the popup screen window is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the screen window configuration.

## Methods

The "PopupScreenWindow" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the screen window.
- **Close()**  
Closes the screen window.
- **PropertyFlashing()**  
Configures flashing of a property.

## PopupScreenWindow.Adaption

### Description

The "Adaption" property specifies how the window size adapts.

### Type

Int32, HmiScreenWindowAdaption

Specifies how the window size adapts:

- None (0): No adaptation
- WindowToScreen (1): Window size corresponds to screen size
- ScreenToWindow (2): Screen is scaled to window size.

### Access

Read-write

### Syntax

`PopupScreenWindow.Adaption`

### See also

[PopupScreenWindow \(Page 4475\)](#)

## PopupScreenWindow.Caption

### Description

The "Caption" property specifies the text to be displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`PopupScreenWindow.Caption`

**See also**

PopupScreenWindow (Page 4475)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

PopupScreenWindow.Caption (Page 4478)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 4479)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 4479)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 4479)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

**See also**

Text.Font (Page 4479)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

[Text.Font \(Page 4479\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

[Text.Font \(Page 4479\)](#)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Text.ForeColor`**See also**

PopupScreenWindow.Caption (Page 4478)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

PopupScreenWindow.Caption (Page 4478)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

[PopupScreenWindow.Caption \(Page 4478\)](#)

**PopupScreenWindow.CaptionColor**

**Description**

The "CaptionColor" property specifies the color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`PopupScreenWindow.CaptionColor`

**See also**

[PopupScreenWindow \(Page 4475\)](#)

**PopupScreenWindow.CurrentQuality**

**Description**

The "CurrentQuality" property returns the current worst quality code of all tags which influence the specified popup screen window.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

`PopupScreenWindow.CurrentQuality`

**See also**

[PopupScreenWindow \(Page 4475\)](#)

**PopupScreenWindow.CurrentScreen****Description**

The "CurrentScreen" property returns the screen of the current popup screen window.

**Type**

Object, HmiScreen (Page 1560)

**Access**

Read-only

**Syntax**

`PopupScreenWindow.CurrentScreen`

## See also

[PopupScreenWindow](#) (Page 4475)

[Screen](#) (Page 1560)

## Screen

### Description

[Screen](#) (Page 1560)

## PopupScreenWindow.CurrentZoomFactor

### Description

The "CurrentZoomFactor" property specifies the zoom factor of the popup screen window. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

### Type

Float

### Access

Read-write

### Syntax

```
PopupScreenWindow.CurrentZoomFactor
```

## See also

[PopupScreenWindow](#) (Page 4475)

## PopupScreenWindow.Enabled

### Description

The "Enabled" property specifies whether the popup screen window can be operated in runtime.

### Type

Bool

**Access**

Read-write

**Syntax**`PopupScreenWindow.Enabled`**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.Height****Description**

The "Height" property specifies the height of the popup screen window in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`PopupScreenWindow.Height`**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.HorizontalScrollBarPosition****Description**

The "HorizontalScrollBarPosition" property specifies the horizontal alignment for the scroll bar.

**Type**

Int32

### Access

Read-write

### Syntax

`PopupScreenWindow.HorizontalScrollBarPosition`

### See also

[PopupScreenWindow \(Page 4475\)](#)

## PopupScreenWindow.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

`PopupScreenWindow.HorizontalScrollBarVisibility`

### See also

[PopupScreenWindow \(Page 4475\)](#)

## PopupScreenWindow.Icon

### Description

The "Icon" property specifies the icon of the popup screen window.

**Type**

String

**Access**

Read-write

**Syntax**`PopupScreenWindow.Icon`**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.InteractiveZooming****Description**

The "InteractiveZooming" property specifies whether zooming is supported.

**Type**

Bool

**Access**

Read-write

**Syntax**`PopupScreenWindow.InteractiveZooming`**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.IsModal****Description**

The "IsModal" property returns whether the popup screen window is modal.

**Type**

Bool

**Access**

Read-only

**Syntax**

`PopupScreenWindow.IsModal`

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.Layer**

**Description**

The "Layer" property returns the layer of the screen where the popup screen window is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`PopupScreenWindow.Layer`

**See also**

PopupScreenWindow (Page 4475)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MaximumZoom`**See also**

PopupScreenWindow.Layer (Page 4490)

Layer.MinimumZoom (Page 4491)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MinimumZoom`**See also**

PopupScreenWindow.Layer (Page 4490)

Layer.MaximumZoom (Page 4490)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

[PopupScreenWindow.Layer \(Page 4490\)](#)

**Layer.Visible**

**Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[PopupScreenWindow.Layer \(Page 4490\)](#)

**PopupScreenWindow.Left**

**Description**

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`PopupScreenWindow.Left`**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.Margin****Description**

The "Margin" property specifies the surrounded outer distance of the popup screen window.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`PopupScreenWindow.Margin`**See also**

PopupScreenWindow (Page 4475)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[PopupScreenWindow.Margin \(Page 4493\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[PopupScreenWindow.Margin \(Page 4493\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

PopupScreenWindow.Margin (Page 4493)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**

PopupScreenWindow.Margin (Page 4493)

**PopupScreenWindow.Monitor****Description**

The "Monitor" property returns the monitor on which the window is displayed.

**Type**

UInt8

**Access**

Read-only

**Syntax**

`PopupScreenWindow.Monitor`

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.Name**

**Description**

The "Name" property returns the name of the pop- up screen window.

**Type**

String

**Access**

Read-only

**Syntax**

`PopupScreenWindow.Name`

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.Parent**

**Description**

The "Parent" property returns the parent screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`PopupScreenWindow.Parent`

**See also**

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**PopupScreenWindow.Path****Description**

The "Path" property returns the absolute object path of the popup screen window in runtime, starting from the top-level screen window.

---

**Note**

For the syntax of an object path, see the "FindItem" method (Page 1720).

---

**Type**

String

**Access**

Read-only

**Syntax**

`PopupScreenWindow.Path`

## See also

[UI.FindItem\(\)](#) (Page 1720)

[PopupScreenWindow](#) (Page 4475)

## PopupScreenWindow.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the object has been created.

### Type

String

### Access

Read-only

### Syntax

```
PopupScreenWindow.RenderingTemplate
```

## See also

[PopupScreenWindow](#) (Page 4475)

## PopupScreenWindow.Screen

### Description

The "Screen" property specifies the name of the screen ("HmiScreen" type) contained in the pop-up screen window. Loads a new screen via its name into the popup screen window.

The "Screen" property returns a different value than the "CurrentScreen" when the referenced screen is not yet loaded completely or does not exist.

### Type

String, HmiStoredScreen

### Access

Read-write

**Syntax**

`PopupScreenWindow.Screen`

**See also**

[PopupScreenWindow \(Page 4475\)](#)

**PopupScreenWindow.ScreenName****Description**

The "ScreenName" property returns the screen name.

**Type**

String

**Access**

Read-only

**Syntax**

`PopupScreenWindow.ScreenName`

**See also**

[PopupScreenWindow \(Page 4475\)](#)

**PopupScreenWindow.ScreenNumber****Description**

The "ScreenNumber" property returns the screen number.

**Type**

UInt16

**Access**

Read-only

## Syntax

`PopupScreenWindow.ScreenNumber`

## See also

[PopupScreenWindow \(Page 4475\)](#)

## PopupScreenWindow.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the popup screen window is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`PopupScreenWindow.ShowFocusVisual`

## See also

[PopupScreenWindow \(Page 4475\)](#)

## PopupScreenWindow.StartupPosition

### Description

The "StartupPosition" property specifies the position of the popup screen window at runtime start.

### Type

Int32, HmiWindowStartupPosition

Specifies the position of the screen window:

- None (0): Relative placement on the configured monitor via "Left" and "Top".
- CenteredMonitor (1): Centered on the configured monitor.

- Maximized (2): Maximized on the configured monitor.
- CenteredOwner (3): Centered on the displayed screen.

**Access**

Read-write

**Syntax**

```
PopupScreenWindow.StartupPosition
```

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.StyleItemClass****Description**

The "StyleItemClass" property returns the style applied to the popup screen window.

**Type**

String

**Access**

Read-only

**Syntax**

```
PopupScreenWindow.StyleItemClass
```

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.System****Description**

The "System" property specifies the server prefix.

**Type**

String, HmiSystem

**Access**

Read-write

**Syntax**

PopupScreenWindow.System

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.TabIndex**

**Description**

The "TabIndex" property returns the position of the popup screen window in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

PopupScreenWindow.TabIndex

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.TabIntoWindow**

**Description**

The "TabIntoWindow" property specifies that the configured tab sequence of the displayed screen is resumed on activation via the configured tab sequence.

**Type**

Bool

**Access**

Read-write

**Syntax**`PopupScreenWindow.TabIntoWindow`**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.Top****Description**

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`PopupScreenWindow.Top`**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.VerticalScrollBarPosition****Description**

The "VerticalScrollBarPosition" property specifies the vertical position for the scroll bar.

**Type**

Int32

**Access**

Read-write

**Syntax**

`PopupScreenWindow.VerticalScrollBarPosition`

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.VerticalScrollBarVisibility**

**Description**

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the window.

**Type**

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

**Access**

Read-write

**Syntax**

`PopupScreenWindow.VerticalScrollBarVisibility`

**See also**

PopupScreenWindow (Page 4475)

## PopupScreenWindow.Visible

### Description

The "Visible" property specifies whether the popup screen window is visible.

### Type

Bool

### Access

Read-write

### Syntax

PopupScreenWindow.Visible

### See also

PopupScreenWindow (Page 4475)

## PopupScreenWindow.Width

### Description

The "Width" property specifies the width of the popup screen window in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

PopupScreenWindow.Width

### See also

PopupScreenWindow (Page 4475)

## PopupScreenWindow.WindowFlags

### Description

The "WindowFlags" property specifies the screen window configuration.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

### Note

Enable multiple properties by adding the integer values or bit operators.

---

### Access

Read-write

### Syntax

PopupScreenWindow.WindowFlags

### Example

Adapt the "windowFlags" tag depending on the window configuration:

#### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;  
if (CanClose) {  
    windowFlags |= HmiWindowFlag.CanClose;  
} else {  
    windowFlags &= HmiWindowFlag.CanClose;  
}
```

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the popup screen window.

**Syntax**

```
PopupScreenWindow.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

PopupScreenWindow (Page 4475)

**PopupScreenWindow.Close()****Description**

The "Close" method closes the popup screen window.

**Syntax**

```
PopupScreenWindow.Close()
```

## Parameters

--

## Return value

Bool

## See also

PopupScreenWindow (Page 4475)

## PopupScreenWindow.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

### Syntax

```
PopupScreenWindow.PropertyFlashing (propertyName, enable [, value]  
[, alternateValue] [, rate])
```

### Parameters

#### **propertyName**

Type: String

Name of the property for which flashing is configured.

#### **enable**

Type: Bool

Specifies that flashing is activated.

#### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

#### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

#### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

PopupScreenWindow (Page 4475)

**Window****ProcessControl****Description**

The "ProcessControl" object shows a process control of tag values from the current process or the log in runtime.

**Object type**

HmiProcessControl

**Properties**

The "ProcessControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the process control.

- **EditMode**  
Specifies the editing mode for values in runtime.
- **Enabled**  
Specifies whether the process control can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the process control.
- **Layer**  
Returns the screen layer in which the process control is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the process control.
- **Online**  
Specifies the start and stop of updating the process control.
- **Parent**  
Returns the higher-level screen object.
- **ProcessView**  
Specifies the appearance of the process control.
- **RenderingTemplate**  
Returns the name of the template from which the process control was created.
- **ShowFocusVisual**  
Specifies whether the process control is highlighted when in focus.
- **StatusBar**  
Specifies the information bar of the process control.
- **StyleItemClass**  
Returns the style which is applied to the process control.
- **TabIndex**  
Returns the position of the process control in the tab sequence.
- **TimeStepSmoothingBase**  
Specifies the base of the time range for the smoothing the values/times.
- **TimeStepSmoothingFactor**  
Specifies the time base factor for smoothing.
- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Specifies the toolbar of the process control.
- **Top**  
Specifies the value of the Y coordinate.

- **Visible**  
Specifies whether the process control is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the process control.

## Methods

The "ProcessControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the process control.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the process control.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ProcessControl" object has the following events:

- **OnActivated()**  
Occurs when a process control receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the process control.
- **OnDeactivated()**  
Occurs when a process control loses focus.
- **OnInitialized()**  
Occurs when a process control has been successfully initialized and the data connection to the PLC has been established.

## ProcessControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

**Syntax**

`ProcessControl.BackColor`

**See also**

ProcessControl (Page 4509)

**ProcessControl.Caption**

**Description**

The "Caption" property specifies the text that is displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`ProcessControl.Caption`

**See also**

ProcessControl (Page 4509)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

ProcessControl.Caption (Page 4512)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 4512)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Text.Font (Page 4512)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 4512)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**`Text.Font` (Page 4512)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**`Text.Font` (Page 4512)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 4512\)](#)

### Text.ForeColor

#### Description

The "ForeColor" property sets the font color of the text.

#### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[ProcessControl.Caption \(Page 4512\)](#)

### Text.Text

#### Description

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

ProcessControl.Caption (Page 4512)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

ProcessControl.Caption (Page 4512)

**ProcessControl.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessControl.CaptionColor`

### See also

ProcessControl (Page 4509)

## ProcessControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the process control.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`ProcessControl.CurrentQuality`

### See also

ProcessControl (Page 4509)

## ProcessControl.EditMode

### Description

The "EditMode" property specifies the editing mode for values in runtime. This also defines the activation state of the toolbar buttons.

### Type

Int32, HmiEditMode

Specifies the editing mode:

- None (0): No access
- Update (1): Update values
- Create (2): Create values
- Delete (4): Delete values

### Access

Read-write

### Syntax

`ProcessControl.EditMode`

### See also

[ProcessControl \(Page 4509\)](#)

## ProcessControl.Enabled

### Description

The "Enabled" property specifies whether the process control can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ProcessControl.Enabled`

**See also**

ProcessControl (Page 4509)

**ProcessControl.Height**

**Description**

The "Height" property specifies the height in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessControl.Height`

**See also**

ProcessControl (Page 4509)

**ProcessControl.Icon**

**Description**

The "Icon" property specifies the icon of the process control.

**Type**

String

**Access**

Read-write

**Syntax**

`ProcessControl.Icon`

**See also**

ProcessControl (Page 4509)

## ProcessControl.Layer

### Description

The "Layer" property returns the screen layer in which the process control is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
ProcessControl.Layer
```

### See also

ProcessControl (Page 4509)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

ProcessControl.Layer (Page 4521)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

ProcessControl.Layer (Page 4521)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

ProcessControl.Layer (Page 4521)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[ProcessControl.Layer \(Page 4521\)](#)

## ProcessControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`ProcessControl.Left`

### See also

[ProcessControl \(Page 4509\)](#)

## ProcessControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ProcessControl.Margin`

### See also

ProcessControl (Page 4509)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

ProcessControl.Margin (Page 4524)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

ProcessControl.Margin (Page 4524)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Right

### See also

ProcessControl.Margin (Page 4524)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ProcessControl.Margin \(Page 4524\)](#)

## ProcessControl.Name

### Description

The "Name" property returns the name of the process control.

### Type

String

### Access

Read-only

### Syntax

`ProcessControl.Name`

### See also

[ProcessControl \(Page 4509\)](#)

## ProcessControl.Online

### Description

The "Online" property specifies the start and stop of the table view updating.

- True: Online. The table view is updated with new values.
- False: Offline. No new values are added to the table view.

### Type

Bool

### Access

Read-write

### Syntax

`ProcessControl.Online`

### See also

ProcessControl (Page 4509)

## ProcessControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`ProcessControl.Parent`

### See also

ProcessControl (Page 4509)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## ProcessControl.ProcessView

### Description

The "ProcessView" specifies the appearance of the table display.

### Type

Object, HmiDataGridViewPart (Page 4528)

### Access

Read-write

### Syntax

```
ProcessControl.ProcessView
```

### See also

ProcessControl (Page 4509)

DataGridView (Page 4528)

## DataGridView

### DataGridView.AllowFilter

### Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

### Type

Bool

### Access

Read-write

**Syntax**

```
DataGridView.AllowFilter
```

**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.AllowSort****Description**

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
DataGridView.AllowSort
```

**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

### Access

Read-write

### Syntax

`DataGridView.AlternateBackColor`

### See also

`ProcessControl.ProcessView` (Page 4528)

## **DataGridView.AlternateForeColor**

### Description

The "AlternateForeColor" property specifies the flashing color for the text.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.AlternateForeColor`

### See also

`ProcessControl.ProcessView` (Page 4528)

## **DataGridView.BackColor**

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

**Access**

Read-write

**Syntax**`DataGridView.BackColor`**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.CellPadding****Description**

The "CellPadding" property specifies the inner spacing of the content from the cell border.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`DataGridView.CellPadding`**See also**

ProcessControl.ProcessView (Page 4528)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[DataGridView.CellPadding \(Page 4531\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[DataGridView.CellPadding \(Page 4531\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[DataGridView.CellPadding \(Page 4531\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[DataGridView.CellPadding \(Page 4531\)](#)**DataGridView.ColoringMode****Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

### Access

Read-write

### Syntax

`DataGridView.ColoringMode`

### See also

[ProcessControl.ProcessView \(Page 4528\)](#)

## DataGridView.Columns

### Description

The "Columns" property represents the quantity of columns.

### Type

Object, [HmiDataGridColumnCollection \(Page 4535\)](#)

### Access

Read-only

### Syntax

`DataGridView.Columns`

### See also

[ProcessControl.ProcessView \(Page 4528\)](#)

[HmiDataGridColumnCollection \(Page 4535\)](#)

## HmiDataGridColumnCollection

### Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

### Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

### Object type

HmiDataGridColumnCollection

### Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

### Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

### See also

[DataGridView.Columns](#) (Page 4534)

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

`HmiDataGridColumnCollection.Count`

### See also

[HmiDataGridColumnCollection \(Page 4535\)](#)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

### Syntax

`HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)`

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

### Parameters

#### **HmiDataGridColumnName**

Type: String

Name of the column

### Return value

Object, [HmiDataGridColumnPartBase \(Page 4537\)](#)

### See also

[HmiDataGridColumnCollection \(Page 4535\)](#)

[Process View Columns \(Page 4537\)](#)

## Process View Columns

### ProcessColumn

#### Description

The "ProcessColumn" object represents a value column.

#### Object type

HmiProcessColumnPart

#### Properties

The "ProcessColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **Content**  
Specifies the display options for text and graphics.
- **DataSource**  
Specifies the data source.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.

- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiDataGridColumnCollection (Page 4535)

## ProcessColumn.AllowSort

### Description

The "AllowSort" property specifies whether column sorting is permitted.  
This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

`ProcessColumn.AllowSort`

## See also

ProcessColumn (Page 4537)

## ProcessColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

**Access**

Read-write

**Syntax**`ProcessColumn.BackColor`**See also**

ProcessColumn (Page 4537)

**ProcessColumn.Content****Description**

The "Content" property specifies the display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**`ProcessColumn.Content`**See also**

ProcessColumn (Page 4537)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics

- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

`ProcessColumn.Content` (Page 4539)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

`ProcessColumn.Content` (Page 4539)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.HorizontalTextAlignment
```

### See also

ProcessColumn.Content (Page 4539)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Content.Spacing
```

## See also

ProcessColumn.Content (Page 4539)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

## See also

ProcessColumn.Content (Page 4539)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

`ProcessColumn.Content` (Page 4539)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

`ProcessColumn.Content` (Page 4539)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ProcessColumn.Content \(Page 4539\)](#)

## ProcessColumn.DataSource

### Description

The "DataSource" property specifies the data source.

### Type

Object, HmiDataSourcePart

### Access

Read-write

### Syntax

`ProcessColumn.DataSource`

### See also

[ProcessColumn \(Page 4537\)](#)

## **DataSource.Source**

### **Description**

The "Source" property specifies the data source, e.g. a tag or logging tag.

### **Type**

String

### **Access**

Read-write

### **Syntax**

`DataSource.Source`

### **See also**

[ProcessColumn.DataSource \(Page 4544\)](#)

## **DataSource.VisualizeQuality**

### **Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### **Type**

Bool

### **Access**

Read-write

### **Syntax**

`DataSource.VisualizeQuality`

### **See also**

[ProcessColumn.DataSource \(Page 4544\)](#)

## ProcessColumn.Enabled

### Description

The "Enabled" property specifies whether the column can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ProcessColumn.Enabled`

### See also

ProcessColumn (Page 4537)

## ProcessColumn.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessColumn.ForeColor`

### See also

ProcessColumn (Page 4537)

## ProcessColumn.Header

### Description

The "Header" property specifies the properties of the column header.

### Type

Object, HmiDataGridColumnHeaderPart

### Access

Read-write

### Syntax

```
ProcessColumn.Header
```

### See also

ProcessColumn (Page 4537)

## DataGridColumnHeader.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
DataGridColumnHeader.Content
```

### See also

ProcessColumn.Header (Page 4547)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[DataGridColumnHeader.Content \(Page 4547\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[DataGridColumnHeader.Content \(Page 4547\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[DataGridColumnHeader.Content \(Page 4547\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DataGridColumnHeader.Content \(Page 4547\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[DataGridColumnHeader.Content \(Page 4547\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

DataGridColumnHeader.Content (Page 4547)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[DataGridColumnHeader.Content \(Page 4547\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 4547\)](#)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

**Type**

String

**Access**

Read-write

**Syntax**`DataGridColumnHeader.Graphic`**See also**

ProcessColumn.Header (Page 4547)

**DataGridColumnHeader.Text****Description**

The "Text" property specifies the label of the column header.

**Type**

String

**Access**

Read-write

**Syntax**`DataGridColumnHeader.Text`**See also**

ProcessColumn.Header (Page 4547)

**ProcessColumn.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessColumn.MaximumWidth`

**See also**

ProcessColumn (Page 4537)

**ProcessColumn.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessColumn.MinimumWidth`

**See also**

ProcessColumn (Page 4537)

**ProcessColumn.Name**

**Description**

The "Name" property returns the name of the column.

**Type**

String

**Access**

Read-only

**Syntax**`ProcessColumn.Name`**See also**

ProcessColumn (Page 4537)

**ProcessColumn.OutputFormat****Description**

The "OutputFormat" property specifies the format for displaying values.

**Type**

String

**Access**

Read-write

**Syntax**`ProcessColumn.OutputFormat`**See also**

ProcessColumn (Page 4537)

**ProcessColumn.SortDirection****Description**

The "SortDirection" property specifies the sorting direction.

**Type**

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

### Access

Read-write

### Syntax

`ProcessColumn.SortDirection`

### See also

[ProcessColumn \(Page 4537\)](#)

## ProcessColumn.SortOrder

### Description

The "SortOrder" property specifies the sorting order.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

### Type

UInt16

### Access

Read-write

### Syntax

`ProcessColumn.SortOrder`

### See also

[ProcessColumn \(Page 4537\)](#)

## ProcessColumn.Visible

### Description

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessColumn.Visible`**See also**

ProcessColumn (Page 4537)

**ProcessColumn.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessColumn.Width`**See also**

ProcessColumn (Page 4537)

**TimeRangeColumn****Description**

The "TimeRangeColumn" object represents a time column. The time column is the first column of the process control and can only occur once.

## Object type

HmiTimeRangeColumnPart

## Properties

The "TimeRangeColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **BeginTime**  
Specifies the date and time for the start time of the time range.
- **Content**  
Specifies the display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **EndTime**  
Specifies the date and time for the end time of the time range.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **PointCount**  
Specifies the number of measurement points from the start time.
- **RangeType**  
Specifies the type of time range.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **TimeRangeBase**  
Specifies the basis of the time range.
- **TimeRangeFactor**  
Specifies the factor of the time base for defining the time range.

- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiDataGridColumnCollection (Page 4535)

## TimeRangeColumn.AllowSort

### Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

`TimeRangeColumn.AllowSort`

## See also

TimeRangeColumn (Page 4557)

## TimeRangeColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

**Access**

Read-write

**Syntax**

`TimeRangeColumn.BackColor`

**See also**

[TimeRangeColumn \(Page 4557\)](#)

**TimeRangeColumn.BeginTime**

**Description**

The "BeginTime" property specifies the date and time for the start time of the time range.

**Type**

DateTime

**Access**

Read-write

**Syntax**

`TimeRangeColumn.BeginTime`

**See also**

[TimeRangeColumn \(Page 4557\)](#)

**TimeRangeColumn.Content**

**Description**

The "Content" property specifies the display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**`TimeRangeColumn.Content`**See also**`TimeRangeColumn` (Page 4557)**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**`Int32, HmiContentMode`

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**`Read-write`**Syntax**`Content.ContentMode`**See also**`TimeRangeColumn.Content` (Page 4560)**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**`Int32, HmiGraphicStretchMode`

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[TimeRangeColumn.Content \(Page 4560\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

**See also**

TimeRangeColumn.Content (Page 4560)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

TimeRangeColumn.Content (Page 4560)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

## See also

TimeRangeColumn.Content (Page 4560)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

## See also

TimeRangeColumn.Content (Page 4560)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

```
Content.TextTrimming
```

### See also

TimeRangeColumn.Content (Page 4560)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

TimeRangeColumn.Content (Page 4560)

## TimeRangeColumn.Enabled

### Description

The "Enabled" property specifies whether the column can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`TimeRangeColumn.Enabled`

### See also

[TimeRangeColumn \(Page 4557\)](#)

## TimeRangeColumn.EndTime

### Description

The "EndTime" property specifies the date and time for the end time of the time range.

### Type

DateTime

### Access

Read-write

### Syntax

`TimeRangeColumn.EndTime`

### See also

[TimeRangeColumn \(Page 4557\)](#)

## TimeRangeColumn.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
TimeRangeColumn.ForeColor
```

### See also

TimeRangeColumn (Page 4557)

## TimeRangeColumn.Header

### Description

The "Header" property specifies the properties of the column header.

### Type

Object, HmiDataGridColumnHeaderPart

### Access

Read-write

### Syntax

```
TimeRangeColumn.Header
```

### See also

TimeRangeColumn (Page 4557)

## DataGridColumnHeader.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`DataGridColumnHeader.Content`

### See also

[TimeRangeColumn.Header \(Page 4567\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

DataGridColumnHeader.Content (Page 4568)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

DataGridColumnHeader.Content (Page 4568)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 4568\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DataGridColumnHeader.Content \(Page 4568\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

```
Content.SplitRatio
```

### See also

DataGridColumnHeader.Content (Page 4568)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[DataGridColumnHeader.Content \(Page 4568\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[DataGridColumnHeader.Content \(Page 4568\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[DataGridColumnHeader.Content \(Page 4568\)](#)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

### Type

String

### Access

Read-write

### Syntax

```
DataGridColumnHeader.Graphic
```

### See also

[TimeRangeColumn.Header \(Page 4567\)](#)

## DataGridColumnHeader.Text

### Description

The "Text" property specifies the label of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Text`

### See also

[TimeRangeColumn.Header](#) (Page 4567)

## TimeRangeColumn.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

`TimeRangeColumn.MaximumWidth`

### See also

[TimeRangeColumn](#) (Page 4557)

## TimeRangeColumn.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
TimeRangeColumn.MinimumWidth
```

### See also

TimeRangeColumn (Page 4557)

## TimeRangeColumn.Name

### Description

The "Name" property returns the name of the column.

### Type

String

### Access

Read-only

### Syntax

```
TimeRangeColumn.Name
```

### See also

TimeRangeColumn (Page 4557)

## TimeRangeColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

`TimeRangeColumn.OutputFormat`

### See also

[TimeRangeColumn \(Page 4557\)](#)

## TimeRangeColumn.PointCount

### Description

The "PointCount" property specifies the number of measurement points from the start time.

### Type

Int32

### Access

Read-write

### Syntax

`TimeRangeColumn.PointCount`

### See also

[TimeRangeColumn \(Page 4557\)](#)

## TimeRangeColumn.RangeType

### Description

The "RangeType" property specifies the type of time range.

### Type

Int32, HmiTimeRangeType

Specifies the time range:

- TimeRange (0): Any time range
- FromBeginToEnd (1): Total time range
- PointCount (2): Number of measurement points

### Access

Read-write

### Syntax

`TimeRangeColumn.RangeType`

### See also

[TimeRangeColumn \(Page 4557\)](#)

## TimeRangeColumn.SortDirection

### Description

The "SortDirection" property specifies the sorting direction.

### Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

### Access

Read-write

### Syntax

`TimeRangeColumn.SortDirection`

### See also

[TimeRangeColumn \(Page 4557\)](#)

## TimeRangeColumn.SortOrder

### Description

The "SortOrder" property specifies the sorting order.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

### Type

UInt16

### Access

Read-write

### Syntax

`TimeRangeColumn.SortOrder`

### See also

[TimeRangeColumn \(Page 4557\)](#)

## TimeRangeColumn.TimeRangeBase

### Description

The "TimeRangeBase" property specifies the base of the time range.

### Type

Int32, HmiTimeRangeBase

Specifies the time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute

- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

**Access**

Read-write

**Syntax**

`TimeRangeColumn.TimeRangeBase`

**See also**

[TimeRangeColumn \(Page 4557\)](#)

**TimeRangeColumn.TimeRangeFactor****Description**

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

**Type**

Int32

**Access**

Read-write

**Syntax**

`TimeRangeColumn.TimeRangeFactor`

**See also**

[TimeRangeColumn \(Page 4557\)](#)

**TimeRangeColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TimeRangeColumn.Visible`

**See also**

[TimeRangeColumn \(Page 4557\)](#)

**TimeRangeColumn.Width**

**Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TimeRangeColumn.Width`

**See also**

[TimeRangeColumn \(Page 4557\)](#)

**DataGridView.Font**

**Description**

The "Font" property specifies the font of the cells.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridView.Font`

**See also**

[ProcessControl.ProcessView \(Page 4528\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[DataGridView.Font \(Page 4580\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

### Access

Read-write

### Syntax

Font.Name

### See also

DataGridView.Font (Page 4580)

### Font.Size

#### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

#### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

DataGridView.Font (Page 4580)

### Font.StrikeOut

#### Description

The "StrikeOut" property specifies whether font is struck through.

#### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

DataGridView.Font (Page 4580)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
Font.Underline
```

**See also**

DataGridView.Font (Page 4580)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[DataGridView.Font \(Page 4580\)](#)

## DataGridView.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.ForeColor`

### See also

[ProcessControl.ProcessView \(Page 4528\)](#)

## DataGridView.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.GridLineColor
```

### See also

ProcessControl.ProcessView (Page 4528)

## DataGridView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

### Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

```
DataGridView.GridLineVisibility
```

### See also

ProcessControl.ProcessView (Page 4528)

## DataGridView.GridLineWidth

### Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

### Type

UInt8

### Access

Read-write

### Syntax

`DataGridView.GridLineWidth`

### See also

ProcessControl.ProcessView (Page 4528)

## DataGridView.GridSelectionMode

### Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

### Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

### Access

Read-write

**Syntax**

`DataGridView.GridSelectionMode`

**See also**

`ProcessControl.ProcessView` (Page 4528)

**DataGridView.HeaderSettings****Description**

The "HeaderSettings" property specifies the settings for all column headers in the table.

**Type**

Object, `HmiDataGridHeaderSettingsPart`

**Access**

Read-write

**Syntax**

`DataGridView.HeaderSettings`

**See also**

`ProcessControl.ProcessView` (Page 4528)

**DataGridHeaderSettings.AllowColumnReorder****Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

## Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

## See also

DataGridView.HeaderSettings (Page 4587)

## DataGridHeaderSettings.AllowColumnResize

### Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

## See also

DataGridView.HeaderSettings (Page 4587)

## DataGridHeaderSettings.ColumnHeaderType

### Description

The "ColumnHeaderType" property specifies the type of content of a column header.

### Type

Int32, HmiDataGridColumnHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.ColumnHeaderType`

**See also**

[DataGridView.HeaderSettings \(Page 4587\)](#)

**DataGridHeaderSettings.Font****Description**

The "Font" property specifies the font of the headers.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.Font`

**See also**

[DataGridView.HeaderSettings \(Page 4587\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

DataGridHeaderSettings.Font (Page 4589)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

DataGridHeaderSettings.Font (Page 4589)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

DataGridHeaderSettings.Font (Page 4589)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

DataGridHeaderSettings.Font (Page 4589)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

DataGridHeaderSettings.Font (Page 4589)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

DataGridHeaderSettings.Font (Page 4589)

## DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

### See also

DataGridView.HeaderSettings (Page 4587)

## DataGridHeaderSettings.HeaderForeColor

### Description

The "HeaderForeColor" property specifies the font color of the headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

### See also

DataGridView.HeaderSettings (Page 4587)

## DataGridHeaderSettings.HeaderGridLineColor

### Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

### See also

DataGridView.HeaderSettings (Page 4587)

## DataGridHeaderSettings.HeaderSelectionBackColor

### Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

### See also

DataGridView.HeaderSettings (Page 4587)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### Object

Required. An object from the "Availability" section.

### See also

DataGridView.HeaderSettings (Page 4587)

## DataGridHeaderSettings.RowHeaderType

### Description

The "RowHeaderType" property specifies the type of content of a row header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

## Syntax

`DataGridHeaderSettings.RowHeaderType`

## See also

`DataGridView.HeaderSettings` (Page 4587)

## DataGridView.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

`DataGridView.HorizontalScrollBarVisibility`

### See also

`ProcessControl.ProcessView` (Page 4528)

## DataGridView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.RowHeight`**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.SelectFullRow****Description**

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

**Type**

Bool

**Access**

Read-write

**Syntax**`DataGridView.SelectFullRow`**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.SelectionBackColor****Description**

The "SelectionBackColor" property specifies the background color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBackColor`

**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.SelectionBorderColor**

**Description**

The "SelectionBorderColor" property specifies the border color of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBorderColor`

**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.SelectionBorderWidth**

**Description**

The "SelectionBorderWidth" property specifies the border width of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.SelectionBorderWidth`**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.SelectionForeColor****Description**

The "SelectionForeColor" property specifies the font color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridView.SelectionForeColor`**See also**

ProcessControl.ProcessView (Page 4528)

**DataGridView.VerticalScrollBarVisibility****Description**

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.VerticalScrollBarVisibility
```

### See also

ProcessControl.ProcessView (Page 4528)

## ProcessControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the process control was created.

### Type

String

### Access

Read-only

### Syntax

```
ProcessControl.RenderingTemplate
```

### See also

ProcessControl (Page 4509)

## ProcessControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the process control is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
ProcessControl.ShowFocusVisual
```

### See also

ProcessControl (Page 4509)

## ProcessControl.StatusBar

### Description

The "StatusBar" property specifies the information bar of the process control.

### Type

Object, HmiStatusBarPart

### Access

Read-write

### Syntax

```
ProcessControl.StatusBar
```

### See also

ProcessControl (Page 4509)

## StatusBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
StatusBar.BackColor
```

### See also

ProcessControl.StatusBar (Page 4601)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 4603)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

### See also

ProcessControl.StatusBar (Page 4601)

HmiControlBarElementCollection (Page 4603)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

### See also

[StatusBar.Elements](#) (Page 4602)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

## Access

Read-only

## Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 4603)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

### Return value

Object, HmiControlBarElementPartBase (Page 4621)

### See also

HmiControlBarElementCollection (Page 4603)

Control Bar Elements (Page 4621)

## Control Bar Elements

### Description

Control Bar Elements (Page 4621)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.Enabled
```

### See also

ProcessControl.StatusBar (Page 4601)

## StatusBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
StatusBar.Font
```

**See also**

ProcessControl.StatusBar (Page 4601)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

StatusBar.Font (Page 4605)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

StatusBar.Font (Page 4605)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

StatusBar.Font (Page 4605)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

## Syntax

`Font.StrikeOut`

## See also

StatusBar.Font (Page 4605)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

## See also

StatusBar.Font (Page 4605)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[StatusBar.Font \(Page 4605\)](#)

**StatusBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the information bar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`StatusBar.Margin`

**See also**

[ProcessControl.StatusBar \(Page 4601\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

StatusBar.Margin (Page 4609)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

StatusBar.Margin (Page 4609)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

StatusBar.Margin (Page 4609)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**

StatusBar.Margin (Page 4609)

**StatusBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the information bar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`StatusBar.Padding`

**See also**

[ProcessControl.StatusBar \(Page 4601\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[StatusBar.Padding \(Page 4611\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

StatusBar.Padding (Page 4611)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

StatusBar.Padding (Page 4611)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

StatusBar.Padding (Page 4611)

**StatusBar.ShowToolTips**

**Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

StatusBar.ShowToolTips

**See also**

ProcessControl.StatusBar (Page 4601)

**StatusBar.Visible**

**Description**

The "Visible" property specifies whether the information bar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`StatusBar.Visible`**See also**

ProcessControl.StatusBar (Page 4601)

**ProcessControl.StyleItemClass****Description**

The "StyleItemClass" property returns the style that is applied to the process control.

**Type**

String

**Access**

Read-only

**Syntax**`ProcessControl.StyleItemClass`**See also**

ProcessControl (Page 4509)

**ProcessControl.TabIndex****Description**

The "TabIndex" property returns the position of the process control in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`ProcessControl.TabIndex`

**See also**

ProcessControl (Page 4509)

**ProcessControl.TimeStepSmoothingBase**

**Description**

The "TimeStepSmoothingBase" property specifies the base of the time range for smoothing the values/times.

**Type**

Int32, HmiTimeRangeBase

Specifies the time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

**Access**

Read-write

**Syntax**

`ProcessControl.TimeStepSmoothingBase`

**See also**

ProcessControl (Page 4509)

**ProcessControl.TimeStepSmoothingFactor****Description**

The "TimeStepSmoothingFactor" property specifies the factor for smoothing the time base.

**Type**

Int32

**Access**

Read-write

**Syntax**

`ProcessControl.TimeStepSmoothingFactor`

**See also**

ProcessControl (Page 4509)

**ProcessControl.TimeZone****Description**

The "TimeZone" property specifies the time zone.

**Type**

Int32, HmiTimeZone

**Access**

Read-write

**Syntax**

`ProcessControl.TimeZone`

**See also**

ProcessControl (Page 4509)

## ProcessControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the table display.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

`ProcessControl.ToolBar`

### See also

ProcessControl (Page 4509)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ToolBar.BackColor`

### See also

ProcessControl.ToolBar (Page 4618)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 4619)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

HmiControlBarElementCollection (Page 4619)

ProcessControl.ToolBar (Page 4618)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[ToolBar.Elements](#) (Page 4619)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

[HmiControlBarElementCollection](#) (Page 4619)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 4621)

## See also

HmiControlBarElementCollection (Page 4619)

Control Bar Elements (Page 4621)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 4621)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 4621)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 4621)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 4621)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.BorderColor`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`ControlBarButton.BorderWidth`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarButton.Content
```

### See also

ControlBarButton (Page 4621)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

```
Content.ContentMode
```

## See also

ControlBarButton.Content (Page 4627)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarButton.Content (Page 4627)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.HorizontalTextAlignment
```

### See also

[ControlBarButton.Content \(Page 4627\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Content.Spacing
```

### See also

[ControlBarButton.Content \(Page 4627\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarButton.Content (Page 4627)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarButton.Content (Page 4627)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 4627\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarButton.CustomID`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 4621)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 4621)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.Graphic`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarButton.Mapping`

**See also**

[ControlBarButton \(Page 4621\)](#)

**ControlBarButton.Margin****Description**

The "Margin" property specifies the surrounded outer distance of the button.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 4621\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarButton.Margin \(Page 4637\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 4637)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarButton.Margin` (Page 4637)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 4637\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MaximumHeight`

## See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 4621)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MinimumHeight
```

**See also**

ControlBarButton (Page 4621)

**ControlBarButton.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarButton.MinimumWidth
```

## See also

ControlBarButton (Page 4621)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarButton.Operability
```

## See also

ControlBarButton (Page 4621)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**[ControlBarButton \(Page 4621\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**[ControlBarButton.Padding \(Page 4642\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarButton.Padding \(Page 4642\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarButton.Padding \(Page 4642\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 4642\)](#)**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarButton.RequireExplicitUnlock`**See also**[ControlBarButton \(Page 4621\)](#)**ControlBarButton.Text****Description**

The "Text" property specifies the label of the button.

**Type**

String

### Access

Read-write

### Syntax

`ControlBarButton.Text`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.ToolTipText`

### See also

[ControlBarButton \(Page 4621\)](#)

## ControlBarButton.Visible

### Description

The "Visible" property specifies whether the button is visible.

### Type

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 4621)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.Width`**See also**

ControlBarButton (Page 4621)

**ControlBarDisplay****Description**

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

[ControlBarDisplay \(Page 4647\)](#)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

## Syntax

`ControlBarDisplay.Content`

## See also

[ControlBarDisplay \(Page 4647\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

[ControlBarDisplay.Content \(Page 4649\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

`ControlBarDisplay.Content` (Page 4649)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

**See also**

ControlBarDisplay.Content (Page 4649)

**Content.Spacing**

**Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 4649)

**Content.SplitRatio**

**Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

**See also**

ControlBarDisplay.Content (Page 4649)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

ControlBarDisplay.Content (Page 4649)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

`ControlBarDisplay.Content` (Page 4649)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

`ControlBarDisplay.Content` (Page 4649)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarDisplay.CustomID
```

### See also

ControlBarDisplay (Page 4647)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarDisplay.Enabled
```

### See also

ControlBarDisplay (Page 4647)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.ForeColor
```

### See also

ControlBarDisplay (Page 4647)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 4647)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

### See also

[ControlBarDisplay](#) (Page 4647)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarDisplay.Mapping`

**See also**

[ControlBarDisplay \(Page 4647\)](#)

**ControlBarDisplay.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the display.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 4647\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarDisplay.Margin \(Page 4659\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarDisplay.Margin \(Page 4659\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**[ControlBarDisplay.Margin \(Page 4659\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

`ControlBarDisplay.Margin` (Page 4659)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MaximumHeight`

## See also

`ControlBarDisplay` (Page 4647)

## ControlBarDisplay.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MaximumWidth
```

**See also**

ControlBarDisplay (Page 4647)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.MinimumHeight
```

**See also**

ControlBarDisplay (Page 4647)

**ControlBarDisplay.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarDisplay.MinimumWidth
```

## See also

ControlBarDisplay (Page 4647)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarDisplay.Operability
```

## See also

ControlBarDisplay (Page 4647)

## ControlBarDisplay.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the display.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 4647)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarDisplay.Padding (Page 4664)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarDisplay.Padding \(Page 4664\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarDisplay.Padding \(Page 4664\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarDisplay.Padding \(Page 4664\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarDisplay.RequireExplicitUnlock`**See also**[ControlBarDisplay \(Page 4647\)](#)**ControlBarDisplay.Text****Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Text`

**See also**

ControlBarDisplay (Page 4647)

**ControlBarDisplay.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.ToolTipText`

**See also**

ControlBarDisplay (Page 4647)

**ControlBarDisplay.Visible**

**Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 4647)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.Width`**See also**

ControlBarDisplay (Page 4647)

**ControlBarLabel****Description**

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.

- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarLabel.Authorization
```

### See also

ControlBarLabel (Page 4669)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarLabel.CustomID
```

### See also

ControlBarLabel (Page 4669)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarLabel.Enabled
```

### See also

ControlBarLabel (Page 4669)

## ControlBarLabel.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.ForeColor`**See also**

ControlBarLabel (Page 4669)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.Height`**See also**

ControlBarLabel (Page 4669)

**ControlBarLabel.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

### See also

ControlBarLabel (Page 4669)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 4669\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

**See also**

[ControlBarLabel](#) (Page 4669)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarLabel.Margin](#) (Page 4676)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

ControlBarLabel.Margin (Page 4676)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

ControlBarLabel.Margin (Page 4676)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

[ControlBarLabel.Margin](#) (Page 4676)

**ControlBarLabel.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MaximumHeight
```

**See also**

[ControlBarLabel](#) (Page 4669)

**ControlBarLabel.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MaximumWidth
```

## See also

ControlBarLabel (Page 4669)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MinimumHeight`

## See also

ControlBarLabel (Page 4669)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MinimumWidth`

**See also**

[ControlBarLabel \(Page 4669\)](#)

**ControlBarLabel.Operability****Description**

The "Operability" property returns whether the identifier is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarLabel.Operability
```

**See also**

[ControlBarLabel \(Page 4669\)](#)

**ControlBarLabel.Padding****Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

## Syntax

`ControlBarLabel.Padding`

## See also

[ControlBarLabel \(Page 4669\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

## See also

[ControlBarLabel.Padding \(Page 4681\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Left`**See also**`ControlBarLabel.Padding` (Page 4681)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Right`**See also**`ControlBarLabel.Padding` (Page 4681)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Top`

## See also

`ControlBarLabel.Padding` (Page 4681)

## **ControlBarLabel.RequireExplicitUnlock**

### Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarLabel.RequireExplicitUnlock`

### See also

`ControlBarLabel` (Page 4669)

## **ControlBarLabel.Text**

### Description

The "Text" property specifies the label of the identifier.

### Type

String

### Access

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

ControlBarLabel (Page 4669)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

**See also**

ControlBarLabel (Page 4669)

**ControlBarLabel.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.VerticalTextAlignment`

### See also

[ControlBarLabel \(Page 4669\)](#)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarLabel.Visible`

### See also

[ControlBarLabel \(Page 4669\)](#)

## ControlBarLabel.Width

### Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

### Type

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 4669)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar. You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

**Properties**

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarSeparator.Authorization`

**See also**

[ControlBarSeparator](#) (Page 4687)

**ControlBarSeparator.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

```
ControlBarSeparator.CustomID
```

**See also**

[ControlBarSeparator](#) (Page 4687)

**ControlBarSeparator.Enabled****Description**

The "Enabled" property specifies whether the separator is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.Enabled
```

## See also

[ControlBarSeparator \(Page 4687\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.ForeColor
```

## See also

[ControlBarSeparator \(Page 4687\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

**See also**

ControlBarSeparator (Page 4687)

**ControlBarSeparator.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**`ControlBarSeparator.Mapping`**See also**

ControlBarSeparator (Page 4687)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ControlBarSeparator.Margin`**See also**

ControlBarSeparator (Page 4687)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarSeparator.Margin \(Page 4693\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarSeparator.Margin \(Page 4693\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarSeparator.Margin \(Page 4693\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarSeparator.Margin \(Page 4693\)](#)**ControlBarSeparator.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MaximumHeight`

**See also**

[ControlBarSeparator \(Page 4687\)](#)

**ControlBarSeparator.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MaximumWidth`

**See also**

[ControlBarSeparator \(Page 4687\)](#)

**ControlBarSeparator.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MinimumHeight`**See also**

ControlBarSeparator (Page 4687)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MinimumWidth`**See also**

ControlBarSeparator (Page 4687)

**ControlBarSeparator.Operability****Description**

The "Operability" property returns whether the separator is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarSeparator.Operability`

### See also

[ControlBarSeparator \(Page 4687\)](#)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Padding`

### See also

[ControlBarSeparator \(Page 4687\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarSeparator.Padding (Page 4698)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarSeparator.Padding (Page 4698)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarSeparator.Padding \(Page 4698\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarSeparator.Padding \(Page 4698\)](#)

## ControlBarSeparator.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

### See also

ControlBarSeparator (Page 4687)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarSeparator.ToolTipText
```

### See also

ControlBarSeparator (Page 4687)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Visible`

### See also

[ControlBarSeparator \(Page 4687\)](#)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Width`

### See also

[ControlBarSeparator \(Page 4687\)](#)

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.

- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.AlternateBorderColor
```

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.Authorization
```

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarTextBox.BackColor`

## See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarTextBox.BorderColor`

## See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

**Syntax**

```
ControlBarTextBox.BorderWidth
```

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.CustomID
```

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.Enabled****Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**

Bool

**Access**

Read-write

## Syntax

`ControlBarTextBox.Enabled`

## See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.ForeColor`

## See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.Height
```

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.HorizontalTextAlignment
```

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 4703\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarTextBox.Margin \(Page 4712\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarTextBox.Margin \(Page 4712\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 4712\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarTextBox.Margin \(Page 4712\)](#)

## ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MaximumHeight`

### See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MaximumWidth
```

### See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumHeight
```

### See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumWidth
```

### See also

ControlBarTextBox (Page 4703)

## ControlBarTextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarTextBox.Operability
```

**See also**

[ControlBarTextBox \(Page 4703\)](#)

**ControlBarTextBox.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Padding
```

**See also**

[ControlBarTextBox \(Page 4703\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Bottom
```

**See also**

[ControlBarTextBox.Padding \(Page 4717\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarTextBox.Padding \(Page 4717\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarTextBox.Padding](#) (Page 4717)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarTextBox.Padding](#) (Page 4717)

**ControlBarTextBox.ReadOnly****Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ReadOnly`

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarTextBox.RequireExplicitUnlock`

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.Text**

**Description**

The "Text" property specifies the label of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Text`

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.ToolTipText
```

**See also**

ControlBarTextBox (Page 4703)

**ControlBarTextBox.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

## Syntax

`ControlBarTextBox.VerticalTextAlignment`

## See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarTextBox.Visible`

## See also

[ControlBarTextBox \(Page 4703\)](#)

## ControlBarTextBox.Width

### Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

## Syntax

```
ControlBarTextBox.Width
```

## See also

ControlBarTextBox (Page 4703)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.

- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

**Methods**

--

**ControlBarToggleSwitch.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.AlternateBackColor`**See also**[ControlBarToggleSwitch \(Page 4723\)](#)**ControlBarToggleSwitch.AlternateBorderColor****Description**

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.AlternateBorderColor`

**See also**

ControlBarToggleSwitch (Page 4723)

**ControlBarToggleSwitch.AlternateGraphic**

**Description**

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateGraphic`

**See also**

ControlBarToggleSwitch (Page 4723)

**ControlBarToggleSwitch.AlternateText**

**Description**

The "AlternateText" property specifies the text of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateText`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ControlBarToggleSwitch.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarToggleSwitch.Authorization
```

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ControlBarToggleSwitch.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BackColor
```

**See also**

[ControlBarToggleSwitch](#) (Page 4723)

**ControlBarToggleSwitch.Badge**

**Description**

The "Badge" property specifies the identifier of the switch.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Badge`

**See also**

[ControlBarToggleSwitch](#) (Page 4723)

**ControlBarToggleSwitch.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.BorderColor`

**See also**

[ControlBarToggleSwitch](#) (Page 4723)

**ControlBarToggleSwitch.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderWidth
```

**See also**

[ControlBarToggleSwitch](#) (Page 4723)

**ControlBarToggleSwitch.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.Content
```

## See also

ControlBarToggleSwitch (Page 4723)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

ControlBarToggleSwitch.Content (Page 4729)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

`ControlBarToggleSwitch.Content` (Page 4729)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

`ControlBarToggleSwitch.Content` (Page 4729)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 4729\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 4729\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

[ControlBarToggleSwitch.Content \(Page 4729\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarToggleSwitch.Content \(Page 4729\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 4729\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch \(Page 4723\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Enabled
```

### See also

[ControlBarToggleSwitch \(Page 4723\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 4723)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 4723)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Height`

### See also

[ControlBarToggleSwitch \(Page 4723\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 4723\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

### See also

ControlBarToggleSwitch (Page 4723)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Mapping`

### See also

[ControlBarToggleSwitch \(Page 4723\)](#)

## ControlBarToggleSwitch.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the switch.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Margin`**See also**[ControlBarToggleSwitch \(Page 4723\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**[ControlBarToggleSwitch.Margin \(Page 4740\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarToggleSwitch.Margin \(Page 4740\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarToggleSwitch.Margin \(Page 4740\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarToggleSwitch.Margin \(Page 4740\)](#)**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumHeight`**See also**[ControlBarToggleSwitch \(Page 4723\)](#)**ControlBarToggleSwitch.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumHeight`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ControlBarToggleSwitch.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumWidth`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Operability`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ControlBarToggleSwitch.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Padding`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarToggleSwitch.Padding \(Page 4745\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarToggleSwitch.Padding \(Page 4745\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarToggleSwitch.Padding \(Page 4745\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarToggleSwitch.Padding (Page 4745)

**ControlBarToggleSwitch.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarToggleSwitch.RequireExplicitUnlock

**See also**

ControlBarToggleSwitch (Page 4723)

**ControlBarToggleSwitch.Text**

**Description**

The "Text" property specifies the label of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Text`**See also**

ControlBarToggleSwitch (Page 4723)

**ControlBarToggleSwitch.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.ToolTipText`**See also**

ControlBarToggleSwitch (Page 4723)

**ControlBarToggleSwitch.Visible****Description**

The "Visible" property specifies whether the switch is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Visible`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ControlBarToggleSwitch.Width**

**Description**

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Width`

**See also**

[ControlBarToggleSwitch \(Page 4723\)](#)

**ToolBar.Enabled**

**Description**

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.Enabled`**See also**

ProcessControl.ToolBar (Page 4618)

**ToolBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`ToolBar.Font`**See also**

ProcessControl.ToolBar (Page 4618)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

ToolBar.Font (Page 4751)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

ToolBar.Font (Page 4751)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

ToolBar.Font (Page 4751)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

ToolBar.Font (Page 4751)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[ToolBar.Font \(Page 4751\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

**Syntax**`Font.Weight`**See also**`ToolBar.Font` (Page 4751)**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**`Object, HmiMarginPart`**Access**`Read-write`**Syntax**`ToolBar.Margin`**See also**`ProcessControl.ToolBar` (Page 4618)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Bottom`

## See also

[ToolBar.Margin \(Page 4755\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

## See also

[ToolBar.Margin \(Page 4755\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**[ToolBar.Margin \(Page 4755\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**[ToolBar.Margin \(Page 4755\)](#)**ToolBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**`Object, HmiPaddingPart`**Access**`Read-write`

## Syntax

`ToolBar.Padding`

## See also

[ProcessControl.ToolBar \(Page 4618\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

## See also

[ToolBar.Padding \(Page 4757\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Left`**See also**`ToolBar.Padding` (Page 4757)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Right`**See also**`ToolBar.Padding` (Page 4757)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Top`

## See also

`ToolBar.Padding` (Page 4757)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.ShowToolTips`

## See also

`ProcessControl.ToolBar` (Page 4618)

## ToolBar.UseHotKeys

### Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

### Type

Bool

### Access

Read-write

**Syntax**

```
ToolBar.UseHotKeys
```

**See also**

ProcessControl.ToolBar (Page 4618)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ToolBar.Visible
```

**See also**

ProcessControl.ToolBar (Page 4618)

**ProcessControl.Top****Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ProcessControl.Top`

**See also**

ProcessControl (Page 4509)

**ProcessControl.Visible**

**Description**

The "Visible" property specifies whether the process control is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessControl.Visible`

**See also**

ProcessControl (Page 4509)

**ProcessControl.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessControl.Width`

**See also**

ProcessControl (Page 4509)

**ProcessControl.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the process control display.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`ProcessControl.WindowFlags`

**See also**

ProcessControl (Page 4509)

## ProcessControl.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the table view.

### Syntax

```
ProcessControl.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[ProcessControl](#) (Page 4509)

## ProcessControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the table view.

### Syntax

```
ProcessControl.FireCommand(commandId, custom)
```

## Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## Return value

--

## See also

[ProcessControl](#) (Page 4509)

## ProcessControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ProcessControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

ProcessControl (Page 4509)

**ProcessControl\_OnActivated()**

**Description**

The "OnActivated" event occurs when a table view receives focus:

- A table display is selected via the configured tab sequence.
- A table display that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

ProcessControl\_OnActivated(item)

## Context

**item**

Type: Object

Table view where the event occurs.

## See also

ProcessControl (Page 4509)

## ProcessControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the table view.

### Syntax

```
ProcessControl_OnCommandFired(item, commandId, custom)
```

## Context

**item**

Type: Object

Table view where the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## See also

ProcessControl (Page 4509)

## ProcessControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the table view loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
ProcessControl_OnDeactivated(item)
```

### Context

**item**

Type: Object

Table view where the event occurs.

### See also

ProcessControl (Page 4509)

## ProcessControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a table view has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
ProcessControl_OnInitialized(item)
```

### Context

**item**

Type: Object

Table view where the event occurs.

## See also

ProcessControl (Page 4509)

## ProcessDiagnosisCriteriaAnalysisControl

### Description

The "ProcessDiagnosisCriteriaAnalysisControl" object represents a criteria analysis control of the operands with errors for a selected process diagnostics alarm in runtime.

### Object type

HmiProcessDiagnosisCriteriaAnalysisControl

### Properties

The "ProcessDiagnosisCriteriaAnalysisControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CriteriaAnalysisView**  
Defines the appearance of the criteria analysis control.
- **CurrentQuality**  
Returns the worst quality code of all tags that influence the criteria analysis control.
- **Enabled**  
Specifies whether the criteria analysis control can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the criteria analysis control.
- **Layer**  
Returns the screen layer in which the criteria analysis control is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the criteria analysis control.

- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the criteria analysis control was created.
- **ShowFocusVisual**  
Specifies whether the criteria analysis control is highlighted when it has the focus.
- **SnapToSourceControl**  
Specifies whether the criteria analysis control snaps to the window of the associated data source.
- **SourceControl**  
Specifies an alarm control as the data source.
- **StatusBar**  
Specifies the information bar of the criteria analysis control.
- **StyleItemClass**  
Returns the style that is applied to the criteria analysis control.
- **TabIndex**  
Returns the position of the criteria analysis control in the tab sequence.
- **ToolBar**  
Specifies the toolbar of the criteria analysis control.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the criteria analysis control is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the criteria analysis control.

## Methods

The "ProcessDiagnosisCriteriaAnalysisControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the criteria analysis control.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the criteria analysis control.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ProcessDiagnosisCriteriaAnalysisControl" object has the following events:

- **OnActivated()**  
Occurs when a criteria analysis control receives the focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the criteria analysis control.
- **OnDeactivated()**  
Occurs when a criteria analysis control loses the focus.
- **OnInitialized()**  
Occurs when a criteria analysis control has been successfully initialized and the data connection to the PLC has been established.

## ProcessDiagnosisCriteriaAnalysisControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessDiagnosisCriteriaAnalysisControl.BackColor`

### See also

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.Caption`

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

ProcessDiagnosisCriteriaAnalysisControl.Caption (Page 4771)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

Text.Font (Page 4772)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

Text.Font (Page 4772)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

### Access

Read-write

### Syntax

`Font.Size`

### See also

[Text.Font \(Page 4772\)](#)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[Text.Font \(Page 4772\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

Text.Font (Page 4772)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**

Text.Font (Page 4772)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Text.ForeColor
```

### See also

ProcessDiagnosisCriteriaAnalysisControl.Caption (Page 4771)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

```
Text.Text
```

### See also

ProcessDiagnosisCriteriaAnalysisControl.Caption (Page 4771)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl.Caption \(Page 4771\)](#)

**ProcessDiagnosisCriteriaAnalysisControl.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.CaptionColor`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView

### Description

The "CriteriaAnalysisView" property specifies the appearance of the criteria analysis control.

### Type

Object, HmiDataGridViewPart (Page 4778)

### Access

Read-write

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView
```

### See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

DataGridView (Page 4778)

## DataGridView

### DataGridView.AllowFilter

### Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridView.AllowFilter
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**DataGridView.AllowSort****Description**

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
DataGridView.AllowSort
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**DataGridView.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
DataGridView.AlternateBackColor
```

## See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

## DataGridView.AlternateForeColor

### Description

The "AlternateForeColor" property specifies the flashing color for the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.AlternateForeColor
```

## See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

## DataGridView.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

**Syntax**

```
DataGridView.BackColor
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**DataGridView.CellPadding****Description**

The "CellPadding" property specifies the inner spacing of the content from the cell border.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

```
DataGridView.CellPadding
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

## Syntax

`Padding.Bottom`

## See also

[DataGridView.CellPadding \(Page 4781\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Left`

## See also

[DataGridView.CellPadding \(Page 4781\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Right`**See also**`DataGridView.CellPadding` (Page 4781)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Top`**See also**`DataGridView.CellPadding` (Page 4781)**DataGridView.ColoringMode****Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**`Int32, HmiGridColoringMode`

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

### Access

Read-write

### Syntax

`DataGridView.ColoringMode`

### See also

`ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView` (Page 4778)

## DataGridView.Columns

### Description

The "Columns" property represents the set of all criteria analysis columns.

### Type

Object, `HmiDataGridColumnCollection` (Page 4784)

### Access

Read-only

### Syntax

`DataGridView.Columns`

### See also

`ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView` (Page 4778)

`HmiDataGridColumnCollection` (Page 4784)

## HmiDataGridColumnCollection

### Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

**Use**

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

**Object type**

HmiDataGridColumnCollection

**Properties**

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

**Methods**

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

**See also**

DataGridView.Columns (Page 4784)

**HmiDataGridColumnCollection.Count****Description**

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
HmiDataGridColumnCollection.Count
```

**See also**

HmiDataGridColumnCollection (Page 4784)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

### Syntax

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

### Parameters

#### **HmiDataGridColumnName**

Type: String

Name of the column

### Return value

Object, HmiDataGridColumnPartBase (Page 4786)

### See also

HmiDataGridColumnCollection (Page 4784)

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

## ProcessDiagnosisCriteriaAnalysisControlColumn

### Description

The "ProcessDiagnosisCriteriaAnalysisControlColumn" object represents a criteria analysis column.

### Object type

HmiProcessDiagnosisCriteriaAnalysisControlColumnPart

## Properties

The "ProcessDiagnosisCriteriaAnalysisControlColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **Content**  
Specifies display options for text and graphics.
- **CriteriaAnalysisBlock**  
Returns the column type.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiDataGridColumnCollection (Page 4784)

## ProcessDiagnosisCriteriaAnalysisControlColumn.AllowSort

### Description

The "AllowSort" property specifies whether column sorting is permitted.  
This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

`ProcessDiagnosisCriteriaAnalysisControlColumn.AllowSort`

### See also

[ProcessDiagnosisCriteriaAnalysisControlColumn \(Page 4786\)](#)

## ProcessDiagnosisCriteriaAnalysisControlColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessDiagnosisCriteriaAnalysisControlColumn.BackColor`

### See also

[ProcessDiagnosisCriteriaAnalysisControlColumn \(Page 4786\)](#)

## ProcessDiagnosisCriteriaAnalysisControlColumn.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.Content
```

### See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

```
Content.ContentMode
```

## See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4789)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4789)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ProcessDiagnosisCriteriaAnalysisControlColumn.Content \(Page 4789\)](#)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

[ProcessDiagnosisCriteriaAnalysisControlColumn.Content \(Page 4789\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ProcessDiagnosisCriteriaAnalysisControlColumn.Content](#) (Page 4789)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4789)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4789)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

`ProcessDiagnosisCriteriaAnalysisControlColumn.Content` (Page 4789)

## ProcessDiagnosisCriteriaAnalysisControlColumn.CriteriaAnalysisBlock

### Description

The "CriteriaAnalysisBlock" property returns the column type of the criteria analysis.

### Type

Int32, HmiProcessDiagnosisCriteriaAnalysisBlock

Returns the column type:

- SymbolName (0): Symbolic name of the operand
- Address (1): Absolute address of the operand
- Value (2): Value of the operand
- Comment (3): Comment

### Access

Read-only

### Syntax

`ProcessDiagnosisCriteriaAnalysisControlColumn.CriteriaAnalysisBlock`

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.Enabled****Description**

The "Enabled" property specifies whether the column can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControlColumn.Enabled`

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControlColumn.ForeColor`

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

## ProcessDiagnosisCriteriaAnalysisControlColumn.Header

### Description

The "Header" property specifies the properties of the column header.

### Type

Object, HmiDataGridColumnHeaderPart

### Access

Read-write

### Syntax

`ProcessDiagnosisCriteriaAnalysisControlColumn.Header`

### See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

## DataGridColumnHeader.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`DataGridColumnHeader.Content`

### See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Header (Page 4796)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[DataGridColumnHeader.Content \(Page 4796\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[DataGridColumnHeader.Content \(Page 4796\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 4796\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DataGridColumnHeader.Content \(Page 4796\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[DataGridColumnHeader.Content \(Page 4796\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[DataGridColumnHeader.Content \(Page 4796\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

DataGridColumnHeader.Content (Page 4796)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.VerticalTextAlignment
```

**See also**

DataGridColumnHeader.Content (Page 4796)

**DataGridColumnHeader.Graphic****Description**

The "Graphic" property specifies the graphic of the column header.

**Type**

String

**Access**

Read-write

**Syntax**

`DataGridColumnHeader.Graphic`

**See also**

[ProcessDiagnosisCriteriaAnalysisControlColumn.Header \(Page 4796\)](#)

**DataGridColumnHeader.Text**

**Description**

The "Text" property specifies the label of the column header.

**Type**

String

**Access**

Read-write

**Syntax**

`DataGridColumnHeader.Text`

**See also**

[ProcessDiagnosisCriteriaAnalysisControlColumn.Header \(Page 4796\)](#)

**ProcessDiagnosisCriteriaAnalysisControlColumn.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisCriteriaAnalysisControlColumn.MaximumWidth`**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisCriteriaAnalysisControlColumn.MinimumWidth`**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.Name****Description**

The "Name" property returns the name of the column.

**Type**

String

**Access**

Read-only

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControlColumn.Name`

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.OutputFormat**

**Description**

The "OutputFormat" property specifies the format for displaying values.

**Type**

String

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControlColumn.OutputFormat`

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.SortDirection**

**Description**

The "SortDirection" property specifies the sorting direction.

**Type**

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisCriteriaAnalysisControlColumn.SortDirection
```

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.SortOrder****Description**

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

**Type**

UInt16

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisCriteriaAnalysisControlColumn.SortOrder
```

**See also**

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4786)

**ProcessDiagnosisCriteriaAnalysisControlColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControlColumn.Visible`

**See also**

[ProcessDiagnosisCriteriaAnalysisControlColumn \(Page 4786\)](#)

**ProcessDiagnosisCriteriaAnalysisControlColumn.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControlColumn.Width`

**See also**

[ProcessDiagnosisCriteriaAnalysisControlColumn \(Page 4786\)](#)

**DataGridView.Font**

**Description**

The "Font" property specifies the font of the cells.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridView.Font`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView \(Page 4778\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[DataGridView.Font \(Page 4806\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

### Access

Read-write

### Syntax

Font.Name

### See also

DataGridView.Font (Page 4806)

### Font.Size

#### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

#### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

DataGridView.Font (Page 4806)

### Font.StrikeOut

#### Description

The "StrikeOut" property specifies whether font is struck through.

#### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

DataGridView.Font (Page 4806)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
Font.Underline
```

**See also**

DataGridView.Font (Page 4806)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[DataGridView.Font \(Page 4806\)](#)

## DataGridView.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.ForeColor`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView \(Page 4778\)](#)

## DataGridView.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.GridLineColor
```

### See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

## DataGridView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

### Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

```
DataGridView.GridLineVisibility
```

## See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

## DataGridView.GridLineWidth

### Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

### Type

UInt8

### Access

Read-write

### Syntax

`DataGridView.GridLineWidth`

## See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

## DataGridView.GridSelectionMode

### Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

### Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

### Access

Read-write

**Syntax**

`DataGridView.GridSelectionMode`

**See also**

`ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView` (Page 4778)

**DataGridView.HeaderSettings****Description**

The "HeaderSettings" property specifies the settings for all column headers in the table.

**Type**

Object, `HmiDataGridHeaderSettingsPart`

**Access**

Read-write

**Syntax**

`DataGridView.HeaderSettings`

**See also**

`ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView` (Page 4778)

**DataGridHeaderSettings.AllowColumnReorder****Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

## Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

## See also

DataGridView.HeaderSettings (Page 4813)

## DataGridHeaderSettings.AllowColumnResize

### Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

## See also

DataGridView.HeaderSettings (Page 4813)

## DataGridHeaderSettings.ColumnHeaderType

### Description

The "ColumnHeaderType" property specifies the type of content of a column header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.ColumnHeaderType`

**See also**

[DataGridView.HeaderSettings \(Page 4813\)](#)

**DataGridHeaderSettings.Font****Description**

The "Font" property specifies the font of the headers.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.Font`

**See also**

[DataGridView.HeaderSettings \(Page 4813\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

DataGridHeaderSettings.Font (Page 4815)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

DataGridHeaderSettings.Font (Page 4815)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

DataGridHeaderSettings.Font (Page 4815)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

DataGridHeaderSettings.Font (Page 4815)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

DataGridHeaderSettings.Font (Page 4815)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

DataGridHeaderSettings.Font (Page 4815)

## DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

### See also

DataGridView.HeaderSettings (Page 4813)

## DataGridHeaderSettings.HeaderForeColor

### Description

The "HeaderForeColor" property specifies the font color of the headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

### See also

DataGridView.HeaderSettings (Page 4813)

## DataGridHeaderSettings.HeaderGridLineColor

### Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

### See also

DataGridView.HeaderSettings (Page 4813)

## DataGridHeaderSettings.HeaderSelectionBackColor

### Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

### See also

DataGridView.HeaderSettings (Page 4813)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### Object

Required. An object from the "Availability" section.

### See also

DataGridView.HeaderSettings (Page 4813)

## DataGridHeaderSettings.RowHeaderType

### Description

The "RowHeaderType" property specifies the type of content of a row header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

## Syntax

```
DataGridHeaderSettings.RowHeaderType
```

## See also

DataGridView.HeaderSettings (Page 4813)

## DataGridView.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

## See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

## DataGridView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.RowHeight`**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**DataGridView.SelectFullRow****Description**

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

**Type**

Bool

**Access**

Read-write

**Syntax**`DataGridView.SelectFullRow`**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**DataGridView.SelectionBackColor****Description**

The "SelectionBackColor" property specifies the background color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBackColor`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView \(Page 4778\)](#)

**DataGridView.SelectionBorderColor**

**Description**

The "SelectionBorderColor" property specifies the border color of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBorderColor`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView \(Page 4778\)](#)

**DataGridView.SelectionBorderWidth**

**Description**

The "SelectionBorderWidth" property specifies the border width of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.SelectionBorderWidth`**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**DataGridView.SelectionForeColor****Description**

The "SelectionForeColor" property specifies the font color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridView.SelectionForeColor`**See also**

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

**DataGridView.VerticalScrollBarVisibility****Description**

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

## Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

## Access

Read-write

## Syntax

```
DataGridView.VerticalScrollBarVisibility
```

## See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4778)

## ProcessDiagnosisCriteriaAnalysisControl.CurrentQuality

### Description

The "CurrentQuality" property returns the worst quality code of all tags that influence the criteria analysis control.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

**Syntax**

```
ProcessDiagnosisCriteriaAnalysisControl.CurrentQuality
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.Enabled****Description**

The "Enabled" property specifies whether the criteria analysis control can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisCriteriaAnalysisControl.Enabled
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisCriteriaAnalysisControl.ForeColor
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.Height**

**Description**

The "Height" property specifies the height in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

ProcessDiagnosisCriteriaAnalysisControl.Height

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.Icon**

**Description**

The "Icon" property specifies the icon of the criteria analysis control.

**Type**

String

**Access**

Read-write

**Syntax**

ProcessDiagnosisCriteriaAnalysisControl.Icon

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisCriteriaAnalysisControl.Layer

### Description

The "Layer" property returns the screen layer in which the criteria analysis control is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Layer
```

### See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

ProcessDiagnosisCriteriaAnalysisControl.Layer (Page 4829)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.Layer \(Page 4829\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.Layer \(Page 4829\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.Layer \(Page 4829\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`ProcessDiagnosisCriteriaAnalysisControl.Left`

### See also

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ProcessDiagnosisCriteriaAnalysisControl.Margin`

### See also

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.Margin \(Page 4832\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.Margin \(Page 4832\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.Margin \(Page 4832\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.Margin \(Page 4832\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.Name

### Description

The "Name" property returns the name of the criteria analysis control.

### Type

String

### Access

Read-only

### Syntax

`ProcessDiagnosisCriteriaAnalysisControl.Name`

### See also

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Parent
```

### See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## ProcessDiagnosisCriteriaAnalysisControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the criteria analysis control was created.

### Type

String

### Access

Read-only

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.RenderingTemplate`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

**ProcessDiagnosisCriteriaAnalysisControl.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the criteria analysis control is highlighted when it has the focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.ShowFocusVisual`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

**ProcessDiagnosisCriteriaAnalysisControl.SnapToSourceControl**

**Description**

The "SnapToSourceControl" property specifies whether the criteria analysis control snaps to the window of the associated alarm control.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisCriteriaAnalysisControl.SnapToSourceControl
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.SourceControl****Description**

The "SourceControl" property specifies an alarm control as the data source.

**Type**

Object, HmiAlarmControl (Page 1742)

**Access**

Read-only

**Syntax**

```
ProcessDiagnosisCriteriaAnalysisControl.SourceControl
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

AlarmControl (Page 1742)

**AlarmControl****Description**

AlarmControl (Page 1742)

**ProcessDiagnosisCriteriaAnalysisControl.StatusBar****Description**

The "StatusBar" property specifies the information bar of the criteria analysis control.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.StatusBar`

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**StatusBar.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`StatusBar.BackColor`

**See also**

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4837)

**StatusBar.Elements**

**Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

**Type**

Object, HmiControlBarElementCollection (Page 4839)

**Access**

Read-only

**Syntax**

`StatusBar.Elements`

**See also**

`ProcessDiagnosisCriteriaAnalysisControl.StatusBar` (Page 4837)

`HmiControlBarElementCollection` (Page 4839)

**HmiControlBarElementCollection****Description**

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property

`StatusBar.Elements` or `ToolBar.Elements`

**Use**

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

**Object type**

HmiControlBarElementCollection

**Properties**

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

**Methods**

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

**See also**

`StatusBar.Elements` (Page 4838)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

### See also

HmiControlBarElementCollection (Page 4839)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 4856)

**See also**

HmiControlBarElementCollection (Page 4839)

Control Bar Elements (Page 4856)

**Control Bar Elements****Description**

Control Bar Elements (Page 4856)

**StatusBar.Enabled****Description**

The "Enabled" property specifies whether the information bar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
StatusBar.Enabled
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4837)

**StatusBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4837)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

StatusBar.Font (Page 4841)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 4841)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

StatusBar.Font (Page 4841)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

StatusBar.Font (Page 4841)

### Font.Underline

#### Description

The "Underline" property specifies whether the font is underlined.

#### Type

Bool

#### Access

Read-write

#### Syntax

```
Font.Underline
```

#### See also

StatusBar.Font (Page 4841)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

### See also

StatusBar.Font (Page 4841)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

## Syntax

`StatusBar.Margin`

## See also

[ProcessDiagnosisCriteriaAnalysisControl.StatusBar \(Page 4837\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[StatusBar.Margin \(Page 4845\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`StatusBar.Margin` (Page 4845)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**

Read-write

**Syntax**`Margin.Right`**See also**`StatusBar.Margin` (Page 4845)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**

Read-write

## Syntax

`Margin.Top`

## See also

[StatusBar.Margin \(Page 4845\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

## See also

[ProcessDiagnosisCriteriaAnalysisControl.StatusBar \(Page 4837\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Bottom`**See also**`StatusBar.Padding` (Page 4848)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Left`**See also**`StatusBar.Padding` (Page 4848)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Right`

## See also

[StatusBar.Padding \(Page 4848\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Top`

## See also

[StatusBar.Padding \(Page 4848\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

**Syntax**

```
StatusBar.ShowToolTips
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4837)

**StatusBar.Visible****Description**

The "Visible" property specifies whether the information bar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
StatusBar.Visible
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4837)

**ProcessDiagnosisCriteriaAnalysisControl.StyleItemClass****Description**

The "StyleItemClass" property returns the style that is applied to the criteria analysis control.

**Type**

String

**Access**

Read-only

### Syntax

`ProcessDiagnosisCriteriaAnalysisControl.StyleItemClass`

### See also

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.TabIndex

### Description

The "TabIndex" property returns the position of the criteria analysis control in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`ProcessDiagnosisCriteriaAnalysisControl.TabIndex`

### See also

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

## ProcessDiagnosisCriteriaAnalysisControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the criteria analysis control.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

`ProcessDiagnosisCriteriaAnalysisControl.ToolBar`

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ToolBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ToolBar.BackColor
```

**See also**

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4852)

**ToolBar.Elements****Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

**Type**

Object, HmiControlBarElementCollection (Page 4854)

**Access**

Read-only

**Syntax**

```
ToolBar.Elements
```

## See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4852)

HmiControlBarElementCollection (Page 4854)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

ToolBar.Elements (Page 4853)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**`HmiControlBarElementCollection.Count`**See also**

HmiControlBarElementCollection (Page 4854)

**HmiControlBarElementCollection.Item()****Description**

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

**Syntax**`HmiControlBarElementCollection[.Item] (HmiControlBarElementName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

**Parameters****HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 4856)

## See also

HmiControlBarElementCollection (Page 4854)

Control Bar Elements (Page 4856)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

#### Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.

- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarButton.Content
```

### See also

ControlBarButton (Page 4856)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ControlBarButton.Content \(Page 4861\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[ControlBarButton.Content \(Page 4861\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarButton.Content \(Page 4861\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 4861\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content \(Page 4861\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

ControlBarButton.Content (Page 4861)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 4861\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 4861\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

ControlBarButton (Page 4856)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 4856\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 4856\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarButton.Mapping`

## See also

[ControlBarButton \(Page 4856\)](#)

## ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer distance of the button.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 4856\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ControlBarButton.Margin` (Page 4872)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 4872)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 4872\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 4872\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumHeight
```

**See also**

ControlBarButton (Page 4856)

**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 4856)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarButton.MinimumHeight
```

## See also

ControlBarButton (Page 4856)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.MinimumWidth
```

## See also

ControlBarButton (Page 4856)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarButton.Operability`**See also**[ControlBarButton \(Page 4856\)](#)**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**[ControlBarButton \(Page 4856\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarButton.Padding \(Page 4877\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 4877\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 4877\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 4877\)](#)**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarButton.RequireExplicitUnlock`

**See also**

[ControlBarButton \(Page 4856\)](#)

**ControlBarButton.Text**

**Description**

The "Text" property specifies the label of the button.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarButton.Text`

**See also**

[ControlBarButton \(Page 4856\)](#)

**ControlBarButton.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**

ControlBarButton (Page 4856)

**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 4856)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

```
ControlBarButton.Width
```

## See also

ControlBarButton (Page 4856)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

### Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.

- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

```
ControlBarDisplay.Authorization
```

## See also

ControlBarDisplay (Page 4882)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarDisplay.Content
```

## See also

ControlBarDisplay (Page 4882)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

`ControlBarDisplay.Content` (Page 4884)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

`ControlBarDisplay.Content` (Page 4884)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarDisplay.Content \(Page 4884\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 4884)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Content.SplitRatio
```

**See also**

ControlBarDisplay.Content (Page 4884)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

`ControlBarDisplay.Content` (Page 4884)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

`ControlBarDisplay.Content` (Page 4884)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[ControlBarDisplay.Content \(Page 4884\)](#)

**ControlBarDisplay.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay \(Page 4882\)](#)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 4882\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.ForeColor`

### See also

[ControlBarDisplay \(Page 4882\)](#)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 4882)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.Height
```

### See also

ControlBarDisplay (Page 4882)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarDisplay.Mapping`

## See also

[ControlBarDisplay \(Page 4882\)](#)

## ControlBarDisplay.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 4882\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**[ControlBarDisplay.Margin \(Page 4894\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**[ControlBarDisplay.Margin \(Page 4894\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarDisplay.Margin \(Page 4894\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ControlBarDisplay.Margin \(Page 4894\)](#)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MaximumHeight
```

**See also**

ControlBarDisplay (Page 4882)

**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.MaximumWidth
```

**See also**

ControlBarDisplay (Page 4882)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 4882\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumWidth`

## See also

[ControlBarDisplay \(Page 4882\)](#)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarDisplay.Operability`**See also**

ControlBarDisplay (Page 4882)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 4882)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarDisplay.Padding \(Page 4899\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarDisplay.Padding \(Page 4899\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarDisplay.Padding \(Page 4899\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarDisplay.Padding \(Page 4899\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarDisplay.RequireExplicitUnlock`

**See also**

ControlBarDisplay (Page 4882)

**ControlBarDisplay.Text**

**Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Text`

**See also**

ControlBarDisplay (Page 4882)

**ControlBarDisplay.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 4882)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 4882)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

`ControlBarDisplay.Width`

## See also

ControlBarDisplay (Page 4882)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

### Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

```
ControlBarLabel.Authorization
```

## See also

ControlBarLabel (Page 4904)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarLabel.CustomID
```

## See also

ControlBarLabel (Page 4904)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Enabled
```

**See also**

ControlBarLabel (Page 4904)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ForeColor
```

**See also**

ControlBarLabel (Page 4904)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarLabel.Height`

## See also

[ControlBarLabel \(Page 4904\)](#)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.HorizontalTextAlignment`

## See also

[ControlBarLabel \(Page 4904\)](#)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 4904\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

### See also

[ControlBarLabel \(Page 4904\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarLabel.Margin \(Page 4911\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarLabel.Margin \(Page 4911\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarLabel.Margin \(Page 4911\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarLabel.Margin \(Page 4911\)](#)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

### See also

[ControlBarLabel \(Page 4904\)](#)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MaximumWidth
```

### See also

ControlBarLabel (Page 4904)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumHeight
```

### See also

ControlBarLabel (Page 4904)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

### See also

ControlBarLabel (Page 4904)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

**See also**

ControlBarLabel (Page 4904)

**ControlBarLabel.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Padding`

**See also**

ControlBarLabel (Page 4904)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarLabel.Padding (Page 4916)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarLabel.Padding (Page 4916)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

ControlBarLabel.Padding (Page 4916)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarLabel.Padding (Page 4916)

**ControlBarLabel.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarLabel.RequireExplicitUnlock

**See also**

[ControlBarLabel \(Page 4904\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

[ControlBarLabel \(Page 4904\)](#)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

## See also

[ControlBarLabel \(Page 4904\)](#)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.VerticalTextAlignment
```

## See also

[ControlBarLabel \(Page 4904\)](#)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Visible
```

**See also**

ControlBarLabel (Page 4904)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 4904)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

## Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 4921)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 4921)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 4921\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 4921\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

### See also

ControlBarSeparator (Page 4921)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Mapping`

**See also**

[ControlBarSeparator \(Page 4921\)](#)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarSeparator.Margin`

## See also

[ControlBarSeparator \(Page 4921\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarSeparator.Margin \(Page 4927\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarSeparator.Margin` (Page 4927)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarSeparator.Margin` (Page 4927)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarSeparator.Margin \(Page 4927\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MaximumHeight`

## See also

[ControlBarSeparator \(Page 4921\)](#)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarSeparator.MaximumWidth
```

**See also**

ControlBarSeparator (Page 4921)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.MinimumHeight
```

**See also**

ControlBarSeparator (Page 4921)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarSeparator.MinimumWidth
```

## See also

ControlBarSeparator (Page 4921)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

## See also

ControlBarSeparator (Page 4921)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarSeparator.Padding`**See also**

ControlBarSeparator (Page 4921)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarSeparator.Padding (Page 4932)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarSeparator.Padding \(Page 4932\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarSeparator.Padding \(Page 4932\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarSeparator.Padding \(Page 4932\)](#)**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarSeparator.RequireExplicitUnlock`**See also**[ControlBarSeparator \(Page 4921\)](#)**ControlBarSeparator.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ToolTipText`

**See also**

[ControlBarSeparator \(Page 4921\)](#)

**ControlBarSeparator.Visible**

**Description**

The "Visible" property specifies whether the separator is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Visible`

**See also**

[ControlBarSeparator \(Page 4921\)](#)

**ControlBarSeparator.Width**

**Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Width`

**See also**

ControlBarSeparator (Page 4921)

**ControlBarTextBox****Description**

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarTextBoxPart

**Properties**

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.AlternateBorderColor
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarTextBox.Authorization
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

[ControlBarTextBox \(Page 4937\)](#)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

[ControlBarTextBox \(Page 4937\)](#)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Enabled
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.ForeColor
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

## See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 4937\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 4937\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin \(Page 4946\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarTextBox.Margin \(Page 4946\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 4946\)](#)

### Margin.Top

#### Description

The "Top" property specifies the spacing to the top.

#### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarTextBox.Margin \(Page 4946\)](#)

### ControlBarTextBox.MaximumHeight

#### Description

The "MaximumHeight" property specifies the maximum height.

#### Type

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumHeight`**See also**

ControlBarTextBox (Page 4937)

**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumWidth`**See also**

ControlBarTextBox (Page 4937)

**ControlBarTextBox.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumHeight`

**See also**

[ControlBarTextBox \(Page 4937\)](#)

**ControlBarTextBox.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumWidth`

**See also**

[ControlBarTextBox \(Page 4937\)](#)

**ControlBarTextBox.Operability**

**Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarTextBox.Operability`

### See also

[ControlBarTextBox \(Page 4937\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 4937\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarTextBox.Padding \(Page 4951\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarTextBox.Padding \(Page 4951\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 4951\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 4951\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.ReadOnly
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

[ControlBarTextBox \(Page 4937\)](#)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

[ControlBarTextBox \(Page 4937\)](#)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

ControlBarTextBox (Page 4937)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

**See also**

[ControlBarTextBox \(Page 4937\)](#)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Width
```

**See also**

[ControlBarTextBox \(Page 4937\)](#)

**ControlBarToggleSwitch****Description**

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarToggleSwitchPart

**Properties**

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateBorderColor`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateGraphic`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BackColor`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Badge`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderWidth
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarToggleSwitch.Content (Page 4964)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarToggleSwitch.Content (Page 4964)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 4964\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 4964\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 4964\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarToggleSwitch.Content \(Page 4964\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarToggleSwitch.Content \(Page 4964\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarToggleSwitch.Content](#) (Page 4964)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch](#) (Page 4957)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ForeColor`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.IsAlternateState`

**See also**

ControlBarToggleSwitch (Page 4957)

**ControlBarToggleSwitch.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 4957\)](#)

**ControlBarToggleSwitch.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 4957\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 4975\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarToggleSwitch.Margin \(Page 4975\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarToggleSwitch.Margin \(Page 4975\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarToggleSwitch.Margin \(Page 4975\)](#)**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

[ControlBarToggleSwitch \(Page 4957\)](#)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

[ControlBarToggleSwitch \(Page 4957\)](#)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 4957)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumWidth`**See also**

ControlBarToggleSwitch (Page 4957)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 4957\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarToggleSwitch.Padding (Page 4980)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarToggleSwitch.Padding (Page 4980)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 4980\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 4980\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ToolTipText
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Visible
```

### See also

ControlBarToggleSwitch (Page 4957)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Width
```

### See also

ControlBarToggleSwitch (Page 4957)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Enabled
```

### See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4852)

## ToolBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`ToolBar.Font`

### See also

[ProcessDiagnosisCriteriaAnalysisControl.ToolBar \(Page 4852\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

[ToolBar.Font \(Page 4986\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToolBar.Font (Page 4986)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 4986)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ToolBar.Font (Page 4986)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

ToolBar.Font (Page 4986)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

```
Font.Weight
```

**See also**

ToolBar.Font (Page 4986)

**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ToolBar.Margin`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl.ToolBar \(Page 4852\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ToolBar.Margin \(Page 4989\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**

ToolBar.Margin (Page 4989)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

ToolBar.Margin (Page 4989)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ToolBar.Margin \(Page 4989\)](#)

**ToolBar.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ToolBar.Padding`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl.ToolBar \(Page 4852\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ToolBar.Padding (Page 4992)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

ToolBar.Padding (Page 4992)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

`ToolBar.Padding` (Page 4992)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

`ToolBar.Padding` (Page 4992)

**ToolBar.ShowToolTips**

**Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.ShowToolTips`**See also**

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4852)

**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.UseHotKeys`**See also**

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4852)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.Visible`

**See also**

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4852)

**ProcessDiagnosisCriteriaAnalysisControl.Top**

**Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.Top`

**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.Visible**

**Description**

The "Visible" property specifies whether the criteria analysis control is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessDiagnosisCriteriaAnalysisControl.Visible`**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.Width****Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisCriteriaAnalysisControl.Width`**See also**

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

**ProcessDiagnosisCriteriaAnalysisControl.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the criteria analysis control.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.WindowFlags`

**See also**

[ProcessDiagnosisCriteriaAnalysisControl \(Page 4769\)](#)

**ProcessDiagnosisCriteriaAnalysisControl.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the criteria analysis control.

**Syntax**

`ProcessDiagnosisCriteriaAnalysisControl.CheckAuthorization()`

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisCriteriaAnalysisControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element of the toolbar or information bar (control bar element, e.g. a button) of the criteria analysis control.

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.FireCommand(commandId,  
custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

## See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisCriteriaAnalysisControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisCriteriaAnalysisControl\_OnActivated()

### Description

The "OnActivated" event occurs when a criteria analysis control receives the focus:

- A criteria analysis control is selected via the configured tab sequence.
- A criteria analysis control that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl_OnActivated(item)
```

### Context

**item**

Type: Object

Criteria analysis control for which the event occurs.

## See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisCriteriaAnalysisControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the criteria analysis control.

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl_OnCommandFired(item,  
commandId, custom)
```

## Context

### **item**

Type: Object

Criteria analysis control for which the event occurs.

### **commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

### **custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisCriteriaAnalysisControl\_OnDeactivated()

## Description

The "OnDeactivated" event occurs when the criteria analysis control loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

## Syntax

```
ProcessDiagnosisCriteriaAnalysisControl_OnDeactivated(item)
```

## Context

### **item**

Type: Object

Criteria analysis control for which the event occurs.

## See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisCriteriaAnalysisControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a criteria analysis control has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
ProcessDiagnosisCriteriaAnalysisControl_OnInitialized(item)
```

### Context

**item**

Type: Object

Criteria analysis control for which the event occurs.

## See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4769)

## ProcessDiagnosisGraphOverviewControl

### Description

The "ProcessDiagnosisGraphOverviewControl" object represents a GRAPH overview for displaying the current program status for executed steps of the GRAPH sequencer. Errors during execution of a program are displayed directly at the corresponding step.

### Object type

HmiProcessDiagnosisGraphOverviewControl

### Properties

The "ProcessDiagnosisGraphOverviewControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.

- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the worst quality code of all tags that influence the GRAPH overview.
- **Enabled**  
Specifies whether the GRAPH overview can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **GraphOverview**  
Specifies the appearance of the GRAPH overview.
- **GridLineColor**  
Specifies the color of the grid lines.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the GRAPH overview.
- **Layer**  
Returns the screen layer in which the GRAPH overview is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the GRAPH overview.
- **OperationMode**  
Represents the operating mode for execution of the GRAPH sequencer.
- **Parent**  
Returns the higher-level screen object.
- **PlcSource**  
Specifies the PLC source.
- **RenderingTemplate**  
Returns the name of the template from which the GRAPH overview was created.
- **SelectedStep**  
Specifies which step is selected.
- **ShowFocusVisual**  
Specifies whether the GRAPH overview is highlighted when it has the focus.
- **ShowOperationMode**  
Specifies whether the operating mode is displayed.
- **StatusBar**  
Specifies the information bar of the GRAPH overview.

- **StyleItemClass**  
Returns the style that is applied to the GRAPH overview.
- **TabIndex**  
Returns the position of the GRAPH overview in the tab sequence.
- **ToolBar**  
Specifies the toolbar of the GRAPH overview.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the GRAPH overview is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the GRAPH overview.

## Methods

The "ProcessDiagnosisGraphOverviewControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the GRAPH overview.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the GRAPH overview.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ProcessDiagnosisGraphOverviewControl" object has the following events:

- **OnActivated()**  
Occurs when a GRAPH overview receives the focus.
- **OnAlarmViewButtonTapped()**  
Occurs when the "Alarm control button of the GRAPH overview is pressed.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the GRAPH overview.
- **OnDeactivated()**  
Occurs when a GRAPH overview loses the focus.
- **OnInitialized()**  
Occurs when a GRAPH overview has been successfully initialized and the data connection to the PLC has been established.

- **OnPlcCodeViewerButtonTapped()**  
Occurs when the "PLC code view" button of the GRAPH overview is pressed.
- **OnTIAPortalButtonTapped()**  
Occurs when the "TIA Portal" button of the GRAPH overview is pressed.

## ProcessDiagnosisGraphOverviewControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessDiagnosisGraphOverviewControl.BackColor`

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`ProcessDiagnosisGraphOverviewControl.Caption`

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

ProcessDiagnosisGraphOverviewControl.Caption (Page 5006)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 5007)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 5007)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 5007)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

Text.Font (Page 5007)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

`Text.Font` (Page 5007)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

`Text.Font` (Page 5007)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Text.ForeColor`**See also**

ProcessDiagnosisGraphOverviewControl.Caption (Page 5006)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

ProcessDiagnosisGraphOverviewControl.Caption (Page 5006)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

ProcessDiagnosisGraphOverviewControl.Caption (Page 5006)

**ProcessDiagnosisGraphOverviewControl.CaptionColor**

**Description**

The "CaptionColor" property specifies the color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisGraphOverviewControl.CaptionColor`

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

**ProcessDiagnosisGraphOverviewControl.CurrentQuality**

**Description**

The "CurrentQuality" property returns the worst quality code of all tags that influence the GRAPH overview.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

```
ProcessDiagnosisGraphOverviewControl.CurrentQuality
```

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

**ProcessDiagnosisGraphOverviewControl.Enabled****Description**

The "Enabled" property specifies whether the GRAPH overview can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisGraphOverviewControl.Enabled
```

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`ProcessDiagnosisGraphOverviewControl.Font`

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

ProcessDiagnosisGraphOverviewControl.Font (Page 5014)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ProcessDiagnosisGraphOverviewControl.Font (Page 5014)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ProcessDiagnosisGraphOverviewControl.Font (Page 5014)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ProcessDiagnosisGraphOverviewControl.Font (Page 5014)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

ProcessDiagnosisGraphOverviewControl.Font (Page 5014)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

ProcessDiagnosisGraphOverviewControl.Font (Page 5014)

**ProcessDiagnosisGraphOverviewControl.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisGraphOverviewControl.ForeColor`

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

**ProcessDiagnosisGraphOverviewControl.GraphOverview**

**Description**

The "GraphOverview" property specifies the appearance of the GRAPH overview.

**Type**

Object, HmiDataGridViewPart (Page 5018)

**Access**

Read-write

**Syntax**

`ProcessDiagnosisGraphOverviewControl.GraphOverview`

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

DataGridView (Page 5018)

**DataGridView**

**DataGridView.AllowFilter**

**Description**

The "AllowFilter" property specifies whether filtering of columns is permitted.

**Type**

Bool

**Access**

Read-write

**Syntax**`DataGridView.AllowFilter`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.AllowSort****Description**

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

**Type**

Bool

**Access**

Read-write

**Syntax**`DataGridView.AllowSort`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.AlternateBackColor`

**See also**

[ProcessDiagnosisGraphOverviewControl.GraphOverview \(Page 5018\)](#)

**DataGridView.AlternateForeColor**

**Description**

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.AlternateForeColor`

**See also**

[ProcessDiagnosisGraphOverviewControl.GraphOverview \(Page 5018\)](#)

**DataGridView.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridView.BackColor`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.CellPadding****Description**

The "CellPadding" property specifies the inner spacing of the content from the cell border.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`DataGridView.CellPadding`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[DataGridView.CellPadding \(Page 5021\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[DataGridView.CellPadding \(Page 5021\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[DataGridView.CellPadding \(Page 5021\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[DataGridView.CellPadding \(Page 5021\)](#)**DataGridView.ColoringMode****Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

### Type

Int32, HmiGridColumnColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

### Access

Read-write

### Syntax

`DataGridView.ColoringMode`

### See also

[ProcessDiagnosisGraphOverviewControl.GraphOverview \(Page 5018\)](#)

## DataGridView.Columns

### Description

The "Columns" property represents the quantity of columns.

### Type

Object, HmiDataGridColumnCollection (Page 5025)

### Access

Read-only

### Syntax

`DataGridView.Columns`

### See also

[ProcessDiagnosisGraphOverviewControl.GraphOverview \(Page 5018\)](#)

[HmiDataGridColumnCollection \(Page 5025\)](#)

## HmiDataGridColumnCollection

### Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

### Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

### Object type

HmiDataGridColumnCollection

### Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

### Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

### See also

`DataGridView.Columns` (Page 5024)

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiDataGridColumnCollection.Count
```

### See also

HmiDataGridColumnCollection (Page 5025)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

### Syntax

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

### Parameters

#### **HmiDataGridColumnName**

Type: String

Name of the column

### Return value

Object, HmiDataGridColumnPartBase (Page 5027)

### See also

HmiDataGridColumnCollection (Page 5025)

GraphOverviewControlColumn (Page 5027)

## GraphOverviewControlColumn

### Description

The "GraphOverviewControlColumn" object represents a value column.

### Object type

HmiGraphOverviewControlColumnPart

### Properties

The "GraphOverviewControlColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **Content**  
Specifies display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **GraphOverviewControlBlock**  
Specifies the graphic overview block.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiDataGridColumnCollection.Item() (Page 5026)

## GraphOverviewGridColumn.AllowSort

### Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

`GraphOverviewGridColumn.AllowSort`

## See also

GraphOverviewGridColumn (Page 5027)

## GraphOverviewGridColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

**Syntax**

`GraphOverviewControlColumn.BackColor`

**See also**

[GraphOverviewControlColumn \(Page 5027\)](#)

**GraphOverviewControlColumn.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`GraphOverviewControlColumn.Content`

**See also**

[GraphOverviewControlColumn \(Page 5027\)](#)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

`GraphOverviewControlColumn.Content` (Page 5029)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

`GraphOverviewControlColumn.Content` (Page 5029)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.HorizontalTextAlignment
```

### See also

GraphOverviewControlColumn.Content (Page 5029)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Content.Spacing
```

## See also

GraphOverviewControlColumn.Content (Page 5029)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

## See also

GraphOverviewControlColumn.Content (Page 5029)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**`Content.TextPosition`**See also**

GraphOverviewControlColumn.Content (Page 5029)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**`Content.TextTrimming`**See also**

GraphOverviewControlColumn.Content (Page 5029)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[GraphOverviewControlColumn.Content](#) (Page 5029)

## GraphOverviewControlColumn.Enabled

### Description

The "Enabled" property specifies whether the column can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`GraphOverviewControlColumn.Enabled`

### See also

[GraphOverviewControlColumn](#) (Page 5027)

## GraphOverviewControlColumn.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

GraphOverviewControlColumn.ForeColor

### See also

GraphOverviewControlColumn (Page 5027)

## GraphOverviewControlColumn.GraphOverviewControlBlock

### Description

The "GraphOverviewControlBlock" property specifies the column type of the GRAPH overview.

### Type

Int32, HmiGraphOverviewBlock

Specifies the column type:

- Undefined (0): Not defined
- Step (1): Step
- StepName (2): Step name

### Access

Read-write

### Syntax

GraphOverviewControlColumn.GraphOverviewControlBlock

**See also**

GraphOverviewControlColumn (Page 5027)

**GraphOverviewControlColumn.Header**

**Description**

The "Header" property specifies the properties of the column header.

**Type**

Object, HmiDataGridColumnHeaderPart

**Access**

Read-write

**Syntax**

`GraphOverviewControlColumn.Header`

**See also**

GraphOverviewControlColumn (Page 5027)

**DataGridColumnHeader.Content**

**Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`DataGridColumnHeader.Content`

**See also**

GraphOverviewControlColumn.Header (Page 5036)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

DataGridColumnHeader.Content (Page 5036)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[DataGridColumnHeader.Content \(Page 5036\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 5036\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DataGridColumnHeader.Content \(Page 5036\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[DataGridColumnHeader.Content \(Page 5036\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[DataGridColumnHeader.Content \(Page 5036\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

[DataGridColumnHeader.Content \(Page 5036\)](#)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[DataGridColumnHeader.Content \(Page 5036\)](#)

**DataGridColumnHeader.Graphic****Description**

The "Graphic" property specifies the graphic of the column header.

**Type**

String

**Access**

Read-write

**Syntax**

`DataGridColumnHeader.Graphic`

**See also**

`GraphOverviewControlColumn.Header` (Page 5036)

**DataGridColumnHeader.Text**

**Description**

The "Text" property specifies the label of the column header.

**Type**

String

**Access**

Read-write

**Syntax**

`DataGridColumnHeader.Text`

**See also**

`GraphOverviewControlColumn.Header` (Page 5036)

**GraphOverviewControlColumn.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`GraphOverviewControlColumn.MaximumWidth`**See also**

GraphOverviewControlColumn (Page 5027)

**GraphOverviewControlColumn.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`GraphOverviewControlColumn.MinimumWidth`**See also**

GraphOverviewControlColumn (Page 5027)

**GraphOverviewControlColumn.Name****Description**

The "Name" property returns the name of the column.

**Type**

String

**Access**

Read-only

**Syntax**

`GraphOverviewControlColumn.Name`

**See also**

GraphOverviewControlColumn (Page 5027)

**GraphOverviewControlColumn.OutputFormat**

**Description**

The "OutputFormat" property specifies the format for displaying values.

**Type**

String

**Access**

Read-write

**Syntax**

`GraphOverviewControlColumn.OutputFormat`

**See also**

GraphOverviewControlColumn (Page 5027)

**GraphOverviewControlColumn.SortDirection**

**Description**

The "SortDirection" property specifies the sorting direction.

**Type**

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

**Access**

Read-write

**Syntax**

`GraphOverviewControlColumn.SortDirection`

**See also**

[GraphOverviewControlColumn \(Page 5027\)](#)

**GraphOverviewControlColumn.SortOrder****Description**

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

**Type**

UInt16

**Access**

Read-write

**Syntax**

`GraphOverviewControlColumn.SortOrder`

**See also**

[GraphOverviewControlColumn \(Page 5027\)](#)

**GraphOverviewControlColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`GraphOverviewControlColumn.Visible`

**See also**

[GraphOverviewControlColumn \(Page 5027\)](#)

**GraphOverviewControlColumn.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`GraphOverviewControlColumn.Width`

**See also**

[GraphOverviewControlColumn \(Page 5027\)](#)

**DataGridView.Font**

**Description**

The "Font" property specifies the font of the cells.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`DataGridView.Font`**See also**[ProcessDiagnosisGraphOverviewControl.GraphOverview \(Page 5018\)](#)**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**[DataGridView.Font \(Page 5046\)](#)**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

DataGridView.Font (Page 5046)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

DataGridView.Font (Page 5046)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

DataGridView.Font (Page 5046)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
Font.Underline
```

**See also**

DataGridView.Font (Page 5046)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

## Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

## Access

Read-write

## Syntax

`Font.Weight`

## See also

[DataGridView.Font \(Page 5046\)](#)

## DataGridView.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.ForeColor`

### See also

[ProcessDiagnosisGraphOverviewControl.GraphOverview \(Page 5018\)](#)

## DataGridView.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.GridLineColor
```

### See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

## DataGridView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

### Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

```
DataGridView.GridLineVisibility
```

## See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

## DataGridView.GridLineWidth

### Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

### Type

UInt8

### Access

Read-write

### Syntax

`DataGridView.GridLineWidth`

## See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

## DataGridView.GridSelectionMode

### Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

### Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

### Access

Read-write

**Syntax**

```
DataGridView.GridSelectionMode
```

**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.HeaderSettings****Description**

The "HeaderSettings" property specifies the settings for all column headers in the table.

**Type**

Object, HmiDataGridHeaderSettingsPart

**Access**

Read-write

**Syntax**

```
DataGridView.HeaderSettings
```

**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridHeaderSettings.AllowColumnReorder****Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

## Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

## See also

DataGridView.HeaderSettings (Page 5053)

## DataGridHeaderSettings.AllowColumnResize

### Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

## See also

DataGridView.HeaderSettings (Page 5053)

## DataGridHeaderSettings.ColumnHeaderType

### Description

The "ColumnHeaderType" property specifies the type of content of a column header.

### Type

Int32, HmiDataGridColumnHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.ColumnHeaderType`

**See also**

[DataGridView.HeaderSettings \(Page 5053\)](#)

**DataGridHeaderSettings.Font****Description**

The "Font" property specifies the font of the headers.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.Font`

**See also**

[DataGridView.HeaderSettings \(Page 5053\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

DataGridHeaderSettings.Font (Page 5055)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

DataGridHeaderSettings.Font (Page 5055)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

`Font.Size`

**See also**

`DataGridHeaderSettings.Font` (Page 5055)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

`DataGridHeaderSettings.Font` (Page 5055)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

DataGridHeaderSettings.Font (Page 5055)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

DataGridHeaderSettings.Font (Page 5055)

## DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

### See also

DataGridView.HeaderSettings (Page 5053)

## DataGridHeaderSettings.HeaderForeColor

### Description

The "HeaderForeColor" property specifies the font color of the headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

### See also

DataGridView.HeaderSettings (Page 5053)

## DataGridHeaderSettings.HeaderGridLineColor

### Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

### See also

DataGridView.HeaderSettings (Page 5053)

## DataGridHeaderSettings.HeaderSelectionBackColor

### Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

### See also

DataGridView.HeaderSettings (Page 5053)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### Object

Required. An object from the "Availability" section.

### See also

DataGridView.HeaderSettings (Page 5053)

## DataGridHeaderSettings.RowHeaderType

### Description

The "RowHeaderType" property specifies the type of content of a row header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

## Syntax

`DataGridHeaderSettings.RowHeaderType`

## See also

`DataGridView.HeaderSettings` (Page 5053)

## DataGridView.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

`DataGridView.HorizontalScrollBarVisibility`

## See also

`ProcessDiagnosisGraphOverviewControl.GraphOverview` (Page 5018)

## DataGridView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.RowHeight`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.SelectFullRow****Description**

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

**Type**

Bool

**Access**

Read-write

**Syntax**`DataGridView.SelectFullRow`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.SelectionBackColor****Description**

The "SelectionBackColor" property specifies the background color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBackColor`

**See also**

`ProcessDiagnosisGraphOverviewControl.GraphOverview` (Page 5018)

**DataGridView.SelectionBorderColor**

**Description**

The "SelectionBorderColor" property specifies the border color of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBorderColor`

**See also**

`ProcessDiagnosisGraphOverviewControl.GraphOverview` (Page 5018)

**DataGridView.SelectionBorderWidth**

**Description**

The "SelectionBorderWidth" property specifies the border width of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.SelectionBorderWidth`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.SelectionForeColor****Description**

The "SelectionForeColor" property specifies the font color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridView.SelectionForeColor`**See also**

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

**DataGridView.VerticalScrollBarVisibility****Description**

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.VerticalScrollBarVisibility
```

### See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 5018)

## ProcessDiagnosisGraphOverviewControl.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.GridLineColor
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.Height
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.Icon

### Description

The "Icon" property specifies the icon of the GRAPH overview.

### Type

String

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.Icon
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.Layer

### Description

The "Layer" property returns the screen layer in which the GRAPH overview is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`ProcessDiagnosisGraphOverviewControl.Layer`

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

ProcessDiagnosisGraphOverviewControl.Layer (Page 5068)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

ProcessDiagnosisGraphOverviewControl.Layer (Page 5068)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

```
Layer.Name
```

### See also

ProcessDiagnosisGraphOverviewControl.Layer (Page 5068)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[ProcessDiagnosisGraphOverviewControl.Layer](#) (Page 5068)

## ProcessDiagnosisGraphOverviewControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`ProcessDiagnosisGraphOverviewControl.Left`

### See also

[ProcessDiagnosisGraphOverviewControl](#) (Page 5003)

## ProcessDiagnosisGraphOverviewControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.Margin
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

ProcessDiagnosisGraphOverviewControl.Margin (Page 5071)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ProcessDiagnosisGraphOverviewControl.Margin \(Page 5071\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ProcessDiagnosisGraphOverviewControl.Margin \(Page 5071\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

ProcessDiagnosisGraphOverviewControl.Margin (Page 5071)

**ProcessDiagnosisGraphOverviewControl.Name****Description**

The "Name" property returns the name of the GRAPH overview.

**Type**

String

**Access**

Read-only

**Syntax**

ProcessDiagnosisGraphOverviewControl.Name

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.OperationMode

### Description

The "OperationMode" property represents the operating mode for executing the GRAPH sequencer.

### Type

Object, HmiProcessDiagnosisOperationModePart

### Access

Read-write

### Syntax

`ProcessDiagnosisGraphOverviewControl.OperationMode`

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisOperationMode.OpModeAutoText

### Description

The "OpModeAutoText" property specifies the name for the display of "AUTO" operating mode in the GRAPH overview.

### Type

String

### Access

Read-write

### Syntax

`ProcessDiagnosisOperationMode.OpModeAutoText`

### See also

ProcessDiagnosisGraphOverviewControl.OperationMode (Page 5074)

## ProcessDiagnosisOperationMode.OpModeManText

### Description

The "OpModeManText" property specifies the name for the display of "MAN" operating mode in the GRAPH overview.

### Type

String

### Access

Read-only

### Syntax

```
ProcessDiagnosisOperationMode.OpModeManText
```

### See also

ProcessDiagnosisGraphOverviewControl.OperationMode (Page 5074)

## ProcessDiagnosisOperationMode.OpModeTapText

### Description

The "OpModeTapText" property specifies the name for the display of "TAP" operating mode in the GRAPH overview.

### Type

String

### Access

Read-write

### Syntax

```
ProcessDiagnosisOperationMode.OpModeTapText
```

### See also

ProcessDiagnosisGraphOverviewControl.OperationMode (Page 5074)

## ProcessDiagnosisOperationMode.OpModeTopText

### Description

The "OpModeTopText" property specifies the name for the display of "TOP" operating mode in the GRAPH overview.

### Type

String

### Access

Read-only

### Syntax

`ProcessDiagnosisOperationMode.OpModeTopText`

### See also

[ProcessDiagnosisGraphOverviewControl.OperationMode \(Page 5074\)](#)

## ProcessDiagnosisGraphOverviewControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, [HmiScreenObjectBase \(Page 1742\)](#)

### Access

Read-only

### Syntax

`ProcessDiagnosisGraphOverviewControl.Parent`

### See also

[ProcessDiagnosisGraphOverviewControl \(Page 5003\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

Screen Items (Page 1742)

## ProcessDiagnosisGraphOverviewControl.PlcSource

### Description

The "PlcSource" property specifies the PLC source.

### Type

Object, HmiPlcDataSourcePart

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.PlcSource
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## PlcDataSource.Connection

### Description

The "Connection" property returns the connection of the tag.

### Type

Object, HmiConnection (Page 1296)

### Access

Read-only

### Syntax

```
PlcDataSource.Connection
```

**See also**

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 5077)  
Connection (Page 1296)

**Connection**

**Description**

Connection (Page 1296)

**PlcDataSource.DB\_Name**

**Description**

The "DB\_Name" property returns the S7 GRAPH instance data block of the PLC.

**Type**

String

**Access**

Read-only

**Syntax**

`PlcDataSource.DB_Name`

**See also**

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 5077)

**PlcDataSource.HmiConnectionName**

**Description**

The "HmiConnectionName" property specifies the connection name of the tag.

**Type**

String

**Access**

Read-write

**Syntax**`PlcDataSource.HmiConnectionName`**See also**

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 5077)

**PlcDataSource.Tag****Description**

The "Tag" property returns the tag that is used for the process diagnostics.

**Type**

String, HMITag (Page 1490)

**Access**

Read-only

**Syntax**`PlcDataSource.Tag`**See also**

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 5077)

Tag (Page 1490)

**Tag****Description**

Tag (Page 1490)

## ProcessDiagnosisGraphOverviewControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the GRAPH overview was created.

### Type

String

### Access

Read-only

### Syntax

```
ProcessDiagnosisGraphOverviewControl.RenderingTemplate
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.SelectedStep

### Description

The "SelectedStep" property specifies which step is selected.

### Type

UInt16

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.SelectedStep
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the GRAPH overview is highlighted when it has the focus.

### Type

Bool

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.ShowFocusVisual
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.ShowOperationMode

### Description

The "ShowOperationMode" property specifies whether the operating mode is displayed.

### Type

Bool

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.ShowOperationMode
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.StatusBar

### Description

The "StatusBar" property specifies the information bar of the GRAPH overview.

### Type

Object, HmiStatusBarPart

### Access

Read-write

### Syntax

`ProcessDiagnosisGraphOverviewControl.StatusBar`

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## StatusBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`StatusBar.BackColor`

### See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 5082)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 5083)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

### See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 5082)

HmiControlBarElementCollection (Page 5083)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 5083)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 5083)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 5100)

## See also

HmiControlBarElementCollection (Page 5083)

Control Bar Elements (Page 5100)

## Control Bar Elements

### Description

Control Bar Elements (Page 5100)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

## Syntax

`StatusBar.Enabled`

## See also

[ProcessDiagnosisGraphOverviewControl.StatusBar \(Page 5082\)](#)

## StatusBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`StatusBar.Font`

## See also

[ProcessDiagnosisGraphOverviewControl.StatusBar \(Page 5082\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

**Syntax**`Font.Italic`**See also**

StatusBar.Font (Page 5086)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 5086)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

## Syntax

`Font.Size`

## See also

StatusBar.Font (Page 5086)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

## See also

StatusBar.Font (Page 5086)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

StatusBar.Font (Page 5086)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

StatusBar.Font (Page 5086)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`StatusBar.Margin`

### See also

[ProcessDiagnosisGraphOverviewControl.StatusBar \(Page 5082\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[StatusBar.Margin \(Page 5090\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[StatusBar.Margin \(Page 5090\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[StatusBar.Margin \(Page 5090\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[StatusBar.Margin \(Page 5090\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

### See also

[ProcessDiagnosisGraphOverviewControl.StatusBar \(Page 5082\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

StatusBar.Padding (Page 5092)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

StatusBar.Padding (Page 5092)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[StatusBar.Padding \(Page 5092\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[StatusBar.Padding \(Page 5092\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.ShowToolTips
```

### See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 5082)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.Visible
```

### See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 5082)

## ProcessDiagnosisGraphOverviewControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style that is applied to the GRAPH overview.

### Type

String

### Access

Read-only

### Syntax

```
ProcessDiagnosisGraphOverviewControl.StyleItemClass
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.TabIndex

### Description

The "TabIndex" property returns the position of the GRAPH overview in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
ProcessDiagnosisGraphOverviewControl.TabIndex
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the GRAPH overview.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

```
ProcessDiagnosisGraphOverviewControl.ToolBar
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ToolBar.BackColor
```

### See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 5097)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 5098)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 5097)

HmiControlBarElementCollection (Page 5098)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[ToolBar.Elements](#) (Page 5098)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

[HmiControlBarElementCollection](#) (Page 5098)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 5100)

## See also

HmiControlBarElementCollection (Page 5098)

Control Bar Elements (Page 5100)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.AlternateBackColor`

### See also

[ControlBarButton \(Page 5100\)](#)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarButton.Content`

### See also

[ControlBarButton](#) (Page 5100)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarButton.Content (Page 5106)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarButton.Content (Page 5106)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 5106\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 5106\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content](#) (Page 5106)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarButton.Content \(Page 5106\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarButton.Content \(Page 5106\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarButton.Content](#) (Page 5106)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

[ControlBarButton](#) (Page 5100)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.Height
```

### See also

ControlBarButton (Page 5100)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

ControlBarButton (Page 5100)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarButton.Mapping`

#### See also

[ControlBarButton \(Page 5100\)](#)

### ControlBarButton.Margin

#### Description

The "Margin" property specifies the surrounded outer distance of the button.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**`ControlBarButton.Margin`**See also**[ControlBarButton \(Page 5100\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Bottom`**See also**[ControlBarButton.Margin \(Page 5116\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Left`

## See also

[ControlBarButton.Margin \(Page 5116\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 5116\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarButton.Margin` (Page 5116)**ControlBarButton.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarButton.MaximumHeight`**See also**`ControlBarButton` (Page 5100)**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarButton.MaximumWidth`

## See also

[ControlBarButton \(Page 5100\)](#)

## ControlBarButton.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MinimumHeight`

## See also

[ControlBarButton \(Page 5100\)](#)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MinimumWidth
```

**See also**

ControlBarButton (Page 5100)

**ControlBarButton.Operability****Description**

The "Operability" property returns whether the button is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarButton.Operability
```

**See also**

ControlBarButton (Page 5100)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarButton.Padding`

### See also

[ControlBarButton \(Page 5100\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarButton.Padding \(Page 5121\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarButton.Padding \(Page 5121\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 5121\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarButton.Padding \(Page 5121\)](#)

## ControlBarButton.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarButton.RequireExplicitUnlock`

### See also

[ControlBarButton \(Page 5100\)](#)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarButton.Text`**See also**[ControlBarButton \(Page 5100\)](#)**ControlBarButton.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**[ControlBarButton \(Page 5100\)](#)**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 5100\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 5100\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

[ControlBarDisplay \(Page 5126\)](#)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

**Syntax**

`ControlBarDisplay.Content`

**See also**

`ControlBarDisplay` (Page 5126)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

`ControlBarDisplay.Content` (Page 5128)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[ControlBarDisplay.Content](#) (Page 5128)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

**See also**

ControlBarDisplay.Content (Page 5128)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 5128)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

## See also

ControlBarDisplay.Content (Page 5128)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

## See also

ControlBarDisplay.Content (Page 5128)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

`ControlBarDisplay.Content` (Page 5128)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

`ControlBarDisplay.Content` (Page 5128)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarDisplay.CustomID`

### See also

[ControlBarDisplay \(Page 5126\)](#)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 5126\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.ForeColor
```

### See also

ControlBarDisplay (Page 5126)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 5126)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

### See also

[ControlBarDisplay \(Page 5126\)](#)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarDisplay.Mapping`

#### See also

[ControlBarDisplay \(Page 5126\)](#)

### ControlBarDisplay.Margin

#### Description

The "Margin" property specifies the surrounded outer spacing of the display.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**`ControlBarDisplay.Margin`**See also**[ControlBarDisplay \(Page 5126\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Bottom`**See also**[ControlBarDisplay.Margin \(Page 5138\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Left`

## See also

[ControlBarDisplay.Margin \(Page 5138\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarDisplay.Margin \(Page 5138\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarDisplay.Margin` (Page 5138)**ControlBarDisplay.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarDisplay.MaximumHeight`**See also**`ControlBarDisplay` (Page 5126)**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarDisplay.MaximumWidth`

## See also

[ControlBarDisplay \(Page 5126\)](#)

## ControlBarDisplay.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 5126\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MinimumWidth
```

**See also**

ControlBarDisplay (Page 5126)

**ControlBarDisplay.Operability****Description**

The "Operability" property returns whether the display is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarDisplay.Operability
```

**See also**

ControlBarDisplay (Page 5126)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Padding`

### See also

[ControlBarDisplay \(Page 5126\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarDisplay.Padding \(Page 5143\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarDisplay.Padding \(Page 5143\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarDisplay.Padding \(Page 5143\)](#)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarDisplay.Padding \(Page 5143\)](#)

## ControlBarDisplay.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarDisplay.RequireExplicitUnlock`

### See also

[ControlBarDisplay \(Page 5126\)](#)

## ControlBarDisplay.Text

### Description

The "Text" property specifies the label of the display.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.Text`**See also**

ControlBarDisplay (Page 5126)

**ControlBarDisplay.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 5126)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Visible`

**See also**

ControlBarDisplay (Page 5126)

**ControlBarDisplay.Width**

**Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Width`

**See also**

ControlBarDisplay (Page 5126)

**ControlBarLabel**

**Description**

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.

- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarLabel.Authorization`

### See also

[ControlBarLabel \(Page 5148\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

**Access**

Read-only

**Syntax**`ControlBarLabel.CustomID`**See also**[ControlBarLabel \(Page 5148\)](#)**ControlBarLabel.Enabled****Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Enabled`**See also**[ControlBarLabel \(Page 5148\)](#)**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.ForeColor`

**See also**

ControlBarLabel (Page 5148)

**ControlBarLabel.Height**

**Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.Height`

**See also**

ControlBarLabel (Page 5148)

**ControlBarLabel.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

## Access

Read-write

## Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

## See also

ControlBarLabel (Page 5148)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarLabel.Mapping`

**See also**

[ControlBarLabel \(Page 5148\)](#)

**ControlBarLabel.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the identifier.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Margin`

**See also**

ControlBarLabel (Page 5148)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Bottom

**See also**

ControlBarLabel.Margin (Page 5155)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Left

**See also**

ControlBarLabel.Margin (Page 5155)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

ControlBarLabel.Margin (Page 5155)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

[ControlBarLabel.Margin \(Page 5155\)](#)

**ControlBarLabel.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MaximumHeight`

**See also**

[ControlBarLabel \(Page 5148\)](#)

**ControlBarLabel.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MaximumWidth`

**See also**

ControlBarLabel (Page 5148)

**ControlBarLabel.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MinimumHeight`

**See also**

ControlBarLabel (Page 5148)

**ControlBarLabel.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MinimumWidth`

## See also

ControlBarLabel (Page 5148)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

## See also

ControlBarLabel (Page 5148)

## ControlBarLabel.Padding

### Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**`ControlBarLabel.Padding`**See also**[ControlBarLabel \(Page 5148\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Bottom`**See also**[ControlBarLabel.Padding \(Page 5160\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Left`

## See also

[ControlBarLabel.Padding \(Page 5160\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Right`

## See also

[ControlBarLabel.Padding \(Page 5160\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Top`**See also**`ControlBarLabel.Padding` (Page 5160)**ControlBarLabel.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**`Bool`**Access**`Read-only`**Syntax**`ControlBarLabel.RequireExplicitUnlock`**See also**`ControlBarLabel` (Page 5148)**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**`String`**Access**`Read-write`

## Syntax

```
ControlBarLabel.Text
```

## See also

ControlBarLabel (Page 5148)

## ControlBarLabel.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

### Type

String

### Access

Read-write

## Syntax

```
ControlBarLabel.ToolTipText
```

## See also

ControlBarLabel (Page 5148)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**`ControlBarLabel.VerticalTextAlignment`**See also**

ControlBarLabel (Page 5148)

**ControlBarLabel.Visible****Description**

The "Visible" property specifies whether the identifier is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Visible`**See also**

ControlBarLabel (Page 5148)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

```
ControlBarLabel.Width
```

## See also

ControlBarLabel (Page 5148)

## ControlBarSeparator

### Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarSeparatorPart

### Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarSeparator.Authorization`

**See also**

[ControlBarSeparator](#) (Page 5166)

**ControlBarSeparator.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarSeparator.CustomID`

**See also**

[ControlBarSeparator](#) (Page 5166)

**ControlBarSeparator.Enabled**

**Description**

The "Enabled" property specifies whether the separator is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Enabled`

**See also**

ControlBarSeparator (Page 5166)

**ControlBarSeparator.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ForeColor`

**See also**

ControlBarSeparator (Page 5166)

**ControlBarSeparator.Height****Description**

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Height`

## See also

ControlBarSeparator (Page 5166)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarSeparator.Mapping`

### See also

[ControlBarSeparator \(Page 5166\)](#)

## ControlBarSeparator.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the separator.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Margin`

### See also

[ControlBarSeparator \(Page 5166\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**[ControlBarSeparator.Margin \(Page 5172\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarSeparator.Margin \(Page 5172\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarSeparator.Margin \(Page 5172\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarSeparator.Margin \(Page 5172\)](#)

**ControlBarSeparator.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MaximumHeight`**See also**

ControlBarSeparator (Page 5166)

**ControlBarSeparator.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MaximumWidth`**See also**

ControlBarSeparator (Page 5166)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MinimumHeight`

**See also**

[ControlBarSeparator \(Page 5166\)](#)

**ControlBarSeparator.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MinimumWidth`

**See also**

[ControlBarSeparator \(Page 5166\)](#)

**ControlBarSeparator.Operability**

**Description**

The "Operability" property returns whether the separator is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarSeparator.Operability`

### See also

[ControlBarSeparator \(Page 5166\)](#)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Padding`

### See also

[ControlBarSeparator \(Page 5166\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarSeparator.Padding \(Page 5177\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarSeparator.Padding \(Page 5177\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Right

### See also

ControlBarSeparator.Padding (Page 5177)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Top

### See also

ControlBarSeparator.Padding (Page 5177)

## ControlBarSeparator.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

### See also

ControlBarSeparator (Page 5166)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarSeparator.ToolTipText
```

### See also

ControlBarSeparator (Page 5166)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Visible`

### See also

[ControlBarSeparator \(Page 5166\)](#)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Width`

### See also

[ControlBarSeparator \(Page 5166\)](#)

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar. You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.

- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarTextBox.AlternateBorderColor`

## See also

[ControlBarTextBox \(Page 5182\)](#)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

`ControlBarTextBox.Authorization`

## See also

[ControlBarTextBox \(Page 5182\)](#)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.BackColor
```

**See also**

ControlBarTextBox (Page 5182)

**ControlBarTextBox.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.BorderColor
```

**See also**

ControlBarTextBox (Page 5182)

**ControlBarTextBox.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

## Syntax

`ControlBarTextBox.BorderWidth`

## See also

[ControlBarTextBox \(Page 5182\)](#)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

## Syntax

`ControlBarTextBox.CustomID`

## See also

[ControlBarTextBox \(Page 5182\)](#)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarTextBox.Enabled
```

**See also**

[ControlBarTextBox \(Page 5182\)](#)

**ControlBarTextBox.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.ForeColor
```

**See also**

[ControlBarTextBox \(Page 5182\)](#)

**ControlBarTextBox.Height****Description**

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarTextBox.Height
```

## See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

## See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 5182\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 5182\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarTextBox.Margin \(Page 5191\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarTextBox.Margin \(Page 5191\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 5191\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

ControlBarTextBox.Margin (Page 5191)

## ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

ControlBarTextBox.MaximumHeight

### See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MaximumWidth
```

### See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumHeight
```

### See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumWidth
```

### See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarTextBox.Operability
```

**See also**

ControlBarTextBox (Page 5182)

**ControlBarTextBox.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Padding`

**See also**

ControlBarTextBox (Page 5182)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarTextBox.Padding](#) (Page 5196)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Left
```

**See also**

[ControlBarTextBox.Padding](#) (Page 5196)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Right
```

**See also**

[ControlBarTextBox.Padding \(Page 5196\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarTextBox.Padding \(Page 5196\)](#)

**ControlBarTextBox.ReadOnly**

**Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ReadOnly`

**See also**

[ControlBarTextBox](#) (Page 5182)

**ControlBarTextBox.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.RequireExplicitUnlock
```

**See also**

[ControlBarTextBox](#) (Page 5182)

**ControlBarTextBox.Text****Description**

The "Text" property specifies the label of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Text
```

## See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

## See also

ControlBarTextBox (Page 5182)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

**Syntax**

```
ControlBarTextBox.VerticalTextAlignment
```

**See also**

ControlBarTextBox (Page 5182)

**ControlBarTextBox.Visible****Description**

The "Visible" property specifies whether the text box is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Visible
```

**See also**

ControlBarTextBox (Page 5182)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarTextBox.Width
```

## See also

ControlBarTextBox (Page 5182)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.

- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

### ControlBarToggleSwitch.AlternateBackColor

#### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

#### Type

UInt32

#### Access

Read-write

#### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

#### See also

ControlBarToggleSwitch (Page 5202)

### ControlBarToggleSwitch.AlternateBorderColor

#### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

#### Type

UInt32

#### Access

Read-write

#### Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

**See also**

[ControlBarToggleSwitch](#) (Page 5202)

**ControlBarToggleSwitch.AlternateGraphic****Description**

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.AlternateGraphic
```

**See also**

[ControlBarToggleSwitch](#) (Page 5202)

**ControlBarToggleSwitch.AlternateText****Description**

The "AlternateText" property specifies the text of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.AlternateText
```

**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.Authorization**

**Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Authorization`

**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.BackColor`

**See also**

[ControlBarToggleSwitch](#) (Page 5202)

**ControlBarToggleSwitch.Badge****Description**

The "Badge" property specifies the identifier of the switch.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.Badge
```

**See also**

[ControlBarToggleSwitch](#) (Page 5202)

**ControlBarToggleSwitch.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderColor
```

**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.BorderWidth`

**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.Content**

**Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Content`

**See also**

ControlBarToggleSwitch (Page 5202)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

ControlBarToggleSwitch.Content (Page 5208)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[ControlBarToggleSwitch.Content \(Page 5208\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 5208\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 5208\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 5208\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ControlBarToggleSwitch.Content](#) (Page 5208)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

`ControlBarToggleSwitch.Content` (Page 5208)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

`ControlBarToggleSwitch.Content` (Page 5208)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.CustomID`

### See also

[ControlBarToggleSwitch \(Page 5202\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 5202\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 5202)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 5202)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Height`

### See also

[ControlBarToggleSwitch \(Page 5202\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 5202\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

### See also

ControlBarToggleSwitch (Page 5202)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

```
ControlBarToggleSwitch.Mapping
```

**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 5202\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 5219\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarToggleSwitch.Margin \(Page 5219\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarToggleSwitch.Margin \(Page 5219\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarToggleSwitch.Margin \(Page 5219\)](#)

**ControlBarToggleSwitch.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

[ControlBarToggleSwitch \(Page 5202\)](#)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumWidth`**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

### See also

ControlBarToggleSwitch (Page 5202)

## ControlBarToggleSwitch.Operability

### Description

The property "Operability" returns whether the switch is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Operability
```

### See also

ControlBarToggleSwitch (Page 5202)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Padding`

**See also**

[ControlBarToggleSwitch \(Page 5202\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarToggleSwitch.Padding \(Page 5224\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarToggleSwitch.Padding \(Page 5224\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarToggleSwitch.Padding \(Page 5224\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarToggleSwitch.Padding \(Page 5224\)](#)**ControlBarToggleSwitch.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarToggleSwitch.RequireExplicitUnlock`**See also**[ControlBarToggleSwitch \(Page 5202\)](#)**ControlBarToggleSwitch.Text****Description**

The "Text" property specifies the label of the switch.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Text`

**See also**

[ControlBarToggleSwitch \(Page 5202\)](#)

**ControlBarToggleSwitch.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the switch.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.ToolTipText`

**See also**

[ControlBarToggleSwitch \(Page 5202\)](#)

**ControlBarToggleSwitch.Visible**

**Description**

The "Visible" property specifies whether the switch is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Visible`**See also**

ControlBarToggleSwitch (Page 5202)

**ControlBarToggleSwitch.Width****Description**

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Width`**See also**

ControlBarToggleSwitch (Page 5202)

**ToolBar.Enabled****Description**

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.Enabled`

**See also**

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 5097)

**ToolBar.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ToolBar.Font`

**See also**

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 5097)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

ToolBar.Font (Page 5230)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

ToolBar.Font (Page 5230)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 5230)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

**See also**

ToolBar.Font (Page 5230)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

Font.Underline

### See also

ToolBar.Font (Page 5230)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

## Syntax

`Font.Weight`

## See also

`ToolBar.Font` (Page 5230)

## ToolBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ToolBar.Margin`

## See also

`ProcessDiagnosisGraphOverviewControl.ToolBar` (Page 5097)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ToolBar.Margin` (Page 5234)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ToolBar.Margin` (Page 5234)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ToolBar.Margin \(Page 5234\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ToolBar.Margin \(Page 5234\)](#)

## ToolBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**`ToolBar.Padding`**See also**`ProcessDiagnosisGraphOverviewControl.ToolBar` (Page 5097)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Bottom`**See also**`ToolBar.Padding` (Page 5236)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Left`

## See also

[ToolBar.Padding \(Page 5236\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Right`

## See also

[ToolBar.Padding \(Page 5236\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Top`**See also**`ToolBar.Padding` (Page 5236)**ToolBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**`Bool`**Access**`Read-write`**Syntax**`ToolBar.ShowToolTips`**See also**`ProcessDiagnosisGraphOverviewControl.ToolBar` (Page 5097)**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**`Bool`**Access**`Read-write`

## Syntax

```
ToolBar.UseHotKeys
```

## See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 5097)

## ToolBar.Visible

### Description

The "Visible" property specifies whether the toolbar is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Visible
```

## See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 5097)

## ProcessDiagnosisGraphOverviewControl.Top

### Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

**Syntax**

`ProcessDiagnosisGraphOverviewControl.Top`

**See also**

[ProcessDiagnosisGraphOverviewControl \(Page 5003\)](#)

**ProcessDiagnosisGraphOverviewControl.Visible****Description**

The "Visible" property specifies whether the GRAPH overview is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessDiagnosisGraphOverviewControl.Visible`

**See also**

[ProcessDiagnosisGraphOverviewControl \(Page 5003\)](#)

**ProcessDiagnosisGraphOverviewControl.Width****Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisGraphOverviewControl.Width`

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the GRAPH overview.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

### Note

You can enable multiple properties by adding integer values or bit operators.

---

### Access

Read-write

### Syntax

`ProcessDiagnosisGraphOverviewControl.WindowFlags`

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the GRAPH overview.

### Syntax

```
ProcessDiagnosisGraphOverviewControl.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element of the toolbar or information bar (control bar element, e.g. a button) of the GRAPH overview.

### Syntax

```
ProcessDiagnosisGraphOverviewControl.FireCommand(commandId, custom)
```

## Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## Return value

--

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl.PropertyFlashing()

## Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

## Syntax

```
ProcessDiagnosisGraphOverviewControl.PropertyFlashing(propertyName,  
enable[, value][, alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

ProcessDiagnosisGraphOverviewControl (Page 5003)

**ProcessDiagnosisGraphOverviewControl\_OnActivated()****Description**

The "OnActivated" event occurs when a GRAPH overview receives the focus:

- A GRAPH overview is selected via the configured tab sequence.
- A GRAPH overview that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
ProcessDiagnosisGraphOverviewControl_OnActivated(item)
```

## Context

**item**

Type: Object

GRAPH overview for which the event occurs.

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl\_OnAlarmViewButtonTapped()

### Description

The "AlarmViewButtonTapped" event occurs when the "Alarm control" button of the GRAPH overview is pressed.

### Syntax

```
ProcessDiagnosisGraphOverviewControl_OnAlarmViewButtonTapped(item)
```

## Context

**item**

Type: Object

GRAPH overview for which the event occurs.

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the GRAPH overview.

### Syntax

```
ProcessDiagnosisGraphOverviewControl_OnCommandFired(item,  
commandId, custom)
```

## Context

**item**

Type: Object

GRAPH overview for which the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the GRAPH overview loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
ProcessDiagnosisGraphOverviewControl_OnDeactivated(item)
```

## Context

**item**

Type: Object

GRAPH overview for which the event occurs.

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a GRAPH overview has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
ProcessDiagnosisGraphOverviewControl_OnInitialized(item)
```

### Context

#### **item**

Type: Object

GRAPH overview for which the event occurs.

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl\_OnPlcCodeViewerButtonTapped()

### Description

The "PlcCodeViewerButtonTapped" event occurs when the "PLC code view" button of the GRAPH overview is pressed.

### Syntax

```
ProcessDiagnosisGraphOverviewControl_OnPlcCodeViewerButtonTapped(item)
```

### Context

#### **item**

Type: Object

GRAPH overview for which the event occurs.

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisGraphOverviewControl\_OnTIAPortalButtonTapped()

### Description

The "TIAPortalButtonTapped" event occurs when the "TIA Portal" button of the GRAPH overview is pressed.

### Syntax

```
ProcessDiagnosisGraphOverviewControl_OnTIAPortalButtonTapped (item)
```

### Context

**item**

Type: Object

GRAPH overview for which the event occurs.

## See also

ProcessDiagnosisGraphOverviewControl (Page 5003)

## ProcessDiagnosisOverviewControl

### Description

The "ProcessDiagnosisOverviewControl" object represents a process diagnostics overview in runtime. When an error occurs, the type of error and the error category are displayed in the process diagnostics overview.

### Object type

HmiProcessDiagnosisOverviewControl

### Properties

The "Object" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.

- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the process diagnostics overview.
- **Enabled**  
Specifies whether the process diagnostics overview can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the process diagnostics overview.
- **Layer**  
Returns the screen layer in which the process diagnostics overview is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the process diagnostics overview.
- **Parent**  
Returns the higher-level screen object.
- **PDiagCategories**  
Specifies the categories of the process diagnostics overview.
- **PDiagSupervisionTypes**  
Specifies the supervision types of the process diagnostics overview.
- **PlcSource**  
Specifies the PLC source.
- **RenderingTemplate**  
Returns the name of the template from which the process diagnostics overview was created.
- **ShowFocusVisual**  
Specifies whether the process diagnostics overview is highlighted when in focus.
- **StatusBar**  
Specifies the information bar of the process diagnostics overview.
- **StyleItemClass**  
Returns the style which is applied to the process diagnostics overview.
- **TabIndex**  
Returns the position of the process diagnostics overview in the tab sequence.
- **ToolBar**  
Specifies the toolbar of the process diagnostics overview.

- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the process diagnostics overview is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the process diagnostics overview.

## Methods

The "ProcessDiagnosisOverviewControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the process diagnostics overview.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the process diagnostics overview.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ProcessDiagnosisOverviewControl" object has the following events:

- **OnActivated()**  
Occurs when a process diagnostics overview receives the focus.
- **OnAlarmViewButtonTapped()**  
Occurs when the "Alarm control" button of the process diagnostics overview is pressed.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the process diagnostics overview.
- **OnDeactivated()**  
Occurs when a process diagnostics overview loses the focus.
- **OnInitialized()**  
Occurs when a process diagnostics overview has been successfully initialized and the data connection to the PLC has been established.

## ProcessDiagnosisOverviewControl.BackColor

### Description

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.BackColor`

**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ProcessDiagnosisOverviewControl.Caption**

**Description**

The "Caption" property specifies the text that is displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.Caption`

**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`Text.Font`**See also**

ProcessDiagnosisOverviewControl.Caption (Page 5252)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

Text.Font (Page 5252)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 5252)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 5252)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

[Text.Font \(Page 5252\)](#)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

[Text.Font \(Page 5252\)](#)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 5252\)](#)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[ProcessDiagnosisOverviewControl.Caption \(Page 5252\)](#)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

`Text.Text`

**See also**

[ProcessDiagnosisOverviewControl.Caption \(Page 5252\)](#)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

[ProcessDiagnosisOverviewControl.Caption \(Page 5252\)](#)

## ProcessDiagnosisOverviewControl.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

```
ProcessDiagnosisOverviewControl.CaptionColor
```

### See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the process diagnostics overview.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

**Syntax**

`ProcessDiagnosisOverviewControl.CurrentQuality`

**See also**

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

**ProcessDiagnosisOverviewControl.Enabled****Description**

The "Enabled" property specifies whether the process diagnostics overview can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.Enabled`

**See also**

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

**ProcessDiagnosisOverviewControl.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.Font`

**See also**

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[ProcessDiagnosisOverviewControl.Font \(Page 5259\)](#)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**[ProcessDiagnosisOverviewControl.Font \(Page 5259\)](#)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**`Float`**Access**`Read-write`**Syntax**`Font.Size`**See also**[ProcessDiagnosisOverviewControl.Font \(Page 5259\)](#)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**`Int32, HmiFontStrikeOut`

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

ProcessDiagnosisOverviewControl.Font (Page 5259)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

ProcessDiagnosisOverviewControl.Font (Page 5259)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[ProcessDiagnosisOverviewControl.Font](#) (Page 5259)

**ProcessDiagnosisOverviewControl.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.ForeColor`

**See also**

[ProcessDiagnosisOverviewControl](#) (Page 5249)

## ProcessDiagnosisOverviewControl.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessDiagnosisOverviewControl.Height`

### See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl.Icon

### Description

The "Icon" property specifies the icon of the process diagnostics overview.

### Type

String

### Access

Read-write

### Syntax

`ProcessDiagnosisOverviewControl.Icon`

### See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl.Layer

### Description

The "Layer" property returns the screen layer in which the process diagnostics overview is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`ProcessDiagnosisOverviewControl.Layer`

### See also

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[ProcessDiagnosisOverviewControl.Layer \(Page 5265\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[ProcessDiagnosisOverviewControl.Layer \(Page 5265\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[ProcessDiagnosisOverviewControl.Layer \(Page 5265\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[ProcessDiagnosisOverviewControl.Layer \(Page 5265\)](#)

## ProcessDiagnosisOverviewControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`ProcessDiagnosisOverviewControl.Left`

### See also

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

## ProcessDiagnosisOverviewControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
ProcessDiagnosisOverviewControl.Margin
```

### See also

ProcessDiagnosisOverviewControl (Page 5249)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

ProcessDiagnosisOverviewControl.Margin (Page 5268)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

ProcessDiagnosisOverviewControl.Margin (Page 5268)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Right

### See also

ProcessDiagnosisOverviewControl.Margin (Page 5268)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ProcessDiagnosisOverviewControl.Margin \(Page 5268\)](#)

## ProcessDiagnosisOverviewControl.Name

### Description

The "Name" property returns the name of the process diagnostics overview.

### Type

String

### Access

Read-only

### Syntax

`ProcessDiagnosisOverviewControl.Name`

### See also

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

## ProcessDiagnosisOverviewControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
ProcessDiagnosisOverviewControl.Parent
```

### See also

ProcessDiagnosisOverviewControl (Page 5249)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## ProcessDiagnosisOverviewControl.PDiagCategories

### Description

The "PDiagCategories" property specifies the categories of the process diagnostics overview.

### Type

Object, HmiProcessDiagnosisOverviewPart

### Access

Read-write

### Syntax

```
ProcessDiagnosisOverviewControl.PDiagCategories
```

### See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverview.Label

### Description

The "Label" property specifies the label.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

ProcessDiagnosisOverview.Label

### See also

ProcessDiagnosisOverviewControl.PDiagCategories (Page 5271)

## Text.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

Text.Font

**See also**

ProcessDiagnosisOverview.Label (Page 5272)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 5272)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Text.Font (Page 5272)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 5272)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**`Text.Font` (Page 5272)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**`Text.Font` (Page 5272)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 5272\)](#)

### Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[ProcessDiagnosisOverview.Label \(Page 5272\)](#)

### Text.Text

### Description

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

ProcessDiagnosisOverview.Label (Page 5272)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

ProcessDiagnosisOverview.Label (Page 5272)

**ProcessDiagnosisOverview.PDiagElements****Description**

The "PDiagElements" property represents the set of process diagnostics overview elements.

## Type

Object, HmiProcessDiagnosisOverviewElementCollection (Page 5278)

## Access

Read-only

## Syntax

`ProcessDiagnosisOverview.PDiagElements`

## See also

ProcessDiagnosisOverviewControl.PDiagCategories (Page 5271)

HmiProcessDiagnosisOverviewElementCollection (Page 5278)

## HmiProcessDiagnosisOverviewElementCollection

### Description

The "HmiProcessDiagnosisOverviewElementCollection" object is a list of all process diagnostics overview elements ("ProcessDiagnosisOverviewElement" objects).

### Use

The "HmiProcessDiagnosisOverviewElementCollection" object is a list and can be counted and enumerated. You can access the "HmiProcessDiagnosisOverviewElementCollection" list using the index or the tag names.

### Object type

HmiProcessDiagnosisOverviewElementCollection

### Properties

The "HmiProcessDiagnosisOverviewElementCollection" object has the following properties:

- **Count**  
Returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

### Methods

The "HmiProcessDiagnosisOverviewElementCollection" object has the following methods:

- **Item()**  
Returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

**See also**

ProcessDiagnosisOverview.PDiagElements (Page 5277)

**HmiProcessDiagnosisOverviewElementCollection.Count****Description**

The "Count" property returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
HmiProcessDiagnosisOverviewElementCollection.Count
```

**See also**

HmiProcessDiagnosisOverviewElementCollection (Page 5278)

**HmiProcessDiagnosisOverviewElementCollection.Item()****Description**

The "Item" method returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

**Syntax**

```
HmiProcessDiagnosisOverviewElementCollection[.Item]  
(HmiProcessDiagnosisOverviewElementName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiProcessDiagnosisOverviewElementCollection" object.

---

## Parameters

### **HmiProcessDiagnosisOverviewElementName**

Type: String

Name of the process diagnostics overview element

## Return value

Object, HmiProcessDiagnosisOverviewElementPart (Page 5280)

## See also

HmiProcessDiagnosisOverviewElementCollection (Page 5278)

ProcessDiagnosisOverviewElement (Page 5280)

## ProcessDiagnosisOverviewElement

### Description

The "ProcessDiagnosisOverviewElement" object represents a process diagnostics overview element.

### Object type

HmiProcessDiagnosisOverviewElementPart

### Properties

The "ProcessDiagnosisOverviewElement" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateForeColor**  
Specifies the flashing color for the text.
- **BackColor**  
Specifies the background color.
- **FlashingRate**  
Specifies the flash rate.
- **ForeColor**  
Specifies the font color of the text.
- **Text**  
Specifies the labeling of the process diagnostics overview element.
- **Visible**  
Specifies whether the process diagnostics overview element is visible.

**Methods**

--

**See also**[HmiProcessDiagnosisOverviewElementCollection.Item\(\)](#) (Page 5279)**ProcessDiagnosisOverviewElement.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the flashing color for the background.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewElement.AlternateBackColor`**See also**[ProcessDiagnosisOverviewElement](#) (Page 5280)**ProcessDiagnosisOverviewElement.AlternateForeColor****Description**

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewElement.AlternateForeColor`

### See also

ProcessDiagnosisOverviewElement (Page 5280)

## ProcessDiagnosisOverviewElement.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessDiagnosisOverviewElement.BackColor`

### See also

ProcessDiagnosisOverviewElement (Page 5280)

## ProcessDiagnosisOverviewElement.FlashingRate

### Description

The "FlashingRate" property specifies the flash rate.

### Type

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

### Access

Read-write

**Syntax**

```
ProcessDiagnosisOverviewElement.FlashingRate
```

**See also**

ProcessDiagnosisOverviewElement (Page 5280)

**ProcessDiagnosisOverviewElement.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisOverviewElement.ForeColor
```

**See also**

ProcessDiagnosisOverviewElement (Page 5280)

**ProcessDiagnosisOverviewElement.Text****Description**

The "Text" property specifies the labeling of the process diagnostics overview element.

**Type**

String

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisOverviewElement.Text
```

**See also**

ProcessDiagnosisOverviewElement (Page 5280)

**ProcessDiagnosisOverviewElement.Visible**

**Description**

The "Visible" property specifies whether the process diagnostics overview element is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewElement.Visible`

**See also**

ProcessDiagnosisOverviewElement (Page 5280)

**ProcessDiagnosisOverview.SymbolFont**

**Description**

The "SymbolFont" property specifies the font of the symbol text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverview.SymbolFont`

**See also**

ProcessDiagnosisOverviewControl.PDiagCategories (Page 5271)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[ProcessDiagnosisOverview.SymbolFont \(Page 5284\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

[ProcessDiagnosisOverview.SymbolFont \(Page 5284\)](#)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

`Font.Size`

### See also

[ProcessDiagnosisOverview.SymbolFont \(Page 5284\)](#)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

**See also**

ProcessDiagnosisOverview.SymbolFont (Page 5284)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

ProcessDiagnosisOverview.SymbolFont (Page 5284)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[ProcessDiagnosisOverview.SymbolFont \(Page 5284\)](#)

## ProcessDiagnosisOverview.Visible

### Description

The "Visible" property specifies whether the process diagnostics view is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ProcessDiagnosisOverview.Visible`

### See also

[ProcessDiagnosisOverviewControl.PDiagCategories \(Page 5271\)](#)

## ProcessDiagnosisOverviewControl.PDiagSupervisionTypes

### Description

The "PDiagSupervisionTypes" property specifies the supervision types of the process diagnostics overview.

### Type

Object, HmiProcessDiagnosisOverviewPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.PDiagSupervisionTypes`

**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ProcessDiagnosisOverview.Label****Description**

The "Label" property specifies the label.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverview.Label`

**See also**

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes (Page 5288)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

## Syntax

`Text.Font`

## See also

ProcessDiagnosisOverview.Label (Page 5289)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

## Syntax

`Font.Italic`

## See also

Text.Font (Page 5289)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

**Syntax**`Font.Name`**See also**`Text.Font` (Page 5289)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**`Text.Font` (Page 5289)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

Text.Font (Page 5289)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

Text.Font (Page 5289)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 5289\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[ProcessDiagnosisOverview.Label \(Page 5289\)](#)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

ProcessDiagnosisOverview.Label (Page 5289)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

ProcessDiagnosisOverview.Label (Page 5289)

## ProcessDiagnosisOverview.PDiagElements

### Description

The "PDiagElements" property represents the set of process diagnostics overview elements.

### Type

Object, HmiProcessDiagnosisOverviewElementCollection (Page 5295)

### Access

Read-only

### Syntax

```
ProcessDiagnosisOverview.PDiagElements
```

### See also

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes (Page 5288)

HmiProcessDiagnosisOverviewElementCollection (Page 5295)

## HmiProcessDiagnosisOverviewElementCollection

### Description

The "HmiProcessDiagnosisOverviewElementCollection" object is a list of all process diagnostics overview elements ("ProcessDiagnosisOverviewElement" objects).

### Use

The "HmiProcessDiagnosisOverviewElementCollection" object is a list and can be counted and enumerated. You can access the "HmiProcessDiagnosisOverviewElementCollection" list using the index or the tag names.

### Object type

HmiProcessDiagnosisOverviewElementCollection

### Properties

The "HmiProcessDiagnosisOverviewElementCollection" object has the following properties:

- **Count**  
Returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

## Methods

The "HmiProcessDiagnosisOverviewElementCollection" object has the following methods:

- **Item()**  
Returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

## See also

ProcessDiagnosisOverview.PDiagElements (Page 5295)

## HmiProcessDiagnosisOverviewElementCollection.Count

### Description

The "Count" property returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiProcessDiagnosisOverviewElementCollection.Count
```

## See also

HmiProcessDiagnosisOverviewElementCollection (Page 5295)

## HmiProcessDiagnosisOverviewElementCollection.Item()

### Description

The "Item" method returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

### Syntax

```
HmiProcessDiagnosisOverviewElementCollection[.Item]  
(HmiProcessDiagnosisOverviewElementName)
```

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiProcessDiagnosisOverviewElementCollection" object.

---

**Parameters****HmiProcessDiagnosisOverviewElementName**

Type: String

Name of the process diagnostics overview element

**Return value**

Object, HmiProcessDiagnosisOverviewElementPart (Page 5297)

**See also**

HmiProcessDiagnosisOverviewElementCollection (Page 5295)

ProcessDiagnosisOverviewElement (Page 5297)

**ProcessDiagnosisOverviewElement****Description**

The "ProcessDiagnosisOverviewElement" object represents a process diagnostics overview element.

**Object type**

HmiProcessDiagnosisOverviewElementPart

**Properties**

The "ProcessDiagnosisOverviewElement" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateForeColor**  
Specifies the flashing color for the text.
- **BackColor**  
Specifies the background color.
- **FlashingRate**  
Specifies the flash rate.

- **ForeColor**  
Specifies the font color of the text.
- **Text**  
Specifies the labeling of the process diagnostics overview element.
- **Visible**  
Specifies whether the process diagnostics overview element is visible.

## Methods

--

## See also

HmiProcessDiagnosisOverviewElementCollection.Item() (Page 5296)

## ProcessDiagnosisOverviewElement.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the flashing color for the background.

### Type

UInt32

### Access

Read-write

### Syntax

```
ProcessDiagnosisOverviewElement.AlternateBackColor
```

## See also

ProcessDiagnosisOverviewElement (Page 5297)

## ProcessDiagnosisOverviewElement.AlternateForeColor

### Description

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewElement.AlternateForeColor`**See also**

ProcessDiagnosisOverviewElement (Page 5297)

**ProcessDiagnosisOverviewElement.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewElement.BackColor`**See also**

ProcessDiagnosisOverviewElement (Page 5297)

**ProcessDiagnosisOverviewElement.FlashingRate****Description**

The "FlashingRate" property specifies the flash rate.

**Type**

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

### Access

Read-write

### Syntax

`ProcessDiagnosisOverviewElement.FlashingRate`

### See also

[ProcessDiagnosisOverviewElement \(Page 5297\)](#)

## ProcessDiagnosisOverviewElement.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ProcessDiagnosisOverviewElement.ForeColor`

### See also

[ProcessDiagnosisOverviewElement \(Page 5297\)](#)

## ProcessDiagnosisOverviewElement.Text

### Description

The "Text" property specifies the labeling of the process diagnostics overview element.

**Type**

String

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewElement.Text`**See also**

ProcessDiagnosisOverviewElement (Page 5297)

**ProcessDiagnosisOverviewElement.Visible****Description**

The "Visible" property specifies whether the process diagnostics overview element is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewElement.Visible`**See also**

ProcessDiagnosisOverviewElement (Page 5297)

**ProcessDiagnosisOverview.SymbolFont****Description**

The "SymbolFont" property specifies the font of the symbol text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverview.SymbolFont`

**See also**

[ProcessDiagnosisOverviewControl.PDiagSupervisionTypes \(Page 5288\)](#)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[ProcessDiagnosisOverview.SymbolFont \(Page 5301\)](#)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

ProcessDiagnosisOverview.SymbolFont (Page 5301)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

ProcessDiagnosisOverview.SymbolFont (Page 5301)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[ProcessDiagnosisOverview.SymbolFont \(Page 5301\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[ProcessDiagnosisOverview.SymbolFont \(Page 5301\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

ProcessDiagnosisOverview.SymbolFont (Page 5301)

**ProcessDiagnosisOverview.Visible****Description**

The "Visible" property specifies whether the process diagnostics view is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

ProcessDiagnosisOverview.Visible

**See also**

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes (Page 5288)

## ProcessDiagnosisOverviewControl.PlcSource

### Description

The "PlcSource" property specifies the PLC source.

### Type

Object, HmiPlcDataSourcePart

### Access

Read-write

### Syntax

`ProcessDiagnosisOverviewControl.PlcSource`

### See also

ProcessDiagnosisOverviewControl (Page 5249)

## PlcDataSource.Connection

### Description

The "Connection" property returns the connection of the tag.

### Type

Object, HmiConnection (Page 1296)

### Access

Read-only

### Syntax

`PlcDataSource.Connection`

### See also

ProcessDiagnosisOverviewControl.PlcSource (Page 5306)  
Connection (Page 1296)

## Connection

### Description

Connection (Page 1296)

## PlcDataSource.DB\_Name

### Description

The "DB\_Name" property returns the S7 GRAPH instance data block of the PLC.

### Type

String

### Access

Read-only

### Syntax

`PlcDataSource.DB_Name`

### See also

`ProcessDiagnosisOverviewControl.PlcSource` (Page 5306)

## PlcDataSource.HmiConnectionName

### Description

The "HmiConnectionName" property specifies the connection name of the tag.

### Type

String

### Access

Read-write

### Syntax

`PlcDataSource.HmiConnectionName`

## See also

ProcessDiagnosisOverviewControl.PlcSource (Page 5306)

## PlcDataSource.Tag

### Description

The "Tag" property returns the tag that is used for the process diagnostics.

### Type

String, HMITag (Page 1490)

### Access

Read-only

### Syntax

```
PlcDataSource.Tag
```

## See also

ProcessDiagnosisOverviewControl.PlcSource (Page 5306)

Tag (Page 1490)

## Tag

### Description

Tag (Page 1490)

## ProcessDiagnosisOverviewControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the process diagnostics overview was created.

### Type

String

**Access**

Read-only

**Syntax**`ProcessDiagnosisOverviewControl.RenderingTemplate`**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ProcessDiagnosisOverviewControl.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the process diagnostics overview is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewControl.ShowFocusVisual`**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ProcessDiagnosisOverviewControl.StatusBar****Description**

The "StatusBar" property specifies the information bar of the process diagnostics overview.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.StatusBar`

**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**StatusBar.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`StatusBar.BackColor`

**See also**

ProcessDiagnosisOverviewControl.StatusBar (Page 5309)

**StatusBar.Elements**

**Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

**Type**

Object, HmiControlBarElementCollection (Page 5311)

**Access**

Read-only

**Syntax**

`StatusBar.Elements`

**See also**

[ProcessDiagnosisOverviewControl.StatusBar \(Page 5309\)](#)

[HmiControlBarElementCollection \(Page 5311\)](#)

**HmiControlBarElementCollection****Description**

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

**Use**

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

**Object type**

HmiControlBarElementCollection

**Properties**

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

**Methods**

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

**See also**

[StatusBar.Elements \(Page 5310\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

### See also

HmiControlBarElementCollection (Page 5311)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 5328)

**See also**

HmiControlBarElementCollection (Page 5311)

Control Bar Elements (Page 5328)

**Control Bar Elements****Description**

Control Bar Elements (Page 5328)

**StatusBar.Enabled****Description**

The "Enabled" property specifies whether the information bar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
StatusBar.Enabled
```

**See also**

ProcessDiagnosisOverviewControl.StatusBar (Page 5309)

**StatusBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

ProcessDiagnosisOverviewControl.StatusBar (Page 5309)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

StatusBar.Font (Page 5313)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 5313)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

StatusBar.Font (Page 5313)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

StatusBar.Font (Page 5313)

### Font.Underline

#### Description

The "Underline" property specifies whether the font is underlined.

#### Type

Bool

#### Access

Read-write

#### Syntax

`Font.Underline`

#### See also

StatusBar.Font (Page 5313)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

### See also

StatusBar.Font (Page 5313)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

## Syntax

`StatusBar.Margin`

## See also

[ProcessDiagnosisOverviewControl.StatusBar \(Page 5309\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[StatusBar.Margin \(Page 5317\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`StatusBar.Margin` (Page 5317)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**

Read-write

**Syntax**`Margin.Right`**See also**`StatusBar.Margin` (Page 5317)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**

Read-write

## Syntax

`Margin.Top`

## See also

[StatusBar.Margin \(Page 5317\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

## See also

[ProcessDiagnosisOverviewControl.StatusBar \(Page 5309\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Bottom`**See also**`StatusBar.Padding` (Page 5320)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Left`**See also**`StatusBar.Padding` (Page 5320)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Right`

## See also

[StatusBar.Padding \(Page 5320\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

## See also

[StatusBar.Padding \(Page 5320\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

**Syntax**

```
StatusBar.ShowToolTips
```

**See also**

ProcessDiagnosisOverviewControl.StatusBar (Page 5309)

**StatusBar.Visible****Description**

The "Visible" property specifies whether the information bar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
StatusBar.Visible
```

**See also**

ProcessDiagnosisOverviewControl.StatusBar (Page 5309)

**ProcessDiagnosisOverviewControl.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the process diagnostics overview.

**Type**

String

**Access**

Read-only

### Syntax

`ProcessDiagnosisOverviewControl.StyleItemClass`

### See also

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

## ProcessDiagnosisOverviewControl.TabIndex

### Description

The "TabIndex" property returns the position of the process diagnostics overview in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`ProcessDiagnosisOverviewControl.TabIndex`

### See also

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

## ProcessDiagnosisOverviewControl.ToolBar

### Description

The property "ToolBar" specifies the toolbar of the process diagnostics overview.

### Type

Object, HmiToolBarPart

### Access

Read-write

**Syntax**

```
ProcessDiagnosisOverviewControl.ToolBar
```

**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ToolBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ToolBar.BackColor
```

**See also**

ProcessDiagnosisOverviewControl.ToolBar (Page 5324)

**ToolBar.Elements****Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

**Type**

Object, HmiControlBarElementCollection (Page 5326)

**Access**

Read-only

## Syntax

`ToolBar.Elements`

## See also

[ProcessDiagnosisOverviewControl.ToolBar \(Page 5324\)](#)

[HmiControlBarElementCollection \(Page 5326\)](#)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[ToolBar.Elements \(Page 5325\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

### See also

HmiControlBarElementCollection (Page 5326)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 5328)

## See also

HmiControlBarElementCollection (Page 5326)

Control Bar Elements (Page 5328)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar. You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

#### Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.

- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarButton.Content
```

### See also

ControlBarButton (Page 5328)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ControlBarButton.Content \(Page 5333\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[ControlBarButton.Content \(Page 5333\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarButton.Content \(Page 5333\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 5333\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content \(Page 5333\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

ControlBarButton.Content (Page 5333)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 5333\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 5333\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

[ControlBarButton \(Page 5328\)](#)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

[ControlBarButton \(Page 5328\)](#)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

ControlBarButton (Page 5328)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 5328\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 5328\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarButton.Mapping`

## See also

[ControlBarButton \(Page 5328\)](#)

## ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer distance of the button.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 5328\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ControlBarButton.Margin` (Page 5344)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 5344)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 5344\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 5344\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumHeight
```

**See also**

ControlBarButton (Page 5328)

**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 5328)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarButton.MinimumHeight
```

## See also

ControlBarButton (Page 5328)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.MinimumWidth
```

## See also

ControlBarButton (Page 5328)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarButton.Operability`**See also**[ControlBarButton \(Page 5328\)](#)**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**[ControlBarButton \(Page 5328\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarButton.Padding \(Page 5349\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarButton.Padding \(Page 5349\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 5349\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 5349\)](#)**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarButton.RequireExplicitUnlock`

**See also**

[ControlBarButton \(Page 5328\)](#)

**ControlBarButton.Text**

**Description**

The "Text" property specifies the label of the button.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarButton.Text`

**See also**

[ControlBarButton \(Page 5328\)](#)

**ControlBarButton.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**

ControlBarButton (Page 5328)

**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 5328)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

```
ControlBarButton.Width
```

## See also

ControlBarButton (Page 5328)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

### Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.

- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

```
ControlBarDisplay.Authorization
```

## See also

ControlBarDisplay (Page 5354)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarDisplay.Content
```

## See also

ControlBarDisplay (Page 5354)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

`ControlBarDisplay.Content` (Page 5356)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

`ControlBarDisplay.Content` (Page 5356)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarDisplay.Content](#) (Page 5356)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 5356)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Content.SplitRatio
```

**See also**

ControlBarDisplay.Content (Page 5356)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

`ControlBarDisplay.Content` (Page 5356)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

`ControlBarDisplay.Content` (Page 5356)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[ControlBarDisplay.Content](#) (Page 5356)

**ControlBarDisplay.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay](#) (Page 5354)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 5354\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.ForeColor`

### See also

[ControlBarDisplay \(Page 5354\)](#)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 5354)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.Height
```

### See also

ControlBarDisplay (Page 5354)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarDisplay.Mapping`

## See also

[ControlBarDisplay \(Page 5354\)](#)

## ControlBarDisplay.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 5354\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**[ControlBarDisplay.Margin \(Page 5366\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**[ControlBarDisplay.Margin \(Page 5366\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarDisplay.Margin \(Page 5366\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Top`

## See also

[ControlBarDisplay.Margin \(Page 5366\)](#)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MaximumHeight
```

**See also**

ControlBarDisplay (Page 5354)

**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.MaximumWidth
```

**See also**

ControlBarDisplay (Page 5354)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 5354\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumWidth`

## See also

[ControlBarDisplay \(Page 5354\)](#)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarDisplay.Operability`**See also**

ControlBarDisplay (Page 5354)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 5354)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarDisplay.Padding \(Page 5371\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarDisplay.Padding \(Page 5371\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarDisplay.Padding \(Page 5371\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarDisplay.Padding \(Page 5371\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarDisplay.RequireExplicitUnlock`

**See also**

ControlBarDisplay (Page 5354)

**ControlBarDisplay.Text**

**Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Text`

**See also**

ControlBarDisplay (Page 5354)

**ControlBarDisplay.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 5354)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 5354)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

`ControlBarDisplay.Width`

## See also

ControlBarDisplay (Page 5354)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

### Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarLabel.Authorization`

### See also

[ControlBarLabel \(Page 5376\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarLabel.CustomID`

### See also

[ControlBarLabel \(Page 5376\)](#)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Enabled
```

**See also**

ControlBarLabel (Page 5376)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ForeColor
```

**See also**

ControlBarLabel (Page 5376)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarLabel.Height`

## See also

[ControlBarLabel \(Page 5376\)](#)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.HorizontalTextAlignment`

## See also

[ControlBarLabel \(Page 5376\)](#)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 5376\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

### See also

[ControlBarLabel \(Page 5376\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarLabel.Margin \(Page 5383\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarLabel.Margin \(Page 5383\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarLabel.Margin \(Page 5383\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarLabel.Margin \(Page 5383\)](#)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

### See also

[ControlBarLabel \(Page 5376\)](#)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MaximumWidth
```

### See also

ControlBarLabel (Page 5376)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumHeight
```

### See also

ControlBarLabel (Page 5376)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

### See also

ControlBarLabel (Page 5376)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

## See also

[ControlBarLabel \(Page 5376\)](#)

## ControlBarLabel.Padding

### Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarLabel.Padding
```

## See also

[ControlBarLabel \(Page 5376\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

```
Padding.Bottom
```

**See also**

ControlBarLabel.Padding (Page 5388)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarLabel.Padding (Page 5388)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarLabel.Padding \(Page 5388\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarLabel.Padding \(Page 5388\)](#)

**ControlBarLabel.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarLabel.RequireExplicitUnlock`

**See also**

[ControlBarLabel \(Page 5376\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

[ControlBarLabel \(Page 5376\)](#)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

## See also

ControlBarLabel (Page 5376)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.VerticalTextAlignment`

## See also

ControlBarLabel (Page 5376)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Visible
```

**See also**

ControlBarLabel (Page 5376)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 5376)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

## Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 5393)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 5393)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 5393\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 5393\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

### See also

ControlBarSeparator (Page 5393)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Mapping`

**See also**

[ControlBarSeparator \(Page 5393\)](#)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarSeparator.Margin`

## See also

[ControlBarSeparator \(Page 5393\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarSeparator.Margin \(Page 5399\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarSeparator.Margin` (Page 5399)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarSeparator.Margin` (Page 5399)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarSeparator.Margin \(Page 5399\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MaximumHeight`

## See also

[ControlBarSeparator \(Page 5393\)](#)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarSeparator.MaximumWidth
```

**See also**

ControlBarSeparator (Page 5393)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.MinimumHeight
```

**See also**

ControlBarSeparator (Page 5393)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarSeparator.MinimumWidth
```

## See also

ControlBarSeparator (Page 5393)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

## See also

ControlBarSeparator (Page 5393)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarSeparator.Padding`**See also**

ControlBarSeparator (Page 5393)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarSeparator.Padding (Page 5404)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarSeparator.Padding \(Page 5404\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarSeparator.Padding \(Page 5404\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarSeparator.Padding \(Page 5404\)](#)**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarSeparator.RequireExplicitUnlock`**See also**[ControlBarSeparator \(Page 5393\)](#)**ControlBarSeparator.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ToolTipText`

**See also**

[ControlBarSeparator \(Page 5393\)](#)

**ControlBarSeparator.Visible**

**Description**

The "Visible" property specifies whether the separator is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Visible`

**See also**

[ControlBarSeparator \(Page 5393\)](#)

**ControlBarSeparator.Width**

**Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Width`

**See also**

[ControlBarSeparator \(Page 5393\)](#)

**ControlBarTextBox****Description**

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarTextBoxPart

**Properties**

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.AlternateBorderColor
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarTextBox.Authorization
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarTextBox.Enabled`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.ForeColor`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

## See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin \(Page 5418\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarTextBox.Margin \(Page 5418\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarTextBox.Margin \(Page 5418\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarTextBox.Margin \(Page 5418\)](#)

**ControlBarTextBox.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumHeight`**See also**

ControlBarTextBox (Page 5409)

**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumWidth`**See also**

ControlBarTextBox (Page 5409)

**ControlBarTextBox.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MinimumHeight`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MinimumWidth`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## ControlBarTextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarTextBox.Operability`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 5409\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarTextBox.Padding \(Page 5423\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarTextBox.Padding \(Page 5423\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 5423\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 5423\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.ReadOnly
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

ControlBarTextBox (Page 5409)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

**See also**

[ControlBarTextBox](#) (Page 5409)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Width
```

**See also**

[ControlBarTextBox](#) (Page 5409)

**ControlBarToggleSwitch****Description**

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarToggleSwitchPart

**Properties**

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BackColor
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Badge
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderWidth
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarToggleSwitch.Content (Page 5436)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarToggleSwitch.Content (Page 5436)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 5436\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 5436\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

`ControlBarToggleSwitch.Content` (Page 5436)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

`ControlBarToggleSwitch.Content` (Page 5436)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

`ControlBarToggleSwitch.Content` (Page 5436)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarToggleSwitch.Content](#) (Page 5436)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch](#) (Page 5429)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ForeColor`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.IsAlternateState`

**See also**

ControlBarToggleSwitch (Page 5429)

**ControlBarToggleSwitch.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 5429\)](#)

**ControlBarToggleSwitch.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 5429\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 5447\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarToggleSwitch.Margin \(Page 5447\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarToggleSwitch.Margin \(Page 5447\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarToggleSwitch.Margin \(Page 5447\)](#)**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

ControlBarToggleSwitch (Page 5429)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

ControlBarToggleSwitch (Page 5429)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 5429)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumWidth`**See also**

ControlBarToggleSwitch (Page 5429)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarToggleSwitch.Padding (Page 5452)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarToggleSwitch.Padding (Page 5452)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 5452\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 5452\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 5429)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ToolTipText`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Visible`

### See also

[ControlBarToggleSwitch \(Page 5429\)](#)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Width
```

### See also

ControlBarToggleSwitch (Page 5429)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Enabled
```

### See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5324)

## ToolBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`ToolBar.Font`

### See also

[ProcessDiagnosisOverviewControl.ToolBar \(Page 5324\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

[ToolBar.Font \(Page 5458\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToolBar.Font (Page 5458)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 5458)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ToolBar.Font (Page 5458)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

ToolBar.Font (Page 5458)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

ToolBar.Font (Page 5458)

**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ToolBar.Margin`

**See also**

[ProcessDiagnosisOverviewControl.ToolBar \(Page 5324\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ToolBar.Margin \(Page 5461\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**

ToolBar.Margin (Page 5461)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

ToolBar.Margin (Page 5461)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ToolBar.Margin \(Page 5461\)](#)

## ToolBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ToolBar.Padding`

### See also

[ProcessDiagnosisOverviewControl.ToolBar \(Page 5324\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ToolBar.Padding \(Page 5464\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ToolBar.Padding \(Page 5464\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ToolBar.Padding \(Page 5464\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ToolBar.Padding \(Page 5464\)](#)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

**Access**

Read-write

**Syntax**`ToolBar.ShowToolTips`**See also**

ProcessDiagnosisOverviewControl.ToolBar (Page 5324)

**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.UseHotKeys`**See also**

ProcessDiagnosisOverviewControl.ToolBar (Page 5324)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.Visible`

**See also**

[ProcessDiagnosisOverviewControl.ToolBar \(Page 5324\)](#)

**ProcessDiagnosisOverviewControl.Top**

**Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.Top`

**See also**

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

**ProcessDiagnosisOverviewControl.Visible**

**Description**

The "Visible" property specifies whether the process diagnostics view is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewControl.Visible`**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ProcessDiagnosisOverviewControl.Width****Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisOverviewControl.Width`**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ProcessDiagnosisOverviewControl.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the process diagnostics overview.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`ProcessDiagnosisOverviewControl.WindowFlags`

**See also**

[ProcessDiagnosisOverviewControl \(Page 5249\)](#)

**ProcessDiagnosisOverviewControl.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the process diagnostics overview.

**Syntax**

`ProcessDiagnosisOverviewControl.CheckAuthorization()`

**Parameters**

--

## Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the process diagnostics overview.

### Syntax

```
ProcessDiagnosisOverviewControl.FireCommand(commandId, custom)
```

### Parameters

#### **commandId**

Type: Int32

ID of the element of the toolbar or information bar

#### **custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

## See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ProcessDiagnosisOverviewControl.PropertyFlashing(propertyName,  
enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

ProcessDiagnosisOverviewControl (Page 5249)

**ProcessDiagnosisOverviewControl\_OnActivated()****Description**

The "OnActivated" event occurs when a process diagnostics overview receives the focus:

- A process diagnostics overview is selected via the configured tab sequence.
- A process diagnostics overview that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
ProcessDiagnosisOverviewControl_OnActivated(item)
```

**Context**

**item**

Type: Object

Process diagnostics overview for which the event occurs.

**See also**

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl\_OnAlarmViewButtonTapped()

### Description

The "AlarmViewButtonTapped" event occurs when the "Alarm control" button of the process diagnostics overview is pressed.

### Syntax

```
ProcessDiagnosisOverviewControl_AlarmViewButtonTapped(item)
```

### Context

**item**

Type: Object

Process diagnostics overview for which the event occurs.

### See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the process diagnostics overview.

### Syntax

```
ProcessDiagnosisOverviewControl_OnCommandFired(item, commandId, custom)
```

### Context

**item**

Type: Object

Process diagnostics overview for which the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControllID)

## See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the process diagnostics overview loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
ProcessDiagnosisOverviewControl_OnDeactivated(item)
```

### Context

**item**

Type: Object

Process diagnostics overview for which the event occurs.

## See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisOverviewControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a process diagnostics overview has been successfully initialized and the data connection to the PLC has been established.

## Syntax

`ProcessDiagnosisOverviewControl_OnInitialized(item)`

## Context

### **item**

Type: Object

Process diagnostics overview for which the event occurs.

## See also

ProcessDiagnosisOverviewControl (Page 5249)

## ProcessDiagnosisPlcCodeViewerControl

### Description

The "ProcessDiagnosisPlcCodeViewerControl" object is a PLC code view of the current program status of user programs that have been programmed in the GRAPH programming language.

### Object type

HmiProcessDiagnosisPlcCodeViewerControl

### Properties

The "ProcessDiagnosisPlcCodeViewerControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the PLC code view.
- **CurrentZoomFactor**  
Specifies the zoom factor of the PLC code view.
- **Enabled**  
Specifies whether the PLC code view can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the PLC code view.

- **Layer**  
Returns the screen layer in which the PLC code view is located.
- **Left**  
Specifies the value of the X coordinate.
- **LineColors**  
Returns the line colors.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the PLC code view.
- **OverviewDetailRatio**  
Specifies how much space the detail view takes up in the PLC code view.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the PLC code view was created.
- **ShowFocusVisual**  
Specifies whether the PLC code view is highlighted when in focus.
- **ShowSymbolLine**  
Specifies whether the symbol line is displayed.
- **StatusBar**  
Specifies the information bar of the PLC code view.
- **StyleItemClass**  
Returns the style which is applied to the PLC code view.
- **SymbolLineBackColor**  
Specifies the background color of the symbol line.
- **SymbolLineFont**  
Specifies the font of the text in the symbol line.
- **SymbolLineForeColor**  
Specifies the text font color of the symbol line.
- **TabIndex**  
Returns the position of the PLC code view in the tab sequence.
- **ToolBar**  
Specifies the toolbar of the PLC code view.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the PLC code view is visible.
- **Width**  
Specifies the width of the PLC code view.
- **WindowFlags**  
Specifies the window configuration of the PLC code view.

## Methods

The "ProcessDiagnosisPlcCodeViewerControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the PLC code view.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the PLC code view.
- **Next()**  
Navigates to the next network.
- **OpenCodeViewerFromAlarm()**  
Opens the associated block of the selection in the alarm control in the PLC code view.
- **OpenGRAPHDetails()**  
Opens the GRAPH details of a PLC in the PLC code view.
- **OpenGRAPHDetailsByConnectionName()**  
Opens the GRAPH details of a connection in the PLC code view.
- **OpenProDiagDetailsFB()**  
Displays the upstream connection of a network input of a standard block in the PLC code view.
- **OpenProDiagDetailsFC()**  
Displays the upstream connection of a network input of a standard block, taking the UDT instance into consideration, in the PLC code view.
- **OpenProDiagDetailsNetwork()**  
Displays the assignment to an operand and its upstream connection in the PLC code view.
- **Previous()**  
Navigates to the previous network.
- **PropertyFlashing()**  
Configures flashing of a property.
- **ResetToConfiguration()**  
Executes the "ResetToConfiguration" command of the PLC code view.
- **ToggleCriteriaAnalysis()**  
Executes the "Toggle criteria analysis" command of the PLC code view.
- **ToggleGRAPHViewerMode()**  
Executes the "Toggle GRAPH mode" command of the PLC code view.
- **ToggleNetworkDisplay()**  
Executes the "Toggle detail view" command of the PLC code view.
- **ZoomIn()**  
Executes the "Zoom in" command of the PLC code view.
- **ZoomOut()**  
Executes the "Zoom out" command of the PLC code view.

## Events

The "ProcessDiagnosisPlcCodeViewerControl" object has the following events:

- **OnActivated()**  
Occurs when a PLC code view receives the focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the PLC code view.
- **OnDeactivated()**  
Occurs when a PLC code view loses the focus.
- **OnInitialized()**  
Occurs when a PLC code view has been successfully initialized and the data connection to the PLC has been established.

## ProcessDiagnosisPlcCodeViewerControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.BackColor
```

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.Caption

### Description

The "Caption" property specifies the text to be displayed in the title bar.

### Type

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.Caption`

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

ProcessDiagnosisPlcCodeViewerControl.Caption (Page 5479)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

Text.Font (Page 5480)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

Text.Font (Page 5480)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

### Access

Read-write

### Syntax

`Font.Size`

### See also

[Text.Font \(Page 5480\)](#)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[Text.Font \(Page 5480\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

Text.Font (Page 5480)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**

Text.Font (Page 5480)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Text.ForeColor
```

### See also

ProcessDiagnosisPlcCodeViewerControl.Caption (Page 5479)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

```
Text.Text
```

### See also

ProcessDiagnosisPlcCodeViewerControl.Caption (Page 5479)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

`ProcessDiagnosisPlcCodeViewerControl.Caption` (Page 5479)

**ProcessDiagnosisPlcCodeViewerControl.CaptionColor****Description**

The "CaptionColor" property specifies the background color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.CaptionColor`

**See also**

`ProcessDiagnosisPlcCodeViewerControl` (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the PLC code view.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`ProcessDiagnosisPlcCodeViewerControl.CurrentQuality`

### See also

[ProcessDiagnosisPlcCodeViewerControl \(Page 5476\)](#)

## ProcessDiagnosisPlcCodeViewerControl.CurrentZoomFactor

### Description

The "CurrentZoomFactor" property specifies the zoom factor of the PLC code view. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

### Type

Float

**Access**

Read-write

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.CurrentZoomFactor`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.Enabled****Description**

The "Enabled" property specifies whether the PLC code view can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.Enabled`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.Height****Description**

The "Height" property specifies the height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.Height`

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.Icon**

**Description**

The "Icon" property specifies the icon of the PLC code view.

**Type**

String

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.Icon`

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.Layer**

**Description**

The "Layer" property returns the screen layer in which the PLC code view is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.Layer
```

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Layer.MaximumZoom
```

**See also**

ProcessDiagnosisPlcCodeViewerControl.Layer (Page 5488)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

## Syntax

`Layer.MinimumZoom`

## See also

[ProcessDiagnosisPlcCodeViewerControl.Layer \(Page 5488\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

## Syntax

`Layer.Name`

## See also

[ProcessDiagnosisPlcCodeViewerControl.Layer \(Page 5488\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

**Syntax**

```
Layer.Visible
```

**See also**

ProcessDiagnosisPlcCodeViewerControl.Layer (Page 5488)

**ProcessDiagnosisPlcCodeViewerControl.Left****Description**

The "Left" property specifies the value of the X coordinate.

**Type**

```
Int32
```

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.Left
```

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.LineColors****Description**

The "LineColors" property returns the line colors.

**Type**

```
Object, HmiLineColorPart
```

**Access**

Read-only

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.LineColors
```

## See also

[ProcessDiagnosisPlcCodeViewerControl](#) (Page 5476)

## LineColor.ActiveLine

### Description

The "ActiveLine" property returns the active line.

### Type

UInt32

### Access

Read-only

### Syntax

```
LineColor.ActiveLine
```

## See also

[ProcessDiagnosisPlcCodeViewerControl.LineColors](#) (Page 5491)

## LineColor.InactiveLine

### Description

The "InactiveLine" property returns the inactive line.

### Type

UInt32

### Access

Read-only

### Syntax

```
LineColor.InactiveLine
```

**See also**

ProcessDiagnosisPlcCodeViewerControl.LineColors (Page 5491)

**LineColor.NormalLine****Description**

The "NormalLine" property returns the normal line.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
LineColor.NormalLine
```

**See also**

ProcessDiagnosisPlcCodeViewerControl.LineColors (Page 5491)

**ProcessDiagnosisPlcCodeViewerControl.Margin****Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.Margin
```

### See also

[ProcessDiagnosisPlcCodeViewerControl \(Page 5476\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ProcessDiagnosisPlcCodeViewerControl.Margin \(Page 5493\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

**See also**

ProcessDiagnosisPlcCodeViewerControl.Margin (Page 5493)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

ProcessDiagnosisPlcCodeViewerControl.Margin (Page 5493)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

### See also

[ProcessDiagnosisPlcCodeViewerControl.Margin \(Page 5493\)](#)

## ProcessDiagnosisPlcCodeViewerControl.Name

### Description

The "Name" property returns the name of the PLC code view.

### Type

String

### Access

Read-only

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Name
```

### See also

[ProcessDiagnosisPlcCodeViewerControl \(Page 5476\)](#)

## ProcessDiagnosisPlcCodeViewerControl.OverviewDetailRatio

### Description

The "OverviewDetailRatio" property specifies how much space the detail view takes up in the PLC code view.

### Type

Float

### Access

Read-write

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OverviewDetailRatio
```

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 5497)

**Access**

Read-only

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.Parent
```

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

Screen Items (Page 5497)

**Screen Items****Description**

Screen Items (Page 1742)

**ProcessDiagnosisPlcCodeViewerControl.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the PLC code view was created.

**Type**

String

**Access**

Read-only

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.RenderingTemplate`

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the PLC code view is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.ShowFocusVisual`

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.ShowSymbolLine**

**Description**

The "ShowSymbolLine" property specifies whether the symbol line is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.ShowSymbolLine`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.StatusBar****Description**

The "StatusBar" property specifies the information bar.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.StatusBar`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**StatusBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
StatusBar.BackColor
```

## See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5499)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 5500)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

## See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5499)

HmiControlBarElementCollection (Page 5500)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

**Object type**

HmiControlBarElementCollection

**Properties**

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

**Methods**

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

**See also**

StatusBar.Elements (Page 5500)

**HmiControlBarElementCollection.Count****Description**

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
HmiControlBarElementCollection.Count
```

**See also**

HmiControlBarElementCollection (Page 5500)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

#### **HmiControlBarElementName**

Type: String

Name of the element

### Return value

Object, HmiControlBarElementPartBase (Page 5502)

### See also

HmiControlBarElementCollection (Page 5500)

Control Bar Elements (Page 5502)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

HmiControlBarElementCollection (Page 5500)

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.AlternateBackColor`

## See also

ControlBarButton (Page 5502)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarButton.Content`

### See also

[ControlBarButton](#) (Page 5502)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarButton.Content (Page 5508)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarButton.Content (Page 5508)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 5508\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 5508\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content](#) (Page 5508)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarButton.Content \(Page 5508\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 5508\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarButton.Content](#) (Page 5508)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

[ControlBarButton](#) (Page 5502)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.Height
```

### See also

ControlBarButton (Page 5502)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

ControlBarButton (Page 5502)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarButton.Mapping`

#### See also

[ControlBarButton \(Page 5502\)](#)

### ControlBarButton.Margin

#### Description

The "Margin" property specifies the surrounded outer distance of the button.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**

```
ControlBarButton.Margin
```

**See also**

ControlBarButton (Page 5502)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Margin.Bottom
```

**See also**

ControlBarButton.Margin (Page 5518)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Left`

## See also

[ControlBarButton.Margin \(Page 5518\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 5518\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarButton.Margin` (Page 5518)**ControlBarButton.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarButton.MaximumHeight`**See also**`ControlBarButton` (Page 5502)**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarButton.MaximumWidth`

## See also

[ControlBarButton \(Page 5502\)](#)

## ControlBarButton.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MinimumHeight`

## See also

[ControlBarButton \(Page 5502\)](#)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MinimumWidth
```

**See also**

ControlBarButton (Page 5502)

**ControlBarButton.Operability****Description**

The "Operability" property returns whether the button is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarButton.Operability
```

**See also**

ControlBarButton (Page 5502)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarButton.Padding`

### See also

[ControlBarButton \(Page 5502\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarButton.Padding \(Page 5523\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarButton.Padding \(Page 5523\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 5523\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarButton.Padding \(Page 5523\)](#)

## ControlBarButton.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarButton.RequireExplicitUnlock`

### See also

[ControlBarButton \(Page 5502\)](#)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarButton.Text`**See also**[ControlBarButton \(Page 5502\)](#)**ControlBarButton.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**[ControlBarButton \(Page 5502\)](#)**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 5502\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 5502\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

### Methods

--

### See also

HmiControlBarElementCollection (Page 5500)

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

ControlBarDisplay (Page 5528)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Content`

**See also**

`ControlBarDisplay` (Page 5528)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

`ControlBarDisplay.Content` (Page 5530)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

## Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

## Access

Read-write

## Syntax

`Content.GraphicStretchMode`

## See also

`ControlBarDisplay.Content` (Page 5530)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

## Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

## Access

Read-write

**Syntax**

```
Content.HorizontalTextAlignment
```

**See also**

ControlBarDisplay.Content (Page 5530)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Content.Spacing
```

**See also**

ControlBarDisplay.Content (Page 5530)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

## Syntax

`Content.SplitRatio`

## See also

[ControlBarDisplay.Content \(Page 5530\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

## See also

[ControlBarDisplay.Content \(Page 5530\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarDisplay.Content (Page 5530)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.VerticalTextAlignment
```

**See also**

[ControlBarDisplay.Content](#) (Page 5530)

**ControlBarDisplay.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay](#) (Page 5528)

**ControlBarDisplay.Enabled**

**Description**

The "Enabled" property specifies whether the display is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Enabled`

**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.ForeColor
```

**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.Graphic****Description**

The "Graphic" property specifies the graphic of the display.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.Graphic
```

## See also

ControlBarDisplay (Page 5528)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

## See also

ControlBarDisplay (Page 5528)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment

- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms

- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarDisplay.Mapping`

### See also

[ControlBarDisplay \(Page 5528\)](#)

## ControlBarDisplay.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Margin`**See also**

ControlBarDisplay (Page 5528)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

ControlBarDisplay.Margin (Page 5540)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarDisplay.Margin \(Page 5540\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarDisplay.Margin \(Page 5540\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarDisplay.Margin \(Page 5540\)](#)**ControlBarDisplay.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.MaximumHeight`**See also**[ControlBarDisplay \(Page 5528\)](#)**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.MaximumWidth`

**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.MinimumHeight`

**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.MinimumWidth`

**See also**

[ControlBarDisplay \(Page 5528\)](#)

**ControlBarDisplay.Operability****Description**

The "Operability" property returns whether the display is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarDisplay.Operability`

**See also**

[ControlBarDisplay \(Page 5528\)](#)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Padding`

**See also**

[ControlBarDisplay \(Page 5528\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarDisplay.Padding \(Page 5545\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

ControlBarDisplay.Padding (Page 5545)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarDisplay.Padding (Page 5545)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarDisplay.Padding (Page 5545)

**ControlBarDisplay.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarDisplay.RequireExplicitUnlock

**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.Text**

**Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.Text`**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Visible`

**See also**

ControlBarDisplay (Page 5528)

**ControlBarDisplay.Width**

**Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Width`

**See also**

ControlBarDisplay (Page 5528)

**ControlBarLabel**

**Description**

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

## Object type

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiControlBarElementCollection (Page 5500)

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarLabel.Authorization
```

## See also

ControlBarLabel (Page 5550)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**`ControlBarLabel.CustomID`**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.Enabled****Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Enabled`**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.ForeColor`

**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.Height**

**Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.Height`

**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

## Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

## Access

Read-write

## Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

## See also

ControlBarLabel (Page 5550)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

## Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarLabel.Mapping`

**See also**

[ControlBarLabel \(Page 5550\)](#)

**ControlBarLabel.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the identifier.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarLabel.Margin`

## See also

[ControlBarLabel \(Page 5550\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarLabel.Margin \(Page 5557\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarLabel.Margin` (Page 5557)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarLabel.Margin` (Page 5557)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

`ControlBarLabel.Margin` (Page 5557)

## **ControlBarLabel.MaximumHeight**

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

## See also

`ControlBarLabel` (Page 5550)

## **ControlBarLabel.MaximumWidth**

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarLabel.MaximumWidth
```

**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MinimumHeight
```

**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarLabel.MinimumWidth
```

## See also

ControlBarLabel (Page 5550)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

## See also

ControlBarLabel (Page 5550)

## ControlBarLabel.Padding

### Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarLabel.Padding`**See also**[ControlBarLabel \(Page 5550\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**[ControlBarLabel.Padding \(Page 5562\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarLabel.Padding \(Page 5562\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarLabel.Padding \(Page 5562\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarLabel.Padding \(Page 5562\)](#)**ControlBarLabel.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarLabel.RequireExplicitUnlock`**See also**[ControlBarLabel \(Page 5550\)](#)**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarLabel.Text`

**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarLabel.ToolTipText`

**See also**

ControlBarLabel (Page 5550)

**ControlBarLabel.VerticalTextAlignment**

**Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.VerticalTextAlignment
```

### See also

[ControlBarLabel \(Page 5550\)](#)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarLabel.Visible
```

### See also

[ControlBarLabel \(Page 5550\)](#)

## ControlBarLabel.Width

### Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.Width
```

### See also

ControlBarLabel (Page 5550)

## ControlBarSeparator

### Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarSeparatorPart

### Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

HmiControlBarElementCollection (Page 5500)

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Authorization`

**See also**

[ControlBarSeparator \(Page 5568\)](#)

**ControlBarSeparator.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarSeparator.CustomID`

**See also**

[ControlBarSeparator \(Page 5568\)](#)

**ControlBarSeparator.Enabled**

**Description**

The "Enabled" property specifies whether the separator is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarSeparator.Enabled`**See also**

ControlBarSeparator (Page 5568)

**ControlBarSeparator.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.ForeColor`**See also**

ControlBarSeparator (Page 5568)

**ControlBarSeparator.Height****Description**

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Height`

### See also

[ControlBarSeparator \(Page 5568\)](#)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line

- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time

- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarSeparator.Mapping`

[ControlBarSeparator \(Page 5568\)](#)

## ControlBarSeparator.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the separator.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Margin`

### See also

[ControlBarSeparator \(Page 5568\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Bottom

### See also

ControlBarSeparator.Margin (Page 5574)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

ControlBarSeparator.Margin (Page 5574)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarSeparator.Margin \(Page 5574\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarSeparator.Margin \(Page 5574\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.MaximumHeight
```

### See also

ControlBarSeparator (Page 5568)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.MaximumWidth
```

### See also

ControlBarSeparator (Page 5568)

## ControlBarSeparator.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumHeight`

### See also

[ControlBarSeparator \(Page 5568\)](#)

## ControlBarSeparator.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumWidth`

### See also

[ControlBarSeparator \(Page 5568\)](#)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

### See also

[ControlBarSeparator \(Page 5568\)](#)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarSeparator.Padding
```

### See also

[ControlBarSeparator](#) (Page 5568)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarSeparator.Padding](#) (Page 5579)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

**See also**

[ControlBarSeparator.Padding](#) (Page 5579)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarSeparator.Padding](#) (Page 5579)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarSeparator.Padding \(Page 5579\)](#)

**ControlBarSeparator.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarSeparator.RequireExplicitUnlock`

**See also**

[ControlBarSeparator \(Page 5568\)](#)

**ControlBarSeparator.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ToolTipText`

**See also**

ControlBarSeparator (Page 5568)

**ControlBarSeparator.Visible****Description**

The "Visible" property specifies whether the separator is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

ControlBarSeparator.Visible

**See also**

ControlBarSeparator (Page 5568)

**ControlBarSeparator.Width****Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

ControlBarSeparator.Width

## See also

ControlBarSeparator (Page 5568)

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar. You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.

- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.AlternateBorderColor`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.Authorization**

**Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ControlBarTextBox.Authorization`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.BackColor`**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.BorderColor`**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`ControlBarTextBox.BorderWidth`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarTextBox.CustomID`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.Enabled**

**Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarTextBox.Enabled`**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.ForeColor`**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.Height****Description**

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Height`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`ControlBarTextBox.HorizontalTextAlignment`

**See also**

ControlBarTextBox (Page 5584)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

**Syntax**

```
ControlBarTextBox.Mapping
```

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the text box.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Margin
```

**See also**

ControlBarTextBox (Page 5584)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Bottom`

## See also

[ControlBarTextBox.Margin \(Page 5593\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

## See also

[ControlBarTextBox.Margin \(Page 5593\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**`ControlBarTextBox.Margin` (Page 5593)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**`ControlBarTextBox.Margin` (Page 5593)**ControlBarTextBox.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`

## Syntax

```
ControlBarTextBox.MaximumHeight
```

## See also

ControlBarTextBox (Page 5584)

## ControlBarTextBox.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MaximumWidth
```

## See also

ControlBarTextBox (Page 5584)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.MinimumHeight
```

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.MinimumWidth
```

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.Operability****Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarTextBox.Operability`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Padding`

**See also**

ControlBarTextBox (Page 5584)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarTextBox.Padding \(Page 5598\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarTextBox.Padding \(Page 5598\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 5598\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 5598\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

**Access**

Read-write

**Syntax**`ControlBarTextBox.ReadOnly`**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarTextBox.RequireExplicitUnlock`**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.Text****Description**

The "Text" property specifies the label of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Text`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ToolTipText`

**See also**

ControlBarTextBox (Page 5584)

**ControlBarTextBox.VerticalTextAlignment**

**Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

[ControlBarTextBox \(Page 5584\)](#)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

### See also

[ControlBarTextBox \(Page 5584\)](#)

## ControlBarTextBox.Width

### Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Width
```

### See also

ControlBarTextBox (Page 5584)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.

- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.

- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

### Methods

--

### See also

HmiControlBarElementCollection (Page 5500)

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateBackColor`

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BackColor
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Badge
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BorderColor`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BorderWidth`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

ControlBarToggleSwitch.Content

### See also

ControlBarToggleSwitch (Page 5604)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

Content.ContentMode

## See also

ControlBarToggleSwitch.Content (Page 5611)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarToggleSwitch.Content (Page 5611)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.HorizontalTextAlignment
```

**See also**

[ControlBarToggleSwitch.Content \(Page 5611\)](#)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Content.Spacing
```

**See also**

[ControlBarToggleSwitch.Content \(Page 5611\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 5611\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarToggleSwitch.Content (Page 5611)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarToggleSwitch.Content (Page 5611)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarToggleSwitch.Content \(Page 5611\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ForeColor`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Graphic`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Height`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

```
Button.HotKey
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

## See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 5604\)](#)

**ControlBarToggleSwitch.Margin**

**Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 5604\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

`ControlBarToggleSwitch.Margin` (Page 5622)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

`ControlBarToggleSwitch.Margin` (Page 5622)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarToggleSwitch.Margin \(Page 5622\)](#)

### Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarToggleSwitch.Margin \(Page 5622\)](#)

### ControlBarToggleSwitch.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumHeight`**See also**

ControlBarToggleSwitch (Page 5604)

**ControlBarToggleSwitch.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumWidth`**See also**

ControlBarToggleSwitch (Page 5604)

**ControlBarToggleSwitch.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumHeight`

**See also**

[ControlBarToggleSwitch \(Page 5604\)](#)

**ControlBarToggleSwitch.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumWidth`

**See also**

[ControlBarToggleSwitch \(Page 5604\)](#)

**ControlBarToggleSwitch.Operability**

**Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarToggleSwitch.Padding \(Page 5627\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarToggleSwitch.Padding \(Page 5627\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Right

### See also

ControlBarToggleSwitch.Padding (Page 5627)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Top

### See also

ControlBarToggleSwitch.Padding (Page 5627)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ToolTipText
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Visible
```

### See also

ControlBarToggleSwitch (Page 5604)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Width`

### See also

[ControlBarToggleSwitch \(Page 5604\)](#)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.Enabled`

### See also

[ProcessDiagnosisPlcCodeViewerControl.StatusBar \(Page 5499\)](#)

## StatusBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
StatusBar.Font
```

### See also

[ProcessDiagnosisPlcCodeViewerControl.StatusBar \(Page 5499\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

[StatusBar.Font \(Page 5633\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

StatusBar.Font (Page 5633)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

StatusBar.Font (Page 5633)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

StatusBar.Font (Page 5633)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

## See also

StatusBar.Font (Page 5633)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

## See also

StatusBar.Font (Page 5633)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`StatusBar.Margin`**See also**[ProcessDiagnosisPlcCodeViewerControl.StatusBar \(Page 5499\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**[StatusBar.Margin \(Page 5636\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

StatusBar.Margin (Page 5636)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

StatusBar.Margin (Page 5636)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[StatusBar.Margin \(Page 5636\)](#)**StatusBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the information bar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`StatusBar.Padding`**See also**[ProcessDiagnosisPlcCodeViewerControl.StatusBar \(Page 5499\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

StatusBar.Padding (Page 5639)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

StatusBar.Padding (Page 5639)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

StatusBar.Padding (Page 5639)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**

StatusBar.Padding (Page 5639)

**StatusBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**

Bool

### Access

Read-write

### Syntax

```
StatusBar.ShowToolTips
```

### See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5499)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.Visible
```

### See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5499)

## ProcessDiagnosisPlcCodeViewerControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the PLC code view.

### Type

String

**Access**

Read-only

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.StyleItemClass`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.SymbolLineColor****Description**

The "SymbolLineColor" property specifies the background color of the symbol line.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.SymbolLineColor`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont****Description**

The "SymbolLineFont" property specifies the font of the text in the symbol line.

**Type**

Object, HmiFontPart

**Access**

Read-write

## Syntax

`ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont`

## See also

[ProcessDiagnosisPlcCodeViewerControl \(Page 5476\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

## See also

[ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont \(Page 5643\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

**Syntax**`Font.Name`**See also**[ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont \(Page 5643\)](#)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**`Float`**Access**`Read-write`**Syntax**`Font.Size`**See also**[ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont \(Page 5643\)](#)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**`Int32, HmiFontStrikeOut`

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5643)

**Font.Underline**

**Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5643)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont](#) (Page 5643)

**ProcessDiagnosisPlcCodeViewerControl.SymbolLineForeColor****Description**

The "SymbolLineForeColor" property specifies the text font color of the symbol line.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.SymbolLineForeColor`

**See also**

[ProcessDiagnosisPlcCodeViewerControl](#) (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.TabIndex

### Description

The "TabIndex" property returns the position of the PLC code view in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.TabIndex
```

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the PLC code view.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ToolBar
```

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ToolBar.BackColor
```

### See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5648)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 5650)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5648)

HmiControlBarElementCollection (Page 5650)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

### See also

[ToolBar.Elements](#) (Page 5649)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

**Access**

Read-only

**Syntax**`HmiControlBarElementCollection.Count`**See also**

HmiControlBarElementCollection (Page 5650)

**HmiControlBarElementCollection.Item()****Description**

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

**Syntax**`HmiControlBarElementCollection[.Item] (HmiControlBarElementName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

**Parameters****HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 5652)

**See also**

HmiControlBarElementCollection (Page 5650)

Control Bar Elements (Page 5652)

## Control Bar Elements

### Description

Control Bar Elements (Page 5502)

### ToolBar.Enabled

#### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

#### Type

Bool

#### Access

Read-write

#### Syntax

`ToolBar.Enabled`

#### See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5648)

### ToolBar.Font

#### Description

The "Font" property specifies the font of the text.

#### Type

Object, HmiFontPart

#### Access

Read-write

#### Syntax

`ToolBar.Font`

**See also**

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5648)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

ToolBar.Font (Page 5652)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

ToolBar.Font (Page 5652)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 5652)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

ToolBar.Font (Page 5652)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
Font.Underline
```

**See also**

ToolBar.Font (Page 5652)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[ToolBar.Font \(Page 5652\)](#)

## ToolBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ToolBar.Margin`

### See also

[ProcessDiagnosisPlcCodeViewerControl.ToolBar \(Page 5648\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

ToolBar.Margin (Page 5656)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**

ToolBar.Margin (Page 5656)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ToolBar.Margin \(Page 5656\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ToolBar.Margin \(Page 5656\)](#)

**ToolBar.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ToolBar.Padding`

**See also**

[ProcessDiagnosisPlcCodeViewerControl.ToolBar \(Page 5648\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ToolBar.Padding \(Page 5658\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ToolBar.Padding \(Page 5658\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ToolBar.Padding \(Page 5658\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**

ToolBar.Padding (Page 5658)

**ToolBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.ShowToolTips`**See also**

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5648)

**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.UseHotKeys`

**See also**

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5648)

**ToolBar.Visible**

**Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.Visible`

**See also**

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5648)

**ProcessDiagnosisPlcCodeViewerControl.Top**

**Description**

The "Top" property specifies the value of the Y coordinate.

**Type**

Int32

**Access**

Read-write

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.Top`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.Visible****Description**

The "Visible" property specifies whether the PLC code view is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ProcessDiagnosisPlcCodeViewerControl.Visible`**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.Width****Description**

The "Width" property specifies the width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.Width`

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.WindowFlags**

**Description**

The "WindowFlags" property specifies the window configuration of the system PLC code view.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`ProcessDiagnosisPlcCodeViewerControl.WindowFlags`

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the PLC code view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.FireCommand()****Description**

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the PLC code view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.FireCommand(commandId, custom)
```

## Parameters

### **commandId**

Type: Int32

ID of the element of the toolbar or information bar

### **custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## Return value

--

## See also

[ProcessDiagnosisPlcCodeViewerControl](#) (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.Next()

## Description

The "Next" method navigates to the next network.

## Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Next()
```

## Parameters

--

## Return value

--

## See also

[ProcessDiagnosisPlcCodeViewerControl](#) (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.OpenCodeViewerFromAlarm()

### Description

The "OpenCodeViewerFromAlarm" method opens the associated block of the alarm selected in the alarm control in the PLC code view.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenCodeViewerFromAlarm(HmiConnectionName, CpuAlarmID, TextlistIndex)
```

### Parameters

**HmiConnectionName**

Type: String

Connection name

**CpuAlarmID**

Type: Object, HMIUint64

ID of the CPU alarm

**TextlistIndex**

Type: Object, HMIUint64

Index of the text list

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetails()

### Description

The "OpenGRAPHDetails" method opens the GRAPH details of a PLC in the PLC code view.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetails(PlcName, Block, StepNumber)
```

## Parameters

### **PlcName**

Type: String

Name of the PLC

### **Block**

Type: String

Name of the block

### **StepNumber**

Type: UInt16

Step number

## Return value

--

## See also

[ProcessDiagnosisPlcCodeViewerControl](#) (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetailsByConnectionName()

## Description

The "OpenGRAPHDetailsByConnectionName" method opens the GRAPH details of a connection in the PLC code view.

## Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetailsByConnectionName(HmiConnectionName, Block, StepNumber)
```

## Parameters

### **HmiConnectionName**

Type: String

Connection name

### **Block**

Type: String

Name of the block

**StepNumber**

Type: UInt16

Step number

**Return value**

--

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFB()****Description**

The "OpenProDiagDetailsFB" method displays the upstream connection of a network input of a standard block in the PLC code view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFB(PlcName,  
ContainingBlock, CallBlock, Pin, PinSubstringSearch)
```

**Parameters****PlcName**

Type: String

Name of the PLC

**ContainingBlock**

Type: String

Name of the contained block that is to be opened and displayed.

**CallBlock**

Type: String

Name of the called block

**Pin**

Type: String

Name of the input pin of the "CallBlock".

**PinSubstringSearch**

Type: Bool

Specifies whether the pin name starts with the transferred pin parameter.

- True: Pin name starts with the transferred pin parameter.
- False: Pin name must be the same as the pin parameter.

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFC()

### Description

The "OpenProDiagDetailsFC" method displays the upstream connection of a network input of a standard block, taking the UDT instance into consideration, in the PLC code view.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFC(PlcName,  
ContainingBlock, CallBlock, Pin, UdtInstance, PinSubstringSearch)
```

### Parameters

#### **PlcName**

Type: String

Name of the PLC

#### **ContainingBlock**

Type: String

Name of the contained block that is to be opened and displayed.

#### **CallBlock**

Type: String

Name of the called block

#### **Pin**

Type: String

Name of the input pin of the "CallBlock".

#### **UdtInstance**

Type: String

UDT instance that is used to limit the display of FCs called multiple times.

**PinSubstringSearch**

Type: Bool

Specifies whether the pin name starts with the transferred pin parameter.

- True: Pin name starts with the transferred pin parameter.
- False: Pin name must be the same as the pin parameter.

**Return value**

--

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsNetwork()****Description**

The "OpenProDiagDetailsNetwork" method displays the assignment to an operand and its upstream connection in the PLC code view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsNetwork(PlcName, ContainingBlock, Operand)
```

**Parameters****PlcName**

Type: String

Name of the PLC

**ContainingBlock**

Type: String

Name of the contained block that is to be opened and displayed.

**Operand**

Type: String

Name of an operand to which an assignment is made.

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.Previous()

### Description

The "Previous" method navigates to the previous network.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Previous()
```

### Parameters

--

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.PropertyFlashing(propertyName,  
enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.ResetToConfiguration()****Description**

The "ResetToConfiguration" method executes the "ResetToConfiguration" command of the PLC code view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.ResetToConfiguration()
```

### Parameters

--

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.ToggleCriteriaAnalysis()

### Description

The "ToggleCriteriaAnalysis" method executes the "Toggle criteria analysis" command and switches to the criteria analysis control of the PLC code view.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ToggleCriteriaAnalysis()
```

### Parameters

--

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.ToggleGRAPHViewerMode()

### Description

The "ToggleGRAPHViewerMode" method executes the "Toggle GRAPH mode" command of the PLC code view and toggles the Graph mode between manual step selection and automatic selection of the active step.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ToggleGRAPHViewerMode()
```

**Parameters**

--

**Return value**

--

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.ToggleNetworkDisplay()****Description**

The "ToggleNetworkDisplay" method executes the "Toggle detail view" command of the PLC code view and toggles between steps and transitions in the detail view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.ToggleNetworkDisplay()
```

**Parameters**

--

**Return value**

--

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl.ZoomIn()****Description**

The "ZoomIn" method executes the "Zoom in" command of the PLC code view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl.ZoomIn()
```

### Parameters

--

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl.ZoomOut()

### Description

The "ZoomOut" method executes the "Zoom out" command of the PLC code view.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ZoomOut()
```

### Parameters

--

### Return value

--

### See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl\_OnActivated()

### Description

The "OnActivated" event occurs when a PLC code view receives the focus:

- A PLC code view is selected via the configured tab sequence.
- A PLC code view that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl_OnActivated(item)
```

**Context****item**

Type: Object

PLC code view for which the event occurs.

**See also**

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

**ProcessDiagnosisPlcCodeViewerControl\_OnCommandFired()****Description**

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the PLC code view.

**Syntax**

```
ProcessDiagnosisPlcCodeViewerControl_OnCommandFired(item,  
commandId, custom)
```

**Context****item**

Type: Object

PLC code view for which the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControllID)

## See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the PLC code view loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl_OnDeactivated(item)
```

### Context

**item**

Type: Object

PLC code view for which the event occurs.

## See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## ProcessDiagnosisPlcCodeViewerControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a PLC code view has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
ProcessDiagnosisPlcCodeViewerControl_OnInitialized(item)
```

## Context

### **item**

Type: Object

PLC code view for which the event occurs.

## See also

ProcessDiagnosisPlcCodeViewerControl (Page 5476)

## RadioButtonGroup

### Description

The "RadioButtonGroup" object represents an option button in runtime.

### Object type

HmiRadioButtonGroup

### Properties

The "RadioButtonGroup" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **Content**  
Specifies the display options for text and graphics.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the option button.
- **Enabled**  
Specifies whether the option button can be operated in runtime.
- **Font**  
Specifies the font of the text.

- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the option button is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the option button.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the option button is operable.
- **Padding**  
Specifies the distance of the content from the border of the option button.
- **Parent**  
Returns the higher-level screen object.
- **ProcessValue**  
Specifies the process value.
- **RenderingTemplate**  
Returns the name of the template from which the option button was created.
- **RequireExplicitUnlock**  
Returns whether the option button is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the option button rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**  
Specifies the height of the option button entries.
- **SelectionItems**  
Returns the list of all option button entries.
- **SelectorPosition**  
Specifies the horizontal alignment of the option button entries.

- **ShowFocusVisual**  
Specifies whether the option button is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the option button.
- **TabIndex**  
Returns the position of the option button in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the option button is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "RadioButtonGroup" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the option button.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "RadioButtonGroup" object has the following events:

- **OnActivated()**  
Occurs when an option button receives focus.
- **OnContextTapped()**  
Occurs when an option button is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when an option button loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the option button is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the option button is in focus.
- **OnTapped()**  
Occurs when an option button is left-clicked or short-touched.

## RadioButtonGroup.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`RadioButtonGroup.AlternateBackColor`

### See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`RadioButtonGroup.AlternateBorderColor`

### See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
RadioButtonGroup.Authorization
```

### See also

RadioButtonGroup (Page 5679)

## RadioButtonGroup.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
RadioButtonGroup.BackColor
```

### See also

RadioButtonGroup (Page 5679)

## RadioButtonGroup.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`RadioButtonGroup.BorderColor`

### See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`RadioButtonGroup.BorderWidth`

### See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.Content

### Description

The "Content" property specifies the display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`RadioButtonGroup.Content`

### See also

[RadioButtonGroup](#) (Page 5679)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

[RadioButtonGroup.Content \(Page 5685\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

```
Content.GraphicStretchMode
```

## See also

[RadioButtonGroup.Content \(Page 5685\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[RadioButtonGroup.Content \(Page 5685\)](#)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

[RadioButtonGroup.Content \(Page 5685\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[RadioButtonGroup.Content \(Page 5685\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

RadioButtonGroup.Content (Page 5685)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

RadioButtonGroup.Content (Page 5685)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[RadioButtonGroup.Content \(Page 5685\)](#)

## RadioButtonGroup.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the option button.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`RadioButtonGroup.CurrentQuality`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**RadioButtonGroup.Enabled****Description**

The "Enabled" property specifies whether the option button can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`RadioButtonGroup.Enabled`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**RadioButtonGroup.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`RadioButtonGroup.Font`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

RadioButtonGroup.Font (Page 5691)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

`Font.Name`

### See also

RadioButtonGroup.Font (Page 5691)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

RadioButtonGroup.Font (Page 5691)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

### See also

RadioButtonGroup.Font (Page 5691)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

RadioButtonGroup.Font (Page 5691)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**[RadioButtonGroup.Font \(Page 5691\)](#)**RadioButtonGroup.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`RadioButtonGroup.ForeColor`**See also**[RadioButtonGroup \(Page 5679\)](#)**RadioButtonGroup.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`RadioButtonGroup.Height`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**RadioButtonGroup.Layer**

**Description**

The "Layer" property returns the layer of the screen in which the option button is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`RadioButtonGroup.Layer`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Layer.MaximumZoom
```

**See also**

RadioButtonGroup.Layer (Page 5696)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Layer.MinimumZoom
```

**See also**

RadioButtonGroup.Layer (Page 5696)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

## Syntax

`Layer.Name`

## See also

[RadioButtonGroup.Layer \(Page 5696\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

## See also

[RadioButtonGroup.Layer \(Page 5696\)](#)

## RadioButtonGroup.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

**Syntax**

`RadioButtonGroup.Left`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**RadioButtonGroup.Margin****Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`RadioButtonGroup.Margin`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

### See also

[RadioButtonGroup.Margin \(Page 5699\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[RadioButtonGroup.Margin \(Page 5699\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

**See also**

RadioButtonGroup.Margin (Page 5699)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

RadioButtonGroup.Margin (Page 5699)

**RadioButtonGroup.Name****Description**

The "Name" property returns the name of the option button.

**Type**

String

**Access**

Read-only

**Syntax**

RadioButtonGroup.Name

## See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`RadioButtonGroup.Opacity`

## See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.Operability

### Description

The "Operability" property returns whether the option button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

**Syntax**

`RadioButtonGroup.Operability`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**RadioButtonGroup.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the option button.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`RadioButtonGroup.Padding`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

## Syntax

`Padding.Bottom`

## See also

[RadioButtonGroup.Padding \(Page 5703\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Left`

## See also

[RadioButtonGroup.Padding \(Page 5703\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Right`**See also**[RadioButtonGroup.Padding \(Page 5703\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Top`**See also**[RadioButtonGroup.Padding \(Page 5703\)](#)**RadioButtonGroup.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**`Object, HmiScreenObjectBase (Page 1742)`**Access**`Read-only`

## Syntax

`RadioButtonGroup.Parent`

## See also

[RadioButtonGroup \(Page 5679\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

## Description

[Screen Items \(Page 1742\)](#)

## RadioButtonGroup.ProcessValue

## Description

The "ProcessValue" property specifies the process value.

## Type

Variant

## Access

Read-write

## Syntax

`RadioButtonGroup.ProcessValue`

## See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.RenderingTemplate

## Description

The "RenderingTemplate" property returns the name of the template from which the option button was created.

**Type**

String

**Access**

Read-only

**Syntax**`RadioButtonGroup.RenderingTemplate`**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the option button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`RadioButtonGroup.RequireExplicitUnlock`**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup.RotationAngle****Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`RadioButtonGroup.RotationAngle`

### See also

[RadioButtonGroup \(Page 5679\)](#)

[RadioButtonGroup.RotationCenterPlacement \(Page 5708\)](#)

[RadioButtonGroup.RotationCenterX \(Page 5709\)](#)

[RadioButtonGroup.RotationCenterY \(Page 5709\)](#)

## RadioButtonGroup.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the option button rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- `AbsoluteFromCenter (0)`: Absolute distance from the object center in DIU (Device Independent Unit).
- `NormedFromCenter (1)`: Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- `AbsoluteToContainer (2)`: Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`RadioButtonGroup.RotationCenterPlacement`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

[RadioButtonGroup.RotationAngle \(Page 5707\)](#)

[RadioButtonGroup.RotationCenterX \(Page 5709\)](#)

[RadioButtonGroup.RotationCenterY \(Page 5709\)](#)

**RadioButtonGroup.RotationCenterX****Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

```
RadioButtonGroup.RotationCenterX
```

[RadioButtonGroup.RotationCenterPlacement \(Page 5708\)](#)

[RadioButtonGroup.RotationCenterY \(Page 5709\)](#)

**RadioButtonGroup.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

### Access

Read-write

### Syntax

`RadioButtonGroup.RotationCenterY`

### See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.SelectionItemHeight

### Description

The "SelectionItemHeight" property specifies the height of the option button entries. The value "0" indicates that the height is calculated automatically.

### Type

UInt16

### Access

Read-write

### Syntax

`RadioButtonGroup.SelectionItemHeight`

### See also

[RadioButtonGroup \(Page 5679\)](#)

## RadioButtonGroup.SelectionItems

### Description

The "SelectionItems" property returns the list of all option button entries ("SelectionItem" objects).

**Type**

Object, HmiSelectedItemCollection (Page 5711)

**Access**

Read-only

**Syntax**

`RadioButtonGroup.SelectionItems`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

[HmiSelectedItemCollection \(Page 5711\)](#)

**HmiSelectedItemCollection****Description**

The "HmiSelectedItemCollection" object is a list of all entries ("SelectedItem" objects) of a list object.

**Use**

The "HmiSelectedItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectedItemCollection" list using the index or the tag name.

**Object type**

HmiSelectedItemCollection

**Properties**

The "HmiSelectedItemCollection" object has the following properties:

- **Count**  
Returns the number of list entries of the "HmiSelectedItemCollection" list.

**Methods**

The "HmiSelectedItemCollection" object has the following methods:

- **Item()**  
Returns a list entry of the "HmiSelectedItemCollection" list.

**See also**

RadioButtonGroup.SelectionItems (Page 5710)

**HmiSelectedItemCollection.Count**

**Description**

The "Count" property returns the number of list entries in the "HmiSelectedItemCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

HmiSelectedItemCollection.Count

**See also**

HmiSelectedItemCollection (Page 5711)

**HmiSelectedItemCollection.Item()**

**Description**

The "Item" method returns a list entry of the "HmiSelectedItemCollection" list.

**Syntax**

HmiSelectedItemCollection[.Item] (HmiSelectedItemName)

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectedItemCollection" object.

---

**Parameters**

**HmiSelectedItemName**

Type: String

Name of the list entry

### Return value

Object, HmiSelectionItemPart (Page 5713)

### See also

HmiSelectionItemCollection (Page 5711)

SelectionItem (Page 5713)

## SelectionItem

### Description

The "SelectionItem" object represents a list entry.

### Object type

HmiSelectionItemPart

### Properties

The "SelectionItem" object has the following properties:

- **Graphic**  
Specifies the graphic of the list entry.
- **IsSelected**  
Specifies whether the list entry is selected.
- **Text**  
Specifies the list entry text.

### Methods

--

## SelectionItem.Graphic

### Description

The "Graphic" property specifies the graphic of the list entry.

### Type

String

**Access**

Read-write

**Syntax**

`SelectedItem.Graphic`

**See also**

[SelectedItem \(Page 5713\)](#)

**SelectedItem.IsSelected**

**Description**

The "IsSelected" property specifies whether the list entry is selected.

**Type**

Bool

**Access**

Read-write

**Syntax**

`SelectedItem.IsSelected`

**See also**

[SelectedItem \(Page 5713\)](#)

**SelectedItem.Text**

**Description**

The "Text" property specifies the text of the list entry.

**Type**

String

**Access**

Read-write

**Syntax**`SelectedItem.Text`**See also**[SelectedItem \(Page 5713\)](#)**RadioButtonGroup.SelectorPosition****Description**

The "SelectorPosition" property specifies the horizontal alignment of the option button entries.

**Type**`Int32, HmiHorizontalAlignment`

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

**Access**

Read-write

**Syntax**`RadioButtonGroup.SelectorPosition`**See also**[RadioButtonGroup \(Page 5679\)](#)**RadioButtonGroup.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the option button is highlighted when in focus.

**Type**`Bool`

**Access**

Read-write

**Syntax**

`RadioButtonGroup.ShowFocusVisual`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**RadioButtonGroup.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the option button.

**Type**

String

**Access**

Read-only

**Syntax**

`RadioButtonGroup.StyleItemClass`

**See also**

[RadioButtonGroup \(Page 5679\)](#)

**RadioButtonGroup.TabIndex**

**Description**

The "TabIndex" property returns the position of the option button in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`RadioButtonGroup.TabIndex`**See also**[RadioButtonGroup \(Page 5679\)](#)**RadioButtonGroup.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**`RadioButtonGroup.ToolTipText`**See also**[RadioButtonGroup \(Page 5679\)](#)**RadioButtonGroup.Top****Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`RadioButtonGroup.Top`

**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup.Visible**

**Description**

The "Visible" property specifies whether the option button is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

RadioButtonGroup.Visible

**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup.VisualizeQuality**

**Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

RadioButtonGroup.VisualizeQuality

**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

RadioButtonGroup.Width

**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the option button.

**Syntax**

RadioButtonGroup.CheckAuthorization()

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

[RadioButtonGroup](#) (Page 5679)

## RadioButtonGroup.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
RadioButtonGroup.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

### Parameters

#### **propertyName**

Type: String

Name of the property for which flashing is configured.

#### **enable**

Type: Bool

Specifies that flashing is activated.

#### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

#### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup\_OnActivated()****Description**

The "OnActivated" event occurs when an option button receives focus:

- An option button is selected via the configured tab sequence.
- An option button that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
RadioButtonGroup_OnActivated(item)
```

**Context****item**

Type: Object

Option button where the event occurs.

## See also

RadioButtonGroup (Page 5679)

## RadioButtonGroup\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An option button is right-clicked.
- An option button is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
RadioButtonGroup_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Option button where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

RadioButtonGroup (Page 5679)

**RadioButtonGroup\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the option button loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
RadioButtonGroup_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Option button where the event occurs.

## See also

RadioButtonGroup (Page 5679)

## RadioButtonGroup\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the option button is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
RadioButtonGroup_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Option button where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

RadioButtonGroup (Page 5679)

## RadioButtonGroup\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the option button is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
RadioButtonGroup_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Option button where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

RadioButtonGroup (Page 5679)

## RadioButtonGroup\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- An option button is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an option button has the focus.
- An option button is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
RadioButtonGroup_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Option button where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

RadioButtonGroup (Page 5679)

**Rectangle****Description**

The "Rectangle" object represents a rectangle in runtime.

## Object type

HmiRectangle

## Properties

The "Rectangle" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **Corners**  
Specifies the rounding of the rectangle corners.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the rectangle.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the rectangle can be operated in runtime.
- **FillDirection**  
Specifies the direction from which the rectangle is filled.
- **FillLevel**  
Specifies the fill of the rectangle in percent.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the rectangle is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the rectangle.

- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the rectangle is operable.
- **Parent**  
Returns the higher-level screen object.
- **RequireExplicitUnlock**  
Returns whether the rectangle is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the rectangle rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**  
Specifies whether the fill level is displayed.
- **ShowFocusVisual**  
Specifies whether the rectangle is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the rectangle.
- **TabIndex**  
Returns the position of the rectangle in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the rectangle is visible.
- **Width**  
Specifies the width.

## Methods

The "Rectangle" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the rectangle.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Rectangle" object has the following events:

- **OnActivated()**  
Occurs when a rectangle receives focus.
- **OnContextTapped()**  
Occurs when a rectangle is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a rectangle loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the rectangle is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the rectangle is in focus.
- **OnTapped()**  
Occurs when a rectangle is left-clicked or short-touched.

## Rectangle.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`Rectangle.AlternateBackColor`

### See also

[Rectangle \(Page 5727\)](#)

## Rectangle.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`Rectangle.AlternateBorderColor`**See also**

Rectangle (Page 5727)

**Rectangle.Authorization****Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**`Rectangle.Authorization`**See also**

Rectangle (Page 5727)

**Rectangle.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

## Access

Read-write

## Syntax

`Rectangle.BackColor`

## See also

Rectangle (Page 5727)

## Rectangle.BackFillPattern

### Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

### Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

**Access**

Read-write

**Syntax**`Rectangle.BackFillPattern`**See also**

Rectangle (Page 5727)

**Rectangle.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Rectangle.BorderColor`**See also**

Rectangle (Page 5727)

**Rectangle.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`Rectangle.BorderWidth`

**See also**

Rectangle (Page 5727)

**Rectangle.Corners**

**Description**

The "Corners" property specifies the rounding of the rectangle corners.

**Type**

Object, HmiCornersPart

**Access**

Read-write

**Syntax**

`Rectangle.Corners`

**See also**

Rectangle (Page 5727)

**Corners.BottomLeftRadius**

**Description**

The "BottomLeftRadius" property specifies the radius of the rounding of the bottom-left corner.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Corners.BottomLeftRadius`

**See also**

Rectangle.Corners (Page 5734)

**Corners.BottomRightRadius****Description**

The "BottomRightRadius" property specifies the radius of the rounding of the bottom-right corner.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Corners.BottomRightRadius`

**See also**

Rectangle.Corners (Page 5734)

**Corners.TopLeftRadius****Description**

The "TopLeftRadius" property specifies the radius of the rounding of the top-left corner.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Corners.TopLeftRadius`

## See also

Rectangle.Corners (Page 5734)

## Corners.TopRightRadius

### Description

The "TopRightRadius" property specifies the radius of the rounding of the top-right corner.

### Type

UInt32

### Access

Read-write

### Syntax

`Corners.TopRightRadius`

## See also

Rectangle.Corners (Page 5734)

## Rectangle.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the rectangle.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**`Rectangle.CurrentQuality`**See also**

Rectangle (Page 5727)

**Rectangle.DashType****Description**

The "DashType" property specifies the stroke type of the border or line.

**Type**

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

**Access**

Read-write

**Syntax**`Rectangle.DashType`**See also**

Rectangle (Page 5727)

**Rectangle.Enabled****Description**

The "Enabled" property specifies whether the rectangle can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Rectangle.Enabled`

**See also**

Rectangle (Page 5727)

**Rectangle.FillDirection**

**Description**

The "FillDirection" property specifies the direction from which the rectangle is filled.

**Type**

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

**Access**

Read-write

**Syntax**

`Rectangle.FillDirection`

**See also**

Rectangle (Page 5727)

## Rectangle.FillLevel

### Description

The "FillLevel" property specifies the fill level of the rectangle in percent.

### Type

UInt8

### Access

Read-write

### Syntax

`Rectangle.FillLevel`

### See also

[Rectangle \(Page 5727\)](#)

## Rectangle.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Rectangle.Height`

### See also

[Rectangle \(Page 5727\)](#)

## Rectangle.Layer

### Description

The "Layer" property returns the layer of the screen in which the rectangle is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Rectangle.Layer`

### See also

[Rectangle \(Page 5727\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[Rectangle.Layer \(Page 5740\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

Rectangle.Layer (Page 5740)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

```
Layer.Name
```

### See also

Rectangle.Layer (Page 5740)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[Rectangle.Layer \(Page 5740\)](#)

## Rectangle.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Rectangle.Left`

### See also

[Rectangle \(Page 5727\)](#)

## Rectangle.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Rectangle.Margin`

### See also

[Rectangle \(Page 5727\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[Rectangle.Margin \(Page 5743\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[Rectangle.Margin \(Page 5743\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Rectangle.Margin \(Page 5743\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

Rectangle.Margin (Page 5743)

## Rectangle.Name

### Description

The "Name" property returns the name of the rectangle.

### Type

String

### Access

Read-only

### Syntax

Rectangle.Name

### See also

Rectangle (Page 5727)

## Rectangle.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`Rectangle.Opacity`

### See also

Rectangle (Page 5727)

## Rectangle.Operability

### Description

The "Operability" property returns whether the rectangle is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Rectangle.Operability`

**See also**

[Rectangle \(Page 5727\)](#)

**Rectangle.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

```
Rectangle.Parent
```

**See also**

[Rectangle \(Page 5727\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**Rectangle.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the rectangle can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`Rectangle.RequireExplicitUnlock`

**See also**

[Rectangle \(Page 5727\)](#)

**Rectangle.RotationAngle**

**Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**

`Rectangle.RotationAngle`

**See also**

[Rectangle \(Page 5727\)](#)

[Rectangle.RotationCenterPlacement \(Page 5748\)](#)

[Rectangle.RotationCenterX \(Page 5749\)](#)

[Rectangle.RotationCenterY \(Page 5750\)](#)

**Rectangle.RotationCenterPlacement**

**Description**

The "RotationCenterPlacement" property sets the reference point around which the rectangle rotates.

## Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

## Access

Read-write

## Syntax

`Rectangle.RotationCenterPlacement`

## See also

[Rectangle \(Page 5727\)](#)

[Rectangle.RotationAngle \(Page 5748\)](#)

[Rectangle.RotationCenterX \(Page 5749\)](#)

[Rectangle.RotationCenterY \(Page 5750\)](#)

## Rectangle.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

## Type

Float

## Access

Read-write

## Syntax

`Rectangle.RotationCenterX`

## See also

[Rectangle \(Page 5727\)](#)

[Rectangle.RotationAngle \(Page 5748\)](#)

[Rectangle.RotationCenterPlacement \(Page 5748\)](#)

[Rectangle.RotationCenterY \(Page 5750\)](#)

## Rectangle.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
Rectangle.RotationCenterY
```

## See also

[Rectangle \(Page 5727\)](#)

[Rectangle.RotationAngle \(Page 5748\)](#)

[Rectangle.RotationCenterPlacement \(Page 5748\)](#)

[Rectangle.RotationCenterX \(Page 5749\)](#)

## Rectangle.ShowFillLevel

### Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

### Type

Bool

**Access**

Read-write

**Syntax**`Rectangle.ShowFillLevel`**See also**

Rectangle (Page 5727)

**Rectangle.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the rectangle is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`Rectangle.ShowFocusVisual`**See also**

Rectangle (Page 5727)

**Rectangle.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the rectangle.

**Type**

String

**Access**

Read-only

**Syntax**

`Rectangle.StyleItemClass`

**See also**

Rectangle (Page 5727)

**Rectangle.TabIndex**

**Description**

The "TabIndex" property returns the position of the rectangle in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`Rectangle.TabIndex`

**See also**

Rectangle (Page 5727)

**Rectangle.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`Rectangle.ToolTipText`

**See also**

Rectangle (Page 5727)

**Rectangle.Top****Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

Rectangle.Top

**See also**

Rectangle (Page 5727)

**Rectangle.Visible****Description**

The "Visible" property specifies whether the rectangle is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

Rectangle.Visible

**See also**

Rectangle (Page 5727)

## Rectangle.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Rectangle.Width`

### See also

Rectangle (Page 5727)

## Rectangle.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the rectangle.

### Syntax

`Rectangle.CheckAuthorization()`

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

Rectangle (Page 5727)

## Rectangle.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Rectangle.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Rectangle (Page 5727)

**Rectangle\_OnActivated()**

**Description**

The "OnActivated" event occurs when a rectangle receives focus:

- A rectangle is selected via the configured tab sequence.
- A rectangle that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

`Rectangle_OnActivated(item)`

**Context**

**item**

Type: Object

Rectangle where the event occurs.

## See also

Rectangle (Page 5727)

## Rectangle\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A rectangle is right-clicked.
- A rectangle is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Rectangle_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Rectangle where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Rectangle (Page 5727)

**Rectangle\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when the rectangle loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

`Rectangle_OnDeactivated(item)`

**Context**

**item**

Type: Object

Rectangle where the event occurs.

## See also

Rectangle (Page 5727)

## Rectangle\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the rectangle is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Rectangle_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Rectangle where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Rectangle (Page 5727)

## Rectangle\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the rectangle is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Rectangle_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Rectangle where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Rectangle (Page 5727)

## Rectangle\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A rectangle is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a rectangle has the focus.
- A rectangle is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Rectangle_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Rectangle where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Rectangle (Page 5727)

**ScreenWindow**

**Description**

ScreenWindow (Page 1600)

## Slider

### Description

The "Slider" object represents a slider for monitoring of process values in runtime.

### Object type

HmiSlider

### Properties

The "Slider" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BarMode**  
Specifies the color display of the slider.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **ComputedMaxPeakValue**  
Returns the highest process value that occurred.
- **ComputedMinPeakValue**  
Returns the lowest process value that occurred.
- **ComputedValueTendency**  
Returns the change of the process value.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the slider.
- **Enabled**  
Specifies whether the slider can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **Height**  
Specifies the height.
- **Label**  
Specifies the labeling below the slider.

- **Layer**  
Returns the layer of the screen in which the slider is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the slider.
- **NormalRangeColor**  
Specifies the color of the normal range.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the slider is operable.
- **OriginValue**  
Specifies the output value of the normal range that is visualized.
- **OutputFormat**  
Specifies the format for displaying the process values.
- **Parent**  
Returns the higher-level screen object.
- **PeakIndicators**  
Specifies whether the highest and lowest process value up to this time are displayed.
- **ProcessValue**  
Specifies the process value.
- **ProcessValueIndicatorBackColor**  
Specifies the background color for the process value.
- **ProcessValueIndicatorForeColor**  
Specifies the foreground color for the process value.
- **ProcessValueIndicatorMode**  
Specifies the type of display of the current process value.
- **RelativeToOrigin**  
Specifies whether the output value is an absolute or a percentage value between the minimum and maximum value.
- **RenderingTemplate**  
Returns the name of the template from which the slider was created.
- **RequireExplicitUnlock**  
Returns whether the slider is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the slider rotates.

- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ScaleBackColor**  
Specifies the background color of the scale.
- **ScaleForeColor**  
Specifies the foreground color of the scale.
- **ShowFocusVisual**  
Specifies whether the slider is highlighted when in focus.
- **ShowTrendIndicator**  
Specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.
- **ShowValue**  
Specifies whether the process value is additionally output as text.
- **StraightScale**  
Specifies the scale of the slider.
- **StyleItemClass**  
Returns the style which is applied to the slider.
- **TabIndex**  
Returns the position of the slider in the tab sequence.
- **ThresholdIndicators**  
Specifies how parameterized limit values are visualized.
- **Thresholds**  
Returns the list of all limit values of the slider.
- **ThumbBackColor**  
Specifies the background color of the slider.
- **ThumbForeColor**  
Specifies the foreground color of the slider.
- **Title**  
Specifies the caption which appears as the title.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **TrendIndicatorColor**  
Specifies the color of the trend indicator.
- **ValuePosition**  
Specifies where the value of the current slider position is additionally displayed numerically.
- **Visible**  
Specifies whether the slider is visible.

- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.
- **WriteDuringChange**  
Specifies when changes are transferred.

## Methods

The "Slider" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the slider.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Slider" object has the following events:

- **OnActivated()**  
Occurs when a slider receives focus.
- **OnContextTapped()**  
Occurs when a slider is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a slider loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the slider is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the slider is in focus.
- **OnTapped()**  
Occurs when a slider is left-clicked or short-touched.

## Slider.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

**Syntax**`Slider.AlternateBackColor`**See also**

Slider (Page 5763)

**Slider.AlternateBorderColor****Description**

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`Slider.AlternateBorderColor`**See also**

Slider (Page 5763)

**Slider.Authorization****Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

### Syntax

`Slider.Authorization`

### See also

Slider (Page 5763)

### Slider.BackColor

#### Description

The "BackColor" property specifies the background color.

#### Type

UInt32

#### Access

Read-write

### Syntax

`Slider.BackColor`

### See also

Slider (Page 5763)

### Slider.BarMode

#### Description

The "BarMode" property specifies the color of the slider.

#### Type

Int32, HmiBarMode

Specifies the bar mode:

- Segmented (0): Bar changes color according to the bar segments.
- Unicolor (1): Entire bar has same color.

- SegmentedStatic (2): Bar segments in the background, process value indicator in front of the bar segments.
- UnicolorStatic (3): Background color changes according to the process value and the limit colors, process value indicator runs in front of the bar segments.

**Access**

Read-write

**Syntax**`Slider.BarMode`**See also**

Slider (Page 5763)

**Slider.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Slider.BorderColor`**See also**

Slider (Page 5763)

**Slider.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`Slider.BorderWidth`

**See also**

Slider (Page 5763)

**Slider.ComputedMaxPeakValue**

**Description**

The "ComputedMaxPeakValue" property returns the highest process value that occurred.

**Type**

Variant

**Access**

Read-only

**Syntax**

`Slider.ComputedMaxPeakValue`

**See also**

Slider (Page 5763)

Slider.ComputedMinPeakValue (Page 5770)

**Slider.ComputedMinPeakValue**

**Description**

The "ComputedMinPeakValue" property returns the lowest process value which occurred.

**Type**

Variant

**Access**

Read-only

**Syntax**`Slider.ComputedMinPeakValue`**See also**

Slider (Page 5763)

Slider.ComputedMaxPeakValue (Page 5770)

**Slider.ComputedValueTendency****Description**

The "ComputedValueTendency" property returns the change in the process value.

**Type**

Int32, HmiValueTendency

Returns the modification:

- Steady (0): No change
- Upwards (1): Change upwards
- Downwards (2): Change downwards

**Access**

Read-only

**Syntax**`Slider.ComputedValueTendency`**See also**

Slider (Page 5763)

## Slider.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the slider.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`Slider.CurrentQuality`

### See also

Slider (Page 5763)

## Slider.Enabled

### Description

The "Enabled" property specifies whether the slider can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**`Slider.Enabled`**See also**

Slider (Page 5763)

**Slider.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`Slider.Font`**See also**

Slider (Page 5763)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`

**See also**

Slider.Font (Page 5773)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Slider.Font (Page 5773)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Slider.Font (Page 5773)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

Slider.Font (Page 5773)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

Slider.Font (Page 5773)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

Slider.Font (Page 5773)

## Slider.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`Slider.Height`**See also**

Slider (Page 5763)

**Slider.Label****Description**

The "Label" property specifies the labeling below the slider.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**`Slider.Label`**See also**

Slider (Page 5763)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

Slider.Label (Page 5777)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 5777)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 5777)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 5777)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[Text.Font \(Page 5777\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[Text.Font \(Page 5777\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 5777\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[Slider.Label \(Page 5777\)](#)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

Slider.Label (Page 5777)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

Slider.Label (Page 5777)

## Slider.Layer

### Description

The "Layer" property returns the layer of the screen in which the slider is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
Slider.Layer
```

### See also

Slider (Page 5763)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

Slider.Layer (Page 5783)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

Slider.Layer (Page 5783)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

Slider.Layer (Page 5783)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[Slider.Layer \(Page 5783\)](#)

## Slider.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Slider.Left`

### See also

[Slider \(Page 5763\)](#)

## Slider.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Slider.Margin`

### See also

Slider (Page 5763)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

Slider.Margin (Page 5786)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[Slider.Margin \(Page 5786\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Slider.Margin \(Page 5786\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[Slider.Margin \(Page 5786\)](#)

## Slider.Name

### Description

The "Name" property returns the name of the slider.

### Type

String

### Access

Read-only

### Syntax

`Slider.Name`

### See also

[Slider \(Page 5763\)](#)

## Slider.NormalRangeColor

### Description

The "NormalRangeColor" property specifies the color of the normal range.

### Type

UInt32

### Access

Read-write

### Syntax

```
Slider.NormalRangeColor
```

### See also

Slider (Page 5763)

## Slider.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

```
Slider.Opacity
```

### See also

Slider (Page 5763)

## Slider.Operability

### Description

The "Operability" property returns whether the slider is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Slider.Operability`

### See also

Slider (Page 5763)

## Slider.OriginValue

### Description

The "OriginValue" property specifies the output value of the normal range to be visualized.

### Type

Float

### Access

Read-write

### Syntax

`Slider.OriginValue`

**See also**

Slider (Page 5763)

**Slider.OutputFormat****Description**

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

**Type**

String

**Access**

Read-write

**Syntax**

`Slider.OutputFormat`

**See also**

Slider (Page 5763)

**Slider.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`Slider.Parent`

## See also

Slider (Page 5763)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## Slider.PeakIndicators

### Description

The "PeakIndicators" property specifies whether the highest and lowest process value up to this time are displayed.

### Type

Int32, HmiPeakIndicator

Specifies the display of the peak indicator:

- None (0): No display
- Low (1): Only the lowest process value
- High (2): Only the highest process value

### Access

Read-write

### Syntax

`Slider.PeakIndicators`

## See also

Slider (Page 5763)

## Slider.ProcessValue

### Description

The "ProcessValue" property specifies the process value.

**Type**

Variant

**Access**

Read-write

**Syntax**`Slider.ProcessValue`**See also**

Slider (Page 5763)

**Slider.ProcessValueIndicatorBackColor****Description**

The "ProcessValueIndicatorBackColor" property specifies the background color for the process value indicator.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Slider.ProcessValueIndicatorBackColor`**See also**

Slider (Page 5763)

Slider.ProcessValueIndicatorForeColor (Page 5793)

**Slider.ProcessValueIndicatorForeColor****Description**

The "ProcessValueIndicatorForeColor" property specifies the foreground color for the process value indicator.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Slider.ProcessValueIndicatorForeColor`

**See also**

Slider (Page 5763)

Slider.ProcessValueIndicatorBackColor (Page 5793)

**Slider.ProcessValueIndicatorMode**

**Description**

The "ProcessValueIndicatorMode" property specifies the type of display of the current process value.

**Type**

Int32, HmiProcessIndicatorMode

Specifies the type of display:

- Bar (0): Bar only
- Indicator (1): Hair line or needle, no numerical display of the process value.
- DetailedIndicator (2): Detailed display with numerical value
- BarWithDetailedIndicator (3): Bar with numerical value

**Access**

Read-write

**Syntax**

`Slider.ProcessValueIndicatorMode`

**See also**

Slider (Page 5763)

## Slider.RelativeToOrigin

### Description

The "RelativeToOrigin" property specifies whether the output value is an absolute or a percentage value between minimum and maximum value.

### Type

Bool

### Access

Read-write

### Syntax

`Slider.RelativeToOrigin`

### See also

Slider (Page 5763)

## Slider.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the slider was created.

### Type

String

### Access

Read-only

### Syntax

`Slider.RenderingTemplate`

### See also

Slider (Page 5763)

## Slider.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the slider can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`Slider.RequireExplicitUnlock`

### See also

Slider (Page 5763)

## Slider.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`Slider.RotationAngle`

### See also

Slider (Page 5763)

Slider.RotationCenterPlacement (Page 5797)

[Slider.RotationCenterX \(Page 5797\)](#)

[Slider.RotationCenterY \(Page 5798\)](#)

## Slider.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the slider rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

```
Slider.RotationCenterPlacement
```

### See also

[Slider \(Page 5763\)](#)

[Slider.RotationAngle \(Page 5796\)](#)

[Slider.RotationCenterX \(Page 5797\)](#)

[Slider.RotationCenterY \(Page 5798\)](#)

## Slider.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`Slider.RotationCenterX`

**See also**

- Slider (Page 5763)
- Slider.RotationAngle (Page 5796)
- Slider.RotationCenterPlacement (Page 5797)
- Slider.RotationCenterY (Page 5798)

**Slider.RotationCenterY**

**Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`Slider.RotationCenterY`

**See also**

- Slider (Page 5763)
- Slider.RotationAngle (Page 5796)
- Slider.RotationCenterPlacement (Page 5797)
- Slider.RotationCenterX (Page 5797)

## Slider.ScaleBackColor

### Description

The "ScaleBackColor" property specifies the background color of the scale.

### Type

UInt32

### Access

Read-write

### Syntax

```
Slider.ScaleBackColor
```

### See also

[Slider \(Page 5763\)](#)

[Slider.ScaleForeColor \(Page 5799\)](#)

## Slider.ScaleForeColor

### Description

The "ScaleForeColor" property specifies the foreground color of the scale.

### Type

UInt32

### Access

Read-write

### Syntax

```
Slider.ScaleForeColor
```

### See also

[Slider \(Page 5763\)](#)

[Slider.ScaleBackColor \(Page 5799\)](#)

## Slider.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the slider is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`Slider.ShowFocusVisual`

### See also

Slider (Page 5763)

## Slider.ShowTrendIndicator

### Description

The "ShowTrendIndicator" property specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.

### Type

Bool

### Access

Read-write

### Syntax

`Slider.ShowTrendIndicator`

### See also

Slider (Page 5763)

## Slider.ShowValue

### Description

The "ShowValue" property specifies whether the process value is additionally output as text.

### Type

Bool

### Access

Read-write

### Syntax

```
Slider.ShowValue
```

### See also

Slider (Page 5763)

## Slider.StraightScale

### Description

The "StraightScale" property specifies the scale of the slider.

### Type

Object, HmiStraightScalePart

### Access

Read-write

### Syntax

```
Slider.StraightScale
```

### See also

Slider (Page 5763)

## StraightScale.AutoScaling

### Description

The "AutoScaling" property specifies whether automatic scaling is activated.

### Type

Bool

### Access

Read-write

### Syntax

`StraightScale.AutoScaling`

### See also

Slider.StraightScale (Page 5801)

## StraightScale.BeginValue

### Description

The "BeginValue" property specifies the start of a value range or value range section.

### Type

Float

### Access

Read-write

### Syntax

`StraightScale.BeginValue`

### See also

Slider.StraightScale (Page 5801)

## StraightScale.DivisionCount

### Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

### Type

Int32

### Access

Read-write

### Syntax

`StraightScale.DivisionCount`

### See also

Slider.StraightScale (Page 5801)

## StraightScale.EndValue

### Description

The "EndValue" property specifies the end of a value range or value range section.

### Type

Float

### Access

Read-write

### Syntax

`StraightScale.EndValue`

### See also

Slider.StraightScale (Page 5801)

## StraightScale.LabelColor

### Description

The "LabelColor" property specifies the color of the labeling.

### Type

UInt32

### Access

Read-write

### Syntax

`StraightScale.LabelColor`

### See also

Slider.StraightScale (Page 5801)

## StraightScale.LabelFont

### Description

The "LabelFont" property specifies the font of the labeling.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`StraightScale.LabelFont`

### See also

Slider.StraightScale (Page 5801)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

[StraightScale.LabelFont \(Page 5804\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

`Font.Name`

### See also

[StraightScale.LabelFont \(Page 5804\)](#)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

`Font.Size`

### See also

[StraightScale.LabelFont \(Page 5804\)](#)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

**See also**

StraightScale.LabelFont (Page 5804)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

StraightScale.LabelFont (Page 5804)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

`StraightScale.LabelFont` (Page 5804)

**StraightScale.LargeTickLabelingStep**

**Description**

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`StraightScale.LargeTickLabelingStep`

**See also**

`Slider.StraightScale` (Page 5801)

**StraightScale.MeasurementUnit**

**Description**

The "MeasurementUnit" property returns the displayed unit.

**Type**

String

**Access**

Read-only

**Syntax**

`StraightScale.MeasurementUnit`

**See also**

Slider.StraightScale (Page 5801)

**StraightScale.MeasurementUnitType****Description**

The "MeasurementUnitType" property specifies the display format of the unit.

**Type**

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

**Access**

Read-write

**Syntax**

`StraightScale.MeasurementUnitType`

**See also**

Slider.StraightScale (Page 5801)

**StraightScale.Orientation****Description**

The "Orientation" property specifies the orientation of the scale.

### Type

Int32, HmiOrientation

Specifies the alignment:

- Horizontal (0): Horizontal
- Vertical (1): Vertical

### Access

Read-write

### Syntax

`StraightScale.Orientation`

### See also

Slider.StraightScale (Page 5801)

## StraightScale.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

### Type

String

### Access

Read-write

### Syntax

`StraightScale.OutputFormat`

### See also

Slider.StraightScale (Page 5801)

## StraightScale.ScaleMode

### Description

The "ScaleMode" property specifies the type of scaling.

### Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

### Access

Read-write

### Syntax

```
StraightScale.ScaleMode
```

### See also

Slider.StraightScale (Page 5801)

## StraightScale.ScalingType

### Description

The "ScalingType" property specifies the scaling.

### Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

**Access**

Read-write

**Syntax**

`StraightScale.ScalingType`

**See also**

Slider.StraightScale (Page 5801)

**StraightScale.SubDivisionCount**

**Description**

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

**Type**

Int32

**Access**

Read-write

**Syntax**

`StraightScale.SubDivisionCount`

**See also**

Slider.StraightScale (Page 5801)

**StraightScale.TickColor**

**Description**

The "TickColor" property specifies the color of the tick marks.

**Type**

UInt32

**Access**

Read-write

**Syntax**`StraightScale.TickColor`**See also**`Slider.StraightScale` (Page 5801)**Slider.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the slider.

**Type**

String

**Access**

Read-only

**Syntax**`Slider.StyleItemClass`**See also**`Slider` (Page 5763)**Slider.TabIndex****Description**

The "TabIndex" property returns the position of the slider in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`Slider.TabIndex`

## See also

Slider (Page 5763)

## Slider.ThresholdIndicators

### Description

The "ThresholdIndicators" property specifies how parameterized limit values are visualized.

### Type

Int32, HmiThresholdIndicator

Specifies the visualization:

- None (0): None
- Lines (1): Lines
- Markers (2): Markers

### Access

Read-write

### Syntax

`Slider.ThresholdIndicators`

## See also

Slider (Page 5763)

## Slider.Thresholds

### Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the slider.

### Type

Object, HmiThresholdCollection (Page 5815)

### Access

Read-only

**Syntax**

```
Slider.Thresholds
```

**See also**

Slider (Page 5763)

HmiThresholdCollection (Page 5815)

**HmiThresholdCollection****Description**

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

**Use**

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

**Object type**

HmiThresholdCollection

**Properties**

The "HmiThresholdCollection" object has the following properties:

- **Count**  
Returns the number of limit values of the "HmiThresholdCollection" list.

**Methods**

The "HmiThresholdCollection" object has the following methods:

- **Item()**  
Returns a limit value of the "HmiThresholdCollection" list.

**See also**

Slider.Thresholds (Page 5814)

**HmiThresholdCollection.Count****Description**

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

`HmiThresholdCollection.Count`

**See also**

HmiThresholdCollection (Page 5815)

**HmiThresholdCollection.Item()**

**Description**

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

**Syntax**

`HmiThresholdCollection[.Item] (HmiThresholdName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

---

**Parameters**

**HmiThresholdName**

Type: String

Name of the limit value

**Return value**

Object, HmiThresholdPart (Page 5817)

**See also**

HmiThresholdCollection (Page 5815)

Threshold (Page 5817)

## Threshold

### Description

The "Threshold" object represents a limit value.

### Object type

HmiThresholdPart

### Properties

The "Threshold" object has the following properties:

- **Color**  
Specifies the color of the limit value.
- **DisplayName**  
Specifies the display name of the limit value.
- **Name**  
Specifies the name of the limit value.
- **ThresholdMode**  
Specifies the type of limit value.
- **Value**  
Returns the limit value.

### Methods

--

### See also

HmiThresholdCollection (Page 5815)

## Threshold.Color

### Description

The "Color" property specifies the color of the limit value.

### Type

UInt32

### Access

Read-write

### Syntax

`Threshold.Color`

### See also

Threshold (Page 5817)

## Threshold.DisplayName

### Description

The "DisplayName" property specifies the display name of the limit value.

### Type

String

### Access

Read-write

### Syntax

`Threshold.DisplayName`

### See also

Threshold (Page 5817)

## Threshold.Name

### Description

The "Name" property specifies the name of the limit value.

### Type

String

### Access

Read-write

### Syntax

`Threshold.Name`

**See also**

Threshold (Page 5817)

**Threshold.ThresholdMode****Description**

The "ThresholdMode" property specifies the type of limit value.

**Type**

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

**Access**

Read-write

**Syntax**

`Threshold.ThresholdMode`

**See also**

Threshold (Page 5817)

**Threshold.Value****Description**

The "Value" property returns the limit value of the tag.

**Type**

Float

**Access**

Read-only

**Syntax**

`Threshold.Value`

**See also**

Threshold (Page 5817)

**Slider.ThumbBackColor**

**Description**

The "ThumbBackColor" property specifies the background color of the handle of the slider.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Slider.ThumbBackColor`

**See also**

Slider (Page 5763)

Slider.ThumbForeColor (Page 5820)

**Slider.ThumbForeColor**

**Description**

The "ThumbForeColor" property specifies the foreground color of the handle of the slider.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Slider.ThumbForeColor`**See also**

Slider (Page 5763)

Slider.ThumbBackColor (Page 5820)

**Slider.Title****Description**

The "Title" property specifies the caption that appears as the title.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**`Slider.Title`**See also**

Slider (Page 5763)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

Slider.Title (Page 5821)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 5821)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

Text.Font (Page 5821)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

Text.Font (Page 5821)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[Text.Font \(Page 5821\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[Text.Font \(Page 5821\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 5821\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[Slider.Title \(Page 5821\)](#)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

Slider.Title (Page 5821)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

Slider.Title (Page 5821)

## Slider.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`Slider.ToolTipText`

### See also

Slider (Page 5763)

## Slider.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Slider.Top`

### See also

Slider (Page 5763)

## Slider.TrendIndicatorColor

### Description

The "TrendIndicatorColor" property specifies the color of the trend indicator. The trend indicator uses a small arrow to represent the tendency (rising or falling) of the process value to be monitored. To activate the trend indicator, the "ShowTrendIndicator" property must be activated.

### Type

UInt32

### Access

Read-write

### Syntax

`Slider.TrendIndicatorColor`

### See also

Slider (Page 5763)

## Slider.ValuePosition

### Description

The "ValuePosition" property specifies where the value of the current slider position is additionally displayed numerically.

### Type

Int32, HmiSimplePosition

Specifies the position:

- LeftOrTop (0): Left for vertical alignment, top for horizontal alignment
- RightOrBottom (1): Right for vertical alignment, bottom for horizontal alignment

### Access

Read-write

### Syntax

`Slider.ValuePosition`

**See also**

Slider (Page 5763)

**Slider.Visible****Description**

The "Visible" property specifies whether the slider is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Slider.Visible`

**See also**

Slider (Page 5763)

**Slider.VisualizeQuality****Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Slider.VisualizeQuality`

**See also**

Slider (Page 5763)

**Slider.Width**

**Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Slider.Width`

**See also**

Slider (Page 5763)

**Slider.WriteDuringChange**

**Description**

The "WriteDuringChange" property specifies when changes are transferred.

- True: Even during the modification of the slider.
- False: Only after the slider has been released.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Slider.WriteDuringChange`

**See also**

Slider (Page 5763)

**Slider.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the slider.

**Syntax**

```
Slider.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

Slider (Page 5763)

**Slider.PropertyFlashing()****Description**

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

## Syntax

```
Slider.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

## Parameters

### **propertyName**

Type: String

Name of the property for which flashing is configured.

### **enable**

Type: Bool

Specifies that flashing is activated.

### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

### **Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

Slider (Page 5763)

## Slider\_OnActivated()

### Description

The "OnActivated" event occurs when a slider receives focus:

- A slider is selected via the configured tab sequence.
- A slider that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Slider_OnActivated(item)
```

### Context

**item**

Type: Object

Slider where the event occurs.

### See also

Slider (Page 5763)

## Slider\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A slider is right-clicked.
- A slider is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Slider_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Slider where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Slider (Page 5763)

**Slider\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the slider loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
Slider_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Slider where the event occurs.

**See also**

Slider (Page 5763)

**Slider\_OnKeyDown()****Description**

The "OnKeyDown" event occurs when a key is pressed while the slider is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
Slider_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Slider where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Slider (Page 5763)

## Slider\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the slider is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
Slider_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

Slider where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**[Slider \(Page 5763\)](#)

## Slider\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A slider is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a slider has the focus.
- A slider is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Slider_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Slider where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

#### **See also**

Slider (Page 5763)

#### **SwacContainer**

##### **Description**

The "SwacContainer" object represents a container for SWAC components (Siemens Web Application Collaboration) in runtime.

##### **Object type**

HmiSwacContainer

## Properties

The "SwacContainer" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **ContainedType**  
Returns the type of the contained SWAC component.
- **CurrentQuality**  
Returns the worst quality code of all tags that influence the container.
- **Enabled**  
Specifies whether the container can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the container.
- **Layer**  
Returns the screen layer in which the container is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the container.
- **Operability**  
Returns whether the container is operable.
- **Parent**  
Returns the higher-level screen object.
- **Properties**  
allows access to the dynamic properties of the SWAC component.
- **RenderingTemplate**  
Returns the name of the template from which the container was created.
- **RequireExplicitUnlock**  
Returns whether the container is only operable while the corresponding button is being pressed.
- **ShowFocusVisual**  
Specifies whether the container is highlighted when it has the focus.
- **StyleItemClass**  
Returns the style that is applied to the container.

- **TabIndex**  
Returns the position of the container in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **Url**  
Specifies the URL of the SWAC component displayed by the container.
- **Visible**  
Specifies whether the container is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the container.

## Methods

The "SwacContainer" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the container.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "SwacContainer" object has the following events:

- **OnActivated()**  
Occurs when a container receives the focus.
- **OnDeactivated()**  
Occurs when a container loses the focus.

## SwacContainer.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

**Syntax**

`SwacContainer.Authorization`

**See also**

SwacContainer (Page 5839)

**SwacContainer.Caption**

**Description**

The "Caption" property specifies the text that is displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`SwacContainer.Caption`

**See also**

SwacContainer (Page 5839)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

SwacContainer.Caption (Page 5842)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 5842)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

### See also

Text.Font (Page 5842)

### Font.Size

#### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

#### Type

Float

#### Access

Read-write

#### Syntax

Font.Size

### See also

Text.Font (Page 5842)

### Font.StrikeOut

#### Description

The "StrikeOut" property specifies whether font is struck through.

#### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

#### Access

Read-write

**Syntax**`Font.StrikeOut`**See also**`Text.Font` (Page 5842)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**`Text.Font` (Page 5842)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 5842\)](#)

### Text.ForeColor

#### Description

The "ForeColor" property sets the font color of the text.

#### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[SwacContainer.Caption \(Page 5842\)](#)

### Text.Text

#### Description

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

SwacContainer.Caption (Page 5842)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

SwacContainer.Caption (Page 5842)

**SwacContainer.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`SwacContainer.CaptionColor`

**See also**

SwacContainer (Page 5839)

**SwacContainer.ContainedType**

**Description**

The "ContainedType" property returns the type of the contained SWAC component.

**Type**

String

**Access**

Read-only

**Syntax**

`SwacContainer.ContainedType`

**See also**

SwacContainer (Page 5839)

**SwacContainer.CurrentQuality**

**Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the container.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

```
SwacContainer.CurrentQuality
```

**See also**

SwacContainer (Page 5839)

**SwacContainer.Enabled****Description**

The "Enabled" property specifies whether the container can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
SwacContainer.Enabled
```

**See also**

SwacContainer (Page 5839)

## SwacContainer.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`SwacContainer.Height`

### See also

SwacContainer (Page 5839)

## SwacContainer.Icon

### Description

The "Icon" property specifies the icon of the container.

### Type

String

### Access

Read-write

### Syntax

`SwacContainer.Icon`

### See also

SwacContainer (Page 5839)

## SwacContainer.Layer

### Description

The "Layer" property returns the screen layer in which the container is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
SwacContainer.Layer
```

### See also

SwacContainer (Page 5839)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

SwacContainer.Layer (Page 5851)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

SwacContainer.Layer (Page 5851)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

SwacContainer.Layer (Page 5851)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[SwacContainer.Layer \(Page 5851\)](#)

## SwacContainer.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`SwacContainer.Left`

### See also

[SwacContainer \(Page 5839\)](#)

## SwacContainer.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`SwacContainer.Margin`

### See also

SwacContainer (Page 5839)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

SwacContainer.Margin (Page 5854)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[SwacContainer.Margin \(Page 5854\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[SwacContainer.Margin \(Page 5854\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[SwacContainer.Margin \(Page 5854\)](#)

## SwacContainer.Name

### Description

The "Name" property returns the name of the container.

### Type

String

### Access

Read-only

### Syntax

`SwacContainer.Name`

### See also

[SwacContainer \(Page 5839\)](#)

## SwacContainer.Operability

### Description

The "Operability" property returns whether the container is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
SwacContainer.Operability
```

### See also

SwacContainer (Page 5839)

## SwacContainer.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
SwacContainer.Parent
```

## See also

SwacContainer (Page 5839)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## SwacContainer.Properties

### Description

The "Properties" property allows access to the dynamic properties of the SWAC component.

### Type

Object, HmiDynamicPropertyPart

### Access

Read-write

### Syntax

```
SwacContainer.Properties
```

## See also

SwacContainer (Page 5839)

## SwacContainer.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the container was created.

### Type

String

**Access**

Read-only

**Syntax**`SwacContainer.RenderingTemplate`**See also**

SwacContainer (Page 5839)

**SwacContainer.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the container is only operable while the corresponding button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`SwacContainer.RequireExplicitUnlock`**See also**

SwacContainer (Page 5839)

**SwacContainer.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the container is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`SwacContainer.ShowFocusVisual`

**See also**

SwacContainer (Page 5839)

**SwacContainer.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the container.

**Type**

String

**Access**

Read-only

**Syntax**

`SwacContainer.StyleItemClass`

**See also**

SwacContainer (Page 5839)

**SwacContainer.TabIndex**

**Description**

The "TabIndex" property returns the position of the container in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`SwacContainer.TabIndex`**See also**

SwacContainer (Page 5839)

**SwacContainer.Top****Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`SwacContainer.Top`**See also**

SwacContainer (Page 5839)

**SwacContainer.Url****Description**

The "Url" property specifies the URL of the SWAC component displayed by the container.

**Type**

String

**Access**

Read-write

**Syntax**`SwacContainer.Url`

**See also**

SwacContainer (Page 5839)

**SwacContainer.Visible**

**Description**

The "Visible" property specifies whether the container is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`SwacContainer.Visible`

**See also**

SwacContainer (Page 5839)

**SwacContainer.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`SwacContainer.Width`

**See also**

SwacContainer (Page 5839)

## SwacContainer.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the container.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

### Note

You can enable multiple properties by adding integer values or bit operators.

---

### Access

Read-write

### Syntax

SwacContainer.WindowFlags

### Example

Adapting the "windowFlags" tag depending on the window configuration:

#### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

## See also

SwacContainer (Page 5839)

## SwacContainer.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the container.

### Syntax

```
SwacContainer.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

SwacContainer (Page 5839)

## SwacContainer.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

**Syntax**

```
SwacContainer.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

**Parameters****propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

SwacContainer (Page 5839)

## SwacContainer\_OnActivated()

### Description

The "OnActivated" event occurs when a container receives the focus:

- A container is selected via the configured tab sequence.
- A container that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
SwacContainer_OnActivated(item)
```

### Context

**item**

Type: Object

Container for which the event occurs.

### See also

SwacContainer (Page 5839)

## SwacContainer\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a container loses the focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
SwacContainer_OnDeactivated(item)
```

## Context

### **item**

Type: Object

Container for which the event occurs.

## See also

SwacContainer (Page 5839)

## SymbolContainer

### Description

The "SymbolContainer" object represents a container for displaying predefined symbols in runtime.

### Object type

HmiSymbolContainer

### Properties

The "SymbolContainer" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **ContainedType**  
Returns the type of the contained symbols.
- **CurrentQuality**  
Returns the worst quality code of all tags that influence the container.
- **Effect**  
Specifies the effect for the appearance of the symbols.
- **EffectColor**  
Specifies the effect color.
- **Enabled**  
Specifies whether the container can be operated in runtime.
- **Flip**  
Specifies whether the symbol is mirrored.
- **Height**  
Specifies the height.
- **Layer**  
Returns the screen layer in which the container is located.

- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the container.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the container is operable.
- **Parent**  
Returns the higher-level screen object.
- **ProcessValue**  
Specifies the process value.
- **Properties**  
Enables access to the dynamic properties of the symbols of the container.
- **RenderingTemplate**  
Returns the name of the template from which the container was created.
- **RequireExplicitUnlock**  
Returns whether the container is only operable while the corresponding button is being pressed.
- **RotationAngle**  
Specifies the rotation angle in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the container rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the container is highlighted when it has the focus.
- **StyleItemClass**  
Returns the style that is applied to the container.
- **TabIndex**  
Returns the position of the container in the tab sequence.
- **Thresholds**  
Returns the list of all limit values of the container.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.

- **Visible**  
Specifies whether the container is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "SymbolContainer" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the container.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "SymbolContainer" object has the following events:

- **OnActivated()**  
Occurs when a container receives the focus.
- **OnContextTapped()**  
Occurs when a container is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a container loses the focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the container is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the container is in focus.
- **OnTapped()**  
Occurs when a container is left-clicked or short-touched.

## SymbolContainer.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`SymbolContainer.Authorization`

### See also

[SymbolContainer \(Page 5867\)](#)

## SymbolContainer.ContainedType

### Description

The "ContainedType" property returns the type of the contained symbols.

### Type

String

### Access

Read-only

### Syntax

`SymbolContainer.ContainedType`

### See also

[SymbolContainer \(Page 5867\)](#)

## SymbolContainer.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the container.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.

- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

`SymbolContainer.CurrentQuality`

**See also**

[SymbolContainer \(Page 5867\)](#)

**SymbolContainer.Effect****Description**

The "Effect" property specifies the effect for the appearance of the symbols.

**Type**

Int32, HmiSymbolEffect

Specifies the effect.

- None (0): None
- UseEffectColor (1): Uses the "EffectColor".

**Access**

Read-write

**Syntax**

`SymbolContainer.Effect`

**See also**

[SymbolContainer \(Page 5867\)](#)

**SymbolContainer.EffectColor****Description**

The "EffectColor" property specifies the effect color for the symbols.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`SymbolContainer.EffectColor`

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Enabled**

**Description**

The "Enabled" property specifies whether the container can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`SymbolContainer.Enabled`

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Flip**

**Description**

The "Flip" property specifies whether the symbol is mirrored.

**Type**

Int32, HmiFlipMode

Specifies the mirroring:

- None (0): None
- Horizontal (1): Horizontal (mirrored at vertical axis)

**Access**

Read-write

**Syntax**

```
SymbolContainer.Flip
```

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Height****Description**

The "Height" property specifies the height in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
SymbolContainer.Height
```

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Layer****Description**

The "Layer" property returns the screen layer in which the container is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`SymbolContainer.Layer`

**See also**

SymbolContainer (Page 5867)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

SymbolContainer.Layer (Page 5873)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MinimumZoom`**See also**

SymbolContainer.Layer (Page 5873)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**`Layer.Name`**See also**

SymbolContainer.Layer (Page 5873)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

SymbolContainer.Layer (Page 5873)

**SymbolContainer.Left**

**Description**

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`SymbolContainer.Left`

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Margin**

**Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

SymbolContainer.Margin

**See also**

SymbolContainer (Page 5867)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Bottom

**See also**

SymbolContainer.Margin (Page 5876)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

SymbolContainer.Margin (Page 5876)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

SymbolContainer.Margin (Page 5876)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[SymbolContainer.Margin \(Page 5876\)](#)**SymbolContainer.Name****Description**

The "Name" property returns the name of the container.

**Type**

String

**Access**

Read-only

**Syntax**`SymbolContainer.Name`**See also**[SymbolContainer \(Page 5867\)](#)**SymbolContainer.Opacity****Description**

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

**Type**

Float

**Access**

Read-write

**Syntax**

`SymbolContainer.Opacity`

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Operability**

**Description**

The "Operability" property returns whether the container is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`SymbolContainer.Operability`

**See also**

SymbolContainer (Page 5867)

## SymbolContainer.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
SymbolContainer.Parent
```

### See also

SymbolContainer (Page 5867)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## SymbolContainer.ProcessValue

### Description

The "ProcessValue" property specifies the process value.

### Type

Variant

### Access

Read-write

### Syntax

```
SymbolContainer.ProcessValue
```

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Properties**

**Description**

The "Properties" property enables access to the dynamic properties of the symbols.

**Type**

Object, HmiDynamicPropertyPart

**Access**

Read-write

**Syntax**

`SymbolContainer.Properties`

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.RenderingTemplate**

**Description**

The "RenderingTemplate" property returns the name of the template from which the container was created.

**Type**

String

**Access**

Read-only

**Syntax**

`SymbolContainer.RenderingTemplate`

**See also**

[SymbolContainer \(Page 5867\)](#)

**SymbolContainer.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the container is only operable while the corresponding button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`SymbolContainer.RequireExplicitUnlock`

**See also**

[SymbolContainer \(Page 5867\)](#)

**SymbolContainer.RotationAngle****Description**

The "RotationAngle" property specifies the rotation angle in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**

`SymbolContainer.RotationAngle`

## See also

[SymbolContainer](#) (Page 5867)

[SymbolContainer.RotationCenterPlacement](#) (Page 5884)

[SymbolContainer.RotationCenterX](#) (Page 5885)

[SymbolContainer.RotationCenterY](#) (Page 5885)

## SymbolContainer.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the container rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

```
SymbolContainer.RotationCenterPlacement
```

## See also

[SymbolContainer](#) (Page 5867)

[SymbolContainer.RotationAngle](#) (Page 5883)

[SymbolContainer.RotationCenterX](#) (Page 5885)

[SymbolContainer.RotationCenterY](#) (Page 5885)

## SymbolContainer.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
SymbolContainer.RotationCenterX
```

### See also

[SymbolContainer \(Page 5867\)](#)

[SymbolContainer.RotationAngle \(Page 5883\)](#)

[SymbolContainer.RotationCenterPlacement \(Page 5884\)](#)

[SymbolContainer.RotationCenterY \(Page 5885\)](#)

## SymbolContainer.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
SymbolContainer.RotationCenterY
```

## See also

SymbolContainer (Page 5867)

SymbolContainer.RotationAngle (Page 5883)

SymbolContainer.RotationCenterPlacement (Page 5884)

SymbolContainer.RotationCenterX (Page 5885)

## SymbolContainer.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the container is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
SymbolContainer.ShowFocusVisual
```

## See also

SymbolContainer (Page 5867)

## SymbolContainer.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the container.

### Type

String

### Access

Read-only

### Syntax

```
SymbolContainer.StyleItemClass
```

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.TabIndex****Description**

The "TabIndex" property returns the position of the container in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`SymbolContainer.TabIndex`

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Thresholds****Description**

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the container.

**Type**

Object, HmiThresholdCollection (Page 5888)

**Access**

Read-only

**Syntax**

`SymbolContainer.Thresholds`

## See also

SymbolContainer (Page 5867)

HmiThresholdCollection (Page 5888)

## HmiThresholdCollection

### Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

### Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

### Object type

HmiThresholdCollection

### Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**  
Returns the number of limit values of the "HmiThresholdCollection" list.

### Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**  
Returns a limit value of the "HmiThresholdCollection" list.

## See also

SymbolContainer.Thresholds (Page 5887)

## HmiThresholdCollection.Count

### Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

### Type

UInt32

**Access**

Read-only

**Syntax**

`HmiThresholdCollection.Count`

**See also**

[HmiThresholdCollection \(Page 5888\)](#)

**HmiThresholdCollection.Item()****Description**

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

**Syntax**

`HmiThresholdCollection[.Item] (HmiThresholdName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

---

**Parameters****HmiThresholdName**

Type: String

Name of the limit value

**Return value**

Object, [HmiThresholdPart \(Page 5890\)](#)

**See also**

[HmiThresholdCollection \(Page 5888\)](#)

[Threshold \(Page 5890\)](#)

## Threshold

### Description

The "Threshold" object represents a limit value.

### Object type

HmiThresholdPart

### Properties

The "Threshold" object has the following properties:

- **Color**  
Specifies the color of the limit value.
- **DisplayName**  
Specifies the display name of the limit value.
- **Name**  
Specifies the name of the limit value.
- **ThresholdMode**  
Specifies the type of limit value.
- **Value**  
Returns the limit value.

### Methods

--

### See also

HmiThresholdCollection (Page 5888)

## Threshold.Color

### Description

The "Color" property specifies the color of the limit value.

### Type

UInt32

### Access

Read-write

**Syntax**`Threshold.Color`**See also**

Threshold (Page 5890)

**Threshold.DisplayName****Description**

The "DisplayName" property specifies the display name of the limit value.

**Type**

String

**Access**

Read-write

**Syntax**`Threshold.DisplayName`**See also**

Threshold (Page 5890)

**Threshold.Name****Description**

The "Name" property specifies the name of the limit value.

**Type**

String

**Access**

Read-write

**Syntax**`Threshold.Name`

## See also

Threshold (Page 5890)

## Threshold.ThresholdMode

### Description

The "ThresholdMode" property specifies the type of limit value.

### Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

### Access

Read-write

### Syntax

`Threshold.ThresholdMode`

## See also

Threshold (Page 5890)

## Threshold.Value

### Description

The "Value" property returns the limit value of the tag.

### Type

Float

**Access**

Read-only

**Syntax**`Threshold.Value`**See also**

Threshold (Page 5890)

**SymbolContainer.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**`SymbolContainer.ToolTipText`**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Top****Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`SymbolContainer.Top`

**See also**

[SymbolContainer \(Page 5867\)](#)

**SymbolContainer.Visible**

**Description**

The "Visible" property specifies whether the container is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`SymbolContainer.Visible`

**See also**

[SymbolContainer \(Page 5867\)](#)

**SymbolContainer.VisualizeQuality**

**Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
SymbolContainer.VisualizeQuality
```

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.Width****Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
SymbolContainer.Width
```

**See also**

SymbolContainer (Page 5867)

**SymbolContainer.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the container.

**Syntax**

```
SymbolContainer.CheckAuthorization()
```

**Parameters**

--

## Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

SymbolContainer (Page 5867)

## SymbolContainer.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
SymbolContainer.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

#### **propertyName**

Type: String

Name of the property for which flashing is configured.

#### **enable**

Type: Bool

Specifies that flashing is activated.

#### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

#### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

SymbolContainer (Page 5867)

**SymbolContainer\_OnActivated()****Description**

The "OnActivated" event occurs when a container receives the focus:

- A container is selected via the configured tab sequence.
- A container that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
SwacContainer_OnActivated(item)
```

**Context****item**

Type: Object

Container for which the event occurs.

## See also

SymbolContainer (Page 5867)

## SymbolContainer\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A container is right-clicked.
- A container is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

SymbolContainer\_OnContextTapped(item, x, y, modifiers, trigger)

### Context

#### **item**

Type: Object

Container where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

SymbolContainer (Page 5867)

**SymbolContainer\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when a container loses the focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
SwacContainer_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Container for which the event occurs.

### See also

SymbolContainer (Page 5867)

## SymbolContainer\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the container is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
SymbolContainer_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Container where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

SymbolContainer (Page 5867)

## SymbolContainer\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the container is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
SymbolContainer_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Container where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

SymbolContainer (Page 5867)

## SymbolContainer\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A container type is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an container has the focus.
- A container is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
SymbolContainer_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Container where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

SymbolContainer (Page 5867)

**SymbolicIOField****Description**

The "SymbolicIOField" object represents a symbolic I/O field for the input and display of text or graphic objects as a list in runtime.

## Object type

HmiSymbolicIOField

## Properties

The "SymbolicIOField" object has the following properties:

- **AcceptExplicitely**  
Specifies whether the process value is only written by explicit triggering of double-click, enter key, or tab.
- **AcceptOnDeactivated**  
Specifies whether the process value is written when the symbolic I/O field loses the input focus.
- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **AutoTabOnAccept**  
Specifies whether a switch to the next object in the configured tab sequence occurs automatically after a value is entered.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **Content**  
Specifies the display options for text and graphics.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the symbolic I/O field.
- **Enabled**  
Specifies whether the symbolic I/O field can be operated in runtime.
- **ExpandOnActivate**  
Specifies whether the list drops down when the symbolic I/O field receives focus.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Graphic**  
Returns the graphic of the graphics list according to the process value.
- **Height**  
Specifies the height.

- **IOFieldType**  
Specifies the mode of the symbolic I/O field.
- **Layer**  
Returns the layer of the screen in which the symbolic I/O field is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the symbolic I/O field.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the symbolic I/O field is operable.
- **Padding**  
Specifies the distance of the content from the border of the symbolic I/O field.
- **Parent**  
Returns the higher-level screen object.
- **ProcessValue**  
Specifies the process value.
- **RenderingTemplate**  
Returns the name of the template from which the symbolic I/O field was created.
- **RequireExplicitUnlock**  
Returns whether the symbolic I/O field is only operable while the associated button is being pressed.
- **ResourceList**  
Specifies the text or graphics list.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the symbolic I/O field rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **SelectedIndex**  
Specifies the index for the selected list entry.
- **SelectionBackColor**  
Specifies the background color of the selected list entry.
- **SelectionForeColor**  
Specifies the font color of the text of the selected list entry.

- **ShowFocusVisual**  
Specifies whether the symbolic I/O field is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the symbolic I/O field.
- **TabIndex**  
Returns the position of the symbolic I/O field in the tab sequence.
- **Text**  
Returns the text of the text list according to the process value.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the symbolic I/O field is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "SymbolicIOField" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the symbolic I/O field.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "SymbolicIOField" object has the following events:

- **OnActivated()**  
Occurs when a symbolic I/O field receives focus.
- **OnContextTapped()**  
Occurs when a symbolic I/O field is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a symbolic I/O field loses the focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the symbolic I/O field is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the symbolic I/O field is in focus.
- **OnTapped()**  
Occurs when a symbolic I/O field is left-clicked or short-touched.

## SymbolicIOField.AcceptExplicitely

### Description

The "AcceptExplicitely" property specifies whether the process value is only written by explicit triggering of double-click, Enter key, or tab.

### Type

Bool

### Access

Read-write

### Syntax

`SymbolicIOField.AcceptExplicitely`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.AcceptOnDeactivated

### Description

The "AcceptOnDeactivated" property specifies whether the process value is written when the symbolic I/O field loses the input focus.

### Type

Bool

### Access

Read-write

### Syntax

`SymbolicIOField.AcceptOnDeactivated`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

SymbolicIOField.AlternateBackColor

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

SymbolicIOField.AlternateBorderColor

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
SymbolicIOField.Authorization
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.AutoTabOnAccept

### Description

The "AutoTabOnAccept" property specifies whether a switch to the next object in the configured tab sequence occurs automatically after a value is entered.

### Type

Bool

### Access

Read-write

### Syntax

```
SymbolicIOField.AutoTabOnAccept
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`SymbolicIOField.BackColor`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`SymbolicIOField.BorderColor`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
SymbolicIOField.BorderWidth
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Content

### Description

The "Content" property specifies the display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
SymbolicIOField.Content
```

### See also

SymbolicIOField (Page 5903)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[SymbolicIOField.Content \(Page 5911\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[SymbolicIOField.Content \(Page 5911\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[SymbolicIOField.Content \(Page 5911\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[SymbolicIOField.Content \(Page 5911\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[SymbolicIOField.Content \(Page 5911\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

SymbolicIOField.Content (Page 5911)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[SymbolicIOField.Content \(Page 5911\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[SymbolicIOField.Content \(Page 5911\)](#)

## SymbolicIOField.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the symbolic I/O field.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

```
SymbolicIOField.CurrentQuality
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Enabled

### Description

The "Enabled" property specifies whether the symbolic I/O field can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`SymbolicIOField.Enabled`

### See also

[SymbolicIOField \(Page 5903\)](#)

## SymbolicIOField.ExpandOnActivate

### Description

The "ExpandOnActivate" property specifies whether the list drops down when the symbolic I/O field receives focus.

### Type

Bool

### Access

Read-write

### Syntax

`SymbolicIOField.ExpandOnActivate`

### See also

[SymbolicIOField \(Page 5903\)](#)

## SymbolicIOField.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

**Syntax**`SymbolicIOField.Font`**See also**[SymbolicIOField \(Page 5903\)](#)**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**`Bool`**Access**`Read-write`**Syntax**`Font.Italic`**See also**[SymbolicIOField.Font \(Page 5918\)](#)**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**`String`**Access**`Read-write`

## Syntax

Font.Name

## See also

SymbolicIOField.Font (Page 5918)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

## Syntax

Font.Size

## See also

SymbolicIOField.Font (Page 5918)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

SymbolicIOField.Font (Page 5918)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

SymbolicIOField.Font (Page 5918)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[SymbolicIOField.Font \(Page 5918\)](#)

## SymbolicIOField.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`SymbolicIOField.ForeColor`

### See also

[SymbolicIOField \(Page 5903\)](#)

## SymbolicIOField.Graphic

### Description

The "Graphic" property returns the graphic of the graphics list according to the process value.

### Type

String

### Access

Read-only

### Syntax

```
SymbolicIOField.Graphic
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
SymbolicIOField.Height
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.IOFieldType

### Description

The "IOFieldType" property specifies the mode of the symbolic I/O field.

### Type

Int32, HmiIOFieldType

Specifies the type:

- Output (0): Output only
- InputOutput (2): Input and output

### Access

Read-write

### Syntax

`SymbolicIOField.IOFieldType`

### See also

[SymbolicIOField \(Page 5903\)](#)

## SymbolicIOField.Layer

### Description

The "Layer" property returns the layer of the screen in which the symbolic I/O field is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`SymbolicIOField.Layer`

### See also

[SymbolicIOField \(Page 5903\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

SymbolicIOField.Layer (Page 5924)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

SymbolicIOField.Layer (Page 5924)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[SymbolicIOField.Layer \(Page 5924\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[SymbolicIOField.Layer \(Page 5924\)](#)

## SymbolicIOField.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

```
SymbolicIOField.Left
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
SymbolicIOField.Margin
```

### See also

SymbolicIOField (Page 5903)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[SymbolicIOField.Margin \(Page 5927\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[SymbolicIOField.Margin \(Page 5927\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[SymbolicIOField.Margin \(Page 5927\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[SymbolicIOField.Margin \(Page 5927\)](#)

## SymbolicIOField.Name

### Description

The "Name" property returns the name of the symbolic I/O field.

### Type

String

### Access

Read-only

### Syntax

`SymbolicIOField.Name`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`SymbolicIOField.Opacity`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Operability

### Description

The "Operability" property returns whether the symbolic I/O field is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`SymbolicIOField.Operability`

### See also

[SymbolicIOField \(Page 5903\)](#)

## SymbolicIOField.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the symbolic I/O field.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`SymbolicIOField.Padding`

**See also**

SymbolicIOField (Page 5903)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Bottom

**See also**

SymbolicIOField.Padding (Page 5931)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Left

**See also**

SymbolicIOField.Padding (Page 5931)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

SymbolicIOField.Padding (Page 5931)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

## See also

[SymbolicIOField.Padding \(Page 5931\)](#)

## SymbolicIOField.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
SymbolicIOField.Parent
```

## See also

[SymbolicIOField \(Page 5903\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

[Screen Items \(Page 1742\)](#)

## SymbolicIOField.ProcessValue

### Description

The "ProcessValue" property specifies the process value.

### Type

Variant

**Access**

Read-write

**Syntax**`SymbolicIOField.ProcessValue`**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the symbolic I/O field was created.

**Type**

String

**Access**

Read-only

**Syntax**`SymbolicIOField.RenderingTemplate`**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the symbolic I/O field can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`SymbolicIOField.RequireExplicitUnlock`

**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField.ResourceList**

**Description**

The "ResourceList" property specifies the text or graphics list.

**Type**

String, HmiResourceList

**Access**

Read-write

**Syntax**

`SymbolicIOField.ResourceList`

**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField.RotationAngle**

**Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**

`SymbolicIOField.RotationAngle`

**See also**

[SymbolicIOField \(Page 5903\)](#)

[SymbolicIOField.RotationCenterPlacement \(Page 5937\)](#)

[SymbolicIOField.RotationCenterX \(Page 5938\)](#)

[SymbolicIOField.RotationCenterY \(Page 5938\)](#)

**SymbolicIOField.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property sets the reference point around which the symbolic I/O field rotates.

**Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

**Access**

Read-write

**Syntax**

`SymbolicIOField.RotationCenterPlacement`

**See also**

[SymbolicIOField \(Page 5903\)](#)

[SymbolicIOField.RotationAngle \(Page 5936\)](#)

[SymbolicIOField.RotationCenterX \(Page 5938\)](#)

[SymbolicIOField.RotationCenterY \(Page 5938\)](#)

## SymbolicIOField.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`SymbolicIOField.RotationCenterX`

### See also

[SymbolicIOField \(Page 5903\)](#)

[SymbolicIOField.RotationAngle \(Page 5936\)](#)

[SymbolicIOField.RotationCenterPlacement \(Page 5937\)](#)

[SymbolicIOField.RotationCenterY \(Page 5938\)](#)

## SymbolicIOField.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`SymbolicIOField.RotationCenterY`

**See also**

[SymbolicIOField \(Page 5903\)](#)

[SymbolicIOField.RotationAngle \(Page 5936\)](#)

[SymbolicIOField.RotationCenterPlacement \(Page 5937\)](#)

[SymbolicIOField.RotationCenterX \(Page 5938\)](#)

**SymbolicIOField.SelectedIndex****Description**

The "SelectedIndex" property specifies the index of the selected list entry. Returns the index according to the process value. The index is "-1", if no selection is available or the process value does not match.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
SymbolicIOField.SelectedIndex
```

**See also**

[SymbolicIOField \(Page 5903\)](#)

**SymbolicIOField.SelectionBackColor****Description**

The "SelectionBackColor" property specifies the background color of the selected list entry

**Type**

UInt32

**Access**

Read-write

**Syntax**

`SymbolicIOField.SelectionBackColor`

**See also**

[SymbolicIOField \(Page 5903\)](#)

**SymbolicIOField.SelectionForeColor**

**Description**

The "SelectionForeColor" property specifies the font color of the text of the selected list entry.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`SymbolicIOField.SelectionForeColor`

**See also**

[SymbolicIOField \(Page 5903\)](#)

**SymbolicIOField.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the symbolic I/O field is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`SymbolicIOField.ShowFocusVisual`**See also**[SymbolicIOField \(Page 5903\)](#)**SymbolicIOField.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the symbolic I/O field.

**Type**

String

**Access**

Read-only

**Syntax**`SymbolicIOField.StyleItemClass`**See also**[SymbolicIOField \(Page 5903\)](#)**SymbolicIOField.TabIndex****Description**

The "TabIndex" property returns the position of the symbolic I/O field in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`SymbolicIOField.TabIndex`

**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField.Text**

**Description**

The "Text" property returns the text of the text list according to the process value.

**Type**

String

**Access**

Read-only

**Syntax**

SymbolicIOField.Text

**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

SymbolicIOField.ToolTipText

**See also**

SymbolicIOField (Page 5903)

## SymbolicIOField.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`SymbolicIOField.Top`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Visible

### Description

The "Visible" property specifies whether the symbolic I/O field is visible.

### Type

Bool

### Access

Read-write

### Syntax

`SymbolicIOField.Visible`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`SymbolicIOField.VisualizeQuality`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`SymbolicIOField.Width`

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the symbolic I/O field.

### Syntax

```
SymbolicIOField.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
SymbolicIOField.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

SymbolicIOField (Page 5903)

## SymbolicIOField\_OnActivated()

### Description

The "OnActivated" event occurs when a symbolic I/O field receives focus:

- A symbolic I/O field is selected via the configured tab sequence.
- A symbolic I/O field that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
SymbolicIOField_OnActivated(item)
```

### Context

**item**

Type: Object

Symbolic I/O field where the event occurs.

### See also

SymbolicIOField (Page 5903)

## SymbolicIOField\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A symbolic I/O field is right-clicked.
- A symbolic I/O field is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
SymbolicIOField_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Symbolic I/O field where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the symbolic I/O field loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
SymbolicIOField_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Symbolic I/O field where the event occurs.

**See also**

SymbolicIOField (Page 5903)

**SymbolicIOField\_OnKeyDown()****Description**

The "OnKeyDown" event occurs when a key is pressed while the symbolic I/O field is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
SymbolicIOField_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Symbolic I/O field where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

SymbolicIOField (Page 5903)

## SymbolicIOField\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the symbolic I/O field is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
SymbolicIOField_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

Symbolic I/O field where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**[SymbolicIOField \(Page 5903\)](#)

## SymbolicIOField\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A symbolic I/O field is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a symbolic I/O field has the focus.
- A symbolic I/O field is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
SymbolicIOField_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Symbolic I/O field where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

SymbolicIOField (Page 5903)

**SystemDiagnosisControl**

**Description**

The "SystemDiagnosisControl" object represents a system diagnostics control in runtime.

**Object type**

HmiSystemDiagnosisControl

## Properties

The "SystemDiagnosisControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the system diagnostics control.
- **DiagnosisBufferPathText**  
Specifies the path to the diagnostic buffer.
- **DiagnosisOverviewPathText**  
Specifies the path to the diagnostics overview.
- **Enabled**  
Specifies whether the system diagnostics control can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the system diagnostics control.
- **Layer**  
Returns the screen layer in which the system diagnostics control is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **MatrixView**  
Specifies the matrix view of the system diagnostics control.
- **Name**  
Returns the name of the system diagnostics control.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the system diagnostics control was created.
- **ShowFocusVisual**  
Specifies whether the system diagnostics control is highlighted when in focus.
- **ShowStatusPath**  
Specifies that the status path is displayed.
- **StatusBar**  
Specifies the information bar of the system diagnostics control.
- **StyleItemClass**  
Returns the style which is applied to the system diagnostics control.

- **SystemDiagnosisView**  
Specifies the table layout.
- **SystemDiagnosisViewType**  
Specifies the type of table layout.
- **TabIndex**  
Returns the position of the system diagnostics control in the tab sequence.
- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Specifies the toolbar of the system diagnostics control.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the system diagnostics control is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the system diagnostics control.

## Methods

The "SystemDiagnosisControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the system diagnostics control.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the system diagnostics control.
- **GoToPlc()**  
Navigates to the next PLC.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "SystemDiagnosisControl" object has the following events:

- **OnActivated()**  
Occurs when a system diagnostics control receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the system diagnostics control.

- **OnDeactivated()**  
Occurs when a system diagnostics control loses focus.
- **OnInitialized()**  
Occurs when a system diagnostics control has been successfully initialized and the data connection to the PLC has been established.

## SystemDiagnosisControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`SystemDiagnosisControl.BackColor`

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.Caption

### Description

The "Caption" property specifies the text to be displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`SystemDiagnosisControl.Caption`

**See also**

SystemDiagnosisControl (Page 5953)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

SystemDiagnosisControl.Caption (Page 5956)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 5957)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 5957)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 5957)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

Text.Font (Page 5957)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

`Text.Font` (Page 5957)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

`Text.Font` (Page 5957)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Text.ForeColor`**See also**

SystemDiagnosisControl.Caption (Page 5956)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

SystemDiagnosisControl.Caption (Page 5956)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

SystemDiagnosisControl.Caption (Page 5956)

**SystemDiagnosisControl.CaptionColor**

**Description**

The "CaptionColor" property specifies the background color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`SystemDiagnosisControl.CaptionColor`

**See also**

SystemDiagnosisControl (Page 5953)

**SystemDiagnosisControl.CurrentQuality**

**Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the system diagnostics control.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

```
SystemDiagnosisControl.CurrentQuality
```

**See also**

SystemDiagnosisControl (Page 5953)

**SystemDiagnosisControl.DiagnosisBufferPathText****Description**

The "DiagnosisBufferPathText" property specifies the path to the diagnostic buffer.

**Type**

String

**Access**

Read-write

**Syntax**

```
SystemDiagnosisControl.DiagnosisBufferPathText
```

**See also**

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.DiagnosisOverviewPathText

### Description

The "DiagnosisOverviewPathText" property specifies the path to the diagnostics overview.

### Type

String

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.DiagnosisOverviewPathText
```

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.Enabled

### Description

The "Enabled" property specifies whether the system diagnostics control can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.Enabled
```

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.Height

### Description

The "Height" property specifies the height.

### Type

UInt32

### Access

Read-write

### Syntax

`SystemDiagnosisControl.Height`

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.Icon

### Description

The "Icon" property specifies the icon of the system diagnostics control.

### Type

String

### Access

Read-write

### Syntax

`SystemDiagnosisControl.Icon`

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.Layer

### Description

The "Layer" property returns the screen layer in which the system diagnostics control is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`SystemDiagnosisControl.Layer`

### See also

SystemDiagnosisControl (Page 5953)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

SystemDiagnosisControl.Layer (Page 5966)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

SystemDiagnosisControl.Layer (Page 5966)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

```
Layer.Name
```

### See also

SystemDiagnosisControl.Layer (Page 5966)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[SystemDiagnosisControl.Layer \(Page 5966\)](#)

## SystemDiagnosisControl.Left

### Description

The "Left" property specifies the value of the X coordinate.

### Type

Int32

### Access

Read-write

### Syntax

`SystemDiagnosisControl.Left`

### See also

[SystemDiagnosisControl \(Page 5953\)](#)

## SystemDiagnosisControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.Margin
```

### See also

SystemDiagnosisControl (Page 5953)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

SystemDiagnosisControl.Margin (Page 5969)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[SystemDiagnosisControl.Margin \(Page 5969\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[SystemDiagnosisControl.Margin \(Page 5969\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

SystemDiagnosisControl.Margin (Page 5969)

**SystemDiagnosisControl.MatrixView****Description**

The "MatrixView" property specifies the matrix view of the system diagnostics control.

**Type**

Object, HmiMatrixViewPart

**Access**

Read-write

**Syntax**

SystemDiagnosisControl.MatrixView

**See also**

SystemDiagnosisControl (Page 5953)

## MatrixView.TileBorderWidth

### Description

The "TileBorderWidth" property specifies the border width of the tile.

### Type

UInt8

### Access

Read-write

### Syntax

`MatrixView.TileBorderWidth`

### See also

[SystemDiagnosisControl.MatrixView \(Page 5971\)](#)

## MatrixView.TileHeightMax

### Description

The "TileHeightMax" property specifies the maximum height of the tile.

### Type

UInt16

### Access

Read-write

### Syntax

`MatrixView.TileHeightMax`

### See also

[SystemDiagnosisControl.MatrixView \(Page 5971\)](#)

## MatrixView.TileHeightMin

### Description

The "TileHeightMin" property specifies the minimum height of the tile.

### Type

UInt16

### Access

Read-write

### Syntax

```
MatrixView.TileHeightMin
```

### See also

SystemDiagnosisControl.MatrixView (Page 5971)

## MatrixView.TileWidthMax

### Description

The "TileWidthMax" property specifies the maximum width of the tile.

### Type

UInt16

### Access

Read-write

### Syntax

```
MatrixView.TileWidthMax
```

### See also

SystemDiagnosisControl.MatrixView (Page 5971)

## MatrixView.TileWidthMin

### Description

The "TileWidthMin" property specifies the minimum width of the tile.

### Type

UInt16

### Access

Read-write

### Syntax

```
MatrixView.TileWidthMin
```

### See also

SystemDiagnosisControl.MatrixView (Page 5971)

## MatrixView.HardwareDetails

### Description

The "HardwareDetails" property returns a list of the HMI device hardware details.

### Type

Object, HmiSystemDiagnosisHardwareDetailCollection (Page 5975)

### Access

Read-only

### Syntax

```
MatrixView.HardwareDetails
```

### See also

SystemDiagnosisControl.MatrixView (Page 5971)

HmiSystemDiagnosisHardwareDetailCollection (Page 5975)

## HmiSystemDiagnosisHardwareDetailCollection

### Description

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list of all hardware details ("HmiSystemDiagnosisHardwareDetailPart" objects) of the HMI device on which the system diagnostics were activated.

You can reference the "HmiSystemDiagnosisHardwareDetailCollection" object via the "MatrixView.HardwareDetails" property.

### Use

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list which can be counted and enumerated. You can access the "HmiSystemDiagnosisHardwareDetailCollection" list using the index or the tag names.

### Object type

HmiSystemDiagnosisHardwareDetailCollection

### Properties

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following properties:

- **Count**  
Returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

### Methods

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following methods:

- **Item()**  
Returns the name of a hardware detail.

### See also

MatrixView.HardwareDetails (Page 5974)

SystemDiagnosisControl.MatrixView (Page 5971)

## HmiSystemDiagnosisHardwareDetailCollection.Count

### Description

The "Count" property returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiSystemDiagnosisHardwareDetailCollection.Count
```

### See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5975)

MatrixView.HardwareDetails (Page 5974)

## HmiSystemDiagnosisHardwareDetailCollection.Item()

### Description

The "Item" method returns a hardware detail of the "HmiSystemDiagnosisHardwareDetailCollection" list.

### Syntax

```
HmiSystemDiagnosisHardwareDetailCollection[.Item]  
(HmiSystemDiagnosisHardwareDetailName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSystemDiagnosisHardwareDetailCollection" object.

---

### Parameters

#### HmiSystemDiagnosisHardwareDetailName

Type: String

Name of a hardware detail

### Return value

Object, HmiSystemDiagnosisHardwareDetailPart (Page 5977)

## See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5975)

SystemDiagnosisHardwareDetail (Page 5977)

## SystemDiagnosisHardwareDetail

### Description

The "SystemDiagnosisHardwareDetail" object represents a hardware detail.

### Object type

HmiSystemDiagnosisHardwareDetailPart

### Properties

The "SystemDiagnosisHardwareDetail" object has the following properties:

- **SystemDiagnosisMatrixBlock**  
Sets the matrix block of the system diagnostics control.
- **Visible**  
Specifies whether the hardware detail is visible.

### Methods

--

## See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5975)

MatrixView.HardwareDetails (Page 5974)

## SystemDiagnosisHardwareDetail.SystemDiagnosisMatrixBlock

### Description

The "SystemDiagnosisMatrixBlock" property specifies the matrix block of a hardware detail.

### Type

Int32, HmiSystemDiagnosisMatrixBlock

Specifies the type of matrix block.

- Undefined (0): None
- Status (1): Status

- Name (2): Name
- OperatingState (3): Operating state
- Rack (4): Rack
- Slot (5): Slot
- OrderNumber (6): Order number
- Address (7): Address
- PlantDesignation (8): Plant Designation
- LocationIdentifier (9): Location identifier
- Subsystem (10): Subsystem
- Station (11): Station
- Subslot (12): Subslot
- SubAddress (13): Subaddress
- SoftwareVersion (14): Software Version
- Installation (15): Installation
- AdditionalInformation (16): Additional information
- ErrorDescription (17): Error description
- ManufacturerID (18): Manufacturer ID
- HardwareVersion (19): Hardware version
- ProfileID (20): Profile ID
- SpecificProfileData (21): Specific profile data
- landMDataVersion (22): I and M Data Version
- SerialNumber (23): Serial number
- RevisionCounter (24): Version counter
- Type (25): Type
- IPAddress (32): IP addresses

### Access

Read-write

### Syntax

`SystemDiagnosisHardwareDetail.SystemDiagnosisMatrixBlock`

### See also

[SystemDiagnosisHardwareDetail \(Page 5977\)](#)

[HmiSystemDiagnosisHardwareDetailCollection \(Page 5975\)](#)

## SystemDiagnosisHardwareDetail.Visible

### Description

The "Visible" property specifies whether the hardware detail is visible.

### Type

Bool

### Access

Read-write

### Syntax

`SystemDiagnosisHardwareDetail.Visible`

### See also

[SystemDiagnosisHardwareDetail \(Page 5977\)](#)

[HmiSystemDiagnosisHardwareDetailCollection \(Page 5975\)](#)

## MatrixView.SystemDiagnosisHardwareDetailView

### Description

The "SystemDiagnosisHardwareDetailView" property specifies the view of the hardware detail.

### Type

Object, HmiSystemDiagnosisDetailViewPart

### Access

Read-write

### Syntax

`MatrixView.SystemDiagnosisHardwareDetailView`

### See also

[SystemDiagnosisControl.MatrixView \(Page 5971\)](#)

[SystemDiagnosisControl \(Page 5953\)](#)

## SystemDiagnosisDetailView.AllowFilter

### Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

### Type

Bool

### Access

Read-write

### Syntax

```
SystemDiagnosisDetailView.AllowFilter
```

### See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

## SystemDiagnosisDetailView.AllowSort

### Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "True".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

### Type

Bool

### Access

Read-write

### Syntax

```
SystemDiagnosisDetailView.AllowSort
```

**See also**

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

**SystemDiagnosisDetailView.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
SystemDiagnosisDetailView.AlternateBackColor
```

**See also**

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

**SystemDiagnosisDetailView.AlternateForeColor****Description**

The "AlternateForeColor" property specifies the second foreground color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
SystemDiagnosisDetailView.AlternateForeColor
```

### See also

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

## SystemDiagnosisDetailView.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
SystemDiagnosisDetailView.BackColor
```

### See also

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

## SystemDiagnosisDetailView.CellPadding

### Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
SystemDiagnosisDetailView.CellPadding
```

**See also**

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[SystemDiagnosisDetailView.CellPadding \(Page 5982\)](#)

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

### See also

SystemDiagnosisDetailView.CellPadding (Page 5982)

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

SystemDiagnosisDetailView.CellPadding (Page 5982)

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

**See also**

SystemDiagnosisDetailView.CellPadding (Page 5982)

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.ColoringMode****Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

**Access**

Read-write

**Syntax**

```
SystemDiagnosisDetailView.ColoringMode
```

**See also**

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`SystemDiagnosisDetailView.Font`

**See also**

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[SystemDiagnosisDetailView.Font \(Page 5985\)](#)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

SystemDiagnosisDetailView.Font (Page 5985)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

SystemDiagnosisDetailView.Font (Page 5985)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[SystemDiagnosisDetailView.Font \(Page 5985\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[SystemDiagnosisDetailView.Font \(Page 5985\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

```
Font.Weight
```

**See also**

[SystemDiagnosisDetailView.Font \(Page 5985\)](#)

**SystemDiagnosisDetailView.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
SystemDiagnosisDetailView.ForeColor
```

**See also**

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

## SystemDiagnosisDetailView.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

`SystemDiagnosisDetailView.GridLineColor`

### See also

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

## SystemDiagnosisDetailView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies whether the grid lines are visible.

### Type

Int32, HmiSimpleGridLine

Specifies the visibility of the grid lines:

- None (0): None
- Vertikal (1): Vertical grid lines visible
- Horizontal (2): Horizontal grid lines visible

### Access

Read-write

### Syntax

`SystemDiagnosisDetailView.GridLineVisibility`

**See also**

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.GridLineWidth****Description**

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

**Type**

UInt8

**Access**

Read-write

**Syntax**

SystemDiagnosisDetailView.GridLineWidth

**See also**

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.GridSelectionMode****Description**

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

**Type**

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

**Access**

Read-write

## Syntax

`SystemDiagnosisDetailView.GridSelectionMode`

## See also

`MatrixView.SystemDiagnosisHardwareDetailView` (Page 5979)

## SystemDiagnosisDetailView.HardwareDetails

### Description

The "HardwareDetails" property returns a list of all hardware details.

### Type

Object, `HmiSystemDiagnosisHardwareDetailCollection` (Page 5992)

### Access

Read-only

### Syntax

`SystemDiagnosisDetailView.HardwareDetails`

## See also

`MatrixView.SystemDiagnosisHardwareDetailView` (Page 5979)

`HmiSystemDiagnosisHardwareDetailCollection` (Page 5992)

## HmiSystemDiagnosisHardwareDetailCollection

### Description

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list of all hardware details ("HmiSystemDiagnosisHardwareDetailPart" objects) of the HMI device on which the system diagnostics were activated.

You can reference the "HmiSystemDiagnosisHardwareDetailCollection" object via the "`SystemDiagnosisDetailView.HardwareDetails`" property.

### Use

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list which can be counted and enumerated. You can access the "HmiSystemDiagnosisHardwareDetailCollection" list using the index or the tag names.

**Object type**

HmiSystemDiagnosisHardwareDetailCollection

**Properties**

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following properties:

- **Count**  
Returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

**Methods**

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following methods:

- **Item()**  
Returns the name of a hardware detail.

**See also**

SystemDiagnosisDetailView.HardwareDetails (Page 5992)

**HmiSystemDiagnosisHardwareDetailCollection.Count****Description**

The "Count" property returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
HmiSystemDiagnosisHardwareDetailCollection.Count
```

**See also**

HmiSystemDiagnosisHardwareDetailCollection (Page 5992)

## HmiSystemDiagnosisHardwareDetailCollection.Item()

### Description

The "Item" method returns a hardware detail of the "HmiSystemDiagnosisHardwareDetailCollection" list.

### Syntax

```
HmiSystemDiagnosisHardwareDetailCollection[.Item]  
(HmiSystemDiagnosisHardwareDetailName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSystemDiagnosisHardwareDetailCollection" object.

---

### Parameters

#### HmiSystemDiagnosisHardwareDetailName

Type: String

Name of a hardware detail

### Return value

Object, HmiSystemDiagnosisHardwareDetailPart (Page 5994)

### See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5992)

SystemDiagnosisHardwareDetail (Page 5994)

## SystemDiagnosisHardwareDetail

### Description

SystemDiagnosisHardwareDetail (Page 5977)

## SystemDiagnosisDetailView.HeaderSettings

### Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

**Type**

Object, HmiDataGridHeaderSettingsPart

**Access**

Read-write

**Syntax**

`SystemDiagnosisDetailView.HeaderSettings`

**See also**

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

**DataGridHeaderSettings.AllowColumnReorder****Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.AllowColumnReorder`

**See also**

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

**DataGridHeaderSettings.AllowColumnResize****Description**

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.AllowColumnResize`

**See also**

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

**DataGridHeaderSettings.ColumnHeaderType**

**Description**

The "ColumnHeaderType" property specifies the type of content of a column header.

**Type**

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.ColumnHeaderType`

**See also**

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

## DataGridHeaderSettings.Font

### Description

The "Font" property specifies the font of the headers.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.Font
```

### See also

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

[DataGridHeaderSettings.Font \(Page 5997\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

DataGridHeaderSettings.Font (Page 5997)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

DataGridHeaderSettings.Font (Page 5997)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

DataGridHeaderSettings.Font (Page 5997)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

### See also

DataGridHeaderSettings.Font (Page 5997)

### Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

### See also

DataGridHeaderSettings.Font (Page 5997)

### DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.HeaderBackColor`**See also**

SystemDiagnosisDetailView.HeaderSettings (Page 5994)

**DataGridHeaderSettings.HeaderForeColor****Description**

The "HeaderForeColor" property specifies the font color of the headers.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.HeaderForeColor`**See also**

SystemDiagnosisDetailView.HeaderSettings (Page 5994)

**DataGridHeaderSettings.HeaderGridLineColor****Description**

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.HeaderGridLineColor`

**See also**

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

**DataGridHeaderSettings.HeaderSelectionBackColor**

**Description**

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.HeaderSelectionBackColor`

**See also**

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

**DataGridHeaderSettings.HeaderSelectionForeColor**

**Description**

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Object.HeaderSelectionForeColor`

**Object**

Required. An object from the "Availability" section.

**See also**

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

**DataGridHeaderSettings.RowHeaderType****Description**

The "RowHeaderType" property specifies the type of content of a row header.

**Type**

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.RowHeaderType`

**See also**

[SystemDiagnosisDetailView.HeaderSettings \(Page 5994\)](#)

## SystemDiagnosisDetailView.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
SystemDiagnosisDetailView.HorizontalScrollBarVisibility
```

### See also

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

## SystemDiagnosisDetailView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

### Type

UInt8

### Access

Read-write

**Syntax**

```
SystemDiagnosisDetailView.RowHeight
```

**See also**

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.SelectFullRow****Description**

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
SystemDiagnosisDetailView.SelectFullRow
```

**See also**

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.SelectionBackColor****Description**

The "SelectionBackColor" property specifies the background color of the selected cells.

**Type**

UInt32

**Access**

Read-write

## Syntax

`SystemDiagnosisDetailView.SelectionBackColor`

## See also

`MatrixView.SystemDiagnosisHardwareDetailView` (Page 5979)

## SystemDiagnosisDetailView.SelectionBorderColor

### Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

### Type

UInt8

### Access

Read-write

## Syntax

`DataGridView.SelectionBorderColor`

## See also

`MatrixView.SystemDiagnosisHardwareDetailView` (Page 5979)

## SystemDiagnosisDetailView.SelectionBorderWidth

### Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

### Type

UInt8

### Access

Read-write

**Syntax**

```
SystemDiagnosisDetailView.SelectionBorderWidth
```

**See also**

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.SelectionForeColor****Description**

The "SelectionForeColor" property specifies the font color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
SystemDiagnosisDetailView.SelectionForeColor
```

**See also**

MatrixView.SystemDiagnosisHardwareDetailView (Page 5979)

**SystemDiagnosisDetailView.VerticalScrollBarVisibility****Description**

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

**Type**

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

**Access**

Read-write

**Syntax**

`SystemDiagnosisDetailView.VerticalScrollBarVisibility`

**See also**

[MatrixView.SystemDiagnosisHardwareDetailView \(Page 5979\)](#)

**SystemDiagnosisControl.Name**

**Description**

The "Name" property returns the name of the system diagnostics control.

**Type**

String

**Access**

Read-only

**Syntax**

`SystemDiagnosisControl.Name`

**See also**

[SystemDiagnosisControl \(Page 5953\)](#)

**SystemDiagnosisControl.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, [HmiScreenObjectBase \(Page 5953\)](#)

**Access**

Read-only

**Syntax**`SystemDiagnosisControl.Parent`**See also**[SystemDiagnosisControl \(Page 5953\)](#)[Screen Items \(Page 1742\)](#)**Screen Items****Description**[Screen Items \(Page 1742\)](#)**SystemDiagnosisControl.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the system diagnostics control was created.

**Type**

String

**Access**

Read-only

**Syntax**`SystemDiagnosisControl.RenderingTemplate`**See also**[SystemDiagnosisControl \(Page 5953\)](#)

## SystemDiagnosisControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the system diagnostics control is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.ShowFocusVisual
```

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.ShowStatusPath

### Description

The "ShowStatusPath" property specifies that the status path is displayed.

### Type

Bool

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.ShowStatusPath
```

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.StatusBar

### Description

The "StatusBar" property specifies the information bar.

### Type

Object, HmiStatusBarPart

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.StatusBar
```

### See also

SystemDiagnosisControl (Page 5953)

## StatusBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
StatusBar.BackColor
```

### See also

SystemDiagnosisControl.StatusBar (Page 6011)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 6012)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

### See also

SystemDiagnosisControl.StatusBar (Page 6011)

HmiControlBarElementCollection (Page 6012)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 6012)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 6012)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 6014)

## See also

HmiControlBarElementCollection (Page 6012)

Control Bar Elements (Page 6014)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

HmiControlBarElementCollection (Page 6012)

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.AlternateBackColor`

## See also

ControlBarButton (Page 6014)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 6014)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 6014)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 6014)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 6014)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 6014)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 6014)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarButton.Content`

### See also

[ControlBarButton](#) (Page 6014)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarButton.Content (Page 6020)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarButton.Content (Page 6020)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 6020\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 6020\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content](#) (Page 6020)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarButton.Content \(Page 6020\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 6020\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarButton.Content](#) (Page 6020)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

[ControlBarButton](#) (Page 6014)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Enabled`

### See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.ForeColor`

### See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.Graphic`

### See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton](#) (Page 6014)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarButton.Mapping`

#### See also

[ControlBarButton \(Page 6014\)](#)

### ControlBarButton.Margin

#### Description

The "Margin" property specifies the surrounded outer distance of the button.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**

```
ControlBarButton.Margin
```

**See also**

ControlBarButton (Page 6014)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Margin.Bottom
```

**See also**

ControlBarButton.Margin (Page 6030)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Left`

## See also

[ControlBarButton.Margin \(Page 6030\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 6030\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarButton.Margin` (Page 6030)**ControlBarButton.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarButton.MaximumHeight`**See also**`ControlBarButton` (Page 6014)**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarButton.MaximumWidth`

## See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarButton.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MinimumHeight`

## See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MinimumWidth
```

**See also**

ControlBarButton (Page 6014)

**ControlBarButton.Operability****Description**

The "Operability" property returns whether the button is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarButton.Operability
```

**See also**

ControlBarButton (Page 6014)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarButton.Padding`

### See also

[ControlBarButton \(Page 6014\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarButton.Padding \(Page 6035\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarButton.Padding \(Page 6035\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 6035\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

`ControlBarButton.Padding` (Page 6035)

## **ControlBarButton.RequireExplicitUnlock**

### Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarButton.RequireExplicitUnlock`

### See also

`ControlBarButton` (Page 6014)

## **ControlBarButton.Text**

### Description

The "Text" property specifies the label of the button.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarButton.Text`**See also**

ControlBarButton (Page 6014)

**ControlBarButton.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**

ControlBarButton (Page 6014)

**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 6014\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

### Methods

--

### See also

HmiControlBarElementCollection (Page 6012)

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

ControlBarDisplay (Page 6040)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Content`

**See also**

[ControlBarDisplay \(Page 6040\)](#)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

[ControlBarDisplay.Content \(Page 6042\)](#)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

## Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

## Access

Read-write

## Syntax

`Content.GraphicStretchMode`

## See also

[ControlBarDisplay.Content](#) (Page 6042)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

## Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

## Access

Read-write

**Syntax**

```
Content.HorizontalTextAlignment
```

**See also**

ControlBarDisplay.Content (Page 6042)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Content.Spacing
```

**See also**

ControlBarDisplay.Content (Page 6042)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

## Syntax

`Content.SplitRatio`

## See also

[ControlBarDisplay.Content \(Page 6042\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

## See also

[ControlBarDisplay.Content \(Page 6042\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarDisplay.Content (Page 6042)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.VerticalTextAlignment
```

**See also**

[ControlBarDisplay.Content](#) (Page 6042)

**ControlBarDisplay.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay](#) (Page 6040)

**ControlBarDisplay.Enabled**

**Description**

The "Enabled" property specifies whether the display is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Enabled`

**See also**

ControlBarDisplay (Page 6040)

**ControlBarDisplay.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.ForeColor
```

**See also**

ControlBarDisplay (Page 6040)

**ControlBarDisplay.Graphic****Description**

The "Graphic" property specifies the graphic of the display.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.Graphic
```

## See also

ControlBarDisplay (Page 6040)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

## See also

ControlBarDisplay (Page 6040)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment

- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms

- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

## ControlBarDisplay.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Margin`**See also**

ControlBarDisplay (Page 6040)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

ControlBarDisplay.Margin (Page 6052)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarDisplay.Margin \(Page 6052\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarDisplay.Margin \(Page 6052\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarDisplay.Margin \(Page 6052\)](#)**ControlBarDisplay.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.MaximumHeight`**See also**[ControlBarDisplay \(Page 6040\)](#)**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MaximumWidth`

### See also

ControlBarDisplay (Page 6040)

## ControlBarDisplay.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumHeight`

### See also

ControlBarDisplay (Page 6040)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.MinimumWidth`

**See also**

[ControlBarDisplay \(Page 6040\)](#)

**ControlBarDisplay.Operability****Description**

The "Operability" property returns whether the display is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarDisplay.Operability`

**See also**

[ControlBarDisplay \(Page 6040\)](#)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Padding`

**See also**

ControlBarDisplay (Page 6040)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarDisplay.Padding (Page 6057)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

ControlBarDisplay.Padding (Page 6057)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarDisplay.Padding (Page 6057)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarDisplay.Padding (Page 6057)

**ControlBarDisplay.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarDisplay.RequireExplicitUnlock

**See also**

ControlBarDisplay (Page 6040)

**ControlBarDisplay.Text**

**Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.Text`**See also**

ControlBarDisplay (Page 6040)

**ControlBarDisplay.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 6040)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Visible`

**See also**

ControlBarDisplay (Page 6040)

**ControlBarDisplay.Width**

**Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Width`

**See also**

ControlBarDisplay (Page 6040)

**ControlBarLabel**

**Description**

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

## Object type

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiControlBarElementCollection (Page 6012)

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarLabel.Authorization
```

## See also

ControlBarLabel (Page 6062)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**`ControlBarLabel.CustomID`**See also**

ControlBarLabel (Page 6062)

**ControlBarLabel.Enabled****Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Enabled`**See also**

ControlBarLabel (Page 6062)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.ForeColor`

**See also**

[ControlBarLabel \(Page 6062\)](#)

**ControlBarLabel.Height**

**Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.Height`

**See also**

[ControlBarLabel \(Page 6062\)](#)

**ControlBarLabel.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

## Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

## Access

Read-write

## Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

## See also

ControlBarLabel (Page 6062)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

## Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarLabel.Mapping`

**See also**

[ControlBarLabel \(Page 6062\)](#)

**ControlBarLabel.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the identifier.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarLabel.Margin`

## See also

[ControlBarLabel \(Page 6062\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarLabel.Margin \(Page 6069\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarLabel.Margin` (Page 6069)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarLabel.Margin` (Page 6069)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

`ControlBarLabel.Margin` (Page 6069)

## **ControlBarLabel.MaximumHeight**

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

## See also

`ControlBarLabel` (Page 6062)

## **ControlBarLabel.MaximumWidth**

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarLabel.MaximumWidth
```

**See also**

ControlBarLabel (Page 6062)

**ControlBarLabel.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MinimumHeight
```

**See also**

ControlBarLabel (Page 6062)

**ControlBarLabel.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarLabel.MinimumWidth
```

## See also

ControlBarLabel (Page 6062)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

## See also

ControlBarLabel (Page 6062)

## ControlBarLabel.Padding

### Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarLabel.Padding`**See also**

ControlBarLabel (Page 6062)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarLabel.Padding (Page 6074)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarLabel.Padding \(Page 6074\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarLabel.Padding \(Page 6074\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarLabel.Padding \(Page 6074\)](#)**ControlBarLabel.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarLabel.RequireExplicitUnlock`**See also**[ControlBarLabel \(Page 6062\)](#)**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarLabel.Text`

**See also**

ControlBarLabel (Page 6062)

**ControlBarLabel.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarLabel.ToolTipText`

**See also**

ControlBarLabel (Page 6062)

**ControlBarLabel.VerticalTextAlignment**

**Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.VerticalTextAlignment
```

### See also

ControlBarLabel (Page 6062)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarLabel.Visible
```

### See also

ControlBarLabel (Page 6062)

## ControlBarLabel.Width

### Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.Width
```

### See also

ControlBarLabel (Page 6062)

## ControlBarSeparator

### Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarSeparatorPart

### Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

HmiControlBarElementCollection (Page 6012)

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Authorization`

**See also**

ControlBarSeparator (Page 6080)

**ControlBarSeparator.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarSeparator.CustomID`

**See also**

ControlBarSeparator (Page 6080)

**ControlBarSeparator.Enabled**

**Description**

The "Enabled" property specifies whether the separator is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarSeparator.Enabled`**See also**

ControlBarSeparator (Page 6080)

**ControlBarSeparator.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.ForeColor`**See also**

ControlBarSeparator (Page 6080)

**ControlBarSeparator.Height****Description**

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Height`

### See also

[ControlBarSeparator \(Page 6080\)](#)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line

- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time

- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarSeparator.Mapping`

### See also

[ControlBarSeparator \(Page 6080\)](#)

## ControlBarSeparator.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the separator.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Margin`

### See also

[ControlBarSeparator \(Page 6080\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Bottom

### See also

ControlBarSeparator.Margin (Page 6086)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

ControlBarSeparator.Margin (Page 6086)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarSeparator.Margin \(Page 6086\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarSeparator.Margin \(Page 6086\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.MaximumHeight
```

### See also

ControlBarSeparator (Page 6080)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.MaximumWidth
```

### See also

ControlBarSeparator (Page 6080)

## ControlBarSeparator.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumHeight`

### See also

[ControlBarSeparator \(Page 6080\)](#)

## ControlBarSeparator.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumWidth`

### See also

[ControlBarSeparator \(Page 6080\)](#)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

### See also

[ControlBarSeparator \(Page 6080\)](#)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarSeparator.Padding
```

**See also**

ControlBarSeparator (Page 6080)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Bottom

**See also**

ControlBarSeparator.Padding (Page 6091)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Left

**See also**

[ControlBarSeparator.Padding](#) (Page 6091)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarSeparator.Padding](#) (Page 6091)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

## See also

[ControlBarSeparator.Padding](#) (Page 6091)

## ControlBarSeparator.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

## See also

[ControlBarSeparator](#) (Page 6080)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarSeparator.ToolTipText
```

**See also**

ControlBarSeparator (Page 6080)

**ControlBarSeparator.Visible****Description**

The "Visible" property specifies whether the separator is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

ControlBarSeparator.Visible

**See also**

ControlBarSeparator (Page 6080)

**ControlBarSeparator.Width****Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

ControlBarSeparator.Width

## See also

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar. You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.

- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.AlternateBorderColor`

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.Authorization**

**Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ControlBarTextBox.Authorization`

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.BackColor`**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.BorderColor`**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`ControlBarTextBox.BorderWidth`

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarTextBox.CustomID`

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.Enabled**

**Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarTextBox.Enabled`**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.ForeColor`**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.Height****Description**

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Height`

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`ControlBarTextBox.HorizontalTextAlignment`

**See also**

ControlBarTextBox (Page 6096)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

**Syntax**

```
ControlBarTextBox.Mapping
```

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the text box.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Margin
```

**See also**

ControlBarTextBox (Page 6096)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Bottom`

## See also

[ControlBarTextBox.Margin \(Page 6105\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Left`

## See also

[ControlBarTextBox.Margin \(Page 6105\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**`ControlBarTextBox.Margin` (Page 6105)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**`ControlBarTextBox.Margin` (Page 6105)**ControlBarTextBox.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarTextBox.MaximumHeight`

## See also

[ControlBarTextBox \(Page 6096\)](#)

## ControlBarTextBox.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarTextBox.MaximumWidth`

## See also

[ControlBarTextBox \(Page 6096\)](#)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.MinimumHeight
```

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.MinimumWidth
```

**See also**

ControlBarTextBox (Page 6096)

**ControlBarTextBox.Operability****Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarTextBox.Operability`

### See also

[ControlBarTextBox \(Page 6096\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 6096\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarTextBox.Padding \(Page 6110\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarTextBox.Padding \(Page 6110\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

`ControlBarTextBox.Padding` (Page 6110)

### Padding.Top

#### Description

The "Top" property specifies the top distance of the content from the border.

#### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

`ControlBarTextBox.Padding` (Page 6110)

### ControlBarTextBox.ReadOnly

#### Description

The "ReadOnly" property specifies whether the text box is read-only.

#### Type

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ReadOnly`

**See also**

[ControlBarTextBox \(Page 6096\)](#)

**ControlBarTextBox.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarTextBox.RequireExplicitUnlock`

**See also**

[ControlBarTextBox \(Page 6096\)](#)

**ControlBarTextBox.Text****Description**

The "Text" property specifies the label of the text box.

**Type**

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

ControlBarTextBox (Page 6096)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

ControlBarTextBox (Page 6096)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

[ControlBarTextBox \(Page 6096\)](#)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

### See also

[ControlBarTextBox \(Page 6096\)](#)

## ControlBarTextBox.Width

### Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Width
```

### See also

ControlBarTextBox (Page 6096)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.

- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.

- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

### Methods

--

### See also

HmiControlBarElementCollection (Page 6012)

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateBackColor`

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BackColor
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Badge
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderWidth
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

ControlBarToggleSwitch.Content (Page 6123)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarToggleSwitch.Content (Page 6123)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.HorizontalTextAlignment
```

**See also**

ControlBarToggleSwitch.Content (Page 6123)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Content.Spacing
```

**See also**

ControlBarToggleSwitch.Content (Page 6123)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 6123\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarToggleSwitch.Content (Page 6123)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarToggleSwitch.Content (Page 6123)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 6123\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.CustomID`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Enabled
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Graphic`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Height`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

```
Button.HotKey
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

## See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 6116\)](#)

**ControlBarToggleSwitch.Margin**

**Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 6116\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

`ControlBarToggleSwitch.Margin` (Page 6134)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

`ControlBarToggleSwitch.Margin` (Page 6134)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarToggleSwitch.Margin \(Page 6134\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarToggleSwitch.Margin \(Page 6134\)](#)

**ControlBarToggleSwitch.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumHeight`**See also**

ControlBarToggleSwitch (Page 6116)

**ControlBarToggleSwitch.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumWidth`**See also**

ControlBarToggleSwitch (Page 6116)

**ControlBarToggleSwitch.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.MinimumHeight`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## ControlBarToggleSwitch.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.MinimumWidth`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## ControlBarToggleSwitch.Operability

### Description

The property "Operability" returns whether the switch is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarToggleSwitch.Padding \(Page 6139\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarToggleSwitch.Padding \(Page 6139\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 6139\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 6139\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ToolTipText
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Visible
```

### See also

ControlBarToggleSwitch (Page 6116)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Width`

### See also

[ControlBarToggleSwitch \(Page 6116\)](#)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.Enabled`

### See also

[SystemDiagnosisControl.StatusBar \(Page 6011\)](#)

## StatusBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
StatusBar.Font
```

### See also

SystemDiagnosisControl.StatusBar (Page 6011)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

StatusBar.Font (Page 6145)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

StatusBar.Font (Page 6145)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

StatusBar.Font (Page 6145)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

StatusBar.Font (Page 6145)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

## See also

StatusBar.Font (Page 6145)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

StatusBar.Font (Page 6145)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`StatusBar.Margin`**See also**

SystemDiagnosisControl.StatusBar (Page 6011)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

StatusBar.Margin (Page 6148)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

StatusBar.Margin (Page 6148)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

StatusBar.Margin (Page 6148)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[StatusBar.Margin \(Page 6148\)](#)**StatusBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the information bar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`StatusBar.Padding`**See also**[SystemDiagnosisControl.StatusBar \(Page 6011\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[StatusBar.Padding \(Page 6151\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[StatusBar.Padding \(Page 6151\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

StatusBar.Padding (Page 6151)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**

StatusBar.Padding (Page 6151)

**StatusBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`StatusBar.ShowToolTips`

**See also**

[SystemDiagnosisControl.StatusBar \(Page 6011\)](#)

**StatusBar.Visible**

**Description**

The "Visible" property specifies whether the information bar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`StatusBar.Visible`

**See also**

[SystemDiagnosisControl.StatusBar \(Page 6011\)](#)

**SystemDiagnosisControl.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style that is applied to the system diagnostics control.

**Type**

String

**Access**

Read-only

**Syntax**`SystemDiagnosisControl.StyleItemClass`**See also**

SystemDiagnosisControl (Page 5953)

**SystemDiagnosisControl.SystemDiagnosisView****Description**

The "SystemDiagnosisView" property specifies the system diagnostics control.

**Type**

Object, HmiDataGridViewPart

**Access**

Read-write

**Syntax**`SystemDiagnosisControl.SystemDiagnosisView`**See also**

SystemDiagnosisControl (Page 5953)

**DataGridView.AllowFilter****Description**

The "AllowFilter" property specifies whether filtering of columns is permitted.

**Type**

Bool

**Access**

Read-write

## Syntax

```
DataGridView.AllowFilter
```

## See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.AllowSort

### Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridView.AllowSort
```

## See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

**Access**

Read-write

**Syntax**`DataGridView.AlternateBackColor`**See also**

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

**DataGridView.AlternateForeColor****Description**

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridView.AlternateForeColor`**See also**

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

**DataGridView.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.BackColor`

**See also**

[SystemDiagnosisControl.SystemDiagnosisView \(Page 6155\)](#)

**DataGridView.CellPadding**

**Description**

The "CellPadding" property specifies the inner spacing of the content from the cell border.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`DataGridView.CellPadding`

**See also**

[SystemDiagnosisControl.SystemDiagnosisView \(Page 6155\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[DataGridView.CellPadding \(Page 6158\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[DataGridView.CellPadding \(Page 6158\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[DataGridView.CellPadding \(Page 6158\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[DataGridView.CellPadding \(Page 6158\)](#)

**DataGridView.ColoringMode**

**Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

**Access**

Read-write

**Syntax**

```
DataGridView.ColoringMode
```

**See also**

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

**DataGridView.Columns****Description**

The "Columns" property represents the quantity of columns.

**Type**

Object, HmiDataGridColumnCollection (Page 6162)

**Access**

Read-only

**Syntax**

```
DataGridView.Columns
```

**See also**

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

HmiDataGridColumnCollection (Page 6162)

## HmiDataGridColumnCollection

### Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

### Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

### Object type

HmiDataGridColumnCollection

### Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

### Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

### See also

[DataGridView.Columns \(Page 6161\)](#)

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

**Access**

Read-only

**Syntax**

```
HmiDataGridColumnCollection.Count
```

**See also**

HmiDataGridColumnCollection (Page 6162)

**HmiDataGridColumnCollection.Item()****Description**

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

**Syntax**

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

**Parameters****HmiDataGridColumnName**

Type: String

Name of the column

**Return value**

Object, HmiDataGridColumnPartBase (Page 6164)

**See also**

HmiDataGridColumnCollection (Page 6162)

SystemDiagnosisControlColumn (Page 6164)

## SystemDiagnosisControlColumn

### Description

The "SystemDiagnosisControlColumn" object represents a value column.

### Object type

HmiSystemDiagnosisControlColumnPart

### Properties

The "SystemDiagnosisControlColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **Content**  
Specifies the display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **SystemDiagnosisControlBlock**  
Specifies property that will be displayed in the column.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width.

**Methods**

--

**See also**[HmiDataGridColumnCollection](#) (Page 6162)[HmiDataGridColumnCollection.Item\(\)](#) (Page 6163)**SystemDiagnosisControlColumn.AllowSort****Description**

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

**Type**

Bool

**Access**

Read-write

**Syntax**`SystemDiagnosisControlColumn.AllowSort`**See also**[SystemDiagnosisControlColumn](#) (Page 6164)**SystemDiagnosisControlColumn.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

### Syntax

`SystemDiagnosisControlColumn.BackColor`

### See also

[SystemDiagnosisControlColumn \(Page 6164\)](#)

## SystemDiagnosisControlColumn.Content

### Description

The "Content" property specifies the display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`SystemDiagnosisControlColumn.Content`

### See also

[SystemDiagnosisControlColumn \(Page 6164\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**`Content.ContentMode`**See also**

SystemDiagnosisControlColumn.Content (Page 6166)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**`Content.GraphicStretchMode`**See also**

SystemDiagnosisControlColumn.Content (Page 6166)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

`SystemDiagnosisControlColumn.Content` (Page 6166)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

**See also**

SystemDiagnosisControlColumn.Content (Page 6166)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Content.SplitRatio
```

**See also**

SystemDiagnosisControlColumn.Content (Page 6166)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[SystemDiagnosisControlColumn.Content \(Page 6166\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[SystemDiagnosisControlColumn.Content \(Page 6166\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[SystemDiagnosisControlColumn.Content](#) (Page 6166)

**SystemDiagnosisControlColumn.Enabled****Description**

The "Enabled" property specifies whether the column can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`SystemDiagnosisControlColumn.Enabled`

**See also**

[SystemDiagnosisControlColumn](#) (Page 6164)

## SystemDiagnosisControlColumn.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`SystemDiagnosisControlColumn.ForeColor`

### See also

SystemDiagnosisControlColumn (Page 6164)

## SystemDiagnosisControlColumn.Header

### Description

The "Header" property specifies the properties of the column header.

### Type

Object, HmiDataGridColumnHeaderPart

### Access

Read-write

### Syntax

`SystemDiagnosisControlColumn.Header`

### See also

SystemDiagnosisControlColumn (Page 6164)

## DataGridColumnHeader.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`DataGridColumnHeader.Content`

### See also

[SystemDiagnosisControlColumn.Header \(Page 6172\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

DataGridColumnHeader.Content (Page 6173)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

DataGridColumnHeader.Content (Page 6173)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.HorizontalTextAlignment
```

**See also**

[DataGridColumnHeader.Content \(Page 6173\)](#)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Content.Spacing
```

**See also**

[DataGridColumnHeader.Content \(Page 6173\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[DataGridColumnHeader.Content \(Page 6173\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

DataGridColumnHeader.Content (Page 6173)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

DataGridColumnHeader.Content (Page 6173)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 6173\)](#)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Graphic`

### See also

[SystemDiagnosisControlColumn.Header \(Page 6172\)](#)

## DataGridColumnHeader.Text

### Description

The "Text" property specifies the label of the column header.

### Type

String

### Access

Read-write

### Syntax

```
DataGridColumnHeader.Text
```

### See also

[SystemDiagnosisControlColumn.Header](#) (Page 6172)

## SystemDiagnosisControlColumn.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
SystemDiagnosisControlColumn.MaximumWidth
```

### See also

[SystemDiagnosisControlColumn](#) (Page 6164)

## SystemDiagnosisControlColumn.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`SystemDiagnosisControlColumn.MinimumWidth`

### See also

[SystemDiagnosisControlColumn](#) (Page 6164)

## SystemDiagnosisControlColumn.Name

### Description

The "Name" property returns the name of the column.

### Type

String

### Access

Read-only

### Syntax

`SystemDiagnosisControlColumn.Name`

### See also

[SystemDiagnosisControlColumn](#) (Page 6164)

## SystemDiagnosisControlColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

```
SystemDiagnosisControlColumn.OutputFormat
```

### See also

SystemDiagnosisControlColumn (Page 6164)

## SystemDiagnosisControlColumn.SortDirection

### Description

The "SortDirection" property specifies the sorting direction.

### Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

### Access

Read-write

### Syntax

```
SystemDiagnosisControlColumn.SortDirection
```

## See also

SystemDiagnosisControlColumn (Page 6164)

## SystemDiagnosisControlColumn.SortOrder

### Description

The "SortOrder" property specifies the sorting order.

The sorting index begins at "1" (highest priority) in ascending order. 0 is ignored.

### Type

UInt16

### Access

Read-write

### Syntax

```
SystemDiagnosisControlColumn.SortOrder
```

## See also

SystemDiagnosisControlColumn (Page 6164)

## SystemDiagnosisControlColumn.SystemDiagnosisControlBlock

### Description

The "SystemDiagnosisControlBlock" specifies the property that will be displayed in the column.

### Type

Int32, HmiSystemDiagnosisControlBlock

Specifies the control block:

- Undefined (0): Not defined
- Number (1): Number
- DateTime (2): Time information
- EventMessage (3): Event message
- EventType (4): Event type
- EventState (5): Event state

**Access**

Read-write

**Syntax**`SystemDiagnosisControlColumn.SystemDiagnosisControlBlock`**See also**

SystemDiagnosisControlColumn (Page 6164)

**SystemDiagnosisControlColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`SystemDiagnosisControlColumn.Visible`**See also**

SystemDiagnosisControlColumn (Page 6164)

**SystemDiagnosisControlColumn.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`SystemDiagnosisControlColumn.Width`

**See also**

[SystemDiagnosisControlColumn \(Page 6164\)](#)

**DataGridView.Font**

**Description**

The "Font" property specifies the font of the cells.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridView.Font`

**See also**

[SystemDiagnosisControl.SystemDiagnosisView \(Page 6155\)](#)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

DataGridView.Font (Page 6184)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

DataGridView.Font (Page 6184)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

## Syntax

`Font.Size`

## See also

[DataGridView.Font \(Page 6184\)](#)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

## See also

[DataGridView.Font \(Page 6184\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

[DataGridView.Font \(Page 6184\)](#)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[DataGridView.Font \(Page 6184\)](#)

## DataGridView.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.ForeColor
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.GridLineColor
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

### Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

```
DataGridView.GridLineVisibility
```

### See also

[SystemDiagnosisControl.SystemDiagnosisView \(Page 6155\)](#)

## DataGridView.GridLineWidth

### Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.GridLineWidth
```

## See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.GridSelectionMode

### Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

### Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

### Access

Read-write

### Syntax

`DataGridView.GridSelectionMode`

## See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.HeaderSettings

### Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

### Type

Object, HmiDataGridHeaderSettingsPart

### Access

Read-write

**Syntax**

```
DataGridView.HeaderSettings
```

**See also**

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

**DataGridHeaderSettings.AllowColumnReorder****Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
DataGridHeaderSettings.AllowColumnReorder
```

**See also**

DataGridView.HeaderSettings (Page 6190)

**DataGridHeaderSettings.AllowColumnResize****Description**

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

**Type**

Bool

**Access**

Read-write

## Syntax

`DataGridHeaderSettings.AllowColumnResize`

## See also

`DataGridView.HeaderSettings` (Page 6190)

## DataGridHeaderSettings.ColumnHeaderType

### Description

The "ColumnHeaderType" property specifies the type of content of a column header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

### Syntax

`DataGridHeaderSettings.ColumnHeaderType`

## See also

`DataGridView.HeaderSettings` (Page 6190)

## DataGridHeaderSettings.Font

### Description

The "Font" property specifies the font of the headers.

### Type

Object, HmiFontPart

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.Font`**See also**[DataGridView.HeaderSettings \(Page 6190\)](#)**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**[DataGridHeaderSettings.Font \(Page 6192\)](#)**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

DataGridHeaderSettings.Font (Page 6192)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

DataGridHeaderSettings.Font (Page 6192)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

[DataGridHeaderSettings.Font \(Page 6192\)](#)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

[DataGridHeaderSettings.Font \(Page 6192\)](#)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[DataGridHeaderSettings.Font](#) (Page 6192)

## DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridHeaderSettings.HeaderBackColor`

### See also

[DataGridView.HeaderSettings](#) (Page 6190)

## DataGridHeaderSettings.HeaderForeColor

### Description

The "HeaderForeColor" property specifies the font color of the headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

### See also

DataGridView.HeaderSettings (Page 6190)

## DataGridHeaderSettings.HeaderGridLineColor

### Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

### See also

DataGridView.HeaderSettings (Page 6190)

## DataGridHeaderSettings.HeaderSelectionBackColor

### Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

### See also

DataGridView.HeaderSettings (Page 6190)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### **Object**

Required. An object from the "Availability" section.

**See also**

DataGridView.HeaderSettings (Page 6190)

**DataGridView.HeaderSettings.RowHeaderType****Description**

The "RowHeaderType" property specifies the type of content of a row header.

**Type**

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridView.HeaderSettings.RowHeaderType`

**See also**

DataGridView.HeaderSettings (Page 6190)

**DataGridView.HorizontalScrollBarVisibility****Description**

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

**Type**

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.RowHeight
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.SelectFullRow

### Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridView.SelectFullRow
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.SelectionBackColor

### Description

The "SelectionBackColor" property specifies the background color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.SelectionBackColor
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.SelectionBorderColor

### Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.SelectionBorderColor
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.SelectionBorderWidth

### Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.SelectionBorderWidth
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.SelectionForeColor

### Description

The "SelectionForeColor" property specifies the font color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.SelectionForeColor
```

### See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## DataGridView.VerticalScrollBarVisibility

### Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.VerticalScrollBarVisibility
```

## See also

SystemDiagnosisControl.SystemDiagnosisView (Page 6155)

## SystemDiagnosisControl.SystemDiagnosisViewType

### Description

The "SystemDiagnosisViewType" property specifies the type of system diagnostics control.

### Type

Int32, HmiSystemDiagnosisViewType

Specifies the type of system diagnostics control.

- Diagnosis (0): Diagnostic view
- Matrix (1): Matrix view

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.SystemDiagnosisViewType
```

## See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.TabIndex

### Description

The "TabIndex" property returns the position of the system diagnostics control in the tab sequence.

### Type

UInt16

### Access

Read-only

**Syntax**

`SystemDiagnosisControl.TabIndex`

**See also**

[SystemDiagnosisControl \(Page 5953\)](#)

**SystemDiagnosisControl.TimeZone****Description**

The "TimeZone" property specifies the time zone.

**Type**

HmiTimeZone

**Access**

Read-write

**Syntax**

`SystemDiagnosisControl.TimeZone`

**See also**

[SystemDiagnosisControl \(Page 5953\)](#)

**SystemDiagnosisControl.ToolBar****Description**

The "ToolBar" property specifies the toolbar.

**Type**

Object, HmiToolBarPart

**Access**

Read-write

**Syntax**

`SystemDiagnosisControl.ToolBar`

**See also**

SystemDiagnosisControl (Page 5953)

**ToolBar.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ToolBar.BackColor`

**See also**

SystemDiagnosisControl.ToolBar (Page 6205)

**ToolBar.Elements**

**Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

**Type**

Object, HmiControlBarElementCollection (Page 6207)

**Access**

Read-only

**Syntax**

`ToolBar.Elements`

## See also

SystemDiagnosisControl.ToolBar (Page 6205)

HmiControlBarElementCollection (Page 6207)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

ToolBar.Elements (Page 6206)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

`HmiControlBarElementCollection.Count`

**See also**

HmiControlBarElementCollection (Page 6207)

**HmiControlBarElementCollection.Item()**

**Description**

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

**Syntax**

`HmiControlBarElementCollection[.Item] (HmiControlBarElementName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

**Parameters**

**HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 6014)

**See also**

HmiControlBarElementCollection (Page 6207)

Control Bar Elements (Page 6014)

**Control Bar Elements****Description**

Control Bar Elements (Page 6014)

**ToolBar.Enabled****Description**

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ToolBar.Enabled
```

**See also**

SystemDiagnosisControl.ToolBar (Page 6205)

**Toolbar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ToolBar.Font`

**See also**

SystemDiagnosisControl.ToolBar (Page 6205)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Toolbar.Font (Page 6209)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

Toolbar.Font (Page 6209)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

Toolbar.Font (Page 6209)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

#### Access

Read-write

#### Syntax

`Font.StrikeOut`

#### See also

Toolbar.Font (Page 6209)

### Font.Underline

#### Description

The "Underline" property specifies whether the font is underlined.

#### Type

Bool

#### Access

Read-write

#### Syntax

`Font.Underline`

#### See also

Toolbar.Font (Page 6209)

### Font.Weight

#### Description

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

Toolbar.Font (Page 6209)

**Toolbar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

ToolBar.Margin

**See also**

SystemDiagnosisControl.ToolBar (Page 6205)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[Toolbar.Margin \(Page 6213\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[Toolbar.Margin \(Page 6213\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Toolbar.Margin \(Page 6213\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[Toolbar.Margin \(Page 6213\)](#)

## Toolbar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ToolBar.Padding`

### See also

[SystemDiagnosisControl.ToolBar \(Page 6205\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[Toolbar.Padding \(Page 6216\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

Toolbar.Padding (Page 6216)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Right

### See also

Toolbar.Padding (Page 6216)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ToolBar.Padding \(Page 6216\)](#)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.ShowToolTips`

### See also

[SystemDiagnosisControl.ToolBar \(Page 6205\)](#)

## ToolBar.UseHotKeys

### Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.UseHotKeys
```

### See also

SystemDiagnosisControl.ToolBar (Page 6205)

## ToolBar.Visible

### Description

The "Visible" property specifies whether the toolbar is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Visible
```

### See also

SystemDiagnosisControl.ToolBar (Page 6205)

## SystemDiagnosisControl.Top

### Description

The "Top" property specifies the value of the Y coordinate.

### Type

Int32

### Access

Read-write

### Syntax

`SystemDiagnosisControl.Top`

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.Visible

### Description

The "Visible" property specifies whether the system diagnostics control is visible.

### Type

Bool

### Access

Read-write

### Syntax

`SystemDiagnosisControl.Visible`

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.Width

### Description

The "Width" property specifies the width.

### Type

UInt32

### Access

Read-write

### Syntax

```
SystemDiagnosisControl.Width
```

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the system diagnostics control.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Type**

HmiWindowFlag

**Access**

Read-write

**Syntax**

`SystemDiagnosisControl.WindowFlags`

**See also**

SystemDiagnosisControl (Page 5953)

**SystemDiagnosisControl.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the system diagnostics control.

**Syntax**

`SystemDiagnosisControl.CheckAuthorization()`

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the system diagnostics control.

### Syntax

```
SystemDiagnosisControl.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

## See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.GoToPlc()

### Description

The "GoToPlc" method navigates to the next PLC.

### Syntax

```
SystemDiagnosisControl.GoToPlc()
```

### Parameters

--

### Return value

--

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
SystemDiagnosisControl.PropertyFlashing(propertyName, enable[,  
value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

SystemDiagnosisControl (Page 5953)

**SystemDiagnosisControl\_OnActivated()****Description**

The "OnActivated" event occurs when a system diagnostics control receives focus:

- A system diagnostics control is selected via the configured tab sequence.
- A system diagnostics control that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
SystemDiagnosisControl_OnActivated(item)
```

## Context

### **item**

Type: Object

System diagnostics control where the event occurs.

## See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl\_OnCommandFired()

## Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the system diagnostics control.

## Syntax

```
SystemDiagnosisControl_OnCommandFired(item, commandId, custom)
```

## Context

### **item**

Type: Object

System diagnostics control where the event occurs.

### **commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

### **custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the system diagnostics control loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
SystemDiagnosisControl_OnDeactivated(item)
```

### Context

**item**

Type: Object

System diagnostics control where the event occurs.

### See also

SystemDiagnosisControl (Page 5953)

## SystemDiagnosisControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a system diagnostics control has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
SystemDiagnosisControl_OnInitialized(item)
```

### Context

**item**

Type: Object

System diagnostics control where the event occurs.

## See also

SystemDiagnosisControl (Page 5953)

## Text

## Description

The "Text" object represents a text box without frame and background.

## Object type

HmiText

## Properties

The "Text" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the text box.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height in the (Device Independent Unit).
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Layer**  
Returns the screen layer in which the text box is located.
- **Left**  
Specifies the value of the X coordinate in the (Device Independent Unit).
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the text box.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the text box is operable.

- **Parent**  
Returns the higher-level screen object (Parent container).
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the rotation angle of the text box in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the text box rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the text box is highlighted when in focus.
- **StyleItemClass**  
Specifies the style which is applied to the text box.
- **TabIndex**  
Returns the position of the text box in the tab sequence.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width in (Device Independent Unit).

## Methods

The "Text" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the text box.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Text" object has the following events:

- **OnActivated()**  
Occurs when a text box receives focus.
- **OnContextTapped()**  
Occurs when the text box is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a text box loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the text box is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the text box is in focus.
- **OnTapped()**  
Occurs when the text box is left-clicked or short-touched.

## Text.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`Text.Authorization`

### See also

Text (Page 6228)

## Text.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the text box.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

`Text.CurrentQuality`

**See also**

Text (Page 6228)

**Text.Enabled****Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Enabled`

**See also**

Text (Page 6228)

## Text.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`Text.Font`

### See also

Text (Page 6228)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

Text.Font (Page 6232)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 6232)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 6232)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

Text.Font (Page 6232)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

Text.Font (Page 6232)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

Text.Font (Page 6232)

**Text.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

Text (Page 6228)

**Text.Height**

**Description**

The "Height" property specifies the height in the (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.Height`

**See also**

Text (Page 6228)

**Text.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered

- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Text.HorizontalTextAlignment`

**See also**

Text (Page 6228)

**Text.Layer****Description**

The "Layer" property returns the screen layer in which the text box is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`Text.Layer`

**See also**

Text (Page 6228)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

Text.Layer (Page 6237)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**`Layer.Name`**See also**`Text.Layer` (Page 6237)**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**`Bool`**Access**`Read-write`**Syntax**`Layer.Visible`**See also**`Text.Layer` (Page 6237)**Text.Left****Description**

The "Left" property sets the value of the X coordinate in the (Device Independent Unit).

**Type**`Int32`**Access**`Read-write`

### Syntax

`Text.Left`

### See also

Text (Page 6228)

### Text.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Text.Margin`

### See also

Text (Page 6228)

### Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

**See also**

Text.Margin (Page 6240)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Left

**See also**

Text.Margin (Page 6240)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

Text.Margin (Page 6240)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

Text.Margin (Page 6240)

**Text.Name**

**Description**

The "Name" property returns the name of the text box.

**Type**

String

**Access**

Read-only

**Syntax**

Text.Name

**See also**

Text (Page 6228)

**Text.Opacity****Description**

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

**Type**

Float

**Access**

Read-write

**Syntax**

`Text.Opacity`

**See also**

Text (Page 6228)

**Text.Operability****Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

### Syntax

`Text.Operability`

### See also

Text (Page 6228)

### Text.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`Text.Parent`

### See also

Text (Page 6228)

Screen Items (Page 1742)

### Screen Items

### Description

Screen Items (Page 1742)

### Text.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`Text.RequireExplicitUnlock`**See also**

Text (Page 6228)

**Text.RotationAngle****Description**

The "RotationAngle" property specifies the rotation angle of the text box in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**`Text.RotationAngle`**See also**

Text (Page 6228)

Text.RotationCenterPlacement (Page 6246)

Text.RotationCenterY (Page 6247)

Text.RotationCenterX (Page 6246)

## Text.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the text box rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`Text.RotationCenterPlacement`

### See also

## Text.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point.

### Type

Float

**Access**

Read-write

**Syntax**`Text.RotationCenterX`**See also**[Text \(Page 6228\)](#)[Text.RotationAngle \(Page 6245\)](#)[Text.RotationCenterPlacement \(Page 6246\)](#)[Text.RotationCenterY \(Page 6247\)](#)**Text.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point.

**Type**

Float

**Access**

Read-write

**Syntax**`Text.RotationCenterY`**See also**[Text \(Page 6228\)](#)[Text.RotationAngle \(Page 6245\)](#)[Text.RotationCenterPlacement \(Page 6246\)](#)[Text.RotationCenterX \(Page 6246\)](#)**Text.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the text box is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.ShowFocusVisual`

**See also**

Text (Page 6228)

**Text.StyleItemClass**

**Description**

The "StyleItemClass" property specifies the style which is applied to the text box.

**Type**

String

**Access**

Read-only

**Syntax**

`Text.StyleItemClass`

**See also**

Text (Page 6228)

**Text.TabIndex**

**Description**

The "TabIndex" property returns the position of the text box in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`Text.TabIndex`**See also**

Text (Page 6228)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

Text (Page 6228)

**Text.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

### Syntax

`Text.ToolTipText`

### See also

Text (Page 6228)

### Text.Top

### Description

The "Top" property specifies the value of the Y coordinate.

### Type

Int32

### Access

Read-write

### Syntax

`Text.Top`

### See also

Text (Page 6228)

### Text.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**`Text.VerticalTextAlignment`**See also**

Text (Page 6228)

**Text.Visible****Description**

The "Visible" property specifies whether the text box is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

Text (Page 6228)

**Text.Width****Description**

The "Width" property specifies the width in the (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`Text.Width`

## See also

[Text \(Page 6228\)](#)

## Text.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the text box.

### Syntax

`Text.CheckAuthorization()`

### Parameters

-

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

[Text \(Page 6228\)](#)

## Text.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

**Syntax**

```
Text.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

**Parameters****propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Text (Page 6228)

## Text\_OnActivated()

### Description

The "OnActivated" event occurs when a text box receives focus:

- A text box is selected via the configured tab sequence.
- A text box that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Text_OnActivated(item)
```

### Context

**item**

Type: Object

Text box where the event occurs.

### See also

Text (Page 6228)

## Text\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A text box is right-clicked.
- A text box is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Text_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Text box where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

Text (Page 6228)

## Text\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the text box loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
Text_OnDeactivated(item)
```

### Context

**item**

Type: Object

Text box where the event occurs.

## See also

Text (Page 6228)

## Text\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the text box is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
Text_OnKeyDown(item, keyCode, modifiers)
```

**Context****item**

Type: Object

Text box where the event occurs.

**keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**

Text (Page 6228)

**Text\_OnKeyUp()****Description**

The "OnKeyUp" event occurs when a key is released while the text box is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
Text_OnKeyUp(item, keyCode, modifiers)
```

## Context

### **item**

Type:

Text box where the event occurs.

### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Text (Page 6228)

## Text\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A text box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a text box has the focus.
- A text box is short-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Text_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Text box where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Text (Page 6228)

**TextBox**

**Description**

The "TextBox" object represents a text box in runtime.

**Object type**

HmiTextBox

## Properties

The "TextBox" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the text box.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Layer**  
Returns the layer of the screen in which the text box is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the text box.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border of the text box.
- **Parent**  
Returns the higher-level screen object.

- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RenderingTemplate**  
Returns the name of the template from which the text box was created.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the text box rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the text box is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the text box.
- **TabIndex**  
Returns the position of the text box in the tab sequence.
- **Text**  
Specifies the labeling of the text box.
- **TextTrimming**  
Specifies the type of text trimming if space is not sufficient.
- **TextWrapping**  
Specifies how text is wrapped if there is insufficient space.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "TextBox" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the text box.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "TextBox" object has the following events:

- **OnActivated()**  
Occurs when a text box receives focus.
- **OnContextTapped()**  
Occurs when a text box is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a text box loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the text box is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the text box is in focus.
- **OnTapped()**  
Occurs when a text box is left-clicked or short-touched.

## TextBox.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`TextBox.AlternateBackColor`

### See also

[TextBox \(Page 6260\)](#)

## TextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
TextBox.AlternateBorderColor
```

### See also

TextBox (Page 6260)

## TextBox.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
TextBox.Authorization
```

### See also

TextBox (Page 6260)

## TextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
TextBox.BackColor
```

### See also

[TextBox \(Page 6260\)](#)

## TextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
TextBox.BorderColor
```

### See also

[TextBox \(Page 6260\)](#)

## TextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`TextBox.BorderWidth`

### See also

[TextBox \(Page 6260\)](#)

## TextBox.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the text box.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

**Syntax**`TextBox.CurrentQuality`**See also**[TextBox \(Page 6260\)](#)**TextBox.Enabled****Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**`Bool`**Access**`Read-write`**Syntax**`TextBox.Enabled`**See also**[TextBox \(Page 6260\)](#)**TextBox.Font****Description**

The "Font" property specifies the font of the text.

**Type**`Object, HmiFontPart`**Access**`Read-write`**Syntax**`TextBox.Font`

**See also**

TextBox (Page 6260)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

TextBox.Font (Page 6267)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

TextBox.Font (Page 6267)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

TextBox.Font (Page 6267)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

## Syntax

`Font.StrikeOut`

## See also

[TextBox.Font \(Page 6267\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

## See also

[TextBox.Font \(Page 6267\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[TextBox.Font \(Page 6267\)](#)

**TextBox.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TextBox.ForeColor`

**See also**

[TextBox \(Page 6260\)](#)

**TextBox.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TextBox.Height`

**See also**

[TextBox \(Page 6260\)](#)

**TextBox.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

**Access**

Read-write

**Syntax**

`TextBox.HorizontalTextAlignment`

**See also**

[TextBox \(Page 6260\)](#)

## TextBox.Layer

### Description

The "Layer" property returns the layer of the screen in which the text box is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
TextBox.Layer
```

### See also

[TextBox \(Page 6260\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

[TextBox.Layer \(Page 6273\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[TextBox.Layer \(Page 6273\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[TextBox.Layer \(Page 6273\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[TextBox.Layer \(Page 6273\)](#)

## TextBox.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`TextBox.Left`

### See also

[TextBox \(Page 6260\)](#)

## TextBox.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`TextBox.Margin`

### See also

[TextBox \(Page 6260\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[TextBox.Margin \(Page 6276\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[TextBox.Margin \(Page 6276\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[TextBox.Margin \(Page 6276\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[TextBox.Margin \(Page 6276\)](#)

## TextBox.Name

### Description

The "Name" property returns the name of the text box.

### Type

String

### Access

Read-only

### Syntax

`TextBox.Name`

### See also

[TextBox \(Page 6260\)](#)

## TextBox.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`TextBox.Opacity`

### See also

[TextBox \(Page 6260\)](#)

## TextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`TextBox.Operability`

## See also

[TextBox \(Page 6260\)](#)

## TextBox.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`TextBox.Padding`

## See also

[TextBox \(Page 6260\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

**See also**

TextBox.Padding (Page 6280)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

TextBox.Padding (Page 6280)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

### See also

[TextBox.Padding \(Page 6280\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[TextBox.Padding \(Page 6280\)](#)

## TextBox.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, [HmiScreenObjectBase \(Page 1742\)](#)

### Access

Read-only

### Syntax

`TextBox.Parent`

**See also**

[TextBox \(Page 6260\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**TextBox.ReadOnly****Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
TextBox.ReadOnly
```

**See also**

[TextBox \(Page 6260\)](#)

**TextBox.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the text box was created.

**Type**

String

**Access**

Read-only

**Syntax**

`TextBox.RenderingTemplate`

**See also**

[TextBox \(Page 6260\)](#)

**TextBox.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`TextBox.RequireExplicitUnlock`

**See also**

[TextBox \(Page 6260\)](#)

**TextBox.RotationAngle**

**Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**`TextBox.RotationAngle`**See also**[TextBox \(Page 6260\)](#)[TextBox.RotationCenterPlacement \(Page 6285\)](#)[TextBox.RotationCenterX \(Page 6286\)](#)[TextBox.RotationCenterY \(Page 6286\)](#)**TextBox.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property sets the reference point around which the text box rotates.

**Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- `AbsoluteFromCenter (0)`: Absolute distance from the object center in DIU (Device Independent Unit).
- `NormedFromCenter (1)`: Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- `AbsoluteToContainer (2)`: Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

**Access**

Read-write

**Syntax**`TextBox.RotationCenterPlacement`

## See also

[TextBox \(Page 6260\)](#)

[TextBox.RotationCenterX \(Page 6286\)](#)

[TextBox.RotationCenterY \(Page 6286\)](#)

[TextBox.RotationAngle \(Page 6284\)](#)

## TextBox.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
TextBox.RotationCenterX
```

## See also

[TextBox \(Page 6260\)](#)

[TextBox.RotationCenterPlacement \(Page 6285\)](#)

[TextBox.RotationAngle \(Page 6284\)](#)

[TextBox.RotationCenterY \(Page 6286\)](#)

## TextBox.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

**Access**

Read-write

**Syntax**`TextBox.RotationCenterY`**See also**[TextBox \(Page 6260\)](#)[TextBox.RotationCenterPlacement \(Page 6285\)](#)[TextBox.RotationAngle \(Page 6284\)](#)[TextBox.RotationCenterX \(Page 6286\)](#)**TextBox.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the text box is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`TextBox.ShowFocusVisual`**See also**[TextBox \(Page 6260\)](#)**TextBox.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the text box.

**Type**

String

**Access**

Read-only

**Syntax**

`TextBox.StyleItemClass`

**See also**

TextBox (Page 6260)

**TextBox.TabIndex**

**Description**

The "TabIndex" property returns the position of the text box in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`TextBox.TabIndex`

**See also**

TextBox (Page 6260)

**TextBox.Text**

**Description**

The "Text" property specifies the labeling of the text box.

**Type**

String

**Access**

Read-write

**Syntax**`TextBox.Text`**See also**[TextBox \(Page 6260\)](#)**TextBox.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**`TextBox.TextTrimming`**See also**[TextBox \(Page 6260\)](#)**TextBox.TextWrapping****Description**

The "TextWrapping" property specifies how text is wrapped if there is insufficient space.

**Type**

Int32, HmiTextWrapping

Specifies the text break:

- NoWrap (0): No text break
- WordWrap (1): Text break at the end of the line

**Access**

Read-write

**Syntax**

`TextBox.TextWrapping`

**See also**

[TextBox \(Page 6260\)](#)

**TextBox.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`TextBox.ToolTipText`

**See also**

[TextBox \(Page 6260\)](#)

**TextBox.Top**

**Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`TextBox.Top`**See also**`TextBox` (Page 6260)**TextBox.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**`Int32, HmiVerticalAlignment`

Specifies the text alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

**Access**

Read-write

**Syntax**`TextBox.VerticalTextAlignment`**See also**`TextBox` (Page 6260)**TextBox.Visible****Description**

The "Visible" property specifies whether the text box is visible.

**Type**`Bool`

**Access**

Read-write

**Syntax**

`TextBox.Visible`

**See also**

TextBox (Page 6260)

**TextBox.VisualizeQuality**

**Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TextBox.VisualizeQuality`

**See also**

TextBox (Page 6260)

**TextBox.Width**

**Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`TextBox.Width`**See also**

TextBox (Page 6260)

**TextBox.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the text box.

**Syntax**`TextBox.CheckAuthorization()`**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

**See also**

TextBox (Page 6260)

## TextBox.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
TextBox.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

TextBox (Page 6260)

**TextBox\_OnActivated()****Description**

The "OnActivated" event occurs when a text box receives focus:

- A text box is selected via the configured tab sequence.
- A text box that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
TextBox_OnActivated(item)
```

**Context****item**

Type: Object

Text box where the event occurs.

**See also**

TextBox (Page 6260)

## TextBox\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A text box is right-clicked.
- A text box is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
TextBox_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Text box where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

TextBox (Page 6260)

**TextBox\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the text box loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
TextBox_OnDeactivated(item)
```

**Context****item**

Type: Object

Text box where the event occurs.

**See also**

TextBox (Page 6260)

## TextBox\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the text box is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
TextBox_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Text box where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### See also

TextBox (Page 6260)

## TextBox\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the text box is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
TextBox_OnKeyUp(item, keyCode, modifiers)
```

### Context

**item**

Type:

Text box where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### See also

TextBox (Page 6260)

## TextBox\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A text box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a text box has the focus.
- A text box is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
TextBox_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Text box where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

#### **See also**

TextBox (Page 6260)

#### **ToggleSwitch**

##### **Description**

The "ToggleSwitch" object represents a switch in runtime.

##### **Object type**

HmiToggleSwitch

## Properties

The "ToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border width.
- **Content**  
Specifies the display options for text and graphics.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the switch.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Graphic**  
Specifies the graphic for the "not pressed" state.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the state of the switch.
- **Layer**  
Returns the screen layer in which the switch is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.

- **Name**  
Returns the name of the switch.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border of the switch.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the switch was created.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the rotation angle in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the switch rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the switch is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the switch.
- **TabIndex**  
Returns the position of the switch in the tab sequence.
- **Text**  
Specifies the text for the "not pressed" state.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the switch is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "ToggleSwitch" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the switch.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ToggleSwitch" object has the following events:

- **OnActivated()**  
Occurs when a switch receives focus.
- **OnContextTapped()**  
Occurs when a switch is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a switch loses focus.
- **OnDown()**  
Occurs when the operator presses a switch.
- **OnKeyDown()**  
Occurs when a key is pressed while the switch is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the switch is in focus.
- **OnStateChanged()**  
Occurs if the state of a switch changes.
- **OnTapped()**  
Occurs when a switch is left-clicked or short-touched.
- **OnUp()**  
Occurs when the operator resolves the pressure on a switch via the input device.

## ToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

**Syntax**

`ToggleSwitch.AlternateBackColor`

**See also**

[ToggleSwitch \(Page 6301\)](#)

**ToggleSwitch.AlternateBorderColor****Description**

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ToggleSwitch.AlternateBorderColor`

**See also**

[ToggleSwitch \(Page 6301\)](#)

**ToggleSwitch.AlternateGraphic****Description**

The "AlternateGraphic" property specifies the graphic for the "pressed" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ToggleSwitch.AlternateGraphic`

**See also**

[ToggleSwitch \(Page 6301\)](#)

**ToggleSwitch.AlternateText**

**Description**

The "AlternateText" property specifies the text for the "pressed" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ToggleSwitch.AlternateText`

**See also**

[ToggleSwitch \(Page 6301\)](#)

**ToggleSwitch.Authorization**

**Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ToggleSwitch.Authorization`

**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

ToggleSwitch.BackColor

**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

ToggleSwitch.BorderColor

**See also**

ToggleSwitch (Page 6301)

## ToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`ToggleSwitch.BorderWidth`

### See also

[ToggleSwitch \(Page 6301\)](#)

## ToggleSwitch.Content

### Description

The "Content" property specifies the display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ToggleSwitch.Content`

### See also

[ToggleSwitch \(Page 6301\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ToggleSwitch.Content](#) (Page 6308)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

ToggleSwitch.Content (Page 6308)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

ToggleSwitch.Content (Page 6308)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ToggleSwitch.Content \(Page 6308\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ToggleSwitch.Content \(Page 6308\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ToggleSwitch.Content \(Page 6308\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

[ToggleSwitch.Content \(Page 6308\)](#)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[ToggleSwitch.Content \(Page 6308\)](#)

## ToggleSwitch.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the switch.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`ToggleSwitch.CurrentQuality`

### See also

[ToggleSwitch \(Page 6301\)](#)

## ToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**`ToggleSwitch.Enabled`**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`ToggleSwitch.Font`**See also**

ToggleSwitch (Page 6301)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`

**See also**

ToggleSwitch.Font (Page 6315)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToggleSwitch.Font (Page 6315)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToggleSwitch.Font (Page 6315)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

ToggleSwitch.Font (Page 6315)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

[ToggleSwitch.Font \(Page 6315\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

[ToggleSwitch.Font \(Page 6315\)](#)

## ToggleSwitch.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ToggleSwitch.ForeColor`**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.Graphic****Description**

The "Graphic" property specifies the graphic for the "not pressed" state.

**Type**

String

**Access**

Read-write

**Syntax**`ToggleSwitch.Graphic`**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

### Access

Read-write

### Syntax

`ToggleSwitch.Height`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ToggleSwitch.HotKey`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the state of the switch:

- True: Pressed
- False: Not pressed

**Type**

Bool

**Access**

Read-write

**Syntax**`ToggleSwitch.IsAlternateState`**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.Layer****Description**

The "Layer" property returns the layer of the screen in which the switch is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**`ToggleSwitch.Layer`**See also**

ToggleSwitch (Page 6301)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

[ToggleSwitch.Layer \(Page 6321\)](#)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

[ToggleSwitch.Layer \(Page 6321\)](#)

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**`Layer.Name`**See also**

ToggleSwitch.Layer (Page 6321)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Layer.Visible`**See also**

ToggleSwitch.Layer (Page 6321)

**ToggleSwitch.Left****Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ToggleSwitch.Left`

**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.Margin**

**Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ToggleSwitch.Margin`

**See also**

ToggleSwitch (Page 6301)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**`ToggleSwitch.Margin` (Page 6324)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ToggleSwitch.Margin` (Page 6324)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ToggleSwitch.Margin \(Page 6324\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ToggleSwitch.Margin \(Page 6324\)](#)

## ToggleSwitch.Name

### Description

The "Name" property returns the name of the switch.

### Type

String

### Access

Read-only

**Syntax**`ToggleSwitch.Name`**See also**[ToggleSwitch \(Page 6301\)](#)**ToggleSwitch.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

**Type**

Float

**Access**

Read-write

**Syntax**`ToggleSwitch.Opacity`**See also**[ToggleSwitch \(Page 6301\)](#)**ToggleSwitch.Operability****Description**

The "Operability" property returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ToggleSwitch.Operability`

**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch.Padding**

**Description**

The "Padding" property specifies the distance of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ToggleSwitch.Padding`

**See also**

ToggleSwitch (Page 6301)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**[ToggleSwitch.Padding \(Page 6328\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Left`**See also**[ToggleSwitch.Padding \(Page 6328\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Right`

## See also

[ToggleSwitch.Padding \(Page 6328\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

## See also

[ToggleSwitch.Padding \(Page 6328\)](#)

## ToggleSwitch.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

**Syntax**

`ToggleSwitch.Parent`

**See also**

[ToggleSwitch \(Page 6301\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**ToggleSwitch.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the switch was created.

**Type**

String

**Access**

Read-only

**Syntax**

`ToggleSwitch.RenderingTemplate`

**See also**

[ToggleSwitch \(Page 6301\)](#)

**ToggleSwitch.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ToggleSwitch.RequireExplicitUnlock`

**See also**

[ToggleSwitch \(Page 6301\)](#)

**ToggleSwitch.RotationAngle**

**Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**

`ToggleSwitch.RotationAngle`

**See also**

[ToggleSwitch \(Page 6301\)](#)

[ToggleSwitch.RotationCenterPlacement \(Page 6333\)](#)

[ToggleSwitch.RotationCenterX \(Page 6333\)](#)

[ToggleSwitch.RotationCenterY \(Page 6334\)](#)

## ToggleSwitch.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the switch rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`ToggleSwitch.RotationCenterPlacement`

### See also

[ToggleSwitch \(Page 6301\)](#)

[ToggleSwitch.RotationAngle \(Page 6332\)](#)

[ToggleSwitch.RotationCenterX \(Page 6333\)](#)

[ToggleSwitch.RotationCenterY \(Page 6334\)](#)

## ToggleSwitch.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

**Access**

Read-write

**Syntax**

`ToggleSwitch.RotationCenterX`

**See also**

[ToggleSwitch \(Page 6301\)](#)

[ToggleSwitch.RotationAngle \(Page 6332\)](#)

[ToggleSwitch.RotationCenterPlacement \(Page 6333\)](#)

[ToggleSwitch.RotationCenterY \(Page 6334\)](#)

**ToggleSwitch.RotationCenterY**

**Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`ToggleSwitch.RotationCenterY`

**See also**

[ToggleSwitch \(Page 6301\)](#)

[ToggleSwitch.RotationAngle \(Page 6332\)](#)

[ToggleSwitch.RotationCenterPlacement \(Page 6333\)](#)

[ToggleSwitch.RotationCenterX \(Page 6333\)](#)

## ToggleSwitch.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the switch is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
ToggleSwitch.ShowFocusVisual
```

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the switch.

### Type

String

### Access

Read-only

### Syntax

```
ToggleSwitch.StyleItemClass
```

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.TabIndex

### Description

The "TabIndex" property returns the position of the switch in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`ToggleSwitch.TabIndex`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.Text

### Description

The "Text" property specifies the text for the "not pressed" state.

### Type

String

### Access

Read-write

### Syntax

`ToggleSwitch.Text`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`ToggleSwitch.ToolTipText`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`ToggleSwitch.Top`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ToggleSwitch.Visible`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`ToggleSwitch.VisualizeQuality`

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ToggleSwitch.Width
```

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the switch.

### Syntax

```
ToggleSwitch.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

ToggleSwitch (Page 6301)

## ToggleSwitch.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ToggleSwitch.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

ToggleSwitch (Page 6301)

**ToggleSwitch\_OnActivated()****Description**

The "OnActivated" event occurs when a switch receives focus:

- A switch is selected via the configured tab sequence.
- A switch that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
ToggleSwitch_OnActivated(item)
```

**Context****item**

Type: Object

Switch where the event occurs.

## See also

ToggleSwitch (Page 6301)

## ToggleSwitch\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A switch is right-clicked.
- A switch is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnDown
2. OnUp
3. OnContextTapped

### Syntax

```
ToggleSwitch_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Switch where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

#### **See also**

ToggleSwitch (Page 6301)

### **ToggleSwitch\_OnDeactivated()**

#### **Description**

The "OnDeactivated" event occurs when the switch loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

`ToggleSwitch_OnDeactivated(item)`

### Context

**item**

Type: Object

Switch where the event occurs.

### See also

[ToggleSwitch \(Page 6301\)](#)

## ToggleSwitch\_OnDown()

### Description

The "OnDown" event occurs when the operator presses a switch:

- A switch is clicked with a mouse button.
- The <RETURN> or <SPACE> key is pressed when a switch has the focus.
- A switch is touched.

### Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

### Syntax

`ToggleSwitch_OnDown(item, x, y, modifiers, trigger)`

### Context

**Item**

Type: Object

Switch where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

ToggleSwitch (Page 6301)

## ToggleSwitch\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the switch is in focus. If the key is <RETURN> or <SPACE>, an "OnKeyDown" event is triggered before an "OnDown" event.

## Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

## Syntax

```
ToggleSwitch_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Switch where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

ToggleSwitch (Page 6301)

## ToggleSwitch\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the switch is in focus. If the key is <RETURN> or <SPACE>, an "OnUp" event is triggered after the "OnKeyUp" event.

### Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

### Syntax

```
ToggleSwitch_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Switch where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

ToggleSwitch (Page 6301)

## ToggleSwitch\_OnStateChanged()

### Description

The "OnStateChanged" event occurs when the state of a switch changes, for example, from "On" to "Off".

### Syntax

```
ToggleSwitch_OnStateChanged(item, isAlternate)
```

### Context

#### **item**

Type: Object

Switch where the event occurs.

#### **isAlternate**

Type: Bool

Specifies the state of the switch.

## See also

ToggleSwitch (Page 6301)

## ToggleSwitch\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A switch is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a switch has the focus.
- A switch is short-touched.

---

#### **Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

## Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp
5. OnTapped

## Syntax

```
ToggleSwitch_OnTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Switch where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

### See also

ToggleSwitch (Page 6301)

## ToggleSwitch\_OnUp()

### Description

The event "OnUp" occurs when the operator releases the pressure on a switch via the input device:

- The mouse button is released via a switch.
- The <RETURN> or <SPACE> key is released when a switch has the focus.
- The touch of a switch is canceled.
- A switch is exited while pressed.

This event does not occur as long as the operator keeps the switch pressed.

### Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

### Syntax

```
ToggleSwitch_OnUp(item, x, y, modifiers, trigger)
```

## Context

### **Item**

Type: Object

Switch where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## TouchArea

### Description

The "TouchArea" object represents a touch area in runtime.

### Object type

HmiTouchArea

### Properties

The "TouchArea" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Enabled**  
Specifies whether the touch area can be operated in runtime.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the touch area is located.
- **Left**  
Specifies the value of the X coordinate.
- **Name**  
Returns the name of the touch area.
- **Operability**  
Returns whether the touch area is operable.
- **Parent**  
Returns the higher-level screen object.
- **RequireExplicitUnlock**  
Returns whether the touch area is only operable while the associated button is being pressed.
- **StyleItemClass**  
Returns the style which is applied to the touch area.
- **TabIndex**  
Returns the position of the touch area in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.

- **Visible**  
Specifies whether the touch area is visible.
- **Width**  
Specifies the width.

## Methods

The "TouchArea" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the touch area.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "TouchArea" object has the following events:

- **OnGestureDetected()**  
Occurs when the operator performs a touch gesture.

## TouchArea.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`TouchArea.Authorization`

### See also

[TouchArea \(Page 6352\)](#)

## TouchArea.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`TouchArea.BackColor`

### See also

[TouchArea \(Page 6352\)](#)

## TouchArea.Enabled

### Description

The "Enabled" property specifies whether the touch area can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`TouchArea.Enabled`

### See also

[TouchArea \(Page 6352\)](#)

## TouchArea.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`TouchArea.Height`

### See also

[TouchArea \(Page 6352\)](#)

## TouchArea.Layer

### Description

The "Layer" property returns the layer of the screen in which the touch area is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`TouchArea.Layer`

### See also

[TouchArea \(Page 6352\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[TouchArea.Layer \(Page 6355\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[TouchArea.Layer \(Page 6355\)](#)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

[TouchArea.Layer \(Page 6355\)](#)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[TouchArea.Layer \(Page 6355\)](#)

## TouchArea.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`TouchArea.Left`

### See also

[TouchArea \(Page 6352\)](#)

## TouchArea.Name

### Description

The "Name" property returns the name of the touch area.

### Type

String

### Access

Read-only

### Syntax

`TouchArea.Name`

### See also

[TouchArea \(Page 6352\)](#)

## TouchArea.Operability

### Description

The "Operability" property returns whether the option button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`TouchArea.Operability`

### See also

[TouchArea \(Page 6352\)](#)

## TouchArea.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`TouchArea.Parent`

### See also

[TouchArea \(Page 6352\)](#)

[Screen Items \(Page 1742\)](#)

### Screen Items

#### Description

[Screen Items \(Page 1742\)](#)

### TouchArea.RequireExplicitUnlock

#### Description

The "RequireExplicitUnlock" property returns whether the touch area can only be operated while the associated button is being pressed.

#### Type

Bool

#### Access

Read-only

#### Syntax

```
TouchArea.RequireExplicitUnlock
```

### See also

[TouchArea \(Page 6352\)](#)

### TouchArea.StyleItemClass

#### Description

The "StyleItemClass" property returns the style which is applied to the touch area.

#### Type

String

**Access**

Read-only

**Syntax**`TouchArea.StyleItemClass`**See also**

TouchArea (Page 6352)

**TouchArea.TabIndex****Description**

The "TabIndex" property returns the position of the touch area in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`TouchArea.TabIndex`**See also**

TouchArea (Page 6352)

**TouchArea.Top****Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Syntax**

`TouchArea.Width`

**See also**

[TouchArea \(Page 6352\)](#)

**TouchArea.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the touch area.

**Syntax**

```
TouchArea.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

[TouchArea \(Page 6352\)](#)

**TouchArea.PropertyFlashing()****Description**

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

## Syntax

```
TouchArea.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

## Parameters

### **propertyName**

Type: String

Name of the property for which flashing is configured.

### **enable**

Type: Bool

Specifies that flashing is activated.

### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

### **Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

TouchArea (Page 6352)

## TouchArea\_OnGestureDetected()

### Description

The "OnGestureDetected" event occurs when the operator performs a touch gesture:

### Syntax

```
TouchArea_OnGestureDetected(item, gesture)
```

### Context

**item**

Type: Object

Touch area where the event occurs.

**gesture**

Type: Int32, HmiGesture

Touch gesture which is detected:

- Unknown (0): Unknown
- SwipeLeft (1): Swipe to the left
- SwipeRight (2): Swipe to the right
- SwipeUp (3): Swipe upwards
- SwipeDown (4): Swipe downwards

## Example

Set the value of the "MyTag1" tag depending on the detected gesture:

### Copy code

```
export function Touch_area_1_OnGestureDetected(item, gesture) {
// value of tag ,MyTag1` will be set depending on the detected gesture
  if(gesture == UI.Enums.HmiGesture.SwipeRight)
  {
    UI.RootWindow.Screen = 'ScreenRight';
    let tag1 = Tags('tag1');
    tag1.Write(1); //write value '1234' to tag 'MyTag1'
  }
  if(gesture == UI.Enums.HmiGesture.SwipeLeft)
  {
    UI.RootWindow.Screen = 'ScreenLeft';
    let tag1 = Tags('tag1');
    tag1.Write(2); //write value '1234' to tag 'MyTag1'
  }
  if(gesture == UI.Enums.HmiGesture.SwipeUp)
  {
    UI.RootWindow.Screen = 'ScreenUp';
    let tag1 = Tags('tag1');
    tag1.Write(3); //write value '1234' to tag 'MyTag1'
  }
  if(gesture == UI.Enums.HmiGesture.SwipeDown)
  {
    UI.RootWindow.Screen = 'ScreenDown';
    let tag1 = Tags('tag1');
    tag1.Write(4); //write value '1234' to tag 'MyTag1'
  }
  if(gesture == UI.Enums.HmiGesture.Unknown)
  {
    let tag1 = Tags('tag1');
    tag1.Write(0); //write value '1234' to tag 'MyTag1'
  }
}
```

## TrendCompanion

### Description

The "TrendCompanion" object represents a value table in runtime.

### Object type

HmiTrendCompanion

## Properties

The "TrendCompanion" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the value table.
- **Enabled**  
Specifies whether the value table can be operated in runtime.
- **Height**  
Specifies the height in the (Device Independent Unit).
- **Icon**  
Specifies the icon of the value table.
- **Layer**  
Returns the screen layer in which the value table is located.
- **Left**  
Specifies the value of the X coordinate in the (Device Independent Unit).
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the value table.
- **Parent**  
Returns the higher-level screen object (Parent container).
- **RenderingTemplate**  
Returns the name of the template from which the value table was created.
- **ShowAlways**  
Specifies whether the value table can be closed.
- **ShowFocusVisual**  
Specifies whether the value table is highlighted when in focus.
- **SnapToSourceControl**  
Specifies whether the value table snaps to the window of the associated data source.
- **SourceTrendControl**  
Specifies the data source.
- **StatusBar**  
Specifies the information bar of the value table.
- **StyleItemClass**  
Specifies the style which is applied to the value table.
- **TabIndex**  
Returns the position of the value table in the tab sequence.

- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Specifies the toolbar of the value table.
- **Top**  
Specifies the value of the Y coordinate.
- **TrendCompanionMode**  
Specifies the window display of the value table.
- **TrendRulerView**  
Specifies the ruler window of the value table.
- **TrendStatisticAreaView**  
Specifies the view of the statistics area.
- **TrendStatisticResultView**  
Specifies the view of the statistics mode.
- **UseSourceControlBackColor**  
Specifies whether the background color of the value table is taken from the associated data source.
- **UseSourceControlTrendColors**  
Specifies whether the font color of the value table is taken from the associated data source.
- **Visible**  
Specifies whether the value table is visible.
- **Width**  
Specifies the width in (Device Independent Unit).
- **WindowFlags**  
Specifies the window configuration of the value table.

## Methods

The "TrendCompanion" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the value table.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the value table.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "TrendCompanion" object has the following events:

- **OnActivated()**  
Occurs when the value table receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the value table.
- **OnDeactivated()**  
Occurs when the value table loses focus.
- **OnInitialized()**  
Occurs when the value table has been successfully initialized and the data connection to the PLC has been established.

## TrendCompanion.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`TrendCompanion.BackColor`

### See also

[TrendCompanion \(Page 6366\)](#)

## TrendCompanion.Caption

### Description

The "Caption" property specifies the text to be displayed in the title bar.

### Type

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`TrendCompanion.Caption`

**See also**

TrendCompanion (Page 6366)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

TrendCompanion.Caption (Page 6369)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

Text.Font (Page 6370)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

Text.Font (Page 6370)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

### Access

Read-write

### Syntax

`Font.Size`

### See also

[Text.Font \(Page 6370\)](#)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[Text.Font \(Page 6370\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

Text.Font (Page 6370)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**

Text.Font (Page 6370)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Text.ForeColor
```

### See also

TrendCompanion.Caption (Page 6369)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

```
Text.Text
```

### See also

TrendCompanion.Caption (Page 6369)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

[TrendCompanion.Caption \(Page 6369\)](#)

**TrendCompanion.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TrendCompanion.CaptionColor`

**See also**

[TrendCompanion \(Page 6366\)](#)

## TrendCompanion.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the value table.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`TrendCompanion.CurrentQuality`

### See also

TrendCompanion (Page 6366)

## TrendCompanion.Enabled

### Description

The "Enabled" property specifies whether the value table can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**`TrendCompanion.Enabled`**See also**

TrendCompanion (Page 6366)

**TrendCompanion.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`TrendCompanion.Height`**See also**

TrendCompanion (Page 6366)

**TrendCompanion.Icon****Description**

The "Icon" property specifies the icon of the value table.

**Type**

String

**Access**

Read-write

**Syntax**`TrendCompanion.Icon`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.Layer**

**Description**

The "Layer" property returns the screen layer in which the value table is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`TrendCompanion.Layer`

**See also**

TrendCompanion (Page 6366)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

TrendCompanion.Layer (Page 6378)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

TrendCompanion.Layer (Page 6378)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

TrendCompanion.Layer (Page 6378)

**Layer.Visible**

**Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

TrendCompanion.Layer (Page 6378)

**TrendCompanion.Left**

**Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`TrendCompanion.Left`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.Margin****Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

TrendCompanion.Margin

**See also**

TrendCompanion (Page 6366)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Bottom

**See also**

TrendCompanion.Margin (Page 6381)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

TrendCompanion.Margin (Page 6381)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

TrendCompanion.Margin (Page 6381)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

TrendCompanion.Margin (Page 6381)

**TrendCompanion.Name****Description**

The "Name" property returns the name of the value table.

**Type**

String

**Access**

Read-only

**Syntax**

TrendCompanion.Name

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`TrendCompanion.Parent`

**See also**

TrendCompanion (Page 6366)

Screen Items (Page 1742)

**Screen Items**

**Description**

Screen Items (Page 1742)

**TrendCompanion.RenderingTemplate**

**Description**

The "RenderingTemplate" property returns the name of the template from which the value table was created.

**Type**

String

**Access**

Read-only

**Syntax**`TrendCompanion.RenderingTemplate`**See also**

TrendCompanion (Page 6366)

**TrendCompanion.ShowAlways****Description**

The "ShowAlways" property specifies whether the value table can be closed.

**Type**

Bool

**Access**

Read-write

**Syntax**`TrendCompanion.ShowAlways`**See also**

TrendCompanion (Page 6366)

**TrendCompanion.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the value table is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendCompanion.ShowFocusVisual`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.SnapToSourceControl**

**Description**

The "SnapToSourceControl" property specifies whether the value table snaps to the window of the associated data source.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendCompanion.SnapToSourceControl`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.SourceTrendControl**

**Description**

The "SourceTrendControl" property specifies the data source.

**Type**

Object, HmiTrendControlBase (Page 6577)

**Access**

Read-write

**Syntax**

`TrendCompanion.SourceTrendControl`

**See also**

[TrendCompanion \(Page 6366\)](#)

[TrendControl \(Page 6577\)](#)

**TrendControl****Description**

[TrendControl \(Page 6577\)](#)

**TrendCompanion.StatusBar****Description**

The "StatusBar" property specifies the information bar of the value table.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

`TrendCompanion.StatusBar`

**See also**

[TrendCompanion \(Page 6366\)](#)

**StatusBar.BackColor****Description**

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`StatusBar.BackColor`

### See also

TrendCompanion.StatusBar (Page 6387)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 6388)

### Access

Read-only

### Syntax

`StatusBar.Elements`

### See also

TrendCompanion.StatusBar (Page 6387)

HmiControlBarElementCollection (Page 6388)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

## Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

## Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[StatusBar.Elements](#) (Page 6388)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

`HmiControlBarElementCollection.Count`

## See also

HmiControlBarElementCollection (Page 6388)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

### Return value

Object, HmiControlBarElementPartBase (Page 6390)

## See also

HmiControlBarElementCollection (Page 6388)

Control Bar Elements (Page 6390)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

## Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.

- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiControlBarElementCollection (Page 6388)

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.AlternateBackColor`

**See also**

[ControlBarButton \(Page 6390\)](#)

**ControlBarButton.AlternateBorderColor****Description**

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.AlternateBorderColor
```

**See also**

[ControlBarButton \(Page 6390\)](#)

**ControlBarButton.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarButton.Authorization
```

## See also

[ControlBarButton](#) (Page 6390)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

## See also

[ControlBarButton](#) (Page 6390)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

**See also**

[ControlBarButton \(Page 6390\)](#)

**ControlBarButton.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.BorderColor
```

**See also**

[ControlBarButton \(Page 6390\)](#)

**ControlBarButton.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
ControlBarButton.BorderWidth
```

## See also

ControlBarButton (Page 6390)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarButton.Content`

## See also

ControlBarButton (Page 6390)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

**Syntax**

`Content.ContentMode`

**See also**

[ControlBarButton.Content \(Page 6396\)](#)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[ControlBarButton.Content \(Page 6396\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 6396\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 6396\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content](#) (Page 6396)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarButton.Content \(Page 6396\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarButton.Content \(Page 6396\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarButton.Content](#) (Page 6396)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

[ControlBarButton](#) (Page 6390)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Enabled`

### See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.ForeColor`

### See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.Height
```

### See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton](#) (Page 6390)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarButton.Mapping`

#### See also

[ControlBarButton \(Page 6390\)](#)

### ControlBarButton.Margin

#### Description

The "Margin" property specifies the surrounded outer distance of the button.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**

```
ControlBarButton.Margin
```

**See also**

ControlBarButton (Page 6390)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Margin.Bottom
```

**See also**

ControlBarButton.Margin (Page 6406)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Left`

## See also

[ControlBarButton.Margin \(Page 6406\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 6406\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarButton.Margin` (Page 6406)**ControlBarButton.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarButton.MaximumHeight`**See also**`ControlBarButton` (Page 6390)**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarButton.MaximumWidth`

## See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarButton.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MinimumHeight`

## See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MinimumWidth
```

**See also**

ControlBarButton (Page 6390)

**ControlBarButton.Operability****Description**

The "Operability" property returns whether the button is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarButton.Operability
```

**See also**

ControlBarButton (Page 6390)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarButton.Padding`

**See also**

[ControlBarButton \(Page 6390\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarButton.Padding \(Page 6411\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarButton.Padding \(Page 6411\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 6411\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

`ControlBarButton.Padding` (Page 6411)

## ControlBarButton.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarButton.RequireExplicitUnlock`

### See also

`ControlBarButton` (Page 6390)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarButton.Text`**See also**

ControlBarButton (Page 6390)

**ControlBarButton.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**

ControlBarButton (Page 6390)

**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 6390\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

### Methods

--

### See also

HmiControlBarElementCollection (Page 6388)

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

ControlBarDisplay (Page 6416)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Content`

**See also**

[ControlBarDisplay \(Page 6416\)](#)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

[ControlBarDisplay.Content \(Page 6418\)](#)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

## Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

## Access

Read-write

## Syntax

`Content.GraphicStretchMode`

## See also

[ControlBarDisplay.Content \(Page 6418\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

## Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

## Access

Read-write

**Syntax**

```
Content.HorizontalTextAlignment
```

**See also**

ControlBarDisplay.Content (Page 6418)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Content.Spacing
```

**See also**

ControlBarDisplay.Content (Page 6418)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

## Syntax

`Content.SplitRatio`

## See also

[ControlBarDisplay.Content \(Page 6418\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

## See also

[ControlBarDisplay.Content \(Page 6418\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarDisplay.Content (Page 6418)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.VerticalTextAlignment
```

**See also**

[ControlBarDisplay.Content](#) (Page 6418)

**ControlBarDisplay.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay](#) (Page 6416)

**ControlBarDisplay.Enabled**

**Description**

The "Enabled" property specifies whether the display is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Enabled`

**See also**

ControlBarDisplay (Page 6416)

**ControlBarDisplay.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.ForeColor`

**See also**

ControlBarDisplay (Page 6416)

**ControlBarDisplay.Graphic****Description**

The "Graphic" property specifies the graphic of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Graphic`

## See also

[ControlBarDisplay](#) (Page 6416)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarDisplay.Mapping`

[ControlBarDisplay \(Page 6416\)](#)

### ControlBarDisplay.Margin

#### Description

The "Margin" property specifies the surrounded outer spacing of the display.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**`ControlBarDisplay.Margin`**See also**[ControlBarDisplay \(Page 6416\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Bottom`**See also**[ControlBarDisplay.Margin \(Page 6428\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Left`

## See also

[ControlBarDisplay.Margin \(Page 6428\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarDisplay.Margin \(Page 6428\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarDisplay.Margin` (Page 6428)**ControlBarDisplay.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarDisplay.MaximumHeight`**See also**`ControlBarDisplay` (Page 6416)**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarDisplay.MaximumWidth`

## See also

ControlBarDisplay (Page 6416)

## ControlBarDisplay.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

ControlBarDisplay (Page 6416)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MinimumWidth
```

**See also**

ControlBarDisplay (Page 6416)

**ControlBarDisplay.Operability****Description**

The "Operability" property returns whether the display is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarDisplay.Operability
```

**See also**

ControlBarDisplay (Page 6416)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Padding`

**See also**

[ControlBarDisplay \(Page 6416\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarDisplay.Padding \(Page 6433\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarDisplay.Padding \(Page 6433\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarDisplay.Padding \(Page 6433\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarDisplay.Padding \(Page 6433\)](#)

## ControlBarDisplay.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarDisplay.RequireExplicitUnlock`

### See also

[ControlBarDisplay \(Page 6416\)](#)

## ControlBarDisplay.Text

### Description

The "Text" property specifies the label of the display.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.Text`**See also**

ControlBarDisplay (Page 6416)

**ControlBarDisplay.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 6416)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Visible`

### See also

ControlBarDisplay (Page 6416)

## ControlBarDisplay.Width

### Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Width`

### See also

ControlBarDisplay (Page 6416)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.

- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiControlBarElementCollection (Page 6388)

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarLabel.Authorization`

## See also

ControlBarLabel (Page 6438)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**`ControlBarLabel.CustomID`**See also**

ControlBarLabel (Page 6438)

**ControlBarLabel.Enabled****Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Enabled`**See also**

ControlBarLabel (Page 6438)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.ForeColor`

**See also**

ControlBarLabel (Page 6438)

**ControlBarLabel.Height**

**Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.Height`

**See also**

ControlBarLabel (Page 6438)

**ControlBarLabel.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
ControlBarLabel.HorizontalTextAlignment
```

**See also**

ControlBarLabel (Page 6438)

**ControlBarLabel.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

`ControlBarLabel.Mapping`

**See also**

[ControlBarLabel \(Page 6438\)](#)

**ControlBarLabel.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the identifier.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarLabel.Margin`

## See also

[ControlBarLabel \(Page 6438\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarLabel.Margin \(Page 6445\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarLabel.Margin \(Page 6445\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**[ControlBarLabel.Margin \(Page 6445\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarLabel.Margin \(Page 6445\)](#)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

## See also

[ControlBarLabel \(Page 6438\)](#)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarLabel.MaximumWidth
```

**See also**

ControlBarLabel (Page 6438)

**ControlBarLabel.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MinimumHeight
```

**See also**

ControlBarLabel (Page 6438)

**ControlBarLabel.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarLabel.MinimumWidth
```

## See also

ControlBarLabel (Page 6438)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

## See also

ControlBarLabel (Page 6438)

## ControlBarLabel.Padding

### Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarLabel.Padding`**See also**

ControlBarLabel (Page 6438)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarLabel.Padding (Page 6450)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarLabel.Padding \(Page 6450\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarLabel.Padding \(Page 6450\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarLabel.Padding \(Page 6450\)](#)

**ControlBarLabel.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarLabel.RequireExplicitUnlock`

**See also**

[ControlBarLabel \(Page 6438\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

### Access

Read-write

### Syntax

```
ControlBarLabel.Text
```

## ControlBarLabel.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarLabel.ToolTipText
```

### See also

ControlBarLabel (Page 6438)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**`ControlBarLabel.VerticalTextAlignment`**ControlBarLabel.Visible****Description**

The "Visible" property specifies whether the identifier is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Visible`**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.Width`

## See also

ControlBarLabel (Page 6438)

## ControlBarSeparator

### Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarSeparatorPart

### Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.

- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

HmiControlBarElementCollection (Page 6388)

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

## See also

ControlBarSeparator (Page 6456)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 6456)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarSeparator.Enabled
```

### See also

ControlBarSeparator (Page 6456)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.ForeColor
```

### See also

ControlBarSeparator (Page 6456)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

### See also

ControlBarSeparator (Page 6456)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarSeparator.Mapping`

## See also

[ControlBarSeparator \(Page 6456\)](#)

## ControlBarSeparator.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the separator.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Margin`

## See also

[ControlBarSeparator \(Page 6456\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ControlBarSeparator.Margin` (Page 6462)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ControlBarSeparator.Margin` (Page 6462)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarSeparator.Margin \(Page 6462\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Top`

## See also

[ControlBarSeparator.Margin \(Page 6462\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

`ControlBarSeparator.MaximumHeight`

**See also**

[ControlBarSeparator \(Page 6456\)](#)

**ControlBarSeparator.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MaximumWidth`

**See also**

[ControlBarSeparator \(Page 6456\)](#)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarSeparator.MinimumHeight`

## See also

[ControlBarSeparator \(Page 6456\)](#)

## ControlBarSeparator.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumWidth`

## See also

[ControlBarSeparator \(Page 6456\)](#)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarSeparator.Operability`**See also**

ControlBarSeparator (Page 6456)

**ControlBarSeparator.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the separator.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarSeparator.Padding`**See also**

ControlBarSeparator (Page 6456)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

`ControlBarSeparator.Padding` (Page 6467)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

`ControlBarSeparator.Padding` (Page 6467)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarSeparator.Padding (Page 6467)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**

ControlBarSeparator.Padding (Page 6467)

**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

### Access

Read-only

### Syntax

`ControlBarSeparator.RequireExplicitUnlock`

### See also

[ControlBarSeparator \(Page 6456\)](#)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

### Access

Read-write

### Syntax

`ControlBarSeparator.ToolTipText`

### See also

[ControlBarSeparator \(Page 6456\)](#)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

**Access**

Read-write

**Syntax**`ControlBarSeparator.Visible`**See also**

ControlBarSeparator (Page 6456)

**ControlBarSeparator.Width****Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.Width`**See also**

ControlBarSeparator (Page 6456)

**ControlBarTextBox****Description**

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarTextBoxPart

## Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.

- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.AlternateBorderColor
```

## See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarTextBox.Authorization
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Enabled
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.ForeColor
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
ControlBarTextBox.Margin
```

**See also**

[ControlBarTextBox](#) (Page 6471)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin](#) (Page 6478)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

### See also

[ControlBarTextBox.Margin \(Page 6478\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 6478\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

**See also**

ControlBarTextBox.Margin (Page 6478)

**ControlBarTextBox.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**`ControlBarTextBox.Mapping`**See also**[ControlBarTextBox \(Page 6471\)](#)**ControlBarTextBox.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumHeight`**See also**[ControlBarTextBox \(Page 6471\)](#)**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MaximumWidth`

### See also

[ControlBarTextBox \(Page 6471\)](#)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MinimumHeight`

### See also

[ControlBarTextBox \(Page 6471\)](#)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumWidth`

**See also**

[ControlBarTextBox \(Page 6471\)](#)

**ControlBarTextBox.Operability****Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarTextBox.Operability`

**See also**

[ControlBarTextBox \(Page 6471\)](#)

**ControlBarTextBox.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 6471\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarTextBox.Padding \(Page 6485\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

ControlBarTextBox.Padding (Page 6485)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarTextBox.Padding (Page 6485)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarTextBox.Padding (Page 6485)

**ControlBarTextBox.ReadOnly**

**Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**

Bool

**Access**

Read-write

**Syntax**

ControlBarTextBox.ReadOnly

**See also**

ControlBarTextBox (Page 6471)

**ControlBarTextBox.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarTextBox.RequireExplicitUnlock`**See also**

ControlBarTextBox (Page 6471)

**ControlBarTextBox.Text****Description**

The "Text" property specifies the label of the text box.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarTextBox.Text`**See also**

ControlBarTextBox (Page 6471)

**ControlBarTextBox.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ToolTipText`

**See also**

ControlBarTextBox (Page 6471)

**ControlBarTextBox.VerticalTextAlignment**

**Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`ControlBarTextBox.VerticalTextAlignment`

**See also**

ControlBarTextBox (Page 6471)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarTextBox.Width

### Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Width
```

### See also

ControlBarTextBox (Page 6471)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.

- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiControlBarElementCollection (Page 6388)

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BackColor
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Badge
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BorderWidth`

### See also

[ControlBarToggleSwitch \(Page 6492\)](#)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 6492\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ControlBarToggleSwitch.Content \(Page 6498\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

`ControlBarToggleSwitch.Content` (Page 6498)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

`ControlBarToggleSwitch.Content` (Page 6498)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 6498\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 6498\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ControlBarToggleSwitch.Content](#) (Page 6498)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

`ControlBarToggleSwitch.Content` (Page 6498)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

`ControlBarToggleSwitch.Content` (Page 6498)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Enabled
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Height`

### See also

[ControlBarToggleSwitch \(Page 6492\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 6492\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Mapping
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the switch.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Margin`

### See also

[ControlBarToggleSwitch \(Page 6492\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarToggleSwitch.Margin \(Page 6509\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarToggleSwitch.Margin \(Page 6509\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarToggleSwitch.Margin \(Page 6509\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarToggleSwitch.Margin \(Page 6509\)](#)

**ControlBarToggleSwitch.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

[ControlBarToggleSwitch \(Page 6492\)](#)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumWidth`**See also**

ControlBarToggleSwitch (Page 6492)

**ControlBarToggleSwitch.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 6492)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Operability

### Description

The property "Operability" returns whether the switch is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Operability
```

### See also

ControlBarToggleSwitch (Page 6492)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Padding`

**See also**

[ControlBarToggleSwitch \(Page 6492\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarToggleSwitch.Padding \(Page 6514\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarToggleSwitch.Padding \(Page 6514\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarToggleSwitch.Padding \(Page 6514\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarToggleSwitch.Padding \(Page 6514\)](#)**ControlBarToggleSwitch.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarToggleSwitch.RequireExplicitUnlock`**See also**[ControlBarToggleSwitch \(Page 6492\)](#)**ControlBarToggleSwitch.Text****Description**

The "Text" property specifies the label of the switch.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Text`

**See also**

ControlBarToggleSwitch (Page 6492)

**ControlBarToggleSwitch.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the switch.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.ToolTipText`

**See also**

ControlBarToggleSwitch (Page 6492)

**ControlBarToggleSwitch.Visible**

**Description**

The "Visible" property specifies whether the switch is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Visible`**See also**

ControlBarToggleSwitch (Page 6492)

**ControlBarToggleSwitch.Width****Description**

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Width`**See also**

ControlBarToggleSwitch (Page 6492)

**StatusBar.Enabled****Description**

The "Enabled" property specifies whether the information bar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`StatusBar.Enabled`

**See also**

TrendCompanion.StatusBar (Page 6387)

**StatusBar.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

TrendCompanion.StatusBar (Page 6387)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

StatusBar.Font (Page 6520)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 6520)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

StatusBar.Font (Page 6520)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

**See also**

StatusBar.Font (Page 6520)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

Font.Underline

### See also

StatusBar.Font (Page 6520)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

## Syntax

`Font.Weight`

## See also

`StatusBar.Font` (Page 6520)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`StatusBar.Margin`

## See also

`TrendCompanion.StatusBar` (Page 6387)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`StatusBar.Margin` (Page 6524)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**

Read-write

**Syntax**`Margin.Left`**See also**`StatusBar.Margin` (Page 6524)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**

Read-write

## Syntax

`Margin.Right`

## See also

[StatusBar.Margin \(Page 6524\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Top`

## See also

[StatusBar.Margin \(Page 6524\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**

```
StatusBar.Padding
```

**See also**

TrendCompanion.StatusBar (Page 6387)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

```
Int32
```

**Access**

```
Read-write
```

**Syntax**

```
Padding.Bottom
```

**See also**

StatusBar.Padding (Page 6526)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

```
Int32
```

**Access**

```
Read-write
```

## Syntax

`Padding.Left`

## See also

[StatusBar.Padding \(Page 6526\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Right`

## See also

[StatusBar.Padding \(Page 6526\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Top`**See also**`StatusBar.Padding` (Page 6526)**StatusBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**`Bool`**Access**`Read-write`**Syntax**`StatusBar.ShowToolTips`**See also**`TrendCompanion.StatusBar` (Page 6387)**StatusBar.Visible****Description**

The "Visible" property specifies whether the information bar is visible.

**Type**`Bool`**Access**`Read-write`

### Syntax

`StatusBar.Visible`

### See also

[TrendCompanion.StatusBar \(Page 6387\)](#)

## TrendCompanion.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the value table.

### Type

String

### Access

Read-only

### Syntax

`TrendCompanion.StyleItemClass`

### See also

[TrendCompanion \(Page 6366\)](#)

## TrendCompanion.TabIndex

### Description

The "TabIndex" property returns the position of the value table in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`TrendCompanion.TabIndex`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.TimeZone****Description**

The "TimeZone" property specifies the time zone.

**Type**

HmiTimeZone

**Access**

Read-write

**Syntax**

`TrendCompanion.TimeZone`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.ToolBar****Description**

The "ToolBar" property specifies the toolbar of the value table.

**Type**

Object, HmiToolBarPart

**Access**

Read-write

**Syntax**

`TrendCompanion.ToolBar`

**See also**

TrendCompanion (Page 6366)

**ToolBar.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ToolBar.BackColor`

**See also**

TrendCompanion.ToolBar (Page 6531)

**ToolBar.Elements**

**Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

**Type**

Object, HmiControlBarElementCollection (Page 6533)

**Access**

Read-only

**Syntax**

`ToolBar.Elements`

## See also

TrendCompanion.ToolBar (Page 6531)  
HmiControlBarElementCollection (Page 6533)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

ToolBar.Elements (Page 6532)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

`HmiControlBarElementCollection.Count`

**See also**

HmiControlBarElementCollection (Page 6533)

**HmiControlBarElementCollection.Item()**

**Description**

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

**Syntax**

`HmiControlBarElementCollection[.Item] (HmiControlBarElementName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

**Parameters**

**HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 6535)

**See also**

HmiControlBarElementCollection (Page 6533)

Control Bar Elements (Page 6535)

**Control Bar Elements****Description**

Control Bar Elements (Page 6390)

**ToolBar.Enabled****Description**

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ToolBar.Enabled
```

**See also**

TrendCompanion.ToolBar (Page 6531)

**ToolBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ToolBar.Font`

**See also**

TrendCompanion.ToolBar (Page 6531)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

ToolBar.Font (Page 6535)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToolBar.Font (Page 6535)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 6535)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[ToolBar.Font \(Page 6535\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[ToolBar.Font \(Page 6535\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

ToolBar.Font (Page 6535)

**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

ToolBar.Margin

**See also**

TrendCompanion.ToolBar (Page 6531)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ToolBar.Margin \(Page 6539\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ToolBar.Margin \(Page 6539\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ToolBar.Margin \(Page 6539\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ToolBar.Margin \(Page 6539\)](#)

## ToolBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ToolBar.Padding`

### See also

TrendCompanion.ToolBar (Page 6531)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

ToolBar.Padding (Page 6542)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ToolBar.Padding \(Page 6542\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ToolBar.Padding \(Page 6542\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Top

### See also

ToolBar.Padding (Page 6542)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

ToolBar.ShowToolTips

### See also

TrendCompanion.ToolBar (Page 6531)

## ToolBar.UseHotKeys

### Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.UseHotKeys`

### See also

[TrendCompanion.ToolBar \(Page 6531\)](#)

## ToolBar.Visible

### Description

The "Visible" property specifies whether the toolbar is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.Visible`

### See also

[TrendCompanion.ToolBar \(Page 6531\)](#)

## TrendCompanion.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`TrendCompanion.Top`

### See also

TrendCompanion (Page 6366)

## TrendCompanion.TrendCompanionMode

### Description

The "TrendCompanionMode" property specifies the window display of the value table.

### Type

HmiTrendCompanionMode

Specifies the window display of the value table:

- Ruler (0): Ruler as reading aid
- StatisticArea (1): Statistics area
- StatisticResult (2): Statistics result

### Access

Read-write

### Syntax

`TrendCompanion.TrendCompanionMode`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.TrendRulerView****Description**

The "TrendRulerView" property specifies the ruler window of the value table.

**Type**

Object, HmiTrendColumnPart (Page 6547)

**Access**

Read-write

**Syntax**

`TrendCompanion.TrendRulerView`

**See also**

TrendCompanion (Page 6366)

TrendColumn (Page 6547)

**TrendColumn****Description**

The "TrendColumn" object represents a column in the trend view.

**Object type**

HmiTrendColumnPart

**Properties**

The "TrendColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.

- **Content**  
Specifies display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **TrendInfoBlock**  
Specifies the info block.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width of the column in the DIU (Device Independent Unit).

## Methods

--

## See also

TrendCompanion.TrendRulerView (Page 6547)

## TrendColumn.AllowSort

### Description

The "AllowSort" property specifies whether the sorting of the column is permitted.  
This property is ignored if the parent object has the "AllowSort" property set to "False".

**Type**

Bool

**Access**

Read-write

**Syntax**`TrendColumn.AllowSort`**See also**

TrendColumn (Page 6547)

**TrendColumn.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`TrendColumn.BackColor`**See also**

TrendColumn (Page 6547)

**TrendColumn.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`TrendColumn.Content`

**See also**

TrendColumn (Page 6547)

**Content.ContentMode**

**Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

TrendColumn.Content (Page 6549)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[TrendColumn.Content \(Page 6549\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered

- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[TrendColumn.Content \(Page 6549\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[TrendColumn.Content \(Page 6549\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**`Content.SplitRatio`**See also**

TrendColumn.Content (Page 6549)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**`Content.TextPosition`**See also**

TrendColumn.Content (Page 6549)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

TrendColumn.Content (Page 6549)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

`TrendColumn.Content` (Page 6549)

**TrendColumn.Enabled****Description**

The "Enabled" property specifies whether the column can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendColumn.Enabled`

**See also**

`TrendColumn` (Page 6547)

**TrendColumn.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`TrendColumn.ForeColor`

## See also

TrendColumn (Page 6547)

## TrendColumn.Header

### Description

The "Header" property specifies the properties of the column header.

### Type

Object, HmiDataGridColumnHeaderPart

### Access

Read-write

### Syntax

`TrendColumn.Header`

## See also

TrendColumn (Page 6547)

## DataGridColumnHeader.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

**Syntax**

`DataGridColumnHeader.Content`

**See also**

`TrendColumn.Header` (Page 6556)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

`DataGridColumnHeader.Content` (Page 6556)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[DataGridColumnHeader.Content](#) (Page 6556)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

**See also**

DataGridColumnHeader.Content (Page 6556)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

DataGridColumnHeader.Content (Page 6556)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

## See also

DataGridColumnHeader.Content (Page 6556)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

## See also

DataGridColumnHeader.Content (Page 6556)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[DataGridColumnHeader.Content \(Page 6556\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 6556\)](#)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Graphic`

### See also

[TrendColumn.Header \(Page 6556\)](#)

## DataGridColumnHeader.Text

### Description

The "Text" property specifies the label of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Text`

### See also

[TrendColumn.Header \(Page 6556\)](#)

## TrendColumn.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
TrendColumn.MaximumWidth
```

### See also

TrendColumn (Page 6547)

## TrendColumn.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
TrendColumn.MinimumWidth
```

### See also

TrendColumn (Page 6547)

## TrendColumn.Name

### Description

The "Name" property returns the name of the column.

### Type

String

### Access

Read-only

### Syntax

`TrendColumn.Name`

### See also

[TrendColumn \(Page 6547\)](#)

## TrendColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

`TrendColumn.OutputFormat`

### See also

[TrendColumn \(Page 6547\)](#)

## TrendColumn.SortDirection

### Description

The "SortDirection" property specifies the direction of the sorting.

### Type

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

### Access

Read-write

### Syntax

`TrendColumn.SortDirection`

### See also

[TrendColumn](#) (Page 6547)

## TrendColumn.SortOrder

### Description

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

### Type

UInt16

### Access

Read-write

### Syntax

`TrendColumn.SortOrder`

## See also

TrendColumn (Page 6547)

## TrendColumn.TrendInfoBlock

### Description

The "TrendInfoBlock" property specifies the info block.

### Type

Int32, HmiTrendInfoBlock

Specifies the info block:

- None (0): None
- Name (1): Name
- Index (2): Index
- Label (3): Labels
- Show (4): Show
- TagNameY (5): Tag name X
- TagNameX (6): Tag name Y
- YValue (7): Y value
- XValueOrTimestamp (8): X values or time stamp
- YValueLowerLimit (9): Y value low limit
- TimestampLowerLimit (10): Time stamp low limit
- YValueUpperLimit (11): Y value high limit
- TimestampUpperLimit (12): Time stamp low limit
- Minimum (13): Minimum
- MinimumTimestamp (14): Minimum time stamp
- Maximum (15): Maximum
- MaximumTimestamp (16): Maximum time stamp
- Average (17): Average
- StandardDeviation (18): Standard deviation
- Integral (19): Integral
- WeightedAverageValue (20): Weighted mean
- Duration (21): Duration
- NumberOfValues (22): Number of values
- AreaName (23): Area name

- AreaNameLL (24): Area name (LL)
- AreaNameHL (25): Area name (HL)
- Sum (32): Total

**Access**

Read-write

**Syntax**

`TrendColumn.TrendInfoBlock`

**See also**

TrendColumn (Page 6547)

**TrendColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendColumn.Visible`

**See also**

TrendColumn (Page 6547)

**TrendColumn.Width****Description**

The "Width" property specifies the width of the column in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TrendColumn.Width`

**See also**

TrendColumn (Page 6547)

**TrendCompanion.TrendStatisticAreaView**

**Description**

The "TrendStatisticAreaView" property specifies the view of the statistics area.

**Type**

Object, HmiTrendColumnPart (Page 6568)

**Access**

Read-write

**Syntax**

`TrendCompanion.TrendStatisticAreaView`

**See also**

TrendCompanion (Page 6366)

TrendColumn (Page 6568)

**TrendColumn**

**Description**

TrendColumn (Page 6547)

## TrendCompanion.TrendStatisticResultView

### Description

The "TrendStatisticResultView" property specifies the view of the statistics mode.

### Type

Object, HmiTrendColumnPart (Page 6569)

### Access

Read-write

### Syntax

`TrendCompanion.TrendStatisticResultView`

### See also

[TrendCompanion \(Page 6366\)](#)

[TrendColumn \(Page 6569\)](#)

## TrendColumn

### Description

[TrendColumn \(Page 6547\)](#)

## TrendCompanion.UseSourceControlBackColor

### Description

The "UseSourceControlBackColor" property specifies whether the background color of the value table is taken from the associated data source.

### Type

Bool

### Access

Read-write

**Syntax**

`TrendCompanion.UseSourceControlBackColor`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.UseSourceControlTrendColors**

**Description**

The "UseSourceControlTrendColors"property specifies whether the font color of the value table is taken from the associated data source.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendCompanion.UseSourceControlTrendColors`

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.Visible**

**Description**

The "Visible" property specifies whether the value table is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendCompanion.Visible`

**See also**

[TrendCompanion \(Page 6366\)](#)

**TrendCompanion.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TrendCompanion.Width`

**See also**

[TrendCompanion \(Page 6366\)](#)

**TrendCompanion.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the value table.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized

- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

Enable multiple properties by adding the integer values or bit operators.

---

**Access**

Read-write

**Syntax**

TrendCompanion.WindowFlags

**Example**

Adapt the "windowFlags" tag depending on the window configuration:

**Copy code**

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;  
if (CanClose) {  
    windowFlags |= HmiWindowFlag.CanClose;  
} else {  
    windowFlags &= HmiWindowFlag.CanClose;  
}
```

**See also**

TrendCompanion (Page 6366)

**TrendCompanion.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the value table.

**Syntax**

TrendCompanion.CheckAuthorization()

## Parameters

--

## Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

TrendCompanion (Page 6366)

## TrendCompanion.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the value table.

### Syntax

```
TrendCompanion.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## Return value

--

## See also

TrendCompanion (Page 6366)

## TrendCompanion.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
TrendCompanion.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

TrendCompanion (Page 6366)

**TrendCompanion\_OnActivated()****Description**

The "OnActivated" event occurs when a value table receives focus:

- A value table is selected via the configured tab sequence.
- A value table that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
TrendCompanion_OnActivated(item)
```

**Context**

**item**

Type: Object

Value table where the event occurs.

**See also**

TrendCompanion (Page 6366)

## TrendCompanion\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the value table.

### Syntax

```
TrendCompanion_OnCommandFired(item, commandId, custom)
```

### Context

#### **item**

Type: Object

Value table where the event occurs.

#### **commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

#### **custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### See also

TrendCompanion (Page 6366)

## TrendCompanion\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a value table loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
TrendCompanion_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Value table where the event occurs.

**See also**

TrendCompanion (Page 6366)

**TrendCompanion\_OnInitialized()****Description**

The "OnInitialized" event occurs when a value table has been successfully initialized and the data connection to the PLC has been established.

**Syntax**

```
TrendCompanion_OnInitialized(item)
```

**Context**

**item**

Type: Object

Value table where the event occurs.

**See also**

TrendCompanion (Page 6366)

**TrendControl****Description**

The "TrendControl" object represents a trend control of tag values from the current process or the archive in runtime.

## Object type

HmiTrendControl

## Properties

The "TrendControl" object has the following properties:

- **AreaSpacing**  
Specifies the distance between trend areas.
- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the trend control.
- **Enabled**  
Specifies whether the trend control can be operated in runtime.
- **ExtendRulerToAxis**  
Specifies whether the ruler is extended into the axis.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the trend control.
- **Layer**  
Returns the screen layer in which the trend control is located.
- **Left**  
Specifies the value of the X coordinate.
- **Legend**  
Specifies the appearance of the legend.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the trend control.
- **Online**  
Specifies the start and stop of the trend control updating.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the trend control was created.
- **ShiftAxis**  
Specifies whether to swap the x axis and y axis of the trend control.

- **ShowFocusVisual**  
Specifies whether the trend control is highlighted when in focus.
- **ShowRuler**  
Specifies whether the ruler is displayed for determining a trend value.
- **ShowStatisticRulers**  
Specifies whether to display the two rulers for specifying the statistics area.
- **StatusBar**  
Sets the information bar of the trend control.
- **StyleItemClass**  
Returns the style which is applied to the trend control.
- **TabIndex**  
Returns the position of the trend control in the tab sequence.
- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Specifies the toolbar of the trend control.
- **Top**  
Specifies the value of the Y coordinate.
- **TrendAreas**  
Returns the trend areas of the trend control.
- **Visible**  
Specifies whether the trend control is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the trend control.

## Methods

The "TrendControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the trend control.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the trend view.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "TrendControl" object has the following events:

- **OnActivated()**  
Occurs when a trend control receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the trend control.
- **OnDeactivated()**  
Occurs when a trend control loses focus.
- **OnInitialized()**  
Occurs when a trend control has been successfully initialized and the data connection to the PLC has been established.

## TrendControl.AreaSpacing

### Description

The "AreaSpacing" property specifies the spacing between trend areas.

### Type

UInt16

### Access

Read-write

### Syntax

`TrendControl.AreaSpacing`

### See also

[TrendControl \(Page 6577\)](#)

## TrendControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

**Access**

Read-write

**Syntax**`TrendControl.BackColor`**See also**

TrendControl (Page 6577)

**TrendControl.Caption****Description**

The "Caption" property specifies the text to be displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**`TrendControl.Caption`**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

## Syntax

`Text.Font`

## See also

[TrendControl.Caption \(Page 6581\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

## Syntax

`Font.Italic`

## See also

[Text.Font \(Page 6581\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

**Syntax**`Font.Name`**See also**`Text.Font` (Page 6581)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**`Text.Font` (Page 6581)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

Text.Font (Page 6581)

**Font.Underline**

**Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

Text.Font (Page 6581)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 6581\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[TrendControl.Caption \(Page 6581\)](#)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

[TrendControl.Caption \(Page 6581\)](#)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

[TrendControl.Caption \(Page 6581\)](#)

## TrendControl.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

```
TrendControl.CaptionColor
```

### See also

TrendControl (Page 6577)

## TrendControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the trend view.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

**Syntax**

`TrendControl.CurrentQuality`

**See also**

TrendControl (Page 6577)

**TrendControl.Enabled**

**Description**

The "Enabled" property specifies whether the trend view can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendControl.Enabled`

**See also**

TrendControl (Page 6577)

**TrendControl.ExtendRulerToAxis**

**Description**

The "ExtendRulerToAxis" property specifies whether the ruler is extended to the axis.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TrendControl.ExtendRulerToAxis`

**See also**

TrendControl (Page 6577)

**TrendControl.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TrendControl.Height`

**See also**

TrendControl (Page 6577)

**TrendControl.Icon****Description**

The "Icon" property specifies the icon of the trend view.

**Type**

String

**Access**

Read-write

**Syntax**

`TrendControl.Icon`

**See also**

TrendControl (Page 6577)

**TrendControl.Layer**

**Description**

The "Layer" property returns the layer of the screen in which the trend view is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`TrendControl.Layer`

**See also**

TrendControl (Page 6577)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

TrendControl.Layer (Page 6590)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

TrendControl.Layer (Page 6590)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

### See also

TrendControl.Layer (Page 6590)

### Layer.Visible

#### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

#### Type

Bool

#### Access

Read-write

#### Syntax

`Layer.Visible`

### See also

TrendControl.Layer (Page 6590)

### TrendControl.Left

#### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

#### Type

Int32

#### Access

Read-write

#### Syntax

`TrendControl.Left`

**See also**

TrendControl (Page 6577)

**TrendControl.Legend****Description**

The "Legend" property specifies the appearance of the legend ("Legend" object).

**Type**

Object, HmiLegendPart

**Access**

Read-write

**Syntax**

`TrendControl.Legend`

**See also**

TrendControl (Page 6577)

**Legend.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Legend.ForeColor`

**See also**

TrendControl.Legend (Page 6593)

**Legend.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

Legend.Font

**See also**

TrendControl.Legend (Page 6593)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Italic

**See also**

Legend.Font (Page 6594)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Legend.Font (Page 6594)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

## See also

Legend.Font (Page 6594)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

## See also

Legend.Font (Page 6594)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

**Syntax**

Font.Underline

**See also**

Legend.Font (Page 6594)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

Legend.Font (Page 6594)

**Legend.Visible****Description**

The "Visible" property specifies whether the legend is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

Legend.Visible

**See also**

TrendControl.Legend (Page 6593)

**TrendControl.Margin**

**Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

TrendControl.Margin

**See also**

TrendControl (Page 6577)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[TrendControl.Margin \(Page 6598\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[TrendControl.Margin \(Page 6598\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

TrendControl.Margin (Page 6598)

### Margin.Top

#### Description

The "Top" property specifies the spacing to the top.

#### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

TrendControl.Margin (Page 6598)

### TrendControl.Name

#### Description

The "Name" property returns the name of the trend view.

#### Type

String

**Access**

Read-only

**Syntax**`TrendControl.Name`**See also**

TrendControl (Page 6577)

**TrendControl.Online****Description**

The "Online" property specifies the start and stop of the updating of the trend view.

- True: Online. The trend view is updated with new values.
- False: Offline. No new values are added to the trend view.

**Type**

Bool

**Access**

Read-write

**Syntax**`TrendControl.Online`**See also**

TrendControl (Page 6577)

**TrendControl.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`TrendControl.Parent`

### See also

[TrendControl \(Page 6577\)](#)

[Screen Items \(Page 1742\)](#)

### Screen Items

### Description

[Screen Items \(Page 1742\)](#)

### TrendControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the trend view was created.

### Type

String

### Access

Read-only

### Syntax

`TrendControl.RenderingTemplate`

### See also

[TrendControl \(Page 6577\)](#)

## TrendControl.ShiftAxis

### Description

The "ShiftAxis" property specifies whether to swap the x axis and y axis of the trend view.

### Type

Bool

### Access

Read-write

### Syntax

```
TrendControl.ShiftAxis
```

### See also

TrendControl (Page 6577)

## TrendControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the trend view is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
TrendControl.ShowFocusVisual
```

### See also

TrendControl (Page 6577)

## TrendControl.ShowRuler

### Description

The "ShowRuler" property specifies whether the ruler is displayed for determining a trend value.

### Type

Bool

### Access

Read-write

### Syntax

`TrendControl.ShowRuler`

### See also

TrendControl (Page 6577)

## TrendControl.ShowStatisticRulers

### Description

The "ShowStatisticRulers" property specifies whether to display the two rulers for specifying the statistics area.

### Type

Bool

### Access

Read-write

### Syntax

`TrendControl.ShowStatisticRulers`

### See also

TrendControl (Page 6577)

## TrendControl.StatusBar

### Description

The "StatusBar" property specifies the information bar of the trend view.

### Type

Object, HmiStatusBarPart

### Access

Read-write

### Syntax

```
TrendControl.StatusBar
```

### See also

TrendControl (Page 6577)

## StatusBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
StatusBar.BackColor
```

### See also

TrendControl.StatusBar (Page 6605)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 6606)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

### See also

HmiControlBarElementCollection (Page 6606)

TrendControl.StatusBar (Page 6605)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 6606)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 6606)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 6624)

## See also

HmiControlBarElementCollection (Page 6606)

Control Bar Elements (Page 6624)

## Control Bar Elements

### Description

Control Bar Elements (Page 6624)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

`StatusBar.Enabled`

**See also**

[TrendControl.StatusBar \(Page 6605\)](#)

**StatusBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

[TrendControl.StatusBar \(Page 6605\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Italic`

## See also

StatusBar.Font (Page 6609)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

## Syntax

`Font.Name`

## See also

StatusBar.Font (Page 6609)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

**Syntax**`Font.Size`**See also**[StatusBar.Font \(Page 6609\)](#)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**`Int32, HmiFontStrikeOut`

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**`Read-write`**Syntax**`Font.StrikeOut`**See also**[StatusBar.Font \(Page 6609\)](#)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**`Bool`

### Access

Read-write

### Syntax

`Font.Underline`

### See also

StatusBar.Font (Page 6609)

### Font.Weight

#### Description

The "Weight" property specifies the font thickness.

#### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
StatusBar.Margin
```

### See also

TrendControl.StatusBar (Page 6605)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

StatusBar.Margin (Page 6613)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[StatusBar.Margin \(Page 6613\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[StatusBar.Margin \(Page 6613\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[StatusBar.Margin \(Page 6613\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

### See also

[TrendControl.StatusBar \(Page 6605\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[StatusBar.Padding \(Page 6615\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[StatusBar.Padding \(Page 6615\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[StatusBar.Padding \(Page 6615\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[StatusBar.Padding \(Page 6615\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.ShowToolTips`

### See also

TrendControl.StatusBar (Page 6605)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.Visible`

### See also

TrendControl.StatusBar (Page 6605)

## TrendControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the trend view.

### Type

String

### Access

Read-only

### Syntax

```
TrendControl.StyleItemClass
```

### See also

TrendControl (Page 6577)

## TrendControl.TabIndex

### Description

The "TabIndex" property returns the position of the trend view in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
TrendControl.TabIndex
```

### See also

TrendControl (Page 6577)

## TrendControl.TimeZone

### Description

The "TimeZone" property specifies the time zone.

### Type

Int32, HmiTimeZone

Values corresponding to the Microsoft Time Zone Index Value specification. "-1" stands for local time.

### Access

Read-write

### Syntax

```
TrendControl.TimeZone
```

### See also

TrendControl (Page 6577)

## TrendControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the trend view.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

```
TrendControl.ToolBar
```

### See also

TrendControl (Page 6577)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ToolBar.BackColor
```

### See also

TrendControl.ToolBar (Page 6620)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 6622)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

HmiControlBarElementCollection (Page 6622)

TrendControl.ToolBar (Page 6620)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

### See also

[ToolBar.Elements](#) (Page 6621)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

**Access**

Read-only

**Syntax**

```
HmiControlBarElementCollection.Count
```

**See also**

HmiControlBarElementCollection (Page 6622)

**HmiControlBarElementCollection.Item()****Description**

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

**Syntax**

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

**Parameters****HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 6624)

**See also**

HmiControlBarElementCollection (Page 6622)

Control Bar Elements (Page 6624)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar. You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

#### Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.

- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

ControlBarButton (Page 6624)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 6624)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**`ControlBarButton.Authorization`**See also**

ControlBarButton (Page 6624)

**ControlBarButton.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.BackColor`**See also**

ControlBarButton (Page 6624)

**ControlBarButton.Badge****Description**

The "Badge" property specifies the label of the button.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

`ControlBarButton.Badge`

**See also**

[ControlBarButton \(Page 6624\)](#)

**ControlBarButton.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.BorderColor`

**See also**

[ControlBarButton \(Page 6624\)](#)

**ControlBarButton.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`ControlBarButton.BorderWidth`

**See also**

[ControlBarButton \(Page 6624\)](#)

**ControlBarButton.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`ControlBarButton.Content`

**See also**

[ControlBarButton \(Page 6624\)](#)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ControlBarButton.Content \(Page 6629\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

**See also**

ControlBarButton.Content (Page 6629)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

Content.HorizontalTextAlignment

**See also**

ControlBarButton.Content (Page 6629)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`Content.Spacing`

## See also

[ControlBarButton.Content \(Page 6629\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

## Syntax

`Content.SplitRatio`

## See also

[ControlBarButton.Content \(Page 6629\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

[ControlBarButton.Content \(Page 6629\)](#)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

[ControlBarButton.Content \(Page 6629\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content](#) (Page 6629)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

**Syntax**

```
ControlBarButton.CustomID
```

**See also**

ControlBarButton (Page 6624)

**ControlBarButton.Enabled****Description**

The "Enabled" property specifies whether the button can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ControlBarButton.Enabled
```

**See also**

ControlBarButton (Page 6624)

**ControlBarButton.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarButton.ForeColor`

## See also

[ControlBarButton \(Page 6624\)](#)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.Graphic`

## See also

[ControlBarButton \(Page 6624\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.Height
```

**See also**

ControlBarButton (Page 6624)

**ControlBarButton.HotKey****Description**

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

**Type**

UInt16

**Access**

Read-only

**Syntax**

```
ControlBarButton.HotKey
```

**See also**

ControlBarButton (Page 6624)

**ControlBarButton.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog

- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarButton.Mapping`

## See also

[ControlBarButton](#) (Page 6624)

## ControlBarButton.Margin

## Description

The "Margin" property specifies the surrounded outer distance of the button.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarButton.Margin`

**See also**

[ControlBarButton \(Page 6624\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarButton.Margin \(Page 6639\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarButton.Margin \(Page 6639\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarButton.Margin \(Page 6639\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

ControlBarButton.Margin (Page 6639)

**ControlBarButton.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

ControlBarButton.MaximumHeight

**See also**

ControlBarButton (Page 6624)

**ControlBarButton.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.MaximumWidth`**See also**

ControlBarButton (Page 6624)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.MinimumHeight`**See also**

ControlBarButton (Page 6624)

**ControlBarButton.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MinimumWidth`

### See also

ControlBarButton (Page 6624)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarButton.Operability`

### See also

ControlBarButton (Page 6624)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarButton.Padding
```

### See also

ControlBarButton (Page 6624)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

```
Padding.Bottom
```

### See also

ControlBarButton.Padding (Page 6645)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 6645\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarButton.Padding \(Page 6645\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Top

### See also

ControlBarButton.Padding (Page 6645)

## ControlBarButton.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

ControlBarButton.RequireExplicitUnlock

### See also

ControlBarButton (Page 6624)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Text
```

### See also

ControlBarButton (Page 6624)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.ToolTipText
```

### See also

ControlBarButton (Page 6624)

## ControlBarButton.Visible

### Description

The "Visible" property specifies whether the button is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 6624\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 6624\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

### Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarDisplay.Authorization
```

### See also

ControlBarDisplay (Page 6650)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Content`

### See also

ControlBarDisplay (Page 6650)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarButton.Content (Page 6652)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarButton.Content (Page 6652)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 6652\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 6652\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content](#) (Page 6652)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarButton.Content \(Page 6652\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarButton.Content \(Page 6652\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarButton.Content](#) (Page 6652)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarDisplay.CustomID
```

### See also

[ControlBarDisplay](#) (Page 6650)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 6650\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.ForeColor`

### See also

[ControlBarDisplay \(Page 6650\)](#)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 6650)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.Height
```

### See also

ControlBarDisplay (Page 6650)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarDisplay.Mapping`

## See also

[ControlBarDisplay \(Page 6650\)](#)

## ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 6650\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ControlBarButton.Margin` (Page 6662)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 6662)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 6662\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 6662\)](#)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MaximumHeight
```

**See also**

ControlBarDisplay (Page 6650)

**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.MaximumWidth
```

**See also**

ControlBarDisplay (Page 6650)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 6650\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumWidth`

## See also

[ControlBarDisplay \(Page 6650\)](#)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarDisplay.Operability`**See also**

ControlBarDisplay (Page 6650)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 6650)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarButton.Padding \(Page 6667\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarButton.Padding \(Page 6667\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 6667\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 6667\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

### Access

Read-only

### Syntax

`ControlBarDisplay.RequireExplicitUnlock`

### See also

ControlBarDisplay (Page 6650)

## ControlBarDisplay.Text

### Description

The "Text" property specifies the label of the display.

### Type

String

### Access

Read-write

### Syntax

`ControlBarDisplay.Text`

### See also

ControlBarDisplay (Page 6650)

## ControlBarDisplay.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the display.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 6650)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 6650)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

`ControlBarDisplay.Width`

## See also

ControlBarDisplay (Page 6650)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

### Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

`ControlBarLabel.Authorization`

## See also

[ControlBarLabel \(Page 6672\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

## Syntax

`ControlBarLabel.CustomID`

## See also

[ControlBarLabel \(Page 6672\)](#)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Enabled
```

**See also**

ControlBarLabel (Page 6672)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ForeColor
```

**See also**

ControlBarLabel (Page 6672)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarLabel.Height`

## See also

[ControlBarLabel \(Page 6672\)](#)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.HorizontalTextAlignment`

## See also

[ControlBarLabel \(Page 6672\)](#)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 6672\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

### See also

[ControlBarLabel \(Page 6672\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarLabel.Margin \(Page 6679\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarLabel.Margin \(Page 6679\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarLabel.Margin \(Page 6679\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarLabel.Margin \(Page 6679\)](#)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

### See also

[ControlBarLabel \(Page 6672\)](#)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MaximumWidth
```

### See also

ControlBarLabel (Page 6672)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumHeight
```

### See also

ControlBarLabel (Page 6672)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

### See also

ControlBarLabel (Page 6672)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

**See also**

ControlBarLabel (Page 6672)

**ControlBarLabel.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Padding`

**See also**

ControlBarLabel (Page 6672)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarLabel.Padding (Page 6684)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarLabel.Padding (Page 6684)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

ControlBarLabel.Padding (Page 6684)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarLabel.Padding (Page 6684)

**ControlBarLabel.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarLabel.RequireExplicitUnlock

**See also**

[ControlBarLabel \(Page 6672\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

[ControlBarLabel \(Page 6672\)](#)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

## See also

[ControlBarLabel](#) (Page 6672)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.VerticalTextAlignment
```

## See also

[ControlBarLabel](#) (Page 6672)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Visible
```

**See also**

ControlBarLabel (Page 6672)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 6672)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

## Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 6689)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 6689)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 6689\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 6689\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Height`

### See also

[ControlBarSeparator](#) (Page 6689)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Mapping`

**See also**

[ControlBarSeparator \(Page 6689\)](#)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarSeparator.Margin`

## See also

[ControlBarSeparator \(Page 6689\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarSeparator.Margin \(Page 6695\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarSeparator.Margin` (Page 6695)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarSeparator.Margin` (Page 6695)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarSeparator.Margin \(Page 6695\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MaximumHeight`

## See also

[ControlBarSeparator \(Page 6689\)](#)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarSeparator.MaximumWidth
```

**See also**

ControlBarSeparator (Page 6689)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.MinimumHeight
```

**See also**

ControlBarSeparator (Page 6689)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarSeparator.MinimumWidth
```

## See also

ControlBarSeparator (Page 6689)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

## See also

ControlBarSeparator (Page 6689)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Padding`

**See also**

[ControlBarSeparator \(Page 6689\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarSeparator.Padding \(Page 6700\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

`ControlBarSeparator.Padding` (Page 6700)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

`ControlBarSeparator.Padding` (Page 6700)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarSeparator.Padding \(Page 6700\)](#)**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarSeparator.RequireExplicitUnlock`**See also**[ControlBarSeparator \(Page 6689\)](#)**ControlBarSeparator.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ToolTipText`

**See also**

[ControlBarSeparator \(Page 6689\)](#)

**ControlBarSeparator.Visible**

**Description**

The "Visible" property specifies whether the separator is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Visible`

**See also**

[ControlBarSeparator \(Page 6689\)](#)

**ControlBarSeparator.Width**

**Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.Width
```

**See also**

ControlBarSeparator (Page 6689)

**ControlBarTextBox****Description**

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarTextBoxPart

**Properties**

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.AlternateBorderColor
```

### See also

[ControlBarTextBox \(Page 6705\)](#)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarTextBox.Authorization
```

### See also

[ControlBarTextBox \(Page 6705\)](#)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarTextBox.Enabled`

### See also

[ControlBarTextBox \(Page 6705\)](#)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.ForeColor`

### See also

[ControlBarTextBox \(Page 6705\)](#)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

## See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarTextBox.Mapping`

[ControlBarTextBox \(Page 6705\)](#)

**ControlBarTextBox.Margin**

**Description**

The "Margin" property specifies the surrounded outer spacing of the text box.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Margin`

**See also**

[ControlBarTextBox \(Page 6705\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin \(Page 6714\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarTextBox.Margin \(Page 6714\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

`ControlBarTextBox.Margin` (Page 6714)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

`ControlBarTextBox.Margin` (Page 6714)

**ControlBarTextBox.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumHeight`**See also**

ControlBarTextBox (Page 6705)

**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumWidth`**See also**

ControlBarTextBox (Page 6705)

**ControlBarTextBox.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

Read-write

**Syntax**

`ControlBarTextBox.MinimumHeight`

**See also**

ControlBarTextBox (Page 6705)

**ControlBarTextBox.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumWidth`

**See also**

ControlBarTextBox (Page 6705)

**ControlBarTextBox.Operability**

**Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarTextBox.Operability`

### See also

[ControlBarTextBox \(Page 6705\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 6705\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarTextBox.Padding \(Page 6719\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarTextBox.Padding \(Page 6719\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 6719\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 6719\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.ReadOnly
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

ControlBarTextBox (Page 6705)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

**See also**

[ControlBarTextBox](#) (Page 6705)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Width
```

**See also**

[ControlBarTextBox](#) (Page 6705)

**ControlBarToggleSwitch****Description**

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarToggleSwitchPart

**Properties**

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateBorderColor`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateGraphic`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BackColor`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Badge`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderWidth
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarToggleSwitch.Content (Page 6732)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarToggleSwitch.Content (Page 6732)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 6732\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 6732\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 6732\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarToggleSwitch.Content \(Page 6732\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarToggleSwitch.Content \(Page 6732\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarToggleSwitch.Content](#) (Page 6732)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch](#) (Page 6725)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ForeColor`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.IsAlternateState`

## See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 6725\)](#)

**ControlBarToggleSwitch.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 6725\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 6743\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarToggleSwitch.Margin \(Page 6743\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarToggleSwitch.Margin \(Page 6743\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarToggleSwitch.Margin \(Page 6743\)](#)

**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

ControlBarToggleSwitch (Page 6725)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

ControlBarToggleSwitch (Page 6725)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 6725)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumWidth`**See also**

ControlBarToggleSwitch (Page 6725)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarToggleSwitch.Padding (Page 6748)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarToggleSwitch.Padding (Page 6748)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 6748\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 6748\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 6725)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ToolTipText`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Visible`

### See also

[ControlBarToggleSwitch \(Page 6725\)](#)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

ControlBarToggleSwitch.Width

### See also

ControlBarToggleSwitch (Page 6725)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

ToolBar.Enabled

### See also

TrendControl.ToolBar (Page 6620)

## ToolBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
ToolBar.Font
```

### See also

TrendControl.ToolBar (Page 6620)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

ToolBar.Font (Page 6754)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToolBar.Font (Page 6754)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 6754)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ToolBar.Font (Page 6754)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

ToolBar.Font (Page 6754)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

```
Font.Weight
```

**See also**

ToolBar.Font (Page 6754)

**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ToolBar.Margin`

**See also**

TrendControl.ToolBar (Page 6620)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

ToolBar.Margin (Page 6757)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**

ToolBar.Margin (Page 6757)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

ToolBar.Margin (Page 6757)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ToolBar.Margin \(Page 6757\)](#)

**ToolBar.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ToolBar.Padding`

**See also**

[TrendControl.ToolBar \(Page 6620\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ToolBar.Padding \(Page 6760\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ToolBar.Padding \(Page 6760\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

`ToolBar.Padding` (Page 6760)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

`ToolBar.Padding` (Page 6760)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

**Access**

Read-write

**Syntax**`ToolBar.ShowToolTips`**See also**

TrendControl.ToolBar (Page 6620)

**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.UseHotKeys`**See also**

TrendControl.ToolBar (Page 6620)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.Visible`

**See also**

TrendControl.ToolBar (Page 6620)

**TrendControl.Top**

**Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`TrendControl.Top`

**See also**

TrendControl (Page 6577)

**TrendControl.TrendAreas**

**Description**

The "TrendAreas" property returns the trend areas ("TrendArea" objects) of the trend control.

**Type**

Object, HmiTrendAreaCollection (Page 6765)

**Access**

Read-only

**Syntax**

`TrendControl.TrendAreas`

**See also**

[TrendControl \(Page 6577\)](#)

[HmiTrendAreaCollection \(Page 6765\)](#)

**HmiTrendAreaCollection****Description**

The "HmiTrendAreaCollection" object is a list of all trend areas ("TrendArea" objects) of the trend view.

**Use**

The "HmiTrendAreaCollection" object is a list and can be counted and enumerated. You can access the "HmiTrendAreaCollection" list using the index or the tag name.

**Object type**

HmiTrendAreaCollection

**Properties**

The "HmiTrendAreaCollection" object has the following properties:

- **Count**  
Returns the number of trend areas of the "HmiTrendAreaCollection" list.

**Methods**

The "HmiTrendAreaCollection" object has the following methods:

- **Item()**  
Returns a trend area of the "HmiTrendAreaCollection" list.

**See also**

[TrendControl.TrendAreas \(Page 6764\)](#)

## HmiTrendAreaCollection.Count

### Description

The "Count" property returns the number of trend areas in the "HmiTrendAreaCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiTrendAreaCollection.Count
```

### See also

HmiTrendAreaCollection (Page 6765)

## HmiTrendAreaCollection.Item()

### Description

The "Item" method returns a trend area of the "HmiTrendAreaCollection" list.

### Syntax

```
HmiTrendAreaCollection[.Item] (HmiTrendAreaName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTrendAreaCollection" object.

---

### Parameters

#### **HmiTrendAreaName**

Type: String

Name of the trend area

**Return value**

Object, HmiTrendAreaPart (Page 6767)

**See also**

HmiTrendAreaCollection (Page 6765)

TrendArea (Page 6767)

**TrendArea****Description**

The "TrendArea" object represents a trend view of the trend display.

**Object type**

HmiTrendAreaPart

**Properties**

The "TrendArea" object has the following properties:

- **BackColor**  
Specifies the background color.
- **BottomTimeAxes**  
Returns the lower time axes of the trend area.
- **GridLines**  
Specifies the grid lines of the trend area.
- **LeftValueAxes**  
Returns the left value axes of the trend area.
- **MajorGridLinesColor**  
Specifies the color of the main grid lines.
- **MinorGridLinesColor**  
Specifies the color of the auxiliary grid lines.
- **Name**  
Returns the name of the trend area.
- **RightValueAxes**  
Returns the right value axes of the trend area.
- **Ruler**  
Specifies the appearance of the ruler to determine the trend value.
- **SelectedTrend**  
Specifies the selected trend of the trend area.
- **SizeFactor**  
Specifies the scaling factor of the trend area relative to its height.

- **StatisticRulers**  
Specifies the two rulers for specifying the statistics area.
- **TopTimeAxes**  
Returns the upper time axes of the trend area.
- **Trends**  
Returns the trends of the trend area.
- **Visible**  
Specifies whether the trend area is visible.

## Methods

--

## TrendArea.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`TrendArea.BackColor`

### See also

[TrendArea \(Page 6767\)](#)

## TrendArea.BottomTimeAxes

### Description

The "BottomTimeAxes" property returns the lower time axes of the trend area.

### Type

Object, [HmiTimeAxisCollection \(Page 6769\)](#)

**Access**

Read-only

**Syntax**

`TrendArea.BottomTimeAxes`

**See also**

[TrendArea \(Page 6767\)](#)

[HmiTimeAxisCollection \(Page 6769\)](#)

**HmiTimeAxisCollection****Description**

The "HmiTimeAxisCollection" object is a list of all time axes ("TimeAxis" objects) of the trend area.

**Use**

The "HmiTimeAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiTimeAxisCollection" list using the index or the tag name.

**Object type**

HmiTimeAxisCollection

**Properties**

The "HmiTimeAxisCollection" object has the following properties:

- **Count**  
Returns the number of time axes of the "HmiTimeAxisCollection" list.

**Methods**

The "HmiTimeAxisCollection" object has the following methods:

- **Item()**  
Returns a time axis of the "HmiTimeAxisCollection" list.

**See also**

[TrendArea.BottomTimeAxes \(Page 6768\)](#)

## HmiTimeAxisCollection.Count

### Description

The "Count" property returns the number of time axes in the "HmiTimeAxisCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiTimeAxisCollection.Count
```

### See also

HmiTimeAxisCollection (Page 6769)

## HmiTimeAxisCollection.Item()

### Description

The "Item" method returns a time axis of the "HmiTimeAxisCollection" list.

### Syntax

```
HmiTimeAxisCollection[.Item] (HmiTimeAxisName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTimeAxisCollection" object.

---

### Parameters

#### **HmiTimeAxisName**

Type: String

Name of the time axis

**Return value**

Object, HmiTimeAxisPart (Page 6771)

**See also**

HmiTimeAxisCollection (Page 6769)

TimeAxis (Page 6771)

**TimeAxis****Description**

The "TimeAxis" object represents a time axis of the trend area.

**Object type**

HmiTimeAxisPart

**Properties**

The "TimeAxis" object has the following properties:

- **AlwaysShowRecent**  
Specifies whether the area with the youngest value is always displayed.
- **AutoScaling**  
Specifies whether the automatic scaling is activated.
- **AxisColor**  
Specifies the color of the time axis.
- **BeginTime**  
Specifies the date and time for the start time of the time range.
- **DisplayName**  
Specifies the display name of the time axis.
- **EndTime**  
Specifies the date and time for the end time of the time range.
- **LabelColor**  
Specifies the color of the axis labeling.
- **LabelFont**  
Specifies the font of the axis labeling.
- **OutputFormat**  
Specifies the format for displaying the time axis values.
- **PointCount**  
Specifies the number of measurement points from the start time.
- **RangeType**  
Specifies the type of time range.

- **ScaleMode**  
Specifies the type of scaling.
- **TickColor**  
Specifies the color of the tick marks.
- **TimeRangeBase**  
Specifies the basis of the time range.
- **TimeRangeFactor**  
Specifies the factor of the time base for defining the time range.
- **Visible**  
Specifies whether the time axis is visible.

## Methods

--

## TimeAxis.AlwaysShowRecent

### Description

The "AlwaysShowRecent" property specifies whether the area with the most recent value is always displayed.

### Type

Bool

### Access

Read-write

### Syntax

`TimeAxis.AlwaysShowRecent`

### See also

[TimeAxis \(Page 6771\)](#)

## TimeAxis.AutoScaling

### Description

The "AutoScaling" property specifies whether automatic scaling is activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`TimeAxis.AutoScaling`**See also**

TimeAxis (Page 6771)

**TimeAxis.AxisColor****Description**

The "AxisColor" property specifies the color of the time axis.

**Type**

UInt32

**Access**

Read-write

**Syntax**`TimeAxis.BackColor`**See also**

TimeAxis (Page 6771)

**TimeAxis.BeginTime****Description**

The "BeginTime" property specifies the date and time for the start time of the time range.

**Type**

DateTime

**Access**

Read-write

**Syntax**

`TimeAxis.BeginValue`

**See also**

TimeAxis (Page 6771)

**TimeAxis.DisplayName**

**Description**

The "DisplayName" property specifies the display name of the time axis.

**Type**

String

**Access**

Read-write

**Syntax**

`TimeAxis.DisplayName`

**See also**

TimeAxis (Page 6771)

**TimeAxis.EndTime**

**Description**

The "EndTime" property specifies the date and time for the end time of the time range.

**Type**

DateTime

**Access**

Read-write

**Syntax**`TimeAxis.EndValue`**See also**[TimeAxis \(Page 6771\)](#)**TimeAxis.LabelColor****Description**

The "LabelColor" property specifies the color of the axis labeling.

**Type**`UInt32`**Access**`Read-write`**Syntax**`TimeAxis.LabelColor`**See also**[TimeAxis \(Page 6771\)](#)**TimeAxis.LabelFont****Description**

The "LabelFont" property specifies the font of the axis labeling.

**Type**`Object, HmiFontPart`**Access**`Read-write`**Syntax**`TimeAxis.LabelFont`

**See also**

TimeAxis (Page 6771)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

TimeAxis.LabelFont (Page 6775)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

TimeAxis.LabelFont (Page 6775)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

TimeAxis.LabelFont (Page 6775)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

## Syntax

`Font.StrikeOut`

## See also

[TimeAxis.LabelFont \(Page 6775\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

## See also

[TimeAxis.LabelFont \(Page 6775\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

TimeAxis.LabelFont (Page 6775)

**TimeAxis.OutputFormat****Description**

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

**Type**

String

**Access**

Read-write

**Syntax**

TimeAxis.OutputFormat

**See also**

TimeAxis (Page 6771)

**TimeAxis.PointCount****Description**

The "PointCount" property specifies the number of measurement points from the start time.

**Type**

Int32

**Access**

Read-write

**Syntax**

`TimeAxis.PointCount`

**See also**

TimeAxis (Page 6771)

**TimeAxis.RangeType**

**Description**

The "RangeType" property specifies the type of time range.

**Type**

Int32, HmiTimeRangeType

Specifies the time range:

- TimeRange (0): Any time range
- FromBeginToEnd (1): Total time range
- PointCount (2): Number of measurement points

**Access**

Read-write

**Syntax**

`TimeAxis.RangeType`

**See also**

TimeAxis (Page 6771)

## TimeAxis.ScaleMode

### Description

The "ScaleMode" property specifies the type of scaling.

### Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

### Access

Read-write

### Syntax

`TimeAxis.ScaleMode`

### See also

[TimeAxis \(Page 6771\)](#)

## TimeAxis.TickColor

### Description

The "TickColor" property specifies the color of the tick marks.

### Type

UInt32

### Access

Read-write

### Syntax

`TimeAxis.TickColor`

## See also

TimeAxis (Page 6771)

## TimeAxis.TimeRangeBase

### Description

The "TimeRangeBase" property specifies the base of the time range.

### Type

Int32, HmiTimeRangeBase

Specifies a time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

### Access

Read-write

### Syntax

`TimeAxis.TimeRangeBase`

## See also

TimeAxis (Page 6771)

## TimeAxis.TimeRangeFactor

### Description

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

**Type**

Int32

**Access**

Read-write

**Syntax**`TimeAxis.TimeRangeFactor`**See also**

TimeAxis (Page 6771)

**TimeAxis.Visible****Description**

The "Visible" property specifies whether the time axis is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`TimeAxis.Visible`**See also**

TimeAxis (Page 6771)

**TrendArea.GridLines****Description**

The "GridLines" property specifies the grid lines of the trend area.

## Type

Int32, HmiGridLine

Specifies the display of the grid lines:

- None (0): None
- VerticalMajor (1): Vertical, coarse
- HorizontalMajor (2): Horizontal, coarse
- VerticalMinor (4): Vertical, fine
- HorizontalMinor (8): Horizontal, fine

## Access

Read-write

## Syntax

```
TrendArea.GridLines
```

## See also

TrendArea (Page 6767)

## TrendArea.LeftValueAxes

### Description

The "LeftValueAxes" property returns the left value axes of the trend area.

### Type

Object, HmiYValueAxisCollection (Page 6785)

### Access

Read-only

### Syntax

```
TrendArea.LeftValueAxes
```

### See also

TrendArea (Page 6767)

HmiYValueAxisCollection (Page 6785)

## HmiYValueAxisCollection

### Description

The "HmiYValueAxisCollection" object is a list of all value axes ("YValueAxis" objects) of the trend area.

### Use

The "HmiYValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiYValueAxisCollection" list using the index or the tag name.

### Object type

HmiYValueAxisCollection

### Properties

The "HmiYValueAxisCollection" object has the following properties:

- **Count**  
Returns the number of value axes in the "HmiYValueAxisCollection" list.

### Methods

The "HmiYValueAxisCollection" object has the following methods:

- **Item()**  
Returns a value axis of the "HmiYValueAxisCollection" list.

### See also

TrendArea.LeftValueAxes (Page 6784)

## HmiYValueAxisCollection.Count

### Description

The "Count" property returns the number of value axes in the "HmiYValueAxisCollection" list.

### Type

UInt32

### Access

Read-only

## Syntax

```
HmiYValueAxisCollection.Count
```

## See also

HmiYValueAxisCollection (Page 6785)

## HmiYValueAxisCollection.Item()

### Description

The "Item" method returns a value axis of the "HmiYValueAxisCollection" list.

### Syntax

```
HmiYValueAxisCollection[.Item] (HmiYValueAxisName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiYValueAxisCollection" object.

---

### Parameters

#### **HmiYValueAxisName**

Type: String

Name of the value axis

### Return value

Object, HmiYValueAxisPart (Page 6786)

## See also

HmiYValueAxisCollection (Page 6785)

YValueAxis (Page 6786)

## YValueAxis

### Description

The "YValueAxis" object represents a value axis of the trend area.

## Object type

HmiYValueAxisPart

## Properties

The "YValueAxis" object has the following properties:

- **ApplyScalingEntries**  
Specifies whether the user scaling of the axis section is applied.
- **AutoRange**  
Specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.
- **AutoScaling**  
Specifies whether the automatic scaling is activated.
- **AxisColor**  
Specifies the color of the value axis.
- **BeginValue**  
Specifies the start of a value range or value range section.
- **DisplayName**  
Specifies the display name of the value axis.
- **DivisionCount**  
Specifies the number of main units with subdivisions.
- **EndValue**  
Specifies the end of a value range or value range section.
- **HelpLines**  
Returns the appearance of the help lines.
- **LabelColor**  
Specifies the color of the axis labeling.
- **LabelFont**  
Specifies the font of the axis labeling.
- **LargeTickLabelingStep**  
Specifies the interval at which scale sections are labeled.
- **MeasurementUnit**  
Returns the displayed unit.
- **MeasurementUnitType**  
Specifies the display format of the unit.
- **OutputFormat**  
Specifies the format for displaying the axis values.
- **ScalingEntries**  
Returns the specification of the user scaling of the axis sections.
- **ScaleMode**  
Specifies the scale mode:

- **ScalingType**  
Specifies the scaling.
- **ShowScalingDisplayNames**  
Specifies whether the display names of the user scaling are used.
- **SubDivisionCount**  
Specifies the number of divisions of the main units.
- **TickColor**  
Specifies the color of the tick marks.
- **Visible**  
Specifies whether the value axis is visible.

## Methods

--

## YValueAxis.ApplyScalingEntries

### Description

The "ApplyScalingEntries" property specifies whether the user scaling of the axis sections is applied.

### Type

Bool

### Access

Read-write

### Syntax

```
YValueAxis.ApplyScalingEntries
```

### See also

YValueAxis (Page 6786)

## YValueAxis.AutoRange

### Description

The "AutoRange" property specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.

**Type**

Bool

**Access**

Read-write

**Syntax**`YValueAxis.AutoRange`**See also**

YValueAxis (Page 6786)

**YValueAxis.AutoScaling****Description**

The "AutoScaling" property specifies whether automatic scaling is activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`YValueAxis.AutoScaling`**See also**

YValueAxis (Page 6786)

**YValueAxis.AxisColor****Description**

The "AxisColor" property specifies the color of the value axis.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`YValueAxis.BackColor`

**See also**

YValueAxis (Page 6786)

**YValueAxis.BeginValue**

**Description**

The "BeginValue" property specifies the start of a value range or value range section.

**Type**

Float

**Access**

Read-write

**Syntax**

`YValueAxis.BeginValue`

**See also**

YValueAxis (Page 6786)

**YValueAxis.DisplayName**

**Description**

The "DisplayName" property specifies the display name of the value axis.

**Type**

String

**Access**

Read-write

**Syntax**`YValueAxis.DisplayName`**See also**

YValueAxis (Page 6786)

**YValueAxis.DivisionCount****Description**

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

**Type**

Int32

**Access**

Read-write

**Syntax**`YValueAxis.DivisionCount`**See also**

YValueAxis (Page 6786)

**YValueAxis.EndValue****Description**

The "EndValue" property specifies the end of a value range or value range section.

**Type**

Float

**Access**

Read-write

**Syntax**

`YValueAxis.EndValue`

**See also**

[YValueAxis \(Page 6786\)](#)

**YValueAxis.HelpLines**

**Description**

The "HelpLines" property returns the appearance of the help lines.

**Type**

Object, [HmiHelpLineCollection \(Page 6792\)](#)

**Access**

Read-only

**Syntax**

`YValueAxis.HelpLines`

**See also**

[YValueAxis \(Page 6786\)](#)

[HmiHelpLineCollection \(Page 6792\)](#)

**HmiHelpLineCollection**

**Description**

The "HmiHelpLineCollection" object is a list of all help lines ("HelpLine" objects).

**Use**

The "HmiHelpLineCollection" object is a list and can be counted and enumerated. You can access the "HmiHelpLineCollection" list using the index or the tag name.

**Object type**

HmiHelpLineCollection

**Properties**

The "HmiHelpLineCollection" object has the following properties:

- **Count**  
Returns the number of help lines of the "HmiHelpLineCollection" list.

**Methods**

The "HmiHelpLineCollection" object has the following methods:

- **Item()**  
Returns a help line of the "HmiHelpLineCollection" list.

**See also**

YValueAxis.HelpLines (Page 6792)

**HmiHelpLineCollection.Count****Description**

The "Count" property returns the number of help lines in the "HmiHelpLineCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

`HmiHelpLineCollection.Count`

**See also**

HmiHelpLineCollection (Page 6792)

## HmiHelpLineCollection.Item()

### Description

The "Item" method returns help line of the "HmiHelpLineCollection" list.

### Syntax

```
HmiHelpLineCollection[.Item] (HmiHelpLineName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiHelpLineCollection" object.

---

### Parameters

#### **HmiHelpLineName**

Type: String

Name of the help line

### Return value

Object, HmiHelpLinePart (Page 6794)

### See also

HmiHelpLineCollection (Page 6792)

HelpLine (Page 6794)

## HelpLine

### Description

The "HelpLine" object represents a help line of the value axis.

### Object type

HmiHelpLinePart

## Properties

The "HelpLine" object has the following properties:

- **Value**  
Specifies the value of the help line.
- **Visible**  
Specifies whether the help line is visible.

## Methods

--

## HelpLine.Value

### Description

The "Value" property sets the value of the help line.

### Type

Float

### Access

Read-write

### Syntax

HelpLine.Value

### See also

HelpLine (Page 6794)

## HelpLine.Visible

### Description

The "Visible" property specifies whether the help line is visible.

### Type

Bool

**Access**

Read-write

**Syntax**

`HelpLine.Visible`

**See also**

HelpLine (Page 6794)

**YValueAxis.LabelColor**

**Description**

The "LabelColor" property specifies the color of the axis labeling.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`YValueAxis.LabelColor`

**See also**

YValueAxis (Page 6786)

**YValueAxis.LabelFont**

**Description**

The "LabelFont" property specifies the font of the axis labeling.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`YValueAxis.LabelFont`**See also**[YValueAxis \(Page 6786\)](#)**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**[YValueAxis.LabelFont \(Page 6796\)](#)**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

## Syntax

Font.Name

## See also

YValueAxis.LabelFont (Page 6796)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

## Syntax

Font.Size

## See also

YValueAxis.LabelFont (Page 6796)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

[YValueAxis.LabelFont \(Page 6796\)](#)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

[YValueAxis.LabelFont \(Page 6796\)](#)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[YValueAxis.LabelFont \(Page 6796\)](#)

## YValueAxis.LargeTickLabelingStep

### Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

### Type

UInt8

### Access

Read-write

### Syntax

`YValueAxis.LargeTickLabelingStep`

### See also

[YValueAxis \(Page 6786\)](#)

## YValueAxis.MeasurementUnit

### Description

The "MeasurementUnit" property returns the displayed unit.

### Type

String

### Access

Read-only

### Syntax

```
YValueAxis.MeasurementUnit
```

### See also

YValueAxis (Page 6786)

## YValueAxis.MeasurementUnitType

### Description

The "MeasurementUnitType" property specifies the display format of the unit.

### Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

### Access

Read-write

### Syntax

```
YValueAxis.MeasurementUnitType
```

**See also**

YValueAxis (Page 6786)

**YValueAxis.OutputFormat**

**Description**

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

**Type**

String

**Access**

Read-write

**Syntax**

`YValueAxis.OutputFormat`

**See also**

YValueAxis (Page 6786)

**YValueAxis.ScalingEntries**

**Description**

The "ScalingEntries" property returns the user scaling of the axes sections.

**Type**

Object, HmiScalingEntryCollection (Page 6803)

**Access**

Read-only

**Syntax**

`YValueAxis.ScalingEntries`

## See also

YValueAxis (Page 6786)

HmiScalingEntryCollection (Page 6803)

## HmiScalingEntryCollection

### Description

The "HmiScalingEntryCollection" object is a list of all user-defined axis sections ("ScalingEntry" objects).

### Use

The "HmiScalingEntryCollection" object is a list and can be counted and enumerated. You can access the "HmiScalingEntryCollection" list using the index or the tag name.

### Object type

HmiHelpLineCollection

### Properties

The "HmiScalingEntryCollection" object has the following properties:

- **Count**  
Returns the number of user-defined axis sections of the "HmiScalingEntryCollection" list.

### Methods

The "HmiScalingEntryCollection" object has the following methods:

- **Item()**  
Returns a user-defined axis section of the "HmiScalingEntryCollection" list.

## See also

YValueAxis.ScalingEntries (Page 6802)

## HmiScalingEntryCollection.Count

### Description

The "Count" property returns the number of the user-defined axis sections in the "HmiScalingEntryCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

`HmiScalingEntryCollection.Count`

### See also

[HmiScalingEntryCollection](#) (Page 6803)

## HmiScalingEntryCollection.Item()

### Description

The "Item" method returns a user-defined axis section of the "HmiScalingEntryCollection" list.

### Syntax

`HmiScalingEntryCollection[.Item] (HmiScalingEntryName)`

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiScalingEntryCollection" object.

---

### Parameters

#### **HmiScalingEntryName**

Type: String

Name of the user-defined axis section

### Return value

Object, [HmiScalingEntryPart](#) (Page 6805)

### See also

[HmiScalingEntryCollection](#) (Page 6803)

[Scaling Entry](#) (Page 6805)

## Scaling Entry

### Description

The "ScalingEntry" object represents a user-defined axis section of the value axis.

### Object type

HmiScalingEntryPart

### Properties

The "YValueAxis" object has the following properties:

- **BeginValue**  
Specifies the start of a value range section.
- **BeginValueTarget**  
Specifies the scaled value for the start of a value range section.
- **DisplayName**  
Specifies the display name of an axis section.
- **EndValue**  
Specifies the end of a value range section.
- **EndValueTarget**  
Specifies the scaled value for the end of a value range section.

### Methods

--

## ScalingEntry.BeginValue

### Description

The "BeginValue" property specifies the start of a value range section.

### Type

Float

### Access

Read-write

### Syntax

`ScalingEntry.BeginValue`

**See also**

Scaling Entry (Page 6805)

**ScalingEntry.BeginValueTarget**

**Description**

The "BeginValueTarget" property specifies the scaled value for the start of a value range section.

**Type**

Float

**Access**

Read-write

**Syntax**

`ScalingEntry.BeginValueTarget`

**See also**

Scaling Entry (Page 6805)

**ScalingEntry.DisplayName**

**Description**

The "DisplayName" property specifies the display name of an axis section.

**Type**

String

**Access**

Read-write

**Syntax**

`ScalingEntry.DisplayName`

**See also**

Scaling Entry (Page 6805)

## ScalingEntry.EndValue

### Description

The "EndValue" property specifies the end of a value range section.

### Type

Float

### Access

Read-write

### Syntax

```
ScalingEntry.EndValue
```

### See also

Scaling Entry (Page 6805)

## ScalingEntry.EndValueTarget

### Description

The "EndValueTarget" property specifies the scaled value for the end of a value range section.

### Type

Float

### Access

Read-write

### Syntax

```
ScalingEntry.EndValueTarget
```

### See also

Scaling Entry (Page 6805)

## YValueAxis.ScaleMode

### Description

The "ScaleMode" property specifies the scale mode.

### Type

Int32, HmiScaleMode

Specifies the scale mode:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

### Access

Read-write

### Syntax

`YValueAxis.ScaleMode`

### See also

YValueAxis (Page 6786)

## YValueAxis.ScalingType

### Description

The "ScalingType" property specifies the scaling.

### Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

**Access**

Read-write

**Syntax**`YValueAxis.ScalingType`**See also**

YValueAxis (Page 6786)

**YValueAxis.ShowScalingDisplayNames****Description**

The "ShowScalingDisplayNames" property specifies whether the display names of the user scaling are used.

**Type**

Bool

**Access**

Read-write

**Syntax**`YValueAxis.ShowScalingDisplayNames`**See also**

YValueAxis (Page 6786)

**YValueAxis.SubDivisionCount****Description**

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

**Type**

Int32

**Access**

Read-write

**Syntax**

`YValueAxis.SubDivisionCount`

**See also**

YValueAxis (Page 6786)

**YValueAxis.TickColor**

**Description**

The "TickColor" property specifies the color of the tick marks.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`YValueAxis.TickColor`

**See also**

YValueAxis (Page 6786)

**YValueAxis.Visible**

**Description**

The "Visible" property specifies whether the value axis is visible.

---

**Note**

If the change of the "Visible" property of one or more value axes causes trends to disappear in the trend control, reload the page.

---

**Type**

Bool

**Access**

Read-write

**Syntax**`YValueAxis.Visible`**See also**

YValueAxis (Page 6786)

**TrendArea.MajorGridLinesColor****Description**

The "MajorGridLinesColor" property specifies the color of the main grid lines.

**Type**

UInt32

**Access**

Read-write

**Syntax**`TrendArea.MajorGridLinesColor`**See also**

TrendArea (Page 6767)

**TrendArea.MinorGridLinesColor****Description**

The "MinorGridLinesColor" specifies the color of the auxiliary grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

`TrendArea.MinorGridLinesColor`

### See also

TrendArea (Page 6767)

## TrendArea.Name

### Description

The "Name" property returns the name of the trend view.

### Type

String

### Access

Read-only

### Syntax

`TrendArea.Name`

### See also

TrendArea (Page 6767)

## TrendArea.RightValueAxes

### Description

The "RightValueAxes" property returns the right value axes of the trend area.

**Type**

Object, HmiYValueAxisCollection (Page 6813)

**Access**

Read-only

**Syntax**

```
TrendArea.RightValueAxes
```

**See also**

TrendArea (Page 6767)

HmiYValueAxisCollection (Page 6813)

**HmiYValueAxisCollection****Description**

The "HmiYValueAxisCollection" object is a list of all value axes ("YValueAxis" objects) of the trend area.

**Use**

The "HmiYValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiYValueAxisCollection" list using the index or the tag name.

**Object type**

HmiYValueAxisCollection

**Properties**

The "HmiYValueAxisCollection" object has the following properties:

- **Count**  
Returns the number of value axes in the "HmiYValueAxisCollection" list.

**Methods**

The "HmiYValueAxisCollection" object has the following methods:

- **Item()**  
Returns a value axis of the "HmiYValueAxisCollection" list.

## See also

TrendArea.RightValueAxes (Page 6812)

## HmiYValueAxisCollection.Count

### Description

The "Count" property returns the number of value axes in the "HmiYValueAxisCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiYValueAxisCollection.Count
```

## See also

HmiYValueAxisCollection (Page 6813)

## HmiYValueAxisCollection.Item()

### Description

The "Item" method returns a value axis of the "HmiYValueAxisCollection" list.

### Syntax

```
HmiYValueAxisCollection[.Item] (HmiYValueAxisName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiYValueAxisCollection" object.

---

## Parameters

**HmiYValueAxisName**

Type: String

Name of the value axis

**Return value**

Object, HmiYValueAxisPart (Page 6786)

**See also**

HmiYValueAxisCollection (Page 6813)

YValueAxis (Page 6786)

**YValueAxis****Description**

YValueAxis (Page 6786)

**TrendArea.Ruler****Description**

The "Ruler" property specifies the appearance of the ruler for determining the trend value.

**Type**

Object, HmiRulerPart

**Access**

Read-write

**Syntax**

```
TrendArea.Ruler
```

**See also**

TrendArea (Page 6767)

**Ruler.Color****Description**

The "Color" property specifies the color of the ruler.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Ruler.Color`

**See also**

TrendArea.Ruler (Page 6815)

**Ruler.Width**

**Description**

The "Width" property specifies the width of the ruler.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Ruler.Width`

**See also**

TrendArea.Ruler (Page 6815)

**TrendArea.SelectedTrend**

**Description**

The "SelectedTrend" property specifies the selected trend of the trend area.

**Type**

Object, HmiTrendPart (Page 6824)

**Access**

Read-write

**Syntax**

`TrendArea.SelectedTrend`

**See also**

[TrendArea \(Page 6767\)](#)

[Trend \(Page 6824\)](#)

**Trend****Description**

[Trend \(Page 6824\)](#)

**TrendArea.SizeFactor****Description**

The "SizeFactor" property specifies the scaling factor of the trend area relative to its height.

**Type**

UInt16

**Access**

Read-write

**Syntax**

`TrendArea.SizeFactor`

**See also**

[TrendArea \(Page 6767\)](#)

## TrendArea.StatisticRulers

### Description

The "StatisticRulers" property specifies the two rulers for specifying the statistics area.

### Type

Object, HmiRulerPart

### Access

Read-write

### Syntax

```
TrendArea.StatisticRulers
```

### See also

TrendArea (Page 6767)

## Ruler.Color

### Description

The "Color" property specifies the color of the ruler.

### Type

UInt32

### Access

Read-write

### Syntax

```
Ruler.Color
```

### See also

TrendArea.StatisticRulers (Page 6818)

## Ruler.Width

### Description

The "Width" property specifies the width of the ruler.

### Type

UInt32

### Access

Read-write

### Syntax

```
Ruler.Width
```

### See also

TrendArea.StatisticRulers (Page 6818)

## TrendArea.TopTimeAxes

### Description

The "TopTimeAxes" property returns the upper value axes of the trend area.

### Type

Object, HmiTimeAxisCollection (Page 6820)

### Access

Read-only

### Syntax

```
TrendArea.TopTimeAxes
```

### See also

TrendArea (Page 6767)

HmiTimeAxisCollection (Page 6820)

## HmiTimeAxisCollection

### Description

The "HmiTimeAxisCollection" object is a list of all time axes ("TimeAxis" objects) of the trend area.

### Use

The "HmiTimeAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiTimeAxisCollection" list using the index or the tag name.

### Object type

HmiTimeAxisCollection

### Properties

The "HmiTimeAxisCollection" object has the following properties:

- **Count**  
Returns the number of time axes of the "HmiTimeAxisCollection" list.

### Methods

The "HmiTimeAxisCollection" object has the following methods:

- **Item()**  
Returns a time axis of the "HmiTimeAxisCollection" list.

### See also

TrendArea.TopTimeAxes (Page 6819)

## HmiTimeAxisCollection.Count

### Description

The "Count" property returns the number of time axes in the "HmiTimeAxisCollection" list.

### Type

UInt32

### Access

Read-only

**Syntax**

```
HmiTimeAxisCollection.Count
```

**See also**

HmiTimeAxisCollection (Page 6820)

**HmiTimeAxisCollection.Item()****Description**

The "Item" method returns a time axis of the "HmiTimeAxisCollection" list.

**Syntax**

```
HmiTimeAxisCollection[.Item] (HmiTimeAxisName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTimeAxisCollection" object.

---

**Parameters****HmiTimeAxisName**

Type: String

Name of the time axis

**Return value**

Object, HmiTimeAxisPart (Page 6771)

**See also**

HmiTimeAxisCollection (Page 6820)

TimeAxis (Page 6771)

**TimeAxis****Description**

TimeAxis (Page 6771)

## TrendArea.Trends

### Description

The "Trends" property returns the trends ("Trend" objects) of the trend area.

### Type

Object, HmiTrendCollection (Page 6822)

### Access

Read-only

### Syntax

```
TrendArea.Trends
```

### See also

TrendArea (Page 6767)

HmiTrendCollection (Page 6822)

## HmiTrendCollection

### Description

The "HmiTrendCollection" object is a list of all trends ("Trend" objects) of the trend view.

### Use

The "HmiTrendCollection" object is a list and can be counted and enumerated. You can access the "HmiTrendCollection" list using the index or the tag name.

### Object type

HmiTrendCollection

### Properties

The "HmiTrendCollection" object has the following properties:

- **Count**  
Returns the number of trends of the "HmiTrendCollection" list.

## Methods

The "HmiTrendCollection" object has the following methods:

- **Item()**  
Returns a trend of the "HmiTrendCollection" list.

## See also

TrendArea.Trends (Page 6822)

## HmiTrendCollection.Count

### Description

The "Count" property returns the number of curves in the "HmiTrendCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiTrendCollection.Count
```

## See also

HmiTrendCollection (Page 6822)

## HmiTrendCollection.Item()

### Description

The "Item" method returns a trend of the "HmiTrendCollection" list.

### Syntax

```
HmiTrendCollection[.Item] (HmiTrendName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTrendCollection" object.

---

## Parameters

### **HmiTrendName**

Type: String

Trend name

## Return value

Object, HmiTrendPart (Page 6824)

## See also

HmiTrendCollection (Page 6822)

Trend (Page 6824)

## Trend

## Description

The "Trend" object represents a trend of the trend area.

## Object type

HmiTrendPart

## Properties

The "Trend" object has the following properties:

- **AggregationMode**  
Specifies the compression of values for logging tags.
- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **DashType**  
Specifies the stroke style of the trend.
- **DataSourceY**  
Specifies the tag for the data source of the value axis.
- **DisplayName**  
Specifies the display name of the trend.

- **LineColor**  
Specifies the line color.
- **LineWidth**  
Specifies the line thickness.
- **MarkerColor**  
Specifies the color of the trend points.
- **MarkerDimension**  
Specifies the width of the trend points.
- **MarkerGraphic**  
Specifies a graphic object as a trend point.
- **MarkerType**  
Specifies the type of the trend points.
- **QualityVisualization**  
Specifies the colors for values of a specific quality.
- **ShowLoggedDataImmediately**  
Specifies which logged values are displayed.
- **Thresholds**  
Returns the list of all limit values of the trend.
- **TimeAxis**  
References a time axis of the trend.
- **TrendMode**  
Specifies the type of trend view.
- **Visible**  
Specifies whether the trend is visible.
- **YValueAxis**  
References a value axis of the trend.

## Methods

--

## Trend.AggregationMode

### Description

The "AggregationMode" property specifies the compression of values for logging tags.

### Type

Int32, HmiAggregationMode

Specifies the type of compression:

- None (0): None
- TimeAverageStepped (1): Average over time displayed in steps
- MinMax (2): Lowest and highest value from defined period

### Access

Read-write

### Syntax

`Trend.AggregationMode`

### See also

Trend (Page 6824)

## Trend.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`Trend.AlternateBackColor`

### See also

Trend (Page 6824)

## Trend.BackColor

### Description

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

Trend.BackColor

**See also**

Trend (Page 6824)

**Trend.BackFillPattern****Description**

The "BackFillPattern" property specifies the pattern of the background or the fill.

**Type**

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient

- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

### Access

Read-write

### Syntax

`Trend.BackFillPattern`

### See also

Trend (Page 6824)

## Trend.DashType

### Description

The "DashType" property specifies the stroke style type of the trend.

### Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

### Access

Read-write

### Syntax

`Trend.DashType`

### See also

Trend (Page 6824)

## Trend.DataSourceY

### Description

The "DataSourceY" property specifies the tag for the data source of the values axis.

### Type

Object, HmiDataSourcePart

### Access

Read-write

### Syntax

`Trend.DataSourceX`

### See also

[Trend \(Page 6824\)](#)

## DataSource.Source

### Description

The "Source" property specifies the data source, e.g. a tag or logging tag.

### Type

String

### Access

Read-write

### Syntax

`DataSource.Source`

### See also

[Trend.DataSourceY \(Page 6829\)](#)

## DataSource.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`DataSource.VisualizeQuality`

### See also

[Trend.DataSourceY \(Page 6829\)](#)

## Trend.DisplayName

### Description

The "DisplayName" property specifies the display name of the trend.

### Type

String

### Access

Read-write

### Syntax

`Trend.DisplayName`

### See also

[Trend \(Page 6824\)](#)

## Trend.LineColor

### Description

The "LineColor" property specifies the line color.

### Type

UInt32

### Access

Read-write

### Syntax

`Trend.LineColor`

### See also

Trend (Page 6824)

## Trend.LineWidth

### Description

The "LineWidth" property specifies the line thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`Trend.LineWidth`

### See also

Trend (Page 6824)

## Trend.MarkerColor

### Description

The "MarkerColor" property specifies the color of the trend points.

### Type

UInt32

### Access

Read-write

### Syntax

`Trend.MarkerColor`

### See also

Trend (Page 6824)

## Trend.MarkerDimension

### Description

The "MarkerDimension" property specifies the width of the trend points.

### Type

UInt32

### Access

Read-write

### Syntax

`Trend.MarkerDimension`

### See also

Trend (Page 6824)

## Trend.MarkerGraphic

### Description

The "MarkerGraphic" property specifies a graphic object as a trend point.

### Type

String

### Access

Read-write

### Syntax

`Trend.MarkerGraphic`

### See also

[Trend \(Page 6824\)](#)

## Trend.MarkerType

### Description

The "MarkerType" property specifies the type of trend points.

### Type

Int32, HmiMarkerType

Specifies the type of the trend points:

- None (0): None
- Points (1): Dots
- Square (2): Square
- Circle (3): Circles
- Graphic (4): Graphic

### Access

Read-write

## Syntax

`Trend.MarkerType`

## See also

Trend (Page 6824)

## Trend.QualityVisualization

### Description

The "QualityVisualization" property specifies the colors for values of a specific quality.

### Type

Object, HmiQualityPart

### Access

Read-write

### Syntax

`Trend.QualityVisualization`

## See also

Trend (Page 6824)

## Quality.BadColor

### Description

The "BadColor" property specifies the color for values of the quality "Bad". Values of this quality cannot be used.

### Type

UInt32

### Access

Read-write

**Syntax**

```
Quality.BadColor
```

**See also**

Trend.QualityVisualization (Page 6834)

**Quality.UncertainColor****Description**

The "UncertainColor" property specifies the color for values of the quality "Uncertain". The quality of this level's values is worse than usual. It might still be possible to use the values, however.

**Type**

```
UInt32
```

**Access**

Read-write

**Syntax**

```
Quality.UncertainColor
```

**See also**

Trend.QualityVisualization (Page 6834)

**Quality.Visible****Description**

The "Visible" property specifies whether the colors are visible.

**Type**

```
Bool
```

**Access**

Read-write

### Syntax

`Quality.Visible`

### See also

`Trend.QualityVisualization` (Page 6834)

## Trend.ShowLoggedDataImmediately

### Description

The "ShowLoggedDataImmediately" property specifies which logged values are displayed:

- True: Entire visible range
- False: Only from current time

### Type

Bool

### Access

Read-write

### Syntax

`Trend.ShowLoggedDataImmediately`

### See also

`Trend` (Page 6824)

## Trend.Thresholds

### Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the trend.

### Type

Object, `HmiThresholdCollection` (Page 6837)

### Access

Read-only

**Syntax**

Trend.Thresholds

**See also**

Trend (Page 6824)

HmiThresholdCollection (Page 6837)

**HmiThresholdCollection****Description**

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

**Use**

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

**Object type**

HmiThresholdCollection

**Properties**

The "HmiThresholdCollection" object has the following properties:

- **Count**  
Returns the number of limit values of the "HmiThresholdCollection" list.

**Methods**

The "HmiThresholdCollection" object has the following methods:

- **Item()**  
Returns a limit value of the "HmiThresholdCollection" list.

**See also**

Trend.Thresholds (Page 6836)

**HmiThresholdCollection.Count****Description**

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

`HmiThresholdCollection.Count`

**See also**

HmiThresholdCollection (Page 6837)

**HmiThresholdCollection.Item()**

**Description**

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

**Syntax**

`HmiThresholdCollection[.Item] (HmiThresholdName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

---

**Parameters**

**HmiThresholdName**

Type: String

Name of the limit value

**Return value**

Object, HmiThresholdPart (Page 6839)

**See also**

HmiThresholdCollection (Page 6837)

Threshold (Page 6839)

## Threshold

### Description

The "Threshold" object represents a limit value.

### Object type

HmiThresholdPart

### Properties

The "Threshold" object has the following properties:

- **Color**  
Specifies the color of the limit value.
- **DisplayName**  
Specifies the display name of the limit value.
- **Name**  
Specifies the name of the limit value.
- **ThresholdMode**  
Specifies the type of limit value.
- **Value**  
Returns the limit value.

### Methods

--

## Threshold.Color

### Description

The "Color" property specifies the color of the limit value.

### Type

UInt32

### Access

Read-write

### Syntax

Threshold.Color

**See also**

Threshold (Page 6839)

**Threshold.DisplayName**

**Description**

The "DisplayName" property specifies the display name of the limit value.

**Type**

String

**Access**

Read-write

**Syntax**

Threshold.DisplayName

**See also**

Threshold (Page 6839)

**Threshold.Name**

**Description**

The "Name" property specifies the name of the limit value.

**Type**

String

**Access**

Read-write

**Syntax**

Threshold.Name

**See also**

Threshold (Page 6839)

## Threshold.ThresholdMode

### Description

The "ThresholdMode" property specifies the type of limit value.

### Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

### Access

Read-write

### Syntax

`Threshold.ThresholdMode`

### See also

[Threshold \(Page 6839\)](#)

## Threshold.Value

### Description

The "Value" property returns the limit value of the tag.

### Type

Float

### Access

Read-only

### Syntax

Threshold.Value

### See also

Threshold (Page 6839)

### Trend.TimeAxis

#### Description

The "TimeAxis" property references a time axis of the trend.

#### Type

Object, HmiTimeAxisPart (Page 6771)

#### Access

Read-write

#### Syntax

Trend.TimeAxis

### See also

Trend (Page 6824)

TimeAxis (Page 6771)

### TimeAxis

#### Description

TimeAxis (Page 6771)

### Trend.TrendMode

#### Description

The "TrendMode" property specifies the type of trend view.

**Type**

Int32, HmiTrendMode

Specifies the trend type:

- Points (0): Dots
- Interpolated (1): Interpolated
- Stepped (2): Levels
- Bar (3): Bar
- Value (4): Values

**Access**

Read-write

**Syntax**

Trend.TrendMode

**See also**

Trend (Page 6824)

**Trend.Visible****Description**

The "Visible" property specifies whether the trend is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

Trend.Visible

**See also**

Trend (Page 6824)

## Trend.YValueAxis

### Description

The "YValueAxis" property references a value axis of the trend.

### Type

Object, HmiYValueAxisPart (Page 6786)

### Access

Read-write

### Syntax

```
Trend.YValueAxis
```

### See also

Trend (Page 6824)

YValueAxis (Page 6786)

## YValueAxis

### Description

YValueAxis (Page 6786)

## TrendArea.Visible

### Description

The "Visible" property specifies whether the trend area is visible.

### Type

Bool

### Access

Read-write

**Syntax**`TrendArea.Visible`**See also**[TrendArea \(Page 6767\)](#)**TrendControl.Visible****Description**

The "Visible" property specifies whether the trend view is visible.

**Type**`Bool`**Access**`Read-write`**Syntax**`TrendControl.Visible`**See also**[TrendControl \(Page 6577\)](#)**TrendControl.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**`UInt32`**Access**`Read-write`**Syntax**`TrendControl.Width`

## See also

TrendControl (Page 6577)

## TrendControl.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the trend view.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

### Note

Enable multiple properties by adding the integer values or bit operators.

---

### Access

Read-write

### Syntax

`TrendControl.WindowFlags`

## Example

Adapt the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

## See also

TrendControl (Page 6577)

## TrendControl.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the trend view.

### Syntax

```
TrendControl.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

## See also

TrendControl (Page 6577)

## TrendControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the trend view.

### Syntax

```
TrendControl.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

### See also

TrendControl (Page 6577)

## TrendControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
TrendControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

TrendControl (Page 6577)

## TrendControl\_OnActivated()

### Description

The "OnActivated" event occurs when a trend view receives focus:

- A trend view is selected via the configured tab sequence.
- A trend view that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
TrendControl_OnActivated(item)
```

### Context

**item**

Type: Object

Trend view where the event occurs.

### See also

TrendControl (Page 6577)

## TrendControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the trend control.

### Syntax

```
TrendControl_OnCommandFired(item, commandId, custom)
```

### Context

**item**

Type: Object

Trend control where the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControllID)

**See also**

TrendControl (Page 6577)

**TrendControl\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when a trend view loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
TrendControl_OnDeactivated(item)
```

**Context****item**

Type: Object

Trend view where the event occurs.

**See also**

TrendControl (Page 6577)

## TrendControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a trend view has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
TrendControl_OnInitialized(item)
```

### Context

**item**

Type: Object

Trend view where the event occurs.

### See also

TrendControl (Page 6577)

## WebControl

### Description

The "WebControl" object represents a web browser in runtime.

### Object type

HmiWebControl

### Properties

The "WebControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the web browser.
- **Enabled**  
Specifies whether the web browser can be operated in runtime.

- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the web browser.
- **Layer**  
Returns the screen layer in which the web browser is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the web browser.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the web browser was created.
- **ShowFocusVisual**  
Specifies whether the web browser is highlighted when in focus.
- **StatusBar**  
Specifies the information bar of the web browser.
- **StyleItemClass**  
Returns the style which is applied to the web browser.
- **TabIndex**  
Returns the position of the web browser in the tab sequence.
- **ToolBar**  
Specifies the toolbar of the web browser.
- **Top**  
Specifies the value of the Y coordinate.
- **Url**  
Specifies the URL displayed by the web browser.
- **Visible**  
Specifies whether the web browser is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the web browser.

## Methods

The "WebControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the web browser.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the browser.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "WebControl" object has the following events:

- **OnActivated()**  
Occurs when a web browser receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the web browser.
- **OnDeactivated()**  
Occurs when a web browser loses focus.
- **OnInitialized()**  
Occurs when a web browser has been successfully initialized and the data connection to the PLC has been established.

## WebControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`WebControl.BackColor`

### See also

WebControl (Page 6852)

## WebControl.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`WebControl.Caption`

### See also

[WebControl \(Page 6852\)](#)

## Text.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`Text.Font`

### See also

[WebControl.Caption \(Page 6855\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

[Text.Font \(Page 6855\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

`Font.Name`

### See also

[Text.Font \(Page 6855\)](#)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 6855)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

## See also

Text.Font (Page 6855)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

Font.Underline

## See also

Text.Font (Page 6855)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 6855\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[WebControl.Caption \(Page 6855\)](#)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

[WebControl.Caption \(Page 6855\)](#)

### Text.Visible

#### Description

The "Visible" property specifies whether the text is visible.

#### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

[WebControl.Caption \(Page 6855\)](#)

### WebControl.CaptionColor

#### Description

The "CaptionColor" property specifies the color of the title bar.

#### Type

UInt32

**Access**

Read-write

**Syntax**`WebControl.CaptionColor`**See also**[WebControl \(Page 6852\)](#)**WebControl.CurrentQuality****Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the web browser.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**`WebControl.CurrentQuality`**See also**[WebControl \(Page 6852\)](#)

## WebControl.Enabled

### Description

The "Enabled" property specifies whether the web browser can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`WebControl.Enabled`

### See also

WebControl (Page 6852)

## WebControl.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`WebControl.Height`

### See also

WebControl (Page 6852)

## WebControl.Icon

### Description

The "Icon" property specifies the icon of the web browser.

### Type

String

### Access

Read-write

### Syntax

```
WebControl.Icon
```

### See also

WebControl (Page 6852)

## WebControl.Layer

### Description

The "Layer" property returns the screen layer in which the web browser is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
WebControl.Layer
```

### See also

WebControl (Page 6852)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[WebControl.Layer \(Page 6863\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[WebControl.Layer \(Page 6863\)](#)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

[WebControl.Layer \(Page 6863\)](#)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[WebControl.Layer \(Page 6863\)](#)

## WebControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`WebControl.Left`

### See also

WebControl (Page 6852)

## WebControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`WebControl.Margin`

### See also

WebControl (Page 6852)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Bottom

### See also

WebControl.Margin (Page 6866)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

WebControl.Margin (Page 6866)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[WebControl.Margin \(Page 6866\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[WebControl.Margin \(Page 6866\)](#)

## WebControl.Name

### Description

The "Name" property returns the name of the web browser.

### Type

String

### Access

Read-only

### Syntax

```
WebControl.Name
```

### See also

[WebControl \(Page 6852\)](#)

## WebControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, [HmiScreenObjectBase \(Page 1742\)](#)

### Access

Read-only

### Syntax

```
WebControl.Parent
```

### See also

[WebControl \(Page 6852\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

Screen Items (Page 1742)

## WebControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the web browser was created.

### Type

String

### Access

Read-only

### Syntax

`WebControl.RenderingTemplate`

### See also

WebControl (Page 6852)

## WebControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the web browser is highlighted when in focus.

### Type

Bool

### Access

Read-write

**Syntax**

```
WebControl.ShowFocusVisual
```

**See also**

WebControl (Page 6852)

**WebControl.StatusBar****Description**

The "StatusBar" property specifies the information bar of the web browser.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

```
WebControl.StatusBar
```

**See also**

WebControl (Page 6852)

**StatusBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
StatusBar.BackColor
```

## See also

[WebControl.StatusBar \(Page 6871\)](#)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, [HmiControlBarElementCollection \(Page 6872\)](#)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

## See also

[WebControl.StatusBar \(Page 6871\)](#)

[HmiControlBarElementCollection \(Page 6872\)](#)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property

```
StatusBar.Elements or Toolbar.Elements
```

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 6872)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 6872)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 6889)

## See also

HmiControlBarElementCollection (Page 6872)

Control Bar Elements (Page 6889)

## Control Bar Elements

### Description

Control Bar Elements (Page 6889)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

`StatusBar.Enabled`

**See also**

[WebControl.StatusBar \(Page 6871\)](#)

**StatusBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

[WebControl.StatusBar \(Page 6871\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Italic`

## See also

StatusBar.Font (Page 6875)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

## Syntax

`Font.Name`

## See also

StatusBar.Font (Page 6875)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

**Syntax**`Font.Size`**See also**`StatusBar.Font` (Page 6875)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**`Int32, HmiFontStrikeOut`

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**`Read-write`**Syntax**`Font.StrikeOut`**See also**`StatusBar.Font` (Page 6875)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**`Bool`

### Access

Read-write

### Syntax

`Font.Underline`

### See also

StatusBar.Font (Page 6875)

### Font.Weight

#### Description

The "Weight" property specifies the font thickness.

#### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

StatusBar.Font (Page 6875)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
StatusBar.Margin
```

### See also

WebControl.StatusBar (Page 6871)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

StatusBar.Margin (Page 6879)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[StatusBar.Margin \(Page 6879\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[StatusBar.Margin \(Page 6879\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[StatusBar.Margin \(Page 6879\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

### See also

[WebControl.StatusBar \(Page 6871\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[StatusBar.Padding \(Page 6881\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[StatusBar.Padding \(Page 6881\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[StatusBar.Padding \(Page 6881\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[StatusBar.Padding \(Page 6881\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.ShowToolTips`

### See also

[WebControl.StatusBar \(Page 6871\)](#)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.Visible`

### See also

[WebControl.StatusBar \(Page 6871\)](#)

## WebControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the web browser.

### Type

String

### Access

Read-only

### Syntax

```
WebControl.StyleItemClass
```

### See also

WebControl (Page 6852)

## WebControl.TabIndex

### Description

The "TabIndex" property returns the position of the web browser in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
WebControl.TabIndex
```

### See also

WebControl (Page 6852)

## WebControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the web browser.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

`WebControl.ToolBar`

### See also

WebControl (Page 6852)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ToolBar.BackColor`

### See also

WebControl.ToolBar (Page 6886)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 6887)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

WebControl.ToolBar (Page 6886)

HmiControlBarElementCollection (Page 6887)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[ToolBar.Elements \(Page 6887\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

[HmiControlBarElementCollection \(Page 6887\)](#)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 6889)

## See also

HmiControlBarElementCollection (Page 6887)

Control Bar Elements (Page 6889)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.BorderColor`

### See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`ControlBarButton.BorderWidth`

### See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarButton.Content
```

### See also

ControlBarButton (Page 6889)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

```
Content.ContentMode
```

## See also

ControlBarButton.Content (Page 6895)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarButton.Content (Page 6895)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.HorizontalTextAlignment
```

### See also

[ControlBarButton.Content \(Page 6895\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Content.Spacing
```

### See also

[ControlBarButton.Content \(Page 6895\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content](#) (Page 6895)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarButton.Content (Page 6895)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarButton.Content (Page 6895)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 6895\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarButton.CustomID`

### See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.Graphic`

### See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarButton.Mapping`

**See also**

[ControlBarButton \(Page 6889\)](#)

**ControlBarButton.Margin****Description**

The "Margin" property specifies the surrounded outer distance of the button.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 6889\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarButton.Margin \(Page 6905\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 6905)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarButton.Margin` (Page 6905)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 6905\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MaximumHeight`

## See also

[ControlBarButton \(Page 6889\)](#)

## ControlBarButton.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 6889)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MinimumHeight
```

**See also**

ControlBarButton (Page 6889)

**ControlBarButton.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarButton.MinimumWidth
```

## See also

ControlBarButton (Page 6889)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarButton.Operability
```

## See also

ControlBarButton (Page 6889)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**

ControlBarButton (Page 6889)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarButton.Padding (Page 6910)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarButton.Padding \(Page 6910\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarButton.Padding \(Page 6910\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 6910\)](#)**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarButton.RequireExplicitUnlock`**See also**[ControlBarButton \(Page 6889\)](#)**ControlBarButton.Text****Description**

The "Text" property specifies the label of the button.

**Type**

String

### Access

Read-write

### Syntax

```
ControlBarButton.Text
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.ToolTipText
```

### See also

ControlBarButton (Page 6889)

## ControlBarButton.Visible

### Description

The "Visible" property specifies whether the button is visible.

### Type

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 6889)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.Width`**See also**

ControlBarButton (Page 6889)

**ControlBarDisplay****Description**

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

[ControlBarDisplay \(Page 6915\)](#)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

## Syntax

`ControlBarDisplay.Content`

## See also

[ControlBarDisplay \(Page 6915\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

[ControlBarDisplay.Content \(Page 6917\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[ControlBarDisplay.Content \(Page 6917\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

**See also**

ControlBarDisplay.Content (Page 6917)

**Content.Spacing**

**Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 6917)

**Content.SplitRatio**

**Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

**See also**

ControlBarDisplay.Content (Page 6917)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

ControlBarDisplay.Content (Page 6917)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarDisplay.Content](#) (Page 6917)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarDisplay.Content](#) (Page 6917)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarDisplay.CustomID
```

### See also

ControlBarDisplay (Page 6915)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarDisplay.Enabled
```

### See also

ControlBarDisplay (Page 6915)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.ForeColor
```

### See also

ControlBarDisplay (Page 6915)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 6915)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

### See also

[ControlBarDisplay \(Page 6915\)](#)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarDisplay.Mapping`

**See also**

[ControlBarDisplay \(Page 6915\)](#)

**ControlBarDisplay.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the display.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 6915\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarDisplay.Margin \(Page 6927\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarDisplay.Margin` (Page 6927)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarDisplay.Margin` (Page 6927)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

`ControlBarDisplay.Margin` (Page 6927)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MaximumHeight`

## See also

`ControlBarDisplay` (Page 6915)

## ControlBarDisplay.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**`ControlBarDisplay.MaximumWidth`**See also**

ControlBarDisplay (Page 6915)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.MinimumHeight`**See also**

ControlBarDisplay (Page 6915)

**ControlBarDisplay.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarDisplay.MinimumWidth
```

## See also

ControlBarDisplay (Page 6915)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarDisplay.Operability
```

## See also

ControlBarDisplay (Page 6915)

## ControlBarDisplay.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the display.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 6915)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarDisplay.Padding (Page 6932)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarDisplay.Padding \(Page 6932\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarDisplay.Padding \(Page 6932\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarDisplay.Padding \(Page 6932\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarDisplay.RequireExplicitUnlock`**See also**[ControlBarDisplay \(Page 6915\)](#)**ControlBarDisplay.Text****Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Text`

**See also**

ControlBarDisplay (Page 6915)

**ControlBarDisplay.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.ToolTipText`

**See also**

ControlBarDisplay (Page 6915)

**ControlBarDisplay.Visible**

**Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 6915)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.Width`**See also**

ControlBarDisplay (Page 6915)

**ControlBarLabel****Description**

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.

- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarLabel.Authorization
```

### See also

[ControlBarLabel \(Page 6937\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

**Access**

Read-only

**Syntax**

`ControlBarLabel.CustomID`

**See also**

[ControlBarLabel \(Page 6937\)](#)

**ControlBarLabel.Enabled**

**Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarLabel.Enabled`

**See also**

[ControlBarLabel \(Page 6937\)](#)

**ControlBarLabel.ForeColor**

**Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.ForeColor`**See also**[ControlBarLabel \(Page 6937\)](#)**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.Height`**See also**[ControlBarLabel \(Page 6937\)](#)**ControlBarLabel.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

### See also

ControlBarLabel (Page 6937)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 6937\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

**See also**

[ControlBarLabel \(Page 6937\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarLabel.Margin \(Page 6944\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

ControlBarLabel.Margin (Page 6944)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

ControlBarLabel.Margin (Page 6944)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

[ControlBarLabel.Margin](#) (Page 6944)

**ControlBarLabel.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MaximumHeight
```

**See also**

[ControlBarLabel](#) (Page 6937)

**ControlBarLabel.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MaximumWidth
```

**See also**

ControlBarLabel (Page 6937)

**ControlBarLabel.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MinimumHeight`

**See also**

ControlBarLabel (Page 6937)

**ControlBarLabel.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MinimumWidth`

**See also**

[ControlBarLabel \(Page 6937\)](#)

**ControlBarLabel.Operability****Description**

The "Operability" property returns whether the identifier is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarLabel.Operability
```

**See also**

[ControlBarLabel \(Page 6937\)](#)

**ControlBarLabel.Padding****Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

## Syntax

`ControlBarLabel.Padding`

## See also

[ControlBarLabel \(Page 6937\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Bottom`

## See also

[ControlBarLabel.Padding \(Page 6949\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarLabel.Padding \(Page 6949\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Right`**See also**[ControlBarLabel.Padding \(Page 6949\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Top`

## See also

`ControlBarLabel.Padding` (Page 6949)

## **ControlBarLabel.RequireExplicitUnlock**

### Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarLabel.RequireExplicitUnlock`

### See also

`ControlBarLabel` (Page 6937)

## **ControlBarLabel.Text**

### Description

The "Text" property specifies the label of the identifier.

### Type

String

### Access

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

ControlBarLabel (Page 6937)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

**See also**

ControlBarLabel (Page 6937)

**ControlBarLabel.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`ControlBarLabel.VerticalTextAlignment`

**See also**

[ControlBarLabel \(Page 6937\)](#)

**ControlBarLabel.Visible**

**Description**

The "Visible" property specifies whether the identifier is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarLabel.Visible`

**See also**

[ControlBarLabel \(Page 6937\)](#)

**ControlBarLabel.Width**

**Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 6937)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar. You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

**Properties**

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarSeparator.Authorization`

**See also**

[ControlBarSeparator](#) (Page 6955)

**ControlBarSeparator.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

```
ControlBarSeparator.CustomID
```

**See also**

[ControlBarSeparator](#) (Page 6955)

**ControlBarSeparator.Enabled****Description**

The "Enabled" property specifies whether the separator is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.Enabled
```

**See also**

[ControlBarSeparator \(Page 6955\)](#)

**ControlBarSeparator.ForeColor**

**Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ForeColor`

**See also**

[ControlBarSeparator \(Page 6955\)](#)

**ControlBarSeparator.Height**

**Description**

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Height`

**See also**

ControlBarSeparator (Page 6955)

**ControlBarSeparator.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

ControlBarSeparator (Page 6955)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ControlBarSeparator.Margin`**See also**

ControlBarSeparator (Page 6955)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarSeparator.Margin \(Page 6961\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarSeparator.Margin \(Page 6961\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarSeparator.Margin \(Page 6961\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarSeparator.Margin \(Page 6961\)](#)**ControlBarSeparator.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MaximumHeight`

**See also**

[ControlBarSeparator \(Page 6955\)](#)

**ControlBarSeparator.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MaximumWidth`

**See also**

[ControlBarSeparator \(Page 6955\)](#)

**ControlBarSeparator.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MinimumHeight`**See also**

ControlBarSeparator (Page 6955)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MinimumWidth`**See also**

ControlBarSeparator (Page 6955)

**ControlBarSeparator.Operability****Description**

The "Operability" property returns whether the separator is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarSeparator.Operability`

### See also

[ControlBarSeparator \(Page 6955\)](#)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Padding`

### See also

[ControlBarSeparator \(Page 6955\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarSeparator.Padding (Page 6966)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarSeparator.Padding (Page 6966)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarSeparator.Padding \(Page 6966\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarSeparator.Padding \(Page 6966\)](#)

## ControlBarSeparator.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

### See also

ControlBarSeparator (Page 6955)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarSeparator.ToolTipText
```

### See also

ControlBarSeparator (Page 6955)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Visible`

### See also

[ControlBarSeparator \(Page 6955\)](#)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Width`

### See also

[ControlBarSeparator \(Page 6955\)](#)

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.

- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.AlternateBorderColor
```

**See also**

ControlBarTextBox (Page 6971)

**ControlBarTextBox.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.Authorization
```

**See also**

ControlBarTextBox (Page 6971)

**ControlBarTextBox.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarTextBox.BackColor`

## See also

[ControlBarTextBox \(Page 6971\)](#)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarTextBox.BorderColor`

## See also

[ControlBarTextBox \(Page 6971\)](#)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

**Syntax**

```
ControlBarTextBox.BorderWidth
```

**See also**

ControlBarTextBox (Page 6971)

**ControlBarTextBox.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.CustomID
```

**See also**

ControlBarTextBox (Page 6971)

**ControlBarTextBox.Enabled****Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**

Bool

**Access**

Read-write

## Syntax

`ControlBarTextBox.Enabled`

## See also

[ControlBarTextBox \(Page 6971\)](#)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.ForeColor`

## See also

[ControlBarTextBox \(Page 6971\)](#)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.Height
```

**See also**

ControlBarTextBox (Page 6971)

**ControlBarTextBox.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.HorizontalTextAlignment
```

**See also**

ControlBarTextBox (Page 6971)

**ControlBarTextBox.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 6971\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 6971\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarTextBox.Margin \(Page 6980\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarTextBox.Margin \(Page 6980\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 6980\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

`ControlBarTextBox.Margin` (Page 6980)

## ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MaximumHeight`

### See also

`ControlBarTextBox` (Page 6971)

## ControlBarTextBox.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MaximumWidth
```

### See also

ControlBarTextBox (Page 6971)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumHeight
```

### See also

ControlBarTextBox (Page 6971)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumWidth
```

### See also

ControlBarTextBox (Page 6971)

## ControlBarTextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarTextBox.Operability
```

**See also**

[ControlBarTextBox \(Page 6971\)](#)

**ControlBarTextBox.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Padding
```

**See also**

[ControlBarTextBox \(Page 6971\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Bottom
```

### See also

[ControlBarTextBox.Padding \(Page 6985\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarTextBox.Padding \(Page 6985\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

**See also**

[ControlBarTextBox.Padding \(Page 6985\)](#)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarTextBox.Padding \(Page 6985\)](#)

**ControlBarTextBox.ReadOnly****Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ReadOnly`

## See also

[ControlBarTextBox](#) (Page 6971)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

## See also

[ControlBarTextBox](#) (Page 6971)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

**See also**

[ControlBarTextBox \(Page 6971\)](#)

**ControlBarTextBox.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.ToolTipText
```

**See also**

[ControlBarTextBox \(Page 6971\)](#)

**ControlBarTextBox.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

## Syntax

`ControlBarTextBox.VerticalTextAlignment`

## See also

[ControlBarTextBox \(Page 6971\)](#)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarTextBox.Visible`

## See also

[ControlBarTextBox \(Page 6971\)](#)

## ControlBarTextBox.Width

### Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

## Syntax

```
ControlBarTextBox.Width
```

## See also

ControlBarTextBox (Page 6971)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.

- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

**Methods**

--

**ControlBarToggleSwitch.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.AlternateBackColor`**See also**[ControlBarToggleSwitch \(Page 6991\)](#)**ControlBarToggleSwitch.AlternateBorderColor****Description**

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.AlternateBorderColor`

**See also**

ControlBarToggleSwitch (Page 6991)

**ControlBarToggleSwitch.AlternateGraphic**

**Description**

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateGraphic`

**See also**

ControlBarToggleSwitch (Page 6991)

**ControlBarToggleSwitch.AlternateText**

**Description**

The "AlternateText" property specifies the text of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateText`

**See also**

[ControlBarToggleSwitch](#) (Page 6991)

**ControlBarToggleSwitch.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarToggleSwitch.Authorization
```

**See also**

[ControlBarToggleSwitch](#) (Page 6991)

**ControlBarToggleSwitch.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BackColor
```

**See also**

ControlBarToggleSwitch (Page 6991)

**ControlBarToggleSwitch.Badge**

**Description**

The "Badge" property specifies the identifier of the switch.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Badge`

**See also**

ControlBarToggleSwitch (Page 6991)

**ControlBarToggleSwitch.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.BorderColor`

**See also**

[ControlBarToggleSwitch](#) (Page 6991)

**ControlBarToggleSwitch.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderWidth
```

**See also**

[ControlBarToggleSwitch](#) (Page 6991)

**ControlBarToggleSwitch.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.Content
```

## See also

ControlBarToggleSwitch (Page 6991)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

ControlBarToggleSwitch.Content (Page 6997)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[ControlBarToggleSwitch.Content \(Page 6997\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarToggleSwitch.Content \(Page 6997\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 6997\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 6997\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

ControlBarToggleSwitch.Content (Page 6997)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarToggleSwitch.Content \(Page 6997\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 6997\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch \(Page 6991\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Enabled
```

### See also

[ControlBarToggleSwitch \(Page 6991\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 6991)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 6991)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

[ControlBarToggleSwitch \(Page 6991\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

```
Button.HotKey
```

### See also

[ControlBarToggleSwitch \(Page 6991\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

### See also

ControlBarToggleSwitch (Page 6991)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Mapping`

### See also

[ControlBarToggleSwitch \(Page 6991\)](#)

## ControlBarToggleSwitch.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the switch.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 7008\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarToggleSwitch.Margin \(Page 7008\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarToggleSwitch.Margin \(Page 7008\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarToggleSwitch.Margin \(Page 7008\)](#)**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumHeight`**See also**[ControlBarToggleSwitch \(Page 6991\)](#)**ControlBarToggleSwitch.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumHeight`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**ControlBarToggleSwitch.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumWidth`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Operability`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**ControlBarToggleSwitch.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Padding`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarToggleSwitch.Padding \(Page 7013\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarToggleSwitch.Padding \(Page 7013\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarToggleSwitch.Padding \(Page 7013\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarToggleSwitch.Padding (Page 7013)

**ControlBarToggleSwitch.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarToggleSwitch.RequireExplicitUnlock

**See also**

ControlBarToggleSwitch (Page 6991)

**ControlBarToggleSwitch.Text**

**Description**

The "Text" property specifies the label of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Text`**See also**

ControlBarToggleSwitch (Page 6991)

**ControlBarToggleSwitch.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.ToolTipText`**See also**

ControlBarToggleSwitch (Page 6991)

**ControlBarToggleSwitch.Visible****Description**

The "Visible" property specifies whether the switch is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Visible`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**ControlBarToggleSwitch.Width**

**Description**

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Width`

**See also**

[ControlBarToggleSwitch \(Page 6991\)](#)

**ToolBar.Enabled**

**Description**

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.Enabled`**See also**

WebControl.ToolBar (Page 6886)

**ToolBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`ToolBar.Font`**See also**

WebControl.ToolBar (Page 6886)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

ToolBar.Font (Page 7019)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

ToolBar.Font (Page 7019)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

ToolBar.Font (Page 7019)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

ToolBar.Font (Page 7019)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[ToolBar.Font \(Page 7019\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

**Syntax**`Font.Weight`**See also**`ToolBar.Font` (Page 7019)**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**`Object, HmiMarginPart`**Access**`Read-write`**Syntax**`ToolBar.Margin`**See also**`WebControl.ToolBar` (Page 6886)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Bottom`

## See also

[ToolBar.Margin \(Page 7023\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

## See also

[ToolBar.Margin \(Page 7023\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**`ToolBar.Margin` (Page 7023)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**`ToolBar.Margin` (Page 7023)**ToolBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**`Object, HmiPaddingPart`**Access**`Read-write`

## Syntax

`ToolBar.Padding`

## See also

[WebControl.ToolBar \(Page 6886\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

## See also

[ToolBar.Padding \(Page 7025\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Left`**See also**`ToolBar.Padding` (Page 7025)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Right`**See also**`ToolBar.Padding` (Page 7025)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Top`

## See also

`ToolBar.Padding` (Page 7025)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.ShowToolTips`

## See also

`WebControl.ToolBar` (Page 6886)

## ToolBar.UseHotKeys

### Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

### Type

Bool

### Access

Read-write

**Syntax**

```
ToolBar.UseHotKeys
```

**See also**

WebControl.ToolBar (Page 6886)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ToolBar.Visible
```

**See also**

WebControl.ToolBar (Page 6886)

**WebControl.Top****Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`WebControl.Top`

**See also**

WebControl (Page 6852)

**WebControl.Url**

**Description**

The "Url" property specifies the URL displayed by the web browser.

**Type**

String

**Access**

Read-write

**Syntax**

`WebControl.Url`

**See also**

WebControl (Page 6852)

**WebControl.Visible**

**Description**

The "Visible" property specifies whether the web browser is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`WebControl.Visible`

**See also**

WebControl (Page 6852)

**WebControl.Width****Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`WebControl.Width`

**See also**

WebControl (Page 6852)

**WebControl.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the web browser.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized

- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`WebControl.WindowFlags`

**See also**

WebControl (Page 6852)

**WebControl.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the web browser.

**Syntax**

`WebControl.CheckAuthorization()`

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

WebControl (Page 6852)

## WebControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the browser.

### Syntax

```
WebControl.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlIID)

### Return value

--

## See also

WebControl (Page 6852)

## WebControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
WebControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

WebControl (Page 6852)

**WebControl\_OnActivated()****Description**

The "OnActivated" event occurs when a web browser receives focus:

- A web browser is selected via the configured tab sequence.
- A web browser that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
Ellipse_OnActivated(item)
```

**Context****item**

Type: Object

Web browser where the event occurs.

**See also**

WebControl (Page 6852)

**WebControl\_OnCommandFired()****Description**

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the web browser.

**Syntax**

```
WebControl_OnCommandFired(item, commandId, custom)
```

## Context

### **item**

Type: Object

Web browser where the event occurs.

### **commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

### **custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## See also

WebControl (Page 6852)

## WebControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a web browser loses focus because the operator presses the <TAB> key or executes a different action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
WebControl_OnDeactivated(item)
```

## Context

### **item**

Type: Object

Web browser where the event occurs.

**See also**

WebControl (Page 6852)

**WebControl\_OnInitialized()****Description**

The "OnInitialized" event occurs when a web browser has been successfully initialized and the data connection to the PLC has been established.

**Syntax**

```
WebControl_OnInitialized(item)
```

**Context**

**item**

Type: Object

Web browser where the event occurs.

**See also**

WebControl (Page 6852)

**ParameterControl****Description**

The "ParameterControl" object represents a parameter set control.

**Object type**

HMIUIParameterControl

**Properties**

--

**Methods**

--

## SysFct

### Description

The "SysFct" object enables access to the system functions of the "ParameterControl" object.

### Object type

HMIUIParameterControlSysFct

### Properties

--

### Methods

The "SysFct" object has the following methods:

- **ExecuteToolBarButton()**  
Calls the "ExecuteToolBarButton" function of a parameter set control.

## SysFct.ExecuteToolBarButton()

### Description

The "ExecuteToolBarButton" method calls the "ExecuteToolBarButton" function of a parameter set control. A button of the toolbar of the parameter set control is triggered.

### Syntax

```
[HMIRuntime.]UI.ParameterControl.SysFct.(screenItemPath,  
detailedViewToolBarButtonID);
```

### Parameters

#### **screenItemPath**

Type: String, HmiDetailedParameterControl

Path of the screen object.

#### **detailedViewToolBarButtonID**

Type: HmiDetailedParameterControlID

Control ID of the parameter set control:

- .Create for "Create" button
- .Save for "Save" button

- .SaveAs for "Save As" button
- .Delete for "Delete" button
- .Rename for "Rename" button
- .WriteToPLC for "Write to PLC" button
- .ReadFromPLC for "Read from PLC" button
- .Export for "Export" button
- .Import for "Import" button
- .Cancel for "Cancel" button

**Return value**

ErrorCode

**SysDiag****Description**

The "SysDiag" object enables access to the system diagnostics control.

**Object type**

HMIUISysDiag

**Properties**

--

**Methods**

--

**See also**

UI (Page 1558)

**SysFct****Description**

The "SysFct" object enables access to the system functions of the "SysDiag" object.

## Object type

HMIUISysDiagSysFct

## Properties

--

## Methods

The "SysFct" object has the following methods:

- **GoToPlc()**  
Calls the "GoToPlc" method of the system diagnostics control.
- **ExecuteToolBarButton()**  
Calls the "ExecuteToolBarButton" method of the system diagnostics control.

## See also

SysDiag (Page 7039)

## SysFct.ExecuteToolBarButton()

### Description

The "ExecuteToolBarButton" method calls the "ExecuteToolBarButton" method of a system diagnostics control. A button of the system diagnostics control's toolbar is triggered.

If the authorization to operate the control or toolbar has been limited or blocked, the buttons can still be operated using the method.

The authorization must be configured at the object that the method executes.

Buttons that are not available due to missing functionality in the current display (e.g. "Next line" if the last line has been selected) cannot be executed using the method.

### Syntax

```
[HMIRuntime.]UI.SysDiag.SysFct.ExecuteToolBarButton(screenItemPath,  
systemDiagnosisControlID);
```

### Parameters

#### **screenItemPath**

Type: String, HmiSystemDiagnosisControl

Path of the system diagnostics control

#### **systemDiagnosisControlID**

Type: HmiSystemDiagnosisControlID

Control ID of the button:

- Previous (2): Previous
- Next (3): Continue
- Home (5): Home
- Reload (6): Reload
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- SplitView (18): Enabled/disabled detail view
- Back (19): Previous
- ShowDiagnosticsBuffer (20): Show diagnostic buffer

### Return value

ErrorCode

### See also

SysFct (Page 7039)

### SysFct.GoToPlc()

### Description

The "GoToPlc" calls the "GoToPlc" method of the system diagnostics control.

### Syntax

```
[HMIRuntime.]UI.SysDiag.SysFct.GoToPlc(screenItemPath);
```

### Parameters

**screenItemPath**

Type: String, HmiSystemDiagnosisControl

Path of the system diagnostics control

### Return value

ErrorCode

## See also

SysFct (Page 7039)

## SysFct

### Description

The "SysFct" object ("HMIUISysFct" type) enables access to the system functions of the "UI" object.

### Object type

HMIUISysFct

### Properties

--

### Methods

The "SysFct" object has the following methods:

- **ChangeScreen()**  
Loads a new screen into a screen window.
- **ChangeScreenAsync()**  
Loads a new screen asynchronously into a screen window.
- **ChangeScreenAsyncByNumber()**  
Loads a new screen asynchronously into a screen window.
- **ChangeScreenByNumber()**  
Loads a new screen into a screen window.
- **ClosePopup()**  
Closes a popup window in runtime.
- **GetPropertyValue()**  
Returns the current value of a property of a screen object.
- **LogOff()**  
Logs off the current user.
- **OpenScreenByNumberInPopup()**  
Opens a screen in a popup window.
- **OpenScreenInPopup()**  
Opens a screen in a popup window.
- **OpenScreenInPopupAsync()**  
Opens a screen asynchronously in a popup window.
- **SetLanguage()**  
Sets a new current runtime language.

- **SetPropertyValue()**  
Sets the current value of a property of a screen object.
- **ToggleLanguage()**  
Changes the runtime language to the next one in the list of configured languages.

**See also**

UI (Page 1558)

**SysFct.ActivateCleanScreen()****Description**

The "ActivateCleanScreen" method opens a clean screen as a full-screen pop-up and disables the Unified Panels touchscreen.

**Syntax**

```
[HMIRuntime.]UI.SysFct.ActivateCleanScreen(timeout);
```

**Parameters**

**timeout**

Type: UInt32

Time period after which the popup closes. The maximum value is 300 seconds.

**Return value**

ErrorCode

**See also**

SysFct (Page 7042)

**SysFct.ChangeScreen()****Description**

The "ChangeScreen" method loads a new screen into a screen window.

**Syntax**

```
[HMIRuntime.]UI.SysFct.ChangeScreen(screenName, screenWindowPath);
```

## Parameters

### **screenName**

Type: String, HmiScreen

Name of the new screen

### **screenWindowPath**

Type: String, HmiScreenWindow

Object path of the top-level screen window or screen in which the screen is to be changed, e.g. "~/Screen\_window\_1".

## Return value

ErrorCode

## See also

SysFct (Page 7042)

## SysFct.ChangeScreenAsync()

## Description

The "ChangeScreenAsync" method loads a new screen asynchronously into a screen window.

This method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

## Syntax

```
[HMIRuntime.]UI.SysFct.ChangeScreenAsync(screenName,  
screenWindowPath)  
.then(function() {  
    ...  
})  
.catch(function(errorCode) {  
    ...  
})
```

## Parameters

### **screenName**

Type: String, HmiScreen

Name of the new screen

**screenWindowPath**

Type: String, HmiScreenWindow

Object path of the top-level screen window or screen in which the screen is to be changed, e.g. "~/Screen\_window\_1".

**Return value**

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)  
No return for the "then()" handler.
- Promise rejected (rejected)  
ErrorCode as parameter of the "catch()" handler.

**Example**

Find the screen named "myScreen" asynchronously in screen window "ScreenWindow\_1" and set a property:

**Copy code**

```
HMIRuntime.UI.SysFct.ChangeScreenAsync('myScreen', './ScreenWindow_1')
  .then(function () {
    HMIRuntime.UI.SysFct.SetPropertyValue('./ScreenWindow_1/Button_1',
    'Text', 'Button text abc');
  })
  .catch((error) => {
    HMIRuntime.Trace('screen change failed');
  });
```

**See also**

SysFct (Page 7042)

**SysFct.ChangeScreenAsyncByNumber()****Description**

The "ChangeScreenAsyncByNumber" method loads a new screen asynchronously into a screen window.

This method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

## Syntax

```
[HMIRuntime.]UI.SysFct.ChangeScreenAsyncByNumber (screenNumber,  
screenWindowPath)  
.then(function () {  
    ...  
})  
.catch(function (errorCode) {  
    ...  
})
```

## Parameters

**screenNumber**

Type: UInt32

Unique number (&gt; 0) of the new screen

**screenWindowPath**

Type: String, HmiScreenWindow

Object path of the top-level screen window or screen in which the screen is to be changed, e.g. "~/Screen\_window\_1".

## Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)  
No return for the "then()" handler.
- Promise rejected (rejected)  
ErrorCode as parameter of the "catch()" handler.

## Example

Load the screen with the number "6" asynchronously into the screen window "ScreenWindow\_1":

**Copy code**

```
HMIRuntime.UI.SysFct.ChangeScreenAsyncByNumber (6, "~/ScreenWindow_1")  
.then(function () {  
    HMIRuntime.Trace ("Screen changed!");  
})  
.catch((error) => {  
    let errMsg = HMIRuntime.GetDetailedErrorDescription(error);  
    HMIRuntime.Trace ("ChangeScreen failed! Error = " + error + " " +  
errMsg);  
});
```

**See also**

SysFct (Page 7042)

**SysFct.ChangeScreenByNumber()****Description**

The "ChangeScreenByNumber" method loads a new screen into a screen window.

**Syntax**

```
[HMIRuntime.]UI.SysFct.ChangeScreenByNumber (screenNumber,  
screenWindowPath);
```

**Parameters****screenNumber**

Type: UInt32

Unique number (> 0) of the new screen

**screenWindowPath**

Type: String, HmiScreenWindow

Object path of the top-level screen window or screen in which the screen is to be changed, e.g. "~/Screen\_window\_1".

**Return value**

ErrorCode

**Example**

Load the screen with the number "6" into the screen window "ScreenWindow\_1":

**Copy code**

```
let err = HMIRuntime.UI.SysFct.ChangeScreenByNumber(6, "~/ScreenWindow_1");
```

SysFct (Page 7042)

## SysFct.ClosePopup()

### Description

The "ClosePopup" method closes a popup window in runtime.

### Syntax

```
[HMIRuntime.]UI.SysFct.ClosePopup (popupWindowPath) ;
```

### Parameter

**popupWindowPath**

Type: String, HmiPopupScreenPath

Object path of the popup window to be closed

### Return value

ErrorCode

### See also

SysFct (Page 7042)

## SysFct.GetPropertyValue()

### Description

The "GetPropertyValue" method returns the current value of a property of a screen object.

### Syntax

```
[HMIRuntime.]UI.SysFct.GetPropertyValue (screenItemPath,  
screenItemPropertyName) ;
```

### Parameters

**screenItemPath**

Type: String, HmiScreenItemBase

Screen object path

**screenItemPropertyName**

Type: String

Name of the property of the screen object

**Return value**

Variant

**See also**

SysFct (Page 7042)

**SysFct.LogOff()****Description**

The "LogOff" method logs off the current user.

**Syntax**

```
[HMIRuntime.]UI.SysFct.LogOff();
```

**Parameters**

--

**Return value**

ErrorCode

**See also**

SysFct (Page 7042)

**SysFct.OpenScreenByNumberInPopup()****Description**

The "OpenScreenByNumberInPopup" method opens a screen in a popup window.

**Syntax**

```
[HMIRuntime.]UI.SysFct.OpenScreenByNumberInPopup (popupWindowName,  
screenNumber, toggleOpen, caption, left, top, hideCloseButton[,  
parentScreenPath]);
```

**Parameters****popupWindowName**

Type: String, HmiPopupScreenName

Name of the popup window. The name must be unique within the parent screen.

**screenNumber**

Type: UInt32

Unique number (> 0) of the screen that will be loaded into the popup window.

**toggleOpen**

Type: Bool

Specifies the behavior of the popup window when it is reopened:

- True: If the window is open, it will be closed.
- False: If the window is open, it remains open.

**caption**

Type: String

Specifies the window title of the popup window.

**left**

Type: Int32

Specifies the window position as offset from the left-hand margin.

**top**

Type: Int32

Specifies the window position as offset from the top margin.

**hideCloseButton**

Type: Bool

Specifies whether the Close button is displayed:

- True: Close button is not displayed.
- False: Close button is displayed.

**parentScreenPath**

Optional, type: String, HmiParentScreen

Object path of the parent screen. If this value is left empty, the popup window is global and will not close along with the parent screen.

**Return value**

ErrorCode

## Example

Load the screen with the number "6" into the screen window "ScreenWindow\_1":

### Copy code

```
let err = HMIRuntime.UI.SysFct.OpenScreenByNumberInPopup("popup", 6, false, "popup caption", 20, 30, false, undefined);
```

## See also

SysFct (Page 7042)

## SysFct.OpenScreenInPopup()

### Description

The "OpenScreenInPopup" method opens a screen in a popup window.

---

### Note

When dragging a popup window to the area outside the visible workspace, it may not be possible to pull this window back. To prevent this, set the "AlwaysInParent" property for the popup window in "WindowFlags".

---

### Syntax

```
[HMIRuntime.]UI.SysFct.OpenScreenInPopup (popupWindowName, screenName, toggleOpen, caption, left, top, hideCloseButton[, parentScreenPath]);
```

### Parameters

#### **popupWindowName**

Type: String, HMIPopupScreenWindow

Name of the popup window. The name must be unique within the parent screen.

#### **screenName**

Type: String, HMIScreen

Name of the screen that will be loaded into the popup window.

#### **toggleOpen**

Type: Bool

Specifies the behavior of the popup window when it is reopened:

- True: If the window is open, it will be closed.
- False: If the window is open, it remains open.

**caption**

Type: String

Specifies the window title of the popup window.

**left**

Type: Int32

Specifies the window position as offset from the left-hand margin.

**top**

Type: Int32

Specifies the window position as offset from the top margin.

**hideCloseButton**

Type: Bool

Specifies whether the Close button is displayed:

- True: Close button is not displayed.
- False: Close button is displayed.

**parentScreenPath**

Optional, type: String, HmiParentScreen

Object path of the parent screen. If this value is left empty, the popup window is global and will not close along with the parent screen.

**Return value**

ErrorCode

**Example**

Open a screen in a popup window:

**Copy code**

```
UI.SysFct.OpenScreenInPopup("PopupWindowName", "Screen_1", true, "WindowCaption", 0, 0, false);  
let po = UI.FindItem("/PopupWindowName");  
po.Left = 100;  
po.Top = 150;  
po.Visible = true;  
let flags = po.WindowFlags;  
po.WindowFlags = flags | UI.Enums.HmiWindowFlag.AlwaysInParent;
```

## SysFct.OpenScreenInPopupAsync()

### Description

The "OpenScreenInPopupAsync" method opens a screen in a popup window.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

### Syntax

```
[HMIRuntime.]UI.SysFct.OpenScreenInPopup (popupWindowName,  
screenName, toggleOpen, caption, left, top, hideCloseButton[,  
parentScreenPath])  
.then(function() {  
    ...  
})  
.catch(function(errorCode) {  
    ...  
});
```

### Parameters

**popupWindowName**

Type: String, HMIPopupScreenName

Name of the popup window. The name must be unique within the parent screen.

**screenName**

Type: String, HMIScreen

Name of the screen that will be loaded into the popup window.

**toggleOpen**

Type: Bool

Specifies the behavior of the popup window when it is reopened:

- True: If the window is open, it will be closed.
- False: If the window is open, it remains open.

**caption**

Type: String

Specifies the window title of the popup window.

**left**

Type: Int32

Specifies the window position as offset from the left-hand margin.

**top**

Type: Int32

Specifies the window position as offset from the top margin.

**hideCloseButton**

Type: Bool

Specifies whether the Close button is displayed:

- True: Close button is not displayed.
- False: Close button is displayed.

**parentScreenPath**

Optional, type: String, HmiParentScreen

Object path of the parent screen. If this value is left empty, the popup window is global and will not close along with the parent screen.

**Return value**

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)  
No return for the "then()" handler.
- Promise rejected (rejected)  
ErrorCode as parameter of the "catch()" handler.

**SysFct.SetLanguage()**

**Description**

The "SetLanguage" method specifies a new current runtime language.

**Syntax**

```
[HMIRuntime.]UI.SysFct.SetLanguage(lcid);
```

**Parameters**

**lcid**

Type: UInt32, HMILCID

ID of the new language

## Return value

ErrorCode

## Locale IDs (HMILCID)

The following table contains the Microsoft locale IDs of the languages supported in runtime:

Language	Country/Region	Locale ID
Afrikaans	South Africa	1078
Albanian	Albania	1052
Armenian	Armenia	1067

**SysFct.SetPropertyValue()****Description**

The "SetPropertyValue" method sets the current value of a property of a screen object.

### Syntax

```
[HMIRuntime.]UI.SysFct.SetPropertyValue(screenItemPath,  
screenItemPropertyName, value);
```

### Parameters

**screenItemPath**

Type: String, HmiScreenItemBase

Object path of the screen object

**screenItemPropertyName**

Type: String

Name of the property of the screen object

**value**

Type: Variant

New value of the property of the screen object

### Return value

ErrorCode

### See also

SysFct (Page 7042)

## SysFct.ToggleLanguage()

### Description

The "ToggleLanguage" method toggles the runtime language to the next in the list of configured languages.

### Syntax

```
[HMIRuntime.]UI.SysFct.ToggleLanguage();
```

### Parameters

--

### Return value

ErrorCode

**See also**

SysFct (Page 7042)

**GetAndClearScreenItemCommand****Description of GetAndClearScreenItemCommand****Description**

The "GetAndClearScreenItemCommand" object enables the reading and deletion of the value of a screen object.

**Object type**

HMIGetAndClearScreenItemCommand

**Properties**

--

**Methods**

The "GetAndClearScreenItemCommand" object has the following methods:

- **GetAndClearValue()**  
Auxiliary function for the "SysFct" object for reading and deleting the value of a screen object.

**See also**

SysFct (Page 7042)

**GetAndClearScreenItemCommand.ChangeScreen()****Description**

The "GetAndClearValue" method is an auxiliary function for the "SysFct" object for reading and deleting the value of a screen object.

**Syntax**

```
[HMIRuntime.]UI.GetAndClearScreenItemCommand.GetAndClearValue ();
```

**Parameters**

--

### Return value

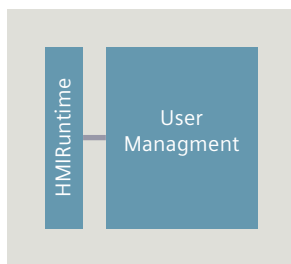

Variant

### See also

Description of GetAndClearScreenItemCommand (Page 7059)

## 10.2.2.20 UserManagement

### Description

The "UserManagement" object allows the roles of the current user to be checked.

### Object type

HMIUserManagement

### Properties

--

### Methods

The "UserManagement" object has the following methods:

- **GetRolesFromUser()**  
Returns the roles of the current user.
- **HasUserRole()**  
returns whether the current user has the selected role.

## UserManagement.GetRolesFromUser()

### Description

The "GetRolesFromUser" method returns the roles of the current user.

## Syntax

```
HMIRuntime.UserManagement.GetRolesFromUser();
```

## Parameters

--

## Return value

String[], HMIUserRole[]

## Example

Output all roles of the current user:

### Copy code

```
let roles = HMIRuntime.UserManagement.GetRolesFromUser();
if (roles.length > 0) {
    let strRoles = '';
    roles.forEach((roleName) => {

        strRoles += roleName + ',';
    });
    HMIRuntime.Trace("The current user is in role(s): " + strRoles);
} else {
    HMIRuntime.Trace("User has no roles.");
}
```

## See also

UserManagement (Page 7060)

## UserManagement.HasUserRole()

### Description

The "HasUserRole" method returns whether the current user has the selected role.

### Syntax

```
HMIRuntime.UserManagement.HasUserRole(RoleName);
```

### Parameters

#### RoleName

Type: String, HMIUserRole

Name of the role.

## Return value

Bool

## Example

Check the current user for the "HMI Operator" role.

### Copy code

```
let roleName = "HMI Operator";  
let retVal = HMIRuntime.UserManagement.HasUserRole(roleName);  
if (retVal) {  
    HMIRuntime.Trace("The current user is in role: " + roleName);  
} else {  
    HMIRuntime.Trace("The current user isn't in role: " + roleName);  
}
```

## SysFct

### 10.2.2.21 WAMP

## Description

The "WAMP" object ("HMIWAMP" type) enables a connection to the WAMP router via WebSocket.

## Object type

HMIWAMP

## Properties

--

## Methods

The "WAMP" object has the following methods:

- **CreateConnection()**  
Establishes a connection to the WAMP router via WebSocket.

## WAMP.CreateConnection

### Description

The "CreateConnection" method establishes a connection to the WAMP router via WebSocket.

### Syntax

```
HMIRuntime.WAMP.CreateConnection();
```

### Parameters

--

### Return value

Object, HMIWAMPConnection

## Example

Connect to WAMP router:

### Copy code

```
try {
  const domain = 'com.myapp';
  const connection = HMIRuntime.WAMP.CreateConnection();

  let session = await connection.CreateSession();

  try{
    let ticks = await session.Call(domain + '.GetTickCount', []);
    HMIRuntime.Trace(`GetTickCount: ${ticks}`);
    session.Close();
  }

  catch(e){
    HMIRuntime.Trace(`WAMP call GetTickCount failed: ${e}`);
    session.Close();
  }

}

catch(e) {
  HMIRuntime.Trace(`CreateSession failed: ${e}`);
}
```

## See also

[WAMP \(Page 7062\)](#)

## WAMPConnection

### Description

The "WAMPConnection" object ("HMIWAMPConnection" type) enables a connection between client and router.

### Object type

HMIWAMPConnection

### Properties

--

## Methods

The "WAMPConnection" object has the following methods:

- **CreateSession()**  
Establishes a session between client and router.

## WAMPConnection.CreateSession

### Description

The "CreateSession" establishes a session between client and router.

### Syntax

```
WAMPConnection.CreateSession();
```

### Parameters

--

### Return value

Promise

Depending on the state of the promise object:

- Promise fulfilled  
Object, HMIWAMPSession (Page 7066) as parameter of the "then()" handler.
- Promise rejected  
ErrorCode as parameter of the "catch()" handler.

## Example

Create session:

### Copy code

```
try {
  const domain = 'com.myapp';
  const connection = HMIRuntime.WAMP.CreateConnection();

  let session = await connection.CreateSession();

  try{
    let ticks = await session.Call(domain + '.GetTickCount', []);
    HMIRuntime.Trace(`GetTickCount: ${ticks}`);
    session.Close();
  }

  catch(e){
    HMIRuntime.Trace(`WAMP call GetTickCount failed: ${e}`);
    session.Close();
  }

}

catch(e) {
  HMIRuntime.Trace(`CreateSession failed: ${e}`);
}
```

## See also

[WAMPConnection \(Page 7064\)](#)

## WAMPSession

### Description

The "WAMPSession" object ("HMIWAMPSession" type) opens the session between client and router.

### Object type

HMIWAMPSession

### Properties

--

## Methods

The "WAMPSession" object has the following methods:

- **Call()**  
Calls the remote procedure call registered in the router.
- **Close()**  
Closes the WAMP session.

## WAMPSession.Call

### Description

The "Call" method calls the remote procedure call registered in the router.

### Syntax

```
WAMPSession.Call(procedure, args, timeout);
```

### Parameters

**procedure**

Type: String

Name of the remote procedure that is to be executed.

**args**

Type: Variant, Variant[]

Arguments for the remote procedure to be called.

**timeout**

Type: Int32

The options that are transferred to the router during the call, in milliseconds.

### Return value

Promise

Depending on the state of the promise object:

- Promise fulfilled  
Variant as parameter of the "then()" handler.
- Promise rejected  
ErrorCode as parameter of the "catch()" handler.

### See also

WAMPSession (Page 7066)

## WAMPSession.Close

### Description

The "Close" method closes the WAMP session.

### Syntax

```
WAMPSession.Close();
```

### Parameters

--

### Return value

ErrorCode

### See also

WAMPSession (Page 7066)

## Planning tasks

### 11.1 Basics

#### 11.1.1 Field of application of the Scheduler (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

In the Scheduler, you configure tasks that are executed in the background regardless of the screen. You create tasks by linking scripts to a trigger. The linked functions will be called when the triggering event occurs.

#### Application example

You use Scheduled tasks to execute event-controlled tasks automatically. For example, you use a task to automate the following:

- Regular swap out of log data
- Printout of an alarm report when an alarm buffer overflow occurs
- Printout of a report at shift end
- Monitoring a tag
- Monitoring of a user change

---

#### Note

The availability of the listed examples is dependent on the HMI device.

---

#### 11.1.2 Basic of the scheduler (RT Unified)

#### Definition

You use Scheduled tasks to configure tasks which are only to be executed cyclically or at a specific condition. Each task has a trigger and an action.

## Triggers

You use the triggers to define when and how often the task is to be processed during runtime. The following triggers are supported:

Triggers	Type	Description
Time	Cyclic	Executed cyclically at the set time from runtime start, for example, every 2 seconds with "T2s".
Daily Weekly Monthly Yearly	Cyclic	Is executed in cycles starting from runtime start, in each case at the configured time, for example "Daily, 12:00:00 h".
Once	Acyclic	Is executed exactly once at the configured time.
Tags	Acyclic	Executed when the value of one of the projected tags changes.
Alarms	Acyclic	Executed when the state of one of the following alarm properties changes: <ul style="list-style-type: none"> <li>• Alarm class, for example "Warning"</li> <li>• Alarm state, for example "Incoming"</li> <li>• Priority, for example "4"</li> </ul>

### Note

Local session tags cannot be used as triggers.

## Trigger an action

If the configured trigger condition is fulfilled, the event "Update" is triggered. You configure a local script, which triggers one or more actions.

## Filling out property values of one or more tasks automatically

When planning new tasks, Scheduled tasks allows the property values of already defined tasks to be used. Bulk creation of property values is possible in the Scheduled tasks editor. This functionality saves the time that would be needed to create individual tasks.

Follow these steps to fill out the property values of one or more tasks automatically:

1. In the Task editor, select the "Name" or "Trigger" cell.
2. Use the mouse to drag the bottom right-hand corner downwards. The values are transferred to the destination cells.

Projekt10 ▶ PC-System\_1 [SIMATIC PC station] ▶ HMI\_RT\_1 [WinCC Unified PC RT] ▶ Scheduled tasks

	Name	Trigger	Description	Comment
5	Task_1	T500ms	Execute every 500 milliseconds.	
5	Task_2	T500ms	Execute every 500 milliseconds.	
5	Task_3	T500ms	Execute every 500 milliseconds.	
5	Task_4	T500ms	Execute every 500 milliseconds.	
5	Task_5	T500ms	Execute every 500 milliseconds.	
	<Add new>			

3. To change the attributes, use the text boxes in the editor or the text boxes under "Properties > Properties > General". In the latter, you can also define the time specifications, for example, time, day, month and year.

Task\_1 [Task] Properties Info Diagnostics

Properties Events Texts

General

Name: Task\_1

Description: Execute every year on September 17 at 12:42:10 PM.

Comment:

Triggers: Yearly

Execute every year... at 09 / 17 12 : 42 : 10 PM

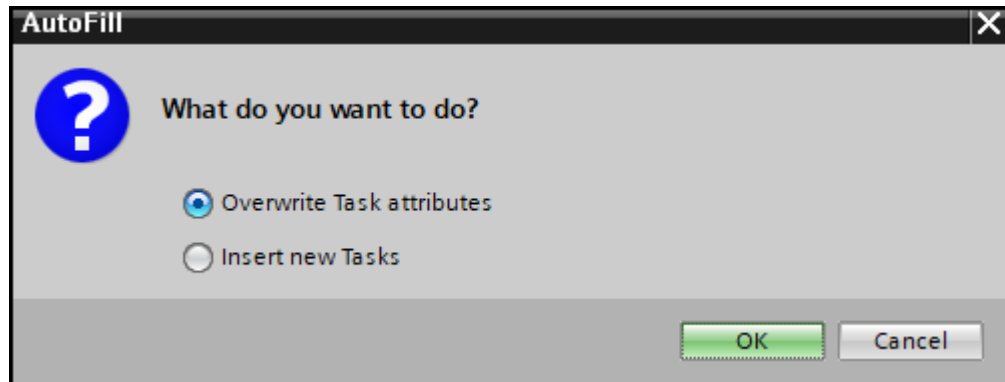

September 2023

	S	M	T	W	T
36	29	30	31	1	2
37	5	6	7	8	9
38	12	13	14	15	16
39	19	20	21	22	23
40	26	27	28	29	30
41	3	4	5	6	7

Toda

### Overwriting property values of one or more tasks automatically

1. In the "Trigger" column, select the cell whose value you want to change. Select the desired value from the list.
2. To overwrite the changed value in tasks below, select the source cell in the "Trigger" column.
3. Use the mouse to drag the bottom right-hand corner downwards.
4. In the dialog box, confirm your choice with OK. The values are overwritten in the destination cells.

### Sorting values in the Scheduler editor

By clicking the column header, the table is sorted alphabetically in the selected column.

### See also

Creating tasks with the "Time" trigger (Page 7072)

Creating tasks with the "Tags" trigger (Page 7073)

Creating tasks with the "Alarms" trigger (Page 7073)

## 11.2 Creating tasks with the "Time" trigger (RT Unified)

### Requirement

- The "Scheduler" editor is open.

### Procedure

Follow these steps to create a task with the trigger "Time":

1. Create a new task with "Add".
2. Select the required cycle as the "Trigger", for example "T250ms" for 250 ms.

**Result**

The task with the "Time" trigger has been created.

**See also**

Basic of the scheduler (Page 7069)

Creating tasks with the "Tags" trigger (Page 7073)

Creating tasks with the "Alarms" trigger (Page 7073)

## 11.3 Creating tasks with the "Tags" trigger (RT Unified)

**Requirement**

- The "Scheduler" editor is open.
- You have created a tag that is monitored for changes in value.

**Procedure**

Follow these steps to create a task with the trigger "Tags":

1. Create a new task with "Add".
2. Select the option "Tags" as the "Trigger."
3. Select "Properties > Properties > General" in the Inspector window to select the tag.

**Result**

The task with the "Tags" trigger has been created.

**See also**

Basic of the scheduler (Page 7069)

Creating tasks with the "Time" trigger (Page 7072)

Creating tasks with the "Alarms" trigger (Page 7073)

## 11.4 Creating tasks with the "Alarms" trigger (RT Unified)

**Requirement**

- The "Scheduler" editor is open.

## 11.4 Creating tasks with the "Alarms" trigger (RT Unified)

### Procedure

Follow these steps to create a task with the trigger "Alarms":

1. Create a new task with "Add".
2. Select the option "Alarms" as the "Trigger".
3. Configure the trigger under "Properties > Properties > General" in the Inspector window.
  - Select the "Criterion", for example "Alarm class".
  - Select the "Condition", for example "Not equal".
  - Select the "Operand", for example "Alarm".

### Result

The task with the "Alarms" trigger has been created.

### See also

Basic of the scheduler (Page 7069)

Creating tasks with the "Time" trigger (Page 7072)

Creating tasks with the "Tags" trigger (Page 7073)

## Using the diagnostics functions (RT Unified)

### 12.1 Configuring system diagnostics objects (RT Unified)

#### 12.1.1 Activating system diagnostics (S7-1200/1500) (RT Unified)

##### Introduction

An integrated HMI connection must exist between the controller and the HMI device so that the controller can send alarms to the system diagnostics view. In addition, the system diagnostics must be enabled both in the PLC and on the HMI device.

With an HMI connection to a SIMATIC S7-1200/1500 controller, the system diagnostics on the HMI device can be activated and deactivated by default.

The following describes how to activate system diagnostics in a controller and on an HMI device, if necessary.

---

##### Note

System diagnostics works only for integrated connections.

---

##### Requirement

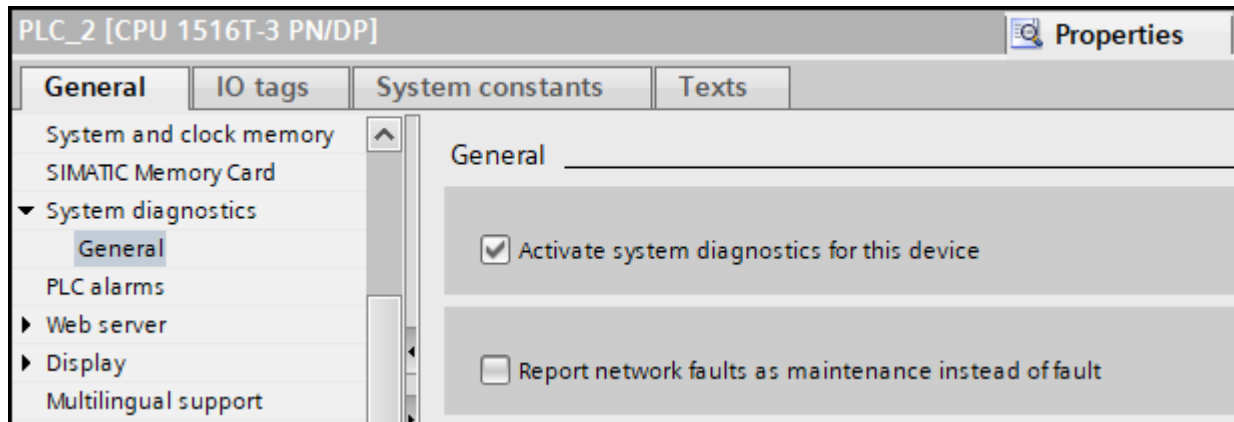

- There is an integrated HMI connection between the S7-1200/1500 controller and the HMI device (WinCC Unified PC or WinCC Unified Panel).
- The S7-1200 PLC is supported as of firmware version 4.0.
- PLC S7-1500 is supported as of firmware version 2.0.

##### Activating system diagnostics in the controller

To activate the system diagnostics in a controller, proceed as follows:

1. Open the "Device configuration" of the controller in the project tree.
2. In the "Device view" tab, select the CPU on the rack.
3. Select "Properties > General > System diagnostics" in the Inspector window.

4. Activate the option "Activate system diagnostics for this device".

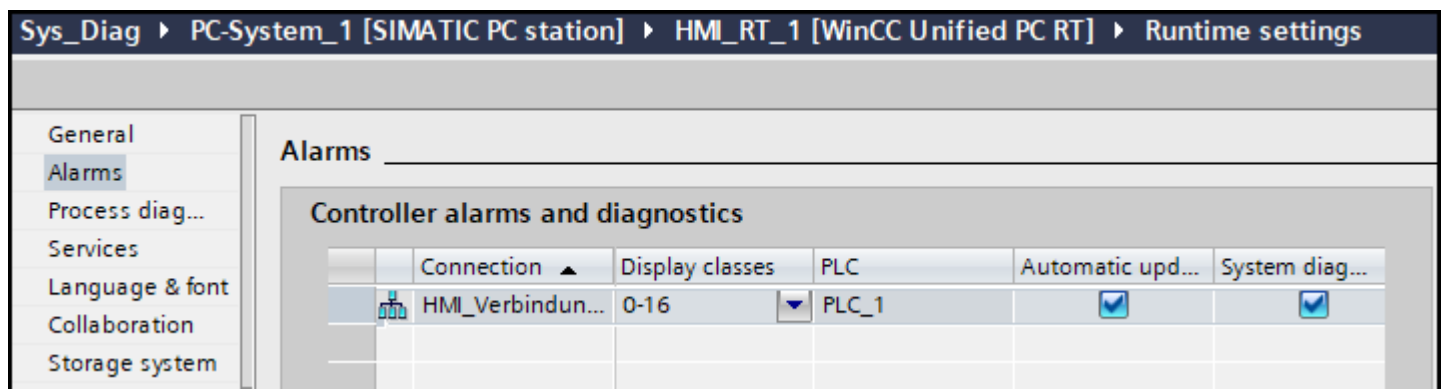

5. Right-click the controller in the project tree and select "Compile > Hardware (rebuild all)" in the shortcut menu.

### Activating system diagnostics on the HMI device

To activate the system diagnostics on an HMI device, proceed as follows:

1. Open the "Runtime settings" of the HMI device in the project tree.
2. Activate the option "System diagnostics" under "Alarms > Controller alarms and diagnostics".

The display of system diagnostic alarms is enabled in Runtime.

#### Note

**When an upload is performed from the PLC to the TIA Portal, the uploaded PLC must be compiled to HMI RT before it is compiled and downloaded.**

This is system behavior, because the Runtime data file is created during compiling.

## 12.1.2 Configuring diagnostics indicators (S7-1200/1500) (RT Unified)

### Showing the overall status of HMI connections via traffic light SVGs

The diagnostic status is represented by a system tag named "@DiagnosticsIndicatorTag". The "System" is notified of the diagnostic status of the configured PLCs.

The diagnostic status represents the overall status of all supported/connected PLCs. The merged state always corresponds to the worst state of all relevant PLCs.

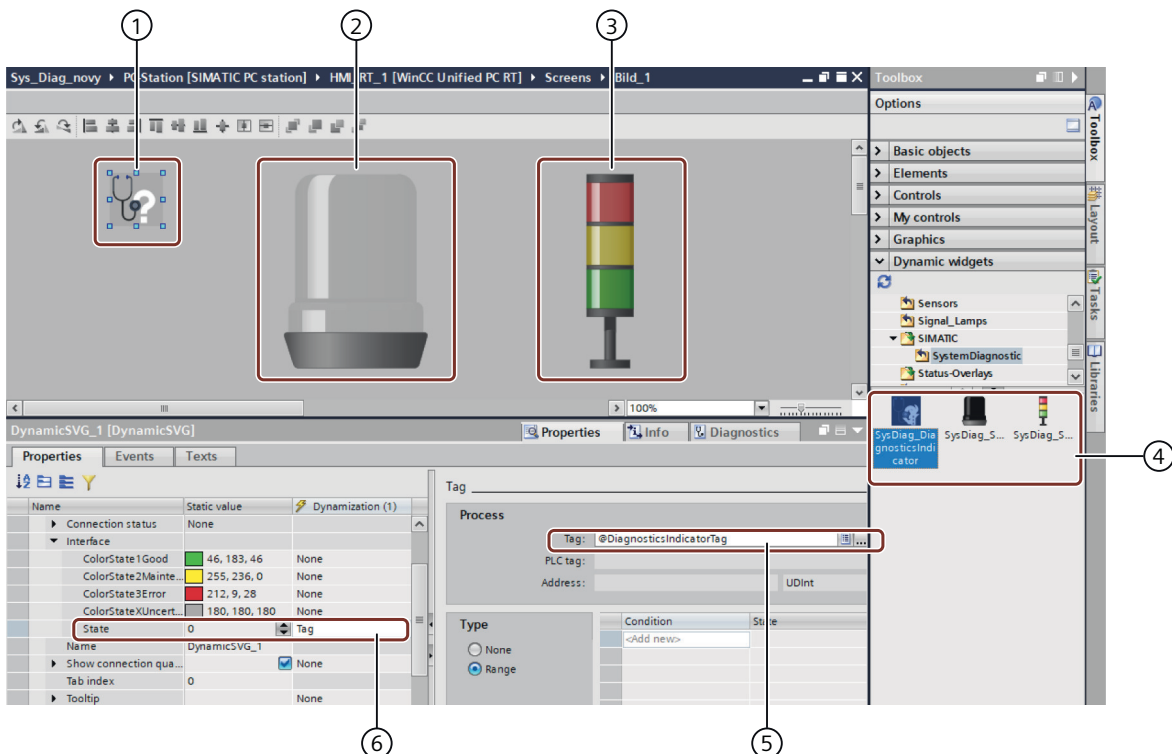

### Requirements

- Integrated HMI connection with PLC S7-1200/1500.
- PLC setting "Central alarm management in the PLC" is enabled.
- "Automatic update" and "System diagnostics" are enabled for the controller alarms of the HMI connection.

### Using dynamic SVGs

System diagnostics for RT Unified provides 3 pre-programmed dynamic SVGs for S7-1200/1500 PLCs as tools for dynamic widgets:

- Diagnostics indicator ①
- Signal lamp ②
- Signal tower ③

12.1 Configuring system diagnostics objects (RT Unified)

To create a diagnostics indicator, proceed as follows:

1. Open the "Toolbox" and find "IndustryGraphicLibrary > Dynamic widgets > SIMATIC > SystemDiagnostic" ④.
2. Select one of the 3 pre-programmed SVGs:
  - "SysDiag\_DiagnosticsIndicator"
  - "SysDiag\_SignalLamp"
  - "SysDiag\_SignalTower"
3. Double-click or drag-and-drop the selected SVG over to the screen. The object is added to the screen.
4. Open the properties of the object in the Inspector window. Assign the "Tag" dynamization to the interface element "State" ⑥.
5. Dynamize the State property with the tag "@DiagnosticsIndicatorTag" ⑤.

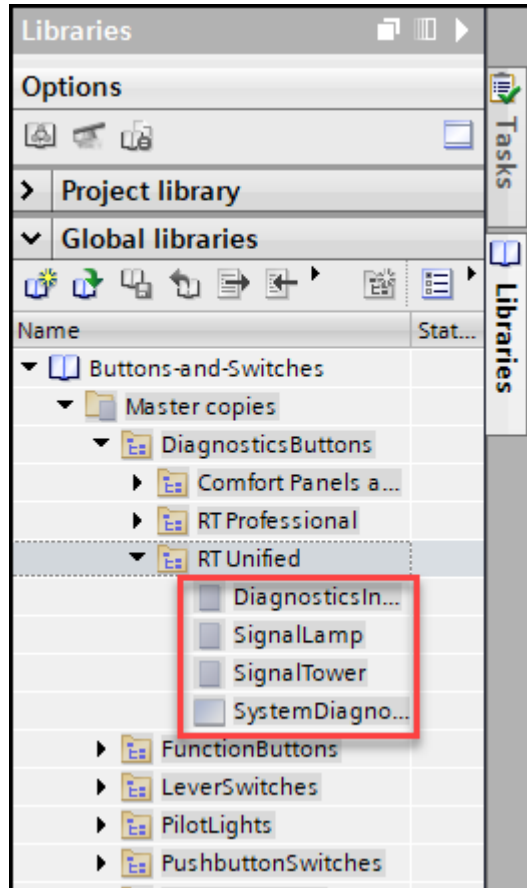

The color of the dynamized SVG changes according to the defined tag values in Runtime.

Table 12-1 Possible diagnostic values

Status	Diagnostic value	Color
Uncertain	0	Gray
Good	1	Green
Maintenance	2	Yellow
Error	3	Red

## Global libraries

In the "Global libraries" task card, the system diagnostics contains screen objects to reduce the configuration effort as far as possible.

Under "Global libraries > Buttons-and-Switches > Master copies > DiagnosticsButtons > RT Unified", three pre-programmed dynamic SVGs are available which you can drag-and-drop into an open screen:

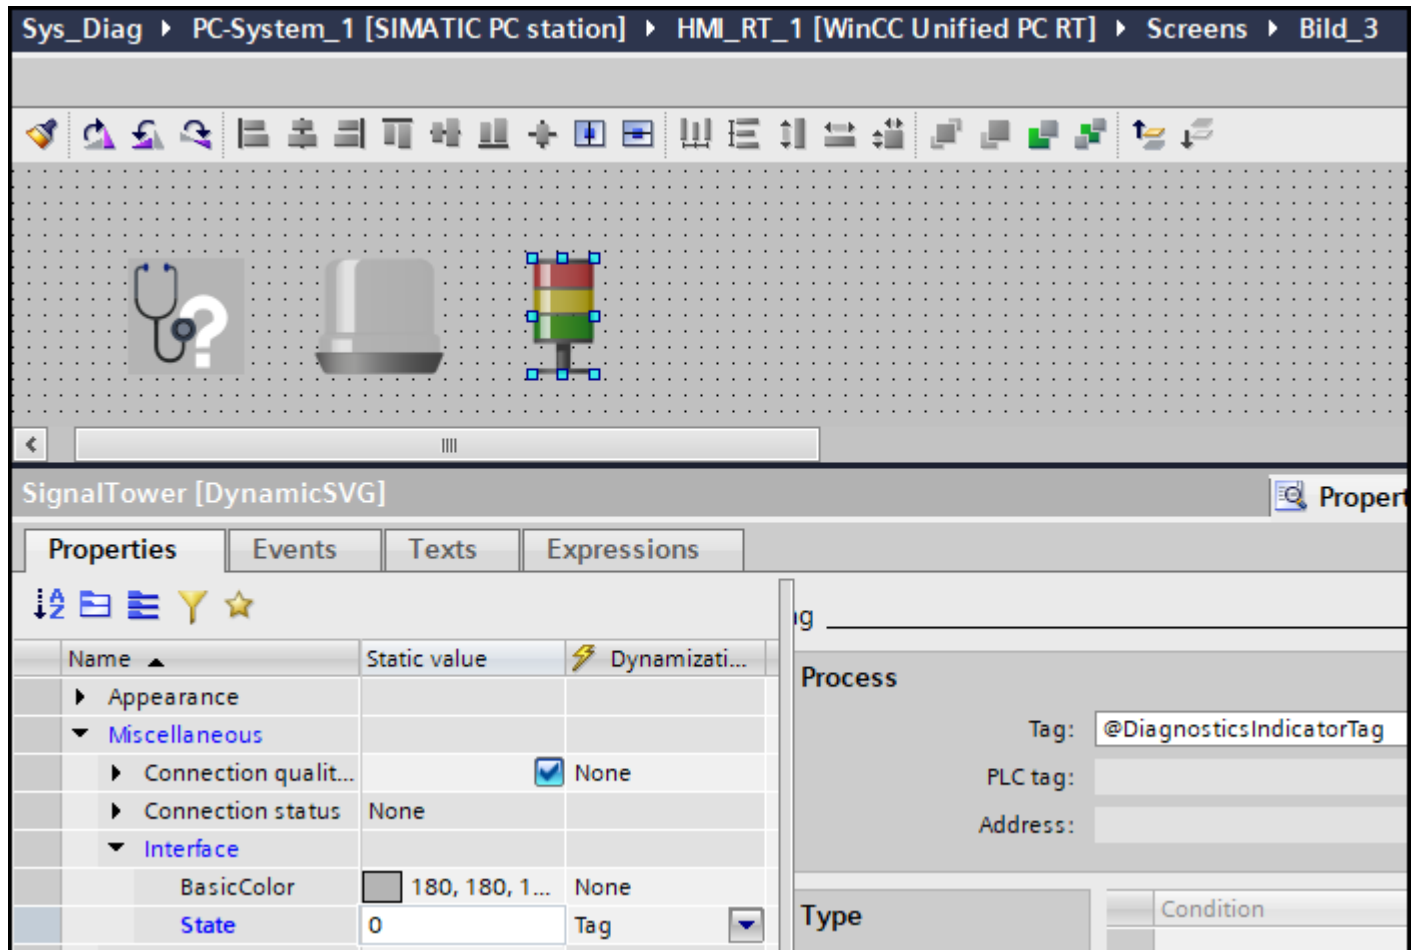

- "DiagnosticIndicator"
- "SignalLamp"
- "Signal Tower"

With "SystemDiagnostics", a pre-programmed screen already containing the system diagnostics control is available to you.

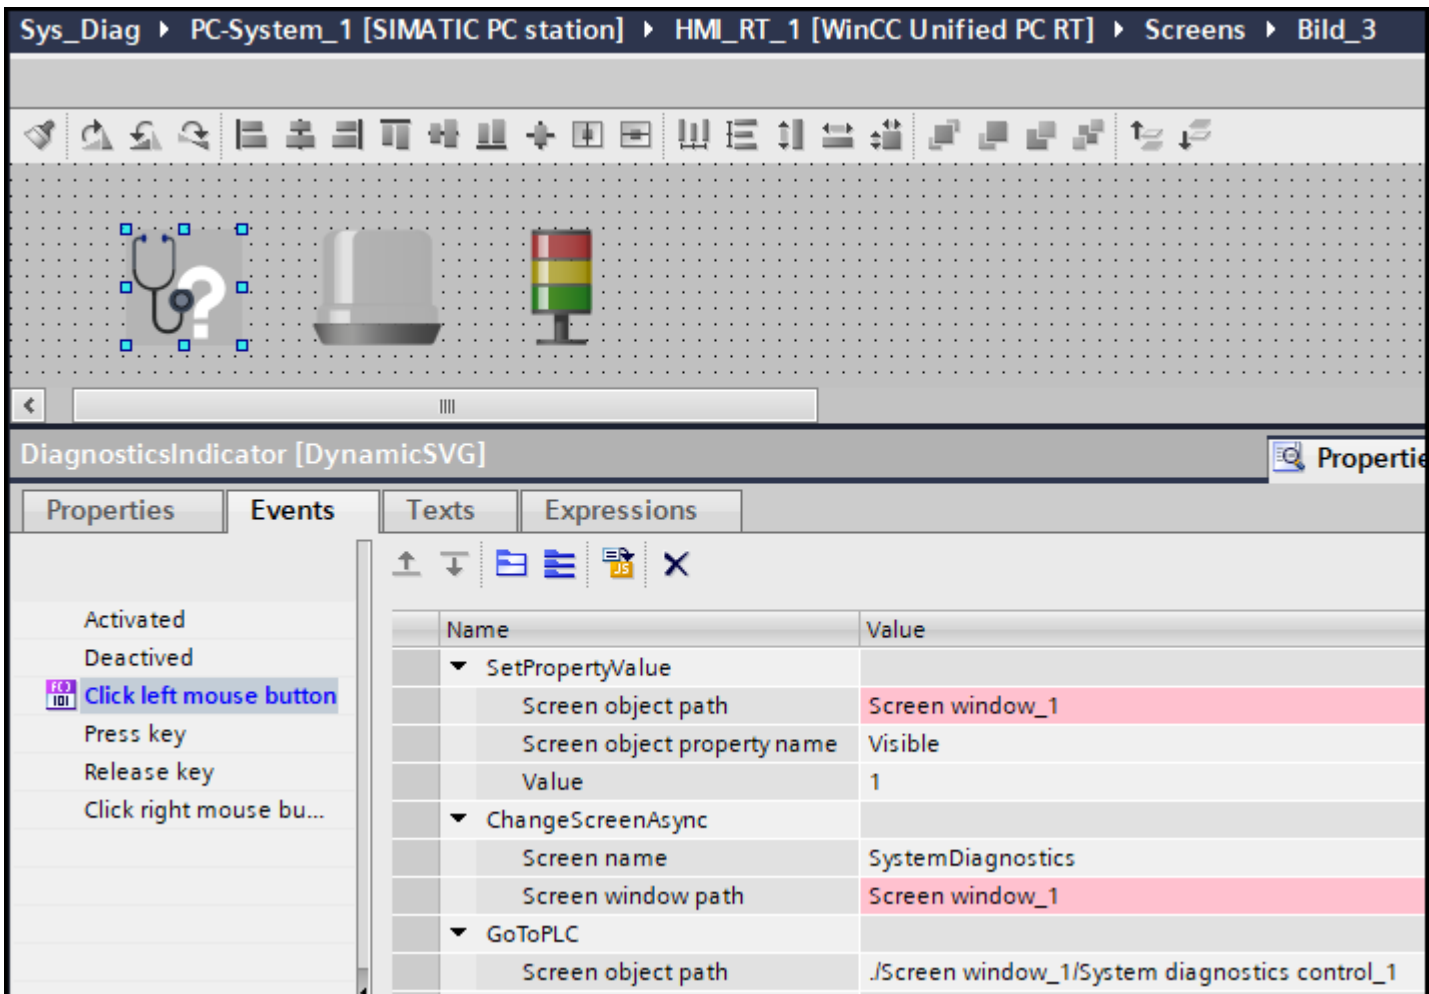

12.1 Configuring system diagnostics objects (RT Unified)

The indicators serve to display the general diagnostic status of the PLCs and to switch to the matrix view with a click on a button.

- To display the correct status, the "@DiagnosticsIndicatorTag" tag is assigned to the state property.

- To switch from a diagnostics indicator to the system diagnostics control, the relevant function list is pre-programmed.

You can use the pre-programmed function list for the following configuration:

- Screen\_1 contains the indicator button and an empty screen window "Screen window\_1".
- Another screen "SystemDiagnostics" is created which contains the system diagnostics control named "System diagnostics control\_1". You create this screen by dragging the screen from the global libraries into the Screens folder in the project tree, or you can drag it directly into an existing screen. In this case, it is shown as a button with which you can switch from the existing screen to the "SystemDiagnostics" screen.

### Result

In Runtime, a screen window is displayed, the system diagnostics control is loaded with the matrix view and a switch to the hardware module with error takes place.

### Note

**Switching from the diagnostics indicator to the matrix view works in the following way:**

- No error or multiple errors present: Switches to the diagnostic overview of the matrix view.
- Exactly one error present: Switches to the hardware module with error in the matrix view.

### 12.1.3 Configuring system diagnostics of the controller (S7-1200/1500) (RT Unified)

The system diagnostics control shows the diagnostic events of the configured PLCs in your HMI device. When loading the screen, the control displays the diagnostic buffer of the PLC with the most serious status.

#### Requirements

- At least one S7-1200/1500 PLC is configured.
- The S7-1200 PLC is supported as of firmware version 4.0.
- The S7-1500 PLC is supported as of firmware version 2.0.
- PLC setting "Central alarm management in the PLC" is enabled.
- An HMI device has been configured.
- An integrated HMI connection has been established between the S7-1200/1500 PLC and the HMI device.
- "Automatic update" and "System diagnostics" are enabled for the controller alarms of the HMI connection.
- System diagnostics is enabled in every controller and on the HMI device.
- A screen has been created.
- The Inspector window is open.

---

#### Note

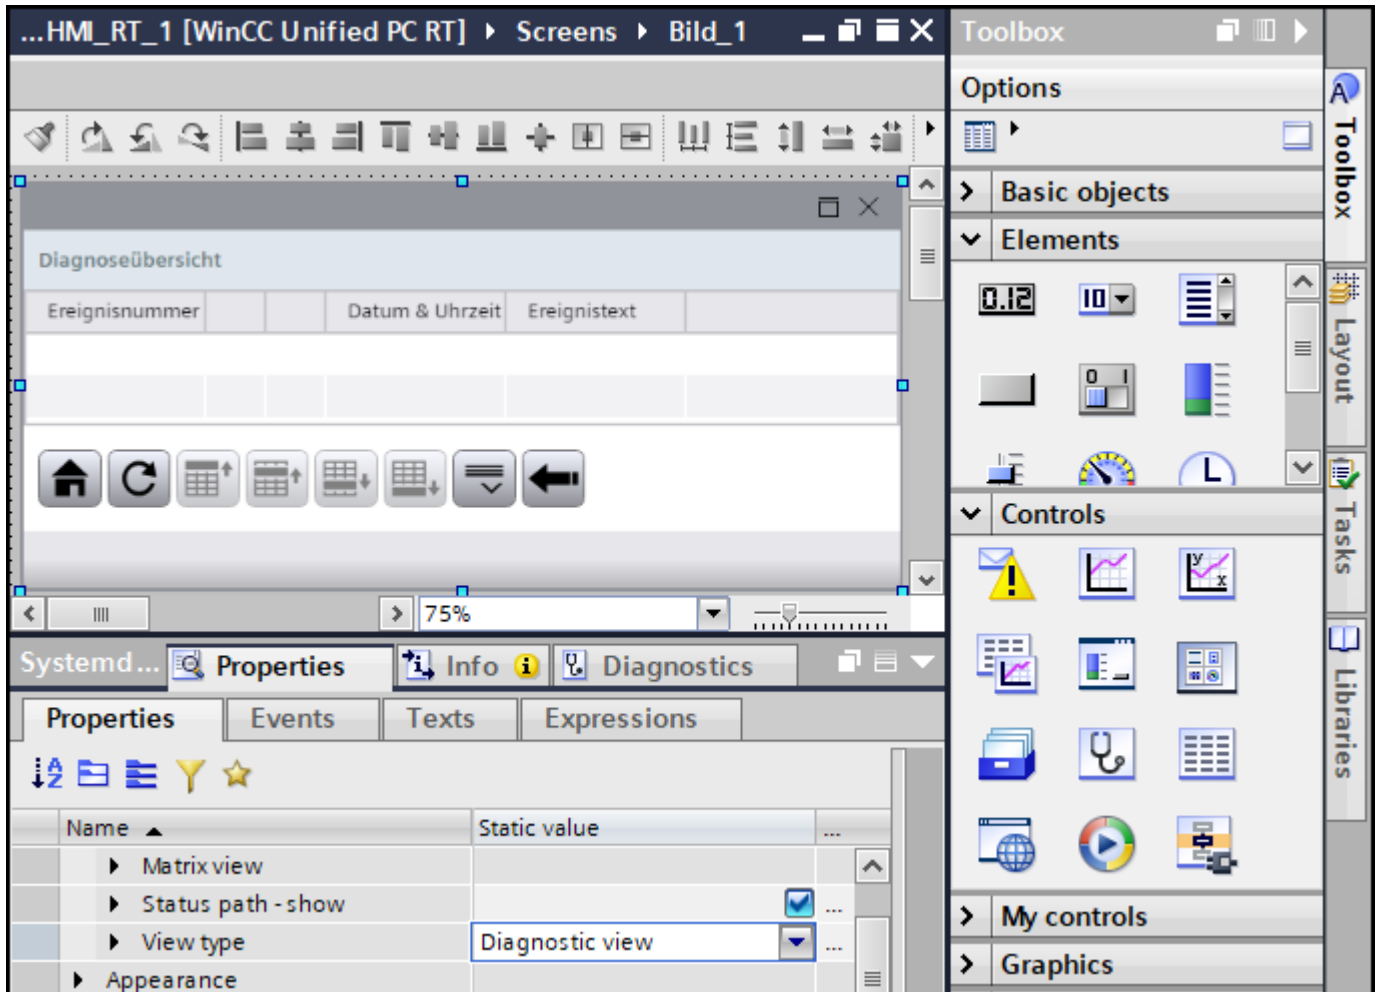

If you configure the HMI connections to more than 50 PLCs for the object, this can lead to an overload in runtime. As a result, HMI connections can no longer be established.

---

## Procedure

Double-click the icon of the "System diagnostics control" object  in the "Controls" section of the "Toolbox" task card, or drag it into the screen using drag-and-drop. The object is added to the screen.

You can change the setting for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

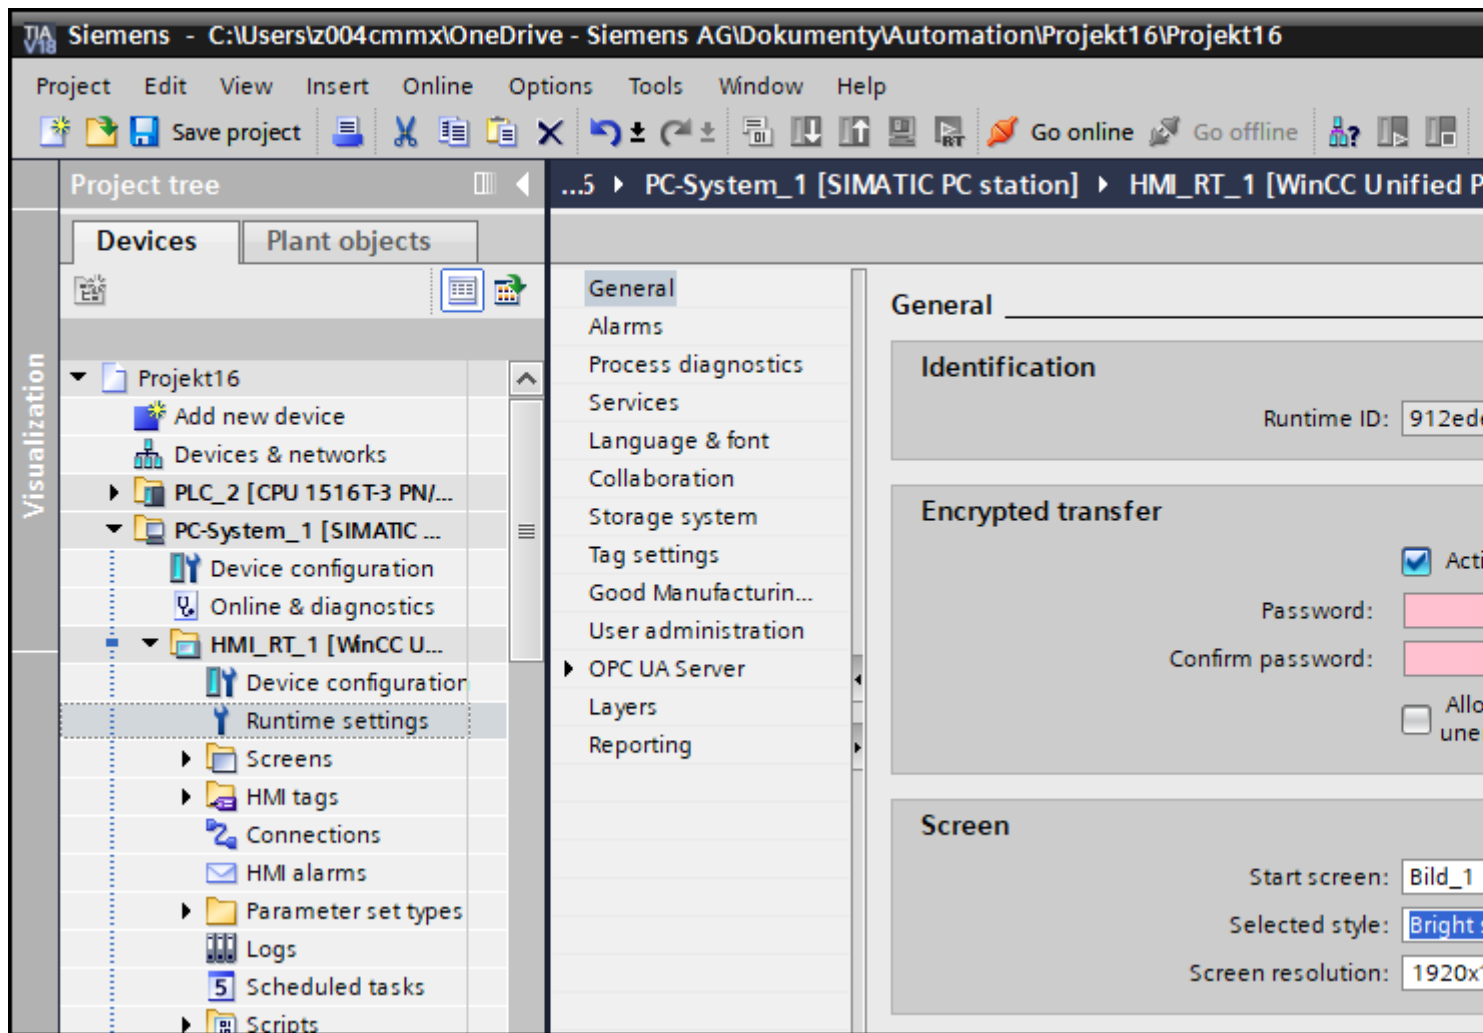

- "View type": Switches between diagnostic view, matrix view, and Distributed I/O view.
- "Information bar": Specifies the representation of the information bar.
- "Toolbar": Specifies the buttons of the system diagnostics control.

## Setting pre-defined styles

You can assign pre-defined styles to the object in Runtime: "Dark Style", "Extended Style" or "Bright Style". You can use pre-defined styles to change the background color of the object.

To assign a style, follow these steps:

1. Open the Runtime settings of the HMI device.

2. In the "General > Screen > Selected style" tab, select one of the following options: "Bright style", "Extended style" or "Dark style" to use the style.

## Result

The "System diagnostics control" has been added to the screen. The system diagnostics can access the data of the integrated HMI connections to S7-1200/1500 PLCs. In Runtime, the diagnostic alarms of the selected PLC are displayed in the "System diagnostics control". Once Runtime has started, the events of the PLC with the most serious error are displayed.

### Diagnostic buffer

If the diagnostic view was selected during the configuration, the diagnostic buffer is displayed in Runtime. The diagnostic buffer displays the diagnostics events of a PLC in a grid view. The grid view shows the last 200 diagnostics events of the PLC.

Event number			Date & Time	Event text
1	✓	i	1/1/01 5:56:13 A	Communication
2	✓	i	1/1/01 5:56:13 A	Communication
3	🔧	↩	1/1/01 5:56:13 A	Multi-interface n
4	🔧	↩	1/1/01 5:56:13 A	Multi-interface n
5	✓	↩	1/1/01 5:56:13 A	Multi-interface n
6	✓	↩	1/1/01 5:56:13 A	Multi-interface n
7	✓	i	1/1/01 5:56:13 A	Follow-on opera
8	🔴	↩	1/1/01 5:56:13 A	Retentive data w
9	🔧	↩	1/1/01 5:56:13 A	Multi-interface n
10	🔧	↩	1/1/01 5:56:13 A	Multi-interface n
11	✓	i	1/1/01 5:56:13 A	Boot up - CPU cl

The first column shows the number of the entry.

The symbols in the second column indicate the event type of the PLC:

	Device in operation
	Maintenance required
	Maintenance necessary
	Error in the device

You can see the symbols of the incoming or outgoing status in the third column:

	Incoming event
	Outgoing event
	Incoming event for which there is no independent outgoing event
	User-defined diagnostics event

The fourth column shows the date and time of the event. You can see the event information in the last column.

Below the grid view, the detail view of the selected row from the grid view is displayed. You can enable or disable the detail view.

For performance reasons, no automatic update is performed. You need to perform the update manually.

At the bottom of the window, a status box is displayed with the diagnostic status and the name of the station/PLC.

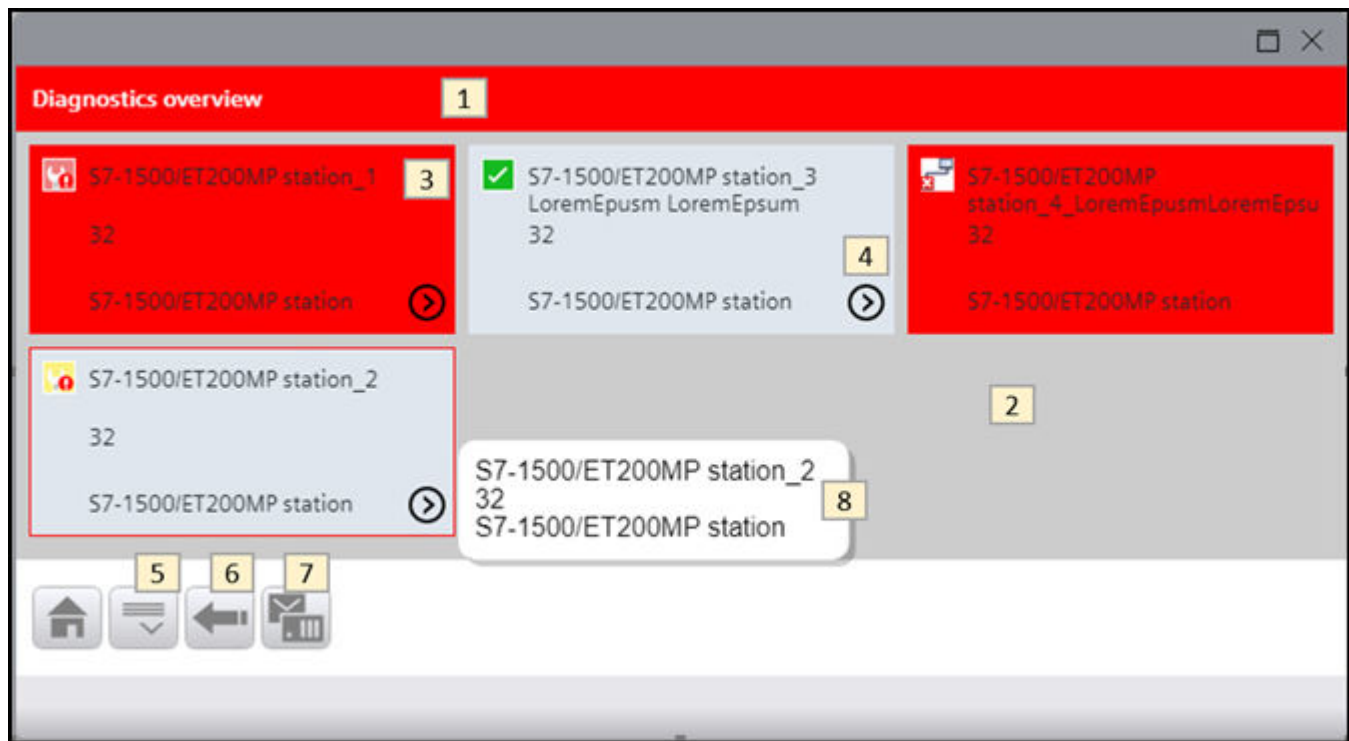

### Note

#### Rearranging columns

You have the option of changing the column order configured in the Engineering System. You can find more detailed information in section "Rearranging columns at runtime (Page 7767)".

#### Matrix view

If the matrix view was selected during the configuration, the status of your PLC and its lower-level hardware components are displayed as tiles in Runtime.

- Status path (1)
  - The status path shows the navigation path.
  - The background color of the status path shows the higher-level state of the plant, independent of the navigation level.
- Tile area (2)
  - The tile area adapts to the width of the control.
  - You can configure the minimum tile width and the maximum tile width.
  - You can move the tile width vertically with a scroll bar if the view area is not large enough.

- Tile (3)
 

The following details are shown in the tile:

  - The state of the tile is displayed primarily by the fill color and an additional symbol. The red color means an error, i.e. when there is at least one error in the PLC or in the lower-level hardware component. The gray color is displayed if there is no error in the PLC or in the lower-level hardware component.
  - The difference, i.e. the state of the lower-level nodes, is shown by the border color of the tile. The red color means an error and the gray color stands for "State OK".
  - Name of the device.
  - Type of the device.
  - PLC operating state.
  - IP address.
  - Navigation view (4) - if further navigation is possible.
- Tooltip (8)
 

When you move the mouse pointer over the tile, a tooltip appears. The tooltip shows the details of the device such as name, type, IP address, etc.
- Toolbar
 

These buttons are available:

  - Home page: Switches to the diagnostic overview.
  - Split view (5): Opens the detail view to show the hardware details of a higher-level device.
  - Previous (6): Navigates to the previous PLC.
  - Show diagnostic buffer (7): Shows the buffer event of the currently navigated PLC.

### Hardware detail view

## 12.1 Configuring system diagnostics objects (RT Unified)

In addition to the details shown on the tile, there are additional attributes for a device that can give the user further details on the device. These details are displayed as a table in the hardware detail view.

The hardware details of a device can be displayed when you navigate within the device and click the button (4) in the toolbar.

### Languages in Runtime

The alarms are displayed in the RT language selected by the user in the screen logon dialog. The Runtime language and the PLC language should be identical.

The PLC supports only three languages, which can be configured by the user in the engineering. If the PLC language and the Runtime language are different, the event text is displayed as follows according to the fallback mechanism:

- English US
- English UK
- the standard text "## text is missing ##"

### See also

System diagnostics display (Page 7088)

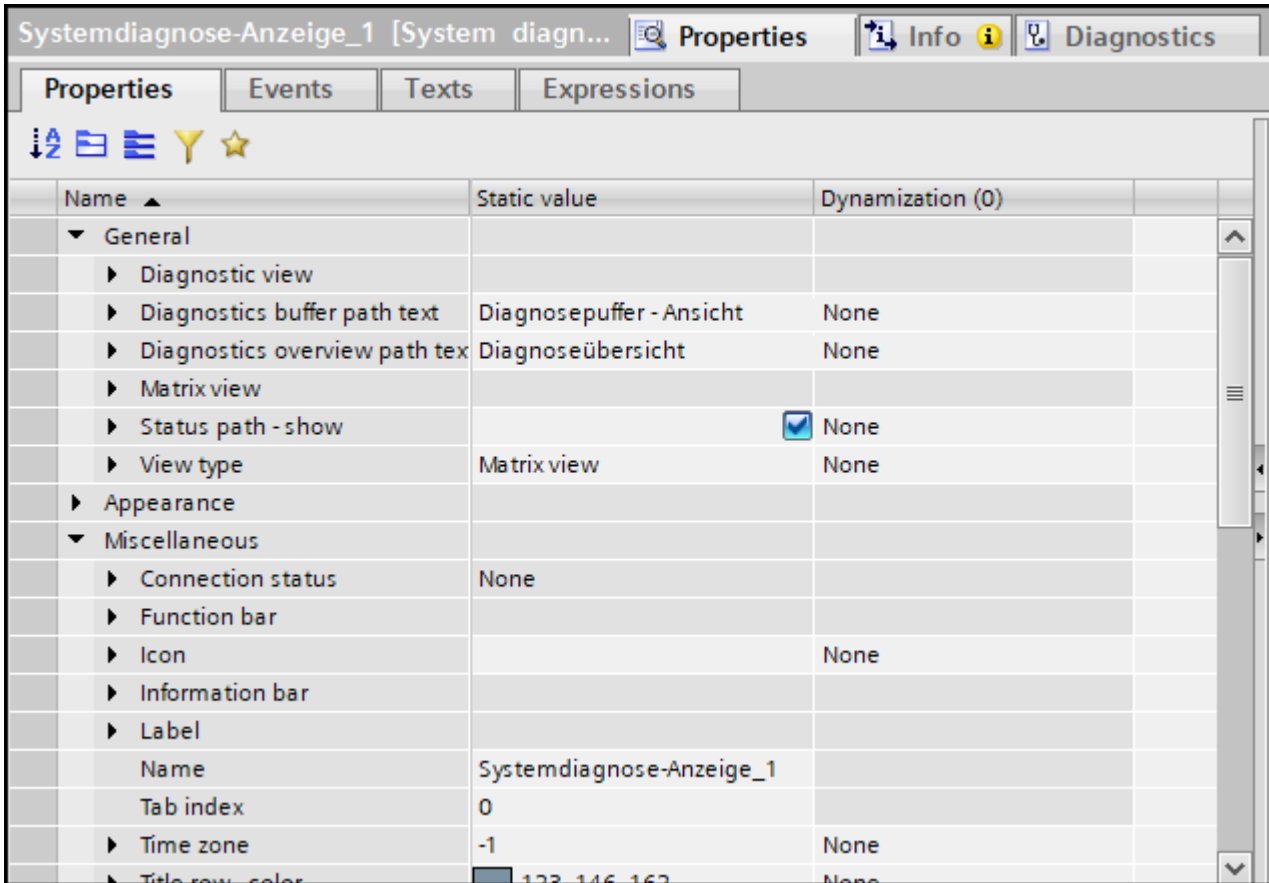

## 12.1.4 System diagnostics display (RT Unified)

### Use

You can use the "System diagnostics control" object to display the diagnostic status of several PLCs using traffic light SVGs. The diagnostic status contains the overall status of all relevant PLCs. The merged state is always the worst state of all PLCs.

## Defining the properties of the system diagnostics control

You define the properties of the system diagnostics control in the Inspector window under "Properties > Properties".

## Selecting the view type

You select the view type in the following way:

1. Click "Properties > Properties > General > View type" in the Inspector window.
2. Select between the "Matrix view", "Diagnostic view" and the "Distributed I/O view".

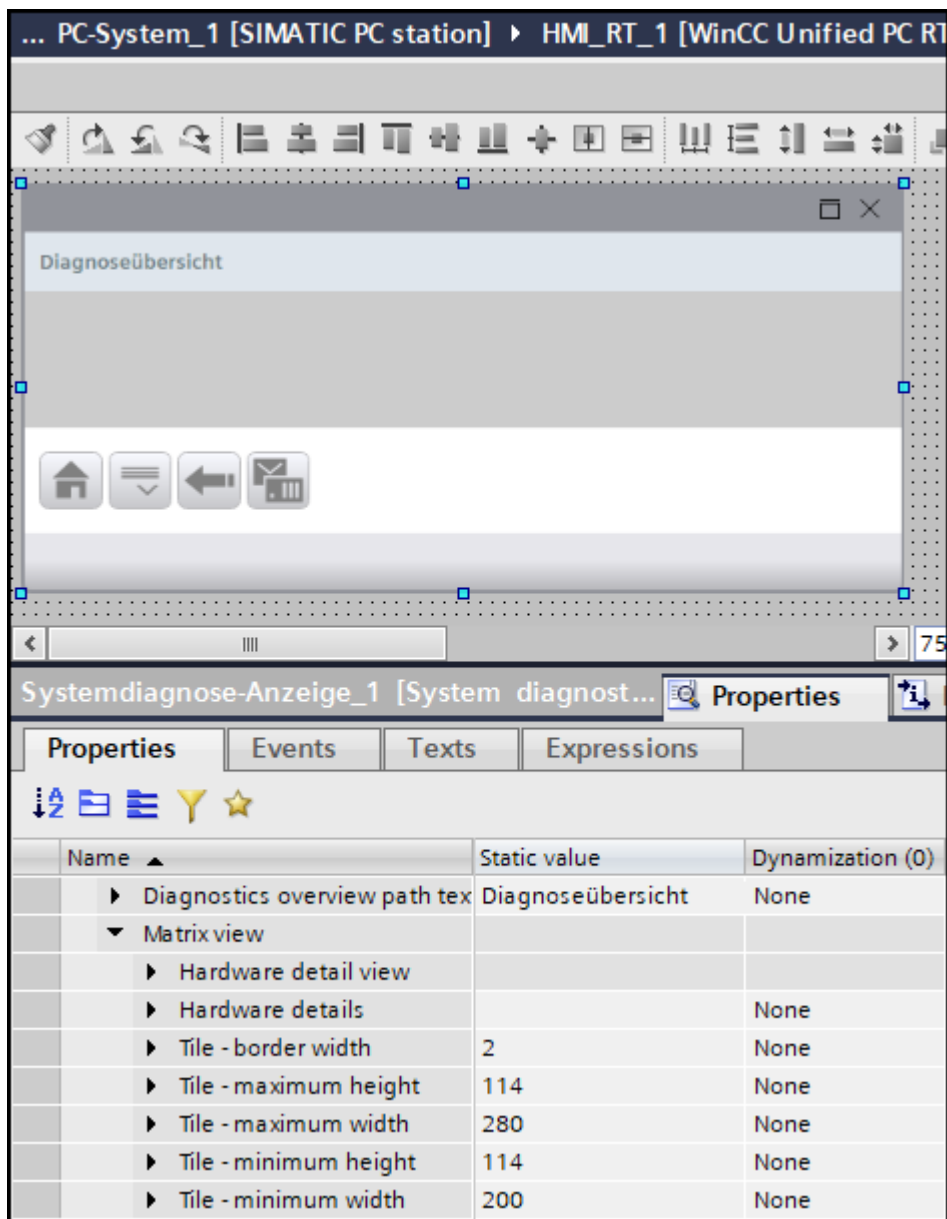

Selection of the matrix view as start view is recommended. From the matrix view, you can switch to the diagnostic view using the corresponding button in the toolbar.

### Matrix view

With the matrix view, you have the possibility to check the status of your PLCs and their lower-level hardware components.

All hardware components are displayed as tiles. You can configure the display as well as the content of the tiles:

Make the settings for hardware details and tiles under "Properties > Properties > General > Matrix view".

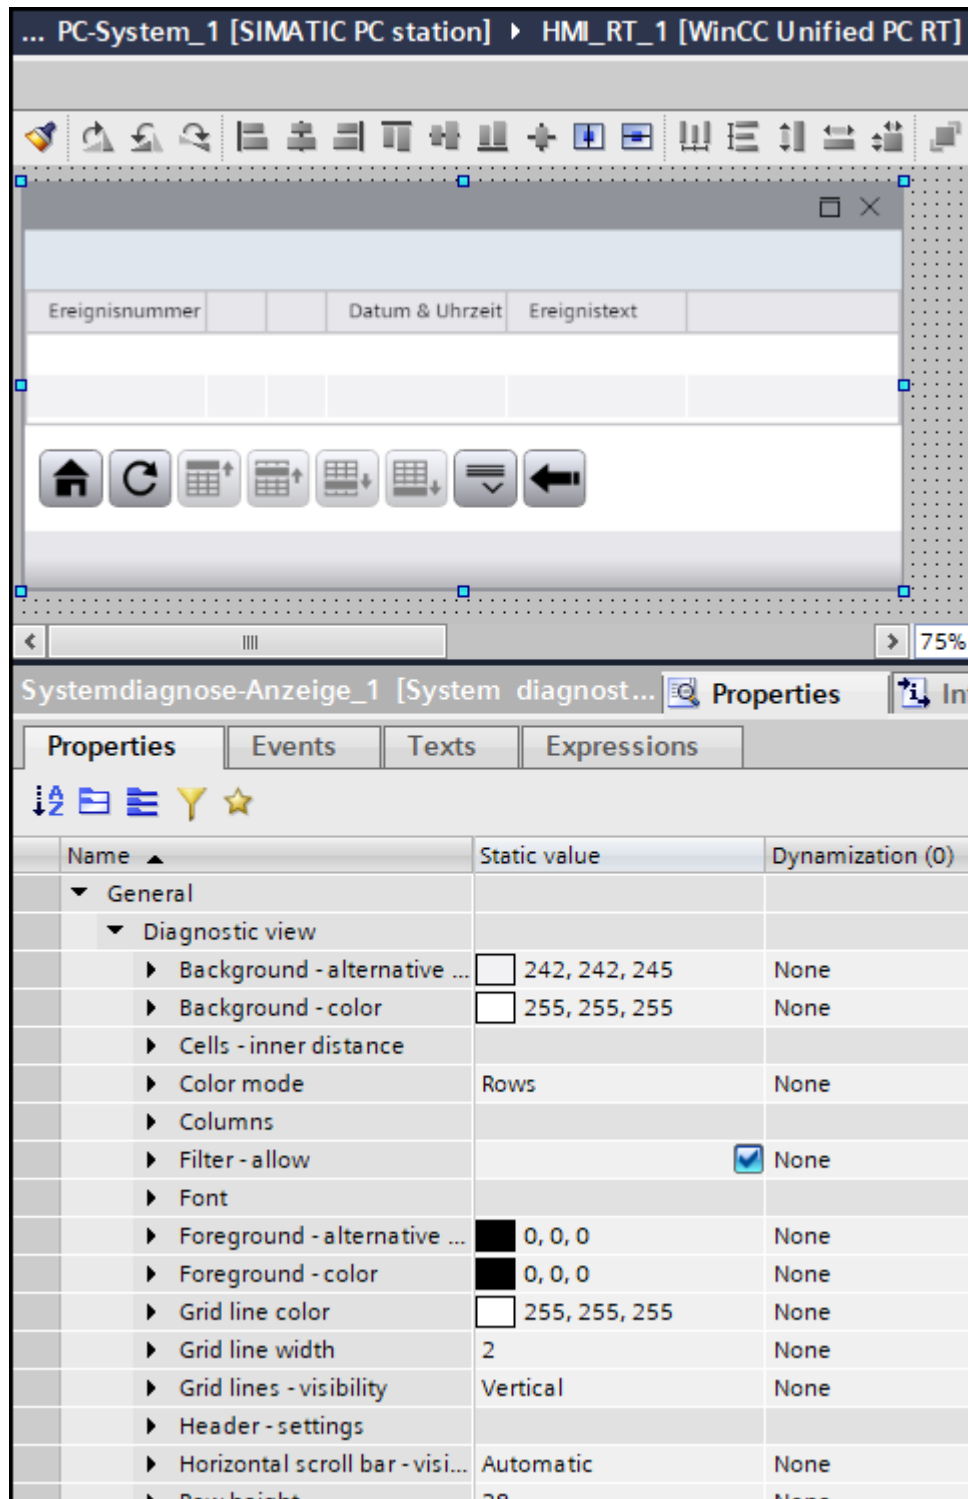

### Diagnostic view

The diagnostic view shows the diagnostic buffer of the PLC with the diagnostic events of the currently selected PLC.

It is not possible to switch between different PLCs in Runtime. Navigating to the diagnostic view via the selected PLC in the matrix view is recommended.

Under "Properties > Properties > General > Diagnostic view", you make the settings for the rows, header, grid lines, scroll bar, cells and columns.

### Distributed I/O view

The distributed I/O view shows the distributed devices of the Profinet IO system.

The requirement is that only one PLC is configured with a Profinet IO system. Otherwise, Runtime changes back to the matrix view.

Using the "Start page" button, you can switch from the distributed I/O view to the diagnostic overview. From the distributed I/O view, you can also jump to the diagnostic buffer.

If the Profinet IO system is not accessible, the diagnostic overview is displayed.

If you change the device version from 18.00.01.01 to 18.00.01.00, the matrix view is displayed and the distributed I/O view is not visible in the selection field.

## Setting up column sorting

To set up the column sorting in the diagnostic view, follow these steps:

1. In the Inspector window, click "Properties > Properties > General > Diagnostic view > Columns > [0] Column".
2. Select the sorting direction and sorting order for the individual columns.

## Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

## Access protection in Runtime

Configure access protection with the property "Operator control - allow" in the Inspector window under "Properties > Properties > Security". A logged-in user having the required authorization can acknowledge and edit the system diagnostics control using the buttons in the system diagnostics control.

## Configuring the information bar

The information bar of the system diagnostics control shows the connection status and path.

The connection status is not displayed while the PLC is starting.

To configure the information bar, follow these steps:

1. Configure the general properties of the information bar, such as the font and background color, under "Properties > Properties > Miscellaneous > Information bar".
2. Configure the display of the information bar elements under "Properties > Properties > Miscellaneous > Information bar > Elements".

## Toolbar

You can define the buttons of the system diagnostics control in Runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the system diagnostics control:

Button		Function
	Home	Shows the home page.
	Reload	Updates the view of the diagnostic event.
	First line	Selects the first of the pending diagnostic events. The visible area of the view is moved.
	Previous line	Selects the previous diagnostic event, starting from the currently selected diagnostic event. The visible area of the view is moved.
	Next line	Selects the next diagnostic event, starting from the currently selected diagnostic event. The visible area of the view is moved.
	Last line	Selects the last of the pending diagnostic events. The visible area of the view is moved.
	Share view	Enables/disables the detail view.
	Previous	Navigates to the previous PLC.
	Show diagnostic buffer	Changes from the matrix view to the diagnostic view. The diagnostic view shows the diagnostics buffer of the PLC. This button is only enabled if a PLC or one of its lower-level modules is shown in the matrix view.

## Setting the time zone

Under Properties > Properties > Miscellaneous > Time zone, you set the desired time zone by entering a decimal value for the time zone.

- "0" and positive numerical values: The values correspond to the index values of the Microsoft time zones.
- "-1": The local time zone of the device.

---

### Note

**In Runtime, you also have the option of setting the time zone via a selection list.**

---

Activating system diagnostics (S7-1200/1500) (Page 7075)

Configuring diagnostics indicators (S7-1200/1500) (Page 7077)

Configuring system diagnostics of the controller (S7-1200/1500) (Page 7082)

## 12.2 Example: System diagnostics with all objects (RT Unified)

### 12.2.1 Example: Procedures overview (RT Unified)

#### Introduction

- A controller and an HMI device have been created.
- An HMI connection has been established between the controller and HMI device.
- System diagnostics is activated in the controller and on the HMI device.

#### Configuration steps

To get a quick view of errors, create an overview screen with the various objects for displaying diagnostic alarms.

The following example shows how to efficiently use the objects of the "Tools" or "Libraries" task cards in your project.

The example is divided into several steps:

- Creating screens  
The project engineer creates multiple screens for system diagnostics:
  - Overview screen with all objects for system diagnostics
  - Screen for the alarm view
  - Screen for the system diagnostics view
- Inserting objects in the screens  
The project engineer inserts various objects in the screens:
  - Alarm view in the "Alarm" screen
  - Screen window for displaying the alarm view and system diagnostics view
- Configuring objects  
The project engineer connects objects to enable targeted navigation to the cause of the error in runtime.
  - System diagnostics indicator with screen window of the system diagnostics view
  - Goto button with the screen window of the alarm view and the system diagnostics view.

## 12.3 Process diagnostics (RT Unified)

### 12.3.1 Basics of supervision with ProDiag (RT Unified)

#### Introduction

The TIA Portal functionality, ProDiag (Process Diagnostics), is used to monitor and determine errors that occur in your plant or machine. You can use ProDiag to show the type of error, the cause of the error and the location of the error on the HMI device.

#### Use

You can use ProDiag functions to monitor your plant and to visualize it on an HMI device. The main objective of ProDiag is the reduction of downtime and loss of production after an error occurs, and the avoidance of errors using timely warnings. Diagnostic and display objects provide specific information for the operator for troubleshooting and show the processes on an HMI device on site.

#### Principle

In STEP 7, you create operand supervisions and configure the settings according to your requirements. When an error occurs, a supervision alarm is generated based on the criteria you have configured. The configured supervision instances are stored in the preset ProDiag function block. You can use the automatically generated ProDiag FBs or create and configure your own ProDiag FBs according to technological aspects.

#### Advantages

ProDiag enables you to configure supervisions and monitor your plant without changing the user program code.

You perform plant diagnostics on your HMI device. The data is automatically synchronized in order to keep the display on your HMI device always up-to-date.

### 12.3.2 Requirements and licensing (RT Unified)

#### Introduction

You configure the ProDiag supervisions in TIA Portal with STEP 7 and create the screen objects for monitoring and diagnostics with WinCC. You need a license to use the ProDiag functionality and the corresponding screen objects.

### Software requirements

You need the following products to configure ProDiag supervisions and visualization on the HMI device:

- TIA Portal STEP 7 Professional
- WinCC Unified

### Hardware requirements

ProDiag functionality is available for CPUs of the S7-1500 series with firmware version 2.0 or higher.

The objects for the supervision and diagnostics of plants are available for the following HMI devices:

- WinCC Unified

---

#### Note

Objects for supervision and diagnostics of plants can be used under the "Full access" and "Read access" protection levels configured in the CPU.

ProDiag objects under the "HMI access" and "No access" protection levels cannot be used.

---

### Licensing of ProDiag supervisions

The number of ProDiag monitors that you configure with STEP 7 is licensed. You do not need a license for the first 25 supervisions, licenses must be used for additional supervisions.

Number of supervisions	<= 25	<= 250	<= 500	<= 750	<= 1000	> 1000 *)
Number of licenses	None	1	2	3	4	5

\*) If it is clear from the beginning that > 1000 supervisions are required in the project, a license to use supervisions can be ordered without limitation.

### Licensing of ProjDiag objects

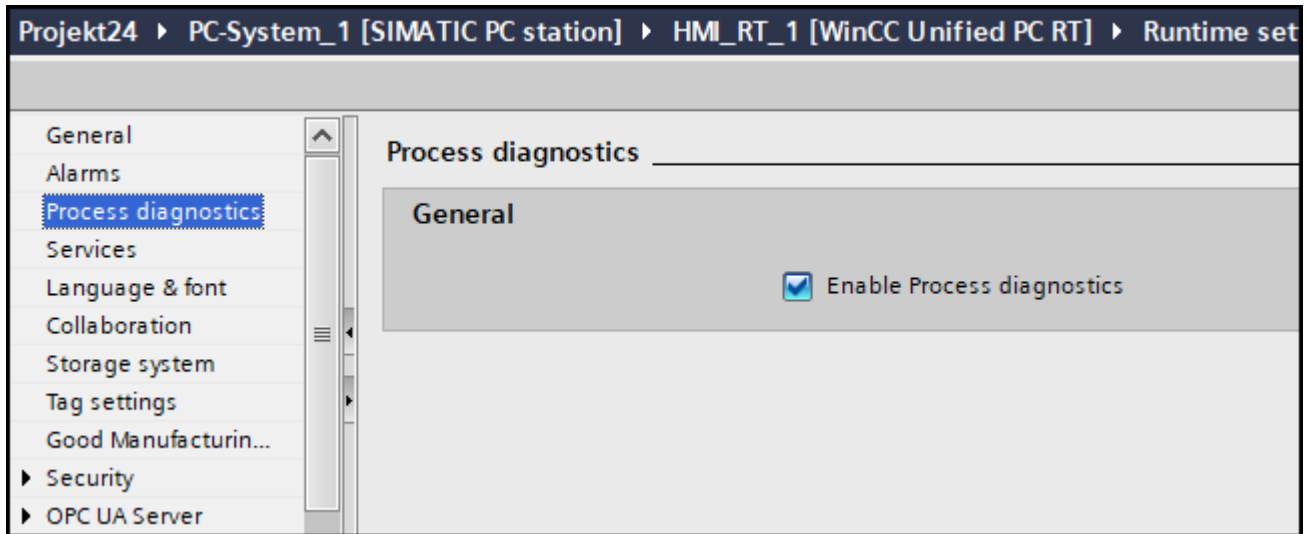

To use the objects for the diagnostics and supervision in conjunction with the ProDiag supervision in your program, you need a WinCC Unified ProDiag license.

### Enable process diagnostics

To activate process diagnostics on an HMI device, follow these steps:

1. Open the "Runtime settings" of the HMI device in the project tree.
2. Under Process diagnostics, select the "Enable process diagnostics" option.

The display of process diagnostic alarms is enabled in runtime.

### 12.3.3 Objects for the supervision and diagnostics of plants

#### Introduction

WinCC offers the following objects for displaying the current monitoring status and for fault diagnostics in the program code:

- GRAPH overview
- PLC code view
- ProDiag overview
- Criteria analysis control

#### GRAPH overview

The "GRAPH overview" object is used to display the current program status for executed steps of the GRAPH sequencer.

#### PLC code view

The "PLC code view" object is used to display the current program status of user programs that have been programmed in the LAD, FBD or GRAPH graphic programming languages.

#### ProDiag overview

The "ProDiag overview" object provides an overview of the current status of the supervisions in the context of a ProDiag Overview supervision block.

### Criteria analysis control

The "Criteria analysis control" object is used to display the faulty operands in the user program that were determined for a selected alarm by criteria analysis.

### 12.3.4 GRAPH overview

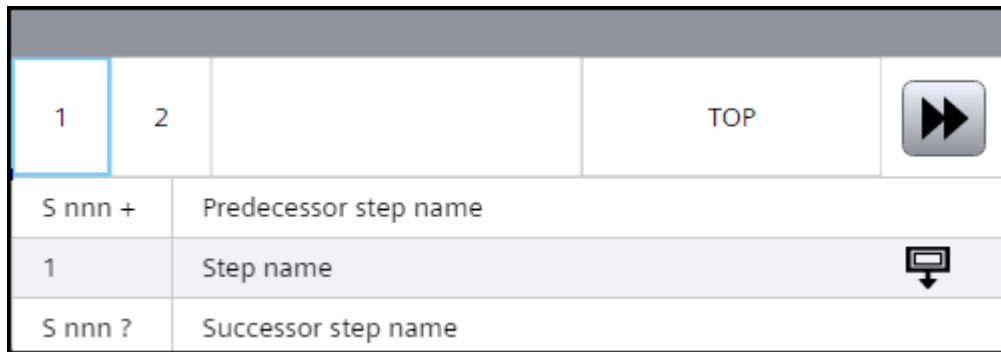

#### Use

The "GRAPH Overview" object is used to display the current program status for executed steps of the GRAPH sequencer. Errors during execution of a program are displayed directly at the corresponding step.

The following information is displayed in the "GRAPH Overview" object:

- Name and status of the function block
- Status of initial and simultaneous steps
- Number and name of the first step currently executed step
- Operating mode for running the GRAPH sequencer

WinCC supports the display of step names for the GRAPH blocks in multiple languages starting from Version 6.0. The step names will then be displayed in the selected Runtime language following a language changeover in Runtime. If the selected language is not available, the names are displayed in the default language (English).

#### Note

To view the program status of an GRAPH instance data block in the "GRAPH overview" object, set the block's instance-specific properties to "Visible in HMI" and "Accessible from HMI".

## Layout

In the Inspector window, you can change the settings for the position, geometry, style, and color of the object. You can adapt the following properties in particular:

- "Process > Tag": Assign the tag.
- "Function bar": Specifies the buttons of the GRAPH overview.

## Operating mode

There are four modes of operation available to you for running the GRAPH sequence:

- AUTO (default setting) - Automatically switches to the next step when the transition is fulfilled.
- TAP - Automatically switches to the next step when the transition is fulfilled and there is an edge change from "0" to "1" at the T\_PUSH parameter.
- TOP - Automatically switches to the next step when the transition is fulfilled or there is an edge change from "0" to "1" at the T\_PUSH parameter.
- MAN - The next step is not automatically enabled when the transition is fulfilled. You can select and deselect the steps manually.

---

### Note

You set the operating mode by modifying the interface parameters of the GRAPH block in your control program.

---

In WinCC Unified Runtime, you can customize the name for the operating mode that is displayed in the GRAPH overview.

## Configuring a compact view

You can also configure a compact GRAPH overview without function bar buttons and operating mode display.

To display a compact GRAPH overview in single-line compatibility mode, drag the control to the desired size.

## Symbols

The symbols displayed in the GRAPH overview are pre-defined:

Symbol		Function
	Error	Indicates that an error has occurred during the execution of a step.
	Initial step	Indicates that the currently executing step is the first step in the GRAPH step sequence.
	Simultaneous step	Shows that there are other simultaneous steps in the GRAPH step sequence in addition to the current one.

## Function bar

You can define the buttons of the GRAPH overview in runtime along with their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Function bar > Elements". By default, only the "Next Step" button is available. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the GRAPH overview:

Button	Function
 Next Step	Jumps to the next step in parallel step. When you get to the last step, you can jump back to the first step.
 Jump to Alarm Control	Opens the configured alarm control with the error message in WinCC Unified. The button is intended to be populated with appropriate system functions/scripts.
 Jump To PLC code view	Opens the configured PLC code view. The button is intended to be populated with appropriate system functions/scripts. Ideally, use the "OpenGRAPHViewerFromOverview" system function.
 Jump to TIA Portal	Several script functions are available for opening the TIA Portal.

### 12.3.5 Configuring a GRAPH overview (RT Unified)

#### Introduction

You can use the GRAPH overview to view the current program status for the executed steps of a GRAPH sequencer.

#### Requirement

- A PLC including a GRAPH instance data block has been created.
- GRAPH instance data block contains at least one tag which is visible in HMI and accessible from HMI.

---

#### Note

The process tag you are using for the GRAPH overview must be visible in HMI and accessible from HMI.

To identify the tags of the GRAPH data block as visible and accessible for HMI, open the GRAPH function block, select the block in the work area, and select "Edit > Internal parameters visible/accessible from HMI" in the menu bar. Then compile the program blocks.

---

- An HMI device has been created.
- You have created a screen.
- The Inspector window is open.

## Procedure

1. Drag-and-drop the GRAPH overview from the toolbox view into the configured screen.
2. In the Inspector window, click "Properties > Properties > Miscellaneous".
3. Open the selection button under "PLC Source > Tag".  
The "Add new object" dialog opens.
4. Select the corresponding PLC in the "Program blocks" folder.
5. Select the corresponding PLC tag of the GRAPH instance data block.

---

### Note

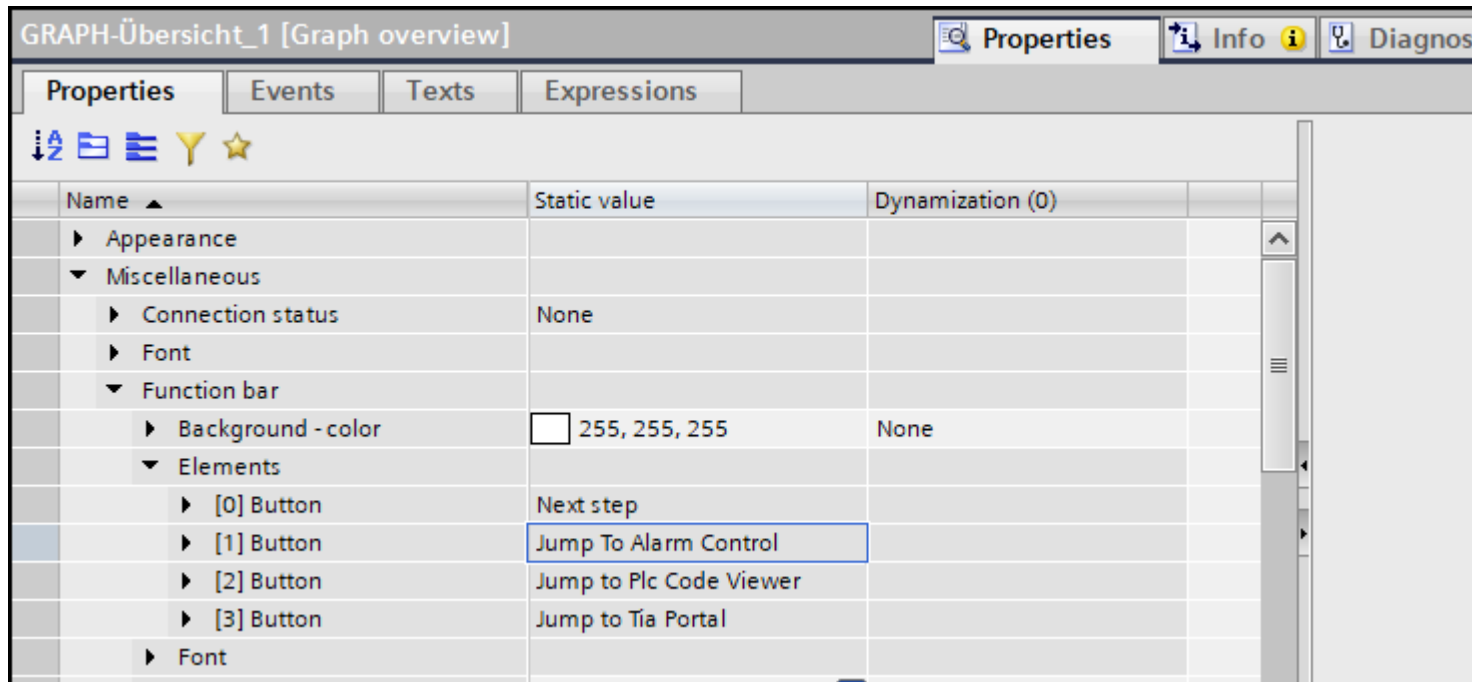

If no connection was configured between the HMI device and the selected PLC, a connection is set up automatically.

In addition, an HMI tag is created which is connected to the PLC tag.

---

6. To display the GRAPH overview in compatibility mode without function bar buttons and operating mode display, drag the object to the desired size, whereby multiple basic views are possible.

- Under "Properties > Properties > Miscellaneous > Function bar > Elements", specify the buttons to be displayed in the object.

- Under "Properties > Events", you can assign system functions or scripts to the buttons in the GRAPH overview in order, for example, to jump to the alarm control or the PLC code view in Runtime and to open the TIA Portal.

## Result

The GRAPH overview is inserted in the screen. The current status of the GRAPH step sequence is displayed in Runtime.

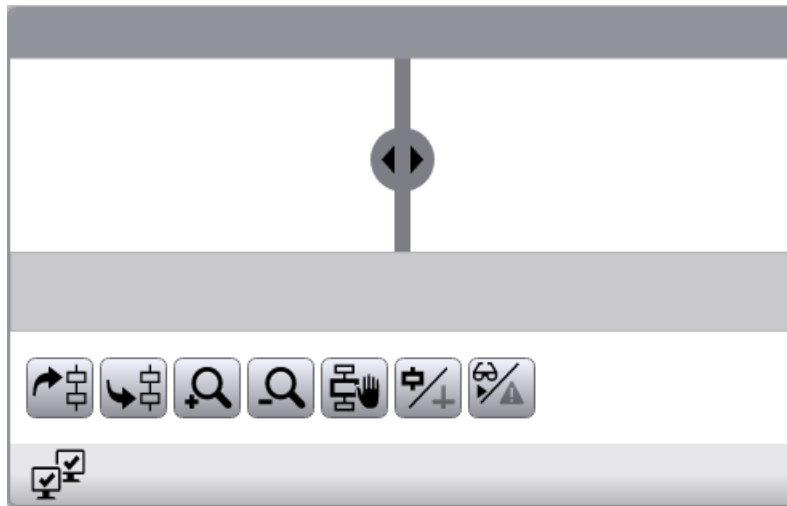

### 12.3.6 PLC code view (RT Unified)

#### Use

The "PLC code view" object is used to display the current program status of user programs that have been programmed in the LAD, FBD or GRAPH graphic programming languages.

A variety of information about the user program is displayed in the PLC code view:

- Information area
- Symbol line
- Detail view
- Transition/Interlock view

## Layout

In the Inspector window, you can change the settings for the position, geometry, style, and color of the object. You can adapt the following properties in particular:

- "Function bar": Specifies the buttons of the PLC code view control.
- "Symbol line": Shows information about the first or the selected icon.

## Information area

In the information area of the PLC code view, you are shown:

- In the left area, the GRAPH sequence.
- In the right area, the details, e.g. for the step or for the transition. In the ProDiag view, the networks to the supervised operands are displayed in this area.

## Buttons of the function bar

You can define the buttons of the PLC code view control in runtime along with their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Function bar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the PLC code view:

Button		Function
	Previous	Navigates to the previous sequence / previous network.
	Continue	Navigates to the next sequence / next network.
	Zoom in	Enlarges the information area.

Button		Function
	Zoom out	Reduces the information area.
	Toggle GRAPH mode	Switches between manual and automatic step selection for the active step.
	Toggle detail view	1. GRAPH view: Switches between the transition and interlock networks. 2. ProDiag view: Switches between network and the whole block.
	Toggle criteria analysis	Switches between the network view including criteria analysis and the standard network display without criteria analysis.

### 12.3.7 Configuring the PLC code view

#### Introduction

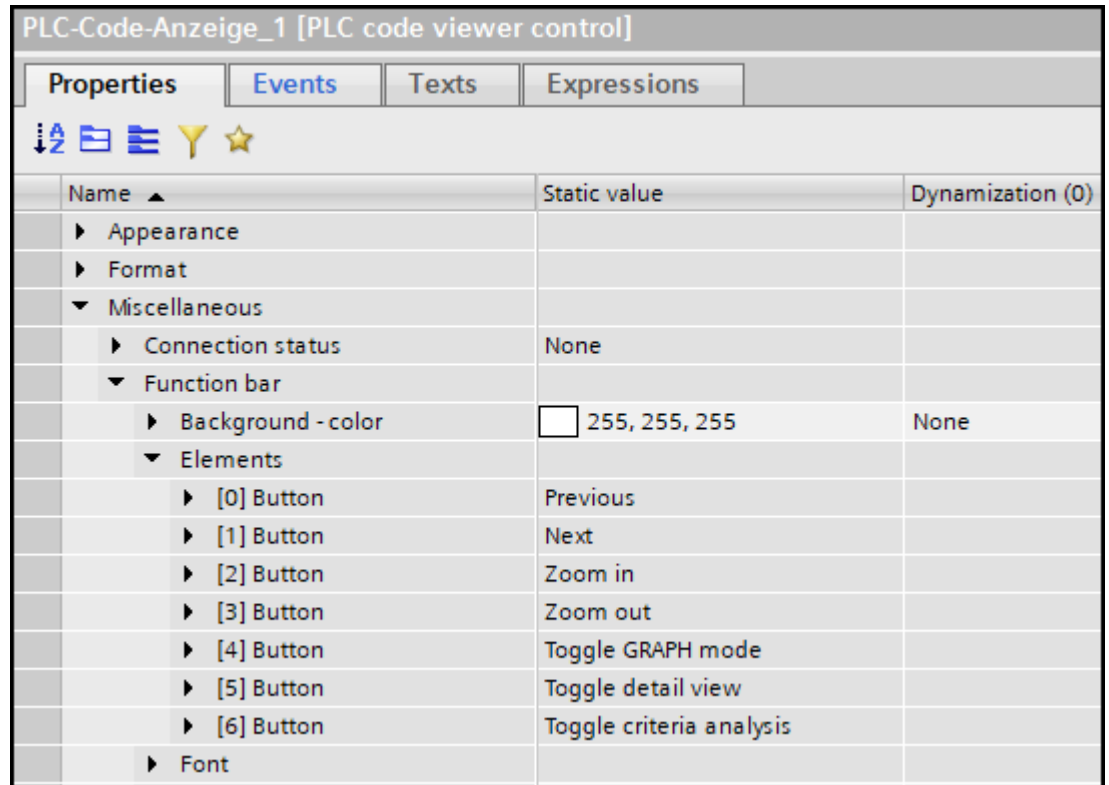

To display the PLC program networks in the graphic programming languages LAD, FBD and GRAPH in Runtime, insert a PLC code viewer control into your project.

#### Requirement

- At least one PLC has been created.
- An HMI device has been created.
- An HMI connection has been established between the controller and HMI device.
- The process diagnosis is activated on the HMI device.
- You have created a screen.

## Procedure

1. Drag-and-drop the PLC code view control from the toolbox view.
2. In the Inspector window, click "Properties > Properties > Function bar".
3. Select the buttons that you require in Runtime, for example: Back, Next, Zoom in.

PLC-Code-Anzeige\_1 [PLC code viewer control]

Properties | Events | Texts | Expressions

↓ ↻ 📄 📋 🏠 ☆

Name ▲	Static value	Dynamization (0)
▶ Appearance		
▶ Format		
▼ Miscellaneous		
▶ Connection status	None	
▼ Function bar		
▶ Background - color	<input type="text" value="255, 255, 255"/> 255, 255, 255	None
▼ Elements		
▶ [0] Button	Previous	
▶ [1] Button	Next	
▶ [2] Button	Zoom in	
▶ [3] Button	Zoom out	
▶ [4] Button	Toggle GRAPH mode	
▶ [5] Button	Toggle detail view	
▶ [6] Button	Toggle criteria analysis	
▶ Font		

## Result

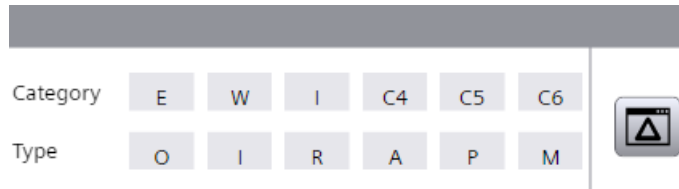

The PLC code view is inserted in the screen. In Runtime, PLC user programs can be displayed that are programmed in the graphic programming languages LAD and FBD as well as GRAPH.

You can populate the PLC code viewer using system functions, e.g. jump from the GRAPH overview or from the alarm, or you can select the corresponding parameters directly.

### 12.3.8 ProDiag overview

#### Use

The "ProDiag overview" object provides an overview of the current status of the configured monitoring in Runtime. When an error occurs, the type of error and the error category are determined in the ProDiag overview. You can navigate directly to the alarm control to find the error and you can jump from the corresponding alarm to the PLC code viewer control. You can display the affected program code in the PLC code viewer control.

#### Note

##### Device dependency of the "ProDiag overview" object

The "ProDiag overview" object is available for WinCC Unified.

#### Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Displayed buttons
- Names and colors for categories
- Names and colors for monitoring types

#### Monitoring types and categories

You can display a maximum of 8 categories and 6 monitoring types in the "ProDiag overview" object. The following pre-defined categories and monitoring types are available:

Designation	Categories
E (Error)	Error
W (Warning)	Warning
I (Info)	Information
C4 ... C8	Additional categories

Rename the categories C4 to C8, which are created by default, according to your requirements.

Designation	Monitoring type
O (Operand)	Operand error
I (Interlock)	Interlock error

Designation	Monitoring type
R (Reaction)	Reaction error
A (Action)	Action error
P (Position)	Position error
M (Message error)	Alarm

You can change display symbols of the supervision types and categories at any time in the Inspector window under "Miscellaneous".

## Symbols

The icons displayed in the ProDiag overview are fixed.

Icon	Name	Function
	Error	Indicates that an error has occurred.

## "Jump to Alarm Control" button

The "Jump to Alarm Control" button in the ProDiag overview is activated by default.

Button	Name	Function
	Jump to Alarm Control	Opens the configured alarm control with the error message after system functions or scripts have been assigned to the button.

## Deactivated display

If there is a faulty connection to the controller during runtime, the object "ProDiag overview" is displayed grayed-out (unavailable). This deactivated display can be due to the following:

- The controller is deactivated
- The configured ProDiag program block was removed from the control program
- The controller is in Stop mode

As soon as the cause of the error is removed and the connection reestablished, the ProDiag overview shows the current online status of the monitoring during runtime.

## 12.3.9 Configuring the ProDiag overview

### Introduction

The ProDiag overview is used to monitor your machine or system at runtime and determination of diagnostic information in the event of a fault occurring.

Once you have set the status tag in the object and the connection to a ProDiag FB has been established, the status of the "State" status tag of the corresponding PLC data type is queried.

In Runtime, the states of the monitored operands are represented as symbols in the ProDiag overview, similar to a traffic light colors.

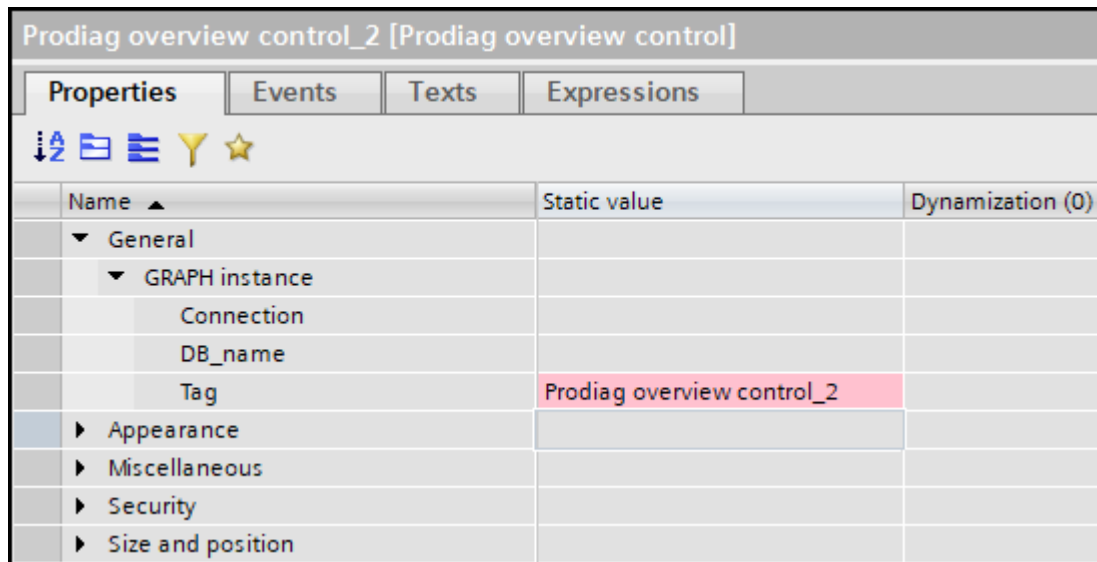

In WinCC, you configure the display and the representation of categories and supervision types that are displayed in the "ProDiag overview" object independent of the supervision settings in STEP 7.

## Requirements

- At least one S7-1500 controller has been created.
- At least one supervision instance has been configured.
- A ProDiag FB and ProDiag DB are available.
- A PC station or an HMI device that supports the ProDiag functionality has been created.
- An HMI connection has been established between the controller and HMI device.
- An screen is created and the Inspector window is open.

## Procedure

1. Drag-and-drop the ProDiag overview from the toolbox view.
2. In the Inspector window, select "Properties > Properties > General".
3. Open the selection button under the "Tag" property.
4. Select the status tag of ProDiag FB.  
Alternatively, you can add the corresponding status tags from the detail view using drag-and-drop.

5. Under "Properties > Properties > Miscellaneous > P Diag Categories", define the names and colors for the supervision categories.

6. Under "Properties > Properties > Miscellaneous > P Diag Supervision types", define the names and colors for the supervision types.
7. Under "Properties > Events", you can configure a system function for the "Alarm view - Button tapped" event to jump from the ProDiag overview to the alarm view in Runtime.

## Result

The ProDiag overview is inserted in the screen. The current states of the supervised events are displayed in Runtime.

## 12.3.10 Initial value acquisition and criteria analysis (RT Unified)

### 12.3.10.1 Overview of initial value acquisition and criteria analysis (RT Unified)

#### Introduction

In the TIA Portal you have the option of testing the execution of your user program on the HMI device. The data and values on the HMI device are continuously synchronized with the PLC and updated. You therefore see the current program status with the actual values of the signal states on the HMI device.

If an error occurs in your plant, you have the option of jumping to the program code from the corresponding error message and displaying the error location in the network in the "PLC code view". In the "Criteria analysis view" object, you see the faulty operands for a selected GRAPH alarm or ProDiag alarm at a glance.

The initial value acquisition and criteria analysis functions enable you to record the values at the time of the error and to quickly identify the faulty operands in the program.

The actual value acquisition and criteria analysis functions are available for GRAPH function blocks, ProDiag function blocks and safety programs (F-blocks).

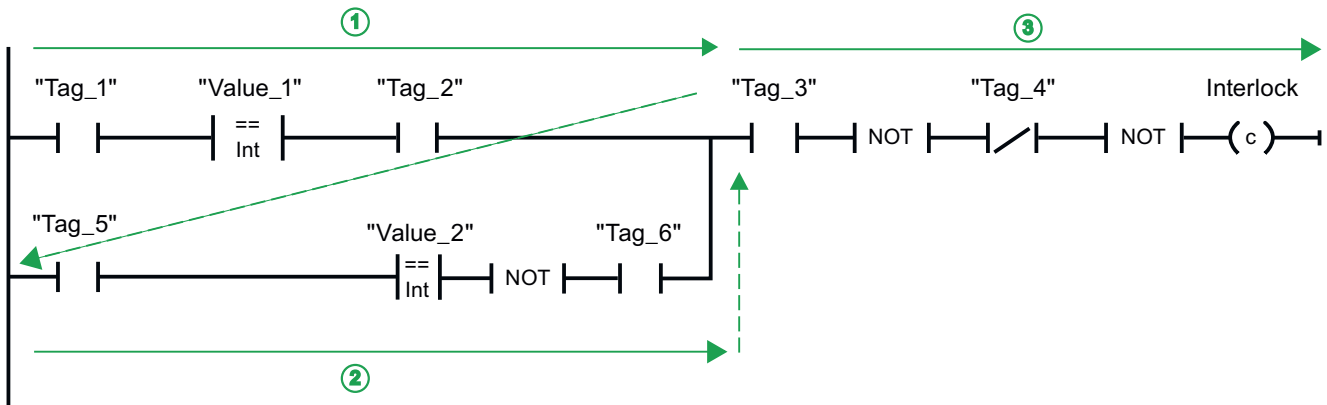

#### Requirement

- The initial value acquisition is available in WinCC Unified Runtime for the following blocks:
  - For the GRAPH function blocks as of version 6.0.
  - For the ProDiag function blocks as of version 2.0.
- Maximum of 32 statuses can be recorded. The initial values for a network that contains more than 32 elements are not recorded.

#### Initial value acquisition

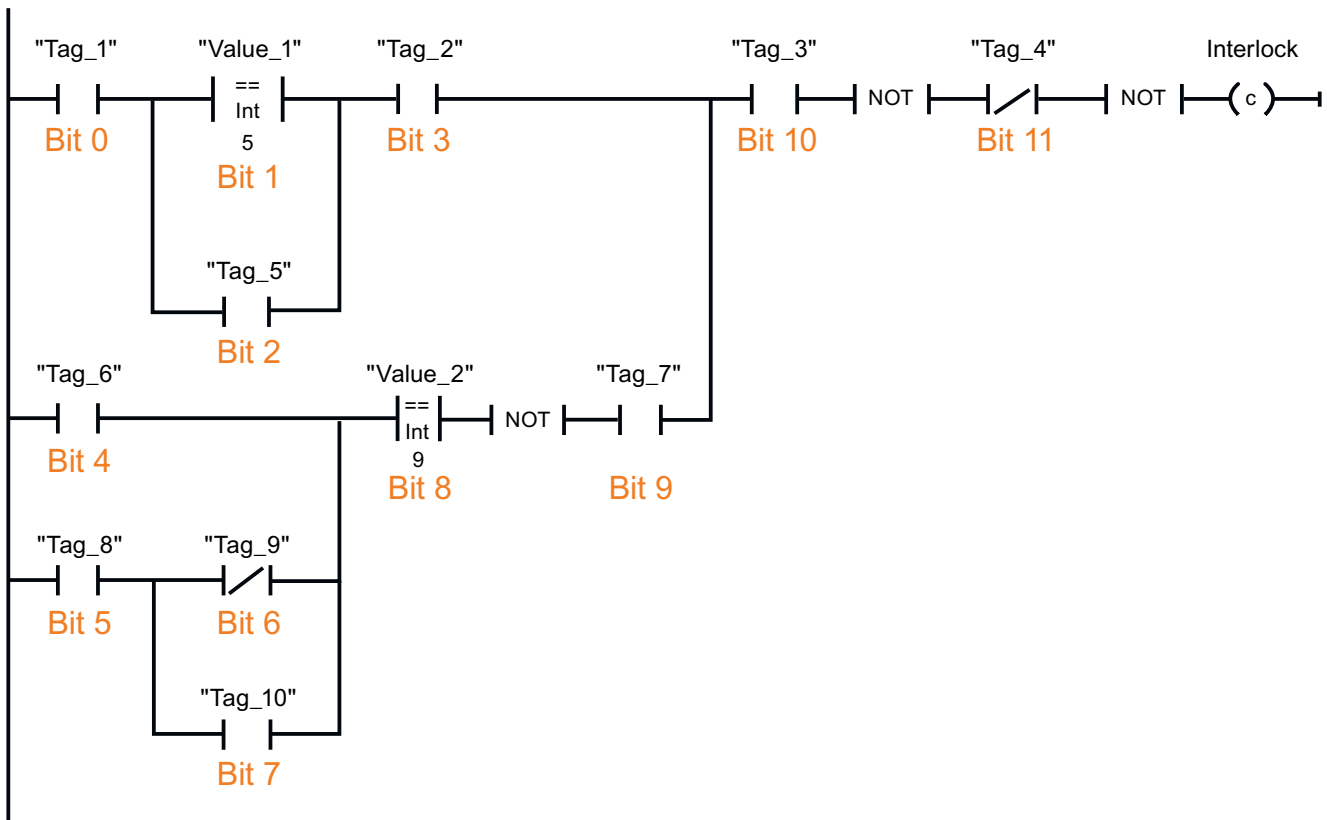

With the help of initial value acquisition you can acquire the values at the time of the error in the PLC, display them in the PLC code view and compare them with the actual values. With initial value acquisition you continuously record the signal states of Boolean operands and results of comparators in transitions and interlocks.

The signal states are recorded in a defined order from top left to bottom right:

You activate initial value acquisition individually for each GRAPH block in the user program. A maximum of 32 signal states of Boolean operands can be recorded per interlock or per transition of a GRAPH step. Each individual signal state occupies one bit. The values are saved in a DWORD.

In the following example you can see the principle and order in which the initial values are recorded in the interlock:

## Criteria analysis

Initial value acquisition in the PLC enables the analysis of criteria and operands with error in the program. You see the evaluation of the criteria analysis on your HMI in the PLC code view. In addition, in the "Criteria analysis view" object, you can use the criteria analysis to have the faulty operands displayed for a selected GRAPH alarm or ProDiag alarm.

---

### Note

If the upstream network has been changed, the alarm is not be triggered again. This leads to inconsistencies between the network and faulty operands. As a result, the criteria analysis view cannot correctly display the faulty operands. If the alarm is triggered again, the faulty operands are displayed correctly again in the criteria analysis view.

---

For the blocks for which you have activated initial value acquisition, after the jump the initial value view is displayed by default in the PLC code view. In addition, the operands with error and criteria are highlighted visually in the initial value view.

All information about the selected operand can be seen in one line of the PLC code view.

In the event of an error in a comparator, both operands are marked as having errors. Only the recorded values are shown in the initial value view. To see the actual values of the tags, change to the actual value view.

### 12.3.10.2 Supported instructions (RT Unified)

#### Introduction

You see the initial values and the results of the criteria analysis in the "PLC code view" object.

For global supervisions, the initial values of all Boolean operands in the network are recorded. If the network contains multiple individual power rails that are not connected to each other, only the initial values of the respective power rail are recorded.

For local supervisions, only the initial values that are specified as conditions for the supervised parameter for the block call are recorded.

#### Supported instructions

The following instructions are supported in LAD and FBD for initial value acquisition:

Instructions	Display on the HMI device
<b>Bit logic operations</b>	
Normally open contact	Initial values and criteria analysis
Normally closed contact	
Invert RLO	The instruction is supported but it is not relevant for initial values or the criteria analysis.
Assignment	
Negate assignment	
Reset output	Initial values
Set output	

Instructions	Display on the HMI device
Set/reset flip-flop	Initial values and criteria analysis up to and including the instruction box
Reset/set flip-flop	
<b>Comparator operations</b>	
Equal	Initial values and criteria analysis
Not equal	
Greater or equal	
Less or equal	
Greater than	
Less than	
<b>Timers</b>	
TP	Initial values and criteria analysis up to and including the instruction box
TON	Initial values and criteria analysis
TOF	Initial values and criteria analysis up to and including the instruction box
TONR	
<b>Counters</b>	
CTU	Initial values and criteria analysis up to and including the instruction box
CTD	
CTUD	

For bit logic operations, the status of the operand is recorded. For comparators, the result of the comparison is recorded.

For flip-flops, both inputs (R and S) are recorded if they are interconnected.

For timers and counters, the status of the operand at the output, and the inputs if they are interconnected, are recorded. (For example, for CTUD: CU, CD, R, LD)

The FBD instructions AND and OR are also supported for initial value acquisition and criteria analysis. The FBD instruction EXCLUSIVE OR is not supported by the initial value acquisition and criteria analysis.

### 12.3.10.3 Criteria analysis view

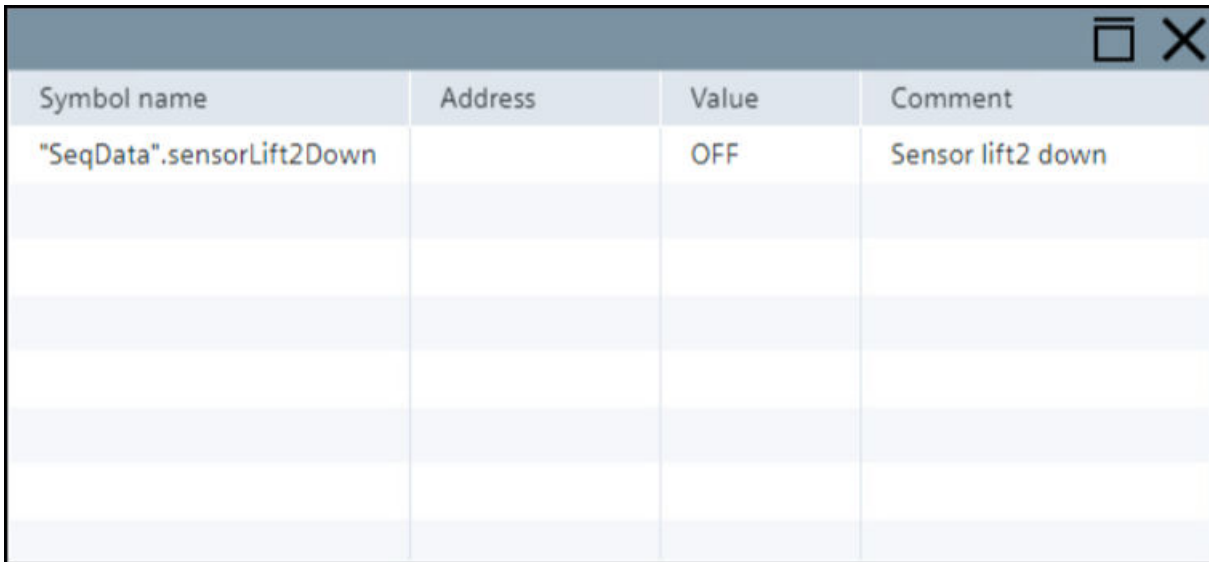

#### Use

The "Criteria analysis view" object shows you the faulty operands in the user program that have triggered a selected ProDiag alarm or GRAPH alarm. As a result, you have the option of seeing the list of faulty operands in addition to the alarm in the same screen.

To see the evaluation of the criteria analysis in the "Criteria analysis view" object in Runtime, select the initial value acquisition in the settings of the function blocks in the user program. The initial value acquisition is available for GRAPH function blocks as of version 6.0 and ProDiag function blocks as of version 2.0.

To enable the link to the corresponding error message, configure a reference to a previously configured alarm control. If you select a GRAPH alarm or a ProDiag alarm in the alarm control

in Runtime, then the name, address, comment and value of the operand that caused this error is displayed in the criteria analysis view.

Symbol name	Address	Value	Comment
"SeqData".sensorLift2Down		OFF	Sensor lift2 down

You see the incoming alarms and the faulty operands at a glance in Runtime if you configure the criteria analysis view and its linked alarm control in the same screen.

#### Note

Criteria analysis is only available for the user programs for which initial value acquisition has been activated.

Activate initial value acquisition in the properties of the following blocks:

- ProDiag function blocks with version greater than or equal to V2.0
- GRAPH function blocks with version greater than or equal to 6.0

## Layout

You change the settings for the position, style, colors, and fonts of the object in the Inspector window.

## Columns

The following columns are displayed in the criteria analysis view in Runtime.

Column	Description
Symbol name	Symbolic name of the operand in the user program.
Address	Absolute address of the operand.
Value	The value of the operand at the time of the error.
Comment	Additional comments from the user program in the language that is loaded into the controller.

## See also

Configuring the criteria analysis view (Page 7114)

### 12.3.10.4 Configuring the criteria analysis view

#### "Criteria analysis view" object

The "Criteria analysis view" object shows you the faulty operands in the user program that have triggered a selected ProDiag alarm or GRAPH alarm. It is used to list the initial values in a separate view in order to obtain an overview of the fault status of the plant.

If you select the incoming ProDiag alarm or GRAPH alarm in the alarm control in Runtime, you see the operands that were determined in the criteria analysis view.

You configure the criteria analysis view and its linked alarm control in the same screen.

#### Requirement

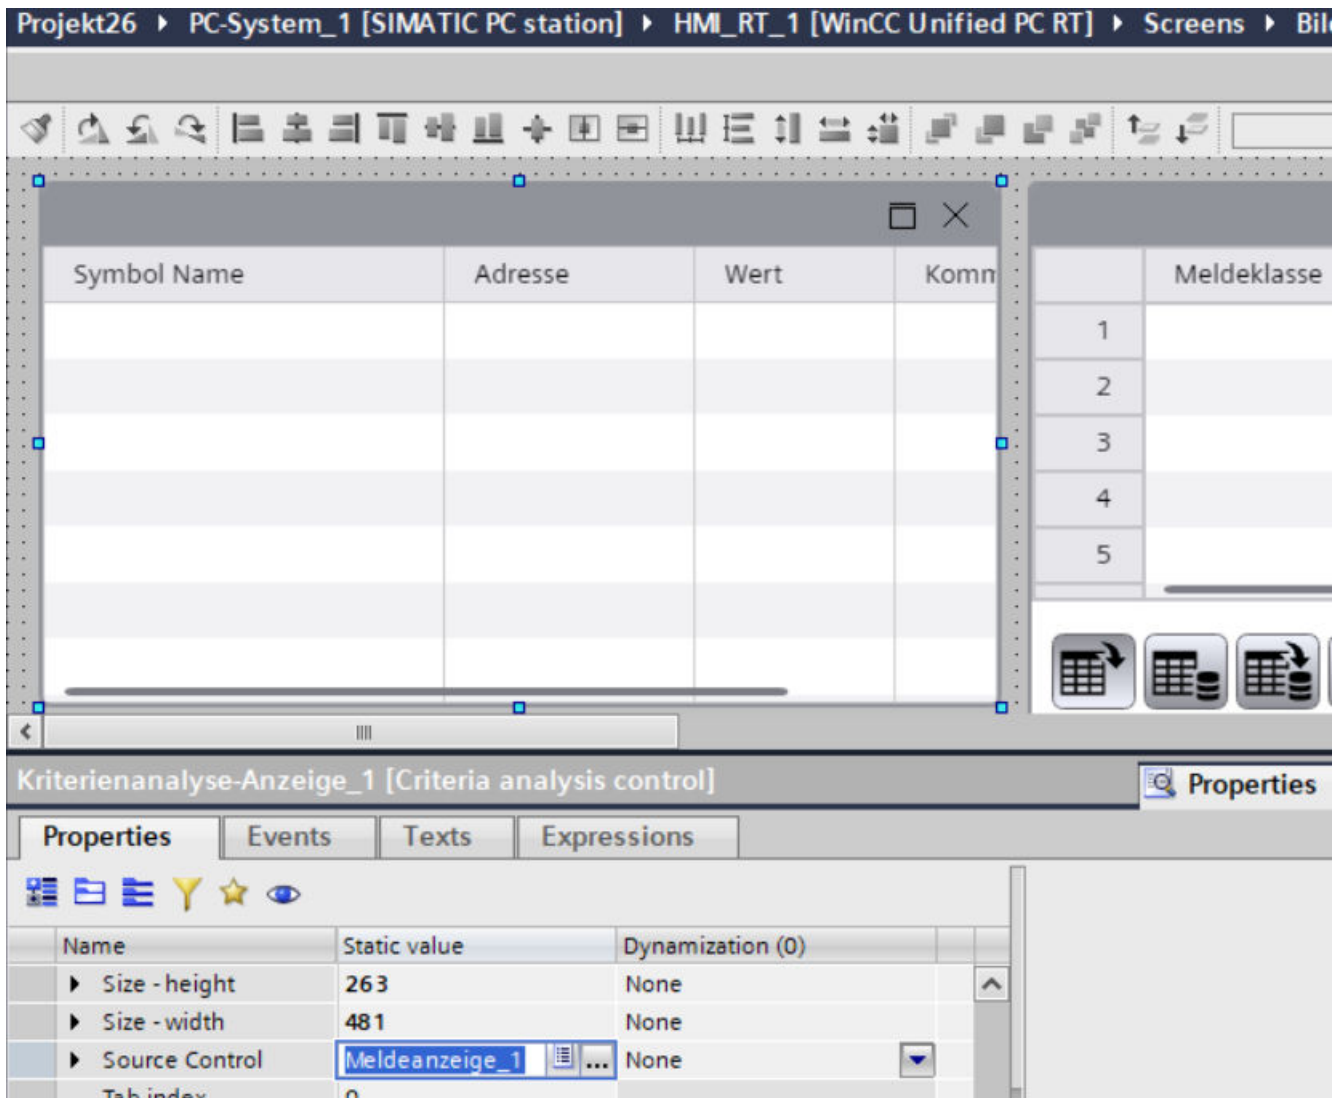

- The HMI device is connected to the controller.
- A ProDiag program version 2.0 or a GRAPH program Version 6.0 or higher is installed on the controller.
- Process diagnostics is enabled in the "Runtime settings > Process diagnostics > General" of the Unified Runtime device.
- Initial value acquisition is enabled for the function blocks.
- An alarm control has been configured.

#### Procedure

1. Move the criteria analysis view from the toolbox window using drag-and-drop.
2. Click on "Properties > Properties" in the Inspector window.

3. Open the selection button under the "Data source" property.
4. Select the configured alarm control.

## Result

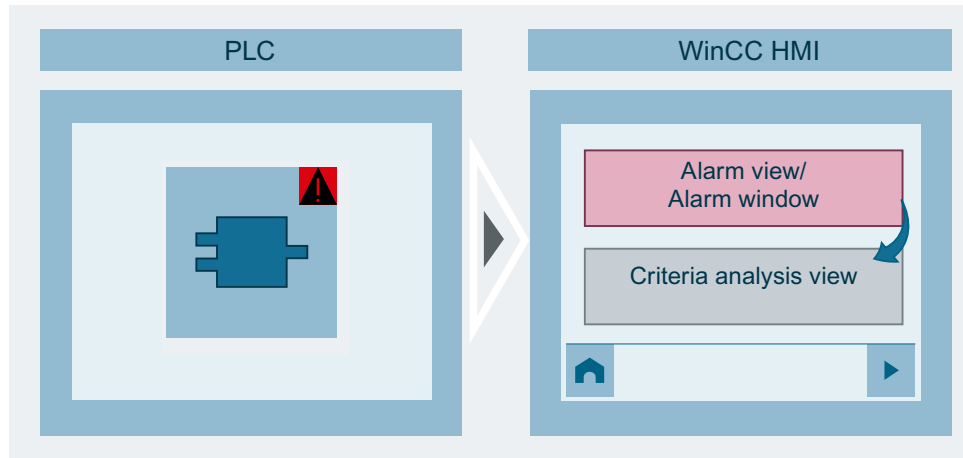

The criteria analysis view is configured in the screen and connected to the alarm control. For a selected alarm you can see detailed information in Runtime about that operands that triggered this alarm.

### 12.3.10.5 Outputting alarms with criteria (RT Unified)

#### Introduction

When initial value acquisition is activated, the values of the faulty operands are recorded at the time of the error and missing criteria are analyzed and determined.

You have the option to add additional information about faulty operands to the GRAPH and ProDiag alarms and output them on your HMI device. If an error occurs in the program flow in runtime, the error message also indicates the faulty operands in the faulty network. You see detailed information on all operands with error of the error message in the "Criteria analysis view" object.

In WinCC Unified Runtime, you have the option to add additional information to the alarms. For this, select the appropriate text that you want to extend under "Runtime settings > Process diagnostics > Criteria analysis > Extend text", i.e. alarm text, info text or additional text 1 - 9. You can extend the texts with the first faulty operand or with all faulty operands.

The following information can be added to the operands:

- Symbol: The symbolic name of the first or all faulty operands.
- Absolute address: The address of the first or all faulty operands.
- Value: The value of the first or all faulty operands at the time of the fault.
- Comment: Multilingual comments that were configured in the user program.

The additional information is separated in the alarm by semicolons and spaces.

---

**Note**

The order of the additional information that is added to the alarm is predefined and cannot be changed.

---

**Note**

To completely display the alarms from the controller on the HMI device, the "Automatic update" option must be selected under "Runtime settings > Alarms > Controller alarms" for the relevant connection. You can find additional information on complete alarms under "Sending a complete alarm from the controller to the HMI device (Page 918)".

---

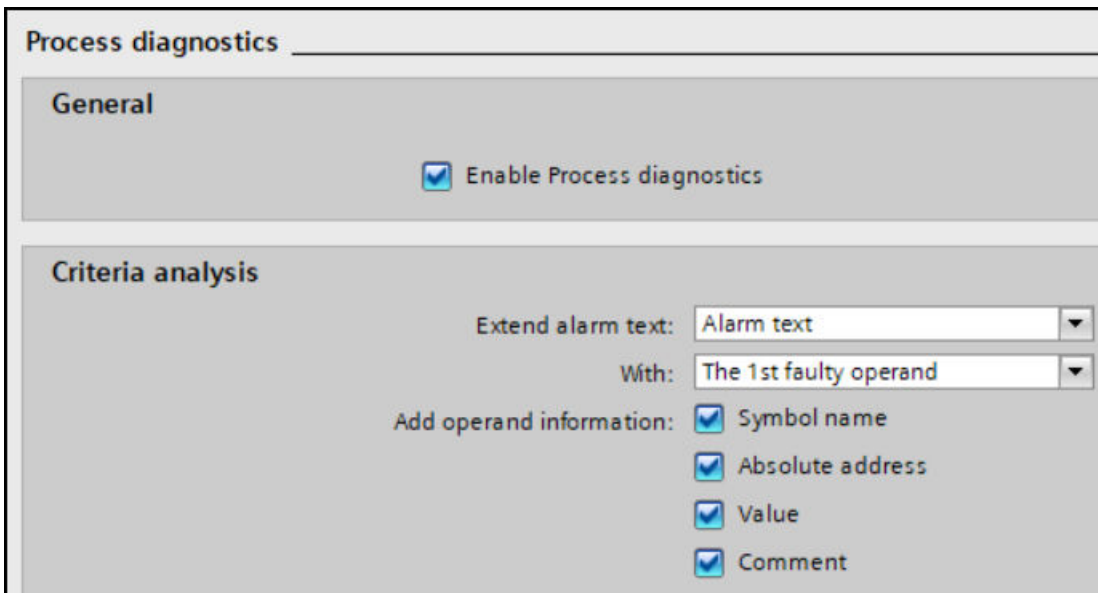

## Criteria analysis in the alarm system

You visualize the alarms for the criteria analysis in the following steps:

- You enable the initial value acquisition in the properties of the ProDiag function block or GRAPH function block of the user program
- You enable the options to extend the alarm texts or info texts in the runtime settings of the HMI device

## Extend alarms

1. Open the "Runtime settings" editor of the HMI device.
2. Click "Process diagnostics > Criteria analysis".
3. Under "Criteria analysis > Extend text", select which texts you want to extend.
4. Select the additional information to be added to the alarm text in the alarm, such as symbol name, address and value of the first faulty operand and comment.

## Result

If an error occurs, you see not only the alarm text in the alarm control but also the operands that triggered the error message.

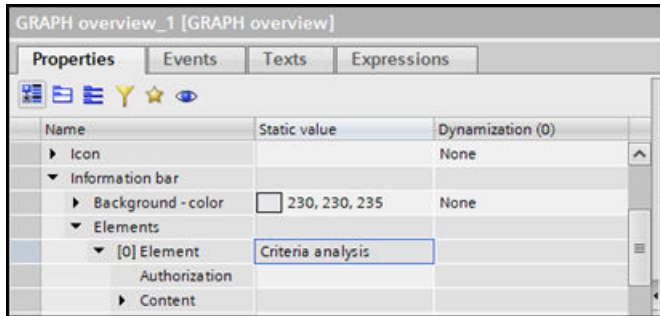

## See also

Sending complete alarms from the controller to the HMI device and automatically updating them (Page 918)

### 12.3.10.6 Criteria analysis in the "GRAPH overview" object

#### Extension of the "GRAPH overview" object with the criteria analysis

To display the criteria analysis in the "GRAPH overview" object, the criteria analysis must be enabled in the Inspector window under "Properties > Properties > Information bar > Elements".

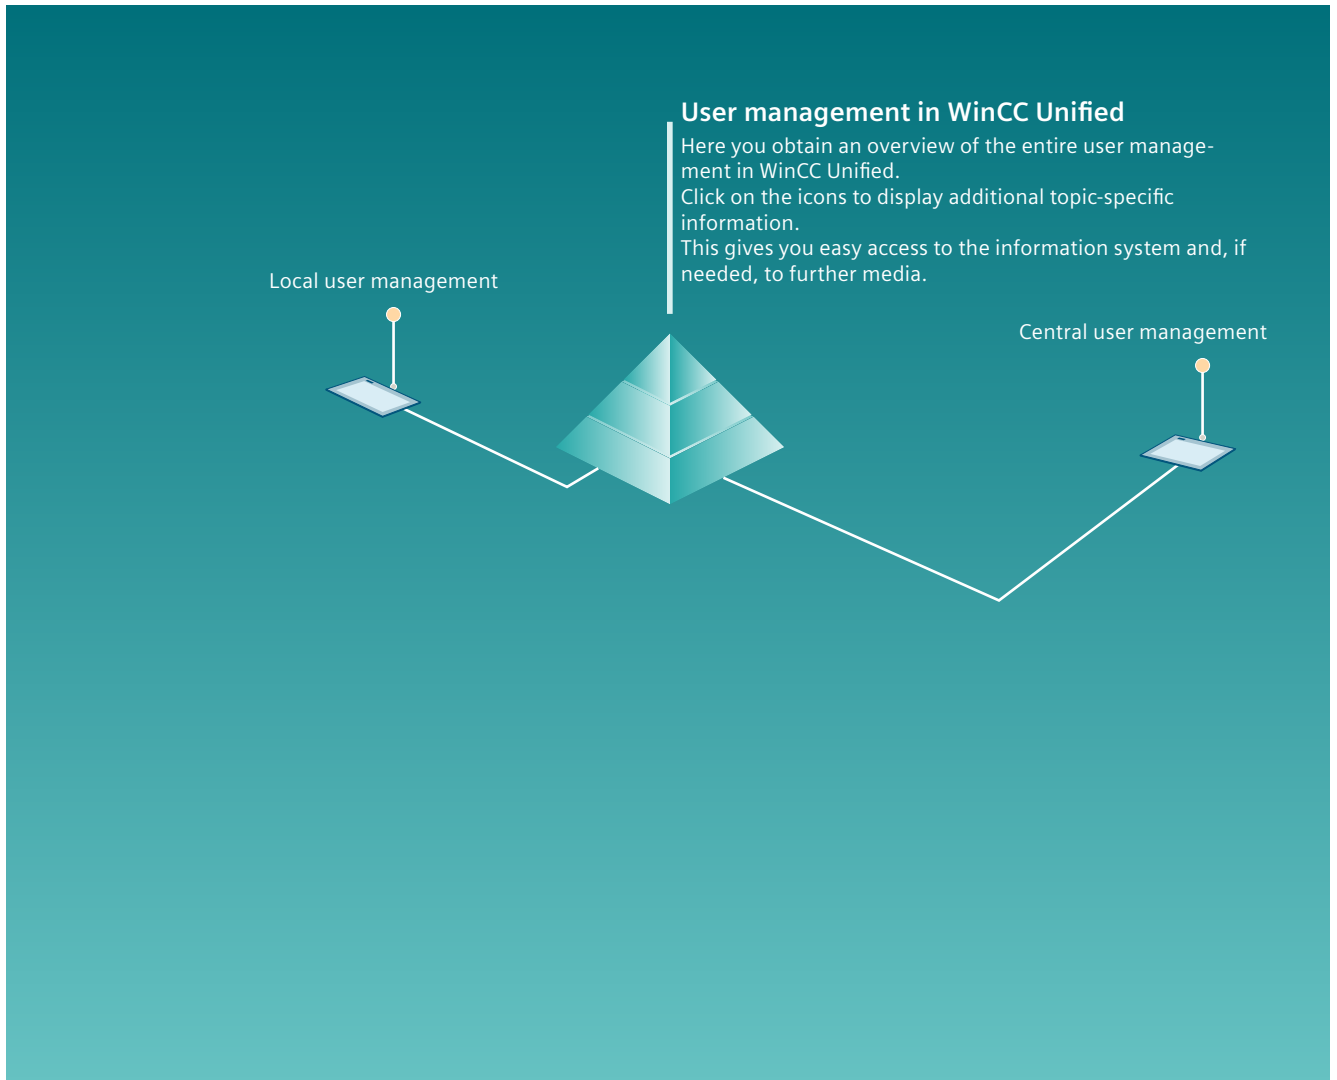

#### Result

In runtime, the information bar of the "GRAPH overview" object displays the symbolic name of the 1st faulty operand.

## Configuring users and roles (RT Unified)

### 13.1 Configuring users and roles (RT Unified)

## 13.2 Basics (RT Unified)

### 13.2.1 User management in the TIA Portal (RT Unified)

The user management in the TIA Portal allows for the plant-wide, central user management including optional connection of Microsoft Active Directories. The user management forms the basis for an efficient and integrated management of personalized access rights in the plant. The safety risks are significantly reduced through this approach. Thanks to the specific assignment of roles and rights to individuals, maintenance is minimized while achieving a high degree of transparency.

#### Functions

The user management in the TIA Portal offers:

- Central, cross-project management of user groups and users in the system.
- Import of user groups and users from Microsoft Active Directory.
- Failsafe performance thanks to redundant design of a User Management Control domain (UMC domain).
- Load distribution thanks to multiple UMC stations in one UMC domain.

You can also find this information on the Internet in the "Centralized user management in TIA Portal" tile on the Software in TIA Portal (<https://new.siemens.com/global/en/products/automation/industry-software/automation-software/tia-portal/software/tia-portal-options.html>) page.

You can configure the user management for:

- Engineering System
- Runtime

In the engineering system, you specify whether you are using a local or a central user management. By default, the use of the local user management is specified in the engineering system.

#### Protection in the engineering system

In the engineering system, you can protect the project from unintentional or unauthorized changes.

When you set up project protection in the engineering system, you will become the project administrator. Only authorized users can open and edit the protected project.

To protect the project, follow these steps:

1. Click "Security settings > Settings > Password policies" in the project tree.
2. You can define your own password policies.
3. Click on "Project protection > Protect this project".

4. Specify the login information for the project administrator.
5. The project administrator with the system-defined role "Engineering administrator" is created. The project is protected.

Project protection cannot be revoked.

### Protection in Runtime

In Runtime, you can protect:

- Access to Runtime.
- Operation of objects from authorized use.

You can also use the user management without project protection. The system-defined engineering roles are not available in an unprotected project.

### User management for the runtime

All information for user management in runtime is available in the following sections.

### See also

Configuring user management in the engineering system for Runtime (Page 7127)

## 13.2.2 Local user management (RT Unified)

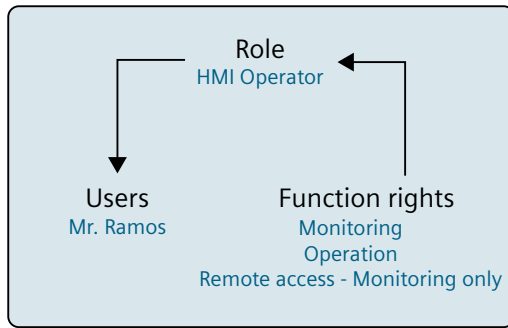

In the Engineering System, you specify whether you are using a local or a central user management. By default, the use of the local user management is specified in the Engineering System.

### Local users and local user management

You define and manage the local users in a TIA Portal project. The local users are only valid for this project. You assign users different functions with system-defined or user-defined roles. You assign the function rights to the roles.

You cannot configure user groups in the local user management.

The following figure shows how you assign a role to a user and how you assign different function rights to the role:

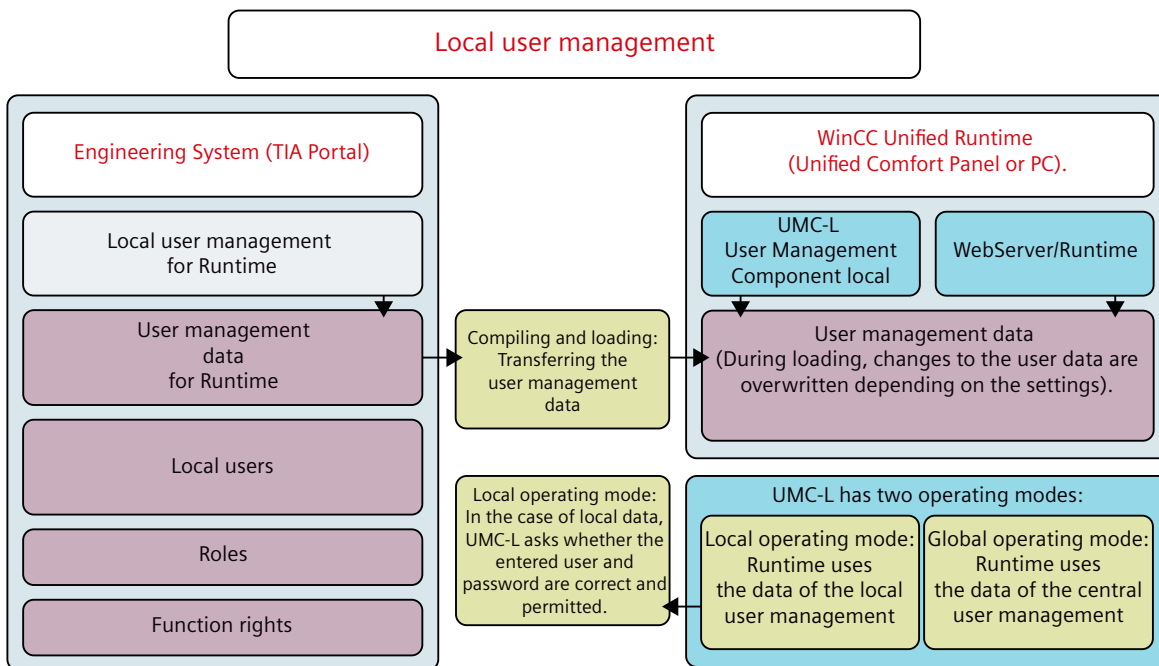

### Options for local user management

A local user management is always part of the specific project in which the user management is configured.

The following figure shows the options of the local user management.

- Engineering system:
  - Configuring local users.
  - Adding roles and assigning function rights to the roles.
  - Assigning the roles to local users.
- WinCC Unified Runtime:
  - Managing local users.
  - Managing data of the local users.
  - Assigning the available roles to local users.

### Logon via RFID with local user management for Unified PCs

If local user management is used, WinCC Unified Runtime supports login with RFID and PM-LOGON for local web clients. The prerequisite is that PM-LOGON is installed on the UMC server and the teach-in of the RFID cards has been completed.

Additional information on licensing and installing PM-LOGON as well as on the teach-in for the RFID cards is available in the PM-LOGON Operating Manual (<https://support.industry.siemens.com/cs/de/en/view/109810587>).

### Logon via RFID with local user management for Unified Control Panels

Additional information on using RFID on Unified Control Panels is available in the Unified Comfort Panels (<https://support.industry.siemens.com/cs/ww/en/view/109810754>) Operating Instructions TIA V18 or higher.

## 13.2.3 Central user management and UMC (RT Unified)

User Management Component (UMC) allows you to set up a central user management. You can define and manage the users and user groups across software and devices. You can also take users and user groups from a Microsoft Active Directory (AD).

From the TIA Portal, you can add the centrally defined user groups and users to the user management of the project. To add user groups and users from UMC, the corresponding rights are required in UMC.

### Installing User Management Component (UMC)

To use the central user management, install the "User Management Component UMC" software package. The UMC installation file and the UMC documentation in English is available on the TIA Portal installation data storage medium ("..\support", "...\Documents\Readme\English").

Install the UMC files on the PC on which you are managing the data of the central user management.

---

#### Note

We highly recommend that you read the UMC documentation completely before you start working with the user management, especially the sections on "Secure Application Data Support (SADS)". SADS is mandatory for working with the user management in the TIA Portal.

---

You can find complete information on UMC in the document Central user management with the "User Management Component (UMC)" (<https://support.industry.siemens.com/cs/ww/en/view/109780337>).

### Licenses for central user management

The number of UMC domains is cumulative.

The license is free for up to 10 users.

The following licenses are available if you are managing more users:

Software/license	Article number
TIA Portal User Management Component (UMC) Rental license for 100 user accounts and 365 days	6ES7823-1UE30-0YAO
TIA Portal User Management Component (UMC) Rental license for 4000 user accounts and 365 days	6ES7823-1UE10-0YAO

- Certificates of license (<https://mall.industry.siemens.com/mall/en/WW/Catalog/Search?searchTerm=user%20management%20component&tab=Product>)
- Details about license concepts: Software and licenses (<https://new.siemens.com/global/en/products/automation/topic-areas/simatic/licenses.html>)
- Trial license (<https://support.industry.siemens.com/cs/ww/en/view/109772992>) for registered users in the Siemens Industry Online Support. The software is subject to export restrictions.

### 13.2.4 Central user management (RT Unified)

In the Engineering System, you specify whether you are using a local or a central user management. By default, the use of the local user management is specified in the Engineering System.

#### Central user groups, users and central user management

Outside of the TIA Portal, you define and manage the following in the central user management:

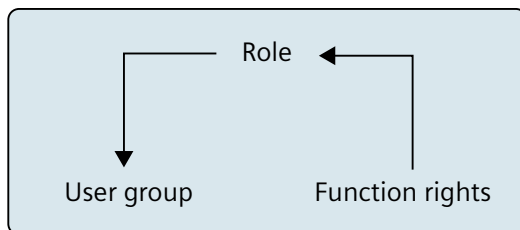

- User groups
- Central users

You organize the users in various user groups.

In the TIA Portal, you assign:

- The different functions to the user groups with the help of system-defined or user-defined roles.
- The function rights to the roles.

The following figure shows you how to you assign a role to a user group and function rights to the role:

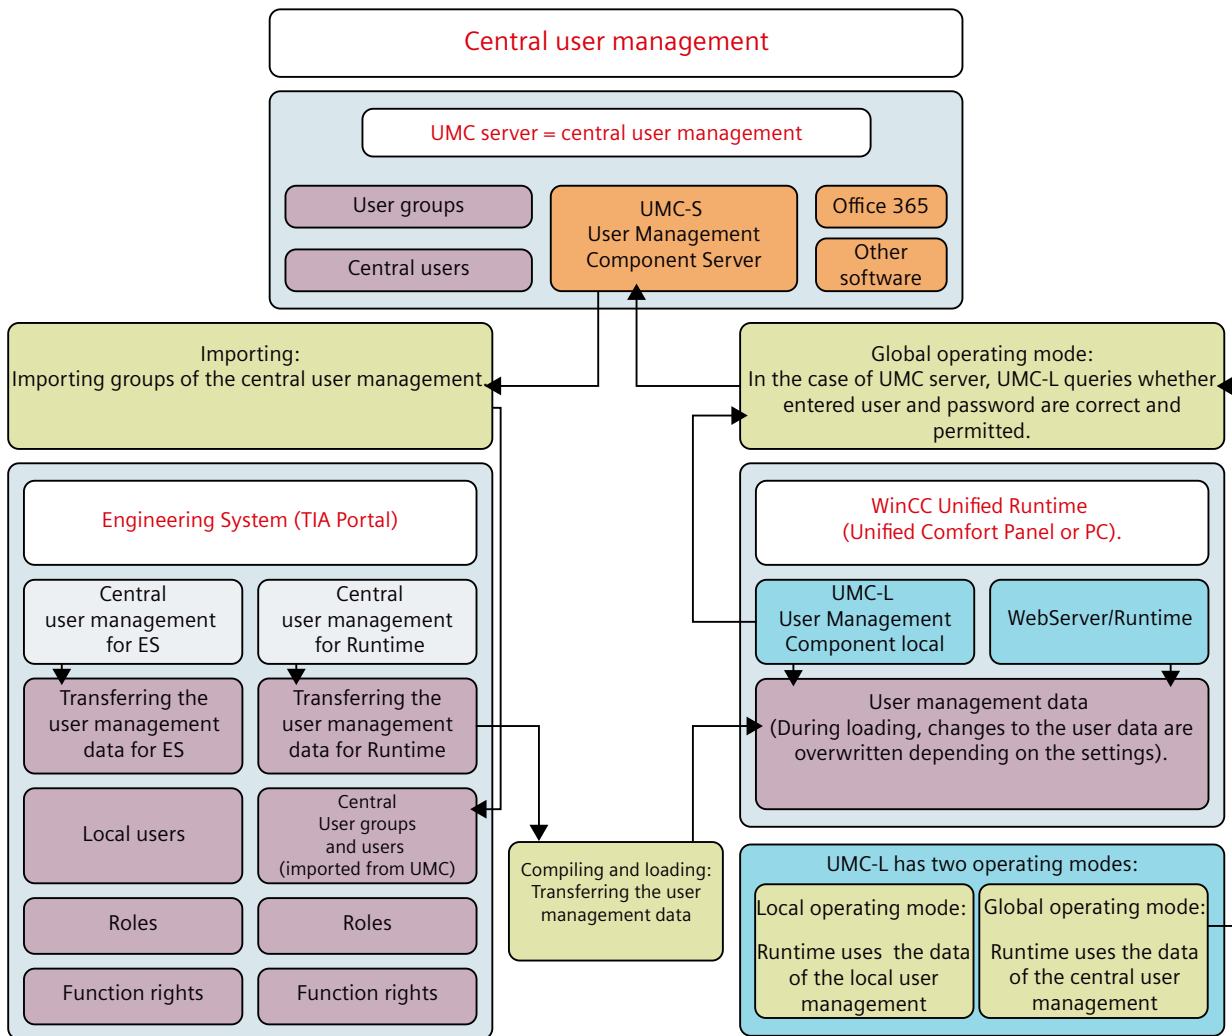

You can repeatedly import the user groups and central users from the central user management into the TIA Portal projects. You require the corresponding rights in the central user management for importing.

### Options of the central user management

The following figure shows the options of the central user management.

- Engineering system:
  - Importing user groups and central users into a TIA Portal project.
- Central user management:
  - Managing user groups and their data.
  - Managing central users and their data.

## See also

Examples (Page 7160)

### 13.2.5 Roles and function rights (RT Unified)

In the user management, you assign users or user groups different functions through system-defined or user-defined roles. The roles are assigned system-defined and user-defined function rights by the system or by you.

- System-defined roles are specified by the system.  
You cannot rename or delete the system-defined roles. The function rights are assigned to the roles by the system. You cannot change the assignment.
- You can add user-defined roles.  
You can rename or delete the user-defined roles. You assign different function rights to a role.

#### Relevant roles in the engineering system

The system creates the following system-defined roles that are relevant for the engineering system.

Engineering roles:

- Engineering administrator
- Engineering standard

The roles are only available in a protected project.

#### Relevant roles in runtime

The system creates the following system-defined roles that are relevant for runtime.

HMI roles:

- HMI Administrator
- HMI Operator
- HMI Monitor
- HMI Monitor Client

The roles are also available in an unprotected project.

#### Function rights

The function rights specify which functions a user or a user group may use in a specific role. You can link different function rights to multiple roles. You can also add user-specific runtime rights.

You can assign multiple function rights to a role.

---

**Note**

**User - Role - Function right**

If you do not assign a role to a user or a function right to a role, the user or role is not downloaded to the device.

---

## 13.3 Configuring user management in the engineering system for Runtime (RT Unified)

### 13.3.1 Specifying local or central user management (RT Unified)

In the Engineering System, you specify whether you are using local or central user management. By default, the use of the local user management is specified in the Engineering System.

#### Requirement

- A project is open.
- A device has been created.
- Password settings for Runtime and engineering are defined.

#### Specify password settings

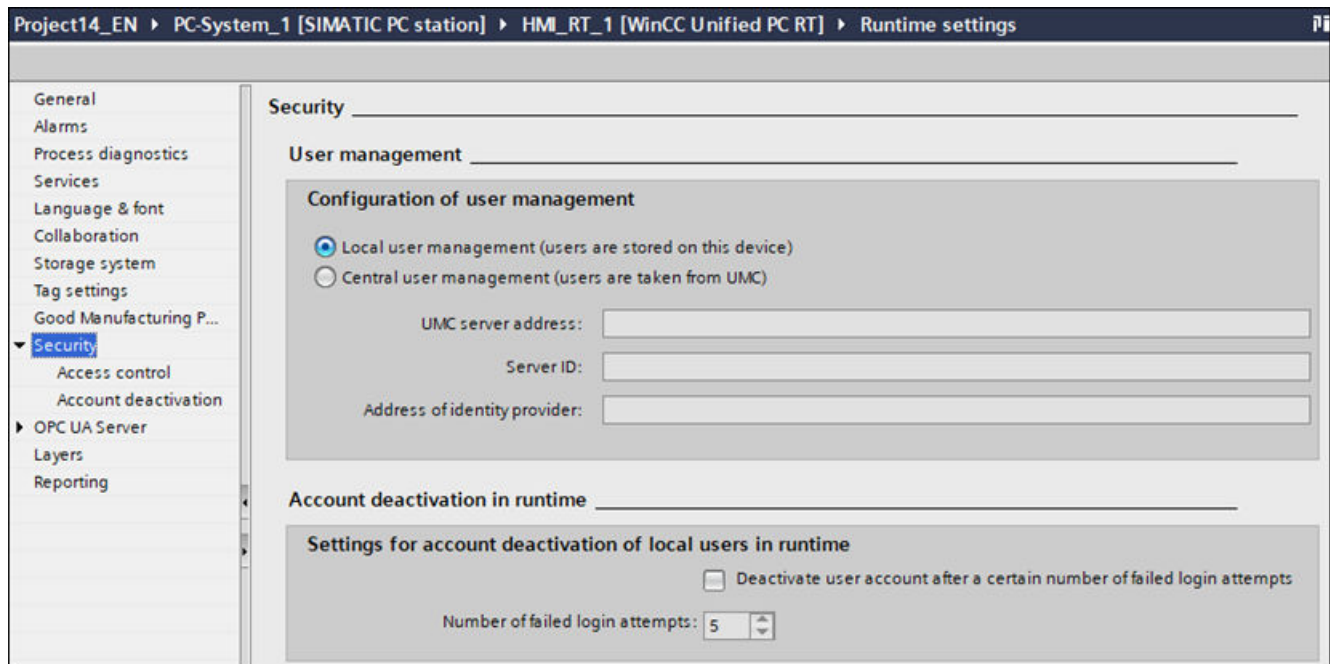

To set the password settings for the runtime and engineering, follow these steps:

1. Open "Security settings > Settings" in the project tree.
2. In the "Settings" editor, select the "Password policies" menu command.
3. Specify the password settings.

## Specifying the user management

To define the user management, follow these steps:

1. Open the "Runtime settings" of the device in the project tree of the project.
2. Under "Security > Access control", select:
  - Local user management: User data is stored on the device.
  - Central user management: User data is loaded from the UMC.
3. Under "Security > Account deactivation in Runtime", you can specify whether and after how many failed login attempts a user is logged out.

### See also

Managing local users (Page 7134)

Managing central users and user groups (Page 7145)

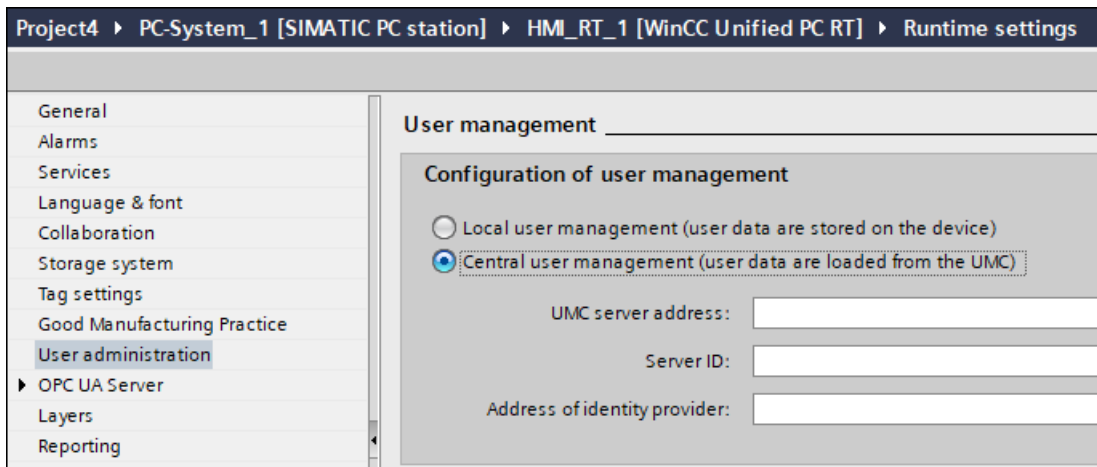

## 13.3.2 Configuring a connection to the central user management (RT Unified)

You have specified in the Engineering System that you are using central user management.

## Configuring a connection to the central user management

Follow these steps to configure the connection to the central user management:

1. Enter the UMC server address in "User management configuration".
2. Enter the server ID. The server ID can be determined from the configuration of the UMC server.  
The server ID is the fingerprint of the web certificate (https) on which the UMC server is installed. For more information, refer to Server ID (Page 7129).
3. Enter the address of the identity provider.

You are connected with the central user management.

### Note

If you cannot connect to the central user management or you do not know the server ID, leave the entry field for the server ID empty.

The configuration is nevertheless downloaded to Runtime. Enter the server ID:

1. On the PC using Runtime Manager.
2. On the Panel using the Control Panel.

### 13.3.3 Server ID (RT Unified)

The WinCC Unified PC Station or the Unified Panel communicate via an encrypted HTTPS connection to the UMC server to verify the authentication.

13.3 Configuring user management in the engineering system for Runtime (RT Unified)

The server ID is the fingerprint of the Internet Information Service (IIS) web certificate (HTTPS) on the computer where the UMC server is installed.

---

**Note**

In a distributed UMC domain with UMC ring server and multiple UMC servers / UMC RT servers, you decide which server of the UMC domain is used for user authentication of the respective Unified Station.

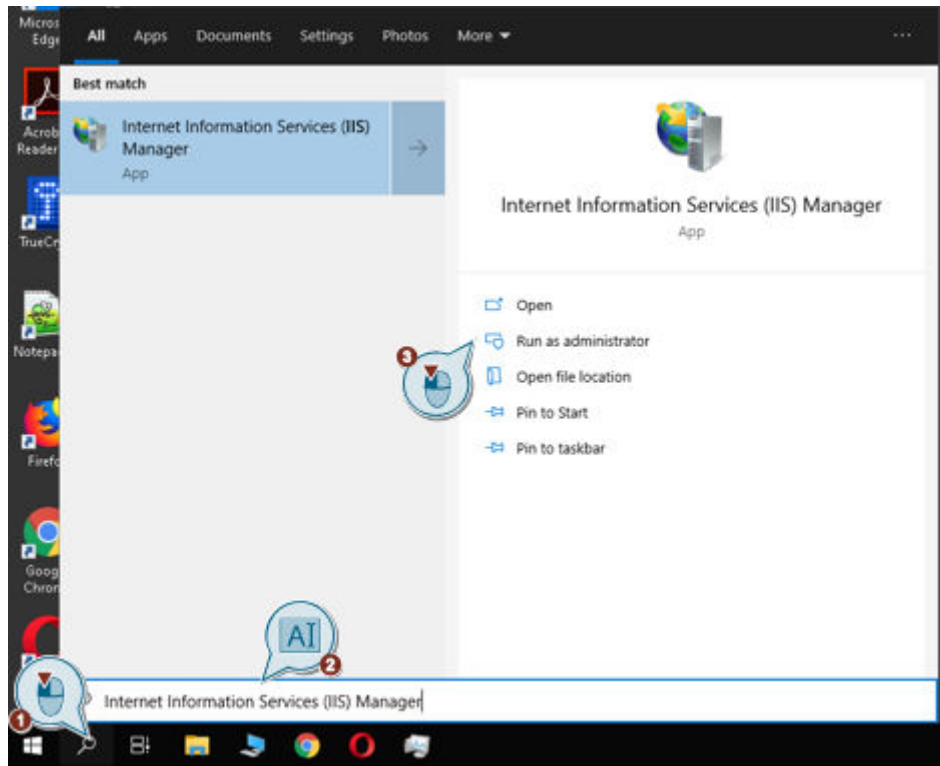

---

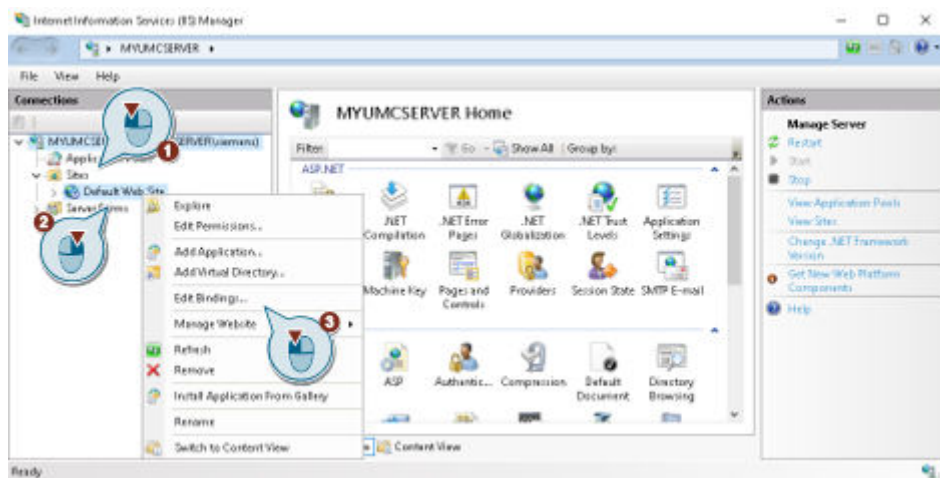

## Take over server ID via the IIS Manager

If you want to apply the server ID via the IIS Manager, follow these steps:

1. Open the IIS Manager on the computer to which the WinCC Unified PC Station or the SIMATIC WinCC Unified Panel is to connect for authentication.

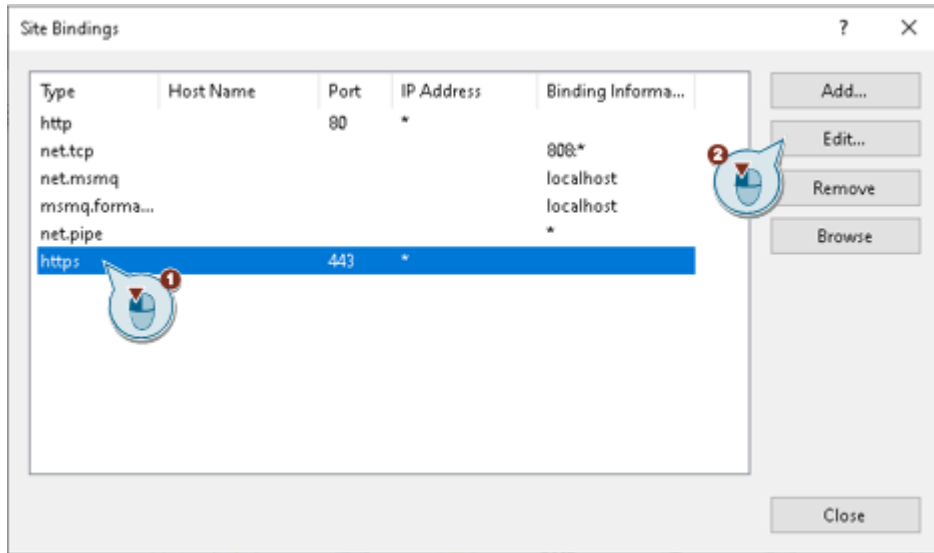

2. Edit the bindings of the default web page in IIS.

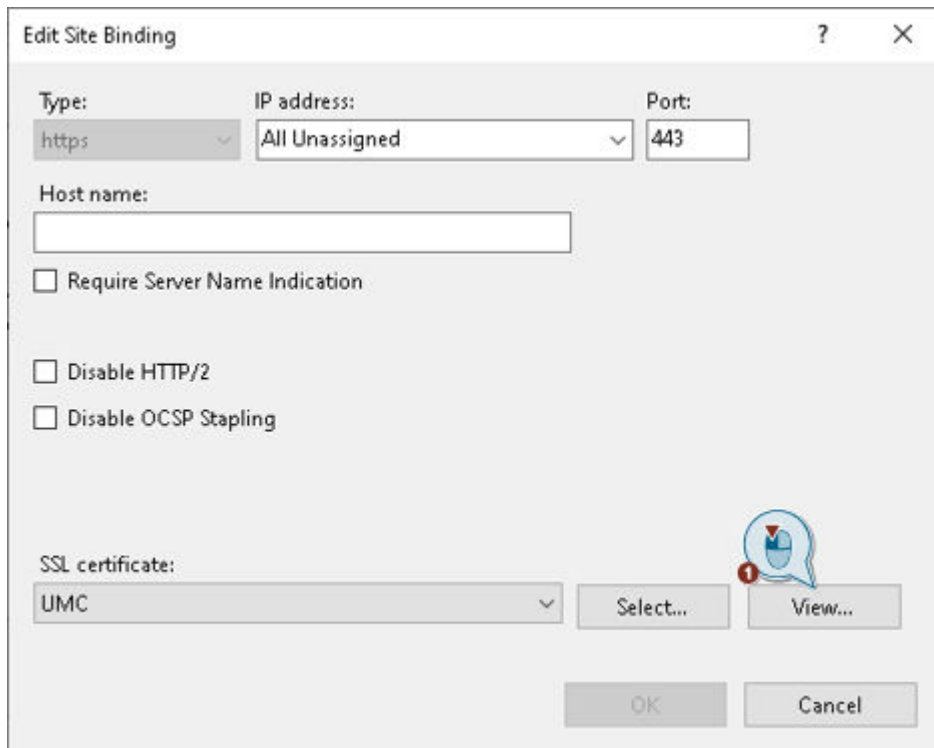

### Note

If WinCC Unified is already installed on the same computer (single-user station system), select the "WinCC Unified SCADA" web page as the web page.

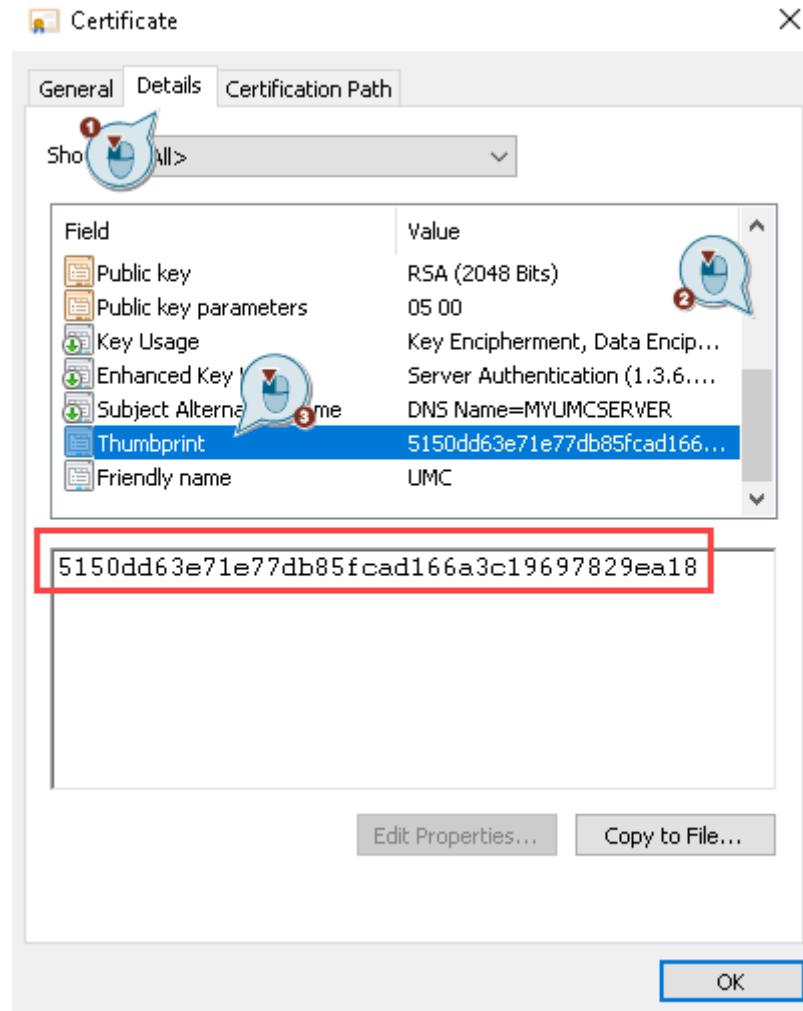

- 3. Edit the bindings of the 'HTTPS' type.

- 4. Open the stored SSL certificate.

- Open the details of the SSL certificate. Scroll to the "Fingerprint" attribute.

- Transfer the fingerprint of the certificate into the runtime settings of the WinCC Unified Station.

### Take over server ID via a browser

You can also take over the server ID via a browser and without administrator rights.

You can find the procedure under the following link to "Fingerprints (<https://www.grc.com/fingerprints.htm>)" in the section "How to display this page's (or any page's) SSL certificate fingerprint".

## 13.3.4 Users and user groups (RT Unified)

### 13.3.4.1 Managing local users (RT Unified)

You have specified in the Engineering System that you are using local user management. To manage the local users in your project, you have the option of:

- Adding users
- Specifying data of a user
- Copying, pasting, deleting users

#### Requirement

- A project is open.
- The "Security Settings > Users and Roles" editor is open.
- The "Users" tab is open.

#### Restrictions

Please note the following restrictions:

- You can add a maximum of 256 users.
- The user name may not exceed 255 characters.
- The password must be a minimum of 8 and a maximum of 120 characters long and must comply with the defined password guidelines.
- The comment may not exceed 1000 characters.

---

#### Note

##### Permissible characters for user names and passwords

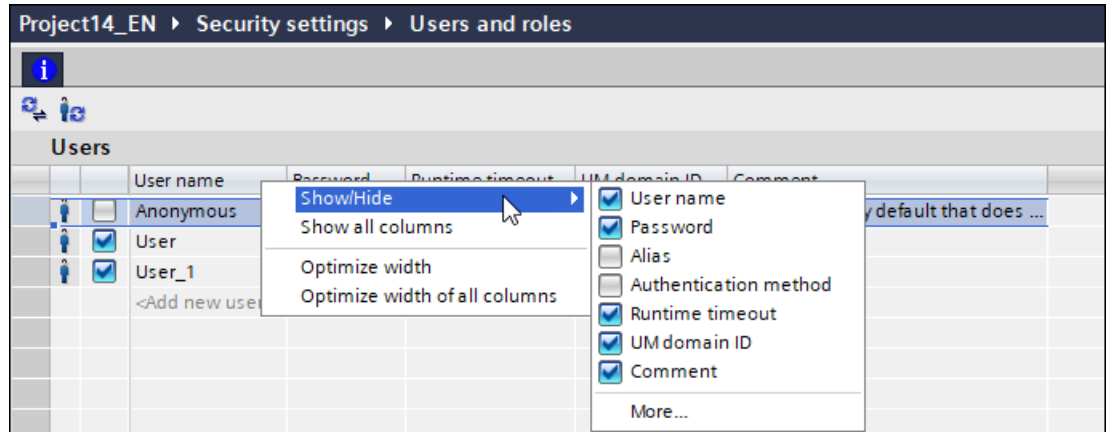

You can use the following numbers, letters and special characters for user names and passwords:

- 0123456789
  - A...Z a...z
  - !#\$%&()\*+,-./:;<=>?@[ ]^\_`{|~|
  - Spaces within the user name or password
-

## Displaying columns for user data

To display the columns for user data, follow these steps:

1. Right-click in the row with the user data.

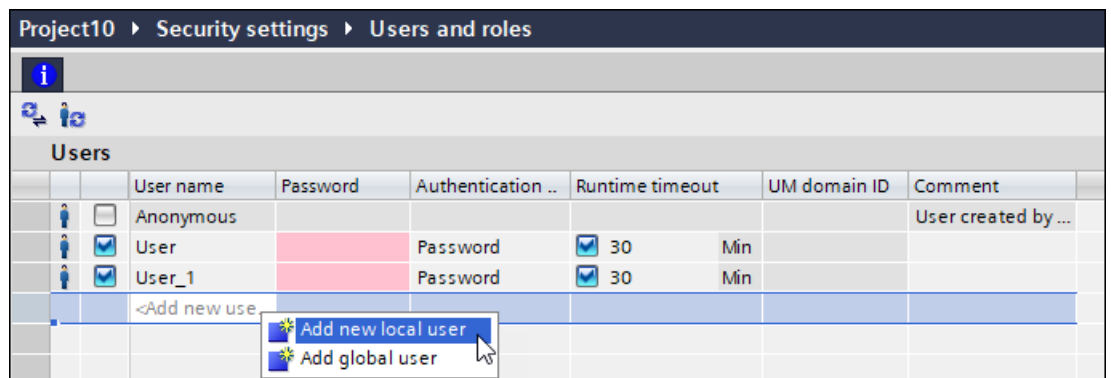

2. Select from the following columns:

- User name
- Password
- Alias
- Authentication procedure
- Runtime timeout
- UM Domain ID
- Comment

## Creating users

To create a user, follow these steps:

1. Click "Add new user".
2. Click "Add new local user" in the submenu.

3. Enter a user name according to the password policies.

4. Select the authentication procedure for the user:
  - Password: Enter a password according to the password policies. Enter the password again to confirm.
  - Radius: The logon is made via a RADIUS server on which the password is saved. This option is only used for devices that support logon using a RADIUS server.
5. Configure "Runtime timeout" for the user. The configured time defines the time of inactivity in Runtime, after which the user is automatically logged off. To change the specification for "Runtime timeout", select the option in the "Runtime timeout" column. The option is activated by default.
6. You can enter a comment for the project user.

A new project user has been created. Assign the roles to the user.

**Tips for working efficiently**

- You can also create a new user by copying an existing user. As a result, the assigned roles are also assigned to the copied user. You must re-assign the password for the copied user.

**"Anonymous" user**

As of V18, a default "Anonymous" user is available. When enabled, the "Anonymous" user does not require a password.

You cannot use the "Anonymous" user to log in to Runtime.

**Changing local user data**

Proceed as follows to change the data of a local user:

1. Open the "Users" tab.
2. Click in the text box with the data you want to change.
3. Change the user name, password, authentication procedure, "Runtime timeout" or comment.

The user data has been changed.

**Deleting users**

To delete a project user, proceed as follows:

1. Select the user in the "Users" tab that is open.
2. In the shortcut menu, select the "Delete" command or press the <Del> key.

The user has been deleted.

**See also**

Configuring automatic logoff (Page 7138)

### 13.3.4.2 Configuring the display of the login dialog (RT Unified)

You can configure the display of the login dialog in the Engineering System. A pop-up window with the "User Login" dialog is displayed in Runtime via the "ShowLoginDialog" system function. A new user can log in to Runtime.

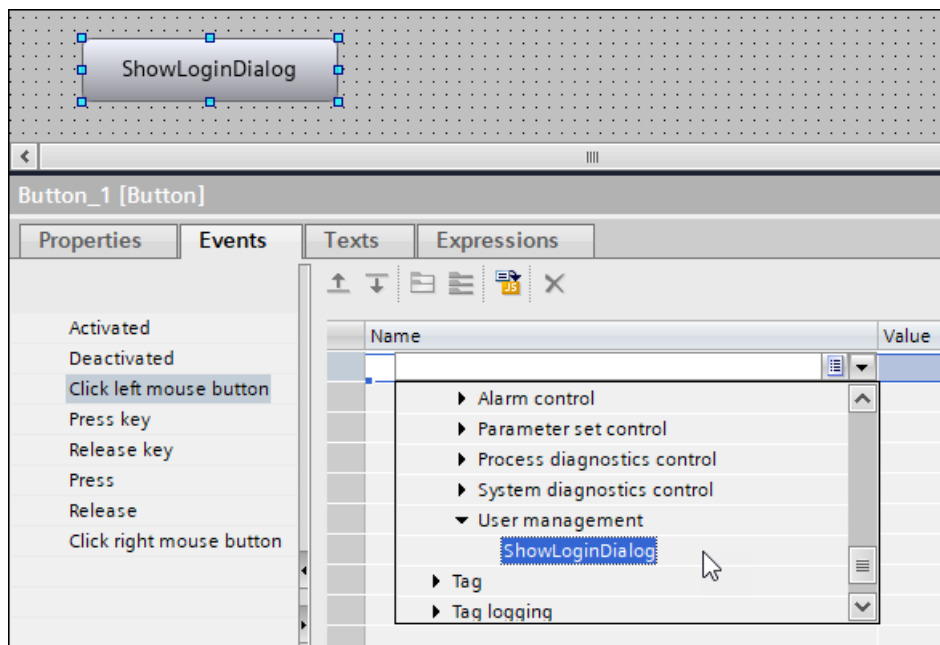

#### Requirement

- A project is open.
- A device has been created.
- A screen is open.

#### Configuring "ShowLoginDialog" system function

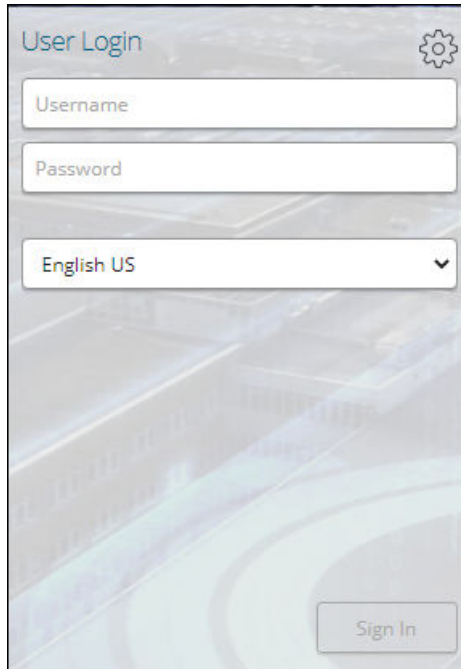

To configure the "ShowLoginDialog" system function, follow these steps:

1. Configure a button in the screen.
2. Enter the "ShowLoginDialog" name in the "Static value" column under "Properties > General > Content > Text".
3. Under "Events > Click left mouse button" in the "Name" column under "Screen > Account management", select the system function "ShowLoginDialog".

## Result

When you click the button in Runtime, the "User Login" dialog is displayed. A new user can log in to Runtime.

### 13.3.4.3 Configuring automatic logoff (RT Unified)

#### Configuring automatic logoff (RT Unified)

You can configure a "Runtime timeout", i.e. automatic logoff, on the Unified PC in the Engineering System. You are automatically logged off if you remain inactive in Runtime for the configured time period.

In the Engineering System you can configure the "Runtime timeout" for:

- Users
- Roles

If the values differ for a user and their roles, the lowest value is transferred when loading the project.

After automatic logoff you are by default shown the "User login" dialog. This page requires a network connection to the Unified server.

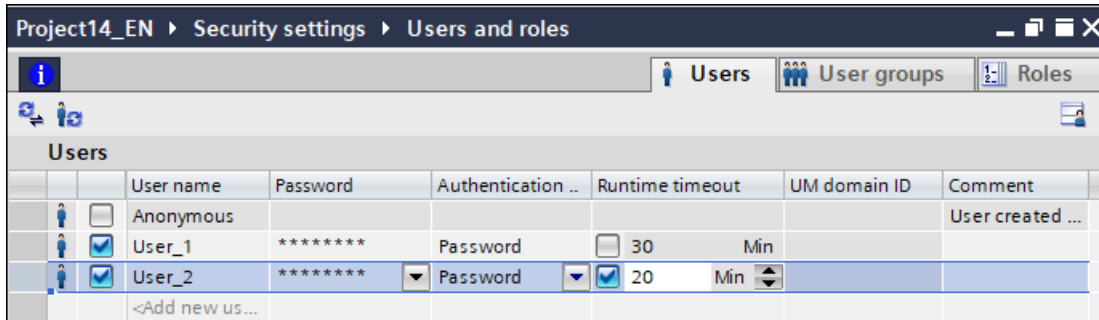

### Configuring automatic logoff for a local user

To configure the "Runtime timeout", i.e. automatic logoff, for a local user, proceed as follows:

1. Open the editor "Security settings > Users and roles".
2. Open the "Users" tab.
3. Select the check box in the "Runtime timeout" column of the selected user.

4. Enter the inactivity time in the text box. The user is automatically logged off after the specified time.

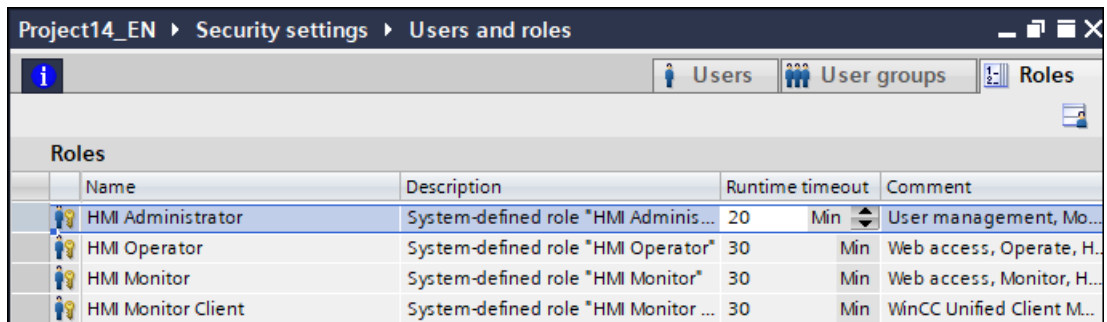

5. Download the project to the device.

### Configuring automatic logoff for a role

To configure the automatic logoff, "Runtime timeout", for a role proceed as follows:

1. Open the editor "Security settings > Users and roles".
2. Open the "Roles" tab.
3. Click in the text box in the "Runtime timeout" column of the selected role.
4. Enter the inactivity time in the text box. The role is automatically logged off after the specified time.

5. Download the project to the device.

### See also

- Managing local users (Page 7134)
- Configuring security settings (Page 7832)

### Configuring website after automatic logoff (RT Unified)

You can specify in the Engineering System which website is shown to you in your browser after the automatic logoff in runtime. By default, the "User login" dialog is displayed. This page requires a network connection to the Unified server.

In the runtime settings in the Engineering System you can configure a URL address of the website shown to you in your browser after the automatic logoff in runtime.

**Requirement**

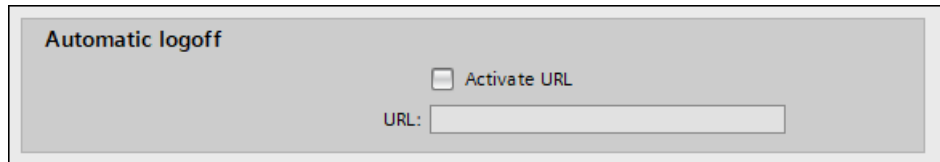

- A WinCC Unified PC as of Version V19 is installed.

**Configuring the display of the website after an automatic logoff**

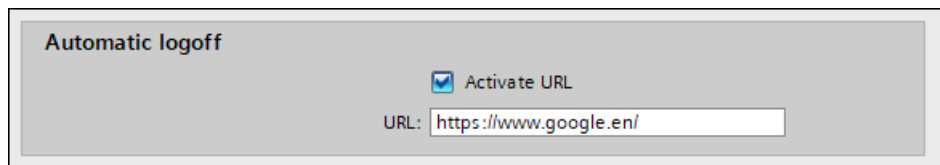

To configure the display of the website after an automatic logoff, proceed as follows:

1. Under "Runtime settings > General > Automatic logoff", select the option "Activate URL for automatic logoff".

The option is disabled by default and the text box is empty.

2. Enter a URL address into the text box. Note the following information:
  - The maximum length of the URL address is 2048 characters.
  - If you exceed the maximum length of the URL address, an error message is displayed.
  - The address is shortened if you enter a URL address that contains more than 2048 characters via copy and paste.

After automatic logoff in runtime the corresponding website is displayed.

**Note**

If you deselect the option again, the URL address is still shown in the text box and the text box is grayed out. After automatic logoff in runtime, the "User login" dialog is displayed.

**13.3.4.4 Downloading local user management (RT Unified)**

You have added at least one user. Compile and download the local user management.

**Compiling and downloading local user management**

Note that you need to set the setting in the "Preview load" differently for the first load than for each subsequent load.

- For the first download of a TIA Portal project to a runtime device, select the option "Reset to start values" for "Runtime values" when loading the user data.
- For all subsequent loading processes, select the option "Keep current values" or "Keep selected" for "Runtime values".

On the runtime device, the user configuration is not project-specific, but device-specific. The defined user management is used in all projects in a device.

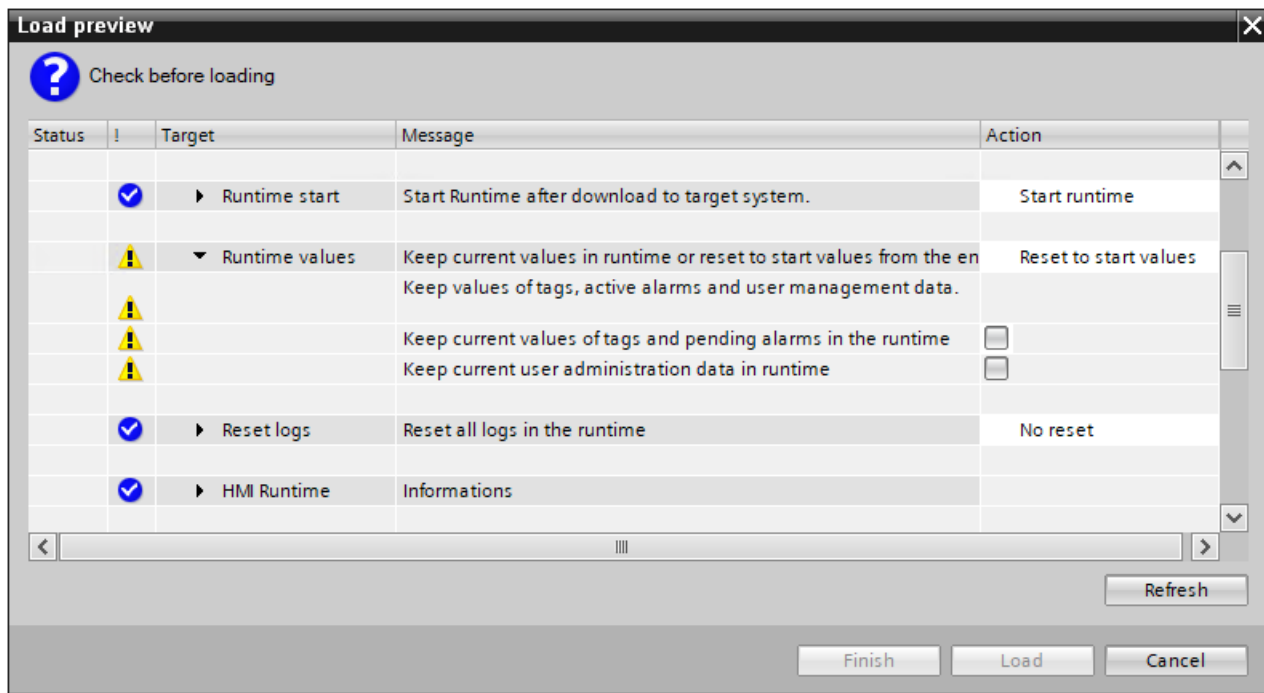

All system-defined roles are included in each runtime project.

### Compiling and downloading local user management initially

To load the local user management for the first time, follow these steps:

1. Select the device in the project tree.
2. Select "Download to device > Software (all)" from the shortcut menu.  
The compilation of the project is checked and content that has not been compiled is compiled. The compilation result is displayed in the Inspector window under "Info > Compile".
3. The "Load Preview" dialog is displayed.
4. Check the displayed defaults and change the settings if necessary:
  - Specify whether runtime should start on the target system after the download.
  - Select "Reset to start values".
  - Specify whether all logs are reset in runtime.

The setting is only accepted when you have selected "Start runtime".

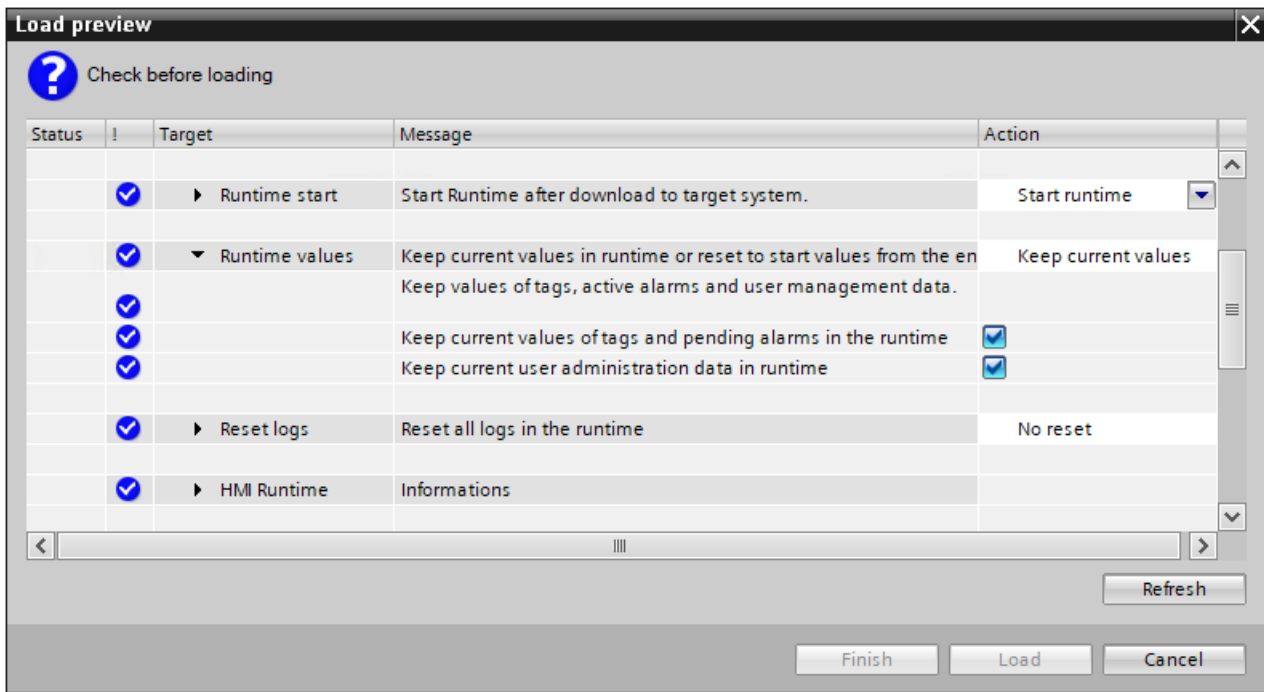

5. Click "Download".

Runtime starts after loading the settings.

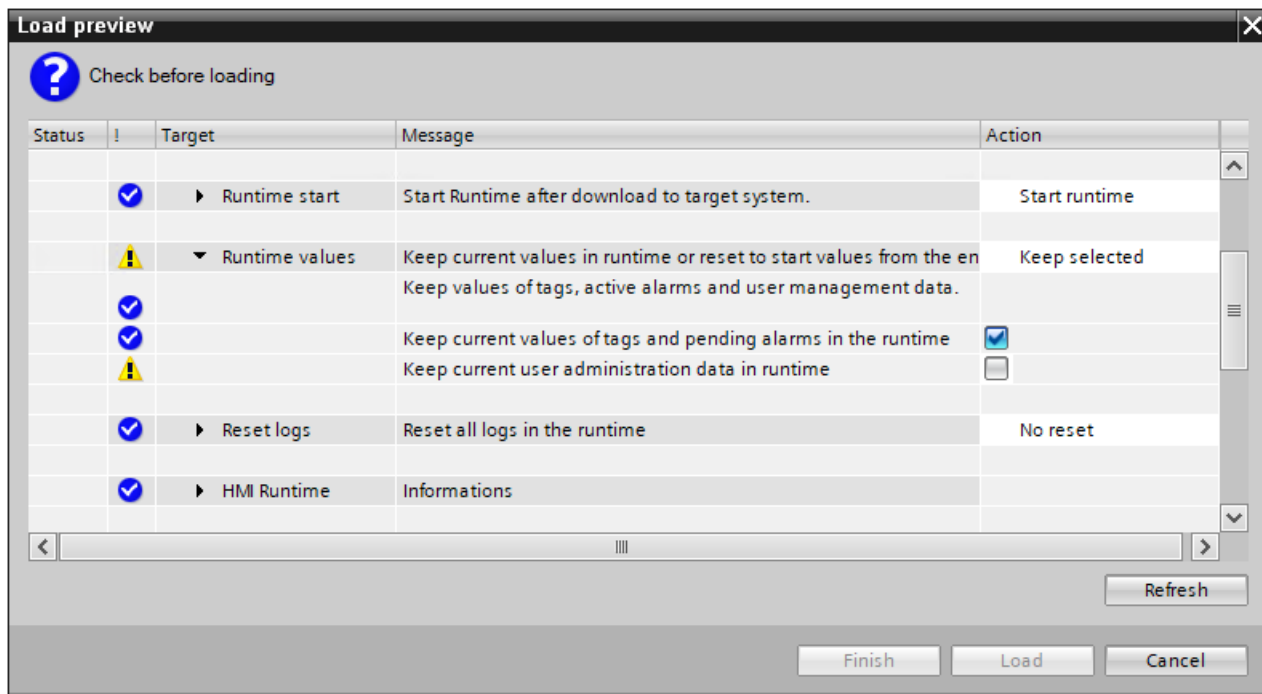

### Keep current values when reloading

If you want to keep the current values during the next download, select "Keep current values" during download.

- "Keep current values"

- "Keep selected"
  - With the "Keep selected" option, you specify which values you want to keep in Runtime:
    - Current values of tags and pending alarms
    - Current user management data

### Note

To prevent the users created in the user administration from being overwritten in runtime by the complete download of the project, activate the "Keep current user administration data in runtime" option.

### Retained data

If you have enabled the "Keep current user management data in Runtime" option, the following user management data will be kept:

- User name
- Password
- Password guidelines
- Comment
- Language
- Function rights
- User role
- User group
- User management mode - local or central
- Data of the central user management: Server address, server ID, identity provider address

## See also

Complete reloading of a project (Page 7454)

### 13.3.4.5 Managing central users and user groups (RT Unified)

You have specified in the Engineering System that you are using central user management.

You can add central users and user groups that were created in the central user management to a project. Central users and user groups are managed in the central user management. The changes affect the project to which these users or user groups belong.

You can synchronize the user management in the engineering system with the central user management or check the synchronization status.

### Main advantage of the central user management

The main advantage of the central user management is the management of the user groups.

- In the user groups, you manage the central users independent of the engineering system. You add the central users to the user groups.
- The function rights of a user are known via the role assignment in the user group in the Unified Runtime.
- Changes to the user data are effective in Runtime even without loading the project.
- When you import the user group into the TIA Portal, the users and their data including passwords is automatically imported into the project.

### Requirement

- A project is open.
- The connection to the central user management is configured.
- You have a user account with the corresponding rights in the central user management.
- The "Security Settings > Users and Roles" editor is open.
- The "User groups" tab is open.

### Restrictions

Please note the following restrictions:

- You can add a maximum of 256 central users.
- You can add a maximum of 50 central user groups.
- You cannot copy central users and user groups.

## Information about user groups and users

You can display the following information for central users and user groups:

- User groups: The users they contain and whether they have already been imported into the user management.
- User: The user groups of which the user is a member and whether they have already been imported into the user management.

## Adding user group

To add a user group from the central user management to a TIA Portal project, follow these steps:

1. Open the "User groups" tab.
2. Click "Add new user group".  
If you have not yet logged in to the central user management yet, the "UMC Login" dialog opens:
  - Enter your UMC user name and the corresponding password.
  - Click "OK".
3. If you are logged in to the central user management, the "Add new user group from UMC" dialog opens. All available user groups from the central user management are displayed. Already added user groups are activated and write-protected.
4. Activate the user groups that you want to add to the TIA Portal project. Click "OK".
5. The selected user groups are added as central user groups. Their data is write-protected, and you cannot change the data within the TIA Portal project.

## Deleting a user group

To delete a user group from the TIA Portal project, follow these steps:

1. Open the "User groups" tab.
2. Select one or more user groups.
3. In the shortcut menu, select the "Delete" command or press the <Del> key.

## Adding central users

You can also import the individual central users into a TIA Portal project.

To add a central user from the central user management, follow these steps:

1. Open the "Users" tab.
2. Click "Add new user".

## 13.3 Configuring user management in the engineering system for Runtime (RT Unified)

3. Click "Add global users" in the submenu.  
If you have not yet logged in to the central user management yet, the "UMC Login" dialog opens:
  - Enter your UMC user name and the corresponding password.
  - Click "OK".
 If you are logged in to the central user management, the "Add new user from UMC" dialog opens. All available users from the central user management are displayed. Already activated users are activated and write-protected.
4. Activate the user that you want to add to the TIA Portal project. Click "OK".
5. The selected users are added as central users. Their data is write-protected, and you cannot change the data within the TIA Portal project.

	<b>Tips for effective procedure</b>
<ul style="list-style-type: none"> <li>• To find the required users, filter the table by the columns "Name" and "Long name". Enter the name in the first line. All users with this name are displayed. To cancel filtering, click on the "Filter" button or select "*" in the drop-down list.</li> </ul>	

### Deleting a central user

To delete a central user from the TIA Portal project, follow these steps:

1. Open the "Users" tab.
2. Select one or more central users.
3. In the shortcut menu, select the "Delete" command or press the <Del> key.

### See also

Server ID (Page 7129)

#### 13.3.4.6 Loading central user management (RT Unified)

You have added at least one user group. Compile and load the central user management.

### Compiling and loading central user management

Note that you need to set the setting in the "Preview load" differently for the first load than for each subsequent load.

- For the first download of a TIA Portal project to a runtime device, select the option "Reset to start values" for "Runtime values" when loading the user data.
- For all subsequent loading processes, select the option "Keep current values" or "Keep selected" for "Runtime values".

On the runtime device, the user configuration is not project-specific, but device-specific. The defined user management is used in all projects in a device.

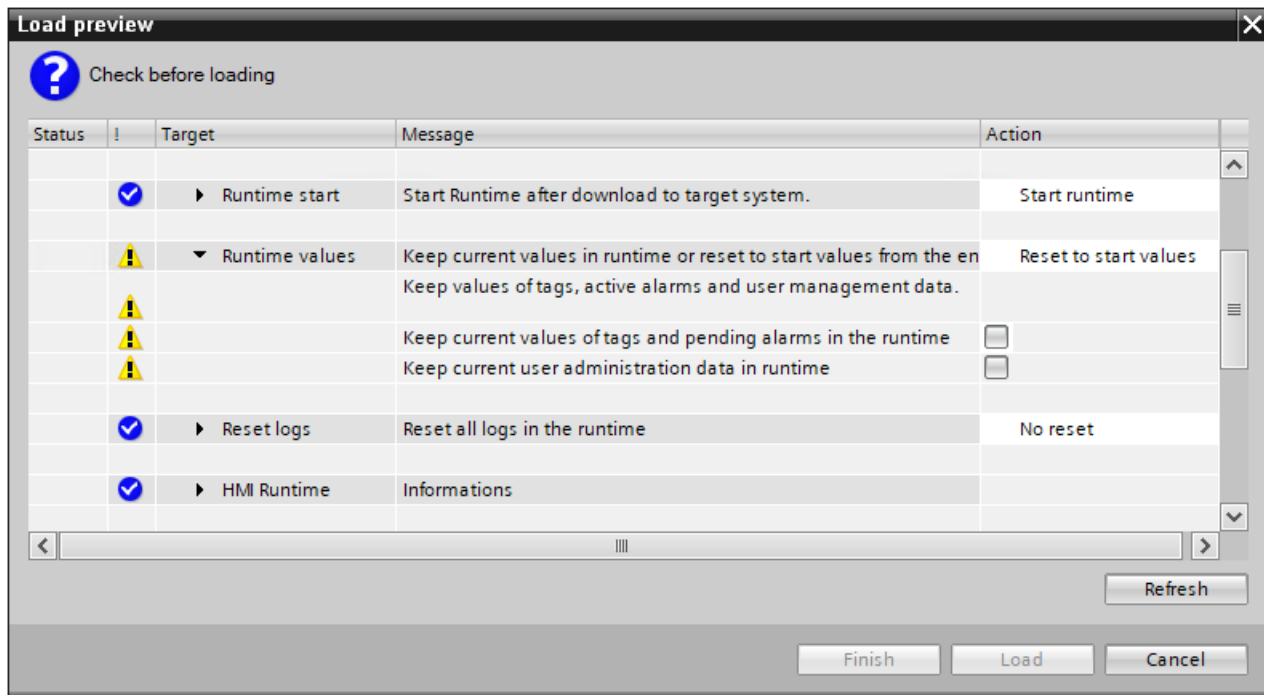

All system-defined roles are included in each runtime project.

### Compiling and downloading central user management initially

To load the central user management for the first time, follow these steps:

1. Select the device in the project tree.
2. Select "Download to device > Software (all)" from the shortcut menu.  
The compilation of the project is checked and content that has not been compiled is compiled. The compilation result is displayed in the Inspector window under "Info > Compile".
3. The "Load Preview" dialog is displayed.
4. Check the displayed defaults and change the settings if necessary:
  - Specify whether runtime should start on the target system after the download.
  - Select "Reset to start values".
  - Specify whether all logs are reset in runtime.

The setting is only accepted when you have selected "Start runtime".

5. Click "Download".

The connection to the central user management is established after loading the settings. Depending on the selected options, runtime is started during loading.

#### Note

Enter the settings loaded for the central user management:

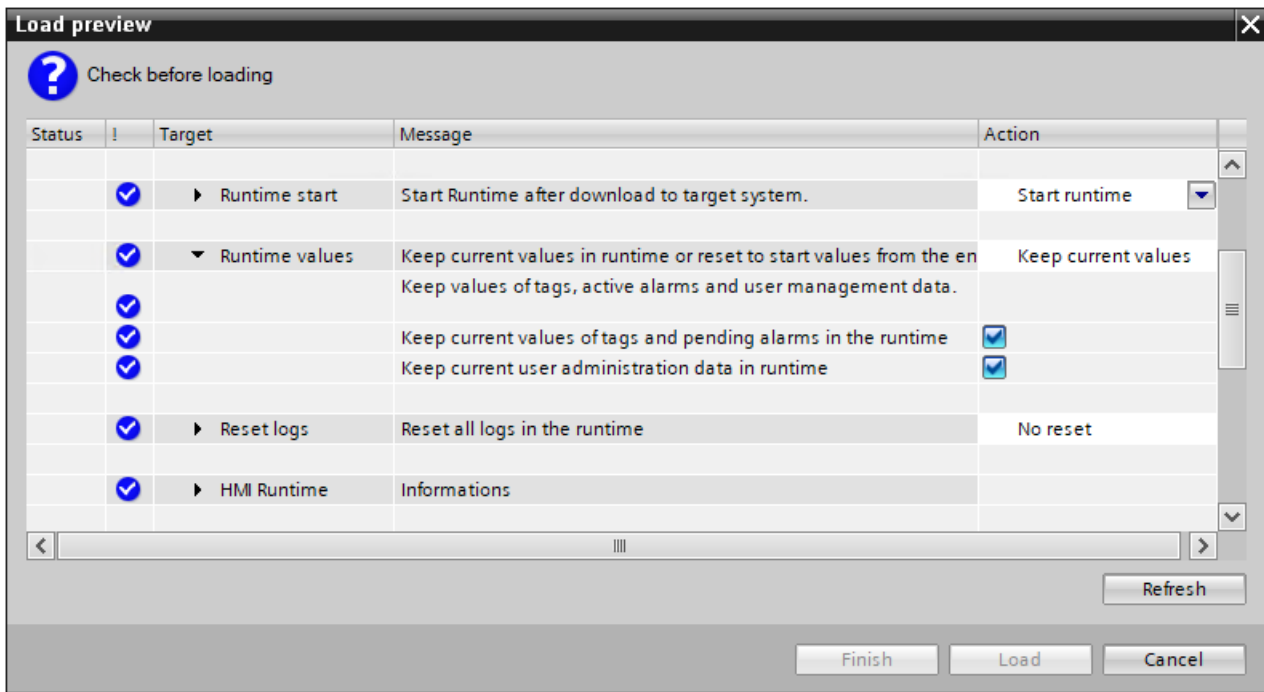

- On the PC in the SIMATIC Runtime Manager
- On the Panel in the Control Panel.

Depending on the setting, data is overwritten during loading.

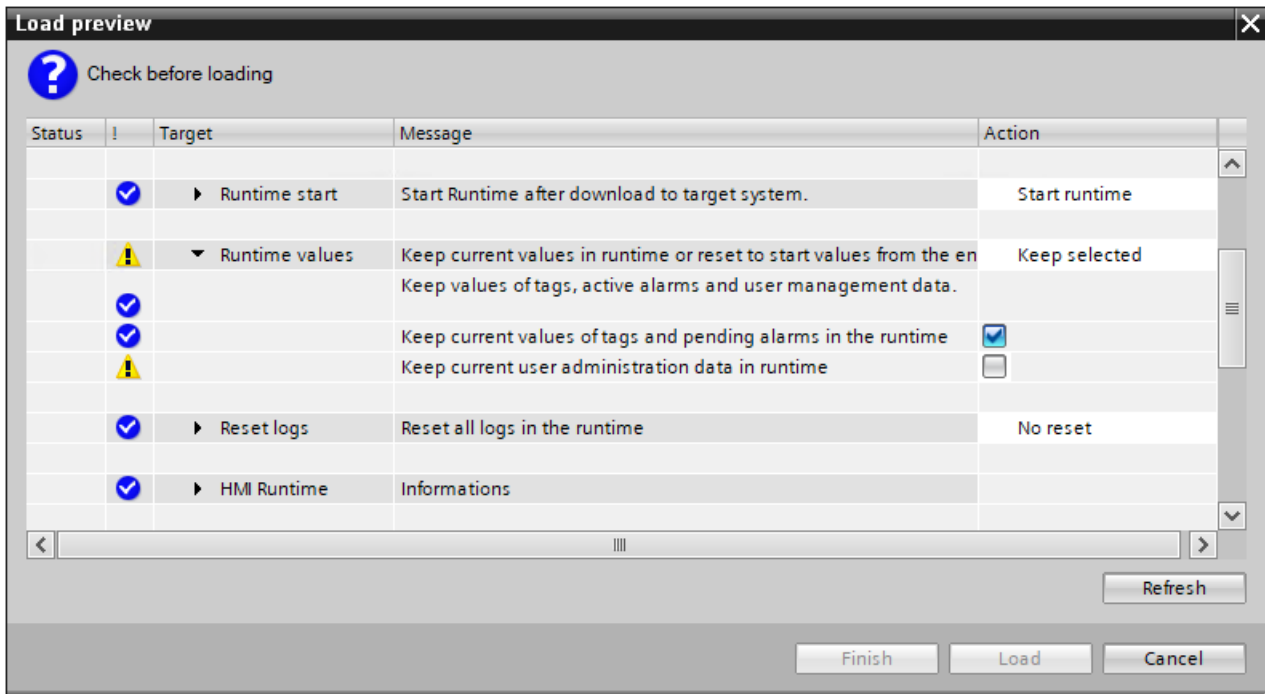

## Keep current values when reloading

If you want to keep the current values during the next download, select "Keep current values" during download.

- "Keep current values"

- "Keep selected"
  - With the "Keep selected" option, you can specify which values you want to keep in Runtime:
    - Current values of tags and pending alarms
    - Current user management data

**Note**

To prevent the users created in the user administration from being overwritten in runtime by the complete download of the project, activate the "Keep current user administration data in runtime" option.

**Retained data**

If you have enabled the "Keep current user management data in Runtime" option, the following user management data will be kept:

- User name
- Password
- Password guidelines
- Comment
- Language
- Function rights
- User role
- User group
- User management mode - local or central
- Data of the central user management: Server address, server ID, identity provider address

## Behavior of the runtime after the download

If all your entries are correct, runtime uses the downloaded settings.

If the entries are incomplete or incorrect, runtime exhibits the following behavior:

- If the data of the central user management has already been downloaded successfully once before, runtime uses the user data that was downloaded last.  
Enter missing settings for central user management:
  - On the PC in the SIMATIC Runtime Manager
  - On the Panel in the Control Panel.
- If the data of the central user management has never been downloaded, runtime does not start.  
Enter missing settings for central user management:
  - On the PC in the SIMATIC Runtime Manager
  - On the Panel in the Control Panel.

## 13.3.5 HMI roles (RT Unified)

### 13.3.5.1 Managing HMI roles (RT Unified)

You assign users the roles with the function rights. You can manage the user-defined HMI roles in your project.

## System-defined roles relevant for HMI

System-defined HMI roles without engineering function rights are created in an unprotected project:

- HMI Administrator
- HMI Operator
- HMI Monitor
- HMI Monitor Client

You cannot rename or delete system-defined HMI roles. Also, you cannot change the assignment of the function rights to system-defined roles.

## User-defined roles relevant for HMI

You can perform the following actions to manage the user-defined HMI roles in your project:

- Add a new user-defined role.
- Change the data of the user-defined role:
  - Name
  - Runtime timeout
  - Comment
- Assign the function rights to the role.
- Change or delete the assignment of the function rights.
- Delete a role.

---

### Note

- When setting the runtime timeout, observe the information in the individual manuals.
  - In the Engineering System, you can configure a runtime timeout both for a role and for a user. If the values are different, only the smaller of the two values is transferred to the Panel during loading.
- 

## Requirement

- A project is open.
- A device has been created.
- The "Security Settings > Users and Roles" editor is open.
- The "Roles" tab is open.

## Adding a user-defined HMI role

To add a user-defined HMI role, follow these steps:

1. Double-click "Add new role".
2. Enter a name, runtime timeout and a comment, if required.

A user-defined HMI role has been created. Assign the function rights to the role.

### Tips for effective procedure

- You can also create a user-defined HMI role by copying an existing HMI role. As a result, the assigned function rights are also assigned to the copied HMI role.

### Change the data of a user-defined role

To change the data of a user-defined role, follow these steps:

1. Click in the field whose data you want to change.
2. Change the role name, runtime timeout or comment.

### Delete user-defined role

To delete a user-defined role, follow these steps:

1. Select the user-defined role.
2. In the shortcut menu, select the "Delete" command or press the <Del> key.

#### 13.3.5.2 Assigning HMI roles (RT Unified)

You can assign HMI roles with different function rights to local users and global user groups.

#### Requirement

- A project is open.
- A device has been created.
- Users and user groups have been created.
- The "Security Settings > Users and Roles" editor is open.

#### Assigning HMI roles to local users

To assign roles to a user, follow these steps:

1. Open the "Users" tab.
2. Select the user.
3. Activate the desired HMI roles in the "Assigned roles" tab.

#### Assigning HMI roles to global user groups

To assign roles to a global user group, follow these steps:

1. Open the "User groups" tab.
2. Select the user group.
3. Activate the desired HMI roles in the "Assigned roles" tab.

### Revoking role assignments for local users

To revoke a role for a user, follow these steps:

1. Open the "Users" tab.
2. Select the user.
3. In the "Assigned roles" tab, disable the roles that you no longer want to assign to the user.

### Revoking role assignments for global user groups

To revoke a role assignment for a global user group, follow these steps:

1. Open the "User groups" tab.
2. Select the user group. Note that you cannot use multiple selection.
3. In the "Assigned roles" tab, clear the roles that you no longer want to assign to the user group.

#### 13.3.5.3 HMI role "HMI Monitor Client" (RT Unified)

The system-defined role "HMI Monitor Client" contains the function right "WinCC Unified Client Monitor - Limited Access". No other function rights can be assigned to this role.

The "HMI Monitor Client" role allows you to monitor and analyze the production process without influencing the processes in the PLC unintentionally or without authorization.

The following description applies to Unified PC and Unified Panel.

---

#### Note

To operate the "HMI Monitor Client", you need one or more "HMI Monitor Client" licenses depending on the number of accesses.

---

### "HMI Monitor Client" role

A user who is assigned the "HMI Monitor Client" role or the "Enable HMI Monitor Client" function right contained in the role cannot make any changes or write operations in the processes, regardless of other assigned roles and function rights.

### Restrictions of the "HMI Monitor Client" role

A user with the function right "WinCC Unified Client Monitor - Limited access" may monitor the processes but only operate them to a limited extent.

The following table shows which operations the user cannot carry out:

Tags	Transfer value changes from external tags (PowerTags) to the PLC
Data logging	Clear logs
	Write log values manually
	Comment log values
	Write correction values

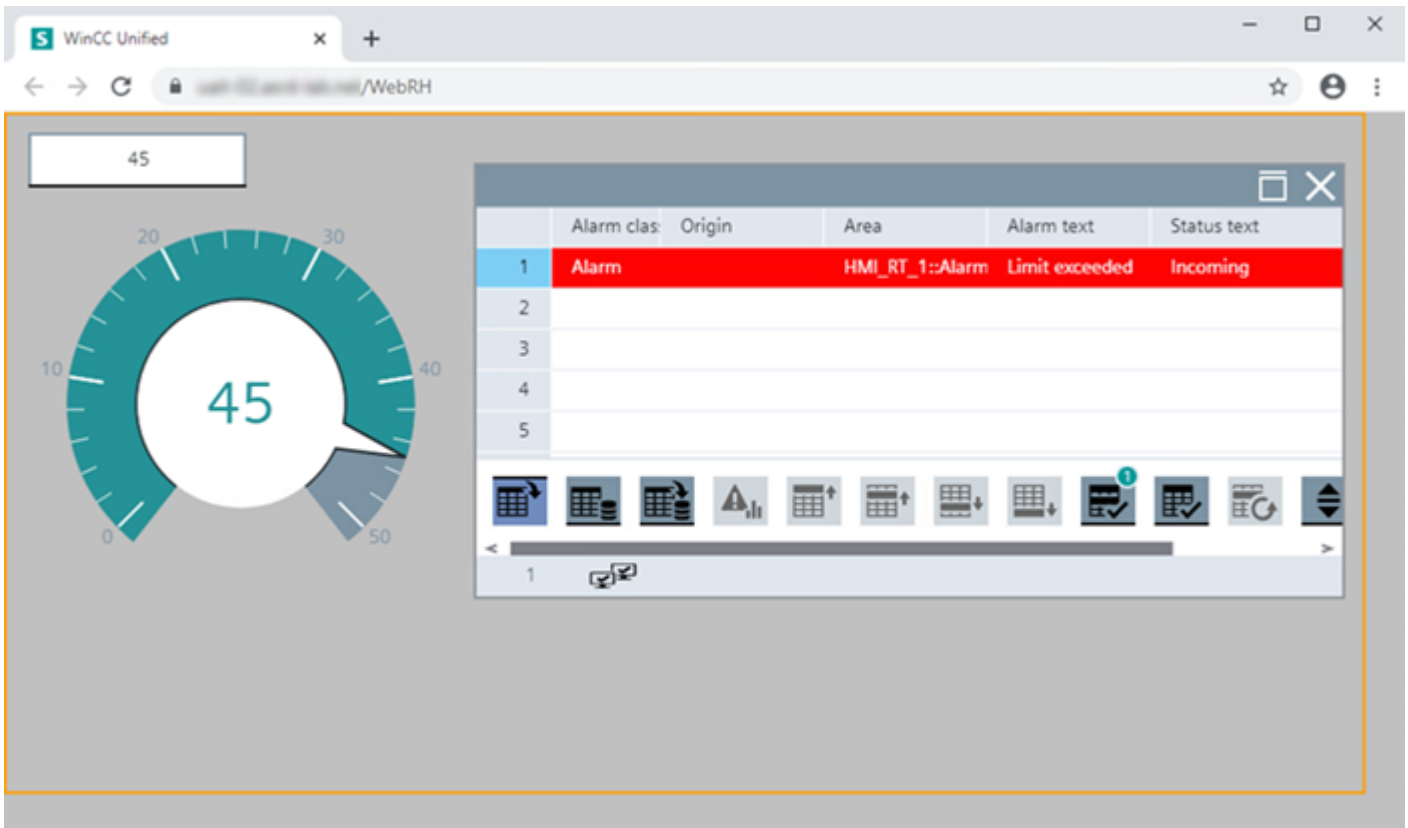

13.3 Configuring user management in the engineering system for Runtime (RT Unified)

Alarms	Acknowledge active alarms
	Reset active alarms
	Disable alarms
	Enable alarms
Alarm logging	Delete alarm log
	Comment logged alarms
Parameter set control	Process values cannot be written to the PLC with the "Write to PLC" button of the parameter set control.
	Process values cannot be written to the PLC with the system function "LoadAndWriteParameterSet".
	Process values cannot be written to the PLC with the snippet "Load Parameter Set from storage and write to PLC".
	Parameters sets cannot be loaded from the parameter set memory using control tags. Process values cannot be written to the PLC using control tags.

**Visualization in Runtime**

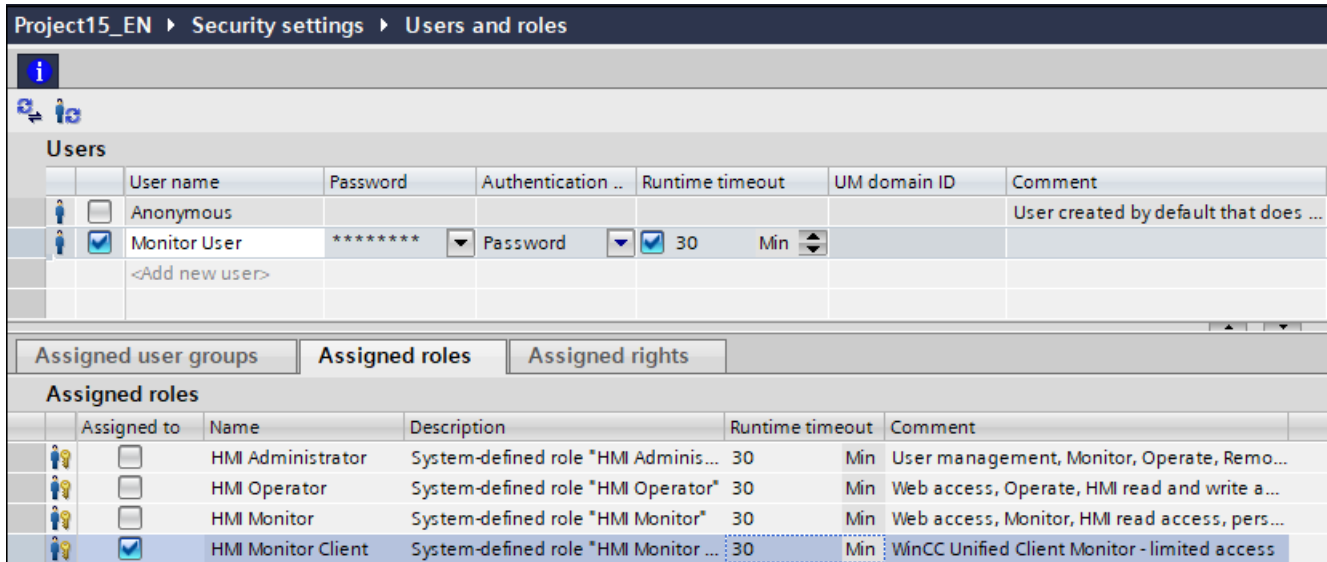

In Runtime, the Monitor Client mode is visualized by an orange frame around the root screen.

### Activating Monitor Client mode

To activate the Monitor Client mode, follow these steps:

1. Create a user or select an existing user.
2. Assign one of the following roles to the user:
  - The system-defined role "HMI Monitor Client".
  - A user-defined role that contains the function right "WinCC Unified Client Monitor - Limited access".

3. The user logs on to Runtime.
4. The Monitor Client mode is activated.

The user is allowed to monitor the process but not to change any values that are relevant for the process. These values are listed at the top of the table.

#### See also

- System-defined function rights (Page 7156)
- Managing HMI roles (Page 7151)

### 13.3.6 Function rights (RT Unified)

#### 13.3.6.1 System-defined function rights (RT Unified)

You can assign the different system-defined function rights to the HMI roles. These function rights specify which functions a user may use in Runtime. You cannot rename or delete the system-defined function rights.

## 13.3 Configuring user management in the engineering system for Runtime (RT Unified)

**Function rights on the screen objects**

The following table shows an overview of the function rights that are set on the screen objects. These function rights have no pre-defined meaning.

The meaning of the function rights comes from the objects that are protected and trigger an action.

Function right	Example application	HMI roles
Operate	The user may operate access-protected objects in runtime.	HMI Administrator HMI Operator
Monitor	The user may only monitor but not operate the objects.	HMI Administrator HMI Operator HMI Monitor
Remote access	The user may use Unified Collaboration to access an HMI device.	HMI Administrator
Remote access - Monitor only	The user may use Unified Collaboration to access an HMI device. The user may only monitor but not operate the objects.	HMI Administrator HMI Operator HMI Monitor

**Specific function rights**

The following table shows an overview of the specific function rights in the TIA Portal. These function rights are automatically checked and activate the associated functionality.

These rights are not set on the screen objects.

Function right	Description	HMI roles
Importing and exporting users	The user may import and export user management data in runtime. This function right is not supported on Unified Panels.	User-defined role
User management	The user has permission to manage the existing users and add and manage the new users in Runtime.	HMI Administrator
Enable HMI Monitor Client	The user may observe the process on an HMI device to a limited extent without unintentionally or unauthorizedly influencing the processes in the PLC.	HMI Monitor Client
OPC UA read and write access	The user may access the data of a different device with read and write permission via OPC UA.	HMI Administrator
Openness Runtime read and write access	The user may access the data of a Unified runtime with read and write permission via Openness.	HMI Administrator
Reset UMC password	The user may reset the UMC password.	User-defined role
Control Panel access	The user may change the settings in the Control Panel of a Unified Panel.	HMI Administrator

Additional function rights may be available that are associated with additional products and options that are installed.

## See also

Protecting the Control Panel from being accessed (Page 7168)

HMI role "HMI Monitor Client" (Page 7154)

### 13.3.6.2 User-defined function rights (RT Unified)

You can assign different runtime rights to the HMI roles. These function rights specify which functions a user may use in WinCC Unified Runtime in Runtime.

You can implement your protection concepts with the user-defined runtime rights.

## Restrictions

Please note the following restrictions:

- You can add a maximum of 999 user-defined Runtime rights.
- The name of the user-defined runtime right and the name of the group of runtime rights can be up to 128 characters long.
- The comment may not exceed 1000 characters.

---

### Note

You can use the following numbers, letters, and special characters for the names and groups of the user-defined runtime rights:

- 0123456789
  - A...Z a...z
  - !#\$%&()\*+,-./:;<=>?@\[\]^\_`{|}~|
  - Spaces within the user name or password
- 

## Requirement

- A project is open.
- A device has been created.
- The "Security Settings > Users and Roles" editor is open.
- The "Roles" tab is open.

### Adding a user-defined Runtime right

To add a user-defined runtime right, follow these steps:

1. Click on the "User defined runtime rights" tab.
2. In the "Function rights" area, double-click "Add new right" in the "Name" column.
3. Enter a name, a group and a comment, if required.

---

**Note**

The "Group" column is used to group the user-defined runtime rights in the engineering system. The assignment of the runtime rights to a group has no effect on the runtime.

---

A user-defined runtime right has been created. Assign the runtime right to a role.

**Tips for effective procedure**

- You can also create a user-defined runtime right by copying an existing runtime right.

### Changing the data of a user-defined runtime right

To change the data of a user-defined runtime right, follow these steps:

1. Click in the field whose data you want to change.
2. Change the name, the group or the comment.

### Deleting a user-defined runtime right

To delete a user-defined runtime right, follow these steps:

1. Select the user-defined runtime right.
2. In the shortcut menu, select the "Delete" command or press the <Del> key.

#### 13.3.6.3 Assigning function rights to an HMI role (RT Unified)

You assign the function rights to the roles.

### Assign function rights to a user-defined role

To assign the function rights to a user-defined role, follow these steps:

1. Select the user-defined role.
2. In the "Runtime rights" tab, open the category from which you want to assign the function rights.
3. In the "Function rights" area, enable the function rights that you want to assign to the role.

### Changing or deleting the assignment of the function rights

To change or delete the assignment of the function rights to a user-defined role, follow these steps:

1. Select the user-defined role.
2. In the "Runtime rights" tab, open the category from which you want to assign the function rights or revoke the assignment:
  - In the "Function rights" area, enable the function rights that you want to assign to the role.
  - In the "Function rights" area, disable the function rights that you no longer want to assign to the role.

### Displaying assigned function rights of a local user

To display the assigned function rights of a local user, follow these steps:

1. Open the "Users" tab.
2. Select the user.
3. Open the "Assigned rights" tab in the lower area.
4. Expand the categories of function rights in the "Categories of function rights" column. The assigned function rights are displayed in the "List of rights" column. The roles by which the function rights are assigned to the user are displayed in the "Rights derived from role" column.

### Display assigned function rights of a global user group

To display the assigned function rights of a global user group, follow these steps:

1. Open the "User groups" tab.
2. Select the global user group.
3. The assigned function rights are displayed in the lower area of the "Assigned rights" tab.

## 13.3.7 Examples (RT Unified)

### 13.3.7.1 Example: Setup of the local user management (RT Unified)

#### Task

In the following example, you set up a user management for different users. The example orientates itself to a typical requirement profile from manufacturing engineering.

#### Principle

Users with various roles are involved in a project. Create the users and assign them to the roles.

You can reproduce different views through the roles.

Example:

- Organizational view: Commissioners, Operators, Shift I, Shift II.
- Technological view: Axis control, Tool changers, Plant North, Plant South.

The following example orientates itself to the organizational view.

Each user has function rights for specific applications.

In the example, you create Mr. Meier, Ms. Ramos, Ms. Greenwood, Messrs. Peters and Santini. You assign roles to each user.

## Requirements

- A new project has been created.
- The "Users and roles" editor in "Security settings" is open.

## Procedures overview

To assign the users one or more roles, follow these steps:

1. Create the users.
2. Create the roles and assign the users one or more roles. Note the following information:
  - The function rights have been defined for the system-defined roles.
  - You assign the required function rights to the user-defined roles.
3. Configure a button with access protection.

## Result

The goal is the following structure of the user management consisting of users, roles and function rights:

The user "Meier" has the "HMI administrator" role.

---

### Note

Not all function rights that have been specified for the system-defined "HMI Administrator" role are displayed in the table.

---

Users	Role	Function rights		
		User management	Operation	Remote access
Meier	HMI Administrator	x	x	x

13.3 Configuring user management in the engineering system for Runtime (RT Unified)

You assign the required roles to the other persons.

Users	Role	Function rights							
		Operation	Monitoring	Remote access	User-defined runtime right Screen change	User-defined runtime right Toggle language	User-defined runtime right Change parameter sets	User-defined runtime right Delete parameter sets	User-defined runtime right Stop Runtime
Ramos	HMI Operator	x	x	x					
Greenwood	Operator				x	x			
Peters	Line-Manager				x	x	x	x	
Santini	Service				x	x	x	x	x

13.3.7.2 Example: Add user and assign to a role (RT Unified)

Task

In the following example, you create the users and assign them to their roles. The users are sorted alphabetically immediately after the name has been entered.

Procedure

1. Open the "Users" work area.
2. Double-click "Add new user" in the "Users" table.
3. Enter "Meier" as the user name.
4. Click the  button in the "Password" column. The dialog box for entering the password is opened.
5. Enter "Meier123" as the password. The password must meet the defined password policies.
6. To confirm the password, enter it a second time in the lower field.
7. Close the dialog box by using the  icon.
8. Enable the "HMI Administrator" role in the "Assigned Roles" table.

## Interim result

The screenshot shows the 'Users and roles' configuration window. The 'Users' table contains the following data:

	User name	Password	Authentication ..	Maximum sessi...	Comment
<input type="checkbox"/>	Anonymous				Default user that doesn't need to authenticat.
<input checked="" type="checkbox"/>	Meier	*****	Password	30 Min	
<Add new user>					

The 'Assigned roles' table contains the following data:

Assigned to	Name	Description	Maximum sessi...	Comment
<input checked="" type="checkbox"/>	Engineering administrator	System-defined role "Engineering a. 30	Min	Engineering-Administrator-Rolle
<input type="checkbox"/>	Engineering standard	System-defined role "Engineering s. 30	Min	Engineering-Standard-Rolle

<input type="checkbox"/>	NET Administrator Radius	System-defined role "NET Administ... 30	Min	
<input type="checkbox"/>	NET Radius	System-defined role "NET Radius" 30	Min	

## Procedure

1. Double-click "Add new user" in the "Users" table.
2. Enter "Ramos" as the user name.
3. Click the  button in the "Password" column. The dialog box for entering the password is opened.
4. Enter "Ramos123" as the password.
5. To confirm the password, enter it a second time in the lower field.
6. Close the dialog box by using the  icon.
7. Enable the "HMI Operator" role in the "Assigned Roles" table.
8. Repeat steps 2 to 6 for the users "Greenwood", "Peters" and "Santini".
9. Enable the user-defined roles "Operator", "LineManager" and "Service" of the individual users in the "Assigned Roles" table.

## Result

The screenshot shows the 'Users and roles' configuration window in WinCC Engineering V19. The window is divided into two main sections: 'Users' and 'Assigned roles'.

**Users Section:**

	User name	Password	Authentication ..	Maximum sessi...	Comment
<input type="checkbox"/>	Anonymous				Default user that doesn't need to a.
<input checked="" type="checkbox"/>	Meier	*****	Password	30 Min	
<input checked="" type="checkbox"/>	Ramos	*****	Password	30 Min	
<input checked="" type="checkbox"/>	Greenwood	*****	Password	30 Min	
<input checked="" type="checkbox"/>	Peters	*****	Password	30 Min	
<input checked="" type="checkbox"/>	Santini	*****	Password	30 Min	
<Add new user>					

**Assigned roles Section:**

<input type="checkbox"/>		Service	User-defined role	30 Min	

### 13.3.7.3 Example: Add roles and assign function rights (RT Unified)

#### Task

In the following example, you create the roles and assign the function rights to the roles.

#### Procedure

1. Open the "Roles" work area.
2. Double-click "Add new role" in the "Roles" table and enter a name for the role.
3. In the "Runtime rights" table, click on "Runtime rights > WinCC Unified devices > HMI\_RT\_1" in the "Categories of function rights" column.
4. In the "Function rights" column, assign the desired function rights to the role.

## Result

Name	Description	Maximum sessi...	Comment	
Engineering administrator	System-defined role "Engineering ...	30	Min	Engineering-Administrator-Rolle
Engineering standard	System-defined role "Engineering s...	30	Min	Engineering-Standard-Rolle

### 13.3.7.4 Example: Configuring a button with access protection (RT Unified)

#### Task

In the following example, you use a system function to create a button for a screen change. You protect the "To Recipe view" button against unauthorized operation. To do so, you configure the "Change parameter sets" function right at the "To Recipe view" button.

#### Requirements

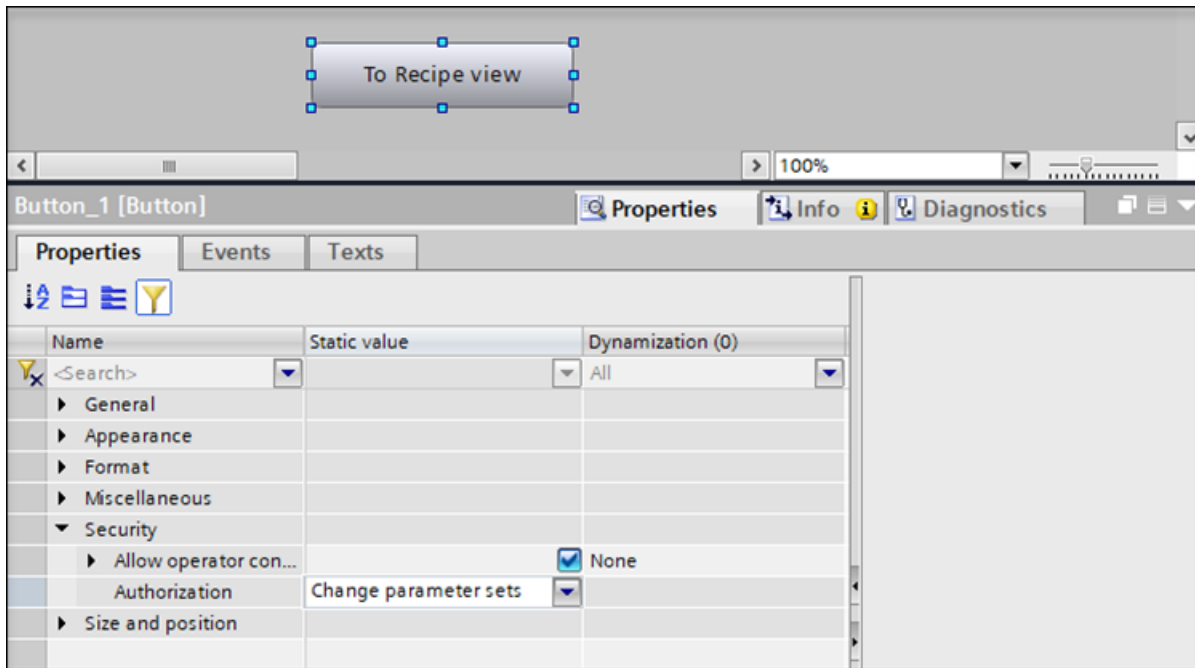

- A "Change parameter sets" function right has been created.
- A "Recipes" screen has been created.

- A "Start" screen has been created and opened.
- A button has been created and marked in the "Start" screen.

**Procedure**

1. In the Inspector window, click "Properties > Properties > General > Text".
2. Enter "To Recipe view" as the text.
3. Click "Properties > Events > Click left mouse button" in the Inspector window.
4. Click the "Add function" entry in the first line of the "Function list" table.
5. Select the system function "ChangeScreen" from the "Screen" group.
6. Click on the  button in the "Screen name" row of the "Value" column. A dialog box for selecting the screen opens.
7. Select the "Recipes" screen and use the  button to close the dialog box.
8. Click "Properties > Properties > Security" in the Inspector window.
9. Select "Change parameter sets" as function right.

**Result**

Access to the "To Recipe view" button is protected. If the user "Greenwood" clicks the button in Runtime, for example, the "Recipes" screen opens. Requirement:

- The user "Greenwood" has logged on correctly and has the required function right.
- The "Recipes" screen contains a recipe view and other screen objects.

**Note**

If the logged-on user does not have the required function right or if no user is logged on, the "Logon dialog box" is displayed. An alarm indicating that no operator authorization is available for this user appears in Runtime.

---

## 13.4 Using user management on the Unified Panel (RT Unified)

### 13.4.1 Notes on commissioning (RT Unified)

#### Commissioning with central user management

To ensure that the connection to the central user management is set up during initial commissioning of the Panel, we recommend that you do not activate any access protection for the Control Panel on the Panel.

If the access protection is not activated for the Control Panel, configure the connection to the central user management in the Control Panel.

If the access protection for the Control Panel is activated and no connection could be set up during commissioning for the central user management, you have the following options:

- Download the project and the settings for user management from the engineering system.
- Reset the Panel to the factory settings.

---

**Note****Failure of the network connection**

If the network connection to the central user management fails, all users who have already logged on to the project once before can still log on for some time. When the connection to the central user management has been restored, other users can log on once again as well.

---

### 13.4.2 User management on the Unified Panel (RT Unified)

In the engineering system, you can specify whether you want to work with local or central users and user groups from the central user management on a Unified Panel. By default, the use of the local user management is specified in the engineering system.

---

**Note**

You can only switch between local and central user management in the engineering system.

---

To manage users in Runtime, you require the "User management" function right. Configure a user with the required rights in the engineering system and load the user into Runtime.

### 13.4.3 Protecting the Control Panel from being accessed (RT Unified)

In the engineering system, you can protect the Control Panel of a Unified Panel from unauthorized access. You can assign a user the access right for changes on the Control Panel.

#### Requirement

- A project is open.
- A user has been created in the engineering system.
- A user-defined role has been created.
- A Unified Panel has been created.

#### Assign access right to Control Panel to a user

To assign a user the function right "Control Panel access" to access the Control Panel, follow these steps:

1. Open the "Security settings" folder in the project tree.
2. Double-click on "Users and roles".  
The "Users and roles" editor opens in the work area.
3. Open the "Roles" tab.
4. Select a user-defined role.
5. In the lower area "Function rights categories", open the category of the Runtime rights.
6. Click on the Unified Panels category.
7. In the lower area "Function rights", activate the function right "Control Panel access".
8. Open the "Users" tab.
9. Select a user.
10. In the area "Assigned roles", activate the user-defined role to which you have assigned the function right for access to the Control Panel.

The user receives the access right for the Unified Control Panel and is permitted to change the Panel settings.

#### Activate access control for Control Panel

In addition, activate the access control in the Control Panel:

1. Start the Panel.
2. Open the Control Panel.
3. Under "Security > Control Panel Access", activate the access control for the Control Panel.

**Note**

In contrast to the Unified PC Runtime, no login is required. When you open the protected Control Panel, your user rights are checked. If you do not have the necessary rights, a login window is displayed.

---

**See also**

System-defined function rights (Page 7156)

Using central user management in the Control Panel (Page 7180)

## 13.4.4 Managing local users (RT Unified)

### 13.4.4.1 Options for local user management (RT Unified)

To manage local users in Runtime, the user requires the "User management" function right on the HMI device.

#### Managing local users

You have the following options for managing local users:

1. Control Panel of the Unified Panel. You can find all information in the "SIMATIC HMI devices Unified Comfort Panels (<https://support.industry.siemens.com/cs/ww/en/view/109773257>)" manual.
2. Via the "Browser" screen object in a project.
3. Using an Internet browser on a PC.

### 13.4.4.2 Using local user management in the Control Panel (RT Unified)

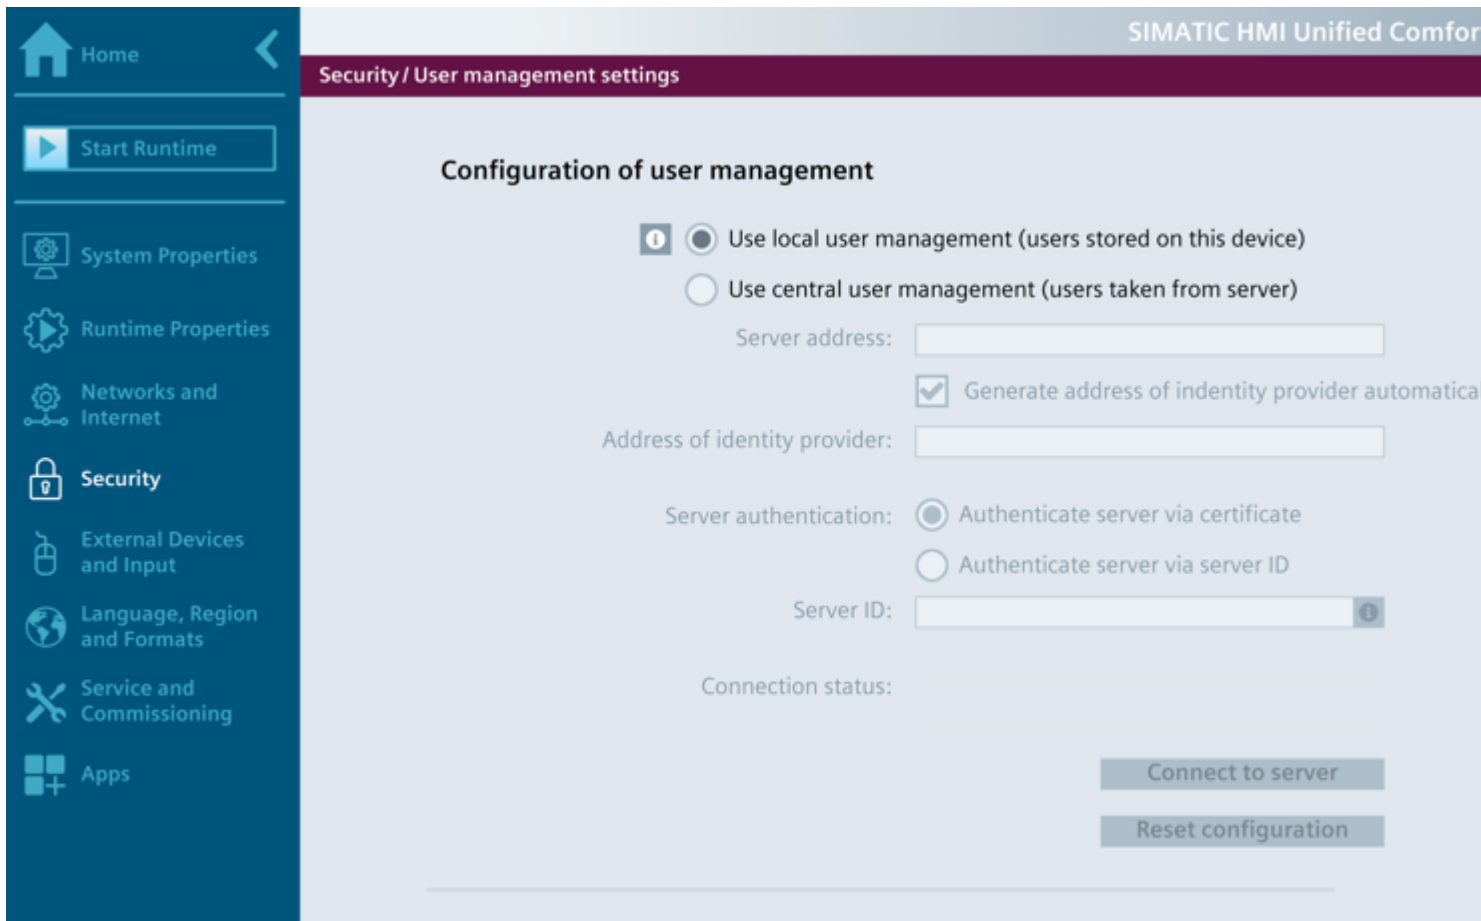

If access protection is configured for the Control Panel in the Engineering System, you need the "Control Panel access" function right. If you do not have the necessary rights, a login window is displayed.

You cannot make any changes to the user management in the Control Panel.

#### Local user management in the Control Panel

To use the user management on the Unified Panel, follow these steps:

1. Select "Security" in the navigation.
2. Click "User management settings".
3. In the "Configuration of user management" dialog, you can see whether the local or central user management is enabled.

---

**Note**

If you have made changes to the Runtime settings in the "Security" area in the Engineering System, you must ensure before loading that the page "Security > User management settings" is closed in the Control Panel of the Unified Panel. Otherwise, the changes may not be applied after loading.

---

**13.4.4.3 Opening local user management in the "Browser" screen object (RT Unified)**

In Runtime, you access local user management of a Panel by using the "Browser" screen object in a screen.

The detailed description of the individual steps in Runtime can be found in the section "Managing local users in Runtime (Page 7172)".

---

**Note**

The specific possible operations depend on the function right.

---

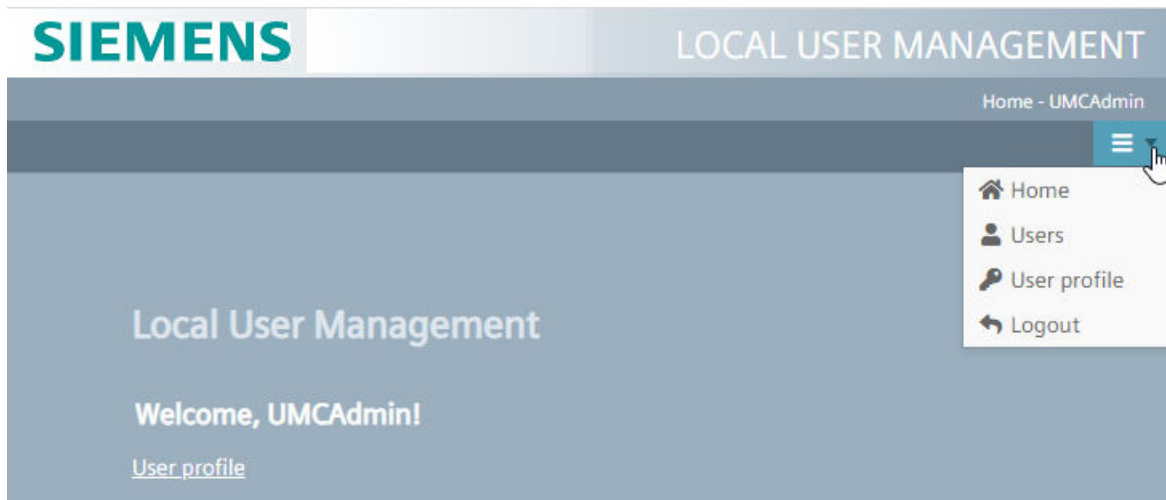

## Requirement

- To access the user management, the user must have the "User management" or "Monitor" function right.
- To access the Control Panel, the user must have the "Control Panel access" function right.
- A screen with the "Browser" screen object is displayed in Runtime.

## Managing local user in the "Browser" screen object

If you want to manage local users in the "Browser" screen object, follow these steps:

1. Enter the address "https://localhost/umc" in the "Browser" screen object. The "User login" dialog is displayed.
2. Log in to the user management. The home page of the user management opens.

3. Select "Users" in the menu. The user list is displayed.
4. You manage the user information in the user list with the buttons "Add user", "Details", "Edit" and "Delete".

## Users without "User management" function right

If you do not have the "User management" function right, you can only select your own "User profile" and change your own password.

### 13.4.4.4 Opening local user management in the Internet browser (RT Unified)

From a PC, you access local user management of a Panel via an Internet browser.

The detailed description of the individual steps in Runtime can be found in the section "Managing local users in Runtime (Page 7172)".

---

#### Note

The specific possible operations depend on the function right.

---

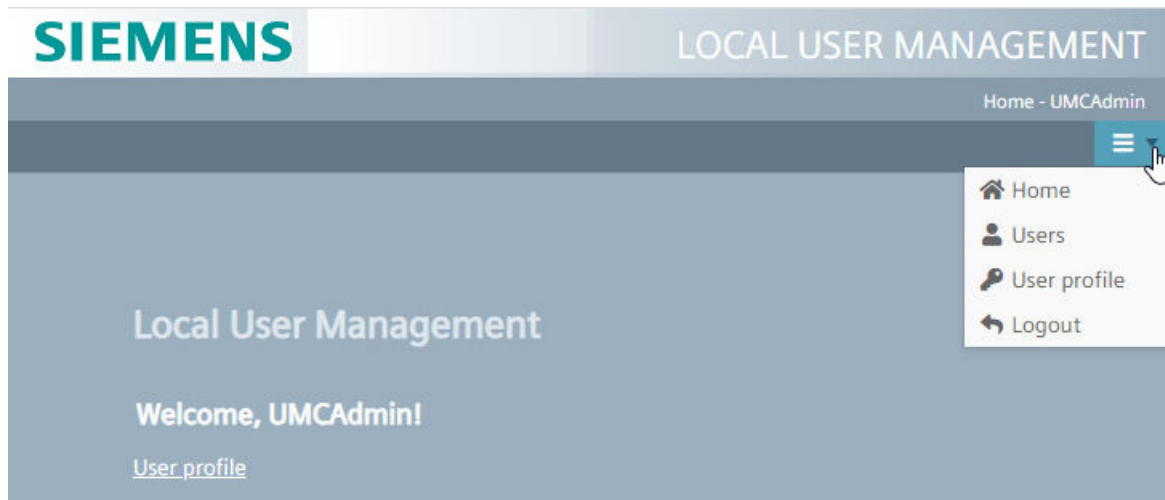

## Requirement

- To access the user management, the user must have the "User management" or "Monitor" function right.
- To access the Control Panel, the user must have the "Control Panel access" function right.
- Internet browser is open.

## Managing local users in the web browser

If you want to manage local users in the Internet browser, follow these steps:

1. In the address line of the browser, enter the IP address of the Unified Panel "https://<UCP-IP>/umc". The "User login" dialog is displayed.
2. Log in to the user management. The home page of the user management opens.

3. Select "Users" in the menu. The user list is displayed.
4. You manage the user information in the user list with the buttons "Add user", "Details", "Edit" and "Delete".

## Users without "User management" function right

If you do not have the "User management" function right, you can only select your own "User profile" and change your own password.

### 13.4.4.5 Managing local users in Runtime (RT Unified)

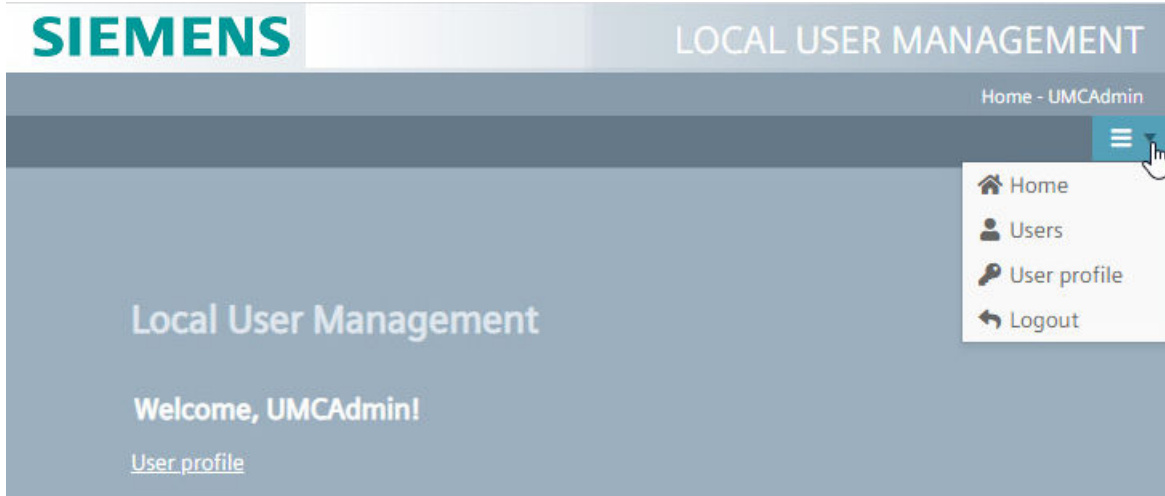

## Changing your password (RT Unified)

### Introduction

You can change your own password in the user management.

## Requirement

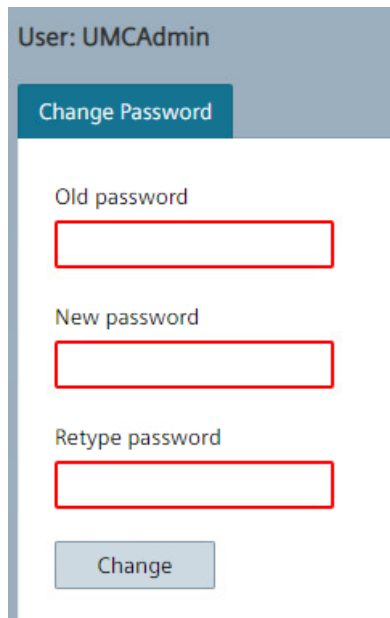

- You have the "User management" function right.
- The home page of the user management is open.

## Procedure

To change the password, follow these steps:

1. Select "User profile" directly on the home page or in the menu. The "Change Password" dialog is displayed.

2. Change the password and save the change with the "Change" button. The password must meet the password policies.

## Editing password, status or role (RT Unified)

### Introduction

In the user list you can edit the password, the status or the role of a user.

### Requirement

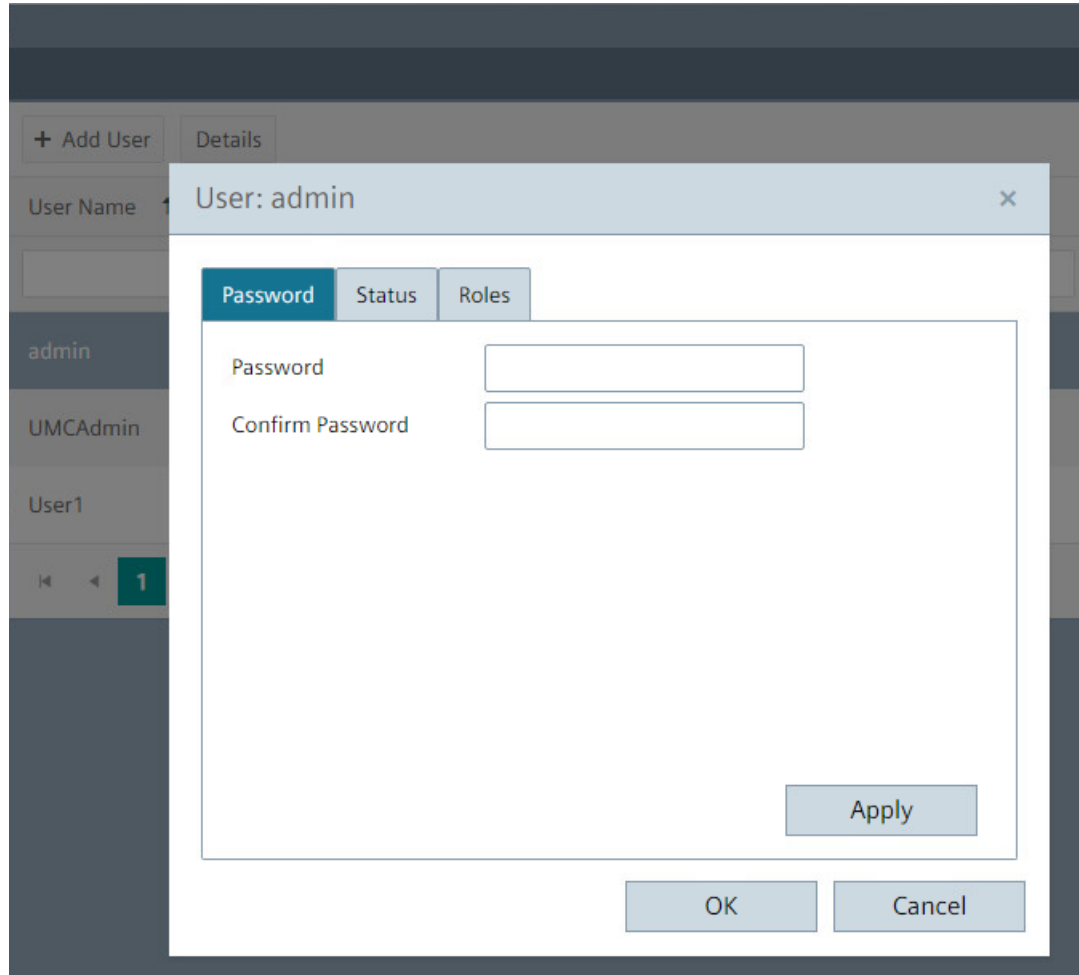

- You have the "User management" function right.
- The home page of the user management is open.

### Changing the password

To change the password of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

3. Enter the new password in the "Password" tab and confirm the password.
4. Confirm your entries with the "Apply" button.  
Save the settings with "OK".

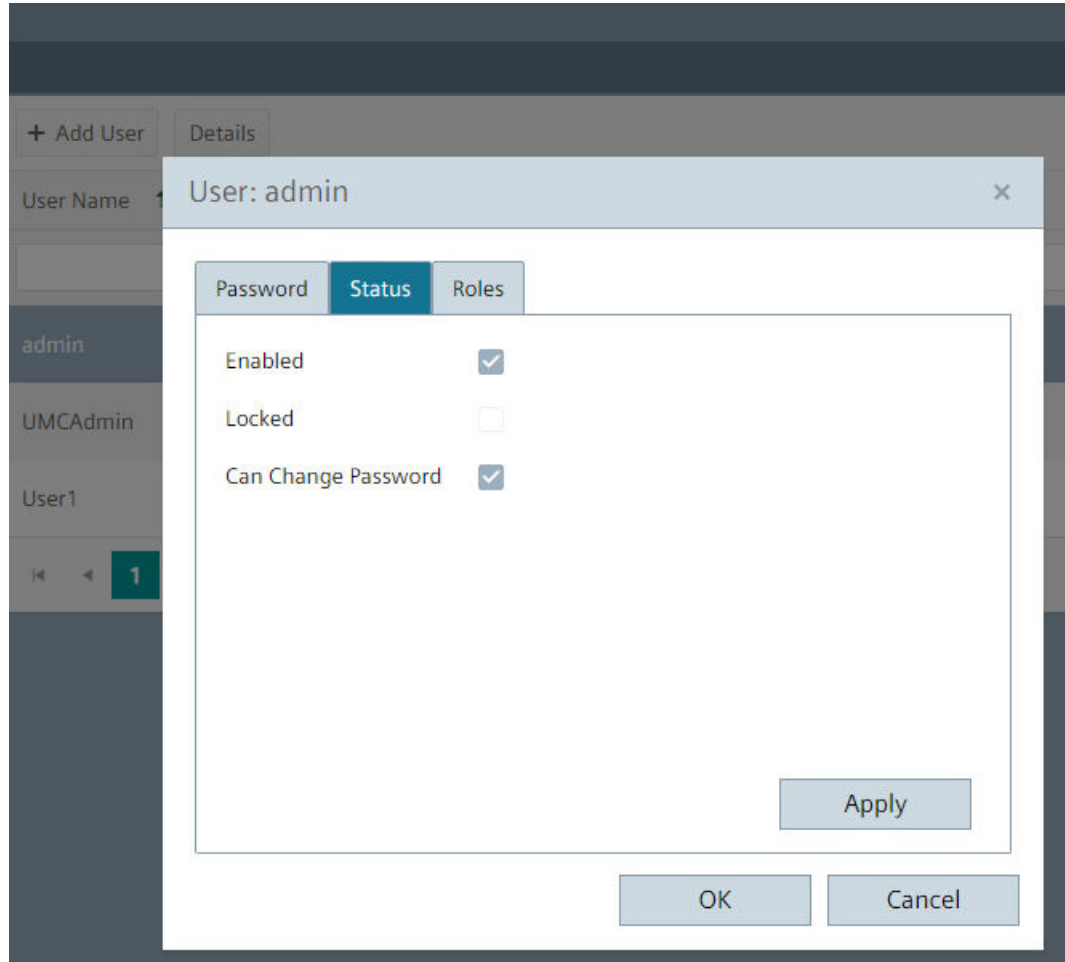

### Changing the status

To edit the status of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

13.4 Using user management on the Unified Panel (RT Unified)

3. In the "Status" tab, you can disable the user or keep this user from changing the password. You cannot change the "Locked" property.
4. Confirm your entries with the "Apply" button. Save the settings with "OK".

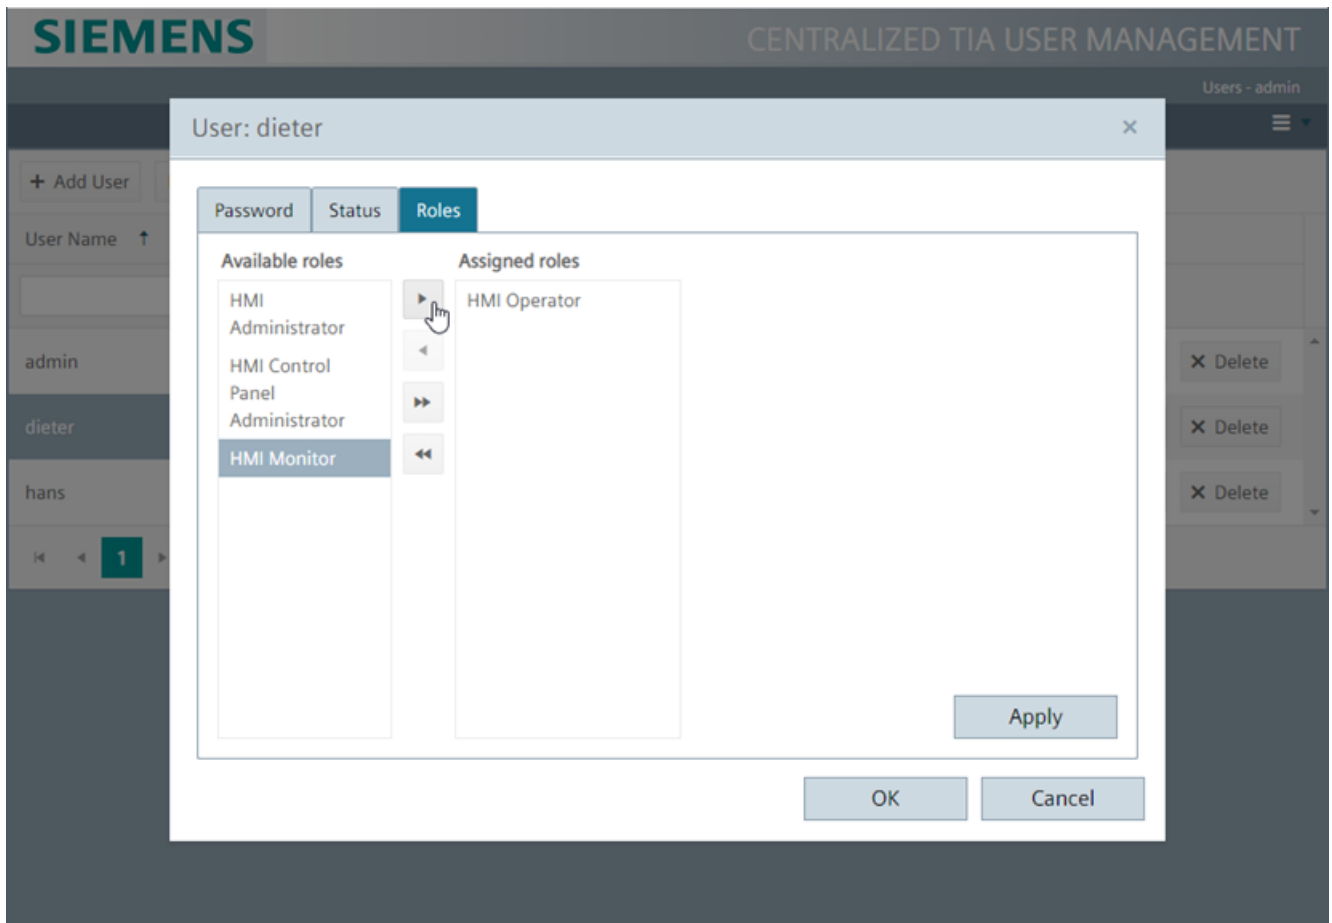

## Changing the role

To edit the role of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.
3. In the "Roles" tab, you can change the roles and thus the associated function rights of the user:
  - Select a role from the "Available roles" or "Assigned roles" list.
  - Change the assignment of this role using the buttons between the two lists.
  - Confirm your entries with the "Apply" button.  
Save the settings with "OK".

The figure below shows you how to assign the "HMI Monitor" role to a user in addition to the "HMI Operator" role.

### Note

Note that at least one user in the project has the "HMI Administrator" role and at least one user has access to the Control Panel. If access to the user management or the Control Panel is not possible, a complete download from the TIA Portal is necessary.

## Adding users (RT Unified)

### Introduction

You can add a new user in the user list.

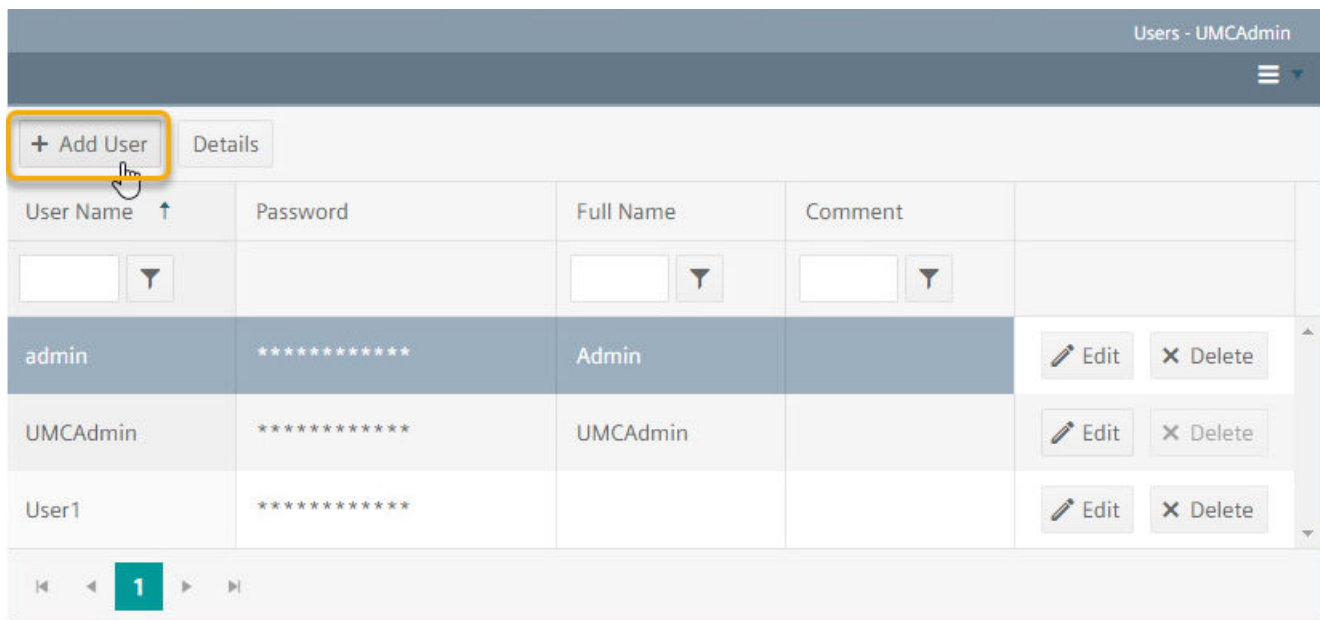

### Requirement

- You have the "User management" function right.
- The home page of the user management is open.

### Adding a new user

To add a new user, follow these steps:

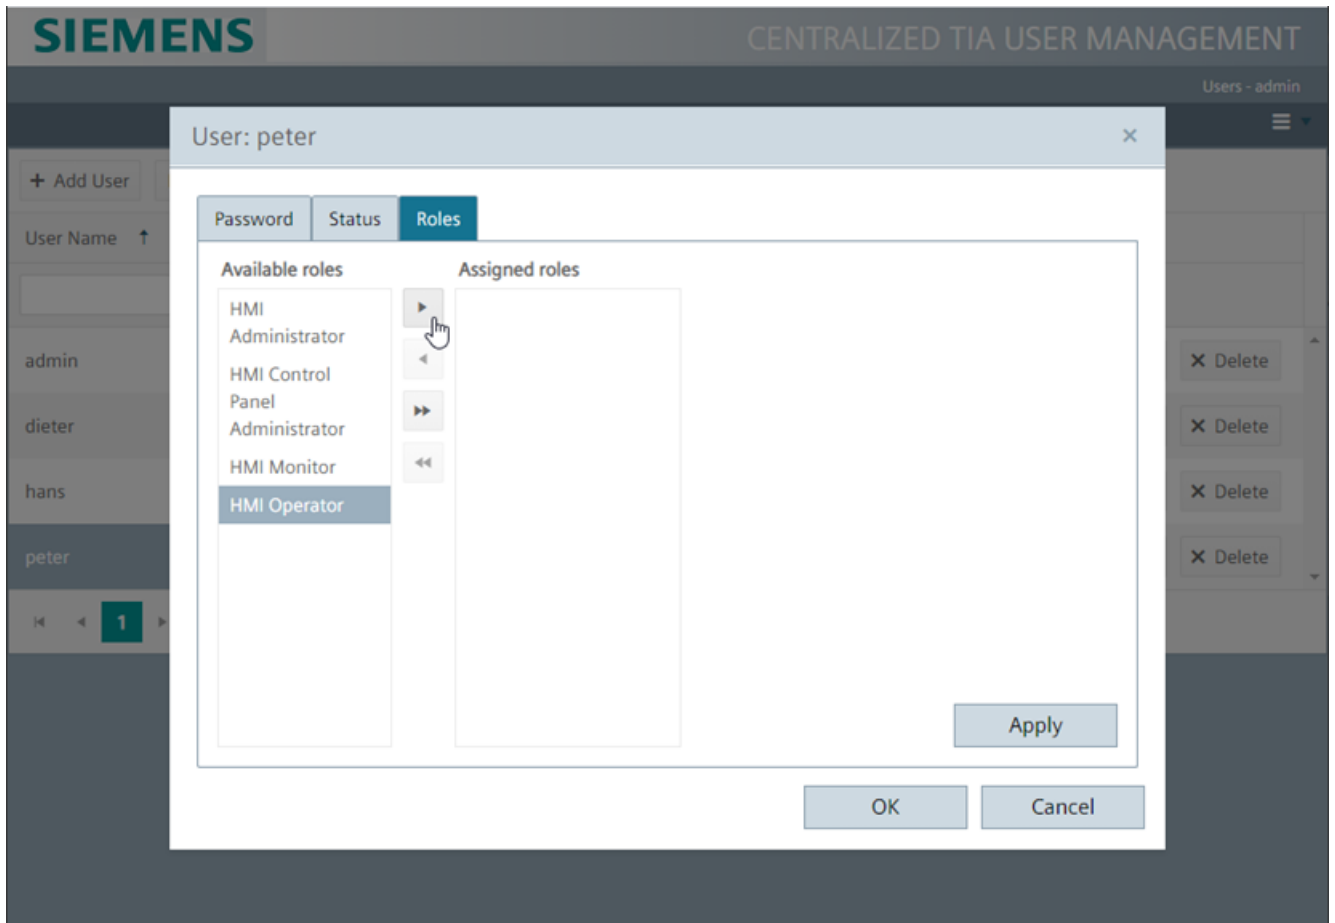

1. Select "Users" in the menu. The user list is displayed.
2. In the user list, click "Add User".

3. A new row is displayed for the new user in the user list. Enter the information of the new user in the row.

- Click "Details" in the user list. Assign roles to the new user.

- Confirm your entries with the "Apply" button. Save the settings with "OK".

## Deleting users (RT Unified)

### Introduction

You can delete a user in the user list.

### Requirement

- You have the "User management" function right.
- The home page of the user management is open.

## Deleting users

To delete a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select the user.
3. Click the "Delete" button in the row. The user is deleted.

Deleting the user from the user list will become effective once the user logs off in Runtime.

## 13.4.5 Using central user management (RT Unified)

### 13.4.5.1 Using central user management in the Control Panel (RT Unified)

In the engineering system, you can specify whether you want to work with local or central users and user groups from the central user management on a Unified Panel. By default, the use of the local user management is specified in the engineering system.

---

#### Note

You can only switch between local and central user management in the engineering system.

---

## Requirement

- User management has been configured in the engineering system.
- A user with the access right to the Control Panel "Access Control Panel" has been created.
- A Unified Panel has been started.

---

#### Note

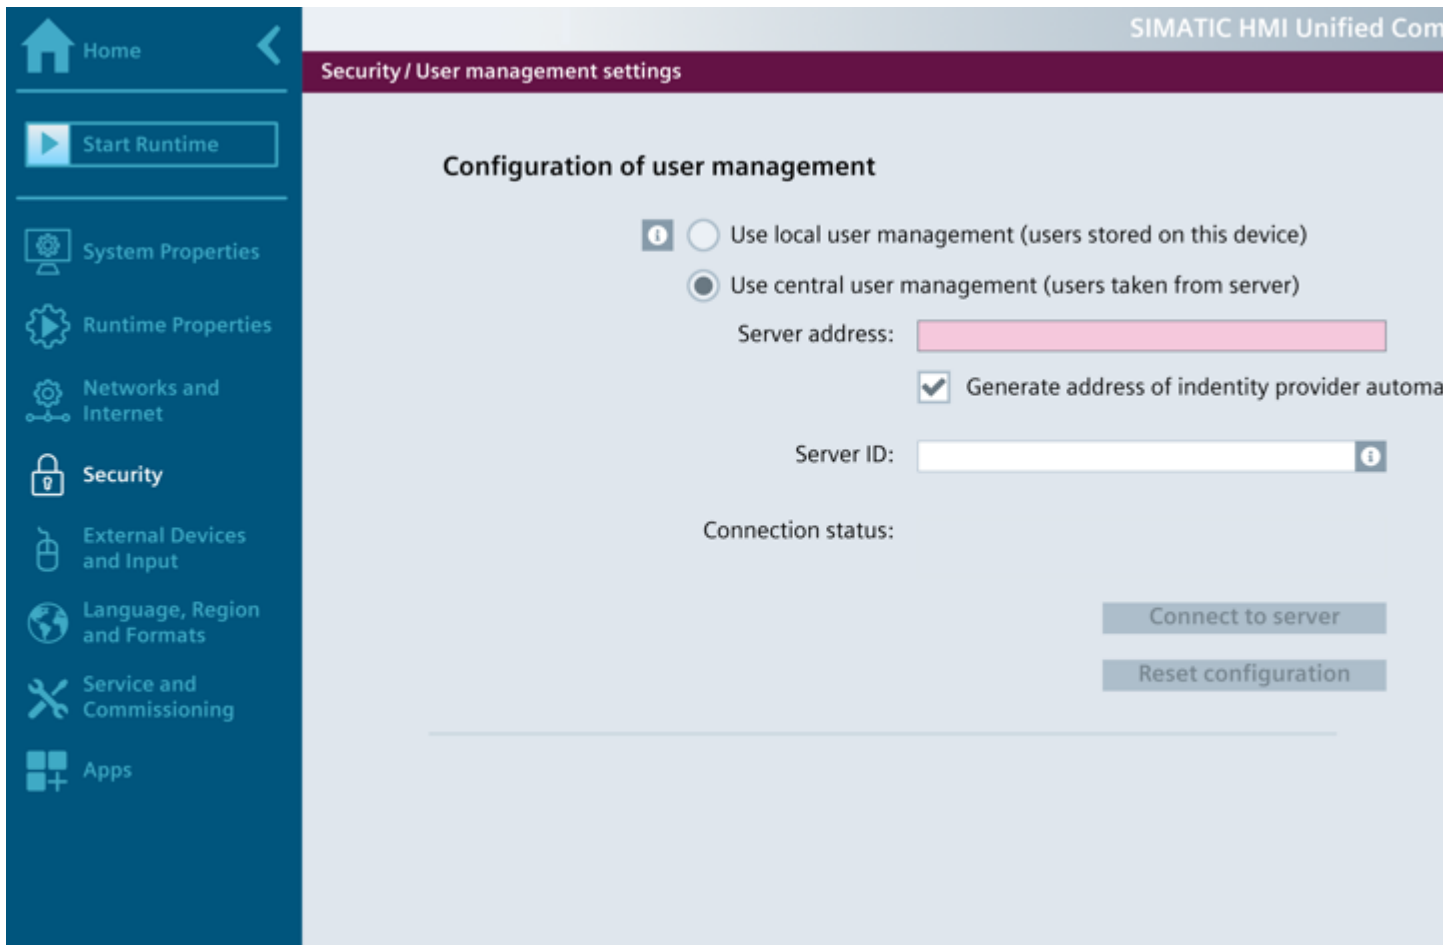

In contrast to the Unified PC Runtime, no login is required. When you open the protected Control Panel, your user rights are checked. If you do not have the necessary rights, a login window is displayed.

---

## Using user management on the Unified Panel

To use the user management on the Unified Panel, follow these steps:

1. Select "Security" in the navigation.
2. Select the "User management settings" tile.
3. In the "Configuration of user management" dialog, you can see whether the local or central user management is enabled. You can only switch between local and central user management in the engineering system.

### Establishing a connection to the central user management

If you have not entered any information in the engineering system, follow these steps:

1. Enter the server address.
2. The "Connect to server" button is activated.
3. Enter the server ID manually or click the "Connect to server" button. The server ID is read in from the central user management.
4. In the "Verify user management server" dialog, confirm the displayed server. All input fields are filled in and write-protected. Status of the connection is "Connected".
  - The "Connect to server" button is changed to "Check connection".
  - You can check or reset the connection.

### Adapting the connection to the central user management

If you have only entered some information in the engineering system, the input field for the missing information is marked in red. Proceed as follows in this case:

1. Enter the missing information.
2. The "Connect to server" button is activated.
3. Click "Connect to server". The server ID is read in from the central user management.
4. In the "Verify user management server" dialog, confirm the displayed server.  
All input fields are filled in and write-protected. Status of the connection is "Connected".
  - The "Connect to server" button is changed to "Check connection".
  - You can check or reset the connection.

If the entered server ID is not the same as the online server ID, you can apply the online server ID.

1. Confirm this in the "Verify user management server" dialog.  
The online server ID is read in. All input fields are filled in and write-protected. Status of the connection is "Connected".
  - The "Connect to server" button is changed to "Check connection".
  - You can check or reset the connection.

### Verifying the connection to the central user management

You have entered all information in the engineering system. When the server ID in the engineering system and on the Panel match, the Panel is automatically connected to the central user management.

Status of the connection is not displayed. To verify the central user management on the Unified Panel, follow these steps:

1. Click "Check connection".
2. The connection to the central user management is established.

When the Panel is not connected to the central user management and no status is displayed, change the server ID.

1. The "Check connection" button is changed to "Connect to server".
2. You can make or reset the connection.

## Resetting the connection to the central user management

If you have entered all information in the engineering system, the Panel is connected to the central UMC server. If you want to reset the central user management, follow these steps:

1. Click "Reset configuration".
2. In the "Reset central user management" dialog, confirm the reset.
3. The default is set:
  - The input field for the server address is empty and marked in red.
  - The input field for the server ID is empty.
  - The "Connect to server" button is hidden.
  - The "Reset configuration" button is hidden.

### 13.4.5.2 Simulating a central user management (RT Unified)

You want to simulate a project in which a central user management is configured for a customer. You have two options if you do not have access to the central user management of the customer:

- Configure your own central user management.
- Configure a local user management.

## Requirement

- You know which groups and their function rights are contained in the central user management of the customer.

## Configuring a central user management

Configure a central user management for the simulation project.

1. Create the users.
2. Create the user groups according to the customer project.
3. Assign the users to the groups.
4. Establish the connection to the central user management.
5. Start the simulation.
6. Log on in runtime.

Changes can be downloaded.

## Configuring a local user management

Configure a local user management.

1. Create one or more users.
2. Assign the roles to the users.
3. Start the simulation.

Changes cannot be downloaded.

**See also**

Simulate Unified Comfort Panel (Page 7505)

## **13.5 Using user management on the WinCC Unified PC (RT Unified)**

### **13.5.1 Notes on commissioning (RT Unified)**

#### **Commissioning with central user management**

To establish the connection to the central user management, configure the connection to the central user management on the PC with SIMATIC Runtime Manager.

---

**Note**

**Failure of the network connection**

If the network connection to the central user management fails, all users who have already logged on to the project once before can still log on for some time. When the connection to the central user management has been restored, other users can log on once again as well.

---

**See also**

SIMATIC Runtime Manager users (Page 7187)

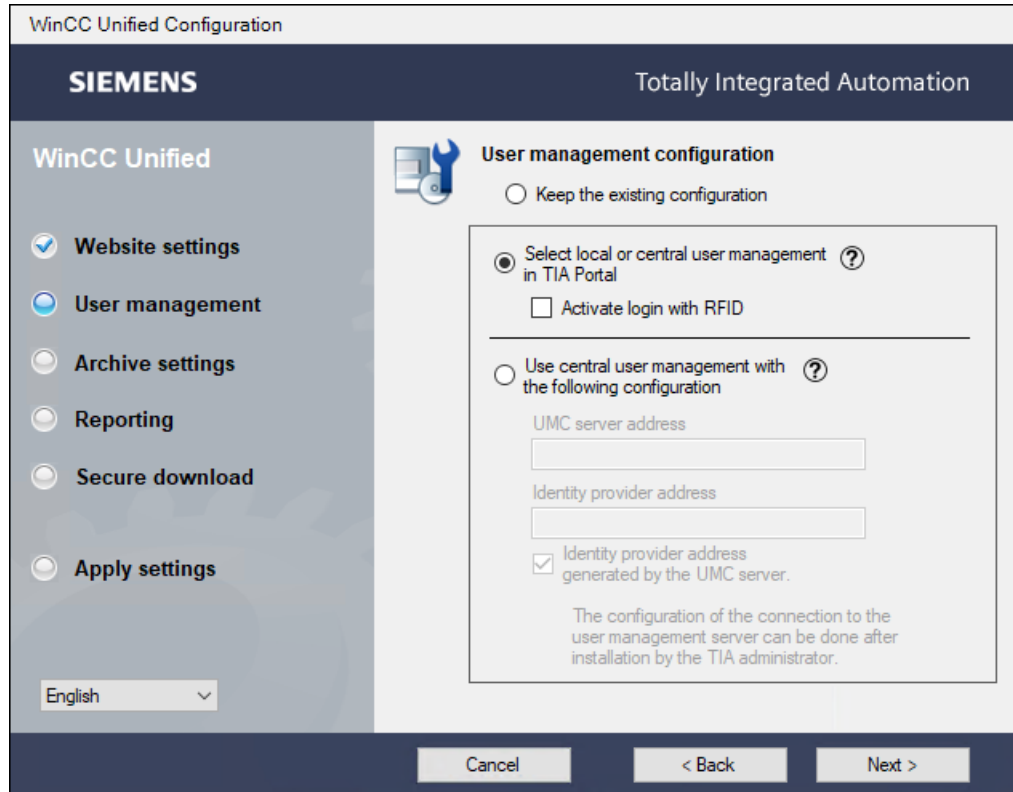

### **13.5.2 Setting the user management with WinCC Unified Configuration (RT Unified)**

The "WinCC Unified Configuration" application is installed with the installation of WinCC Unified. A link is automatically created on your desktop for "WinCC Unified Configuration".

You can change the setting made during setup at any time.

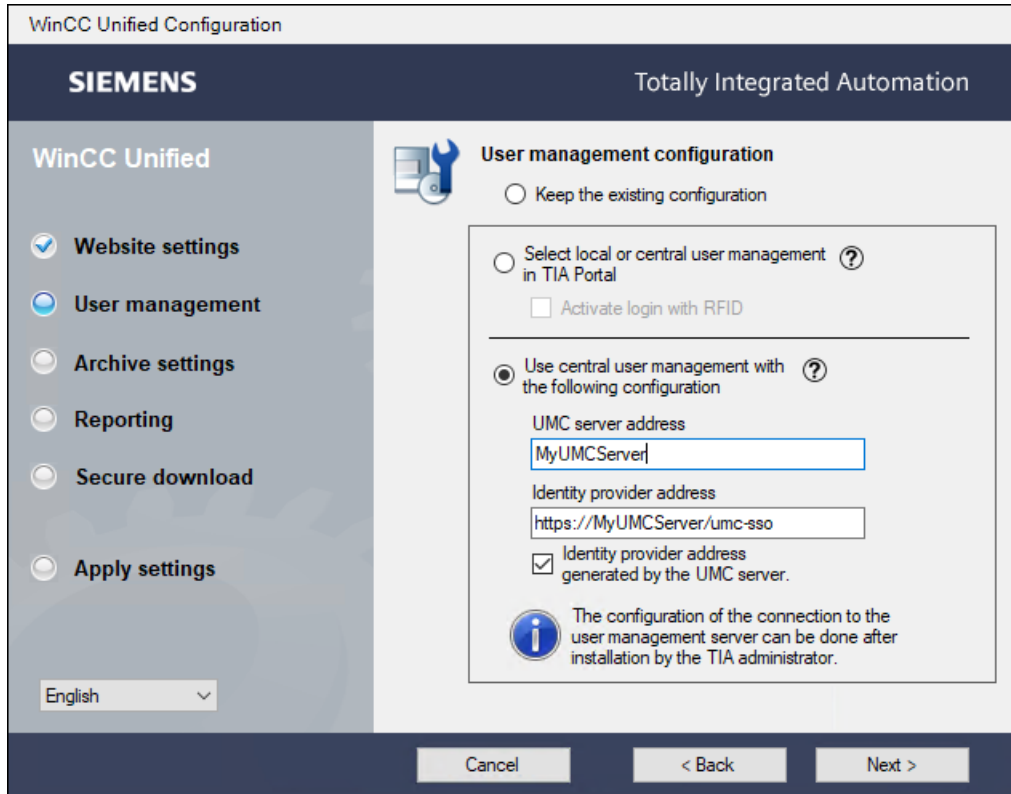

## Local user management

If you exclusively edit projects with local user management in TIA Portal, use the setting "Select local or central user management in TIA Portal".

### Central user management

If you exclusively edit projects with central user management in TIA Portal, use the setting "Use central user management with the following configuration".

### Using local and central user management

When you edit projects with local as well as central user management, note the following special features:

"Select local or central user management in TIA Portal" setting:

- You cannot simulate projects with central user management.
- Groups and users of the central server cannot be imported into projects with central user management.

"Use central user management with the following configuration" setting:

- You cannot simulate projects with local user management.

### 13.5.3 Managing multiple projects in the SIMATIC Runtime Manager (RT Unified)

The SIMATIC Runtime Manager is installed with the installation of WinCC Unified Runtime. A link for the SIMATIC Runtime Manager is automatically created on your desktop.

You manage the Runtime projects in the SIMATIC Runtime Manager. Multiple projects can be available on one PC. In SIMATIC Runtime Manager, you enable the matching configuration of the user data for a selected project or you adapt the configuration.

You cannot switch between local and central user management in the Runtime Manager.

### See also

Checking local user management in the SIMATIC Runtime Manager (Page 7187)

Setting central user management in the SIMATIC Runtime Manager (Page 7206)

## 13.5.4 SIMATIC Runtime Manager users (RT Unified)

### Groups for the user management

Groups are created during the installation of WinCC Unified that enable a user to access specific WinCC Unified functions:

- **\*\*umcd\_domain\_manager\*\***
- **\*\*umcd\_um\*\***
- **\*\*umcd\_dsso\*\***

To log in with single sign-on (SSO), the user must be added to the following group:

- **\*\*umcd\_dsso\*\***

### Groups for the Runtime Manager

For a Windows user to be able to change user data in the Runtime Manager, add the user to the following groups:

- **\*\*umcd\_domain\_manager\*\***
- **\*\*umcd\_um\*\***
- "SIMATIC HMI"

### See also

Notes on commissioning (Page 7184)

## 13.5.5 Managing local users (RT Unified)

### 13.5.5.1 Checking local user management in the SIMATIC Runtime Manager (RT Unified)

Multiple projects can be available on one PC. In SIMATIC Runtime Manager, you can activate the matching configuration of the user data for a selected project.

You cannot switch between local and central user management.

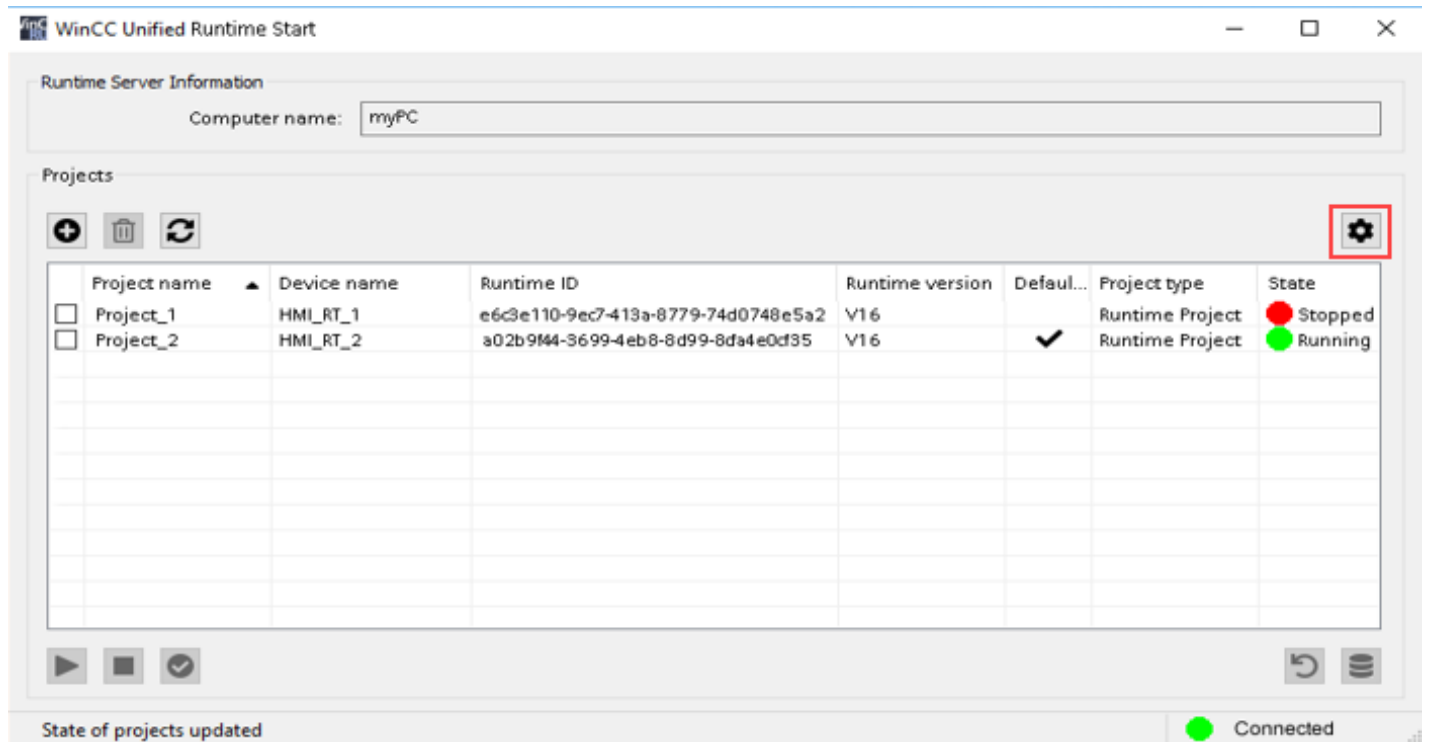

## Requirement

- At least one project with user management is loaded on the Runtime PC.
- WinCC Unified Runtime is installed.
- SIMATIC Runtime Manager has been started.

## Checking local user management in the SIMATIC Runtime Manager

You cannot configure the local user management in the SIMATIC Runtime Manager.

1. In the SIMATIC Runtime Manager, click "Settings" on the home page.

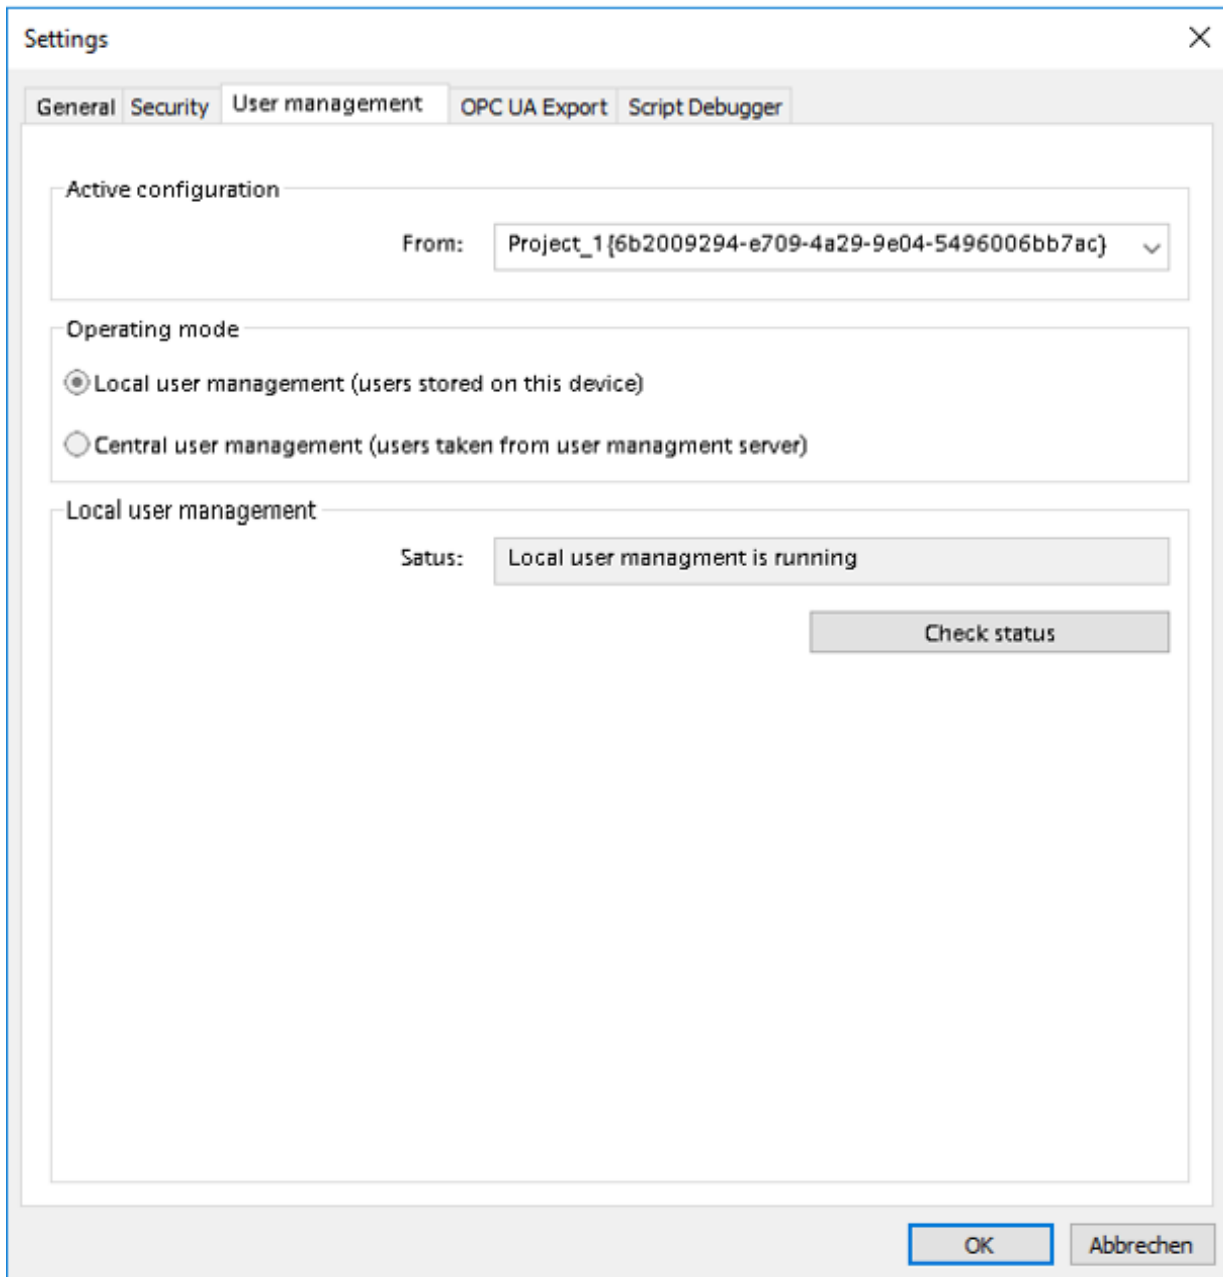

2. Select the "User management" tab.
3. When multiple projects are available on the PC, select the configuration of the user management of a project under "Select configuration".

- To activate the local user data of the selected project, click "Load user management".

**Note**

When you click "Load user management", the changes of the user management that you have made in runtime are overwritten by the configuration of the last download.

- The status of the local user management is displayed. You check the status of the local user management with the "Check status" button.

## See also

Managing multiple projects in the SIMATIC Runtime Manager (Page 7186)

### 13.5.5.2 Managing local users in Runtime (RT Unified)

#### User logon (RT Unified)

##### Introduction

From a PC, you access local user management via an Internet browser.

To manage the local users on a Unified PC, you require the "User management" function rights. Configure a user with the required rights in the engineering system and load the user into Runtime.

---

##### Note

The specific possible operations depend on the function right.

---

##### Requirement

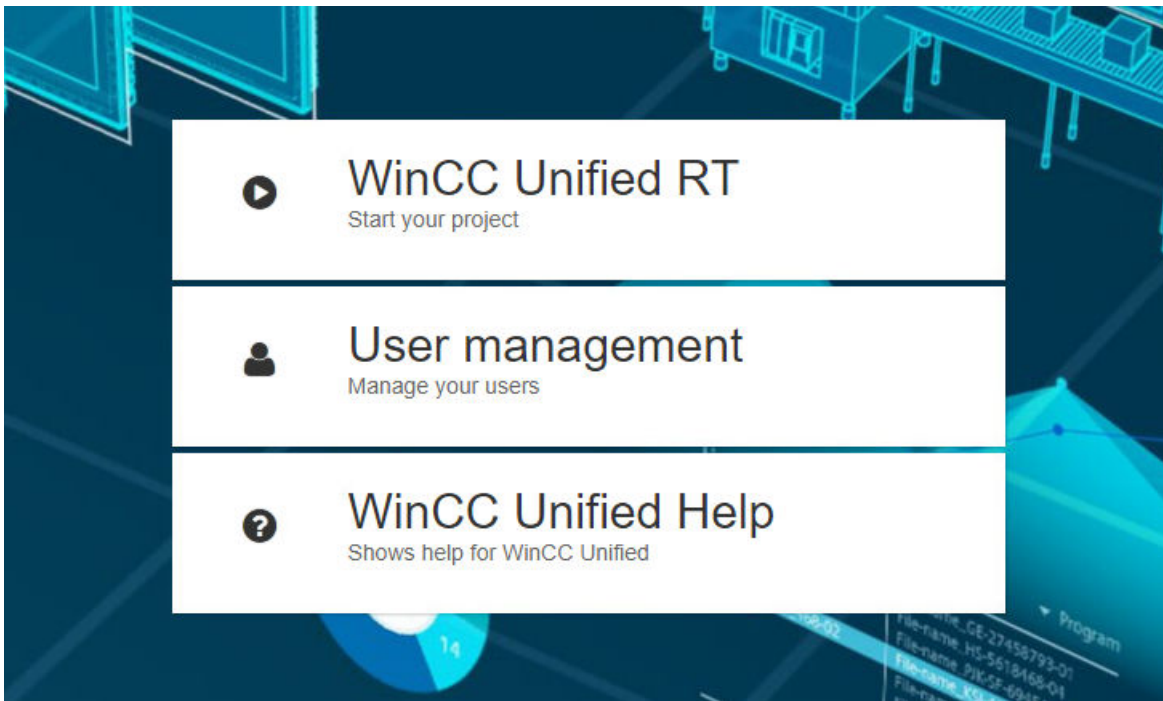

- The user has the "User management" function rights.
- Internet browser is open.

## Logging on to the user management

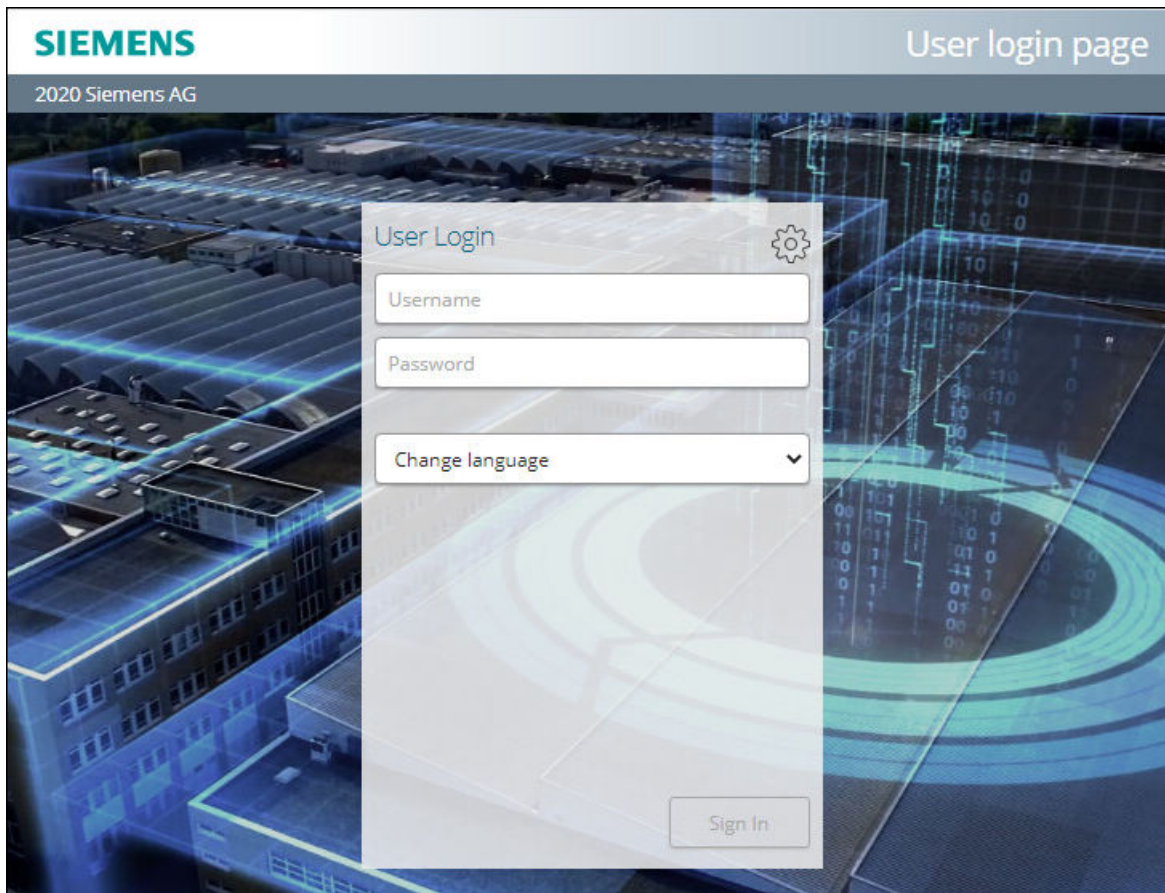

To log on to the user management in Runtime, follow these steps:

1. In the browser, enter the IP address of the Runtime PC "https://<PC-IP>/umc". If runtime is installed on the same PC as the browser, enter the address "https://localhost/umc".

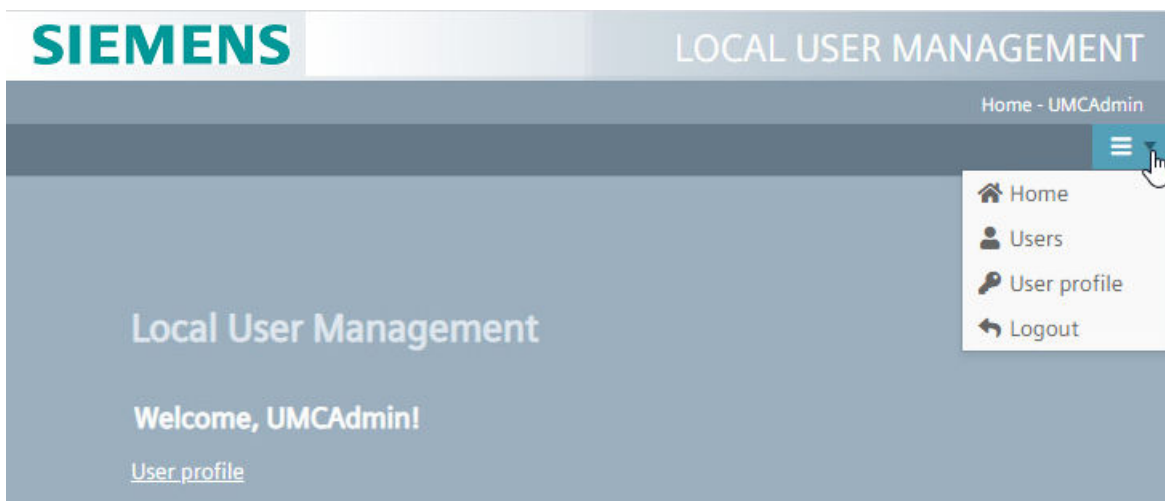

The start page of Runtime is displayed.

2. Click the "User management" button. The "User login" dialog is displayed.

3. Type in the user name and password.
4. If required, use the selection list to change the displayed language.
5. Click "Login".  
The user management start page opens in Runtime.

## See also

Managing local users in Runtime (Page 7190)

## Structure of the start page (RT Unified)

### Introduction

In menu on the start page, select whether you want to manage the users, change the password or language, or log out. You can find the menu via the drop-down list in the upper right corner.

---

#### Note

Users with the "User management" function right have access to all functions.

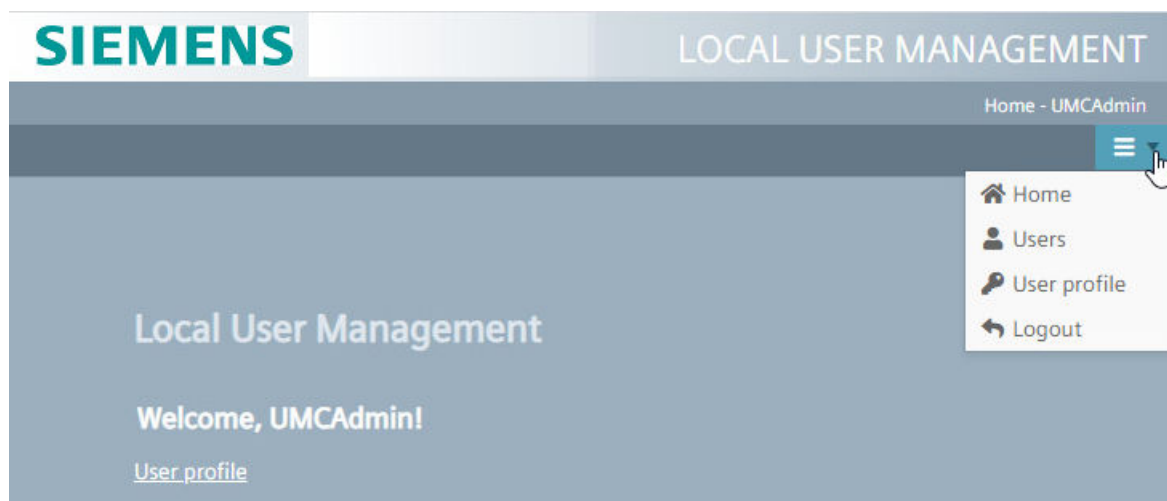

Users without the "User management" function right can change their password under "User profile".

---

### Menu

The following options are available to you under the symbols in the menu:

- "Home"  
This takes you to the start page of the user management.
- "Users"  
You can create new users or manage the existing users.
- "User profile"  
You can change your password and switch the language.
- "Logoff"  
You will be logged out directly and can log in again.

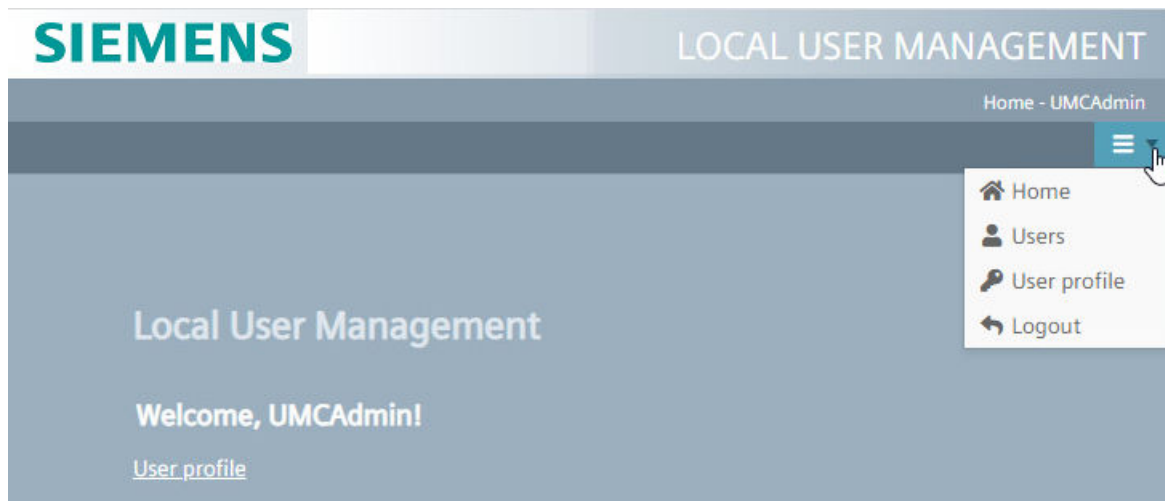

## Changing your password (RT Unified)

### Introduction

You can change your own password in the user management.

### Requirement

- You have the "User management" function right.
- The home page of the user management is open.

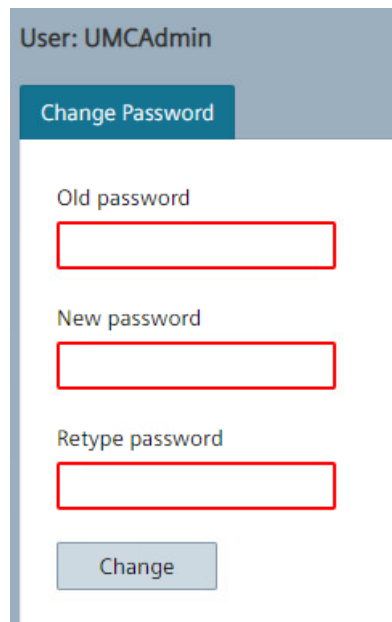

## Procedure

To change the password, follow these steps:

1. Select "User profile" directly on the home page or in the menu.  
The "Change Password" dialog is displayed.

The screenshot shows a dialog box titled "User: UMCAdmin". Inside the dialog, there is a blue button labeled "Change Password". Below this button are three text input fields: "Old password", "New password", and "Retype password". Each input field is outlined with a red border. At the bottom of the dialog is a light blue button labeled "Change".

2. Change the password and save the change with the "Change" button. The password must meet the password policies.

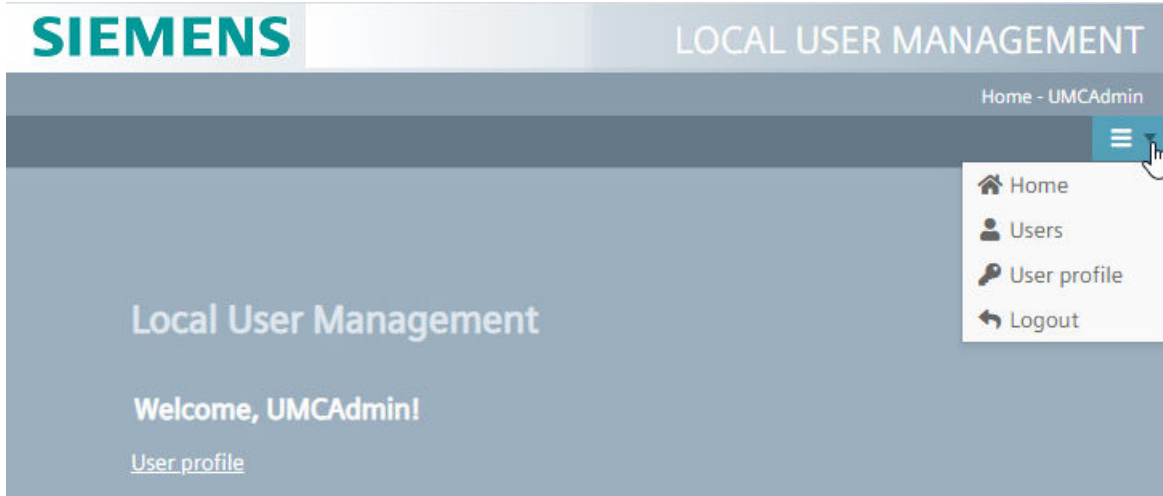

## Managing the user list (RT Unified)

### Introduction

In the user list you can manage the data of the other users.

**Requirement**

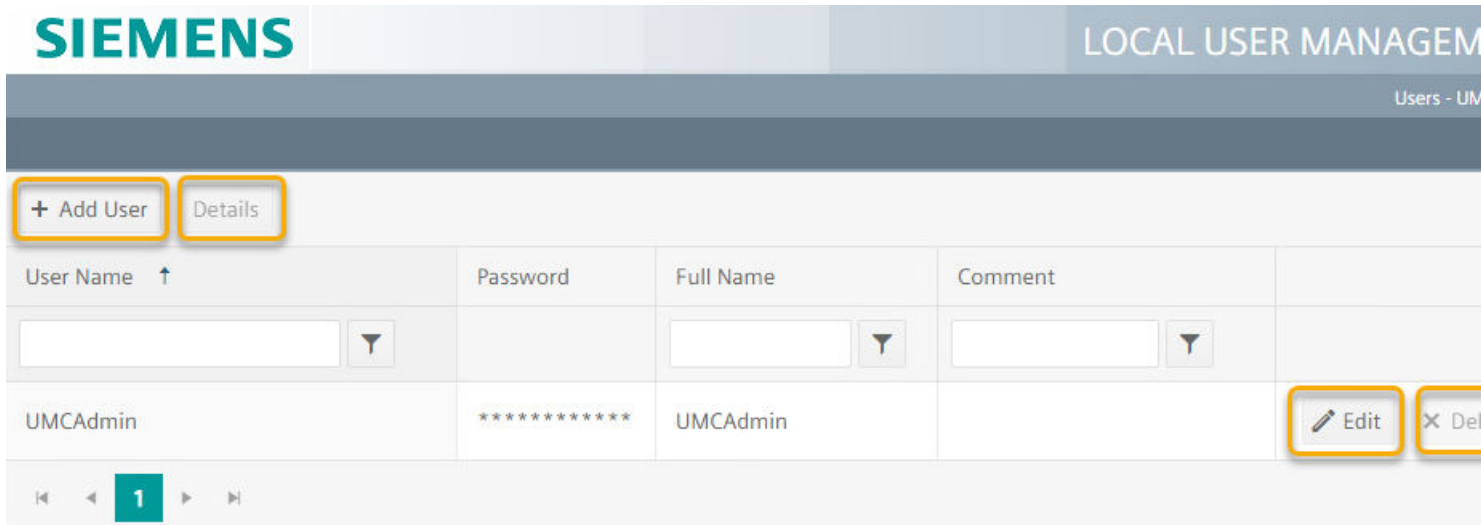

- You have the "User management" function right.
- The home page of the user management is open.

**Opening a user list**

To display the user list, click "Users" in the menu on the homepage.

The user list is displayed.

**Options in the user list**

In the user list you can manage the data of the user via the following buttons:

- "Add users"
- "Details"

- "Edit"
- "Clear"

In the user list, you can:

- Sort users by user name or comment.
- Filter users by user name or comment.
- Display 20 users on one page. Additional users are displayed on a new page. You can switch between the pages.

## Changing the password of a different user (RT Unified)

### Introduction

In the user management you can change the password of a different user. You can also edit the comment.

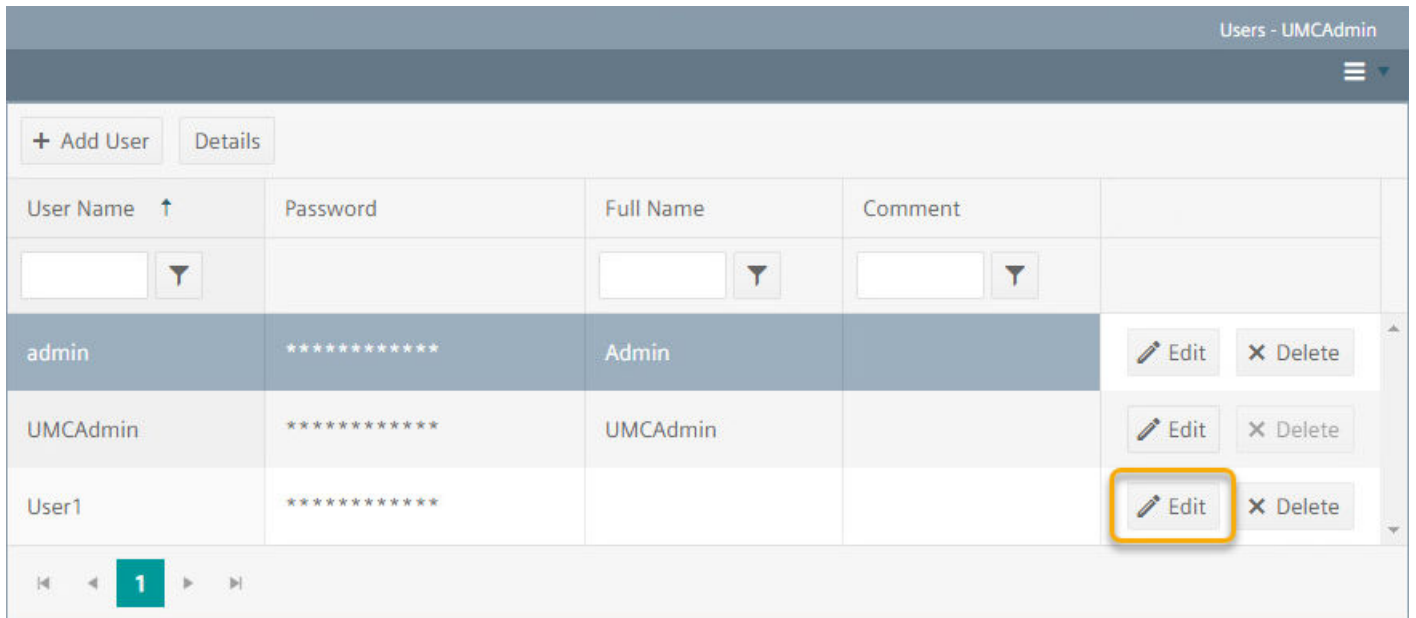

### Requirement

- You have the "User management" function right.
- The home page of the user management is open.

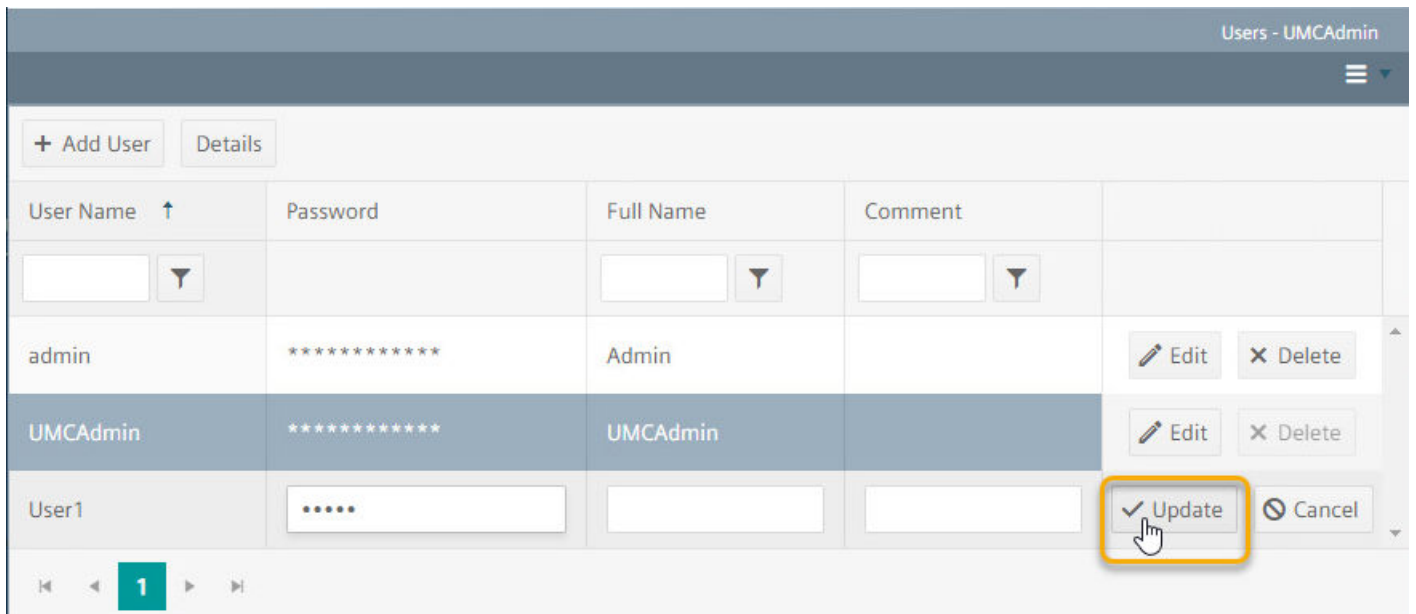

### Changing the password and comment

To change the password or comment of a user in the user list, follow these steps:

1. Select "Users" in the menu.  
The user list is displayed.

2. Select a user and click on "Edit" in the respective row.
3. Change the password or the comment and save the change with the "Update" button.

## Editing password, status or role (RT Unified)

### Introduction

In the user list you can edit the password, the status or the role of a user.

### Requirement

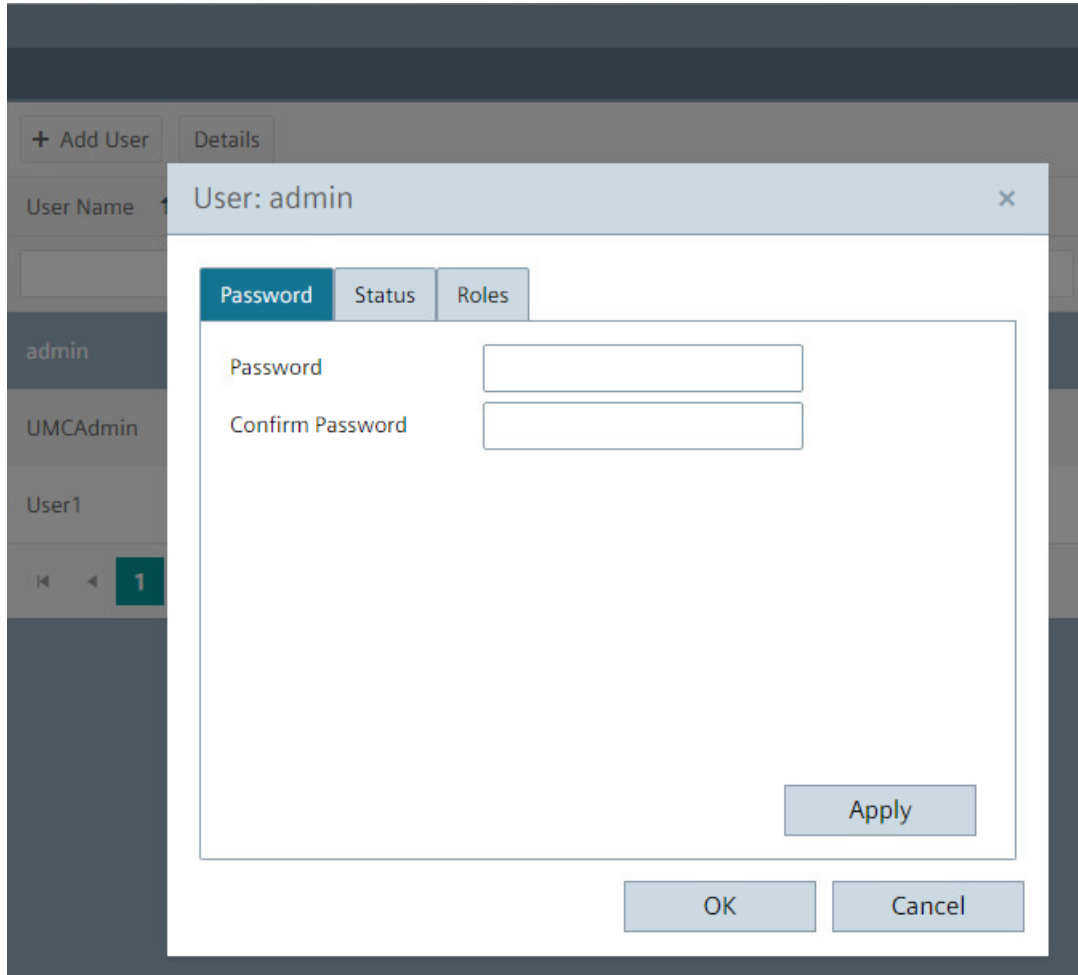

- You have the "User management" function right.
- The home page of the user management is open.

### Changing the password

To change the password of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

3. Enter the new password in the "Password" tab and confirm the password.
4. Confirm your entries with the "Apply" button.  
Save the settings with "OK".

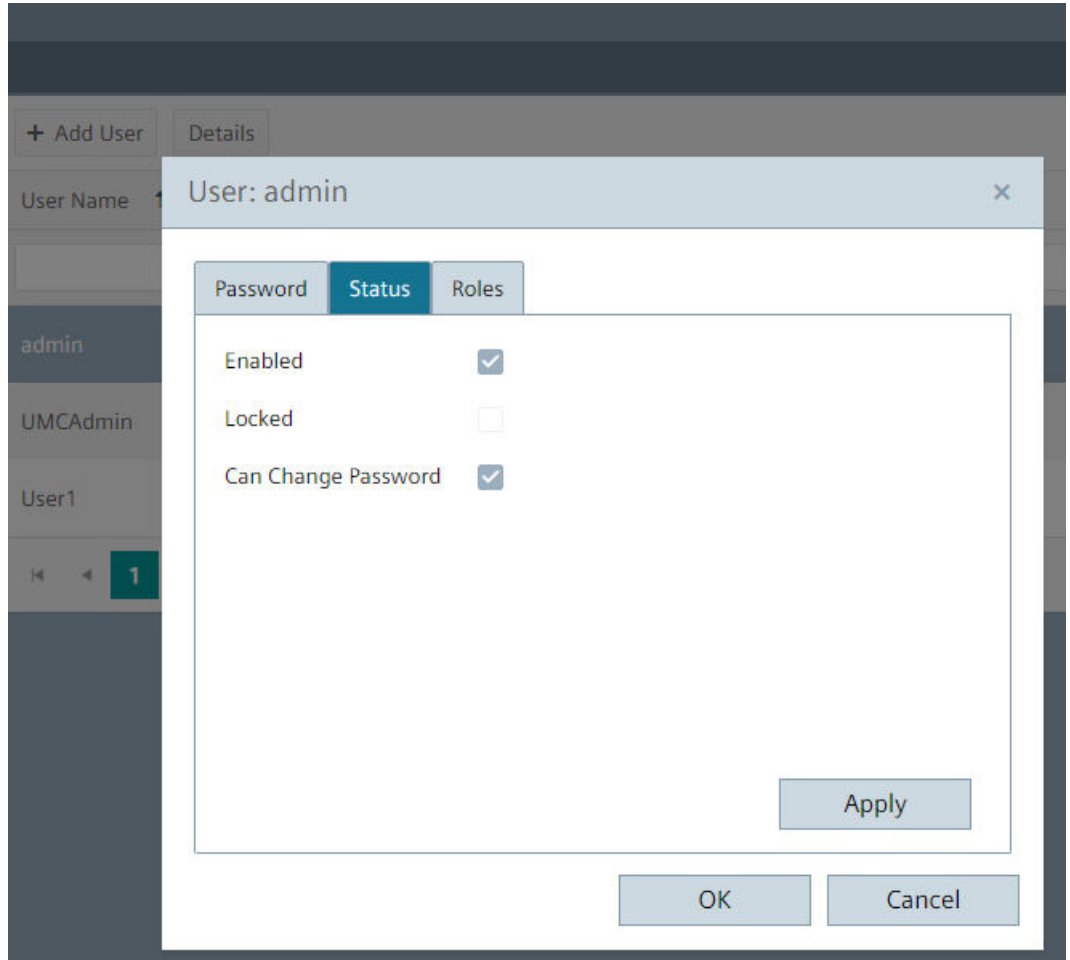

### Changing the status

To edit the status of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

3. In the "Status" tab, you can disable the user or keep this user from changing the password. You cannot change the "Locked" property.
4. Confirm your entries with the "Apply" button. Save the settings with "OK".

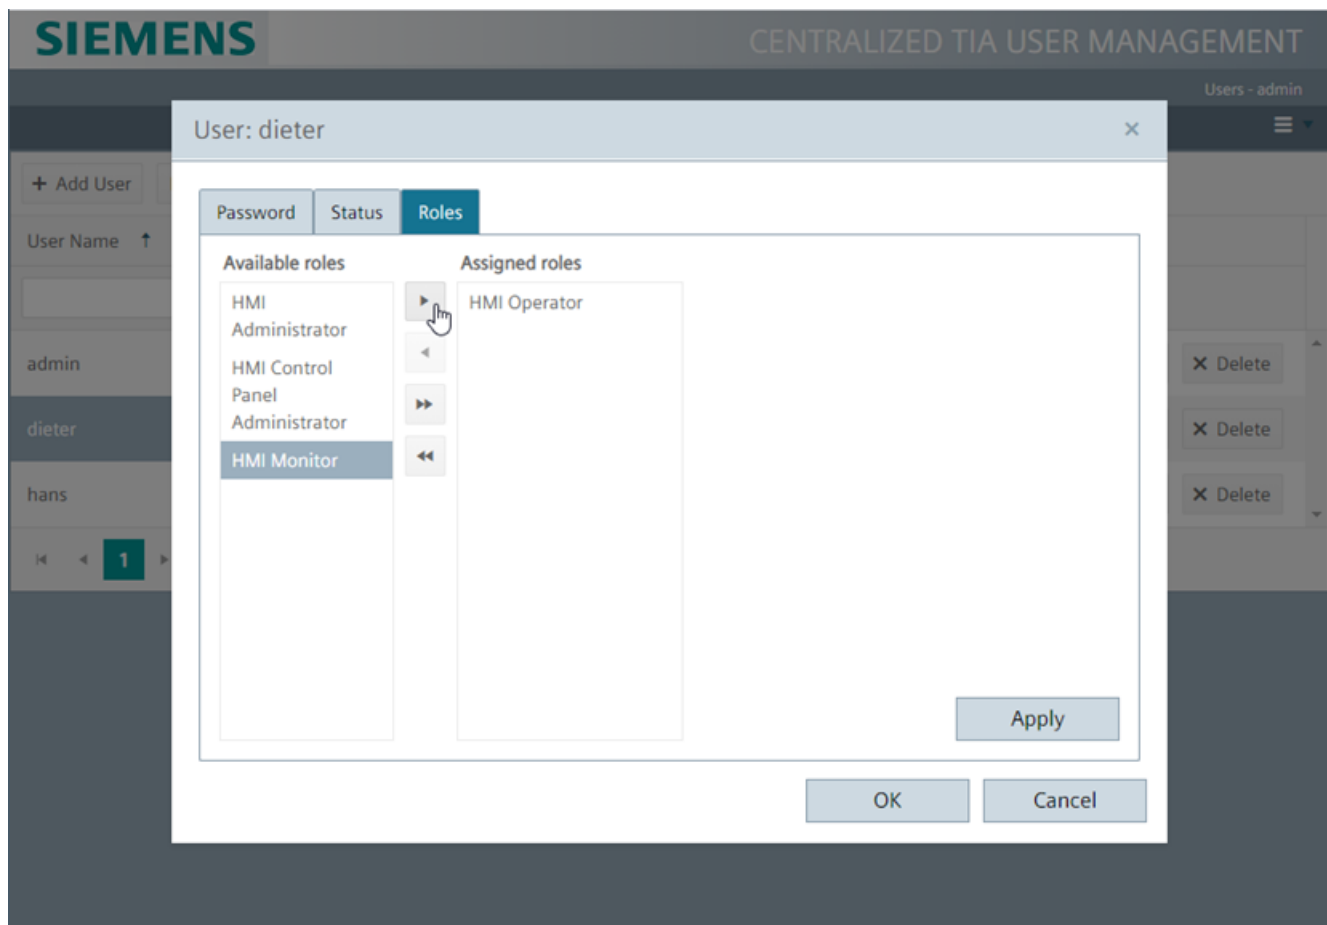

## Changing the role

To edit the role of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.
3. In the "Roles" tab, you can change the roles and thus the associated function rights of the user:
  - Select a role from the "Available roles" or "Assigned roles" list.
  - Change the assignment of this role using the buttons between the two lists.
  - Confirm your entries with the "Apply" button.  
Save the settings with "OK".

The figure below shows you how to assign the "HMI Monitor" role to a user in addition to the "HMI Operator" role.

### Note

Note that at least one user in the project has the "HMI Administrator" role. If access to the user management is not possible, a complete download from the TIA Portal is necessary.

## Adding users (RT Unified)

### Introduction

You can add a new user in the user list.

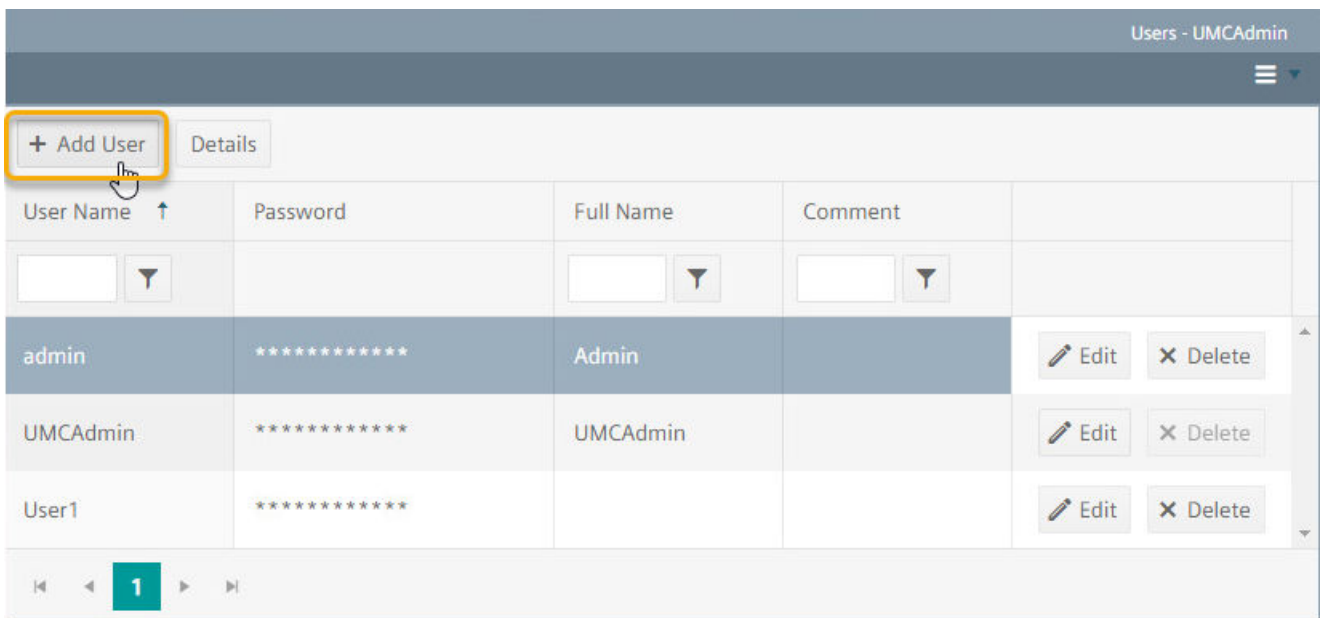

### Requirement

- You have the "User management" function right.
- The home page of the user management is open.

### Adding a new user

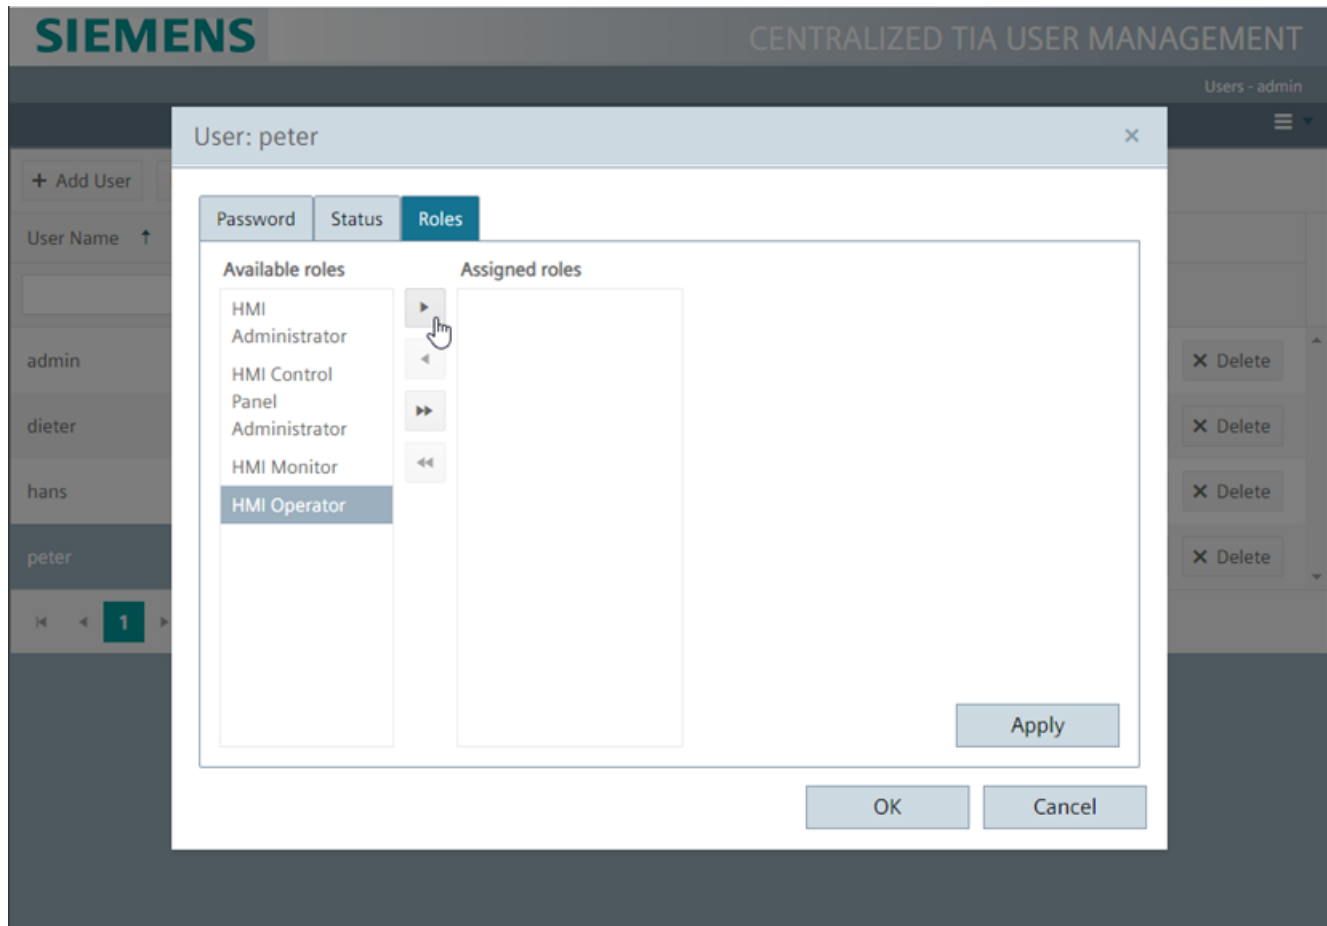

To add a new user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. In the user list, click "Add User".

3. A new row is displayed for the new user in the user list. Enter the information of the new user in the row.

4. Click "Details" in the user list. Assign roles to the new user.

5. Confirm your entries with the "Apply" button. Save the settings with "OK".

## Deleting users (RT Unified)

### Introduction

You can delete a user in the user list.

### Requirement

- You have the "User management" function right.
- The home page of the user management is open.

## Deleting users

To delete a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select the user.
3. Click the "Delete" button in the row. The user is deleted.

Deleting the user from the user list will become effective once the user logs off in Runtime.

## Logging a user out (RT Unified)

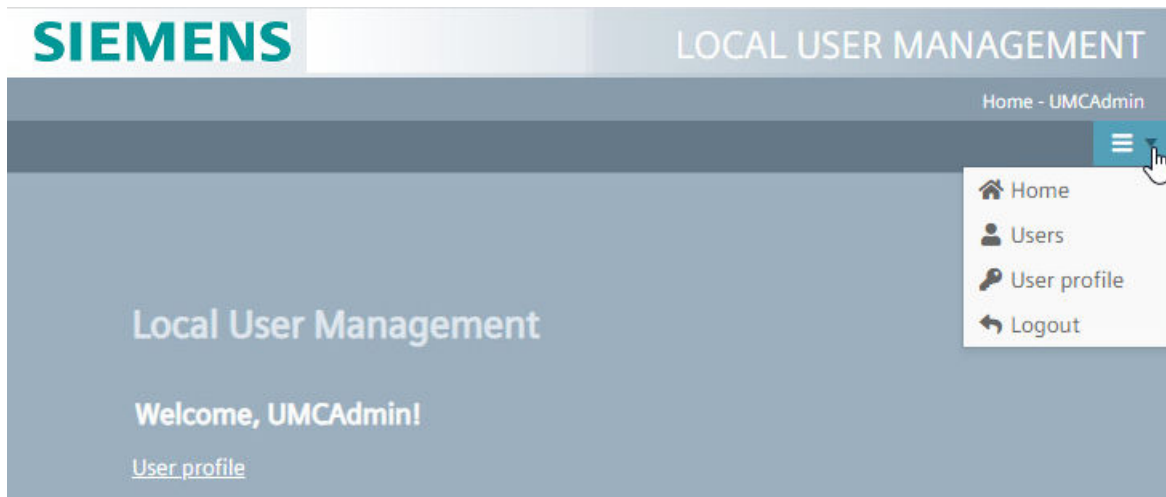

### Introduction

You can log out from the user management.

### Logging out

To log out, proceed as follows:

1. Close all open pages.
2. Select "Logout" from the menu.

You are logged out from runtime and from the user management.

Newly loaded data from the TIA Portal will not be applied until the next time you log in.

## 13.5.6 Using central user management (RT Unified)

### 13.5.6.1 Setting central user management in the SIMATIC Runtime Manager (RT Unified)

Multiple projects can be available on one PC. In SIMATIC Runtime Manager, you can activate the matching configuration of the user data for a selected project.

You cannot switch between local and central user management.

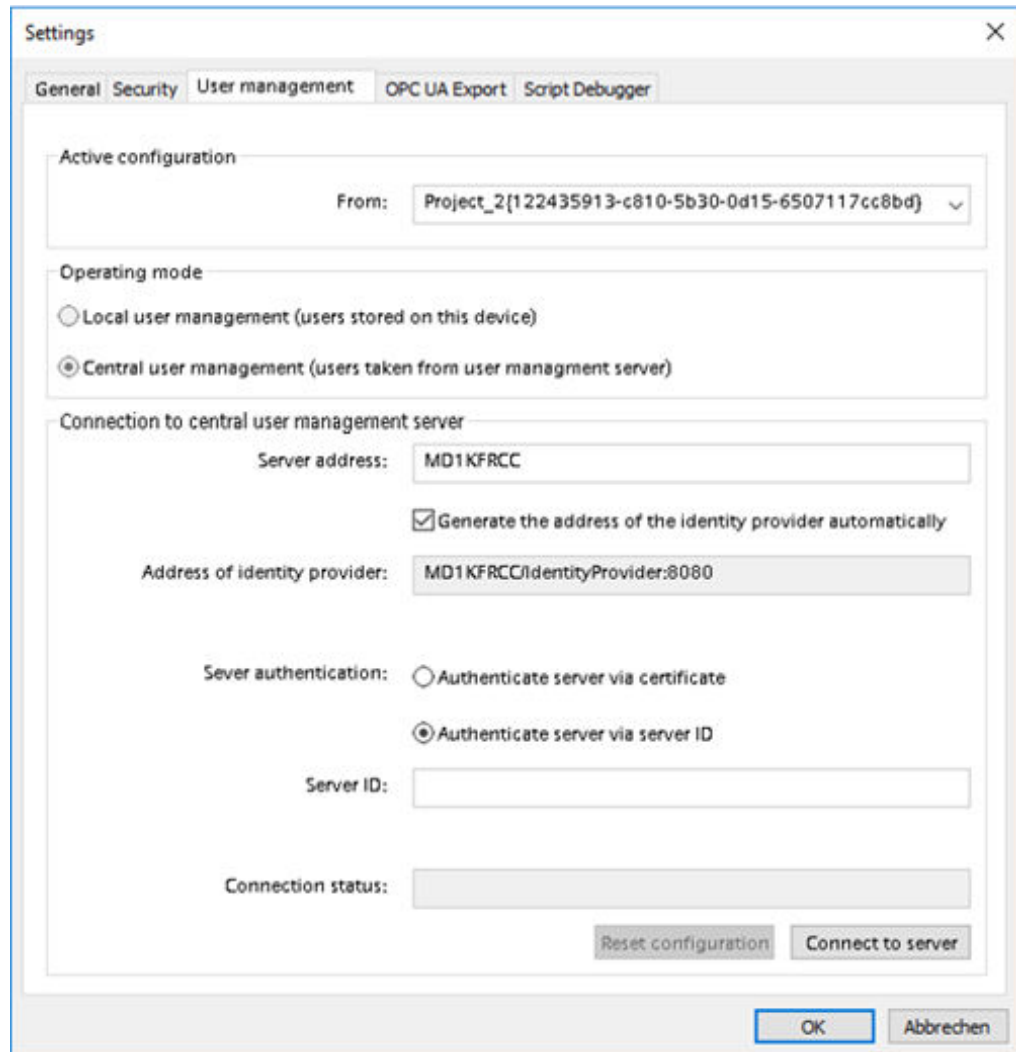

#### Requirement

- At least one project with user management is loaded on the Runtime PC.
- WinCC Unified Runtime is installed.
- SIMATIC Runtime Manager has been started.

## Checking central user management in the SIMATIC Runtime Manager

When you have entered all information in the engineering system and the connection to the central user management can be established, all information is write-protected.

1. In the SIMATIC Runtime Manager, click "Settings" on the home page.
2. Select the "User management" tab.

3. When multiple projects are available on the PC, select the configuration of the user management of a project under "Select configuration".
4. Check the information in the area "Connection to UMC server".
5. Click the "Connect to server" button.
6. If the connection was successfully established, the status of the connection changes to "Connected" and the "Connect to server" button changes to "Check connection". You can reset the connection via "Reset configuration".

## Configuring central user management

When the connection to the central user management could not be established, you can complete the information in the SIMATIC Runtime Manager.

1. In WinCC Unified Runtime, click "Settings" on the start page.
2. Select the "User management" tab.
3. When multiple projects are available on the PC, select the configuration of the user management of a project under "Activate configuration".
4. Complete the information. The setting "Authenticate server using server ID" is not changeable.
5. Click the "Connect to server" button.
6. If the connection was successfully established, the status of the connection changes to "Connected" and the "Connect to server" button changes to "Check connection". You can reset the connection via "Reset configuration".

### 13.5.6.2 Simulating a central user management (RT Unified)

You want to simulate a project in which a central user management is configured for a customer. You have two options if you do not have access to the central user management of the customer:

- Configure your own central user management.
- Configure a local user management.

### Requirement

- You know which groups and their function rights are contained in the central user management of the customer.

## Configuring a central user management

Configure a central user management for the simulation project.

1. Create the users.
2. Create the user groups according to the customer project.
3. Assign the users to the groups.
4. Establish the connection to the central user management.
5. Start the simulation.
6. Log on in runtime.

Changes can be downloaded.

## Configuring a local user management

Configure a local user management.

1. Create one or more users.
2. Assign the roles to the users.
3. Start the simulation.

Changes cannot be downloaded.

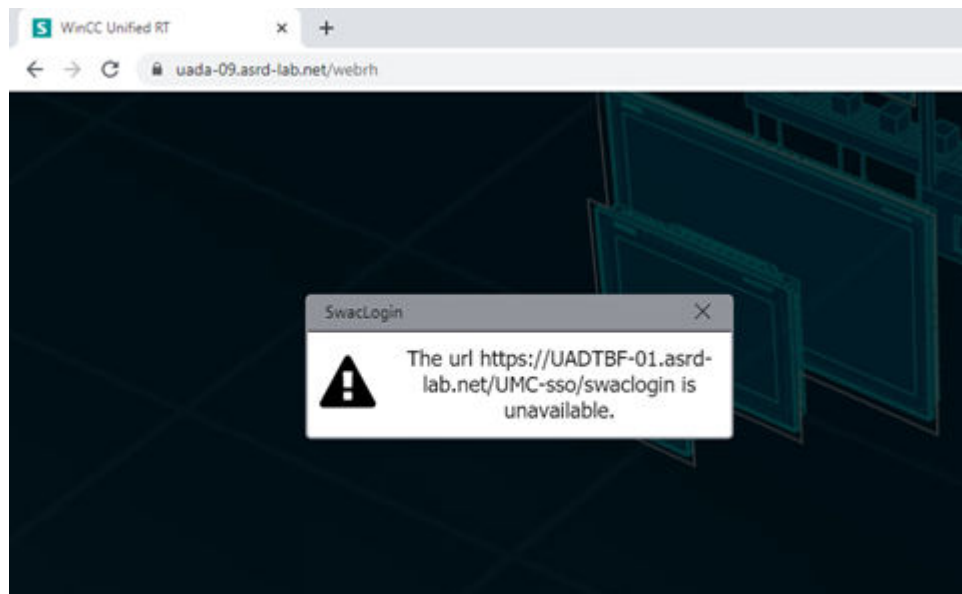

### 13.5.6.3 SwacLogin: Errors after complete download (RT Unified)

After complete download of a project to a Unified PC, an error can occur when you open the WinCC Unified home page. The error can occur regardless of whether you open the home page locally on the PC or from a different device.

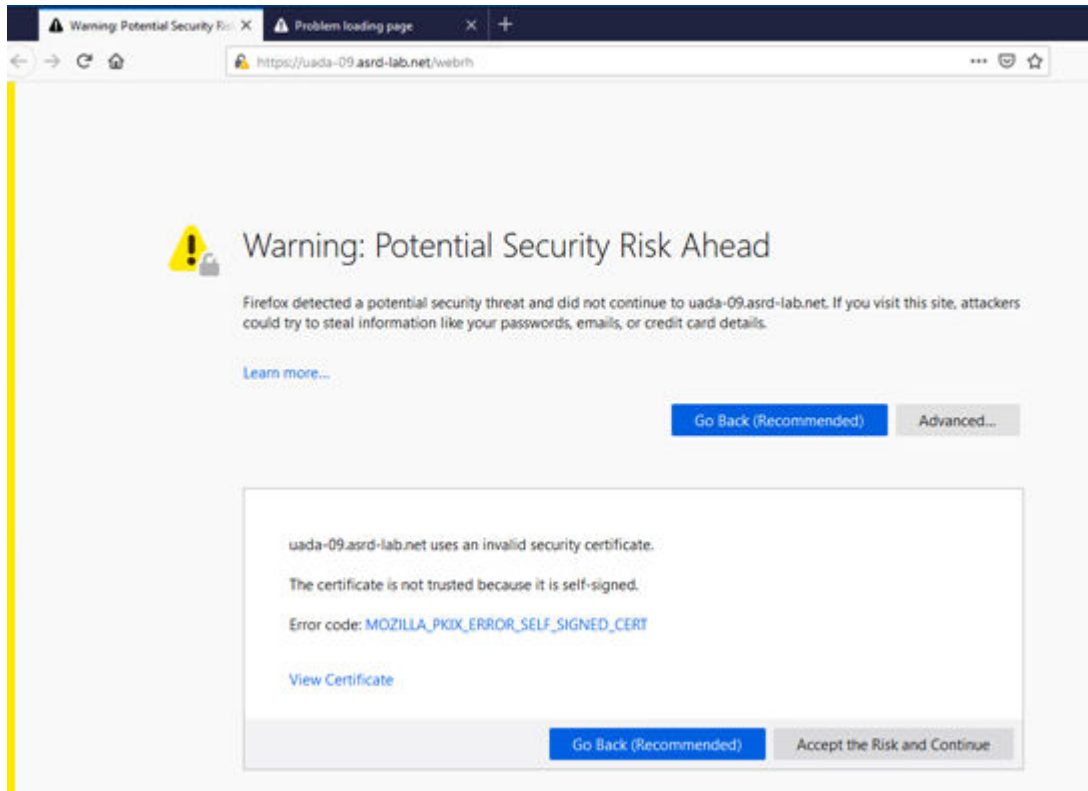

A possible cause of the error is the deletion of the browser cache.

#### Error description

In "Chrome" and "MS Edge", the error is displayed with the following alarm:

In "Firefox", the error is displayed with the following alarm:

After accepting the warning of a potential security risk, the page remains empty in Firefox. Only the background screen is visible.

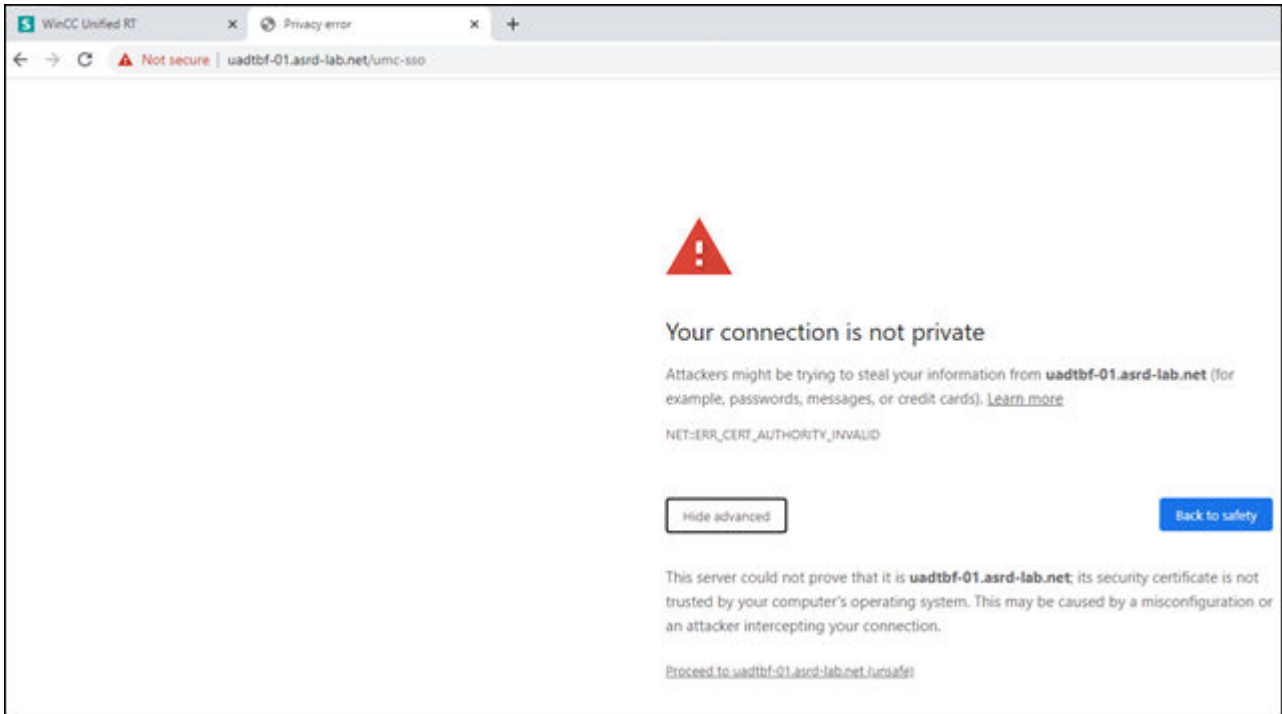

### Remedy the error in "Chrome" and "MS Edge"

To fix the error in "Chrome" and "MS Edge", proceed as follows:

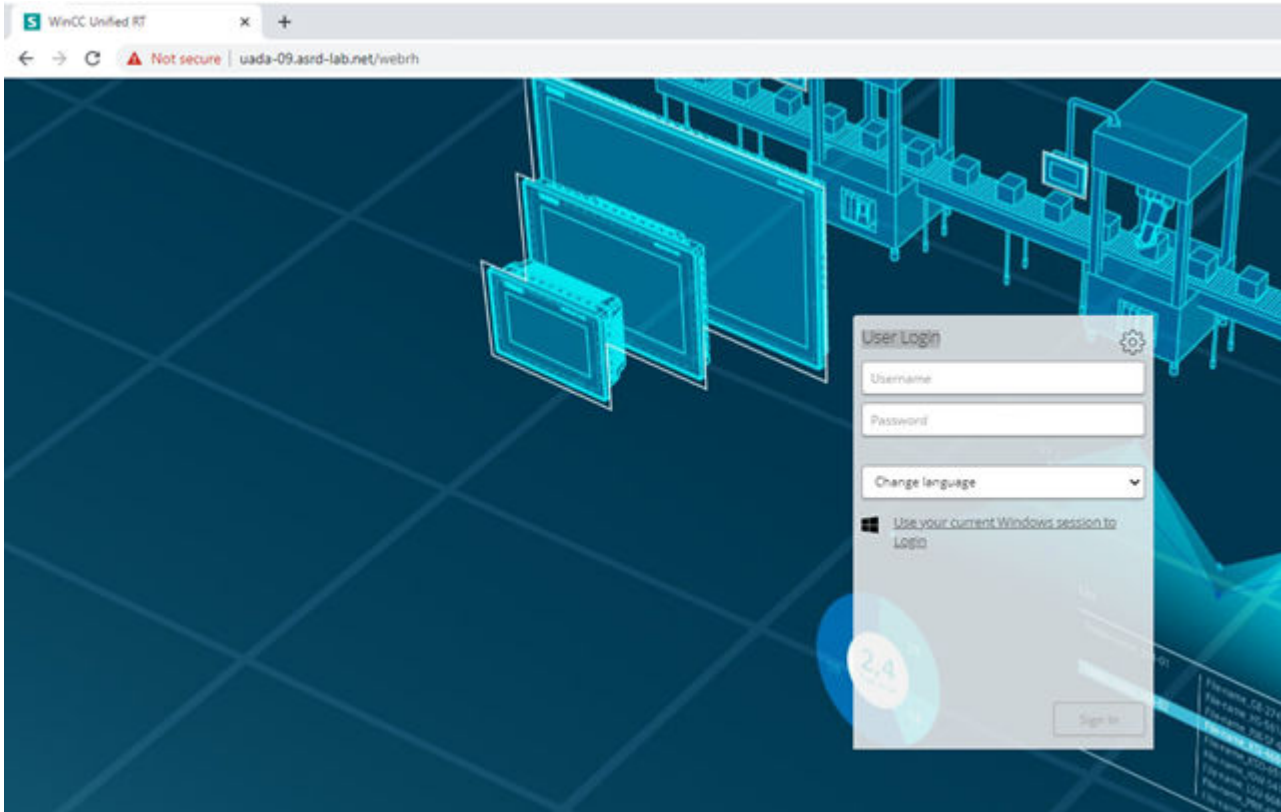

1. Open a new tab.
2. Enter the URL address of the identity provider of the UMC server in the address line of the browser. The URL is the same as the one in the error message without "/swaclogin", for example, "https://uadtbf-01.asrd-lab.net/umc-sso".

3. The page with a warning regarding the secure connection is displayed.

4. Accept the warning by clicking on "Proceed to uadtbf-01.asrd-lab.net (unsafe)".
5. The home page with the "User login" dialog is displayed.

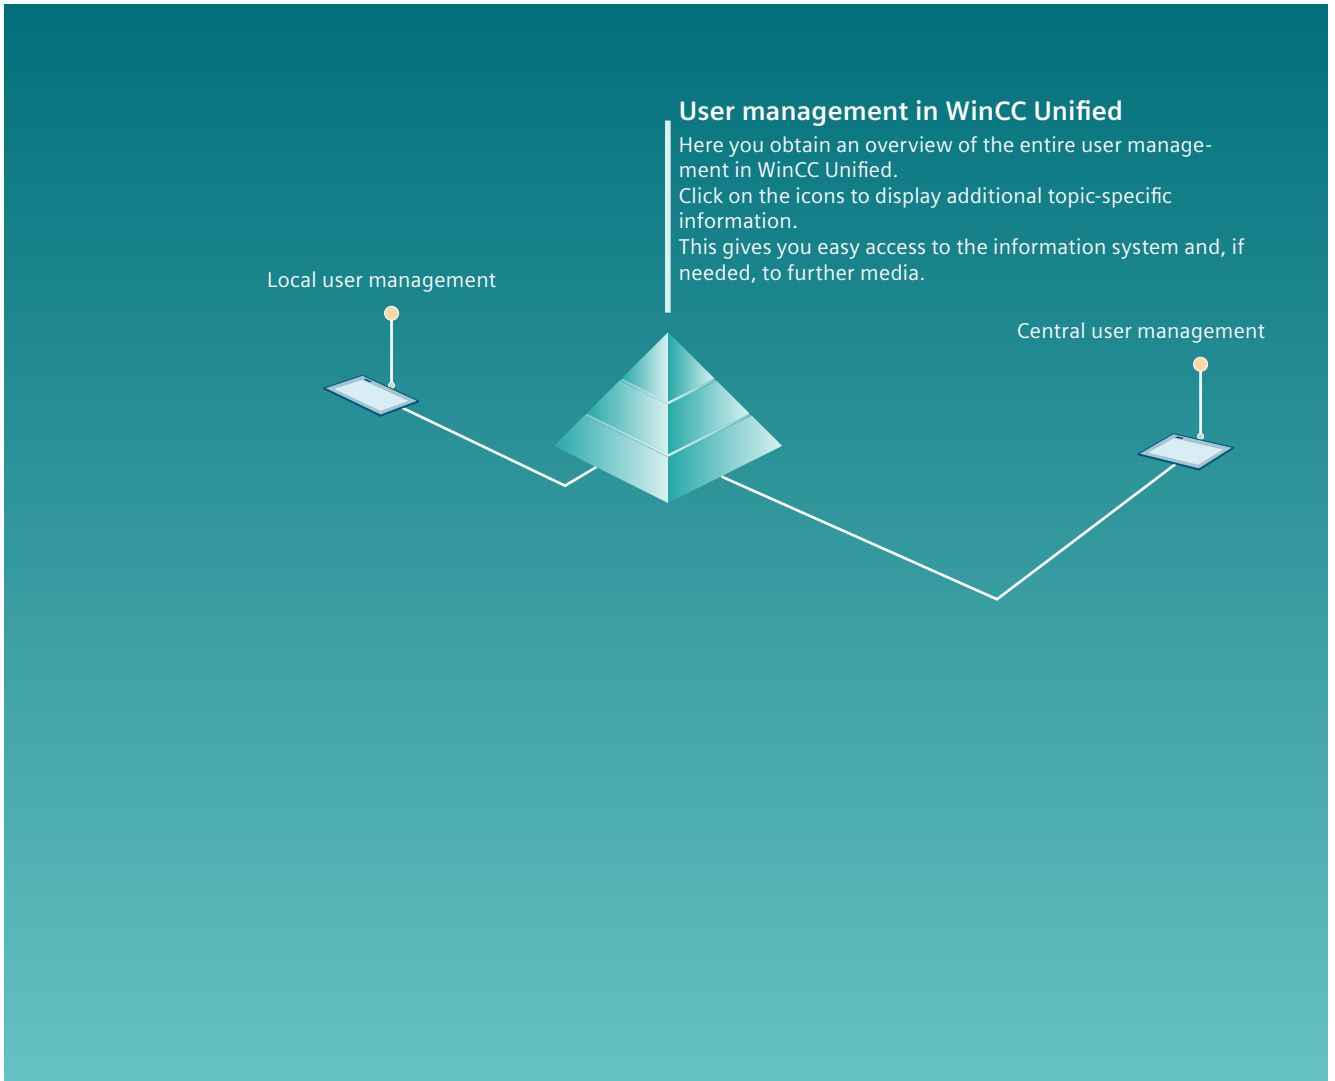

### Remedy the error in "Firefox"

To remedy the error in "Firefox", follow these steps:

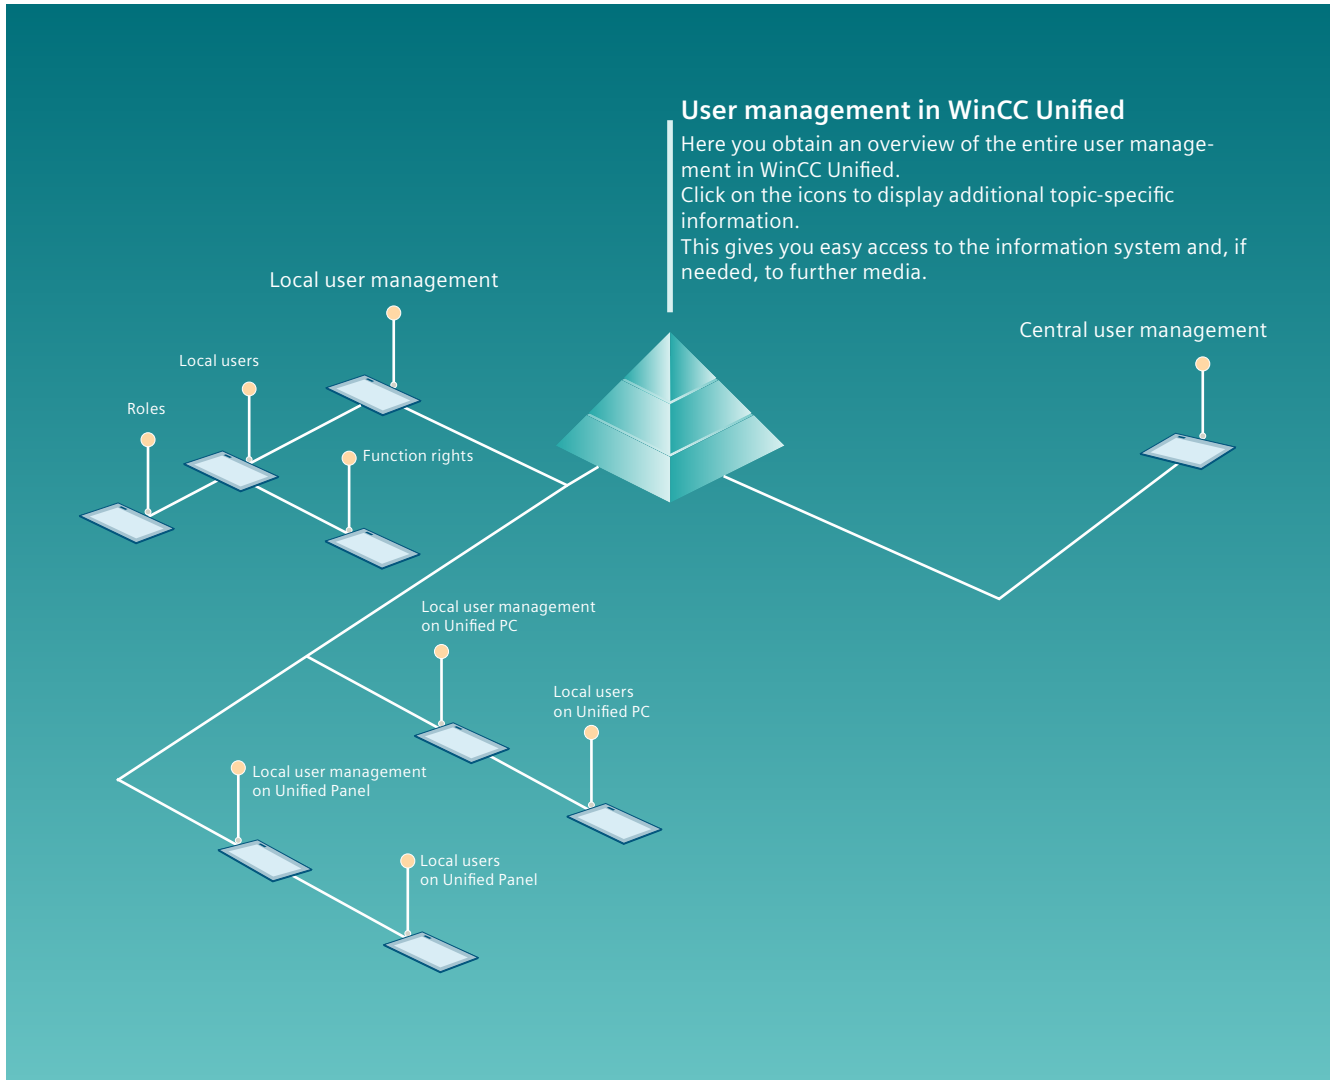

1. Open a new tab.
2. Enter the URL address of the identity provider of the UMC server (ring server) in the address line of the browser, for example, "https://uadtbf-01.asrd-lab.net/umc-sso".
3. A blank page opens. Close the page.
4. Refresh the home page with the function key <F5>. The home page with the "User login" dialog is displayed.

# Connectivity

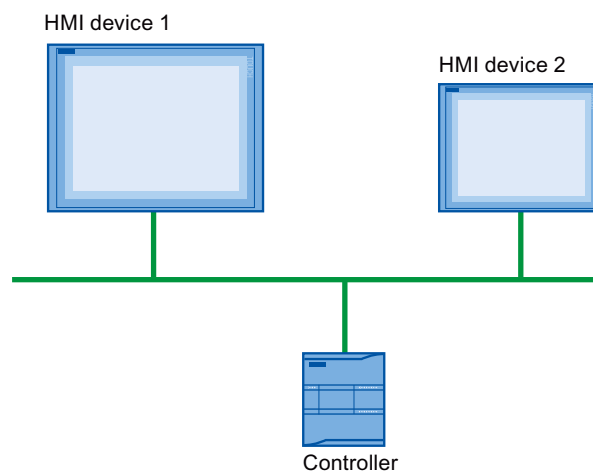

## 14.1 Basics

### 14.1.1 Basics of communication (RT Unified)

#### 14.1.1.1 Communication between devices (RT Unified)

#### Communication

The data exchange between two devices is known as communication. The devices can be interconnected directly or via a network. The networked devices in communication are referred to as communication partners.

Data transferred between the communication partners is used for various purposes:

- Display processes
- Operate processes
- Output alarms
- Archive process values and alarms
- Document process values and alarms
- Administer process parameters and machine parameters

## Communication partners in the automation system

An automation system consists of the following communication partners:

- PLC  
The PLC controls a process by means of a user program.
- HMI device  
The HMI device is used to operate and monitor the process.  
Communication between the communication partners PLC and HMI device is described below.  
Additional information on other forms of communication is available in the online help of the TIA Portal in the section "Editing devices & networks".  
If the following requirements are met, the PLC and HMI device form an automation system:
  - PLC and HMI device are linked to each other
  - Network between PLC and HMI device is configured

## Network configuration

The basis for all types of communication is a network configuration.

- Every device in a network has a unique address.
- The devices carry out communication with consistent transmission characteristics.

## Data exchange using tags

Process values such as temperatures and levels are transferred by tags in Runtime. Process values are stored in the memory of one of the connected automation systems.

To access the process data with the HMI device, link the external HMI tags to the PLC tags.

For additional information on configuring tags, refer to "Configuring tags (Page 707)".

## Communication via a uniform and vendor-neutral interface

With OPC UA (Open Platform Communications Unified Architecture), WinCC has a uniform and manufacturer-independent software interface. This interface enables standardized data exchange between industrial, office, and manufacturing applications.

For more detailed information, refer to the documentation for OPC UA.

Configuring communication (Page 7255)

Resources Monitor (Page 279)

### 14.1.1.2 Configuring communication (RT Unified)

#### Introduction

To configure an automation system, you configure the connections in the "Devices & networks" editor. Connections of devices that are within the same project and were created with the "Devices & networks" editor are referred to as integrated connections. Connections of devices that were created with the "Connections" editor are referred to as non-integrated connections. The devices do not all have to be within the same project.

You use the graphic and table network view for the configuration.

#### Requirement

- The network configuration is complete.
- HMI device and PLC are available in the hardware catalog.

---

#### Note

##### Non-integrated configuration

If integrated configuration of the HMI connections is not possible, create non-integrated HMI connections of the HMI device using the "Connections" editor.

---

#### Procedure

To set up an automation system, always follow the steps below:

##### 1. Inserting devices

You drag a PLC and an HMI device from the hardware catalog to the network view of the "Devices & networks" editor.

##### 2. Configuring devices

Depending on the HMI device used, you add the required communications modules to your PC station.

##### 3. Networking devices

In the networking step, you configure the physical connection of the devices.

To connect the devices, you connect the interfaces of the devices with communications capability using drag and drop.

##### 4. Connecting devices

To set up a logical communication connection between the communication partners, you create an HMI connection between the networked devices.

The tabular network overview supplements the graphical network view.

In addition, the created HMI connection is also visible in the "Connections" editor of the HMI device where it can be configured.

### 14.1.1.3 Secure communication and certificates (RT Unified)

#### Introduction

Runtime Unified supports secure communication with PLCs of the series S7-1200 and S7-1500.

With secure communication, the connection between Runtime and PLC is encrypted by the TLS protocol. A valid PLC certificate must be configured on the PLC.

---

#### Note

##### Encryption with TLS

Always use the most current version of TLS. Disable the older version.

The use of older versions (TLS 1.0 und 1.1) is at your own risk.

---

Also observe the instructions in SiePortal:

- Making use of Runtime by using certificates (<https://support.industry.siemens.com/cs/ww/en/view/109806850>)
- Security guidelines for SIMATIC HMI operator devices and SIMATIC WinCC Unified (<https://support.industry.siemens.com/cs/ww/en/view/109481300>)

##### Connection without secure communication

The connection between Runtime and a PLC without certificate is possible in the following cases:

- If the PLC does not support the use of certificates, e.g. PLCs with older firmware or other series.
- If the option "Only allow secure PG/PC and HMI communication" has been disabled in the engineering at the PLC.  
If this option is disabled, the use of a PLC certificate is optional. If no PLC certificate has been configured, communication is encrypted via CSI. If a PLC certificate has been configured, it is used for authentication and encryption.

---

#### Note

Disabling this option increases the security risk. Using certificates is recommended.

---

## Requirement

The following requirements apply for secure communication between Runtime and PLC:

- The PLC has the following firmware:
  - S7-1200: Firmware 4.5 and higher
  - S7-1500: Firmware 2.9 and higher
- A valid certificate has been configured for the PLC in engineering in the certificate manager:
  - Self-signed end unit certificate  
or
  - End entity certificate issued by a certification authority as well as the root certificate of the certification authority and its certificate revocation list.

---

### Note

It is recommended to enable the "Only allow secure PG/PC and HMI communication" option on the PLC under "Protection & Security > Connection mechanism". If this option is enabled, the PLC always uses secure communication.

---

- The HMI device has an integrated connection to the PLC.  
Or  
The HMI device has a non-integrated connection to a device proxy. The device proxy uses the current device proxy data of the PLC.  
Or  
The HMI device has been connected to the PLC using the "ChangeConnection" system function.

---

### Note

The HMI device does not initially trust the PLC certificate after calling the system function. To establish a secure connection, you must trust the certificate manually:

- Unified PC: SIMATIC Runtime Manager > Settings > Certificates
  - Unified Panel: Control Panel > Security > Certificates
-

## Connection establishment

With secure communication, the PLC sends its certificate to the HMI device for establishing the connection. The HMI device checks the certificate:

- If the HMI device trusts the PLC certificate, the connection is established. The session remains until the connection is interrupted. The process is repeated the next time the connection is established.

---

### Note

Stopping or restarting Runtime interrupts the connection.

The following actions do not interrupt the connection:

- Stopping or restarting the PLC.
  - Download to device (PLC or HMI device)
- 

- If the HMI device does not trust the certificate, the connection is rejected. A system event is output. After the time needed for reconnection (ReconnectTime) has elapsed, the HMI device starts a new connection attempt.

If an integrated connection to the PLC is configured on the HMI device or a non-integrated connection to a device proxy of the PLC, the PLC certificates are loaded into the device when the HMI device is loaded. They are part of the current configuration of the HMI device and automatically have the "Trusted" status. The connection is established automatically.

If the "ChangeConnection" system function was called on the HMI device, the HMI device does not trust the PLC certificate at first. The PLC certificate has the status "untrusted". You must trust the certificate manually:

- Unified PC: SIMATIC Runtime Manager > Settings > Certificates
- Unified Panel: Control Panel > Security > Certificates

## Change to PLC configuration after loading the HMI device.

If you change the PLC configuration in the Engineering System and do not reload the HMI device, the following scenarios may occur the next time a connection is established.

### PLC certificate deleted

If secure communication is not mandatory for the PLC, the connection is established.

If secure communication is mandatory for the PLC, no connection is established.

### PLC certificate added for the first time or existing PLC certificate replaced.

The connection is rejected. Trust the certificate on the HMI device manually:

- Unified PC: Via "SIMATIC Runtime Manager > Settings > Certificates"
