SysFct.CreateSetTagCommand() (Page 1539)

**10.2.2.16 TagLogging**

**Description**

The "TagLogging" object ("HMITagLogging" type) enables access to the logging tags of a logging system.

**Object type**

HMITagLogging

**Properties**

--

**Methods**

The "TagLogging" object has the following methods:

- **CreateLoggedTagSet()**  
Creates a new "LoggedTagSet" object.
- **LoggedTags()**  
References a logging tag ("LoggedTag" object) of a logging system.

## TagLogging.CreateLoggedTagSet()

### Description

The "CreateLoggedTagSet" method creates a new "LoggedTagSet" object ("HMILoggedTagSet" type). The "LoggedTagSet" object can be filled with one or more logging tags.

You use the returned "LoggedTagSet" object for optimized read and write access to multiple logging tags.

### Syntax

```
HMIRuntime.TagLogging.CreateLoggedTagSet ([loggedTagNameArray]);
```

### Parameter

**loggedTagNameArray**

Type: String, HMILoggedTag | String[], HMILoggedTag[]

Logging tag name or array with names of multiple logging tags that are added to the "LoggedTagSet" object. Without parameters, an empty "LoggedTagSet" object is created.

### Return value

Object, HMILoggedTagSet (Page 1476)

### See also

[TagLogging](#) (Page 1464)

[LoggedTagSet](#) (Page 1476)

[LoggedTagSet](#) (Page 1476)

## TagLogging.LoggedTags()

### Description

The "LoggedTags" method references a logging tag ("LoggedTag" object) of a logging system.

### Syntax

```
HMIRuntime.TagLogging.LoggedTags (loggedTagName);
```

### Parameter

**loggedTagName**

Type: String, HMILoggedTag

Logging tag name of a "LoggedTag" object

### Return value

Object, HMILoggedTag (Page 1466)

### See also

TagLogging (Page 1464)

LoggedTag (Page 1466)

## LoggedTag

### Description

The "LoggedTag" object ("HMILoggedTag" type) represents a logging tag of a logging system. A "LoggedTag" object is returned by the "TagLogging" object or the "LoggedTagSet" list.

### Object type

HMILoggedTag

### Properties

The "LoggedTag" object has the following property:

- **Name**  
Returns the name of the logging tag.

### Methods

The "LoggedTag" object has the following methods:

- **AddComment()**  
Adds a comment to a logging tag asynchronously in the logging system.
- **Read()**  
Reads a logging tag of a period from a logging system.
- **WriteCorrectionValue()**  
Writes a correction value to a logging tag.

### See also

TagLogging (Page 1464)

LoggedTagSet (Page 1476)

## LoggedTag.Name

### Description

The "Name" property returns the name of the logging tag ("LoggedTag" object).

### Type

String, HMILoggedTag

### Access

Read-only

### Syntax

```
LoggedTag.Name
```

### See also

LoggedTag (Page 1466)

## LoggedTag.AddComment()

### Description

The "AddComment" method adds a comment to a logging tag ("LoggedTag" object) asynchronously in the logging system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the write operation.

---

#### Note

The comment properties "User", "OperatorStation" and "CommentTimeStamp" are determined from the current script context and cannot be set manually.

---

### Syntax

```
LoggedTag.AddComment (TimeStamp, Language, Comment)  
.then(function() {  
    ...  
})  
.catch(function(errorCode) {  
    ...  
});
```

## Parameters

### **TimeStamp**

Type: DateTime

Time stamp of the comment

### **Language**

Type: UInt32, HMILCID

Country identification of the language of the comment

### **Comment**

Type: String

Comment on the logged tags

## Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)  
No return for the "then()" handler
- Promise rejected (rejected)  
ErrorCode as parameter of the "catch()" handler

## Example

Add a comment for the logging tag:

### **Copy code**

```
let loggedtag = HMIRuntime.TagLogging.LoggedTags("Tag1:LoggingTag1");
let ts = new Date();
HMIRuntime.TagLogging.SysFct.WriteManualValue(loggedtag.Name, 22, ts);
loggedtag.AddComment(ts, 1033, "My Comment")
.then(() => {
    HMIRuntime.Trace("AddComment finished successfully");
})
.catch((errorCode) => {
    HMIRuntime.Trace("AddComment failed, Error: " + errorCode);
});
```

## See also

[LoggedTag \(Page 1466\)](#)

## LoggedTag.Read()

### Description

The "Read" method reads out a logging tag ("LoggedTag" object) of a time period from a logging system. The value, the Quality Code, the time stamp and context information of the logging tag are determined when the logging tag is read.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, after execution is complete, the corresponding handler of the Promise pattern is called with an "LoggedTagResult" object or an error code as parameter.

### Syntax

```
LoggedTag.Read(dateFrom, dateTo, boundingValue)
    .then(function(loggedTagResult) {
        ...
    })
    .catch(function(errorCode) {
        ...
    });
```

### Parameters

**dateFrom**

Type: DateTime

End date of the time period

**dateTo**

Type: DateTime

Start date of the time period

**boundingValue**

Type: Bool

Specifies whether the limit values of the time period are transferred.

### Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)  
Object, HMILoggedTagResult (Page 1471) as parameter of the "then()" handler.
- Promise rejected (rejected)  
ErrorCode as parameter of the "catch()" handler.

## See also

[LoggedTag](#) (Page 1466)

[LoggedTagResult](#) (Page 1471)

## LoggedTag.WriteCorrectionValue()

### Description

The "WriteCorrectionValue" method writes a correction value into a logging tag.

### Syntax

```
LoggedTag.WriteCorrectionValue (Timestamp, Value)
```

### Parameters

#### Timestamp

Type: DateTime

Time stamp of the logging tag whose value is being corrected.

#### Value

Type: Variant

Corrected value which is assigned to the logging tag.

### Return value

ErrorCode

## Example

Correct the values of a logging tag:

### Copy code

```
let tag1 = HMIRuntime.TagLogging.LoggedTags("HMI_Tag_1:LoggingTag_1");

//read logged tag value from the last 10 minutes
let start = new Date();
start.setMinutes(start.getMinutes() - 10);
let end = new Date();
let tagValue = tag1.Read(start, end, 0);
tagValue.then((loggedTagResult) => {
    for (let logtag of loggedTagResult.Values) {
        //increase the logged value by 1
        let corrval = logtag.Value + 1;
        tag1.WriteCorrectionValue(logtag.TimeStamp, corrval);
    }
});
```

## See also

[LoggedTag \(Page 1466\)](#)

## LoggedTagResult

### Description

The "LoggedTagResult" object ("HMILoggedTagResult" type) enables access to the process values of a logging tag. The "LoggedTagResult" object is returned by a read operation of objects "LoggedTag" and "LoggedTagSet" in the logging system. You have access to the process values of logging tags and errors of read operations in the logging system.

### Object type

HMILoggedTagResult

### Properties

The "LoggedTagResult" object has the following properties:

- **Error**  
Returns an error code for the last faulty read or write operation.
- **Name**  
Returns the name of the object or specifies it.
- **Values**  
Returns an array of process values including the quality code.

## Methods

--

## See also

[TagLogging \(Page 1464\)](#)

[LoggedTag \(Page 1466\)](#)

[LoggedTagSet \(Page 1476\)](#)

## LoggedTagResult.Error

### Description

The "Error" property returns an error code for the last faulty read or write operation.

---

#### Note

The value "0" is returned after a successful read or write operation. The error code always relates to the last method call of the object.

---

### Type

ErrorCode

### Access

Read-write

### Syntax

`LoggedTagResult.Error`

## See also

[LoggedTagResult \(Page 1471\)](#)

## LoggedTagResult.Name

### Description

The "Name" property returns or specifies the name of the logging tag.

**Type**

String, HMILoggedTag

**Access**

Read-write

**Syntax**

`LoggedTagResult.Name`

**See also**

[LoggedTagResult \(Page 1471\)](#)

**LoggedTagResult.Values****Description**

The "Values" property returns an array of process values including quality code.

**Type**

Object, HMILoggedTagValueResult[] (Page 1473)

**Access**

Read-write

**Syntax**

`LoggedTagResult.Values`

**See also**

[LoggedTagResult \(Page 1471\)](#)

[LoggedTagValueResult \(Page 1473\)](#)

**LoggedTagValueResult****Description**

The "LoggedTagValueResult" object ("HMILoggedTagValueResult" type) represents the process values of a logging tag with all associated context information.

The object is referenced via the `LoggedTagResult.Values` property.

## Object type

HMILoggedTagValueResult

## Properties

The "LoggedTagValueResult" object has the following properties:

- **Flags**  
Returns context information on the process value.
- **Quality**  
Returns the level of the quality of the process value.
- **TimeStamp**  
Returns the time stamp of the process value.
- **Value**  
Returns the process value.

## Methods

--

## See also

TagLogging (Page 1464)

LoggedTagResult.Values (Page 1473)

## LoggedTagValueResult.Flags

### Description

The "Flags" property returns context information on the process value.

### Type

Int32, hmiTagLoggingValueFlags

Returns context information on the process value:

- Extra (0): There are still additional values at the time of the process value.
- Calculated (2): Process value is calculated.
- Bounding (16): Process value is a limit value.
- NoData (32): No additional information available
- FirstStored (64): Process value is the first value stored in the logging system.
- LastStored (128): Process value is the last value stored in the logging system.

**Access**

Read-write

**Syntax**`LoggedTagValueResult.Flags`**See also**[LoggedTagValueResult \(Page 1473\)](#)**LoggedTagValueResult.Quality****Description**

The "Quality" property returns the level of the quality of the process value.

**Type**

UInt32

**Access**

Read-write

**Syntax**`LoggedTagValueResult.Quality`**See also**[LoggedTagValueResult \(Page 1473\)](#)**LoggedTagValueResult.TimeStamp****Description**

The "TimeStamp" property returns the time stamp of the process value.

**Type**

DateTime

**Access**

Read-write

## Syntax

`LoggedTagValueResult.TimeStamp`

## See also

[LoggedTagValueResult \(Page 1473\)](#)

## LoggedTagValueResult.Value

### Description

The "Value" property returns the process value.

### Type

Variant

### Access

Read-write

### Syntax

`LoggedTagValueResult.Value`

## See also

[LoggedTagValueResult \(Page 1473\)](#)

## LoggedTagSet

### Description

The "LoggedTagSet" object ("HMILoggedTagSet" type) is a list of "LoggedTag" objects that provides optimized access to logging tags. After initialization of the "LoggedTagSet" object, you have read access to multiple logging tags in one call. Access demonstrates better performance and lower communication load than single access to multiple logging tags.

You create a new "LoggedTagSet" object with the "TagLogging.CreateLoggedTagSet" method.

The "LoggedTagSet" object can be counted and enumerated. You can access the "LoggedTagSet" list via the index or the logging tag name.

### Object type

HMILoggedTagSet

## Properties

The "LoggedTagSet" object has the following properties:

- **Count**  
Returns the number of elements of the "LoggedTagSet" list.
- **Error**  
Returns an error code for the last faulty read or write operation.

## Methods

The "LoggedTagSet" object has the following methods:

- **Add()**  
Adds a logging tag to the "LoggedTagSet" list.
- **Clear()**  
Removes all logging tags from the "LoggedTagSet" list.
- **Item()**  
Returns a logging tag of the "LoggedTagSet" list.
- **Read()**  
Reads in all logging tags of the "LoggedTagSet" list.
- **Remove()**  
Removes a logging tag by its name from the "LoggedTagSet" list.

## See also

[TagLogging](#) (Page 1464)

[TagLogging.CreateLoggedTagSet\(\)](#) (Page 1465)

[LoggedTag](#) (Page 1466)

## LoggedTagSet.Count

### Description

The "Count" property returns the number of elements in the "LoggedTagSet" list.

### Type

UInt32

### Access

Read-only

## Syntax

`LoggedTagSet.Count`

## See also

[LoggedTagSet \(Page 1476\)](#)

## LoggedTagSet.Error

### Description

The "Error" property returns an error code for the last faulty read or write operation.

The value "0" is returned after a successful read or write operation. The error code always relates to the last method call of the object.

Evaluate the "Error" property for all objects of the "LoggedTagSet".

### Type

ErrorCode

### Access

Read-only

### Syntax

`LoggedTagSet.Error`

## See also

[LoggedTagSet \(Page 1476\)](#)

## LoggedTagSet.Add()

### Description

The "Add" method adds logging tags ("LoggedTag" objects) to the "LoggedTagSet" list. The logging tags are referenced using the name.

### Syntax

`LoggedTagSet.Add(loggedTags)`

## Parameters

### **LoggedTags**

Type: String, HMILoggedTag | String[], HMILoggedTag

Names of "LoggedTag" objects that are added to the list.

---

### **Note**

No "LoggedTag" object can be transferred as a parameter. A "LoggedTag" object is referenced using the name.

---

## Return value

Object[], HMILoggedTag[] (Page 1466)

## See also

LoggedTag (Page 1466)

LoggedTagSet (Page 1476)

## LoggedTagSet.Clear()

### Description

The "Clear" method removes all logging tags ("LoggedTag" objects) from the "LoggedTagSet" list.

### Syntax

```
LoggedTagSet.Clear()
```

### Parameter

--

### Return value

--

## See also

LoggedTagSet (Page 1476)

LoggedTag (Page 1466)

## LoggedTagSet.Item()

### Description

The "Item()" method returns a "LoggedTag" object of the "LoggedTagSet" list.

### Syntax

```
LoggedTagSet [ .Item ] (name)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "LoggedTagSet" object.

---

### Parameters

#### name

Type: String, HMILoggedTag | Int32, HMILoggedTag

Tag name or index number (1 ... n) of a "LoggedTag" object of the list.

---

#### Note

The index number does not describe the order in which the "LoggedTag" objects were added to the "LoggedTagSet" list.

---

### Return

Object, HMILoggedTag (Page 1466)

### See also

LoggedTagSet (Page 1476)

LoggedTag (Page 1466)

## LoggedTagSet.Read()

### Description

The "Read" method reads all logging tags ("LoggedTag" objects) from the "LoggedTagSet" list. The value, the Quality Code, the time stamp and context information of all logging tags are determined when the logging tag is read.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the

successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, after execution is complete, the corresponding handler of the Promise pattern is called with an array with "LoggedTagResult" object or an error code as parameter.

## Syntax

```
LoggedTagSet.Read(dateFrom, dateTo, boundingValue)
  .then(function(loggedTagArrayResult) {
    ...
  })
  .catch(function(errorCode) {
    ...
  })
```

## Parameters

### **dateFrom**

Type: DateTime

End date of the time period

### **dateTo**

Type: DateTime

Start date of the time period

### **boundingValue**

Type: Boolean

Specifies whether the limit values of the time period are transferred.

## Return value

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)  
Object, HMILoggedTagResult[] (Page 1471) as parameter of the "then()" handler
- Promise rejected (rejected)  
ErrorCode as parameter of the "catch()" handler. This state only exists when all logging tags of the "LoggedTagSet" object could not be read.

## Example

Read and output the content of the logging tag:

### Copy code

```
let logTagSet = HMIRuntime.TagLogging.CreateLoggedTagSet(["Tag1:LoggingTag1",
"Tag1:LoggingTag2"]);
let end = new Date(); // now
let duration = 1000*60*60; // 1h in ms
let begin = new Date(end - duration);
let loggedTagMap = await logTagSet.Read(begin, end, false);
for(let loggedTag of loggedTagMap)
{
    HMIRuntime.Trace("Name:" + loggedTag.Name);
    for(let loggedTagValue of loggedTag.Values) {
        HMIRuntime.Trace("Value:" + loggedTagValue.Value + " Quality:" +
loggedTagValue.Quality + " TS:" + loggedTagValue.TimeStamp + " Flags:" +
loggedTagValue.Flags);
    }
}
```

## See also

[LoggedTagSet \(Page 1476\)](#)

[LoggedTag \(Page 1466\)](#)

[LoggedTagResult \(Page 1471\)](#)

## LoggedTagSet.Remove()

### Description

The "Remove" method removes logging tags ("LoggedTag" objects) using their names from the "LoggedTagSet" list.

### Syntax

```
LoggedTagSet.Remove(loggedTags)
```

### Parameters

#### **loggedTags**

Type: String, HMILoggedTag | String[], HMILoggedTag

Removes a "LoggedTag" object from the "LoggedTagSet" list.

---

#### **Note**

No "LoggedTag" object can be transferred as a parameter. A "LoggedTag" object is referenced using the name.

---

**Return value**

--

**See also**[LoggedTagSet \(Page 1476\)](#)[LoggedTag \(Page 1466\)](#)**LoggedTag****Description**[LoggedTag \(Page 1466\)](#)**LoggedTagResult****Description**[LoggedTagResult \(Page 1471\)](#)**SysFct****Description**

The "SysFct" object ("HMITagLoggingSysFct" type) enables access to system functions of the "TagLogging" object.

**Object type**

HMITagLoggingSysFct

**Properties**

--

**Methods**

The "SysFct" object has the following methods:

- **ClearTagLog()**  
Deletes all logging tags in the specified logging system.
- **WriteManualValue()**  
Assigns a new value to the specified logging tag.

**See also**

TagLogging (Page 1464)

**SysFct.ClearTagLog()****Description**

The "ClearTagLog" method deletes the logged tags from the logging system whose name was passed via the parameter. The method removes all records from the specified logging system. All segments up to the current segment are deleted. The remaining segment is given a new start time.

---

**Note**

No automatic backup is created before the "ClearTagLog" method is executed.

---

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

**Syntax**

```
HMIRuntime.TagLogging.SysFct.ClearTagLog(LogName)
  .then(function() {
    ...
  })
  .catch(function(errorCode) {
    ...
  });
```

**Parameters****LogName**

Type: String, HMIDataLog

Name of the logging system from which the logging tags are deleted.

**Return value**

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)  
No return for the "then()" handler
- Promise rejected (rejected)  
ErrorCode as parameter of the "catch()" handler

**See also**

SysFct (Page 1483)

**SysFct.WriteManualValue()****Description**

The "WriteManualValue" method assigns a new value to the specified logging tag. The associated time stamp is transferred in this process.

**Syntax**

```
HMIRuntime.TagLogging.SysFct.WriteManualValue (LoggedTagName, Value, Timestamp);
```

**Parameter****LoggedTagName**

Type: String, HMILoggedTag

Logging tag which is assigned the specified value.

**Value**

Type: Variant

Value assigned to the specified logging tag.

**Timestamp**

Type: DateTime

Time stamp assigned to the specified value.

**Return value**

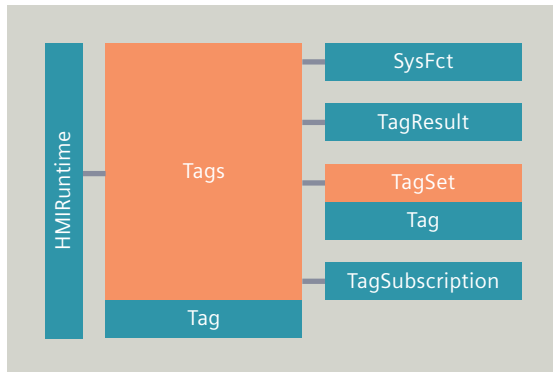

ErrorCode

**See also**

SysFct (Page 1483)

### 10.2.2.17 Tags

#### Description

The "Tags" object ("HMITags" type) enables access to HMI tags in runtime. By default, you reference a "Tag" object ("HMITag" type) through the "Tags" object. The "Tag" object gives you access to all properties and methods of the tags.

#### Use

---

##### Note

The "Tags" object is not a listing like, for example the objects "TagSet" or "AlarmSet", but rather a Factory. You create an instance of the "Tag" object via the tag name.

The "Tag" objects cannot be counted and enumerated like conventional lists.

---

The Tags object declares tags ("Tag" objects) for read and write access. The appropriate HMI tags must exist for the read and write access to be executed without errors.

To reduce the use of the "Tags" object, you can also use the alias `Tags` for `HMIRuntime.Tags`.

#### Object type

HMITags

#### Properties

--

## Methods

The "Tags" object has the following methods:

- **CreateSubscription()**  
Creates a "TagSubscription" object for monitoring HMI tags
- **CreateTagSet()**  
Creates a new "TagSet" object.
- **Item()**  
Returns a new instance of a "Tag" object.

## Tags.CreateSubscription()

### Description

The "CreateSubscription" method creates a "TagSubscription" object ("HMITagSubscription" type). The "TagSubscription" returned object enables HMI tags to be monitored for change.

### Syntax

```
Tags.CreateSubscription(tagNameArray, OnTag);
```

### Parameters

**tagNameArray**

Type: String | String[], HMITag[]

Name or array of names of the monitored HMI tags.

**OnTag**

Type: Function, HMIONTagCB

Callback function that is executed when HMI tags are changed.

Prototype of the callback function: OnTag (tagResult)

The "tagResult" parameter is an object of type "HMITagResult[]" that contains the properties of the changed HMI tags.

### Return value

Object, HMITagSubscription (Page 1519)

## Example

Monitor changes to HMI tags "HMI\_Tag\_1", "HMI\_Tag\_2", "HMI\_Tag\_3", and output names and changed values:

### Copy code

```
let subs = HMIRuntime.Tags.CreateSubscription(['HMI_Tag_1', 'HMI_Tag_2',
'HMI_Tag_3'], function (TagArray) {
    for (let index in TagArray) {
        HMIRuntime.Trace("Tag Name_" + (index + 1) + " = " +
TagArray[index].Name);
        HMIRuntime.Trace("Tag Value_" + (index + 1) + "= " +
TagArray[index].Value);
    }
});
subs.Start();
```

## See also

[Tags \(Page 1486\)](#)

[TagResult \(Page 1508\)](#)

[TagSubscription \(Page 1519\)](#)

## Tags.CreateTagSet()

### Description

The "CreateTagSet" method creates a new "TagSet" object ("HMITagSet" type). The "TagSet" object can be filled with one or more tags.

You use the returned "TagSet" object for read and write access to multiple tags.

### Syntax

```
[HMIRuntime.]Tags.CreateTagSet([tagNameArray]);
```

---

#### Note

The `HMIRuntime.` part of the expression is not required. The alias `Tags` stands for `HMIRuntime.Tags`.

---

### Parameters

#### **tagNameArray**

Optional, type: String, HMITag | String[], HMITag

Name of a tag or array with names of multiple tags that are added to the "TagSet" object. Without parameters, an empty "TagSet" object is created.

## Return value

Object, HMITagSet (Page 1521)

## Example

Create a "TagSet" object and add multiple objects "Tag" by their names:

### Copy code

```
function TagSetCreate() {  
    //Tags_Required: "Tag0"; "Tag1"; "Tag2"  
    var tagnameArray = ["Tag0", "Tag1", "Tag2"];  
    var ts = Tags.CreateTagSet(tagnameArray);  
}
```

## See also

Tags (Page 1486)

TagSet (Page 1521)

## Tags.Item()

## Description

The "Item" returns a new instance of a "Tag" object.

## Syntax

```
[HMIRuntime.]Tags[.Item] (tagName);
```

---

### Note

The `HMIRuntime.` part of the expression is not required. The alias `Tags` stands for `HMIRuntime.Tags`.

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Tags" object.

---

## Parameters

### **tagName**

Type: String, HMITag

Tag name of a "Tag" object.

---

**Note**

The "Tags" object is not a list, but rather a Factory. The "Tag" objects cannot be counted and enumerated like conventional lists. Tags are only referenced through their configured name.

---

**Return value**

Object, HMI Tag (Page 1490)

**Example**

Instantiate the "TankLevel" tag as the "Tag" object and assign it to the "level" tag:

**Copy code**

```
var level = HMIRuntime.Tags.Item("TankLevel");
```

or

**Copy code**

```
var level = Tags("TankLevel");
```

**See also**

Tags (Page 1486)

Tag (Page 1490)

**Tag**

**Description**

The "Tag" object (type "HMI Tag") represents an HMI tag in runtime. A "Tag" object is returned by the "Tags" object or the "TagSet" list. The "Tag" object gives you access to all properties and methods of a tag.

**Object type**

HMI Tag

## Properties

The "Tag" object has the following properties:

- **ErrorDescription**  
Returns a description of the error code for the last faulty access.
- **LastError**  
Returns an error code for the last faulty read or write operation.
- **Name**  
Returns the name of the tag.
- **QualityCode**  
Returns the quality level of a tag value after reading a tag.
- **TimeStamp**  
Returns the time stamp of the last read operation.
- **Value**  
Specifies a value for the object being used or returns it.

## Methods

The "Tag" object has the following methods:

- **Decrease()**  
Reduces the current tag value in the AS by the specified value.
- **Increase()**  
Increases the current tag value in the AS by the specified value.
- **Read()**  
Reads a tag ("Tag" object).
- **ResetBit()**  
Deletes a bit of the tag in the automation system.
- **SetBit()**  
Sets a bit of the tag in the AS.
- **Write()**  
Writes tag in the automation system.
- **WriteQCD()**  
Writes the value of the tag ("Tag" object).
- **WriteWithOperatorMessage()**  
Writes the values of the tag ("Tag" object) and then triggers an operator input alarm.

## Values after initialization

The properties of the "Tag" object include the following values after successful initialization of the object:

Property	After successful initialization
Name	Tag name (unchanged)
Value	VT_EMPTY

Property	After successful initialization
QualityCode	BAD NON-SPECIFIC
TimeStamp	0
LastError	0
ErrorDescription	""

### Values after a read operation

The properties of the "Tag" object include the following values after the last read operation:

Property	After successful read operation	After unsuccessful read operation
Name	Tag name (unchanged)	
Value	Current value of the tag	VT_EMPTY
QualityCode	Quality level	BAD OUT OF SERVICE
TimeStamp	Current time stamp of the tag	0
LastError	0	Error code of read operation
ErrorDescription	""	Description of the error code

### Values after a write operation

The properties of the "Tag" object include the following values after the last write operation:

Property	After successful write operation	After unsuccessful write operation
Name	Tag name (unchanged)	
Value	Current value of the "Tag" object (unchanged)	
QualityCode	BAD OUT OF SERVICE	
TimeStamp	0	
LastError	0	Error code of write operation
ErrorDescription	""	Description of the error code

## Tag.ErrorDescription

### Description

The "ErrorDescription" property returns a description of the error code for the last faulty access.

#### Note

An empty string is returned after a successful read or write operation.

### Type

String

**Access**

Read-only

**Syntax**`Tag.ErrorDescription`**See also**

Tag (Page 1490)

**Tag.LastError****Description**

The "LastError" property returns an error code for the last faulty read or write operation.

---

**Note**

The value "0" is returned after a successful read or write operation.

---

**Type**

ErrorCode

**Access**

Read-only

**Syntax**`Tag.LastError`**See also**

Tag (Page 1490)

**Tag.Name****Description**

The "Name" property returns the name of the tag ("Tag" object).

**Type**

String, HMITag

**Access**

Read-only

**Syntax**

Tag.Name

**See also**

Tag (Page 1490)

**Tag.QualityCode**

**Description**

The "QualityCode" property returns the level of the quality of a tag value after the reading of a tag.

The quality code has the binary 8-bit structure **QQSSLL**. The first two positions (QQ) of the quality code define the quality of the tag value:

Quality	Description	Q	Q	S	S	S	S	L	L
Bad	Tag value cannot be used.	0	0	-	-	-	-	-	-
Uncertain	Quality of the tag value is worse than usual. However, it might still be possible to use the tag value.	0	1	-	-	-	-	-	-
Good (Non-Cascade)	Quality of the tag value is good. Attention should be paid to substatus.	1	0	-	-	-	-	-	-
Good (Cascade)	Quality of the tag value is good. Tag value could be used.	1	1	-	-	-	-	-	-

Positions 3 to 6 (SSSS) of the quality code specify the substatus of the quality. Positions 7 and 8 (LL) are optional and define possible limits.

---

**Note**

Directly after initializing a "Tag" object, the "BAD NON-SPECIFIC" value is returned. After a write operation or an incorrect read operation, the value "BAD OUT OF SERVICE" is returned.

---

**Type**

UInt32

**Access**

Read-write

**Syntax**

Tag.QualityCode

**Quality code of tags**

The realized quality codes are listed in the following table. The table begins with the worst quality code and ends with the best quality code. The best quality code has the lowest priority, while the worst quality has the highest priority. If several statuses occur simultaneously for a tag in the processing chain, the poorest code is passed on.

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x23	Bad	Device passivated - Diagnostic alerts inhibited	0	0	1	0	0	0	1	1
0x3F	Bad	Function check - Local override	0	0	1	1	1	1	1	1
0x1C	Bad	Out of Service - The value is not reliable because the block is not being evaluated, and may be under construction by a configurer. Set if the block mode is O/S.	0	0	0	1	1	1	-	-
0x73	Uncertain	Simulated value - Start	0	1	1	1	0	0	1	1
0x74	Uncertain	Simulated value - End	0	1	1	1	0	1	-	-
0x84	Good (Non-Cascade)	Active Update event - Set if the value is good and the block has an active Update event.	1	0	0	0	0	1	-	-
0x24	Bad	Maintenance alarm - More diagnostics available.	0	0	1	0	0	1	-	-
0x18	Bad	No Communication, with no usable value - Set if there has never been any communication with this value since it was last "Out of Service".	0	0	0	1	1	0	-	-
0x14	Bad	No Communication, with last usable value - Set if this value had been set by communication, which has now failed.	0	0	0	1	0	1	-	-
0x0C	Bad	Device Failure - Set if the source of the value is affected by a device failure.	0	0	0	0	1	1	-	-
0x10	Bad	Sensor failure	0	0	0	1	0	0	-	-
0x08	Bad	Not Connected - Set if this input is required to be connected and is not connected.	0	0	0	0	1	0	-	-
0x04	Bad	Configuration Error - Set if the value is not useful because there is some inconsistency regarding the parameterization or configuration, depending on what a specific manufacturer can detect.	0	0	0	0	0	1	-	-
0x00	Bad	Non-specific - There is no specific reason why the value is bad. Used for propagation.	0	0	0	0	0	0	-	-
0x28	Bad	Process related - Substitute value	0	0	1	0	1	0	-	-
0x2B	Bad	Process related - No maintenance	0	0	1	0	1	0	1	1
0x68	Uncertain	Maintenance demanded	0	1	1	0	1	0	-	-

10.2 WinCC Unified object model

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x60	Uncertain	Simulated value - Set when the process value is written by the operator while the block is in manual mode.	0	1	1	0	0	0	-	-
0x64	Uncertain	Sensor calibration	0	1	1	0	0	1	-	-
0x5C	Uncertain	Configuration error	0	1	0	1	1	1	-	-
0x58	Uncertain	Sub-normal	0	1	0	1	1	0	-	-
0x54	Uncertain	Engineering Unit Range Violation - Set if the value lies outside of the set of values defined for this parameter. The Limits define which direction has been exceeded.	0	1	0	1	0	1	-	-
0x50	Uncertain	Sensor conversion not accurate	0	1	0	1	0	0	-	-
0x4B	Uncertain	Substitute (constant)	0	1	0	0	1	0	1	1
0x78	Uncertain	Process related - No maintenance	0	1	1	1	1	0	-	-
0x4C	Uncertain	Initial Value - Value of volatile parameters during and after reset of the device or of a parameter.	0	1	0	0	1	1	-	-
0x48	Uncertain	Substitute value - Predefined value is used instead of the calculated one. This is used for fail safe handling.	0	1	0	0	1	0	-	-
0x44	Uncertain	Last Usable Value - Whatever was writing this value has stopped doing so. This is used for fail safe handling.	0	1	0	0	0	1	-	-
0x40	Uncertain	Non-specific - There is no specific reason why the value is uncertain.	0	1	0	0	0	0	-	-
0xE0	Good (Cascade)	Initiate Fail Safe (IFS) - The value is from a block that wants its downstream output block (e.g. AO) to go to Fail Safe.	1	1	1	0	0	0	-	-
0xD8	Good (Cascade)	Local Override (LO) - The value is from a block that has been locked out by a local key switch or is a Complex AO/DO with interlock logic active. The failure of normal control must be propagated to a function running in a host system for alarm and display purposes. This also implies "Not Invited".	1	1	0	1	1	0	-	-
0xD4	Good (Cascade)	Do Not Select (DNS) - The value is from a block which should not be selected, due to conditions in or above the block.	1	1	0	1	0	1	-	-
0xCC	Good (Cascade)	Not Invited (NI) - The value is from a block which does not have a target mode that would use this input.	1	1	0	0	1	1	-	-
0xC8	Good (Cascade)	Initialization Request (IR) - The value is an initialization value for a source (back calculation input parameter), because the lower loop is broken or the mode is wrong.	1	1	0	0	1	0	-	-
0xC4	Good (Cascade)	Initialization Acknowledge (IA) - The value is an initialized value from a source (cascade input, remote-cascade in, and remote-output in parameters).	1	1	0	0	0	1	-	-

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0xC0	Good (Cascade)	OK - No error or special condition is associated with this value.	1	1	0	0	0	0	-	-
0xA0	Good (Non-Cascade)	Initiate fail safe	1	0	1	0	0	0	-	-
0x98	Good (Non-Cascade)	Unacknowledged Critical Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority greater than or equal to 8.	1	0	0	1	1	0	-	-
0x94	Good (Non-Cascade)	Unacknowledged Advisory Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority less than 8.	1	0	0	1	0	1	-	-
0x90	Good (Non-Cascade)	Unacknowledged Update event - Set if the value is good and the block has an unacknowledged Update event.	1	0	0	1	0	0	-	-
0x8C	Good (Non-Cascade)	Active Critical Alarm - Set if the value is good and the block has an active Alarm with a priority greater than or equal to 8.	1	0	0	0	1	1	-	-
0x88	Good (Non-Cascade)	Active Advisory Alarm - Set if the value is good and the block has an active Alarm with a priority less than 8.	1	0	0	0	1	0	-	-
0xA8	Good (Non-Cascade)	Maintenance demanded	1	0	1	0	1	0	-	-
0xA4	Good (Non-Cascade)	Maintenance required	1	0	1	0	0	1	-	-
0xBC	Good (Non-Cascade)	Function check - Local override	1	0	1	1	1	1	-	-
0x80	Good (Non-Cascade)	OK - No error or special condition is associated with this value.	1	0	0	0	0	0	-	-

## Limit

The quality codes can be further subdivided by limits. Limits are optional.

Description	Q	Q	S	S	S	S	L	L
O.K. - The value is free to move.	-	-	-	-	-	-	0	0
Low limited - The value has acceded its low limits.	-	-	-	-	-	-	0	1
High limited - The value has acceded its high limits.	-	-	-	-	-	-	1	0
Constant (high and low limited) - The value cannot move, no matter what the process does.	-	-	-	-	-	-	1	1

## See also

Tag (Page 1490)

Tag.WriteQCD() (Page 1506)

## Tag.TimeStamp

### Description

The "TimeStamp" property returns or specifies the time stamp of the last read operation.

---

#### Note

After a write operation or an incorrect read operation, the value "0" is returned.

---

### Type

DateTime

### Access

Read-write

### Syntax

Tag.TimeStamp

### See also

Tag (Page 1490)

Tag.WriteQCD() (Page 1506)

## Tag.Value

### Description

The "Value" property specifies or returns the value of a tag.

---

#### Note

Immediately after initialization of a "Tag" object or an incorrect read operation, the value "VT\_EMPTY" is returned.

---

### Type

Variant

### Access

Read-write

## Syntax

Tag.Value

## See also

Tag (Page 1490)

## Tag.Decrease()

## Description

The "Decrease" method reduces the current tag value in the automation system by the specified value. The value is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

## Syntax

```
Tag.Decrease (value)
  .then (function (ErrorCode) {
    ...
  })
  .catch (function (ErrorCode) {
    ...
  })
```

## Parameters

### value

Type: Float

Numerical value by which the current tag value is decreased in the AS.

## Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)  
ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")  
ErrorCode as parameter of the "catch()" handler

## See also

Tag (Page 1490)

Tag.Increase() (Page 1500)

SysFct.DecreaseTag() (Page 1540)

## Tag.Increase()

### Description

The "Increase" method increases the current tag value in the AS by the specified value. The value is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read-" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

### Syntax

```
Tag.Increase (value)  
.then (function (ErrorCode) {  
    ...  
})  
.catch (function (ErrorCode) {  
    ...  
})
```

```
} )
```

## Parameters

### **value**

Type: Float

Numerical value by which the current tag value is increased in the AS.

## Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)  
    ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")  
    ErrorCode as parameter of the "catch()" handler

## See also

Tag (Page 1490)

Tag.Decrease() (Page 1499)

SysFct.IncreaseTag() (Page 1541)

## Tag.Read()

## Description

The "Read" method reads a tag ("Tag" object). The value, the Quality Code and the time stamp of the tag are determined when the tag is read.

The tags are either read from the tag image (cache) or directly from the AS. When the tag image is used, the method registers all tags that are not yet registered. You should use the tag image for cyclic readout of tags. If you do not need the tag value cyclically or the update cycle of the tag is too long, use direct readout (hmiReadDirect).

The method executes a synchronous read operation. When completed, you can use the "" properties "LastError" and "ErrorDescription" to determine if the execution was successful.

## Syntax

```
Tag.Read ( [ readType ] )
```

## Parameters

### **readType**

Optional, type: Int32, hmiReadType

Origin of the tag values:

- hmiReadCache (0) or empty  
Reads the tag value from the tag image. If no registration exists, the tag is registered. For high-performance access, define the used tags as triggers of the script.
- hmiReadDirect (1)  
Reads the tag value directly from the AS. The tag image is not used.

## Return value

Variant

## Example

Read and output the value of the tag "MyTag1":

### Copy code

```
let tag1 = Tags("MyTag1");  
let tagValue1 = tag1.Read();  
HMIRuntime.Trace("value of MyTag1: " + tagValue1);
```

## See also

[Tag \(Page 1490\)](#)

## Tag.ResetBit()

### Description

The "ResetBit" method deletes a bit of the tag in the AS. The bit of the tag is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

## Syntax

```
Tag.ResetBit(BitNumber)
  .then(function(ErrorCode) {
    ...
  })
  .catch(function(ErrorCode) {
    ...
  })
```

## Parameters

### **BitNumber**

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "0" (False).

## Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)  
 ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")  
 ErrorCode as parameter of the "catch()" handler

## See also

[SysFct.ResetBitInTag\(\)](#) (Page 1542)

## Tag.SetBit()

## Description

The "SetBit" method sets a bit of the tag in the AS. The bit of the tag is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

## Syntax

```
Tag.SetBit(BitNumber)
  .then(function(ErrorCode) {
    ...
  })
  .catch(function(ErrorCode) {
    ...
  })
```

## Parameters

### **BitNumber**

Type: UInt8, value range: 0-63, depending on the data type of the tag  
Bit of the tag that is set to "1" (TRUE).

## Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)  
 ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")  
 ErrorCode as parameter of the "catch()" handler

## See also

[SysFct.SetBitInTag\(\)](#) (Page 1543)

## Tag.Write()

### Description

The "Write" method writes the values of the tag ("Tag" object). You must first set the values of the individual tags with the "Value" property. The value of the "Value" property does not have to be the current value of the tag after the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

The Tag.Write method works asynchronously. The Tag.Read method may return unexpected results if the processing of a preceding Write call is not yet complete.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method of the "TagSet" object.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

### Syntax

```
Tag.Write([value],[writeType])
```

### Parameters

#### **value**

Optional, type: Variant

Writes the tag value:

- Specify value  
The specified value overwrites the current value of the "Value" property of the tag.
- Without value  
The current value of the "Value" property of the tag is written.

#### **writeType**

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty  
Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)  
Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

### Return value

ErrorCode

## Example

Write the tag "MyTag1":

### Copy code

```
let tag1 = Tags("MyTag1");  
tag1.Write(1234);
```

## See also

[Tag](#) (Page 1490)

[Tag.WriteQCD\(\)](#) (Page 1506)

[Tag.WriteWithOperatorMessage\(\)](#) (Page 1507)

## Tag.WriteQCD()

### Description

The "WriteQCD" method writes the value of an internal tag ("Tag" object), including its quality code and time stamp, both synchronously and asynchronously.

When you call the method for an external tag, it writes the quality code and time stamp predefined by the system, not the one defined by the user.

Use this method to import already logged tag values from a runtime system to WinCC Unified.

### Syntax

```
Tag.WriteQCD([value],[writeType],[TimeStamp],[QualityCode])
```

### Parameters

#### **value**

Optional, type: Variant

Writes the tag value.

#### **writeType**

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty  
Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)  
Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

**TimeStamp**

Optional, type: DateTime

Writes the time stamp.

**QualityCode**

Optional, type: UInt32

Writes the quality code.

**Return value**

ErrorCode

**See also**

Tag (Page 1490)

Tag.QualityCode (Page 1494)

Tag.TimeStamp (Page 1498)

Tag.Write() (Page 1505)

Tag.WriteWithOperatorMessage() (Page 1507)

**Tag.WriteWithOperatorMessage()****Description**

The "WriteWithOperatorMessage" method writes the values of the tag ("Tag" object) and then triggers an operator input alarm. The value of the "Value" property does not have to be the current value of the tags after the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

The triggered operator input alarm contains the reason for the value change, the old and new value, the user and host name and the unit.

Once the write operation is completed, the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

**Syntax**

```
Tag.WriteWithOperatorMessage (value, reason)
```

## Parameters

### **value**

Type: Variant

Tag value. The specified value overwrites the current value of the "Value" property of the tags.

### **reason**

Type: String

Reason for the value change of the triggered alarm.

## Return value

ErrorCode

## Example

Write a tag and then output the operator input alarm "Reason":

### Copy code

```
var tag1 = Tags("Tag1");  
var err = tag1.WriteWithOperatorMessage(5000, "Reason");
```

## TagResult

### Description

The "TagResult" object represents the result of a changed HMI tag.

### Object type

HMITagResult

## Properties

The "TagResult" object has the following properties:

- **ErrorDescription**  
Returns a description of the error code for the last faulty access.
- **LastError**  
Returns an error code for the last faulty read or write operation.
- **Name**  
Returns the name of the tag.
- **QualityCode**  
Returns the quality level of a tag value after reading a tag.
- **TimeStamp**  
Returns the time stamp of the last read operation.
- **Value**  
Specifies or returns a value, depending on the object being used.

## Methods

--

## TagResult.ErrorDescription

### Description

The "ErrorDescription" property returns a description of the error code for the last faulty access.

---

**Note**

An empty string is returned after a successful read or write operation.

---

### Type

String

### Access

Read-only

### Syntax

`TagResult.ErrorDescription`

### See also

[TagResult \(Page 1508\)](#)

## TagResult.LastError

### Description

The "LastError" property returns an error code for the last faulty read or write operation.

---

#### Note

The value "0" is returned after a successful read or write operation.

---

### Type

ErrorCode

### Access

Read-only

### Syntax

`TagResult.LastError`

### See also

TagResult (Page 1508)

## TagResult.Name

### Description

The "Name" property returns the name of the tag ("Tag" object).

### Type

String, HMITag

### Access

Read-only

### Syntax

`TagResult.Name`

**See also**

TagResult (Page 1508)

**TagResult.QualityCode****Description**

The "QualityCode" property returns the quality level of a tag value after reading a tag.

The Quality Code is binary-coded. The value must be converted to hexadecimal format for the analysis of the Quality Code.

The quality codes are prioritized. If several codes occur at the same time, the Quality Code reflecting the lowest quality is displayed.

**Type**

UInt32

**Access**

Read-write

**Syntax**

TagResult.QualityCode

**Structure**

The Quality Code has the following binary structure:

High byte: Specific information for WinCC Unified								Low byte: Quality code according to PROFIBUS PA or OPC DA							
Flags				Enhanced substatus				Quality		Substatus				Limits	
Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

### Low byte (bit 7 to bit 0)

The quality code according to PROFIBUS PA, or OPC DA, is described by the low byte (bit 7 to bit 0).

- **Quality (bit 7 and bit 6)**

Quality represents the basic values of the quality levels. Making use of the substatus and limits gives rise to intermediate values over and above the quality stage concerned.

Bit 7	Bit 6	
0	0	Bad - The value is not useful. The reasons are indicated by the sub-status.
0	1	Uncertain - The quality of the value is less than normal, but the value may still be useful. The reasons are indicated by the sub-status.
1	0	Good (Non-Cascade) - The quality of the value is good. Possible alarm conditions may be indicated by the sub-status.
1	1	Good (Cascade) - The quality of the value is good and may be used in control.

- **Sub-status (bit 5 to bit 2)**

The quality alone is not enough. Substatuses divide the individual qualities.

- **Limits (bit 1 and bit 0)**

The Quality Codes can be further subdivided by limits. Limits are optional.

Bit 1	Bit 0	
0	0	O.K. - The value is free to move.
0	1	Low limited - The value has acceded its low limits.
1	0	High limited - The value has acceded its high limits.
1	1	Constant (high and low limited) - The value cannot move, no matter what the process does.

For example, the limits further subdivide the quality code 0x54 (Engineering Unit Range Violation) into the quality codes 0x55, 0x56 and 0x57.

### High byte (bit 15 to bit 8)

Specific information for WinCC Unified is described by the high byte (bit 15 to bit 8).

- **Flags (bit 15 to bit 12)**

Flags contain information on the interpretation of the Quality Code.

Bit 15	reserved	
Bit 14	Time corrected	1: The data timestamp applied by external data source has been corrected by the system. Thus, Bit 13 "Source time" is not set. Time correction happens if the external timestamp is older than the timestamp of the last known value.
Bit 13	Source time	1: The data timestamp has been produced and assigned by external data source.
Bit 12	Source quality	0: The data quality has been determined and assigned by external data source.

- **Extended sub-status (bit 11 to bit 8)**

The extended sub-status provides more detailed information about the sub-status. The extended sub-status is relevant for some quality codes formed by the HMI system.

**Note**

Directly after initializing a "Tag" object, the "BAD NON-SPECIFIC" value is returned. After a write operation or an incorrect read operation, the value "BAD OUT OF SERVICE" is returned.

**Externally generated quality code of tags**

If bit 12 is not set, the Quality Code was generated from an external source in accordance with PROFIBUS PA. The table begins with the worst Quality Code and ends with the best Quality Code. The best Quality Code has the lowest priority, while the worst Quality Code has the highest priority. If several statuses occur for one tag in the process, the poorest code is passed on.

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x23	Bad	Device passivated - Diagnostic alerts inhibited	0	0	1	0	0	0	1	1
0x3C	Bad	Function check - Local override	0	0	1	1	1	1	-	-
0x04	Bad	Configuration Error - Set if the value is not useful because there is some inconsistency regarding the parameterization or configuration, depending on what a specific manufacturer can detect.	0	0	0	0	0	1	-	-
0x1C	Bad	Out of Service - The value is not reliable because the block is not being evaluated, and may be under construction by a configurer. Set if the block mode is O/S.	0	0	0	1	1	1	-	-
0x73	Uncertain	Simulated value - Start	0	1	1	1	0	0	1	1
0x74	Uncertain	Simulated value - End	0	1	1	1	0	1	-	-
0x84	Good (Non-Cascade)	Active Update event - Set if the value is good and the block has an active Update event.	1	0	0	0	0	1	-	-
0x24	Bad	Maintenance alarm - More diagnostics available.	0	0	1	0	0	1	-	-
0x18	Bad	No Communication, with no usable value - Set if there has never been any communication with this value since it was last "Out of Service".	0	0	0	1	1	0	-	-
0x14	Bad	No Communication, with last usable value - Set if this value had been set by communication, which has now failed.	0	0	0	1	0	1	-	-
0x0C	Bad	Device Failure - Set if the source of the value is affected by a device failure.	0	0	0	0	1	1	-	-
0x10	Bad	Sensor failure	0	0	0	1	0	0	-	-
0x08	Bad	Not Connected - Set if this input is required to be connected and is not connected.	0	0	0	0	1	0	-	-
0x00	Bad	Non-specific - There is no specific reason why the value is bad. Used for propagation.	0	0	0	0	0	0	-	-
0x28	Bad	Process related - Substitute value	0	0	1	0	1	0	-	-
0x2B	Bad	Process related - No maintenance	0	0	1	0	1	0	1	1
0x68	Uncertain	Maintenance demanded	0	1	1	0	1	0	-	-

10.2 WinCC Unified object model

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x60	Uncertain	Simulated value - Set when the process value is written by the operator while the block is in manual mode.	0	1	1	0	0	0	-	-
0x64	Uncertain	Sensor calibration	0	1	1	0	0	1	-	-
0x5C	Uncertain	Configuration error	0	1	0	1	1	1	-	-
0x58	Uncertain	Sub-normal	0	1	0	1	1	0	-	-
0x54	Uncertain	Engineering Unit Range Violation - Set if the value lies outside of the set of values defined for this parameter. The Limits define which direction has been exceeded.	0	1	0	1	0	1	-	-
0x50	Uncertain	Sensor conversion not accurate	0	1	0	1	0	0	-	-
0x4B	Uncertain	Substitute (constant)	0	1	0	0	1	0	1	1
0x78	Uncertain	Process related - No maintenance	0	1	1	1	1	0	-	-
0x4C	Uncertain	Initial Value - Value of volatile parameters during and after reset of the device or of a parameter.	0	1	0	0	1	1	-	-
0x48	Uncertain	Substitute value - Predefined value is used instead of the calculated one. This is used for fail safe handling.	0	1	0	0	1	0	-	-
0x44	Uncertain	Last Usable Value - Whatever was writing this value has stopped doing so. This is used for fail safe handling.	0	1	0	0	0	1	-	-
0x40	Uncertain	Non-specific - There is no specific reason why the value is uncertain.	0	1	0	0	0	0	-	-
0xE0	Good (Cascade)	Initiate Fail Safe (IFS) - The value is from a block that wants its downstream output block (e.g. AO) to go to Fail Safe.	1	1	1	0	0	0	-	-
0xD8	Good (Cascade)	Local Override (LO) - The value is from a block that has been locked out by a local key switch or is a Complex AO/DO with interlock logic active. The failure of normal control must be propagated to a function running in a host system for alarm and display purposes. This also implies "Not Invited".	1	1	0	1	1	0	-	-
0xD4	Good (Cascade)	Do Not Select (DNS) - The value is from a block which should not be selected, due to conditions in or above the block.	1	1	0	1	0	1	-	-
0xCC	Good (Cascade)	Not Invited (NI) - The value is from a block which does not have a target mode that would use this input.	1	1	0	0	1	1	-	-
0xC8	Good (Cascade)	Initialization Request (IR) - The value is an initialization value for a source (back calculation input parameter), because the lower loop is broken or the mode is wrong.	1	1	0	0	1	0	-	-
0xC4	Good (Cascade)	Initialization Acknowledge (IA) - The value is an initialized value from a source (cascade input, remote-cascade in, and remote-output in parameters).	1	1	0	0	0	1	-	-

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0xA0	Good (Non-Cascade)	Initiate fail safe	1	0	1	0	0	0	-	-
0x98	Good (Non-Cascade)	Unacknowledged Critical Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority greater than or equal to 8.	1	0	0	1	1	0	-	-
0x94	Good (Non-Cascade)	Unacknowledged Advisory Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority less than 8.	1	0	0	1	0	1	-	-
0x90	Good (Non-Cascade)	Unacknowledged Update event - Set if the value is good and the block has an unacknowledged Update event.	1	0	0	1	0	0	-	-
0x8C	Good (Non-Cascade)	Active Critical Alarm - Set if the value is good and the block has an active Alarm with a priority greater than or equal to 8.	1	0	0	0	1	1	-	-
0x88	Good (Non-Cascade)	Active Advisory Alarm - Set if the value is good and the block has an active Alarm with a priority less than 8.	1	0	0	0	1	0	-	-
0xA8	Good (Non-Cascade)	Maintenance demanded	1	0	1	0	1	0	-	-
0xA4	Good (Non-Cascade)	Maintenance required	1	0	1	0	0	1	-	-
0xBC	Good (Non-Cascade)	Function check - Local override	1	0	1	1	1	1	-	-
0xC0	Good(Cascade)	OK - No error or special condition is associated with this value.	1	1	0	0	0	0	-	-
0x80	Good (Non-Cascade)	OK - No error or special condition is associated with this value.	1	0	0	0	0	0	-	-

### Internally generated quality code of tags

If bit 12 in flags is set, the Quality Code was generated by the HMI system. The table begins with the worst Quality Code and ends with the best Quality Code. The best Quality Code has the lowest priority, while the worst Quality Code has the highest priority. If several statuses occur for one tag in the process, the poorest code is passed on.

---

#### Note

The quality codes in the following table with 3 hexadecimal places have an extended sub-status (bit 11 to bit 8).

---

Code (hex)	Quality		Low byte							
			Q	Q	S	S	S	L	L	L
0x70n	Bad	Disabled	0	0	0	0	-	-	-	-
0x300	Bad	Unusable value - A logged value has been identified to be incorrect, but a respective correction value is not available. The corresponding sub-status is set to 'non-specific'.	0	0	0	0	0	0	0	0
0x04	Bad	Configuration Error - Set if the value is not useful because there is some inconsistency regarding the parameterization or configuration, depending on what a specific manufacturer can detect.	0	0	0	0	0	1	-	-
0x1C	Bad	Out of Service - The value is not reliable because the block is not being evaluated, and may be under construction by a configurer. Set if the block mode is O/S.	0	0	0	1	1	1	-	-
0x18	Bad	No Communication, with no usable value - Set if there has never been any communication with this value since it was last "Out of Service".	0	0	0	1	1	0	-	-
0x14	Bad	No Communication, with last usable value - Set if this value had been set by communication, which has now failed.	0	0	0	1	0	1	-	-
0x10	Bad	Sensor failure	0	0	0	1	0	0	-	-
0x08	Bad	Not Connected - Set if this input is required to be connected and is not connected.	0	0	0	0	1	0	-	-
0x100	Bad	Aggregated value - The value has been calculated out of multiple values with less than the required number of good sources. This includes data aggregation by means of data compression algorithms. The corresponding sub-status is set to 'non-specific'.	0	0	0	0	0	0	0	0
0x00	Bad	non-specific - There is no specific reason why the value is bad. Used for propagation.	0	0	0	0	0	0	-	-
0x74n	Uncertain	Disabled - The provider of the value, e.g. logging tag for logged value, has been disabled and the previous value was GOOD or UNCERTAIN. In case of GOOD the corresponding sub-status is set to 'last usable value'. In case of UNCERTAIN the corresponding sub-status is taken from the last sub-status.	0	1	0	0	-	-	-	-
0x158	Uncertain	Aggregated value - The value has been calculated out of multiple values with less than the required number of good sources to be GOOD as well as less than required number of bad sources to be BAD. This includes data aggregation by means of data compression algorithms. The corresponding sub-status is set to 'sub-normal'.	0	1	0	1	1	0	0	0
0x58	Uncertain	Sub-normal	0	1	0	1	1	0	-	-
0x54	Uncertain	Engineering Unit Range Violation - Set if the value lies outside of the set of values defined for this parameter. The Limits define which direction has been exceeded.	0	1	0	1	0	1	-	-
0x4C	Uncertain	Initial Value - Value of volatile parameters during and after reset of the device or of a parameter.	0	1	0	0	1	1	-	-
0x48	Uncertain	Substitute value - Predefined value is used instead of the calculated one. This is used for fail safe handling.	0	1	0	0	1	0	-	-
0x44	Uncertain	Last Usable Value - Whatever was writing this value has stopped doing so. This is used for fail safe handling.	0	1	0	0	0	1	-	-

Code (hex)	Quality		Low byte								
			Q	Q	S	S	S	S	L	L	
0x40	Uncertain	Non-specific - There is no specific reason why the value is uncertain. Used for propagation.	0	1	0	0	0	0	0	-	-
0x3C0	Good(Cascade)	Corrected value - A logged value has been corrected. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0	0
0x2C0	Good(Cascade)	Manual input - A logged value has been created manually. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0	0
0x1C0	Good(Cascade)	Aggregated value -The value has been calculated out of multiple (GOOD) values. This includes data aggregation by means of data compression algorithms. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0	0
0xD8	Good (Cascade)	Local Override (LO) - The value is from a block that has been locked out by a local key switch or is a Complex AO/DO with interlock logic active. The failure of normal control must be propagated to a function running in a host system for alarm and display purposes. This also implies "Not Invited".	1	1	0	1	1	0	-	-	-
0x6C0	Good(Cascade)	Initial value - The local data source has been initialized with the configured initial value. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0	0
0x4C0	Good(Cascade)	Last usable value - The local data source has been initialized with the last usable value, if pre-sent inside a local persistency. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0	0
0xC0	Good(Cascade)	OK - No error or special condition is associated with this value.	1	1	0	0	0	0	-	-	-

### Quality codes in communication with OPC

When connecting to a OPC UA server, the OPC UA status code is shown in a quality code.

Quality code in WinCC Unified	Status code according to OPC
0x48	0x40
0x4C	0x40
0x5C	0x40
0x60	0x40
0x80...0xD4	0xC0
0xD8	0xC0

### See also

TagResult (Page 1508)

## TagResult.TimeStamp

### Description

The "TimeStamp" property returns or specifies the time stamp of the last read operation.

---

#### Note

After a write operation or an incorrect read operation, the value "0" is returned.

---

### Type

DateTime

### Access

Read-write

### Syntax

`TagResult.TimeStamp`

### See also

TagResult (Page 1508)

## TagResult.Value

### Description

The "Value" property specifies or returns the value of a tag.

---

#### Note

Immediately after initialization of a "Tag" object or an incorrect read operation, the value "VT\_EMPTY" is returned.

---

### Type

Variant

### Access

Read-write

**Syntax**

`TagResult.Value`

**See also**

TagResult (Page 1508)

**TagSubscription****Description**

The "TagSubscription" object enables HMI tags to be monitored for change.

**Use**

The "AlarmSubscription" object represents a selection of active alarms. A "TagSubscription" object is initialized through the "CreateSubscription" method of the "Tags" object.

**Object type**

HMITagSubscription

**Properties**

--

**Methods**

The "TagSubscription" object has the following methods:

- **Start()**  
Activates monitoring of HMI tags of the "TagSubscription" object.
- **Stop()**  
Stops monitoring of HMI tags of the "TagSubscription" object.

**TagSubscription.Start()****Description**

The "Start" method activates the monitoring of HMI tags of the "TagSubscription" object.

**Syntax**

`TagSubscription.Start();`

## Parameters

--

## Return value

ErrorCode

## Example

Monitor changes to the "HMI\_Tag\_1" and "HMI\_Tag\_1" tags:

### Copy code

```
const subs = HMIRuntime.Tags.CreateSubscription(['HMI_Tag_1', 'HMI_Tag_2'], (changedTags)
=> {
  for (const tag of changedTags) {
    HMIRuntime.Trace(`Tag ${tag.Name} value updated to ${tag.Value}`);
  }
  subs.Stop();
});
subs.Start();
```

## See also

[TagSubscription](#) (Page 1519)

[TagSubscription.Stop\(\)](#) (Page 1520)

## TagSubscription.Stop()

### Description

The "Stop" method terminates the monitoring of HMI tags of the "TagSubscription" object.

### Syntax

```
TagSubscription.Stop();
```

## Parameters

--

## Return value

ErrorCode

## Example

Stop monitoring the changes to the "HMI\_Tag\_1" and "HMI\_Tag\_1" tags:

### Copy code

```
const subs = HMIRuntime.Tags.CreateSubscription(['HMI_Tag_1', 'HMI_Tag_2'], (changedTags) =>
{
  for(const tag of changedTags)
  {
    HMIRuntime.Trace(`Tag ${tag.Name} value updated to ${tag.Value}`);
  }
  subs.Stop();
});
subs.Start();
```

[TagSubscription.Start\(\)](#) (Page 1519)

## TagSet

### Description

The "TagSet" object ("HMITagSet" type) is a list of "Tag" objects that provides optimized access to tags in runtime. After initialization of the "TagSet" object, you can execute read and write access to multiple tags in one call. Access demonstrates better performance and lower communication load than single access to multiple tags.

You reference a "TagSet" object through the "Tags" object or create a new "TagSet" object with the "Tags.CreateTagSet" method.

By default, you access a "Tag" object (type "HMITag") through the "TagSet" object. The "Tag" object gives you access to all properties and methods of the tags.

### Use

The "TagSet" object is a list and can be counted and enumerated. You can access the "TagSet" list using the index or the tag name.

The appropriate HMI tags must exist for the read and write access to tags ("Tag" objects) of the list to be executed without errors. If a read or write access error has occurred, can be read out with the properties "LastError" and "ErrorDescription" once the methods have been executed.

### Object type

HMITagSet

## Properties

The "TagSet" object has the following properties:

- **Count**  
Returns the number of elements of the "TagSet" list.
- **ErrorDescription**  
Returns a description of the error code for the last faulty access.
- **LastError**  
Returns an error code for the last faulty read or write operation.

## Methods

The "TagSet" object has the following methods:

- **Add()**  
Adds a tag to the "TagSet" list.
- **Clear()**  
Removes all tags from the "TagSet" list.
- **Item()**  
Returns a tag of the "TagSet" list.
- **Read()**  
Reads in all tags of the "TagSet" list.
- **ReadAsync()**  
Reads in all tags of the "TagSet" list (asynchronous).
- **ReadMaxAge()**  
Reads in all tags of the "TagSet" list and ensures that these are not older than the specified time period (maxAge).
- **Remove()**  
Removes a tag by its name from the "TagSet" list.
- **Write()**  
Writes the values of all tags of the "TagSet" list.
- **WriteAsync()**  
Writes the values of all tags of the "TagSet" list (asynchronous).
- **WriteAsyncQCD()**  
Writes the values of all tags in the "TagSet" list, including their quality code and time stamps (asynchronous).
- **WriteQCD()**  
Writes the values of all tags in the "TagSet" list, including their quality code and time stamps.
- **WriteWithOperatorMessage()**  
Writes the values of all tags of the "TagSet" list and then triggers an operator input alarm for each tag.

## TagSet.Count

### Description

The "Count" property returns the number of elements in the "TagSet" list.

### Type

UInt32

### Access

Read-only

### Syntax

TagSet.Count

### See also

TagSet (Page 1521)

## TagSet.ErrorDescription

### Description

The "ErrorDescription" property returns a description of the error code for the last faulty access. The description of the error code of the last method call is returned.

---

**Note**

An empty string is returned after a successful read or write operation.

---

### Type

String

### Access

Read-only

### Syntax

TagSet.ErrorDescription

**See also**

TagSet (Page 1521)

**TagSet.LastError**

**Description**

The "LastError" property returns an error code for the last faulty read or write operation. The error code for the last method call is returned.

---

**Note**

The value "0" is returned after a successful read or write operation.

---

**Type**

ErrorCode

**Access**

Read-only

**Syntax**

`TagSet.LastError`

---

**Note**

Evaluate the "LastError" property for all objects of the TagSet.

---

**See also**

TagSet (Page 1521)

**TagSet.Add()**

**Description**

The "Add" method adds a tag ("Tag" object) to the "TagSet" list. The tags are referenced by the name.

**Syntax**

`TagSet.Add (tag)`

## Parameters

**tag**

Type: String, HMITag | String[], HMITag | Variant[][], HMITag

Names of "Tag" objects that are added to the list.

---

**Note**

No "Tag" object can be transferred as a parameter. A "Tag" object is referenced using the name.

---

## Return value

Object[], HMITag (Page 1490)

## See also

Tag (Page 1490)

TagSet (Page 1521)

## TagSet.Clear()

### Description

The "Clear" method removes all tags ("Tag" objects) from the "TagSet" list.

### Syntax

```
TagSet.Clear()
```

### Parameter

--

### Return value

--

## See also

TagSet (Page 1521)

TagSet.Remove() (Page 1530)

## TagSet.Item()

### Description

The "Item" method returns a "Tag" object of the "TagSet" list.

### Syntax

```
TagSet [ . Item ] ( name )
```

---

#### Note

The `. Item` part of the expression is not required. The "Item" method is the standard method of the "TagSet" object.

---

### Parameter

#### **name**

Type: String, HMITag | Int32, HMITag

Tag name or index number (1...n) of a "Tag" object in the list

---

#### Note

The index number of a "Tag" object does not represent the order in which the "Tag" objects were added to the TagSet list.

---

### Return value

Object, HMITag (Page 1490)

### See also

Tag (Page 1490)

TagSet (Page 1521)

## TagSet.Read()

### Description

The "Read" method reads in all tags ("Tag" objects) of the "TagSet" list. The value, the Quality Code and the time stamp of all tags are determined when the tag is read.

The tags are either read from the tag image (cache) or directly from the AS. When the tag image is used, the method registers all tags that are not yet registered. You should use the

tag image for cyclic readout of tags. If you do not need the tag value cyclically or the update cycle of the tag is too long, use direct readout (`hmiReadDirect`).

The method executes a synchronous read operation. When completed, you can use the "TagSet" properties "LastError" and "ErrorDescription" to determine if the execution was successful.

## Syntax

```
TagSet.Read([readType])
```

## Parameter

### **readType**

Optional, type: Int32, `hmiReadType`

Origin of the tag values:

- `hmiReadCache` (0) or empty  
Reads the tag value from the tag image. If no registration exists, the tag is registered. For high-performance access, define the used tags as triggers of the script.
- `hmiReadDirect` (1)  
Reads the tag value directly from the AS. The tag image is not used.

## Return value

--

## Example

Read and output all tags of the list:

### Copy code

```
let ts = Tags.CreateTagSet(["MyTag1", "MyTag2"]);  
ts.Read();  
HMIRuntime.Trace("value of MyTag1: " + ts("MyTag1").Value);  
HMIRuntime.Trace("value of MyTag2: " + ts("MyTag2").Value);
```

## See also

[TagSet](#) (Page 1521)

[TagSet.ReadAsync\(\)](#) (Page 1528)

[TagSet.ReadMaxAge\(\)](#) (Page 1529)

## TagSet.ReadAsync()

### Description

The "ReadAsync" method reads in all tags ("Tag" objects) of the "TagSet" list. The value, the Quality Code and the time stamp of all tags are determined when the tag is read.

The tags are either read from the tag image (cache) or directly from the AS. When the tag image is used, the method registers all tags that are not yet registered. You should use the tag image for cyclic readout of tags. If you do not need the tag value cyclically or the update cycle of the tag is too long, use direct readout (hmiReadDirect).

The method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter.

### Syntax

```
TagSet.ReadAsync ([readType])  
.then (function (HMITagSet) {  
    ...  
})  
.catch (function (ErrorCode) {  
    ...  
})
```

### Parameters

#### **readType**

Optional, type: Int32, hmiReadType

Origin of the tag values:

- hmiReadCache (0) or empty  
Reads the tag value from the tag image. If no registration exists, the tag is registered. For high-performance access, define the used tags as triggers of the script.
- hmiReadDirect (1)  
Reads the tag value directly from the AS. The tag image is not used.

### Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled  
Object, HMITagSet (Page 1521) as parameter of the "then()" handler.
- Promise failed (rejected)  
ErrorCode as parameter of the "catch()" handler. This status only exists when all tags of the "TagSet" object could not be read.

## See also

TagSet (Page 1521)

TagSet.Read() (Page 1526)

TagSet.ReadMaxAge() (Page 1529)

## TagSet.ReadMaxAge()

### Description

The "ReadMaxAge" method reads in all tags ("Tag" objects) of the "TagSet" list and ensures that these are not older than the specified time period (maxAge). The value, the Quality Code and the time stamp of all tags are determined when the tag is read.

The tags are read either from the process image (maxAge > 0) or directly from the AS (maxAge = 0). The method does not use the tag image and does not register tags. You should not use this method for cyclic readout of tags.

The method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter.

### Syntax

```
TagSet.ReadMaxAge(maxAge)
  .then(function(HMITagSet) {
    ...
  })
  .catch(function(ErrorCode) {
    ...
  })
```

### Parameters

#### **maxAge**

Type: UInt32

Time interval in milliseconds after which a tag value must be updated.

- maxAge = 0  
Read tag value immediately directly from the AS.
- maxAge > 0  
Read tag value from process image according to time stamp.

### Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled  
Object, HMITagSet (Page 1521) as parameter of the "then()" handler.
- Promise failed (rejected)  
ErrorCode as parameter of the "catch()" handler. This status only exists when all tags of the "TagSet" object could not be read.

### See also

TagSet (Page 1521)

TagSet.Read() (Page 1526)

TagSet.ReadAsync() (Page 1528)

## TagSet.Remove()

### Description

The "Remove" method removes tags ("Tag" objects) using their names from the "TagSet" list.

### Syntax

```
TagSet.Remove (tag)
```

### Parameters

**tag**

Type: String, HMITag | String[], HMITag | Variant[[]], HMITag

Removes a "Tag" object from the "TagSet" list.

---

**Note**

No "Tag" object can be transferred as a parameter. A "Tag" object is referenced using the name.

---

### Return value

--

### See also

TagSet (Page 1521)

TagSet.Clear() (Page 1525)

## TagSet.Write()

### Description

The "Write" method writes the values of all tags ("Tag" objects) of the "TagSet" list. You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

### Syntax

```
TagSet.Write([writeType])
```

### Parameters

#### **writeType**

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty  
Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)  
Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

### Return value

--

### Example

Write the values of all tags to the list:

#### **Copy code**

```
let ts = Tags.CreateTagSet(["MyTag1", "MyTag2"]);  
ts("MyTag1").Value = 1234;  
ts("MyTag2").Value = 5678;  
ts.Write();
```

Or in abbreviated form:

**Copy code**

```
Tags.CreateTagSet(["MyTag1", 1234], ["MyTag2", 4678]).Write();
```

**See also**

[TagSet](#) (Page 1521)

[TagSet.WriteQCD\(\)](#) (Page 1535)

[TagSet.WriteWithOperatorMessage\(\)](#) (Page 1536)

**TagSet.WriteAsync()****Description**

The "WriteAsync" method writes the values of all tags ("Tag" objects) of the "TagSet" list. You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are written for each tag. This enables you to determine if the execution was successful.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter. An execution is only faulty ("Promise rejected") when none of the tags of the "TagSet" object could be written.

**Syntax**

```
TagSet.WriteAsync([writeType])  
.then(function(HMITagSet) {  
    ...  
})  
.catch(function(ErrorCode) {  
    ...  
})
```

## Parameters

### **writeType**

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty  
Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)  
Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

## Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled  
Object, HMITagSet (Page 1521) as parameter of the "then()" handler.
- Promise failed (rejected)  
ErrorCode as parameter of the "catch()" handler. This status only exists when none of the tags of the "TagSet" object could be written.

TagSet.WriteAsyncQCD() (Page 1533)

TagSet.WriteQCD() (Page 1535)

TagSet.WriteWithOperatorMessage() (Page 1536)

## TagSet.WriteAsyncQCD()

### Description

The "WriteAsync" method writes the values of all tags ("Tag" objects) of the "TagSet" list, including their quality code and time stamps.

You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are written for each tag. This enables you to determine if the execution was successful.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter. An execution is only faulty ("Promise rejected") when none of the tags of the "TagSet" object could be written.

When you call the method for external tags, it writes the quality code and time stamp predefined by the system, not the one defined by the user.

## Syntax

```
TagSet.WriteAsyncQCD([writeType])  
  .then(function(HMITagSet) {  
    ...  
  })  
  .catch(function(ErrorCode) {  
    ...  
  })
```

## Parameters

### **writeType**

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty  
Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)  
Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

## Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled  
Object, HMITagSet (Page 1521) as parameter of the "then()" handler.
- Promise failed (rejected)  
ErrorCode as parameter of the "catch()" handler. This status only exists when none of the tags of the "TagSet" object could be written.

## TagSet.WriteQCD()

### Description

The "Write" method writes the values of all tags ("Tag" objects) of the "TagSet" list, including their quality code and time stamps.

You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

When you call the method for external tags, it writes the quality code and time stamp predefined by the system, not the one defined by the user.

### Syntax

```
TagSet.WriteQCD([writeType])
```

### Parameter value

#### **writeType**

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty  
Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)  
Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

### Return value

--

### See also

TagSet (Page 1521)

TagSet.Write() (Page 1531)

TagSet.WriteAsync() (Page 1532)

TagSet.WriteAsyncQCD() (Page 1533)

TagSet.WriteWithOperatorMessage() (Page 1536)

## TagSet.WriteWithOperatorMessage()

### Description

The "WriteWithOperatorMessage" method writes the values of all tags ("Tag" objects) of the "TagSet" list and then triggers an operator input alarm for each tag. You must first set the values of the individual tags with the "Value" property. The value of the "Value" property does not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

In addition to the reason, the triggered operator input alarms contain the old and new value, the user and host name and the unit.

Once the write operation is completed, the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

### Syntax

```
TagSet.WriteWithOperatorMessage(reason)
```

### Parameters

**reason**

Type: String

Reason for the change in value of the triggered alarms.

### Return value

ErrorCode

## Example

Write tags in a TagSet and then output the operator input alarm "Reason":

### Copy code

```
var ts = Tags.CreateTagSet();  
ts.Add("Tag1"); ts.Add("Tag2");  
ts.Item("Tag1").Value = 10; ts.Item("Tag2").Value = 20;  
var err = tag1.WriteWithOperatorMessage("Reason");
```

## SysFct

### Description

The "SysFct" object ("HMITagSysFct" type) enables access to the system functions of the "Tags" object.

### Object type

HMITagSysFct

### Properties

--

## Methods

The "SysFct" object has the following methods:

- **DecreaseTag()**  
Subtracts a value from the value of the tag.
- **IncreaseTag()**  
Adds a value to the value of the tag.
- **InvertBitInTag()**  
Inverts a bit in the tag.
- **ResetBitInTag()**  
Resets a bit in the tag.
- **SetBitInTag()**  
Sets a bit in the tag.
- **SetTagValue()**  
Assigns a new value to the tag.
- **ShiftAndMask()**  
Converts the bit pattern of a source tag into the bit pattern of a target tag.
- **UpdateTag()**  
Reads from the PLC the current value of the tags with the specified update ID.

## See also

Tags (Page 1486)

## SysFct.CreateGetAndClearTagCommand

### Description

The "CreateGetAndClearTagCommand" method is an auxiliary function via which the result of return parameters of system functions can be written to HMI tags.

### Syntax

```
[HMIRuntime.]Tag.SysFct.CreateGetAndClearTagCommand(TagName);
```

### Parameters

**TagName**

Type: String, HMI tag

HMI tag to which the return is written.

### Return value

Object, HMIGetAndClearTagCommand

**See also**

SysFct (Page 1537)

**SysFct.CreateSetTagCommand()****Description**

The "CreateSetTagCommand" method is an auxiliary function via which the result of return parameters of system functions can be written to HMI tags.

**Syntax**

```
[HMIRuntime.]Tags.SysFct.CreateSetTagCommand(TagName);
```

**Parameters****TagName**

Type: String, HMITag

HMI tag to which the return is written.

**Return value**

Object, HMISetTagCommand

**Example**

Write the result of the "LookUpText" system function to the "tempResultTagName" HMI tag and read it out:

**Copy code**

```
let setTagCommand = HMIRuntime.Tags.SysFct.CreateSetTagCommand(tempResultTagName);
HMIRuntime.Resources.SysFct.LookUpText(setTagCommand, qualityValue.value,
HMIRuntime.Language, nameTextList);
result = Tags(tempResultTagName).Read();
```

**See also**

SysFct (Page 1537)

## SysFct.DecreaseTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "DecreaseTag" method subtracts the given value from the value of the tag.

---

#### Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, an auxiliary tag must be used. You can assign the tag value to the auxiliary tag with the "SetTagValue" system function.

---

### Syntax

```
[HMIRuntime.]Tags.SysFct.DecreaseTag(Tag,value);
```

### Parameters

#### Tag

Type: String, HMITag

Tag from which the specified value is subtracted.

#### value

Type: Float

Numeric value that is subtracted.

### Return value

ErrorCode

### See also

[SysFct \(Page 1537\)](#)

[SysFct.IncreaseTag\(\) \(Page 1541\)](#)

[Tag.Decrease\(\) \(Page 1499\)](#)

## SysFct.IncreaseTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "IncreaseTag" method adds the specified value to the value of the tag.

---

#### Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, an auxiliary tag must be used. You can assign the tag value to the auxiliary tag with the "SetTagValue" system function.

---

### Syntax

```
[HMIRuntime.]Tags.SysFct.IncreaseTag(Tag, value);
```

### Parameters

**Tag**

Type: String, HMITag

Tag to which the specified value is added.

**value**

Type: Float

Numeric value that is added.

### Return value

ErrorCode

### See also

SysFct (Page 1537)

SysFct.DecreaseTag() (Page 1540)

Tag.Increase() (Page 1500)

## SysFct.InvertBitInTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "InvertBitInTag" method inverts a bit in the specified tag:

- If the bit in the tag has the value "1" (True), it is set to "0" (False).
- If the bit in the tag has the value "0" (False), it is set to "1" (True).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

### Syntax

```
[HMIRuntime.]Tags.SysFct.InvertBitInTag(Tag, BitNumber);
```

### Parameters

#### Tag

Type: String, HMITag

tag in which the bit is inverted.

#### BitNumber

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of the tag that is inverted.

The bits are counted in a tag from right to left. The counting begins with 0.

### Return value

ErrorCode

### See also

[SysFct](#) (Page 1537)

[SysFct.ResetBitInTag\(\)](#) (Page 1542)

[SysFct.SetBitInTag\(\)](#) (Page 1543)

## SysFct.ResetBitInTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "ResetBitInTag" method sets a bit in the specified tag to "0" (False).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

### Syntax

```
[HMIRuntime.]Tags.SysFct.ResetBitInTag(Tag, BitNumber);
```

## Parameters

**Tag**

Type: String, HMITag

Tag in which the bit is set.

**BitNumber**

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "0" (False).

The bits are counted in a tag from right to left. The counting begins with 0.

## Return value

ErrorCode

## See also

SysFct (Page 1537)

SysFct.InvertBitInTag() (Page 1541)

SysFct.SetBitInTag() (Page 1543)

Tag.ResetBit() (Page 1502)

## SysFct.SetBitInTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "SetBitInTag" method sets a bit in the specified tag to "1" (True).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

---

**Note**

This function does not support data types of type UInt.

---

### Syntax

```
[HMIRuntime.]Tags.SysFct.SetBitInTag(Tag, BitNumber);
```

## Parameters

**Tag**

Type: String, HMITag

Tag in which the bit is set.

**BitNumber**

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "1" (True).

The bits are counted in a tag from right to left. The counting begins with 0.

**Return value**

ErrorCode

**See also**

SysFct (Page 1537)

SysFct.InvertBitInTag() (Page 1541)

SysFct.ResetBitInTag() (Page 1542)

Tag.SetBit() (Page 1503)

**SysFct.SetTagValue() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)**

**Description**

The "SetTagValue" method assigns a new value to the specified tag.

---

**Note**

This system function can be used to assign strings and numbers, depending on the type of tag.

---

**Note**

The system function is only executed after a connection has been established.

---

**Syntax**

```
[HMIRuntime.]Tags.SysFct.SetTagValue(Tag, Value);
```

**Parameters**

**Tag**

Type: String, HMITag

Tag to which a value is assigned.

**Value**

Type: Variant

Value that is assigned.

**Return value**

ErrorCode

**See also**

SysFct (Page 1537)

**SysFct.ShiftAndMask() (Basic Panels, Panels, Comfort Panels, RT Advanced)****Description**

The "ShiftAndMask" method converts the input bit pattern of a source tag into the output bit pattern of a target tag. This involves bit shifting and masking.

---

**Note**

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

---

**Syntax**

```
[HMIRuntime.]Tags.SysFct.ShiftAndMask(Source,Target,bitsToShift,bitPattern);
```

**Parameter****Source**

Type: String, HMITag

Source tag that receives the input bit pattern. Tags of integer type are allowed.

The source and target tags must have the same number of bits.

**Target**

Type: String, HMITag

Target tag to which the output bit pattern is saved. Tags of integer type are allowed.

The source and target tags must have the same number of bits.

**bitsToShift**

Type: Int8

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

The number of bits to be shifted must be less than the number of bits of the source and target tags.

---

**Note**

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

---

**bitPattern**

Type: UInt32

Integer number that is used as bit mask. The bit pattern is used to multiply the shifted input bit pattern.

The bit mask must not have more bits than the source and target tags.

**Return value**

ErrorCode

**Example**

The source tag of the 16-bit integer type has the current value "72": 000000001001000.

**Shift bits**

`bitsToShift` has the value "+3". The input bit pattern is shifted 3 bits to the right. Left is filled with "0". Three bits are truncated on the right: 000000000001001. The new decimal value is "9".

**Mask bits**

`bitPattern` has the value "2478" with the bit pattern "0000100110101110". The shifted input bit pattern (000000000001001) is multiplied by the bit mask, with bit-by-bit logical AND operation. The result is the decimal value "8".

**Save result**

The decimal value is stored in the target tag.

**See also**

[SysFct \(Page 1537\)](#)

## SysFct.UpdateTag()

### Description

The "UpdateTag" method reads from the PLC the current value of the tags with the specified update ID. An update ID can be used for several tags.

---

**Note**

Tags of the data type STRUCT are not supported.

---

### Syntax

```
[HMIRuntime.]Tags.SysFct.UpdateTag(UpdateID);
```

### Parameter

**UpdateID**

Type: UInt32, HMI TagUpdateID

Specifies the Update ID.

### Return value

ErrorCode

### See also

SysFct (Page 1537)

### Inching

### SysFct

### Description SysFct

#### Description

The "SysFct" object ("HMIIInchingSysFct" type) enables access to the system functions of the "Inching" object.

#### Object type

HMIIInchingSysFct

## Properties

--

## Methods

The "SysFct" object has the following methods:

- **ReadAndDecreaseTag()**  
Reads the current value of a tag and subtracts a value.
- **ReadAndIncreaseTag()**  
Reads the current value of a tag and adds a value.
- **ReadAndInvertBitInTag()**  
Reads the current bit at a position in a tag and inverts the bit.
- **ReadAndResetBitInTag()**  
Reads the current bit at a position in a tag and resets the bit.
- **ReadAndSetBitInTag()**  
Reads the current bit at a position in a tag and sets the bit.
- **ReadAndSetTagValue()**  
Reads the current value of a tag and assigns the tag a new value.

## SysFct.ReadAndDecreaseTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "ReadAndDecreaseTag" method reads the current value of a tag and then subtracts the specified value.

---

#### Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, an auxiliary tag must be used. You can assign the tag value to the auxiliary tag with the "SetTagValue" system function.

---

### Syntax

```
[HMIRuntime.]Tags.Inching.SysFct.ReadAndDecreaseTag(Tag, value);
```

### Parameters

#### Tag

Type: String, HMITag

Tag from which the specified value is subtracted.

**value**

Type: Float

Numeric value that is subtracted.

**Return value**

ErrorCode

**SysFct.ReadAndIncreaseTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)****Description**

The "ReadAndIncreaseTag" method reads the current value of a tag and then adds the specified value.

---

**Note**

The system function uses the same tag as input and output values. When this system function is used to convert a value, an auxiliary tag must be used. You can assign the tag value to the auxiliary tag with the "SetTagValue" system function.

---

**Syntax**

```
[HMIRuntime.]Tags.Inching.SysFct.ReadAndIncreaseTag(Tag,value);
```

**Parameters****Tag**

Type: String, HMITag

Tag to which the specified value is added.

**value**

Type: Float

Numeric value that is added.

**Return value**

ErrorCode

## SysFct.ReadAndInvertBitInTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "ReadAndInvertBitInTag" method reads the current value of a bit in the tag and the inverts the value of the bit. The following options are available:

- If the bit in the tag has the value "1" (True), it is set to "0" (False).
- If the bit in the tag has the value "0" (False), it is set to "1" (True).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

### Syntax

```
[HMIRuntime.]Tags.Inching.SysFct.ReadAndInvertBitInTag(Tag, BitNumber);
```

### Parameters

**Tag**

Type: String, HMITag

tag in which the bit is inverted.

**BitNumber**

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of the tag that is inverted.

The bits are counted in a tag from right to left. The counting begins with 0.

### Return value

ErrorCode

## SysFct.ReadAndResetBitInTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)

### Description

The "ReadAndResetBitInTag" method reads the current value of a bit and sets the bit to "0" (False).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

**Syntax**

```
[HMIRuntime.]Tags.Inching.SysFct.ReadAndResetBitInTag (Tag, BitNumber)  
;
```

**Parameters****Tag**

Type: String, HMITag

Tag in which the bit is set.

**BitNumber**

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "0" (False).

The bits are counted in a tag from right to left. The counting begins with 0.

**Return value**

ErrorCode

**SysFct.ReadAndSetBitInTag() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)****Description**

The "ReadAndSetBitInTag" method reads the current value of a bit in the tag and then sets the bit to "1" (True).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

---

**Note**

This function does not support data types of type UInt.

---

**Syntax**

```
[HMIRuntime.]Tags.Inching.SysFct.ReadAndSetBitInTag (Tag, BitNumber) ;
```

**Parameters****Tag**

Type: String, HMITag

Tag in which the bit is set.

**BitNumber**

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "1" (True).

The bits are counted in a tag from right to left. The counting begins with 0.

**Return value**

ErrorCode

**SysFct.ReadAndSetTagValue() (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)**

**Description**

The "ReadAndSetTagValue" method reads the current value of a tag and then assigns a new value.

---

**Note**

This system function can be used to assign strings and numbers, depending on the type of tag.

---

**Note**

The system function is only executed after a connection has been established.

---

**Syntax**

```
[HMIRuntime.]Tags.Inching.SysFct.ReadAndSetTagValue(Tag,Value);
```

**Parameters**

**Tag**

Type: String, HMITag

Tag to which a value is assigned.

**Value**

Type: Variant

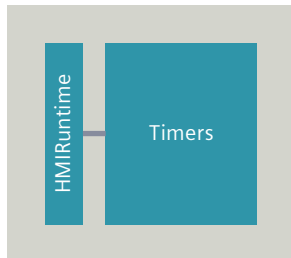

Value that is assigned.

**Return value**

ErrorCode

## 10.2.2.18 Timers

### Description

The "Timers" object can time the script run by means of one-time or cyclic timers. You can execute individual functions delayed or repeatedly.

### Object type

HMITimers

### Properties

--

### Methods

The "Timers" object has the following methods:

- **ClearInterval()**  
Deletes a timer object for cyclic execution of a function.
- **ClearTimeout()**  
Deletes a timer object for delayed execution of a function.
- **SetInterval()**  
Creates a timer object for the cyclic execution of a function.
- **SetTimeout()**  
Creates a timer object for delayed execution of a function.

### Example

Execution of the "myFunc" function is delayed:

#### Copy code

```
function setDelay() {  
    var timerId = HMI Runtime.Timers.SetTimeout(myFunc, 5000);  
    function myFunc() {  
        HMI Runtime.Trace("SetTimeout triggered");  
    }  
}
```

## Timers.ClearInterval()

### Description

The "ClearInterval" method deletes a timer object for cyclic execution of a function. You can delete a timer object at any time prior to the next execution.

### Syntax

```
HMIRuntime.Timers.ClearInterval (TimerID);
```

### Parameters

#### TimerID

Type: Int32

ID of the timer object to be deleted. The ID is returned by the "SetInterval" method during creation of the timer object.

### Return value

--

### Example

Create and delete a cyclic timer:

#### Copy code

```
var TimerID = HMIRuntime.Timers.SetInterval (update, 1000);  
HMIRuntime.Timers.ClearInterval (TimerID);
```

### See also

[Timers \(Page 1553\)](#)

[Timers.SetInterval\(\) \(Page 1555\)](#)

## Timers.ClearTimeout()

### Description

The "ClearTimeout" method deletes a timer object for delayed execution of a function. You can delete a timer object at any time prior to the execution.

### Syntax

```
HMIRuntime.Timers.ClearTimeout (TimerID);
```

## Parameters

### TimerID

Type: Int32

ID of the timer object to be deleted. The ID is returned by the "SetTimeout" method during creation of the timer object.

## Return value

--

## Example

Create and delete a one-time timer:

### Copy code

```
var TimerID = HMIRuntime.Timers.SetTimeout(update,1000);  
HMIRuntime.Timers.ClearTimeout(TimerID);
```

## See also

[Timers \(Page 1553\)](#)

[Timers.SetTimeout\(\) \(Page 1556\)](#)

## Timers.SetInterval()

## Description

The "SetIntervall" method creates a timer object for cyclic execution of a function and returns the ID of the timer object. When a time interval expires, a function is started and scheduled for a new execution according to the time interval.

---

### Note

If you use the "SetInterval" method for an "OnLoaded" event, delete the timer object again with the "ClearInterval" method for the associated "OnUnloaded" event.

---

## Syntax

```
HMIRuntime.Timers.SetIntervall( CallbackFunction, DelayInMillisecs );
```

## Parameters

### CallbackFunction

Type: Function, HMIONTimerCB

Function that is executed cyclically.

Required prototype of the callback function: `TimerCallback()`

**DelayInMillisecs**

Type: `UInt32`

Time interval in milliseconds in which the function is executed cyclically.

**Return value**

`Int32`

**Example**

Create a cyclic timer:

**Copy code**

```
var TimerID = HMIRuntime.Timers.SetInterval(update,1000);
```

**See also**

[Timers \(Page 1553\)](#)

[Timers.ClearInterval\(\) \(Page 1554\)](#)

**Timers.SetTimeout()**

**Description**

The "SetTimeout" method creates a timer object for time-delayed execution of a function and returns the ID of the timer object. When a time interval has elapsed, a function is started.

---

**Note**

To increase the runtime stability in Unified Panels, use the "SetInterval" method as an alternative.

---

**Note**

If you use the "SetTimeout" method for an "OnLoaded" event, delete the timer object again with the "ClearTimeout" method for the associated "OnUnloaded" event.

---

**Syntax**

```
HMIRuntime.Timers.SetTimeout(CallbackFunction, DelayInMillisecs);
```

## Parameters

### CallbackFunction

Type: Function, HMIONTimerCB

Function that is executed once.

Required prototype of the callback function: `TimerCallback()`

### DelayInMillisecs

Type: UInt32

Time interval in milliseconds after which the function is executed delayed.

## Return value

Int32

## Example

Create a one-time timer:

### Copy code

```
var TimerID = HMIRuntime.Timers.SetInterval(update,1000);
```

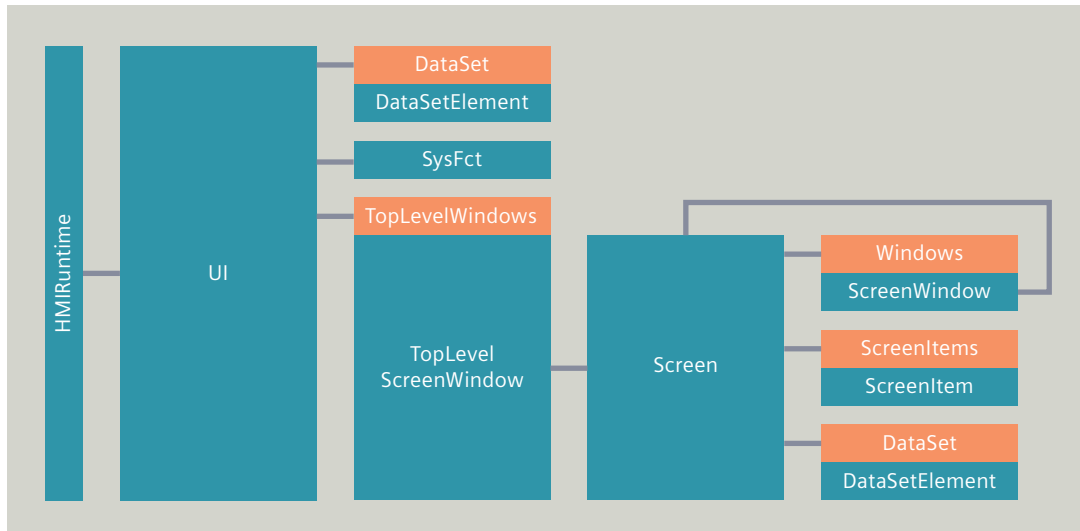

## See also

[Timers \(Page 1553\)](#)

[Timers.ClearTimeout\(\) \(Page 1554\)](#)

### 10.2.2.19 UI

#### Description

The "UI" object ("HMIUI" type) represents the user interface of the graphical runtime. You use the "UI" object to directly reference the currently active screen or the listing of the screen windows on the highest level.

#### Application

The "UI" object is used to reference the configured elements of the graphical runtime system, such as screen windows, screens or screen objects. This means that you have access to all the properties and methods of these elements.

To simplify the use of the "UI" object, you can also use the alias `UI` for `HMIRuntime.UI`.

#### Note

Several screens can be opened simultaneously in runtime. These screens are displayed in screen windows. Each screen window contains exactly one screen (Screen) that can contain any number of further screen windows (Screen Window). The resulting hierarchy can be mapped by using an object path, which is used in the "FindItem" method for addressing.

In the window arrangement of the runtime (Screen Window Layout), one screen window can be defined at the highest level (Top Level Screen Window) for each existing monitor.

#### Object type

HMIUI

## Properties

The "UI" object has the following properties:

- **ActiveScreen**  
Returns the screen that has the input focus.
- **DataSet**  
Returns the global parameter set.
- **PopupScreenWindows**  
Returns the list of all popup screen windows.
- **RootWindow**  
Returns the top-level screen window (Top Level Screen Window) of the screen in which the script is executed.
- **Style**  
Specifies the style of the display and operating objects.
- **Windows**  
Returns the "Windows" object with the list of screen windows.

## Methods

The "UI" object has the following methods:

- **FindItem()**  
Returns screen windows or screen objects through their object path.
- **GetClientInfo()**  
Returns information about the client.
- **OpenFaceplateInPopup()**  
Opens a faceplate in a popup window and sets the values of the faceplate interface.

## Example

Modify the screen of the own screen window on the highest level:

```
UI.RootWindow.Screen = 'NewScreen';
```

or with the "FindItem" method and relative addressing:

```
UI.FindItem('~').Screen = 'NewScreen';
```

Reference and modify the screen of a screen window in absolute terms on the highest level outside of the own screen hierarchy:

```
UI.FindItem('/TopLevelWindow2').Screen = 'NewScreen';
```

## UI.ActiveScreen

### Description

The "ActiveScreen" property returns the screen that has the input focus.

---

#### Note

You access the screen with input focus via the "ActiveScreen" property without specification of an object path.

If the runtime loses the input focus, the "ActiveScreen" property references the screen that last had the input focus.

---

### Type

Object, HmiScreen (Page 1560)

### Access

Read-only

### Syntax

```
[HMIRuntime.]UI.ActiveScreen
```

### See also

UI (Page 1558)

Screen (Page 1560)

## Screen

### Description

The "Screen" object ("HmiScreen" type) displays a screen in runtime. A screen can contain any number of screen windows ("Window" objects) and screen objects ("ScreenItem" object).

You reference a "Screen" object via the properties `UI.ActiveScreen`, `Window.CurrentScreen`, `Screen.ParentScreen` or `ScreenItem.Parent`.

## Use

You can use the "this" and "Item" objects in scripts. The "this" object refers in this case to the screen ("Screen" object) and the "Item" object to the screen object (ScreenItem) in which the script is created. For better clarity, you can also use the `Screen` alias for the "this" object.

---

### Note

Several screens can be opened simultaneously in runtime. These screens are displayed in screen windows. Each screen window contains exactly one screen (Screen) that can contain any number of additional screen windows (Screen Window). The resulting hierarchy can be mapped by using an object path, which is used in the "FindItem" method for addressing.

You can specify one top level screen window (Top Level Screen Window) for each monitor in the window layout of the runtime system (Screen Window Layout).

---

## Object type

HmiScreen

## Properties

The "Screen" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the fill pattern of the background.
- **BackGraphic**  
Specifies the graphic for the image background.
- **BackGraphicStretchMode**  
Specifies the type of scaling of the background graphic in the screen.
- **BackgroundFillMode**  
Specifies the fill area of the background fill.
- **CurrentWindow**  
Returns the screen window which contains the current screen.
- **DataSet**  
Returns the parameter set of the screen.
- **DisplayName**  
Specifies the display name.
- **Enabled**  
Specifies whether the screen can be operated in runtime.

- **EnableExplicitUnlock**  
Returns which button must be pressed for the screen to be operable.
- **Height**  
Specifies the height.
- **HorizontalAlignment**  
Specifies the horizontal alignment.
- **HotKeys**  
Returns the hotkeys defined for the screen.
- **Items**  
Returns a list of all screen objects of the screen.
- **Layers**  
Returns a list of all layers of the screen.
- **Name**  
Returns the name of the screen.
- **Operability**  
Returns whether the screen is operable.
- **Parent**  
Returns the higher-level screen object (here: screen window).
- **ParentScreen**  
Returns the higher-level screen.
- **RequireExplicitUnlock**  
Returns whether the screen can only be operated while the associated button is being pressed.
- **ScreenMaster**  
Specifies the screen template of the screen.
- **ScreenNumber**  
Returns the screen number.
- **VerticalAlignment**  
Specifies the vertical alignment.
- **Width**  
Specifies the width.
- **Windows**  
Returns a list of all screen windows of the screen.

## Methods

The "Screen" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the screen.
- **FindItem()**  
Returns screen windows or screen objects through their object path.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Screen" object has the following events:

- **OnContextTapped()**  
Occurs when the screen is right-clicked or long-touched.
- **OnHotKey()**  
Occurs when a hotkey is pressed.
- **OnLoaded()**  
Occurs when the screen is fully loaded in runtime.
- **OnTapped()**  
Occurs when the screen is clicked with the left mouse button or short-touched.
- **OnUnloaded()**  
Occurs when the active screen on the HMI device is completely cleared.

## Screen.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
Screen.AlternateBackColor
```

### See also

Screen (Page 1560)

## Screen.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the screen.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`Screen.Authorization`

**See also**

Screen (Page 1560)

**Screen.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Screen.BackColor`

**See also**

Screen (Page 1560)

**Screen.BackFillPattern**

**Description**

The "BackFillPattern" property specifies the fill pattern of the background.

## Type

Int32, HmiFillPattern

Specifies the fill pattern:

- Solid (0): Solid
- Transparent (65536): Transparent. Depending on the runtime settings, visible objects in the background can be selected.
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonally striped
- BackwardDiagonal (131075): Backward diagonally striped
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Gradient vertical tricolor
- GradientForwardDiagonalTricolor (1048834): Gradient forward diagonal tricolor
- GradientBackwardDiagonalTricolor (1048835): Gradient backward diagonal tricolor

## Access

Read-write

## Syntax

```
Screen.BackFillPattern
```

## See also

Screen (Page 1560)

## Screen.BackGraphic

## Description

The "BackGraphic" property specifies the graphic for the screen background.

### Type

String

### Access

Read-write

### Syntax

`Screen.BackGraphic`

### See also

Screen (Page 1560)

## Screen.BackGraphicStretchMode

### Description

The "BackGraphicStretchMode" property specifies the type of scaling of the background graphic in the screen.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Screen.BackGraphicStretchMode`

### See also

Screen (Page 1560)

## Screen.BackgroundFillMode

### Description

The "BackgroundFillMode" property specifies the fill area of the background fill.

### Type

Int32, HmiBackgroundFillMode

Specifies the type of background fill:

- Window (0): The filling is adapted to the size of the window.
- Screen (1): The filling is adapted to the size of the screen.

### Access

Read-write

### Syntax

```
Screen.BackgroundFillMode
```

### See also

Screen (Page 1560)

## Screen.CurrentWindow

### Description

The "CurrentWindow" property returns the screen window which contains the current screen.

### Type

Object, HmiScreenWindow (Page 1600)

### Access

Read-only

### Syntax

```
Screen.CurrentWindow
```

## See also

Screen (Page 1560)

ScreenWindow (Page 1600)

## ScreenWindow

### Description

ScreenWindow (Page 1600)

## Screen.DataSet

### Description

The "DataSet" property returns the data set ("DataSet" object) of the screen.

### Type

Object, HMIDDataSet (Page 1568)

### Access

Read-only

### Syntax

```
Screen.DataSet
```

## See also

Screen (Page 1560)

DataSet (Page 1568)

## DataSet

### Description

The "DataSet" object ("HMIDDataSet" type) is a list of "DataSetElement" objects that enable data exchange in runtime.

A "DataSet" object is defined globally (on the "UI" object) or on a screen (the "Screen" object). You can access the data from any action.

You reference a "DataSet" object via the `UI.DataSet` property or via the respective screen with the `Screen.DataSet` property.

The "DataSet" object exists as long as the screen is displayed. The global object exists over the entire time period in which runtime runs.

## Use

The "DataSet" object is a list which be counted and enumerated. You can access the "DataSet" list via the index or the element names.

## Object type

HMIDataSet

## Properties

The "DataSet" object has the following properties:

- **Count**  
Returns the number of elements of the "DataSet" list.

## Methods

The "DataSet" object has the following methods:

- **Add()**  
Adds an element with value to the "DataSet" list.
- **Clear()**  
Removes all elements from the "DataSet" list.
- **Exists()**  
Checks whether an element is present in the "DataSet" list.
- **Item()**  
Returns the value of an element of the "DataSet" list.
- **Remove()**  
Removes an element by its name from the "DataSet" list.

## DataSet.Count

## Description

The "Count" property returns the number of elements in the "DataSet" list.

## Type

UInt32

## Access

Read-only

## Syntax

`DataSet.Count`

## See also

[DataSet \(Page 1568\)](#)

## DataSet.Add()

## Description

The "Add" method adds an element ("DataSetElement" object) to the "DataSet" list. The elements are referenced by name.

## Syntax

`DataSet.Add(name, value)`

## Parameters

### **name**

Type: String

Name of the element that will be added to the list.

### **value**

Type: Variant

Value of the element that will be added to the list.

## Return value

--

## Example

Add a database connection for the "DataSet" list:

### Copy code

```
(async function() {
  try{
    let connectionstring = "Driver={SQL Server}; Server=localhost;
    Database=MyDB;trusted_connection=yes;";
    let conn = await
    HMIRuntime.Database.CreateConnection(connectionstring);
    HMIRuntime.UI.DataSet.Add("DatabaseConnection",conn);
    let con = HMIRuntime.UI.DataSet("DatabaseConnection");
    let query = "Select * from MyTable;";
    let results = await con.Execute(query);
    if(results !== undefined && results !== null)
    {
      let statements = results.Results;
      for(let statement in statements)
      {
        let rows = statements[statement].Rows;
        for (let i in rows)
        {
          let row = rows[i];
          for(let key in row)
          {
            HMIRuntime.Trace(key+":"+row[key]);
          }
        }
      }
    }
    conn.Close();
  }
  catch(e)
  {
    let res = e.Results;
    for(let statement in res)
    {
      let errors = res[statement].Errors;
      for (let i in errors)
      {
        let detailed = errors[i];
        HMIRuntime.Trace("Errors state : "+detailed.State);
        HMIRuntime.Trace("Errors Message : "+detailed.Message);
      }
    }
  }
})();
```

## See also

[DataSet \(Page 1568\)](#)

## **DataSet.Clear()**

### **Description**

The "Clear" method removes all elements ("DataSetElement" objects) from the "DataSet" list.

### **Syntax**

```
DataSet.Clear()
```

### **Parameter**

--

### **Return value**

--

### **See also**

DataSet (Page 1568)

## **DataSet.Exists()**

### **Description**

The "Exists" method searches for an element ("DataSetElement" object) in the "DataSet" list.

### **Syntax**

```
DataSet.Exists(name)
```

### **Parameters**

**name**

Type: String

Name of the element that is being searched for.

### **Return value**

Bool

### **See also**

DataSet (Page 1568)

## DataSet.Item()

### Description

The "Item" method returns the value of a "DataSetElement" object of the "DataSet" list.

### Syntax

```
DataSet[.Item] (name)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "DataSet" object.

---

### Parameter

**name**

Type: String

Element name or index number (1...n) of an object "DataSetElement" of the list

### Return value

Variant

### See also

[DataSet \(Page 1568\)](#)

[DataSetElement \(Page 1574\)](#)

## DataSet.Remove()

### Description

The "Remove" method removes an element ("DataSetElement" object) from the "DataSet" list by its name.

### Syntax

```
DataSet.Remove (name)
```

## Parameters

### **name**

Type: String

Name of the element that will be removed.

## Return value

--

## See also

DataSet (Page 1568)

## DataSetElement

### Description

The "DataSetElement" object represents a data set element in the "DataSet" list.

### Object type

HMIDataSetElement

### Properties

The "DataSetElement" object has the following properties:

- **Name**  
Returns the name of the element.
- **Value**  
Returns the value of the element.

### Methods

--

## DataSetElement.Name

### Description

The "Name" property returns the name of the element ("DataSetElement" object).

**Type**

String

**Access**

Read-only

**Syntax**`DataSetElement.Name`**See also**

DataSetElement (Page 1574)

**DataSetElement.Value****Description**

The "Name" property returns the value of the element ("DataSetElement" object).

**Type**

Variant

**Access**

Read-only

**Syntax**`DataSetElement.Value`**See also**

DataSetElement (Page 1574)

**Screen.DisplayName****Description**

The "DisplayName" property specifies the display name of the screen.

**Type**

String

**Access**

Read-write

**Syntax**

`Screen.DisplayName`

**See also**

Screen (Page 1560)

**Screen.Enabled**

**Description**

The "Enabled" property specifies whether the screen can be operated with all screen objects in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Screen.Enabled`

**See also**

Screen (Page 1560)

**Screen.EnableExplicitUnlock**

**Description**

The "EnableExplicitUnlock" property returns the button that must be pressed for the screen to be operable.

**Type**

Object, HmiButton (Page 2135)

**Access**

Read-only

**Syntax**

```
Screen.EnableExplicitUnlock
```

**See also**

Screen (Page 1560)

Button (Page 2135)

**Button****Description**

Button (Page 2135)

**Screen.Height****Description**

The "Height" property specifies the height of the screen in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Screen.Height
```

**See also**

Screen (Page 1560)

## Screen.HorizontalAlignment

### Description

The "HorizontalAlignment" property specifies the horizontal alignment of the screen. This property is used when the screen is smaller than the screen window.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Screen.HorizontalAlignment
```

### See also

Screen (Page 1560)

## Screen.Items

### Description

The "Items" property returns a list of all screen objects of the screen.

### Type

Object, HMIScreenItems (Page 1579)

### Access

Read-only

## Syntax

Screen.Items

## Example

Retrieve the names of the screen objects and set the background color dependent on the type:

### Copy code

```
for(let scritem of Screen.Items)
{
    HMIRuntime.Trace('name: ' + scritem.constructor.name);
    if ('HmiRectangle' == scritem.constructor.name)
    {
        scritem.BackColor = HMIRuntime.Math.RGB(255, 0,0 );
    }
    else if('HmiEllipse' == scritem.constructor.name)
    {
        scritem.BackColor = HMIRuntime.Math.RGB(0, 0,255 );
    }
}
```

## See also

[Screen \(Page 1560\)](#)

[ScreenItems \(Page 1579\)](#)

## ScreenItems

### Description

The "ScreenItems" object is a list of all screen objects ("HmiScreenItemBase" objects) of the screen.

You reference a "ScreenItems" object via the `Screen.Items` property.

### Use

The "ScreenItems" object is a list and can be enumerated. You can access the "ScreenItems" list using the index or the tag name.

### Object type

HMIScreenItems

### Properties

--

## Methods

The "ScreenItems" object has the following methods:

- **Item()**  
Returns a screen object of the "ScreenItems" list.

## ScreenItems.Item()

### Description

The "Item" method returns a screen object of a screen window via the "ScreenItems" list.

### Syntax

```
ScreenItems [.Item] (ScreenItemName) ;
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "ScreenItems" object.

---

### Parameters

#### **ScreenItemName**

Type: String, HmiScreenItemBase

Name of the screen object

### Return value

Object, HmiScreenItemBase (Page 1742)

### See also

ScreenItems (Page 1579)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## Screen.Layers

### Description

The "Layers" property returns a list of all layers of the screen.

### Type

Object, HmiLayerCollection (Page 1581)

### Access

Read-only

### Syntax

```
Screen.Layers
```

### See also

Screen (Page 1560)

HmiLayerCollection (Page 1581)

## HmiLayerCollection

### Description

The "HmiLayerCollection" object is a list of all layers ("Layer" objects) of the screen. You reference a "HmiLayerCollection" object via the `Screen.Layers` property.

### Use

The "HmiLayerCollection" object is a list and can be counted and enumerated. You can access the "HmiLayerCollection" list using the index or the tag name.

### Object type

HmiLayerCollection

### Properties

The "HmiLayerCollection" object has the following properties:

- **Count**  
Returns the number of layers of the "HmiLayerCollection" list.

## Methods

The "HmiLayerCollection" object has the following methods:

- **Item()**  
Returns a level of the "HmiLayerCollection" list.

## HmiLayerCollection.Count

### Description

The "Count" property returns the number of screen layers of the "HmiLayerCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiLayerCollection.Count
```

### See also

HmiLayerCollection (Page 1581)

## HmiLayerCollection.Item()

### Description

The "Item" method returns a screen layer of the "HmiLayerCollection" list.

### Syntax

```
HmiLayerCollection[.Item] (HmiLayerName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiLayerCollection" object.

---

## Parameters

**HmiLayerName**

Type: String

Name of the screen layer

## Return value

Object, HmiLayerPart (Page 1583)

## See also

HmiLayerCollection (Page 1581)

Layer (Page 1583)

## Layer

## Description

The "Layer" object represents the layers of an object (e.g. screen).

## Object type

HmiLayerPart

## Properties

The "Layer" object has the following properties:

- **MaximumZoom**  
Specifies the maximum zoom of the screen up to which the level is to be seen.
- **MinimumZoom**  
Specifies the minimum zoom of the screen up to which the level is to be seen.
- **Name**  
Returns the name of the screen layer.
- **Visible**  
Specifies whether the screen layer and contained objects are visible.

## Methods

--

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[Layer \(Page 1583\)](#)

[Layer.MinimumZoom \(Page 1584\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[Layer \(Page 1583\)](#)

[Layer.MaximumZoom \(Page 1584\)](#)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

Layer (Page 1583)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

Layer (Page 1583)

## Screen.Name

### Description

The "Name" property returns the name of the screen.

### Type

String

### Access

Read-only

### Syntax

`Screen.Name`

### See also

Screen (Page 1560)

## Screen.Operability

### Description

The "Operability" property returns whether the screen is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Screen.Operability`

**See also**

Screen (Page 1560)

**Screen.Parent****Description**

The "Parent" property specifies the parent screen object (here: screen window).

**Type**

Object, HmiScreenWindow (Page 1600)

**Access**

Read-only

**Syntax**

```
Screen.Parent
```

**See also**

Screen (Page 1560)

ScreenWindow (Page 1600)

**ScreenWindow****Description**

ScreenWindow (Page 1600)

**Screen.ParentScreen****Description**

The "ParentScreen" property returns the parent screen that contains the screen window of the current screen.

**Type**

Object, HmiScreen (Page 1560)

**Access**

Read-only

**Syntax**

`Screen.ParentScreen`

**See also**

Screen (Page 1560)

**Screen**

**Description**

Screen (Page 1560)

**Screen.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the screen can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`Screen.RequireExplicitUnlock`

**See also**

Screen (Page 1560)

## Screen.ScreenMaster

### Description

The "ScreenMaster" property specifies the screen template of the screen. All screen objects, layers and properties of the referenced screen template are inherited.

### Type

Object, HmiScreenMaster (Page 1589)

### Access

Read-write

### Syntax

```
Screen.ScreenMaster
```

### See also

Screen (Page 1560)

ScreenMaster (Page 1589)

## ScreenMaster

### Description

The "ScreenMaster" object is the screen template of a screen. All screen objects, layers and properties of a screen template are inherited by the screen. The screen template is a type of main layer of the screen.

### Object type

HmiScreenMaster

### Properties

The "ScreenMaster" object has the following properties:

- **DisplayName**  
Specifies the display name.
- **HotKeys**  
Returns the hotkeys specified for the screen template.
- **Layers**  
Returns a list of all layers of the screen template.

- **Name**  
Returns the name of the screen template.
- **Visible**  
Specifies whether the screen template is visible in the screen.

## Methods

--

## ScreenMaster.DisplayName

### Description

The "DisplayName" property specifies the display name of the screen template.

### Type

String

### Access

Read-write

### Syntax

`ScreenMaster.DisplayName`

### See also

[ScreenMaster \(Page 1589\)](#)

## ScreenMaster.Layers

### Description

The "Layers" property returns a list of all layers of the screen template.

### Type

Object, [HmiLayerCollection \(Page 1591\)](#)

### Access

Read-only

## Syntax

```
ScreenMaster.Layers
```

## See also

ScreenMaster (Page 1589)

HmiLayerCollection (Page 1591)

## HmiLayerCollection

### Description

The "HmiLayerCollection" object is a list of all layers ("Layer" objects) of the screen.

You reference a "HmiLayerCollection" object via the `Screen.Layers` property.

### Use

The "HmiLayerCollection" object is a list and can be counted and enumerated. You can access the "HmiLayerCollection" list using the index or the tag name.

### Object type

HmiLayerCollection

### Properties

The "HmiLayerCollection" object has the following properties:

- **Count**  
Returns the number of layers of the "HmiLayerCollection" list.

### Methods

The "HmiLayerCollection" object has the following methods:

- **Item()**  
Returns a level of the "HmiLayerCollection" list.

## HmiLayerCollection.Count

### Description

The "Count" property returns the number of screen layers of the "HmiLayerCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

`HmiLayerCollection.Count`

**See also**

[HmiLayerCollection \(Page 1591\)](#)

**HmiLayerCollection.Item()**

**Description**

The "Item" method returns a screen layer of the "HmiLayerCollection" list.

**Syntax**

`HmiLayerCollection[.Item] (HmiLayerName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiLayerCollection" object.

---

**Parameters**

**HmiLayerName**

Type: String, HmiLayerPart

Name of the screen layer

**Return value**

Object, HmiLayerPart (Page 1593)

**See also**

[HmiLayerCollection \(Page 1591\)](#)

[Layer \(Page 1593\)](#)

## Layer

### Description

The "Layer" object represents the layers of an object (e.g. screen).

### Object type

HmiLayerPart

### Properties

The "Layer" object has the following properties:

- **MaximumZoom**  
Specifies the maximum zoom of the screen up to which the level is to be seen.
- **MinimumZoom**  
Specifies the minimum zoom of the screen up to which the level is to be seen.
- **Name**  
Returns the name of the screen layer.
- **Visible**  
Specifies whether the screen layer and contained objects are visible.

### Methods

--

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

**See also**

Layer (Page 1593)

Layer.MinimumZoom (Page 1594)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

Layer (Page 1593)

Layer.MaximumZoom (Page 1593)

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

Layer (Page 1593)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

Layer (Page 1593)

**ScreenMaster.Name****Description**

The "Name" property returns the name of the screen template.

**Type**

String

**Access**

Read-only

**Syntax**

`ScreenMaster.Name`

**See also**

ScreenMaster (Page 1589)

**ScreenMaster.Visible**

**Description**

The "Visible" property specifies whether the screen template is visible. The screen template is a type of main layer of a screen.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ScreenMaster.Visible`

**See also**

ScreenMaster (Page 1589)

**Screen.ScreenNumber**

**Description**

The "ScreenNumber" property returns the screen number.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`Screen.ScreenNumber`

**See also**

Screen (Page 1560)

**Screen.VerticalAlignment****Description**

The "VerticalAlignment" property specifies the vertical alignment.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

Screen.VerticalAlignment

**See also**

Screen (Page 1560)

**Screen.Width****Description**

The "Width" property specifies the width of the screen in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`Screen.Width`

## See also

Screen (Page 1560)

## Screen.Windows

### Description

The "Windows" returns a list of all screen windows of the screen.

### Type

Object, HMIWindows (Page 1598)

### Access

Read-only

### Syntax

`Screen.Windows`

## See also

Screen (Page 1560)

Windows (Page 1598)

## Windows

### Description

The "Windows" object is a list of all screen windows ("ScreenWindow" objects) of the screen. You reference a "Windows" object via the `Screen.Windows` property.

### Use

The "Windows" object is a list and can be counted and enumerated. You can access the "Windows" list using the index or the tag name.

**Object type**

HMIWindows

**Properties**

The "Windows" object has the following properties:

- **Count**  
Returns the number of screen windows of the "Windows" list.

**Methods**

The "Windows" object has the following methods:

- **Item()**  
Returns a screen window of the "Windows" list.

**Windows.Count****Description**

The "Count" property returns the number of screen windows in the "Windows" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**`Windows.Count`**See also**[Windows \(Page 1598\)](#)**Windows.Item()****Description**

The "Item" method returns a screen window of the "Windows" list.

## Syntax

```
Windows [.Item] (WindowName) ;
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Windows" object.

---

## Parameters

### WindowName

Type: String, HmiScreenWindow

Name of the screen window

## Return value

Object, HmiScreenWindow (Page 1600)

## See also

Windows (Page 1598)

ScreenWindow (Page 1600)

## ScreenWindow

### Description

The "ScreenWindow" object represents a screen window in runtime. A screen window contains exactly one screen ("Screen" object).

The "ScreenWindow" object is returned from the `Screen.Windows` list, the `FindItem()` method or the `Screen.CurrentWindow` and `Screen.Parent` properties.

### Object type

HmiScreenWindow

## Use

You use the "ScreenWindow" object to reference a "Screen" object and have access to all the objects and properties of a screen.

---

### Note

Several screens can be opened simultaneously in runtime. These screens are displayed in screen windows. Each screen window contains exactly one screen (Screen) that can contain any number of additional screen windows (Screen Window). The resulting hierarchy can be mapped by using an object path, which is used in the "FindItem" method for addressing.

You can specify one top level screen window (Top Level Screen Window) for each monitor in the window layout of the runtime system (Screen Window Layout).

---

## Properties

The "ScreenWindow" object has the following properties:

- **Adaption**  
Specifies how the window size adapts.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the specified screen window.
- **CurrentScreen**  
Returns the screen of the current screen window.
- **CurrentZoomFactor**  
Specifies the zoom factor which is applied to the displayed screen.
- **Enabled**  
Specifies whether the specified object can be operated in runtime.
- **Height**  
Specifies the height.
- **HorizontalScrollBarPosition**  
Specifies the horizontal alignment for the scroll bar.
- **HorizontalScrollBarVisibility**  
Specifies the setting for the horizontal scroll bar of the window.
- **Icon**  
Specifies the icon.
- **InteractiveZooming**  
Specifies whether zooming is supported.
- **Layer**  
Returns the layer of the screen that contains the screen window.

- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin of the screen window.
- **Monitor**  
Returns the monitor on which the screen window is displayed.
- **Name**  
Returns the name of the screen window.
- **Parent**  
Returns the higher-level screen object (Parent container).
- **Path**  
Returns the absolute object path of the screen window.
- **RenderingTemplate**  
Returns the name of the template from which the object was created.
- **Screen**  
Specifies the name of the screen contained in the screen window.
- **ScreenName**  
Returns the screen name.
- **ScreenNumber**  
Returns the screen number.
- **ShowFocusVisual**  
Specifies whether the screen window is highlighted when in focus.
- **StartupPosition**  
Specifies the position of the screen window at runtime start.
- **StyleItemClass**  
Returns the style which is applied to the screen window.
- **System**  
Specifies the server prefix.
- **TabIndex**  
Returns the position of the screen window in the tab sequence.
- **TabIntoWindow**  
Specifies that the configured tab sequence of the displayed screen is resumed on activation via the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **VerticalScrollBarPosition**  
Specifies the vertical alignment for the scroll bar.
- **VerticalScrollBarVisibility**  
Specifies the setting for the vertical scroll bar of the window.
- **Visible**  
Specifies whether the screen window is visible.

- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the screen window configuration.

## Methods

The "ScreenWindow" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the screen window.
- **Close()**  
Closes the screen window.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ScreenWindow" object has the following events:

- **OnActivated()**  
Occurs when a screen window receives focus.
- **OnDeactivated()**  
Occurs when a screen window loses focus.

## Example

Change the screen in the adjacent screen window "Window2":

```
Screen.ParentScreen.Windows('Window2').Screen = 'NewScreen';
```

or with the "FindItem" method and relative addressing:

```
Screen.FindItem('../Window2').Screen = 'NewScreen';
```

## ScreenWindow.Adaption

### Description

The "Adaption" property specifies how the window size adapts.

### Type

Int32, HmiScreenWindowAdaption

Specifies how the window size adapts:

- None (0): No adaptation
- WindowToScreen (1): Window size corresponds to screen size
- ScreenToWindow (2): Screen is scaled to window size.

#### Access

Read-write

#### Syntax

`ScreenWindow.Adaption`

#### See also

ScreenWindow (Page 1600)

### ScreenWindow.Caption

#### Description

The "Caption" property specifies the text to be displayed in the title bar.

#### Type

Object, HmiTextPart

#### Access

Read-write

#### Syntax

`ScreenWindow.Caption`

#### See also

ScreenWindow (Page 1600)

### Text.Font

#### Description

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

ScreenWindow.Caption (Page 1604)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 1604)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 1604)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 1604)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

[Text.Font \(Page 1604\)](#)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

[Text.Font \(Page 1604\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 1604\)](#)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

**Syntax**

```
Text.ForeColor
```

**See also**

ScreenWindow.Caption (Page 1604)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

```
Text.Text
```

**See also**

ScreenWindow.Caption (Page 1604)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

## Syntax

`Text.Visible`

## See also

[ScreenWindow.Caption \(Page 1604\)](#)

## ScreenWindow.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

`ScreenWindow.CaptionColor`

## See also

[ScreenWindow \(Page 1600\)](#)

## ScreenWindow.CurrentQuality

### Description

The property "CurrentQuality" returns the current worst quality code of all tags which influence the specified screen window.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.

- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

`ScreenWindow.CurrentQuality`

**See also**

[ScreenWindow \(Page 1600\)](#)

**ScreenWindow.CurrentScreen****Description**

The "CurrentScreen" property returns the screen of the current screen window.

**Type**

Object, [HmiScreen \(Page 1560\)](#)

**Access**

Read-only

**Syntax**

`ScreenWindow.CurrentScreen`

**See also**

[Screen \(Page 1560\)](#)

[ScreenWindow \(Page 1600\)](#)

**Screen****Description**

[Screen \(Page 1560\)](#)

## ScreenWindow.CurrentZoomFactor

### Description

The "CurrentZoomFactor" property specifies the zoom factor of the screen window. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

### Type

Float

### Access

Read-write

### Syntax

`ScreenWindow.CurrentZoomFactor`

### See also

ScreenWindow (Page 1600)

## ScreenWindow.Enabled

### Description

The "Enabled" property specifies whether the screen window can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ScreenWindow.Enabled`

### See also

ScreenWindow (Page 1600)

## ScreenWindow.Height

### Description

The "Height" property specifies the height of the screen window in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ScreenWindow.Height
```

### See also

ScreenWindow (Page 1600)

## ScreenWindow.HorizontalScrollBarPosition

### Description

The "HorizontalScrollBarPosition" property specifies the horizontal alignment for the scroll bar.

### Type

Int32

### Access

Read-write

### Syntax

```
ScreenWindow.HorizontalScrollBarPosition
```

### See also

ScreenWindow (Page 1600)

ScreenWindow.HorizontalScrollBarVisibility (Page 1614)

## ScreenWindow.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
ScreenWindow.HorizontalScrollBarVisibility
```

### See also

ScreenWindow (Page 1600)

ScreenWindow.HorizontalScrollBarPosition (Page 1613)

## ScreenWindow.Icon

### Description

The "Icon" property specifies the icon of the screen window.

### Type

String

### Access

Read-write

### Syntax

```
ScreenWindow.Icon
```

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.InteractiveZooming****Description**

The "InteractiveZooming" property specifies whether zooming is supported.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ScreenWindow.InteractiveZooming`

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.Layer****Description**

The "Layer" property returns the layer of the screen that contains the screen window.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`ScreenWindow.Layer`

**See also**

ScreenWindow (Page 1600)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

ScreenWindow.Layer (Page 1615)

Layer.MinimumZoom (Page 1616)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

ScreenWindow.Layer (Page 1615)

Layer.MaximumZoom (Page 1616)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

ScreenWindow.Layer (Page 1615)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

ScreenWindow.Layer (Page 1615)

**ScreenWindow.Left**

**Description**

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ScreenWindow.Left`

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.Margin**

**Description**

The "Margin" property specifies the surrounding outer distance of the screen window.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ScreenWindow.Margin`

**See also**

[ScreenWindow](#) (Page 1600)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ScreenWindow.Margin](#) (Page 1618)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

ScreenWindow.Margin (Page 1618)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

ScreenWindow.Margin (Page 1618)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

[ScreenWindow.Margin](#) (Page 1618)

**ScreenWindow.Monitor****Description**

The "Monitor" property returns the monitor on which the window is displayed.

**Type**

UInt8

**Access**

Read-only

**Syntax**

```
ScreenWindow.Monitor
```

**See also**

[ScreenWindow](#) (Page 1600)

**ScreenWindow.Name****Description**

The "Name" property returns the name of the screen window.

**Type**

String

**Access**

Read-only

**Syntax**

```
ScreenWindow.Name
```

## See also

[ScreenWindow \(Page 1600\)](#)

## ScreenWindow.Parent

### Description

The "Parent" property returns the parent screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
ScreenWindow.Parent
```

## See also

[ScreenWindow \(Page 1600\)](#)

## Screen Items

### Description

[Screen Items \(Page 1742\)](#)

## ScreenWindow.Path

### Description

The "Path" property returns the absolute object path of a screen window in runtime starting from the screen window on the highest level.

---

#### Note

For the syntax of an object path, see the "FindItem" method (Page 1720).

---

**Type**

String

**Access**

Read-only

**Syntax**`ScreenWindow.Path`**See also**

UI.FindItem() (Page 1720)

ScreenWindow (Page 1600)

**ScreenWindow.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the object has been created.

**Type**

String

**Access**

Read-only

**Syntax**`ScreenWindow.RenderingTemplate`**See also**

ScreenWindow (Page 1600)

**ScreenWindow.Screen****Description**

The "Screen" property specifies the name of the screen ("HMIScreen" type) that is contained in the screen window. Loads a new screen via its name into the screen window.

The "Screen" property returns a different value than the "CurrentScreen" when the referenced screen is not yet loaded completely or does not exist.

**Type**

String, HmiStoredScreen

**Access**

Read-write

**Syntax**

`ScreenWindow.Screen`

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.ScreenName**

**Description**

The "ScreenName" property returns the screen name.

**Type**

String

**Access**

Read-only

**Syntax**

`ScreenWindow.ScreenName`

**See also**

ScreenWindow (Page 1600)

## ScreenWindow.ScreenNumber

### Description

The "ScreenNumber" property returns the screen number.

### Type

UInt16

### Access

Read-only

### Syntax

```
ScreenWindow.ScreenNumber
```

### See also

ScreenWindow (Page 1600)

## ScreenWindow.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the screen window is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
ScreenWindow.ShowFocusVisual
```

### See also

ScreenWindow (Page 1600)

## ScreenWindow.StartupPosition

### Description

The "StartupPosition" property sets the position of the screen window at runtime start.

### Type

Int32, HmiWindowStartupPosition

Specifies the position of the screen window:

- None (0): Relative placement on the configured monitor via "Left" and "Top".
- CenteredMonitor (1): Centered on the configured monitor.
- Maximized (2): Maximized on the configured monitor.
- CenteredOwner (3): Centered on the displayed screen.

### Access

Read-write

### Syntax

```
ScreenWindow.StartupPosition
```

### See also

ScreenWindow (Page 1600)

## ScreenWindow.StyleItemClass

### Description

The "StyleItemClass" property returns the style that is applied to the screen window.

### Type

String

### Access

Read-only

### Syntax

```
ScreenWindow.StyleItemClass
```

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.System****Description**

The "System" property specifies the server prefix.

**Type**

String, HmiSystem

**Access**

Read-write

**Syntax**

```
ScreenWindow.System
```

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.TabIndex****Description**

The "TabIndex" returns the position of the screen window in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

```
ScreenWindow.TabIndex
```

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.TabIntoWindow**

**Description**

The "TabIntoWindow" property specifies that the configured tab sequence of the displayed screen is resumed on activation via the configured tab sequence.

**Type**

Bool

**Access**

Read-write

**Syntax**

ScreenWindow.TabIntoWindow

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.Top**

**Description**

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

ScreenWindow.Top

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.VerticalScrollBarPosition****Description**

The "VerticalScrollBarPosition" property specifies the vertical position for the scroll bar.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
ScreenWindow.VerticalScrollBarPosition
```

**See also**

ScreenWindow (Page 1600)

ScreenWindow.VerticalScrollBarVisibility (Page 1629)

**ScreenWindow.VerticalScrollBarVisibility****Description**

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the window.

**Type**

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

**Access**

Read-write

**Syntax**

`ScreenWindow.VerticalScrollBarVisibility`

**See also**

[ScreenWindow \(Page 1600\)](#)

[ScreenWindow.VerticalScrollBarPosition \(Page 1629\)](#)

**ScreenWindow.Visible**

**Description**

The "Visible" property specifies whether the screen window is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ScreenWindow.Visible`

**See also**

[ScreenWindow \(Page 1600\)](#)

**ScreenWindow.Width**

**Description**

The "Width" property specifies the width of the screen window in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ScreenWindow.Width`**See also**

ScreenWindow (Page 1600)

**ScreenWindow.WindowFlags****Description**

The "WindowFlags" property specifies the screen window configuration.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

Enable multiple properties by adding the integer values or bit operators.

---

**Access**

Read-write

## Syntax

```
ScreenWindow.WindowFlags
```

## Example

Adapt the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;  
if (CanClose){  
    windowFlags |= HmiWindowFlag.CanClose;  
} else {  
    windowFlags &= HmiWindowFlag.CanClose;  
}
```

## See also

ScreenWindow (Page 1600)

## ScreenWindow.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the screen window.

### Syntax

```
ScreenWindow.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.Close()****Description**

The "Close" method closes the screen window.

**Syntax**

```
ScreenWindow.Close()
```

**Parameters**

--

**Return value**

Bool

**See also**

ScreenWindow (Page 1600)

**ScreenWindow.PropertyFlashing()****Description**

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

**Syntax**

```
ScreenWindow.PropertyFlashing (propertyName, enable [, value]  
[, alternateValue] [, rate])
```

**Parameters****propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

ScreenWindow (Page 1600)

**ScreenWindow\_OnActivated()**

**Description**

The "OnActivated" event occurs when a screen window receives focus:

- A screen window is selected via the configured tab sequence.
- A screen window that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
ScreenWindow_OnActivated(item)
```

**Context****Item**

Type: Object

Screen window where the event occurs.

**See also**

ScreenWindow (Page 1600)

**ScreenWindow\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when a screen window loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
ScreenWindow_OnDeactivated(item)
```

**Context****Item**

Type: Object

Screen window where the event occurs.

**See also**

ScreenWindow (Page 1600)

## Chapter 6

### Screen.CheckAuthorization()

#### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the screen.

#### Syntax

```
Screen.CheckAuthorization()
```

#### Parameters

--

#### Return value

Bool

#### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

##### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

#### See also

[Screen \(Page 1560\)](#)

### Screen.FindItem()

#### Description

The "FindItem" method returns screen windows or screen objects through their object path.

#### Syntax

```
Screen.FindItem(ScreenItemPath)
```

## Parameter

### **ScreenItemPath**

Type: String

Object path of the searched screen window or screen object.

---

### **Note**

The "UI.FindItem" method has a global search context and requires absolute object paths. The "Screen.FindItem" method has the current screen as the search context and can also use relative object paths.

---

### **Formulation of the object path**

The syntax of the object path orients itself to the notation of the file system paths. The object path consists of the names of the screen windows (Screen Windows) and screen objects (Screen Items). The names are connected via a slash ("/") according to the hierarchical positioning. Screens (Screens) and their names are not used in the formulation.

Relative and absolute object paths are distinguished by the prefix of the object path. The following prefixes can be used:

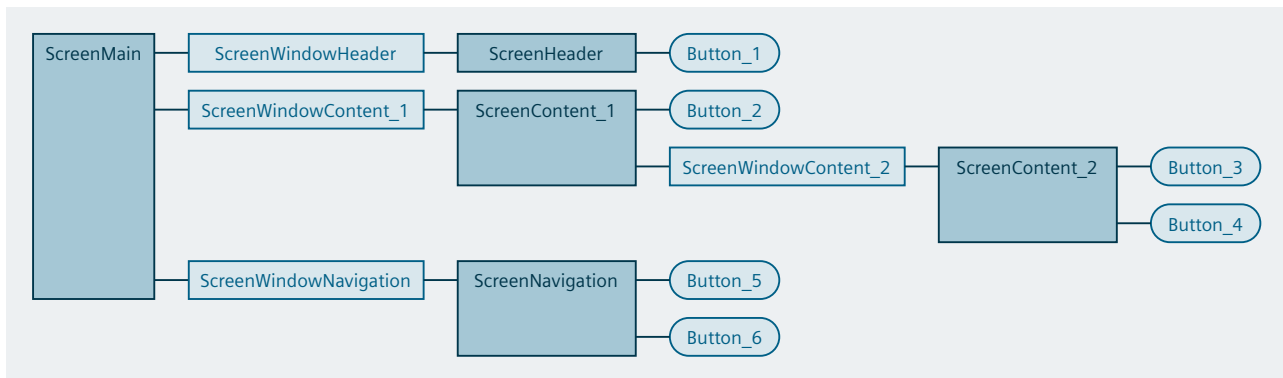

- Relative object path
  - "..": References the parent screen window (Parent) in the context of the current screen window.
  - ".": References the own screen window (Self).
  - "": A screen object of the current screen window is referenced without prefix.
- Absolute object path
  - "/": References a screen window on the highest level, whose name must follow.
  - "~": References the screen window on the highest level in the own screen hierarchy.

Additional rules for formulating an object path:

- The string ".." may be used several times in the object path, but only together at the beginning of the object path, for example, "../Window5".
- If the object path does not end with a screen object name, a screen window is referenced.
- A search is performed for screen objects of the object path in the screens of the referenced screen window. It is not permitted to specify a screen name.

### **Examples of object paths**

The following window / screen object hierarchy is adopted for the following examples:

The following objects paths for addressing the object result from this:

- Relative addressing:
  - "Button\_2" changes the label of "Button\_1":
 

```
// Navigate one level up and find "Button_1" inside the
"ScreenWindowHeader"
Screen.FindItem("../ScreenWindowHeader/Button_1").Text =
"Changed by Button_2"
```
  - "Button\_3" changes the label of "Button\_5":
 

```
// Navigate two levels up and find "Button 2" inside the
"ScreenWindowNavigation"
Screen.FindItem("../../ScreenWindowNavigation/Button_5").Text =
"Changed by Button_3"
```
  - "Button\_3" changes the label of "Button\_4":
 

```
// Find "Button_4" in same screen ("ScreenContent_2")
Screen.FindItem("Button_4").Text = "Changed by Button_3"
Screen.FindItem("./Button_4").Text = "Changed by Button_3"
```
- Absolute addressing:
  - "Button\_4" changes the label of "Button\_6":
 

```
// Navigate to the root screen and find "Button_6" inside the
"ScreenWindowNavigation"
Screen.FindItem("~/ScreenWindowNavigation/Button_6").Text =
"Changed by Button_4"
```

## Return value

Object, HmiScreenObjectBase (Page 1742)

## See also

Screen (Page 1560)

Screen Items (Page 1742)

## Screen.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

### Syntax

```
Screen.PropertyFlashing (propertyName, enable [, value] [, alternateValue]  
[, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

Screen (Page 1560)

## Screen\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- Screen is clicked with the right mouse button.
- Screen is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Screen_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### Item

Type: Object

Image where the event occurs.

#### x

Type: DInt

X-coordinate of the input point

#### y

Type: DInt

Y-coordinate of the input point

#### modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key

- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Screen (Page 1560)

**Screen\_OnHotKey()****Description**

The "OnHotKey" event occurs when the operator presses a hotkey:

Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

**Syntax**

```
Screen_OnHotKey(item, keyCode, modifiers)
```

**Context****item**

Type: Object

Image where the event occurs.

**keyCode**

Type: DInt

Numeric identifier of the pressed hotkey

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**

Screen (Page 1560)

**Screen\_OnLoaded()**

**Description**

The "OnLoaded" event occurs when the screen is fully loaded in runtime.

**Syntax**

`Screen_OnLoaded(item)`

**Context**

**Item**

Type: Object

Image at which the event occurs.

**See also**

Screen (Page 1560)

## Screen\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- Screen is clicked with the left mouse button.
- <RETURN> or <SPACE> key is pressed when a screen has the focus.
- Screen is short-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Screen_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**Item**

Type: Object

Image where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Screen (Page 1560)

**Screen\_OnUnloaded()**

**Description**

The "OnUnloaded" event occurs when the active screen on the HMI device is completely removed.

**Syntax**

```
Screen_OnUnloaded(item)
```

**Context**

**Item**

Type: Object

Image at which the event occurs.

**See also**

Screen (Page 1560)

## UI.Alarm

### Description

The "Alarm" object enables access to the properties of a selected alarm in the alarm control.

### Object type

HMIUIAlarm

### Properties

--

### Methods

The "Alarm" object has the following methods:

- **GetSelectedAlarmAttributes()**  
Returns all properties of a selected alarm in the alarm control.

### See also

UI (Page 1558)

## Alarm.GetSelectedAlarmAttributes()

### Description

The "GetSelectedAlarmAttributes" method returns all properties of a selected alarm in the alarm control.

The method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a promise object which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result, once execution is complete the corresponding handler of the promise pattern is called with the "AlarmResult" objects or the error code as parameter.

### Syntax

```
[HMIRuntime.]UI.Alarm.GetSelectedAlarmAttributes(PathAlarmControl)
.then(function(HMIAlarmBlockResult[]) {
    ...
});
.catch(function(ErrorCode) {
    ...
});
```

## Parameters

### **PathAlarmControl**

Type: String, HmiAlarmControl

Path to the alarm control

## Return value

Promise

Depending on the state of the promise object:

- Promise fulfilled  
Object, HMIAlarmBlockResult[] (Page 1649) as parameter of the "then()" handler.
- Promise rejected  
ErrorCode as parameter of the "catch()" handler.

### Example

Output all properties of an alarm of the alarm control "Alarm control 1" via the debug output:

**Copy code**

```
try
{
    let alarmControlName = "Alarm control_1";
    let ui = HMIRuntime.UI;
    let data = await ui.Alarm.GetSelectedAlarmAttributes(alarmControlName);
    let traceText = "\nID: " + data.ID +
        "\nModificationTime: " + data.ModificationTime +

        "\nAlarmClassName: " + data.AlarmClassName +
        "\nName: " + data.Name +

    HMIRuntime.Trace(traceText);
}
catch(errorCode)
{
    let errMsg = HMIRuntime.GetDetailedErrorDescription(errorCode);
    HMIRuntime.Trace("Error Code: " + errorCode + "--> Message: " + errMsg);
}
```

**See also**

[UI.Alarm \(Page 1645\)](#)

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult****Description**

The "AlarmBlockResult" object enables access to the properties of a selected alarm. The "AlarmBlockResult" object is a pure data object which maps all the properties of a selected alarm.

**Use**

The "AlarmBlockResult" object only contains properties and no methods.

All texts of the "AlarmBlockResult" object are monolingual strings. The language is specified with the "HMIRuntime.Language" property.

**Object type**

HMIAlarmBlockResult

## Properties

The "AlarmBlockResult" object has the following properties:

- **AcknowledgmentTime**  
Returns the time of the alarm acknowledgment.
- **AlarmClassName**  
Returns the name of the alarm class.
- **AlarmClassSymbol**  
Returns the icon of the alarm class.
- **AlarmGroupID**  
Returns the alarm group ID.
- **AlarmText1**  
Returns the localized additional text 1 of the alarm.
- **AlarmText2**  
Returns the localized additional text 2 of the alarm.
- **AlarmText3**  
Returns the localized additional text 3 of the alarm.
- **AlarmText4**  
Returns the localized additional text 4 of the alarm.
- **AlarmText5**  
Returns the localized additional text 5 of the alarm.
- **AlarmText6**  
Returns the localized additional text 6 of the alarm.
- **AlarmText7**  
Returns the localized additional text 7 of the alarm.
- **AlarmText8**  
Returns the localized additional text 8 of the alarm.
- **AlarmText9**  
Returns the localized additional text 9 of the alarm.
- **Area**  
Returns the alarm area of origin.
- **AverageActiveAcknowledged**  
Returns the average display duration between the alarm states "active" and "acknowledged" of an alarm in seconds.
- **AverageActiveActive**  
Returns the average display duration between the alarm states "active" and "active " of an alarm in seconds.
- **AverageActiveInactive**  
Returns the average display duration between the alarm states "active" and "inactive " of an alarm in seconds.
- **ClearTime**  
Returns the time of the alarm reset.

- **Duration**  
Returns the duration of the alarm.
- **EventText**  
Returns a localized text describing an event to the alarm.
- **Frequency**  
Returns the frequency of an alarm.
- **HostName**  
Returns the name of the PC on which the alarm was triggered.
- **ID**  
Returns the ID of the alarm that is also used in the display.
- **InfoText**  
Returns the text information.
- **InstanceID**  
Returns the ID of the instance of the alarm.
- **LoopInAlarm**  
Returns the name of the function that navigates from the display of the alarm to its origin.
- **ModificationTime**  
Returns the time stamp of the last alarm state modification.
- **Name**  
Returns the name of the alarm.
- **Origin**  
Returns the origin of the alarm.
- **Priority**  
Returns the relevance of the alarm or of the machine status.
- **ProcessValue1**  
Returns process value 1 of the alarm.
- **ProcessValue2**  
Returns process value 2 of the alarm.
- **ProcessValue3**  
Returns process value 3 of the alarm.
- **ProcessValue4**  
Returns process value 4 of the alarm.
- **ProcessValue5**  
Returns process value 5 of the alarm.
- **ProcessValue6**  
Returns process value 6 of the alarm.
- **ProcessValue7**  
Returns process value 7 of the alarm.
- **ProcessValue8**  
Returns process value 8 of the alarm.
- **ProcessValue9**  
Returns process value 9 of the alarm.

- **ProcessValue10**  
Returns process value 10 of the alarm.
- **RaiseTime**  
Returns the raise time of the alarm.
- **ResetTime**  
Returns the time of the alarm reset.
- **State**  
Returns the status of the alarm.
- **StateText**  
Returns the text of the status of the alarm.
- **SumActiveAcknowledged**  
Returns the total display duration between the alarm states "active" and "acknowledged" of an alarm in seconds.
- **SumActiveActive**  
Returns the total display duration between the alarm states "active" and "active" of an alarm in seconds.
- **SumActiveInactive**  
Returns the total display duration between the alarm states "active" and "inactive" of an alarm in seconds.
- **SuppressionState**  
Returns the visibility status of the alarm.
- **UserName**  
Returns the name of the user who triggered the alarm.
- **Value**  
Returns the process value of the alarm.
- **ValueLimit**  
Returns the limit of the process value of the alarm.
- **ValueQuality**  
Returns the quality level of the process value of the alarm.

## AlarmBlockResult.AcknowledgmentTime

### Description

The "AcknowledgmentTime" property returns the time of the alarm acknowledgment.

**Type**

DateTime

**Access**

Read-only

**Syntax**`AlarmBlockResult.AcknowledgmentTime`**AlarmBlockResult.AlarmClassName****Description**

The "AlarmClassName" property returns the name of the alarm class.

**Type**

String

**Access**

Read-only

**Syntax**`AlarmBlockResult.AlarmClassName`**See also**[AlarmBlockResult \(Page 1649\)](#)**AlarmBlockResult.AlarmClassSymbol****Description**

The "AlarmClassSymbol" property returns the icon of the alarm class.

**Type**

String

**Access**

Read-only

**Syntax**

`AlarmBlockResult.AlarmClassSymbol`

**See also**

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult.AlarmGroupID**

**Description**

The "AlarmGroupID" property returns the alarm group ID.

**Type**

UInt8

**Access**

Read-only

**Syntax**

`AlarmBlockResult.AlarmGroupID`

**See also**

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult.AlarmText1**

**Description**

The "AlarmText1" property returns the localized additional text 1 of the alarm.

**Type**

String

**Access**

Read-only

**Syntax**

`AlarmBlockResult.AlarmText1`

**See also**

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult.AlarmText2****Description**

The "AlarmText2" property returns the localized additional text 2 of the alarm.

**Type**

String

**Access**

Read-only

**Syntax**

```
AlarmBlockResult.AlarmText2
```

**See also**

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult.AlarmText3****Description**

The "AlarmText3" property returns the localized additional text 3 of the alarm.

**Type**

String

**Access**

Read-only

**Syntax**

```
AlarmBlockResult.AlarmText3
```

**See also**

[AlarmBlockResult \(Page 1649\)](#)

## AlarmBlockResult.AlarmText4

### Description

The "AlarmText4" property returns the localized additional text 4 of the alarm.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.AlarmText4
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.AlarmText5

### Description

The "AlarmText5" property returns the localized additional text 5 of the alarm.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.AlarmText5
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.AlarmText6

### Description

The "AlarmText6" property returns the localized additional text 6 of the alarm.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.AlarmText6
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.AlarmText7

### Description

The "AlarmText7" property returns the localized additional text 7 of the alarm.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.AlarmText7
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.AlarmText8

### Description

The "AlarmText8" property returns the localized additional text 8 of the alarm.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.AlarmText8
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.AlarmText9

### Description

The "AlarmText9" property returns the localized additional text 9 of the alarm.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.AlarmText9
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.Area

### Description

The "Area" property specifies the alarm area of origin.

The "Area" property can be configured and, together with the "Origin" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

The "Area" property, for example, includes subsystem, application name, or PLC ID. You can sort and filter alarms using the "Area" context.

### Type

String

### Access

Read-only

### Syntax

`AlarmBlockResult.Area`

### See also

[AlarmBlockResult \(Page 1649\)](#)

## AlarmBlockResult.AverageActiveAcknowledged

### Description

The "AverageActiveAcknowledged" property returns the average display duration of an alarm in seconds. The time period between the alarm states "active" and "acknowledged" is calculated.

### Type

String

### Access

Read-only

### Syntax

`AlarmBlockResult.AverageActiveAcknowledged`

**See also**

AlarmBlockResult (Page 1649)

**AlarmBlockResult.AverageActiveActive**

**Description**

The "AverageActiveActive" property returns the average display duration of an alarm in seconds. The time period between the alarm states "active" and "active" is calculated.

**Type**

String

**Access**

Read-only

**Syntax**

`AlarmBlockResult.AverageActiveActive`

**See also**

AlarmBlockResult (Page 1649)

**AlarmBlockResult.AverageActiveInactive**

**Description**

The "AverageActiveInactive" property returns the average display duration of an alarm in seconds. The time period between the alarm states "active" and "inactive" is calculated.

**Type**

String

**Access**

Read-only

**Syntax**

`AlarmBlockResult.AverageActiveInactive`

**See also**

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult.ClearTime****Description**

The "ClearTime" property returns the time of the alarm reset.

**Type**

DateTime

**Access**

Read-only

**Syntax**

```
AlarmBlockResult.ClearTime
```

**See also**

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult.Duration****Description**

The "Duration" property returns the duration of the alarm.

**Type**

Time

**Access**

Read-only

**Syntax**

```
AlarmBlockResult.Duration
```

**See also**

[AlarmBlockResult \(Page 1649\)](#)

## AlarmBlockResult.EventText

### Description

The "EventText" property returns a localized text describing an event to the alarm.

### Type

String

### Access

Read-only

### Syntax

`AlarmBlockResult.EventText`

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.Frequency

### Description

The "Frequency" property returns the frequency of an alarm. The system counts the number of occurrences of an alarm with "active" status in the log.

### Type

UInt32

### Access

Read-only

### Syntax

`AlarmBlockResult.Frequency`

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.HostName

### Description

The "HostName" property returns the name of the PC on which the alarm was triggered.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.HostName
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ID

### Description

The "ID" property returns the alarm ID.

### Type

UInt32

### Access

Read-only

### Syntax

```
AlarmBlockResult.ID
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.InfoText

### Description

The "InfoText" property returns the text information.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.InfoText
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.InstanceID

### Description

The "InstanceID" property returns the ID of the instance of the alarm.

### Type

UInt32

### Access

Read-only

### Syntax

```
AlarmBlockResult.InstanceID
```

## AlarmBlockResult.LoopInAlarm

### Description

The "LoopInAlarm" property returns the name of the function that navigates from the alarm display to its origin.

**Type**

String

**Access**

Read-only

**Syntax**`AlarmBlockResult.LoopInAlarm`**See also**

AlarmBlockResult (Page 1649)

**AlarmBlockResult.ModificationTime****Description**

The "ModificationTime" property returns the time stamp of the last modification to the alarm state.

**Type**

DateTime

**Access**

Read-only

**Syntax**`AlarmBlockResult.ModificationTime`**See also**

AlarmBlockResult (Page 1649)

**AlarmBlockResult.Name****Description**

The "Name" property returns the name of the alarm.

**Type**

String

**Access**

Read-only

**Syntax**

`AlarmBlockResult.Name`

**See also**

[AlarmBlockResult \(Page 1649\)](#)

**AlarmBlockResult.Origin**

**Description**

The "Origin" property returns the origin of the alarm.

For example, the "Origin" property contains the system name, data source, or CPU ID. You can sort and filter alarms using the "Origin" context.

The "Origin" property can be configured and, together with the "Area" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

**Type**

String

**Access**

Read-only

**Syntax**

`AlarmBlockResult.Origin`

**See also**

[AlarmBlockResult \(Page 1649\)](#)

## AlarmBlockResult.Priority

### Description

The "Priority" property returns the relevance of the alarm or of the machine status.

### Type

UInt8

### Access

Read-only

### Syntax

```
AlarmBlockResult.Priority
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue1

### Description

The "ProcessValue1" property returns process value 1 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue1
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue2

### Description

The "ProcessValue2" property returns process value 2 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue2
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue3

### Description

The "ProcessValue3" property returns process value 3 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue3
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue4

### Description

The "ProcessValue4" property returns process value 4 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue4
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue5

### Description

The "ProcessValue5" property returns process value 5 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue5
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue6

### Description

The "ProcessValue6" property returns process value 6 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue6
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue7

### Description

The "ProcessValue7" property returns process value 7 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue7
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ProcessValue8

### Description

The "ProcessValue8" property returns process value 8 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue8
```

### See also

[AlarmBlockResult \(Page 1649\)](#)

## AlarmBlockResult.ProcessValue9

### Description

The "ProcessValue9" property returns process value 9 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue9
```

### See also

[AlarmBlockResult \(Page 1649\)](#)

## AlarmBlockResult.ProcessValue10

### Description

The "ProcessValue10" property returns process value 10 of the alarm.

### Type

Variant

### Access

Read-only

### Syntax

```
AlarmBlockResult.ProcessValue10
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.RaiseTime

### Description

The "RaiseTime" property returns the raise time of the alarm.

### Type

DateTime

### Access

Read-only

### Syntax

```
AlarmBlockResult.RaiseTime
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ResetTime

### Description

The "ResetTime" property returns the time of the alarm reset.

### Type

DateTime

### Access

Read-only

### Syntax

```
AlarmBlockResult.ResetTime
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.State

### Description

The "State" property returns the status of the alarm.

### Type

UInt32

### Access

Read-only

### Syntax

```
AlarmBlockResult.State
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.StateText

### Description

The "StateText" property returns the text of the status of the alarm.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.StateText
```

## AlarmBlockResult.SumActiveAcknowledged

### Description

The "SumActiveAcknowledged" property returns the total display duration of an alarm in seconds. The time period between the alarm states "active" and "acknowledged" is calculated.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.SumActiveAcknowledged
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.SumActiveActive

### Description

The "SumActiveActive" property returns the total display duration of an alarm in seconds. The time period between the alarm states "active" and "active" is calculated.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.SumActiveActive
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.SumActiveInactive

### Description

The "SumActiveInactive" property returns the total display duration of an alarm in seconds. The time period between the alarm states "active" and "inactive" is calculated.

### Type

String

### Access

Read-only

### Syntax

```
AlarmBlockResult.SumActiveInactive
```

### See also

AlarmBlockResult (Page 1649)

## AlarmBlockResult.SuppressionState

### Description

The "SuppressionState" property returns the visibility status of the alarm.

Value	SuppressionState	Description
0x0	Unsuppressed	Alarm is visible.
0x1	Suppressed	Alarm is configured as not visible.
0x3	Shelved	Alarm was hidden manually. The "Unshelve" and "Shelve" methods can be applied.

### Type

UInt8

### Access

Read-only

### Syntax

`AlarmBlockResult.SuppressionState`

### See also

[AlarmBlockResult \(Page 1649\)](#)

## AlarmBlockResult.UserName

### Description

The "UserName" property returns the name of the user who triggered the alarm.

### Type

String

### Access

Read-only

### Syntax

`AlarmBlockResult.UserName`

**See also**

AlarmBlockResult (Page 1649)

**AlarmBlockResult.Value****Description**

The "Value" property returns the process value of the alarm.

**Type**

Variant

**Access**

Read-only

**Syntax**

AlarmBlockResult.Value

**See also**

AlarmBlockResult (Page 1649)

**AlarmBlockResult.ValueLimit****Description**

The "ValueLimit" property returns the limit of the alarm process value.

**Type**

Variant

**Access**

Read-only

**Syntax**

AlarmBlockResult.ValueLimit

**See also**

AlarmBlockResult (Page 1649)

## AlarmBlockResult.ValueQuality

### Description

The "ValueQuality" property returns the quality level of the process value of the alarm.

### Type

UInt16

### Access

Read-only

### Syntax

`AlarmBlockResult.ValueQuality`

### See also

AlarmBlockResult (Page 1649)

## SysFct

### Description SysFct

#### Description

The "SysFct" object enables access to the system functions of the "Alarm" object.

#### Object type

HMIUIAlarmSysFct

#### Properties

--

#### Methods

The "SysFct" object has the following methods:

- **ExecuteToolBarButton**  
Calls the "ExecuteToolBarButton" method of the alarm control.

## See also

UI.Alarm (Page 1645)

## SysFct.ExecuteToolBarButton()

### Description

The "ExecuteToolBarButton" method calls the "ExecuteToolBarButton" method of an alarm control. A button of the alarm control toolbar is triggered.

If the authorization to operate the control or toolbar has been limited or blocked, the buttons can still be operated using the method.

The authorization must be configured at the object that the method executes.

Buttons that are not available due to missing functionality in the current display (e.g. acknowledge button without alarms requiring acknowledgment) cannot be executed via the method.

### Syntax

```
[HMIRuntime.]UI.Alarm.SysFct.ExecuteToolBarButton(screenItemPath,  
alarmControlID);
```

### Parameters

#### **screenItemPath**

Type: String, HmiAlarmControl

Path of the alarm control

#### **alarmControlID**

Type: HmiAlarmControlID

Control ID of the button:

- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line

- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- SelectContext (38): Select context
- StatisticsSetup (39): Show alarm statistics settings

### Return value

ErrorCode

### See also

Description SysFct (Page 1678)

### UI.DataSet

### Description

The "DataSet" property returns the global data set ("DataSet" object) of the session.

**Type**

Object, HMIDDataSet (Page 1681)

**Access**

Read-only

**Syntax**

```
[HMIRuntime.]UI.DataSet
```

**See also**

UI (Page 1558)

DataSet (Page 1681)

**DataSet****Description**

The "DataSet" object ("HMIDDataSet" type) is a list of "DataSetElement" objects that enable data exchange in runtime.

A "DataSet" object is defined globally (on the "UI" object) or on a screen (the "Screen" object). You can access the data from any action.

You reference a "DataSet" object via the `UI.DataSet` property or via the respective screen with the `Screen.DataSet` property.

The "DataSet" object exists as long as the screen is displayed. The global object exists over the entire time period in which runtime runs.

**Use**

The "DataSet" object is a list which be counted and enumerated. You can access the "DataSet" list via the index or the element names.

**Limitations**

The following restrictions apply to the "DataSet" object:

- Only alphanumeric data types, such as "Number", "String", or "Bool" can be stored.
- JavaScript objects or classes cannot be saved.
- Triggers on changes are not possible.

**Object type**

HMIDDataSet

## Properties

The "DataSet" object has the following properties:

- **Count**  
Returns the number of elements of the "DataSet" list.

## Methods

The "DataSet" object has the following methods:

- **Add()**  
Adds an element with value to the "DataSet" list.
- **Clear()**  
Removes all elements from the "DataSet" list.
- **Exists()**  
Checks whether an element is present in the "DataSet" list.
- **Item()**  
Returns the value of an element of the "DataSet" list.
- **Remove()**  
Removes an element by its name from the "DataSet" list.

## DataSet.Count

### Description

The "Count" property returns the number of elements in the "DataSet" list.

### Type

UInt32

### Access

Read-only

### Syntax

`DataSet.Count`

### See also

[DataSet \(Page 1681\)](#)

## DataSet.Add()

### Description

The "Add" method adds an element ("DataSetElement" object) to the "DataSet" list. The elements are referenced by name.

### Syntax

```
DataSet.Add(name, value)
```

### Parameters

**name**

Type: String

Name of the element that will be added to the list.

**value**

Type: Variant

Value of the element that will be added to the list.

### Return value

--

### See also

[DataSet \(Page 1681\)](#)

## DataSet.Clear()

### Description

The "Clear" method removes all elements ("DataSetElement" objects) from the "DataSet" list.

### Syntax

```
DataSet.Clear()
```

### Parameter

--

### Return value

--

### See also

[DataSet](#) (Page 1681)

[DataSet.Remove\(\)](#) (Page 1685)

### DataSet.Exists()

#### Description

The "Exists" method searches for an element ("DataSetElement" object) in the "DataSet" list.

#### Syntax

```
DataSet.Exists (name)
```

#### Parameters

**name**

Type: String

Name of the element that is being searched for.

#### Return value

Bool

### See also

[DataSet](#) (Page 1681)

### DataSet.Item()

#### Description

The "Item" method returns the value of a "DataSetElement" object of the "DataSet" list.

## Syntax

`DataSet [.Item] (name)`

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "DataSet" object.

---

## Parameter

### **name**

Type: String

Element name or index number (1...n) of an object "DataSetElement" of the list

## Return value

Variant

## See also

[DataSet \(Page 1681\)](#)

[DataSetElement \(Page 1686\)](#)

## DataSet.Remove()

## Description

The "Remove" method removes an element ("DataSetElement" object) from the "DataSet" list by its name.

## Syntax

`DataSet.Remove (name)`

## Parameters

### **name**

Type: String

Name of the element that will be removed.

## Return value

--

## See also

[DataSet](#) (Page 1681)

[DataSet.Clear\(\)](#) (Page 1683)

## DataSetElement

### Description

The "DataSetElement" object represents a data set element in the "DataSet" list.

### Object type

HMIDataSetElement

### Properties

The "DataSetElement" object has the following properties:

- **Name**  
Returns the name of the element.
- **Value**  
Returns the value of the element.

### Methods

--

## DataSetElement.Name

### Description

The "Name" property returns the name of the element ("DataSetElement" object).

### Type

String

### Access

Read-only

### Syntax

`DataSetElement.Name`

**See also**

[DataSetElement](#) (Page 1686)

**DataSetElement.Value****Description**

The "Name" property returns the value of the element ("DataSetElement" object).

**Type**

Variant

**Access**

Read-only

**Syntax**

```
DataSetElement.Value
```

**See also**

[DataSetElement](#) (Page 1686)

**UI.PopupScreenWindows****Description**

The "PopupScreenWindows" property returns the list of all popup screen windows ("HMIPopupScreenWindows" objects).

**Type**

Object, [HMIPopupScreenWindows](#) (Page 1688)

**Access**

Read-only

**Syntax**

```
[HMIRuntime.]UI.PopupScreenWindows
```

## See also

UI (Page 1558)

PopupScreenWindows (Page 1688)

## PopupScreenWindows

### Description

The "PopupScreenWindows" object is a list of all popup screen windows ("PopupScreenWindow" objects).

### Use

The "PopupScreenWindows" object is a list which can be counted and enumerated. You can access the "PopupScreenWindows" list using the index or the tag names.

### Object type

HMIPopupScreenWindows

### Properties

The "PopupScreenWindows" object has the following properties:

- **Count**  
Returns the number of popup screen windows in the "PopupScreenWindows" list.

### Methods

The "PopupScreenWindows" object has the following methods:

- **Item()**  
Returns a popup screen window of the "PopupScreenWindows" list.

## See also

UI.PopupScreenWindows (Page 1687)

## PopupScreenWindows.Count

### Description

The "Count" property returns the number of popup screen windows in the "PopupScreenWindows" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**`PopupScreenWindows.Count`**See also**

PopupScreenWindows (Page 1688)

**PopupScreenWindows.Item()****Description**

The "Item" method returns a popup screen window of the "PopupScreenWindows" list.

**Syntax**

```
PopupScreenWindows[.Item] (WindowName) ;
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "PopupScreenWindows" object.

---

**Parameter****WindowName**

Type: String, HMIPopupScreenWindow

Name of the popup screen window

**Return value**

Object, HMIPopupScreenWindow (Page 4475)

**See also**

PopupScreenWindows (Page 1688)

PopupScreenWindow (Page 4475)

## PopupScreenWindow

### Description

PopupScreenWindow (Page 4475)

## UI.RootWindow

### Description

The "RootWindow" property returns the top level (Top Level Screen Window) screen window of the screen where the script is executed.

### Type

Object, HmiTopLevelScreenWindow (Page 1693)

### Access

Read-only

### Syntax

```
[HMIRuntime.]UI.RootWindow
```

### See also

UI (Page 1558)

TopLevelScreenWindow (Page 1693)

## TopLevelScreenWindow

### Description

TopLevelScreenWindow (Page 1693)

## UI.Style

### Description

The "Style" property specifies the style of the display and operating objects.

**Type**

String, HmiStyle

**Access**

Read-write

**Syntax**`[HMIRuntime.]UI.Style`**Example**

Switch all objects in runtime to the dark style and then output the style via the debug output:

**Copy code**

```
HMIRuntime.UI.Style = "FlatStyle_Dark";  
HMIRuntime.Trace("Switched style to: " + HMIRuntime.UI.Style);
```

**See also**[UI \(Page 1558\)](#)**UI.Windows****Description**

The "Windows" property returns a list of all screen windows at the top level (Top Level Screen Window).

**Type**

Object, HMITopLevelWindows (Page 1692)

**Access**

Read-only

**Syntax**`[HMIRuntime.]UI.Windows`**See also**[UI \(Page 1558\)](#)[TopLevelWindows \(Page 1692\)](#)

## TopLevelWindows

### Description

The "TopLevelWindows" object is a list of "TopLevelScreenWindow" objects that provides access to the top-level screen windows in runtime.

You reference a "TopLevelWindows" object via the `UI.Windows` property.

### Use

The "TopLevelWindows" object is a list and can be counted and enumerated. You can access the "TopLevelWindows" list using the index or the tag name.

### Object type

HMITopLevelWindows

### Properties

The "TopLevelWindows" object has the following properties:

- **Count**  
Returns the number of screen windows at the highest level of the "TopLevelWindows" list.

### Methods

The "TopLevelWindows" object has the following methods:

- **Item()**  
Returns a screen window at the highest level of the "TopLevelWindows" list.

## TopLevelWindows.Count

### Description

The "Count" property returns the number of screen windows at the highest level of the "TopLevelWindows" list.

### Type

UInt32

### Access

Read-only

## Syntax

```
TopLevelWindows.Count
```

## See also

TopLevelWindows (Page 1692)

## TopLevelWindows.Item()

## Description

The "Item" method returns a screen window at the highest level of the "TopLevelWindows" list.

## Syntax

```
TopLevelWindows [.Item] (WindowName) ;
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "TopLevelWindows" object.

---

## Parameter

### WindowName

Type: String, HmiTopLevelScreenWindow

Name of the screen window at the highest level

## Return value

Object, HmiTopLevelScreenWindow (Page 1693)

## See also

TopLevelWindows (Page 1692)

TopLevelScreenWindow (Page 1693)

## TopLevelScreenWindow

## Description

The "TopLevelScreenWindows" object represents a screen window at the highest hierarchy level.

## Object type

HmiTopLevelScreenWindow

## Properties

The "TopLevelScreenWindow" object has the following properties:

- **Adaption**  
Specifies how the window size adapts.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentScreen**  
Returns the screen of the current screen window.
- **CurrentZoomFactor**  
Specifies the zoom factor which is applied to the displayed screen.
- **Enabled**  
Specifies whether the specified object can be operated in runtime.
- **Height**  
Specifies the height.
- **HorizontalScrollBarPosition**  
Specifies the horizontal alignment for the scroll bar.
- **HorizontalScrollBarVisibility**  
Specifies the setting for the horizontal scroll bar of the window.
- **Icon**  
Specifies the icon.
- **InteractiveZooming**  
Specifies whether zooming is supported.
- **Layer**  
Returns the layer of the screen that contains the screen window.
- **Left**  
Specifies the value of the X coordinate.
- **Monitor**  
Returns the monitor on which the screen window is displayed.
- **Name**  
Returns the name of the screen window.
- **Parent**  
Returns the parent screen object (Parent container).
- **Path**  
Returns the absolute object path of the screen window.
- **RenderingTemplate**  
Returns the name of the template from which the object was created.

- **Screen**  
Specifies the name of the screen contained in the referenced screen window.
- **ScreenName**  
Returns the screen name.
- **ScreenNumber**  
Returns the screen number.
- **StartupPosition**  
Specifies the position of the screen window at runtime start.
- **StyleItemClass**  
Returns the style that is applied to the screen window.
- **System**  
Specifies the server prefix.
- **TabIndex**  
Returns the position of the screen window in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **VerticalScrollBarPosition**  
Specifies the vertical alignment for the scroll bar.
- **VerticalScrollBarVisibility**  
Specifies the setting for the vertical scroll bar of the window.
- **Visible**  
Specifies whether the screen window is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the screen window configuration.

## Methods

The "TopLevelScreenWindow" object has the following methods:

- **Close()**  
Closes the screen window.

## TopLevelScreenWindow.Adaption

### Description

The "Adaption" property specifies how the window size adapts.

### Type

Int32, HmiScreenWindowAdaption

Specifies how the window size adapts:

- None (0): No adaptation
- WindowToScreen (1): Window size corresponds to screen size
- ScreenToWindow (2): Screen is scaled to window size.

### Access

Read-write

### Syntax

`TopLevelScreenWindow.Adaption`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Caption

### Description

The "Caption" property specifies the text to be displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`TopLevelScreenWindow.Caption`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## Text.Font

### Description

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

[TopLevelScreenWindow.Caption \(Page 1696\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[Text.Font \(Page 1696\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 1696)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 1696)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

[Text.Font \(Page 1696\)](#)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

[Text.Font \(Page 1696\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 1696\)](#)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

**Syntax**

```
Text.ForeColor
```

**See also**

TopLevelScreenWindow.Caption (Page 1696)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

```
Text.Text
```

**See also**

TopLevelScreenWindow.Caption (Page 1696)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

## Syntax

`Text.Visible`

## See also

`TopLevelScreenWindow.Caption` (Page 1696)

## TopLevelScreenWindow.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

`TopLevelScreenWindow.CaptionColor`

## See also

`TopLevelScreenWindow` (Page 1693)

## TopLevelScreenWindow.CurrentScreen

### Description

The "CurrentScreen" property returns the screen of the current screen window.

### Type

Object, `HmiScreen` (Page 1560)

### Access

Read-only

**Syntax**

```
TopLevelScreenWindow.CurrentScreen
```

**See also**

TopLevelScreenWindow (Page 1693)

Screen (Page 1560)

**Screen****Description**

Screen (Page 1560)

**TopLevelScreenWindow.CurrentZoomFactor****Description**

The "CurrentZoomFactor" property specifies the zoom factor of the screen window. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

**Type**

Float

**Access**

Read-write

**Syntax**

```
TopLevelScreenWindow.CurrentZoomFactor
```

**See also**

TopLevelScreenWindow (Page 1693)

**TopLevelScreenWindow.Enabled****Description**

The "Enabled" property specifies whether the screen window can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`TopLevelScreenWindow.Enabled`

**See also**

TopLevelScreenWindow (Page 1693)

**TopLevelScreenWindow.Height**

**Description**

The "Height" property specifies the height of the screen window in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`TopLevelScreenWindow.Height`

**See also**

TopLevelScreenWindow (Page 1693)

**TopLevelScreenWindow.HorizontalScrollBarPosition**

**Description**

The "HorizontalScrollBarPosition" property specifies the horizontal alignment for the scroll bar.

**Type**

Int32

**Access**

Read-write

**Syntax**`TopLevelScreenWindow.HorizontalScrollBarPosition`**See also**[TopLevelScreenWindow \(Page 1693\)](#)[TopLevelScreenWindow.HorizontalScrollBarVisibility \(Page 1705\)](#)**TopLevelScreenWindow.HorizontalScrollBarVisibility****Description**

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar.

**Type**

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

**Access**

Read-write

**Syntax**`TopLevelScreenWindow.HorizontalScrollBarVisibility`**See also**[TopLevelScreenWindow \(Page 1693\)](#)[TopLevelScreenWindow.HorizontalScrollBarPosition \(Page 1704\)](#)

## TopLevelScreenWindow.Icon

### Description

The "Icon" property specifies the icon of the screen window.

### Type

String

### Access

Read-write

### Syntax

`TopLevelScreenWindow.Icon`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.InteractiveZooming

### Description

The "InteractiveZooming" property specifies whether zooming is supported.

### Type

Bool

### Access

Read-write

### Syntax

`TopLevelScreenWindow.InteractiveZooming`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Layer

### Description

The "Layer" property returns the layer of the screen that contains the screen window.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
TopLevelScreenWindow.Layer
```

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

[Layer.MinimumZoom \(Page 1708\)](#)

[TopLevelScreenWindow.Layer \(Page 1707\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[Layer.MaximumZoom \(Page 1707\)](#)

[TopLevelScreenWindow.Layer \(Page 1707\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[TopLevelScreenWindow.Layer \(Page 1707\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[TopLevelScreenWindow.Layer \(Page 1707\)](#)

## TopLevelScreenWindow.Left

### Description

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`TopLevelScreenWindow.Left`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Monitor

### Description

The "Monitor" property returns the monitor on which the window is displayed.

### Type

UInt8

### Access

Read-only

### Syntax

`TopLevelScreenWindow.Monitor`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Name

### Description

The "Name" property returns the name of the screen window.

### Type

String

### Access

Read-only

### Syntax

`TopLevelScreenWindow.Name`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Parent

### Description

The "Parent" property returns the parent screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
TopLevelScreenWindow.Parent
```

### See also

TopLevelScreenWindow (Page 1693)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## TopLevelScreenWindow.Path

### Description

The "Path" property returns the absolute object path of a screen window in runtime starting from the screen window on the highest level.

---

**Note**

For the syntax of an object path, see the "FindItem" method (Page 1720).

---

### Type

String

### Access

Read-only

### Syntax

`TopLevelScreenWindow.Path`

### See also

[UI.FindItem\(\)](#) (Page 1720)

[TopLevelScreenWindow](#) (Page 1693)

## TopLevelScreenWindow.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the object has been created.

### Type

String

### Access

Read-only

### Syntax

`TopLevelScreenWindow.RenderingTemplate`

### See also

[TopLevelScreenWindow](#) (Page 1693)

## TopLevelScreenWindow.Screen

### Description

The "Screen" property specifies the name of the screen ("HMIScreen" type) that is contained in the screen window. Loads a new screen via its name into the screen window.

The "Screen" property returns a different value than the "CurrentScreen" when the referenced screen is not yet loaded completely or does not exist.

**Type**

String, HmiStoredScreen

**Access**

Read-write

**Syntax**

`TopLevelScreenWindow.Screen`

**See also**

[TopLevelScreenWindow \(Page 1693\)](#)

**TopLevelScreenWindow.ScreenName****Description**

The "ScreenName" property returns the screen name.

**Type**

String

**Access**

Read-only

**Syntax**

`TopLevelScreenWindow.ScreenName`

**See also**

[TopLevelScreenWindow \(Page 1693\)](#)

**TopLevelScreenWindow.ScreenNumber****Description**

The "ScreenNumber" property returns the screen number.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`TopLevelScreenWindow.ScreenNumber`

**See also**

TopLevelScreenWindow (Page 1693)

**TopLevelScreenWindow.StartupPosition**

**Description**

The "StartupPosition" property sets the position of the screen window at runtime start.

**Type**

Int32, HmiWindowStartupPosition

Specifies the position of the screen window:

- None (0): Relative placement on the configured monitor via "Left" and "Top".
- CenteredMonitor (1): Centered on the configured monitor.
- Maximized (2): Maximized on the configured monitor.
- CenteredOwner (3): Centered on the displayed screen.

**Access**

Read-write

**Syntax**

`TopLevelScreenWindow.StartupPosition`

**See also**

TopLevelScreenWindow (Page 1693)

## TopLevelScreenWindow.StyleItemClass

### Description

The "StyleItemClass" property returns the style that is applied to the screen window.

### Type

String

### Access

Read-only

### Syntax

```
TopLevelScreenWindow.StyleItemClass
```

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.System

### Description

The "System" property specifies the server prefix.

### Type

String, HmiSystem

### Access

Read-write

### Syntax

```
TopLevelScreenWindow.System
```

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.TabIndex

### Description

The "TabIndex" returns the position of the screen window in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`TopLevelScreenWindow.TabIndex`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Top

### Description

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`TopLevelScreenWindow.Top`

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.VerticalScrollBarPosition

### Description

The "VerticalScrollBarPosition" property specifies the vertical position for the scroll bar.

### Type

Int32

### Access

Read-write

### Syntax

```
TopLevelScreenWindow.VerticalScrollBarPosition
```

### See also

[TopLevelScreenWindow \(Page 1693\)](#)

[TopLevelScreenWindow.VerticalScrollBarVisibility \(Page 1717\)](#)

## TopLevelScreenWindow.VerticalScrollBarVisibility

### Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the window.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

## Syntax

`TopLevelScreenWindow.VerticalScrollBarVisibility`

## See also

[TopLevelScreenWindow \(Page 1693\)](#)

[TopLevelScreenWindow.VerticalScrollBarPosition \(Page 1717\)](#)

## TopLevelScreenWindow.Visible

### Description

The "Visible" property specifies whether the screen window is visible.

### Type

Bool

### Access

Read-write

### Syntax

`TopLevelScreenWindow.Visible`

## See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Width

### Description

The "Width" property specifies the width of the screen window in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**

```
TopLevelScreenWindow.Width
```

**See also**

TopLevelScreenWindow (Page 1693)

**TopLevelScreenWindow.WindowFlags****Description**

The "WindowFlags" property specifies the screen window configuration.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

Enable multiple properties by adding the integer values or bit operators.

---

**Access**

Read-write

**Syntax**

```
TopLevelScreenWindow.WindowFlags
```

## Example

Adapt the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;  
if (CanClose){  
    windowFlags |= HmiWindowFlag.CanClose;  
} else {  
    windowFlags &= HmiWindowFlag.CanClose;  
}
```

## See also

[TopLevelScreenWindow \(Page 1693\)](#)

## TopLevelScreenWindow.Close()

### Description

The "Close" method closes the screen window.

### Syntax

```
TopLevelScreenWindow.Close()
```

### Parameters

--

### Return value

Bool

## See also

[TopLevelScreenWindow \(Page 1693\)](#)

## UI.FindItem()

### Description

The "FindItem" method returns screen windows or screen objects through their object path.

### Syntax

```
[HMIRuntime.]UI.FindItem(ScreenItemPath);
```

## Parameter

### ScreenItemPath

Type: String

Object path of the searched screen window or screen object.

---

### Note

The "UI.FindItem" method has a global search context and requires absolute object paths. The "Screen.FindItem" method has the current screen as the search context and can also use relative object paths.

---

### Formulation of the object path

The syntax of the object path orients itself to the notation of the file system paths. The object path consists of the names of the screen windows (Screen Windows) and screen objects (Screen Items). The names are connected via a slash ("/") according to the hierarchical positioning. Screens (Screens) and their names are not used in the formulation.

Relative and absolute object paths are distinguished by the prefix of the object path. The following prefixes can be used:

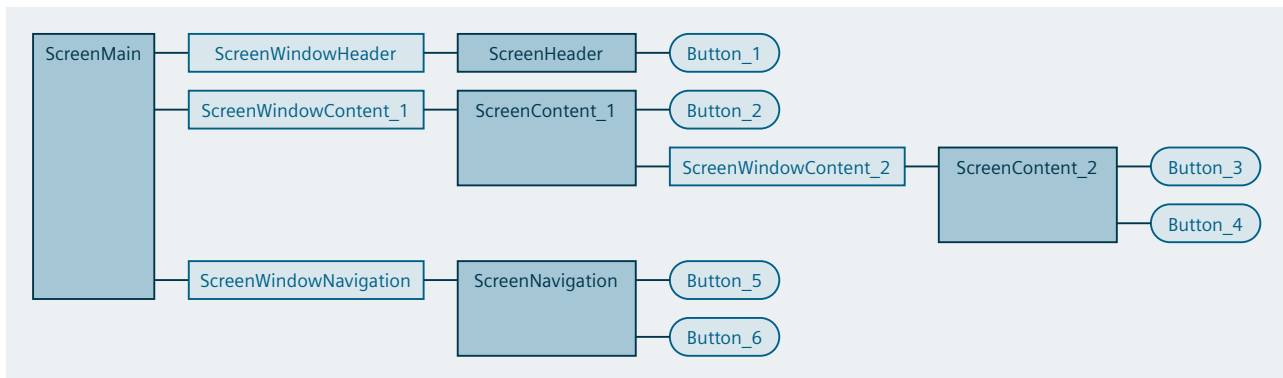

- Relative object path
  - "..": References the parent screen window (Parent) in the context of the current screen window.
  - ".": References the own screen window (Self).
  - "": A screen object of the current screen window is referenced without prefix.
- Absolute object path
  - "/": References a screen window on the highest level, whose name must follow.
  - "~": References the screen window on the highest level in the own screen hierarchy.

Additional rules for formulating an object path:

- The string ".." may be used several times in the object path, but only together at the beginning of the object path, for example, "../../../Window5".
- If the object path does not end with a screen object name, a screen window is referenced.
- A search is performed for screen objects of the object path in the screens of the referenced screen window. It is not permitted to specify a screen name.

### Examples of object paths

The following window / screen object hierarchy is adopted for the following examples:

The following objects paths for addressing the object result from this:

- Relative addressing:
  - "Button\_2" changes the label of "Button\_1":
 

```
// Navigate one level up and find "Button_1" inside the
"ScreenWindowHeader"
Screen.FindItem("../ScreenWindowHeader/Button_1").Text =
"Changed by Button_2"
```
  - "Button\_3" changes the label of "Button\_5":
 

```
// Navigate two levels up and find "Button 2" inside the
"ScreenWindowNavigation"
Screen.FindItem("../../ScreenWindowNavigation/Button_5").Text =
"Changed by Button_3"
```
  - "Button\_3" changes the label of "Button\_4":
 

```
// Find "Button_4" in same screen ("ScreenContent_2")
Screen.FindItem("Button_4").Text = "Changed by Button_3"
Screen.FindItem("./Button_4").Text = "Changed by Button_3"
```
- Absolute addressing:
  - "Button\_4" changes the label of "Button\_6":
 

```
// Navigate to the root screen and find "Button_6" inside the
"ScreenWindowNavigation"
Screen.FindItem("~/ScreenWindowNavigation/Button_6").Text =
"Changed by Button_4"
```

## Return value

Object, HmiScreenObjectBase (Page 1742)

## See also

UI (Page 1558)

Screen Items (Page 1742)

## UI.GetClientInfo()

### Description

The "GetClientInfo" method returns information about the resolution of the screen.

### Syntax

```
[HMIRuntime.]UI.GetClientInfo(infoType);
```

### Parameters

#### **infoType**

Type: Int32, HmiClientInfoType

Specifies which information is requested:

- None (0): Does not return any information.
- PrimaryDisplayWidth (1): Returns the width of the screen in DIU (Device Independent Unit).
- PrimaryDisplayHeight (2): Returns the height of the screen in DIU (Device Independent Unit).
- PrimaryDisplayPixelRatio (3): Returns the ratio of the screen pixels in DIU (Device Independent Unit).

### Return value

Variant

### Example

Specify the screen window on the highest level depending on the resolution:

#### Copy code

```
let displayWidth = UI.GetClientInfo(UI.Enums.HmiClientInfoType.PrimaryDisplayWidth);  
let displayHeight = UI.GetClientInfo(UI.Enums.HmiClientInfoType.PrimaryDisplayHeight);  
  
if (displayHeight > displayWidth) {  
    UI.RootWindow.Screen = "StartScreenPortrait";  
} else {  
    UI.RootWindow.Screen = "StartScreenLandscape";  
}
```

### See also

UI (Page 1558)

## UI.OpenFaceplateInPopup()

### Description

The "OpenFaceplateInPopup" method opens a faceplate from a screen in a popup window.

---

#### Note

When dragging a popup window to the area outside the visible workspace, it may not be possible to pull this window back. To prevent this, set the "AlwaysInParent" property for the popup window in "WindowFlags".

---

### Syntax

```
[HMIruntime.]UI.OpenFaceplateInPopup(faceplateType,title,interface[,parentScreen][,invisible]);
```

### Parameters

#### **faceplateType**

Type: String, HmiFaceplateType

Name of the faceplate type

---

#### Note

When referencing faceplate types, you must replace spaces and dots within the faceplate name with underscores.

Reference faceplate types with full version number, for example: "Faceplate\_1\_V\_0\_0\_1"

---

#### **title**

Type: String

Title of the popup window

#### **interface**

Type: Object

Interface data of the faceplate in literal notation, e.g.

```
{Interface_Tag_1:{Tag:"HMI_Tag_1"}, Color_Property_1:0xff00ff00, ResourceList_Property_1:"@Default.Text_list_1"}. The specification of the interface data by entering a graphics list is not supported.
```

#### **parentScreen**

Optional, type: Object, HmiScreen

Parent screen

**invisible**

Optional, type: Bool

Causes the faceplate to be configured so that it is invisible to the operator.

To then display the faceplate, set the property `visible=true`.

**Return value**

Object, HmiPopupScreenWindow (Page 4475)

**Example**

Open a faceplate in a popup window:

**Copy code**

```
let data = {TagProperty_1:{Tag:"Tag_1"}, ColorProperty:0xff00ff00};
let po = UI.OpenFaceplateInPopup("Faceplate_1_V_0_0_1", "title", data);
po.Left = 100;
po.Top = 150;
po.Visible = true;
let flags = po.WindowFlags;
po.WindowFlags = flags | UI.Enums.HmiWindowFlag.AlwaysInParent;

**UserManagment****Description of UserManagment****Description**

The "UserManagment" object enables call-up of the login dialog for users.

**Object type**

HMIUIUserManagment

**Properties**

--

## Methods

--

## SysFct

### Description SysFct

#### Description

The "SysFct" object ("HMIUIUserManagementSysFct" type) enables access to the system functions of the "UserManagement" object.

#### Object type

HMIUIUserManagementSysFct

#### Properties

--

#### Methods

The "SysFct" object has the following methods:

- **ShowLoginDialog**  
Opens the login dialog in a pop-up window.

#### See also

Description of UserManagement (Page 1725)

### SysFct.ShowLoginDialog()

#### Description

The "ShowLoginDialog" method opens the login dialog in a pop-up window.

#### Syntax

```
[HMIRuntime.]UI.UserManagement.SysFct.ShowLoginDialog();
```

#### Parameters

--

**Return value**

ErrorCode

**See also**

Description SysFct (Page 1726)

**ParameterControl****Description of ParameterControl****Description**

The "ParameterControl" object represents a parameter set control.

**Object type**

HMIUIParameterControl

**Properties**

--

**Methods**

--

**See also**

UI (Page 1558)

**SysFct****Description SysFct****Description**

The "SysFct" object enables access to the system functions of the "ParameterControl" object.

**Object type**

HMIUIParameterControlSysFct

## Properties

--

## Methods

The "SysFct" object has the following methods:

- **ExecuteToolBarButton()**  
Calls the "ExecuteToolBarButton" function of a parameter set control.

## See also

Description of ParameterControl (Page 1727)

## SysFct.ExecuteToolBarButton()

### Description

The "ExecuteToolBarButton" method calls the "ExecuteToolBarButton" method of a parameter set control. A button of the toolbar of the parameter set control is triggered.

If the authorization to operate the control or the toolbar is restricted or locked, the buttons can still be operated via the method.

The authorization must be configured at the object that the method executes.

Buttons that are inactive because the corresponding functionality is not available in the current display (e.g. "Create" if no parameter set type is configured) cannot be executed via the method.

### Syntax

```
[HMIRuntime.]UI.ParameterControl.SysFct.(screenItemPath,  
detailedViewToolBarButtonID);
```

### Parameters

#### **screenItemPath**

Type: String, HmiDetailedParameterControl

Path of the parameter set control

#### **detailedViewToolBarButtonID**

Type: HmiDetailedParameterControlID

Control ID of the button:

- Create (48): Create parameter set
- Save (49): Save parameter set

- SaveAs (50): Save parameter set as
- Delete (51): Delete parameter set
- Rename (52): Rename parameter set
- WriteToPLC (53): Write to PLC
- ReadFromPLC (54): Read from PLC
- Export (36): Export parameter set
- Import (37): Import parameter set
- Cancel (38): Cancel

### Return value

Description SysFct (Page 1727)

### ProDiag

### Description

The "ProDiag" object enables process diagnostics in the TIA Portal.

### Object type

HMIUIProDiag

### Properties

--

### Methods

The "ProDiag" object has the following methods:

- **OpenTIAPortalFromAlarm()**  
Opens a TIA Portal project corresponding to the selection in an alarm control.
- **OpenTIAPortalGRAPHDetails()**  
Opens a TIA Portal project and jumps to the GRAPH details.
- **OpenTIAPortalProDiagDetailsByAssignment()**  
Opens a TIA Portal project and shows the assignment to an operand and its upstream connection in the PLC code view.

- **OpenTIAPortalProDiagDetailsByCall()**  
Opens a TIA Portal project and shows the upstream connection of a network input of a standard block in the PLC code view.
- **OpenTIAPortalProject()**  
Opens a TIA Portal project.

## See also

UI (Page 1558)

## ProDiag.OpenTIAPortalFromAlarm()

### Description

The "OpenTIAPortalFromAlarm" method opens a TIA Portal project corresponding to the selection in an alarm control.

### Syntax

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalFromAlarm(DontUseModifiedProject, ReadOnly, Online, AlarmView, pathToProject);
```

### Parameters

#### **DontUseModifiedProject**

Type: Bool

If a changed project is already open, the project will not be opened.

#### **ReadOnly**

Type: Bool

Opens the project write-protected.

#### **Online**

Type: Bool

Goes into online mode once the block has been opened.

#### **AlarmView**

Type: String

Path of the alarm control

#### **pathToProject**

Type: String

Path of the project

**Return value**

ErrorCode

**See also**

ProDiag (Page 1729)

**ProDiag.OpenTIAPortalGRAPHDetails()****Description**

The "OpenTIAPortalGRAPHDetails" method opens a TIA Portal project and jumps to the GRAPH details.

**Syntax**

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalGRAPHDetails(DontUseModifiedProject, ReadOnly, Online, PlcName, Block, pathToProject);
```

**Parameters****DontUseModifiedProject**

Type: Bool

If a changed project is already open, the project will not be opened.

**ReadOnly**

Type: Bool

Opens the project write-protected.

**Online**

Type: Bool

Goes into online mode once the block has been opened.

**PlcName**

Type: String

Name of the PLC

**Block**

Type: String

Name of the block

**pathToProject**

Type: String

Path of the project

## Return value

ErrorCode

## See also

ProDiag (Page 1729)

## ProDiag.OpenTIAPortalProDiagDetailsByAssignment()

### Description

The "OpenTIAPortalProDiagDetailsByAssignment" method opens a TIA Portal project and shows the assignment to an operand and its upstream connection in the PLC code view.

### Syntax

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalProDiagDetailsByAssignment(DontUseModifiedProject, ReadOnly, Online, PlcName, Block, Operand, pathToProject);
```

### Parameters

#### **DontUseModifiedProject**

Type: Bool

If a changed project is already open, the project will not be opened.

#### **ReadOnly**

Type: Bool

Opens the project write-protected.

#### **Online**

Type:Bool

Goes into online mode once the block has been opened.

#### **PlcName**

Type: String

Name of the PLC

#### **Block**

Type: String

Name of the block

#### **Operand**

Type: String

Name of an operand to which an assignment is made.

**pathToProject**

Type: String

Path of the project

**Return value**

ErrorCode

**See also**

ProDiag (Page 1729)

**ProDiag.OpenTIAPortalProDiagDetailsByCall()****Description**

The "OpenTIAPortalProDiagDetailsByCall" method opens a TIA Portal project and shows the upstream connection of a network input of a standard block in the PLC code view.

**Syntax**

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalProDiagDetailsByCall(DontUseModifiedProject, ReadOnly, Online, PlcName, ContainingBlock, CalledBlock, Pin, pathToProject);
```

**Parameters****DontUseModifiedProject**

Type: Bool

If a changed project is already open, the project will not be opened.

**ReadOnly**

Type: Bool

Opens the project write-protected.

**Online**

Type: Bool

Goes into online mode once the block has been opened.

**PlcName**

Type: String

Name of the PLC

**ContainingBlock**

Type: String

Name of the contained block that is to be opened and displayed.

**CalledBlock**

Type: String

Name of the called block

**Pin**

Type: String

Name of the input pin of the "CallBlock".

**pathToProject**

Type: String

Path of the project

**Return value**

ErrorCode

**See also**

ProDiag (Page 1729)

**ProDiag.OpenTIAPortalProject()**

**Description**

The "OpenTIAPortalProject" method opens a TIA Portal project.

**Syntax**

```
[HMIruntime.]UI.ProDiag.OpenTIAPortalProject(DontUseModifiedProject,  
ReadOnly, pathToProject);
```

**Parameters**

**DontUseModifiedProject**

Type: Bool

If a changed project is already open, the project will not be opened.

**ReadOnly**

Type: Bool

Opens the project write-protected.

**pathToProject**

Type: String

Path of the project

**Return value**

ErrorCode

**See also**

ProDiag (Page 1729)

**SysFct****Description**

The "SysFct" object enables access to the system functions of the "ProDiag" object.

**Object type**

HMIUIProDiagSysFct

**Properties**

--

**Methods**

The "SysFct" object has the following methods:

- **IsJumpableAlarm()**  
Checks whether the alarm selected in the alarm control is a process diagnostics alarm.
- **Next()**  
Navigates to the next network in the PLC code view.
- **OpenPlcCodeViewFromAlarm()**  
Opens the associated block of the alarm selected in the alarm control in the PLC code view.
- **OpenViewerGraphByBlock()**  
Jumps to the PLC code view and opens the GRAPH details of a PLC.
- **OpenViewerGraphFromOverview()**  
Jumps from the GRAPH overview to the PLC code view.
- **Previous()**  
Navigates to the previous network in the PLC code view.
- **ToggleGRAPHViewerMode()**  
Executes the "Toggle GRAPH mode" command of the PLC code view.

- **ToggleNetworkDisplay()**  
Executes the "Toggle detail view" command of the PLC code view.
- **ZoomIn()**  
Executes the "Zoom in" command of the PLC code view.
- **ZoomOut()**  
Executes the "Zoom out" command of the PLC code view.

### See also

ProDiag (Page 1729)

## SysFct.IsJumpableAlarm()

### Description

The "IsJumpableAlarm" method checks whether the alarm selected in the alarm control is a process diagnostics alarm. If so, the specified screen object is enabled; otherwise, it is disabled.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.IsJumpableAlarm(AlarmView,  
screenItemPath);
```

### Parameters

#### **AlarmView**

Type: String, HmiAlarmControl

Path of the alarm control with selected alarm

#### **screenItemPath**

Type: String, HmiScreenItemBase

Path of the screen object

### Return value

ErrorCode

### See also

SysFct (Page 1735)

## SysFct.Next()

### Description

The "Next" method navigates to the next network in the PLC code view.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.Next(screenItemPathCodeViewer);
```

### Parameters

**screenItemPathCodeViewer**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

### Return value

ErrorCode

### See also

SysFct (Page 1735)

## SysFct.OpenPlcCodeViewFromAlarm()

### Description

The "OpenPlcCodeViewFromAlarm" method opens the associated block of the alarm selected in the alarm control in the PLC code view.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenPlcCodeViewFromAlarm(AlarmView,  
PlcCodeView);
```

### Parameters

**AlarmView**

Type: String, HmiAlarmControl

Path of the alarm control

**PlcCodeView**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

## Return value

ErrorCode

## See also

SysFct (Page 1735)

## SysFct.OpenViewerGraphByBlock()

### Description

The "OpenViewerGraphByBlock" method jumps to the PLC code view and opens the GRAPH details of a PLC.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenViewerGraphByBlock(plcName,  
graphBlockName, stepNumber, screenItemPath);
```

### Parameters

**plcName**

Type: String

Name of the PLC

**graphBlockName**

Type: String

Name of the block

**stepNumber**

Type: UInt32

Step number

**screenItemPath**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

## Return value

ErrorCode

## See also

SysFct (Page 1735)

## SysFct.OpenViewerGraphFromOverview()

### Description

The "OpenViewerGraphFromOverview" method jumps from the GRAPH overview to the PLC code view.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenViewerGraphFromOverview(screenItemPathOverviewControl, screenItemPathCodeViewer);
```

### Parameters

**screenItemPathOverviewControl**

Type: String, HmiProcessDiagnosisGraphOverviewControl

Path of the GRAPH overview

**screenItemPathCodeViewer**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

### Return value

ErrorCode

### See also

SysFct (Page 1735)

## SysFct.Previous()

### Description

The "Previous" method navigates to the previous network in the PLC code view.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.Previous(screenItemPathCodeViewer);
```

### Parameters

**screenItemPathCodeViewer**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

### Return value

ErrorCode

### See also

SysFct (Page 1735)

## SysFct.ToggleGRAPHViewerMode()

### Description

The "ToggleGRAPHViewerMode" method executes the "Toggle GRAPH mode" command of the PLC code view and toggles the Graph mode between manual step selection and automatic selection of the active step.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ToggleGRAPHViewerMode(screenItemPathCodeViewer);
```

### Parameters

**screenItemPathCodeViewer**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

### Return value

ErrorCode

### See also

SysFct (Page 1735)

## SysFct.ToggleNetworkDisplay()

### Description

The "ToggleNetworkDisplay" method executes the "Toggle detail view" command of the PLC code view and toggles between steps and transitions in the detail view.

### Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ToggleNetworkDisplay(screenItemPathCodeViewer);
```

**Parameters****screenItemPathCodeViewer**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

**Return value**

ErrorCode

**See also**

SysFct (Page 1735)

**SysFct.ZoomIn()****Description**

The "ZoomIn" method executes the "Zoom in" command of the PLC code view.

**Syntax**

```
[HMIRuntime.]UI.ProDiag.SysFct.ZoomIn(screenItemPathCodeViewer);
```

**Parameters****screenItemPathCodeViewer**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

**Return value**

ErrorCode

**See also**

SysFct (Page 1735)

**SysFct.ZoomOut()****Description**

The "ZoomOut" method executes the "Zoom out" command of the PLC code view.

## Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ZoomOut(screenItemPathCodeViewer);
```

## Parameters

### **screenItemPathCodeViewer**

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the PLC code view

## Return value

ErrorCode

## See also

SysFct (Page 1735)

## Screen Items

## AlarmControl

## Description

The "AlarmControl" object represents an alarm control. It displays current or logged alarms of a plant in list form.

## Object type

HMIAlarmControl

## Properties

The "AlarmControl" object has the following properties:

- **AcknowledgmentFlashingRate**  
Specifies the flashing frequency for alarms that must be acknowledged.
- **ActiveAlarmsViewSetup**  
Specifies which predefined alarm filter is applied to pending alarms.
- **AlarmDefinitionViewSetup**  
Specifies which predefined alarm filter is applied for user-defined alarm definitions.
- **AlarmSourceType**  
Specifies the alarm source of the alarm control.

- **AlarmStatisticsSettings**  
Returns the "AlarmStatisticsSettings" object. Assigns parameters for the statistical calculations for logged alarms.
- **AlarmStatisticsView**  
Sets the "AlarmStatisticsView" object.  
Sets an alarm window with columns and alarm rows for statistical calculations on logged alarms.
- **AlarmView**  
Specifies the "AlarmView" object.
- **AlwaysShowRecent**  
Specifies whether the most recent alarm is displayed at the beginning or end of the list, depending on the sorting.
- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the color of the title bar.
- **CurrentQuality**  
Returns the current worst quality code of all tags which influence the alarm control.
- **DefaultSortDirection**  
Specifies the sorting order of the time column if no other sorting is active.
- **Enabled**  
Specifies whether the alarm control can be operated in runtime.
- **Filter**  
Specifies a string for filtering alarms.
- **Height**  
Specifies the height of the alarm control.
- **Icon**  
Specifies the icon of the alarm control.
- **Layer**  
Returns the layer of the screen where the alarm control is located.
- **Left**  
Specifies the value of the X coordinate of the alarm control.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the alarm control.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the object was created.

- **ResetFlashingRate**  
Sets the flashing frequency for alarms that need to be reset.
- **ShowFocusVisual**  
Specifies whether the alarm control is highlighted when in focus.
- **StatusBar**  
Sets the information bar of the alarm control.
- **StyleItemClass**  
Returns the style which is applied to the alarm control.
- **SuppressFlashing**  
Specifies whether flashing is suppressed.
- **Systems**  
Specifies the name of the runtime system for the grouping of active alarms.
- **TabIndex**  
Returns the position of the alarm control in the tab sequence.
- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Sets the toolbar of the alarm control.
- **Top**  
Specifies the value of the Y coordinate of the alarm control.
- **UseAlarmColors**  
Specifies whether the configured color of the alarm is used.
- **Visible**  
Specifies whether the alarm control is visible.
- **Width**  
Specifies the width of the alarm control.
- **WindowFlags**  
Specifies the window configuration of the alarm control.

## Methods

The "AlarmControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the alarm control.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the alarm control.
- **GetSelectedAlarmData()**  
Returns all the data of the selected alarm of the alarm control.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "AlarmControl" object has the following events:

- **OnActivated()**  
Occurs when an alarm control receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the alarm control.
- **OnDeactivated()**  
Occurs when an alarm control loses focus.
- **OnInitialized()**  
Occurs when an alarm control has been successfully initialized and the data connection to the PLC has been established.
- **OnSelectionChanged()**  
Occurs when the selection in the alarm control changes.

## AlarmControl.AcknowledgmentFlashingRate

### Description

The "AcknowledgmentFlashingRate" property specifies the flashing frequency for alarms that must be acknowledged.

### Type

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

### Access

Read-write

### Syntax

`AlarmControl.AcknowledgmentFlashingRate`

### See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.ActiveAlarmsViewSetup

### Description

The "ActiveAlarmsViewSetup" property specifies which predefined alarm filter is applied to current alarms ("ActiveAlarms" alarm source).

### Type

Int32, HmiVisibleAlarms

Specifies the displayed alarms:

- None (0): Show no alarms.
- UnSuppressed (1): Show all alarms that are not suppressed.
- Disabled (2): Show only locked alarms (only if alarm source "AlarmDefinition").
- SuppressedByDesign (4): Show only alarms suppressed by design.
- Shelved (8): Show only shelved alarms.

### Access

Read-write

### Syntax

```
AlarmControl.ActiveAlarmsViewSetup
```

### See also

AlarmControl (Page 1742)

## AlarmControl.AlarmDefinitionViewSetup

### Description

The "AlarmDefinitionViewSetup" property specifies which predefined alarm filter is applied to displayed alarms from a configured alarm filter configuration (alarm source "AlarmDefinition").

### Type

Int32, HmiVisibleAlarms

Specifies the displayed alarms:

- None (0): Show no alarms.
- UnSuppressed (1): Show all alarms that are not suppressed.
- Disabled (2): Show only locked alarms (only if alarm source "AlarmDefinition").

- SuppressedByDesign (4): Show only alarms suppressed by design.
- Shelved (8): Show only shelved alarms.

**Access**

Read-write

**Syntax**

```
AlarmControl.AlarmDefinitionViewSetup
```

**See also**

AlarmControl (Page 1742)

**AlarmControl.AlarmSourceType****Description**

The "AlarmSourceType" property specifies the alarm source of the alarm control.

**Type**

Int32, HmiAlarmSourceType

Specifies the alarm source:

- NotConfigured (0): Not defined
- ActiveAlarms (1): Pending alarms
- LoggedAlarms (2): Logged alarms
- LoggedAlarmsUpdated (3): Logged alarms with updates
- AlarmDefintion (4): Alarms from configured alarm filter configuration
- AlarmStatistics (5): Alarm statistics

**Access**

Read-write

**Syntax**

```
AlarmControl.AlarmSourceType
```

**See also**

AlarmControl (Page 1742)

## AlarmControl.AlarmStatisticsSettings

### Description

The "AlarmStatisticsSettings" property specifies time settings for statistical calculations on logged alarms.

### Type

Object, HmiAlarmStatisticsSettingsPart

### Access

Read-write

### Syntax

```
AlarmControl.AlarmStatisticsSettings
```

### See also

AlarmControl (Page 1742)

## AlarmStatisticsSettings.BeginTime

### Description

The "BeginTime" property specifies the date and time for the start time of the time range.

### Type

DateTime

### Access

Read-write

### Syntax

```
AlarmStatisticsSettings.BeginTime
```

### See also

AlarmControl.AlarmStatisticsSettings (Page 1748)

## AlarmStatisticsSettings.MaximumRecords

### Description

The "MaximumRecords" property specifies the maximum number of logged alarms.

### Type

UInt16

### Access

Read-write

### Syntax

```
AlarmStatisticsSettings.MaximumRecords
```

### See also

AlarmControl.AlarmStatisticsSettings (Page 1748)

## AlarmStatisticsSettings.TimeRangeBase

### Description

The "TimeRangeBase" property specifies the base of the time range.

### Type

Int32, HmiTimeRangeBase

Specifies a time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

**Access**

Read-write

**Syntax**

`AlarmStatisticsSettings.TimeRangeBase`

**See also**

`AlarmControl.AlarmStatisticsSettings` (Page 1748)

**AlarmStatisticsSettings.TimeRangeFactor**

**Description**

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

**Type**

Int32

**Access**

Read-write

**Syntax**

`AlarmStatisticsSettings.TimeRangeFactor`

**See also**

`AlarmControl.AlarmStatisticsSettings` (Page 1748)

**AlarmStatisticsSettings.TimeRangeStart**

**Description**

The "TimeRangeStart" property specifies the start of the time range.

**Type**

Int32, HmiTimeRangeStart

Specifies the start of the time period:

- Now (0): Time period starts at the current time
- Fixed (1): Time period starts at a fixed time ("BeginTime" property)

**Access**

Read-write

**Syntax**

```
AlarmStatisticsSettings.TimeRangeStart
```

**See also**

AlarmControl.AlarmStatisticsSettings (Page 1748)

**AlarmControl.AlarmStatisticsView****Description**

The "AlarmStatisticsView" property specifies an alarm window with columns and alarm rows for statistical calculations on logged alarms.

**Type**

Object, HmiDataGridViewPart (Page 1801)

**Access**

Read-write

**Syntax**

```
AlarmControl.AlarmStatisticsView
```

**See also**

DataGridView (Page 1801)

## DataGridView

### DataGridView.AllowFilter

#### Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

#### Type

Bool

#### Access

Read-write

#### Syntax

`DataGridView.AllowFilter`

#### See also

[AlarmControl.AlarmStatisticsView \(Page 1751\)](#)

### DataGridView.AllowSort

#### Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

#### Type

Bool

#### Access

Read-write

#### Syntax

`DataGridView.AllowSort`

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**DataGridView.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
DataGridView.AlternateBackColor
```

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**DataGridView.AlternateForeColor****Description**

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
DataGridView.AlternateForeColor
```

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**DataGridView.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.BackColor`

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**DataGridView.CellPadding**

**Description**

The "CellPadding" property specifies the inner spacing of the content from the cell border.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`DataGridView.CellPadding`

**See also**

[AlarmControl.AlarmStatisticsView \(Page 1751\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[DataGridView.CellPadding \(Page 1754\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

### See also

[DataGridView.CellPadding \(Page 1754\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[DataGridView.CellPadding \(Page 1754\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

**See also**

[DataGridView.CellPadding](#) (Page 1754)

**DataGridView.Columns****Description**

The "Columns" property represents the quantity of columns.

**Type**

Object, [HmiDataGridColumnCollection](#) (Page 1757)

**Access**

Read-only

**Syntax**

```
DataGridView.Columns
```

**See also**

[HmiDataGridColumnCollection](#) (Page 1757)

[AlarmControl.AlarmStatisticsView](#) (Page 1751)

**HmiDataGridColumnCollection****Description**

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

**Use**

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

**Object type**

HmiDataGridColumnCollection

## Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

## Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiDataGridColumnCollection.Count
```

### See also

HmiDataGridColumnCollection (Page 1757)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

## Syntax

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

## Parameters

### **HmiDataGridColumnName**

Type: String

Name of the column

## Return value

Object, HmiDataGridColumnPartBase (Page 1759)

## See also

HmiDataGridColumnCollection (Page 1757)

AlarmStatisticColumn (Page 1759)

## AlarmStatisticColumn

### Description

The "AlarmStatisticColumn" object represents a value column.

### Object type

HmiAlarmStatisticColumnPart

### Properties

The "AlarmStatisticColumn" object has the following properties:

- **AlarmStatisticBlock**  
Sets the property of the alarm that is displayed in the column.
- **AllowSort**  
Specifies whether the sorting of the column is permitted.
- **BackColor**  
Specifies the background color.

- **Content**  
Specifies display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the direction of the sorting.
- **SortOrder**  
Specifies the order of the sorting.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width of the column in DIU (Device Independent Unit).

## Methods

--

## AlarmStatisticColumn.AlarmStatisticBlock

### Description

The "AlarmStatisticBlock" property specifies the property of the alarm that is displayed in the column.

### Type

Int32, HmiAlarmStatisticBlock

Specifies the alarm property:

- Undefined (0): Not defined
- AverageRaisedRaised (4097): Average time between the alarm and the resulting alarms

- AverageRaisedCleared (4098): Average time between the alarm and its clearance
- AverageRaisedAcknowledged (4099): Average time between the alarm and its acknowledgment
- AverageRaisedReset (4100): Average time between the alarm and its reset
- Frequency (4101): Number of alarms per unit of time
- SumRaisedRaised (4102): Sum of all alarms and resulting alarms
- SumRaisedCleared (4103): Sum of all alarms and their elimination
- SumRaisedAcknowledged (4104): Sum of all alarms and their acknowledgement
- SumRaisedReset (4105): Sum of all alarms and their resets
- ID (1): Alarm number
- Name (2): Alarm name
- Class (3): Alarm class
- Priority (4): Priority
- Group (5): Alarm group
- Origin (6): Origin
- Area (7): Area
- Comments (8): Alarm comment
- Information (9): Information text
- LoopInAlarm (10): Navigates to the screen in which the alarm was triggered.
- EventText (11): Alarm text
- AlarmText1...9 (12-20): User-defined alarm text
- AlarmState (21): Alarm state
- ModificationTime (22): Time of modification
- RaiseTime (23): Tripping time
- AcknowledgeTime (24): Time of acknowledgment
- ClearTime (25): Time of completion
- ResetTime (26): Reset time
- SuppressionState (27): Status of the alarm suppression
- EscalationLevel (28): Escalation level
- Context (29): Context
- Duration (30): Duration
- AcknowledgmentState (31): Acknowledgment state
- Value (32): Value
- ValueQuality (33): Quality code
- ValueLimit (34): Limit

- TagName (35): Name of the trigger tag
- HostName (36): PC name
- UserName (37): Logged-on user
- ProcessValue1...10 (38-47): Process value
- ClassSymbol (48): Alarm class icon
- StateText (49): Status text

### Access

Read-write

### Syntax

`AlarmStatisticColumn.AlarmStatisticBlock`

### See also

[AlarmStatisticColumn \(Page 1759\)](#)

## AlarmStatisticColumn.AllowSort

### Description

The "AllowSort" property specifies whether the sorting of the column is permitted. This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

`AlarmStatisticColumn.AllowSort`

### See also

[AlarmStatisticColumn \(Page 1759\)](#)

## AlarmStatisticColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
AlarmStatisticColumn.BackColor
```

### See also

AlarmStatisticColumn (Page 1759)

## AlarmColumn.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
AlarmStatisticColumn.Content
```

### See also

AlarmStatisticColumn (Page 1759)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[AlarmColumn.Content \(Page 1763\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[AlarmColumn.Content \(Page 1763\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[AlarmColumn.Content \(Page 1763\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[AlarmColumn.Content \(Page 1763\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[AlarmColumn.Content \(Page 1763\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

[AlarmColumn.Content \(Page 1763\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[AlarmColumn.Content \(Page 1763\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[AlarmColumn.Content \(Page 1763\)](#)

## AlarmStatisticColumn.Enabled

### Description

The "Enabled" property specifies whether the column can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`AlarmStatisticColumn.Enabled`**See also**

AlarmStatisticColumn (Page 1759)

**AlarmStatisticColumn.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`AlarmStatisticColumn.ForeColor`**See also**

AlarmStatisticColumn (Page 1759)

**AlarmColumn.Header****Description**

The "Header" property specifies the properties of the column header.

**Type**

Object, HmiDataGridColumnHeaderPart

**Access**

Read-write

**Syntax**

`AlarmStatisticColumn.Header`

**See also**

AlarmStatisticColumn (Page 1759)

**DataGridColumnHeader.Content**

**Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`DataGridColumnHeader.Content`

**See also**

AlarmColumn.Header (Page 1769)

**Content.ContentMode**

**Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

[DataGridColumnHeader.Content \(Page 1770\)](#)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

## Syntax

`Content.GraphicStretchMode`

## See also

[DataGridColumnHeader.Content \(Page 1770\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

## See also

[DataGridColumnHeader.Content \(Page 1770\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

**Access**

Read-write

**Syntax**`Content.Spacing`**See also**[DataGridColumnHeader.Content \(Page 1770\)](#)**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**`Content.SplitRatio`**See also**[DataGridColumnHeader.Content \(Page 1770\)](#)**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[DataGridColumnHeader.Content \(Page 1770\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

**See also**

DataGridColumnHeader.Content (Page 1770)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

DataGridColumnHeader.Content (Page 1770)

**DataGridColumnHeader.Graphic****Description**

The "Graphic" property specifies the graphic of the column header.

**Type**

String

**Access**

Read-write

## Syntax

`DataGridColumnHeader.Graphic`

## See also

[AlarmColumn.Header \(Page 1769\)](#)

## DataGridColumnHeader.Text

### Description

The "Text" property specifies the label of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Text`

## See also

[AlarmColumn.Header \(Page 1769\)](#)

## AlarmStatisticColumn.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
AlarmStatisticColumn.MaximumWidth
```

**See also**

AlarmStatisticColumn (Page 1759)

**AlarmStatisticColumn.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
AlarmStatisticColumn.MinimumWidth
```

**See also**

AlarmStatisticColumn (Page 1759)

**AlarmStatisticColumn.Name****Description**

The "Name" property returns the name of the column.

**Type**

String

**Access**

Read-only

## Syntax

`AlarmStatisticColumn.Name`

## See also

[AlarmStatisticColumn \(Page 1759\)](#)

## AlarmStatisticColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

`AlarmStatisticColumn.OutputFormat`

## See also

[AlarmStatisticColumn \(Page 1759\)](#)

## AlarmStatisticColumn.SortDirection

### Description

The "SortDirection" property specifies the direction of the sorting.

### Type

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

**Access**

Read-write

**Syntax**`AlarmStatisticColumn.SortDirection`**See also**

AlarmStatisticColumn (Page 1759)

**AlarmStatisticColumn.SortOrder****Description**

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

**Type**

UInt16

**Access**

Read-write

**Syntax**`AlarmStatisticColumn.SortOrder`**See also**

AlarmStatisticColumn (Page 1759)

**AlarmStatisticColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`AlarmStatisticColumn.Visible`

**See also**

AlarmStatisticColumn (Page 1759)

**AlarmStatisticColumn.Width**

**Description**

The "Width" property specifies the width of the column in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`AlarmStatisticColumn.Width`

**See also**

AlarmStatisticColumn (Page 1759)

**DataGridView.ColoringMode**

**Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**

Int32, HmiGridColumnColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

**Access**

Read-write

**Syntax**

```
DataGridView.ColoringMode
```

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**DataGridView.Font****Description**

The "Font" property specifies the font of the cells.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

```
DataGridView.Font
```

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

DataGridView.Font (Page 1781)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

DataGridView.Font (Page 1781)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**[DataGridView.Font \(Page 1781\)](#)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**[DataGridView.Font \(Page 1781\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[DataGridView.Font \(Page 1781\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

**Syntax**`Font.Weight`**See also**[DataGridView.Font \(Page 1781\)](#)**DataGridView.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**`UInt32`**Access**`Read-write`**Syntax**`DataGridView.ForeColor`**See also**[AlarmControl.AlarmStatisticsView \(Page 1751\)](#)**DataGridView.GridLineColor****Description**

The "GridLineColor" property specifies the color of grid lines.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`DataGridView.GridLineColor`

## See also

`AlarmControl.AlarmStatisticsView` (Page 1751)

## DataGridView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

### Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

`DataGridView.GridLineVisibility`

## See also

`AlarmControl.AlarmStatisticsView` (Page 1751)

## DataGridView.GridLineWidth

### Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

### Type

UInt8

**Access**

Read-write

**Syntax**

`DataGridView.GridLineWidth`

**See also**

`AlarmControl.AlarmStatisticsView` (Page 1751)

**DataGridView.GridSelectionMode****Description**

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

**Type**

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

**Access**

Read-write

**Syntax**

`DataGridView.GridSelectionMode`

**See also**

`AlarmControl.AlarmStatisticsView` (Page 1751)

**DataGridView.HeaderSettings****Description**

The "HeaderSettings" property specifies the settings for all column headers in the table.

**Type**

Object, HmiDataGridHeaderSettingsPart

**Access**

Read-write

**Syntax**

`DataGridView.HeaderSettings`

**See also**

`AlarmControl.AlarmStatisticsView` (Page 1751)

**DataGridHeaderSettings.AllowColumnReorder**

**Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.AllowColumnReorder`

**See also**

`DataGridView.HeaderSettings` (Page 1787)

**DataGridHeaderSettings.AllowColumnResize**

**Description**

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.AllowColumnResize`**See also**[DataGridView.HeaderSettings \(Page 1787\)](#)**DataGridHeaderSettings.ColumnHeaderType****Description**

The "ColumnHeaderType" property specifies the type of content of a column header.

**Type**

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.ColumnHeaderType`**See also**[DataGridView.HeaderSettings \(Page 1787\)](#)

## DataGridHeaderSettings.Font

### Description

The "Font" property specifies the font of the headers.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`DataGridHeaderSettings.Font`

### See also

[DataGridView.HeaderSettings \(Page 1787\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

[DataGridHeaderSettings.Font \(Page 1790\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

DataGridHeaderSettings.Font (Page 1790)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

DataGridHeaderSettings.Font (Page 1790)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

DataGridHeaderSettings.Font (Page 1790)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

DataGridHeaderSettings.Font (Page 1790)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

```
Font.Weight
```

**See also**

DataGridHeaderSettings.Font (Page 1790)

**DataGridHeaderSettings.HeaderBackColor****Description**

The "HeaderBackColor" property specifies the background color of the header.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.HeaderBackColor`

**See also**

`DataGridView.HeaderSettings` (Page 1787)

**DataGridHeaderSettings.HeaderForeColor**

**Description**

The "HeaderForeColor" property specifies the font color of the headers.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.HeaderForeColor`

**See also**

`DataGridView.HeaderSettings` (Page 1787)

**DataGridHeaderSettings.HeaderGridLineColor**

**Description**

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.HeaderGridLineColor`**See also**`DataGridView.HeaderSettings` (Page 1787)**DataGridHeaderSettings.HeaderSelectionBackColor****Description**

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.HeaderSelectionBackColor`**See also**`DataGridView.HeaderSettings` (Page 1787)**DataGridHeaderSettings.HeaderSelectionForeColor****Description**

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

**Type**

UInt32

### Access

Read-write

### Syntax

`Object.HeaderSelectionForeColor`

#### **Object**

Required. An object from the "Availability" section.

### See also

[DataGridView.HeaderSettings \(Page 1787\)](#)

## **DataGridHeaderSettings.RowHeaderType**

### Description

The "RowHeaderType" property specifies the type of content of a row header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

### Syntax

`DataGridHeaderSettings.RowHeaderType`

### See also

[DataGridView.HeaderSettings \(Page 1787\)](#)

## DataGridView.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

### See also

[AlarmControl.AlarmStatisticsView \(Page 1751\)](#)

## DataGridView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

### Type

UInt8

### Access

Read-write

## Syntax

`DataGridView.RowHeight`

## See also

`AlarmControl.AlarmStatisticsView` (Page 1751)

## **DataGridView.SelectFullRow**

### Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

### Type

Bool

### Access

Read-write

## Syntax

`DataGridView.SelectFullRow`

## See also

`AlarmControl.AlarmStatisticsView` (Page 1751)

## **DataGridView.SelectionBackColor**

### Description

The "SelectionBackColor" property specifies the background color of the selected cells.

### Type

UInt32

### Access

Read-write

**Syntax**

```
DataGridView.SelectionBackColor
```

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**DataGridView.SelectionBorderColor****Description**

The "SelectionBorderColor" property specifies the border color of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
DataGridView.SelectionBorderColor
```

**See also**

AlarmControl.AlarmStatisticsView (Page 1751)

**DataGridView.SelectionBorderWidth****Description**

The "SelectionBorderWidth" property specifies the border width of the selected cells.

**Type**

UInt8

**Access**

Read-write

## Syntax

`DataGridView.SelectionBorderWidth`

## See also

`AlarmControl.AlarmStatisticsView` (Page 1751)

## DataGridView.SelectionForeColor

### Description

The "SelectionForeColor" property specifies the font color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.SelectionForeColor`

## See also

`AlarmControl.AlarmStatisticsView` (Page 1751)

## DataGridView.VerticalScrollBarVisibility

### Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

**Access**

Read-write

**Syntax**

`DataGridView.VerticalScrollBarVisibility`

**See also**

[AlarmControl.AlarmStatisticsView \(Page 1751\)](#)

**AlarmControl.AlarmView****Description**

The "AlarmView" property specifies the alarm window with columns and alarm lines for alarms without statistical evaluation.

**Type**

Object, [HmiDataGridViewPart \(Page 1801\)](#)

**Access**

Read-write

**Syntax**

`AlarmControl.AlarmView`

**See also**

[AlarmControl \(Page 1742\)](#)

[DataGridView \(Page 1801\)](#)

**DataGridView****DataGridView.AllowFilter****Description**

The "AllowFilter" property specifies whether filtering of columns is permitted.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridView.AllowFilter`

**See also**

AlarmControl.AlarmView (Page 1801)

**DataGridView.AllowSort**

**Description**

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridView.AllowSort`

**See also**

AlarmControl.AlarmView (Page 1801)

## DataGridView.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.AlternateBackColor
```

### See also

AlarmControl.AlarmView (Page 1801)

## DataGridView.AlternateForeColor

### Description

The "AlternateForeColor" property specifies the flashing color for the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.AlternateForeColor
```

### See also

AlarmControl.AlarmView (Page 1801)

## DataGridView.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.BackColor`

### See also

[AlarmControl.AlarmView \(Page 1801\)](#)

## DataGridView.CellPadding

### Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`DataGridView.CellPadding`

### See also

[AlarmControl.AlarmView \(Page 1801\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[DataGridView.CellPadding \(Page 1804\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[DataGridView.CellPadding \(Page 1804\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[DataGridView.CellPadding \(Page 1804\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[DataGridView.CellPadding \(Page 1804\)](#)

## DataGridView.Columns

### Description

The "Columns" property represents the quantity of columns.

### Type

Object, HmiDataGridColumnCollection (Page 1807)

### Access

Read-only

### Syntax

```
DataGridView.Columns
```

### See also

HmiDataGridColumnCollection (Page 1807)

AlarmControl.AlarmView (Page 1801)

## HmiDataGridColumnCollection

### Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

### Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

### Object type

HmiDataGridColumnCollection

## Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

## Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiDataGridColumnCollection.Count
```

### See also

HmiDataGridColumnCollection (Page 1807)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

## Syntax

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

## Parameters

### **HmiDataGridColumnName**

Type: String

Name of the column

## Return value

Object, HmiDataGridColumnPartBase (Page 1809)

## See also

HmiDataGridColumnCollection (Page 1807)

AlarmColumn (Page 1809)

## AlarmColumn

### Description

The "AlarmColumn" object represents a value column.

### Object type

HmiAlarmColumnPart

### Properties

The "AlarmColumn" object has the following properties:

- **AlarmBlock**  
Specifies which property of the alarm is displayed.
- **AllowSort**  
Specifies whether the sorting of the column is permitted.
- **BackColor**  
Specifies the background color.

- **Content**  
Specifies display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the direction of the sorting.
- **SortOrder**  
Specifies the order of the sorting.
- **UseAlarmColors**  
Specifies whether the configured alarm colors are used.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width of the column in DIU (Device Independent Unit).

## Methods

--

## AlarmColumn.AlarmBlock

### Description

The "AlarmBlock" property specifies which property of the alarm is displayed.

### Type

Int32, HmiAlarmBlock

Specifies the alarm property:

- Undefined (0): Not defined
- ID (1): Alarm number
- Name (2): Alarm name
- Class (3): Alarm class
- Priority (4): Priority
- Group (5): Alarm group
- Origin (6): Origin
- Area (7): Area
- Comments (8): Alarm comment
- Information (9): Information text
- LoopInAlarm (10): Navigates to the screen in which the alarm was triggered.
- EventText (11): Alarm text
- AlarmText1...9 (12-20): User-defined alarm text
- AlarmState (21): Alarm state
- ModificationTime (22): Time of modification
- RaiseTime (23): Tripping time
- AcknowledgeTime (24): Time of acknowledgment
- ClearTime (25): Time of completion
- ResetTime (26): Reset time
- SuppressionState (27): Status of the alarm suppression
- EscalationLevel (28): Escalation level
- Context (29): Context
- Duration (30): Duration
- AcknowledgmentState (31): Acknowledgment state
- Value (32): Value
- ValueQuality (33): Quality code
- ValueLimit (34): Limit
- HostName (36): PC name
- UserName (37): Logged-on user
- ProcessValue1...10 (38-47): Process value
- ClassSymbol (48): Alarm class icon
- StateText (49): Status text
- GroupID (50): Number of the alarm group

**Access**

Read-write

**Syntax**

`AlarmColumn.AlarmBlock`

**See also**

AlarmColumn (Page 1809)

**AlarmColumn.AllowSort**

**Description**

The "AllowSort" property specifies whether the sorting of the column is permitted. This property is ignored if the parent object has the "AllowSort" property set to "False".

**Type**

Bool

**Access**

Read-write

**Syntax**

`AlarmColumn.AllowSort`

**See also**

AlarmColumn (Page 1809)

**AlarmColumn.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`AlarmColumn.BackColor`

**See also**

AlarmColumn (Page 1809)

**AlarmColumn.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`AlarmColumn.Content`

**See also**

AlarmColumn (Page 1809)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[AlarmColumn.Content \(Page 1813\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

**See also**

AlarmColumn.Content (Page 1813)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

AlarmColumn.Content (Page 1813)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`Content.Spacing`

## See also

`AlarmColumn.Content` (Page 1813)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

## Syntax

`Content.SplitRatio`

## See also

`AlarmColumn.Content` (Page 1813)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

[AlarmColumn.Content \(Page 1813\)](#)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

[AlarmColumn.Content \(Page 1813\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[AlarmColumn.Content](#) (Page 1813)

## AlarmColumn.Enabled

### Description

The "Enabled" property specifies whether the column can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`AlarmColumn.Enabled`

**See also**

AlarmColumn (Page 1809)

**AlarmColumn.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
AlarmColumn.ForeColor
```

**See also**

AlarmColumn (Page 1809)

**AlarmColumn.Header****Description**

The "Header" property specifies the properties of the column header.

**Type**

Object, HmiDataGridColumnHeaderPart

**Access**

Read-write

**Syntax**

```
AlarmColumn.Header
```

**See also**

AlarmColumn (Page 1809)

**DataGridColumnHeader.Content**

**Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`DataGridColumnHeader.Content`

**See also**

AlarmColumn.Header (Page 1819)

**Content.ContentMode**

**Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

`DataGridColumnHeader.Content` (Page 1820)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

`DataGridColumnHeader.Content` (Page 1820)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 1820\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DataGridColumnHeader.Content \(Page 1820\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

```
Content.SplitRatio
```

### See also

DataGridColumnHeader.Content (Page 1820)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

`DataGridColumnHeader.Content` (Page 1820)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

`DataGridColumnHeader.Content` (Page 1820)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[DataGridColumnHeader.Content \(Page 1820\)](#)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

### Type

String

### Access

Read-write

### Syntax

```
DataGridColumnHeader.Graphic
```

### See also

[AlarmColumn.Header \(Page 1819\)](#)

## DataGridColumnHeader.Text

### Description

The "Text" property specifies the label of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Text`

### See also

[AlarmColumn.Header](#) (Page 1819)

## AlarmColumn.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

`AlarmColumn.MaximumWidth`

### See also

[AlarmColumn](#) (Page 1809)

## AlarmColumn.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
AlarmColumn.MinimumWidth
```

### See also

AlarmColumn (Page 1809)

## AlarmColumn.Name

### Description

The "Name" property returns the name of the column.

### Type

String

### Access

Read-only

### Syntax

```
AlarmColumn.Name
```

### See also

AlarmColumn (Page 1809)

## AlarmColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

`AlarmColumn.OutputFormat`

### See also

[AlarmColumn \(Page 1809\)](#)

## AlarmColumn.SortDirection

### Description

The "SortDirection" property specifies the direction of the sorting.

### Type

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

### Access

Read-write

### Syntax

`AlarmColumn.SortDirection`

**See also**

AlarmColumn (Page 1809)

**AlarmColumn.SortOrder****Description**

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

**Type**

UInt16

**Access**

Read-write

**Syntax**

```
AlarmColumn.SortOrder
```

**See also**

AlarmColumn (Page 1809)

**AlarmColumn.UseAlarmColors****Description**

The "UseAlarmColors" property specifies whether the configured alarm colors are used.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
AlarmColumn.UseAlarmColors
```

## See also

AlarmColumn (Page 1809)

## AlarmColumn.Visible

### Description

The "Visible" property specifies whether the column is visible.

### Type

Bool

### Access

Read-write

### Syntax

AlarmColumn.Visible

## See also

AlarmColumn (Page 1809)

## AlarmColumn.Width

### Description

The "Width" property specifies the width of the column in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

AlarmColumn.Width

**See also**

AlarmColumn (Page 1809)

**DataGridView.ColoringMode****Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

**Access**

Read-write

**Syntax**

`DataGridView.ColoringMode`

**See also**

AlarmControl.AlarmView (Page 1801)

**DataGridView.Font****Description**

The "Font" property specifies the font of the cells.

**Type**

Object, HmiFontPart

**Access**

Read-write

## Syntax

`DataGridView.Font`

## See also

[AlarmControl.AlarmView \(Page 1801\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

## Syntax

`Font.Italic`

## See also

[DataGridView.Font \(Page 1831\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

**Syntax**`Font.Name`**See also**[DataGridView.Font \(Page 1831\)](#)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**[DataGridView.Font \(Page 1831\)](#)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[DataGridView.Font \(Page 1831\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[DataGridView.Font \(Page 1831\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[DataGridView.Font \(Page 1831\)](#)

**DataGridView.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.ForeColor`

**See also**

[AlarmControl.AlarmView \(Page 1801\)](#)

## DataGridView.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.GridLineColor
```

### See also

AlarmControl.AlarmView (Page 1801)

## DataGridView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

### Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

```
DataGridView.GridLineVisibility
```

**See also**

AlarmControl.AlarmView (Page 1801)

**DataGridView.GridLineWidth****Description**

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
DataGridView.GridLineWidth
```

**See also**

AlarmControl.AlarmView (Page 1801)

**DataGridView.GridSelectionMode****Description**

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

**Type**

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

**Access**

Read-write

## Syntax

`DataGridView.GridSelectionMode`

## See also

`AlarmControl.AlarmView` (Page 1801)

## DataGridView.HeaderSettings

### Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

### Type

Object, `HmiDataGridHeaderSettingsPart`

### Access

Read-write

### Syntax

`DataGridView.HeaderSettings`

## See also

`AlarmControl.AlarmView` (Page 1801)

## DataGridHeaderSettings.AllowColumnReorder

### Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

### Type

Bool

### Access

Read-write

**Syntax**

```
DataGridHeaderSettings.AllowColumnReorder
```

**See also**

DataGridView.HeaderSettings (Page 1838)

**DataGridHeaderSettings.AllowColumnResize****Description**

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
DataGridHeaderSettings.AllowColumnResize
```

**See also**

DataGridView.HeaderSettings (Page 1838)

**DataGridHeaderSettings.ColumnHeaderType****Description**

The "ColumnHeaderType" property specifies the type of content of a column header.

**Type**

Int32, HmiDataGridColumnHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.ColumnHeaderType`

**See also**

`DataGridView.HeaderSettings` (Page 1838)

**DataGridHeaderSettings.HeaderBackColor**

**Description**

The "HeaderBackColor" property specifies the background color of the header.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.HeaderBackColor`

**See also**

`DataGridView.HeaderSettings` (Page 1838)

**DataGridHeaderSettings.HeaderForeColor**

**Description**

The "HeaderForeColor" property specifies the font color of the headers.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.HeaderForeColor`**See also**`DataGridView.HeaderSettings` (Page 1838)**DataGridHeaderSettings.HeaderGridLineColor****Description**

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridHeaderSettings.HeaderGridLineColor`**See also**`DataGridView.HeaderSettings` (Page 1838)**DataGridHeaderSettings.HeaderSelectionBackColor****Description**

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

**Type**

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

### See also

DataGridView.HeaderSettings (Page 1838)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### **Object**

Required. An object from the "Availability" section.

### See also

DataGridView.HeaderSettings (Page 1838)

## DataGridHeaderSettings.RowHeaderType

### Description

The "RowHeaderType" property specifies the type of content of a row header.

**Type**

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.RowHeaderType`

**See also**

[DataGridView.HeaderSettings \(Page 1838\)](#)

**DataGridHeaderSettings.Font****Description**

The "Font" property specifies the font of the headers.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.Font`

**See also**

[DataGridView.HeaderSettings \(Page 1838\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

[DataGridHeaderSettings.Font \(Page 1843\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

`Font.Name`

### See also

[DataGridHeaderSettings.Font \(Page 1843\)](#)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

`Font.Size`

**See also**

`DataGridHeaderSettings.Font` (Page 1843)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

### See also

DataGridHeaderSettings.Font (Page 1843)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

DataGridHeaderSettings.Font (Page 1843)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**

DataGridHeaderSettings.Font (Page 1843)

**DataGridView.HorizontalScrollBarVisibility****Description**

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

**Type**

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

**Access**

Read-write

**Syntax**`DataGridView.HorizontalScrollBarVisibility`**See also**

AlarmControl.AlarmView (Page 1801)

**DataGridView.RowHeight****Description**

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`DataGridView.RowHeight`

**See also**

AlarmControl.AlarmView (Page 1801)

**DataGridView.SelectFullRow**

**Description**

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridView.SelectFullRow`

**See also**

AlarmControl.AlarmView (Page 1801)

## DataGridView.SelectionBackColor

### Description

The "SelectionBackColor" property specifies the background color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.SelectionBackColor
```

### See also

AlarmControl.AlarmView (Page 1801)

## DataGridView.SelectionBorderColor

### Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.SelectionBorderColor
```

### See also

AlarmControl.AlarmView (Page 1801)

## DataGridView.SelectionBorderWidth

### Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

`DataGridView.SelectionBorderWidth`

### See also

[AlarmControl.AlarmView \(Page 1801\)](#)

## DataGridView.SelectionForeColor

### Description

The "SelectionForeColor" property specifies the font color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.SelectionForeColor`

### See also

[AlarmControl.AlarmView \(Page 1801\)](#)

## DataGridView.VerticalScrollBarVisibility

### Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.VerticalScrollBarVisibility
```

### See also

AlarmControl.AlarmView (Page 1801)

## AlarmControl.AlwaysShowRecent

### Description

The "AlwaysShowRecent" specifies whether the most recent alarm is displayed at the beginning or end of the list, depending on the sorting.

### Type

Bool

### Access

Read-write

### Syntax

```
AlarmControl.AlwaysShowRecent
```

### See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
AlarmControl.BackColor
```

### See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.Caption

### Description

The "Caption" property specifies the text to be displayed in the header.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

```
AlarmControl.Caption
```

**See also**

AlarmControl (Page 1742)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

AlarmControl.Caption (Page 1852)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 1853)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 1853)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 1853)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

Text.Font (Page 1853)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

`Text.Font` (Page 1853)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

`Text.Font` (Page 1853)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Text.ForeColor`**See also**

AlarmControl.Caption (Page 1852)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

AlarmControl.Caption (Page 1852)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

[AlarmControl.Caption \(Page 1852\)](#)

**AlarmControl.CaptionColor**

**Description**

The "CaptionColor" property specifies the color of the header.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`AlarmControl.CaptionColor`

**See also**

[AlarmControl \(Page 1742\)](#)

**AlarmControl.CurrentQuality**

**Description**

The "CurrentQuality" property returns the current worst quality code of all tags which influence the alarm control.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

```
AlarmControl.CurrentQuality
```

**See also**

AlarmControl (Page 1742)

**AlarmControl.DefaultSortDirection****Description**

The "DefaultSortDirection" property specifies the sorting order of the time column if no other sorting is active.

**Type**

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

**Access**

Read-write

## Syntax

`AlarmControl.DefaultSortDirection`

## See also

AlarmControl (Page 1742)

## AlarmControl.Enabled

### Description

The "Enabled" property specifies whether the alarm control can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`AlarmControl.Enabled`

## See also

AlarmControl (Page 1742)

## AlarmControl.Filter

### Description

The "Filter" property specifies a string for filtering alarms.

The syntax of the filter string corresponds to the WHERE clause of an SQL command.

### Type

String

### Access

Read-write

## Syntax

`AlarmControl.Filter`

### Supported alarm properties

The following properties of an alarm can be used in the filter string:

- AcknowledgementTime
- Alarm
- AlarmClassName
- AlarmClassSymbol
- AlarmParameterValues
- AlarmText1 ... 9
- Area
- BackColor
- ChangeReason
- ClearTime
- Connection
- EventText
- Flashing
- InfoText
- InstanceID
- LoopInAlarm
- ModificationTime
- Name
- Origin
- Priority
- RaiseTime
- ResetTime
- SourceID
- SourceType
- State
- StateMachine
- StateText
- SuppressionState
- SystemSeverity
- TextColor

- Value
- ValueLimit

### Operators

The following operators can be used in the filter string:

Operator	Description	Example
=	equal to	AlarmClassName = 'demo'
IS NOT string	is not equal to the string <i>string</i>	AlarmText4 IS NOT 'Text5'
<>	not equal	Value <> 0.0
>	greater than	ModificationTime > '11.08.2016'
<	less than	Value < 75.0
>=	greater than or equal to	Value >= 25.0
<=	less than or equal to	Value <= 75.0
OR,	logical OR	State = 1 OR State = 3
AND, &&	logical AND	EventText = 'Text1' AND Origin = 'Motor'
BETWEEN	within a range	Value BETWEEN 25.0 AND 75.0
NOT BETWEEN	outside a range	Value NOT BETWEEN 25.0 AND 75.0
LIKE string	corresponds to the string <i>string</i>	Name LIKE 'Motor*'
NOT LIKE string	does not correspond to the string <i>string</i>	Name NOT LIKE 'Valve*'
IN (v1, v2, ...)	corresponds to one or more values	State IN (1, 4, 7)
NOT IN (v1, v2, ...)	does not correspond to one or more values	State NOT IN (0, 2, 3, 5, 6)
IS NULL	compares to zero (missing data)	Context IS NULL
IS NOT NULL	compares to zero (unknown data)	Context IS NOT NULL

### Wildcards

The following wildcards can be used for characters of filter strings:

Wildcard	Description	Example
*	replaces 0, 1 or more characters	Name LIKE 'Motor*'
?	replaces exactly 1 character	Name = 'Recipe?'

### See also

AlarmControl (Page 1742)

## AlarmControl.Height

### Description

The "Height" property specifies the height of the alarm control in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`AlarmControl.Height`

### See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.Icon

### Description

The "Icon" property specifies the icon of the alarm control.

### Type

String

### Access

Read-write

### Syntax

`AlarmControl.Icon`

### See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.Layer

### Description

The "Layer" property returns the layer of the screen in which the alarm control is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`AlarmControl.Layer`

### See also

[AlarmControl \(Page 1742\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[AlarmControl.Layer \(Page 1864\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[AlarmControl.Layer \(Page 1864\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[AlarmControl.Layer \(Page 1864\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[AlarmControl.Layer \(Page 1864\)](#)

## AlarmControl.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`AlarmControl.Left`

### See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the alarm control.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`AlarmControl.Margin`

### See also

[AlarmControl \(Page 1742\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[AlarmControl.Margin \(Page 1867\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[AlarmControl.Margin \(Page 1867\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[AlarmControl.Margin \(Page 1867\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[AlarmControl.Margin \(Page 1867\)](#)

**AlarmControl.Name****Description**

The "Name" property returns the name of the alarm control.

**Type**

String

**Access**

Read-only

**Syntax**

`AlarmControl.Name`

**See also**

[AlarmControl \(Page 1742\)](#)

## AlarmControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
AlarmControl.Parent
```

### See also

AlarmControl (Page 1742)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## AlarmControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the object has been created.

### Type

String

### Access

Read-only

**Syntax**

`AlarmControl.RenderingTemplate`

**See also**

[AlarmControl \(Page 1742\)](#)

**AlarmControl.ResetFlashingRate****Description**

The "ResetFlashingRate" property specifies the flashing frequency for alarms that need to be reset.

**Type**

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

**Access**

Read-write

**Syntax**

`AlarmControl.ResetFlashingRate`

**See also**

[AlarmControl \(Page 1742\)](#)

**AlarmControl.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the alarm window is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`AlarmControl.ShowFocusVisual`

**See also**

AlarmControl (Page 1742)

**AlarmControl.StatusBar**

**Description**

The "StatusBar" property specifies the Information bar of the alarm control.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

`AlarmControl.StatusBar`

**See also**

AlarmControl (Page 1742)

**StatusBar.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`StatusBar.BackColor`**See also**

AlarmControl.StatusBar (Page 1872)

**StatusBar.Elements****Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

**Type**

Object, HmiControlBarElementCollection (Page 1873)

**Access**

Read-only

**Syntax**`StatusBar.Elements`**See also**

AlarmControl.StatusBar (Page 1872)

HmiControlBarElementCollection (Page 1873)

**HmiControlBarElementCollection****Description**

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property

`StatusBar.Elements` or `ToolBar.Elements`

## Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

## Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

### See also

HmiControlBarElementCollection (Page 1873)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

#### **HmiControlBarElementName**

Type: String

Name of the element

### Return value

Object, HmiControlBarElementPartBase (Page 1892)

### See also

HmiControlBarElementCollection (Page 1873)

Control Bar Elements (Page 1892)

## Control Bar Elements

### Description

Control Bar Elements (Page 1892)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`StatusBar.Enabled`

**See also**

AlarmControl.StatusBar (Page 1872)

**StatusBar.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

AlarmControl.StatusBar (Page 1872)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

StatusBar.Font (Page 1876)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 1876)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

`Font.Size`

### See also

StatusBar.Font (Page 1876)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

StatusBar.Font (Page 1876)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

Font.Underline

### See also

StatusBar.Font (Page 1876)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

## Syntax

`Font.Weight`

## See also

[StatusBar.Font \(Page 1876\)](#)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`StatusBar.Margin`

## See also

[AlarmControl.StatusBar \(Page 1872\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`StatusBar.Margin` (Page 1880)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**

Read-write

**Syntax**`Margin.Left`**See also**`StatusBar.Margin` (Page 1880)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**

Read-write

## Syntax

`Margin.Right`

## See also

[StatusBar.Margin \(Page 1880\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[StatusBar.Margin \(Page 1880\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**

```
StatusBar.Padding
```

**See also**

AlarmControl.StatusBar (Page 1872)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

```
Int32
```

**Access**

```
Read-write
```

**Syntax**

```
Padding.Bottom
```

**See also**

StatusBar.Padding (Page 1882)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

```
Int32
```

**Access**

```
Read-write
```

## Syntax

`Padding.Left`

## See also

[StatusBar.Padding \(Page 1882\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Right`

## See also

[StatusBar.Padding \(Page 1882\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Top`**See also**`StatusBar.Padding` (Page 1882)**StatusBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**`Bool`**Access**`Read-write`**Syntax**`StatusBar.ShowToolTips`**See also**`AlarmControl.StatusBar` (Page 1872)**StatusBar.Visible****Description**

The "Visible" property specifies whether the information bar is visible.

**Type**`Bool`**Access**`Read-write`

## Syntax

`StatusBar.Visible`

## See also

[AlarmControl.StatusBar \(Page 1872\)](#)

## AlarmControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the alarm control.

### Type

String

### Access

Read-only

### Syntax

`AlarmControl.StyleItemClass`

## See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.SuppressFlashing

### Description

The "SuppressFlashing" property suppresses all flashing of the alarm control.

### Type

Bool

### Access

Read-write

**Syntax**

```
AlarmControl.SuppressFlashing
```

**See also**

AlarmControl (Page 1742)

**AlarmControl.Systems****Description**

The "Systems" property specifies the name of the runtime system for compiling active alarms. If no reference is specified, all known systems are used.

**Type**

```
String[] | Int32[]
```

**Access**

Read-write

**Syntax**

```
AlarmControl.Systems
```

**See also**

AlarmControl (Page 1742)

**AlarmControl.TabIndex****Description**

The "TabIndex" property returns the position of the alarm control in the tab sequence.

**Type**

```
UInt16
```

**Access**

Read-only

## Syntax

`AlarmControl.TabIndex`

## See also

AlarmControl (Page 1742)

## AlarmControl.TimeZone

### Description

The "TimeZone" property specifies the time zone.

### Type

Int32, HmiTimeZone

Values corresponding to the Microsoft Time Zone Index Value specification. "-1" stands for local time.

### Access

Read-write

### Syntax

`AlarmControl.TimeZone`

## See also

AlarmControl (Page 1742)

## AlarmControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the alarm control.

### Type

Object, HmiToolBarPart

### Access

Read-write

**Syntax**

```
AlarmControl.ToolBar
```

**See also**

AlarmControl (Page 1742)

**ToolBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ToolBar.BackColor
```

**See also**

AlarmControl.ToolBar (Page 1888)

**ToolBar.Elements****Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

**Type**

Object, HmiControlBarElementCollection (Page 1890)

**Access**

Read-only

## Syntax

```
ToolBar.Elements
```

## See also

AlarmControl.ToolBar (Page 1888)

HmiControlBarElementCollection (Page 1890)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**`HmiControlBarElementCollection.Count`**See also**

HmiControlBarElementCollection (Page 1890)

**HmiControlBarElementCollection.Item()****Description**

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

**Syntax**`HmiControlBarElementCollection[.Item] (HmiControlBarElementName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

**Parameters****HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 1892)

## See also

HmiControlBarElementCollection (Page 1890)

Control Bar Elements (Page 1892)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

#### Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.

- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarButton.Content
```

### See also

[ControlBarButton \(Page 1892\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ControlBarButton.Content \(Page 1897\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[ControlBarButton.Content \(Page 1897\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarButton.Content \(Page 1897\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 1897\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content \(Page 1897\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

ControlBarButton.Content (Page 1897)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 1897\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 1897\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarButton.Mapping`

## See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer distance of the button.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 1892\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ControlBarButton.Margin` (Page 1908)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 1908)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 1908\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 1908\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumHeight
```

**See also**

ControlBarButton (Page 1892)

**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 1892)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarButton.MinimumHeight`

## See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MinimumWidth`

## See also

[ControlBarButton \(Page 1892\)](#)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarButton.Operability`**See also**[ControlBarButton \(Page 1892\)](#)**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**[ControlBarButton \(Page 1892\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarButton.Padding \(Page 1913\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 1913\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 1913\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 1913\)](#)**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

### Access

Read-only

### Syntax

```
ControlBarButton.RequireExplicitUnlock
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Text
```

### See also

ControlBarButton (Page 1892)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**

ControlBarButton (Page 1892)

**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 1892)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

```
ControlBarButton.Width
```

## See also

ControlBarButton (Page 1892)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

### Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.

- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

```
ControlBarDisplay.Authorization
```

## See also

ControlBarDisplay (Page 1918)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarDisplay.Content
```

## See also

ControlBarDisplay (Page 1918)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**`Content.ContentMode`**See also**[ControlBarButton.Content \(Page 1920\)](#)**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**`Content.GraphicStretchMode`**See also**[ControlBarButton.Content \(Page 1920\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 1920\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

**See also**

ControlBarButton.Content (Page 1920)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Content.SplitRatio
```

**See also**

ControlBarButton.Content (Page 1920)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ControlBarButton.Content \(Page 1920\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 1920\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[ControlBarButton.Content \(Page 1920\)](#)

**ControlBarDisplay.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay \(Page 1918\)](#)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 1918\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.ForeColor`

### See also

[ControlBarDisplay \(Page 1918\)](#)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 1918)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.Height
```

### See also

ControlBarDisplay (Page 1918)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarDisplay.Mapping`

## See also

[ControlBarDisplay \(Page 1918\)](#)

## ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 1918\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ControlBarButton.Margin` (Page 1930)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 1930)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 1930\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 1930\)](#)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MaximumHeight
```

**See also**

ControlBarDisplay (Page 1918)

**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.MaximumWidth
```

**See also**

ControlBarDisplay (Page 1918)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 1918\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumWidth`

## See also

[ControlBarDisplay \(Page 1918\)](#)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarDisplay.Operability`**See also**

ControlBarDisplay (Page 1918)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 1918)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarButton.Padding \(Page 1935\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarButton.Padding \(Page 1935\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarButton.Padding \(Page 1935\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 1935\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

### Access

Read-only

### Syntax

`ControlBarDisplay.RequireExplicitUnlock`

### See also

ControlBarDisplay (Page 1918)

## ControlBarDisplay.Text

### Description

The "Text" property specifies the label of the display.

### Type

String

### Access

Read-write

### Syntax

`ControlBarDisplay.Text`

### See also

ControlBarDisplay (Page 1918)

## ControlBarDisplay.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the display.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 1918)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 1918)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

`ControlBarDisplay.Width`

## See also

ControlBarDisplay (Page 1918)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

### Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarLabel.Authorization`

### See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarLabel.CustomID`

### See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Enabled
```

**See also**

ControlBarLabel (Page 1940)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ForeColor
```

**See also**

ControlBarLabel (Page 1940)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarLabel.Height`

## See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.HorizontalTextAlignment`

## See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

### See also

[ControlBarLabel \(Page 1940\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarLabel.Margin \(Page 1947\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarLabel.Margin \(Page 1947\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarLabel.Margin \(Page 1947\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarLabel.Margin \(Page 1947\)](#)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

### See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumWidth`

### See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MinimumHeight`

### See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

### See also

ControlBarLabel (Page 1940)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

**See also**

ControlBarLabel (Page 1940)

**ControlBarLabel.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Padding`

**See also**

ControlBarLabel (Page 1940)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarLabel.Padding (Page 1952)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarLabel.Padding (Page 1952)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

ControlBarLabel.Padding (Page 1952)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarLabel.Padding (Page 1952)

**ControlBarLabel.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarLabel.RequireExplicitUnlock

**See also**

[ControlBarLabel \(Page 1940\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

[ControlBarLabel \(Page 1940\)](#)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

## See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.VerticalTextAlignment
```

## See also

[ControlBarLabel \(Page 1940\)](#)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

**Syntax**`ControlBarLabel.Visible`**See also**[ControlBarLabel \(Page 1940\)](#)**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarLabel.Width`**See also**[ControlBarLabel \(Page 1940\)](#)**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**`HmiControlBarSeparatorPart`

## Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 1957)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 1957)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 1957\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 1957\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

### See also

ControlBarSeparator (Page 1957)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Mapping`

**See also**

[ControlBarSeparator \(Page 1957\)](#)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarSeparator.Margin`

## See also

[ControlBarSeparator \(Page 1957\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarSeparator.Margin \(Page 1963\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarSeparator.Margin` (Page 1963)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarSeparator.Margin` (Page 1963)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarSeparator.Margin \(Page 1963\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MaximumHeight`

## See also

[ControlBarSeparator \(Page 1957\)](#)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarSeparator.MaximumWidth
```

**See also**

ControlBarSeparator (Page 1957)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.MinimumHeight
```

**See also**

ControlBarSeparator (Page 1957)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarSeparator.MinimumWidth
```

## See also

ControlBarSeparator (Page 1957)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

## See also

ControlBarSeparator (Page 1957)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarSeparator.Padding`**See also**

ControlBarSeparator (Page 1957)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarSeparator.Padding (Page 1968)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarSeparator.Padding \(Page 1968\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarSeparator.Padding \(Page 1968\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarSeparator.Padding \(Page 1968\)](#)**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarSeparator.RequireExplicitUnlock`**See also**[ControlBarSeparator \(Page 1957\)](#)**ControlBarSeparator.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

### Access

Read-write

### Syntax

`ControlBarSeparator.ToolTipText`

### See also

[ControlBarSeparator \(Page 1957\)](#)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Visible`

### See also

[ControlBarSeparator \(Page 1957\)](#)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Width`

**See also**

[ControlBarSeparator \(Page 1957\)](#)

**ControlBarTextBox****Description**

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarTextBoxPart

**Properties**

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.AlternateBorderColor
```

### See also

[ControlBarTextBox \(Page 1973\)](#)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarTextBox.Authorization
```

### See also

[ControlBarTextBox \(Page 1973\)](#)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Enabled
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.ForeColor
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

[ControlBarTextBox \(Page 1973\)](#)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

## See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 1973\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 1973\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin \(Page 1982\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarTextBox.Margin \(Page 1982\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 1982\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarTextBox.Margin \(Page 1982\)](#)

## ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumHeight`**See also**[ControlBarTextBox \(Page 1973\)](#)**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumWidth`**See also**[ControlBarTextBox \(Page 1973\)](#)**ControlBarTextBox.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumHeight`

**See also**

ControlBarTextBox (Page 1973)

**ControlBarTextBox.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumWidth`

**See also**

ControlBarTextBox (Page 1973)

**ControlBarTextBox.Operability**

**Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarTextBox.Operability
```

### See also

[ControlBarTextBox \(Page 1973\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarTextBox.Padding
```

### See also

[ControlBarTextBox \(Page 1973\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarTextBox.Padding \(Page 1987\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarTextBox.Padding \(Page 1987\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 1987\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 1987\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.ReadOnly
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

ControlBarTextBox (Page 1973)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

**See also**

[ControlBarTextBox \(Page 1973\)](#)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Width
```

**See also**

[ControlBarTextBox \(Page 1973\)](#)

**ControlBarToggleSwitch****Description**

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarToggleSwitchPart

**Properties**

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateBorderColor`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateGraphic`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BackColor
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Badge
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderWidth
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarToggleSwitch.Content (Page 2000)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarToggleSwitch.Content (Page 2000)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 2000\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 2000\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

`ControlBarToggleSwitch.Content` (Page 2000)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

`ControlBarToggleSwitch.Content` (Page 2000)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

`ControlBarToggleSwitch.Content` (Page 2000)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarToggleSwitch.Content \(Page 2000\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ForeColor`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.IsAlternateState`

## See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 1993\)](#)

**ControlBarToggleSwitch.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 1993\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarToggleSwitch.Margin \(Page 2011\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarToggleSwitch.Margin \(Page 2011\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarToggleSwitch.Margin \(Page 2011\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarToggleSwitch.Margin \(Page 2011\)](#)**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

ControlBarToggleSwitch (Page 1993)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

ControlBarToggleSwitch (Page 1993)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 1993)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumWidth`**See also**

ControlBarToggleSwitch (Page 1993)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 1993\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarToggleSwitch.Padding (Page 2016)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarToggleSwitch.Padding (Page 2016)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 2016\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 2016\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ToolTipText
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Visible
```

### See also

ControlBarToggleSwitch (Page 1993)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Width
```

### See also

ControlBarToggleSwitch (Page 1993)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Enabled
```

### See also

AlarmControl.ToolBar (Page 1888)

## ToolBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
ToolBar.Font
```

### See also

AlarmControl.ToolBar (Page 1888)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

ToolBar.Font (Page 2022)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToolBar.Font (Page 2022)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 2022)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ToolBar.Font (Page 2022)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

ToolBar.Font (Page 2022)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

ToolBar.Font (Page 2022)

**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ToolBar.Margin`

**See also**

[AlarmControl.ToolBar \(Page 1888\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ToolBar.Margin \(Page 2025\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**

ToolBar.Margin (Page 2025)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

ToolBar.Margin (Page 2025)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ToolBar.Margin \(Page 2025\)](#)

## ToolBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ToolBar.Padding`

### See also

[AlarmControl.ToolBar \(Page 1888\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ToolBar.Padding \(Page 2028\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ToolBar.Padding \(Page 2028\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ToolBar.Padding \(Page 2028\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ToolBar.Padding \(Page 2028\)](#)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

**Access**

Read-write

**Syntax**`ToolBar.ShowToolTips`**See also**

AlarmControl.ToolBar (Page 1888)

**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.UseHotKeys`**See also**

AlarmControl.ToolBar (Page 1888)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ToolBar.Visible`

### See also

[AlarmControl.ToolBar \(Page 1888\)](#)

## AlarmControl.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`AlarmControl.Top`

### See also

[AlarmControl \(Page 1742\)](#)

## AlarmControl.UseAlarmColors

### Description

The "UseAlarmColors" property specifies whether the configured alarm colors are used.

### Type

Bool

**Access**

Read-write

**Syntax**`AlarmControl.UseAlarmColors`**See also**

AlarmControl (Page 1742)

**AlarmControl.Visible****Description**

The "Visible" property specifies whether the alarm control is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`AlarmControl.Visible`**See also**

AlarmControl (Page 1742)

**AlarmControl.Width****Description**

The "Width" property specifies the width of the alarm control in DIU (Device Independent Unit).

**Type**

UInt32

### Access

Read-write

### Syntax

`AlarmControl.Width`

### See also

AlarmControl (Page 1742)

## AlarmControl.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the alarm control.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

### Note

Enable multiple properties by adding the integer values or bit operators.

---

### Access

Read-write

## Syntax

```
AlarmControl.WindowFlags
```

## Example

Adapt the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;  
if (CanClose){  
    windowFlags |= HmiWindowFlag.CanClose;  
} else {  
    windowFlags &= HmiWindowFlag.CanClose;  
}
```

## See also

AlarmControl (Page 1742)

## AlarmControl.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the alarm control.

### Syntax

```
AlarmControl.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

AlarmControl (Page 1742)

## AlarmControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the alarm control.

### Syntax

```
AlarmControl.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

## See also

AlarmControl (Page 1742)

## AlarmControl.GetSelectedAlarmData()

### Description

The "GetSelectedAlarmData" method returns the visible data of the selected alarm of the alarm control.

The method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a promise object which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result of the execution, the corresponding handler of the Promise pattern is called.

## Syntax

```
AlarmControl.GetSelectedAlarmData()  
  .then(function(Alarmdata) {  
    ...  
  })  
  .catch(function(ErrorCode) {  
    ...  
  })
```

## Parameters

--

## Return value

Promise

Depending on the state of the promise object:

- Promise fulfilled  
Key/value pairs Alarmdata[] as parameter of the "then()" handler.
- Promise rejected  
ErrorCode as parameter of the "catch()" handler.

## Example

Output all alarm attributes of the selected alarm in the "Text box\_1" text box and the debug output:

### Copy code

```
var AlarmDataPromise = Screen.Items("Alarm  
control_1").GetSelectedAlarmData();  
AlarmDataPromise.then(function (data) {  
  var AlarmDetails = " ";  
  for (let key in data) {  
    //statements  
    AlarmDetails = AlarmDetails + key + " = " + data[key] + " \n\r ";  
  }  
  HMIRuntime.Trace("AlarmDetails " + AlarmDetails);  
  Screen.Items("Text box_1").Text = AlarmDetails;  
},  
function (error) {  
  HMIRuntime.Trace("Alarm Data " + error);  
}).catch(function (error) {  
  HMIRuntime.Trace("Alarm Data error " + error);  
});
```

## See also

## AlarmControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
AlarmControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

AlarmControl (Page 1742)

**AlarmControl\_OnActivated()****Description**

The "OnActivated" event occurs when an alarm control receives focus:

- An alarm control is selected via the configured tab sequence.
- An alarm control that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
AlarmControl_OnActivated(item)
```

**Context****item**

Type: Object

Alarm control at which the event occurs.

**See also**

AlarmControl (Page 1742)

AlarmControl\_OnDeactivated() (Page 2039)

**AlarmControl\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when an alarm control loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
AlarmControl_OnDeactivated(item)
```

### Context

**item**

Type: Object

Alarm control at which the event occurs.

### See also

AlarmControl (Page 1742)

AlarmControl\_OnActivated() (Page 2039)

## AlarmControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when an alarm control has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
AlarmControl_OnInitialized(item)
```

### Context

**item**

Type: Object

Alarm control at which the event occurs.

### See also

AlarmControl (Page 1742)

## AlarmControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the alarm control.

### Syntax

```
AlarmControl_OnCommandFired(item, commandId, custom)
```

### Context

**item**

Type: Object

Alarm control at which the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### See also

AlarmControl (Page 1742)

Control Bar Elements (Page 1892)

## AlarmControl\_OnSelectionChanged()

### Description

The "OnSelectionChanged" event occurs when the selection in the alarm control changes.

### Syntax

```
AlarmControl_OnSelectionChanged(item, SelectedRowData)
```

## Context

### **item**

Type: Object

Alarm control at which the event occurs.

### **SelectedRowData**

Type: Variant

Visible properties of the selected alarm line of the alarm control as key/value pairs.

## Example

The visible property "EventText" is passed to a "OnSelectionChanged" tag at the "AlarmText" event.

### **Copy code**

```
export function Alarm_control_1_OnSelectionChanged(item,
SelectedRowData) {

let alarmText = SelectedRowData.EventText;
let tag1 = Tags("AlarmText");
tag1.Write(alarmText);

}
```

AlarmControl (Page 1742)

## Bar

### Description

The "Bar" object represents a bar for the display of process values in runtime.

### Object type

HmiBar

### Properties

The "Bar" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BarMode**  
Specifies the color of the bar.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **ComputedMaxPeakValue**  
Returns the highest process value that occurred.
- **ComputedMinPeakValue**  
Returns the lowest process value that occurred.
- **ComputedValueTendency**  
Returns the change of the process value.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the bar.
- **Enabled**  
Specifies whether the bar can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **Height**  
Specifies the height.
- **Label**  
Specifies the labeling below the bar.
- **Layer**  
Returns the layer of the screen in which the bar is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the bar.
- **NormalRangeColor**  
Specifies the color of the normal range.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the bar is operable.
- **OriginValue**  
Specifies the output value of the normal range that is visualized.

- **OutputFormat**  
Specifies the format for displaying the process values.
- **Parent**  
Returns the higher-level screen object.
- **PeakIndicators**  
Specifies whether the highest and lowest process value up to this time are displayed.
- **ProcessValue**  
Specifies the process value.
- **ProcessValueIndicatorBackColor**  
Specifies the background color for the process value.
- **ProcessValueIndicatorForeColor**  
Specifies the foreground color for the process value.
- **ProcessValueIndicatorMode**  
Specifies the type of display of the current process value.
- **RelativeToOrigin**  
Specifies whether the output value is an absolute or a percentage value between the minimum and maximum value.
- **RenderingTemplate**  
Returns the name of the template from which the bar was created.
- **RequireExplicitUnlock**  
Returns whether the bar is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the bar rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ScaleBackColor**  
Specifies the background color of the scale.
- **ScaleForeColor**  
Specifies the foreground color of the scale.
- **ShowFocusVisual**  
Specifies whether the bar is highlighted when in focus.
- **ShowTrendIndicator**  
Specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.
- **StraightScale**  
Specifies the scale of the bar.
- **StyleItemClass**  
Returns the style which is applied to the bar.

- **TabIndex**  
Returns the position of the bar in the tab sequence.
- **ThresholdIndicators**  
Specifies how parameterized limit values are visualized.
- **Thresholds**  
Returns the list of all limit values of the bar.
- **Title**  
Specifies the caption which appears as the title.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **TrendIndicatorColor**  
Specifies the color of the trend indicator.
- **Visible**  
Specifies whether the bar is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "Bar" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the bar.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Bar" object has the following events:

- **OnActivated()**  
Occurs when a bar receives focus.
- **OnContextTapped()**  
Occurs when a bar is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a bar loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the bar is in focus.

- **OnKeyUp()**  
Occurs when a key is released while the bar is in focus.
- **OnTapped()**  
Occurs when a bar is left-clicked or short-touched.

## Bar.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`Bar.AlternateBackColor`

### See also

Bar (Page 2042)

## Bar.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`Bar.AlternateBorderColor`

**See also**

Bar (Page 2042)

**Bar.Authorization****Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`Bar.Authorization`

**See also**

Bar (Page 2042)

**Bar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Bar.BackColor`

**See also**

Bar (Page 2042)

## Bar.BarMode

### Description

The "BarMode" property specifies the color of the bar.

### Type

Int32, HmiBarMode

Specifies the bar mode:

- Segmented (0): Bar changes color according to the bar segments.
- Unicolor (1): Entire bar has same color.
- SegmentedStatic (2): Bar segments in the background, process value indicator in front of the bar segments.
- UnicolorStatic (3): Background color changes according to the process value and the limit colors, process value indicator runs in front of the bar segments.

### Access

Read-write

### Syntax

`Bar.BarMode`

### See also

Bar (Page 2042)

## Bar.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

**Syntax**`Bar.BorderColor`**See also**

Bar (Page 2042)

**Bar.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**`Bar.BorderWidth`**See also**

Bar (Page 2042)

**Bar.ComputedMaxPeakValue****Description**

The "ComputedMaxPeakValue" property returns the highest process value that occurred.

**Type**

Variant

**Access**

Read-only

**Syntax**`Bar.ComputedMaxPeakValue`

## See also

Bar (Page 2042)

Bar.ComputedMinPeakValue (Page 2050)

## Bar.ComputedMinPeakValue

### Description

The "ComputedMinPeakValue" property returns the lowest process value which occurred.

### Type

Variant

### Access

Read-only

### Syntax

```
Bar.ComputedMinPeakValue
```

## See also

Bar (Page 2042)

Bar.ComputedMaxPeakValue (Page 2049)

## Bar.ComputedValueTendency

### Description

The "ComputedValueTendency" property returns the change in the process value.

### Type

Int32, HmiValueTendency

Returns the modification:

- Steady (0): No change
- Upwards (1): Change upwards
- Downwards (2): Change downwards

**Access**

Read-only

**Syntax**`Bar.ComputedValueTendency`**See also**

Bar (Page 2042)

**Bar.CurrentQuality****Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the bar.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**`Bar.CurrentQuality`**See also**

Bar (Page 2042)

## Bar.Enabled

### Description

The "Enabled" property specifies whether the bar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`Bar.Enabled`

### See also

Bar (Page 2042)

## Bar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`Bar.Font`

### See also

Bar (Page 2042)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Bar.Font (Page 2052)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Bar.Font (Page 2052)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

Bar.Font (Page 2052)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

Font.StrikeOut

**See also**

Bar.Font (Page 2052)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

Bar.Font (Page 2052)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Bar.Font \(Page 2052\)](#)

**Bar.Height**

**Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Bar.Height`

**See also**

[Bar \(Page 2042\)](#)

**Bar.Label**

**Description**

The "Label" property specifies the label below the bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`Bar.Label`

**See also**

Bar (Page 2042)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

Bar.Label (Page 2056)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 2057)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Text.Font (Page 2057)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 2057)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

**See also**

Text.Font (Page 2057)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

Text.Font (Page 2057)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

Text.Font (Page 2057)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
Text.ForeColor
```

### See also

Bar.Label (Page 2056)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

```
Text.Text
```

### See also

Bar.Label (Page 2056)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

Bar.Label (Page 2056)

## Bar.Layer

### Description

The "Layer" property returns the layer of the screen in which the bar is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Bar.Layer`

### See also

Bar (Page 2042)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

Bar.Layer (Page 2062)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

Bar.Layer (Page 2062)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

Bar.Layer (Page 2062)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

Bar.Layer (Page 2062)

## Bar.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Bar.Left`

### See also

Bar (Page 2042)

## Bar.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Bar.Margin`

### See also

Bar (Page 2042)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[Bar.Margin \(Page 2065\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[Bar.Margin \(Page 2065\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Bar.Margin \(Page 2065\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[Bar.Margin \(Page 2065\)](#)

## Bar.Name

### Description

The "Name" property returns the name of the bar.

### Type

String

### Access

Read-only

### Syntax

`Bar.Name`

### See also

Bar (Page 2042)

## Bar.NormalRangeColor

### Description

The "NormalRangeColor" property specifies the color of the normal range.

### Type

UInt32

### Access

Read-write

### Syntax

`Bar.NormalRangeColor`

### See also

Bar (Page 2042)

## Bar.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`Bar.Opacity`

### See also

Bar (Page 2042)

## Bar.Operability

### Description

The "Operability" property returns whether the bar is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Bar.Operability`

**See also**

Bar (Page 2042)

**Bar.OriginValue**

**Description**

The "OriginValue" property specifies the output value of the normal range to be visualized.

**Type**

Float

**Access**

Read-write

**Syntax**

`Bar.OriginValue`

**See also**

Bar (Page 2042)

**Bar.OutputFormat**

**Description**

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

**Type**

String

**Access**

Read-write

**Syntax**

`Bar.OutputFormat`

**See also**

Bar (Page 2042)

**Bar.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

```
Bar.Parent
```

**See also**

Bar (Page 2042)

Screen Items (Page 1742)

**Screen Items****Description**

Screen Items (Page 1742)

**Bar.PeakIndicators****Description**

The "PeakIndicators" property specifies whether the highest and lowest process value up to this time are displayed.

**Type**

Int32, HmiPeakIndicator

Specifies the display of the peak indicator:

- None (0): No display
- Low (1): Only the lowest process value
- High (2): Only the highest process value

### Access

Read-write

### Syntax

`Bar.PeakIndicators`

### See also

Bar (Page 2042)

## Bar.ProcessValue

### Description

The "ProcessValue" property specifies the process value.

### Type

Variant

### Access

Read-write

### Syntax

`Bar.ProcessValue`

### See also

Bar (Page 2042)

## Bar.ProcessValueIndicatorBackColor

### Description

The "ProcessValueIndicatorBackColor" property specifies the background color for the process value indicator.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Bar.ProcessValueIndicatorBackColor`**See also**

Bar (Page 2042)

Bar.ProcessValueIndicatorForeColor (Page 2073)

**Bar.ProcessValueIndicatorForeColor****Description**

The "ProcessValueIndicatorForeColor" property specifies the foreground color for the process value indicator.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Bar.ProcessValueIndicatorForeColor`**See also**

Bar (Page 2042)

Bar.ProcessValueIndicatorBackColor (Page 2072)

## Bar.ProcessValueIndicatorMode

### Description

The "ProcessValueIndicatorMode" property specifies the type of display of the current process value.

### Type

Int32, HmiProcessIndicatorMode

Specifies the type of display:

- Bar (0): Bar only
- Indicator (1): Hair line or needle, no numerical display of the process value.
- DetailedIndicator (2): Detailed display with numerical value
- BarWithDetailedIndicator (3): Bar with numerical value

### Access

Read-write

### Syntax

`Bar.ProcessValueIndicatorMode`

### See also

Bar (Page 2042)

## Bar.RelativeToOrigin

### Description

The "RelativeToOrigin" property specifies whether the output value is an absolute or a percentage value between minimum and maximum value.

### Type

Bool

### Access

Read-write

**Syntax**`Bar.RelativeToOrigin`**See also**

Bar (Page 2042)

**Bar.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the bar was created.

**Type**

String

**Access**

Read-only

**Syntax**`Bar.RenderingTemplate`**See also**

Bar (Page 2042)

**Bar.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the bar can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`Bar.RequireExplicitUnlock`

**See also**

Bar (Page 2042)

**Bar.RotationAngle**

**Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**

`Bar.RotationAngle`

**See also**

Bar (Page 2042)

Bar.RotationCenterPlacement (Page 2076)

Bar.RotationCenterX (Page 2077)

Bar.RotationCenterY (Page 2078)

**Bar.RotationCenterPlacement**

**Description**

The "RotationCenterPlacement" property sets the reference point around which the bar rotates.

**Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- `AbsoluteFromCenter (0)`: Absolute distance from the object center in DIU (Device Independent Unit).
- `NormedFromCenter (1)`: Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- `AbsoluteToContainer (2)`: Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`Bar.RotationCenterPlacement`

### See also

[Bar \(Page 2042\)](#)

[Bar.RotationAngle \(Page 2076\)](#)

[Bar.RotationCenterX \(Page 2077\)](#)

[Bar.RotationCenterY \(Page 2078\)](#)

## Bar.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`Bar.RotationCenterX`

### See also

- Bar (Page 2042)
- Bar.RotationAngle (Page 2076)
- Bar.RotationCenterPlacement (Page 2076)
- Bar.RotationCenterY (Page 2078)

## Bar.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
Bar.RotationCenterY
```

### See also

- Bar (Page 2042)
- Bar.RotationAngle (Page 2076)
- Bar.RotationCenterPlacement (Page 2076)
- Bar.RotationCenterX (Page 2077)

## Bar.ScaleBackColor

### Description

The "ScaleBackColor" property specifies the background color of the scale.

### Type

UInt32

**Access**

Read-write

**Syntax**`Bar.ScaleBackColor`**See also**

Bar (Page 2042)

Bar.ScaleForeColor (Page 2079)

**Bar.ScaleForeColor****Description**

The "ScaleForeColor" property specifies the foreground color of the scale.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Bar.ScaleForeColor`**See also**

Bar (Page 2042)

Bar.ScaleBackColor (Page 2078)

**Bar.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the bar is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Bar.ShowFocusVisual`

**See also**

Bar (Page 2042)

**Bar.ShowTrendIndicator**

**Description**

The "ShowTrendIndicator" property specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Bar.ShowTrendIndicator`

**See also**

Bar (Page 2042)

**Bar.StraightScale**

**Description**

The "StraightScale" property specifies the scale of the bar.

**Type**

Object, HmiStraightScalePart

**Access**

Read-write

**Syntax**`Bar.StraightScale`**See also**

Bar (Page 2042)

**StraightScale.AutoScaling****Description**

The "AutoScaling" property specifies whether automatic scaling is activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`StraightScale.AutoScaling`**See also**

Bar.StraightScale (Page 2080)

**StraightScale.BeginValue****Description**

The "BeginValue" property specifies the start of a value range or value range section.

**Type**

Float

**Access**

Read-write

**Syntax**

`StraightScale.BeginValue`

**See also**

`Bar.StraightScale` (Page 2080)

**StraightScale.DivisionCount**

**Description**

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

**Type**

Int32

**Access**

Read-write

**Syntax**

`StraightScale.DivisionCount`

**See also**

`Bar.StraightScale` (Page 2080)

**StraightScale.EndValue**

**Description**

The "EndValue" property specifies the end of a value range or value range section.

**Type**

Float

**Access**

Read-write

**Syntax**

```
StraightScale.EndValue
```

**See also**

Bar.StraightScale (Page 2080)

**StraightScale.LabelColor****Description**

The "LabelColor" property specifies the color of the labeling.

**Type**

```
UInt32
```

**Access**

Read-write

**Syntax**

```
StraightScale.LabelColor
```

**See also**

Bar.StraightScale (Page 2080)

**StraightScale.LabelFont****Description**

The "LabelFont" property specifies the font of the labeling.

**Type**

```
Object, HmiFontPart
```

**Access**

Read-write

**Syntax**

```
StraightScale.LabelFont
```

**See also**

Bar.StraightScale (Page 2080)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

StraightScale.LabelFont (Page 2083)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

StraightScale.LabelFont (Page 2083)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

```
Font.Size
```

**See also**

StraightScale.LabelFont (Page 2083)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

## Syntax

`Font.StrikeOut`

## See also

`StraightScale.LabelFont` (Page 2083)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

## See also

`StraightScale.LabelFont` (Page 2083)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[StraightScale.LabelFont \(Page 2083\)](#)

**StraightScale.LargeTickLabelingStep****Description**

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`StraightScale.LargeTickLabelingStep`

**See also**

[Bar.StraightScale \(Page 2080\)](#)

**StraightScale.MeasurementUnit****Description**

The "MeasurementUnit" property returns the displayed unit.

**Type**

String

**Access**

Read-only

**Syntax**

`StraightScale.MeasurementUnit`

**See also**

Bar.StraightScale (Page 2080)

**StraightScale.MeasurementUnitType**

**Description**

The "MeasurementUnitType" property specifies the display format of the unit.

**Type**

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

**Access**

Read-write

**Syntax**

`StraightScale.MeasurementUnitType`

**See also**

Bar.StraightScale (Page 2080)

## StraightScale.Orientation

### Description

The "Orientation" property specifies the orientation of the scale.

### Type

Int32, HmiOrientation

Specifies the alignment:

- Horizontal (0): Horizontal
- Vertical (1): Vertical

### Access

Read-write

### Syntax

`StraightScale.Orientation`

### See also

[Bar.StraightScale \(Page 2080\)](#)

## StraightScale.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

### Type

String

### Access

Read-write

### Syntax

`StraightScale.OutputFormat`

## See also

Bar.StraightScale (Page 2080)

## StraightScale.ScaleMode

### Description

The "ScaleMode" property specifies the type of scaling.

### Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

### Access

Read-write

### Syntax

`StraightScale.ScaleMode`

## See also

Bar.StraightScale (Page 2080)

## StraightScale.ScalingType

### Description

The "ScalingType" property specifies the scaling.

### Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic

- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

**Access**

Read-write

**Syntax**

`StraightScale.ScalingType`

**See also**

Bar.StraightScale (Page 2080)

**StraightScale.SubDivisionCount****Description**

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

**Type**

Int32

**Access**

Read-write

**Syntax**

`StraightScale.SubDivisionCount`

**See also**

Bar.StraightScale (Page 2080)

**StraightScale.TickColor****Description**

The "TickColor" property specifies the color of the tick marks.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`StraightScale.TickColor`

**See also**

Bar.StraightScale (Page 2080)

**Bar.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the bar.

**Type**

String

**Access**

Read-only

**Syntax**

`Bar.StyleItemClass`

**See also**

Bar (Page 2042)

**Bar.TabIndex**

**Description**

The "TabIndex" property returns the position of the bar in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`Bar.TabIndex`**See also**

Bar (Page 2042)

**Bar.ThresholdIndicators****Description**

The "ThresholdIndicators" property specifies how parameterized limit values are visualized.

**Type**

Int32, HmiThresholdIndicator

Specifies the visualization:

- None (0): None
- Lines (1): Lines
- Markers (2): Markers

**Access**

Read-write

**Syntax**`Bar.ThresholdIndicators`**See also**

Bar (Page 2042)

**Bar.Thresholds****Description**

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the bar.

## Type

Object, HmiThresholdCollection (Page 2094)

## Access

Read-only

## Syntax

`Bar.Thresholds`

## See also

Bar (Page 2042)

HmiThresholdCollection (Page 2094)

## HmiThresholdCollection

### Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

### Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

### Object type

HmiThresholdCollection

### Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**  
Returns the number of limit values of the "HmiThresholdCollection" list.

### Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**  
Returns a limit value of the "HmiThresholdCollection" list.

**See also**

Bar.Thresholds (Page 2093)

**HmiThresholdCollection.Count****Description**

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
HmiThresholdCollection.Count
```

**See also**

HmiThresholdCollection (Page 2094)

**HmiThresholdCollection.Item()****Description**

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

**Syntax**

```
HmiThresholdCollection[.Item] (HmiThresholdName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

---

**Parameters**

**HmiThresholdName**

Type: String

Name of the limit value

### Return value

Object, HmiThresholdPart (Page 2096)

### See also

HmiThresholdCollection (Page 2094)

Threshold (Page 2096)

### Threshold

### Description

The "Threshold" object represents a limit value.

### Object type

HmiThresholdPart

### Properties

The "Threshold" object has the following properties:

- **Color**  
Specifies the color of the limit value.
- **DisplayName**  
Specifies the display name of the limit value.
- **Name**  
Specifies the name of the limit value.
- **ThresholdMode**  
Specifies the type of limit value.
- **Value**  
Returns the limit value.

### Methods

--

### See also

HmiThresholdCollection (Page 2094)

## Threshold.Color

### Description

The "Color" property specifies the color of the limit value.

### Type

UInt32

### Access

Read-write

### Syntax

`Threshold.Color`

### See also

Threshold (Page 2096)

## Threshold.DisplayName

### Description

The "DisplayName" property specifies the display name of the limit value.

### Type

String

### Access

Read-write

### Syntax

`Threshold.DisplayName`

### See also

Threshold (Page 2096)

## Threshold.Name

### Description

The "Name" property specifies the name of the limit value.

### Type

String

### Access

Read-write

### Syntax

Threshold.Name

### See also

Threshold (Page 2096)

## Threshold.ThresholdMode

### Description

The "ThresholdMode" property specifies the type of limit value.

### Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

### Access

Read-write

**Syntax**`Threshold.ThresholdMode`**See also**[Threshold \(Page 2096\)](#)**Threshold.Value****Description**

The "Value" property returns the limit value of the tag.

**Type**

Float

**Access**

Read-only

**Syntax**`Threshold.Value`**See also**[Threshold \(Page 2096\)](#)**Bar.Title****Description**

The "Title" property specifies the caption that appears as the title.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**`Bar.Title`

**See also**

Bar (Page 2042)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

Bar.Title (Page 2099)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 2100)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 2100)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

### See also

Text.Font (Page 2100)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

Text.Font (Page 2100)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

**Syntax**`Font.Underline`**See also**`Text.Font` (Page 2100)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**`Int32, HmiFontWeight`

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**`Text.Font` (Page 2100)**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

Bar.Title (Page 2099)

**Text.Text**

**Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

`Text.Text`

**See also**

Bar.Title (Page 2099)

**Text.Visible**

**Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

Bar.Title (Page 2099)

**Bar.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**`Bar.ToolTipText`**See also**

Bar (Page 2042)

**Bar.Top****Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

Bar.Top

**See also**

Bar (Page 2042)

**Bar.TrendIndicatorColor**

**Description**

The "TrendIndicatorColor" property specifies the color of the trend indicator. The trend indicator uses a small arrow to represent the tendency (rising or falling) of the process value to be monitored. To activate the trend indicator, the "ShowTrendIndicator" property must be activated.

**Type**

UInt32

**Access**

Read-write

**Syntax**

Bar.TrendIndicatorColor

**See also**

Bar (Page 2042)

**Bar.Visible**

**Description**

The "Visible" property specifies whether the bar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Bar.Visible`**See also**

Bar (Page 2042)

**Bar.VisualizeQuality****Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**`Bar.VisualizeQuality`**See also**

Bar (Page 2042)

**Bar.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

Bar.Width

**See also**

Bar (Page 2042)

**Bar.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the bar.

**Syntax**

Bar.CheckAuthorization()

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

Bar (Page 2042)

## Bar.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Bar.PropertyFlashing(propertyName, enable[, value][, alternateValue]  
[, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Bar (Page 2042)

**Bar\_OnActivated()**

**Description**

The "OnActivated" event occurs when a bar receives focus:

- A bar is selected via the configured tab sequence.
- A bar that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
Bar_OnActivated(item)
```

**Context**

**item**

Type: Object

Bar where the event occurs.

**See also**

Bar (Page 2042)

## Bar\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A bar is right-clicked.
- A bar is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Bar_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Bar where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Bar (Page 2042)

**Bar\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when a bar loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
Bar_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Bar where the event occurs.

**See also**

Bar (Page 2042)

## Bar\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the bar is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Bar_OnKeyDown(item, keyCode, modifiers)
```

### Context

**item**

Type: Object

Bar where the event occurs.

**keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### See also

Bar (Page 2042)

## Bar\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the bar is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Bar_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Bar where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### See also

Bar (Page 2042)

## Bar\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A bar is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a bar has the focus.
- A bar is short-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Bar_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Bar where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Bar (Page 2042)

**BindingSourceElement**

**Description**

The "BindingSourceElement" object represents a binding data source in runtime.

**Object type**

HmiBindingSourceElement

## Properties

The "BindingSourceElement" object has the following properties:

- **AutoRequery**  
Specifies whether the data source is queried automatically after a change.
- **ConsideredColumns**  
Returns information about the selected columns.
- **CursorPosition**  
Specifies the position of the cursor.
- **DataConnection**  
Returns the data connection.
- **Parent**  
Returns the higher-level screen object.
- **ReadCommand**  
Returns a command.
- **RowCount**  
Returns the row count.
- **SourceState**  
Returns the state of the data source.

## Methods

The "BindingSourceElement" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the combo box.
- **MoveFirst()**  
Moves the data source to the first position.
- **MoveLast()**  
Moves the data source to the last position.
- **MoveNext()**  
Moves the data source forwards.
- **MovePrevious()**  
Moves the data source backwards.
- **PropertyFlashing()**  
Configures flashing of a property.

## BindingSourceElement.AutoRequery

### Description

The "AutoRequery" property specifies whether the data source is queried automatically after a change.

**Type**

Bool

**Access**

Read-write

**Syntax**

`BindingSourceElement.AutoRequery`

**See also**

[BindingSourceElement \(Page 2116\)](#)

**BindingSourceElement.ConsideredColumns**

**Description**

The "ConsideredColumns" returns information about the selected columns.

**Type**

Object, [HmiConsideredColumnCollection \(Page 2118\)](#)

**Access**

Read-only

**Syntax**

`BindingSourceElement.ConsideredColumns`

**See also**

[BindingSourceElement \(Page 2116\)](#)

[HmiConsideredColumnCollection \(Page 2118\)](#)

**HmiConsideredColumnCollection**

**Description**

The "HmiConsideredColumnCollection" object is a list of all selected columns ("ConsideredColumn" objects).

## Use

The "HmiConsideredColumnCollection" object is a list which can be counted and enumerated. You can access the "HmiConsideredColumnCollection" list using the index or the tag names.

## Object type

HmiConsideredColumnCollection

## Properties

The "HmiConsideredColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiConsideredColumnCollection" list.

## Methods

The "HmiConsideredColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiConsideredColumnCollection" list.

## See also

[BindingSourceElement.ConsideredColumns \(Page 2118\)](#)

## HmiConsideredColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiConsideredColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiConsideredColumnCollection.Count
```

## See also

[HmiConsideredColumnCollection \(Page 2118\)](#)

## HmiConsideredColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiConsideredColumnCollection" list.

### Syntax

```
HmiConsideredColumnCollection.[.Item] (HmiConsideredColumnName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiConsideredColumnCollection" object.

---

### Parameters

**HmiConsideredColumnName**

Type: String

Name of the column

### Return value

Object, HmiConsideredColumnPart (Page 2120)

### See also

HmiConsideredColumnCollection (Page 2118)

ConsideredColumn (Page 2120)

## ConsideredColumn

### Description

The "ConsideredColumn" object represents a column.

### Object type

HmiConsideredColumnPart

## Properties

The "ConsideredColumn" object has the following properties:

- **IsPrimary**  
Returns whether the column is the primary column.
- **Key**  
Returns the key of the column.

## Methods

--

## See also

HmiConsideredColumnCollection (Page 2118)

## ConsideredColumn.IsPrimary

### Description

The "IsPrimary" property returns whether the column is the primary column.

### Type

Bool

### Access

Read-only

### Syntax

```
ConsideredColumn.IsPrimary
```

## See also

ConsideredColumn (Page 2120)

## ConsideredColumn.Key

### Description

The "Key" property returns the key of the column.

**Type**

String

**Access**

Read-only

**Syntax**

`ConsideredColumn.Key`

**See also**

ConsideredColumn (Page 2120)

**BindingSourceElement.CursorPosition**

**Description**

The "CursorPosition" property specifies the position of the cursor.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`BindingSourceElement.CursorPosition`

**See also**

BindingSourceElement (Page 2116)

**BindingSourceElement.DataConnection**

**Description**

The "DataConnection" property returns the data connection.

**Type**

String, HmiDataConnection

**Access**

Read-only

**Syntax**

`BindingSourceElement.DataConnection`

**See also**

[BindingSourceElement \(Page 2116\)](#)

**BindingSourceElement.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, [HmiScreenObjectBase \(Page 1742\)](#)

**Access**

Read-only

**Syntax**

`BindingSourceElement.Parent`

**See also**

[BindingSourceElement \(Page 2116\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**BindingSourceElement.ReadCommand****Description**

The "ReadCommand" property returns a command.

**Type**

Object, HmiCommandPart

**Access**

Read-only

**Syntax**

`BindingSourceElement.ReadCommand`

**See also**

[BindingSourceElement \(Page 2116\)](#)

**Command.CommandParameters**

**Description**

The "CommandParameters" property returns the parameters of the command.

**Type**

Object, HmiParameterCollection (Page 2124)

**Access**

Read-only

**Syntax**

`Command.CommandParameters`

**See also**

[BindingSourceElement.ReadCommand \(Page 2123\)](#)

[HmiParameterCollection \(Page 2124\)](#)

**HmiParameterCollection**

**Description**

The "HmiParameterCollection" object is a list of all parameters ("Parameter" objects).

**Use**

The "HmiParameterCollection" object is a list which can be counted and enumerated. You can access the "HmiParameterCollection" list using the index or the tag names.

**Object type**

HmiParameterCollection

**Properties**

The "HmiParameterCollection" object has the following properties:

- **Count**  
Returns the number of parameters in the "HmiParameterCollection" list.

**Methods**

The "HmiParameterCollection" object has the following methods:

- **Item()**  
Returns a parameter of the "HmiParameterCollection" list.

**HmiParameterCollection.Count****Description**

The "Count" property returns the number of parameters in the "HmiParameterCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

`HmiParameterCollection.Count`

**See also**

HmiParameterCollection (Page 2124)

## HmiParameterCollection.Item()

### Description

The "Item" method returns a parameter of the "HmiParameterCollection" list.

### Syntax

```
HmiParameterCollection.[.Item] (HmiParameterName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiParameterCollection" object.

---

### Parameters

**HmiParameterName**

Type: String

Name of the parameter

### Return value

Object, HmiParameterPart (Page 2126)

### See also

Parameter (Page 2126)

HmiParameterCollection (Page 2124)

### Parameter

### Description

The "Parameter" object represents a parameter.

### Object type

HmiParameterPart

## Properties

The "Parameter" object has the following properties:

- **ParameterName**  
Specifies the name of the parameter.
- **ParameterValue**  
Specifies the value of the parameter.

## Methods

--

## See also

HmiParameterCollection (Page 2124)

## Parameter.ParameterName

### Description

The "ParameterName" property specifies the name of the parameter.

### Type

String

### Access

Read-write

### Syntax

`Parameter.ParameterName`

## See also

Parameter (Page 2126)

## Parameter.ParameterValue

### Description

The "ParameterValue" property specifies the value of the parameter.

**Type**

Variant

**Access**

Read-write

**Syntax**

`Parameter.ParameterValue`

**See also**

Parameter (Page 2126)

**Command.CommandText**

**Description**

The "CommandText" property returns the text of the command.

**Type**

String

**Access**

Read-only

**Syntax**

`Command.CommandText`

**See also**

BindingSourceElement.ReadCommand (Page 2123)

**Command.CommandType**

**Description**

The "CommandType" property returns the type of the command.

**Type**

String

**Access**

Read-only

**Syntax**`Command.CommandType`**See also**[BindingSourceElement.ReadCommand \(Page 2123\)](#)**Command.Execute()****Description**

The "Execute" method executes the command.

The currently running command is completed. The commands in the queue are deleted and this command is executed.

**Syntax**`Command.Execute ()`**Parameters**

--

**Return value**

--

**See also**[BindingSourceElement.ReadCommand \(Page 2123\)](#)**Command\_OnCompleted()****Description**

The "OnCompleted" event occurs when a command has been executed successfully. The event is only triggered for the latest command.

**Syntax**`Command_OnCompleted (success)`

## Context

### **success**

Type: Bool

Shows the successful execution of a command:

- True: Command was executed successfully.
- False: Command was not executed.

## See also

[BindingSourceElement.ReadCommand](#) (Page 2123)

## BindingSourceElement.RowCount

### Description

The "RowCount" property returns the number of rows.

### Type

UInt32

### Access

Read-only

### Syntax

```
BindingSourceElement.RowCount
```

## See also

[BindingSourceElement](#) (Page 2116)

## BindingSourceElement.SourceState

### Description

The "SourceState" property returns the state of the data source.

### Type

Int32, HmiSourceState

Returns the state:

- Idle (0): Ready
- Busy (1): Busy

### Access

Read-only

### Syntax

`BindingSourceElement.SourceState`

### See also

[BindingSourceElement \(Page 2116\)](#)

## BindingSourceElement.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the data source.

### Syntax

`BindingSourceElement.CheckAuthorization()`

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[BindingSourceElement \(Page 2116\)](#)

## BindingSourceElement.MoveFirst()

### Description

The "MoveFirst" method moves the data source to the first position.

### Syntax

```
BindingSourceElement.MoveFirst()
```

### Parameters

--

### Return value

--

### See also

[BindingSourceElement \(Page 2116\)](#)

## BindingSourceElement.MoveLast()

### Description

The "MoveLast" method moves the data source to the last position.

### Syntax

```
BindingSourceElement.MoveLast()
```

### Parameters

--

### Return value

### See also

[BindingSourceElement \(Page 2116\)](#)

## BindingSourceElement.MoveNext()

### Description

The "MoveNext" method moves the data source forward.

### Syntax

```
BindingSourceElement.MoveNext()
```

### Parameters

--

### Return value

### See also

[BindingSourceElement \(Page 2116\)](#)

## BindingSourceElement.MovePrevious()

### Description

The "MovePrevious" method moves the data source backwards.

### Syntax

```
BindingSourceElement.MovePrevious()
```

### Parameters

--

### Return value

--

### See also

[BindingSourceElement \(Page 2116\)](#)

## BindingSourceElement.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
BindingSourceElement.PropertyFlashing(propertyName, enable[, value]  
[, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

BindingSourceElement (Page 2116)

**Button****Description**

The "Button" object represents a button.

You can reference a "Button" object using the "ScreenItems" list or the "FindItem" method.

**Object type**

HmiButton

**Properties**

The "Button" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CurrentQuality**  
Returns the poorest quality code of all tags that affect the button.
- **Enabled**  
Specifies whether the button can be operated in runtime.

- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Layer**  
Returns the screen layer in which the button is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the button.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the button was created.
- **RequireExplicitUnlock**  
Returns whether the object can only be operated while the associated button is being pressed.
- **RotationAngle**  
Specifies the rotation angle in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the button rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies that the focus rectangle is displayed.

- **StyleItemClass**  
Returns the style which is applied to the button.
- **TabIndex**  
Returns the position of the button in the tab sequence.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the button is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "Button" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the button.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Button" object has the following events:

- **OnActivated()**  
Occurs when a button receives focus.
- **OnContextTapped()**  
Occurs when a button is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a button loses focus.
- **OnDown()**  
Occurs when the operator presses a button.
- **OnKeyDown()**  
Occurs when a button is pressed while the button is in focus.
- **OnKeyUp()**  
Occurs when a button is released while the button is in focus.

- **OnTapped()**  
Occurs when a button is left-clicked or short-touched.
- **OnUp()**  
Occurs when the operator resolves the pressure on a button via the input device.

### Button.AlternateBackColor

#### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

#### Type

UInt32

#### Access

Read-write

#### Syntax

`Button.AlternateBackColor`

#### See also

Button (Page 2135)

### Button.AlternateBorderColor

#### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

#### Type

UInt32

#### Access

Read-write

#### Syntax

`Button.AlternateBorderColor`

**See also**

Button (Page 2135)

**Button.AlternateGraphic****Description**

The "AlternateGraphic" property specifies the graphic of the button for the "pressed" state.

**Type**

String

**Access**

Read-write

**Syntax**

```
Button.AlternateGraphic
```

**See also**

Button (Page 2135)

**Button.AlternateText****Description**

The "AlternateText" property specifies the text of the button for the "pressed" state.

**Type**

String

**Access**

Read-write

**Syntax**

```
Button.AlternateText
```

## See also

Button (Page 2135)

## Button.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`Button.Authorization`

## See also

Button (Page 2135)

## Button.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`Button.BackColor`

## Example

Set the background color of the "Button\_1" button:

### Copy code

```
Screen.Items("Button_1").BackColor = HMIRuntime.Math.RGB(0, 0, 255);
```

## See also

Button (Page 2135)

## Button.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
Button.BorderColor
```

## See also

Button (Page 2135)

## Button.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

## Syntax

`Button.BorderWidth`

## See also

Button (Page 2135)

## Button.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`Button.Content`

## See also

Button (Page 2135)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

Button.Content (Page 2142)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

Button.Content (Page 2142)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

Button.Content (Page 2142)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

**See also**

Button.Content (Page 2142)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Content.SplitRatio
```

**See also**

Button.Content (Page 2142)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

Button.Content (Page 2142)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

Button.Content (Page 2142)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

## Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

## Access

Read-write

## Syntax

`Content.VerticalTextAlignment`

## See also

[Button.Content](#) (Page 2142)

## Button.CurrentQuality

### Description

The "CurrentQuality" property returns the current worst quality code of all tags which influence the button.

## Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

## Access

Read-only

## Syntax

`Button.CurrentQuality`

## See also

Button (Page 2135)

## Button.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`Button.Enabled`

## See also

Button (Page 2135)

## Button.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

**Syntax**`Button.Font`**See also**

Button (Page 2135)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

Button.Font (Page 2148)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

## Syntax

Font.Name

## See also

Button.Font (Page 2148)

## Font.Size

## Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

## Type

Float

## Access

Read-write

## Syntax

Font.Size

## See also

Button.Font (Page 2148)

## Font.StrikeOut

## Description

The "StrikeOut" property specifies whether font is struck through.

## Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

Button.Font (Page 2148)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

Button.Font (Page 2148)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Button.Font \(Page 2148\)](#)

## Button.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`Button.ForeColor`

### See also

[Button \(Page 2135\)](#)

## Button.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`Button.Graphic`

### See also

Button (Page 2135)

## Button.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

Button (Page 2135)

## Button.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Button.Height`

### See also

Button (Page 2135)

## Button.Layer

### Description

The "Layer" property returns the layer of the screen in which the button is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Button.Layer`

### See also

Button (Page 2135)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

Button.Layer (Page 2154)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

Button.Layer (Page 2154)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

Button.Layer (Page 2154)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

Button.Layer (Page 2154)

## Button.Left

### Description

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

```
Button.Left
```

### See also

Button (Page 2135)

## Button.Margin

### Description

The "Margin" property specifies the surrounded outer distance of the button.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
Button.Margin
```

### See also

Button (Page 2135)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[Button.Margin \(Page 2157\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[Button.Margin \(Page 2157\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Button.Margin \(Page 2157\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[Button.Margin \(Page 2157\)](#)

## Button.Name

### Description

The "Name" property returns the name of the button.

### Type

String

### Access

Read-only

### Syntax

`Button.Name`

### See also

[Button \(Page 2135\)](#)

## Button.Opacity

### Description

The "Opacity" property specifies the opacity of the button. The value "0.0" means completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`Button.Opacity`

### See also

[Button \(Page 2135\)](#)

## Button.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
Button.Operability
```

### See also

Button (Page 2135)

## Button.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
Button.Padding
```

**See also**

Button (Page 2135)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Bottom

**See also**

Button.Padding (Page 2161)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Left

**See also**

Button.Padding (Page 2161)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

Button.Padding (Page 2161)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

### See also

[Button.Padding \(Page 2161\)](#)

## Button.Parent

### Description

The "Parent" property returns the parent screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
Button.Parent
```

### See also

[Button \(Page 2135\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

[Screen Items \(Page 1742\)](#)

## Button.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the button was created.

### Type

String

**Access**

Read-only

**Syntax**`Button.RenderingTemplate`**See also**

Button (Page 2135)

**Button.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the object can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`Button.RequireExplicitUnlock`**See also**

Button (Page 2135)

**Button.RotationAngle****Description**

The "RotationAngle" property specifies the rotation angle of the button in degrees.

**Type**

Int16

### Access

Read-write

### Syntax

`Button.RotationAngle`

### See also

Button (Page 2135)

## Button.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property specifies the reference point around which the button rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`Button.RotationCenterPlacement`

### See also

Button (Page 2135)

Button.RotationCenterX (Page 2167)

Button.RotationCenterY (Page 2167)

## Button.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point.

### Type

Float

### Access

Read-write

### Syntax

`Button.RotationCenterX`

### See also

[Button \(Page 2135\)](#)

[Button.RotationCenterPlacement \(Page 2166\)](#)

[Button.RotationCenterY \(Page 2167\)](#)

## Button.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point.

### Type

Float

### Access

Read-write

### Syntax

`Button.RotationCenterY`

### See also

Button (Page 2135)

Button.RotationCenterX (Page 2167)

Button.RotationCenterPlacement (Page 2166)

## Button.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the button is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`Button.ShowFocusVisual`

### See also

Button (Page 2135)

## Button.StyleItemClass

### Description

The "StyleItemClass" property returns the style that will be applied to the button.

### Type

String

### Access

Read-only

### Syntax

`Button.StyleItemClass`

**See also**

Button (Page 2135)

**Button.TabIndex****Description**

The "TabIndex" property returns the position of the button in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`Button.TabIndex`

**See also**

Button (Page 2135)

**Button.Text****Description**

The "Text" property specifies the label of the button.

**Type**

String

**Access**

Read-write

**Syntax**

`Button.Text`

### See also

Button (Page 2135)

## Button.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

`Button.ToolTipText`

### See also

Button (Page 2135)

## Button.Top

### Description

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Button.Top`

**See also**

Button (Page 2135)

**Button.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Button.Visible`

**See also**

Button (Page 2135)

**Button.VisualizeQuality****Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Button.VisualizeQuality`

### See also

Button (Page 2135)

### Button.Width

#### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

#### Type

UInt32

#### Access

Read-write

#### Syntax

`Button.Width`

### See also

Button (Page 2135)

### Button.CheckAuthorization()

#### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the button.

#### Syntax

`Button.CheckAuthorization()`

#### Parameters

--

#### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

Button (Page 2135)

## Button.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

### Syntax

```
Button.PropertyFlashing(propertyName, enable[, value][, alternateValue]  
[, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**Example**

Change the flashing of the background color of the button:

**Copy code**

```
Screen.Items("Button_1").PropertyFlashing("BackColor", true, HMIRuntime.Math.RGB(255, 0, 0), HMIRuntime.Math.RGB(0, 255, 0), UI.Enums.HmiFlashingRate.Fast);
```

**See also**

Button (Page 2135)

**Button\_OnActivated()**

**Description**

The "OnActivated" event occurs when a button receives focus:

- A button is selected via the configured tab sequence.
- A button that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
Button_OnActivated(item)
```

## Context

**Item**

Type: Object

Button at which the event occurs.

## See also

Button (Page 2135)

## Button\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A button is clicked with the right mouse button.
- A button is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnDown
2. OnUp
3. OnContextTapped

### Syntax

```
Button_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

**Item**

Type: Object

Button at which the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Button (Page 2135)

**Button\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when a button loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

## Syntax

```
Button_OnDeactivated(item)
```

## Context

### Item

Type: Object

Button at which the event occurs.

## See also

Button (Page 2135)

## Button\_OnDown()

## Description

The "OnDown" event occurs when the operator presses a button:

- A button is clicked with a mouse button.
- The <RETURN> or <SPACE> key is pressed when a button has the focus.
- A button is touched.

## Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

## Syntax

```
Button_OnDown(item, x, y, modifiers, trigger)
```

## Context

### **Item**

Type: Object

Button at which the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

Button (Page 2135)

## Button\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a button is pressed while the button is in focus. If the key is <RETURN> or <SPACE>, an "OnKeyDown" event is triggered before an "OnDown" event.

### Syntax

```
Button_OnKeyDown (item, keyCode, modifiers)
```

### Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

### Context

#### **Item**

Type: Object

Button at which the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Button (Page 2135)

## Button\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a button is released while the button is in focus. If the key is <RETURN> or <SPACE>, an event "OnUp" is triggered after the event "OnKeyUp".

### Syntax

```
Button_OnKeyUp (item, keyCode, modifiers)
```

### Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

### Context

#### **Item**

Type: Object

Button at which the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key

- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Button (Page 2135)

## Button\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A button is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a button has the focus.
- A button is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp
5. OnTapped

### Syntax

```
Button_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### Item

Type: Object

Button at which the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Button (Page 2135)

## Button\_OnUp()

### Description

The event "OnUp" occurs when the operator releases the pressure on a button via the input device:

- The mouse button is released via a button.
- The <RETURN> or <SPACE> key is released when a button has the focus.
- The touch of a button is canceled.
- A button is exited while pressed.

This event does not occur as long as the operator keeps the button pressed.

### Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

### Syntax

```
Button_OnUp(item, x, y, modifiers, trigger)
```

### Context

**Item**

Type: Object

Button at which the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Button (Page 2135)

**CheckBoxGroup**

**Description**

The "CheckBoxGroup" object represents a checkbox (group of checkboxes) in runtime.

**Object type**

HmiCheckBoxGroup

## Properties

The "CheckBoxGroup" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **Content**  
Specifies the display options for text and graphics.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the checkbox.
- **Enabled**  
Specifies whether the checkbox can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the checkbox is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the checkbox.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the checkbox is operable.
- **Padding**  
Specifies the distance of the content from the border of the checkbox.
- **Parent**  
Returns the higher-level screen object.

- **ProcessValue**  
Specifies the process value.
- **RenderingTemplate**  
Returns the name of the template from which the check box was created.
- **RequireExplicitUnlock**  
Returns whether the checkbox is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the checkbox rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**  
Specifies the height of the checkbox entries.
- **SelectionItems**  
Returns the list of all the checkbox entries.
- **SelectorPosition**  
Specifies the horizontal alignment of the checkbox entries.
- **ShowFocusVisual**  
Specifies whether the checkbox is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the checkbox.
- **TabIndex**  
Returns the position of the checkbox in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the checkbox is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "CheckBoxGroup" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the checkbox.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "CheckBoxGroup" object has the following events:

- **OnActivated()**  
Occurs when a checkbox receives focus.
- **OnContextTapped()**  
Occurs when a checkbox is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a checkbox loses focus.
- **OnKeyDown()**  
Occurs when a button is pressed while the checkbox is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the checkbox is in focus.
- **OnTapped()**  
Occurs when a checkbox is left-clicked or short-touched.

## CheckBoxGroup.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
CheckBoxGroup.AlternateBackColor
```

### See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
CheckBoxGroup.AlternateBorderColor
```

### See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
CheckBoxGroup.Authorization
```

### See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`CheckBoxGroup.BackColor`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`CheckBoxGroup.BorderColor`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`CheckBoxGroup.BorderWidth`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.Content

### Description

The "Content" property specifies the display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`CheckBoxGroup.Content`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

`CheckBoxGroup.Content` (Page 2190)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

`CheckBoxGroup.Content` (Page 2190)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

`CheckBoxGroup.Content` (Page 2190)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[CheckBoxGroup.Content \(Page 2190\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[CheckBoxGroup.Content \(Page 2190\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[CheckBoxGroup.Content \(Page 2190\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

`CheckBoxGroup.Content` (Page 2190)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

`CheckBoxGroup.Content` (Page 2190)

## CheckBoxGroup.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the checkbox.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`CheckBoxGroup.CurrentQuality`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.Enabled

### Description

The "Enabled" property specifies whether the checkbox can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**`CheckBoxGroup.Enabled`**See also**[CheckBoxGroup \(Page 2184\)](#)**CheckBoxGroup.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`CheckBoxGroup.Font`**See also**[CheckBoxGroup \(Page 2184\)](#)**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`

**See also**

CheckBoxGroup.Font (Page 2197)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

CheckBoxGroup.Font (Page 2197)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

CheckBoxGroup.Font (Page 2197)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

CheckBoxGroup.Font (Page 2197)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

`CheckBoxGroup.Font` (Page 2197)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

## Syntax

`Font.Weight`

## See also

`CheckBoxGroup.Font` (Page 2197)

## CheckBoxGroup.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`CheckBoxGroup.ForeColor`**See also**[CheckBoxGroup \(Page 2184\)](#)**CheckBoxGroup.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`CheckBoxGroup.Height`**See also**[CheckBoxGroup \(Page 2184\)](#)**CheckBoxGroup.Layer****Description**

The "Layer" property returns the layer of the screen in which the checkbox is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`CheckBoxGroup.Layer`

**See also**

[CheckBoxGroup \(Page 2184\)](#)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

[CheckBoxGroup.Layer \(Page 2201\)](#)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MinimumZoom`**See also**

CheckBoxGroup.Layer (Page 2201)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**`Layer.Name`**See also**

CheckBoxGroup.Layer (Page 2201)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[CheckBoxGroup.Layer \(Page 2201\)](#)

**CheckBoxGroup.Left**

**Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`CheckBoxGroup.Left`

**See also**

[CheckBoxGroup \(Page 2184\)](#)

**CheckBoxGroup.Margin**

**Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`CheckBoxGroup.Margin`**See also**[CheckBoxGroup \(Page 2184\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**[CheckBoxGroup.Margin \(Page 2204\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[CheckBoxGroup.Margin \(Page 2204\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[CheckBoxGroup.Margin \(Page 2204\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[CheckBoxGroup.Margin \(Page 2204\)](#)**CheckBoxGroup.Name****Description**

The "Name" property returns the name of the checkbox.

**Type**

String

**Access**

Read-only

**Syntax**`CheckBoxGroup.Name`**See also**[CheckBoxGroup \(Page 2184\)](#)**CheckBoxGroup.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

**Type**

Float

### Access

Read-write

### Syntax

`CheckBoxGroup.Opacity`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.Operability

### Description

The "Operability" property returns whether the checkbox is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`CheckBoxGroup.Operability`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the checkbox.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`CheckBoxGroup.Padding`

**See also**

[CheckBoxGroup \(Page 2184\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[CheckBoxGroup.Padding \(Page 2208\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[CheckBoxGroup.Padding \(Page 2208\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[CheckBoxGroup.Padding \(Page 2208\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[CheckBoxGroup.Padding \(Page 2208\)](#)**CheckBoxGroup.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**`CheckBoxGroup.Parent`**See also**[CheckBoxGroup \(Page 2184\)](#)[Screen Items \(Page 1742\)](#)**Screen Items****Description**[Screen Items \(Page 1742\)](#)

## CheckBoxGroup.ProcessValue

### Description

The "ProcessValue" property specifies the process value.

### Type

Variant

### Access

Read-write

### Syntax

`CheckBoxGroup.ProcessValue`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the checkbox was created.

### Type

String

### Access

Read-only

### Syntax

`CheckBoxGroup.RenderingTemplate`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the checkbox can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
CheckBoxGroup.RequireExplicitUnlock
```

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

```
CheckBoxGroup.RotationAngle
```

### See also

[CheckBoxGroup \(Page 2184\)](#)

[CheckBoxGroup.RotationCenterPlacement \(Page 2214\)](#)

[CheckBoxGroup.RotationCenterX \(Page 2214\)](#)

[CheckBoxGroup.RotationCenterY \(Page 2215\)](#)

## CheckBoxGroup.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property specifies the reference point around which the checkbox rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`CheckBoxGroup.RotationCenterPlacement`

### See also

[CheckBoxGroup \(Page 2184\)](#)

[CheckBoxGroup.RotationAngle \(Page 2213\)](#)

[CheckBoxGroup.RotationCenterX \(Page 2214\)](#)

[CheckBoxGroup.RotationCenterY \(Page 2215\)](#)

## CheckBoxGroup.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`CheckBoxGroup.RotationCenterX`**See also**[CheckBoxGroup \(Page 2184\)](#)[CheckBoxGroup.RotationAngle \(Page 2213\)](#)[CheckBoxGroup.RotationCenterPlacement \(Page 2214\)](#)[CheckBoxGroup.RotationCenterY \(Page 2215\)](#)**CheckBoxGroup.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`CheckBoxGroup.RotationCenterY`**See also**[CheckBoxGroup \(Page 2184\)](#)[CheckBoxGroup.RotationAngle \(Page 2213\)](#)[CheckBoxGroup.RotationCenterPlacement \(Page 2214\)](#)[CheckBoxGroup.RotationCenterX \(Page 2214\)](#)

## CheckBoxGroup.SelectionItemHeight

### Description

The "SelectionItemHeight" property specifies the height of the checkbox entries. The value "0" indicates that the height is calculated automatically.

### Type

UInt16

### Access

Read-write

### Syntax

`CheckBoxGroup.SelectionItemHeight`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.SelectionItems

### Description

The "SelectionItems" property returns the list of all checkbox entries ("SelectionItem" objects).

### Type

Object, [HmiSelectedItemCollection \(Page 2217\)](#)

### Access

Read-only

### Syntax

`CheckBoxGroup.SelectionItems`

### See also

[CheckBoxGroup \(Page 2184\)](#)

[HmiSelectedItemCollection \(Page 2217\)](#)

## HmiSelectedItemCollection

### Description

The "HmiSelectedItemCollection" object is a list of all entries ("SelectedItem" objects) of a list object.

### Use

The "HmiSelectedItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectedItemCollection" list using the index or the tag name.

### Object type

HmiSelectedItemCollection

### Properties

The "HmiSelectedItemCollection" object has the following properties:

- **Count**  
Returns the number of list entries of the "HmiSelectedItemCollection" list.

### Methods

The "HmiSelectedItemCollection" object has the following methods:

- **Item()**  
Returns a list entry of the "HmiSelectedItemCollection" list.

### See also

[CheckBoxGroup.SelectionItems](#) (Page 2216)

## HmiSelectedItemCollection.Count

### Description

The "Count" property returns the number of list entries in the "HmiSelectedItemCollection" list.

### Type

UInt32

### Access

Read-only

## Syntax

```
HmiSelectedItemCollection.Count
```

## See also

HmiSelectedItemCollection (Page 2217)

## HmiSelectedItemCollection.Item()

## Description

The "Item" method returns a list entry of the "HmiSelectedItemCollection" list.

## Syntax

```
HmiSelectedItemCollection[.Item] (HmiSelectedItemName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectedItemCollection" object.

---

## Parameters

### **HmiSelectedItemName**

Type: String

Name of the list entry

## Return value

Object, HmiSelectedItemPart (Page 2218)

## See also

HmiSelectedItemCollection (Page 2217)

SelectedItem (Page 2218)

## SelectedItem

## Description

The "SelectedItem" object represents a list entry.

**Object type**

HmiSelectionItemPart

**Properties**

The "SelectionItem" object has the following properties:

- **Graphic**  
Specifies the graphic of the list entry.
- **IsSelected**  
Specifies whether the list entry is selected.
- **Text**  
Specifies the list entry text.

**Methods**

--

**See also**[HmiSelectionItemCollection \(Page 2217\)](#)**SelectionItem.Graphic****Description**

The "Graphic" property specifies the graphic of the list entry.

**Type**

String

**Access**

Read-write

**Syntax**`SelectionItem.Graphic`**See also**[SelectionItem \(Page 2218\)](#)

## SelectedItem.IsSelected

### Description

The "IsSelected" property specifies whether the list entry is selected.

### Type

Bool

### Access

Read-write

### Syntax

```
SelectedItem.IsSelected
```

### See also

SelectedItem (Page 2218)

## SelectedItem.Text

### Description

The "Text" property specifies the text of the list entry.

### Type

String

### Access

Read-write

### Syntax

```
SelectedItem.Text
```

### See also

SelectedItem (Page 2218)

## CheckBoxGroup.SelectorPosition

### Description

The "SelectorPosition" property specifies the horizontal alignment of the checkbox entries.

### Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

### Access

Read-write

### Syntax

`CheckBoxGroup.SelectorPosition`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the checkbox is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`CheckBoxGroup.ShowFocusVisual`

**See also**

[CheckBoxGroup \(Page 2184\)](#)

**CheckBoxGroup.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the checkbox.

**Type**

String

**Access**

Read-only

**Syntax**

`CheckBoxGroup.StyleItemClass`

**See also**

[CheckBoxGroup \(Page 2184\)](#)

**CheckBoxGroup.TabIndex**

**Description**

The "TabIndex" property returns the position of the checkbox in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`CheckBoxGroup.TabIndex`

**See also**

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

```
CheckBoxGroup.ToolTipText
```

### See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

```
CheckBoxGroup.Top
```

### See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup.Visible

### Description

The "Visible" property specifies whether the checkbox is visible.

### Type

Bool

### Access

Read-write

### Syntax

`CheckBoxGroup.Visible`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`CheckBoxGroup.VisualizeQuality`

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
CheckBoxGroup.Width
```

### See also

[CheckBoxGroup \(Page 2184\)](#)

## CheckBoxGroup.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the checkbox.

### Syntax

```
CheckBoxGroup.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

[CheckBoxGroup](#) (Page 2184)

## CheckBoxGroup.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
CheckBoxGroup.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

CheckBoxGroup (Page 2184)

**CheckBoxGroup\_OnActivated()****Description**

The "OnActivated" event occurs when a checkbox receives focus:

- A checkbox is selected via the configured tab sequence.
- A checkbox that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
CheckBoxGroup_OnActivated(item)
```

**Context****item**

Type: Object

Checkbox where the event occurs.

## See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A checkbox is right-clicked.
- A checkbox is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
CheckBoxGroup_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Checkbox where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

CheckBoxGroup (Page 2184)

**CheckBoxGroup\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the checkbox loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
CheckBoxGroup_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Checkbox where the event occurs.

### See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the checkbox is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
CheckBoxGroup_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Checkbox where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the checkbox is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
CheckBoxGroup_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Checkbox where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

CheckBoxGroup (Page 2184)

## CheckBoxGroup\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A checkbox is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a checkbox has the focus.
- A checkbox is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
CheckBoxGroup_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Checkbox where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

[CheckBoxGroup \(Page 2184\)](#)

**Circle****Description**

The "Circle" object represents a circle in runtime.

## Object type

HmiCircle

## Properties

The "Circle" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **CenterX**  
Specifies the X coordinate of the center.
- **CenterY**  
Sets the Y coordinate of the center.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the circle.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the circle can be operated in runtime.
- **FillDirection**  
Specifies the direction from which the circle is filled.
- **FillLevel**  
Specifies the fill of the circle in percent.
- **Layer**  
Returns the layer of the screen in which the circle is located.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the circle.
- **Opacity**  
Specifies the opacity.

- **Operability**  
Returns whether the circle is operable.
- **Parent**  
Returns the higher-level screen object.
- **Radius**  
Specifies the radius.
- **RequireExplicitUnlock**  
Returns whether the circle is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the circle rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**  
Specifies whether the fill level is displayed.
- **ShowFocusVisual**  
Specifies whether the circle is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the circle.
- **TabIndex**  
Returns the position of the circle in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the circle is visible.

## Methods

The "Circle" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the circle.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Circle" object has the following events:

- **OnActivated()**  
Occurs when a circle receives focus.
- **OnContextTapped()**  
Occurs when a circle is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a circle loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the circle is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the circle is in focus.
- **OnTapped()**  
Occurs when a circle is left-clicked or short-touched.

## Circle.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
Circle.AlternateBackColor
```

### See also

Circle (Page 2233)

## Circle.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`Circle.AlternateBorderColor`**See also**

Circle (Page 2233)

**Circle.Authorization****Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**`Circle.Authorization`**See also**

Circle (Page 2233)

**Circle.BackColor****Description**

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`Circle.BackColor`

### See also

Circle (Page 2233)

## Circle.BackFillPattern

### Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

### Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonally striped
- BackwardDiagonal (131075): Backward diagonally striped
- Cross (131076): Grid
- DiagonalCross (131077): Diagonal grid
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Gradient vertical tricolor

- GradientForwardDiagonalTricolor (1048834): Gradient forward diagonal tricolor
- GradientBackwardDiagonalTricolor (1048835): Gradient backward diagonal tricolor

**Access**

Read-write

**Syntax**

```
Circle.BackFillPattern
```

**See also**

Circle (Page 2233)

Circle.FillDirection (Page 2243)

Circle.FillLevel (Page 2244)

Circle.ShowFillLevel (Page 2255)

**Circle.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Circle.BorderColor
```

**See also**

Circle (Page 2233)

## Circle.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`Circle.BorderWidth`

### See also

Circle (Page 2233)

## Circle.CenterX

### Description

The "CenterX" property specifies the X coordinate of the center.

### Type

Int32

### Access

Read-write

### Syntax

`Circle.CenterX`

### See also

Circle (Page 2233)

## Circle.CenterY

### Description

The "CenterY" property specifies the Y coordinate of the center.

### Type

Int32

### Access

Read-write

### Syntax

Circle.CenterY

### See also

Circle (Page 2233)

## Circle.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the circle.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

## Syntax

`Circle.CurrentQuality`

## See also

Circle (Page 2233)

## Circle.DashType

### Description

The "DashType" property specifies the dash type of the border or the line.

### Type

Int32, HmiDashType

Specifies the dash type:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

### Access

Read-write

### Syntax

`Circle.DashType`

## See also

Circle (Page 2233)

## Circle.Enabled

### Description

The "Enabled" property specifies whether the circle can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`Circle.Enabled`**See also**

Circle (Page 2233)

**Circle.FillDirection****Description**

The "FillDirection" property specifies the direction from which the circle is filled.

**Type**

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

**Access**

Read-write

**Syntax**`Circle.FillDirection`**See also**

Circle (Page 2233)

Circle.BackFillPattern (Page 2238)

[Circle.FillLevel \(Page 2244\)](#)

[Circle.ShowFillLevel \(Page 2255\)](#)

## Circle.FillLevel

### Description

The "FillLevel" property specifies the fill level of the circle in percent.

### Type

UInt8

### Access

Read-write

### Syntax

```
Circle.FillLevel
```

### See also

[Circle \(Page 2233\)](#)

[Circle.BackFillPattern \(Page 2238\)](#)

[Circle.FillDirection \(Page 2243\)](#)

[Circle.ShowFillLevel \(Page 2255\)](#)

## Circle.Layer

### Description

The "Layer" property returns the layer of the screen in which the circle is located.

### Type

Object, HmiLayerPart

### Access

Read-only

**Syntax**`Circle.Layer`**See also**[Circle \(Page 2233\)](#)**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MaximumZoom`**See also**[Circle.Layer \(Page 2244\)](#)**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

## Syntax

`Layer.MinimumZoom`

## See also

[Circle.Layer \(Page 2244\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

## Syntax

`Layer.Name`

## See also

[Circle.Layer \(Page 2244\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

**Syntax**`Layer.Visible`**See also**[Circle.Layer \(Page 2244\)](#)**Circle.Margin****Description**

The Margin property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`Circle.Margin`**See also**[Circle \(Page 2233\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Bottom`

## See also

[Circle.Margin \(Page 2247\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

## See also

[Circle.Margin \(Page 2247\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**`Circle.Margin` (Page 2247)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**`Circle.Margin` (Page 2247)**Circle.Name****Description**

The "Name" property returns the name of the circle.

**Type**`String`**Access**`Read-only`

## Syntax

Circle.Name

## See also

Circle (Page 2233)

## Circle.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" means completely transparent.

### Type

Float

### Access

Read-write

## Syntax

Circle.Opacity

## See also

Circle (Page 2233)

## Circle.Operability

### Description

The "Operability" property returns whether the circle is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`Circle.Operability`

**See also**

[Circle \(Page 2233\)](#)

**Circle.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase ([Page 1742](#))

**Access**

Read-only

**Syntax**

`Circle.Parent`

**See also**

[Circle \(Page 2233\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

## Circle.Radius

### Description

The "Radius" property specifies the radius.

### Type

UInt32

### Access

Read-write

### Syntax

`Circle.Radius`

### See also

[Circle \(Page 2233\)](#)

## Circle.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the circle can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`Circle.RequireExplicitUnlock`

### See also

[Circle \(Page 2233\)](#)

## Circle.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

```
Circle.RotationAngle
```

### See also

[Circle](#) (Page 2233)

[Circle.RotationCenterPlacement](#) (Page 2253)

[Circle.RotationCenterX](#) (Page 2254)

[Circle.RotationCenterY](#) (Page 2255)

## Circle.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the circle rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- **AbsoluteFromCenter (0):** Absolute distance from the object center in DIU (Device Independent Unit).
- **NormedFromCenter (1):** Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- **AbsoluteToContainer (2):** Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`Circle.RotationCenterPlacement`

### See also

[Circle \(Page 2233\)](#)

[Circle.RotationAngle \(Page 2253\)](#)

[Circle.RotationCenterX \(Page 2254\)](#)

[Circle.RotationCenterY \(Page 2255\)](#)

## Circle.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`Circle.RotationCenterX`

### See also

[Circle \(Page 2233\)](#)

[Circle.RotationAngle \(Page 2253\)](#)

[Circle.RotationCenterPlacement \(Page 2253\)](#)

[Circle.RotationCenterY \(Page 2255\)](#)

## Circle.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
Circle.RotationCenterY
```

### See also

[Circle \(Page 2233\)](#)

[Circle.RotationAngle \(Page 2253\)](#)

[Circle.RotationCenterPlacement \(Page 2253\)](#)

[Circle.RotationCenterX \(Page 2254\)](#)

## Circle.ShowFillLevel

### Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

### Type

Bool

### Access

Read-write

### Syntax

```
Circle.ShowFillLevel
```

## See also

- Circle (Page 2233)
- Circle.BackFillPattern (Page 2238)
- Circle.FillDirection (Page 2243)
- Circle.FillLevel (Page 2244)

## Circle.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the circle is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`Circle.ShowFocusVisual`

## See also

- Circle (Page 2233)

## Circle.StyleItemClass

### Description

The "StyleItemClass" property returns the style applied to the circle.

### Type

String

### Access

Read-only

**Syntax**

```
Circle.StyleItemClass
```

**See also**

Circle (Page 2233)

**Circle.TabIndex****Description**

The "TabIndex" property returns the position of the circle in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

```
Circle.TabIndex
```

**See also**

Circle (Page 2233)

**Circle.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

### Syntax

`Circle.ToolTipText`

### See also

Circle (Page 2233)

### Circle.Visible

### Description

The "Visible" property specifies whether the circle is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Circle.Visible`

### See also

Circle (Page 2233)

### Circle.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the circle.

### Syntax

`Circle.CheckAuthorization()`

### Parameters

--

## Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

Circle (Page 2233)

## Circle.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Circle.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

### Parameters

#### **propertyName**

Type: String

Name of the property for which flashing is configured.

#### **enable**

Type: Bool

Specifies that flashing is activated.

#### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

#### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Circle (Page 2233)

**Circle\_OnActivated()**

**Description**

The "OnActivated" event occurs when a circle receives focus:

- A circle is selected via the configured tab sequence.
- A circle that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

`Circle_OnActivated(item)`

**Context**

**item**

Type: Object

Circle at which the event occurs.

## See also

Circle (Page 2233)

## Circle\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A circle is clicked with the right mouse button.
- A circle is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Circle_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Circle where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Circle (Page 2233)

**Circle\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when a circle loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

`Circle_OnDeactivated(item)`

**Context**

**item**

Type: Object

Circle at which the event occurs.

## See also

Circle (Page 2233)

## Circle\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the circle is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Circle_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Circle where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Circle (Page 2233)

## Circle\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the circle is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Circle_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Circle where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Circle (Page 2233)

## Circle\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A circle is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a circle has the focus.
- A circle is short-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Circle_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Circle where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Circle (Page 2233)

**CircleSegment**

**Description**

The "CircleSegment" object represents a circle segment in runtime.

## Object type

HmiCircleSegment

## Properties

The "CircleSegment" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AngleRange**  
Specifies the arc angle.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **CenterX**  
Specifies the X coordinate of the rotation point.
- **CenterY**  
Specifies the Y coordinate of the rotation point.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the circle segment.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the circle segment can be operated in runtime.
- **FillDirection**  
Specifies the direction from which the circle segment is filled.
- **FillLevel**  
Specifies the fill of the circle segment in percent.
- **Layer**  
Returns the layer of the screen in which the circle segment is located.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the circle segment.

- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the circle segment is operable.
- **Parent**  
Returns the higher-level screen object.
- **Radius**  
Specifies the radius.
- **RequireExplicitUnlock**  
Returns whether the circle segment is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the circle segment rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**  
Specifies whether the fill level is displayed.
- **ShowFocusVisual**  
Specifies whether the circle segment is highlighted when in focus.
- **StartAngle**  
Specifies the angle by which the start point deviates from the zero position (0°).
- **StyleItemClass**  
Returns the style which is applied to the circle segment.
- **TabIndex**  
Returns the position of the circle segment in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the circle segment is visible.

## Methods

The "CircleSegment" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the circle segment.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "CircleSegment" object has the following events:

- **OnActivated()**  
Occurs when a circle segment receives focus.
- **OnContextTapped()**  
Occurs when a circle segment is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a circle segment loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the circle segment is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the circle segment is in focus.
- **OnTapped()**  
Occurs when a circle segment is left-clicked or short-touched.

## CircleSegment.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`CircleSegment.AlternateBackColor`

### See also

[CircleSegment \(Page 2266\)](#)

## CircleSegment.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`CircleSegment.AlternateBorderColor`

**See also**

CircleSegment (Page 2266)

**CircleSegment.AngleRange**

**Description**

The AngleRange property specifies the arc angle clockwise.

**Type**

Int32

**Access**

Read-write

**Syntax**

`CircleSegment.AngleRange`

**See also**

CircleSegment (Page 2266)

**CircleSegment.Authorization**

**Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**`CircleSegment.Authorization`**See also**

CircleSegment (Page 2266)

**CircleSegment.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`CircleSegment.BackColor`**See also**

CircleSegment (Page 2266)

**CircleSegment.BackFillPattern****Description**

The "BackFillPattern" property specifies the pattern of the background or the fill.

**Type**

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent

- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonally striped
- BackwardDiagonal (131075): Backward diagonally striped
- Cross (131076): Grid
- DiagonalCross (131077): Diagonal grid
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Gradient vertical tricolor
- GradientForwardDiagonalTricolor (1048834): Gradient forward diagonal tricolor
- GradientBackwardDiagonalTricolor (1048835): Gradient backward diagonal tricolor

### Access

Read-write

### Syntax

`CircleSegment.BackFillPattern`

## CircleSegment.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

**Access**

Read-write

**Syntax**`CircleSegment.BorderColor`**See also**

CircleSegment (Page 2266)

**CircleSegment.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**`CircleSegment.BorderWidth`**See also**

CircleSegment (Page 2266)

**CircleSegment.CenterX****Description**

The "CenterX" property specifies the X coordinate of the rotation point.

**Type**

Int32

**Access**

Read-write

### Syntax

`CircleSegment.CenterX`

### See also

[CircleSegment \(Page 2266\)](#)

## CircleSegment.CenterY

### Description

The "CenterY" property specifies the Y coordinate of the rotation point.

### Type

Int32

### Access

Read-write

### Syntax

`CircleSegment.CenterY`

### See also

[CircleSegment \(Page 2266\)](#)

## CircleSegment.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the circle segment.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.

- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

`CircleSegment.CurrentQuality`

**See also**

[CircleSegment \(Page 2266\)](#)

**CircleSegment.DashType****Description**

The "DashType" property specifies the dash type of the border or the line.

**Type**

Int32, HmiDashType

Specifies the dash type:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

**Access**

Read-write

**Syntax**

`CircleSegment.DashType`

**See also**

[CircleSegment \(Page 2266\)](#)

## CircleSegment.Enabled

### Description

The "Enabled" property specifies whether the circle segment can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`CircleSegment.Enabled`

### See also

CircleSegment (Page 2266)

## CircleSegment.FillDirection

### Description

The "FillDirection" property specifies the direction from which the circle segment is filled.

### Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

### Access

Read-write

### Syntax

`CircleSegment.FillDirection`

**See also**

CircleSegment (Page 2266)  
CircleSegment.BackFillPattern (Page 2271)  
CircleSegment.FillLevel (Page 2277)  
CircleSegment.ShowFillLevel (Page 2288)

**CircleSegment.FillLevel****Description**

The "FillLevel" property specifies the fill level of the circle segment in percent.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
CircleSegment.FillLevel
```

**See also**

CircleSegment (Page 2266)  
CircleSegment.BackFillPattern (Page 2271)  
CircleSegment.FillDirection (Page 2276)  
CircleSegment.ShowFillLevel (Page 2288)

**CircleSegment.Layer****Description**

The "Layer" property returns the layer of the screen in which the circle segment is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`CircleSegment.Layer`

**See also**

CircleSegment (Page 2266)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

CircleSegment.Layer (Page 2277)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MinimumZoom`**See also**

CircleSegment.Layer (Page 2277)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**`Layer.Name`**See also**

CircleSegment.Layer (Page 2277)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[CircleSegment.Layer \(Page 2277\)](#)

## CircleSegment.Margin

### Description

The Margin property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`CircleSegment.Margin`

### See also

[CircleSegment \(Page 2266\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[CircleSegment.Margin \(Page 2280\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[CircleSegment.Margin \(Page 2280\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[CircleSegment.Margin \(Page 2280\)](#)

### Margin.Top

#### Description

The "Top" property specifies the spacing to the top.

#### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[CircleSegment.Margin \(Page 2280\)](#)

### CircleSegment.Name

#### Description

The "Name" property returns the name of the circle segment.

#### Type

String

**Access**

Read-only

**Syntax**`CircleSegment.Name`**See also**[CircleSegment \(Page 2266\)](#)**CircleSegment.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" means completely transparent.

**Type**

Float

**Access**

Read-write

**Syntax**`CircleSegment.Opacity`**See also**[CircleSegment \(Page 2266\)](#)**CircleSegment.Operability****Description**

The "Operability" property returns whether the circle segment is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.

- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`CircleSegment.Operability`

### See also

[CircleSegment \(Page 2266\)](#)

## CircleSegment.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, [HmiScreenObjectBase \(Page 1742\)](#)

### Access

Read-only

### Syntax

`CircleSegment.Parent`

### See also

[CircleSegment \(Page 2266\)](#)  
[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

[Screen Items \(Page 1742\)](#)

## CircleSegment.Radius

### Description

The "Radius" property specifies the radius.

### Type

UInt32

### Access

Read-write

### Syntax

`CircleSegment.Radius`

### See also

CircleSegment (Page 2266)

## CircleSegment.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the circle segment can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`CircleSegment.RequireExplicitUnlock`

### See also

CircleSegment (Page 2266)

## CircleSegment.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`CircleSegment.RotationAngle`

### See also

[CircleSegment \(Page 2266\)](#)

[CircleSegment.RotationCenterPlacement \(Page 2286\)](#)

[CircleSegment.RotationCenterX \(Page 2287\)](#)

[CircleSegment.RotationCenterY \(Page 2288\)](#)

## CircleSegment.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the circle segment rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- **AbsoluteFromCenter (0):** Absolute distance from the object center in DIU (Device Independent Unit).
- **NormedFromCenter (1):** Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- **AbsoluteToContainer (2):** Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

**Access**

Read-write

**Syntax**`CircleSegment.RotationCenterPlacement`**See also**[CircleSegment \(Page 2266\)](#)[CircleSegment.RotationAngle \(Page 2286\)](#)[CircleSegment.RotationCenterX \(Page 2287\)](#)[CircleSegment.RotationCenterY \(Page 2288\)](#)**CircleSegment.RotationCenterX****Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`CircleSegment.RotationCenterX`**See also**[CircleSegment \(Page 2266\)](#)[CircleSegment.RotationAngle \(Page 2286\)](#)[CircleSegment.RotationCenterPlacement \(Page 2286\)](#)[CircleSegment.RotationCenterY \(Page 2288\)](#)

## CircleSegment.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`CircleSegment.RotationCenterY`

### See also

[CircleSegment \(Page 2266\)](#)

[CircleSegment.RotationAngle \(Page 2286\)](#)

[CircleSegment.RotationCenterPlacement \(Page 2286\)](#)

[CircleSegment.RotationCenterX \(Page 2287\)](#)

## CircleSegment.ShowFillLevel

### Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`CircleSegment.ShowFillLevel`

**See also**

CircleSegment (Page 2266)  
CircleSegment.BackFillPattern (Page 2271)  
CircleSegment.FillDirection (Page 2276)  
CircleSegment.FillLevel (Page 2277)

**CircleSegment.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the circle segment is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`CircleSegment.ShowFocusVisual`

**See also**

CircleSegment (Page 2266)

**CircleSegment.StartAngle****Description**

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

**Type**

Int32

**Access**

Read-write

**Syntax**

`CircleSegment.StartAngle`

**See also**

[CircleSegment \(Page 2266\)](#)

**CircleSegment.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style applied to the circle segment.

**Type**

String

**Access**

Read-only

**Syntax**

`CircleSegment.StyleItemClass`

**See also**

[CircleSegment \(Page 2266\)](#)

**CircleSegment.TabIndex**

**Description**

The "TabIndex" property returns the position of the circle segment in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`CircleSegment.TabIndex`

**See also**

[CircleSegment \(Page 2266\)](#)

**CircleSegment.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`CircleSegment.ToolTipText`

**See also**

[CircleSegment \(Page 2266\)](#)

**CircleSegment.Visible****Description**

The "Visible" property specifies whether the circle segment is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`CircleSegment.Visible`

**See also**

[CircleSegment \(Page 2266\)](#)

## CircleSegment.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the circle segment.

### Syntax

```
CircleSegment.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[CircleSegment \(Page 2266\)](#)

## CircleSegment.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
CircleSegment.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

[CircleSegment \(Page 2266\)](#)

## CircleSegment\_OnActivated()

### Description

The "OnActivated" event occurs when a circle segment receives focus:

- A circle segment is selected via the configured tab sequence.
- A circle segment that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
CircleSegment_OnActivated(item)
```

### Context

**item**

Type: Object

Circle segment at which the event occurs.

### See also

CircleSegment (Page 2266)

## CircleSegment\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A circle segment is clicked with the right mouse button.
- A circle segment is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
CircleSegment_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Circle segment where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

CircleSegment (Page 2266)

## CircleSegment\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a circle segment loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
CircleSegment_OnDeactivated(item)
```

### Context

**item**

Type: Object

Circle segment at which the event occurs.

## See also

CircleSegment (Page 2266)

## CircleSegment\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the circle segment is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
CircleSegment_OnKeyDown(item, keyCode, modifiers)
```

**Context****item**

Type: Object

Circle segment where the event occurs.

**keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**

[CircleSegment](#) (Page 2266)

**CircleSegment\_OnKeyUp()****Description**

The "OnKeyUp" event occurs when a key is released while the circle segment is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
CircleSegment_OnKeyUp(item, keyCode, modifiers)
```

## Context

### **item**

Type:

Circle segment where the event occurs.

### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

[CircleSegment \(Page 2266\)](#)

## CircleSegment\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A circle segment is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a circle segment has the focus.
- A circle segment is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
CircleSegment_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Circle segment where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

CircleSegment (Page 2266)

**CircularArc**

**Description**

The "CircularArc" object represents a circular arc in runtime.

**Object type**

HmiCircularArc

## Properties

The "CircularArc" object has the following properties:

- **AlternateLineColor**  
Specifies the second line color which is displayed for line styles such as "Dash".
- **AngleRange**  
Specifies the arc angle.
- **Authorization**  
Returns the operator authorization.
- **CapType**  
Specifies the shape of the line ends.
- **CenterX**  
Specifies the X coordinate of the rotation point.
- **CenterY**  
Specifies the Y coordinate of the rotation point.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the circular arc.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the circular arc can be operated in runtime.
- **EndType**  
Specifies the type of line end.
- **Layer**  
Returns the layer of the screen in which the circular arc is located.
- **LineColor**  
Specifies the line color.
- **LineWidth**  
Specifies the line thickness.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the circular arc.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the circular arc is operable.
- **Parent**  
Returns the higher-level screen object.
- **Radius**  
Specifies the radius.
- **RequireExplicitUnlock**  
Returns whether the circular arc is only operable while the associated button is being pressed.

- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the circular arc rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the circular arc is highlighted when in focus.
- **StartAngle**  
Specifies the angle by which the start point deviates from the zero position (0°).
- **StartType**  
Specifies the type of line start.
- **StyleItemClass**  
Returns the style which is applied to the circular arc.
- **TabIndex**  
Returns the position of the circular arc in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the circular arc is visible.

## Methods

The "CircularArc" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the circular arc.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "CircularArc" object has the following events:

- **OnActivated()**  
Occurs when a circular arc receives focus.
- **OnContextTapped()**  
Occurs when a circular arc is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a circular arc loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the circular arc is in focus.

- **OnKeyUp()**  
Occurs when a key is released while the circular arc is in focus.
- **OnTapped()**  
Occurs when a circular arc is left-clicked or short-touched.

## CircularArc.AlternateLineColor

### Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`CircularArc.AlternateLineColor`

### See also

[CircularArc \(Page 2300\)](#)

## CircularArc.AngleRange

### Description

The AngleRange property specifies the arc angle clockwise.

### Type

Int32

### Access

Read-write

### Syntax

`CircularArc.AngleRange`

## See also

CircularArc (Page 2300)

## CircularArc.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`CircularArc.Authorization`

## See also

CircularArc (Page 2300)

## CircularArc.CapType

### Description

The "CapType" property specifies the shape of the line ends.

### Type

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

### Access

Read-write

**Syntax**`CircularArc.CapType`**See also**[CircularArc \(Page 2300\)](#)**CircularArc.CenterX****Description**

The "CenterX" property specifies the X coordinate of the rotation point.

**Type**`Int32`**Access**`Read-write`**Syntax**`CircularArc.CenterX`**See also**[CircularArc \(Page 2300\)](#)**CircularArc.CenterY****Description**

The "CenterY" property specifies the Y coordinate of the rotation point.

**Type**`Int32`**Access**`Read-write`**Syntax**`CircularArc.CenterY`

## See also

CircularArc (Page 2300)

## CircularArc.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the circular arc.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`CircularArc.CurrentQuality`

## See also

CircularArc (Page 2300)

## CircularArc.DashType

### Description

The "DashType" property specifies the dash type of the border or the line.

### Type

Int32, HmiDashType

Specifies the dash type:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

**Access**

Read-write

**Syntax**

`CircularArc.DashType`

**See also**

[CircularArc \(Page 2300\)](#)

**CircularArc.Enabled****Description**

The "Enabled" property specifies whether the circular arc can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`CircularArc.Enabled`

**See also**

[CircularArc \(Page 2300\)](#)

## CircularArc.EndType

### Description

The "EndType" property specifies the type of line end.

### Type

Int32, HmiLineEndType

Specifies the end of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reversed arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

### Access

Read-write

### Syntax

`CircularArc.EndType`

### See also

[CircularArc \(Page 2300\)](#)

## CircularArc.Layer

### Description

The "Layer" property returns the layer of the screen in which the circular arc is located.

### Type

Object, HmiLayerPart

### Access

Read-only

**Syntax**`CircularArc.Layer`**See also**`CircularArc` (Page 2300)**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MaximumZoom`**See also**`CircularArc.Layer` (Page 2308)**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

## Syntax

`Layer.MinimumZoom`

## See also

[CircularArc.Layer \(Page 2308\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

## Syntax

`Layer.Name`

## See also

[CircularArc.Layer \(Page 2308\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

**Syntax**`Layer.Visible`**See also**`CircularArc.Layer` (Page 2308)**CircularArc.LineColor****Description**

The "LineColor" property specifies the line color.

**Type**`UInt32`**Access**`Read-write`**Syntax**`CircularArc.LineColor`**See also**`CircularArc` (Page 2300)**CircularArc.LineWidth****Description**

The "LineWidth" property specifies the line thickness.

**Type**`UInt8`**Access**`Read-write`**Syntax**`CircularArc.LineWidth`

### See also

CircularArc (Page 2300)

## CircularArc.Margin

### Description

The Margin property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`CircularArc.Margin`

### See also

CircularArc (Page 2300)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

**See also**

CircularArc.Margin (Page 2312)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Left

**See also**

CircularArc.Margin (Page 2312)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

CircularArc.Margin (Page 2312)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

CircularArc.Margin (Page 2312)

**CircularArc.Name**

**Description**

The "Name" property returns the name of the circular arc.

**Type**

String

**Access**

Read-only

**Syntax**

CircularArc.Name

**See also**

CircularArc (Page 2300)

**CircularArc.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" means completely transparent.

**Type**

Float

**Access**

Read-write

**Syntax**

`CircularArc.Opacity`

**See also**

CircularArc (Page 2300)

**CircularArc.Operability****Description**

The "Operability" property returns whether the circular arc is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`CircularArc.Operability`

**See also**

[CircularArc \(Page 2300\)](#)

**CircularArc.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, [HmiScreenObjectBase \(Page 1742\)](#)

**Access**

Read-only

**Syntax**

`CircularArc.Parent`

**See also**

[CircularArc \(Page 2300\)](#)  
[Screen Items \(Page 1742\)](#)

**Screen Items**

**Description**

[Screen Items \(Page 1742\)](#)

**CircularArc.Radius**

**Description**

The "Radius" property specifies the radius.

**Type**

UInt32

**Access**

Read-write

**Syntax**`CircularArc.Radius`**See also**

CircularArc (Page 2300)

**CircularArc.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the circular arc can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`CircularArc.RequireExplicitUnlock`**See also**

CircularArc (Page 2300)

**CircularArc.RotationAngle****Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

### Access

Read-write

### Syntax

`CircularArc.RotationAngle`

### See also

[CircularArc \(Page 2300\)](#)

[CircularArc.RotationCenterPlacement \(Page 2318\)](#)

[CircularArc.RotationCenterX \(Page 2319\)](#)

[CircularArc.RotationCenterY \(Page 2319\)](#)

## CircularArc.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the circular arc rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`CircularArc.RotationCenterPlacement`

**See also**

[CircularArc \(Page 2300\)](#)  
[CircularArc.RotationAngle \(Page 2317\)](#)  
[CircularArc.RotationCenterX \(Page 2319\)](#)  
[CircularArc.RotationCenterY \(Page 2319\)](#)

**CircularArc.RotationCenterX****Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

```
CircularArc.RotationCenterX
```

**See also**

[CircularArc \(Page 2300\)](#)  
[CircularArc.RotationAngle \(Page 2317\)](#)  
[CircularArc.RotationCenterPlacement \(Page 2318\)](#)  
[CircularArc.RotationCenterY \(Page 2319\)](#)

**CircularArc.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

### Access

Read-write

### Syntax

`CircularArc.RotationCenterY`

### See also

[CircularArc \(Page 2300\)](#)

[CircularArc.RotationAngle \(Page 2317\)](#)

[CircularArc.RotationCenterX \(Page 2319\)](#)

[CircularArc.RotationCenterPlacement \(Page 2318\)](#)

## CircularArc.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the circular arc is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`CircularArc.ShowFocusVisual`

### See also

[CircularArc \(Page 2300\)](#)

## CircularArc.StartAngle

### Description

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

**Type**

Int32

**Access**

Read-write

**Syntax**`CircularArc.StartAngle`**See also**

CircularArc (Page 2300)

**CircularArc.StartType****Description**

The "StartType" property specifies the type of line start.

**Type**

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reversed arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

**Access**

Read-write

**Syntax**`CircularArc.StartType`**See also**

CircularArc (Page 2300)

## CircularArc.StyleItemClass

### Description

The "StyleItemClass" property returns the style applied to the circular arc.

### Type

String

### Access

Read-only

### Syntax

`CircularArc.StyleItemClass`

### See also

CircularArc (Page 2300)

## CircularArc.TabIndex

### Description

The "TabIndex" property returns the position of the circular arc in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`CircularArc.TabIndex`

### See also

CircularArc (Page 2300)

## CircularArc.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`CircularArc.ToolTipText`

### See also

[CircularArc \(Page 2300\)](#)

## CircularArc.Visible

### Description

The "Visible" property specifies whether the circular arc is visible.

### Type

Bool

### Access

Read-write

### Syntax

`CircularArc.Visible`

### See also

[CircularArc \(Page 2300\)](#)

## CircularArc.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the circular arc.

### Syntax

```
CircularArc.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[CircularArc \(Page 2300\)](#)

## CircularArc.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
CircularArc.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

[CircularArc \(Page 2300\)](#)

## CircularArc\_OnActivated()

### Description

The "OnActivated" event occurs when a circular arc receives focus:

- A circular arc is selected via the configured tab sequence.
- A circular arc that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
CircularArc_OnActivated(item)
```

### Context

**item**

Type: Object

Circle segment at which the event occurs.

### See also

CircularArc (Page 2300)

## CircularArc\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A circular arc is clicked with the right mouse button.
- A circular arc is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
CircularArc_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Circular arc where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

CircularArc (Page 2300)

## CircularArc\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when an arc loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
CircularArc_OnDeactivated(item)
```

### Context

**item**

Type: Object

Circle segment at which the event occurs.

## See also

CircularArc (Page 2300)

## CircularArc\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the circular arc is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
CircularArc_OnKeyDown(item, keyCode, modifiers)
```

**Context****item**

Type: Object

Circular arc where the event occurs.

**keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**

[CircularArc \(Page 2300\)](#)

**CircularArc\_OnKeyUp()****Description**

The "OnKeyUp" event occurs when a key is released while the circular arc is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

`CircularArc_OnKeyUp(item, keyCode, modifiers)`

## Context

### **item**

Type:

Circular arc where the event occurs.

### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

[CircularArc \(Page 2300\)](#)

## CircularArc\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A circular arc is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a circular arc has the focus.
- A circular arc is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
CircularArc_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Circular arc where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

CircularArc (Page 2300)

**Clock**

**Description**

The "Clock" object represents a clock in runtime.

**Object type**

HmiClock

## Properties

The "Clock" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the clock.
- **DialBackColor**  
Specifies the background color of the dial.
- **DialLabelColor**  
Specifies the color of the dial label.
- **DialLabelFont**  
Specifies the font of the dial.
- **DialMode**  
Specifies the details of the dial that are displayed.
- **DialTickColor**  
Specifies the color of the dial divisions.
- **Enabled**  
Specifies whether the clock can be operated in runtime.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the clock is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the clock.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the clock is operable.

- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the clock was created.
- **RequireExplicitUnlock**  
Returns whether the clock is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the clock rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the clock is highlighted when in focus.
- **ShowHours**  
Specifies whether the hour hand is displayed.
- **ShowMinutes**  
Specifies whether the minute hand is displayed.
- **ShowSeconds**  
Specifies whether the second hand is displayed.
- **StyleItemClass**  
Returns the style which is applied to the clock.
- **TabIndex**  
Returns the position of the clock in the tab sequence.
- **TimeSource**  
Specifies the source for the displayed time.
- **Title**  
Specifies the caption which appears as the title.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the clock is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "Clock" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the clock.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Clock" object has the following events:

- **OnActivated()**  
Occurs when a clock receives focus.
- **OnContextTapped()**  
Occurs when a clock is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a clock loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the clock is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the clock is in focus.
- **OnTapped()**  
Occurs when a clock is left-clicked or short-touched.

## Clock.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`Clock.AlternateBackColor`

### See also

[Clock \(Page 2332\)](#)

## Clock.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`Clock.AlternateBorderColor`

### See also

Clock (Page 2332)

## Clock.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`Clock.Authorization`

### See also

Clock (Page 2332)

## Clock.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`Clock.BackColor`

### See also

Clock (Page 2332)

## Clock.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`Clock.BorderColor`

### See also

Clock (Page 2332)

## Clock.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`Clock.BorderWidth`

### See also

Clock (Page 2332)

## Clock.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the clock.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

**Syntax**`Clock.CurrentQuality`**See also**

Clock (Page 2332)

**Clock.DialBackColor****Description**

The "DialBackColor" property specifies the background color of the dial.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Clock.DialBackColor`**See also**

Clock (Page 2332)

**Clock.DialLabelColor****Description**

The "DialLabelColor" property specifies the color of the dial labeling.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Clock.DialLabelColor`

**See also**

Clock (Page 2332)

**Clock.DialLabelFont**

**Description**

The "DialLabelFont" property specifies the font of the dial.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Clock.DialLabelFont`

**See also**

Clock (Page 2332)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Clock.DialLabelFont (Page 2340)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Clock.DialLabelFont (Page 2340)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

### See also

Clock.DialLabelFont (Page 2340)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

Clock.DialLabelFont (Page 2340)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

**Syntax**

Font.Underline

**See also**

Clock.DialLabelFont (Page 2340)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

Clock.DialLabelFont (Page 2340)

**Clock.DialMode****Description**

The "DialMode" property specifies the details of the dial that are displayed.

**Type**

Int32, HmiScaleMode

Specifies the displayed details:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

**Access**

Read-write

**Syntax**

`Clock.DialMode`

**See also**

[Clock \(Page 2332\)](#)

**Clock.DialTickColor**

**Description**

The "DialTickColor" property specifies the color of the dial divisions.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Clock.DialTickColor`

**See also**

[Clock \(Page 2332\)](#)

## Clock.Enabled

### Description

The "Enabled" property specifies whether the parameter set display can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`Clock.Enabled`

### See also

[Clock \(Page 2332\)](#)

## Clock.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Clock.Height`

### See also

[Clock \(Page 2332\)](#)

## Clock.Layer

### Description

The "Layer" property returns the layer of the screen in which the parameter set display is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Clock.Layer`

### See also

Clock (Page 2332)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

Clock.Layer (Page 2346)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

Clock.Layer (Page 2346)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

Clock.Layer (Page 2346)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[Clock.Layer \(Page 2346\)](#)

## Clock.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Clock.Left`

### See also

[Clock \(Page 2332\)](#)

## Clock.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Clock.Margin`

### See also

[Clock \(Page 2332\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[Clock.Margin \(Page 2349\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[Clock.Margin \(Page 2349\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Clock.Margin \(Page 2349\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[Clock.Margin \(Page 2349\)](#)

**Clock.Name****Description**

The "Name" property returns the name of the clock.

**Type**

String

**Access**

Read-only

**Syntax**

`Clock.Name`

**See also**

[Clock \(Page 2332\)](#)

## Clock.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`Clock.Opacity`

### See also

Clock (Page 2332)

## Clock.Operability

### Description

The "Operability" property returns whether the clock is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Clock.Operability`

**See also**

Clock (Page 2332)

**Clock.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

```
Clock.Parent
```

**See also**

Clock (Page 2332)

Screen Items (Page 1742)

**Screen Items****Description**

Screen Items (Page 1742)

**Clock.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the clock was created.

**Type**

String

**Access**

Read-only

**Syntax**

`Clock.RenderingTemplate`

**See also**

Clock (Page 2332)

**Clock.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the clock can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`Clock.RequireExplicitUnlock`

**See also**

Clock (Page 2332)

**Clock.RotationAngle**

**Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**`Clock.RotationAngle`**See also**[Clock \(Page 2332\)](#)[Clock.RotationCenterPlacement \(Page 2355\)](#)[Clock.RotationCenterX \(Page 2356\)](#)[Clock.RotationCenterY \(Page 2356\)](#)**Clock.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property specifies the reference point around which the clock rotates.

**Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- `AbsoluteFromCenter (0)`: Absolute distance from the object center in DIU (Device Independent Unit).
- `NormedFromCenter (1)`: Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- `AbsoluteToContainer (2)`: Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

**Access**

Read-write

**Syntax**`Clock.RotationCenterPlacement`

## See also

[Clock \(Page 2332\)](#)

[Clock.RotationAngle \(Page 2354\)](#)

[Clock.RotationCenterX \(Page 2356\)](#)

[Clock.RotationCenterY \(Page 2356\)](#)

## Clock.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
Clock.RotationCenterX
```

## See also

[Clock \(Page 2332\)](#)

[Clock.RotationAngle \(Page 2354\)](#)

[Clock.RotationCenterPlacement \(Page 2355\)](#)

[Clock.RotationCenterY \(Page 2356\)](#)

## Clock.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

**Access**

Read-write

**Syntax**`Clock.RotationCenterY`**See also**

Clock (Page 2332)

Clock.RotationAngle (Page 2354)

Clock.RotationCenterPlacement (Page 2355)

Clock.RotationCenterX (Page 2356)

**Clock.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the clock is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`Clock.ShowFocusVisual`**See also**

Clock (Page 2332)

**Clock.ShowHours****Description**

The "ShowHours" property specifies whether the hour hand is displayed.

**Type**

Bool

### Access

Read-write

### Syntax

`Clock.ShowHours`

### See also

[Clock \(Page 2332\)](#)

[Clock.ShowMinutes \(Page 2358\)](#)

[Clock.ShowSeconds \(Page 2358\)](#)

## Clock.ShowMinutes

### Description

The "ShowMinutes" property specifies whether the minute hand is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`Clock.ShowMinutes`

### See also

[Clock \(Page 2332\)](#)

[Clock.ShowHours \(Page 2357\)](#)

[Clock.ShowSeconds \(Page 2358\)](#)

## Clock.ShowSeconds

### Description

The "ShowSeconds" property specifies whether the second hand is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**`Clock.ShowSeconds`**See also**

Clock (Page 2332)

Clock.ShowHours (Page 2357)

Clock.ShowMinutes (Page 2358)

**Clock.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the clock.

**Type**

String

**Access**

Read-only

**Syntax**`Clock.StyleItemClass`**See also**

Clock (Page 2332)

**Clock.TabIndex****Description**

The "TabIndex" property returns the position of the clock in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`Clock.TabIndex`

**See also**

Clock (Page 2332)

**Clock.TimeSource**

**Description**

The "TimeSource" property specifies the source for the displayed time. If the property is not configured, local time is used.

**Type**

Variant

**Access**

Read-write

**Syntax**

`Clock.TimeSource`

**See also**

Clock (Page 2332)

**Clock.Title**

**Description**

The "Title" property specifies the caption that appears as the title.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`Clock.Title`

**See also**

[Clock \(Page 2332\)](#)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

[Clock.Title \(Page 2360\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 2361)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Text.Font (Page 2361)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

Text.Font (Page 2361)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

Text.Font (Page 2361)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[Text.Font \(Page 2361\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

**Syntax**`Font.Weight`**See also**`Text.Font` (Page 2361)**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**`UInt32`**Access**

Read-write

**Syntax**`Text.ForeColor`**See also**`Clock.Title` (Page 2360)**Text.Text****Description**

The "Text" property specifies the label.

**Type**`String`**Access**

Read-write

## Syntax

`Text.Text`

## See also

[Clock.Title \(Page 2360\)](#)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

## Syntax

`Text.Visible`

## See also

[Clock.Title \(Page 2360\)](#)

## Clock.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

**Syntax**`Clock.ToolTipText`**See also**

Clock (Page 2332)

**Clock.Top****Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`Clock.Top`**See also**

Clock (Page 2332)

**Clock.Visible****Description**

The "Visible" property specifies whether the clock is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Clock.Visible`

**See also**

Clock (Page 2332)

**Clock.VisualizeQuality**

**Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

Clock.VisualizeQuality

**See also**

Clock (Page 2332)

**Clock.Width**

**Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

Clock.Width

**See also**

Clock (Page 2332)

**Clock.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the clock.

**Syntax**

```
Clock.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

Clock (Page 2332)

**Clock.PropertyFlashing()****Description**

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

## Syntax

```
Clock.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

### **propertyName**

Type: String

Name of the property for which flashing is configured.

### **enable**

Type: Bool

Specifies that flashing is activated.

### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

### **Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

Clock (Page 2332)

## Clock\_OnActivated()

### Description

The "OnActivated" event occurs when a clock receives focus:

- A clock is selected via the configured tab sequence.
- A clock that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Clock_OnActivated(item)
```

### Context

**item**

Type: Object

Clock where the event occurs.

### See also

Clock (Page 2332)

## Clock\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A clock is right-clicked.
- A clock is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Clock_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Clock where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Clock (Page 2332)

**Clock\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the clock loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
Clock_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Clock where the event occurs.

**See also**

Clock (Page 2332)

**Clock\_OnKeyDown()****Description**

The "OnKeyDown" event occurs when a key is pressed while the clock is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
Clock_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Clock where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Clock (Page 2332)

## Clock\_OnKeyUp()

## Description

The "OnKeyUp" event occurs when a key is released while the clock is in focus.

## Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
Clock_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

Clock where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**[Clock \(Page 2332\)](#)

## Clock\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A clock is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a clock has the focus.
- A clock is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Clock_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Clock where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

#### **See also**

Clock (Page 2332)

#### **ComboBox**

#### **Description**

The "ComboBox" object represents a combo box in runtime. The combo box is a combination of text box and list box.

#### **Object type**

HmiComboBox

## Properties

The "ComboBox" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border width.
- **Content**  
Specifies display options for text and graphics.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the combo box.
- **Enabled**  
Specifies whether the combo box can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **Layer**  
Returns the screen layer in which the combo box is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the combo box.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the combo box is operable.
- **Padding**  
Specifies the distance of the content from the border of the combo box.
- **Parent**  
Returns the higher-level screen object.

- **ProcessValue**  
Specifies the process value.
- **RenderingTemplate**  
Returns the name of the template from which the combo box was created.
- **RequireExplicitUnlock**  
Returns whether the combo box is only operable while the corresponding button is being pressed.
- **RotationAngle**  
Specifies the rotation angle in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the combo box rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**  
Specifies the height of the list entries.
- **SelectionItems**  
Returns the list of all list entries in the combo box.
- **SelectionMode**  
Specifies whether one or more list entries can be selected in the combo box.
- **SelectorPosition**  
Specifies the horizontal alignment of the list entries.
- **ShowFocusVisual**  
Specifies whether the combo box is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the combo box.
- **TabIndex**  
Returns the position of the combo box in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the combo box is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "ComboBox" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the combo box.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ComboBox" object has the following events:

- **OnActivated()**  
Occurs when a combo box receives focus.
- **OnContextTapped()**  
Occurs when a combo box is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a combo box loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the combo box is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the combo box is in focus.
- **OnTapped()**  
Occurs when a combo box is left-clicked or short-touched.

## ComboBox.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ComboBox.AlternateBackColor`

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ComboBox.AlternateBorderColor
```

### See also

ComboBox (Page 2377)

## ComboBox.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ComboBox.Authorization
```

### See also

ComboBox (Page 2377)

## ComboBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ComboBox.BackColor`

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`ComboBox.BorderColor`

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.BorderWidth

### Description

The "BorderWidth" property specifies the border width.

### Type

UInt8

### Access

Read-write

### Syntax

```
ComboBox.BorderWidth
```

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ComboBox.Content
```

### See also

[ComboBox \(Page 2377\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ComboBox.Content \(Page 2383\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[ComboBox.Content \(Page 2383\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ComboBox.Content \(Page 2383\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ComboBox.Content \(Page 2383\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ComboBox.Content \(Page 2383\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

ComboBox.Content (Page 2383)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ComboBox.Content \(Page 2383\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ComboBox.Content \(Page 2383\)](#)

## ComboBox.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the combo box.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

```
ComboBox.CurrentQuality
```

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.Enabled

### Description

The "Enabled" property specifies whether the combo box can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

`ComboBox.Enabled`

**See also**

[ComboBox \(Page 2377\)](#)

**ComboBox.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ComboBox.Font`

**See also**

[ComboBox \(Page 2377\)](#)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

ComboBox.Font (Page 2390)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ComboBox.Font (Page 2390)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

### See also

ComboBox.Font (Page 2390)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ComboBox.Font (Page 2390)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

**Syntax**

Font.Underline

**See also**

ComboBox.Font (Page 2390)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

Font.Weight

**See also**

ComboBox.Font (Page 2390)

**ComboBox.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ComboBox.ForeColor`

**See also**

[ComboBox \(Page 2377\)](#)

**ComboBox.Height**

**Description**

The "Height" property specifies the height in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ComboBox.Height`

**See also**

[ComboBox \(Page 2377\)](#)

**ComboBox.Layer**

**Description**

The "Layer" property returns the screen layer in which the combo box is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**`ComboBox.Layer`**See also**[ComboBox \(Page 2377\)](#)**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MaximumZoom`**See also**[ComboBox.Layer \(Page 2394\)](#)**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

[ComboBox.Layer \(Page 2394\)](#)

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

[ComboBox.Layer \(Page 2394\)](#)

**Layer.Visible**

**Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Layer.Visible`**See also**[ComboBox.Layer \(Page 2394\)](#)**ComboBox.Left****Description**

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**`ComboBox.Left`**See also**[ComboBox \(Page 2377\)](#)**ComboBox.Margin****Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ComboBox.Margin`

### See also

[ComboBox \(Page 2377\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ComboBox.Margin \(Page 2397\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ComboBox.Margin \(Page 2397\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ComboBox.Margin \(Page 2397\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ComboBox.Margin \(Page 2397\)](#)

## ComboBox.Name

### Description

The "Name" property returns the name of the combo box.

### Type

String

### Access

Read-only

### Syntax

`ComboBox.Name`

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.Opacity

### Description

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

### Type

Float

**Access**

Read-write

**Syntax**`ComboBox.Opacity`**See also**[ComboBox \(Page 2377\)](#)**ComboBox.Operability****Description**

The "Operability" property returns whether the combo box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ComboBox.Operability`**See also**[ComboBox \(Page 2377\)](#)**ComboBox.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the combo box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ComboBox.Padding`

**See also**

[ComboBox \(Page 2377\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ComboBox.Padding \(Page 2401\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ComboBox.Padding \(Page 2401\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ComboBox.Padding \(Page 2401\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ComboBox.Padding \(Page 2401\)](#)

## ComboBox.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`ComboBox.Parent`

### See also

[ComboBox \(Page 2377\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

[Screen Items \(Page 1742\)](#)

## ComboBox.ProcessValue

### Description

The "ProcessValue" property specifies the process value.

### Type

Variant

### Access

Read-write

### Syntax

```
ComboBox.ProcessValue
```

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the combo box was created.

### Type

String

### Access

Read-only

### Syntax

```
ComboBox.RenderingTemplate
```

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the combo box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ComboBox.RequireExplicitUnlock`

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.RotationAngle

### Description

The "RotationAngle" property specifies the rotation angle in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`ComboBox.RotationAngle`

### See also

[ComboBox \(Page 2377\)](#)

[ComboBox.RotationCenterPlacement \(Page 2407\)](#)

[ComboBox.RotationCenterX \(Page 2407\)](#)

[ComboBox.RotationCenterY \(Page 2408\)](#)

## ComboBox.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the combo box rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

```
ComboBox.RotationCenterPlacement
```

### See also

[ComboBox \(Page 2377\)](#)

[ComboBox.RotationAngle \(Page 2406\)](#)

[ComboBox.RotationCenterX \(Page 2407\)](#)

[ComboBox.RotationCenterY \(Page 2408\)](#)

## ComboBox.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`ComboBox.RotationCenterX`

**See also**

- ComboBox (Page 2377)
- ComboBox.RotationAngle (Page 2406)
- ComboBox.RotationCenterPlacement (Page 2407)
- ComboBox.RotationCenterY (Page 2408)

**ComboBox.RotationCenterY**

**Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`ComboBox.RotationCenterY`

**See also**

- ComboBox (Page 2377)
- ComboBox.RotationAngle (Page 2406)
- ComboBox.RotationCenterPlacement (Page 2407)
- ComboBox.RotationCenterX (Page 2407)

## ComboBox.SelectionItemHeight

### Description

The "SelectionItemHeight" property specifies the height of the list entries. The value "0" indicates that the height is calculated automatically.

### Type

UInt16

### Access

Read-write

### Syntax

ComboBox.SelectionItemHeight

### See also

ComboBox (Page 2377)

## ComboBox.SelectionItems

### Description

The "SelectionItems" property returns the list of all list entries ("SelectionItem" objects) of the combo box.

### Type

Object, HmiSelectedItemCollection (Page 2410)

### Access

Read-only

### Syntax

ComboBox.SelectionItems

### See also

ComboBox (Page 2377)

HmiSelectedItemCollection (Page 2410)

## HmiSelectedItemCollection

### Description

The "HmiSelectedItemCollection" object is a list of all entries ("SelectedItem" objects) of a list object.

### Use

The "HmiSelectedItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectedItemCollection" list using the index or the tag name.

### Object type

HmiSelectedItemCollection

### Properties

The "HmiSelectedItemCollection" object has the following properties:

- **Count**  
Returns the number of list entries of the "HmiSelectedItemCollection" list.

### Methods

The "HmiSelectedItemCollection" object has the following methods:

- **Item()**  
Returns a list entry of the "HmiSelectedItemCollection" list.

### See also

ComboBox.SelectionItems (Page 2409)

## HmiSelectedItemCollection.Count

### Description

The "Count" property returns the number of list entries in the "HmiSelectedItemCollection" list.

### Type

UInt32

### Access

Read-only

**Syntax**

```
HmiSelectedItemCollection.Count
```

**See also**

HmiSelectedItemCollection (Page 2410)

**HmiSelectedItemCollection.Item()****Description**

The "Item" method returns a list entry of the "HmiSelectedItemCollection" list.

**Syntax**

```
HmiSelectedItemCollection[.Item] (HmiSelectedItemName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectedItemCollection" object.

---

**Parameters****HmiSelectedItemName**

Type: String

Name of the list entry

**Return value**

Object, HmiSelectedItemPart (Page 2411)

**See also**

HmiSelectedItemCollection (Page 2410)

SelectedItem (Page 2411)

**SelectedItem****Description**

The "SelectedItem" object represents a list entry.

## Object type

HmiSelectedItemPart

## Properties

The "SelectedItem" object has the following properties:

- **Graphic**  
Specifies the graphic of the list entry.
- **IsSelected**  
Specifies whether the list entry is selected.
- **Text**  
Specifies the list entry text.

## Methods

--

## See also

HmiSelectedItemCollection (Page 2410)

## SelectedItem.Graphic

### Description

The "Graphic" property specifies the graphic of the list entry.

### Type

String

### Access

Read-write

### Syntax

`SelectedItem.Graphic`

## See also

SelectedItem (Page 2411)

## SelectedItem.IsSelected

### Description

The "IsSelected" property specifies whether the list entry is selected.

### Type

Bool

### Access

Read-write

### Syntax

```
SelectedItem.IsSelected
```

### See also

SelectedItem (Page 2411)

## SelectedItem.Text

### Description

The "Text" property specifies the text of the list entry.

### Type

String

### Access

Read-write

### Syntax

```
SelectedItem.Text
```

### See also

SelectedItem (Page 2411)

## ComboBox.SelectionMode

### Description

The "SelectionMode" property specifies whether one or more list entries can be selected in the combo box.

### Type

Int32, HmiSelectionMode

Specifies the type of the selection:

- NonExclusive (0): Selection of multiple list entries possible
- Exclusive (1): Selection of only one list entry possible

### Access

Read-write

### Syntax

`ComboBox.SelectionMode`

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.SelectorPosition

### Description

The "SelectorPosition" property specifies the horizontal alignment of the list entries.

### Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

### Access

Read-write

**Syntax**`ComboBox.SelectorPosition`**See also**[ComboBox \(Page 2377\)](#)**ComboBox.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the combo box is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`ComboBox.ShowFocusVisual`**See also**[ComboBox \(Page 2377\)](#)**ComboBox.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the combo box.

**Type**

String

**Access**

Read-only

**Syntax**`ComboBox.StyleItemClass`

**See also**

ComboBox (Page 2377)

**ComboBox.TabIndex**

**Description**

The "TabIndex" property returns the position of the combo box in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`ComboBox.TabIndex`

**See also**

ComboBox (Page 2377)

**ComboBox.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`ComboBox.ToolTipText`

**See also**

ComboBox (Page 2377)

## ComboBox.Top

### Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

ComboBox.Top

### See also

ComboBox (Page 2377)

## ComboBox.Visible

### Description

The "Visible" property specifies whether the combo box is visible.

### Type

Bool

### Access

Read-write

### Syntax

ComboBox.Visible

### See also

ComboBox (Page 2377)

## ComboBox.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`ComboBox.VisualizeQuality`

### See also

ComboBox (Page 2377)

## ComboBox.Width

### Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ComboBox.Width`

### See also

ComboBox (Page 2377)

## ComboBox.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the combo box.

### Syntax

```
ComboBox.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[ComboBox \(Page 2377\)](#)

## ComboBox.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ComboBox.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

### **propertyName**

Type: String

Name of the property for which flashing is configured.

### **enable**

Type: Bool

Specifies that flashing is activated.

### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

### **Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

ComboBox (Page 2377)

## ComboBox\_OnActivated()

### Description

The "OnActivated" event occurs when a combo box receives focus:

- A combo box is selected via the configured tab sequence.
- A combo box that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
ComboBox_OnActivated(item)
```

### Context

**item**

Type: Object

Combo box where the event occurs.

### See also

ComboBox (Page 2377)

## ComboBox\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A combo box is right-clicked.
- A combo box is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
ComboBox_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Combo box where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

ComboBox (Page 2377)

**ComboBox\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the combo box loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
ComboBox_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Combo box where the event occurs.

**See also**

ComboBox (Page 2377)

**ComboBox\_OnKeyDown()****Description**

The "OnKeyDown" event occurs when a key is pressed while the combo box is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
ComboBox_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Combo box where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

ComboBox (Page 2377)

## ComboBox\_OnKeyUp()

## Description

The "OnKeyUp" event occurs when a key is released while the combo box is in focus.

## Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
ComboBox_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

Combo box where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**[ComboBox \(Page 2377\)](#)

## ComboBox\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A combo box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an combo box has the focus.
- A combo box is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
ComboBox_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Combo box where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

#### **See also**

ComboBox (Page 2377)

## **CommandSourceElement**

### **Description**

The "CommandSourceElement" object represents a command source in runtime.

### **Object type**

HmiCommandSourceElement

## Properties

The "CommandSourceElement" object has the following properties:

- **Command**  
Returns a command.
- **DataConnection**  
Returns the data connection.
- **Parent**  
Returns the higher-level screen object.
- **ResultSet**  
Returns the last result of the executed command.
- **SourceState**  
Returns the state of the command source.

## Methods

The "CommandSourceElement" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the command source.
- **PropertyFlashing()**  
Configures flashing of a property.

## CommandSourceElement.Command

### Description

The "Command" property returns a command.

### Type

Object, HmiCommandPart

### Access

Read-only

### Syntax

`CommandSourceElement.Command`

### See also

[CommandSourceElement \(Page 2427\)](#)

## Command.CommandParameters

### Description

The "CommandParameters" property returns the parameters of the command.

### Type

Object, HmiParameterCollection (Page 2429)

### Access

Read-only

### Syntax

```
Command.CommandParameters
```

### See also

CommandSourceElement.Command (Page 2428)

HmiParameterCollection (Page 2429)

## HmiParameterCollection

### Description

The "HmiParameterCollection" object is a list of all parameters ("Parameter" objects).

### Use

The "HmiParameterCollection" object is a list which can be counted and enumerated. You can access the "HmiParameterCollection" list using the index or the tag names.

### Object type

HmiParameterCollection

### Properties

The "HmiParameterCollection" object has the following properties:

- **Count**  
Returns the number of parameters in the "HmiParameterCollection" list.

## Methods

The "HmiParameterCollection" object has the following methods:

- **Item()**  
Returns a parameter of the "HmiParameterCollection" list.

## See also

Command.CommandParameters (Page 2429)

## HmiParameterCollection.Count

### Description

The "Count" property returns the number of parameters in the "HmiParameterCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

`HmiParameterCollection.Count`

## See also

HmiParameterCollection (Page 2429)

## HmiParameterCollection.Item()

### Description

The "Item" method returns a parameter of the "HmiParameterCollection" list.

### Syntax

`HmiParameterCollection.[.Item] (HmiParameterName)`

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiParameterCollection" object.

---

## Parameters

### **HmiParameterName**

Type: String

Name of the parameter

## Return value

Object, HmiParameterPart (Page 2431)

## See also

Parameter (Page 2431)

HmiParameterCollection (Page 2429)

## Parameter

## Description

The "Parameter" object represents a parameter.

## Object type

HmiParameterPart

## Properties

The "Parameter" object has the following properties:

- **ParameterName**  
Specifies the name of the parameter.
- **ParameterValue**  
Specifies the value of the parameter.

## Methods

--

## Parameter.ParameterName

## Description

The "ParameterName" property specifies the name of the parameter.

**Type**

String

**Access**

Read-write

**Syntax**

`Parameter.ParameterName`

**See also**

Parameter (Page 2431)

**Parameter.ParameterValue**

**Description**

The "ParameterValue" property specifies the value of the parameter.

**Type**

Variant

**Access**

Read-write

**Syntax**

`Parameter.ParameterValue`

**See also**

Parameter (Page 2431)

**Command.CommandText**

**Description**

The "CommandText" property returns the text of the command.

**Type**

String

**Access**

Read-only

**Syntax**`Command.CommandText`**See also**`CommandSourceElement.Command` (Page 2428)**Command.CommandType****Description**

The "CommandType" property returns the type of the command.

**Type**

String

**Access**

Read-only

**Syntax**`Command.CommandType`**See also**`CommandSourceElement.Command` (Page 2428)**Command.Execute()****Description**

The "Execute" method executes the command.

The currently running command is completed. The commands in the queue are deleted and this command is executed.

**Syntax**`Command.Execute ()`

## Parameters

--

## Return value

--

## See also

CommandSourceElement.Command (Page 2428)

## Command\_OnCompleted()

### Description

The "OnCompleted" event occurs when a command has been executed successfully. The event is only triggered for the latest command.

### Syntax

```
Command_OnCompleted(success)
```

### Context

#### **success**

Type: Bool

Shows the successful execution of a command:

- True: Command was executed successfully.
- False: Command was not executed.

## See also

CommandSourceElement.Command (Page 2428)

## CommandSourceElement.DataConnection

### Description

The "DataConnection" property returns the data connection.

### Type

Object, HmiDataConnection

**Access**

Read-only

**Syntax**

`CommandSourceElement.DataConnection`

**See also**

[CommandSourceElement \(Page 2427\)](#)

**CommandSourceElement.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, [HmiScreenObjectBase \(Page 1742\)](#)

**Access**

Read-only

**Syntax**

`CommandSourceElement.Parent`

**See also**

[CommandSourceElement \(Page 2427\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**CommandSourceElement.ResultSet****Description**

The "ResultSet" property returns the last result of the executed command.

**Type**

Object, HmiParameterPart

**Access**

Read-only

**Syntax**

`CommandSourceElement.ResultSet`

**See also**

[CommandSourceElement \(Page 2427\)](#)

**Parameter**

**Description**

The "Parameter" object represents a parameter.

**Object type**

HmiParameterPart

**Properties**

The "Parameter" object has the following properties:

- **ParameterName**  
Specifies the name of the parameter.
- **ParameterValue**  
Specifies the value of the parameter.

**Methods**

--

**See also**

[HmiParameterCollection \(Page 2124\)](#)

## Parameter.ParameterName

### Description

The "ParameterName" property specifies the name of the parameter.

### Type

String

### Access

Read-write

### Syntax

`Parameter.ParameterName`

### See also

Parameter (Page 2436)

## Parameter.ParameterValue

### Description

The "ParameterValue" property specifies the value of the parameter.

### Type

Variant

### Access

Read-write

### Syntax

`Parameter.ParameterValue`

### See also

Parameter (Page 2436)

## CommandSourceElement.SourceState

### Description

The "SourceState" property returns the state of the command source.

### Type

Int32, HmiSourceState

Returns the state:

- Idle (0): Ready
- Busy (1): Busy

### Access

Read-only

### Syntax

`CommandSourceElement.SourceState`

### See also

[CommandSourceElement \(Page 2427\)](#)

## CommandSourceElement.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the command source.

### Syntax

`CommandSourceElement.CheckAuthorization()`

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

[CommandSourceElement \(Page 2427\)](#)

## CommandSourceElement.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
CommandSourceElement.PropertyFlashing(propertyName, enable[, value]  
[, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

CommandSourceElement (Page 2427)

**CustomWebControlContainer**

**Description**

The "CustomWebControlContainer" object represents a container for custom web controls in runtime. Custom web controls are user-defined web objects that extend the provided visualization elements with your own elements.

The following predefined custom web controls are available:

- AuditViewer
- Plant overview
- Reports

**Object type**

HmiCustomWebControlContainer

**Properties**

The "CustomWebControlContainer" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Caption**  
Specifies the text that is displayed in the title bar.

- **CaptionColor**  
Specifies the background color of the title bar.
- **ContainedType**  
Returns the type of the contained custom web control.
- **CurrentQuality**  
Returns the worst quality code of all tags that influence the custom web control.
- **Enabled**  
Specifies whether the custom web control can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the custom web control.
- **Layer**  
Returns the screen layer in which the custom web control is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the custom web control.
- **Operability**  
Returns whether the custom web control is operable.
- **Parent**  
Returns the higher-level screen object.
- **Properties**  
Enables access to the dynamic properties of the web objects.
- **RenderingTemplate**  
Returns the name of the template from which the custom web control was created.
- **RequireExplicitUnlock**  
Returns whether the custom web control is only operable while the associated button is being pressed.
- **ShowFocusVisual**  
Specifies whether the custom web control is highlighted when it has the focus.
- **StyleItemClass**  
Returns the style that is applied to the custom web control.
- **TabIndex**  
Returns the position of the custom web control in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the custom web control is visible.

- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the custom web control.

## Methods

The "CustomWebControlContainer" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the custom web control.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "CustomWebControlContainer" object has the following events:

- **OnActivated()**  
Occurs when a custom web control receives the focus.
- **OnDeactivated()**  
Occurs when a custom web control loses the focus.
- **OnInterfaceEvent()**  
Stands for user-defined interface events of a custom web control.

## CustomWebControlContainer.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`CustomWebControlContainer.Authorization`

### See also

CustomWebControlContainer (Page 2440)

## CustomWebControlContainer.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

```
CustomWebControlContainer.Caption
```

### See also

CustomWebControlContainer (Page 2440)

## Text.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
Text.Font
```

### See also

CustomWebControlContainer.Caption (Page 2443)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

[Text.Font \(Page 2443\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

`Font.Name`

### See also

[Text.Font \(Page 2443\)](#)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 2443)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

## See also

Text.Font (Page 2443)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

Font.Underline

## See also

Text.Font (Page 2443)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 2443\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[CustomWebControlContainer.Caption \(Page 2443\)](#)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

[CustomWebControlContainer.Caption \(Page 2443\)](#)

### Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

[CustomWebControlContainer.Caption \(Page 2443\)](#)

### CustomWebControlContainer.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

**Access**

Read-write

**Syntax**`CustomWebControlContainer.CaptionColor`**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.ContainedType****Description**

The "ContainedType" property returns the type of the contained custom web control.

**Type**

String

**Access**

Read-only

**Syntax**`CustomWebControlContainer.ContainedType`**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.CurrentQuality****Description**

The "CurrentQuality" property returns the worst quality code of all tags that influence the custom web control.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`CustomWebControlContainer.CurrentQuality`

### See also

[CustomWebControlContainer \(Page 2440\)](#)

## CustomWebControlContainer.Enabled

### Description

The "Enabled" property specifies whether the custom web control can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`CustomWebControlContainer.Enabled`

### See also

[CustomWebControlContainer \(Page 2440\)](#)

## CustomWebControlContainer.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`CustomWebControlContainer.Height`

### See also

[CustomWebControlContainer \(Page 2440\)](#)

## CustomWebControlContainer.Icon

### Description

The "Icon" property specifies the icon of the custom web control.

### Type

String

### Access

Read-write

### Syntax

`CustomWebControlContainer.Icon`

### See also

[CustomWebControlContainer \(Page 2440\)](#)

## CustomWebControlContainer.Layer

### Description

The "Layer" property returns the screen layer in which the custom web control is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`CustomWebControlContainer.Layer`

### See also

[CustomWebControlContainer \(Page 2440\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[CustomWebControlContainer.Layer \(Page 2452\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

CustomWebControlContainer.Layer (Page 2452)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

```
Layer.Name
```

### See also

CustomWebControlContainer.Layer (Page 2452)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[CustomWebControlContainer.Layer](#) (Page 2452)

## CustomWebControlContainer.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`CustomWebControlContainer.Left`

### See also

[CustomWebControlContainer](#) (Page 2440)

## CustomWebControlContainer.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`CustomWebControlContainer.Margin`

### See also

[CustomWebControlContainer \(Page 2440\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[CustomWebControlContainer.Margin \(Page 2455\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[CustomWebControlContainer.Margin \(Page 2455\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[CustomWebControlContainer.Margin \(Page 2455\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

CustomWebControlContainer.Margin (Page 2455)

**CustomWebControlContainer.Name****Description**

The "Name" property returns the name of the custom web control.

**Type**

String

**Access**

Read-only

**Syntax**

CustomWebControlContainer.Name

**See also**

CustomWebControlContainer (Page 2440)

## CustomWebControlContainer.Operability

### Description

The "Operability" property returns whether the custom web control is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`CustomWebControlContainer.Operability`

### See also

[CustomWebControlContainer \(Page 2440\)](#)

## CustomWebControlContainer.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`CustomWebControlContainer.Parent`

**See also**

CustomWebControlContainer (Page 2440)

Screen Items (Page 1742)

**Screen Items****Description**

Screen Items (Page 1742)

**CustomWebControlContainer.Properties****Description**

The "Properties" property allows access to the dynamic properties of the web objects.

**Type**

Object, HmiDynamicPropertyPart

**Access**

Read-write

**Syntax**

```
CustomWebControlContainer.Properties
```

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the custom web control was created.

**Type**

String

**Access**

Read-only

**Syntax**

`CustomWebControlContainer.RenderingTemplate`

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the custom web control is only operable while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`CustomWebControlContainer.RequireExplicitUnlock`

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the custom web control is highlighted when it has the focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`CustomWebControlContainer.ShowFocusVisual`**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.StyleItemClass****Description**

The "StyleItemClass" property returns the style that is applied to the custom web control.

**Type**

String

**Access**

Read-only

**Syntax**`CustomWebControlContainer.StyleItemClass`**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.TabIndex****Description**

The "TabIndex" property returns the position of the custom web control in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`CustomWebControlContainer.TabIndex`

**See also**

[CustomWebControlContainer \(Page 2440\)](#)

**CustomWebControlContainer.Top**

**Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`CustomWebControlContainer.Top`

**See also**

[CustomWebControlContainer \(Page 2440\)](#)

**CustomWebControlContainer.Visible**

**Description**

The "Visible" property specifies whether the custom web control is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`CustomWebControlContainer.Visible`

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.Width****Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

CustomWebControlContainer.Width

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the custom web control.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized

- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`CustomWebControlContainer.WindowFlags`

**See also**

[CustomWebControlContainer \(Page 2440\)](#)

**CustomWebControlContainer.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the custom web control.

**Syntax**

`CustomWebControlContainer.CheckAuthorization()`

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

CustomWebControlContainer (Page 2440)

## CustomWebControlContainer.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
CustomWebControlContainer.PropertyFlashing(propertyName, enable[,  
value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer\_OnActivated()**

**Description**

The "OnActivated" event occurs when a custom web control receives the focus:

- A custom web control is selected via the configured tab sequence.
- A custom control that did not previously have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
CustomWebControlContainer_OnActivated(item)
```

**Context**

**item**

Type: Object

Custom web control for which the event occurs.

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the custom web control loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
CustomWebControlContainer_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Custom web control for which the event occurs.

**See also**

CustomWebControlContainer (Page 2440)

**CustomWebControlContainer\_OnInterfaceEvent()****Description**

The "OnInterfaceEvent" event stands for user-defined interface events of a custom web control. You can add any number of interface events with arguments to a custom web control in the manifest.

**Syntax**

```
CustomWebControlContainer_OnInterfaceEvent(item[, Argument_1][, ...  
Argument_n])
```

## Context

### **item**

Type: Object

Custom web control for which the event occurs.

### **Argument\_1**

Argument of the event. Any number of arguments can be added to a user-defined interface event.

## CustomWidgetContainer

### Description

The "CustomWidgetContainer" object represents a container for dynamic widgets in runtime.

### Object type

HmiCustomWidgetContainer

### Properties

The "CustomWidgetContainer" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **ContainedType**  
Returns the type of the contained widget.
- **CurrentQuality**  
Returns the worst quality code of all tags that influence the widget.
- **Enabled**  
Specifies whether the widget can be operated in runtime.
- **Height**  
Specifies the height.
- **Layer**  
Returns the screen layer in which the widget is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the widget.
- **Opacity**  
Specifies the opacity.

- **Operability**  
Returns whether the widget is operable.
- **Parent**  
Returns the higher-level screen object.
- **Properties**  
Enables access to the dynamic properties of the widget.
- **RenderingTemplate**  
Returns the name of the template from which the widget was created.
- **RequireExplicitUnlock**  
Returns whether the widget is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the rotation angle in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the widget rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the widget is highlighted when it has the focus.
- **StyleItemClass**  
Returns the style that is applied to the widget.
- **TabIndex**  
Returns the position of the widget in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the widget is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "CustomWidgetContainer" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the widget.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "CustomWidgetContainer" object has the following events:

- **OnActivated()**  
Occurs when a widget receives the focus.
- **OnContextTapped()**  
Occurs when a widget is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a widget loses the focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the widget has the focus.
- **OnKeyUp()**  
Occurs when a key is released while the widget has the focus.
- **OnTapped()**  
Occurs when a widget is clicked with the left mouse button or short-touched.

## CustomWidgetContainer.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`CustomWidgetContainer.Authorization`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.ContainedType

### Description

The "ContainedType" property returns the type of the contained widget.

**Type**

String

**Access**

Read-only

**Syntax**`CustomWidgetContainer.ContainedType`**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.CurrentQuality****Description**

The "CurrentQuality" property returns the worst quality code of all tags that influence the widget.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**`CustomWidgetContainer.CurrentQuality`**See also**

CustomWidgetContainer (Page 2468)

## CustomWidgetContainer.Enabled

### Description

The "Enabled" property specifies whether the widget can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`CustomWidgetContainer.Enabled`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`CustomWidgetContainer.Height`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.Layer

### Description

The "Layer" property returns the screen layer in which the widget is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`CustomWidgetContainer.Layer`

### See also

CustomWidgetContainer (Page 2468)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

CustomWidgetContainer.Layer (Page 2473)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[CustomWidgetContainer.Layer \(Page 2473\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[CustomWidgetContainer.Layer \(Page 2473\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[CustomWidgetContainer.Layer \(Page 2473\)](#)

## CustomWidgetContainer.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`CustomWidgetContainer.Left`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`CustomWidgetContainer.Margin`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[CustomWidgetContainer.Margin \(Page 2476\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[CustomWidgetContainer.Margin \(Page 2476\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[CustomWidgetContainer.Margin \(Page 2476\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[CustomWidgetContainer.Margin \(Page 2476\)](#)

## CustomWidgetContainer.Name

### Description

The "Name" property returns the name of the widget.

### Type

String

### Access

Read-only

### Syntax

`CustomWidgetContainer.Name`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.Opacity

### Description

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

### Type

Float

### Access

Read-write

### Syntax

`CustomWidgetContainer.Opacity`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.Operability

### Description

The "Operability" property returns whether the widget is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`CustomWidgetContainer.Operability`

### See also

[CustomWidgetContainer](#) (Page 2468)

## CustomWidgetContainer.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, [HmiScreenObjectBase](#) (Page 1742)

### Access

Read-only

### Syntax

```
CustomWidgetContainer.Parent
```

### See also

[CustomWidgetContainer](#) (Page 2468)

[Screen Items](#) (Page 1742)

## Screen Items

### Description

[Screen Items](#) (Page 1742)

## CustomWidgetContainer.Properties

### Description

The "Properties" property allows access to the dynamic properties of the widget.

### Type

Object, [HmiDynamicPropertyPart](#)

**Access**

Read-write

**Syntax**`CustomWidgetContainer.Properties`**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the widget was created.

**Type**

String

**Access**

Read-only

**Syntax**`CustomWidgetContainer.RenderingTemplate`**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the widget can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`CustomWidgetContainer.RequireExplicitUnlock`

**See also**

[CustomWidgetContainer \(Page 2468\)](#)

**CustomWidgetContainer.RotationAngle**

**Description**

The "RotationAngle" property specifies the rotation angle in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**

`CustomWidgetContainer.RotationAngle`

**See also**

[CustomWidgetContainer \(Page 2468\)](#)

[CustomWidgetContainer.RotationCenterPlacement \(Page 2482\)](#)

[CustomWidgetContainer.RotationCenterX \(Page 2483\)](#)

[CustomWidgetContainer.RotationCenterY \(Page 2484\)](#)

**CustomWidgetContainer.RotationCenterPlacement**

**Description**

The "RotationCenterPlacement" property sets the reference point around which the widget rotates.

## Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

## Access

Read-write

## Syntax

`CustomWidgetContainer.RotationCenterPlacement`

## See also

[CustomWidgetContainer](#) (Page 2468)

[CustomWidgetContainer.RotationCenterX](#) (Page 2483)

[CustomWidgetContainer.RotationCenterY](#) (Page 2484)

## CustomWidgetContainer.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

## Type

Float

## Access

Read-write

## Syntax

`CustomWidgetContainer.RotationCenterX`

### See also

- CustomWidgetContainer (Page 2468)
- CustomWidgetContainer.RotationAngle (Page 2482)
- CustomWidgetContainer.RotationCenterPlacement (Page 2482)
- CustomWidgetContainer.RotationCenterY (Page 2484)

## CustomWidgetContainer.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`CustomWidgetContainer.RotationCenterY`

### See also

- CustomWidgetContainer (Page 2468)

## CustomWidgetContainer.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the widget is highlighted when it has the focus.

### Type

Bool

**Access**

Read-write

**Syntax**`CustomWidgetContainer.ShowFocusVisual`**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.StyleItemClass****Description**

The "StyleItemClass" property returns the style that is applied to the widget.

**Type**

String

**Access**

Read-only

**Syntax**`CustomWidgetContainer.StyleItemClass`**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.TabIndex****Description**

The "TabIndex" property returns the position of the widget in the tab sequence.

**Type**

UInt16

**Access**

Read-only

### Syntax

`CustomWidgetContainer.TabIndex`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`CustomWidgetContainer.ToolTipText`

### See also

[CustomWidgetContainer \(Page 2468\)](#)

## CustomWidgetContainer.Top

### Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`CustomWidgetContainer.Top`

**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.Visible****Description**

The "Visible" property specifies whether the widget is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

CustomWidgetContainer.Visible

**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.VisualizeQuality****Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

CustomWidgetContainer.VisualizeQuality

**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

CustomWidgetContainer.Width

**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the widget.

**Syntax**

CustomWidgetContainer.CheckAuthorization()

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

CustomWidgetContainer (Page 2468)

## CustomWidgetContainer.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
CustomWidgetContainer.PropertyFlashing(propertyName, enable[, value]  
[, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer\_OnActivated()**

**Description**

The "OnActivated" event occurs when a widget receives the focus:

- A widget is selected via the configured tab sequence.
- A widget that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

`CustomWidgetContainer_OnActivated(item)`

**Context**

**item**

Type: Object

Widget for which the event occurs.

## See also

CustomWidgetContainer (Page 2468)

## CustomWidgetContainer\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A widget is right-clicked.
- A widget is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
CustomWidgetContainer_OnContextTapped(item, x, y, modifiers,  
trigger)
```

### Context

**item**

Type: Object

Widget for which the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

CustomWidgetContainer (Page 2468)

**CustomWidgetContainer\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when the widget loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

`CustomWidgetContainer_OnDeactivated(item)`

**Context**

**item**

Type: Object

Widget for which the event occurs.

## See also

CustomWidgetContainer (Page 2468)

## CustomWidgetContainer\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the widget has the focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
CustomWidgetContainer_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Widget for which the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

CustomWidgetContainer (Page 2468)

## CustomWidgetContainer\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the widget has the focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
CustomWidgetContainer_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Widget for which the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

CustomWidgetContainer (Page 2468)

## CustomWidgetContainer\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A widget is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a widget has the focus.
- A widget is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
CustomWidgetContainer_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Widget for which the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**DataGridControl**

**Description**

The "DataGridControl" object represents a data grid control for display of tag values in runtime.

## Object type

HmiDataGridControl

## Properties

The "DataGridControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **BindingSource**  
Returns the data source.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the data table display.
- **DataGridView**  
Specifies the appearance of the data table.
- **Enabled**  
Specifies whether the data table display can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the data table display.
- **Layer**  
Returns the screen layer in which the data table display is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the data table display.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the data table display was created.
- **ShowFocusVisual**  
Specifies whether the data table display is highlighted when in focus.
- **StatusBar**  
Specifies the information bar of the data table display.
- **StyleItemClass**  
Returns the style which is applied to the data table display.

- **TabIndex**  
Returns the position of the data table display in the tab sequence.
- **ToolBar**  
Specifies the toolbar of the data table display.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the data table display is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the data table display.

## Methods

The "DataGridControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the data table display.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the data grid control.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "DataGridControl" object has the following events:

- **OnActivated()**  
Occurs when a data table display receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the data table display.
- **OnDeactivated()**  
Occurs when a data table display loses focus.
- **OnInitialized()**  
Occurs when a data table display has been successfully initialized and the data connection to the PLC has been established.

## DataGridControl.BackColor

### Description

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridControl.BackColor`**See also**[DataGridControl \(Page 2496\)](#)**DataGridControl.BindingSource****Description**

The "BindingSource" property returns the binding data source.

**Type**Object, [HmiBindingSourceElement \(Page 2116\)](#)**Access**

Read-only

**Syntax**`DataGridControl.BindingSource`**See also**[DataGridControl \(Page 2496\)](#)[BindingSourceElement \(Page 2116\)](#)**BindingSourceElement****Description**[BindingSourceElement \(Page 2116\)](#)

## DataGridControl.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`DataGridControl.Caption`

### See also

DataGridControl (Page 2496)

## Text.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`Text.Font`

### See also

DataGridControl.Caption (Page 2500)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[Text.Font \(Page 2500\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

[Text.Font \(Page 2500\)](#)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

Text.Font (Page 2500)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

Font.StrikeOut

**See also**

Text.Font (Page 2500)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

Text.Font (Page 2500)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 2500\)](#)

**Text.ForeColor**

**Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[DataGridControl.Caption \(Page 2500\)](#)

**Text.Text**

**Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

DataGridControl.Caption (Page 2500)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

DataGridControl.Caption (Page 2500)

**DataGridControl.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

**Type**

UInt32

### Access

Read-write

### Syntax

`DataGridControl.CaptionColor`

### See also

DataGridControl (Page 2496)

## DataGridControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the data table display.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`DataGridControl.CurrentQuality`

### See also

DataGridControl (Page 2496)

## DataGridControl.DataGridView

### Description

The "DataGridView" property specifies the appearance of the data table.

### Type

Object, HmiDataGridViewPart (Page 2507)

### Access

Read-write

### Syntax

```
DataGridControl.DataGridView
```

### See also

DataGridControl (Page 2496)

DataGridView (Page 2507)

## DataGridView

### DataGridView.AllowFilter

### Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridView.AllowFilter
```

## See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.AllowSort

### Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridView.AllowSort
```

## See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

**Syntax**

```
DataGridView.AlternateBackColor
```

**See also**

DataGridControl.DataGridView (Page 2507)

**DataGridView.AlternateForeColor****Description**

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
DataGridView.AlternateForeColor
```

**See also**

DataGridControl.DataGridView (Page 2507)

**DataGridView.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

## Syntax

`DataGridView.BackColor`

## See also

`DataGridControl.DataGridView` (Page 2507)

## DataGridView.CellPadding

### Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`DataGridView.CellPadding`

## See also

`DataGridControl.DataGridView` (Page 2507)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Bottom`**See also**`DataGridView.CellPadding` (Page 2510)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Left`**See also**`DataGridView.CellPadding` (Page 2510)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Right`

## See also

`DataGridView.CellPadding` (Page 2510)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Top`

## See also

`DataGridView.CellPadding` (Page 2510)

## DataGridView.ColoringMode

### Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

### Type

Int32, `HmiGridColoringMode`

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

**Access**

Read-write

**Syntax**

`DataGridView.ColoringMode`

**See also**

`DataGridControl.DataGridView` (Page 2507)

**DataGridView.Columns****Description**

The "Columns" property represents the quantity of columns.

**Type**

Object, `HmiDataGridColumnCollection` (Page 2513)

**Access**

Read-only

**Syntax**

`DataGridView.Columns`

**See also**

`DataGridControl.DataGridView` (Page 2507)

`HmiDataGridColumnCollection` (Page 2513)

**HmiDataGridColumnCollection****Description**

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

## Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

## Object type

HmiDataGridColumnCollection

## Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

## Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiDataGridColumnCollection.Count
```

### See also

HmiDataGridColumnCollection (Page 2513)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

### Syntax

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

### Parameters

**HmiDataGridColumnName**

Type: String

Name of the column

### Return value

Object, HmiDataGridColumnPartBase (Page 2515)

### See also

HmiDataGridColumnCollection (Page 2513)

DataGridColumn (Page 2515)

## DataGridColumn

### Description

The "DataGridColumn" object represents a value column.

### Object type

HmiDataGridColumnPart

## Properties

The "DataGridColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **Content**  
Specifies display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **Key**  
Corresponds to the column definition from the "ConsideredColumns" property of the connected source.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width of the column in the DIU (Device Independent Unit).

## Methods

--

## See also

HmiDataGridColumnCollection (Page 2513)

## DataGridColumn.AllowSort

### Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridColumn.AllowSort
```

### See also

DataGridColumn (Page 2515)

## DataGridColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridColumn.BackColor
```

### See also

DataGridColumn (Page 2515)

## DataGridColumn.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`DataGridColumn.Content`

### See also

DataGridColumn (Page 2515)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

DataGridColumn.Content (Page 2518)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

DataGridColumn.Content (Page 2518)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[DataGridColumn.Content \(Page 2518\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DataGridColumn.Content \(Page 2518\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

```
Content.SplitRatio
```

### See also

DataGridColumn.Content (Page 2518)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[DataGridColumn.Content \(Page 2518\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[DataGridColumn.Content \(Page 2518\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

DataGridColumn.Content (Page 2518)

## DataGridColumn.Enabled

### Description

The "Enabled" property specifies whether the column can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridColumn.Enabled
```

### See also

DataGridColumn (Page 2515)

## DataGridColumn.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridColumn.ForeColor`

### See also

[DataGridColumn \(Page 2515\)](#)

## DataGridColumn.Header

### Description

The "Header" property specifies the properties of the column header.

### Type

Object, `HmiDataGridColumnHeaderPart`

### Access

Read-write

### Syntax

`DataGridColumn.Header`

### See also

[DataGridColumn \(Page 2515\)](#)

## DataGridColumnHeader.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`DataGridColumnHeader.Content`

### See also

[DataGridColumn.Header \(Page 2524\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

DataGridColumnHeader.Content (Page 2525)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

DataGridColumnHeader.Content (Page 2525)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
Content.HorizontalTextAlignment
```

**See also**

DataGridColumnHeader.Content (Page 2525)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
Content.Spacing
```

**See also**

DataGridColumnHeader.Content (Page 2525)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[DataGridColumnHeader.Content \(Page 2525\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

DataGridColumnHeader.Content (Page 2525)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

DataGridColumnHeader.Content (Page 2525)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 2525\)](#)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Graphic`

### See also

[DataGridColumn.Header \(Page 2524\)](#)

## DataGridColumnHeader.Text

### Description

The "Text" property specifies the label of the column header.

### Type

String

### Access

Read-write

### Syntax

```
DataGridColumnHeader.Text
```

### See also

DataGridColumn.Header (Page 2524)

## DataGridColumn.Key

### Description

The "Key" property corresponds to the column definition from the "ConsideredColumns" property of the binding data source.

### Type

String

### Access

Read-only

### Syntax

```
DataGridColumn.Key
```

### See also

DataGridColumn (Page 2515)

## DataGridColumn.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridColumn.MaximumWidth`

### See also

[DataGridColumn \(Page 2515\)](#)

## DataGridColumn.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridColumn.MinimumWidth`

### See also

[DataGridColumn \(Page 2515\)](#)

## DataGridColumn.Name

### Description

The "Name" property returns the name of the column.

### Type

String

### Access

Read-only

### Syntax

```
DataGridColumn.Name
```

### See also

DataGridColumn (Page 2515)

## DataGridColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

```
DataGridColumn.OutputFormat
```

### See also

DataGridColumn (Page 2515)

## DataGridColumn.SortDirection

### Description

The "SortDirection" property specifies the sorting direction.

### Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

### Access

Read-write

### Syntax

```
DataGridColumn.SortDirection
```

### See also

DataGridColumn (Page 2515)

## DataGridColumn.SortOrder

### Description

The "SortOrder" property specifies the sorting order.

The sorting index begins at "1" (highest priority) in ascending order. Zero is ignored.

### Type

UInt16

### Access

Read-write

### Syntax

```
DataGridColumn.SortOrder
```

**See also**

DataGridColumn (Page 2515)

**DataGridColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridColumn.Visible`

**See also**

DataGridColumn (Page 2515)

**DataGridColumn.Width****Description**

The "Width" property specifies the width of the column in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridColumn.Width`

## See also

DataGridColumn (Page 2515)

## DataGridView.Font

### Description

The "Font" property specifies the font of the cells.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`DataGridView.Font`

## See also

DataGridControl.DataGridView (Page 2507)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

**See also**

DataGridView.Font (Page 2536)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

DataGridView.Font (Page 2536)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

### See also

DataGridView.Font (Page 2536)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

DataGridView.Font (Page 2536)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

**Syntax**`Font.Underline`**See also**`DataGridView.Font` (Page 2536)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**`Int32, HmiFontWeight`

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**`DataGridView.Font` (Page 2536)**DataGridView.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.ForeColor`

**See also**

`DataGridControl.DataGridView` (Page 2507)

**DataGridView.GridLineColor**

**Description**

The "GridLineColor" property specifies the color of grid lines.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.GridLineColor`

**See also**

`DataGridControl.DataGridView` (Page 2507)

**DataGridView.GridLineVisibility**

**Description**

The "GridLineVisibility" property specifies the visibility of the grid lines.

**Type**

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

**Access**

Read-write

**Syntax**

`DataGridView.GridLineVisibility`

**See also**

[DataGridControl.DataGridView \(Page 2507\)](#)

**DataGridView.GridLineWidth****Description**

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`DataGridView.GridLineWidth`

**See also**

[DataGridControl.DataGridView \(Page 2507\)](#)

## DataGridView.GridSelectionMode

### Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

### Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

### Access

Read-write

### Syntax

```
DataGridView.GridSelectionMode
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.HeaderSettings

### Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

### Type

Object, HmiDataGridHeaderSettingsPart

### Access

Read-write

### Syntax

```
DataGridView.HeaderSettings
```

**See also**

DataGridControl.DataGridView (Page 2507)

**DataGridHeaderSettings.AllowColumnReorder****Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
DataGridHeaderSettings.AllowColumnReorder
```

**See also**

DataGridView.HeaderSettings (Page 2542)

**DataGridHeaderSettings.AllowColumnResize****Description**

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
DataGridHeaderSettings.AllowColumnResize
```

## See also

DataGridView.HeaderSettings (Page 2542)

## DataGridView.HeaderSettings.ColumnHeaderType

### Description

The "ColumnHeaderType" property specifies the type of content of a column header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

### Syntax

`DataGridView.HeaderSettings.ColumnHeaderType`

## See also

DataGridView.HeaderSettings (Page 2542)

## DataGridView.HeaderSettings.Font

### Description

The "Font" property specifies the font of the headers.

### Type

Object, HmiFontPart

### Access

Read-write

**Syntax**

```
DataGridHeaderSettings.Font
```

**See also**

DataGridView.HeaderSettings (Page 2542)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
Font.Italic
```

**See also**

DataGridHeaderSettings.Font (Page 2544)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

## Syntax

Font.Name

## See also

DataGridHeaderSettings.Font (Page 2544)

## Font.Size

## Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

## Type

Float

## Access

Read-write

## Syntax

Font.Size

## See also

DataGridHeaderSettings.Font (Page 2544)

## Font.StrikeOut

## Description

The "StrikeOut" property specifies whether font is struck through.

## Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

DataGridHeaderSettings.Font (Page 2544)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

DataGridHeaderSettings.Font (Page 2544)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[DataGridHeaderSettings.Font](#) (Page 2544)

## DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridHeaderSettings.HeaderBackColor`

### See also

[DataGridView.HeaderSettings](#) (Page 2542)

## DataGridHeaderSettings.HeaderForeColor

### Description

The "HeaderForeColor" property specifies the font color of the headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

### See also

DataGridView.HeaderSettings (Page 2542)

## DataGridHeaderSettings.HeaderGridLineColor

### Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

### See also

DataGridView.HeaderSettings (Page 2542)

## DataGridHeaderSettings.HeaderSelectionBackColor

### Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

### See also

DataGridView.HeaderSettings (Page 2542)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### **Object**

Required. An object from the "Availability" section.

**See also**

DataGridView.HeaderSettings (Page 2542)

**DataGridView.HeaderSettings.RowHeaderType****Description**

The "RowHeaderType" property specifies the type of content of a row header.

**Type**

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridView.HeaderSettings.RowHeaderType`

**See also**

DataGridView.HeaderSettings (Page 2542)

**DataGridView.HorizontalScrollBarVisibility****Description**

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

**Type**

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.RowHeight
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.SelectFullRow

### Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridView.SelectFullRow
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.SelectionBackColor

### Description

The "SelectionBackColor" property specifies the background color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.SelectionBackColor
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.SelectionBorderColor

### Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.SelectionBorderColor
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.SelectionBorderWidth

### Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.SelectionBorderWidth
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.SelectionForeColor

### Description

The "SelectionForeColor" property specifies the font color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.SelectionForeColor
```

### See also

DataGridControl.DataGridView (Page 2507)

## DataGridView.VerticalScrollBarVisibility

### Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.VerticalScrollBarVisibility
```

**See also**

DataGridControl.DataGridView (Page 2507)

**DataGridControl.Enabled**

**Description**

The "Enabled" property specifies whether the data table display can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridControl.Enabled`

**See also**

DataGridControl (Page 2496)

**DataGridControl.Height**

**Description**

The "Height" property specifies the height in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridControl.Height`

**See also**

DataGridControl (Page 2496)

## DataGridControl.Icon

### Description

The "Icon" property specifies the icon of the data table display.

### Type

String

### Access

Read-write

### Syntax

`DataGridControl.Icon`

### See also

DataGridControl (Page 2496)

## DataGridControl.Layer

### Description

The "Layer" property returns the screen layer in which the data tables display is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`DataGridControl.Layer`

### See also

DataGridControl (Page 2496)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[DataGridControl.Layer \(Page 2557\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[DataGridControl.Layer \(Page 2557\)](#)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

[DataGridControl.Layer \(Page 2557\)](#)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[DataGridControl.Layer \(Page 2557\)](#)

## DataGridControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`DataGridControl.Left`

### See also

DataGridControl (Page 2496)

## DataGridControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`DataGridControl.Margin`

### See also

DataGridControl (Page 2496)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Bottom

### See also

DataGridControl.Margin (Page 2560)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

DataGridControl.Margin (Page 2560)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[DataGridControl.Margin \(Page 2560\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[DataGridControl.Margin \(Page 2560\)](#)

## DataGridControl.Name

### Description

The "Name" property returns the name of the data table display.

### Type

String

### Access

Read-only

### Syntax

```
DataGridControl.Name
```

### See also

DataGridControl (Page 2496)

## DataGridControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
DataGridControl.Parent
```

### See also

DataGridControl (Page 2496)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## DataGridControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the data table display was created.

### Type

String

### Access

Read-only

### Syntax

`DataGridControl.RenderingTemplate`

### See also

DataGridControl (Page 2496)

## DataGridControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the data table display is highlighted when in focus.

### Type

Bool

### Access

Read-write

**Syntax**

```
DataGridControl.ShowFocusVisual
```

**See also**

DataGridControl (Page 2496)

**DataGridControl.StatusBar****Description**

The "StatusBar" property specifies the information bar of the data table display.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

```
DataGridControl.StatusBar
```

**See also**

DataGridControl (Page 2496)

**StatusBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
StatusBar.BackColor
```

## See also

DataGridControl.StatusBar (Page 2565)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 2566)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

## See also

DataGridControl.StatusBar (Page 2565)

HmiControlBarElementCollection (Page 2566)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property

```
StatusBar.Elements or ToolBar.Elements
```

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 2566)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 2566)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 2583)

## See also

HmiControlBarElementCollection (Page 2566)

Control Bar Elements (Page 2583)

## Control Bar Elements

### Description

Control Bar Elements (Page 2583)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

`StatusBar.Enabled`

**See also**

`DataGridControl.StatusBar` (Page 2565)

**StatusBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

`DataGridControl.StatusBar` (Page 2565)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Italic`

## See also

StatusBar.Font (Page 2569)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

## Syntax

`Font.Name`

## See also

StatusBar.Font (Page 2569)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

**Syntax**`Font.Size`**See also**`StatusBar.Font` (Page 2569)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**`Int32, HmiFontStrikeOut`

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**`Read-write`**Syntax**`Font.StrikeOut`**See also**`StatusBar.Font` (Page 2569)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**`Bool`

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

StatusBar.Font (Page 2569)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

StatusBar.Font (Page 2569)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
StatusBar.Margin
```

### See also

DataGridControl.StatusBar (Page 2565)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

StatusBar.Margin (Page 2573)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[StatusBar.Margin \(Page 2573\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[StatusBar.Margin \(Page 2573\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[StatusBar.Margin \(Page 2573\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

### See also

[DataGridControl.StatusBar \(Page 2565\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[StatusBar.Padding \(Page 2575\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[StatusBar.Padding \(Page 2575\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[StatusBar.Padding \(Page 2575\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[StatusBar.Padding \(Page 2575\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.ShowToolTips`

### See also

DataGridControl.StatusBar (Page 2565)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.Visible`

### See also

DataGridControl.StatusBar (Page 2565)

## DataGridControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the data table display.

### Type

String

### Access

Read-only

### Syntax

```
DataGridControl.StyleItemClass
```

### See also

DataGridControl (Page 2496)

## DataGridControl.TabIndex

### Description

The "TabIndex" property returns the position of the data table display in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
DataGridControl.TabIndex
```

### See also

DataGridControl (Page 2496)

## DataGridControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the data table display.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

`DataGridControl.ToolBar`

### See also

DataGridControl (Page 2496)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ToolBar.BackColor`

### See also

DataGridControl.ToolBar (Page 2580)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 2581)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

DataGridControl.ToolBar (Page 2580)

HmiControlBarElementCollection (Page 2581)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[ToolBar.Elements \(Page 2581\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 2583)

## See also

HmiControlBarElementCollection (Page 2581)

Control Bar Elements (Page 2583)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

[ControlBarButton \(Page 2583\)](#)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarButton.Content
```

### See also

ControlBarButton (Page 2583)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

```
Content.ContentMode
```

## See also

ControlBarButton.Content (Page 2589)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarButton.Content (Page 2589)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarButton.Content \(Page 2589\)](#)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

[ControlBarButton.Content \(Page 2589\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content \(Page 2589\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarButton.Content (Page 2589)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarButton.Content (Page 2589)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 2589\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarButton.CustomID`

### See also

[ControlBarButton \(Page 2583\)](#)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.Graphic`

### See also

[ControlBarButton \(Page 2583\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 2583\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 2583\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**`ControlBarButton.Mapping`**See also**[ControlBarButton \(Page 2583\)](#)**ControlBarButton.Margin****Description**

The "Margin" property specifies the surrounded outer distance of the button.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 2583\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarButton.Margin \(Page 2599\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 2599)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarButton.Margin` (Page 2599)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 2599\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MaximumHeight`

## See also

[ControlBarButton \(Page 2583\)](#)

## ControlBarButton.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 2583)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MinimumHeight
```

**See also**

ControlBarButton (Page 2583)

**ControlBarButton.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarButton.MinimumWidth
```

## See also

ControlBarButton (Page 2583)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarButton.Operability
```

## See also

ControlBarButton (Page 2583)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**[ControlBarButton \(Page 2583\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**[ControlBarButton.Padding \(Page 2604\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarButton.Padding \(Page 2604\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarButton.Padding \(Page 2604\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 2604\)](#)**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarButton.RequireExplicitUnlock`**See also**[ControlBarButton \(Page 2583\)](#)**ControlBarButton.Text****Description**

The "Text" property specifies the label of the button.

**Type**

String

### Access

Read-write

### Syntax

```
ControlBarButton.Text
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.ToolTipText
```

### See also

ControlBarButton (Page 2583)

## ControlBarButton.Visible

### Description

The "Visible" property specifies whether the button is visible.

### Type

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 2583)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.Width`**See also**

ControlBarButton (Page 2583)

**ControlBarDisplay****Description**

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

[ControlBarDisplay \(Page 2609\)](#)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

## Syntax

```
ControlBarDisplay.Content
```

## See also

ControlBarDisplay (Page 2609)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

```
Content.ContentMode
```

## See also

ControlBarDisplay.Content (Page 2611)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

`ControlBarDisplay.Content` (Page 2611)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

**See also**

ControlBarDisplay.Content (Page 2611)

**Content.Spacing**

**Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 2611)

**Content.SplitRatio**

**Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

**See also**

ControlBarDisplay.Content (Page 2611)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

ControlBarDisplay.Content (Page 2611)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarDisplay.Content \(Page 2611\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarDisplay.Content \(Page 2611\)](#)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarDisplay.CustomID
```

### See also

[ControlBarDisplay \(Page 2609\)](#)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarDisplay.Enabled
```

### See also

[ControlBarDisplay \(Page 2609\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.ForeColor
```

### See also

ControlBarDisplay (Page 2609)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 2609)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

### See also

[ControlBarDisplay](#) (Page 2609)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**`ControlBarDisplay.Mapping`**See also**

ControlBarDisplay (Page 2609)

**ControlBarDisplay.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the display.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 2609\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarDisplay.Margin \(Page 2621\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarDisplay.Margin` (Page 2621)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarDisplay.Margin` (Page 2621)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarDisplay.Margin \(Page 2621\)](#)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MaximumHeight`

## See also

[ControlBarDisplay \(Page 2609\)](#)

## ControlBarDisplay.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**`ControlBarDisplay.MaximumWidth`**See also**[ControlBarDisplay \(Page 2609\)](#)**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarDisplay.MinimumHeight`**See also**[ControlBarDisplay \(Page 2609\)](#)**ControlBarDisplay.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

```
ControlBarDisplay.MinimumWidth
```

## See also

ControlBarDisplay (Page 2609)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarDisplay.Operability
```

## See also

ControlBarDisplay (Page 2609)

## ControlBarDisplay.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the display.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 2609)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarDisplay.Padding (Page 2626)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarDisplay.Padding \(Page 2626\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarDisplay.Padding \(Page 2626\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarDisplay.Padding \(Page 2626\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarDisplay.RequireExplicitUnlock`**See also**[ControlBarDisplay \(Page 2609\)](#)**ControlBarDisplay.Text****Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Text`

**See also**

ControlBarDisplay (Page 2609)

**ControlBarDisplay.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.ToolTipText`

**See also**

ControlBarDisplay (Page 2609)

**ControlBarDisplay.Visible**

**Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 2609)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.Width`**See also**

ControlBarDisplay (Page 2609)

**ControlBarLabel****Description**

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.

- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarLabel.Authorization
```

### See also

ControlBarLabel (Page 2631)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

**Access**

Read-only

**Syntax**

`ControlBarLabel.CustomID`

**See also**

ControlBarLabel (Page 2631)

**ControlBarLabel.Enabled**

**Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarLabel.Enabled`

**See also**

ControlBarLabel (Page 2631)

**ControlBarLabel.ForeColor**

**Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.ForeColor`**See also**

ControlBarLabel (Page 2631)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.Height`**See also**

ControlBarLabel (Page 2631)

**ControlBarLabel.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

### See also

ControlBarLabel (Page 2631)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 2631\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

**See also**

[ControlBarLabel](#) (Page 2631)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarLabel.Margin](#) (Page 2638)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

ControlBarLabel.Margin (Page 2638)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

ControlBarLabel.Margin (Page 2638)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

[ControlBarLabel.Margin](#) (Page 2638)

**ControlBarLabel.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MaximumHeight
```

**See also**

[ControlBarLabel](#) (Page 2631)

**ControlBarLabel.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MaximumWidth
```

## See also

[ControlBarLabel](#) (Page 2631)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumHeight
```

## See also

[ControlBarLabel](#) (Page 2631)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

**See also**

[ControlBarLabel \(Page 2631\)](#)

**ControlBarLabel.Operability****Description**

The "Operability" property returns whether the identifier is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarLabel.Operability
```

**See also**

[ControlBarLabel \(Page 2631\)](#)

**ControlBarLabel.Padding****Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

## Syntax

`ControlBarLabel.Padding`

## See also

[ControlBarLabel \(Page 2631\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Bottom`

## See also

[ControlBarLabel.Padding \(Page 2643\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Left`**See also**`ControlBarLabel.Padding` (Page 2643)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Right`**See also**`ControlBarLabel.Padding` (Page 2643)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Top`

## See also

`ControlBarLabel.Padding` (Page 2643)

## **ControlBarLabel.RequireExplicitUnlock**

### Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarLabel.RequireExplicitUnlock`

### See also

`ControlBarLabel` (Page 2631)

## **ControlBarLabel.Text**

### Description

The "Text" property specifies the label of the identifier.

### Type

String

### Access

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

ControlBarLabel (Page 2631)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

**See also**

ControlBarLabel (Page 2631)

**ControlBarLabel.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.VerticalTextAlignment`

### See also

[ControlBarLabel \(Page 2631\)](#)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarLabel.Visible`

### See also

[ControlBarLabel \(Page 2631\)](#)

## ControlBarLabel.Width

### Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

### Type

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 2631)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar. You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

**Properties**

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarSeparator.Authorization`

**See also**

[ControlBarSeparator \(Page 2649\)](#)

**ControlBarSeparator.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

```
ControlBarSeparator.CustomID
```

**See also**

[ControlBarSeparator \(Page 2649\)](#)

**ControlBarSeparator.Enabled****Description**

The "Enabled" property specifies whether the separator is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.Enabled
```

## See also

[ControlBarSeparator \(Page 2649\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.ForeColor
```

## See also

[ControlBarSeparator \(Page 2649\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

**See also**

ControlBarSeparator (Page 2649)

**ControlBarSeparator.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Read-only

### Syntax

`ControlBarSeparator.Operability`

### See also

[ControlBarSeparator \(Page 2649\)](#)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Padding`

### See also

[ControlBarSeparator \(Page 2649\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarSeparator.Padding \(Page 2660\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarSeparator.Padding \(Page 2660\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarSeparator.Padding \(Page 2660\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarSeparator.Padding \(Page 2660\)](#)

## ControlBarSeparator.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

### See also

ControlBarSeparator (Page 2649)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarSeparator.ToolTipText
```

### See also

ControlBarSeparator (Page 2649)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Visible`

### See also

[ControlBarSeparator \(Page 2649\)](#)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Width`

### See also

[ControlBarSeparator \(Page 2649\)](#)

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.

- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.AlternateBorderColor
```

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.Authorization
```

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarTextBox.BackColor
```

## See also

ControlBarTextBox (Page 2665)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

## Syntax

```
ControlBarTextBox.BorderColor
```

## See also

ControlBarTextBox (Page 2665)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

**Syntax**

```
ControlBarTextBox.BorderWidth
```

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.CustomID
```

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.Enabled****Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**

Bool

**Access**

Read-write

## Syntax

`ControlBarTextBox.Enabled`

## See also

[ControlBarTextBox \(Page 2665\)](#)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarTextBox.ForeColor`

## See also

[ControlBarTextBox \(Page 2665\)](#)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.Height
```

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.HorizontalTextAlignment
```

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 2665\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 2665\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarTextBox.Margin \(Page 2674\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarTextBox.Margin \(Page 2674\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 2674\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarTextBox.Margin \(Page 2674\)](#)

## ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MaximumHeight`

### See also

[ControlBarTextBox \(Page 2665\)](#)

## ControlBarTextBox.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MaximumWidth
```

### See also

ControlBarTextBox (Page 2665)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumHeight
```

### See also

ControlBarTextBox (Page 2665)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumWidth
```

### See also

ControlBarTextBox (Page 2665)

## ControlBarTextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarTextBox.Operability
```

**See also**

[ControlBarTextBox \(Page 2665\)](#)

**ControlBarTextBox.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Padding
```

**See also**

[ControlBarTextBox \(Page 2665\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Bottom
```

**See also**

[ControlBarTextBox.Padding \(Page 2679\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarTextBox.Padding \(Page 2679\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarTextBox.Padding \(Page 2679\)](#)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarTextBox.Padding \(Page 2679\)](#)

**ControlBarTextBox.ReadOnly****Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ReadOnly`

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarTextBox.RequireExplicitUnlock`

**See also**

ControlBarTextBox (Page 2665)

**ControlBarTextBox.Text**

**Description**

The "Text" property specifies the label of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Text`

**See also**

[ControlBarTextBox \(Page 2665\)](#)

**ControlBarTextBox.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.ToolTipText
```

**See also**

[ControlBarTextBox \(Page 2665\)](#)

**ControlBarTextBox.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

## Syntax

`ControlBarTextBox.VerticalTextAlignment`

## See also

[ControlBarTextBox \(Page 2665\)](#)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarTextBox.Visible`

## See also

[ControlBarTextBox \(Page 2665\)](#)

## ControlBarTextBox.Width

### Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

## Syntax

```
ControlBarTextBox.Width
```

## See also

ControlBarTextBox (Page 2665)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.

- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

**Methods**

--

**ControlBarToggleSwitch.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.AlternateBackColor`**See also**[ControlBarToggleSwitch \(Page 2685\)](#)**ControlBarToggleSwitch.AlternateBorderColor****Description**

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.AlternateBorderColor`

**See also**

ControlBarToggleSwitch (Page 2685)

**ControlBarToggleSwitch.AlternateGraphic**

**Description**

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateGraphic`

**See also**

ControlBarToggleSwitch (Page 2685)

**ControlBarToggleSwitch.AlternateText**

**Description**

The "AlternateText" property specifies the text of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateText`

**See also**

[ControlBarToggleSwitch](#) (Page 2685)

**ControlBarToggleSwitch.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarToggleSwitch.Authorization
```

**See also**

[ControlBarToggleSwitch](#) (Page 2685)

**ControlBarToggleSwitch.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BackColor
```

## See also

[ControlBarToggleSwitch](#) (Page 2685)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Badge
```

## See also

[ControlBarToggleSwitch](#) (Page 2685)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

**See also**

[ControlBarToggleSwitch](#) (Page 2685)

**ControlBarToggleSwitch.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderWidth
```

**See also**

[ControlBarToggleSwitch](#) (Page 2685)

**ControlBarToggleSwitch.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.Content
```

## See also

ControlBarToggleSwitch (Page 2685)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

## See also

ControlBarToggleSwitch.Content (Page 2691)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

`ControlBarToggleSwitch.Content` (Page 2691)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

`ControlBarToggleSwitch.Content` (Page 2691)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 2691\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 2691\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

ControlBarToggleSwitch.Content (Page 2691)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarToggleSwitch.Content \(Page 2691\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 2691\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

ControlBarToggleSwitch (Page 2685)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Enabled
```

### See also

ControlBarToggleSwitch (Page 2685)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 2685)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 2685)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

[ControlBarToggleSwitch \(Page 2685\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

```
Button.HotKey
```

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

### See also

ControlBarToggleSwitch (Page 2685)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Mapping`

### See also

[ControlBarToggleSwitch \(Page 2685\)](#)

## ControlBarToggleSwitch.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the switch.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 2685\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 2702\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarToggleSwitch.Margin \(Page 2702\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarToggleSwitch.Margin \(Page 2702\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarToggleSwitch.Margin \(Page 2702\)](#)**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumHeight`**See also**[ControlBarToggleSwitch \(Page 2685\)](#)**ControlBarToggleSwitch.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

### See also

ControlBarToggleSwitch (Page 2685)

## ControlBarToggleSwitch.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

### See also

ControlBarToggleSwitch (Page 2685)

## ControlBarToggleSwitch.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumWidth`

**See also**

[ControlBarToggleSwitch \(Page 2685\)](#)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Operability`

**See also**

[ControlBarToggleSwitch \(Page 2685\)](#)

**ControlBarToggleSwitch.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Padding`

**See also**

[ControlBarToggleSwitch \(Page 2685\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarToggleSwitch.Padding \(Page 2707\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarToggleSwitch.Padding \(Page 2707\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarToggleSwitch.Padding \(Page 2707\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarToggleSwitch.Padding (Page 2707)

**ControlBarToggleSwitch.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarToggleSwitch.RequireExplicitUnlock

**See also**

ControlBarToggleSwitch (Page 2685)

**ControlBarToggleSwitch.Text**

**Description**

The "Text" property specifies the label of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Text`**See also**

ControlBarToggleSwitch (Page 2685)

**ControlBarToggleSwitch.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.ToolTipText`**See also**

ControlBarToggleSwitch (Page 2685)

**ControlBarToggleSwitch.Visible****Description**

The "Visible" property specifies whether the switch is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Visible`

**See also**

ControlBarToggleSwitch (Page 2685)

**ControlBarToggleSwitch.Width**

**Description**

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Width`

**See also**

ControlBarToggleSwitch (Page 2685)

**ToolBar.Enabled**

**Description**

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.Enabled`**See also**

DataGridControl.ToolBar (Page 2580)

**ToolBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`ToolBar.Font`**See also**

DataGridControl.ToolBar (Page 2580)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

ToolBar.Font (Page 2713)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

ToolBar.Font (Page 2713)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

ToolBar.Font (Page 2713)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

ToolBar.Font (Page 2713)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[ToolBar.Font \(Page 2713\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

**Syntax**`Font.Weight`**See also**`ToolBar.Font` (Page 2713)**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**`Object, HmiMarginPart`**Access**`Read-write`**Syntax**`ToolBar.Margin`**See also**`DataGridControl.ToolBar` (Page 2580)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Bottom`

## See also

[ToolBar.Margin \(Page 2717\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

## See also

[ToolBar.Margin \(Page 2717\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**`ToolBar.Margin` (Page 2717)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**`ToolBar.Margin` (Page 2717)**ToolBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**`Object, HmiPaddingPart`**Access**`Read-write`

## Syntax

`ToolBar.Padding`

## See also

[DataGridControl.ToolBar \(Page 2580\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

## See also

[ToolBar.Padding \(Page 2719\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Left`**See also**`ToolBar.Padding` (Page 2719)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Right`**See also**`ToolBar.Padding` (Page 2719)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Top`

## See also

`ToolBar.Padding` (Page 2719)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.ShowToolTips`

## See also

`DataGridControl.ToolBar` (Page 2580)

## ToolBar.UseHotKeys

### Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

### Type

Bool

### Access

Read-write

**Syntax**

```
ToolBar.UseHotKeys
```

**See also**

DataGridControl.ToolBar (Page 2580)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ToolBar.Visible
```

**See also**

DataGridControl.ToolBar (Page 2580)

**DataGridControl.Top****Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`DataGridControl.Top`

**See also**

DataGridControl (Page 2496)

**DataGridControl.Visible**

**Description**

The "Visible" property specifies whether the data table display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridControl.Visible`

**See also**

DataGridControl (Page 2496)

**DataGridControl.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridControl.Width`

**See also**

DataGridControl (Page 2496)

**DataGridControl.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the data table display.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`DataGridControl.WindowFlags`

## Example

Adapting the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

## See also

DataGridControl (Page 2496)

## DataGridControl.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the data table display.

### Syntax

```
DataGridControl.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

## See also

DataGridControl (Page 2496)

## DataGridControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the data table display.

### Syntax

```
DataGridControl.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

### See also

DataGridControl (Page 2496)

## DataGridControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
DataGridControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

DataGridControl (Page 2496)

## DataGridControl\_OnActivated()

### Description

The "OnActivated" event occurs when a data table display receives focus:

- A data table display is selected via the configured tab sequence.
- A data table display that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
DataGridControl_OnActivated(item)
```

### Context

**item**

Type: Object

Data table display where the event occurs.

### See also

DataGridControl (Page 2496)

## DataGridControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the data table display.

### Syntax

```
DataGridControl_OnCommandFired(item, commandId, custom)
```

### Context

**item**

Type: Object

Data table display where the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

**See also**

DataGridControl (Page 2496)

**DataGridControl\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when the data table display loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
DataGridControl_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Data table display where the event occurs.

**See also**

DataGridControl (Page 2496)

## DataGridControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a data table display has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
DataGridControl_OnInitialized(item)
```

### Context

**item**

Type: Object

Data table display where the event occurs.

### See also

DataGridControl (Page 2496)

## DcsFaceplateContainer

### Description

The "DcsFaceplateContainer" object represents a container for faceplate instances that can only be used by DCS+ products.

### Object type

HmiDcsFaceplateContainer

### Properties

The "DcsFaceplateContainer" object has the following properties:

- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **ContainedType**  
Returns the type of the contained objects.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the faceplate container.

- **DomainSubTypeGUID**  
Returns the unique designation for the subtype of the displayed faceplate container.
- **DomainTypeGUID**  
Returns the unique designation for the type of displayed faceplate container.
- **Enabled**  
Specifies whether the faceplate container can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon.
- **Layer**  
Returns the layer of the screen in which the faceplate container is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the faceplate container.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the faceplate container was created.
- **ShowFocusVisual**  
Specifies whether the faceplate container is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the faceplate container.
- **TabIndex**  
Returns the position of the faceplate container in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the faceplate container is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the faceplate container.

## Methods

The "DcsFaceplateContainer" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the faceplate container.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "DcsFaceplateContainer" object has the following events:

- **OnActivated()**  
Occurs when a faceplate container receives focus.
- **OnDeactivated()**  
Occurs when a faceplate container loses focus.

## DcsFaceplateContainer.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`DcsFaceplateContainer.Caption`

### See also

[DcsFaceplateContainer \(Page 2731\)](#)

## Text.Font

### Description

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

DcsFaceplateContainer.Caption (Page 2733)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 2733)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

Text.Font (Page 2733)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

Text.Font (Page 2733)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[Text.Font \(Page 2733\)](#)

### Font.Underline

#### Description

The "Underline" property specifies whether the font is underlined.

#### Type

Bool

#### Access

Read-write

#### Syntax

`Font.Underline`

#### See also

[Text.Font \(Page 2733\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

### See also

Text.Font (Page 2733)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

## Syntax

`Text.ForeColor`

## See also

[DcsFaceplateContainer.Caption \(Page 2733\)](#)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

## Syntax

`Text.Text`

## See also

[DcsFaceplateContainer.Caption \(Page 2733\)](#)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

**Syntax**`Text.Visible`**See also**`DcsFaceplateContainer.Caption` (Page 2733)**DcsFaceplateContainer.CaptionColor****Description**

The "CaptionColor" property specifies the background color of the title bar.

**Type**`UInt32`**Access**`Read-write`**Syntax**`DcsFaceplateContainer.CaptionColor`**See also**`DcsFaceplateContainer` (Page 2731)**DcsFaceplateContainer.ContainedType****Description**

The "ContainedType" property returns the type of the contained objects.

**Type**`String`**Access**`Read-only`**Syntax**`DcsFaceplateContainer.ContainedType`

## See also

DcsFaceplateContainer (Page 2731)

## DcsFaceplateContainer.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the faceplate container.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

```
DcsFaceplateContainer.CurrentQuality
```

## See also

DcsFaceplateContainer (Page 2731)

## DcsFaceplateContainer.DomainSubTypeGUID

### Description

The "DomainSubTypeGUID" property returns the unique designation for the subtype of the displayed faceplate container.

### Type

String

**Access**

Read-only

**Syntax**`DcsFaceplateContainer.DomainSubTypeGUID`**See also**[DcsFaceplateContainer \(Page 2731\)](#)**DcsFaceplateContainer.DomainTypeGUID****Description**

The "DomainTypeGUID" property returns the unique designation for the type of the displayed faceplate container.

**Type**

String

**Access**

Read-only

**Syntax**`DcsFaceplateContainer.DomainTypeGUID`**See also**[DcsFaceplateContainer \(Page 2731\)](#)**DcsFaceplateContainer.Enabled****Description**

The "Enabled" property specifies whether the faceplate container can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.Enabled`

**See also**

[DcsFaceplateContainer \(Page 2731\)](#)

**DcsFaceplateContainer.Height**

**Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.Height`

**See also**

[DcsFaceplateContainer \(Page 2731\)](#)

**DcsFaceplateContainer.Icon**

**Description**

The "Icon" property specifies the icon.

**Type**

String

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.Icon`

**See also**

[DcsFaceplateContainer \(Page 2731\)](#)

**DcsFaceplateContainer.Layer****Description**

The "Layer" property returns the layer of the screen in which the faceplate container is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`DcsFaceplateContainer.Layer`

**See also**

[DcsFaceplateContainer \(Page 2731\)](#)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

DcsFaceplateContainer.Layer (Page 2743)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

DcsFaceplateContainer.Layer (Page 2743)

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

DcsFaceplateContainer.Layer (Page 2743)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

DcsFaceplateContainer.Layer (Page 2743)

**DcsFaceplateContainer.Left****Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.Left`

**See also**

DcsFaceplateContainer (Page 2731)

**DcsFaceplateContainer.Margin**

**Description**

The Margin property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

DcsFaceplateContainer.Margin

**See also**

DcsFaceplateContainer (Page 2731)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Bottom

**See also**

DcsFaceplateContainer.Margin (Page 2746)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

DcsFaceplateContainer.Margin (Page 2746)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

DcsFaceplateContainer.Margin (Page 2746)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

DcsFaceplateContainer.Margin (Page 2746)

**DcsFaceplateContainer.Name**

**Description**

The "Name" property returns the name of the faceplate container.

**Type**

String

**Access**

Read-only

**Syntax**

DcsFaceplateContainer.Name

**See also**

DcsFaceplateContainer (Page 2731)

**DcsFaceplateContainer.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

```
DcsFaceplateContainer.Parent
```

**See also**

DcsFaceplateContainer (Page 2731)

Screen Items (Page 1742)

**Screen Items****Description**

Screen Items (Page 1742)

**DcsFaceplateContainer.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the faceplate container was created.

**Type**

String

**Access**

Read-only

**Syntax**

`DcsFaceplateContainer.RenderingTemplate`

**See also**

DcsFaceplateContainer (Page 2731)

**DcsFaceplateContainer.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the faceplate container is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.ShowFocusVisual`

**See also**

DcsFaceplateContainer (Page 2731)

**DcsFaceplateContainer.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the faceplate container.

**Type**

String

**Access**

Read-only

**Syntax**`DcsFaceplateContainer.StyleItemClass`**See also**[DcsFaceplateContainer \(Page 2731\)](#)**DcsFaceplateContainer.TabIndex****Description**

The "TabIndex" property returns the position of the faceplate container in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`DcsFaceplateContainer.TabIndex`**See also**[DcsFaceplateContainer \(Page 2731\)](#)**DcsFaceplateContainer.Top****Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.Top`

**See also**

[DcsFaceplateContainer \(Page 2731\)](#)

**DcsFaceplateContainer.Visible**

**Description**

The "Visible" property specifies whether the faceplate container is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.Visible`

**See also**

[DcsFaceplateContainer \(Page 2731\)](#)

**DcsFaceplateContainer.Width**

**Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.Width`

**See also**

DcsFaceplateContainer (Page 2731)

**DcsFaceplateContainer.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the faceplate container.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

Enable multiple properties by adding the integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`DcsFaceplateContainer.WindowFlags`

## Example

Adapt the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

## See also

DcsFaceplateContainer (Page 2731)

## DcsFaceplateContainer.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the faceplate container.

### Syntax

```
DcsFaceplateContainer.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

## See also

DcsFaceplateContainer (Page 2731)

## DcsFaceplateContainer.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
DcsFaceplateContainer.PropertyFlashing(propertyName, enable[, value]  
[, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

DcsFaceplateContainer (Page 2731)

## DcsFaceplateContainer\_OnActivated()

### Description

The "OnActivated" event occurs when a faceplate container receives focus:

- A faceplate container is selected via the configured tab sequence.
- A faceplate container that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
DcsFaceplateContainer_OnActivated(item)
```

### Context

**item**

Type: Object

Faceplate container where the event occurs.

## See also

DcsFaceplateContainer (Page 2731)

## DcsFaceplateContainer\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a faceplate container loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
DcsFaceplateContainer_OnDeactivated(item)
```

### Context

**item**

Type: Object

Faceplate container where the event occurs.

### See also

DcsFaceplateContainer (Page 2731)

## DetailedParameterControl

### Description

The "DetailedParameterControl" object represents a parameter set control in runtime that manages parameter sets and exchanges them with the PLC.

### Object type

HmiDetailedParameterControl

### Properties

The "DetailedParameterControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentParameterSetID**  
Specifies the current parameter set ID.
- **CurrentParameterSetTypeID**  
Specifies the current parameter set type ID.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the parameter set display.

- **EditMode**  
Specifies the editing mode for values in runtime.
- **Enabled**  
Specifies whether the parameter set display can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **HideDetails**  
Specifies whether to display the parameter table of the control.
- **Icon**  
Specifies the icon of the parameter set display.
- **Layer**  
Returns the screen layer in which the parameter set display is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the parameter set display.
- **ParameterSetTypeFixed**  
Specifies a parameter set type that cannot be changed in runtime.
- **ParameterView**  
Defines the appearance of the parameter table.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the parameter set display was created.
- **SelectionBackColor**  
Specifies the background color of the selected cells.
- **SelectionForeColor**  
Specifies the foreground color of the selected cells.
- **ShowFocusVisual**  
Specifies whether the parameter set display is highlighted when in focus.
- **StatusBar**  
Sets the information bar of the parameter set display.
- **StyleItemClass**  
Returns the style which is applied to the parameter set display.
- **TabIndex**  
Returns the position of the parameter set display in the tab sequence.

- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Sets the toolbar of the parameter set display.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the parameter set display is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the parameter set display.

## Methods

The "DetailedParameterControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the parameter set display.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the parameter set control.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "DetailedParameterControl" object has the following events:

- **OnActivated()**  
Occurs when a parameter set display receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the parameter set display.
- **OnDeactivated()**  
Occurs when a parameter set display loses focus.
- **OnInitialized()**  
Occurs when a parameter set display has been successfully initialized and the data connection to the PLC has been established.

## DetailedParameterControl.BackColor

### Description

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DetailedParameterControl.BackColor`

**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.Caption**

**Description**

The "Caption" property specifies the text that is displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`DetailedParameterControl.Caption`

**See also**

DetailedParameterControl (Page 2757)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

DetailedParameterControl.Caption (Page 2760)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 2760)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Text.Font (Page 2760)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 2760)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

[Text.Font \(Page 2760\)](#)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

[Text.Font \(Page 2760\)](#)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 2760\)](#)

### Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[DetailedParameterControl.Caption \(Page 2760\)](#)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

`Text.Text`

**See also**

DetailedParameterControl.Caption (Page 2760)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

DetailedParameterControl.Caption (Page 2760)

## DetailedParameterControl.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

`DetailedParameterControl.CaptionColor`

### See also

[DetailedParameterControl \(Page 2757\)](#)

## DetailedParameterControl.CurrentParameterSetID

### Description

The "CurrentParameterSetID" property specifies the current parameter set ID.

### Type

UInt32

### Access

Read-write

### Syntax

`DetailedParameterControl.CurrentParameterSetID`

### See also

[DetailedParameterControl \(Page 2757\)](#)

## DetailedParameterControl.CurrentParameterSetTypeID

### Description

The "CurrentParameterSetTypeID" property specifies the current parameter set ID.

### Type

UInt32

### Access

Read-write

### Syntax

`DetailedParameterControl.CurrentParameterSetTypeID`

### See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the parameter set display.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`DetailedParameterControl.CurrentQuality`

### See also

[DetailedParameterControl \(Page 2757\)](#)

## DetailedParameterControl.EditMode

### Description

The "EditMode" property specifies the editing mode for values in runtime. This also defines the activation state of the toolbar buttons.

### Type

Int32, HmiEditMode

Specifies the editing mode:

- None (0): No access
- Update (1): Update values
- Create (2): Create values
- Delete (4): Delete values

### Access

Read-write

### Syntax

`DetailedParameterControl.EditMode`

### See also

[DetailedParameterControl \(Page 2757\)](#)

## DetailedParameterControl.Enabled

### Description

The "Enabled" property specifies whether the parameter set display can be operated in runtime.

### Type

Bool

**Access**

Read-write

**Syntax**`DetailedParameterControl.Enabled`**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`DetailedParameterControl.Font`**See also**

DetailedParameterControl (Page 2757)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Italic`

## See also

DetailedParameterControl.Font (Page 2769)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

## Syntax

`Font.Name`

## See also

DetailedParameterControl.Font (Page 2769)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

**Syntax**`Font.Size`**See also**

DetailedParameterControl.Font (Page 2769)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

DetailedParameterControl.Font (Page 2769)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

DetailedParameterControl.Font (Page 2769)

### Font.Weight

#### Description

The "Weight" property specifies the font thickness.

#### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

DetailedParameterControl.Font (Page 2769)

## DetailedParameterControl.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`DetailedParameterControl.ForeColor`

### See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`DetailedParameterControl.Height`

### See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.HideDetails

### Description

The "HideDetails" property specifies whether to display the parameter table of the control.

### Type

Bool

### Access

Read-write

### Syntax

`DetailedParameterControl.HideDetails`

### See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.Icon

### Description

The "Icon" property specifies the icon of the parameter set display.

### Type

String

### Access

Read-write

### Syntax

`DetailedParameterControl.Icon`

### See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.Layer

### Description

The "Layer" property returns the layer of the screen in which the parameter set display is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`DetailedParameterControl.Layer`

### See also

DetailedParameterControl (Page 2757)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

DetailedParameterControl.Layer (Page 2775)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

DetailedParameterControl.Layer (Page 2775)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

DetailedParameterControl.Layer (Page 2775)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[DetailedParameterControl.Layer \(Page 2775\)](#)

## DetailedParameterControl.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`DetailedParameterControl.Left`

### See also

[DetailedParameterControl \(Page 2757\)](#)

## DetailedParameterControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`DetailedParameterControl.Margin`

### See also

[DetailedParameterControl \(Page 2757\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[DetailedParameterControl.Margin \(Page 2778\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[DetailedParameterControl.Margin \(Page 2778\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[DetailedParameterControl.Margin \(Page 2778\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[DetailedParameterControl.Margin \(Page 2778\)](#)

## DetailedParameterControl.Name

### Description

The "Name" property returns the parameter set display of the column.

### Type

String

### Access

Read-only

### Syntax

`DetailedParameterControl.Name`

### See also

[DetailedParameterControl \(Page 2757\)](#)

**Description**

The "ParameterSetTypeFixed" property specifies a parameter set type that cannot be changed in runtime.

**Type**

String, HmiParameterSetType

**Access**

Read-write

**Syntax**

`DetailedParameterControl.ParameterSetTypeFixed`

**See also**

[DetailedParameterControl \(Page 2757\)](#)

[ParameterSetType \(Page 1383\)](#)

**DetailedParameterControl.ParameterView****Description**

The "ParameterView" property defines the appearance of the parameter table.

**Type**

Object, HmiDataGridViewPart ([Page 2782](#))

**Access**

Read-write

**Syntax**

`DetailedParameterControl.ParameterView`

**See also**

[DetailedParameterControl \(Page 2757\)](#)

[DataGridView \(Page 2782\)](#)

## DataGridView

### DataGridView.AllowFilter

#### Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

#### Type

Bool

#### Access

Read-write

#### Syntax

`DataGridView.AllowFilter`

#### See also

[DetailedParameterControl.ParameterView \(Page 2781\)](#)

### DataGridView.AllowSort

#### Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

#### Type

Bool

#### Access

Read-write

#### Syntax

`DataGridView.AllowSort`

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridView.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
DataGridView.AlternateBackColor
```

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridView.AlternateForeColor****Description**

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
DataGridView.AlternateForeColor
```

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridView.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.BackColor`

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridView.CellPadding**

**Description**

The "CellPadding" property specifies the inner spacing of the content from the cell border.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`DataGridView.CellPadding`

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

DataGridView.CellPadding (Page 2784)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[DataGridView.CellPadding \(Page 2784\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[DataGridView.CellPadding \(Page 2784\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[DataGridView.CellPadding](#) (Page 2784)

**DataGridView.ColoringMode****Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

**Access**

Read-write

**Syntax**

```
DataGridView.ColoringMode
```

**See also**

[DetailedParameterControl.ParameterView](#) (Page 2781)

**DataGridView.Columns****Description**

The "Columns" property represents the quantity of columns.

**Type**

Object, HmiDataGridColumnCollection (Page 2788)

**Access**

Read-only

## Syntax

```
DataGridView.Columns
```

## See also

DetailedParameterControl.ParameterView (Page 2781)

HmiDataGridColumnCollection (Page 2788)

## HmiDataGridColumnCollection

### Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

### Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

### Object type

HmiDataGridColumnCollection

### Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

### Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

## See also

DataGridView.Columns (Page 2787)

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiDataGridColumnCollection.Count
```

### See also

HmiDataGridColumnCollection (Page 2788)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

### Syntax

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

### Parameters

**HmiDataGridColumnName**

Type: String

Name of the column

## Return value

Object, HmiDataGridColumnPartBase (Page 2790)

## See also

HmiDataGridColumnCollection (Page 2788)

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn

### Description

The "DetailedParameterControlColumn" object represents a column of the parameter table.

### Object type

HmiDetailedParameterControlColumnPart

### Properties

The "DetailedParameterControlColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **Content**  
Specifies the display options for text and graphics.
- **DetailedParameterControlBlock**  
Specifies the content block of the column.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **Key**  
Corresponds to the column definition from the "ConsideredColumns" property of the connected source.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.

- **Name**  
Returns the name of the column.
- **OutputFormat**  
Specifies the format for displaying values.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiDataGridColumnCollection (Page 2788)

## DetailedParameterControlColumn.AllowSort

### Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.AllowSort`

## See also

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.BackColor`

### See also

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn.Content

### Description

The "Content" property specifies the display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.Content`

### See also

DetailedParameterControlColumn (Page 2790)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[DetailedParameterControlColumn.Content \(Page 2792\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

DetailedParameterControlColumn.Content (Page 2792)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

DetailedParameterControlColumn.Content (Page 2792)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DetailedParameterControlColumn.Content \(Page 2792\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[DetailedParameterControlColumn.Content \(Page 2792\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[DetailedParameterControlColumn.Content \(Page 2792\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

`DetailedParameterControlColumn.Content` (Page 2792)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

`DetailedParameterControlColumn.Content` (Page 2792)

**DetailedParameterControlColumn.DetailedParameterControlBlock****Description**

The "DetailedParameterControlBlock" property specifies the content block of the column.

### Type

Int32, HmiDetailedParameterControlBlock

Specifies the information blocks:

- None (0): None
- ParameterSetElementName (1): Parameter name. Must always be set.
- ParameterSetValue (2): Parameter value. Must always be set.
- ParameterSetElementUnit (3): Unit, for example "kg"

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.DetailedParameterControlBlock`

### See also

[DetailedParameterControlColumn \(Page 2790\)](#)

## DetailedParameterControlColumn.Enabled

### Description

The "Enabled" property specifies whether the column can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.Enabled`

### See also

[DetailedParameterControlColumn \(Page 2790\)](#)

## DetailedParameterControlColumn.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

DetailedParameterControlColumn.ForeColor

### See also

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn.Header

### Description

The "Header" property specifies the properties of the column header.

### Type

Object, HmiDataGridColumnHeaderPart

### Access

Read-write

### Syntax

DetailedParameterControlColumn.Header

### See also

DetailedParameterControlColumn (Page 2790)

## DataGridColumnHeader.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`DataGridColumnHeader.Content`

### See also

[DetailedParameterControlColumn.Header \(Page 2799\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

DataGridColumnHeader.Content (Page 2800)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

DataGridColumnHeader.Content (Page 2800)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[DataGridColumnHeader.Content \(Page 2800\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[DataGridColumnHeader.Content \(Page 2800\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

```
Content.SplitRatio
```

### See also

DataGridColumnHeader.Content (Page 2800)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[DataGridColumnHeader.Content \(Page 2800\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[DataGridColumnHeader.Content \(Page 2800\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[DataGridColumnHeader.Content \(Page 2800\)](#)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

### Type

String

### Access

Read-write

### Syntax

```
DataGridColumnHeader.Graphic
```

### See also

[DetailedParameterControlColumn.Header \(Page 2799\)](#)

## DataGridColumnHeader.Text

### Description

The "Text" property specifies the label of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Text`

### See also

[DetailedParameterControlColumn.Header \(Page 2799\)](#)

## DetailedParameterControlColumn.Key

### Description

The "Key" property corresponds to the column definition from the "ConsideredColumns" property of the binding data source.

### Type

String

### Access

Read-only

### Syntax

`DetailedParameterControlColumn.Key`

### See also

[DetailedParameterControlColumn \(Page 2790\)](#)

## DetailedParameterControlColumn.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
DetailedParameterControlColumn.MaximumWidth
```

### See also

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
DetailedParameterControlColumn.MinimumWidth
```

### See also

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn.Name

### Description

The "Name" property returns the name of the column.

### Type

String

### Access

Read-only

### Syntax

`DetailedParameterControlColumn.Name`

### See also

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.OutputFormat`

### See also

DetailedParameterControlColumn (Page 2790)

## DetailedParameterControlColumn.SortDirection

### Description

The "SortDirection" property specifies the sorting direction.

### Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.SortDirection`

### See also

[DetailedParameterControlColumn \(Page 2790\)](#)

## DetailedParameterControlColumn.SortOrder

### Description

The "SortOrder" property specifies the sorting order.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

### Type

UInt16

### Access

Read-write

### Syntax

`DetailedParameterControlColumn.SortOrder`

**See also**

DetailedParameterControlColumn (Page 2790)

**DetailedParameterControlColumn.Visible**

**Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

DetailedParameterControlColumn.Visible

**See also**

DetailedParameterControlColumn (Page 2790)

**DetailedParameterControlColumn.Width**

**Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

DetailedParameterControlColumn.Width

**See also**

DetailedParameterControlColumn (Page 2790)

## DataGridView.Font

### Description

The "Font" property specifies the font of the cells.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
DataGridView.Font
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

DataGridView.Font (Page 2811)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

DataGridView.Font (Page 2811)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

DataGridView.Font (Page 2811)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

DataGridView.Font (Page 2811)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

### See also

DataGridView.Font (Page 2811)

### Font.Weight

#### Description

The "Weight" property specifies the font thickness.

#### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

#### Access

Read-write

#### Syntax

`Font.Weight`

### See also

DataGridView.Font (Page 2811)

### DataGridView.ForeColor

#### Description

The "ForeColor" property specifies the font color of the text.

#### Type

UInt32

**Access**

Read-write

**Syntax**`DataGridView.ForeColor`**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridView.GridLineColor****Description**

The "GridLineColor" property specifies the color of grid lines.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridView.GridLineColor`**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridView.GridLineVisibility****Description**

The "GridLineVisibility" property specifies the visibility of the grid lines.

**Type**

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

```
DataGridView.GridLineVisibility
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.GridLineWidth

### Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.GridLineWidth
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.GridSelectionMode

### Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

### Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

### Access

Read-write

### Syntax

```
DataGridView.GridSelectionMode
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.HeaderSettings

### Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

### Type

Object, HmiDataGridHeaderSettingsPart

### Access

Read-write

### Syntax

```
DataGridView.HeaderSettings
```

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridHeaderSettings.AllowColumnReorder**

**Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.AllowColumnReorder`

**See also**

DataGridView.HeaderSettings (Page 2817)

**DataGridHeaderSettings.AllowColumnResize**

**Description**

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.AllowColumnResize`

**See also**

DataGridView.HeaderSettings (Page 2817)

**DataGridHeaderSettings.ColumnHeaderType****Description**

The "ColumnHeaderType" property specifies the type of content of a column header.

**Type**

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

```
DataGridHeaderSettings.ColumnHeaderType
```

**See also**

DataGridView.HeaderSettings (Page 2817)

**DataGridHeaderSettings.Font****Description**

The "Font" property specifies the font of the headers.

**Type**

Object, HmiFontPart

**Access**

Read-write

## Syntax

`DataGridHeaderSettings.Font`

## See also

[DataGridView.HeaderSettings \(Page 2817\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

## See also

[DataGridHeaderSettings.Font \(Page 2819\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

**Syntax**`Font.Name`**See also**[DataGridHeaderSettings.Font \(Page 2819\)](#)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**`Float`**Access**`Read-write`**Syntax**`Font.Size`**See also**[DataGridHeaderSettings.Font \(Page 2819\)](#)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**`Int32, HmiFontStrikeOut`

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

[DataGridHeaderSettings.Font \(Page 2819\)](#)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[DataGridHeaderSettings.Font \(Page 2819\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[DataGridHeaderSettings.Font](#) (Page 2819)

## DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridHeaderSettings.HeaderBackColor`

### See also

[DataGridView.HeaderSettings](#) (Page 2817)

## DataGridHeaderSettings.HeaderForeColor

### Description

The "HeaderForeColor" property specifies the font color of the headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

### See also

DataGridView.HeaderSettings (Page 2817)

## DataGridHeaderSettings.HeaderGridLineColor

### Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

### See also

DataGridView.HeaderSettings (Page 2817)

## DataGridHeaderSettings.HeaderSelectionBackColor

### Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

### See also

DataGridView.HeaderSettings (Page 2817)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### **Object**

Required. An object from the "Availability" section.

## See also

DataGridView.HeaderSettings (Page 2817)

## DataGridView.HeaderSettings.RowHeaderType

### Description

The "RowHeaderType" property specifies the type of content of a row header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

### Syntax

`DataGridView.HeaderSettings.RowHeaderType`

## See also

DataGridView.HeaderSettings (Page 2817)

## DataGridView.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

**Access**

Read-write

**Syntax**

```
DataGridView.HorizontalScrollBarVisibility
```

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DataGridView.RowHeight****Description**

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
DataGridView.RowHeight
```

**See also**

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.SelectFullRow

### Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridView.SelectFullRow
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.SelectionBackColor

### Description

The "SelectionBackColor" property specifies the background color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.SelectionBackColor
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.SelectionBorderColor

### Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.SelectionBorderColor
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.SelectionBorderWidth

### Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

### Type

UInt8

### Access

Read-write

### Syntax

```
DataGridView.SelectionBorderWidth
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.SelectionForeColor

### Description

The "SelectionForeColor" property specifies the font color of the selected cells.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.SelectionForeColor
```

### See also

DetailedParameterControl.ParameterView (Page 2781)

## DataGridView.VerticalScrollBarVisibility

### Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.VerticalScrollBarVisibility
```

**See also**

DetailedParameterControl.ParameterView (Page 2781)

**DetailedParameterControl.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

```
DetailedParameterControl.Parent
```

**See also**

DetailedParameterControl (Page 2757)

Screen Items (Page 1742)

**Screen Items****Description**

Screen Items (Page 1742)

**DetailedParameterControl.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the parameter set display was created.

**Type**

String

**Access**

Read-only

**Syntax**

`DetailedParameterControl.RenderingTemplate`

**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.SelectionBackColor**

**Description**

The "SelectionBackColor" property specifies the background color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DetailedParameterControl.SelectionBackColor`

**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.SelectionForeColor**

**Description**

The "SelectionForeColor" property specifies the foreground color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
DetailedParameterControl.SelectionForeColor
```

**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the parameter set display is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
DetailedParameterControl.ShowFocusVisual
```

**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.StatusBar****Description**

The "StatusBar" property specifies the information bar of the parameter set display.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

### Syntax

`DetailedParameterControl.StatusBar`

### See also

[DetailedParameterControl \(Page 2757\)](#)

## StatusBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`StatusBar.BackColor`

### See also

[DetailedParameterControl.StatusBar \(Page 2833\)](#)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, [HmiControlBarElementCollection \(Page 2835\)](#)

### Access

Read-only

## Syntax

`StatusBar.Elements`

## See also

[DetailedParameterControl.StatusBar \(Page 2833\)](#)

[HmiControlBarElementCollection \(Page 2835\)](#)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[StatusBar.Elements \(Page 2834\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

### See also

HmiControlBarElementCollection (Page 2835)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 2852)

**See also**

HmiControlBarElementCollection (Page 2835)

Control Bar Elements (Page 2852)

**Control Bar Elements****Description**

Control Bar Elements (Page 2852)

**StatusBar.Enabled****Description**

The "Enabled" property specifies whether the information bar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
StatusBar.Enabled
```

**See also**

DetailedParameterControl.StatusBar (Page 2833)

**StatusBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

DetailedParameterControl.StatusBar (Page 2833)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

StatusBar.Font (Page 2837)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 2837)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

StatusBar.Font (Page 2837)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

StatusBar.Font (Page 2837)

### Font.Underline

#### Description

The "Underline" property specifies whether the font is underlined.

#### Type

Bool

#### Access

Read-write

#### Syntax

`Font.Underline`

#### See also

StatusBar.Font (Page 2837)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

### See also

StatusBar.Font (Page 2837)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

## Syntax

`StatusBar.Margin`

## See also

[DetailedParameterControl.StatusBar \(Page 2833\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[StatusBar.Margin \(Page 2841\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`StatusBar.Margin` (Page 2841)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**

Read-write

**Syntax**`Margin.Right`**See also**`StatusBar.Margin` (Page 2841)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**

Read-write

## Syntax

`Margin.Top`

## See also

[StatusBar.Margin \(Page 2841\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

## See also

[DetailedParameterControl.StatusBar \(Page 2833\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Bottom`**See also**`StatusBar.Padding` (Page 2844)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Left`**See also**`StatusBar.Padding` (Page 2844)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Right`

## See also

[StatusBar.Padding \(Page 2844\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

## See also

[StatusBar.Padding \(Page 2844\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

**Syntax**

```
StatusBar.ShowToolTips
```

**See also**

DetailedParameterControl.StatusBar (Page 2833)

**StatusBar.Visible****Description**

The "Visible" property specifies whether the information bar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
StatusBar.Visible
```

**See also**

DetailedParameterControl.StatusBar (Page 2833)

**DetailedParameterControl.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the parameter set display.

**Type**

String

**Access**

Read-only

**Syntax**

`DetailedParameterControl.StyleItemClass`

**See also**

[DetailedParameterControl \(Page 2757\)](#)

**DetailedParameterControl.TabIndex**

**Description**

The "TabIndex" property returns the position of the parameter set display in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`DetailedParameterControl.TabIndex`

**See also**

[DetailedParameterControl \(Page 2757\)](#)

**DetailedParameterControl.TimeZone**

**Description**

The "TimeZone" property specifies the time zone.

**Type**

Int32, HmiTimeZone

**Access**

Read-write

**Syntax**

`DetailedParameterControl.TimeZone`

**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.ToolBar****Description**

The "ToolBar" property specifies the toolbar of the parameter set display.

**Type**

Object, HmiToolBarPart

**Access**

Read-write

**Syntax**

DetailedParameterControl.ToolBar

**See also**

DetailedParameterControl (Page 2757)

**ToolBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

ToolBar.BackColor

## See also

DetailedParameterControl.ToolBar (Page 2849)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 2850)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

## See also

DetailedParameterControl.ToolBar (Page 2849)

HmiControlBarElementCollection (Page 2850)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property  
`StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[ToolBar.Elements \(Page 2850\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

[HmiControlBarElementCollection \(Page 2850\)](#)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 2852)

## See also

HmiControlBarElementCollection (Page 2850)

Control Bar Elements (Page 2852)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.AlternateBackColor`

### See also

[ControlBarButton \(Page 2852\)](#)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarButton.Content`

### See also

[ControlBarButton \(Page 2852\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarButton.Content (Page 2858)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarButton.Content (Page 2858)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 2858\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 2858\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content](#) (Page 2858)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarButton.Content \(Page 2858\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarButton.Content \(Page 2858\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarButton.Content](#) (Page 2858)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

[ControlBarButton](#) (Page 2852)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Enabled`

### See also

[ControlBarButton \(Page 2852\)](#)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.ForeColor`

### See also

[ControlBarButton \(Page 2852\)](#)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.Height
```

### See also

ControlBarButton (Page 2852)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton](#) (Page 2852)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarButton.Mapping`

#### See also

[ControlBarButton \(Page 2852\)](#)

### ControlBarButton.Margin

#### Description

The "Margin" property specifies the surrounded outer distance of the button.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**

```
ControlBarButton.Margin
```

**See also**

ControlBarButton (Page 2852)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Margin.Bottom
```

**See also**

ControlBarButton.Margin (Page 2868)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Left`

## See also

[ControlBarButton.Margin \(Page 2868\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 2868\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarButton.Margin` (Page 2868)**ControlBarButton.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**

Read-write

**Syntax**`ControlBarButton.MaximumHeight`**See also**`ControlBarButton` (Page 2852)**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**

Read-write

## Syntax

```
ControlBarButton.MaximumWidth
```

## See also

ControlBarButton (Page 2852)

## ControlBarButton.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.MinimumHeight
```

## See also

ControlBarButton (Page 2852)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MinimumWidth
```

**See also**

ControlBarButton (Page 2852)

**ControlBarButton.Operability****Description**

The "Operability" property returns whether the button is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarButton.Operability
```

**See also**

ControlBarButton (Page 2852)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarButton.Padding`

**See also**

[ControlBarButton \(Page 2852\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarButton.Padding \(Page 2873\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

ControlBarButton.Padding (Page 2873)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarButton.Padding (Page 2873)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarButton.Padding \(Page 2873\)](#)

**ControlBarButton.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarButton.RequireExplicitUnlock`

**See also**

[ControlBarButton \(Page 2852\)](#)

**ControlBarButton.Text**

**Description**

The "Text" property specifies the label of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.Text`**See also**[ControlBarButton \(Page 2852\)](#)**ControlBarButton.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the button.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**[ControlBarButton \(Page 2852\)](#)**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 2852\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 2852\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

**Syntax**

`ControlBarDisplay.Content`

**See also**

[ControlBarDisplay \(Page 2878\)](#)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

[ControlBarDisplay.Content \(Page 2880\)](#)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[ControlBarDisplay.Content \(Page 2880\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

**See also**

ControlBarDisplay.Content (Page 2880)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 2880)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

## See also

ControlBarDisplay.Content (Page 2880)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

## See also

ControlBarDisplay.Content (Page 2880)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

`ControlBarDisplay.Content` (Page 2880)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

`ControlBarDisplay.Content` (Page 2880)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarDisplay.CustomID`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.ForeColor
```

### See also

ControlBarDisplay (Page 2878)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 2878)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

#### Syntax

`ControlBarDisplay.Mapping`

#### See also

[ControlBarDisplay \(Page 2878\)](#)

### ControlBarDisplay.Margin

#### Description

The "Margin" property specifies the surrounded outer spacing of the display.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**`ControlBarDisplay.Margin`**See also**[ControlBarDisplay \(Page 2878\)](#)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Bottom`**See also**[ControlBarDisplay.Margin \(Page 2890\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Left`

## See also

[ControlBarDisplay.Margin \(Page 2890\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarDisplay.Margin \(Page 2890\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarDisplay.Margin` (Page 2890)**ControlBarDisplay.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarDisplay.MaximumHeight`**See also**`ControlBarDisplay` (Page 2878)**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarDisplay.MaximumWidth`

## See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MinimumWidth
```

**See also**

ControlBarDisplay (Page 2878)

**ControlBarDisplay.Operability****Description**

The "Operability" property returns whether the display is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarDisplay.Operability
```

**See also**

ControlBarDisplay (Page 2878)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Padding`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarDisplay.Padding \(Page 2895\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarDisplay.Padding \(Page 2895\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarDisplay.Padding \(Page 2895\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarDisplay.Padding \(Page 2895\)](#)

## ControlBarDisplay.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarDisplay.RequireExplicitUnlock`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.Text

### Description

The "Text" property specifies the label of the display.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.Text`**See also**

ControlBarDisplay (Page 2878)

**ControlBarDisplay.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 2878)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Visible`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarDisplay.Width

### Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Width`

### See also

[ControlBarDisplay \(Page 2878\)](#)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

## Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.

- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarLabel.Authorization`

### See also

[ControlBarLabel \(Page 2900\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

**Access**

Read-only

**Syntax**`ControlBarLabel.CustomID`**See also**

ControlBarLabel (Page 2900)

**ControlBarLabel.Enabled****Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Enabled`**See also**

ControlBarLabel (Page 2900)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.ForeColor
```

### See also

ControlBarLabel (Page 2900)

## ControlBarLabel.Height

### Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.Height
```

### See also

ControlBarLabel (Page 2900)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

## Access

Read-write

## Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

## See also

ControlBarLabel (Page 2900)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 2900\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

**See also**

ControlBarLabel (Page 2900)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Bottom

**See also**

ControlBarLabel.Margin (Page 2907)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Left

**See also**

[ControlBarLabel.Margin \(Page 2907\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarLabel.Margin \(Page 2907\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarLabel.Margin \(Page 2907\)](#)

**ControlBarLabel.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MaximumHeight`

**See also**

[ControlBarLabel \(Page 2900\)](#)

**ControlBarLabel.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarLabel.MaximumWidth`

**See also**

[ControlBarLabel \(Page 2900\)](#)

**ControlBarLabel.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MinimumHeight
```

**See also**

[ControlBarLabel \(Page 2900\)](#)

**ControlBarLabel.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.MinimumWidth
```

## See also

ControlBarLabel (Page 2900)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

## See also

ControlBarLabel (Page 2900)

## ControlBarLabel.Padding

### Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**`ControlBarLabel.Padding`**See also**[ControlBarLabel \(Page 2900\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Bottom`**See also**[ControlBarLabel.Padding \(Page 2912\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Left`

## See also

[ControlBarLabel.Padding \(Page 2912\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Right`

## See also

[ControlBarLabel.Padding \(Page 2912\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarLabel.Padding \(Page 2912\)](#)

**ControlBarLabel.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarLabel.RequireExplicitUnlock`

**See also**

[ControlBarLabel \(Page 2900\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

## Syntax

```
ControlBarLabel.Text
```

## See also

ControlBarLabel (Page 2900)

## ControlBarLabel.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

### Type

String

### Access

Read-write

## Syntax

```
ControlBarLabel.ToolTipText
```

## See also

ControlBarLabel (Page 2900)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**`ControlBarLabel.VerticalTextAlignment`**See also**

ControlBarLabel (Page 2900)

**ControlBarLabel.Visible****Description**

The "Visible" property specifies whether the identifier is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarLabel.Visible`**See also**

ControlBarLabel (Page 2900)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

```
ControlBarLabel.Width
```

## See also

ControlBarLabel (Page 2900)

## ControlBarSeparator

### Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarSeparatorPart

### Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarSeparator.Authorization`

**See also**

[ControlBarSeparator \(Page 2918\)](#)

**ControlBarSeparator.CustomID**

**Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarSeparator.CustomID`

**See also**

[ControlBarSeparator \(Page 2918\)](#)

**ControlBarSeparator.Enabled**

**Description**

The "Enabled" property specifies whether the separator is active in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Enabled`

**See also**

ControlBarSeparator (Page 2918)

**ControlBarSeparator.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ForeColor`

**See also**

ControlBarSeparator (Page 2918)

**ControlBarSeparator.Height****Description**

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Height`

## See also

ControlBarSeparator (Page 2918)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarSeparator.Mapping`

### See also

[ControlBarSeparator \(Page 2918\)](#)

## ControlBarSeparator.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the separator.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Margin`

### See also

[ControlBarSeparator \(Page 2918\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**[ControlBarSeparator.Margin \(Page 2924\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarSeparator.Margin \(Page 2924\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarSeparator.Margin \(Page 2924\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarSeparator.Margin \(Page 2924\)](#)

**ControlBarSeparator.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MaximumHeight`**See also**

ControlBarSeparator (Page 2918)

**ControlBarSeparator.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarSeparator.MaximumWidth`**See also**

ControlBarSeparator (Page 2918)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumHeight`

### See also

[ControlBarSeparator \(Page 2918\)](#)

## ControlBarSeparator.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumWidth`

### See also

[ControlBarSeparator \(Page 2918\)](#)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarSeparator.Operability`

### See also

[ControlBarSeparator \(Page 2918\)](#)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Padding`

### See also

[ControlBarSeparator \(Page 2918\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarSeparator.Padding \(Page 2929\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarSeparator.Padding \(Page 2929\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarSeparator.Padding \(Page 2929\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarSeparator.Padding \(Page 2929\)](#)

## ControlBarSeparator.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

### See also

ControlBarSeparator (Page 2918)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarSeparator.ToolTipText
```

### See also

ControlBarSeparator (Page 2918)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarSeparator.Visible
```

### See also

ControlBarSeparator (Page 2918)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Width
```

### See also

ControlBarSeparator (Page 2918)

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar. You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.

- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarTextBox.AlternateBorderColor`

## See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

`ControlBarTextBox.Authorization`

## See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarTextBox.BackColor
```

**See also**

ControlBarTextBox (Page 2934)

**ControlBarTextBox.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.BorderColor
```

**See also**

ControlBarTextBox (Page 2934)

**ControlBarTextBox.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

## Syntax

`ControlBarTextBox.BorderWidth`

## See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

## Syntax

`ControlBarTextBox.CustomID`

## See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarTextBox.Enabled
```

**See also**

ControlBarTextBox (Page 2934)

**ControlBarTextBox.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.ForeColor
```

**See also**

ControlBarTextBox (Page 2934)

**ControlBarTextBox.Height****Description**

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarTextBox.Height`

## See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarTextBox.HorizontalTextAlignment`

## See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
ControlBarTextBox.Margin
```

### See also

ControlBarTextBox (Page 2934)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

ControlBarTextBox.Margin (Page 2943)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarTextBox.Margin \(Page 2943\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 2943\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

ControlBarTextBox.Margin (Page 2943)

## ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

ControlBarTextBox.MaximumHeight

### See also

ControlBarTextBox (Page 2934)

## ControlBarTextBox.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MaximumWidth`

### See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.MinimumHeight`

### See also

[ControlBarTextBox \(Page 2934\)](#)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumWidth
```

### See also

ControlBarTextBox (Page 2934)

## ControlBarTextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarTextBox.Operability
```

**See also**

ControlBarTextBox (Page 2934)

**ControlBarTextBox.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Padding`

**See also**

ControlBarTextBox (Page 2934)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarTextBox.Padding (Page 2948)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarTextBox.Padding (Page 2948)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarTextBox.Padding](#) (Page 2948)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarTextBox.Padding](#) (Page 2948)

**ControlBarTextBox.ReadOnly**

**Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ReadOnly`

**See also**

[ControlBarTextBox](#) (Page 2934)

**ControlBarTextBox.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

```
ControlBarTextBox.RequireExplicitUnlock
```

**See also**

[ControlBarTextBox](#) (Page 2934)

**ControlBarTextBox.Text****Description**

The "Text" property specifies the label of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Text
```

## See also

ControlBarTextBox (Page 2934)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

## See also

ControlBarTextBox (Page 2934)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

**Syntax**

```
ControlBarTextBox.VerticalTextAlignment
```

**See also**

ControlBarTextBox (Page 2934)

**ControlBarTextBox.Visible****Description**

The "Visible" property specifies whether the text box is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Visible
```

**See also**

ControlBarTextBox (Page 2934)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarTextBox.Width
```

## See also

ControlBarTextBox (Page 2934)

## ControlBarToggleSwitch

### Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarToggleSwitchPart

### Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.

- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

### ControlBarToggleSwitch.AlternateBackColor

#### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

#### Type

UInt32

#### Access

Read-write

#### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

#### See also

ControlBarToggleSwitch (Page 2954)

### ControlBarToggleSwitch.AlternateBorderColor

#### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

#### Type

UInt32

#### Access

Read-write

#### Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

**See also**

[ControlBarToggleSwitch](#) (Page 2954)

**ControlBarToggleSwitch.AlternateGraphic****Description**

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.AlternateGraphic
```

**See also**

[ControlBarToggleSwitch](#) (Page 2954)

**ControlBarToggleSwitch.AlternateText****Description**

The "AlternateText" property specifies the text of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.AlternateText
```

## See also

[ControlBarToggleSwitch](#) (Page 2954)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

## See also

[ControlBarToggleSwitch](#) (Page 2954)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BackColor
```

**See also**

ControlBarToggleSwitch (Page 2954)

**ControlBarToggleSwitch.Badge****Description**

The "Badge" property specifies the identifier of the switch.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.Badge
```

**See also**

ControlBarToggleSwitch (Page 2954)

**ControlBarToggleSwitch.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderColor
```

## See also

[ControlBarToggleSwitch](#) (Page 2954)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderWidth
```

## See also

[ControlBarToggleSwitch](#) (Page 2954)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Content
```

**See also**

ControlBarToggleSwitch (Page 2954)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

ControlBarToggleSwitch.Content (Page 2960)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

[ControlBarToggleSwitch.Content \(Page 2960\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 2960\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 2960\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 2960\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ControlBarToggleSwitch.Content](#) (Page 2960)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

`ControlBarToggleSwitch.Content` (Page 2960)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

`ControlBarToggleSwitch.Content` (Page 2960)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.CustomID`

### See also

[ControlBarToggleSwitch \(Page 2954\)](#)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 2954\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 2954)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 2954)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Height`

### See also

[ControlBarToggleSwitch \(Page 2954\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 2954\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

### See also

ControlBarToggleSwitch (Page 2954)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Mapping
```

### See also

ControlBarToggleSwitch (Page 2954)

## ControlBarToggleSwitch.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the switch.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 2954\)](#)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 2971\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarToggleSwitch.Margin \(Page 2971\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarToggleSwitch.Margin \(Page 2971\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarToggleSwitch.Margin \(Page 2971\)](#)

**ControlBarToggleSwitch.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

[ControlBarToggleSwitch \(Page 2954\)](#)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumWidth`**See also**

ControlBarToggleSwitch (Page 2954)

**ControlBarToggleSwitch.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 2954)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

### See also

ControlBarToggleSwitch (Page 2954)

## ControlBarToggleSwitch.Operability

### Description

The property "Operability" returns whether the switch is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Operability
```

### See also

ControlBarToggleSwitch (Page 2954)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Padding`

**See also**

[ControlBarToggleSwitch \(Page 2954\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarToggleSwitch.Padding \(Page 2976\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarToggleSwitch.Padding \(Page 2976\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarToggleSwitch.Padding \(Page 2976\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarToggleSwitch.Padding \(Page 2976\)](#)**ControlBarToggleSwitch.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarToggleSwitch.RequireExplicitUnlock`**See also**[ControlBarToggleSwitch \(Page 2954\)](#)**ControlBarToggleSwitch.Text****Description**

The "Text" property specifies the label of the switch.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Text`

**See also**

ControlBarToggleSwitch (Page 2954)

**ControlBarToggleSwitch.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the switch.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.ToolTipText`

**See also**

ControlBarToggleSwitch (Page 2954)

**ControlBarToggleSwitch.Visible**

**Description**

The "Visible" property specifies whether the switch is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Visible`**See also**

ControlBarToggleSwitch (Page 2954)

**ControlBarToggleSwitch.Width****Description**

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Width`**See also**

ControlBarToggleSwitch (Page 2954)

**ToolBar.Enabled****Description**

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.Enabled`

**See also**

DetailedParameterControl.ToolBar (Page 2849)

**ToolBar.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`ToolBar.Font`

**See also**

DetailedParameterControl.ToolBar (Page 2849)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`**See also**

ToolBar.Font (Page 2982)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

ToolBar.Font (Page 2982)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 2982)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

**See also**

ToolBar.Font (Page 2982)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

Font.Underline

### See also

ToolBar.Font (Page 2982)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

## Syntax

`Font.Weight`

## See also

`ToolBar.Font` (Page 2982)

## ToolBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ToolBar.Margin`

## See also

`DetailedParameterControl.ToolBar` (Page 2849)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ToolBar.Margin` (Page 2986)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ToolBar.Margin` (Page 2986)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ToolBar.Margin \(Page 2986\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Top`

## See also

[ToolBar.Margin \(Page 2986\)](#)

## ToolBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**`ToolBar.Padding`**See also**[DetailedParameterControl.ToolBar \(Page 2849\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Bottom`**See also**[ToolBar.Padding \(Page 2988\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Left`

## See also

[ToolBar.Padding \(Page 2988\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Right`

## See also

[ToolBar.Padding \(Page 2988\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Top`**See also**`ToolBar.Padding` (Page 2988)**ToolBar.ShowToolTips****Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**`Bool`**Access**`Read-write`**Syntax**`ToolBar.ShowToolTips`**See also**`DetailedParameterControl.ToolBar` (Page 2849)**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**`Bool`**Access**`Read-write`

## Syntax

```
ToolBar.UseHotKeys
```

## See also

DetailedParameterControl.ToolBar (Page 2849)

## ToolBar.Visible

### Description

The "Visible" property specifies whether the toolbar is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Visible
```

## See also

DetailedParameterControl.ToolBar (Page 2849)

## DetailedParameterControl.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

**Syntax**`DetailedParameterControl.Top`**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.Visible****Description**

The "Visible" property specifies whether the parameter set display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`DetailedParameterControl.Visible`**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`DetailedParameterControl.Width`

## See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the parameter set display.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

### Note

Enable multiple properties by adding the integer values or bit operators.

---

### Access

Read-write

### Syntax

`DetailedParameterControl.WindowFlags`

## Example

Adapting the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

## See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the parameter set display.

### Syntax

```
DetailedParameterControl.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

## See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the parameter set control.

### Syntax

```
DetailedParameterControl.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

### See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
DetailedParameterControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

[DetailedParameterControl \(Page 2757\)](#)

## DetailedParameterControl\_OnActivated()

### Description

The "OnActivated" event occurs when a parameter set display receives focus:

- A parameter set display is selected via the configured tab sequence.
- A parameter set display that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
DetailedParameterControl_OnActivated(item)
```

### Context

**item**

Type: Object

Parameter set display where the event occurs.

### See also

DetailedParameterControl (Page 2757)

## DetailedParameterControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the parameter set display.

### Syntax

```
DetailedParameterControl_OnCommandFired(item, commandId, custom)
```

### Context

**item**

Type: Object

Parameter set display where the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

**See also**

DetailedParameterControl (Page 2757)

**DetailedParameterControl\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the parameter set display loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
DetailedParameterControl_OnDeactivated(item)
```

**Context****item**

Type: Object

Parameter set display where the event occurs.

**See also**

DetailedParameterControl (Page 2757)

## DetailedParameterControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a parameter set display has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
DetailedParameterControl_OnInitialized(item)
```

### Context

**item**

Type: Object

Parameter set display where the event occurs.

### See also

DetailedParameterControl (Page 2757)

## DotNetControlContainer

### Description

The "DotNetControlContainer" object represents a container for the display of WPF and WinForms control elements in runtime.

### Object type

HmiDotNetControlContainer

### Properties

The "DotNetControlContainer" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **ContainedType**  
Returns the type of the contained control element.

- **CurrentQuality**  
Returns the worst quality code of all tags that influence the container.
- **Enabled**  
Specifies whether the container can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the container.
- **Layer**  
Returns the screen layer in which the container is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the container.
- **Operability**  
Returns whether the container is operable.
- **Parent**  
Returns the higher-level screen object.
- **Properties**  
Enables access to the dynamic properties of the control elements of the container.
- **RenderingTemplate**  
Returns the name of the template from which the container was created.
- **RequireExplicitUnlock**  
Returns whether the container is only operable while the corresponding button is being pressed.
- **ShowFocusVisual**  
Specifies whether the container is highlighted when it has the focus.
- **StyleItemClass**  
Returns the style that is applied to the container.
- **TabIndex**  
Returns the position of the container in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the container is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the container.

## Methods

The "DotNetControlContainer" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the container.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "DotNetControlContainer" object has the following events:

- **OnActivated()**  
Occurs when a container receives the focus.
- **OnDeactivated()**  
Occurs when a container loses the focus.

## DotNetControlContainer.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
DotNetControlContainer.Authorization
```

### See also

DotNetControlContainer (Page 3000)

## DotNetControlContainer.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`DotNetControlContainer.Caption`

**See also**

[DotNetControlContainer \(Page 3000\)](#)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

[DotNetControlContainer.Caption \(Page 3002\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 3003)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Text.Font (Page 3003)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

Text.Font (Page 3003)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

Text.Font (Page 3003)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[Text.Font \(Page 3003\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

**Syntax**`Font.Weight`**See also**`Text.Font` (Page 3003)**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**`UInt32`**Access**`Read-write`**Syntax**`Text.ForeColor`**See also**`DotNetControlContainer.Caption` (Page 3002)**Text.Text****Description**

The "Text" property specifies the label.

**Type**`String`**Access**`Read-write`

## Syntax

`Text.Text`

## See also

[DotNetControlContainer.Caption \(Page 3002\)](#)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

## Syntax

`Text.Visible`

## See also

[DotNetControlContainer.Caption \(Page 3002\)](#)

## DotNetControlContainer.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

**Syntax**

```
DotNetControlContainer.CaptionColor
```

**See also**

DotNetControlContainer (Page 3000)

**DotNetControlContainer.ContainedType****Description**

The "ContainedType" property returns the type of the contained control element.

**Type**

String

**Access**

Read-only

**Syntax**

```
DotNetControlContainer.ContainedType
```

**See also**

DotNetControlContainer (Page 3000)

**DotNetControlContainer.CurrentQuality****Description**

The "CurrentQuality" property returns the worst quality code of all tags that influence the container.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.

- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`DotNetControlContainer.CurrentQuality`

### See also

[DotNetControlContainer \(Page 3000\)](#)

## DotNetControlContainer.Enabled

### Description

The "Enabled" property specifies whether the container can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`DotNetControlContainer.Enabled`

### See also

[DotNetControlContainer \(Page 3000\)](#)

## DotNetControlContainer.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

**Access**

Read-write

**Syntax**`DotNetControlContainer.Height`**See also**

DotNetControlContainer (Page 3000)

**DotNetControlContainer.Icon****Description**

The "Icon" property specifies the icon of the container.

**Type**

String

**Access**

Read-write

**Syntax**`DotNetControlContainer.Icon`**See also**

DotNetControlContainer (Page 3000)

**DotNetControlContainer.Layer****Description**

The "Layer" property returns the screen layer in which the container is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`DotNetControlContainer.Layer`

**See also**

`DotNetControlContainer` (Page 3000)

**Layer.MaximumZoom**

**Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

`DotNetControlContainer.Layer` (Page 3011)

**Layer.MinimumZoom**

**Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Layer.MinimumZoom
```

**See also**

DotNetControlContainer.Layer (Page 3011)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

```
Layer.Name
```

**See also**

DotNetControlContainer.Layer (Page 3011)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

## Syntax

`Layer.Visible`

## See also

[DotNetControlContainer.Layer \(Page 3011\)](#)

## DotNetControlContainer.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`DotNetControlContainer.Left`

## See also

[DotNetControlContainer \(Page 3000\)](#)

## DotNetControlContainer.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`DotNetControlContainer.Margin`

**See also**

[DotNetControlContainer](#) (Page 3000)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[DotNetControlContainer.Margin](#) (Page 3014)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

DotNetControlContainer.Margin (Page 3014)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

DotNetControlContainer.Margin (Page 3014)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

[DotNetControlContainer.Margin](#) (Page 3014)

**DotNetControlContainer.Name****Description**

The "Name" property returns the name of the container.

**Type**

String

**Access**

Read-only

**Syntax**

```
DotNetControlContainer.Name
```

**See also**

[DotNetControlContainer](#) (Page 3000)

**DotNetControlContainer.Operability****Description**

The "Operability" property returns whether the container is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

## Syntax

`DotNetControlContainer.Operability`

## See also

[DotNetControlContainer \(Page 3000\)](#)

## DotNetControlContainer.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

`DotNetControlContainer.Parent`

## See also

[DotNetControlContainer \(Page 3000\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

[Screen Items \(Page 1742\)](#)

## DotNetControlContainer.Properties

### Description

The "Properties" property enables access to the dynamic properties of the control elements of the container.

**Type**

Object, HmiDynamicPropertyPart

**Access**

Read-write

**Syntax**

`DotNetControlContainer.Properties`

**See also**

[DotNetControlContainer \(Page 3000\)](#)

**DotNetControlContainer.RenderingTemplate****Description**

The "RenderingTemplate" property returns the name of the template from which the container was created.

**Type**

String

**Access**

Read-only

**Syntax**

`DotNetControlContainer.RenderingTemplate`

**See also**

[DotNetControlContainer \(Page 3000\)](#)

**DotNetControlContainer.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the container is only operable while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`DotNetControlContainer.RequireExplicitUnlock`

**See also**

[DotNetControlContainer \(Page 3000\)](#)

**DotNetControlContainer.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the container is highlighted when it has the focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DotNetControlContainer.ShowFocusVisual`

**See also**

[DotNetControlContainer \(Page 3000\)](#)

**DotNetControlContainer.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style that is applied to the container.

**Type**

String

**Access**

Read-only

**Syntax**`DotNetControlContainer.StyleItemClass`**See also**

DotNetControlContainer (Page 3000)

**DotNetControlContainer.TabIndex****Description**

The "TabIndex" property returns the position of the container in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`DotNetControlContainer.TabIndex`**See also**

DotNetControlContainer (Page 3000)

**DotNetControlContainer.Top****Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`DotNetControlContainer.Top`

**See also**

[DotNetControlContainer \(Page 3000\)](#)

**DotNetControlContainer.Visible**

**Description**

The "Visible" property specifies whether the container is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`DotNetControlContainer.Visible`

**See also**

[DotNetControlContainer \(Page 3000\)](#)

**DotNetControlContainer.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`DotNetControlContainer.Width`**See also**`DotNetControlContainer` (Page 3000)**DotNetControlContainer.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the container.

**Type**`Int32, HmiWindowFlag`

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**`DotNetControlContainer.WindowFlags`

## Example

Adapting the "windowFlags" tag depending on the window configuration:

### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

## See also

[DotNetControlContainer \(Page 3000\)](#)

## DotNetControlContainer.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the container.

### Syntax

```
DotNetControlContainer.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

## DotNetControlContainer.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
DotNetControlContainer.PropertyFlashing(propertyName, enable[,  
value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

DotNetControlContainer (Page 3000)

## DotNetControlContainer\_OnActivated()

### Description

The "OnActivated" event occurs when a container receives the focus:

- A container is selected via the configured tab sequence.
- A container that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
SwacContainer_OnActivated(item)
```

### Context

**item**

Type: Object

Container for which the event occurs.

## See also

DotNetControlContainer (Page 3000)

## DotNetControlContainer\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a container loses the focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
SwacContainer_OnDeactivated(item)
```

### Context

**item**

Type: Object

Container for which the event occurs.

### See also

DotNetControlContainer (Page 3000)

### Ellipse

### Description

The "Ellipse" object represents an ellipse in runtime.

### Object type

HmiEllipse

### Properties

The "Ellipse" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.

- **CenterX**  
Specifies the X coordinate of the center.
- **CenterY**  
Sets the Y coordinate of the center.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the ellipse.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the ellipse can be operated in runtime.
- **FillDirection**  
Specifies the direction from which the ellipse is filled.
- **FillLevel**  
Specifies the fill of the ellipse in percent.
- **Layer**  
Returns the layer of the screen in which the ellipse is located.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the ellipse.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the ellipse is operable.
- **Parent**  
Returns the higher-level screen object.
- **RadiusX**  
Specifies the X radius.
- **RadiusY**  
Specifies the Y radius.
- **RequireExplicitUnlock**  
Returns whether the ellipse is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the ellipse rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**  
Specifies whether the fill level is displayed.

- **ShowFocusVisual**  
Specifies whether the ellipse is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the ellipse.
- **TabIndex**  
Returns the position of the ellipse in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the ellipse is visible.

## Methods

The "Ellipse" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the ellipse.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Ellipse" object has the following events:

- **OnActivated()**  
Occurs when an ellipse receives focus.
- **OnContextTapped()**  
Occurs when an ellipse is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when an ellipse loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the ellipse is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the ellipse is in focus.
- **OnTapped()**  
Occurs when an ellipse is left-clicked or short-touched.

## Ellipse.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Ellipse.AlternateBackColor`

**See also**

Ellipse (Page 3027)

**Ellipse.AlternateBorderColor**

**Description**

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Ellipse.AlternateBorderColor`

**See also**

Ellipse (Page 3027)

**Ellipse.Authorization**

**Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**`Ellipse.Authorization`**See also**

Ellipse (Page 3027)

**Ellipse.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Ellipse.BackColor`**See also**

Ellipse (Page 3027)

**Ellipse.BackFillPattern****Description**

The "BackFillPattern" property specifies the pattern of the background or the fill.

**Type**

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

### Access

Read-write

### Syntax

`Ellipse.BackFillPattern`

### See also

Ellipse (Page 3027)

## Ellipse.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

**Access**

Read-write

**Syntax**`Ellipse.BorderColor`**See also**

Ellipse (Page 3027)

**Ellipse.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**`Ellipse.BorderWidth`**See also**

Ellipse (Page 3027)

**Ellipse.CenterX****Description**

The "CenterX" property specifies the X coordinate of the center.

**Type**

Int32

**Access**

Read-write

### Syntax

`Ellipse.CenterX`

### See also

[Ellipse \(Page 3027\)](#)

[Ellipse.CenterY \(Page 3034\)](#)

## Ellipse.CenterY

### Description

The "CenterY" property specifies the Y coordinate of the center.

### Type

Int32

### Access

Read-write

### Syntax

`Ellipse.CenterY`

### See also

[Ellipse \(Page 3027\)](#)

[Ellipse.CenterX \(Page 3033\)](#)

## Ellipse.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the ellipse.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.

- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

`Ellipse.CurrentQuality`

**See also**

Ellipse (Page 3027)

**Ellipse.DashType****Description**

The "DashType" property specifies the stroke type of the border or line.

**Type**

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

**Access**

Read-write

**Syntax**

`Ellipse.DashType`

**See also**

Ellipse (Page 3027)

## Ellipse.Enabled

### Description

The "Enabled" property specifies whether the ellipse can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`Ellipse.Enabled`

### See also

Ellipse (Page 3027)

## Ellipse.FillDirection

### Description

The "FillDirection" property specifies the direction from which the ellipse is filled.

### Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

### Access

Read-write

### Syntax

`Ellipse.FillDirection`

**See also**

Ellipse (Page 3027)

**Ellipse.FillLevel****Description**

The "FillLevel" property specifies the fill level of the ellipse in percent.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`Ellipse.FillLevel`

**See also**

Ellipse (Page 3027)

**Ellipse.Layer****Description**

The "Layer" property returns the layer of the screen in which the ellipse is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`Ellipse.Layer`

**See also**

Ellipse (Page 3027)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[Ellipse.Layer \(Page 3037\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[Ellipse.Layer \(Page 3037\)](#)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

[Ellipse.Layer \(Page 3037\)](#)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[Ellipse.Layer \(Page 3037\)](#)

## Ellipse.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Ellipse.Margin`

### See also

Ellipse (Page 3027)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

Ellipse.Margin (Page 3040)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[Ellipse.Margin \(Page 3040\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Ellipse.Margin \(Page 3040\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

Ellipse.Margin (Page 3040)

## Ellipse.Name

### Description

The "Name" property returns the name of the ellipse.

### Type

String

### Access

Read-only

### Syntax

Ellipse.Name

### See also

Ellipse (Page 3027)

## Ellipse.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`Ellipse.Opacity`

### See also

Ellipse (Page 3027)

## Ellipse.Operability

### Description

The "Operability" property returns whether the ellipse is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Ellipse.Operability`

**See also**

Ellipse (Page 3027)

**Ellipse.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`Ellipse.Parent`

**See also**

Ellipse (Page 3027)

Screen Items (Page 1742)

**Screen Items**

**Description**

Screen Items (Page 1742)

**Ellipse.RadiusX**

**Description**

The "RadiusX" property specifies the X radius.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Ellipse.RadiusX`**See also**

Ellipse (Page 3027)

Ellipse.RadiusY (Page 3045)

**Ellipse.RadiusY****Description**

The "RadiusY" property specifies the Y radius.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Ellipse.RadiusY`**See also**

Ellipse (Page 3027)

Ellipse.RadiusX (Page 3044)

**Ellipse.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the ellipse can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`Ellipse.RequireExplicitUnlock`

**See also**

[Ellipse \(Page 3027\)](#)

**Ellipse.RotationAngle**

**Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**

`Ellipse.RotationAngle`

**See also**

- [Ellipse \(Page 3027\)](#)
- [Ellipse.RotationCenterPlacement \(Page 3046\)](#)
- [Ellipse.RotationCenterX \(Page 3047\)](#)
- [Ellipse.RotationCenterY \(Page 3048\)](#)

**Ellipse.RotationCenterPlacement**

**Description**

The "RotationCenterPlacement" property specifies the reference point around which the ellipse rotates.

**Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

**Access**

Read-write

**Syntax**

`Ellipse.RotationCenterPlacement`

**See also**

[Ellipse \(Page 3027\)](#)

[Ellipse.RotationAngle \(Page 3046\)](#)

[Ellipse.RotationCenterX \(Page 3047\)](#)

[Ellipse.RotationCenterY \(Page 3048\)](#)

**Ellipse.RotationCenterX****Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`Ellipse.RotationCenterX`

## See also

Ellipse (Page 3027)  
Ellipse.RotationAngle (Page 3046)  
Ellipse.RotationCenterPlacement (Page 3046)  
Ellipse.RotationCenterY (Page 3048)

## Ellipse.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

```
Ellipse.RotationCenterY
```

## See also

Ellipse (Page 3027)  
Ellipse.RotationAngle (Page 3046)  
Ellipse.RotationCenterPlacement (Page 3046)  
Ellipse.RotationCenterX (Page 3047)

## Ellipse.ShowFillLevel

### Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

### Type

Bool

**Access**

Read-write

**Syntax**`Ellipse.ShowFillLevel`**See also**

Ellipse (Page 3027)

**Ellipse.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the ellipse is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**`Ellipse.ShowFocusVisual`**See also**

Ellipse (Page 3027)

**Ellipse.StyleItemClass****Description**

The "StyleItemClass" property returns the style is applied to the ellipse.

**Type**

String

**Access**

Read-only

**Syntax**

`Ellipse.StyleItemClass`

**See also**

Ellipse (Page 3027)

**Ellipse.TabIndex**

**Description**

The "TabIndex" property returns the position of the ellipse in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`Ellipse.TabIndex`

**See also**

Ellipse (Page 3027)

**Ellipse.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`Ellipse.ToolTipText`

**See also**

Ellipse (Page 3027)

**Ellipse.Visible****Description**

The "Visible" property specifies whether the ellipse is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

Ellipse.Visible

**See also**

Ellipse (Page 3027)

**Ellipse.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the ellipse.

**Syntax**

Ellipse.CheckAuthorization()

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## Ellipse.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Ellipse.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Ellipse (Page 3027)

**Ellipse\_OnActivated()****Description**

The "OnActivated" event occurs when an ellipse receives focus:

- An ellipse is selected via the configured tab sequence.
- An ellipse that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
Ellipse_OnActivated(item)
```

**Context****item**

Type: Object

Ellipse where the event occurs.

## See also

Ellipse (Page 3027)

## Ellipse\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An ellipse is right-clicked.
- An ellipse is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Ellipse_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Ellipse where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Ellipse (Page 3027)

**Ellipse\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the ellipse loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
Ellipse_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Ellipse where the event occurs.

## See also

Ellipse (Page 3027)

## Ellipse\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the ellipse is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Ellipse_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Ellipse where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Ellipse (Page 3027)

## Ellipse\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the ellipse is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Ellipse_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Ellipse where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Ellipse (Page 3027)

## Ellipse\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- An ellipse is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an ellipse has the focus.
- An ellipse is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Ellipse_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Ellipse where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**EllipseSegment****Description**

The "EllipseSegment" object represents an ellipse segment in runtime.

## Object type

HmiEllipseSegment

## Properties

The "EllipseSegment" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AngleRange**  
Specifies the arc angle.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **CenterX**  
Specifies the X coordinate of the rotation point.
- **CenterY**  
Specifies the Y coordinate of the rotation point.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the ellipse segment.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the ellipse segment can be operated in runtime.
- **FillDirection**  
Specifies the direction from which the ellipse segment is filled.
- **FillLevel**  
Specifies the fill of the ellipse segment in percent.
- **Layer**  
Returns the layer of the screen in which the ellipse segment is located.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the ellipse segment.

- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the ellipse segment is operable.
- **Parent**  
Returns the higher-level screen object.
- **RadiusX**  
Specifies the X radius.
- **RadiusY**  
Specifies the Y radius.
- **RequireExplicitUnlock**  
Returns whether the ellipse segment is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the ellipse segment rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**  
Specifies whether the fill level is displayed.
- **ShowFocusVisual**  
Specifies whether the ellipse segment is highlighted when in focus.
- **StartAngle**  
Specifies the angle by which the start point deviates from the zero position (0°).
- **StyleItemClass**  
Returns the style which is applied to the ellipse segment.
- **TabIndex**  
Returns the position of the ellipse segment in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the ellipse segment is visible.

## Methods

The "EllipseSegment" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the ellipse segment.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "EllipseSegment" object has the following events:

- **OnActivated()**  
Occurs when an ellipse segment receives focus.
- **OnContextTapped()**  
Occurs when an ellipse segment is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when an ellipse segment loses the focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the ellipse segment is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the ellipse segment is in focus.
- **OnTapped()**  
Occurs when an ellipse segment is left-clicked or short-touched.

## EllipseSegment.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`EllipseSegment.AlternateBackColor`

### See also

[EllipseSegment \(Page 3059\)](#)

## EllipseSegment.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`EllipseSegment.AlternateBorderColor`**See also**

EllipseSegment (Page 3059)

**EllipseSegment.AngleRange****Description**

The "AngleRange" property specifies the arc angle clockwise.

**Type**

Int32

**Access**

Read-write

**Syntax**`EllipseSegment.AngleRange`**See also**

EllipseSegment (Page 3059)

**EllipseSegment.Authorization****Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`EllipseSegment.Authorization`

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`EllipseSegment.BackColor`

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.BackFillPattern**

**Description**

The "BackFillPattern" property specifies the pattern of the background or the fill.

**Type**

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent

- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

**Access**

Read-write

**Syntax**

`EllipseSegment.BackFillPattern`

**See also**

[EllipseSegment \(Page 3059\)](#)

**EllipseSegment.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`EllipseSegment.BorderColor`

**See also**

[EllipseSegment \(Page 3059\)](#)

**EllipseSegment.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`EllipseSegment.BorderWidth`

**See also**

[EllipseSegment \(Page 3059\)](#)

**EllipseSegment.CenterX**

**Description**

The "CenterX" property specifies the X coordinate of the rotation point.

**Type**

Int32

**Access**

Read-write

**Syntax**

`EllipseSegment.CenterX`

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.CenterY****Description**

The "CenterY" property specifies the Y coordinate of the rotation point.

**Type**

Int32

**Access**

Read-write

**Syntax**

EllipseSegment.CenterY

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.CurrentQuality****Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the ellipse segment.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`EllipseSegment.CurrentQuality`

### See also

[EllipseSegment \(Page 3059\)](#)

## EllipseSegment.DashType

### Description

The "DashType" property specifies the stroke type of the border or line.

### Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

### Access

Read-write

### Syntax

`EllipseSegment.DashType`

### See also

[EllipseSegment \(Page 3059\)](#)

## EllipseSegment.Enabled

### Description

The "Enabled" property specifies whether the ellipse segment can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`EllipseSegment.Enabled`**See also**

EllipseSegment (Page 3059)

**EllipseSegment.FillDirection****Description**

The "FillDirection" property specifies the direction from which the ellipse segment is filled.

**Type**

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

**Access**

Read-write

**Syntax**`EllipseSegment.FillDirection`**See also**

EllipseSegment (Page 3059)

## EllipseSegment.FillLevel

### Description

The "FillLevel" property specifies the fill level of the ellipse segment in percent.

### Type

UInt8

### Access

Read-write

### Syntax

`EllipseSegment.FillLevel`

### See also

EllipseSegment (Page 3059)

## EllipseSegment.Layer

### Description

The "Layer" property returns the layer of the screen in which the ellipse segment is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`EllipseSegment.Layer`

### See also

EllipseSegment (Page 3059)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

EllipseSegment.Layer (Page 3070)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

EllipseSegment.Layer (Page 3070)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[EllipseSegment.Layer \(Page 3070\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[EllipseSegment.Layer \(Page 3070\)](#)

## EllipseSegment.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
EllipseSegment.Margin
```

### See also

EllipseSegment (Page 3059)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

EllipseSegment.Margin (Page 3073)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[EllipseSegment.Margin \(Page 3073\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[EllipseSegment.Margin \(Page 3073\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[EllipseSegment.Margin \(Page 3073\)](#)

## EllipseSegment.Name

### Description

The "Name" property returns the name of the ellipse segment.

### Type

String

### Access

Read-only

### Syntax

`EllipseSegment.Name`

### See also

[EllipseSegment \(Page 3059\)](#)

## EllipseSegment.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`EllipseSegment.Opacity`

### See also

EllipseSegment (Page 3059)

## EllipseSegment.Operability

### Description

The "Operability" property returns whether the ellipse segment is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`EllipseSegment.Operability`

**See also**

[EllipseSegment \(Page 3059\)](#)

**EllipseSegment.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

```
EllipseSegment.Parent
```

**See also**

[EllipseSegment \(Page 3059\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**EllipseSegment.RadiusX****Description**

The "RadiusX" property specifies the X radius.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`EllipseSegment.RadiusX`

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.RadiusY**

**Description**

The "RadiusY" property specifies the Y radius.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`EllipseSegment.RadiusY`

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the ellipse segment can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`EllipseSegment.RequireExplicitUnlock`**See also**[EllipseSegment \(Page 3059\)](#)**EllipseSegment.RotationAngle****Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**`EllipseSegment.RotationAngle`**See also**[EllipseSegment \(Page 3059\)](#)[EllipseSegment.RotationCenterPlacement \(Page 3079\)](#)[EllipseSegment.RotationCenterX \(Page 3080\)](#)[EllipseSegment.RotationCenterY \(Page 3081\)](#)**EllipseSegment.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property sets the reference point around which the ellipse segment rotates.

## Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

## Access

Read-write

## Syntax

`EllipseSegment.RotationCenterPlacement`

## See also

[EllipseSegment \(Page 3059\)](#)

[EllipseSegment.RotationAngle \(Page 3079\)](#)

[EllipseSegment.RotationCenterX \(Page 3080\)](#)

[EllipseSegment.RotationCenterY \(Page 3081\)](#)

## EllipseSegment.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`EllipseSegment.RotationCenterX`

**See also**

[EllipseSegment](#) (Page 3059)

[EllipseSegment.RotationAngle](#) (Page 3079)

[EllipseSegment.RotationCenterPlacement](#) (Page 3079)

[EllipseSegment.RotationCenterY](#) (Page 3081)

**EllipseSegment.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

```
EllipseSegment.RotationCenterY
```

**See also**

[EllipseSegment](#) (Page 3059)

[EllipseSegment.RotationAngle](#) (Page 3079)

[EllipseSegment.RotationCenterPlacement](#) (Page 3079)

[EllipseSegment.RotationCenterX](#) (Page 3080)

**EllipseSegment.ShowFillLevel****Description**

The "ShowFillLevel" property specifies whether the fill level is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`EllipseSegment.ShowFillLevel`

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the ellipse segment is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`EllipseSegment.ShowFocusVisual`

**See also**

EllipseSegment (Page 3059)

**EllipseSegment.StartAngle**

**Description**

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

**Type**

Int32

**Access**

Read-write

**Syntax**`EllipseSegment.StartAngle`**See also**

EllipseSegment (Page 3059)

**EllipseSegment.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the ellipse segment.

**Type**

String

**Access**

Read-only

**Syntax**`EllipseSegment.StyleItemClass`**See also**

EllipseSegment (Page 3059)

**EllipseSegment.TabIndex****Description**

The "TabIndex" property returns the position of the ellipse segment in the tab sequence.

**Type**

UInt16

**Access**

Read-only

### Syntax

`EllipseSegment.TabIndex`

### See also

[EllipseSegment \(Page 3059\)](#)

## EllipseSegment.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`EllipseSegment.ToolTipText`

### See also

[EllipseSegment \(Page 3059\)](#)

## EllipseSegment.Visible

### Description

The "Visible" property specifies whether the ellipse segment is visible.

### Type

Bool

### Access

Read-write

### Syntax

`EllipseSegment.Visible`

**See also**

[EllipseSegment \(Page 3059\)](#)

**EllipseSegment.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the ellipse segment.

**Syntax**

```
EllipseSegment.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

[EllipseSegment \(Page 3059\)](#)

**EllipseSegment.PropertyFlashing()****Description**

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

## Syntax

```
EllipseSegment.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

### **propertyName**

Type: String

Name of the property for which flashing is configured.

### **enable**

Type: Bool

Specifies that flashing is activated.

### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

### **Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

EllipseSegment (Page 3059)

## EllipseSegment\_OnActivated()

### Description

The "OnActivated" event occurs when an ellipse segment receives focus:

- An ellipse segment is selected via the configured tab sequence.
- An ellipse segment that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
EllipseSegment_OnActivated(item)
```

### Context

**item**

Type: Object

Ellipse segment where the event occurs.

### See also

EllipseSegment (Page 3059)

## EllipseSegment\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An ellipse segment is right-clicked.
- An ellipse segment is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
EllipseSegment_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Ellipse segment where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

EllipseSegment (Page 3059)

**EllipseSegment\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when an ellipse segment loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
EllipseSegment_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Ellipse segment where the event occurs.

**See also**

EllipseSegment (Page 3059)

**EllipseSegment\_OnKeyDown()****Description**

The "OnKeyDown" event occurs when a key is pressed while the ellipse segment is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
EllipseSegment_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Ellipse segment where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

[EllipseSegment \(Page 3059\)](#)

## EllipseSegment\_OnKeyUp()

## Description

The "OnKeyUp" event occurs when a key is released while the ellipse segment is in focus.

## Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
EllipseSegment_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

Ellipse segment where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**[EllipseSegment \(Page 3059\)](#)

## EllipseSegment\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- An ellipse segment is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an ellipse segment has the focus.
- An ellipse segment is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
EllipseSegment_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Ellipse segment where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

#### **See also**

EllipseSegment (Page 3059)

#### **EllipticalArc**

##### **Description**

The "EllipticalArc" object represents an elliptical arc in runtime.

##### **Object type**

HmiEllipticalArc

## Properties

The "EllipticalArc" object has the following properties:

- **AlternateLineColor**  
Specifies the second line color which is displayed for line styles such as "Dash".
- **AngleRange**  
Specifies the arc angle.
- **Authorization**  
Returns the operator authorization.
- **CapType**  
Specifies the shape of the line ends.
- **CenterX**  
Specifies the X coordinate of the rotation point.
- **CenterY**  
Specifies the Y coordinate of the rotation point.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the elliptical arc.
- **DashType**  
Specifies the stroke style of the border or line.
- **Enabled**  
Specifies whether the elliptical arc can be operated in runtime.
- **EndType**  
Specifies the type of line end.
- **Layer**  
Returns the layer of the screen in which the elliptical arc is located.
- **LineColor**  
Specifies the line color.
- **LineWidth**  
Specifies the line thickness.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the elliptical arc.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the elliptical arc is operable.
- **Parent**  
Returns the higher-level screen object.
- **RadiusX**  
Specifies the X radius.
- **RadiusY**  
Specifies the Y radius.

- **RequireExplicitUnlock**  
Returns whether the elliptical arc is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the elliptical arc rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the elliptical arc is highlighted when in focus.
- **StartAngle**  
Specifies the angle by which the start point deviates from the zero position (0°).
- **StartType**  
Specifies the type of line start.
- **StyleItemClass**  
Returns the style which is applied to the elliptical arc.
- **TabIndex**  
Returns the position of the elliptical arc in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the elliptical arc is visible.

## Methods

The "EllipticalArc" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the elliptical arc.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "EllipticalArc" object has the following events:

- **OnActivated()**  
Occurs when an elliptical arc receives focus.
- **OnContextTapped()**  
Occurs when an elliptical arc is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when an elliptical arc loses focus.

- **OnKeyDown()**  
Occurs when a key is pressed while the elliptical arc is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the elliptical arc is in focus.
- **OnTapped()**  
Occurs when an elliptical arc is left-clicked or short-touched.

## EllipticalArc.AlternateLineColor

### Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`EllipticalArc.AlternateLineColor`

### See also

EllipticalArc (Page 3093)

## EllipticalArc.AngleRange

### Description

The "AngleRange" property specifies the arc angle clockwise.

### Type

Int32

### Access

Read-write

**Syntax**

`EllipticalArc.AngleRange`

**See also**

[EllipticalArc \(Page 3093\)](#)

**EllipticalArc.Authorization****Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`EllipticalArc.Authorization`

**See also**

[EllipticalArc \(Page 3093\)](#)

**EllipticalArc.CapType****Description**

The "CapType" property specifies the shape of the line ends.

**Type**

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

**Access**

Read-write

**Syntax**

`EllipticalArc.CapType`

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.CenterX**

**Description**

The "CenterX" property specifies the X coordinate of the rotation point.

**Type**

Int32

**Access**

Read-write

**Syntax**

`EllipticalArc.CenterX`

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.CenterY**

**Description**

The "CenterY" property specifies the Y coordinate of the rotation point.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
EllipticalArc.CenterY
```

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.CurrentQuality****Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the elliptical arc.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

```
EllipticalArc.CurrentQuality
```

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.DashType****Description**

The "DashType" property specifies the stroke type of the border or line.

### Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

### Access

Read-write

### Syntax

`EllipticalArc.DashType`

### See also

[EllipticalArc \(Page 3093\)](#)

## EllipticalArc.Enabled

### Description

The "Enabled" property specifies whether the elliptical arc can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`EllipticalArc.Enabled`

### See also

[EllipticalArc \(Page 3093\)](#)

## EllipticalArc.EndType

### Description

The "EndType" property specifies the line end type.

### Type

Int32, HmiLineEndType

Specifies the line end type:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

### Access

Read-write

### Syntax

`EllipticalArc.EndType`

### See also

[EllipticalArc \(Page 3093\)](#)

## EllipticalArc.Layer

### Description

The "Layer" property returns the layer of the screen in which the elliptical arc is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`EllipticalArc.Layer`

### See also

[EllipticalArc \(Page 3093\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[EllipticalArc.Layer \(Page 3101\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

**Syntax**`Layer.MinimumZoom`**See also**

EllipticalArc.Layer (Page 3101)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**`Layer.Name`**See also**

EllipticalArc.Layer (Page 3101)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

## Syntax

`Layer.Visible`

## See also

[EllipticalArc.Layer \(Page 3101\)](#)

## EllipticalArc.LineColor

### Description

The "LineColor" property specifies the line color.

### Type

UInt32

### Access

Read-write

### Syntax

`EllipticalArc.LineColor`

## See also

[EllipticalArc \(Page 3093\)](#)

## EllipticalArc.LineWidth

### Description

The "LineWidth" property specifies the line thickness.

### Type

UInt8

### Access

Read-write

### Syntax

`EllipticalArc.LineWidth`

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.Margin****Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

EllipticalArc.Margin

**See also**

EllipticalArc (Page 3093)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Bottom

**See also**

EllipticalArc.Margin (Page 3105)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

EllipticalArc.Margin (Page 3105)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

EllipticalArc.Margin (Page 3105)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

EllipticalArc.Margin (Page 3105)

**EllipticalArc.Name****Description**

The "Name" property returns the name of the elliptical arc.

**Type**

String

**Access**

Read-only

**Syntax**

EllipticalArc.Name

## See also

EllipticalArc (Page 3093)

## EllipticalArc.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`EllipticalArc.Opacity`

## See also

EllipticalArc (Page 3093)

## EllipticalArc.Operability

### Description

The "Operability" property returns whether the elliptical arc is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

**Syntax**

`EllipticalArc.Operability`

**See also**

[EllipticalArc \(Page 3093\)](#)

**EllipticalArc.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, [HmiScreenObjectBase \(Page 1742\)](#)

**Access**

Read-only

**Syntax**

`EllipticalArc.Parent`

**See also**

[EllipticalArc \(Page 3093\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items****Description**

[Screen Items \(Page 1742\)](#)

**EllipticalArc.RadiusX****Description**

The "RadiusX" property specifies the X radius.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`EllipticalArc.RadiusX`

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.RadiusY**

**Description**

The "RadiusY" property specifies the Y radius.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`EllipticalArc.RadiusY`

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the elliptical arc can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`EllipticalArc.RequireExplicitUnlock`**See also**[EllipticalArc \(Page 3093\)](#)**EllipticalArc.RotationAngle****Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**`EllipticalArc.RotationAngle`**See also**[EllipticalArc \(Page 3093\)](#)[EllipticalArc.RotationCenterPlacement \(Page 3111\)](#)[EllipticalArc.RotationCenterX \(Page 3112\)](#)[EllipticalArc.RotationCenterY \(Page 3113\)](#)**EllipticalArc.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property sets the reference point around which the elliptical arc rotates.

## Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

## Access

Read-write

## Syntax

`EllipticalArc.RotationCenterPlacement`

## See also

[EllipticalArc \(Page 3093\)](#)

[EllipticalArc.RotationAngle \(Page 3111\)](#)

[EllipticalArc.RotationCenterX \(Page 3112\)](#)

[EllipticalArc.RotationCenterY \(Page 3113\)](#)

## EllipticalArc.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`EllipticalArc.RotationCenterX`

**See also**

[EllipticalArc \(Page 3093\)](#)  
[EllipticalArc.RotationAngle \(Page 3111\)](#)  
[EllipticalArc.RotationCenterPlacement \(Page 3111\)](#)  
[EllipticalArc.RotationCenterY \(Page 3113\)](#)

**EllipticalArc.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

```
EllipticalArc.RotationCenterY
```

**See also**

[EllipticalArc \(Page 3093\)](#)  
[EllipticalArc.RotationAngle \(Page 3111\)](#)  
[EllipticalArc.RotationCenterPlacement \(Page 3111\)](#)  
[EllipticalArc.RotationCenterX \(Page 3112\)](#)

**EllipticalArc.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the elliptical arc is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`EllipticalArc.ShowFocusVisual`

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.StartAngle**

**Description**

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

**Type**

Int32

**Access**

Read-write

**Syntax**

`EllipticalArc.StartAngle`

**See also**

EllipticalArc (Page 3093)

**EllipticalArc.StartType**

**Description**

The "StartType" property specifies the type of line start.

**Type**

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

**Access**

Read-write

**Syntax**

`EllipticalArc.StartType`

**See also**

[EllipticalArc \(Page 3093\)](#)

**EllipticalArc.StyleItemClass****Description**

The "StyleItemClass" property returns the style which applied to the elliptical arc.

**Type**

String

**Access**

Read-only

**Syntax**

`EllipticalArc.StyleItemClass`

**See also**

[EllipticalArc \(Page 3093\)](#)

## EllipticalArc.TabIndex

### Description

The "TabIndex" property returns the position of the elliptical arc in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
EllipticalArc.TabIndex
```

### See also

EllipticalArc (Page 3093)

## EllipticalArc.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

```
EllipticalArc.ToolTipText
```

### See also

EllipticalArc (Page 3093)

## EllipticalArc.Visible

### Description

The "Visible" property specifies whether the elliptical arc is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
EllipticalArc.Visible
```

### See also

EllipticalArc (Page 3093)

## EllipticalArc.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the elliptical arc.

### Syntax

```
EllipticalArc.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

EllipticalArc (Page 3093)

## EllipticalArc.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
EllipticalArc.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

EllipticalArc (Page 3093)

**EllipticalArc\_OnActivated()****Description**

The "OnActivated" event occurs when an elliptical arc receives focus:

- An elliptical arc is selected via the configured tab sequence.
- An elliptical arc that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
EllipticalArc_OnActivated(item)
```

**Context****item**

Type: Object

Elliptical arc where the event occurs.

## See also

EllipticalArc (Page 3093)

## EllipticalArc\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An elliptical arc is right-clicked.
- An elliptical arc is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
EllipticalArc_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Elliptical arc where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

EllipticalArc (Page 3093)

**EllipticalArc\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when an elliptical arc loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
EllipticalArc_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Elliptical arc where the event occurs.

## See also

EllipticalArc (Page 3093)

## EllipticalArc\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the elliptical arc is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
EllipticalArc_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Elliptical arc where the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

EllipticalArc (Page 3093)

## EllipticalArc\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the elliptical arc is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
EllipticalArc_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Elliptical arc where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

EllipticalArc (Page 3093)

## EllipticalArc\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- An elliptical arc is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an elliptical arc has the focus.
- An elliptical arc is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
EllipticalArc_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Elliptical arc where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

EllipticalArc (Page 3093)

**FaceplateContainer****Description**

The "FaceplateContainer" object represents a container for faceplate instances in runtime.

## Object type

HmiFaceplateContainer

## Properties

The "FaceplateContainer" object has the following properties:

- **Adaption**  
Specifies whether the faceplate container adapts its size.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **ContainedType**  
Returns the type of the contained objects.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the faceplate container.
- **Enabled**  
Specifies whether the faceplate container can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon.
- **Layer**  
Returns the layer of the screen in which the faceplate container is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the faceplate container.
- **Parent**  
Returns the higher-level screen object.
- **Properties**  
Enables access to the interface data of the faceplate container.
- **RenderingTemplate**  
Returns the name of the template from which the faceplate container was created.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the faceplate container rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.

- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the faceplate container is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the faceplate container.
- **TabIndex**  
Returns the position of the faceplate container in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the faceplate container is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the faceplate container.

## Methods

The "FaceplateContainer" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the faceplate container.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "FaceplateContainer" object has the following events:

- **OnActivated()**  
Occurs when a faceplate container receives focus.
- **OnDeactivated()**  
Occurs when a faceplate container loses focus.
- **OnInterfaceEvent()**  
Stands for user-defined interface events of a faceplate container.

## FaceplateContainer.Adaption

### Description

The "Adaption" property specifies whether the faceplate container adapts its size.

### Type

Int32, HmiScreenWindowAdaption

Specifies the adaptation:

- None (0): No adaptation.
- WindowToScreen (1): Window size corresponds to screen size.
- ScreenToWindow (2): Screen size is adapted to window size.

### Access

Read-write

### Syntax

`FaceplateContainer.Adaption`

### See also

[FaceplateContainer \(Page 3125\)](#)

## FaceplateContainer.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`FaceplateContainer.Caption`

### See also

[FaceplateContainer \(Page 3125\)](#)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

FaceplateContainer.Caption (Page 3128)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 3129)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

Text.Font (Page 3129)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

Text.Font (Page 3129)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

Text.Font (Page 3129)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

## See also

Text.Font (Page 3129)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

## See also

Text.Font (Page 3129)

## Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

FaceplateContainer.Caption (Page 3128)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

`Text.Text`

**See also**

FaceplateContainer.Caption (Page 3128)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

FaceplateContainer.Caption (Page 3128)

**FaceplateContainer.CaptionColor**

**Description**

The "CaptionColor" property specifies the background color of the title bar.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`FaceplateContainer.CaptionColor`

**See also**

FaceplateContainer (Page 3125)

**FaceplateContainer.ContainedType**

**Description**

The "ContainedType" property returns the type of the contained objects.

**Type**

String

**Access**

Read-only

**Syntax**

`FaceplateContainer.ContainedType`

**See also**

FaceplateContainer (Page 3125)

**FaceplateContainer.CurrentQuality****Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the faceplate container.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**

`FaceplateContainer.CurrentQuality`

**See also**

FaceplateContainer (Page 3125)

## FaceplateContainer.Enabled

### Description

The "Enabled" property specifies whether the faceplate container can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`FaceplateContainer.Enabled`

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`FaceplateContainer.Height`

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Icon

### Description

The "Icon" property specifies the icon.

### Type

String

### Access

Read-write

### Syntax

FaceplateContainer.Icon

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Layer

### Description

The "Layer" property returns the layer of the screen in which the faceplate container is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

FaceplateContainer.Layer

### See also

FaceplateContainer (Page 3125)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

FaceplateContainer.Layer (Page 3137)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

FaceplateContainer.Layer (Page 3137)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

FaceplateContainer.Layer (Page 3137)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

FaceplateContainer.Layer (Page 3137)

## FaceplateContainer.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`FaceplateContainer.Left`

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`FaceplateContainer.Margin`

### See also

FaceplateContainer (Page 3125)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Bottom

### See also

FaceplateContainer.Margin (Page 3140)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

FaceplateContainer.Margin (Page 3140)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[FaceplateContainer.Margin \(Page 3140\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[FaceplateContainer.Margin \(Page 3140\)](#)

## FaceplateContainer.Name

### Description

The "Name" property returns the name of the faceplate container.

### Type

String

### Access

Read-only

### Syntax

```
FaceplateContainer.Name
```

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
FaceplateContainer.Parent
```

### See also

FaceplateContainer (Page 3125)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## FaceplateContainer.Properties

### Description

The "Properties" property enables access to the interface data (interface tags and interface properties) of the faceplate container.

### Type

Object, HmiDynamicPropertyPart

### Access

Read-write

### Syntax

FaceplateContainer.Properties

### Example

Outputting the name of the connected project tag to the "Tag\_1" interface tag:

#### Copy code

```
let TagName;  
TagName = Faceplate.Parent.Properties.Tag_1.Tag;  
HMIRuntime.Trace("System Tag Name: " + TagName);
```

Outputting the value of the "CustomProperty\_1" interface property:

#### Copy code

```
let PropertyValue;  
PropertyValue = Faceplate.Parent.Properties.CustomProperty_1;  
HMIRuntime.Trace("Value of CustomProperty_1: " + PropertyValue);
```

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the faceplate container was created.

### Type

String

### Access

Read-only

### Syntax

FaceplateContainer.RenderingTemplate

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

FaceplateContainer.RotationAngle

### See also

FaceplateContainer (Page 3125)

FaceplateContainer.RotationCenterPlacement (Page 3146)

FaceplateContainer.RotationCenterX (Page 3146)

FaceplateContainer.RotationCenterY (Page 3147)

## FaceplateContainer.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the faceplate container rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

```
FaceplateContainer.RotationCenterPlacement
```

### See also

FaceplateContainer (Page 3125)

FaceplateContainer.RotationAngle (Page 3145)

FaceplateContainer.RotationCenterX (Page 3146)

FaceplateContainer.RotationCenterY (Page 3147)

## FaceplateContainer.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`FaceplateContainer.RotationCenterX`**See also**[FaceplateContainer \(Page 3125\)](#)[FaceplateContainer.RotationAngle \(Page 3145\)](#)[FaceplateContainer.RotationCenterPlacement \(Page 3146\)](#)[FaceplateContainer.RotationCenterY \(Page 3147\)](#)**FaceplateContainer.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`FaceplateContainer.RotationCenterY`**See also**[FaceplateContainer \(Page 3125\)](#)[FaceplateContainer.RotationAngle \(Page 3145\)](#)[FaceplateContainer.RotationCenterPlacement \(Page 3146\)](#)[FaceplateContainer.RotationCenterX \(Page 3146\)](#)

## FaceplateContainer.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the faceplate container is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
FaceplateContainer.ShowFocusVisual
```

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the faceplate container.

### Type

String

### Access

Read-only

### Syntax

```
FaceplateContainer.StyleItemClass
```

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.TabIndex

### Description

The "TabIndex" property returns the position of the faceplate container in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
FaceplateContainer.TabIndex
```

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

```
FaceplateContainer.Top
```

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Visible

### Description

The "Visible" property specifies whether the faceplate container is visible.

### Type

Bool

### Access

Read-write

### Syntax

`FaceplateContainer.Visible`

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`FaceplateContainer.Width`

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the faceplate container.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

### Note

Enable multiple properties by adding the integer values or bit operators.

---

### Access

Read-write

### Syntax

FaceplateContainer.WindowFlags

### Example

Adapting the "windowFlags" tag depending on the window configuration:

#### Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

## See also

FaceplateContainer (Page 3125)

## FaceplateContainer.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the faceplate container.

### Syntax

```
FaceplateContainer.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

FaceplateContainer (Page 3125)

## FaceplateContainer.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

**Syntax**

```
FaceplateContainer.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

**Parameters****propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

FaceplateContainer (Page 3125)

## FaceplateContainer\_OnActivated()

### Description

The "OnActivated" event occurs when a faceplate container receives focus:

- A faceplate container is selected via the configured tab sequence.
- A faceplate container that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
FaceplateContainer_OnActivated(item)
```

### Context

**item**

Type: Object

Faceplate container where the event occurs.

### See also

FaceplateContainer (Page 3125)

## FaceplateContainer\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a faceplate container loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
FaceplateContainer_OnDeactivated(item)
```

## Context

**item**

Type: Object

Faceplate container where the event occurs.

## See also

FaceplateContainer (Page 3125)

## FaceplateContainer\_OnInterfaceEvent()

### Description

The "OnInterfaceEvent" event stands for user-defined interface events of a faceplate type. In the "Faceplate types" editor you can add any number of interface events with parameters to the faceplate type.

A user-defined interface event can only be triggered via the `FaceplateType.RaiseEvent()` method.

### Syntax

```
FaceplateContainer_OnInterfaceEvent(item[, Parameter_1][, ...  
Parameter_n])
```

## Context

**item**

Type: Object

Faceplate container where the event occurs.

**Parameter\_1**

Type: Bool | Byte | Char | Color | DateTime | DInt | DWord | HmiEventTrigger | HmiGesture | HmiKeyboardModifier | Int | LInt | LReal | LString | LWord | Real | SInt | String | Time | UDInt | UInt | ULInt | USInt | Word

Parameters of the event. Any number of parameters can be added to a user-defined interface event.

## See also

FaceplateContainer (Page 3125)

FaceplateType.RaiseEvent() (Page 3180)

## FaceplateType

### Description

The "FaceplateType" object represents a faceplate type in runtime.

### Object type

HmiFaceplateType

### Properties

The "FaceplateType" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BackGraphic**  
Specifies the background graphic of the faceplate type.
- **BackGraphicStretchMode**  
Specifies the type of scaling of the background graphic of the faceplate type.
- **BackgroundFillMode**  
Specifies the fill area of the background fill.
- **DisplayName**  
Specifies the display name of the faceplate type.
- **Enabled**  
Specifies whether the faceplate type can be operated in runtime.
- **EnableExplicitUnlock**  
Returns which button must be pressed for the faceplate type to be operable.
- **Height**  
Specifies the height.
- **HorizontalAlignment**  
Specifies the horizontal alignment.
- **HotKeys**  
Returns the hotkeys specified for the faceplate type.
- **Items**  
Returns a list of all screen objects of the faceplate type.
- **Layers**  
Returns the list of all layers of the faceplate type.
- **Name**  
Returns the name of the faceplate type.

- **Parent**  
Returns the faceplate container which contains the current faceplate instance as a child.
- **Properties**  
Enables access to the interface data of the faceplate type.
- **Suspendable**  
Determines whether script execution of faceplate instances of the faceplate type can be suspended.
- **VerticalAlignment**  
Specifies the vertical alignment.
- **Width**  
Specifies the width.

## Methods

The "FaceplateType" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the faceplate type.
- **Close()**  
Hides a faceplate container or closes a faceplate popup window.
- **FindItem()**  
Searches for and references screen windows or screen items through their object path.
- **OpenFaceplateInPopup()**  
Opens a faceplate from a faceplate type in a popup window.
- **PropertyFlashing()**  
Configures flashing of a property.
- **RaiseEvent()**  
Triggers a user-defined interface event of a faceplate type.

## Events

The "FaceplateType" object has the following events:

- **OnContextTapped()**  
Occurs when a faceplate type is right-clicked or long-touched.
- **OnHotKey()**  
Occurs when a hotkey is pressed.
- **OnLoaded()**  
Occurs after the faceplate has been built.
- **OnTapped()**  
Occurs when a faceplate type is left-clicked or short-touched.
- **OnUnloaded()**  
Occurs after the faceplate has been cleared.

## FaceplateType.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

Faceplate.AlternateBackColor

### See also

FaceplateType (Page 3156)

## FaceplateType.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

Faceplate.BackColor

### See also

FaceplateType (Page 3156)

## FaceplateType.BackFillPattern

### Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

### Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent. Depending on the runtime settings, visible objects in the background can be selected.
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

### Access

Read-write

### Syntax

Faceplate.BackFillPattern

### See also

FaceplateType (Page 3156)

## FaceplateType.BackGraphic

### Description

The "BackGraphic" property specifies the background graphic of the faceplate type.

### Type

String

### Access

Read-write

### Syntax

`Faceplate.BackGraphic`

### See also

FaceplateType (Page 3156)

## FaceplateType.BackGraphicStretchMode

### Description

The "BackGraphicStretchMode" property specifies the type of scaling of the background graphic of the faceplate type.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling:

- None (0): The graphic is shown in its original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

**Syntax**`Faceplate.BackGraphicStretchMode`**See also**

FaceplateType (Page 3156)

**FaceplateType.BackgroundFillMode****Description**

The "BackgroundFillMode" property specifies the fill area of the background fill.

**Type**

Int32, HmiBackgroundFillMode

Specifies the fill area:

- Window (0): The filling is adapted to the size of the window.
- Screen (1): The filling is adapted to the size of the screen.

**Access**

Read-write

**Syntax**`Faceplate.BackgroundFillMode`**See also**

FaceplateType (Page 3156)

**FaceplateType.DisplayName****Description**

The "DisplayName" property specifies the display name of the faceplate type.

**Type**

String

**Access**

Read-write

**Syntax**

Faceplate.DisplayName

**See also**

FaceplateType (Page 3156)

**FaceplateType.Enabled**

**Description**

The "Enabled" property specifies whether the faceplate type can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

Faceplate.Enabled

**See also**

FaceplateType (Page 3156)

**FaceplateType.EnableExplicitUnlock**

**Description**

The "EnableExplicitUnlock" property returns which button must be pressed for the faceplate type to be operable.

**Type**

Object, HmiButton (Page 2135)

**Access**

Read-only

**Syntax**

Faceplate.EnableExplicitUnlock

**See also**

FaceplateType (Page 3156)

Button (Page 2135)

**Button****Description**

Button (Page 2135)

**FaceplateType.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

Faceplate.Height

**See also**

FaceplateType (Page 3156)

**FaceplateType.HorizontalAlignment****Description**

The "HorizontalAlignment" property specifies the horizontal alignment.

**Type**

Int32, HmiHorizontalAlignment

Specifies the alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

### Access

Read-write

### Syntax

`Faceplate.HorizontalAlignment`

### See also

[FaceplateType \(Page 3156\)](#)

## FaceplateType.Items

### Description

The "Items" property returns a list of all the screen objects of the faceplate type.

### Type

Object, [HMIScreenItems \(Page 3165\)](#)

### Access

Read-only

### Syntax

`Faceplate.Items`

### See also

[FaceplateType \(Page 3156\)](#)

[ScreenItems \(Page 3165\)](#)

## ScreenItems

### Description

The "ScreenItems" object is a list of all screen objects ("HmiScreenItemBase" objects) of the screen.

You reference a "ScreenItems" object via the `Screen.Items` property.

### Use

The "ScreenItems" object is a list and can be enumerated. You can access the "ScreenItems" list using the index or the tag name.

### Object type

HMI ScreenItems

### Properties

--

### Methods

The "ScreenItems" object has the following methods:

- **Item()**  
Returns a screen object of the "ScreenItems" list.

### See also

FaceplateType.Items (Page 3164)

## ScreenItems.Item()

### Description

The "Item" method returns a screen object of a screen window via the "ScreenItems" list.

### Syntax

```
ScreenItems[.Item] (ScreenItemName);
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "ScreenItems" object.

---

## Parameters

### **ScreenItemName**

Type: String, HmiScreenItemBase

Name of the screen object

## Return value

Object, HmiScreenItemBase (Page 1742)

## See also

ScreenItems (Page 3165)

Screen Items (Page 1742)

## Screen Items

## Description

Screen Items (Page 1742)

## FaceplateType.Layers

## Description

The "Layers" property returns the list of all layers ("HmiLayerPart" objects) of the faceplate type.

## Type

Object, HmiLayerCollection (Page 3167)

## Access

Read-only

## Syntax

```
Faceplate.Layers
```

## See also

FaceplateType (Page 3156)

HmiLayerCollection (Page 3167)

## HmiLayerCollection

### Description

The "HmiLayerCollection" object is a list of all layers ("Layer" objects) of the screen. You reference a "HmiLayerCollection" object via the `Screen.Layers` property.

### Use

The "HmiLayerCollection" object is a list and can be counted and enumerated. You can access the "HmiLayerCollection" list using the index or the tag name.

### Object type

HmiLayerCollection

### Properties

The "HmiLayerCollection" object has the following properties:

- **Count**  
Returns the number of layers of the "HmiLayerCollection" list.

### Methods

The "HmiLayerCollection" object has the following methods:

- **Item()**  
Returns a level of the "HmiLayerCollection" list.

### See also

FaceplateType.Layers (Page 3166)

## HmiLayerCollection.Count

### Description

The "Count" property returns the number of screen layers of the "HmiLayerCollection" list.

### Type

UInt32

### Access

Read-only

## Syntax

```
HmiLayerCollection.Count
```

## See also

HmiLayerCollection (Page 3167)

## HmiLayerCollection.Item()

### Description

The "Item" method returns a screen layer of the "HmiLayerCollection" list.

### Syntax

```
HmiLayerCollection[.Item] (HmiLayerName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiLayerCollection" object.

---

### Parameters

#### **HmiLayerName**

Type: String, HmiLayerPart

Name of the screen layer

### Return value

Object, HmiLayerPart (Page 3168)

## See also

HmiLayerCollection (Page 3167)

Layer (Page 3168)

## Layer

### Description

The "Layer" object represents the layers of an object (e.g. screen).

**Object type**

HmiLayerPart

**Properties**

The "Layer" object has the following properties:

- **MaximumZoom**  
Specifies the maximum zoom of the screen up to which the level is to be seen.
- **MinimumZoom**  
Specifies the minimum zoom of the screen up to which the level is to be seen.
- **Name**  
Returns the name of the screen layer.
- **Visible**  
Specifies whether the screen layer and contained objects are visible.

**Methods**

--

**See also**[FaceplateType.Layers \(Page 3166\)](#)**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MaximumZoom`**See also**[Layer \(Page 3168\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[Layer \(Page 3168\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[Layer \(Page 3168\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

Layer (Page 3168)

## FaceplateType.Name

### Description

The "Name" property returns the name of the faceplate type.

### Type

String

### Access

Read-only

### Syntax

`Faceplate.Name`

### See also

FaceplateType (Page 3156)

## FaceplateType.Parent

### Description

The "Parent" property returns the faceplate container which contains the current faceplate instance as a child.

### Type

Object, HmiFaceplateContainer (Page 3125)

### Access

Read-only

### Syntax

```
Faceplate.Parent
```

### See also

FaceplateType (Page 3156)

FaceplateContainer (Page 3125)

## FaceplateContainer

### Description

FaceplateContainer (Page 3125)

## FaceplateType.Properties

### Description

The "Properties" property enables access to the interface data (interface tags and interface properties) of the faceplate type.

### Type

Object, HmiDynamicPropertyPart

### Access

Read-write

**Syntax**`Faceplate.Properties`**Example**

Outputting the name of the connected project tag to the "Tag\_1" interface tag:

**Copy code**

```
let TagName;  
TagName = Faceplate.Properties.Tag_1.Tag;  
HMIRuntime.Trace("System Tag Name: " + TagName);
```

Outputting the value of the "CustomProperty\_1" interface property:

**Copy code**

```
let PropertyValue;  
PropertyValue = Faceplate.Properties.CustomProperty_1;  
HMIRuntime.Trace("Value of CustomProperty_1: " + PropertyValue);
```

**See also**

[FaceplateType \(Page 3156\)](#)

**FaceplateType.Suspendable****Description**

The "Suspendable" property specifies whether script execution of faceplate instances of the faceplate type can be suspended in Runtime.

If the "Suspendable" property is enabled, scripts from non-visible faceplate instances are suspended.

If a faceplate instance is made visible again, pending script executions are carried out.

Faceplate instances are visible if their "Visible" property is enabled and they are in the visible area of the display in Runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`Faceplate.Suspendable`

## FaceplateType.VerticalAlignment

### Description

The "VerticalAlignment" property specifies the vertical alignment.

### Type

Int32, HmiVerticalAlignment

Specifies the alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

### Access

Read-write

### Syntax

`Faceplate.VerticalAlignment`

### See also

FaceplateType (Page 3156)

## FaceplateType.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Faceplate.Width`

**See also**

FaceplateType (Page 3156)

**FaceplateType.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the faceplate type.

**Syntax**

```
Faceplate.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

FaceplateType (Page 3156)

**FaceplateType.Close()****Description**

The "Close" method hides a faceplate container or closes a faceplate popup window.

**Syntax**

```
Faceplate.Close()
```

## Parameters

--

## Return value

Bool

## See also

FaceplateType (Page 3156)

## FaceplateType.FindItem()

## Description

The "FindItem" method searches for and references screen windows or screen objects through their object path.

## Syntax

```
Faceplate.FindItem(screenItemPath)
```

## Parameters

### **ScreenItemPath**

Type: String

Object path of the screen window or screen object you are looking for.

---

### **Note**

The "Faceplate.FindItem" method has the faceplate in which the script is running as the search context and can also use relative object paths.

---

### **Formulation of the object path**

The syntax of the object path orients itself to the notation of the file system paths. The object path consists of the names of the screen windows (Screen Windows) and screen objects (Screen Items). The names are connected via a slash ("/") according to the hierarchical positioning. Screens (Screens) and their names are not used in the formulation.

Relative and absolute object paths are distinguished by the prefix of the object path. The following prefixes can be used:

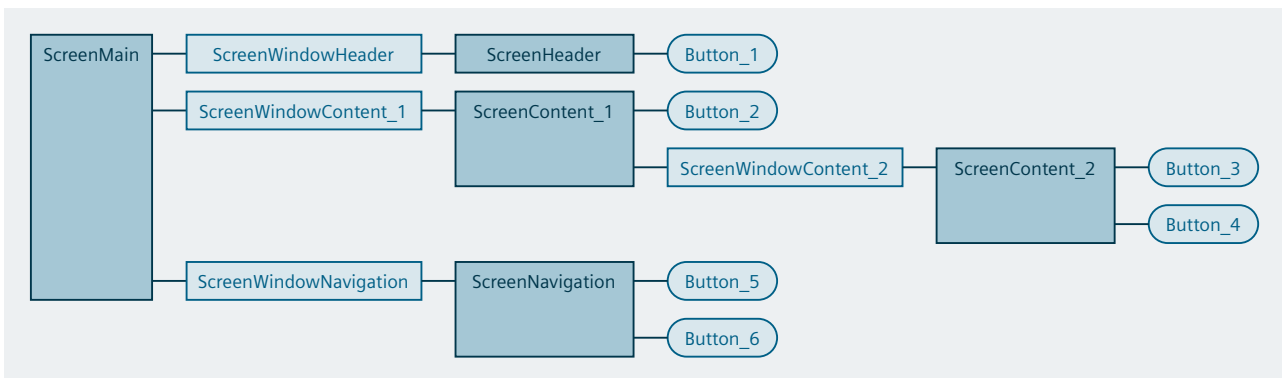

- Relative object path
  - "..": References the higher-level screen window (parent) in the context of the current screen window.
  - ".": References own screen window (self).
  - "": Without a prefix, a screen object of the current screen window is referenced.
- Absolute object paths
  - "/": References a screen window on the highest level, whose name must follow.
  - "~": References the screen window on the highest level in own screen hierarchy.

Additional rules for formulating an object path:

- The ".." string may be used multiple times in the object path, but only together at the beginning of the object path, for example, "../../../Window5".
- If the object path does not end with a screen object name, a screen window is referenced.
- A search is performed for screen objects of the object path in the screens of the referenced screen window. It is not permitted to specify a screen name.

### Examples of object paths

The following window-screen object hierarchy is adopted for the examples:

This results in the following object paths for addressing the objects:

- Relative addressing:
  - "Button\_2" changes the label of "Button\_1":

```
// Navigate one level up and find "Button_1" inside the
"ScreenWindowHeader"
Screen.FindItem("../ScreenWindowHeader/Button_1").Text =
"Changed by Button_2"
```
  - "Button\_3" changes the label of "Button\_5":

```
// Navigate two levels up and find "Button 2" inside the
"ScreenWindowNavigation"
Screen.FindItem("../../ScreenWindowNavigation/Button_5").Text =
"Changed by Button_3"
```
  - "Button\_3" changes the label of "Button\_4":

```
// Find "Button_4" in same screen ("ScreenContent_2")
Screen.FindItem("Button_4").Text = "Changed by Button_3"
Screen.FindItem("./Button_4").Text = "Changed by Button_3"
```
- Absolute addressing:
  - "Button\_4" changes the label of "Button\_6":

```
// Navigate to the root screen and find "Button_6" inside the
"ScreenWindowNavigation"
Screen.FindItem("~/ScreenWindowNavigation/Button_6").Text =
"Changed by Button_4"
```

## Return value

Object, HmiScreenObjectBase (Page 1742)

## See also

FaceplateType (Page 3156)

Screen Items (Page 1742)

## FaceplateType.OpenFaceplateInPopup()

### Description

The "OpenFaceplateInPopup" method opens a faceplate from a faceplate type in a popup window.

### Syntax

```
Faceplate.OpenFaceplateInPopup(faceplateType, title[,
independentWindow][, invisible])
```

## Parameters

**faceplateType**

Type: String, HmiFaceplateType

Name of the faceplate type

**title**

Type: String

Title of the popup window

**independentWindow**

Optional, type: Bool

Specifies the dependency of the popup window on the calling faceplate:

- True: The popup window remains open until either the popup window is closed manually or runtime is exited.
- False: The popup window is closed when the faceplate or the screen is exited.

**invisible**

Optional, type: Bool

Causes the faceplate to be configured so that it is invisible to the operator.

To then display the faceplate, set the property `visible=true`.

## Return value

Object, HmiPopupScreenWindow (Page 4475)

## See also

FaceplateType (Page 3156)

PopupScreenWindow (Page 4475)

## FaceplateType.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Faceplate.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

FaceplateType (Page 3156)

## FaceplateType.RaiseEvent()

## Description

The "RaiseEvent" method triggers a user-defined interface event of a faceplate type.

**Syntax**

```
Faceplate.RaiseEvent(name, parameters)
```

**Parameters****name**

Type: String

Name of the interface event

**parameters**

Type: Object

Parameter of the interface event

**Return value**

Bool

**See also**

FaceplateType (Page 3156)

FaceplateContainer\_OnInterfaceEvent() (Page 3155)

**FaceplateType\_OnContextTapped()****Description**

The "OnContextTapped" event occurs with the following inputs of the operator:

- A faceplate type is right-clicked.
- A faceplate type is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

**Syntax**

```
FaceplateType_OnContextTapped(item, x, y, modifiers, trigger)
```

**Context****item**

Type: Object

Faceplate type where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

FaceplateType (Page 3156)

## FaceplateType\_OnHotKey()

### Description

The "OnHotKey" event occurs when the operator presses a hotkey:

Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Syntax

```
FaceplateType_OnHotKey(item, keyCode, modifiers)
```

### Context

**item**

Type: Object

Faceplate type where the event occurs.

**keyCode**

Type: DInt

Numeric identifier of the pressed hotkey

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### See also

FaceplateType (Page 3156)

## FaceplateType\_OnLoaded()

### Description

The "OnLoaded" event occurs after the faceplate type has been built.

### Syntax

```
FaceplateType_OnLoaded(item)
```

### Context

**item**

Type: Object

Faceplate type where the event occurs.

### See also

FaceplateType (Page 3156)

## FaceplateType\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A faceplate type is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a faceplate type has the focus.
- A faceplate type is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
FaceplateType_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Faceplate type where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

FaceplateType (Page 3156)

## FaceplateType\_OnUnloaded()

### Description

The "OnUnloaded" event occurs after the faceplate type has been cleared.

### Syntax

```
FaceplateType_OnUnloaded(item)
```

### Context

**item**

Type: Object

Faceplate type where the event occurs.

### See also

FaceplateType (Page 3156)

## PopupScreenWindow

### Description

PopupScreenWindow (Page 4475)

## FaceplateInterface

### Description of FaceplateInterface

#### Description

The "FaceplateInterface" object ("FaceplateInterface" type) ###

#### Object type

HmiFaceplateInterface

## Properties

The "FaceplateInterface" object has the following properties:

- **Items**  
Returns a list of all screen objects of the faceplate.
- **Parent**  
Returns the faceplate container that contains the current faceplate instance as child.

## Methods

The "FaceplateInterface" object has the following methods:

- **Close()**  
Hides a faceplate container or closes a faceplate popup window.
- **FindItem()**  
Returns screen objects via their object path.
- **OpenFaceplateInPopup()**  
Opens a faceplate in a popup window.
- **PropertyFlashing()**  
Configures flashing of a property.
- **RaiseEvent()**  
Triggers a user-defined interface event of a faceplate.

## FaceplateInterface.Items

### Description

The "Items" property returns a list of all the screen objects of the faceplate type.

### Type

Object, HMIScreenItems

### Access

Read-only

### Syntax

```
FaceplateInterface.Items
```

### See also

Description of FaceplateInterface (Page 3186)

## Window.Parent

### Description

The "Parent" property returns the parent window.

### Type

Object, HmiScreenObjectBase

### Access

Read-only

### Syntax

```
Window.Parent
```

### See also

Description of FaceplateInterface (Page 3186)

## FaceplateInterface.Close()

### Description

The "Close" method hides a faceplate container or closes a faceplate popup window.

### Syntax

```
Faceplate.Close()
```

### Parameters

--

### Return value

Bool

### See also

Description of FaceplateInterface (Page 3186)

## FaceplateInterface.FindItem()

### Description

The "FindItem" method searches for and references screen windows or screen objects through their object path.

### Syntax

```
FaceplateInterface.FindItem(screenItemPath)
```

### Parameters

#### ScreenItemPath

Type: String

Object path of the screen window or screen object you are looking for.

---

#### Note

The "FaceplateInterface.FindItem" method has the faceplate in which the script is running as the search context and can also use relative object paths.

---

#### Formulation of the object path

The syntax of the object path orients itself to the notation of the file system paths. The object path consists of the names of the screen windows (Screen Windows) and screen objects (Screen Items). The names are connected via a slash ("/") according to the hierarchical positioning. Screens (Screens) and their names are not used in the formulation.

Relative and absolute object paths are distinguished by the prefix of the object path. The following prefixes can be used:

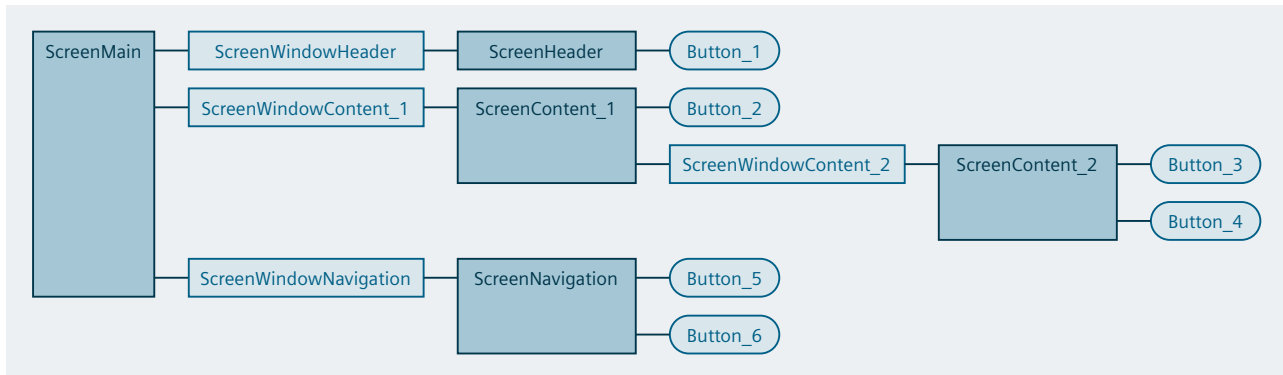

- Relative object path
  - "..": References the higher-level screen window (parent) in the context of the current screen window.
  - ".": References own screen window (self).
  - "": Without a prefix, a screen object of the current screen window is referenced.
- Absolute object paths
  - "/": References a screen window on the highest level, whose name must follow.
  - "~": References the screen window on the highest level in own screen hierarchy.

Additional rules for formulating an object path:

- The ".." string may be used multiple times in the object path, but only together at the beginning of the object path, for example, "../..Window5".
- If the object path does not end with a screen object name, a screen window is referenced.
- A search is performed for screen objects of the object path in the screens of the referenced screen window. It is not permitted to specify a screen name.

### Examples of object paths

The following window-screen object hierarchy is adopted for the examples:

This results in the following object paths for addressing the objects:

- Relative addressing:
  - "Button\_2" changes the label of "Button\_1":
 

```
// Navigate one level up and find "Button_1" inside the
"ScreenWindowHeader"
Screen.FindItem("../ScreenWindowHeader/Button_1").Text =
"Changed by Button_2"
```
  - "Button\_3" changes the label of "Button\_5":
 

```
// Navigate two levels up and find "Button 2" inside the
"ScreenWindowNavigation"
Screen.FindItem("../../ScreenWindowNavigation/Button_5").Text =
"Changed by Button_3"
```
  - "Button\_3" changes the label of "Button\_4":
 

```
// Find "Button_4" in same screen ("ScreenContent_2")
Screen.FindItem("Button_4").Text = "Changed by Button_3"
Screen.FindItem("./Button_4").Text = "Changed by Button_3"
```
- Absolute addressing:
  - "Button\_4" changes the label of "Button\_6":
 

```
// Navigate to the root screen and find "Button_6" inside the
"ScreenWindowNavigation"
Screen.FindItem("~/ScreenWindowNavigation/Button_6").Text =
"Changed by Button_4"
```

### Return value

Object, HmiScreenObjectBase

### See also

Description of FaceplateInterface (Page 3186)

## FaceplateInterface.OpenFaceplateInPopup()

### Description

The "OpenFaceplateInPopup" method opens a faceplate from a faceplate type in a popup window.

### Syntax

```
FaceplateInterface.OpenFaceplateInPopup(faceplateType, title[,  
independentWindow][, invisible])
```

### Parameters

**faceplateType**

Type: String, HmiFaceplateType

Name of the faceplate type

**title**

Type: String

Title of the popup window

**independentWindow**

Optional, type: Bool

Specifies the dependency of the popup window on the calling faceplate:

- True: The popup window remains open until either the popup window is closed manually or runtime is exited.
- False: The popup window is closed when the faceplate or the screen is exited.

**invisible**

Optional, type: Bool

Causes the faceplate to be configured so that it is invisible to the operator.

To then display the faceplate, set the property `visible=true`.

### Return value

Object, HmiPopupScreenWindow

### See also

Description of FaceplateInterface (Page 3186)

## FaceplateInterface.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Faceplate.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Description of FaceplateInterface (Page 3186)

**FaceplateInterface.RaiseEvent()****Description**

The "RaiseEvent" method triggers a user-defined interface event of a faceplate type.

**Syntax**

```
Faceplate.RaiseEvent(name, parameters)
```

**Parameters****name**

Type: String

Name of the interface event

**parameters**

Type: Object

Parameter of the interface event

**Return value**

Bool

**See also**

Description of FaceplateInterface (Page 3186)

**FunctionTrendControl****Description**

The "FunctionTrendControl" object represents an f(x) trend view of tag values as a function of a different tag in runtime.

## Object type

HmiFunctionTrendControl

## Properties

The "FunctionTrendControl" object has the following properties:

- **AreaSpacing**  
Specifies the distance between function trend areas.
- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text to be displayed in the title bar.
- **CaptionColor**  
Specifies the color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the f(x) trend view.
- **Enabled**  
Specifies whether the f(x) trend view can be operated in runtime.
- **ExtendRulerToAxis**  
Specifies whether the ruler is extended into the axis.
- **FunctionTrendAreas**  
Returns the function trend areas of the f(x) trend view.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the f(x) trend view.
- **Layer**  
Returns the screen layer in which the f(x) trend view is located.
- **Left**  
Specifies the value of the X coordinate.
- **Legend**  
Specifies the appearance of the legend.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the f(x) trend view.
- **Online**  
Specifies the start and stop of the update of the f(x) trend view.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the f(x) trend view was created.

- **ShiftAxis**  
Specifies whether to swap the X axis and Y axis of the f(x) trend view.
- **ShowFocusVisual**  
Specifies whether the f(x) trend view is highlighted when in focus.
- **ShowRuler**  
Specifies whether the ruler is displayed for determining a function trend value.
- **ShowStatisticRulers**  
Specifies whether to display the two rulers for specifying the statistics area.
- **StatusBar**  
Specifies the information bar of the f(x) trend view.
- **StyleItemClass**  
Returns the style which is applied to the f(x) trend view.
- **TabIndex**  
Returns the position of the f(x) trend view in the tab sequence.
- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Specifies the toolbar of the f(x) trend view.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the f(x) trend view is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the f(x) trend view.

## Methods

The "FunctionTrendControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the f(x) trend view.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the f(x) trend view.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "FunctionTrendControl" object has the following events:

- **OnActivated()**  
Occurs when a f(x) trend view receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the f(x) trend view.
- **OnDeactivated()**  
Occurs when a f(x) trend view loses focus.
- **OnInitialized()**  
Occurs when a f(x) trend view has been successfully initialized and the data connection to the PLC has been established.

## FunctionTrendControl.AreaSpacing

### Description

The "AreaSpacing" property specifies the spacing between function trend areas.

### Type

UInt16

### Access

Read-write

### Syntax

`FunctionTrendControl.AreaSpacing`

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

**Access**

Read-write

**Syntax**`FunctionTrendControl.BackColor`**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Caption****Description**

The "Caption" property specifies the text to be displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**`FunctionTrendControl.Caption`**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

## Syntax

`Text.Font`

## See also

[FunctionTrendControl.Caption \(Page 3197\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

## Syntax

`Font.Italic`

## See also

[Text.Font \(Page 3197\)](#)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

**Syntax**`Font.Name`**See also**`Text.Font` (Page 3197)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**`Text.Font` (Page 3197)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

Text.Font (Page 3197)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

Text.Font (Page 3197)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 3197\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[FunctionTrendControl.Caption \(Page 3197\)](#)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

[FunctionTrendControl.Caption \(Page 3197\)](#)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

[FunctionTrendControl.Caption \(Page 3197\)](#)

## FunctionTrendControl.CaptionColor

### Description

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

```
FunctionTrendControl.CaptionColor
```

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the f(x) trend view.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

**Syntax**

`FunctionTrendControl.CurrentQuality`

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Enabled**

**Description**

The "Enabled" property specifies whether the f(x) trend view can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`FunctionTrendControl.Enabled`

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.ExtendRulerToAxis**

**Description**

The "ExtendRulerToAxis" property specifies whether the ruler is extended to the axis.

**Type**

Bool

**Access**

Read-write

**Syntax**

`FunctionTrendControl.ExtendRulerToAxis`

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.FunctionTrendAreas****Description**

The "FunctionTrendAreas" property returns the function trend areas ("FunctionTrendArea" objects) of the f(x) trend view.

**Type**

Object, HmiFunctionTrendAreaCollection (Page 3205)

**Access**

Read-only

**Syntax**

```
FunctionTrendControl.TrendAreas
```

**See also**

FunctionTrendControl (Page 3193)

HmiFunctionTrendAreaCollection (Page 3205)

**HmiFunctionTrendAreaCollection****Description**

The "HmiFunctionTrendAreaCollection" object is a list of all function trend areas ("FunctionTrendArea" objects) of the f(x) trend view.

**Use**

The "HmiFunctionTrendAreaCollection" object is a list and can be counted and enumerated. You can access the "HmiFunctionTrendAreaCollection" list using the index or the tag names.

**Object type**

HmiFunctionTrendAreaCollection

## Properties

The "HmiFunctionTrendAreaCollection" object has the following properties:

- **Count**  
Returns the number of function trend areas of the "HmiFunctionTrendAreaCollection" list.

## Methods

The "HmiFunctionTrendAreaCollection" object has the following methods:

- **Item()**  
Returns a function trend area of the "HmiFunctionTrendAreaCollection" list.

## See also

FunctionTrendControl.FunctionTrendAreas (Page 3205)

## HmiFunctionTrendAreaCollection.Count

### Description

The "Count" property returns the number of trend areas in the "HmiFunctionTrendAreaCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiFunctionTrendAreaCollection.Count
```

## See also

HmiFunctionTrendAreaCollection (Page 3205)

## HmiFunctionTrendAreaCollection.Item()

### Description

The "Item" method returns a function trend area of the "HmiFunctionTrendAreaCollection" list.

## Syntax

```
HmiFunctionTrendAreaCollection[.Item] (HmiFunctionTrendAreaName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiFunctionTrendAreaCollection" object.

---

## Parameters

### **HmiFunctionTrendAreaName**

Type: String

Name of the function trend area

## Return value

Object, HmiFunctionTrendAreaPart (Page 3205)

## See also

HmiFunctionTrendAreaCollection (Page 3205)

FunctionTrendArea (Page 3207)

## FunctionTrendArea

### Description

The "TrendArea" object represents a function trend area of the f(x) trend view.

### Object type

HmiFunctionTrendAreaPart

### Properties

The "FunctionTrendArea" object has the following properties:

- **BackColor**  
Specifies the background color.
- **BottomValueAxes**  
Returns the lower value axes of the function trend area.
- **FunctionTrends**  
Returns the function trends of the function trend area.
- **GridLines**  
Specifies the grid lines of the function trend area.

- **LeftValueAxes**  
Returns the left value axes of the function trend area.
- **MajorGridLinesColor**  
Specifies the color of the main grid lines.
- **MinorGridLinesColor**  
Specifies the color of the auxiliary grid lines.
- **Name**  
Returns the name of the function trend area.
- **RightValueAxes**  
Returns the right value axes of the function trend area.
- **Ruler**  
Specifies the appearance of the ruler to determine the function trend value.
- **SelectedFunctionTrend**  
Specifies the selected trend of the function trend area.
- **SizeFactor**  
Specifies the scaling factor of the function trend area relative to its height.
- **TopValueAxes**  
Returns the upper value axes of the function trend area.
- **Visible**  
Specifies whether the function trend area is visible.

## Methods

--

## See also

[HmiFunctionTrendAreaCollection](#) (Page 3205)

[HmiFunctionTrendAreaCollection.Item\(\)](#) (Page 3206)

## FunctionTrendArea.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

**Syntax**

`FunctionTrendArea.BackColor`

**See also**

[FunctionTrendArea \(Page 3207\)](#)

**FunctionTrendArea.BottomValueAxes****Description**

The "BottomValueAxes" property returns the lower value axes of the function trend area.

**Type**

Object, [HmiXValueAxisCollection \(Page 3209\)](#)

**Access**

Read-only

**Syntax**

`FunctionTrendArea.BottomValueAxes`

**See also**

[FunctionTrendArea \(Page 3207\)](#)

[HmiXValueAxisCollection \(Page 3209\)](#)

**HmiXValueAxisCollection****Description**

The "HmiXValueAxisCollection" object is a list of all value axes ("XValueAxis" objects) of the function trend area.

**Use**

The "HmiXValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiXValueAxisCollection" list using the index or the tag names.

**Object type**

HmiXValueAxisCollection

## Properties

The "HmiXValueAxisCollection" object has the following properties:

- **Count**  
Returns the number of value axes in the "HmiXValueAxisCollection" list.

## Methods

The "HmiXValueAxisCollection" object has the following methods:

- **Item()**  
Returns a value axis of the "HmiXValueAxisCollection" list.

## See also

FunctionTrendArea.BottomValueAxes (Page 3209)

## HmiXValueAxisCollection.Count

### Description

The "Count" property returns the number of value axes in the "HmiXValueAxisCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiXValueAxisCollection.Count
```

## See also

HmiXValueAxisCollection (Page 3209)

## HmiXValueAxisCollection.Item()

### Description

The "Item" method returns a value axis of the "HmiXValueAxisCollection" list.

## Syntax

```
HmiXValueAxisCollection[.Item] (HmiXValueAxisName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiXValueAxisCollection" object.

---

## Parameters

### **HmiXValueAxisName**

Type: String

Name of the value axis

## Return value

Object, HmiXValueAxisPart (Page 3211)

## See also

HmiXValueAxisCollection (Page 3209)

XValueAxis (Page 3211)

## XValueAxis

## Description

The "XValueAxis" object represents a value axis of the function trend area.

## Object type

HmiXValueAxisPart

## Properties

The "XValueAxis" object has the following properties:

- **ApplyScalingEntries**  
Specifies whether the user scaling of the axis section is applied.
- **AutoRange**  
Specifies whether automatic determination of the value range is activated by the minimum and maximum value of the function trend.
- **AutoScaling**  
Specifies whether the automatic scaling is activated.

- **AxisColor**  
Specifies the color of the value axis.
- **BeginValue**  
Specifies the start of a value range or value range section.
- **DisplayName**  
Specifies the display name of the value axis.
- **DivisionCount**  
Specifies the number of main units with subdivisions.
- **EndValue**  
Specifies the end of a value range or value range section.
- **HelpLines**  
Returns the appearance of the help lines.
- **LabelColor**  
Specifies the color of the axis labeling.
- **LabelFont**  
Specifies the font of the axis labeling.
- **LargeTickLabelingStep**  
Specifies the interval at which scale sections are labeled.
- **MeasurementUnit**  
Returns the displayed unit.
- **MeasurementUnitType**  
Specifies the display format of the unit.
- **OutputFormat**  
Specifies the format for displaying the axis values.
- **ScalingEntries**  
Returns the specification of the user scaling of the axis sections.
- **ScaleMode**  
Specifies the scale mode:
- **ScalingType**  
Specifies the scaling.
- **ShowScalingDisplayNames**  
Specifies whether the display names of the user scaling are used.
- **SubDivisionCount**  
Specifies the number of divisions of the main units.
- **TickColor**  
Specifies the color of the tick marks.
- **Visible**  
Specifies whether the value axis is visible.

## Methods

--

**See also**

HmiXValueAxisCollection (Page 3209)

HmiXValueAxisCollection.Item() (Page 3210)

**XValueAxis.ApplyScalingEntries****Description**

The "ApplyScalingEntries" property specifies whether the user scaling of the axis sections is applied.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
XValueAxis.ApplyScalingEntries
```

**See also**

XValueAxis (Page 3211)

**XValueAxis.AutoRange****Description**

The "AutoRange" property specifies whether automatic determination of the value range is activated by the minimum and maximum value of the function trend.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
XValueAxis.AutoRange
```

**See also**

XValueAxis (Page 3211)

**XValueAxis.AutoScaling**

**Description**

The "AutoScaling" property specifies whether automatic scaling is activated.

**Type**

Bool

**Access**

Read-write

**Syntax**

XValueAxis.AutoScaling

**See also**

XValueAxis (Page 3211)

**XValueAxis.AxisColor**

**Description**

The "AxisColor" property specifies the color of the value axis.

**Type**

UInt32

**Access**

Read-write

**Syntax**

XValueAxis.BackColor

**See also**

XValueAxis (Page 3211)

## XValueAxis.BeginValue

### Description

The "BeginValue" property specifies the start of a value range or value range section.

### Type

Float

### Access

Read-write

### Syntax

```
XValueAxis.BeginValue
```

### See also

XValueAxis (Page 3211)

## XValueAxis.DisplayName

### Description

The "DisplayName" property specifies the display name of the value axis.

### Type

String

### Access

Read-write

### Syntax

```
XValueAxis.DisplayName
```

### See also

XValueAxis (Page 3211)

## XValueAxis.DivisionCount

### Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

### Type

Int32

### Access

Read-write

### Syntax

`XValueAxis.DivisionCount`

### See also

XValueAxis (Page 3211)

## XValueAxis.EndValue

### Description

The "EndValue" property specifies the end of a value range or value range section.

### Type

Float

### Access

Read-write

### Syntax

`XValueAxis.EndValue`

### See also

XValueAxis (Page 3211)

## XValueAxis.HelpLines

### Description

The "HelpLines" property returns the appearance of the help lines.

### Type

Object, HmiHelpLineCollection (Page 3217)

### Access

Read-only

### Syntax

```
XValueAxis.HelpLines
```

### See also

XValueAxis (Page 3211)

HmiHelpLineCollection (Page 3217)

## HmiHelpLineCollection

### Description

The "HmiHelpLineCollection" object is a list of all help lines ("HelpLine" objects).

### Use

The "HmiHelpLineCollection" object is a list and can be counted and enumerated. You can access the "HmiHelpLineCollection" list using the index or the tag name.

### Object type

HmiHelpLineCollection

### Properties

The "HmiHelpLineCollection" object has the following properties:

- **Count**  
Returns the number of help lines of the "HmiHelpLineCollection" list.

## Methods

The "HmiHelpLineCollection" object has the following methods:

- **Item()**  
Returns a help line of the "HmiHelpLineCollection" list.

## See also

XValueAxis.HelpLines (Page 3217)

## HmiHelpLineCollection.Count

### Description

The "Count" property returns the number of help lines in the "HmiHelpLineCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

`HmiHelpLineCollection.Count`

## See also

HmiHelpLineCollection (Page 3217)

## HmiHelpLineCollection.Item()

### Description

The "Item" method returns help line of the "HmiHelpLineCollection" list.

### Syntax

`HmiHelpLineCollection[.Item] (HmiHelpLineName)`

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiHelpLineCollection" object.

---

**Parameters****HmiHelpLineName**

Type: String

Name of the help line

**Return value**

Object, HmiHelpLinePart (Page 3219)

**See also**

HmiHelpLineCollection (Page 3217)

HelpLine (Page 3219)

**HelpLine****Description**

The "HelpLine" object represents a help line of the value axis.

**Object type**

HmiHelpLinePart

**Properties**

The "HelpLine" object has the following properties:

- **Value**  
Specifies the value of the help line.
- **Visible**  
Specifies whether the help line is visible.

**Methods**

--

**See also**

HmiHelpLineCollection (Page 3217)

HmiHelpLineCollection.Item() (Page 3218)

## HelpLine.Value

### Description

The "Value" property sets the value of the help line.

### Type

Float

### Access

Read-write

### Syntax

`HelpLine.Value`

### See also

[HelpLine \(Page 3219\)](#)

## HelpLine.Visible

### Description

The "Visible" property specifies whether the help line is visible.

### Type

Bool

### Access

Read-write

### Syntax

`HelpLine.Visible`

### See also

[HelpLine \(Page 3219\)](#)

## XValueAxis.LabelColor

### Description

The "LabelColor" property specifies the color of the axis labeling.

### Type

UInt32

### Access

Read-write

### Syntax

```
XValueAxis.LabelColor
```

### See also

XValueAxis (Page 3211)

## XValueAxis.LabelFont

### Description

The "LabelFont" property specifies the font of the axis labeling.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
XValueAxis.LabelFont
```

### See also

XValueAxis (Page 3211)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

XValueAxis.LabelFont (Page 3221)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

`Font.Name`

### See also

XValueAxis.LabelFont (Page 3221)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

XValueAxis.LabelFont (Page 3221)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

### See also

XValueAxis.LabelFont (Page 3221)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

Font.Underline

### See also

XValueAxis.LabelFont (Page 3221)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**`XValueAxis.LabelFont` (Page 3221)**XValueAxis.LargeTickLabelingStep****Description**

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

**Type**

UInt8

**Access**

Read-write

**Syntax**`XValueAxis.LargeTickLabelingStep`**See also**`XValueAxis` (Page 3211)**XValueAxis.MeasurementUnit****Description**

The "MeasurementUnit" property returns the displayed unit.

**Type**

String

### Access

Read-only

### Syntax

`XValueAxis.MeasurementUnit`

### See also

XValueAxis (Page 3211)

## XValueAxis.MeasurementUnitType

### Description

The "MeasurementUnitType" property specifies the display format of the unit.

### Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

### Access

Read-write

### Syntax

`XValueAxis.MeasurementUnitType`

### See also

XValueAxis (Page 3211)

## XValueAxis.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

**Type**

String

**Access**

Read-write

**Syntax**`XValueAxis.OutputFormat`**See also**

XValueAxis (Page 3211)

**XValueAxis.ScalingEntries****Description**

The "ScalingEntries" property returns the user scaling of the axes sections.

**Type**

Object, HmiScalingEntryCollection (Page 3227)

**Access**

Read-only

**Syntax**`XValueAxis.ScalingEntries`**See also**

XValueAxis (Page 3211)

HmiScalingEntryCollection (Page 3227)

**HmiScalingEntryCollection****Description**

The "HmiScalingEntryCollection" object is a list of all user-defined axis sections ("ScalingEntry" objects).

## Use

The "HmiScalingEntryCollection" object is a list and can be counted and enumerated. You can access the "HmiScalingEntryCollection" list using the index or the tag name.

## Object type

HmiHelpLineCollection

## Properties

The "HmiScalingEntryCollection" object has the following properties:

- **Count**  
Returns the number of user-defined axis sections of the "HmiScalingEntryCollection" list.

## Methods

The "HmiScalingEntryCollection" object has the following methods:

- **Item()**  
Returns a user-defined axis section of the "HmiScalingEntryCollection" list.

## See also

XValueAxis.ScalingEntries (Page 3227)

## HmiScalingEntryCollection.Count

### Description

The "Count" property returns the number of the user-defined axis sections in the "HmiScalingEntryCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

`HmiScalingEntryCollection.Count`

**See also**

HmiScalingEntryCollection (Page 3227)

**HmiScalingEntryCollection.Item()****Description**

The "Item" method returns a user-defined axis section of the "HmiScalingEntryCollection" list.

**Syntax**

```
HmiScalingEntryCollection[.Item] (HmiScalingEntryName)
```

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiScalingEntryCollection" object.

---

**Parameters****HmiScalingEntryName**

Type: String

Name of the user-defined axis section

**Return value**

Object, HmiScalingEntryPart (Page 3229)

**See also**

HmiScalingEntryCollection (Page 3227)

Scaling Entry (Page 3229)

**Scaling Entry****Description**

The "ScalingEntry" object represents a user-defined axis section of the value axis.

**Object type**

HmiScalingEntryPart

## Properties

The "YValueAxis" object has the following properties:

- **BeginValue**  
Specifies the start of a value range section.
- **BeginValueTarget**  
Specifies the scaled value for the start of a value range section.
- **DisplayName**  
Specifies the display name of an axis section.
- **EndValue**  
Specifies the end of a value range section.
- **EndValueTarget**  
Specifies the scaled value for the end of a value range section.

## Methods

--

## See also

[HmiScalingEntryCollection](#) (Page 3227)

[HmiScalingEntryCollection.Item\(\)](#) (Page 3229)

## ScalingEntry.BeginValue

### Description

The "BeginValue" property specifies the start of a value range section.

### Type

Float

### Access

Read-write

### Syntax

`ScalingEntry.BeginValue`

## See also

[Scaling Entry](#) (Page 3229)

## ScalingEntry.BeginValueTarget

### Description

The "BeginValueTarget" property specifies the scaled value for the start of a value range section.

### Type

Float

### Access

Read-write

### Syntax

```
ScalingEntry.BeginValueTarget
```

### See also

Scaling Entry (Page 3229)

## ScalingEntry.DisplayName

### Description

The "DisplayName" property specifies the display name of an axis section.

### Type

String

### Access

Read-write

### Syntax

```
ScalingEntry.DisplayName
```

### See also

Scaling Entry (Page 3229)

## ScalingEntry.EndValue

### Description

The "EndValue" property specifies the end of a value range section.

### Type

Float

### Access

Read-write

### Syntax

`ScalingEntry.EndValue`

### See also

Scaling Entry (Page 3229)

## ScalingEntry.EndValueTarget

### Description

The "EndValueTarget" property specifies the scaled value for the end of a value range section.

### Type

Float

### Access

Read-write

### Syntax

`ScalingEntry.EndValueTarget`

### See also

Scaling Entry (Page 3229)

## XValueAxis.ScaleMode

### Description

The "ScaleMode" property specifies the scale mode.

### Type

Int32, HmiScaleMode

Specifies the scale mode:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

### Access

Read-write

### Syntax

```
XValueAxis.ScaleMode
```

### See also

XValueAxis (Page 3211)

## XValueAxis.ScalingType

### Description

The "ScalingType" property specifies the scaling.

### Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

**Access**

Read-write

**Syntax**

`XValueAxis.ScalingType`

**See also**

XValueAxis (Page 3211)

**XValueAxis.ShowScalingDisplayNames**

**Description**

The "ShowScalingDisplayNames" property specifies whether the display names of the user scaling are used.

**Type**

Bool

**Access**

Read-write

**Syntax**

`XValueAxis.ShowScalingDisplayNames`

**See also**

XValueAxis (Page 3211)

**XValueAxis.SubDivisionCount**

**Description**

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

**Type**

Int32

**Access**

Read-write

**Syntax**`XValueAxis.SubDivisionCount`**See also**

XValueAxis (Page 3211)

**XValueAxis.TickColor****Description**

The "TickColor" property specifies the color of the tick marks.

**Type**

UInt32

**Access**

Read-write

**Syntax**`XValueAxis.TickColor`**See also**

XValueAxis (Page 3211)

**XValueAxis.Visible****Description**

The "Visible" property specifies whether the value axis is visible.

**Type**

Bool

**Access**

Read-write

### Syntax

`XValueAxis.Visible`

### See also

[XValueAxis \(Page 3211\)](#)

## FunctionTrendArea.FunctionTrends

### Description

The "Trends" property returns the function trends ("FunctionTrend" objects) of the function trend area.

### Type

Object, [HmiFunctionTrendCollection \(Page 3236\)](#)

### Access

Read-only

### Syntax

`FunctionTrendArea.FunctionTrends`

### See also

[FunctionTrendArea \(Page 3207\)](#)

[HmiFunctionTrendCollection \(Page 3236\)](#)

## HmiFunctionTrendCollection

### Description

The "HmiFunctionTrendCollection" object is a list of all function trends ("FunctionTrend" objects) of the f(x) trend view.

### Use

The "HmiFunctionTrendCollection" object is a list and can be counted and enumerated. You can access the "HmiFunctionTrendCollection" list using the index or the tag names.

**Object type**

HmiFunctionTrendCollection

**Properties**

The "HmiFunctionTrendCollection" object has the following properties:

- **Count**  
Returns the number of function trends of the "HmiFunctionTrendCollection" list.

**Methods**

The "HmiFunctionTrendCollection" object has the following methods:

- **Item()**  
Returns a function trend of the "HmiFunctionTrendCollection" list.

**See also**

FunctionTrendArea.FunctionTrends (Page 3236)

**HmiFunctionTrendCollection.Count****Description**

The "Count" property returns the number of function trends in the "HmiFunctionTrendCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
HmiFunctionTrendCollection.Count
```

**See also**

HmiFunctionTrendCollection (Page 3236)

## HmiFunctionTrendCollection.Item()

### Description

The "Item" method returns a function trend of the "HmiFunctionTrendCollection" list.

### Syntax

```
HmiFunctionTrendCollection[.Item] (HmiFunctionTrendName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiFunctionTrendCollection" object.

---

### Parameters

**HmiFunctionTrendName**

Type: String

Name of the function trend.

### Return value

Object, HmiFunctionTrendPart (Page 3238)

### See also

HmiFunctionTrendCollection (Page 3236)

FunctionTrend (Page 3238)

## FunctionTrend

### Description

The "FunctionTrend" object represents a trend of the trend area.

### Object type

HmiFunctionTrendPart

## Properties

The "FunctionTrend" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **BeginTime**  
Specifies the date and time for the start time of the time range.
- **DashType**  
Specifies the stroke style of the function trend.
- **DataSourceX**  
Specifies the tag for the data source of the x value axis.
- **DataSourceY**  
Specifies the tag for the data source of the y value axis.
- **DisplayName**  
Specifies the display name of the function trend.
- **EndTime**  
Specifies the date and time for the end time of the time range.
- **LineColor**  
Specifies the function trend color.
- **LineWidth**  
Specifies the function trend width.
- **MarkerColor**  
Specifies the color of the function trend points.
- **MarkerDimension**  
Specifies the width of the function trend points.
- **MarkerGraphic**  
Specifies a graphic element as a function trend point.
- **MarkerType**  
Specifies the type of the function trend points.
- **PointCount**  
Specifies the number of measurement points from the start time.
- **QualityVisualization**  
Specifies the colors for values of a specific quality.
- **RangeType**  
Specifies the type of time range.
- **ShowLoggedDataImmediately**  
Specifies which logged values are displayed.
- **Thresholds**  
Returns the list of all limit values of the function trend.

- **TimeRangeBase**  
Specifies the base of the time range.
- **TimeRangeFactor**  
Specifies the factor of the time base for defining the time range.
- **TrendMode**  
Specifies the type of function trend display.
- **Visible**  
Specifies whether the function trend is visible.
- **XValueAxis**  
References an x value axis of the function trend.
- **YValueAxis**  
References a y value axis of the function trend.

## Methods

--

## See also

HmiFunctionTrendCollection (Page 3236)

HmiFunctionTrendCollection.Item() (Page 3238)

## FunctionTrend.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

FunctionTrend.AlternateBackColor

## See also

FunctionTrend (Page 3238)

## FunctionTrend.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

FunctionTrend.BackColor

### See also

FunctionTrend (Page 3238)

## FunctionTrend.BackFillPattern

### Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

### Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient

- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

### Access

Read-write

### Syntax

`FunctionTrend.BackFillPattern`

### See also

[FunctionTrend \(Page 3238\)](#)

## FunctionTrend.BeginTime

### Description

The "BeginTime" property specifies the date and time for the start time of the time range.

### Type

DateTime

### Access

Read-write

### Syntax

`FunctionTrend.BeginValue`

### See also

[FunctionTrend \(Page 3238\)](#)

## FunctionTrend.DashType

### Description

The "DashType" property specifies the stroke style of the function trend.

### Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

### Access

Read-write

### Syntax

```
FunctionTrend.DashType
```

### See also

FunctionTrend (Page 3238)

## FunctionTrend.DataSourceX

### Description

The "DataSourceX" property specifies the tag for the data source of the x value axis.

### Type

Object, HmiDataSourcePart

### Access

Read-write

## Syntax

`FunctionTrend.DataSourceX`

## See also

FunctionTrend (Page 3238)

## DataSource.Source

### Description

The "Source" property specifies the data source, e.g. a tag or logging tag.

### Type

String

### Access

Read-write

### Syntax

`DataSource.Source`

## See also

FunctionTrend.DataSourceX (Page 3243)

## DataSource.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

**Syntax**`DataSource.VisualizeQuality`**See also**`FunctionTrend.DataSourceX` (Page 3243)**FunctionTrend.DataSourceY****Description**

The "DataSourceY" property specifies the tag for the data source of the y value axis.

**Type**`Object, HmiDataSourcePart`**Access**`Read-write`**Syntax**`FunctionTrend.DataSourceX`**See also**`FunctionTrend` (Page 3238)**DataSource.Source****Description**

The "Source" property specifies the data source, e.g. a tag or logging tag.

**Type**`String`**Access**`Read-write`

## Syntax

`DataSource.Source`

## See also

[FunctionTrend.DataSourceY \(Page 3245\)](#)

## DataSource.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`DataSource.VisualizeQuality`

## See also

[FunctionTrend.DataSourceY \(Page 3245\)](#)

## FunctionTrend.DisplayName

### Description

The "DisplayName" property specifies the display name of the function trend.

### Type

String

### Access

Read-write

**Syntax**`FunctionTrend.DisplayName`**See also**

FunctionTrend (Page 3238)

**FunctionTrend.EndTime****Description**

The "EndTime" property specifies the date and time for the end time of the time range.

**Type**

DateTime

**Access**

Read-write

**Syntax**`FunctionTrend.EndValue`**See also**

FunctionTrend (Page 3238)

**FunctionTrend.LineColor****Description**

The "LineColor" property specifies the function trend color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`FunctionTrend.LineColor`

### See also

[FunctionTrend \(Page 3238\)](#)

## FunctionTrend.LineWidth

### Description

The "LineWidth" property specifies the function trend width.

### Type

UInt8

### Access

Read-write

### Syntax

```
FunctionTrend.LineWidth
```

### See also

[FunctionTrend \(Page 3238\)](#)

## FunctionTrend.MarkerColor

### Description

The "MarkerColor" property specifies the color of the function trend points.

### Type

UInt32

### Access

Read-write

### Syntax

```
FunctionTrend.MarkerColor
```

**See also**

FunctionTrend (Page 3238)

**FunctionTrend.MarkerDimension****Description**

The "MarkerDimension" property specifies the width of the function trend points.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`FunctionTrend.MarkerDimension`

**See also**

FunctionTrend (Page 3238)

**FunctionTrend.MarkerGraphic****Description**

The "MarkerGraphic" property specifies a graphic element as a function trend point.

**Type**

String

**Access**

Read-write

**Syntax**

`FunctionTrend.MarkerGraphic`

## See also

FunctionTrend (Page 3238)

## FunctionTrend.MarkerType

### Description

The "MarkerType" property specifies the type of function trend points.

### Type

Int32, HmiMarkerType

Specifies the type of the trend points:

- None (0): None
- Points (1): Dots
- Square (2): Square
- Circle (3): Circles
- Graphic (4): Graphic

### Access

Read-write

### Syntax

FunctionTrend.MarkerType

## See also

FunctionTrend (Page 3238)

## FunctionTrend.PointCount

### Description

The "PointCount" property specifies the number of measurement points from the start time.

### Type

Int32

**Access**

Read-write

**Syntax**`FunctionTrend.PointCount`**See also**

FunctionTrend (Page 3238)

**FunctionTrend.QualityVisualization****Description**

The "QualityVisualization" property specifies the colors for values of a specific quality.

**Type**

Object, HmiQualityPart

**Access**

Read-write

**Syntax**`FunctionTrend.QualityVisualization`**See also**

FunctionTrend (Page 3238)

**Quality.BadColor****Description**

The "BadColor" property specifies the color for values of the quality "Bad". Values of this quality cannot be used.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Quality.BadColor`

**See also**

FunctionTrend.QualityVisualization (Page 3251)

**Quality.UncertainColor**

**Description**

The "UncertainColor" property specifies the color for values of the quality "Uncertain". The quality of this level's values is worse than usual. It might still be possible to use the values, however.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Quality.UncertainColor`

**See also**

FunctionTrend.QualityVisualization (Page 3251)

**Quality.Visible**

**Description**

The "Visible" property specifies whether the colors are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Quality.Visible`**See also**

FunctionTrend.QualityVisualization (Page 3251)

**FunctionTrend.RangeType****Description**

The "RangeType" property specifies the type of time range.

**Type**

Int32, HmiTimeRangeType

Specifies the time range:

- TimeRange (0): Any time range
- FromBeginToEnd (1): Total time range
- PointCount (2): Number of measurement points

**Access**

Read-write

**Syntax**`FunctionTrend.RangeType`**See also**

FunctionTrend (Page 3238)

## FunctionTrend.ShowLoggedDataImmediately

### Description

The "ShowLoggedDataImmediately" property specifies which logged values are displayed:

- True: Entire visible range
- False: Only from current time

### Type

Bool

### Access

Read-write

### Syntax

`Trend.ShowLoggedDataImmediately`

### See also

FunctionTrend (Page 3238)

## FunctionTrend.Thresholds

### Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the function trend.

### Type

Object, HmiThresholdCollection (Page 3255)

### Access

Read-only

### Syntax

`FunctionTrend.Thresholds`

**See also**

FunctionTrend (Page 3238)

HmiThresholdCollection (Page 3255)

**HmiThresholdCollection****Description**

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

**Use**

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

**Object type**

HmiThresholdCollection

**Properties**

The "HmiThresholdCollection" object has the following properties:

- **Count**  
Returns the number of limit values of the "HmiThresholdCollection" list.

**Methods**

The "HmiThresholdCollection" object has the following methods:

- **Item()**  
Returns a limit value of the "HmiThresholdCollection" list.

**See also**

FunctionTrend.Thresholds (Page 3254)

**HmiThresholdCollection.Count****Description**

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

**Type**

UInt32

### Access

Read-only

### Syntax

```
HmiThresholdCollection.Count
```

### See also

HmiThresholdCollection (Page 3255)

## HmiThresholdCollection.Item()

### Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

### Syntax

```
HmiThresholdCollection[.Item] (HmiThresholdName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

---

### Parameters

#### **HmiThresholdName**

Type: String

Name of the limit value

### Return value

Object, HmiThresholdPart (Page 3257)

### See also

HmiThresholdCollection (Page 3255)

Threshold (Page 3257)

## Threshold

### Description

The "Threshold" object represents a limit value.

### Object type

HmiThresholdPart

### Properties

The "Threshold" object has the following properties:

- **Color**  
Specifies the color of the limit value.
- **DisplayName**  
Specifies the display name of the limit value.
- **Name**  
Specifies the name of the limit value.
- **ThresholdMode**  
Specifies the type of limit value.
- **Value**  
Returns the limit value.

### Methods

--

### See also

HmiThresholdCollection (Page 3255)

HmiThresholdCollection.Item() (Page 3256)

## Threshold.Color

### Description

The "Color" property specifies the color of the limit value.

### Type

UInt32

**Access**

Read-write

**Syntax**

`Threshold.Color`

**See also**

Threshold (Page 3257)

**Threshold.DisplayName**

**Description**

The "DisplayName" property specifies the display name of the limit value.

**Type**

String

**Access**

Read-write

**Syntax**

`Threshold.DisplayName`

**See also**

Threshold (Page 3257)

**Threshold.Name**

**Description**

The "Name" property specifies the name of the limit value.

**Type**

String

**Access**

Read-write

**Syntax**

Threshold.Name

**See also**

Threshold (Page 3257)

**Threshold.ThresholdMode****Description**

The "ThresholdMode" property specifies the type of limit value.

**Type**

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

**Access**

Read-write

**Syntax**

Threshold.ThresholdMode

**See also**

Threshold (Page 3257)

**Threshold.Value****Description**

The "Value" property returns the limit value of the tag.

**Type**

Float

**Access**

Read-only

**Syntax**

Threshold.Value

**See also**

Threshold (Page 3257)

**FunctionTrend.TimeRangeBase**

**Description**

The "TimeRangeBase" property specifies the base of the time range.

**Type**

Int32, HmiTimeRangeBase

Specifies a time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

**Access**

Read-write

**Syntax**

FunctionTrend.TimeRangeBase

**See also**

FunctionTrend (Page 3238)

**FunctionTrend.TimeRangeFactor****Description**

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

**Type**

Int32

**Access**

Read-write

**Syntax**

`FunctionTrend.TimeRangeFactor`

**See also**

FunctionTrend (Page 3238)

**FunctionTrend.TrendMode****Description**

The "TrendMode" property specifies the type of function trend display.

**Type**

Int32, HmiTrendMode

Specifies the trend type:

- Points (0): Dots
- Interpolated (1): Interpolated
- Stepped (2): Levels
- Bar (3): Bar
- Value (4): Values

**Access**

Read-write

**Syntax**

`FunctionTrend.TrendMode`

**See also**

FunctionTrend (Page 3238)

**FunctionTrend.Visible**

**Description**

The "Visible" property specifies whether the function trend is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`FunctionTrend.Visible`

**See also**

FunctionTrend (Page 3238)

**FunctionTrend.XValueAxis**

**Description**

The "XValueAxis" property references an x value axis of the function trend.

**Type**

Object, HmiXValueAxisPart (Page 3211)

**Access**

Read-write

**Syntax**

FunctionTrend.XValueAxis

**See also**

FunctionTrend (Page 3238)

XValueAxis (Page 3211)

**XValueAxis****Description**

XValueAxis (Page 3211)

**FunctionTrend.YValueAxis****Description**

The "YValueAxis" property references a y value axis of the function trend.

**Type**

Object, HmiYValueAxisPart (Page 3267)

**Access**

Read-write

**Syntax**

FunctionTrend.YValueAxis

**See also**

FunctionTrend (Page 3238)

YValueAxis (Page 3267)

**YValueAxis****Description**

YValueAxis (Page 3267)

## FunctionTrendArea.GridLines

### Description

The "GridLines" property specifies the grid lines of the function trend area.

### Type

Int32, HmiGridLine

Specifies the display of the grid lines:

- None (0): None
- VerticalMajor (1): Vertical, coarse
- HorizontalMajor (2): Horizontal, coarse
- VerticalMinor (4): Vertical, fine
- HorizontalMinor (8): Horizontal, fine

### Access

Read-write

### Syntax

```
FunctionTrendArea.GridLines
```

### See also

FunctionTrendArea (Page 3207)

## FunctionTrendArea.LeftValueAxes

### Description

The "LeftValueAxes" property returns the left value axes of the function trend area.

### Type

Object, HmiYValueAxisCollection (Page 3265)

### Access

Read-only

## Syntax

```
TrendArea.LeftValueAxes
```

## See also

FunctionTrendArea (Page 3207)

HmiYValueAxisCollection (Page 3265)

## HmiYValueAxisCollection

### Description

The "HmiYValueAxisCollection" object is a list of all value axes ("YValueAxis" objects) of the trend area.

### Use

The "HmiYValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiYValueAxisCollection" list using the index or the tag name.

### Object type

HmiYValueAxisCollection

### Properties

The "HmiYValueAxisCollection" object has the following properties:

- **Count**  
Returns the number of value axes in the "HmiYValueAxisCollection" list.

### Methods

The "HmiYValueAxisCollection" object has the following methods:

- **Item()**  
Returns a value axis of the "HmiYValueAxisCollection" list.

## See also

TrendArea.LeftValueAxes (Page 6784)

HmiYValueAxisCollection (Page 3265)

## HmiYValueAxisCollection.Count

### Description

The "Count" property returns the number of value axes in the "HmiYValueAxisCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiYValueAxisCollection.Count
```

### See also

HmiYValueAxisCollection (Page 3265)

## HmiYValueAxisCollection.Item()

### Description

The "Item" method returns a value axis of the "HmiYValueAxisCollection" list.

### Syntax

```
HmiYValueAxisCollection[.Item] (HmiYValueAxisName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiYValueAxisCollection" object.

---

### Parameters

#### **HmiYValueAxisName**

Type: String

Name of the value axis

**Return value**

Object, HmiYValueAxisPart (Page 3267)

**See also**

HmiYValueAxisCollection (Page 3265)

YValueAxis (Page 3267)

**YValueAxis****Description**

The "YValueAxis" object represents a value axis of the trend area.

**Object type**

HmiYValueAxisPart

**Properties**

The "YValueAxis" object has the following properties:

- **ApplyScalingEntries**  
Specifies whether the user scaling of the axis section is applied.
- **AutoRange**  
Specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.
- **AutoScaling**  
Specifies whether the automatic scaling is activated.
- **AxisColor**  
Specifies the color of the value axis.
- **BeginValue**  
Specifies the start of a value range or value range section.
- **DisplayName**  
Specifies the display name of the value axis.
- **DivisionCount**  
Specifies the number of main units with subdivisions.
- **EndValue**  
Specifies the end of a value range or value range section.
- **HelpLines**  
Returns the appearance of the help lines.
- **LabelColor**  
Specifies the color of the axis labeling.

- **LabelFont**  
Specifies the font of the axis labeling.
- **LargeTickLabelingStep**  
Specifies the interval at which scale sections are labeled.
- **MeasurementUnit**  
Returns the displayed unit.
- **MeasurementUnitType**  
Specifies the display format of the unit.
- **OutputFormat**  
Specifies the format for displaying the axis values.
- **ScalingEntries**  
Returns the specification of the user scaling of the axis sections.
- **ScaleMode**  
Specifies the scale mode:
- **ScalingType**  
Specifies the scaling.
- **ShowScalingDisplayNames**  
Specifies whether the display names of the user scaling are used.
- **SubDivisionCount**  
Specifies the number of divisions of the main units.
- **TickColor**  
Specifies the color of the tick marks.
- **Visible**  
Specifies whether the value axis is visible.

## Methods

--

## See also

HmiYValueAxisCollection (Page 3265)

HmiYValueAxisCollection.Item() (Page 3266)

## YValueAxis.ApplyScalingEntries

### Description

The "ApplyScalingEntries" property specifies whether the user scaling of the axis sections is applied.

**Type**

Bool

**Access**

Read-write

**Syntax**`YValueAxis.ApplyScalingEntries`**See also**

YValueAxis (Page 3267)

**YValueAxis.AutoRange****Description**

The "AutoRange" property specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.

**Type**

Bool

**Access**

Read-write

**Syntax**`YValueAxis.AutoRange`**See also**

YValueAxis (Page 3267)

**YValueAxis.AutoScaling****Description**

The "AutoScaling" property specifies whether automatic scaling is activated.

**Type**

Bool

**Access**

Read-write

**Syntax**

`YValueAxis.AutoScaling`

**See also**

YValueAxis (Page 3267)

**YValueAxis.AxisColor**

**Description**

The "AxisColor" property specifies the color of the value axis.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`YValueAxis.BackColor`

**See also**

YValueAxis (Page 3267)

**YValueAxis.BeginValue**

**Description**

The "BeginValue" property specifies the start of a value range or value range section.

**Type**

Float

**Access**

Read-write

**Syntax**`YValueAxis.BeginValue`**See also**

YValueAxis (Page 3267)

**YValueAxis.DisplayName****Description**

The "DisplayName" property specifies the display name of the value axis.

**Type**

String

**Access**

Read-write

**Syntax**`YValueAxis.DisplayName`**See also**

YValueAxis (Page 3267)

**YValueAxis.DivisionCount****Description**

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

**Type**

Int32

**Access**

Read-write

**Syntax**

`YValueAxis.DivisionCount`

**See also**

YValueAxis (Page 3267)

**YValueAxis.EndValue**

**Description**

The "EndValue" property specifies the end of a value range or value range section.

**Type**

Float

**Access**

Read-write

**Syntax**

`YValueAxis.EndValue`

**See also**

YValueAxis (Page 3267)

**YValueAxis.HelpLines**

**Description**

The "HelpLines" property returns the appearance of the help lines.

**Type**

Object, HmiHelpLineCollection (Page 3273)

**Access**

Read-only

## Syntax

```
YValueAxis.HelpLines
```

## See also

YValueAxis (Page 3267)

HmiHelpLineCollection (Page 3273)

## HmiHelpLineCollection

### Description

The "HmiHelpLineCollection" object is a list of all help lines ("HelpLine" objects).

### Use

The "HmiHelpLineCollection" object is a list and can be counted and enumerated. You can access the "HmiHelpLineCollection" list using the index or the tag name.

### Object type

HmiHelpLineCollection

### Properties

The "HmiHelpLineCollection" object has the following properties:

- **Count**  
Returns the number of help lines of the "HmiHelpLineCollection" list.

### Methods

The "HmiHelpLineCollection" object has the following methods:

- **Item()**  
Returns a help line of the "HmiHelpLineCollection" list.

## See also

YValueAxis.HelpLines (Page 3272)

## HmiHelpLineCollection.Count

### Description

The "Count" property returns the number of help lines in the "HmiHelpLineCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

HmiHelpLineCollection.Count

**See also**

HmiHelpLineCollection (Page 3273)

**HmiHelpLineCollection.Item()**

**Description**

The "Item" method returns help line of the "HmiHelpLineCollection" list.

**Syntax**

HmiHelpLineCollection[.Item] (HmiHelpLineName)

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiHelpLineCollection" object.

---

**Parameters**

**HmiHelpLineName**

Type: String

Name of the help line

**Return value**

Object, HmiHelpLinePart (Page 3275)

**See also**

HmiHelpLineCollection (Page 3273)

HelpLine (Page 3275)

## HelpLine

### Description

The "HelpLine" object represents a help line of the value axis.

### Object type

HmiHelpLinePart

### Properties

The "HelpLine" object has the following properties:

- **Value**  
Specifies the value of the help line.
- **Visible**  
Specifies whether the help line is visible.

### Methods

--

### See also

HmiHelpLineCollection (Page 3273)

HmiHelpLineCollection.Item() (Page 3274)

## HelpLine.Value

### Description

The "Value" property sets the value of the help line.

### Type

Float

### Access

Read-write

### Syntax

HelpLine.Value

### See also

HelpLine (Page 3275)

## HelpLine.Visible

### Description

The "Visible" property specifies whether the help line is visible.

### Type

Bool

### Access

Read-write

### Syntax

HelpLine.Visible

### See also

HelpLine (Page 3275)

## YValueAxis.LabelColor

### Description

The "LabelColor" property specifies the color of the axis labeling.

### Type

UInt32

### Access

Read-write

### Syntax

YValueAxis.LabelColor

### See also

YValueAxis (Page 3267)

## YValueAxis.LabelFont

### Description

The "LabelFont" property specifies the font of the axis labeling.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
YValueAxis.LabelFont
```

### See also

YValueAxis (Page 3267)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

YValueAxis.LabelFont (Page 3277)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

YValueAxis.LabelFont (Page 3277)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

YValueAxis.LabelFont (Page 3277)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

YValueAxis.LabelFont (Page 3277)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

## See also

YValueAxis.LabelFont (Page 3277)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

Font.Weight

## See also

YValueAxis.LabelFont (Page 3277)

## YValueAxis.LargeTickLabelingStep

### Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

### Type

UInt8

**Access**

Read-write

**Syntax**`YValueAxis.LargeTickLabelingStep`**See also**

YValueAxis (Page 3267)

**YValueAxis.MeasurementUnit****Description**

The "MeasurementUnit" property returns the displayed unit.

**Type**

String

**Access**

Read-only

**Syntax**`YValueAxis.MeasurementUnit`**See also**

YValueAxis (Page 3267)

**YValueAxis.MeasurementUnitType****Description**

The "MeasurementUnitType" property specifies the display format of the unit.

**Type**

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

### Access

Read-write

### Syntax

`YValueAxis.MeasurementUnitType`

### See also

[YValueAxis \(Page 3267\)](#)

## YValueAxis.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

### Type

String

### Access

Read-write

### Syntax

`YValueAxis.OutputFormat`

### See also

[YValueAxis \(Page 3267\)](#)

## YValueAxis.ScalingEntries

### Description

The "ScalingEntries" property returns the user scaling of the axes sections.

**Type**

Object, HmiScalingEntryCollection (Page 3283)

**Access**

Read-only

**Syntax**

```
YValueAxis.ScalingEntries
```

**See also**

YValueAxis (Page 3267)

HmiScalingEntryCollection (Page 3283)

**HmiScalingEntryCollection****Description**

The "HmiScalingEntryCollection" object is a list of all user-defined axis sections ("ScalingEntry" objects).

**Use**

The "HmiScalingEntryCollection" object is a list and can be counted and enumerated. You can access the "HmiScalingEntryCollection" list using the index or the tag name.

**Object type**

HmiHelpLineCollection

**Properties**

The "HmiScalingEntryCollection" object has the following properties:

- **Count**  
Returns the number of user-defined axis sections of the "HmiScalingEntryCollection" list.

**Methods**

The "HmiScalingEntryCollection" object has the following methods:

- **Item()**  
Returns a user-defined axis section of the "HmiScalingEntryCollection" list.

## See also

[YValueAxis.ScalingEntries](#) (Page 3282)

## HmiScalingEntryCollection.Count

### Description

The "Count" property returns the number of the user-defined axis sections in the "HmiScalingEntryCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiScalingEntryCollection.Count
```

## See also

[HmiScalingEntryCollection](#) (Page 3283)

## HmiScalingEntryCollection.Item()

### Description

The "Item" method returns a user-defined axis section of the "HmiScalingEntryCollection" list.

### Syntax

```
HmiScalingEntryCollection[.Item] (HmiScalingEntryName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiScalingEntryCollection" object.

---

### Parameters

**HmiScalingEntryName**

Type: String

Name of the user-defined axis section

### Return value

Object, HmiScalingEntryPart (Page 3285)

### See also

HmiScalingEntryCollection (Page 3283)

Scaling Entry (Page 3285)

## Scaling Entry

### Description

The "ScalingEntry" object represents a user-defined axis section of the value axis.

### Object type

HmiScalingEntryPart

### Properties

The "YValueAxis" object has the following properties:

- **BeginValue**  
Specifies the start of a value range section.
- **BeginValueTarget**  
Specifies the scaled value for the start of a value range section.
- **DisplayName**  
Specifies the display name of an axis section.
- **EndValue**  
Specifies the end of a value range section.
- **EndValueTarget**  
Specifies the scaled value for the end of a value range section.

### Methods

--

### See also

HmiScalingEntryCollection (Page 3283)

HmiScalingEntryCollection.Item() (Page 3284)

## ScalingEntry.BeginValue

### Description

The "BeginValue" property specifies the start of a value range section.

### Type

Float

### Access

Read-write

### Syntax

`ScalingEntry.BeginValue`

### See also

Scaling Entry (Page 3285)

## ScalingEntry.BeginValueTarget

### Description

The "BeginValueTarget" property specifies the scaled value for the start of a value range section.

### Type

Float

### Access

Read-write

### Syntax

`ScalingEntry.BeginValueTarget`

### See also

Scaling Entry (Page 3285)

## ScalingEntry.DisplayName

### Description

The "DisplayName" property specifies the display name of an axis section.

### Type

String

### Access

Read-write

### Syntax

```
ScalingEntry.DisplayName
```

### See also

Scaling Entry (Page 3285)

## ScalingEntry.EndValue

### Description

The "EndValue" property specifies the end of a value range section.

### Type

Float

### Access

Read-write

### Syntax

```
ScalingEntry.EndValue
```

### See also

Scaling Entry (Page 3285)

## ScalingEntry.EndValueTarget

### Description

The "EndValueTarget" property specifies the scaled value for the end of a value range section.

### Type

Float

### Access

Read-write

### Syntax

`ScalingEntry.EndValueTarget`

### See also

Scaling Entry (Page 3285)

## YValueAxis.ScaleMode

### Description

The "ScaleMode" property specifies the scale mode.

### Type

Int32, HmiScaleMode

Specifies the scale mode:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

### Access

Read-write

### Syntax

`YValueAxis.ScaleMode`

**See also**

[YValueAxis](#) (Page 3267)

**YValueAxis.ScalingType****Description**

The "ScalingType" property specifies the scaling.

**Type**

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

**Access**

Read-write

**Syntax**

`YValueAxis.ScalingType`

**See also**

[YValueAxis](#) (Page 3267)

**YValueAxis.ShowScalingDisplayNames****Description**

The "ShowScalingDisplayNames" property specifies whether the display names of the user scaling are used.

**Type**

Bool

**Access**

Read-write

**Syntax**

`YValueAxis.ShowScalingDisplayNames`

**See also**

[YValueAxis \(Page 3267\)](#)

**YValueAxis.SubDivisionCount**

**Description**

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

**Type**

Int32

**Access**

Read-write

**Syntax**

`YValueAxis.SubDivisionCount`

**See also**

[YValueAxis \(Page 3267\)](#)

**YValueAxis.TickColor**

**Description**

The "TickColor" property specifies the color of the tick marks.

**Type**

UInt32

**Access**

Read-write

**Syntax**`YValueAxis.TickColor`**See also**

YValueAxis (Page 3267)

**YValueAxis.Visible****Description**

The "Visible" property specifies whether the value axis is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`YValueAxis.Visible`**See also**

YValueAxis (Page 3267)

**FunctionTrendArea.MajorGridLinesColor****Description**

The "MajorGridLinesColor" property specifies the color of the main grid lines.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
FunctionTrendArea.MajorGridLinesColor
```

## See also

FunctionTrendArea (Page 3207)

## FunctionTrendArea.MinorGridLinesColor

### Description

The "MinorGridLinesColor" specifies the color of the auxiliary grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
FunctionTrendArea.MinorGridLinesColor
```

## See also

FunctionTrendArea (Page 3207)

## FunctionTrendArea.Name

### Description

The "Name" property returns the name of the function trend area.

### Type

String

### Access

Read-only

**Syntax**

`FunctionTrendArea.Name`

**See also**

[FunctionTrendArea \(Page 3207\)](#)

**FunctionTrendArea.RightValueAxes****Description**

The "RightValueAxes" property returns the right value axes of the function trend area.

**Type**

Object, [HmiYValueAxisCollection \(Page 3265\)](#)

**Access**

Read-only

**Syntax**

`FunctionTrendArea.RightValueAxes`

**See also**

[FunctionTrendArea \(Page 3207\)](#)

[HmiYValueAxisCollection \(Page 3265\)](#)

**YValueAxisCollection****Description**

[YValueAxisCollection \(Page 3265\)](#)

**FunctionTrendArea.Ruler****Description**

The "Ruler" property specifies the appearance of the ruler to determine the function trend value.

**Type**

Object, HmiRulerPart

**Access**

Read-write

**Syntax**

`FunctionTrendArea.Ruler`

**See also**

FunctionTrendArea (Page 3207)

**Ruler.Color**

**Description**

The "Color" property specifies the color of the ruler.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Ruler.Color`

**See also**

FunctionTrendArea.Ruler (Page 3293)

**Ruler.Width**

**Description**

The "Width" property specifies the width of the ruler.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Ruler.Width`**See also**

FunctionTrendArea.Ruler (Page 3293)

**FunctionTrendArea.SelectedFunctionTrend****Description**

The "SelectedFunctionTrend" property specifies the selected function trend of the function trend area.

**Type**

Object, HmiFunctionTrendPart (Page 3238)

**Access**

Read-write

**Syntax**`FunctionTrendArea.SelectedFunctionTrend`**See also**

FunctionTrendArea (Page 3207)

FunctionTrend (Page 3238)

**FunctionTrend****Description**

FunctionTrend (Page 3238)

## FunctionTrendArea.SizeFactor

### Description

The "SizeFactor" property specifies the scaling factor of the function trend area relative to its height.

### Type

UInt16

### Access

Read-write

### Syntax

```
FunctionTrendArea.SizeFactor
```

### See also

FunctionTrendArea (Page 3207)

## FunctionTrendArea.TopValueAxes

### Description

The "TopValueAxes" property returns the upper value axes of the function trend area.

### Type

Object, HmiXValueAxisCollection (Page 3209)

### Access

Read-only

### Syntax

```
FunctionTrendArea.TopValueAxes
```

### See also

FunctionTrendArea (Page 3207)

HmiXValueAxisCollection (Page 3209)

## XValueAxisCollection

### Description

XValueAxisCollection (Page 3209)

## FunctionTrendArea.Visible

### Description

The "Visible" property specifies whether the function trend area is visible.

### Type

Bool

### Access

Read-write

### Syntax

FunctionTrendArea.Visible

### See also

FunctionTrendArea (Page 3207)

## FunctionTrendControl.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

FunctionTrendControl.Height

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Icon**

**Description**

The "Icon" property specifies the icon of the f(x) trend view.

**Type**

String

**Access**

Read-write

**Syntax**

`FunctionTrendControl.Icon`

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Layer**

**Description**

The "Layer" property returns the layer of the screen in which the f(x) trend view is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`FunctionTrendControl.Layer`

**See also**

FunctionTrendControl (Page 3193)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

**See also**

FunctionTrendControl.Layer (Page 3298)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MinimumZoom`

**See also**

FunctionTrendControl.Layer (Page 3298)

**Layer.Name**

**Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

FunctionTrendControl.Layer (Page 3298)

**Layer.Visible**

**Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

FunctionTrendControl.Layer (Page 3298)

**FunctionTrendControl.Left****Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`FunctionTrendControl.Left`

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Legend****Description**

The "Legend" property specifies the appearance of the legend ("Legend" object).

**Type**

Object, HmiLegendPart

**Access**

Read-write

**Syntax**

`FunctionTrendControl.Legend`

**See also**

FunctionTrendControl (Page 3193)

**Legend.ForeColor**

**Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Legend.ForeColor`

**See also**

FunctionTrendControl.Legend (Page 3301)

**Legend.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Legend.Font`

**See also**

FunctionTrendControl.Legend (Page 3301)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Legend.Font (Page 3302)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Legend.Font (Page 3302)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

Legend.Font (Page 3302)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

Font.StrikeOut

**See also**

Legend.Font (Page 3302)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

Legend.Font (Page 3302)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

Legend.Font (Page 3302)

**Legend.Visible**

**Description**

The "Visible" property specifies whether the legend is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Legend.Visible`

**See also**

FunctionTrendControl.Legend (Page 3301)

**FunctionTrendControl.Margin**

**Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`FunctionTrendControl.Margin`**See also**

FunctionTrendControl (Page 3193)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

FunctionTrendControl.Margin (Page 3306)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

FunctionTrendControl.Margin (Page 3306)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

FunctionTrendControl.Margin (Page 3306)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**

FunctionTrendControl.Margin (Page 3306)

**FunctionTrendControl.Name****Description**

The "Name" property returns the name of the f(x) trend view.

**Type**

String

**Access**

Read-only

**Syntax**`FunctionTrendControl.Name`**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Online****Description**

The "Online" property specifies the start and stop of the update of the f(x) trend view.

- True: Online. The f(x) trend view is updated with new values.
- False: Offline. No new values are added to the f(x) trend view.

**Type**

Bool

**Access**

Read-write

**Syntax**

`FunctionTrendControl.Online`

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`FunctionTrendControl.Parent`

**See also**

FunctionTrendControl (Page 3193)  
Screen Items (Page 1742)

**Screen Items**

**Description**

Screen Items (Page 1742)

## FunctionTrendControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the f(x) trend view was created.

### Type

String

### Access

Read-only

### Syntax

`FunctionTrendControl.RenderingTemplate`

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.ShiftAxis

### Description

The "ShiftAxis" property specifies whether to swap the x axis and y axis of the f(x) trend view.

### Type

Bool

### Access

Read-write

### Syntax

`FunctionTrendControl.ShiftAxis`

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the f(x) trend view is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
FunctionTrendControl.ShowFocusVisual
```

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.ShowRuler

### Description

The "ShowRuler" property specifies whether the ruler is displayed for determining a function trend value.

### Type

Bool

### Access

Read-write

### Syntax

```
FunctionTrendControl.ShowRuler
```

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.StatusBar

### Description

The "StatusBar" property specifies the information bar of the f(x) trend view.

### Type

Object, HmiStatusBarPart

### Access

Read-write

### Syntax

`FunctionTrendControl.StatusBar`

### See also

FunctionTrendControl (Page 3193)

## StatusBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`StatusBar.BackColor`

### See also

FunctionTrendControl.StatusBar (Page 3313)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 3314)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

### See also

HmiControlBarElementCollection (Page 3314)

FunctionTrendControl.StatusBar (Page 3313)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 3314)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 3314)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 6624)

## See also

HmiControlBarElementCollection (Page 3314)

Control Bar Elements (Page 6624)

## Control Bar Elements

### Description

Control Bar Elements (Page 3331)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

`StatusBar.Enabled`

**See also**

[FunctionTrendControl.StatusBar \(Page 3313\)](#)

**StatusBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`StatusBar.Font`

**See also**

[FunctionTrendControl.StatusBar \(Page 3313\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Italic`

## See also

StatusBar.Font (Page 3317)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

## Syntax

`Font.Name`

## See also

StatusBar.Font (Page 3317)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

**Syntax**`Font.Size`**See also**`StatusBar.Font` (Page 3317)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**`Int32, HmiFontStrikeOut`

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**`Read-write`**Syntax**`Font.StrikeOut`**See also**`StatusBar.Font` (Page 3317)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**`Bool`

### Access

Read-write

### Syntax

`Font.Underline`

### See also

StatusBar.Font (Page 3317)

### Font.Weight

#### Description

The "Weight" property specifies the font thickness.

#### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

StatusBar.Font (Page 3317)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
StatusBar.Margin
```

### See also

FunctionTrendControl.StatusBar (Page 3313)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

```
Margin.Bottom
```

### See also

StatusBar.Margin (Page 3321)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[StatusBar.Margin \(Page 3321\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[StatusBar.Margin \(Page 3321\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[StatusBar.Margin \(Page 3321\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

### See also

[FunctionTrendControl.StatusBar \(Page 3313\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[StatusBar.Padding \(Page 3323\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[StatusBar.Padding \(Page 3323\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[StatusBar.Padding \(Page 3323\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[StatusBar.Padding \(Page 3323\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.ShowToolTips`

### See also

FunctionTrendControl.StatusBar (Page 3313)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

`StatusBar.Visible`

### See also

FunctionTrendControl.StatusBar (Page 3313)

## FunctionTrendControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the f(x) trend view.

### Type

String

### Access

Read-only

### Syntax

```
FunctionTrendControl.StyleItemClass
```

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.TabIndex

### Description

The "TabIndex" property returns the position of the f(x) trend view in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
FunctionTrendControl.TabIndex
```

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the f(x) trend view.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

```
FunctionTrendControl.ToolBar
```

### See also

FunctionTrendControl (Page 3193)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ToolBar.BackColor
```

### See also

FunctionTrendControl.ToolBar (Page 3328)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 3329)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

HmiControlBarElementCollection (Page 3329)

FunctionTrendControl.ToolBar (Page 3328)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

[ToolBar.Elements \(Page 3329\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

[HmiControlBarElementCollection \(Page 3329\)](#)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 3331)

## See also

HmiControlBarElementCollection (Page 3329)

Control Bar Elements (Page 3331)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

## Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiControlBarElementCollection (Page 3329)

HmiControlBarElementCollection.Item() (Page 3330)

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

## See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

## See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

**See also**

ControlBarButton (Page 3331)

**ControlBarButton.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.BackColor
```

**See also**

ControlBarButton (Page 3331)

**ControlBarButton.Badge****Description**

The "Badge" property specifies the label of the button.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

```
ControlBarButton.Badge
```

**See also**

[ControlBarButton \(Page 3331\)](#)

**ControlBarButton.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.BorderColor`

**See also**

[ControlBarButton \(Page 3331\)](#)

**ControlBarButton.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`ControlBarButton.BorderWidth`

**See also**

ControlBarButton (Page 3331)

**ControlBarButton.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

```
ControlBarButton.Content
```

**See also**

ControlBarButton (Page 3331)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

## Syntax

`Content.ContentMode`

## See also

[ControlBarButton.Content \(Page 3337\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

[ControlBarButton.Content \(Page 3337\)](#)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarButton.Content \(Page 3337\)](#)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

[ControlBarButton.Content \(Page 3337\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content \(Page 3337\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarButton.Content (Page 3337)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarButton.Content (Page 3337)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 3337\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarButton.CustomID`

### See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 3331)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 3331)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.Graphic`

### See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarButton.Mapping`

### See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer distance of the button.

### Type

Object, HmiMarginPart

### Access

Read-write

## Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 3331\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarButton.Margin \(Page 3347\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 3347)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarButton.Margin` (Page 3347)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 3347\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.MaximumHeight`

## See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 3331)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MinimumHeight
```

**See also**

ControlBarButton (Page 3331)

**ControlBarButton.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarButton.MinimumWidth
```

## See also

ControlBarButton (Page 3331)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarButton.Operability
```

## See also

ControlBarButton (Page 3331)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**[ControlBarButton \(Page 3331\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**[ControlBarButton.Padding \(Page 3352\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 3352\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarButton.Padding \(Page 3352\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarButton.Padding \(Page 3352\)](#)**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarButton.RequireExplicitUnlock`**See also**[ControlBarButton \(Page 3331\)](#)**ControlBarButton.Text****Description**

The "Text" property specifies the label of the button.

**Type**

String

### Access

Read-write

### Syntax

`ControlBarButton.Text`

### See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.ToolTipText`

### See also

[ControlBarButton \(Page 3331\)](#)

## ControlBarButton.Visible

### Description

The "Visible" property specifies whether the button is visible.

### Type

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 3331)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.Width`**See also**

ControlBarButton (Page 3331)

**ControlBarDisplay****Description**

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarDisplayPart

## Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

## See also

ControlBarDisplay (Page 3357)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Content`

**See also**

[ControlBarDisplay \(Page 3357\)](#)

**Content.ContentMode**

**Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

[ControlBarButton.Content \(Page 3359\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

```
Content.GraphicStretchMode
```

### See also

ControlBarButton.Content (Page 3359)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered

- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarButton.Content \(Page 3359\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 3359\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**`Content.SplitRatio`**See also**[ControlBarButton.Content \(Page 3359\)](#)**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**`Content.TextPosition`**See also**[ControlBarButton.Content \(Page 3359\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content](#) (Page 3359)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[ControlBarButton.Content](#) (Page 3359)

**ControlBarDisplay.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay](#) (Page 3357)

**ControlBarDisplay.Enabled****Description**

The "Enabled" property specifies whether the display is active in runtime.

**Type**

Bool

**Access**

Read-write

## Syntax

`ControlBarDisplay.Enabled`

## See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.ForeColor`

## See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

**Syntax**

```
ControlBarDisplay.Graphic
```

**See also**

ControlBarDisplay (Page 3357)

**ControlBarDisplay.Height****Description**

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.Height
```

**See also**

ControlBarDisplay (Page 3357)

**ControlBarDisplay.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control

- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available

- `ConnectionStatus (273)`: Connection status
- `Print (30)`: Print
- `ShowActiveAlarms (31)`: Show active alarms
- `ShowLoggedAlarms (32)`: Show logged alarms
- `ShowLoggedAlarmsUpdated (33)`: Show and update logged alarms
- `ShowDefinedAlarms (34)`: Show defined alarms
- `SingleReset (35)`: Single confirm
- `Export (36)`: Export
- `MoveToNextAcknowledgeableAlarm (37)`: Skip to the next alarm that requires acknowledgment
- `StartTime (274)`: Start time
- `EndTime (275)`: End time
- `CurrentContextHint (276)`: Note on current context
- `SelectContext (38)`: Select context
- `StatusText (277)`: Status text
- `Custom (65536)`: Reserved for user-defined functions. The "CustomID" property can be used for identification.
- `PendingResettableAlarms (278)`: Pending engaged alarms
- `StatisticsSetup (39)`: Show alarm statistics settings
- `MaximumRecordsExceeded (279)`: Number of logged alarms exceeds the value of `AlarmStatisticsSettings.MaximumRecords`.

## Access

Read-only

## Syntax

```
ControlBarDisplay.Mapping
```

## See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarButton.Margin

## Description

The "Margin" property specifies the surrounded outer spacing of the display.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Margin`

**See also**

ControlBarDisplay (Page 3357)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

ControlBarButton.Margin (Page 3369)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarButton.Margin \(Page 3369\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarButton.Margin \(Page 3369\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

ControlBarButton.Margin (Page 3369)

**ControlBarDisplay.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

ControlBarDisplay.MaximumHeight

**See also**

ControlBarDisplay (Page 3357)

**ControlBarDisplay.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.MaximumWidth`**See also**

ControlBarDisplay (Page 3357)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.MinimumHeight`**See also**

ControlBarDisplay (Page 3357)

**ControlBarDisplay.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.MinimumWidth`

**See also**

ControlBarDisplay (Page 3357)

**ControlBarDisplay.Operability**

**Description**

The "Operability" property returns whether the display is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarDisplay.Operability`

**See also**

ControlBarDisplay (Page 3357)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the display.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarDisplay.Padding
```

### See also

ControlBarDisplay (Page 3357)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

```
Padding.Bottom
```

### See also

ControlBarButton.Padding (Page 3375)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 3375\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarButton.Padding \(Page 3375\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Top

### See also

[ControlBarButton.Padding \(Page 3375\)](#)

## ControlBarDisplay.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

ControlBarDisplay.RequireExplicitUnlock

### See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarDisplay.Text

### Description

The "Text" property specifies the label of the display.

### Type

String

### Access

Read-write

### Syntax

`ControlBarDisplay.Text`

### See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarDisplay.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the display.

### Type

String

### Access

Read-write

### Syntax

`ControlBarDisplay.ToolTipText`

### See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarDisplay.Visible

### Description

The "Visible" property specifies whether the display is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Visible`

### See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarDisplay.Width

### Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Width`

### See also

[ControlBarDisplay \(Page 3357\)](#)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

### Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.

- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarLabel.Authorization
```

## See also

[ControlBarLabel](#) (Page 3380)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarLabel.CustomID
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarLabel.Enabled
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.ForeColor
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.Height

### Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.Height
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display

- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status

- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Margin`

**See also**

[ControlBarLabel \(Page 3380\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarLabel.Margin \(Page 3386\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarLabel.Margin \(Page 3386\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarLabel.Margin \(Page 3386\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarLabel.Margin \(Page 3386\)](#)**ControlBarLabel.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.MaximumHeight`**See also**[ControlBarLabel \(Page 3380\)](#)**ControlBarLabel.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

UInt32

**Access**

Read-write

**Syntax**`ControlBarLabel.MinimumWidth`**See also**

ControlBarLabel (Page 3380)

**ControlBarLabel.Operability****Description**

The "Operability" property returns whether the identifier is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarLabel.Operability`**See also**

ControlBarLabel (Page 3380)

## ControlBarLabel.Padding

### Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarLabel.Padding
```

### See also

ControlBarLabel (Page 3380)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

```
Padding.Bottom
```

### See also

ControlBarLabel.Padding (Page 3392)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarLabel.Padding \(Page 3392\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarLabel.Padding \(Page 3392\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarLabel.Padding \(Page 3392\)](#)

## ControlBarLabel.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarLabel.RequireExplicitUnlock`

### See also

[ControlBarLabel \(Page 3380\)](#)

## ControlBarLabel.Text

### Description

The "Text" property specifies the label of the identifier.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarLabel.Text
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarLabel.ToolTipText
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.VerticalTextAlignment
```

### See also

ControlBarLabel (Page 3380)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarLabel.Visible
```

**See also**

[ControlBarLabel \(Page 3380\)](#)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

[ControlBarLabel \(Page 3380\)](#)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

**Properties**

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.

- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiControlBarElementCollection (Page 3329)

HmiControlBarElementCollection.Item() (Page 3330)

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 3397)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 3397)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 3397\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 3397\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

### See also

ControlBarSeparator (Page 3397)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Mapping`

**See also**

[ControlBarSeparator \(Page 3397\)](#)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarSeparator.Margin`

## See also

[ControlBarSeparator \(Page 3397\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarSeparator.Margin \(Page 3403\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarSeparator.Margin` (Page 3403)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarSeparator.Margin` (Page 3403)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarSeparator.Margin \(Page 3403\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

## Syntax

`ControlBarSeparator.MaximumHeight`

## See also

[ControlBarSeparator \(Page 3397\)](#)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarSeparator.MaximumWidth
```

**See also**

ControlBarSeparator (Page 3397)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.MinimumHeight
```

**See also**

ControlBarSeparator (Page 3397)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarSeparator.MinimumWidth
```

## See also

ControlBarSeparator (Page 3397)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

## See also

ControlBarSeparator (Page 3397)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarSeparator.Padding`**See also**

ControlBarSeparator (Page 3397)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ControlBarSeparator.Padding (Page 3408)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarSeparator.Padding \(Page 3408\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarSeparator.Padding \(Page 3408\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarSeparator.Padding \(Page 3408\)](#)**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarSeparator.RequireExplicitUnlock`**See also**[ControlBarSeparator \(Page 3397\)](#)**ControlBarSeparator.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarSeparator.ToolTipText`

**See also**

[ControlBarSeparator \(Page 3397\)](#)

**ControlBarSeparator.Visible**

**Description**

The "Visible" property specifies whether the separator is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Visible`

**See also**

[ControlBarSeparator \(Page 3397\)](#)

**ControlBarSeparator.Width**

**Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Width`

**See also**

[ControlBarSeparator \(Page 3397\)](#)

**ControlBarTextBox****Description**

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarTextBoxPart

**Properties**

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarTextBox.Enabled`

### See also

[ControlBarTextBox \(Page 3413\)](#)

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.ForeColor`

### See also

[ControlBarTextBox \(Page 3413\)](#)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

## See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 3413\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin \(Page 3422\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarTextBox.Margin \(Page 3422\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 3422\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarTextBox.Margin \(Page 3422\)](#)

## ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumHeight`**See also**

ControlBarTextBox (Page 3413)

**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumWidth`**See also**

ControlBarTextBox (Page 3413)

**ControlBarTextBox.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumHeight`

**See also**

ControlBarTextBox (Page 3413)

**ControlBarTextBox.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumWidth`

**See also**

ControlBarTextBox (Page 3413)

**ControlBarTextBox.Operability**

**Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarTextBox.Operability`

### See also

[ControlBarTextBox \(Page 3413\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 3413\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarTextBox.Padding \(Page 3427\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarTextBox.Padding \(Page 3427\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 3427\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 3427\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.ReadOnly
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

ControlBarTextBox (Page 3413)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

**See also**

[ControlBarTextBox](#) (Page 3413)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Width
```

**See also**

[ControlBarTextBox](#) (Page 3413)

**ControlBarToggleSwitch****Description**

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarToggleSwitchPart

**Properties**

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

**See also**

[ControlBarToggleSwitch](#) (Page 3433)

**ControlBarToggleSwitch.AlternateBorderColor**

**Description**

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateBorderColor`

**See also**

[ControlBarToggleSwitch](#) (Page 3433)

**ControlBarToggleSwitch.AlternateGraphic**

**Description**

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.AlternateGraphic`

**See also**

[ControlBarToggleSwitch](#) (Page 3433)

**ControlBarToggleSwitch.AlternateText****Description**

The "AlternateText" property specifies the text of the switch for the "On" state.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.AlternateText
```

**See also**

[ControlBarToggleSwitch](#) (Page 3433)

**ControlBarToggleSwitch.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarToggleSwitch.Authorization
```

**See also**

ControlBarToggleSwitch (Page 3433)

**ControlBarToggleSwitch.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.BackColor`

**See also**

ControlBarToggleSwitch (Page 3433)

**ControlBarToggleSwitch.Badge**

**Description**

The "Badge" property specifies the identifier of the switch.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Badge`

**See also**

[ControlBarToggleSwitch \(Page 3433\)](#)

**ControlBarToggleSwitch.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderColor
```

**See also**

[ControlBarToggleSwitch \(Page 3433\)](#)

**ControlBarToggleSwitch.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderWidth
```

## See also

[ControlBarToggleSwitch](#) (Page 3433)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Content
```

## See also

[ControlBarToggleSwitch](#) (Page 3433)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

## Syntax

`Content.ContentMode`

## See also

`ControlBarToggleSwitch.Content` (Page 3440)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

`ControlBarToggleSwitch.Content` (Page 3440)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 3440\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 3440\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

`ControlBarToggleSwitch.Content` (Page 3440)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

`ControlBarToggleSwitch.Content` (Page 3440)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

`ControlBarToggleSwitch.Content` (Page 3440)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarToggleSwitch.Content](#) (Page 3440)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch](#) (Page 3433)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 3433\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ForeColor`

### See also

[ControlBarToggleSwitch \(Page 3433\)](#)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 3433)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

ControlBarToggleSwitch (Page 3433)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 3433\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.IsAlternateState`

**See also**

ControlBarToggleSwitch (Page 3433)

**ControlBarToggleSwitch.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 3433\)](#)

**ControlBarToggleSwitch.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 3433\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarToggleSwitch.Margin \(Page 3451\)](#)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarToggleSwitch.Margin \(Page 3451\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarToggleSwitch.Margin \(Page 3451\)](#)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ControlBarToggleSwitch.Margin \(Page 3451\)](#)

**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

ControlBarToggleSwitch (Page 3433)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

ControlBarToggleSwitch (Page 3433)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 3433)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumWidth`**See also**

ControlBarToggleSwitch (Page 3433)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 3433\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 3433\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarToggleSwitch.Padding (Page 3456)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarToggleSwitch.Padding (Page 3456)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 3456\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 3456\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 3433)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 3433)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ToolTipText`

### See also

[ControlBarToggleSwitch \(Page 3433\)](#)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Visible`

### See also

[ControlBarToggleSwitch \(Page 3433\)](#)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Width
```

### See also

ControlBarToggleSwitch (Page 3433)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Enabled
```

### See also

FunctionTrendControl.ToolBar (Page 3328)

## ToolBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`ToolBar.Font`

### See also

FunctionTrendControl.ToolBar (Page 3328)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

ToolBar.Font (Page 3462)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToolBar.Font (Page 3462)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 3462)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ToolBar.Font (Page 3462)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

ToolBar.Font (Page 3462)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

```
Font.Weight
```

**See also**

ToolBar.Font (Page 3462)

**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ToolBar.Margin`

### See also

[FunctionTrendControl.ToolBar \(Page 3328\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ToolBar.Margin \(Page 3465\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**

ToolBar.Margin (Page 3465)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

ToolBar.Margin (Page 3465)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Top`

**See also**

[ToolBar.Margin \(Page 3465\)](#)

**ToolBar.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ToolBar.Padding`

**See also**

[FunctionTrendControl.ToolBar \(Page 3328\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ToolBar.Padding \(Page 3468\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ToolBar.Padding \(Page 3468\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ToolBar.Padding \(Page 3468\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ToolBar.Padding \(Page 3468\)](#)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

**Access**

Read-write

**Syntax**`ToolBar.ShowToolTips`**See also**

FunctionTrendControl.ToolBar (Page 3328)

**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.UseHotKeys`**See also**

FunctionTrendControl.ToolBar (Page 3328)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

### Access

Read-write

### Syntax

`ToolBar.Visible`

### See also

[FunctionTrendControl.ToolBar \(Page 3328\)](#)

## FunctionTrendControl.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`FunctionTrendControl.Top`

### See also

[FunctionTrendControl \(Page 3193\)](#)

## FunctionTrendControl.Visible

### Description

The "Visible" property specifies whether the f(x) trend view is visible.

### Type

Bool

**Access**

Read-write

**Syntax**`FunctionTrendControl.Visible`**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`FunctionTrendControl.Width`**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the f(x) trend view.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

Enable multiple properties by adding the integer values or bit operators.

---

**Access**

Read-write

**Syntax**

FunctionTrendControl.WindowFlags

**Example**

Adapt the "windowFlags" tag depending on the window configuration:

**Copy code**

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose) {
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the f(x) trend view.

**Syntax**

```
FunctionTrendControl.CheckAuthorization()
```

**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl.FireCommand()****Description**

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the f(x) trend view.

**Syntax**

```
FunctionTrendControl.FireCommand(commandId, custom)
```

**Parameters****commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## Return value

--

## See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
FunctionTrendControl.PropertyFlashing(propertyName, enable[, value]  
[, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl\_OnActivated()****Description**

The "OnActivated" event occurs when a f(x) trend view receives focus:

- An f(x) trend view is selected via the configured tab sequence.
- An f(x) trend view that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
FunctionTrendControl_OnActivated(item)
```

**Context**

**item**

Type: Object

f(x) trend view where the event occurs.

**See also**

FunctionTrendControl (Page 3193)

## FunctionTrendControl\_OnCommandFired()

### Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the f(x) trend view.

### Syntax

```
FunctionTrendControl_OnCommandFired(item, commandId, custom)
```

### Context

**item**

Type: Object

f(x) trend view where the event occurs.

**commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

**custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### See also

FunctionTrendControl (Page 3193)

## FunctionTrendControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when an f(x) trend view loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
FunctionTrendControl_OnDeactivated(item)
```

**Context**

**item**

Type: Object

f(x) trend view where the event occurs.

**See also**

FunctionTrendControl (Page 3193)

**FunctionTrendControl\_OnInitialized()****Description**

The "OnInitialized" event occurs when an f(x) trend view has been successfully initialized and the data connection to the PLC has been established.

**Syntax**

```
FunctionTrendControl_OnInitialized(item)
```

**Context**

**item**

Type: Object

f(x) trend view where the event occurs.

**See also**

FunctionTrendControl (Page 3193)

**Gauge****Description**

The "Gauge" object represents a pointer instrument as an analog dial gauge for monitoring process values in runtime.

## Object type

HmiGauge

## Properties

The "Gauge" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **ComputedMaxPeakValue**  
Returns the highest process value that occurred.
- **ComputedMinPeakValue**  
Returns the lowest process value that occurred.
- **ComputedValueTendency**  
Returns the change of the process value.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the gauge.
- **CurvedScale**  
Specifies the scale of the gauge.
- **Enabled**  
Specifies whether the gauge can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **Height**  
Specifies the height.
- **Label**  
Specifies the labeling of the gauge.
- **Layer**  
Returns the layer of the screen in which the gauge is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.

- **Name**  
Returns the name of the gauge.
- **NormalRangeColor**  
Specifies the color of the normal range.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the gauge is operable.
- **OriginValue**  
Specifies the output value of the normal range that is visualized.
- **OutputFormat**  
Specifies the format for displaying the process values.
- **Parent**  
Returns the higher-level screen object.
- **PeakIndicators**  
Specifies whether the highest and lowest process value up to this time are displayed.
- **ProcessValue**  
Specifies the process value.
- **ProcessValueIndicatorBackColor**  
Specifies the background color for the process value.
- **ProcessValueIndicatorForeColor**  
Specifies the foreground color for the process value.
- **ProcessValueIndicatorMode**  
Specifies the type of display of the current process value.
- **RelativeToOrigin**  
Specifies whether the output value is an absolute or a percentage value between the minimum and maximum value.
- **RenderingTemplate**  
Returns the name of the template from which the gauge was created.
- **RequireExplicitUnlock**  
Returns whether the gauge is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the gauge rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ScaleBackColor**  
Specifies the background color of the scale.

- **ScaleForeColor**  
Specifies the foreground color of the scale.
- **ShowFocusVisual**  
Specifies whether the gauge is highlighted when in focus.
- **ShowTrendIndicator**  
Specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.
- **StyleItemClass**  
Returns the style which is applied to the gauge.
- **TabIndex**  
Returns the position of the gauge in the tab sequence.
- **ThresholdIndicators**  
Specifies how parameterized limit values are visualized.
- **Thresholds**  
Returns the list of all limit values of the gauge.
- **Title**  
Specifies the caption which appears as the title.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **TrendIndicatorColor**  
Specifies the color of the trend indicator.
- **Visible**  
Specifies whether the gauge is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "Gauge" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the gauge.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Gauge" object has the following events:

- **OnActivated()**  
Occurs when a gauge receives focus.
- **OnContextTapped()**  
Occurs when a gauge is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a gauge loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the gauge is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the gauge is in focus.
- **OnTapped()**  
Occurs when a gauge is left-clicked or short-touched.

## Gauge.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`Gauge.AlternateBackColor`

### See also

[Gauge \(Page 3479\)](#)

## Gauge.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Gauge.AlternateBorderColor`

**See also**

Gauge (Page 3479)

**Gauge.Authorization**

**Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`Gauge.Authorization`

**See also**

Gauge (Page 3479)

**Gauge.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Gauge.BackColor`**See also**

Gauge (Page 3479)

**Gauge.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Gauge.BorderColor`**See also**

Gauge (Page 3479)

**Gauge.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`Gauge.BorderWidth`

**See also**

Gauge (Page 3479)

**Gauge.ComputedMaxPeakValue**

**Description**

The "ComputedMaxPeakValue" property returns the highest process value that occurred.

**Type**

Variant

**Access**

Read-only

**Syntax**

`Gauge.ComputedMaxPeakValue`

**See also**

Gauge (Page 3479)

Gauge.ComputedMinPeakValue (Page 3486)

**Gauge.ComputedMinPeakValue**

**Description**

The "ComputedMinPeakValue" property returns the lowest process value which occurred.

**Type**

Variant

**Access**

Read-only

**Syntax**

`Gauge.ComputedMinPeakValue`

**See also**

[Gauge \(Page 3479\)](#)

[Gauge.ComputedMaxPeakValue \(Page 3486\)](#)

**Gauge.ComputedValueTendency****Description**

The "ComputedValueTendency" property returns the change in the process value.

**Type**

Int32, HmiValueTendency

Returns the modification:

- Steady (0): No change
- Upwards (1): Change upwards
- Downwards (2): Change downwards

**Access**

Read-only

**Syntax**

`Gauge.ComputedValueTendency`

**See also**

[Gauge \(Page 3479\)](#)

**Gauge.CurrentQuality****Description**

The "CurrentQuality" property returns the poorest quality code of all tags which influence the gauge.

**Type**

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`Gauge.CurrentQuality`

### See also

Gauge (Page 3479)

## Gauge.CurvedScale

### Description

The "CurvedScale" property specifies the scale of the gauge.

### Type

Object, HmiCurvedScalePart

### Access

Read-write

### Syntax

`Gauge.CurvedScale`

### See also

Gauge (Page 3479)

## CurvedScale.AngleRange

### Description

The "AngleRange" property specifies the arc angle of the displayed scale clockwise.

### Type

Int32

### Access

Read-write

### Syntax

`CurvedScale.AngleRange`

### See also

[Gauge.CurvedScale \(Page 3488\)](#)

## CurvedScale.AutoScaling

### Description

The "AutoScaling" property specifies whether automatic scaling is activated.

### Type

Bool

### Access

Read-write

### Syntax

`CurvedScale.AutoScaling`

### See also

[Gauge.CurvedScale \(Page 3488\)](#)

## CurvedScale.BeginValue

### Description

The "BeginValue" property specifies the start of a value range or value range section.

### Type

Float

### Access

Read-write

### Syntax

`CurvedScale.BeginValue`

### See also

Gauge.CurvedScale (Page 3488)

## CurvedScale.DivisionCount

### Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

### Type

Int32

### Access

Read-write

### Syntax

`CurvedScale.DivisionCount`

### See also

Gauge.CurvedScale (Page 3488)

## CurvedScale.EndValue

### Description

The "EndValue" property specifies the end of a value range or value range section.

### Type

Float

### Access

Read-write

### Syntax

`CurvedScale.EndValue`

### See also

Gauge.CurvedScale (Page 3488)

## CurvedScale.LabelColor

### Description

The "LabelColor" property specifies the color of the labeling.

### Type

UInt32

### Access

Read-write

### Syntax

`CurvedScale.LabelColor`

### See also

Gauge.CurvedScale (Page 3488)

## CurvedScale.LabelFont

### Description

The "LabelFont" property specifies the font of the labeling.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`CurvedScale.LabelFont`

### See also

Gauge.CurvedScale (Page 3488)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Italic`

### See also

CurvedScale.LabelFont (Page 3492)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

CurvedScale.LabelFont (Page 3492)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

CurvedScale.LabelFont (Page 3492)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

CurvedScale.LabelFont (Page 3492)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

CurvedScale.LabelFont (Page 3492)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

```
Font.Weight
```

**See also**

CurvedScale.LabelFont (Page 3492)

**CurvedScale.LargeTickLabelingStep****Description**

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`CurvedScale.LargeTickLabelingStep`

**See also**

Gauge.CurvedScale (Page 3488)

**CurvedScale.MeasurementUnit**

**Description**

The "MeasurementUnit" property returns the displayed unit.

**Type**

String

**Access**

Read-only

**Syntax**

`CurvedScale.MeasurementUnit`

**See also**

Gauge.CurvedScale (Page 3488)

**CurvedScale.MeasurementUnitType**

**Description**

The "MeasurementUnitType" property specifies the display format of the unit.

**Type**

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

**Access**

Read-write

**Syntax**

`CurvedScale.MeasurementUnitType`

**See also**

[Gauge.CurvedScale \(Page 3488\)](#)

**CurvedScale.OutputFormat****Description**

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

**Type**

String

**Access**

Read-write

**Syntax**

`CurvedScale.OutputFormat`

**See also**

[Gauge.CurvedScale \(Page 3488\)](#)

**CurvedScale.ScaleMode****Description**

The "ScaleMode" property specifies the type of scaling.

### Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

### Access

Read-write

### Syntax

`CurvedScale.ScaleMode`

### See also

[Gauge.CurvedScale \(Page 3488\)](#)

## CurvedScale.ScalingType

### Description

The "ScalingType" property specifies the scaling.

### Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

### Access

Read-write

### Syntax

`CurvedScale.ScalingType`

**See also**

Gauge.CurvedScale (Page 3488)

**CurvedScale.StartAngle****Description**

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

**Type**

Int32

**Access**

Read-write

**Syntax**

CurvedScale.StartAngle

**See also**

Gauge.CurvedScale (Page 3488)

**CurvedScale.SubDivisionCount****Description**

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

**Type**

Int32

**Access**

Read-write

**Syntax**

CurvedScale.SubDivisionCount

**See also**

Gauge.CurvedScale (Page 3488)

**CurvedScale.TickColor**

**Description**

The "TickColor" property specifies the color of the tick marks.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`CurvedScale.TickColor`

**See also**

Gauge.CurvedScale (Page 3488)

**Gauge.Enabled**

**Description**

The "Enabled" property specifies whether the gauge can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Gauge.Enabled`

**See also**

Gauge (Page 3479)

## Gauge.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

Gauge.Font

### See also

Gauge (Page 3479)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

Font.Italic

### See also

Gauge.Font (Page 3501)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

### Syntax

Font.Name

### See also

Gauge.Font (Page 3501)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

Gauge.Font (Page 3501)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

Gauge.Font (Page 3501)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

## See also

Gauge.Font (Page 3501)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

Gauge.Font (Page 3501)

## Gauge.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

**Access**

Read-write

**Syntax**`Gauge.Height`**See also**

Gauge (Page 3479)

**Gauge.Label****Description**

The "Label" property specifies the labeling of the gauge.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**`Gauge.Label`**See also**

Gauge (Page 3479)

**Text.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

## Syntax

`Text.Font`

## See also

Gauge.Label (Page 3505)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

## Syntax

`Font.Italic`

## See also

Text.Font (Page 3505)

## Font.Name

### Description

The "Name" property specifies the name of the character set used.

### Type

String

### Access

Read-write

**Syntax**`Font.Name`**See also**`Text.Font` (Page 3505)**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**`Text.Font` (Page 3505)**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

### See also

Text.Font (Page 3505)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

Text.Font (Page 3505)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 3505\)](#)

**Text.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[Gauge.Label \(Page 3505\)](#)

## Text.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

`Text.Text`

### See also

Gauge.Label (Page 3505)

## Text.Visible

### Description

The "Visible" property specifies whether the text is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Text.Visible`

### See also

Gauge.Label (Page 3505)

## Gauge.Layer

### Description

The "Layer" property returns the layer of the screen in which the gauge is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Gauge.Layer`

### See also

Gauge (Page 3479)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

Gauge.Layer (Page 3511)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

Gauge.Layer (Page 3511)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

Gauge.Layer (Page 3511)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[Gauge.Layer \(Page 3511\)](#)

## Gauge.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Gauge.Left`

### See also

[Gauge \(Page 3479\)](#)

## Gauge.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Gauge.Margin`

### See also

Gauge (Page 3479)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

Gauge.Margin (Page 3514)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

Gauge.Margin (Page 3514)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

Gauge.Margin (Page 3514)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

Gauge.Margin (Page 3514)

## Gauge.Name

### Description

The "Name" property returns the name of the gauge.

### Type

String

### Access

Read-only

### Syntax

Gauge.Name

### See also

Gauge (Page 3479)

## Gauge.NormalRangeColor

### Description

The "NormalRangeColor" property specifies the color of the normal range.

### Type

UInt32

### Access

Read-write

### Syntax

`Gauge.NormalRangeColor`

### See also

Gauge (Page 3479)

## Gauge.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`Gauge.Opacity`

### See also

Gauge (Page 3479)

## Gauge.Operability

### Description

The "Operability" property returns whether the gauge is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Gauge.Operability`

### See also

[Gauge \(Page 3479\)](#)

## Gauge.OriginValue

### Description

The "OriginValue" property specifies the output value of the normal range to be visualized.

### Type

Float

### Access

Read-write

### Syntax

`Gauge.OriginValue`

**See also**

Gauge (Page 3479)

**Gauge.OutputFormat****Description**

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

**Type**

String

**Access**

Read-write

**Syntax**

Gauge.OutputFormat

**See also**

Gauge (Page 3479)

**Gauge.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

Gauge.Parent

## See also

Gauge (Page 3479)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## Gauge.PeakIndicators

### Description

The "PeakIndicators" property specifies whether the highest and lowest process value up to this time are displayed.

### Type

Int32, HmiPeakIndicator

Specifies the display of the peak indicator:

- None (0): No display
- Low (1): Only the lowest process value
- High (2): Only the highest process value

### Access

Read-write

### Syntax

`Gauge.PeakIndicators`

## See also

Gauge (Page 3479)

## Gauge.ProcessValue

### Description

The "ProcessValue" property specifies the process value.

**Type**

Variant

**Access**

Read-write

**Syntax**`Gauge.ProcessValue`**See also**

Gauge (Page 3479)

**Gauge.ProcessValueIndicatorBackColor****Description**

The "ProcessValueIndicatorBackColor" property specifies the background color for the process value indicator.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Gauge.ProcessValueIndicatorBackColor`**See also**

Gauge (Page 3479)

Gauge.ProcessValueIndicatorForeColor (Page 3521)

**Gauge.ProcessValueIndicatorForeColor****Description**

The "ProcessValueIndicatorForeColor" property specifies the foreground color for the process value indicator.

### Type

UInt32

### Access

Read-write

### Syntax

`Gauge.ProcessValueIndicatorForeColor`

### See also

Gauge (Page 3479)

Gauge.ProcessValueIndicatorBackColor (Page 3521)

## Gauge.ProcessValueIndicatorMode

### Description

The "ProcessValueIndicatorMode" property specifies the type of display of the current process value.

### Type

Int32, HmiProcessIndicatorMode

Specifies the type of display:

- Bar (0): Bar only
- Indicator (1): Hair line or needle, no numerical display of the process value.
- DetailedIndicator (2): Detailed display with numerical value
- BarWithDetailedIndicator (3): Bar with numerical value

### Access

Read-write

### Syntax

`Gauge.ProcessValueIndicatorMode`

### See also

Gauge (Page 3479)

## Gauge.RelativeToOrigin

### Description

The "RelativeToOrigin" property specifies whether the output value is an absolute or a percentage value between minimum and maximum value.

### Type

Bool

### Access

Read-write

### Syntax

`Gauge.RelativeToOrigin`

### See also

Gauge (Page 3479)

## Gauge.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the gauge was created.

### Type

String

### Access

Read-only

### Syntax

`Gauge.RenderingTemplate`

### See also

Gauge (Page 3479)

## Gauge.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the gauge can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`Gauge.RequireExplicitUnlock`

### See also

Gauge (Page 3479)

## Gauge.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`Gauge.RotationAngle`

### See also

Gauge (Page 3479)

Gauge.RotationCenterPlacement (Page 3525)

Gauge.RotationCenterX (Page 3525)

Gauge.RotationCenterY (Page 3526)

## Gauge.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the gauge rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

Gauge.RotationCenterPlacement

### See also

Gauge (Page 3479)

Gauge.RotationAngle (Page 3524)

Gauge.RotationCenterX (Page 3525)

Gauge.RotationCenterY (Page 3526)

## Gauge.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`Gauge.RotationCenterX`

**See also**

- Gauge (Page 3479)
- Gauge.RotationAngle (Page 3524)
- Gauge.RotationCenterPlacement (Page 3525)
- Gauge.RotationCenterY (Page 3526)

**Gauge.RotationCenterY**

**Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`Gauge.RotationCenterY`

**See also**

- Gauge (Page 3479)
- Gauge.RotationAngle (Page 3524)
- Gauge.RotationCenterPlacement (Page 3525)
- Gauge.RotationCenterX (Page 3525)

## Gauge.ScaleBackColor

### Description

The "ScaleBackColor" property specifies the background color of the scale.

### Type

UInt32

### Access

Read-write

### Syntax

`Gauge.ScaleBackColor`

### See also

[Gauge \(Page 3479\)](#)

[Gauge.ScaleForeColor \(Page 3527\)](#)

## Gauge.ScaleForeColor

### Description

The "ScaleForeColor" property specifies the foreground color of the scale.

### Type

UInt32

### Access

Read-write

### Syntax

`Gauge.ScaleForeColor`

### See also

[Gauge \(Page 3479\)](#)

[Gauge.ScaleBackColor \(Page 3527\)](#)

## Gauge.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the gauge is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`Gauge.ShowFocusVisual`

### See also

Gauge (Page 3479)

## Gauge.ShowTrendIndicator

### Description

The "ShowTrendIndicator" property specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.

### Type

Bool

### Access

Read-write

### Syntax

`Gauge.ShowTrendIndicator`

### See also

Gauge (Page 3479)

## Gauge.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the gauge.

### Type

String

### Access

Read-only

### Syntax

```
Gauge.StyleItemClass
```

### See also

Gauge (Page 3479)

## Gauge.TabIndex

### Description

The "TabIndex" property returns the position of the gauge in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
Gauge.TabIndex
```

### See also

Gauge (Page 3479)

## Gauge.ThresholdIndicators

### Description

The "ThresholdIndicators" property specifies how parameterized limit values are visualized.

### Type

Int32, HmiThresholdIndicator

Specifies the visualization:

- None (0): None
- Lines (1): Lines
- Markers (2): Markers

### Access

Read-write

### Syntax

`Gauge.ThresholdIndicators`

### See also

Gauge (Page 3479)

## Gauge.Thresholds

### Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the gauge.

### Type

Object, HmiThresholdCollection (Page 3531)

### Access

Read-only

### Syntax

`Gauge.Thresholds`

**See also**

Gauge (Page 3479)

HmiThresholdCollection (Page 3531)

**HmiThresholdCollection****Description**

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

**Use**

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

**Object type**

HmiThresholdCollection

**Properties**

The "HmiThresholdCollection" object has the following properties:

- **Count**  
Returns the number of limit values of the "HmiThresholdCollection" list.

**Methods**

The "HmiThresholdCollection" object has the following methods:

- **Item()**  
Returns a limit value of the "HmiThresholdCollection" list.

**See also**

Gauge.Thresholds (Page 3530)

**HmiThresholdCollection.Count****Description**

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

**Type**

UInt32

### Access

Read-only

### Syntax

```
HmiThresholdCollection.Count
```

### See also

HmiThresholdCollection (Page 3531)

## HmiThresholdCollection.Item()

### Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

### Syntax

```
HmiThresholdCollection[.Item] (HmiThresholdName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

---

### Parameters

#### **HmiThresholdName**

Type: String

Name of the limit value

### Return value

Object, HmiThresholdPart (Page 3533)

### See also

Threshold (Page 3533)

HmiThresholdCollection (Page 3531)

## Threshold

### Description

The "Threshold" object represents a limit value.

### Object type

HmiThresholdPart

### Properties

The "Threshold" object has the following properties:

- **Color**  
Specifies the color of the limit value.
- **DisplayName**  
Specifies the display name of the limit value.
- **Name**  
Specifies the name of the limit value.
- **ThresholdMode**  
Specifies the type of limit value.
- **Value**  
Returns the limit value.

### Methods

--

### See also

HmiThresholdCollection (Page 3531)

## Threshold.Color

### Description

The "Color" property specifies the color of the limit value.

### Type

UInt32

### Access

Read-write

### Syntax

`Threshold.Color`

### See also

Threshold (Page 3533)

## Threshold.DisplayName

### Description

The "DisplayName" property specifies the display name of the limit value.

### Type

String

### Access

Read-write

### Syntax

`Threshold.DisplayName`

### See also

Threshold (Page 3533)

## Threshold.Name

### Description

The "Name" property specifies the name of the limit value.

### Type

String

### Access

Read-write

### Syntax

`Threshold.Name`

**See also**

Threshold (Page 3533)

**Threshold.ThresholdMode****Description**

The "ThresholdMode" property specifies the type of limit value.

**Type**

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

**Access**

Read-write

**Syntax**

`Threshold.ThresholdMode`

**See also**

Threshold (Page 3533)

**Threshold.Value****Description**

The "Value" property returns the limit value of the tag.

**Type**

Float

**Access**

Read-only

**Syntax**

`Threshold.Value`

**See also**

Threshold (Page 3533)

**Gauge.Title**

**Description**

The "Title" property specifies the caption that appears as the title.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`Gauge.Title`

**See also**

Gauge (Page 3479)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`Text.Font`**See also**`Gauge.Title` (Page 3536)**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**`Bool`**Access**`Read-write`**Syntax**`Font.Italic`**See also**`Text.Font` (Page 3536)**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**`String`**Access**`Read-write`

## Syntax

Font.Name

## See also

Text.Font (Page 3536)

## Font.Size

## Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

## Type

Float

## Access

Read-write

## Syntax

Font.Size

## See also

Text.Font (Page 3536)

## Font.StrikeOut

## Description

The "StrikeOut" property specifies whether font is struck through.

## Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

Text.Font (Page 3536)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

Text.Font (Page 3536)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 3536\)](#)

### Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[Gauge.Title \(Page 3536\)](#)

**Text.Text****Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

`Text.Text`

**See also**

Gauge.Title (Page 3536)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

Gauge.Title (Page 3536)

## Gauge.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`Gauge.ToolTipText`

### See also

Gauge (Page 3479)

## Gauge.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Gauge.Top`

### See also

Gauge (Page 3479)

## Gauge.TrendIndicatorColor

### Description

The "TrendIndicatorColor" property specifies the color of the trend indicator. The trend indicator uses a small arrow to represent the tendency (rising or falling) of the process value to be monitored. To activate the trend indicator, the "ShowTrendIndicator" property must be activated.

### Type

UInt32

### Access

Read-write

### Syntax

`Gauge.TrendIndicatorColor`

### See also

Gauge (Page 3479)

## Gauge.Visible

### Description

The "Visible" property specifies whether the gauge is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Gauge.Visible`

### See also

Gauge (Page 3479)

## Gauge.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`Gauge.VisualizeQuality`

### See also

Gauge (Page 3479)

## Gauge.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Gauge.Width`

### See also

Gauge (Page 3479)

## Gauge.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the gauge.

### Syntax

```
Gauge.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

Gauge (Page 3479)

## Gauge.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Gauge.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

### **propertyName**

Type: String

Name of the property for which flashing is configured.

### **enable**

Type: Bool

Specifies that flashing is activated.

### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

### **Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

Gauge (Page 3479)

## Gauge\_OnActivated()

### Description

The "OnActivated" event occurs when a gauge receives focus:

- A gauge is selected via the configured tab sequence.
- A gauge that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Gauge_OnActivated(item)
```

### Context

**item**

Type: Object

Gauge where the event occurs.

### See also

Gauge (Page 3479)

## Gauge\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A gauge is right-clicked.
- A gauge is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Gauge_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Gauge where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Gauge (Page 3479)

**Gauge\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the gauge loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
Gauge_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Gauge where the event occurs.

**See also**

Gauge (Page 3479)

**Gauge\_OnKeyDown()****Description**

The "OnKeyDown" event occurs when a key is pressed while the gauge is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
Gauge_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

Gauge where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Gauge (Page 3479)

## Gauge\_OnKeyUp()

## Description

The "OnKeyUp" event occurs when a key is released while the gauge is in focus.

## Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
Gauge_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

Gauge where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**[Gauge \(Page 3479\)](#)

## Gauge\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A gauge is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a gauge has the focus.
- A gauge is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Gauge_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Gauge where the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

#### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

#### **See also**

Gauge (Page 3479)

#### **GraphicView**

##### **Description**

The "GraphicView" object represents a graphic display in runtime.

##### **Object type**

HmiGraphicView

## Properties

The "GraphicView" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BackFillPattern**  
Specifies the pattern of the background or the fill.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the graphic display.
- **Enabled**  
Specifies whether the graphic display can be operated in runtime.
- **FillDirection**  
Specifies the direction from which the graphic display is filled.
- **FillLevel**  
Specifies the fill of the graphic display in percent.
- **Graphic**  
Specifies the graphic.
- **GraphicStretchMode**  
Specifies the type of scaling of the graphic in the screen.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the graphic display is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the graphic display.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the graphic display is operable.
- **Padding**  
Specifies the distance of the graphic from the frame of the graphic display.
- **Parent**  
Returns the higher-level screen object.

- **RequireExplicitUnlock**  
Returns whether the graphic display is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the graphic display rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**  
Specifies whether the fill level is displayed.
- **ShowFocusVisual**  
Specifies whether the graphic display is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the graphic display.
- **TabIndex**  
Returns the position of the graphic display in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the graphic display is visible.
- **Width**  
Specifies the width.

## Methods

The "GraphicView" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the graphic display.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "GraphicView" object has the following events:

- **OnActivated()**  
Occurs when a graphic display receives focus.
- **OnContextTapped()**  
Occurs when a graphic display is right-clicked or long-touched.

- **OnDeactivated()**  
Occurs when a graphic display loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the graphic display is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the graphic display is in focus.
- **OnTapped()**  
Occurs when a graphic display is left-clicked or short-touched.

## GraphicView.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

GraphicView.AlternateBackColor

### See also

GraphicView (Page 3553)

## GraphicView.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

**Syntax**

`GraphicView.Authorization`

**See also**

[GraphicView \(Page 3553\)](#)

**GraphicView.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`GraphicView.BackColor`

**See also**

[GraphicView \(Page 3553\)](#)

**GraphicView.BackFillPattern****Description**

The "BackFillPattern" property specifies the pattern of the background or the fill.

**Type**

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe

- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

### Access

Read-write

### Syntax

`GraphicView.BackFillPattern`

### See also

[GraphicView \(Page 3553\)](#)

## GraphicView.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the graphic display.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

**Access**

Read-only

**Syntax**`GraphicView.CurrentQuality`**See also**

GraphicView (Page 3553)

**GraphicView.Enabled****Description**

The "Enabled" property specifies whether the graphic display can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`GraphicView.Enabled`**See also**

GraphicView (Page 3553)

**GraphicView.FillDirection****Description**

The "FillDirection" property specifies the direction from which the graphic display is filled.

**Type**

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom

- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

**Access**

Read-write

**Syntax**

`GraphicView.FillDirection`

**See also**

GraphicView (Page 3553)

**GraphicView.FillLevel**

**Description**

The "FillLevel" property specifies the fill level of the graphic display in percent.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`GraphicView.FillLevel`

**See also**

GraphicView (Page 3553)

**GraphicView.Graphic**

**Description**

The "Graphic" property specifies the graphic.

**Type**

String

**Access**

Read-write

**Syntax**`GraphicView.Graphic`**See also**

GraphicView (Page 3553)

**GraphicView.GraphicStretchMode****Description**

The "GraphicStretchMode" property specifies the type of scaling of the graphic in the screen.

**Type**

Int32, HmiGraphicStretchMode

Specifies the graphic scaling:

- None (0): The graphic is shown in its original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**`GraphicView.GraphicStretchMode`**See also**

GraphicView (Page 3553)

## GraphicView.Height

### Description

The "Height" property specifies the height in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`GraphicView.Height`

### See also

[GraphicView \(Page 3553\)](#)

## GraphicView.Layer

### Description

The "Layer" property returns the layer of the screen in which the graphic display is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`GraphicView.Layer`

### See also

[GraphicView \(Page 3553\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

[GraphicView.Layer \(Page 3562\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

[GraphicView.Layer \(Page 3562\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[GraphicView.Layer \(Page 3562\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[GraphicView.Layer \(Page 3562\)](#)

## GraphicView.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

```
GraphicView.Left
```

### See also

GraphicView (Page 3553)

## GraphicView.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
GraphicView.Margin
```

### See also

GraphicView (Page 3553)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[GraphicView.Margin \(Page 3565\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[GraphicView.Margin \(Page 3565\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[GraphicView.Margin \(Page 3565\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[GraphicView.Margin \(Page 3565\)](#)

## GraphicView.Name

### Description

The "Name" property returns the name of the graphic display.

### Type

String

### Access

Read-only

### Syntax

`GraphicView.Name`

### See also

[GraphicView \(Page 3553\)](#)

## GraphicView.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`GraphicView.Opacity`

### See also

[GraphicView \(Page 3553\)](#)

## GraphicView.Operability

### Description

The "Operability" property returns whether the graphic display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`GraphicView.Operability`

### See also

[GraphicView \(Page 3553\)](#)

## GraphicView.Padding

### Description

The "Padding" property specifies the distance of the graphic from the frame of the graphic display.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`GraphicView.Padding`

**See also**

GraphicView (Page 3553)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Bottom

**See also**

GraphicView.Padding (Page 3569)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Left

**See also**

GraphicView.Padding (Page 3569)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

GraphicView.Padding (Page 3569)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

### See also

[GraphicView.Padding](#) (Page 3569)

## GraphicView.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
GraphicView.Parent
```

### See also

[GraphicView](#) (Page 3553)

[Screen Items](#) (Page 1742)

## Screen Items

### Description

[Screen Items](#) (Page 1742)

## GraphicView.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the graphic display can only be operated while the associated button is being pressed.

### Type

Bool

**Access**

Read-only

**Syntax**`GraphicView.RequireExplicitUnlock`**See also**[GraphicView \(Page 3553\)](#)**GraphicView.RotationAngle****Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**`GraphicView.RotationAngle`**See also**[GraphicView.RotationCenterX \(Page 3574\)](#)[GraphicView.RotationCenterY \(Page 3575\)](#)[GraphicView.RotationCenterPlacement \(Page 3573\)](#)[GraphicView \(Page 3553\)](#)**GraphicView.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property specifies the reference point around which the graphic display rotates.

## Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

## Access

Read-write

## Syntax

`GraphicView.RotationCenterPlacement`

## See also

[GraphicView.RotationAngle \(Page 3573\)](#)

[GraphicView.RotationCenterX \(Page 3574\)](#)

[GraphicView.RotationCenterY \(Page 3575\)](#)

[GraphicView \(Page 3553\)](#)

## GraphicView.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`GraphicView.RotationCenterX`

**See also**

[GraphicView.RotationAngle \(Page 3573\)](#)  
[GraphicView.RotationCenterY \(Page 3575\)](#)  
[GraphicView.RotationCenterPlacement \(Page 3573\)](#)  
[GraphicView \(Page 3553\)](#)

**GraphicView.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

```
GraphicView.RotationCenterY
```

**See also**

[GraphicView.RotationAngle \(Page 3573\)](#)  
[GraphicView.RotationCenterX \(Page 3574\)](#)  
[GraphicView.RotationCenterPlacement \(Page 3573\)](#)  
[GraphicView \(Page 3553\)](#)

**GraphicView.ShowFillLevel****Description**

The "ShowFillLevel" property specifies whether the fill level is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

`GraphicView.ShowFillLevel`

**See also**

GraphicView (Page 3553)

**GraphicView.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the graphic display is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`GraphicView.ShowFocusVisual`

**See also**

GraphicView (Page 3553)

**GraphicView.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the graphic display.

**Type**

String

**Access**

Read-only

**Syntax**`GraphicView.StyleItemClass`**See also**

GraphicView (Page 3553)

**GraphicView.TabIndex****Description**

The "TabIndex" property returns the position of the graphic display in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`GraphicView.TabIndex`**See also**

GraphicView (Page 3553)

**GraphicView.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`GraphicView.ToolTipText`

**See also**

[GraphicView \(Page 3553\)](#)

**GraphicView.Top**

**Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`GraphicView.Top`

**See also**

[GraphicView \(Page 3553\)](#)

**GraphicView.Visible**

**Description**

The "Visible" property specifies whether the graphic display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`GraphicView.Visible`

**See also**

GraphicView (Page 3553)

**GraphicView.Width****Description**

The "Width" property specifies the width in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

GraphicView.Width

**See also**

GraphicView (Page 3553)

**GraphicView.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the graphic display.

**Syntax**

GraphicView.CheckAuthorization()

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

GraphicView (Page 3553)

## GraphicView.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
GraphicView.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

GraphicView (Page 3553)

**GraphicView\_OnActivated()****Description**

The "OnActivated" event occurs when a graphic display receives focus:

- A graphic display is selected via the configured tab sequence.
- A graphic display that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
GraphicView_OnActivated(item)
```

**Context****item**

Type: Object

Graphic display at which the event occurs.

## See also

GraphicView (Page 3553)

## GraphicView\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A graphic display is right-clicked.
- A graphic display is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
GraphicView_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Graphic display at which the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

#### **y**

Type: DInt

Y-coordinate of the input point

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

GraphicView (Page 3553)

**GraphicView\_OnDeactivated()****Description**

The "OnDeactivated" event occurs when the graphic display loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

```
GraphicView_OnDeactivated(item)
```

**Context**

**item**

Type: Object

Graphic display at which the event occurs.

### See also

GraphicView (Page 3553)

## GraphicView\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the graphic display is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
GraphicView_OnKeyDown(item, keyCode, modifiers)
```

### Context

#### **item**

Type: Object

Graphic display at which the event occurs.

#### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

GraphicView (Page 3553)

## GraphicView\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the graphic display is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
GraphicView_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Graphic display at which the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

GraphicView (Page 3553)

## GraphicView\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A graphic display is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a graphic display has the focus.
- A graphic display is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
GraphicView_OnTapped(item, x, y, modifiers, trigger)
```

### Context

#### **item**

Type: Object

Graphic display at which the event occurs.

#### **x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

GraphicView (Page 3553)

**Group****Description**

The "Group" object represents grouped objects in runtime.

## Object type

HmiGroup

## Properties

The "Group" object has the following properties:

- **ContainedItems**  
Returns an array with the references of the contained objects.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the group.
- **Enabled**  
Specifies whether the group can be operated in runtime.
- **Height**  
Specifies the height.
- **Layer**  
Returns the screen layer in which the group is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the group.
- **Parent**  
Returns the higher-level screen object.
- **Properties**  
Enables access to the properties of the objects of the group.
- **RotationAngle**  
Specifies the rotation angle in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the group rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the group is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the group.
- **TabIndex**  
Returns the position of the group in the tab sequence.
- **Top**  
Specifies the value of the Y coordinate.

- **Visible**  
Specifies whether the group is visible.
- **Width**  
Specifies the width.

## Methods

The "Group" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the group.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Group" object has the following events:

- **OnActivated()**  
Occurs when a group receives the focus.
- **OnDeactivated()**  
Occurs when a group loses the focus.

## Group.ContainedItems

### Description

The "ContainedItems" property returns an array with the references of the grouped objects.

### Type

ArrayOfSomRef

### Access

Read-only

### Syntax

Group.ContainedItems

### See also

Group (Page 3587)

## Group.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the group.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`Group.CurrentQuality`

### See also

[Group \(Page 3587\)](#)

## Group.Enabled

### Description

The "Enabled" property specifies whether the group can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**`Group.Enabled`**See also**

Group (Page 3587)

**Group.Height****Description**

The "Height" property specifies the height in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`Group.Height`**See also**

Group (Page 3587)

**Group.Layer****Description**

The "Layer" property returns the screen layer in which the group is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**`Group.Layer`

## See also

Group (Page 3587)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

## See also

Group.Layer (Page 3591)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

**See also**

Group.Layer (Page 3591)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

Group.Layer (Page 3591)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

Group.Layer (Page 3591)

**Group.Left**

**Description**

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`Group.Left`

**See also**

Group (Page 3587)

**Group.Margin**

**Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`Group.Margin`

**See also**

Group (Page 3587)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Bottom

### See also

Group.Margin (Page 3594)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

Group.Margin (Page 3594)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[Group.Margin \(Page 3594\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[Group.Margin \(Page 3594\)](#)

**Group.Name****Description**

The "Name" property returns the name of the group.

**Type**

String

**Access**

Read-only

**Syntax**

`Group.Name`

**See also**

[Group \(Page 3587\)](#)

**Group.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, [HmiScreenObjectBase \(Page 1742\)](#)

**Access**

Read-only

**Syntax**

`Group.Parent`

**See also**

[Group \(Page 3587\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

Screen Items (Page 1742)

## Group.Properties

### Description

The "Properties" property enables access to the properties of the objects of the group.

### Type

Object, HmiDynamicPropertyPart

### Access

Read-write

### Syntax

`Group.Properties`

### See also

Group (Page 3587)

## Group.RotationAngle

### Description

The "RotationAngle" property specifies the rotation angle in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`Group.RotationAngle`

**See also**

Group (Page 3587)  
Group.RotationCenterPlacement (Page 3599)  
Group.RotationCenterX (Page 3600)  
Group.RotationCenterY (Page 3600)

**Group.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property specifies the reference point around which the group rotates.

**Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

**Access**

Read-write

**Syntax**

```
Group.RotationCenterPlacement
```

**See also**

Group (Page 3587)  
Group.RotationAngle (Page 3598)  
Group.RotationCenterX (Page 3600)  
Group.RotationCenterY (Page 3600)

## Group.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`Group.RotationCenterX`

### See also

Group (Page 3587)  
Group.RotationAngle (Page 3598)  
Group.RotationCenterPlacement (Page 3599)  
Group.RotationCenterY (Page 3600)

## Group.RotationCenterY

### Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`Group.RotationCenterY`

**See also**

Group (Page 3587)

Group.RotationAngle (Page 3598)

Group.RotationCenterPlacement (Page 3599)

Group.RotationCenterX (Page 3600)

**Group.ShowFocusVisual****Description**

The property "ShowFocusVisual" specifies whether the group is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Group.ShowFocusVisual`

**See also**

Group (Page 3587)

**Group.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the group.

**Type**

String

**Access**

Read-only

**Syntax**

`Group.StyleItemClass`

**See also**

Group (Page 3587)

**Group.TabIndex**

**Description**

The "TabIndex" property returns the position of the group in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`Group.TabIndex`

**See also**

Group (Page 3587)

**Group.Top**

**Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`Group.Top`

**See also**

Group (Page 3587)

## Group.Visible

### Description

The "Visible" property specifies whether the group is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Group.Visible`

### See also

Group (Page 3587)

## Group.Width

### Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Group.Width`

### See also

Group (Page 3587)

## Group.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the group.

### Syntax

```
Group.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[Group](#) (Page 3587)

## Group.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Group.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

Group (Page 3587)

## Group\_OnActivated()

### Description

The "OnActivated" event occurs when a group receives the focus:

- A group is selected via the configured tab sequence.
- A group that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Group_OnActivated(item)
```

### Context

**item**

Type: Object

Group for which the event occurs.

### See also

Group (Page 3587)

## Group\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a group loses the focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
Group_OnDeactivated(item)
```

## Context

### **item**

Type: Object

Group for which the event occurs.

## See also

Group (Page 3587)

## IOField

## Description

The "IOField" object represents an I/O field for the entry and display of process values in runtime.

## Object type

HmiIOField

## Properties

The "IOField" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the I/O field.
- **Enabled**  
Specifies whether the I/O field can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **InputBehavior**  
Specifies the input behavior.
- **IOFieldType**  
Specifies the mode of the I/O field.
- **Layer**  
Returns the layer of the screen in which the I/O field is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **MeasurementUnit**  
Returns the displayed unit.
- **MeasurementUnitType**  
Specifies the display format of the unit.
- **Name**  
Returns the name of the I/O field.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the I/O field is operable.
- **OutputFormat**  
Specifies the format for displaying the process values.
- **Padding**  
Specifies the distance of the content from the border of the I/O field.
- **Parent**  
Returns the higher-level screen object.
- **ProcessValue**  
Specifies the process value.
- **RenderingTemplate**  
Returns the name of the template from which the I/O field was created.
- **RequireExplicitUnlock**  
Returns whether the I/O field is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the I/O field rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.

- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the I/O field is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the I/O field.
- **TabIndex**  
Returns the position of the I/O field in the tab sequence.
- **TextTrimming**  
Specifies the type of text trimming if space is not sufficient.
- **Thresholds**  
Returns the list of all limit values of the I/O field.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the I/O field is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "IOField" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the I/O field.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "IOField" object has the following events:

- **OnActivated()**  
Occurs when an I/O field receives focus.
- **OnContextTapped()**  
Occurs when an I/O field is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when an I/O field loses focus.

- **OnKeyDown()**  
Occurs when a key is pressed while the I/O field is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the I/O field is in focus.
- **OnTapped()**  
Occurs when an I/O field is left-clicked or short-touched.
- **OnInputFinished()**  
Occurs when input to an I/O field is terminated.

## IOField.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

IOField.AlternateBackColor

### See also

IOField (Page 3607)

## IOField.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

**Syntax**`IOField.AlternateBorderColor`**See also**

IOField (Page 3607)

**IOField.Authorization****Description**

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**`IOField.Authorization`**See also**

IOField (Page 3607)

**IOField.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`IOField.BackColor`

**See also**

[IOField \(Page 3607\)](#)

**IOField.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`IOField.BorderColor`

**See also**

[IOField \(Page 3607\)](#)

**IOField.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`IOField.BorderWidth`

**See also**

[IOField \(Page 3607\)](#)

## IOField.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the I/O field.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`IOField.CurrentQuality`

### See also

[IOField \(Page 3607\)](#)

## IOField.Enabled

### Description

The "Enabled" property specifies whether the I/O field can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

`IOField.Enabled`

**See also**

[IOField \(Page 3607\)](#)

**IOField.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`IOField.Font`

**See also**

[IOField \(Page 3607\)](#)

**Font.Italic**

**Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

IOField.Font (Page 3614)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

IOField.Font (Page 3614)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

IOField.Font (Page 3614)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

`Font.StrikeOut`

**See also**

IOField.Font (Page 3614)

**Font.Underline**

**Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**`IOField.Font` (Page 3614)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**`Int32, HmiFontWeight`

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**`IOField.Font` (Page 3614)**IOField.ForeColor****Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`IOField.ForeColor`

**See also**

IOField (Page 3607)

**IOField.Height**

**Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`IOField.Height`

**See also**

IOField (Page 3607)

**IOField.HorizontalTextAlignment**

**Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

**Access**

Read-write

**Syntax**

`IOField.HorizontalTextAlignment`

**See also**

[IOField \(Page 3607\)](#)

**IOField.InputBehavior****Description**

The "InputBehavior" property specifies the input behavior.

**Type**

Object, HmiInputBehaviorPart

**Access**

Read-write

**Syntax**

`IOField.InputBehavior`

**See also**

[IOField \(Page 3607\)](#)

## InputBehavior.AcceptOnDeactivated

### Description

The "AcceptOnDeactivated" property specifies whether the process value is written when the object loses the input focus.

### Type

Bool

### Access

Read-write

### Syntax

`InputBehavior.AcceptOnDeactivated`

### See also

[IOField.InputBehavior \(Page 3619\)](#)

## InputBehavior.ClearOnActivate

### Description

The "ClearOnActivate" property specifies whether the last value is deleted during input focus.

### Type

Bool

### Access

Read-write

### Syntax

`InputBehavior.ClearOnActivate`

### See also

[IOField.InputBehavior \(Page 3619\)](#)

## InputBehavior.HiddenInput

### Description

The "HiddenInput" property specifies whether the input value or an \* is shown for each character during the input.

### Type

Bool

### Access

Read-write

### Syntax

`InputBehavior.HiddenInput`

### See also

[IOField.InputBehavior \(Page 3619\)](#)

## InputBehavior.InputOnActivate

### Description

The "InputOnActivate" property determines whether the input field accepts input when it receives focus.

### Type

Bool

### Access

Read-write

### Syntax

`InputBehavior.InputOnActivate`

### See also

[IOField.InputBehavior \(Page 3619\)](#)

## IOField.IOFieldType

### Description

The "IOFieldType" property specifies the mode of the I/O field.

### Type

Int32, HmiIOFieldType

Specifies the type:

- Output (0): Output only
- InputOutput (2): Input and output

### Access

Read-write

### Syntax

`IOField.IOFieldType`

### See also

IOField (Page 3607)

## IOField.Layer

### Description

The "Layer" property returns the layer of the screen in which the I/O field is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`IOField.Layer`

### See also

IOField (Page 3607)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

[IOField.Layer \(Page 3622\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

[IOField.Layer \(Page 3622\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[IOField.Layer \(Page 3622\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[IOField.Layer \(Page 3622\)](#)

## IOField.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

```
IOField.Left
```

### See also

IOField (Page 3607)

## IOField.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
IOField.Margin
```

### See also

IOField (Page 3607)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[IOField.Margin \(Page 3625\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[IOField.Margin \(Page 3625\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[IOField.Margin \(Page 3625\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[IOField.Margin \(Page 3625\)](#)

## IOField.MeasurementUnit

### Description

The "MeasurementUnit" property returns the displayed unit.

### Type

String

### Access

Read-only

### Syntax

```
IOField.MeasurementUnit
```

### See also

IOField (Page 3607)

## IOField.MeasurementUnitType

### Description

The "MeasurementUnitType" property specifies the display format of the unit.

### Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

### Access

Read-write

### Syntax

```
IOField.MeasurementUnitType
```

**See also**

[IOField \(Page 3607\)](#)

**IOField.Name****Description**

The "Name" property returns the name of the I/O field.

**Type**

String

**Access**

Read-only

**Syntax**

```
IOField.Name
```

**See also**

[IOField \(Page 3607\)](#)

**IOField.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

**Type**

Float

**Access**

Read-write

**Syntax**

```
IOField.Opacity
```

**See also**

[IOField \(Page 3607\)](#)

## IOField.Operability

### Description

The "Operability" property returns whether the I/O field is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`IOField.Operability`

### See also

[IOField \(Page 3607\)](#)

## IOField.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

### Type

String

### Access

Read-write

### Syntax

`IOField.OutputFormat`

**See also**

[IOField \(Page 3607\)](#)

**IOField.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the I/O field.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

```
IOField.Padding
```

**See also**

[IOField \(Page 3607\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Bottom
```

### See also

[IOField.Padding \(Page 3631\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[IOField.Padding \(Page 3631\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

**See also**

[IOField.Padding \(Page 3631\)](#)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Top
```

**See also**

[IOField.Padding \(Page 3631\)](#)

**IOField.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, [HmiScreenObjectBase \(Page 1742\)](#)

**Access**

Read-only

**Syntax**

```
IOField.Parent
```

**See also**

[IOField \(Page 3607\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items**

**Description**

[Screen Items \(Page 1742\)](#)

**IOField.ProcessValue**

**Description**

The "ProcessValue" property specifies the process value.

**Type**

Variant

**Access**

Read-write

**Syntax**

`IOField.ProcessValue`

**See also**

[IOField \(Page 3607\)](#)

**IOField.RenderingTemplate**

**Description**

The "RenderingTemplate" property returns the name of the template from which the I/O field was created.

**Type**

String

**Access**

Read-only

**Syntax**`IOField.RenderingTemplate`**See also**

IOField (Page 3607)

**IOField.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the I/O field can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`IOField.RequireExplicitUnlock`**See also**

IOField (Page 3607)

**IOField.RotationAngle****Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

### Access

Read-write

### Syntax

`IOField.RotationAngle`

### See also

[IOField \(Page 3607\)](#)

[IOField.RotationCenterX \(Page 3637\)](#)

[IOField.RotationCenterY \(Page 3637\)](#)

[IOField.RotationCenterPlacement \(Page 3636\)](#)

## IOField.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the I/O field rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

`IOField.RotationCenterPlacement`

**See also**

[IOField \(Page 3607\)](#)

[IOField.RotationAngle \(Page 3635\)](#)

[IOField.RotationCenterX \(Page 3637\)](#)

[IOField.RotationCenterY \(Page 3637\)](#)

**IOField.RotationCenterX****Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

```
IOField.RotationCenterX
```

**See also**

[IOField \(Page 3607\)](#)

[IOField.RotationAngle \(Page 3635\)](#)

[IOField.RotationCenterY \(Page 3637\)](#)

[IOField.RotationCenterPlacement \(Page 3636\)](#)

**IOField.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

`IOField.RotationCenterY`

**See also**

- IOField (Page 3607)
- IOField.RotationAngle (Page 3635)
- IOField.RotationCenterX (Page 3637)
- IOField.RotationCenterPlacement (Page 3636)

**IOField.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the I/O field is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`IOField.ShowFocusVisual`

**See also**

- IOField (Page 3607)

**IOField.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the I/O field.

**Type**

String

**Access**

Read-only

**Syntax**`IOField.StyleItemClass`**See also**

IOField (Page 3607)

**IOField.TabIndex****Description**

The "TabIndex" property returns the position of the I/O field in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**`IOField.TabIndex`**See also**

IOField (Page 3607)

**IOField.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`IOField.TextTrimming`

**See also**

[IOField \(Page 3607\)](#)

**IOField.Thresholds**

**Description**

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the I/O field.

**Type**

Object, [HmiThresholdCollection \(Page 3640\)](#)

**Access**

Read-only

**Syntax**

`IOField.Thresholds`

**See also**

[IOField \(Page 3607\)](#)

[HmiThresholdCollection \(Page 3640\)](#)

**HmiThresholdCollection**

**Description**

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

**Use**

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

**Object type**

HmiThresholdCollection

**Properties**

The "HmiThresholdCollection" object has the following properties:

- **Count**  
Returns the number of limit values of the "HmiThresholdCollection" list.

**Methods**

The "HmiThresholdCollection" object has the following methods:

- **Item()**  
Returns a limit value of the "HmiThresholdCollection" list.

**See also**

IOField.Thresholds (Page 3640)

**HmiThresholdCollection.Count****Description**

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

**Type**

UInt32

**Access**

Read-only

**Syntax**

```
HmiThresholdCollection.Count
```

**See also**

HmiThresholdCollection (Page 3640)

## HmiThresholdCollection.Item()

### Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

### Syntax

```
HmiThresholdCollection[.Item] (HmiThresholdName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

---

### Parameters

**HmiThresholdName**

Type: String

Name of the limit value

### Return value

Object, HmiThresholdPart (Page 3642)

### See also

HmiThresholdCollection (Page 3640)

Threshold (Page 3642)

## Threshold

### Description

The "Threshold" object represents a limit value.

### Object type

HmiThresholdPart

## Properties

The "Threshold" object has the following properties:

- **Color**  
Specifies the color of the limit value.
- **DisplayName**  
Specifies the display name of the limit value.
- **Name**  
Specifies the name of the limit value.
- **ThresholdMode**  
Specifies the type of limit value.
- **Value**  
Returns the limit value.

## Methods

--

## See also

HmiThresholdCollection (Page 3640)

## Threshold.Color

### Description

The "Color" property specifies the color of the limit value.

### Type

UInt32

### Access

Read-write

### Syntax

Threshold.Color

## See also

Threshold (Page 3642)

## Threshold.DisplayName

### Description

The "DisplayName" property specifies the display name of the limit value.

### Type

String

### Access

Read-write

### Syntax

`Threshold.DisplayName`

### See also

Threshold (Page 3642)

## Threshold.Name

### Description

The "Name" property specifies the name of the limit value.

### Type

String

### Access

Read-write

### Syntax

`Threshold.Name`

### See also

Threshold (Page 3642)

## Threshold.ThresholdMode

### Description

The "ThresholdMode" property specifies the type of limit value.

### Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

### Access

Read-write

### Syntax

`Threshold.ThresholdMode`

### See also

[Threshold \(Page 3642\)](#)

## Threshold.Value

### Description

The "Value" property returns the limit value of the tag.

### Type

Float

### Access

Read-only

**Syntax**

Threshold.Value

**See also**

Threshold (Page 3642)

**IOField.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

IOField.ToolTipText

**See also**

IOField (Page 3607)

**IOField.Top**

**Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

IOField.Top

**See also**

IOField (Page 3607)

**IOField.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the text alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

**Access**

Read-write

**Syntax**

IOField.VerticalTextAlignment

**See also**

IOField (Page 3607)

**IOField.Visible****Description**

The "Visible" property specifies whether the I/O field is visible.

**Type**

Bool

**Access**

Read-write

### Syntax

`IOField.Visible`

### See also

[IOField \(Page 3607\)](#)

## IOField.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

`IOField.VisualizeQuality`

### See also

[IOField \(Page 3607\)](#)

## IOField.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**`IOField.Width`**See also**[IOField \(Page 3607\)](#)**IOField.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the I/O field.

**Syntax**`IOField.CheckAuthorization()`**Parameters**

--

**Return value**

Bool

**Example**

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

**Copy code**

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

**See also**[IOField \(Page 3607\)](#)**IOField.PropertyFlashing()****Description**

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

## Syntax

```
IOField.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

## Parameters

### **propertyName**

Type: String

Name of the property for which flashing is configured.

### **enable**

Type: Bool

Specifies that flashing is activated.

### **value**

Optional, type: Variant

Value of the property for which flashing is configured.

### **alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

### **rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

### **Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

IOField (Page 3607)

## IOField\_OnActivated()

### Description

The "OnActivated" event occurs when an I/O field receives focus:

- An I/O field is selected via the configured tab sequence.
- An I/O field that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

While an I/O field is in input mode, no events are transmitted to the server for the I/O field. Therefore, no events are triggered and no user-define scripts are executed in input mode.

### Syntax

```
IOField_OnActivated(item)
```

### Context

**item**

Type: Object

I/O field where the event occurs.

### See also

IOField (Page 3607)

## IOField\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An I/O field is right-clicked.
- An I/O field is long-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

While an I/O field is in input mode, no events are transmitted to the server for the I/O field. Therefore, no events are triggered and no user-define scripts are executed in input mode.

## Syntax

```
IOField_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

I/O field where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)

- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

[IOField \(Page 3607\)](#)

## IOField\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the I/O field loses focus when because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

While an I/O field is in input mode, no events are transmitted to the server for the I/O field. Therefore, no events are triggered and no user-define scripts are executed in input mode.

### Syntax

```
IOField_OnDeactivated(item)
```

### Context

**item**

Type: Object

I/O field where the event occurs.

## See also

[IOField \(Page 3607\)](#)

## IOField\_OnInputFinished()

### Description

The "OnInputFinished" event occurs when the input in an I/O field is finished.

The event also occurs if no value change takes place, e.g. because new input value would exceed a limit.

While an I/O field is in input mode, no events are transmitted for the I/O field. Therefore, no events are triggered and no user-define scripts are executed in input mode.

### Syntax

```
IOField_OnInputFinished(item, value)
```

### Context

**item**

Type: Object

I/O field where the event occurs.

**value**

Optional, type: Variant

Input value of the I/O field.

### IOField\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the I/O field is in focus.

While an I/O field is in input mode, no events are transmitted to the server for the I/O field. Therefore, no events are triggered and no user-define scripts are executed in input mode.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
IOField_OnKeyDown(item, keyCode, modifiers)
```

### Context

**item**

Type: Object

I/O field where the event occurs.

**keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**

IOField (Page 3607)

**IOField\_OnKeyUp()****Description**

The "OnKeyUp" event occurs when a key is released while the I/O field is in focus.

While an I/O field is in input mode, no events are transmitted to the server for the I/O field. Therefore, no events are triggered and no user-define scripts are executed in input mode.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
IOField_OnKeyUp(item, keyCode, modifiers)
```

**Context****item**

Type:

I/O field where the event occurs.

**keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**

[IOField \(Page 3607\)](#)

**IOField\_OnTapped()**

**Description**

The "OnTapped" event occurs with the following inputs of the operator:

- An I/O field is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a I/O field has the focus.
- An I/O field is short-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

While an I/O field is in input mode, no events are transmitted to the server for the I/O field. Therefore, no events are triggered and no user-define scripts are executed in input mode.

## Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

## Syntax

```
IOField_OnTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

I/O field where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

### See also

IOField (Page 3607)

### Label

### Description

The "Label" object represents an editable text box.

### Object type

HmiLabel

### Properties

The "Label" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border width.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the editable text box.

- **Enabled**  
Specifies whether the editable text box can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height in the (Device Independent Unit).
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of a text.
- **Layer**  
Returns the screen layer in which the editable text box is located.
- **Left**  
Specifies the value of the X coordinate in the (Device Independent Unit).
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the editable text box.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the editable text box is operable.
- **Padding**  
Specifies the distance of the content from the border of the editable text box.
- **Parent**  
Returns the higher-level screen object (Parent container).
- **RenderingTemplate**  
Returns the name of the template from which the editable text box was created.
- **RequireExplicitUnlock**  
Returns whether the editable text box can only be operated while the associated button is being pressed.
- **RotationAngle**  
Specifies the rotation angle of the editable text box in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the editable text box rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the editable text box is highlighted when in focus.

- **StyleItemClass**  
Specifies the style which is applied to the editable text box.
- **TabIndex**  
Returns the position of the editable text box in the tab sequence.
- **Text**  
Specifies the label.
- **TextTrimming**  
Specifies the type of text trimming if space is insufficient.
- **TextWrapping**  
Specifies how text is wrapped if space is insufficient.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **VerticalTextAlignment**  
Specifies the vertical alignment of a text.
- **Visible**  
Specifies whether the editable text box is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width in (Device Independent Unit).

## Methods

The "Label" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the editable text box.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Label" object has the following events:

- **OnActivated()**  
Occurs when the editable text box receives focus.
- **OnContextTapped()**  
Occurs when the editable text box is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when the editable text box loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the text box is in focus.

- **OnKeyUp()**  
Occurs when a key is released while the text box is in focus.
- **OnTapped()**  
Occurs when the editable text box is left-clicked or short-touched.

## Label.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

`Label.AlternateBackColor`

### See also

[Label \(Page 3658\)](#)

## Label.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`Label.AlternateBorderColor`

### See also

Label (Page 3658)

## Label.Authorization

### Description

The "Authorization" property returns the operator authorization.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`Label.Authorization`

### See also

Label (Page 3658)

## Label.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`Label.BackColor`

### See also

Label (Page 3658)

## Label.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

`Label.BorderColor`

### See also

Label (Page 3658)

## Label.BorderWidth

### Description

The "BorderWidth" property specifies the border width.

### Type

UInt32

### Access

Read-write

### Syntax

`Label.BorderWidth`

### See also

Label (Page 3658)

## Label.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the editable text box.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`Label.CurrentQuality`

### See also

Label (Page 3658)

## Label.Enabled

### Description

The "Enabled" property specifies whether the editable text box can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**`Label.Enabled`**See also**

Label (Page 3658)

**Label.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`Label.Font`**See also**

Label (Page 3658)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`

**See also**

Label.Font (Page 3665)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

Label.Font (Page 3665)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Label.Font (Page 3665)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

Label.Font (Page 3665)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

Label.Font (Page 3665)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

## Syntax

`Font.Weight`

## See also

Label.Font (Page 3665)

## Label.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`Label.ForeColor`**See also**

Label (Page 3658)

**Label.Height****Description**

The "Height" property specifies the height in the (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`Label.Height`**See also**

Label (Page 3658)

**Label.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of a text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Label.HorizontalTextAlignment`

### See also

Label (Page 3658)

### Label.Layer

### Description

The "Layer" property returns the screen layer in which the editable text box is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Label.Layer`

### See also

Label (Page 3658)

### Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MaximumZoom`**See also**

Label.Layer (Page 3670)

**Layer.MinimumZoom****Description**

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**`Layer.MinimumZoom`**See also**

Label.Layer (Page 3670)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**

`Layer.Name`

**See also**

Label.Layer (Page 3670)

**Layer.Visible**

**Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

Label.Layer (Page 3670)

**Label.Left**

**Description**

The "Left" property sets the value of the X coordinate in the (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

Label.Left

**See also**

Label (Page 3658)

**Label.Margin****Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

Label.Margin

**See also**

Label (Page 3658)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

Label.Margin (Page 3673)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

Label.Margin (Page 3673)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

Label.Margin (Page 3673)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**

Label.Margin (Page 3673)

**Label.Name****Description**

The "Name" property returns the name of the editable text box.

**Type**

String

**Access**

Read-only

**Syntax**

Label.Name

**See also**

Label (Page 3658)

**Label.Opacity**

**Description**

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

**Type**

Float

**Access**

Read-write

**Syntax**

Label.Opacity

**See also**

Label (Page 3658)

**Label.Operability**

**Description**

The "Operability" property returns whether the editable text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.

- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`Label.Operability`

**See also**

Label (Page 3658)

**Label.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the editable text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`Label.Padding`

**See also**

Label (Page 3658)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Bottom

**See also**

Label.Padding (Page 3677)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Left

**See also**

Label.Padding (Page 3677)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

Label.Padding (Page 3677)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**

Label.Padding (Page 3677)

**Label.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`Label.Parent`

**See also**

Label (Page 3658)

Screen Items (Page 1742)

**Screen Items**

**Description**

Screen Items (Page 1742)

**Label.RenderingTemplate**

**Description**

The "RenderingTemplate" property returns the name of the template from which the editable text box was created.

**Type**

String

**Access**

Read-only

**Syntax**

`Label.RenderingTemplate`

**See also**

Label (Page 3658)

## Label.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the editable text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`Label.RequireExplicitUnlock`

### See also

Label (Page 3658)

## Label.RotationAngle

### Description

The "RotationAngle" property specifies the rotation angle of the editable text box in degrees.

### Type

Int16

### Access

Read-write

### Syntax

`Label.RotationAngle`

### See also

Label (Page 3658)

Label.RotationCenterPlacement (Page 3682)

[Label.RotationCenterX \(Page 3682\)](#)

[Label.RotationCenterY \(Page 3683\)](#)

## Label.RotationCenterPlacement

### Description

The "RotationCenterPlacement" property sets the reference point around which the editable text box rotates.

### Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### Access

Read-write

### Syntax

```
Label.RotationCenterPlacement
```

### See also

[Label \(Page 3658\)](#)

[Label.RotationAngle \(Page 3681\)](#)

[Label.RotationCenterX \(Page 3682\)](#)

[Label.RotationCenterY \(Page 3683\)](#)

## Label.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point.

**Type**

Float

**Access**

Read-write

**Syntax**`Label.RotationCenterX`**See also**[Label \(Page 3658\)](#)[Label.RotationAngle \(Page 3681\)](#)[Label.RotationCenterPlacement \(Page 3682\)](#)[Label.RotationCenterY \(Page 3683\)](#)**Label.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point.

**Type**

Float

**Access**

Read-write

**Syntax**`Label.RotationCenterY`**See also**[Label \(Page 3658\)](#)[Label.RotationAngle \(Page 3681\)](#)[Label.RotationCenterPlacement \(Page 3682\)](#)[Label.RotationCenterX \(Page 3682\)](#)

## Label.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the editable text box is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

`Label.ShowFocusVisual`

### See also

Label (Page 3658)

## Label.StyleItemClass

### Description

The "StyleItemClass" property specifies the style which is applied to the editable text box.

### Type

String

### Access

Read-only

### Syntax

`Label.StyleItemClass`

### See also

Label (Page 3658)

## Label.TabIndex

### Description

The "TabIndex" property returns the position of the editable text box in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`Label.TabIndex`

### See also

Label (Page 3658)

## Label.Text

### Description

The "Text" property specifies the label.

### Type

String

### Access

Read-write

### Syntax

`Label.Text`

### See also

Label (Page 3658)

## Label.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Label.TextTrimming`

### See also

Label (Page 3658)

## Label.TextWrapping

### Description

The "TextWrapping" property specifies how text is wrapped if there is insufficient space.

### Type

Int32, HmiTextWrapping

Specifies the text break:

- NoWrap (0): No text break
- WordWrap (1): Text break at the end of the line

### Access

Read-write

### Syntax

`Label.TextWrapping`

**See also**

Label (Page 3658)

**Label.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

`Label.ToolTipText`

**See also**

Label (Page 3658)

**Label.Top****Description**

The "Top" property specifies the value of the Y coordinate.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Label.Top`

**See also**

Label (Page 3658)

## Label.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of a text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Label.VerticalTextAlignment`

### See also

[Label \(Page 3658\)](#)

## Label.Visible

### Description

The "Visible" property specifies whether the editable text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Label.Visible`

**See also**

Label (Page 3658)

**Label.VisualizeQuality****Description**

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

Label.VisualizeQuality

**See also**

Label (Page 3658)

**Label.Width****Description**

The "Width" property specifies the width in the (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

Label.Width

## See also

Label (Page 3658)

## Label.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the editable text box.

### Syntax

```
Label.CheckAuthorization()
```

### Parameters

-

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

Label (Page 3658)

## Label.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

**Syntax**

```
Label.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

**Parameters****propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

Label (Page 3658)

## Label\_OnActivated()

### Description

The "OnActivated" event occurs when an editable text box receives focus:

- A text box is selected via the configured tab sequence.
- A text box that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Label_OnActivated(item)
```

### Context

**item**

Type: Object

Text box where the event occurs.

### See also

Label (Page 3658)

## Label\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A text box is right-clicked.
- A text box is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Label_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

Text box where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

Label (Page 3658)

## Label\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the text box loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
Label_OnDeactivated(item)
```

### Context

**item**

Type: Object

Text box where the event occurs.

## See also

Label (Page 3658)

## Label\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the text box is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

**Syntax**

```
Label_OnKeyDown(item, keyCode, modifiers)
```

**Context****item**

Type: Object

Text box where the event occurs.

**keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**See also**

Label (Page 3658)

**Label\_OnKeyUp()****Description**

The "OnKeyUp" event occurs when a key is released while the text box is in focus.

**Order**

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
Label_OnKeyUp(item, keyCode, modifiers)
```

## Context

### **item**

Type:

Text box where the event occurs.

### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

Label (Page 3658)

## Label\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A text box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a text box has the focus.
- A text box is short-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Label_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Text box where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Label (Page 3658)

**Line**

**Description**

The "Line" object represents a line in runtime.

**Object type**

HmiLine

## Properties

The "Line" object has the following properties:

- **AlternateLineColor**  
Specifies the second line color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **CapType**  
Specifies the shape of the line ends.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the line.
- **DashType**  
Specifies the stroke style of the line.
- **Enabled**  
Specifies whether the line can be operated in runtime.
- **EndType**  
Specifies the type of line end.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the line is located.
- **Left**  
Specifies the value of the X coordinate.
- **LineColor**  
Specifies the line color.
- **LineWidth**  
Specifies the line thickness.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the line.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the line is operable.
- **Parent**  
Returns the higher-level screen object.
- **RequireExplicitUnlock**  
Returns whether the line is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the line rotates.

- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**  
Specifies whether the line is highlighted when in focus.
- **StartType**  
Specifies the type of line start.
- **StyleItemClass**  
Returns the style which is applied to the line.
- **TabIndex**  
Returns the position of the line in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the line is visible.
- **Width**  
Specifies the width.
- **X1**  
Specifies the X coordinate of the starting point of the line.
- **X2**  
Specifies the X coordinate of the end point of the line.
- **Y1**  
Specifies the Y coordinate of the starting point of the line.
- **Y2**  
Specifies the Y coordinate of the end point of the line.

## Methods

The "Line" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the line.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "Line" object has the following events:

- **OnActivated()**  
Occurs when a line receives focus.
- **OnContextTapped()**  
Occurs when a line is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a line loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the line is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the line is in focus.
- **OnTapped()**  
Occurs when a line is left-clicked or short-touched.

## Line.AlternateLineColor

### Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
Line.AlternateLineColor
```

Line (Page 3698)

## Line.Authorization

### Description

The "Authorization" property returns the operator authorization.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`Line.Authorization`

**See also**

Line (Page 3698)

**Line.CapType**

**Description**

The "CapType" property specifies the shape of the line ends.

**Type**

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

**Access**

Read-write

**Syntax**

`Line.CapType`

**See also**

Line (Page 3698)

## Line.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the line.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`Line.CurrentQuality`

### See also

Line (Page 3698)

## Line.DashType

### Description

The "DashType" property specifies the stroke style of the line.

### Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted

- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

### Access

Read-write

### Syntax

`Line.DashType`

### See also

Line (Page 3698)

### Line.Enabled

#### Description

The "Enabled" property specifies whether the line can be operated in runtime.

#### Type

Bool

### Access

Read-write

### Syntax

`Line.Enabled`

### See also

Line (Page 3698)

### Line.EndType

#### Description

The "EndType" property specifies the line end type.

#### Type

Int32, HmiLineEndType

Specifies the line end type:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

**Access**

Read-write

**Syntax**

`Line.EndType`

**See also**

[Line \(Page 3698\)](#)

**Line.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Line.Height`

**See also**

[Line \(Page 3698\)](#)

## Line.Layer

### Description

The "Layer" property returns the layer of the screen in which the line is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`Line.Layer`

### See also

Line (Page 3698)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

Line.Layer (Page 3706)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[Line.Layer \(Page 3706\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[Line.Layer \(Page 3706\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[Line.Layer \(Page 3706\)](#)

## Line.Left

### Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Line.Left`

### See also

[Line \(Page 3698\)](#)

## Line.LineColor

### Description

The "LineColor" property specifies the line color.

### Type

UInt32

### Access

Read-write

### Syntax

```
Line.LineColor
```

### See also

Line (Page 3698)

## Line.LineWidth

### Description

The "LineWidth" property specifies the line thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
Line.LineWidth
```

### See also

Line (Page 3698)

## Line.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`Line.Margin`

### See also

[Line \(Page 3698\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[Line.Margin \(Page 3710\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Left

### See also

Line.Margin (Page 3710)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Right

### See also

Line.Margin (Page 3710)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

Line.Margin (Page 3710)

## Line.Name

### Description

The "Name" property returns the name of the line.

### Type

String

### Access

Read-only

### Syntax

Line.Name

### See also

Line (Page 3698)

## Line.Opacity

### Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

### Type

Float

### Access

Read-write

### Syntax

`Line.Opacity`

### See also

Line (Page 3698)

## Line.Operability

### Description

The "Operability" property returns whether the line is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`Line.Operability`

**See also**

Line (Page 3698)

**Line.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`Line.Parent`

**See also**

Line (Page 3698)

Screen Items (Page 1742)

**Screen Items**

**Description**

Screen Items (Page 1742)

**Line.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the line can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`Line.RequireExplicitUnlock`**See also**[Line \(Page 3698\)](#)**Line.RotationAngle****Description**

The "RotationAngle" property specifies the angle of rotation in degrees.

**Type**

Int16

**Access**

Read-write

**Syntax**`Line.RotationAngle`**See also**[Line \(Page 3698\)](#)[Line.RotationCenterPlacement \(Page 3715\)](#)[Line.RotationCenterX \(Page 3716\)](#)[Line.RotationCenterY \(Page 3717\)](#)**Line.RotationCenterPlacement****Description**

The "RotationCenterPlacement" property specifies the reference point around which the line rotates.

## Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

## Access

Read-write

## Syntax

`Line.RotationCenterPlacement`

## See also

[Line \(Page 3698\)](#)

[Line.RotationAngle \(Page 3715\)](#)

[Line.RotationCenterX \(Page 3716\)](#)

[Line.RotationCenterY \(Page 3717\)](#)

## Line.RotationCenterX

### Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

### Type

Float

### Access

Read-write

### Syntax

`Line.RotationCenterX`

**See also**

Line (Page 3698)  
Line.RotationAngle (Page 3715)  
Line.RotationCenterPlacement (Page 3715)  
Line.RotationCenterY (Page 3717)

**Line.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Line.RotationCenterY
```

**See also**

Line (Page 3698)  
Line.RotationAngle (Page 3715)  
Line.RotationCenterPlacement (Page 3715)  
Line.RotationCenterX (Page 3716)

**Line.ShowFocusVisual****Description**

The "ShowFocusVisual" property specifies whether the line is highlighted when in focus.

**Type**

Bool

### Access

Read-write

### Syntax

`Line.ShowFocusVisual`

### See also

Line (Page 3698)

## Line.StartType

### Description

The "StartType" property specifies the type of line start.

### Type

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

### Access

Read-write

### Syntax

`Line.StartType`

### See also

Line (Page 3698)

## Line.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the line.

### Type

String

### Access

Read-only

### Syntax

```
Line.StyleItemClass
```

### See also

Line (Page 3698)

## Line.TabIndex

### Description

The "TabIndex" property returns the position of the line in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

```
Line.TabIndex
```

### See also

Line (Page 3698)

## Line.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip.

### Type

String

### Access

Read-write

### Syntax

`Line.ToolTipText`

### See also

Line (Page 3698)

## Line.Top

### Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`Line.Top`

### See also

Line (Page 3698)

## Line.Visible

### Description

The "Visible" property specifies whether the line is visible.

### Type

Bool

### Access

Read-write

### Syntax

`Line.Visible`

### See also

Line (Page 3698)

## Line.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`Line.Width`

### See also

Line (Page 3698)

## Line.X1

### Description

The "X1" property specifies the X coordinate of the starting point of the line.

### Type

Int32

### Access

Read-write

### Syntax

`Line.X1`

### See also

[Line \(Page 3698\)](#)

[Line.X2 \(Page 3722\)](#)

[Line.Y1 \(Page 3723\)](#)

## Line.X2

### Description

The "X2" property specifies the X coordinate of the end point of the line.

### Type

Int32

### Access

Read-write

### Syntax

`Line.X2`

**See also**

[Line](#) (Page 3698)

[Line.X1](#) (Page 3722)

[Line.Y2](#) (Page 3723)

**Line.Y1****Description**

The "Y1" property specifies the Y coordinate of the starting point of the line.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Line.Y1`

**See also**

[Line](#) (Page 3698)

[Line.X1](#) (Page 3722)

[Line.Y2](#) (Page 3723)

**Line.Y2****Description**

The "Y2" property specifies the Y coordinate of the end point of the line.

**Type**

Int32

**Access**

Read-write

## Syntax

Line.Y2

## See also

Line (Page 3698)

Line.X2 (Page 3722)

Line.Y1 (Page 3723)

## Line.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the line.

### Syntax

```
Line.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

Line (Page 3698)

## Line.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
Line.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

Line (Page 3698)

## Line\_OnActivated()

### Description

The "OnActivated" event occurs when a line receives focus:

- A line is selected via the configured tab sequence.
- A line that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
Line_OnActivated(item)
```

### Context

**item**

Type: Object

Line where the event occurs.

## See also

Line (Page 3698)

## Line\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A line is right-clicked.
- A line is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
Line_OnContextTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Line where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Line (Page 3698)

**Line\_OnDeactivated()**

**Description**

The "OnDeactivated" event occurs when the line loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

**Syntax**

`Line_OnDeactivated(item)`

**Context**

**item**

Type: Object

Line where the event occurs.

**See also**

Line (Page 3698)

## Line\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the line is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Line_OnKeyDown(item, keyCode, modifiers)
```

### Context

**item**

Type: Object

Line where the event occurs.

**keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### See also

Line (Page 3698)

## Line\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while a line is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

### Syntax

```
Line_OnKeyUp(item, keyCode, modifiers)
```

### Context

#### **item**

Type:

Line where the event occurs.

#### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

#### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### See also

Line (Page 3698)

## Line\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A line is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a line has the focus.
- A line is short-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
Line_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

Line where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

**See also**

Line (Page 3698)

**ListBox**

**Description**

The "ListBox" object represents a list box in runtime.

**Object type**

HmiListBox

## Properties

The "ListBox" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the border color.
- **BorderWidth**  
Specifies the border thickness.
- **Content**  
Specifies the display options for text and graphics.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the list box.
- **Enabled**  
Specifies whether the list box can be operated in runtime.
- **Font**  
Specifies the font of the text.
- **ForeColor**  
Specifies the font color of the text.
- **Height**  
Specifies the height.
- **Layer**  
Returns the layer of the screen in which the list box is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the list box.
- **Opacity**  
Specifies the opacity.
- **Operability**  
Returns whether the list box is operable.
- **Padding**  
Specifies the distance of the content from the border of the list box.
- **Parent**  
Returns the higher-level screen object.

- **ProcessValue**  
Specifies the process value.
- **RenderingTemplate**  
Returns the name of the template from which the list box was created.
- **RequireExplicitUnlock**  
Returns whether the list box is only operable while the associated button is being pressed.
- **RotationAngle**  
Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**  
Specifies the reference point around which the list box rotates.
- **RotationCenterX**  
Specifies the X coordinate of the rotation point.
- **RotationCenterY**  
Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**  
Specifies the height of the list entries.
- **SelectionItems**  
Returns the list of all list entries of the list box.
- **SelectionMode**  
Specifies whether one or more list entries can be selected from the list box.
- **SelectorPosition**  
Specifies the horizontal alignment of the list entries.
- **ShowFocusVisual**  
Specifies whether the list box is highlighted when in focus.
- **StyleItemClass**  
Returns the style which is applied to the list box.
- **TabIndex**  
Returns the position of the list box in the tab sequence.
- **ToolTipText**  
Specifies the tooltip text.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the list box is visible.
- **VisualizeQuality**  
Specifies whether the connection quality of the process value is displayed.
- **Width**  
Specifies the width.

## Methods

The "ListBox" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the list box.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ListBox" object has the following events:

- **OnActivated()**  
Occurs when a list box receives focus.
- **OnContextTapped()**  
Occurs when a list box is right-clicked or long-touched.
- **OnDeactivated()**  
Occurs when a list box loses focus.
- **OnKeyDown()**  
Occurs when a key is pressed while the list box is in focus.
- **OnKeyUp()**  
Occurs when a key is released while the list box is in focus.
- **OnTapped()**  
Occurs when a list box is left-clicked or short-touched.

## ListBox.AlternateBackColor

### Description

The "AlternateBackColor" specifies the second color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ListBox.AlternateBackColor
```

### See also

[ListBox \(Page 3732\)](#)

## **ListBox.AlternateBorderColor**

### **Description**

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

### **Type**

UInt32

### **Access**

Read-write

### **Syntax**

`ListBox.AlternateBorderColor`

### **See also**

[ListBox \(Page 3732\)](#)

## **ListBox.Authorization**

### **Description**

The "Authorization" property returns the operator authorization.

### **Type**

Object, HmiFunctionRight

### **Access**

Read-only

### **Syntax**

`ListBox.Authorization`

### **See also**

[ListBox \(Page 3732\)](#)

## ListBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ListBox.BackColor
```

### See also

[ListBox \(Page 3732\)](#)

## ListBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ListBox.BorderColor
```

### See also

[ListBox \(Page 3732\)](#)

## **ListBox.BorderWidth**

### **Description**

The "BorderWidth" property specifies the border thickness.

### **Type**

UInt8

### **Access**

Read-write

### **Syntax**

`ListBox.BorderWidth`

### **See also**

[ListBox \(Page 3732\)](#)

## **ListBox.Content**

### **Description**

The "Content" property specifies the display options for text and graphics.

### **Type**

Object, HmiContentPart

### **Access**

Read-write

### **Syntax**

`ListBox.Content`

### **See also**

[ListBox \(Page 3732\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ListBox.Content \(Page 3738\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

`ListBox.Content` (Page 3738)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

`ListBox.Content` (Page 3738)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ListBox.Content \(Page 3738\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ListBox.Content \(Page 3738\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ListBox.Content \(Page 3738\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**`Content.TextTrimming`**See also**[ListBox.Content \(Page 3738\)](#)**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**`Content.VerticalTextAlignment`**See also**[ListBox.Content \(Page 3738\)](#)

## ListBox.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the list box.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

```
ListBox.CurrentQuality
```

### See also

[ListBox \(Page 3732\)](#)

## ListBox.Enabled

### Description

The "Enabled" property specifies whether the list box can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**`ListBox.Enabled`**See also**

ListBox (Page 3732)

**ListBox.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`ListBox.Font`**See also**

ListBox (Page 3732)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Italic`

**See also**

ListBox.Font (Page 3745)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ListBox.Font (Page 3745)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

[ListBox.Font \(Page 3745\)](#)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

```
Font.StrikeOut
```

**See also**

[ListBox.Font \(Page 3745\)](#)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

## Syntax

`Font.Underline`

## See also

[ListBox.Font \(Page 3745\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

## See also

[ListBox.Font \(Page 3745\)](#)

## ListBox.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ListBox.ForeColor`**See also**

ListBox (Page 3732)

**ListBox.Height****Description**

The "Height" property specifies the height in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ListBox.Height`**See also**

ListBox (Page 3732)

**ListBox.Layer****Description**

The "Layer" property returns the layer of the screen in which the list box is located.

**Type**

Object, HmiLayerPart

### Access

Read-only

### Syntax

`ListBox.Layer`

### See also

[ListBox \(Page 3732\)](#)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MaximumZoom`

### See also

[ListBox.Layer \(Page 3749\)](#)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

**Access**

Read-write

**Syntax**`Layer.MinimumZoom`**See also**

ListBox.Layer (Page 3749)

**Layer.Name****Description**

The "Name" property returns the name of the screen layer.

**Type**

String

**Access**

Read-only

**Syntax**`Layer.Name`**See also**

ListBox.Layer (Page 3749)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

[ListBox.Layer \(Page 3749\)](#)

**ListBox.Left**

**Description**

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ListBox.Left`

**See also**

[ListBox \(Page 3732\)](#)

**ListBox.Margin**

**Description**

The "Margin" property specifies the margin.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ListBox.Margin`**See also**

ListBox (Page 3732)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

ListBox.Margin (Page 3752)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ListBox.Margin \(Page 3752\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ListBox.Margin \(Page 3752\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ListBox.Margin \(Page 3752\)](#)**ListBox.Name****Description**

The "Name" property returns the name of the list box.

**Type**

String

**Access**

Read-only

**Syntax**`ListBox.Name`**See also**[ListBox \(Page 3732\)](#)**ListBox.Opacity****Description**

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

**Type**

Float

### Access

Read-write

### Syntax

`ListBox.Opacity`

### See also

[ListBox \(Page 3732\)](#)

## ListBox.Operability

### Description

The "Operability" property returns whether the list box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ListBox.Operability`

### See also

[ListBox \(Page 3732\)](#)

## ListBox.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the list box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ListBox.Padding`**See also**

ListBox (Page 3732)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**

ListBox.Padding (Page 3756)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ListBox.Padding \(Page 3756\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ListBox.Padding \(Page 3756\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ListBox.Padding \(Page 3756\)](#)**ListBox.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**`ListBox.Parent`**See also**[ListBox \(Page 3732\)](#)[Screen Items \(Page 1742\)](#)**Screen Items****Description**[Screen Items \(Page 1742\)](#)

## **ListBox.ProcessValue**

### **Description**

The "ProcessValue" property specifies the process value.

### **Type**

Variant

### **Access**

Read-write

### **Syntax**

`ListBox.ProcessValue`

### **See also**

[ListBox \(Page 3732\)](#)

## **ListBox.RenderingTemplate**

### **Description**

The "RenderingTemplate" property returns the name of the template from which the list box was created.

### **Type**

String

### **Access**

Read-only

### **Syntax**

`ListBox.RenderingTemplate`

### **See also**

[ListBox \(Page 3732\)](#)

## ListBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the list box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ListBox.RequireExplicitUnlock
```

### See also

[ListBox \(Page 3732\)](#)

## ListBox.RotationAngle

### Description

The "RotationAngle" property specifies the angle of rotation in degrees.

### Type

Int16

### Access

Read-write

### Syntax

```
ListBox.RotationAngle
```

### See also

[ListBox \(Page 3732\)](#)

[ListBox.RotationCenterPlacement \(Page 3762\)](#)

[ListBox.RotationCenterX \(Page 3762\)](#)

[ListBox.RotationCenterY \(Page 3763\)](#)

## **ListBox.RotationCenterPlacement**

### **Description**

The "RotationCenterPlacement" property sets the reference point around which the list box rotates.

### **Type**

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

### **Access**

Read-write

### **Syntax**

`ListBox.RotationCenterPlacement`

### **See also**

[ListBox \(Page 3732\)](#)

[ListBox.RotationAngle \(Page 3761\)](#)

[ListBox.RotationCenterX \(Page 3762\)](#)

[ListBox.RotationCenterY \(Page 3763\)](#)

## **ListBox.RotationCenterX**

### **Description**

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`ListBox.RotationCenterX`**See also**[ListBox \(Page 3732\)](#)[ListBox.RotationAngle \(Page 3761\)](#)[ListBox.RotationCenterPlacement \(Page 3762\)](#)[ListBox.RotationCenterY \(Page 3763\)](#)**ListBox.RotationCenterY****Description**

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

**Type**

Float

**Access**

Read-write

**Syntax**`ListBox.RotationCenterY`**See also**[ListBox \(Page 3732\)](#)[ListBox.RotationAngle \(Page 3761\)](#)[ListBox.RotationCenterPlacement \(Page 3762\)](#)[ListBox.RotationCenterX \(Page 3762\)](#)

## ListBox.SelectionItemHeight

### Description

The "SelectionItemHeight" property specifies the height of the list entries. The value "0" indicates that the height is calculated automatically.

### Type

UInt16

### Access

Read-write

### Syntax

`ListBox.SelectionItemHeight`

### See also

[ListBox \(Page 3732\)](#)

## ListBox.SelectionItems

### Description

The "SelectionItems" property returns the list of all list entries ("SelectionItem" objects) of the list box.

### Type

Object, [HmiSelectedItemCollection \(Page 3765\)](#)

### Access

Read-only

### Syntax

`ListBox.SelectionItems`

### See also

[ListBox \(Page 3732\)](#)

[HmiSelectedItemCollection \(Page 3765\)](#)

## HmiSelectedItemCollection

### Description

The "HmiSelectedItemCollection" object is a list of all entries ("SelectedItem" objects) of a list object.

### Use

The "HmiSelectedItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectedItemCollection" list using the index or the tag name.

### Object type

HmiSelectedItemCollection

### Properties

The "HmiSelectedItemCollection" object has the following properties:

- **Count**  
Returns the number of list entries of the "HmiSelectedItemCollection" list.

### Methods

The "HmiSelectedItemCollection" object has the following methods:

- **Item()**  
Returns a list entry of the "HmiSelectedItemCollection" list.

### See also

[ListBox.SelectionItems \(Page 3764\)](#)

## HmiSelectedItemCollection.Count

### Description

The "Count" property returns the number of list entries in the "HmiSelectedItemCollection" list.

### Type

UInt32

### Access

Read-only

## Syntax

```
HmiSelectedItemCollection.Count
```

## See also

HmiSelectedItemCollection (Page 3765)

## HmiSelectedItemCollection.Item()

## Description

The "Item" method returns a list entry of the "HmiSelectedItemCollection" list.

## Syntax

```
HmiSelectedItemCollection[.Item] (HmiSelectedItemName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectedItemCollection" object.

---

## Parameters

### **HmiSelectedItemName**

Type: String

Name of the list entry

## Return value

Object, HmiSelectedItemPart (Page 3766)

## See also

HmiSelectedItemCollection (Page 3765)

SelectedItem (Page 3766)

## SelectedItem

## Description

The "SelectedItem" object represents a list entry.

**Object type**

HmiSelectedItemPart

**Properties**

The "SelectedItem" object has the following properties:

- **Graphic**  
Specifies the graphic of the list entry.
- **IsSelected**  
Specifies whether the list entry is selected.
- **Text**  
Specifies the list entry text.

**Methods**

--

**See also**[HmiSelectedItemCollection \(Page 3765\)](#)**SelectedItem.Graphic****Description**

The "Graphic" property specifies the graphic of the list entry.

**Type**

String

**Access**

Read-write

**Syntax**`SelectedItem.Graphic`**See also**[SelectedItem \(Page 3766\)](#)

## SelectedItem.IsSelected

### Description

The "IsSelected" property specifies whether the list entry is selected.

### Type

Bool

### Access

Read-write

### Syntax

```
SelectedItem.IsSelected
```

### See also

SelectedItem (Page 3766)

## SelectedItem.Text

### Description

The "Text" property specifies the text of the list entry.

### Type

String

### Access

Read-write

### Syntax

```
SelectedItem.Text
```

### See also

SelectedItem (Page 3766)

## ListBox.SelectionMode

### Description

The "SelectionMode" property specifies whether one or more list entries can be selected in a list box.

### Type

Int32, HmiSelectionMode

Specifies the selection type:

- NonExclusive (0): Selection of multiple list entries possible
- Exclusive (1): Selection of only one list entry possible

### Access

Read-write

### Syntax

`ListBox.SelectionMode`

### See also

[ListBox \(Page 3732\)](#)

## ListBox.SelectorPosition

### Description

The "SelectorPosition" property specifies the horizontal alignment of the list entries.

### Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

### Access

Read-write

**Syntax**

`ListBox.SelectorPosition`

**See also**

[ListBox \(Page 3732\)](#)

**ListBox.ShowFocusVisual**

**Description**

The "ShowFocusVisual" property specifies whether the list box is highlighted when in focus.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ListBox.ShowFocusVisual`

**See also**

[ListBox \(Page 3732\)](#)

**ListBox.StyleItemClass**

**Description**

The "StyleItemClass" property returns the style which is applied to the list box.

**Type**

String

**Access**

Read-only

**Syntax**

`ListBox.StyleItemClass`

**See also**

[ListBox \(Page 3732\)](#)

**ListBox.TabIndex****Description**

The "TabIndex" property returns the position of the list box in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

```
ListBox.TabIndex
```

**See also**

[ListBox \(Page 3732\)](#)

**ListBox.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip.

**Type**

String

**Access**

Read-write

**Syntax**

```
ListBox.ToolTipText
```

**See also**

[ListBox \(Page 3732\)](#)

## **ListBox.Top**

### **Description**

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

### **Type**

Int32

### **Access**

Read-write

### **Syntax**

`ListBox.Top`

### **See also**

[ListBox \(Page 3732\)](#)

## **ListBox.Visible**

### **Description**

The "Visible" property specifies whether the list box is visible.

### **Type**

Bool

### **Access**

Read-write

### **Syntax**

`ListBox.Visible`

### **See also**

[ListBox \(Page 3732\)](#)

## ListBox.VisualizeQuality

### Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

### Type

Bool

### Access

Read-write

### Syntax

```
ListBox.VisualizeQuality
```

### See also

ListBox (Page 3732)

## ListBox.Width

### Description

The "Width" property specifies the width in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ListBox.Width
```

### See also

ListBox (Page 3732)

## ListBox.CheckAuthorization()

### Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the list box.

### Syntax

```
ListBox.CheckAuthorization()
```

### Parameters

--

### Return value

Bool

### Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

#### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

### See also

[ListBox \(Page 3732\)](#)

## ListBox.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ListBox.PropertyFlashing(propertyName, enable[, value][,  
alternateValue][, rate])
```

## Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**If the parameter is missing, "Medium" is used.

---

## Return value

Bool

## See also

ListBox (Page 3732)

## ListBox\_OnActivated()

### Description

The "OnActivated" event occurs when a list box receives focus:

- A list box is selected via the configured tab sequence.
- A list box that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

### Syntax

```
ListBox_OnActivated(item)
```

### Context

**item**

Type: Object

List box where the event occurs.

### See also

ListBox (Page 3732)

## ListBox\_OnContextTapped()

### Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A list box is right-clicked.
- A list box is long-touched.

---

#### Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Syntax

```
ListBox_OnContextTapped(item, x, y, modifiers, trigger)
```

## Context

### **item**

Type: Object

List box where the event occurs.

### **x**

Type: DInt

X-coordinate of the input point

### **y**

Type: DInt

Y-coordinate of the input point

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

### **trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

## See also

[ListBox \(Page 3732\)](#)

## ListBox\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when the list box loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
ListBox_OnDeactivated(item)
```

### Context

**item**

Type: Object

List box where the event occurs.

## See also

[ListBox \(Page 3732\)](#)

## ListBox\_OnKeyDown()

### Description

The "OnKeyDown" event occurs when a key is pressed while the list box is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
ListBox_OnKeyDown(item, keyCode, modifiers)
```

## Context

### **item**

Type: Object

List box where the event occurs.

### **keyCode**

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

[ListBox \(Page 3732\)](#)

## ListBox\_OnKeyUp()

### Description

The "OnKeyUp" event occurs when a key is released while the list box is in focus.

### Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

## Syntax

```
ListBox_OnKeyUp(item, keyCode, modifiers)
```

## Context

### **item**

Type:

List box where the event occurs.

### **keyCode**

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

### **modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

## See also

[ListBox \(Page 3732\)](#)

## ListBox\_OnTapped()

### Description

The "OnTapped" event occurs with the following inputs of the operator:

- A list box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a list box has the focus.
- A list box is short-touched.

---

**Note**

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

---

### Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

### Syntax

```
ListBox_OnTapped(item, x, y, modifiers, trigger)
```

### Context

**item**

Type: Object

List box where the event occurs.

**x**

Type: DInt

X-coordinate of the input point

**y**

Type: DInt

Y-coordinate of the input point

**modifiers**

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

**trigger**

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

[ListBox \(Page 3732\)](#)

**MediaControl**

**Description**

The "MediaControl" object represents a media player for playback of multimedia files in runtime.

**Object type**

HmiMediaControl

## Properties

The "MediaControl" object has the following properties:

- **AutoPlay**  
Specifies whether Autoplay is activated.
- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the Media Player.
- **Enabled**  
Specifies whether the Media Player can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the Media Player.
- **Layer**  
Returns the screen layer in which the Media Player is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the Media Player.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the Media Player was created.
- **ShowFocusVisual**  
Specifies whether the Media Player is highlighted when in focus.
- **StatusBar**  
Specifies the information bar of the Media Player.
- **StyleItemClass**  
Specifies the information bar of the Media Player.
- **TabIndex**  
Returns the position of the Media Player in the tab sequence.
- **ToolBar**  
Specifies the toolbar of the Media Player.
- **Top**  
Specifies the value of the Y coordinate.

- **Url**  
Specifies the URL played by the Media Player.
- **VideoOutput**  
Specifies the scaling of the video output.
- **Visible**  
Specifies whether the Media Player is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the Media Player.

## Methods

The "MediaControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the Media Player.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the media player.
- **Pause()**  
Pauses playback.
- **Play()**  
Starts or resumes playback.
- **PropertyFlashing()**  
Configures flashing of a property.
- **Stop()**  
Stops playback.

## Events

The "MediaControl" object has the following events:

- **OnActivated()**  
Occurs when a Media Player receives focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the Media Player.
- **OnDeactivated()**  
Occurs when a Media Player loses focus.
- **OnInitialized()**  
Occurs when a Media Player has been successfully initialized and the data connection to the PLC has been established.
- **OnPaused()**  
Occurs when playback is paused in the Media Player.

- **OnPlaying()**  
Occurs when playback is started or resumed in the Media Player.
- **OnStopped()**  
Occurs when playback is stopped in the Media Player.

## MediaControl.AutoPlay

### Description

The "AutoPlay" property specifies whether Autoplay is activated.

### Type

Bool

### Access

Read-write

### Syntax

`MediaControl.AutoPlay`

### See also

MediaControl (Page 3782)

## MediaControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`MediaControl.BackColor`

**See also**

MediaControl (Page 3782)

**MediaControl.Caption**

**Description**

The "Caption" property specifies the text that is displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`MediaControl.Caption`

**See also**

MediaControl (Page 3782)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

MediaControl.Caption (Page 3786)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 3786)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Text.Font (Page 3786)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 3786)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**`Text.Font` (Page 3786)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**`Text.Font` (Page 3786)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 3786\)](#)

### Text.ForeColor

### Description

The "ForeColor" property sets the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[MediaControl.Caption \(Page 3786\)](#)

### Text.Text

### Description

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

MediaControl.Caption (Page 3786)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

MediaControl.Caption (Page 3786)

**MediaControl.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

`MediaControl.CaptionColor`

### See also

MediaControl (Page 3782)

## MediaControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the Media Player.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`MediaControl.CurrentQuality`

### See also

MediaControl (Page 3782)

## MediaControl.Enabled

### Description

The "Enabled" property specifies whether the Media Player can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
MediaControl.Enabled
```

### See also

MediaControl (Page 3782)

## MediaControl.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
MediaControl.Height
```

### See also

MediaControl (Page 3782)

## MediaControl.Icon

### Description

The "Icon" property specifies the icon of the Media Player.

### Type

String

### Access

Read-write

### Syntax

`MediaControl.Icon`

### See also

MediaControl (Page 3782)

## MediaControl.Layer

### Description

The "Layer" property returns the screen layer in which the Media Player is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

`MediaControl.Layer`

### See also

MediaControl (Page 3782)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

MediaControl.Layer (Page 3794)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MinimumZoom
```

### See also

MediaControl.Layer (Page 3794)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[MediaControl.Layer \(Page 3794\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[MediaControl.Layer \(Page 3794\)](#)

## MediaControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

```
MediaControl.Left
```

### See also

MediaControl (Page 3782)

## MediaControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

```
MediaControl.Margin
```

### See also

MediaControl (Page 3782)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[MediaControl.Margin \(Page 3797\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[MediaControl.Margin \(Page 3797\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[MediaControl.Margin \(Page 3797\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[MediaControl.Margin \(Page 3797\)](#)

## MediaControl.Name

### Description

The "Name" property returns the name of the Media Player.

### Type

String

### Access

Read-only

### Syntax

```
MediaControl.Name
```

### See also

MediaControl (Page 3782)

## MediaControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
MediaControl.Parent
```

### See also

MediaControl (Page 3782)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## MediaControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the Media Player was created.

### Type

String

### Access

Read-only

### Syntax

`MediaControl.RenderingTemplate`

### See also

MediaControl (Page 3782)

## MediaControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the Media Player is highlighted when in focus.

### Type

Bool

### Access

Read-write

**Syntax**

`MediaControl.ShowFocusVisual`

**See also**

MediaControl (Page 3782)

**MediaControl.StatusBar**

**Description**

The "StatusBar" property specifies the information bar of the Media Player.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

`MediaControl.StatusBar`

**See also**

MediaControl (Page 3782)

**StatusBar.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`StatusBar.BackColor`

**See also**

MediaControl.StatusBar (Page 3802)

**StatusBar.Elements****Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

**Type**

Object, HmiControlBarElementCollection (Page 3803)

**Access**

Read-only

**Syntax**

```
StatusBar.Elements
```

**See also**

MediaControl.StatusBar (Page 3802)

HmiControlBarElementCollection (Page 3803)

**HmiControlBarElementCollection****Description**

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

**Use**

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

**Object type**

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 3803)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 3803)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 3820)

## See also

HmiControlBarElementCollection (Page 3803)

Control Bar Elements (Page 3820)

## Control Bar Elements

### Description

Control Bar Elements (Page 3820)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

## Syntax

`StatusBar.Enabled`

## See also

[MediaControl.StatusBar \(Page 3802\)](#)

## StatusBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`StatusBar.Font`

## See also

[MediaControl.StatusBar \(Page 3802\)](#)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

**Syntax**`Font.Italic`**See also**

StatusBar.Font (Page 3806)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 3806)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

## Syntax

`Font.Size`

## See also

StatusBar.Font (Page 3806)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

## Syntax

`Font.StrikeOut`

## See also

StatusBar.Font (Page 3806)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

StatusBar.Font (Page 3806)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**`Font.Weight`**See also**

StatusBar.Font (Page 3806)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`StatusBar.Margin`

### See also

[MediaControl.StatusBar \(Page 3802\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[StatusBar.Margin \(Page 3810\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[StatusBar.Margin \(Page 3810\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[StatusBar.Margin \(Page 3810\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[StatusBar.Margin \(Page 3810\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

### See also

[MediaControl.StatusBar \(Page 3802\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

StatusBar.Padding (Page 3812)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

StatusBar.Padding (Page 3812)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[StatusBar.Padding \(Page 3812\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[StatusBar.Padding \(Page 3812\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.ShowToolTips
```

### See also

MediaControl.StatusBar (Page 3802)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.Visible
```

### See also

MediaControl.StatusBar (Page 3802)

## MediaControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the Media Player.

### Type

String

### Access

Read-only

### Syntax

```
MediaControl.StyleItemClass
```

### See also

MediaControl (Page 3782)

## MediaControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the Media Player.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

```
MediaControl.ToolBar
```

### See also

MediaControl (Page 3782)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ToolBar.BackColor
```

### See also

MediaControl.ToolBar (Page 3816)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 3818)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

MediaControl.ToolBar (Page 3816)

HmiControlBarElementCollection (Page 3818)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

### See also

[ToolBar.Elements](#) (Page 3817)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

**Access**

Read-only

**Syntax**`HmiControlBarElementCollection.Count`**See also**

HmiControlBarElementCollection (Page 3818)

**HmiControlBarElementCollection.Item()****Description**

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

**Syntax**`HmiControlBarElementCollection[.Item] (HmiControlBarElementName)`

---

**Note**

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

**Parameters****HmiControlBarElementName**

Type: String

Name of the element

**Return value**

Object, HmiControlBarElementPartBase (Page 3820)

**See also**

HmiControlBarElementCollection (Page 3818)

Control Bar Elements (Page 3820)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar. You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

#### Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.

- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.AlternateBackColor`

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.AlternateBorderColor**

**Description**

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.AlternateBorderColor`

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.Authorization**

**Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ControlBarButton.Authorization`

**See also**

[ControlBarButton \(Page 3820\)](#)

**ControlBarButton.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.BackColor`

**See also**

[ControlBarButton \(Page 3820\)](#)

**ControlBarButton.Badge****Description**

The "Badge" property specifies the label of the button.

**Type**

Object, HmiBadgePart

**Access**

Read-write

**Syntax**

`ControlBarButton.Badge`

**See also**

[ControlBarButton \(Page 3820\)](#)

**ControlBarButton.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.BorderColor`

**See also**

[ControlBarButton \(Page 3820\)](#)

**ControlBarButton.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`ControlBarButton.BorderWidth`

**See also**

[ControlBarButton \(Page 3820\)](#)

**ControlBarButton.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**

`ControlBarButton.Content`

**See also**

[ControlBarButton \(Page 3820\)](#)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ControlBarButton.Content \(Page 3825\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

**See also**

ControlBarButton.Content (Page 3825)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

ControlBarButton.Content (Page 3825)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`Content.Spacing`

## See also

[ControlBarButton.Content \(Page 3825\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

## Syntax

`Content.SplitRatio`

## See also

[ControlBarButton.Content \(Page 3825\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

[ControlBarButton.Content \(Page 3825\)](#)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

[ControlBarButton.Content \(Page 3825\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content](#) (Page 3825)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

**Syntax**

```
ControlBarButton.CustomID
```

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.Enabled****Description**

The "Enabled" property specifies whether the button can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ControlBarButton.Enabled
```

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarButton.ForeColor`

## See also

[ControlBarButton \(Page 3820\)](#)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

`ControlBarButton.Graphic`

## See also

[ControlBarButton \(Page 3820\)](#)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.Height
```

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.HotKey****Description**

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

**Type**

UInt16

**Access**

Read-only

**Syntax**

```
ControlBarButton.HotKey
```

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog

- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarButton.Mapping`

**See also**

[ControlBarButton \(Page 3820\)](#)

**ControlBarButton.Margin****Description**

The "Margin" property specifies the surrounded outer distance of the button.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarButton.Margin`

**See also**

ControlBarButton (Page 3820)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

ControlBarButton.Margin (Page 3835)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**[ControlBarButton.Margin \(Page 3835\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**[ControlBarButton.Margin \(Page 3835\)](#)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

ControlBarButton.Margin (Page 3835)

**ControlBarButton.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

ControlBarButton.MaximumHeight

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.MaximumWidth`**See also**

ControlBarButton (Page 3820)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.MinimumHeight`**See also**

ControlBarButton (Page 3820)

**ControlBarButton.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.MinimumWidth`

**See also**

ControlBarButton (Page 3820)

**ControlBarButton.Operability**

**Description**

The "Operability" property returns whether the button is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarButton.Operability`

**See also**

ControlBarButton (Page 3820)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarButton.Padding
```

### See also

ControlBarButton (Page 3820)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

```
Padding.Bottom
```

### See also

ControlBarButton.Padding (Page 3841)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 3841\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarButton.Padding \(Page 3841\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Top

### See also

ControlBarButton.Padding (Page 3841)

## ControlBarButton.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

ControlBarButton.RequireExplicitUnlock

### See also

ControlBarButton (Page 3820)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Text
```

### See also

ControlBarButton (Page 3820)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.ToolTipText
```

### See also

ControlBarButton (Page 3820)

## ControlBarButton.Visible

### Description

The "Visible" property specifies whether the button is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 3820\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 3820\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

### Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarDisplay.Authorization
```

### See also

ControlBarDisplay (Page 3846)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Content`

### See also

ControlBarDisplay (Page 3846)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarDisplay.Content (Page 3848)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarDisplay.Content (Page 3848)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarDisplay.Content \(Page 3848\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarDisplay.Content \(Page 3848\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

```
Content.SplitRatio
```

### See also

ControlBarDisplay.Content (Page 3848)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarDisplay.Content \(Page 3848\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarDisplay.Content \(Page 3848\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarDisplay.Content](#) (Page 3848)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarDisplay.CustomID
```

### See also

[ControlBarDisplay](#) (Page 3846)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 3846\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.ForeColor`

### See also

[ControlBarDisplay \(Page 3846\)](#)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarDisplay.Graphic
```

### See also

ControlBarDisplay (Page 3846)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.Height
```

### See also

ControlBarDisplay (Page 3846)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarDisplay.Mapping`

## See also

[ControlBarDisplay \(Page 3846\)](#)

## ControlBarDisplay.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 3846\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**[ControlBarDisplay.Margin \(Page 3858\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**[ControlBarDisplay.Margin \(Page 3858\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarDisplay.Margin \(Page 3858\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Top`

## See also

[ControlBarDisplay.Margin \(Page 3858\)](#)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**`ControlBarDisplay.MaximumHeight`**See also**[ControlBarDisplay \(Page 3846\)](#)**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarDisplay.MaximumWidth`**See also**[ControlBarDisplay \(Page 3846\)](#)**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 3846\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumWidth`

## See also

[ControlBarDisplay \(Page 3846\)](#)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarDisplay.Operability`**See also**

ControlBarDisplay (Page 3846)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 3846)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarDisplay.Padding \(Page 3863\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ControlBarDisplay.Padding \(Page 3863\)](#)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarDisplay.Padding (Page 3863)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**

ControlBarDisplay.Padding (Page 3863)

**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

### Access

Read-only

### Syntax

`ControlBarDisplay.RequireExplicitUnlock`

### See also

[ControlBarDisplay \(Page 3846\)](#)

## ControlBarDisplay.Text

### Description

The "Text" property specifies the label of the display.

### Type

String

### Access

Read-write

### Syntax

`ControlBarDisplay.Text`

### See also

[ControlBarDisplay \(Page 3846\)](#)

## ControlBarDisplay.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the display.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 3846)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 3846)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

```
ControlBarDisplay.Width
```

## See also

ControlBarDisplay (Page 3846)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

### Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

`ControlBarLabel.Authorization`

## See also

[ControlBarLabel \(Page 3868\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

## Syntax

`ControlBarLabel.CustomID`

## See also

[ControlBarLabel \(Page 3868\)](#)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Enabled
```

**See also**

ControlBarLabel (Page 3868)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ForeColor
```

**See also**

ControlBarLabel (Page 3868)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarLabel.Height
```

## See also

ControlBarLabel (Page 3868)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

## See also

ControlBarLabel (Page 3868)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 3868\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

### See also

[ControlBarLabel \(Page 3868\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarLabel.Margin \(Page 3875\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarLabel.Margin \(Page 3875\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarLabel.Margin \(Page 3875\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

ControlBarLabel.Margin (Page 3875)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

ControlBarLabel.MaximumHeight

### See also

ControlBarLabel (Page 3868)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumWidth`

### See also

[ControlBarLabel \(Page 3868\)](#)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MinimumHeight`

### See also

[ControlBarLabel \(Page 3868\)](#)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

### See also

ControlBarLabel (Page 3868)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

**See also**

ControlBarLabel (Page 3868)

**ControlBarLabel.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Padding`

**See also**

ControlBarLabel (Page 3868)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarLabel.Padding (Page 3880)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarLabel.Padding (Page 3880)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

ControlBarLabel.Padding (Page 3880)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarLabel.Padding (Page 3880)

**ControlBarLabel.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarLabel.RequireExplicitUnlock

**See also**

[ControlBarLabel \(Page 3868\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

[ControlBarLabel \(Page 3868\)](#)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

## See also

ControlBarLabel (Page 3868)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.VerticalTextAlignment`

## See also

ControlBarLabel (Page 3868)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Visible
```

**See also**

ControlBarLabel (Page 3868)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 3868)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

## Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 3885)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 3885)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 3885\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 3885\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

### See also

ControlBarSeparator (Page 3885)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Mapping`

**See also**

[ControlBarSeparator \(Page 3885\)](#)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

```
ControlBarSeparator.Margin
```

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

## Syntax

```
Margin.Bottom
```

## See also

[ControlBarSeparator.Margin \(Page 3891\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

## Syntax

```
Margin.Left
```

**See also**

ControlBarSeparator.Margin (Page 3891)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Right

**See also**

ControlBarSeparator.Margin (Page 3891)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

[ControlBarSeparator.Margin \(Page 3891\)](#)

**ControlBarSeparator.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MaximumHeight`

**See also**

[ControlBarSeparator \(Page 3885\)](#)

**ControlBarSeparator.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MaximumWidth`

**See also**

ControlBarSeparator (Page 3885)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MinimumHeight`

**See also**

ControlBarSeparator (Page 3885)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.MinimumWidth`

## See also

[ControlBarSeparator](#) (Page 3885)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

## See also

[ControlBarSeparator](#) (Page 3885)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**

```
ControlBarSeparator.Padding
```

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

```
Int32
```

**Access**

```
Read-write
```

**Syntax**

```
Padding.Bottom
```

**See also**

[ControlBarSeparator.Padding \(Page 3896\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

```
Int32
```

**Access**

```
Read-write
```

**Syntax**

```
Padding.Left
```

### See also

[ControlBarSeparator.Padding \(Page 3896\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarSeparator.Padding \(Page 3896\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

**See also**

[ControlBarSeparator.Padding](#) (Page 3896)

**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

```
ControlBarSeparator.RequireExplicitUnlock
```

**See also**

[ControlBarSeparator](#) (Page 3885)

**ControlBarSeparator.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.ToolTipText
```

## See also

[ControlBarSeparator](#) (Page 3885)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarSeparator.Visible
```

## See also

[ControlBarSeparator](#) (Page 3885)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Width
```

## See also

ControlBarSeparator (Page 3885)

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.

- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.AlternateBorderColor`

**See also**

[ControlBarTextBox \(Page 3901\)](#)

**ControlBarTextBox.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

`ControlBarTextBox.Authorization`

**See also**

[ControlBarTextBox \(Page 3901\)](#)

**ControlBarTextBox.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.BackColor`

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.BorderColor**

**Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.BorderColor`

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.BorderWidth**

**Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**`ControlBarTextBox.BorderWidth`**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**`ControlBarTextBox.CustomID`**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.Enabled****Description**

The "Enabled" property specifies whether the text box can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Enabled`

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.ForeColor**

**Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.ForeColor`

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.Height**

**Description**

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Height`

**See also**

[ControlBarTextBox \(Page 3901\)](#)

**ControlBarTextBox.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`ControlBarTextBox.HorizontalTextAlignment`

**See also**

[ControlBarTextBox \(Page 3901\)](#)

**ControlBarTextBox.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

## Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms

- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarTextBox.Mapping`

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.Margin**

**Description**

The "Margin" property specifies the surrounded outer spacing of the text box.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Margin`

**See also**

ControlBarTextBox (Page 3901)

**Margin.Bottom**

**Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarTextBox.Margin \(Page 3910\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Margin.Left
```

**See also**

[ControlBarTextBox.Margin \(Page 3910\)](#)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Margin.Right
```

**See also**

ControlBarTextBox.Margin (Page 3910)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Top

**See also**

ControlBarTextBox.Margin (Page 3910)

**ControlBarTextBox.MaximumHeight**

**Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

ControlBarTextBox.MaximumHeight

**See also**

[ControlBarTextBox \(Page 3901\)](#)

**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.MaximumWidth
```

**See also**

[ControlBarTextBox \(Page 3901\)](#)

**ControlBarTextBox.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.MinimumHeight
```

## See also

ControlBarTextBox (Page 3901)

## ControlBarTextBox.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.MinimumWidth
```

## See also

ControlBarTextBox (Page 3901)

## ControlBarTextBox.Operability

### Description

The "Operability" property returns whether the text box is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

**Syntax**`ControlBarTextBox.Operability`**See also**[ControlBarTextBox \(Page 3901\)](#)**ControlBarTextBox.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the text box.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarTextBox.Padding`**See also**[ControlBarTextBox \(Page 3901\)](#)**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

## Syntax

`Padding.Bottom`

## See also

[ControlBarTextBox.Padding \(Page 3915\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Left`

## See also

[ControlBarTextBox.Padding \(Page 3915\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Right`**See also**`ControlBarTextBox.Padding` (Page 3915)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Top`**See also**`ControlBarTextBox.Padding` (Page 3915)**ControlBarTextBox.ReadOnly****Description**

The "ReadOnly" property specifies whether the text box is read-only.

**Type**`Bool`**Access**`Read-write`

## Syntax

`ControlBarTextBox.ReadOnly`

## See also

[ControlBarTextBox \(Page 3901\)](#)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

## Syntax

`ControlBarTextBox.RequireExplicitUnlock`

## See also

[ControlBarTextBox \(Page 3901\)](#)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

**Syntax**

```
ControlBarTextBox.Text
```

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the text box.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.ToolTipText
```

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`ControlBarTextBox.VerticalTextAlignment`

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.Visible**

**Description**

The "Visible" property specifies whether the text box is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Visible`

**See also**

ControlBarTextBox (Page 3901)

**ControlBarTextBox.Width**

**Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.Width`

**See also**

[ControlBarTextBox \(Page 3901\)](#)

**ControlBarToggleSwitch****Description**

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarToggleSwitchPart

**Properties**

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.

- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.

- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

ControlBarToggleSwitch.AlternateBackColor

### See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

## Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

## See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

## Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

## See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

**Syntax**

```
ControlBarToggleSwitch.AlternateText
```

**See also**

ControlBarToggleSwitch (Page 3921)

**ControlBarToggleSwitch.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

**Access**

Read-only

**Syntax**

```
ControlBarToggleSwitch.Authorization
```

**See also**

ControlBarToggleSwitch (Page 3921)

**ControlBarToggleSwitch.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarToggleSwitch.BackColor`

## See also

[ControlBarToggleSwitch \(Page 3921\)](#)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Badge`

## See also

[ControlBarToggleSwitch \(Page 3921\)](#)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderColor
```

**See also**

ControlBarToggleSwitch (Page 3921)

**ControlBarToggleSwitch.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

**Access**

Read-write

**Syntax**

```
ControlBarToggleSwitch.BorderWidth
```

**See also**

ControlBarToggleSwitch (Page 3921)

**ControlBarToggleSwitch.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

## Syntax

```
ControlBarToggleSwitch.Content
```

## See also

ControlBarToggleSwitch (Page 3921)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

```
Content.ContentMode
```

## See also

ControlBarToggleSwitch.Content (Page 3927)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

```
Content.GraphicStretchMode
```

### See also

ControlBarToggleSwitch.Content (Page 3927)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.HorizontalTextAlignment
```

**See also**

ControlBarToggleSwitch.Content (Page 3927)

**Content.Spacing**

**Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

ControlBarToggleSwitch.Content (Page 3927)

**Content.SplitRatio**

**Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

**See also**

ControlBarToggleSwitch.Content (Page 3927)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

ControlBarToggleSwitch.Content (Page 3927)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarToggleSwitch.Content \(Page 3927\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 3927\)](#)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Enabled
```

### See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ForeColor
```

### See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

[ControlBarToggleSwitch \(Page 3921\)](#)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

```
Button.HotKey
```

### See also

[ControlBarToggleSwitch \(Page 3921\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

### See also

ControlBarToggleSwitch (Page 3921)

## ControlBarToggleSwitch.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Mapping`

### See also

[ControlBarToggleSwitch \(Page 3921\)](#)

## ControlBarToggleSwitch.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the switch.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Margin`**See also**

ControlBarToggleSwitch (Page 3921)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

ControlBarToggleSwitch.Margin (Page 3938)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarToggleSwitch.Margin \(Page 3938\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarToggleSwitch.Margin \(Page 3938\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarToggleSwitch.Margin \(Page 3938\)](#)**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MaximumHeight`**See also**[ControlBarToggleSwitch \(Page 3921\)](#)**ControlBarToggleSwitch.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

[ControlBarToggleSwitch \(Page 3921\)](#)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumHeight`

**See also**

[ControlBarToggleSwitch \(Page 3921\)](#)

**ControlBarToggleSwitch.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MinimumWidth`

**See also**

[ControlBarToggleSwitch \(Page 3921\)](#)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Operability`

**See also**

[ControlBarToggleSwitch \(Page 3921\)](#)

**ControlBarToggleSwitch.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the switch.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Padding`

**See also**

[ControlBarToggleSwitch \(Page 3921\)](#)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarToggleSwitch.Padding \(Page 3943\)](#)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

ControlBarToggleSwitch.Padding (Page 3943)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarToggleSwitch.Padding (Page 3943)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarToggleSwitch.Padding (Page 3943)

**ControlBarToggleSwitch.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarToggleSwitch.RequireExplicitUnlock

**See also**

ControlBarToggleSwitch (Page 3921)

**ControlBarToggleSwitch.Text**

**Description**

The "Text" property specifies the label of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.Text`**See also**

ControlBarToggleSwitch (Page 3921)

**ControlBarToggleSwitch.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the switch.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.ToolTipText`**See also**

ControlBarToggleSwitch (Page 3921)

**ControlBarToggleSwitch.Visible****Description**

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Visible`

### See also

[ControlBarToggleSwitch \(Page 3921\)](#)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Width`

### See also

[ControlBarToggleSwitch \(Page 3921\)](#)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.Enabled`**See also**

MediaControl.ToolBar (Page 3816)

**ToolBar.Font****Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`ToolBar.Font`**See also**

MediaControl.ToolBar (Page 3816)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

ToolBar.Font (Page 3949)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

ToolBar.Font (Page 3949)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**`Font.Size`**See also**

ToolBar.Font (Page 3949)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

ToolBar.Font (Page 3949)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

`Font.Underline`

### See also

[ToolBar.Font \(Page 3949\)](#)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

**Syntax**`Font.Weight`**See also**`ToolBar.Font` (Page 3949)**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**`Object, HmiMarginPart`**Access**`Read-write`**Syntax**`ToolBar.Margin`**See also**`MediaControl.ToolBar` (Page 3816)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Bottom`

## See also

[ToolBar.Margin \(Page 3953\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

## See also

[ToolBar.Margin \(Page 3953\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**`ToolBar.Margin` (Page 3953)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**`ToolBar.Margin` (Page 3953)**ToolBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the toolbar.

**Type**`Object, HmiPaddingPart`**Access**`Read-write`

## Syntax

`ToolBar.Padding`

## See also

[MediaControl.ToolBar \(Page 3816\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

## See also

[ToolBar.Padding \(Page 3955\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**`Padding.Left`**See also**`ToolBar.Padding` (Page 3955)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**`Int32`**Access**`Read-write`**Syntax**`Padding.Right`**See also**`ToolBar.Padding` (Page 3955)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Padding.Top`

## See also

`ToolBar.Padding` (Page 3955)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

`ToolBar.ShowToolTips`

## See also

`MediaControl.ToolBar` (Page 3816)

## ToolBar.UseHotKeys

### Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

### Type

Bool

### Access

Read-write

**Syntax**

```
ToolBar.UseHotKeys
```

**See also**

MediaControl.ToolBar (Page 3816)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

```
ToolBar.Visible
```

**See also**

MediaControl.ToolBar (Page 3816)

**MediaControl.TabIndex****Description**

The "TabIndex" property returns the position of the Media Player in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`MediaControl.TabIndex`

**See also**

MediaControl (Page 3782)

**MediaControl.Top**

**Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`MediaControl.Top`

**See also**

MediaControl (Page 3782)

**MediaControl.Url**

**Description**

The "Url" property specifies the URL played by the Media Player.

**Type**

String

**Access**

Read-write

**Syntax**

`MediaControl.Url`

**See also**

MediaControl (Page 3782)

**MediaControl.VideoOutput****Description**

The "VideoOutput" property specifies the scaling of the video output.

**Type**

Int32, HmiVideoOutput

Specifies the scaling:

- Undefined (0): Not defined.
- Stretch (1): The video is scaled to match.
- PreserveAspectRatio (2): The video is scaled uniformly so that it fits without cropping.
- PreserveAspectRatioCrop (3): The video is scaled uniformly so that it fills the entire space with cropping.

**Access**

Read-write

**Syntax**

`MediaControl.VideoOutput`

**See also**

MediaControl (Page 3782)

**MediaControl.Visible****Description**

The "Visible" property specifies whether the Media Player is visible.

**Type**

Bool

**Access**

Read-write

### Syntax

`MediaControl.Visible`

### See also

MediaControl (Page 3782)

## MediaControl.Width

### Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`MediaControl.Width`

### See also

MediaControl (Page 3782)

## MediaControl.WindowFlags

### Description

The "WindowFlags" property specifies the window configuration of the Media Player.

### Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized

- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`MediaControl.WindowFlags`

**See also**

MediaControl (Page 3782)

**MediaControl.CheckAuthorization()****Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the Media Player.

**Syntax**

`MediaControl.CheckAuthorization()`

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

MediaControl (Page 3782)

## MediaControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the Media Player.

### Syntax

```
MediaControl.FireCommand(commandId, custom)
```

### Parameters

#### **commandId**

Type: Int32

ID of the element of the toolbar or information bar

#### **custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

## See also

MediaControl (Page 3782)

## MediaControl.Pause()

### Description

The "Pause" method pauses the playback.

### Syntax

```
MediaControl.Pause()
```

### Parameters

--

### Return value

--

### See also

MediaControl (Page 3782)

## MediaControl.Play()

### Description

The "Play" method starts or resumes playback.

### Syntax

```
MediaControl.Play()
```

### Parameters

--

### Return value

### See also

MediaControl (Page 3782)

## MediaControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
MediaControl.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

MediaControl (Page 3782)

**MediaControl.Stop()****Description**

The "Stop" method stops playback.

**Syntax**

```
MediaControl.Stop()
```

**Parameters**

--

**Return value**

--

**See also**

MediaControl (Page 3782)

**MediaControl\_OnActivated()****Description**

The "OnActivated" event occurs when a Media Player receives focus:

- A Media Player is selected via the configured tab sequence.
- A Media Player that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
MediaControl_OnActivated(item)
```

## Context

### **item**

Type: Object

Media Player where the event occurs.

## See also

MediaControl (Page 3782)

## MediaControl\_OnCommandFired()

## Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the Media Player.

## Syntax

```
MediaControl_OnCommandFired(item, commandId, custom)
```

## Context

### **item**

Type: Object

Media Player where the event occurs.

### **commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

### **custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## See also

MediaControl (Page 3782)

## MediaControl\_OnDeactivated()

### Description

The "OnDeactivated" event occurs when a Media Player loses focus because the operator presses the <TAB> key or executes a different action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

### Syntax

```
MediaControl_OnDeactivated(item)
```

### Context

**item**

Type: Object

Media Player where the event occurs.

### See also

MediaControl (Page 3782)

## MediaControl\_OnInitialized()

### Description

The "OnInitialized" event occurs when a Media Player has been successfully initialized and the data connection to the PLC has been established.

### Syntax

```
MediaControl_OnInitialized(item)
```

### Context

**item**

Type: Object

Media Player where the event occurs.

**See also**

MediaControl (Page 3782)

**MediaControl\_OnPaused()**

**Description**

The "OnPaused" event occurs when playback is paused in the Media Player.

**Syntax**

`MediaControl_OnPaused(item)`

**Context**

**item**

Type: Object

Media Player where the event occurs.

**See also**

MediaControl (Page 3782)

**MediaControl\_OnPlaying()**

**Description**

The "OnPlaying" event occurs when playback is started or resumed in the Media Player.

**Syntax**

`MediaControl_OnPlaying(item)`

**Context**

**item**

Type: Object

Media Player where the event occurs.

**See also**

MediaControl (Page 3782)

## MediaControl\_OnStopped()

### Description

The "OnStopped" event occurs when playback is stopped in the Media Player.

### Syntax

```
MediaControl_OnStopped(item)
```

### Context

**item**

Type: Object

Media Player where the event occurs.

### See also

MediaControl (Page 3782)

## ObjectExplorerControl

### Description

The "ObjectExplorerControl" object represents a control for the configuration of "Control"-type screen objects in runtime.

### Object type

HmiObjectExplorerControl

### Properties

The "ObjectExplorerControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the display.
- **DisplayViewType**  
Specifies the display type.

- **Enabled**  
Specifies whether the display can be operated in runtime.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the display.
- **Layer**  
Returns the screen layer in which the display is located.
- **Left**  
Specifies the value of the X coordinate.
- **LinkedItem**  
Specifies the referenced object.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the display.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the display was created.
- **ShowFocusVisual**  
Specifies whether the display is highlighted when in focus.
- **StatusBar**  
Specifies the information bar of the display.
- **StyleItemClass**  
Returns the style which is applied to the display.
- **TabIndex**  
Returns the position of the display in the tab sequence.
- **TargetObjectType**  
Specifies the type of object that is displayed.
- **ToolBar**  
Specifies the toolbar of the display.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the display is visible.
- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the display.

## Methods

The "ObjectExplorerControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the display.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the control.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "ObjectExplorerControl" object has the following events:

- **OnActivated()**  
Occurs when a control receives the focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the control.
- **OnDeactivated()**  
Occurs when a control loses the focus.
- **OnInitialized()**  
Occurs when a control has been successfully initialized and the data connection to the PLC has been established.

## ObjectExplorerControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ObjectExplorerControl.BackColor`

### See also

[ObjectExplorerControl \(Page 3971\)](#)

## ObjectExplorerControl.Caption

### Description

The "Caption" property specifies the text that is displayed in the title bar.

### Type

Object, HmiTextPart

### Access

Read-write

### Syntax

`ObjectExplorerControl.Caption`

### See also

ObjectExplorerControl (Page 3971)

## Text.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`Text.Font`

### See also

ObjectExplorerControl.Caption (Page 3974)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

[Text.Font \(Page 3974\)](#)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

[Text.Font \(Page 3974\)](#)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

### Syntax

Font.Size

### See also

Text.Font (Page 3974)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

Font.StrikeOut

**See also**

Text.Font (Page 3974)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

Font.Underline

**See also**

Text.Font (Page 3974)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[Text.Font \(Page 3974\)](#)

**Text.ForeColor**

**Description**

The "ForeColor" property sets the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Text.ForeColor`

**See also**

[ObjectExplorerControl.Caption \(Page 3974\)](#)

**Text.Text**

**Description**

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**`Text.Text`**See also**

ObjectExplorerControl.Caption (Page 3974)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`Text.Visible`**See also**

ObjectExplorerControl.Caption (Page 3974)

**ObjectExplorerControl.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

**Type**

UInt32

### Access

Read-write

### Syntax

`ObjectExplorerControl.CaptionColor`

### See also

[ObjectExplorerControl \(Page 3971\)](#)

## ObjectExplorerControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the control.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`ObjectExplorerControl.CurrentQuality`

### See also

[ObjectExplorerControl \(Page 3971\)](#)

## ObjectExplorerControl.DisplayViewType

### Description

The "DisplayViewType" property specifies the display type.

### Type

Int32, HmiDisplayViewType

Specifies the display type.

- Standard (0): Default setting; usually list display
- List (1): List display without details
- Details (2): List display with details
- SmallIcons (3): Small icons
- MediumIcons (4): Medium icons
- LargeIcons (5): Large icons

### Access

Read-write

### Syntax

`ObjectExplorerControl.DisplayViewType`

### See also

[ObjectExplorerControl \(Page 3971\)](#)

## ObjectExplorerControl.Enabled

### Description

The "Enabled" property specifies whether the display can be operated in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

`ObjectExplorerControl.Enabled`

**See also**

`ObjectExplorerControl` (Page 3971)

**ObjectExplorerControl.Height**

**Description**

The "Height" property specifies the height in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ObjectExplorerControl.Height`

**See also**

`ObjectExplorerControl` (Page 3971)

**ObjectExplorerControl.Icon**

**Description**

The "Icon" property specifies the icon of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ObjectExplorerControl.Icon`

**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl.Layer****Description**

The "Layer" property returns the screen layer in which the control is located.

**Type**

Object, HmiLayerPart

**Access**

Read-only

**Syntax**

`ObjectExplorerControl.Layer`

**See also**

ObjectExplorerControl (Page 3971)

**Layer.MaximumZoom****Description**

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

**Type**

Float

**Access**

Read-write

**Syntax**

`Layer.MaximumZoom`

### See also

ObjectExplorerControl.Layer (Page 3983)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

ObjectExplorerControl.Layer (Page 3983)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

**See also**

ObjectExplorerControl.Layer (Page 3983)

**Layer.Visible****Description**

The "Visible" property specifies whether the screen layer and contained objects are visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Layer.Visible`

**See also**

ObjectExplorerControl.Layer (Page 3983)

**ObjectExplorerControl.Left****Description**

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ObjectExplorerControl.Left`

## See also

[ObjectExplorerControl \(Page 3971\)](#)

## ObjectExplorerControl.LinkedListItem

### Description

The "LinkedListItem" property specifies the referenced object.

### Type

Object, HmiControlWindowBase (Page 1742)

### Access

Read-write

### Syntax

`ObjectExplorerControl.LinkedListItem`

## See also

[ObjectExplorerControl \(Page 3971\)](#)

[Screen Items \(Page 1742\)](#)

## Screen Items

### Description

[Screen Items \(Page 1742\)](#)

## ObjectExplorerControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

**Access**

Read-write

**Syntax**`ObjectExplorerControl.Margin`**See also**

ObjectExplorerControl (Page 3971)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Bottom`**See also**

ObjectExplorerControl.Margin (Page 3986)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ObjectExplorerControl.Margin \(Page 3986\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ObjectExplorerControl.Margin \(Page 3986\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ObjectExplorerControl.Margin \(Page 3986\)](#)**ObjectExplorerControl.Name****Description**

The "Name" property returns the name of the control.

**Type**

String

**Access**

Read-only

**Syntax**`ObjectExplorerControl.Name`**See also**[ObjectExplorerControl \(Page 3971\)](#)**ObjectExplorerControl.Parent****Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**Object, [HmiScreenObjectBase \(Page 1742\)](#)

**Access**

Read-only

**Syntax**

`ObjectExplorerControl.Parent`

**See also**

[ObjectExplorerControl \(Page 3971\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items**

**Description**

[Screen Items \(Page 1742\)](#)

**ObjectExplorerControl.RenderingTemplate**

**Description**

The "RenderingTemplate" property returns the name of the template from which the control was created.

**Type**

String

**Access**

Read-only

**Syntax**

`ObjectExplorerControl.RenderingTemplate`

**See also**

[ObjectExplorerControl \(Page 3971\)](#)

## ObjectExplorerControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the display is highlighted when in focus.

### Type

Bool

### Access

Read-write

### Syntax

```
ObjectExplorerControl.ShowFocusVisual
```

### See also

ObjectExplorerControl (Page 3971)

## ObjectExplorerControl.StatusBar

### Description

The "StatusBar" property specifies the information bar of the display.

### Type

Object, HmiStatusBarPart

### Access

Read-write

### Syntax

```
ObjectExplorerControl.StatusBar
```

### See also

ObjectExplorerControl (Page 3971)

## StatusBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
StatusBar.BackColor
```

### See also

ObjectExplorerControl.StatusBar (Page 3991)

## StatusBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

### Type

Object, HmiControlBarElementCollection (Page 3993)

### Access

Read-only

### Syntax

```
StatusBar.Elements
```

### See also

ObjectExplorerControl.StatusBar (Page 3991)

HmiControlBarElementCollection (Page 3993)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

### See also

[StatusBar.Elements \(Page 3992\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

## Access

Read-only

## Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 3993)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

#### **HmiControlBarElementName**

Type: String

Name of the element

### Return value

Object, HmiControlBarElementPartBase (Page 4010)

### See also

HmiControlBarElementCollection (Page 3993)

Control Bar Elements (Page 4010)

## Control Bar Elements

### Description

Control Bar Elements (Page 4010)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.Enabled
```

### See also

ObjectExplorerControl.StatusBar (Page 3991)

## StatusBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
StatusBar.Font
```

### See also

ObjectExplorerControl.StatusBar (Page 3991)

### Font.Italic

#### Description

The "Italic" property specifies whether the text is displayed in italics.

#### Type

Bool

#### Access

Read-write

#### Syntax

`Font.Italic`

### See also

StatusBar.Font (Page 3995)

### Font.Name

#### Description

The "Name" property specifies the name of the character set used.

#### Type

String

#### Access

Read-write

#### Syntax

`Font.Name`

**See also**

StatusBar.Font (Page 3995)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

StatusBar.Font (Page 3995)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

## Syntax

```
Font.StrikeOut
```

## See also

StatusBar.Font (Page 3995)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

## See also

StatusBar.Font (Page 3995)

## Font.Weight

### Description

The "Weight" property specifies the font thickness.

### Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

[StatusBar.Font \(Page 3995\)](#)

**StatusBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the information bar.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`StatusBar.Margin`

**See also**

[ObjectExplorerControl.StatusBar \(Page 3991\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Bottom

**See also**

StatusBar.Margin (Page 3999)

**Margin.Left**

**Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

Margin.Left

**See also**

StatusBar.Margin (Page 3999)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

StatusBar.Margin (Page 3999)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**

StatusBar.Margin (Page 3999)

**StatusBar.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the information bar.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`StatusBar.Padding`

**See also**

ObjectExplorerControl.StatusBar (Page 3991)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

StatusBar.Padding (Page 4001)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

StatusBar.Padding (Page 4001)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

StatusBar.Padding (Page 4001)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

StatusBar.Padding (Page 4001)

**StatusBar.ShowToolTips**

**Description**

The "ShowToolTips" property specifies whether tooltips are displayed.

**Type**

Bool

**Access**

Read-write

**Syntax**

StatusBar.ShowToolTips

**See also**

ObjectExplorerControl.StatusBar (Page 3991)

**StatusBar.Visible**

**Description**

The "Visible" property specifies whether the information bar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`StatusBar.Visible`**See also**

ObjectExplorerControl.StatusBar (Page 3991)

**ObjectExplorerControl.StyleItemClass****Description**

The "StyleItemClass" property returns the style which is applied to the display.

**Type**

String

**Access**

Read-only

**Syntax**`ObjectExplorerControl.StyleItemClass`**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl.TabIndex****Description**

The "TabIndex" property returns the position of the display in the tab sequence.

**Type**

UInt16

**Access**

Read-only

**Syntax**

`ObjectExplorerControl.TabIndex`

**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl.TargetObjectType**

**Description**

The "TargetObjectType" property specifies the type of object that is displayed.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ObjectExplorerControl.TargetObjectType`

**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl.ToolBar**

**Description**

The "ToolBar" property specifies the toolbar of the display.

**Type**

Object, HmiToolBarPart

**Access**

Read-write

**Syntax**`ObjectExplorerControl.ToolBar`**See also**

ObjectExplorerControl (Page 3971)

**ToolBar.BackColor****Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ToolBar.BackColor`**See also**

ObjectExplorerControl.ToolBar (Page 4006)

**ToolBar.Elements****Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

**Type**

Object, HmiControlBarElementCollection (Page 4008)

## Access

Read-only

## Syntax

`ToolBar.Elements`

## See also

[ObjectExplorerControl.ToolBar \(Page 4006\)](#)

[HmiControlBarElementCollection \(Page 4008\)](#)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

### See also

[ToolBar.Elements \(Page 4007\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

### See also

HmiControlBarElementCollection (Page 4008)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 4010)

## See also

HmiControlBarElementCollection (Page 4008)

Control Bar Elements (Page 4010)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar. You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

#### Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.

- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBackColor
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.AlternateBorderColor
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarButton.Authorization
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BackColor
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

```
ControlBarButton.Badge
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.BorderColor
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarButton.BorderWidth
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarButton.Content
```

### See also

ControlBarButton (Page 4010)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[ControlBarButton.Content \(Page 4015\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

[ControlBarButton.Content \(Page 4015\)](#)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarButton.Content \(Page 4015\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarButton.Content \(Page 4015\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarButton.Content \(Page 4015\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

```
Content.TextPosition
```

### See also

ControlBarButton.Content (Page 4015)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 4015\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

[ControlBarButton.Content \(Page 4015\)](#)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarButton.CustomID
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarButton.Enabled
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.ForeColor
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.Graphic

### Description

The "Graphic" property specifies the graphic of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Graphic
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.Height

### Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Height`

### See also

[ControlBarButton \(Page 4010\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

### See also

[ControlBarButton \(Page 4010\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarButton.Mapping`

## See also

[ControlBarButton \(Page 4010\)](#)

## ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer distance of the button.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarButton.Margin`

## See also

[ControlBarButton \(Page 4010\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**`ControlBarButton.Margin` (Page 4026)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**`ControlBarButton.Margin` (Page 4026)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarButton.Margin \(Page 4026\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

## See also

[ControlBarButton.Margin \(Page 4026\)](#)

## ControlBarButton.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.MaximumHeight
```

**See also**

ControlBarButton (Page 4010)

**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarButton.MaximumWidth
```

**See also**

ControlBarButton (Page 4010)

**ControlBarButton.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarButton.MinimumHeight
```

## See also

ControlBarButton (Page 4010)

## ControlBarButton.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarButton.MinimumWidth
```

## See also

ControlBarButton (Page 4010)

## ControlBarButton.Operability

### Description

The "Operability" property returns whether the button is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarButton.Operability`**See also**

ControlBarButton (Page 4010)

**ControlBarButton.Padding****Description**

The "Padding" property specifies the distance of the content from the border of the button.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarButton.Padding`**See also**

ControlBarButton (Page 4010)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarButton.Padding \(Page 4031\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 4031\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarButton.Padding (Page 4031)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**

ControlBarButton.Padding (Page 4031)

**ControlBarButton.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

**Type**

Bool

### Access

Read-only

### Syntax

```
ControlBarButton.RequireExplicitUnlock
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Text
```

### See also

ControlBarButton (Page 4010)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarButton.ToolTipText`**See also**

ControlBarButton (Page 4010)

**ControlBarButton.Visible****Description**

The "Visible" property specifies whether the button is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarButton.Visible`**See also**

ControlBarButton (Page 4010)

**ControlBarButton.Width****Description**

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

```
ControlBarButton.Width
```

## See also

ControlBarButton (Page 4010)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

### Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.

- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

## Syntax

```
ControlBarDisplay.Authorization
```

## See also

ControlBarDisplay (Page 4036)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

```
ControlBarDisplay.Content
```

## See also

ControlBarDisplay (Page 4036)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

**Access**

Read-write

**Syntax**

`Content.ContentMode`

**See also**

`ControlBarDisplay.Content` (Page 4038)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

`ControlBarDisplay.Content` (Page 4038)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarDisplay.Content](#) (Page 4038)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

**See also**

ControlBarDisplay.Content (Page 4038)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

```
Content.SplitRatio
```

**See also**

ControlBarDisplay.Content (Page 4038)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ControlBarDisplay.Content \(Page 4038\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarDisplay.Content \(Page 4038\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[ControlBarDisplay.Content \(Page 4038\)](#)

**ControlBarDisplay.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

`ControlBarDisplay.CustomID`

**See also**

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarDisplay.Enabled`

### See also

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.ForeColor`

### See also

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

`ControlBarDisplay.Graphic`

### See also

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

### See also

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

## Syntax

`ControlBarDisplay.Mapping`

## See also

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the display.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Margin`

## See also

[ControlBarDisplay \(Page 4036\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Bottom`**See also**[ControlBarDisplay.Margin \(Page 4048\)](#)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Left`**See also**[ControlBarDisplay.Margin \(Page 4048\)](#)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Right`

## See also

[ControlBarDisplay.Margin \(Page 4048\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Top`

## See also

[ControlBarDisplay.Margin \(Page 4048\)](#)

## ControlBarDisplay.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MaximumHeight
```

**See also**

ControlBarDisplay (Page 4036)

**ControlBarDisplay.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.MaximumWidth
```

**See also**

ControlBarDisplay (Page 4036)

**ControlBarDisplay.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarDisplay.MinimumHeight`

## See also

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MinimumWidth`

## See also

[ControlBarDisplay \(Page 4036\)](#)

## ControlBarDisplay.Operability

### Description

The "Operability" property returns whether the display is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarDisplay.Operability`**See also**

ControlBarDisplay (Page 4036)

**ControlBarDisplay.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the display.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**`ControlBarDisplay.Padding`**See also**

ControlBarDisplay (Page 4036)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarDisplay.Padding \(Page 4053\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarDisplay.Padding \(Page 4053\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**[ControlBarDisplay.Padding \(Page 4053\)](#)**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarDisplay.Padding \(Page 4053\)](#)**ControlBarDisplay.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

`ControlBarDisplay.RequireExplicitUnlock`

**See also**

ControlBarDisplay (Page 4036)

**ControlBarDisplay.Text**

**Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Text`

**See also**

ControlBarDisplay (Page 4036)

**ControlBarDisplay.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.ToolTipText`**See also**

ControlBarDisplay (Page 4036)

**ControlBarDisplay.Visible****Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarDisplay.Visible`**See also**

ControlBarDisplay (Page 4036)

**ControlBarDisplay.Width****Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

`ControlBarDisplay.Width`

## See also

ControlBarDisplay (Page 4036)

## ControlBarLabel

### Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarLabelPart

### Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarLabel.Authorization`

### See also

[ControlBarLabel \(Page 4058\)](#)

## ControlBarLabel.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

`ControlBarLabel.CustomID`

### See also

[ControlBarLabel \(Page 4058\)](#)

## ControlBarLabel.Enabled

### Description

The "Enabled" property specifies whether the identifier is active in runtime.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Enabled
```

**See also**

ControlBarLabel (Page 4058)

**ControlBarLabel.ForeColor****Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ForeColor
```

**See also**

ControlBarLabel (Page 4058)

**ControlBarLabel.Height****Description**

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarLabel.Height`

## See also

[ControlBarLabel \(Page 4058\)](#)

## ControlBarLabel.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.HorizontalTextAlignment`

## See also

[ControlBarLabel \(Page 4058\)](#)

## ControlBarLabel.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarLabel.Mapping`

### See also

[ControlBarLabel \(Page 4058\)](#)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

### See also

[ControlBarLabel \(Page 4058\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarLabel.Margin \(Page 4065\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarLabel.Margin \(Page 4065\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarLabel.Margin \(Page 4065\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

Margin.Top

### See also

ControlBarLabel.Margin (Page 4065)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

ControlBarLabel.MaximumHeight

### See also

ControlBarLabel (Page 4058)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MaximumWidth
```

### See also

ControlBarLabel (Page 4058)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumHeight
```

### See also

ControlBarLabel (Page 4058)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

### See also

ControlBarLabel (Page 4058)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

**See also**

ControlBarLabel (Page 4058)

**ControlBarLabel.Padding**

**Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Padding`

**See also**

ControlBarLabel (Page 4058)

**Padding.Bottom**

**Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarLabel.Padding (Page 4070)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarLabel.Padding (Page 4070)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

ControlBarLabel.Padding (Page 4070)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

Padding.Top

**See also**

ControlBarLabel.Padding (Page 4070)

**ControlBarLabel.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

ControlBarLabel.RequireExplicitUnlock

**See also**

[ControlBarLabel \(Page 4058\)](#)

**ControlBarLabel.Text****Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Text
```

**See also**

[ControlBarLabel \(Page 4058\)](#)

**ControlBarLabel.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarLabel.ToolTipText
```

## See also

ControlBarLabel (Page 4058)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`ControlBarLabel.VerticalTextAlignment`

## See also

ControlBarLabel (Page 4058)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

**Syntax**

```
ControlBarLabel.Visible
```

**See also**

ControlBarLabel (Page 4058)

**ControlBarLabel.Width****Description**

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarLabel.Width
```

**See also**

ControlBarLabel (Page 4058)

**ControlBarSeparator****Description**

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarSeparatorPart

## Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 4075)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 4075)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 4075\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 4075\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarSeparator.Height
```

### See also

ControlBarSeparator (Page 4075)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarSeparator.Mapping`

**See also**

[ControlBarSeparator \(Page 4075\)](#)

**ControlBarSeparator.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the separator.

**Type**

Object, HmiMarginPart

**Access**

Read-write

## Syntax

`ControlBarSeparator.Margin`

## See also

[ControlBarSeparator \(Page 4075\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

## See also

[ControlBarSeparator.Margin \(Page 4081\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Left`**See also**`ControlBarSeparator.Margin` (Page 4081)**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Right`**See also**`ControlBarSeparator.Margin` (Page 4081)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Top`

## See also

[ControlBarSeparator.Margin \(Page 4081\)](#)

## ControlBarSeparator.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MaximumHeight`

## See also

[ControlBarSeparator \(Page 4075\)](#)

## ControlBarSeparator.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarSeparator.MaximumWidth
```

**See also**

ControlBarSeparator (Page 4075)

**ControlBarSeparator.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarSeparator.MinimumHeight
```

**See also**

ControlBarSeparator (Page 4075)

**ControlBarSeparator.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

## Syntax

```
ControlBarSeparator.MinimumWidth
```

## See also

ControlBarSeparator (Page 4075)

## ControlBarSeparator.Operability

### Description

The "Operability" property returns whether the separator is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarSeparator.Operability
```

## See also

ControlBarSeparator (Page 4075)

## ControlBarSeparator.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the separator.

### Type

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Padding`

**See also**

[ControlBarSeparator \(Page 4075\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ControlBarSeparator.Padding \(Page 4086\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

`ControlBarSeparator.Padding` (Page 4086)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

`ControlBarSeparator.Padding` (Page 4086)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Top`**See also**[ControlBarSeparator.Padding \(Page 4086\)](#)**ControlBarSeparator.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarSeparator.RequireExplicitUnlock`**See also**[ControlBarSeparator \(Page 4075\)](#)**ControlBarSeparator.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the separator.

**Type**

String

### Access

Read-write

### Syntax

`ControlBarSeparator.ToolTipText`

### See also

[ControlBarSeparator \(Page 4075\)](#)

## ControlBarSeparator.Visible

### Description

The "Visible" property specifies whether the separator is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Visible`

### See also

[ControlBarSeparator \(Page 4075\)](#)

## ControlBarSeparator.Width

### Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

### Type

UInt32

**Access**

Read-write

**Syntax**

`ControlBarSeparator.Width`

**See also**

ControlBarSeparator (Page 4075)

**ControlBarTextBox****Description**

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarTextBoxPart

**Properties**

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.AlternateBorderColor
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarTextBox.Authorization
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

[ControlBarTextBox \(Page 4091\)](#)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

[ControlBarTextBox \(Page 4091\)](#)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarTextBox.Enabled`

### See also

[ControlBarTextBox \(Page 4091\)](#)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarTextBox.ForeColor`

### See also

[ControlBarTextBox \(Page 4091\)](#)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

## See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarTextBox.Mapping`

### See also

[ControlBarTextBox \(Page 4091\)](#)

## ControlBarTextBox.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the text box.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Margin`

### See also

[ControlBarTextBox \(Page 4091\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

`ControlBarTextBox.Margin` (Page 4100)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

`ControlBarTextBox.Margin` (Page 4100)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarTextBox.Margin \(Page 4100\)](#)

### Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarTextBox.Margin \(Page 4100\)](#)

### ControlBarTextBox.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumHeight`**See also**

ControlBarTextBox (Page 4091)

**ControlBarTextBox.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarTextBox.MaximumWidth`**See also**

ControlBarTextBox (Page 4091)

**ControlBarTextBox.MinimumHeight****Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumHeight`

**See also**

ControlBarTextBox (Page 4091)

**ControlBarTextBox.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarTextBox.MinimumWidth`

**See also**

ControlBarTextBox (Page 4091)

**ControlBarTextBox.Operability**

**Description**

The "Operability" property returns whether the text box is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarTextBox.Operability`

### See also

[ControlBarTextBox \(Page 4091\)](#)

## ControlBarTextBox.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the text box.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarTextBox.Padding`

### See also

[ControlBarTextBox \(Page 4091\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarTextBox.Padding \(Page 4105\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarTextBox.Padding \(Page 4105\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarTextBox.Padding \(Page 4105\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarTextBox.Padding \(Page 4105\)](#)

## ControlBarTextBox.ReadOnly

### Description

The "ReadOnly" property specifies whether the text box is read-only.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.ReadOnly
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.Text

### Description

The "Text" property specifies the label of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.Text
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarTextBox.ToolTipText
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

### See also

ControlBarTextBox (Page 4091)

## ControlBarTextBox.Visible

### Description

The "Visible" property specifies whether the text box is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Visible
```

**See also**

ControlBarTextBox (Page 4091)

**ControlBarTextBox.Width****Description**

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarTextBox.Width
```

**See also**

ControlBarTextBox (Page 4091)

**ControlBarToggleSwitch****Description**

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar. You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarToggleSwitchPart

**Properties**

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**  
Specifies the graphic for the "pressed" state.
- **AlternateText**  
Specifies the text for the "pressed" state.
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the identifier of the switch.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the switch can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **HotKey**  
Returns the hotkey specified for the switch.
- **IsAlternateState**  
Specifies the current state of the switch.
- **Mapping**  
Returns the function of the switch.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the switch is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the switch is only operable while the associated button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the switch is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarToggleSwitch.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateBorderColor`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.AlternateGraphic

### Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.AlternateGraphic`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.AlternateText

### Description

The "AlternateText" property specifies the text of the switch for the "On" state.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.AlternateText
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.Authorization
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.BackColor`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.Badge

### Description

The "Badge" property specifies the identifier of the switch.

### Type

Object, HmiBadgePart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Badge`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderColor
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.BorderWidth
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Content`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

**See also**

ControlBarToggleSwitch.Content (Page 4118)

**Content.GraphicStretchMode****Description**

The "GraphicStretchMode" property defines the type of scaling of the graphic.

**Type**

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

**Access**

Read-write

**Syntax**

`Content.GraphicStretchMode`

**See also**

ControlBarToggleSwitch.Content (Page 4118)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

[ControlBarToggleSwitch.Content \(Page 4118\)](#)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[ControlBarToggleSwitch.Content \(Page 4118\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarToggleSwitch.Content \(Page 4118\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

## Syntax

`Content.TextPosition`

## See also

[ControlBarToggleSwitch.Content \(Page 4118\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

## See also

[ControlBarToggleSwitch.Content \(Page 4118\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

[ControlBarToggleSwitch.Content](#) (Page 4118)

## ControlBarToggleSwitch.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.CustomID
```

### See also

[ControlBarToggleSwitch](#) (Page 4111)

## ControlBarToggleSwitch.Enabled

### Description

The "Enabled" property specifies whether the switch can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Enabled`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.ForeColor`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.Graphic

### Description

The "Graphic" property specifies the graphic of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Graphic
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.Height

### Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Height
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.HotKey

### Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`Button.HotKey`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.IsAlternateState

### Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.IsAlternateState`

**See also**

ControlBarToggleSwitch (Page 4111)

**ControlBarToggleSwitch.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**

`ControlBarToggleSwitch.Mapping`

**See also**

[ControlBarToggleSwitch \(Page 4111\)](#)

**ControlBarToggleSwitch.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the switch.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.Margin`

**See also**

[ControlBarToggleSwitch \(Page 4111\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarToggleSwitch.Margin \(Page 4129\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarToggleSwitch.Margin \(Page 4129\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

ControlBarToggleSwitch.Margin (Page 4129)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**

ControlBarToggleSwitch.Margin (Page 4129)

**ControlBarToggleSwitch.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumHeight`

**See also**

[ControlBarToggleSwitch \(Page 4111\)](#)

**ControlBarToggleSwitch.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarToggleSwitch.MaximumWidth`

**See also**

[ControlBarToggleSwitch \(Page 4111\)](#)

**ControlBarToggleSwitch.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumHeight`**See also**

ControlBarToggleSwitch (Page 4111)

**ControlBarToggleSwitch.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarToggleSwitch.MinimumWidth`**See also**

ControlBarToggleSwitch (Page 4111)

**ControlBarToggleSwitch.Operability****Description**

The property "Operability" returns whether the switch is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarToggleSwitch.Operability`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## ControlBarToggleSwitch.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the switch.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarToggleSwitch.Padding`

### See also

[ControlBarToggleSwitch \(Page 4111\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

ControlBarToggleSwitch.Padding (Page 4134)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

ControlBarToggleSwitch.Padding (Page 4134)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarToggleSwitch.Padding \(Page 4134\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarToggleSwitch.Padding \(Page 4134\)](#)

## ControlBarToggleSwitch.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.Text

### Description

The "Text" property specifies the label of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Text
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.ToolTipText
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.Visible

### Description

The "Visible" property specifies whether the switch is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Visible
```

### See also

ControlBarToggleSwitch (Page 4111)

## ControlBarToggleSwitch.Width

### Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarToggleSwitch.Width
```

### See also

ControlBarToggleSwitch (Page 4111)

## ToolBar.Enabled

### Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ToolBar.Enabled
```

### See also

ObjectExplorerControl.ToolBar (Page 4006)

## ToolBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

```
ToolBar.Font
```

### See also

ObjectExplorerControl.ToolBar (Page 4006)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Italic
```

### See also

ToolBar.Font (Page 4140)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

Font.Name

**See also**

ToolBar.Font (Page 4140)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

ToolBar.Font (Page 4140)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

```
Font.StrikeOut
```

### See also

ToolBar.Font (Page 4140)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

### Access

Read-write

### Syntax

```
Font.Underline
```

**See also**

ToolBar.Font (Page 4140)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

```
Font.Weight
```

**See also**

ToolBar.Font (Page 4140)

**ToolBar.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the toolbar.

**Type**

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ToolBar.Margin`

### See also

[ObjectExplorerControl.ToolBar \(Page 4006\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ToolBar.Margin \(Page 4143\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

**Access**

Read-write

**Syntax**`Margin.Left`**See also**

ToolBar.Margin (Page 4143)

**Margin.Right****Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Right`**See also**

ToolBar.Margin (Page 4143)

**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ToolBar.Margin \(Page 4143\)](#)

## ToolBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ToolBar.Padding`

### See also

[ObjectExplorerControl.ToolBar \(Page 4006\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

[ToolBar.Padding \(Page 4146\)](#)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

[ToolBar.Padding \(Page 4146\)](#)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ToolBar.Padding \(Page 4146\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ToolBar.Padding \(Page 4146\)](#)

## ToolBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

**Access**

Read-write

**Syntax**`ToolBar.ShowToolTips`**See also**

ObjectExplorerControl.ToolBar (Page 4006)

**ToolBar.UseHotKeys****Description**

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

**Type**

Bool

**Access**

Read-write

**Syntax**`ToolBar.UseHotKeys`**See also**

ObjectExplorerControl.ToolBar (Page 4006)

**ToolBar.Visible****Description**

The "Visible" property specifies whether the toolbar is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ToolBar.Visible`

**See also**

[ObjectExplorerControl.ToolBar \(Page 4006\)](#)

**ObjectExplorerControl.Top**

**Description**

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

**Type**

Int32

**Access**

Read-write

**Syntax**

`ObjectExplorerControl.Top`

**See also**

[ObjectExplorerControl \(Page 3971\)](#)

**ObjectExplorerControl.Visible**

**Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ObjectExplorerControl.Visible`**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl.Width****Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**`ObjectExplorerControl.Width`**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl.WindowFlags****Description**

The "WindowFlags" property specifies the window configuration of the display.

**Type**

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

---

**Note**

You can enable multiple properties by adding integer values or bit operators.

---

**Access**

Read-write

**Syntax**

`ObjectExplorerControl.WindowFlags`

**See also**

[ObjectExplorerControl \(Page 3971\)](#)

**ObjectExplorerControl.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the display.

**Syntax**

`ObjectExplorerControl.CheckAuthorization()`

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {  
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {  
        screenItem.BackColor = 0xFFAAAAAA; // light grey  
    }  
}
```

## See also

ObjectExplorerControl (Page 3971)

## ObjectExplorerControl.FireCommand()

### Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the display.

### Syntax

```
ObjectExplorerControl.FireCommand(commandId, custom)
```

### Parameters

**commandId**

Type: Int32

ID of the element of the toolbar or information bar

**custom**

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

### Return value

--

## See also

ObjectExplorerControl (Page 3971)

## ObjectExplorerControl.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
ObjectExplorerControl.PropertyFlashing(propertyName, enable[, value]  
[, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl\_OnActivated()****Description**

The "OnActivated" event occurs when a control receives the focus:

- A control is selected via the configured tab sequence.
- A control that did not have the focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

**Syntax**

```
ObjectExplorerControl_OnActivated(item)
```

**Context****item**

Type: Object

Control for which the event occurs.

**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl\_OnCommandFired()****Description**

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the control.

**Syntax**

```
ObjectExplorerControl_OnCommandFired(item, commandId, custom)
```

## Context

### **item**

Type: Object

Control for which the event occurs.

### **commandId**

Type: DInt

ID of the element of the toolbar or information bar that was operated.

### **custom**

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

## See also

ObjectExplorerControl (Page 3971)

## ObjectExplorerControl\_OnDeactivated()

## Description

The "OnDeactivated" event occurs when the control loses the focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

## Syntax

```
ObjectExplorerControl_OnDeactivated(item)
```

## Context

### **item**

Type: Object

Control for which the event occurs.

**See also**

ObjectExplorerControl (Page 3971)

**ObjectExplorerControl\_OnInitialized()****Description**

The "OnInitialized" event occurs when a control has been successfully initialized and the data connection to the PLC has been established.

**Syntax**

```
ObjectExplorerControl_OnInitialized(item)
```

**Context****item**

Type: Object

Control for which the event occurs.

**See also**

ObjectExplorerControl (Page 3971)

**OpenLinkElement****Description**

The "OpenLinkElement" object displays the connection to an external application in runtime.

**Object type**

HmiOpenLinkElement

**Properties**

The "OpenLinkElement" object has the following properties:

- **ActiveOnStartup**  
Returns whether the connection is active on startup.
- **Application**  
Specifies the application.
- **ContainedType**  
Returns the type of the application.

- **OpenLinkMode**  
Returns the mode of connection.
- **Parent**  
Returns the higher-level screen object.
- **Pipe**  
Specifies the data stream.
- **Properties**  
Enables access to the properties of the connected object.

## Methods

The "OpenLinkElement" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the connection.
- **PropertyFlashing()**  
Configures flashing of a property.
- **Start()**  
Starts the connection.
- **Stop()**  
Terminates the connection.

## OpenLinkElement.ActiveOnStartup

### Description

The "ActiveOnStartup" property returns whether the connection is active on startup.

### Type

Bool

### Access

Read-only

### Syntax

`OpenLinkElement.ActiveOnStartup`

### See also

[OpenLinkElement \(Page 4157\)](#)

## OpenLinkElement.Application

### Description

The "Application" property specifies the application.

### Type

Object, HmiApplicationPart

### Access

Read-write

### Syntax

```
OpenLinkElement.Application
```

### See also

OpenLinkElement (Page 4157)

## Application.ApplicationExitCode

### Description

The "ApplicationExitCode" property returns the exit code of the application.

### Type

UInt32

### Access

Read-only

### Syntax

```
Application.ApplicationExitCode
```

### See also

OpenLinkElement.Application (Page 4159)

## Application.ApplicationName

### Description

The "ApplicationName" property returns the name of the application.

### Type

String

### Access

Read-only

### Syntax

```
Application.ApplicationName
```

### See also

OpenLinkElement.Application (Page 4159)

## Application.ApplicationState

### Description

The "ApplicationState" property returns the current status of the application.

### Type

Int32, HmiApplicationState

Returns the status.

- None (0): None
- Running (1): Running
- Terminated (2): Completed
- Crashed (3): Crashed
- CreateFailed (4): Create failed

### Access

Read-only

### Syntax

```
Application.ApplicationState
```

**See also**

OpenLinkElement.Application (Page 4159)

**Application.Arguments****Description**

The "Arguments" property returns the parameters of the application.

**Type**

String

**Access**

Read-only

**Syntax**

`Application.Arguments`

**See also**

OpenLinkElement.Application (Page 4159)

**Application.Environment****Description**

The "Environment" property returns the environment of the application.

**Type**

String

**Access**

Read-only

**Syntax**

`Application.Environment`

**See also**

OpenLinkElement.Application (Page 4159)

## Application.TerminateApplicationOnLeave

### Description

The "TerminateApplicationOnLeave" property returns whether the application is terminated on exit.

### Type

Bool

### Access

Read-only

### Syntax

`Application.TerminateApplicationOnLeave`

### See also

[OpenLinkElement.Application \(Page 4159\)](#)

## Application.WorkingDirectory

### Description

The "WorkingDirectory" property returns the working directory of the application.

### Type

String

### Access

Read-only

### Syntax

`Application.WorkingDirectory`

### See also

[OpenLinkElement.Application \(Page 4159\)](#)

## OpenLinkElement.ContainedType

### Description

The "ContainedType" property returns the type of the application.

### Type

String

### Access

Read-only

### Syntax

`OpenLinkElement.ContainedType`

### See also

OpenLinkElement (Page 4157)

## OpenLinkElement.OpenLinkMode

### Description

The "OpenLinkMode" property returns the type of connection.

### Type

Int32, HmiOpenLinkMode

Returns the type of connection.

- None (0): None
- Create (1): Create or end external process.
- CreateAndConnect (2): Create data stream and end data stream.
- Connect (3): Use a named data stream that already exists (connect and disconnect).

### Access

Read-only

### Syntax

`OpenLinkElement.OpenLinkMode`

**See also**

[OpenLinkElement \(Page 4157\)](#)

**OpenLinkElement.Parent**

**Description**

The "Parent" property returns the higher-level screen object (Parent container).

**Type**

Object, HmiScreenObjectBase (Page 1742)

**Access**

Read-only

**Syntax**

`OpenLinkElement.Parent`

**See also**

[OpenLinkElement \(Page 4157\)](#)

[Screen Items \(Page 1742\)](#)

**Screen Items**

**Description**

[Screen Items \(Page 1742\)](#)

**OpenLinkElement.Pipe**

**Description**

The "Pipe" property specifies the data stream.

**Type**

Object, HmiPipePart

**Access**

Read-write

**Syntax**`OpenLinkElement.Pipe`**See also**

OpenLinkElement (Page 4157)

**Pipe.CharSet****Description**

The "CharSet" property specifies the character coding of the data stream.

**Type**

Int32, HmiCharSet

Specifies the character coding:

- Console (0): Depending on the setting of the operating system during runtime
- UTF8 (1): UTF-8
- UTF16 (2): UTF 16

**Access**

Read-write

**Syntax**`Pipe.CharSet`**See also**

OpenLinkElement.Pipe (Page 4164)

**Pipe.LastPropertyRequestResult****Description**

The "LastPropertyRequestResult" property returns the result of the last read or write operation of a property of the data stream.

### Type

Int32, HmiRequestResult

Returns the result:

- None (0): None
- Success (1): Success
- AccessDenied (2): Access denied
- InvalidName (3): Invalid name

### Access

Read-only

### Syntax

`Pipe.LastPropertyRequestResult`

### See also

[OpenLinkElement.Pipe \(Page 4164\)](#)

## Pipe.PipeName

### Description

The "PipeName" property returns the name of the data stream.

### Type

String

### Access

Read-only

### Syntax

`Pipe.PipeName`

### See also

[OpenLinkElement.Pipe \(Page 4164\)](#)

## Pipe.PipeState

### Description

The "PipeState" property returns the connection status of the data stream.

### Type

Int32, HmiPipeConnectionState

Returns the connection status:

- Unavailable (0): Initial state or closed
- Connected (1): Connected
- Disconnected (2): Disconnected

### Access

Read-only

### Syntax

```
Pipe.PipeState
```

### See also

[OpenLinkElement.Pipe \(Page 4164\)](#)

## Pipe.ReconnectAutomatically

### Description

The "ReconnectAutomatically" property returns whether the data stream is automatically reconnected.

### Type

Bool

### Access

Read-only

### Syntax

```
Pipe.ReconnectAutomatically
```

**See also**

OpenLinkElement.Pipe (Page 4164)

**OpenLinkElement.Properties**

**Description**

The "Properties" property allows access to dynamic properties of the connected application.

**Type**

Object, HmiDynamicPropertyPart

**Access**

Read-write

**Syntax**

`OpenLinkElement.Properties`

**See also**

OpenLinkElement (Page 4157)

**OpenLinkElement.CheckAuthorization()**

**Description**

The "CheckAuthorization" method returns whether the current user is authorized to operate the connection.

**Syntax**

`OpenLinkElement.CheckAuthorization()`

**Parameters**

--

**Return value**

Bool

## Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

### Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

## See also

[OpenLinkElement](#) (Page 4157)

## OpenLinkElement.PropertyFlashing()

### Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

### Syntax

```
OpenLinkElement.PropertyFlashing(propertyName, enable[, value][, alternateValue][, rate])
```

### Parameters

**propertyName**

Type: String

Name of the property for which flashing is configured.

**enable**

Type: Bool

Specifies that flashing is activated.

**value**

Optional, type: Variant

Value of the property for which flashing is configured.

**alternateValue**

Optional, type: Variant

Specifies the second value for flashing.

**rate**

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

---

**Note**

If the parameter is missing, "Medium" is used.

---

**Return value**

Bool

**See also**

OpenLinkElement (Page 4157)

**OpenLinkElement.Start()**

**Description**

The "Start" method starts the connection.

**Syntax**

```
OpenLinkElement.Start()
```

**Parameters**

--

**Return value**

--

**See also**

OpenLinkElement (Page 4157)

## OpenLinkElement.Stop()

### Description

The "Stop" method terminates the connection.

### Syntax

```
OpenLinkElement.Stop()
```

### Parameters

--

### Return value

--

### See also

OpenLinkElement (Page 4157)

## OverviewParameterControl

### Description

The "OverviewParameterControl" object represents a parameter overview in runtime.

### Object type

HmiOverviewParameterControl

### Properties

The "OverviewParameterControl" object has the following properties:

- **BackColor**  
Specifies the background color.
- **Caption**  
Specifies the text that is displayed in the title bar.
- **CaptionColor**  
Specifies the background color of the title bar.
- **CurrentQuality**  
Returns the poorest quality code of all tags which influence the parameter overview.
- **DetailedParameterControl**  
Specifies the parameter set control of tag values.

- **EditMode**  
Specifies the editing mode for values in runtime.
- **Enabled**  
Specifies whether the parameter overview can be operated in runtime.
- **Filter**  
Specifies a string for filtering parameters.
- **Height**  
Specifies the height.
- **Icon**  
Specifies the icon of the parameter overview.
- **Layer**  
Returns the screen layer in which the parameter overview is located.
- **Left**  
Specifies the value of the X coordinate.
- **Margin**  
Specifies the margin.
- **Name**  
Returns the name of the parameter overview.
- **ParameterSetTypeDefault**  
Specifies the standard parameter set type.
- **ParameterView**  
Defines the appearance of the parameter table.
- **Parent**  
Returns the higher-level screen object.
- **RenderingTemplate**  
Returns the name of the template from which the parameter overview was created.
- **ShowFocusVisual**  
Specifies whether the parameter overview is highlighted when in focus.
- **StatusBar**  
Specifies the information bar of the parameter overview.
- **StyleItemClass**  
Returns the style which is applied to the parameter overview.
- **TabIndex**  
Returns the position of the parameter overview in the tab sequence.
- **TimeZone**  
Specifies the time zone.
- **ToolBar**  
Specifies the toolbar of the parameter overview.
- **Top**  
Specifies the value of the Y coordinate.
- **Visible**  
Specifies whether the parameter overview is visible.

- **Width**  
Specifies the width.
- **WindowFlags**  
Specifies the window configuration of the parameter overview.

## Methods

The "OverviewParameterControl" object has the following methods:

- **CheckAuthorization()**  
Returns whether the current user is authorized to operate the parameter overview.
- **FireCommand()**  
Executes the command of an element of the toolbar or information bar of the parameter overview.
- **PropertyFlashing()**  
Configures flashing of a property.

## Events

The "OverviewParameterControl" object has the following events:

- **OnActivated()**  
Occurs when a parameter overview receives the focus.
- **OnCommandFired()**  
Occurs when the operator has operated an element in the toolbar or information bar of the parameter overview.
- **OnDeactivated()**  
Occurs when a parameter overview loses the focus.
- **OnInitialized()**  
Occurs when a parameter overview has been successfully initialized and the data connection to the PLC has been established.

## OverviewParameterControl.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

**Syntax**

`OverviewParameterControl.BackColor`

**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl.Caption**

**Description**

The "Caption" property specifies the text that is displayed in the title bar.

**Type**

Object, HmiTextPart

**Access**

Read-write

**Syntax**

`OverviewParameterControl.Caption`

**See also**

OverviewParameterControl (Page 4171)

**Text.Font**

**Description**

The "Font" property specifies the font of the text.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`Text.Font`

**See also**

OverviewParameterControl.Caption (Page 4174)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

Text.Font (Page 4174)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

Text.Font (Page 4174)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

Text.Font (Page 4174)

**Font.StrikeOut**

**Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**`Text.Font` (Page 4174)**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**`Text.Font` (Page 4174)**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[Text.Font \(Page 4174\)](#)

### Text.ForeColor

#### Description

The "ForeColor" property sets the font color of the text.

#### Type

UInt32

### Access

Read-write

### Syntax

`Text.ForeColor`

### See also

[OverviewParameterControl.Caption \(Page 4174\)](#)

### Text.Text

#### Description

The "Text" property specifies the label.

**Type**

String

**Access**

Read-write

**Syntax**

`Text.Text`

**See also**

OverviewParameterControl.Caption (Page 4174)

**Text.Visible****Description**

The "Visible" property specifies whether the text is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Text.Visible`

**See also**

OverviewParameterControl.Caption (Page 4174)

**OverviewParameterControl.CaptionColor****Description**

The "CaptionColor" property specifies the color of the title bar.

### Type

UInt32

### Access

Read-write

### Syntax

`OverviewParameterControl.CaptionColor`

### See also

[OverviewParameterControl \(Page 4171\)](#)

## OverviewParameterControl.CurrentQuality

### Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the parameter overview.

### Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

### Access

Read-only

### Syntax

`OverviewParameterControl.CurrentQuality`

### See also

[OverviewParameterControl \(Page 4171\)](#)

## OverviewParameterControl.DetailedParameterControl

### Description

The "DetailedParameterControl" property specifies the parameter set control of tag values.

### Type

Object, HmiDetailedParameterControl (Page 2757)

### Access

Read-write

### Syntax

```
OverviewParameterControl.DetailedParameterControl
```

### See also

OverviewParameterControl (Page 4171)

DetailedParameterControl (Page 2757)

## DetailedParameterControl

### Description

DetailedParameterControl (Page 2757)

## OverviewParameterControl.EditMode

### Description

The "EditMode" property specifies the editing mode for values in runtime. This also defines the activation state of the toolbar buttons.

### Type

Int32, HmiEditMode

Specifies the editing mode:

- None (0): No access
- Update (1): Update values
- Create (2): Create values
- Delete (4): Delete values

**Access**

Read-write

**Syntax**

`OverviewParameterControl.EditMode`

**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl.Enabled**

**Description**

The "Enabled" property specifies whether the parameter overview can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`OverviewParameterControl.Enabled`

**See also**

OverviewParameterControl (Page 4171)

**OverviewParameterControl.Filter**

**Description**

The "Filter" property specifies a string for filtering parameters.

The syntax of the filter string corresponds to the WHERE clause of an SQL command.

**Type**

String

**Access**

Read-write

**Syntax**

OverviewParameterControl.Filter

**Operators**

The following operators can be used in the filter string:

Operator	Description	Example
=	equal to	AlarmClassName = 'demo'
IS NOT <i>string</i>	is not equal to the string <i>string</i>	AlarmText4 IS NOT 'Text5'
<>	not equal	Value <> 0.0
>	greater than	ModificationTime > '11.08.2016'
<	less than	Value < 75.0
>=	greater than or equal to	Value >= 25.0
<=	less than or equal to	Value <= 75.0
OR,	logical OR	State = 1 OR State = 3
AND, &&	logical AND	EventText = 'Text1' AND Origin = 'Motor'
BETWEEN	within a range	Value BETWEEN 25.0 AND 75.0
NOT BETWEEN	outside a range	Value NOT BETWEEN 25.0 AND 75.0
LIKE <i>string</i>	corresponds to the string <i>string</i>	Name LIKE 'Motor*'
NOT LIKE <i>string</i>	does not correspond to the string <i>string</i>	Name NOT LIKE 'Valve*'
IN ( <i>v1</i> , <i>v2</i> , ...)	corresponds to one or more values	State IN (1, 4, 7)
NOT IN ( <i>v1</i> , <i>v2</i> , ...)	does not correspond to one or more values	State NOT IN (0, 2, 3, 5, 6)
IS NULL	compares to zero (missing data)	Context IS NULL
IS NOT NULL	compares to zero (unknown data)	Context IS NOT NULL

**Wildcards**

The following wildcards can be used for characters of filter strings:

Wildcard	Description	Example
*	replaces 0, 1 or more characters	Name LIKE 'Motor*'
?	replaces exactly 1 character	Name = 'Recipe?'

**See also**

OverviewParameterControl (Page 4171)

## OverviewParameterControl.Height

### Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`OverviewParameterControl.Height`

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.Icon

### Description

The "Icon" property specifies the icon of the parameter overview.

### Type

String

### Access

Read-write

### Syntax

`OverviewParameterControl.Icon`

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.Layer

### Description

The "Layer" property returns the screen layer in which the parameter overview is located.

### Type

Object, HmiLayerPart

### Access

Read-only

### Syntax

```
OverviewParameterControl.Layer
```

### See also

OverviewParameterControl (Page 4171)

## Layer.MaximumZoom

### Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

```
Layer.MaximumZoom
```

### See also

OverviewParameterControl.Layer (Page 4185)

## Layer.MinimumZoom

### Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

### Type

Float

### Access

Read-write

### Syntax

`Layer.MinimumZoom`

### See also

[OverviewParameterControl.Layer \(Page 4185\)](#)

## Layer.Name

### Description

The "Name" property returns the name of the screen layer.

### Type

String

### Access

Read-only

### Syntax

`Layer.Name`

### See also

[OverviewParameterControl.Layer \(Page 4185\)](#)

## Layer.Visible

### Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

### Type

Bool

### Access

Read-write

### Syntax

`Layer.Visible`

### See also

[OverviewParameterControl.Layer \(Page 4185\)](#)

## OverviewParameterControl.Left

### Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

### Type

Int32

### Access

Read-write

### Syntax

`OverviewParameterControl.Left`

### See also

[OverviewParameterControl \(Page 4171\)](#)

## OverviewParameterControl.Margin

### Description

The "Margin" property specifies the margin.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`OverviewParameterControl.Margin`

### See also

OverviewParameterControl (Page 4171)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

OverviewParameterControl.Margin (Page 4188)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[OverviewParameterControl.Margin \(Page 4188\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[OverviewParameterControl.Margin \(Page 4188\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[OverviewParameterControl.Margin \(Page 4188\)](#)

## OverviewParameterControl.Name

### Description

The "Name" property returns the name of the parameter overview.

### Type

String

### Access

Read-only

### Syntax

`OverviewParameterControl.Name`

### See also

[OverviewParameterControl \(Page 4171\)](#)

## OverviewParameterControl.ParameterSetTypeDefault

### Description

The "ParameterSetTypeDefault" property specifies the standard parameter set type.

### Type

Object, HmiParameterSetType (Page 1383)

### Access

Read-write

### Syntax

```
OverviewParameterControl.ParameterSetTypeDefault
```

### See also

OverviewParameterControl (Page 4171)

ParameterSetType (Page 1383)

## ParameterSetType

### Description

ParameterSetType (Page 1383)

## OverviewParameterControl.ParameterView

### Description

The "ParameterView" property defines the appearance of the parameter table.

### Type

Object, HmiDataGridViewPart (Page 4192)

### Access

Read-write

### Syntax

```
OverviewParameterControl.ParameterView
```

## See also

DataGridView (Page 4192)

## DataGridView

### DataGridView.AllowFilter

#### Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

#### Type

Bool

#### Access

Read-write

#### Syntax

```
DataGridView.AllowFilter
```

## See also

OverviewParameterControl.ParameterView (Page 4191)

### DataGridView.AllowSort

#### Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

#### Type

Bool

#### Access

Read-write

**Syntax**

```
DataGridView.AllowSort
```

**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.AlternateBackColor****Description**

The "AlternateBackColor" property specifies the second background color for a color gradient.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
DataGridView.AlternateBackColor
```

**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.AlternateForeColor****Description**

The "AlternateForeColor" property specifies the flashing color for the text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`DataGridView.AlternateForeColor`

## See also

[OverviewParameterControl.ParameterView \(Page 4191\)](#)

## DataGridView.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.BackColor`

## See also

[OverviewParameterControl.ParameterView \(Page 4191\)](#)

## DataGridView.CellPadding

### Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

### Type

Object, HmiPaddingPart

### Access

Read-write

**Syntax**

```
DataGridView.CellPadding
```

**See also**

OverviewParameterControl.ParameterView (Page 4191)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Bottom
```

**See also**

DataGridView.CellPadding (Page 4194)

**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

## Syntax

`Padding.Left`

## See also

[DataGridView.CellPadding \(Page 4194\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

## Syntax

`Padding.Right`

## See also

[DataGridView.CellPadding \(Page 4194\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

**Syntax**

`Padding.Top`

**See also**

`DataGridView.CellPadding` (Page 4194)

**DataGridView.ColoringMode****Description**

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

**Type**

Int32, HmiGridColumnColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

**Access**

Read-write

**Syntax**

`DataGridView.ColoringMode`

**See also**

`OverviewParameterControl.ParameterView` (Page 4191)

**DataGridView.Columns****Description**

The "Columns" property represents the quantity of columns.

**Type**

Object, HmiDataGridColumnCollection (Page 4198)

## Access

Read-only

## Syntax

`DataGridView.Columns`

## See also

[OverviewParameterControl.ParameterView \(Page 4191\)](#)

[HmiDataGridColumnCollection \(Page 4198\)](#)

## HmiDataGridColumnCollection

### Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the view.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

### Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

### Object type

HmiDataGridColumnCollection

### Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**  
Returns the number of columns in the "HmiDataGridColumnCollection" list.

### Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**  
Returns a column of the "HmiDataGridColumnCollection" list.

## See also

[DataGridView.Columns \(Page 4197\)](#)

## HmiDataGridColumnCollection.Count

### Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiDataGridColumnCollection.Count
```

### See also

HmiDataGridColumnCollection (Page 4198)

## HmiDataGridColumnCollection.Item()

### Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

### Syntax

```
HmiDataGridColumnCollection[.Item] (HmiDataGridColumnName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

---

### Parameters

#### **HmiDataGridColumnName**

Type: String

Name of the column

## Return value

Object, HmiDataGridColumnPartBase (Page 4200)

## See also

HmiDataGridColumnCollection (Page 4198)

OverviewParameterControlColumn (Page 4200)

## OverviewParameterControlColumn

### Description

The "OverviewParameterControlColumn" object represents a column of the parameter table.

### Object type

HmiOverviewParameterControlColumnPart

### Properties

The "OverviewParameterControlColumn" object has the following properties:

- **AllowSort**  
Specifies whether column sorting is allowed.
- **BackColor**  
Specifies the background color.
- **Content**  
Specifies display options for text and graphics.
- **Enabled**  
Specifies whether the column can be operated in runtime.
- **ForeColor**  
Specifies the font color of the text.
- **Header**  
Specifies the properties of the column header.
- **Key**  
Corresponds to the column definition from the "ConsideredColumns" property of the connected source.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumWidth**  
Specifies the minimum width.
- **Name**  
Returns the name of the column.

- **OutputFormat**  
Specifies the format for displaying values.
- **OverviewParameterControlBlock**  
Specifies the content block of the column.
- **SortDirection**  
Specifies the sorting direction.
- **SortOrder**  
Specifies the sorting order.
- **Visible**  
Specifies whether the column is visible.
- **Width**  
Specifies the width.

## Methods

--

## See also

HmiDataGridColumnCollection (Page 4198)

## OverviewParameterControlColumn.AllowSort

### Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

### Type

Bool

### Access

Read-write

### Syntax

```
OverviewParameterControlColumn.AllowSort
```

## See also

OverviewParameterControlColumn (Page 4200)

## OverviewParameterControlColumn.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`OverviewParameterControlColumn.BackColor`

### See also

OverviewParameterControlColumn (Page 4200)

## OverviewParameterControlColumn.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`OverviewParameterControlColumn.Content`

### See also

OverviewParameterControlColumn (Page 4200)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[OverviewParameterControlColumn.Content \(Page 4202\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

### See also

OverviewParameterControlColumn.Content (Page 4202)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

### See also

OverviewParameterControlColumn.Content (Page 4202)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

### Syntax

`Content.Spacing`

### See also

[OverviewParameterControlColumn.Content \(Page 4202\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[OverviewParameterControlColumn.Content \(Page 4202\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[OverviewParameterControlColumn.Content \(Page 4202\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

[OverviewParameterControlColumn.Content \(Page 4202\)](#)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.VerticalTextAlignment`

**See also**

[OverviewParameterControlColumn.Content \(Page 4202\)](#)

**OverviewParameterControlColumn.Enabled****Description**

The "Enabled" property specifies whether the column can be operated in runtime.

**Type**

Bool

**Access**

Read-write

**Syntax**

`OverviewParameterControlColumn.Enabled`

**See also**

[OverviewParameterControlColumn \(Page 4200\)](#)

**OverviewParameterControlColumn.ForeColor**

**Description**

The "ForeColor" property specifies the font color of the text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`OverviewParameterControlColumn.ForeColor`

**See also**

[OverviewParameterControlColumn \(Page 4200\)](#)

**OverviewParameterControlColumn.Header**

**Description**

The "Header" property specifies the properties of the column header.

**Type**

Object, HmiDataGridColumnHeaderPart

**Access**

Read-write

**Syntax**`OverviewParameterControlColumn.Header`**See also**

OverviewParameterControlColumn (Page 4200)

**DataGridColumnHeader.Content****Description**

The "Content" property specifies display options for text and graphics.

**Type**

Object, HmiContentPart

**Access**

Read-write

**Syntax**`DataGridColumnHeader.Content`**See also**

OverviewParameterControlColumn.Header (Page 4208)

**Content.ContentMode****Description**

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

**Type**

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

[DataGridColumnHeader.Content \(Page 4209\)](#)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

**See also**

DataGridColumnHeader.Content (Page 4209)

**Content.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

DataGridColumnHeader.Content (Page 4209)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

## Syntax

`Content.Spacing`

## See also

[DataGridColumnHeader.Content \(Page 4209\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

## Syntax

`Content.SplitRatio`

## See also

[DataGridColumnHeader.Content \(Page 4209\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

**Access**

Read-write

**Syntax**

`Content.TextPosition`

**See also**

[DataGridColumnHeader.Content \(Page 4209\)](#)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

`Content.TextTrimming`

**See also**

[DataGridColumnHeader.Content \(Page 4209\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.VerticalTextAlignment`

### See also

`DataGridColumnHeader.Content` (Page 4209)

## DataGridColumnHeader.Graphic

### Description

The "Graphic" property specifies the graphic of the column header.

### Type

String

### Access

Read-write

### Syntax

`DataGridColumnHeader.Graphic`

**See also**

[OverviewParameterControlColumn.Header](#) (Page 4208)

**DataGridColumnHeader.Text****Description**

The "Text" property specifies the label of the column header.

**Type**

String

**Access**

Read-write

**Syntax**

```
DataGridColumnHeader.Text
```

**See also**

[OverviewParameterControlColumn.Header](#) (Page 4208)

**OverviewParameterControlColumn.Key****Description**

The "Key" property corresponds to the column definition from the "ConsideredColumns" property of the binding data source.

**Type**

String

**Access**

Read-only

**Syntax**

```
OverviewParameterControlColumn.Key
```

**See also**

OverviewParameterControlColumn (Page 4200)

**OverviewParameterControlColumn.MaximumWidth**

**Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

OverviewParameterControlColumn.MaximumWidth

**See also**

OverviewParameterControlColumn (Page 4200)

**OverviewParameterControlColumn.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

OverviewParameterControlColumn.MinimumWidth

**See also**

OverviewParameterControlColumn (Page 4200)

## OverviewParameterControlColumn.Name

### Description

The "Name" property returns the name of the column.

### Type

String

### Access

Read-only

### Syntax

```
OverviewParameterControlColumn.Name
```

### See also

OverviewParameterControlColumn (Page 4200)

## OverviewParameterControlColumn.OutputFormat

### Description

The "OutputFormat" property specifies the format for displaying values.

### Type

String

### Access

Read-write

### Syntax

```
OverviewParameterControlColumn.OutputFormat
```

### See also

OverviewParameterControlColumn (Page 4200)

## OverviewParameterControlColumn.OverviewParameterControlBlock

### Description

The "OverviewParameterControlBlock" property specifies the content block of the column.

### Type

Int32, HmiOverviewParameterControlBlock

Specifies the information blocks:

- None (0): None
- ParameterSetID (1): ID
- LastUser (2): Last user
- LastAccess (3): Last access
- ParameterSetElementOdd (4): Generic columns (odd numbering)
- ParameterSetElementEven (5): Generic columns (even numbering)

### Access

Read-write

### Syntax

`OverviewParameterControlColumn.OverviewParameterControlBlock`

### See also

OverviewParameterControlColumn (Page 4200)

## OverviewParameterControlColumn.SortDirection

### Description

The "SortDirection" property specifies the sorting direction.

### Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

**Access**

Read-write

**Syntax**`OverviewParameterControlColumn.SortDirection`**See also**

OverviewParameterControlColumn (Page 4200)

**OverviewParameterControlColumn.SortOrder****Description**

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

**Type**

UInt16

**Access**

Read-write

**Syntax**`OverviewParameterControlColumn.SortOrder`**See also**

OverviewParameterControlColumn (Page 4200)

**OverviewParameterControlColumn.Visible****Description**

The "Visible" property specifies whether the column is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`OverviewParameterControlColumn.Visible`

**See also**

OverviewParameterControlColumn (Page 4200)

**OverviewParameterControlColumn.Width**

**Description**

The "Width" property specifies the width in the DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`OverviewParameterControlColumn.Width`

**See also**

OverviewParameterControlColumn (Page 4200)

**DataGridView.Font**

**Description**

The "Font" property specifies the font of the cells.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**`DataGridView.Font`**See also**[OverviewParameterControl.ParameterView \(Page 4191\)](#)**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**`Bool`**Access**`Read-write`**Syntax**`Font.Italic`**See also**[DataGridView.Font \(Page 4220\)](#)**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**`String`**Access**`Read-write`

## Syntax

Font.Name

## See also

DataGridView.Font (Page 4220)

## Font.Size

### Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

### Type

Float

### Access

Read-write

## Syntax

Font.Size

## See also

DataGridView.Font (Page 4220)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**`Font.StrikeOut`**See also**

DataGridView.Font (Page 4220)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**`Font.Underline`**See also**

DataGridView.Font (Page 4220)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

### Access

Read-write

### Syntax

`Font.Weight`

### See also

[DataGridView.Font \(Page 4220\)](#)

## DataGridView.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridView.ForeColor`

### See also

[OverviewParameterControl.ParameterView \(Page 4191\)](#)

## DataGridView.GridLineColor

### Description

The "GridLineColor" property specifies the color of grid lines.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridView.GridLineColor
```

### See also

OverviewParameterControl.ParameterView (Page 4191)

## DataGridView.GridLineVisibility

### Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

### Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

### Access

Read-write

### Syntax

```
DataGridView.GridLineVisibility
```

## See also

OverviewParameterControl.ParameterView (Page 4191)

## DataGridView.GridLineWidth

### Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

### Type

UInt8

### Access

Read-write

### Syntax

`DataGridView.GridLineWidth`

## See also

OverviewParameterControl.ParameterView (Page 4191)

## DataGridView.GridSelectionMode

### Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

### Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

### Access

Read-write

**Syntax**

`DataGridView.GridSelectionMode`

**See also**

`OverviewParameterControl.ParameterView` (Page 4191)

**DataGridView.HeaderSettings****Description**

The "HeaderSettings" property specifies the settings for all column headers in the table.

**Type**

Object, `HmiDataGridHeaderSettingsPart`

**Access**

Read-write

**Syntax**

`DataGridView.HeaderSettings`

**See also**

`OverviewParameterControl.ParameterView` (Page 4191)

**DataGridHeaderSettings.AllowColumnReorder****Description**

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

**Type**

Bool

**Access**

Read-write

## Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

## See also

DataGridView.HeaderSettings (Page 4227)

## DataGridHeaderSettings.AllowColumnResize

### Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

### Type

Bool

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

## See also

DataGridView.HeaderSettings (Page 4227)

## DataGridHeaderSettings.ColumnHeaderType

### Description

The "ColumnHeaderType" property specifies the type of content of a column header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.ColumnHeaderType`

**See also**

[DataGridView.HeaderSettings \(Page 4227\)](#)

**DataGridHeaderSettings.Font****Description**

The "Font" property specifies the font of the headers.

**Type**

Object, HmiFontPart

**Access**

Read-write

**Syntax**

`DataGridHeaderSettings.Font`

**See also**

[DataGridView.HeaderSettings \(Page 4227\)](#)

**Font.Italic****Description**

The "Italic" property specifies whether the text is displayed in italics.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Italic`

**See also**

DataGridHeaderSettings.Font (Page 4229)

**Font.Name**

**Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**

`Font.Name`

**See also**

DataGridHeaderSettings.Font (Page 4229)

**Font.Size**

**Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

**Syntax**

Font.Size

**See also**

DataGridHeaderSettings.Font (Page 4229)

**Font.StrikeOut****Description**

The "StrikeOut" property specifies whether font is struck through.

**Type**

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

**Access**

Read-write

**Syntax**

Font.StrikeOut

**See also**

DataGridHeaderSettings.Font (Page 4229)

**Font.Underline****Description**

The "Underline" property specifies whether the font is underlined.

**Type**

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

DataGridHeaderSettings.Font (Page 4229)

**Font.Weight**

**Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

DataGridHeaderSettings.Font (Page 4229)

## DataGridHeaderSettings.HeaderBackColor

### Description

The "HeaderBackColor" property specifies the background color of the header.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

### See also

DataGridView.HeaderSettings (Page 4227)

## DataGridHeaderSettings.HeaderForeColor

### Description

The "HeaderForeColor" property specifies the font color of the headers.

### Type

UInt32

### Access

Read-write

### Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

### See also

DataGridView.HeaderSettings (Page 4227)

## DataGridHeaderSettings.HeaderGridLineColor

### Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridHeaderSettings.HeaderGridLineColor`

### See also

[DataGridView.HeaderSettings \(Page 4227\)](#)

## DataGridHeaderSettings.HeaderSelectionBackColor

### Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

`DataGridHeaderSettings.HeaderSelectionBackColor`

### See also

[DataGridView.HeaderSettings \(Page 4227\)](#)

## DataGridHeaderSettings.HeaderSelectionForeColor

### Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

### Type

UInt32

### Access

Read-write

### Syntax

```
Object.HeaderSelectionForeColor
```

#### Object

Required. An object from the "Availability" section.

### See also

DataGridView.HeaderSettings (Page 4227)

## DataGridHeaderSettings.RowHeaderType

### Description

The "RowHeaderType" property specifies the type of content of a row header.

### Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

### Access

Read-write

## Syntax

`DataGridHeaderSettings.RowHeaderType`

## See also

`DataGridView.HeaderSettings` (Page 4227)

## DataGridView.HorizontalScrollBarVisibility

### Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

`DataGridView.HorizontalScrollBarVisibility`

## See also

`OverviewParameterControl.ParameterView` (Page 4191)

## DataGridView.RowHeight

### Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.RowHeight`**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.SelectFullRow****Description**

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

**Type**

Bool

**Access**

Read-write

**Syntax**`DataGridView.SelectFullRow`**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.SelectionBackColor****Description**

The "SelectionBackColor" property specifies the background color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBackColor`

**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.SelectionBorderColor**

**Description**

The "SelectionBorderColor" property specifies the border color of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**

`DataGridView.SelectionBorderColor`

**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.SelectionBorderWidth**

**Description**

The "SelectionBorderWidth" property specifies the border width of the selected cells.

**Type**

UInt8

**Access**

Read-write

**Syntax**`DataGridView.SelectionBorderWidth`**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.SelectionForeColor****Description**

The "SelectionForeColor" property specifies the font color of the selected cells.

**Type**

UInt32

**Access**

Read-write

**Syntax**`DataGridView.SelectionForeColor`**See also**

OverviewParameterControl.ParameterView (Page 4191)

**DataGridView.VerticalScrollBarVisibility****Description**

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

### Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

### Access

Read-write

### Syntax

```
DataGridView.VerticalScrollBarVisibility
```

### See also

OverviewParameterControl.ParameterView (Page 4191)

## OverviewParameterControl.Parent

### Description

The "Parent" property returns the higher-level screen object (Parent container).

### Type

Object, HmiScreenObjectBase (Page 1742)

### Access

Read-only

### Syntax

```
OverviewParameterControl.Parent
```

### See also

OverviewParameterControl (Page 4171)

Screen Items (Page 1742)

## Screen Items

### Description

Screen Items (Page 1742)

## OverviewParameterControl.RenderingTemplate

### Description

The "RenderingTemplate" property returns the name of the template from which the parameter overview was created.

### Type

String

### Access

Read-only

### Syntax

```
OverviewParameterControl.RenderingTemplate
```

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.ShowFocusVisual

### Description

The "ShowFocusVisual" property specifies whether the parameter overview is highlighted when in focus.

### Type

Bool

### Access

Read-write

**Syntax**

`OverviewParameterControl.ShowFocusVisual`

**See also**

[OverviewParameterControl \(Page 4171\)](#)

**OverviewParameterControl.StatusBar**

**Description**

The "StatusBar" property specifies the information bar of the parameter overview.

**Type**

Object, HmiStatusBarPart

**Access**

Read-write

**Syntax**

`OverviewParameterControl.StatusBar`

**See also**

[OverviewParameterControl \(Page 4171\)](#)

**StatusBar.BackColor**

**Description**

The "BackColor" property specifies the background color.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`StatusBar.BackColor`

**See also**

OverviewParameterControl.StatusBar (Page 4242)

**StatusBar.Elements****Description**

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

**Type**

Object, HmiControlBarElementCollection (Page 4243)

**Access**

Read-only

**Syntax**

```
StatusBar.Elements
```

**See also**

OverviewParameterControl.StatusBar (Page 4242)

HmiControlBarElementCollection (Page 4243)

**HmiControlBarElementCollection****Description**

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

**Use**

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

**Object type**

HmiControlBarElementCollection

## Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

## Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

## See also

StatusBar.Elements (Page 4243)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

## See also

HmiControlBarElementCollection (Page 4243)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

## Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

## Parameters

### **HmiControlBarElementName**

Type: String

Name of the element

## Return value

Object, HmiControlBarElementPartBase (Page 4261)

## See also

HmiControlBarElementCollection (Page 4243)

Control Bar Elements (Page 4261)

## Control Bar Elements

### Description

Control Bar Elements (Page 4261)

## StatusBar.Enabled

### Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

### Type

Bool

### Access

Read-write

## Syntax

`StatusBar.Enabled`

## See also

OverviewParameterControl.StatusBar (Page 4242)

## StatusBar.Font

### Description

The "Font" property specifies the font of the text.

### Type

Object, HmiFontPart

### Access

Read-write

### Syntax

`StatusBar.Font`

## See also

OverviewParameterControl.StatusBar (Page 4242)

## Font.Italic

### Description

The "Italic" property specifies whether the text is displayed in italics.

### Type

Bool

### Access

Read-write

**Syntax**`Font.Italic`**See also**

StatusBar.Font (Page 4246)

**Font.Name****Description**

The "Name" property specifies the name of the character set used.

**Type**

String

**Access**

Read-write

**Syntax**`Font.Name`**See also**

StatusBar.Font (Page 4246)

**Font.Size****Description**

The "Size" property specifies the font size in DIU (Device Independent Unit).

**Type**

Float

**Access**

Read-write

## Syntax

`Font.Size`

## See also

StatusBar.Font (Page 4246)

## Font.StrikeOut

### Description

The "StrikeOut" property specifies whether font is struck through.

### Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

### Access

Read-write

### Syntax

`Font.StrikeOut`

## See also

StatusBar.Font (Page 4246)

## Font.Underline

### Description

The "Underline" property specifies whether the font is underlined.

### Type

Bool

**Access**

Read-write

**Syntax**

`Font.Underline`

**See also**

StatusBar.Font (Page 4246)

**Font.Weight****Description**

The "Weight" property specifies the font thickness.

**Type**

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

**Access**

Read-write

**Syntax**

`Font.Weight`

**See also**

StatusBar.Font (Page 4246)

## StatusBar.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`StatusBar.Margin`

### See also

[OverviewParameterControl.StatusBar \(Page 4242\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[StatusBar.Margin \(Page 4250\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[StatusBar.Margin \(Page 4250\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[StatusBar.Margin \(Page 4250\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[StatusBar.Margin \(Page 4250\)](#)

## StatusBar.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`StatusBar.Padding`

### See also

[OverviewParameterControl.StatusBar \(Page 4242\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Bottom

### See also

StatusBar.Padding (Page 4252)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

Padding.Left

### See also

StatusBar.Padding (Page 4252)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[StatusBar.Padding \(Page 4252\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[StatusBar.Padding \(Page 4252\)](#)

## StatusBar.ShowToolTips

### Description

The "ShowToolTips" property specifies whether tooltips are displayed.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.ShowToolTips
```

### See also

OverviewParameterControl.StatusBar (Page 4242)

## StatusBar.Visible

### Description

The "Visible" property specifies whether the information bar is visible.

### Type

Bool

### Access

Read-write

### Syntax

```
StatusBar.Visible
```

### See also

OverviewParameterControl.StatusBar (Page 4242)

## OverviewParameterControl.StyleItemClass

### Description

The "StyleItemClass" property returns the style which is applied to the parameter overview.

### Type

String

### Access

Read-only

### Syntax

`OverviewParameterControl.StyleItemClass`

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.TabIndex

### Description

The "TabIndex" property returns the position of the parameter overview in the tab sequence.

### Type

UInt16

### Access

Read-only

### Syntax

`OverviewParameterControl.TabIndex`

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.TimeZone

### Description

The "TimeZone" property specifies the time zone.

### Type

Int32, HmiTimeZone

### Access

Read-write

### Syntax

`OverviewParameterControl.TimeZone`

### See also

OverviewParameterControl (Page 4171)

## OverviewParameterControl.ToolBar

### Description

The "ToolBar" property specifies the toolbar of the parameter overview.

### Type

Object, HmiToolBarPart

### Access

Read-write

### Syntax

`OverviewParameterControl.ToolBar`

### See also

OverviewParameterControl (Page 4171)

## ToolBar.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ToolBar.BackColor
```

### See also

OverviewParameterControl.ToolBar (Page 4257)

## ToolBar.Elements

### Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

### Type

Object, HmiControlBarElementCollection (Page 4259)

### Access

Read-only

### Syntax

```
ToolBar.Elements
```

### See also

OverviewParameterControl.ToolBar (Page 4257)

HmiControlBarElementCollection (Page 4259)

## HmiControlBarElementCollection

### Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

### Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

### Object type

HmiControlBarElementCollection

### Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**  
Returns the number of basic elements of the "HmiControlBarElementCollection" list.

### Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**  
Returns a basic element of the "HmiControlBarElementCollection" list.

### See also

[ToolBar.Elements \(Page 4258\)](#)

## HmiControlBarElementCollection.Count

### Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

### Type

UInt32

### Access

Read-only

### Syntax

```
HmiControlBarElementCollection.Count
```

### See also

HmiControlBarElementCollection (Page 4259)

## HmiControlBarElementCollection.Item()

### Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

### Syntax

```
HmiControlBarElementCollection[.Item] (HmiControlBarElementName)
```

---

#### Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

---

### Parameters

**HmiControlBarElementName**

Type: String

Name of the element

### Return value

Object, HmiControlBarElementPartBase (Page 4261)

### See also

HmiControlBarElementCollection (Page 4259)

Control Bar Elements (Page 4261)

## Control Bar Elements

### ControlBarButton

#### Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

#### Object type

HmiControlBarButtonPart

#### Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**  
Specifies the second color for a color gradient.
- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **Badge**  
Specifies the label of the button.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the button can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.

- **HotKey**  
Returns the hotkey specified for the button.
- **Mapping**  
Returns the function of the button.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the button is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the button is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarButton.AlternateBackColor

### Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

### Type

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.AlternateBackColor`**See also**

ControlBarButton (Page 4261)

**ControlBarButton.AlternateBorderColor****Description**

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.AlternateBorderColor`**See also**

ControlBarButton (Page 4261)

**ControlBarButton.Authorization****Description**

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

**Type**

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarButton.Authorization`

### See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.BackColor`

### See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.Badge

### Description

The "Badge" property specifies the label of the button.

### Type

Object, HmiBadgePart

**Access**

Read-write

**Syntax**`ControlBarButton.Badge`**See also**[ControlBarButton \(Page 4261\)](#)**ControlBarButton.BorderColor****Description**

The "BorderColor" property specifies the border color.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.BorderColor`**See also**[ControlBarButton \(Page 4261\)](#)**ControlBarButton.BorderWidth****Description**

The "BorderWidth" property specifies the border thickness.

**Type**

UInt8

### Access

Read-write

### Syntax

`ControlBarButton.BorderWidth`

### See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

`ControlBarButton.Content`

### See also

[ControlBarButton \(Page 4261\)](#)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

`Content.ContentMode`

### See also

`ControlBarButton.Content` (Page 4266)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarButton.Content (Page 4266)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

`Content.HorizontalTextAlignment`

## See also

ControlBarButton.Content (Page 4266)

## Content.Spacing

### Description

The "Spacing" property specifies the spacing between graphics and text.

### Type

UInt32

### Access

Read-write

**Syntax**

`Content.Spacing`

**See also**

`ControlBarButton.Content` (Page 4266)

**Content.SplitRatio****Description**

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

**Type**

Float

**Access**

Read-write

**Syntax**

`Content.SplitRatio`

**See also**

`ControlBarButton.Content` (Page 4266)

**Content.TextPosition****Description**

The "TextPosition" property specifies the position of the text in comparison to the graphic.

**Type**

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

### Syntax

`Content.TextPosition`

### See also

[ControlBarButton.Content \(Page 4266\)](#)

## Content.TextTrimming

### Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

### Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

### Access

Read-write

### Syntax

`Content.TextTrimming`

### See also

[ControlBarButton.Content \(Page 4266\)](#)

## Content.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

ControlBarButton.Content (Page 4266)

## ControlBarButton.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

## Syntax

`ControlBarButton.CustomID`

## See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.Enabled

### Description

The "Enabled" property specifies whether the button can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Enabled`

## See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarButton.ForeColor
```

**See also**

ControlBarButton (Page 4261)

**ControlBarButton.Graphic****Description**

The "Graphic" property specifies the graphic of the button.

**Type**

String

**Access**

Read-write

**Syntax**

```
ControlBarButton.Graphic
```

**See also**

ControlBarButton (Page 4261)

**ControlBarButton.Height****Description**

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

## Syntax

`ControlBarButton.Height`

## See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.HotKey

### Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

### Type

UInt16

### Access

Read-only

### Syntax

`ControlBarButton.HotKey`

## See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog

- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

`ControlBarButton.Mapping`

### See also

[ControlBarButton \(Page 4261\)](#)

### ControlBarButton.Margin

### Description

The "Margin" property specifies the surrounded outer distance of the button.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarButton.Margin`

**See also**

[ControlBarButton \(Page 4261\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Bottom`

**See also**

[ControlBarButton.Margin \(Page 4276\)](#)

**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Left`

**See also**

[ControlBarButton.Margin \(Page 4276\)](#)

**Margin.Right**

**Description**

The "Right" property specifies the spacing to the right.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Margin.Right`

**See also**

[ControlBarButton.Margin \(Page 4276\)](#)

**Margin.Top**

**Description**

The "Top" property specifies the spacing to the top.

**Type**

Int32

**Access**

Read-write

**Syntax**`Margin.Top`**See also**[ControlBarButton.Margin \(Page 4276\)](#)**ControlBarButton.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.MaximumHeight`**See also**[ControlBarButton \(Page 4261\)](#)**ControlBarButton.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.MaximumWidth`

**See also**

[ControlBarButton \(Page 4261\)](#)

**ControlBarButton.MinimumHeight**

**Description**

The "MinimumHeight" property specifies the minimum height.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarButton.MinimumHeight`

**See also**

[ControlBarButton \(Page 4261\)](#)

**ControlBarButton.MinimumWidth**

**Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**`ControlBarButton.MinimumWidth`**See also**[ControlBarButton \(Page 4261\)](#)**ControlBarButton.Operability****Description**

The "Operability" property returns whether the button is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**`ControlBarButton.Operability`**See also**[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.Padding

### Description

The "Padding" property specifies the distance of the content from the border of the button.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

```
ControlBarButton.Padding
```

### See also

[ControlBarButton](#) (Page 4261)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

```
Padding.Bottom
```

### See also

[ControlBarButton.Padding](#) (Page 4282)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Left`

### See also

[ControlBarButton.Padding \(Page 4282\)](#)

## Padding.Right

### Description

The "Right" property specifies the right distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Right`

### See also

[ControlBarButton.Padding \(Page 4282\)](#)

## Padding.Top

### Description

The "Top" property specifies the top distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

`ControlBarButton.Padding` (Page 4282)

## ControlBarButton.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarButton.RequireExplicitUnlock`

### See also

`ControlBarButton` (Page 4261)

## ControlBarButton.Text

### Description

The "Text" property specifies the label of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.Text
```

### See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the button.

### Type

String

### Access

Read-write

### Syntax

```
ControlBarButton.ToolTipText
```

### See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.Visible

### Description

The "Visible" property specifies whether the button is visible.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarButton.Visible`

### See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarButton.Width

### Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarButton.Width`

### See also

[ControlBarButton \(Page 4261\)](#)

## ControlBarDisplay

### Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarDisplayPart

### Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **Content**  
Specifies display options for text and graphics.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the display area is enabled in runtime.
- **ForeColor**  
Specifies the font color.
- **Graphic**  
Specifies the graphic.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the display area.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.

- **Operability**  
Returns whether the display area is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the display area is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarDisplay.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

`ControlBarDisplay.Authorization`

### See also

[ControlBarDisplay \(Page 4287\)](#)

## ControlBarDisplay.Content

### Description

The "Content" property specifies display options for text and graphics.

### Type

Object, HmiContentPart

### Access

Read-write

### Syntax

ControlBarDisplay.Content

### See also

ControlBarDisplay (Page 4287)

## Content.ContentMode

### Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

### Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

### Access

Read-write

### Syntax

Content.ContentMode

## See also

ControlBarDisplay.Content (Page 4289)

## Content.GraphicStretchMode

### Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

### Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

### Access

Read-write

### Syntax

`Content.GraphicStretchMode`

## See also

ControlBarDisplay.Content (Page 4289)

## Content.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

`Content.HorizontalTextAlignment`

**See also**

[ControlBarDisplay.Content \(Page 4289\)](#)

**Content.Spacing****Description**

The "Spacing" property specifies the spacing between graphics and text.

**Type**

UInt32

**Access**

Read-write

**Syntax**

`Content.Spacing`

**See also**

[ControlBarDisplay.Content \(Page 4289\)](#)

## Content.SplitRatio

### Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

### Type

Float

### Access

Read-write

### Syntax

`Content.SplitRatio`

### See also

[ControlBarDisplay.Content \(Page 4289\)](#)

## Content.TextPosition

### Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

### Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

### Access

Read-write

**Syntax**

```
Content.TextPosition
```

**See also**

ControlBarDisplay.Content (Page 4289)

**Content.TextTrimming****Description**

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

**Type**

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

**Access**

Read-write

**Syntax**

```
Content.TextTrimming
```

**See also**

ControlBarDisplay.Content (Page 4289)

**Content.VerticalTextAlignment****Description**

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

**Type**

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
Content.VerticalTextAlignment
```

### See also

ControlBarDisplay.Content (Page 4289)

## ControlBarDisplay.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarDisplay.CustomID
```

### See also

ControlBarDisplay (Page 4287)

## ControlBarDisplay.Enabled

### Description

The "Enabled" property specifies whether the display is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarDisplay.Enabled
```

### See also

ControlBarDisplay (Page 4287)

## ControlBarDisplay.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarDisplay.ForeColor
```

### See also

ControlBarDisplay (Page 4287)

## ControlBarDisplay.Graphic

### Description

The "Graphic" property specifies the graphic of the display.

### Type

String

### Access

Read-write

### Syntax

`ControlBarDisplay.Graphic`

### See also

ControlBarDisplay (Page 4287)

## ControlBarDisplay.Height

### Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.Height`

### See also

ControlBarDisplay (Page 4287)

## ControlBarDisplay.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

## Access

Read-only

**Syntax**

`ControlBarDisplay.Mapping`

**See also**

[ControlBarDisplay \(Page 4287\)](#)

**ControlBarDisplay.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the display.

**Type**

Object, HmiMarginPart

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Margin`

**See also**

[ControlBarDisplay \(Page 4287\)](#)

**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**

Int32

**Access**

Read-write

## Syntax

`Margin.Bottom`

## See also

[ControlBarDisplay.Margin \(Page 4299\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Left`

## See also

[ControlBarDisplay.Margin \(Page 4299\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Right`**See also**`ControlBarDisplay.Margin` (Page 4299)**Margin.Top****Description**

The "Top" property specifies the spacing to the top.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Top`**See also**`ControlBarDisplay.Margin` (Page 4299)**ControlBarDisplay.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarDisplay.MaximumHeight`

## See also

[ControlBarDisplay \(Page 4287\)](#)

## ControlBarDisplay.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarDisplay.MaximumWidth`

## See also

[ControlBarDisplay \(Page 4287\)](#)

## ControlBarDisplay.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarDisplay.MinimumHeight
```

**See also**

ControlBarDisplay (Page 4287)

**ControlBarDisplay.MinimumWidth****Description**

The "MinimumWidth" property specifies the minimum width.

**Type**

UInt32

**Access**

Read-write

**Syntax**

```
ControlBarDisplay.MinimumWidth
```

**See also**

ControlBarDisplay (Page 4287)

**ControlBarDisplay.Operability****Description**

The "Operability" property returns whether the display is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

`ControlBarDisplay.Operability`

### See also

[ControlBarDisplay \(Page 4287\)](#)

## ControlBarDisplay.Padding

### Description

The "Padding" property specifies the spacing of the content from the border of the display.

### Type

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarDisplay.Padding`

### See also

[ControlBarDisplay \(Page 4287\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Bottom`**See also**[ControlBarDisplay.Padding \(Page 4304\)](#)**Padding.Left****Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**[ControlBarDisplay.Padding \(Page 4304\)](#)**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarDisplay.Padding \(Page 4304\)](#)

**Padding.Top**

**Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Top`

**See also**

[ControlBarDisplay.Padding \(Page 4304\)](#)

**ControlBarDisplay.RequireExplicitUnlock**

**Description**

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**`ControlBarDisplay.RequireExplicitUnlock`**See also**

ControlBarDisplay (Page 4287)

**ControlBarDisplay.Text****Description**

The "Text" property specifies the label of the display.

**Type**

String

**Access**

Read-write

**Syntax**`ControlBarDisplay.Text`**See also**

ControlBarDisplay (Page 4287)

**ControlBarDisplay.ToolTipText****Description**

The "ToolTipText" property specifies the text of the tooltip of the display.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarDislay.ToolTipText`

**See also**

ControlBarDisplay (Page 4287)

**ControlBarDisplay.Visible**

**Description**

The "Visible" property specifies whether the display is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**

`ControlBarDislay.Visible`

**See also**

ControlBarDisplay (Page 4287)

**ControlBarDisplay.Width**

**Description**

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

**Type**

UInt32

**Access**

Read-write

**Syntax**

`ControlBarDisplay.Width`

**See also**

[ControlBarDisplay \(Page 4287\)](#)

**ControlBarLabel****Description**

The "ControlBarLabel" object represents an identifier of an information bar or toolbar. You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

**Object type**

HmiControlBarLabelPart

**Properties**

The "ControlBarLabel" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the identifier can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the identifier.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.

- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the identifier is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**  
Specifies the label.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the identifier is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarLabel.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

### Type

Object, HmiFunctionRight

### Access

Read-only

**Syntax**

```
ControlBarLabel.Authorization
```

**See also**

ControlBarLabel (Page 4309)

**ControlBarLabel.CustomID****Description**

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

**Type**

Int32

**Access**

Read-only

**Syntax**

```
ControlBarLabel.CustomID
```

**See also**

ControlBarLabel (Page 4309)

**ControlBarLabel.Enabled****Description**

The "Enabled" property specifies whether the identifier is active in runtime.

**Type**

Bool

**Access**

Read-write

## Syntax

`ControlBarLabel.Enabled`

## See also

[ControlBarLabel \(Page 4309\)](#)

## ControlBarLabel.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.ForeColor`

## See also

[ControlBarLabel \(Page 4309\)](#)

## ControlBarLabel.Height

### Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarLabel.Height
```

**See also**

ControlBarLabel (Page 4309)

**ControlBarLabel.HorizontalTextAlignment****Description**

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

**Type**

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

**Access**

Read-write

**Syntax**

```
ControlBarLabel.HorizontalTextAlignment
```

**See also**

ControlBarLabel (Page 4309)

**ControlBarLabel.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

### Access

Read-only

### Syntax

```
ControlBarLabel.Mapping
```

### See also

ControlBarLabel (Page 4309)

## ControlBarLabel.Margin

### Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

### Type

Object, HmiMarginPart

### Access

Read-write

### Syntax

`ControlBarLabel.Margin`

### See also

[ControlBarLabel \(Page 4309\)](#)

## Margin.Bottom

### Description

The "Bottom" property specifies the spacing to the bottom.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Bottom`

### See also

[ControlBarLabel.Margin \(Page 4316\)](#)

## Margin.Left

### Description

The "Left" property specifies the spacing to the left.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Left`

### See also

[ControlBarLabel.Margin \(Page 4316\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Right`

### See also

[ControlBarLabel.Margin \(Page 4316\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

### Syntax

`Margin.Top`

### See also

[ControlBarLabel.Margin \(Page 4316\)](#)

## ControlBarLabel.MaximumHeight

### Description

The "MaximumHeight" property specifies the maximum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.MaximumHeight`

### See also

[ControlBarLabel \(Page 4309\)](#)

## ControlBarLabel.MaximumWidth

### Description

The "MaximumWidth" property specifies the maximum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MaximumWidth
```

### See also

ControlBarLabel (Page 4309)

## ControlBarLabel.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumHeight
```

### See also

ControlBarLabel (Page 4309)

## ControlBarLabel.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarLabel.MinimumWidth
```

### See also

ControlBarLabel (Page 4309)

## ControlBarLabel.Operability

### Description

The "Operability" property returns whether the identifier is operable.

### Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

### Access

Read-only

### Syntax

```
ControlBarLabel.Operability
```

**See also**

[ControlBarLabel \(Page 4309\)](#)

**ControlBarLabel.Padding****Description**

The "Padding" property specifies the spacing of the content from the frame of the identifier.

**Type**

Object, HmiPaddingPart

**Access**

Read-write

**Syntax**

`ControlBarLabel.Padding`

**See also**

[ControlBarLabel \(Page 4309\)](#)

**Padding.Bottom****Description**

The "Bottom" property specifies the bottom distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Bottom`

**See also**

ControlBarLabel.Padding (Page 4321)

**Padding.Left**

**Description**

The "Left" property specifies the left distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Left`

**See also**

ControlBarLabel.Padding (Page 4321)

**Padding.Right**

**Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

`Padding.Right`

**See also**

[ControlBarLabel.Padding \(Page 4321\)](#)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**

```
Padding.Top
```

**See also**

[ControlBarLabel.Padding \(Page 4321\)](#)

**ControlBarLabel.RequireExplicitUnlock****Description**

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

**Type**

Bool

**Access**

Read-only

**Syntax**

```
ControlBarLabel.RequireExplicitUnlock
```

**See also**

ControlBarLabel (Page 4309)

**ControlBarLabel.Text**

**Description**

The "Text" property specifies the label of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarLabel.Text`

**See also**

ControlBarLabel (Page 4309)

**ControlBarLabel.ToolTipText**

**Description**

The "ToolTipText" property specifies the text of the tooltip of the identifier.

**Type**

String

**Access**

Read-write

**Syntax**

`ControlBarLabel.ToolTipText`

## See also

[ControlBarLabel \(Page 4309\)](#)

## ControlBarLabel.VerticalTextAlignment

### Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

### Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarLabel.VerticalTextAlignment
```

## See also

[ControlBarLabel \(Page 4309\)](#)

## ControlBarLabel.Visible

### Description

The "Visible" property specifies whether the identifier is visible.

### Type

Bool

### Access

Read-write

## Syntax

`ControlBarLabel.Visible`

## See also

[ControlBarLabel \(Page 4309\)](#)

## ControlBarLabel.Width

### Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarLabel.Width`

## See also

[ControlBarLabel \(Page 4309\)](#)

## ControlBarSeparator

### Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarSeparatorPart

## Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**  
Returns the operator authorization.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the disconnecter can be operated in runtime.
- **ForeColor**  
Specifies the font color.
- **Height**  
Specifies the height.
- **Mapping**  
Returns the function of the separator.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the separator is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **RequireExplicitUnlock**  
Returns whether the disconnecter is only operable while the associated button is being pressed.
- **ToolTipText**  
Specifies the tooltip text.
- **Visible**  
Specifies whether the disconnecter is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarSeparator.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarSeparator.Authorization
```

### See also

ControlBarSeparator (Page 4326)

## ControlBarSeparator.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarSeparator.CustomID
```

### See also

ControlBarSeparator (Page 4326)

## ControlBarSeparator.Enabled

### Description

The "Enabled" property specifies whether the separator is active in runtime.

### Type

Bool

### Access

Read-write

### Syntax

`ControlBarSeparator.Enabled`

### See also

[ControlBarSeparator \(Page 4326\)](#)

## ControlBarSeparator.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.ForeColor`

### See also

[ControlBarSeparator \(Page 4326\)](#)

## ControlBarSeparator.Height

### Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.Height`

### See also

[ControlBarSeparator \(Page 4326\)](#)

## ControlBarSeparator.Mapping

### Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

### Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

#### Access

Read-only

`ControlBarSeparator.Mapping`

#### See also

[ControlBarSeparator \(Page 4326\)](#)

### ControlBarSeparator.Margin

#### Description

The "Margin" property specifies the surrounded outer spacing of the separator.

#### Type

Object, HmiMarginPart

#### Access

Read-write

**Syntax**`ControlBarSeparator.Margin`**See also**`ControlBarSeparator` (Page 4326)**Margin.Bottom****Description**

The "Bottom" property specifies the spacing to the bottom.

**Type**`Int32`**Access**`Read-write`**Syntax**`Margin.Bottom`**See also**`ControlBarSeparator.Margin` (Page 4332)**Margin.Left****Description**

The "Left" property specifies the spacing to the left.

**Type**`Int32`**Access**`Read-write`

## Syntax

`Margin.Left`

## See also

[ControlBarSeparator.Margin \(Page 4332\)](#)

## Margin.Right

### Description

The "Right" property specifies the spacing to the right.

### Type

Int32

### Access

Read-write

## Syntax

`Margin.Right`

## See also

[ControlBarSeparator.Margin \(Page 4332\)](#)

## Margin.Top

### Description

The "Top" property specifies the spacing to the top.

### Type

Int32

### Access

Read-write

**Syntax**`Margin.Top`**See also**`ControlBarSeparator.Margin` (Page 4332)**ControlBarSeparator.MaximumHeight****Description**

The "MaximumHeight" property specifies the maximum height.

**Type**`UInt32`**Access**`Read-write`**Syntax**`ControlBarSeparator.MaximumHeight`**See also**`ControlBarSeparator` (Page 4326)**ControlBarSeparator.MaximumWidth****Description**

The "MaximumWidth" property specifies the maximum width.

**Type**`UInt32`**Access**`Read-write`

## Syntax

`ControlBarSeparator.MaximumWidth`

## See also

[ControlBarSeparator \(Page 4326\)](#)

## ControlBarSeparator.MinimumHeight

### Description

The "MinimumHeight" property specifies the minimum height.

### Type

UInt32

### Access

Read-write

### Syntax

`ControlBarSeparator.MinimumHeight`

## See also

[ControlBarSeparator \(Page 4326\)](#)

## ControlBarSeparator.MinimumWidth

### Description

The "MinimumWidth" property specifies the minimum width.

### Type

UInt32

### Access

Read-write

**Syntax**

```
ControlBarSeparator.MinimumWidth
```

**See also**

ControlBarSeparator (Page 4326)

**ControlBarSeparator.Operability****Description**

The "Operability" property returns whether the separator is operable.

**Type**

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

**Access**

Read-only

**Syntax**

```
ControlBarSeparator.Operability
```

**See also**

ControlBarSeparator (Page 4326)

**ControlBarSeparator.Padding****Description**

The "Padding" property specifies the spacing of the content from the border of the separator.

**Type**

Object, HmiPaddingPart

### Access

Read-write

### Syntax

`ControlBarSeparator.Padding`

### See also

[ControlBarSeparator \(Page 4326\)](#)

## Padding.Bottom

### Description

The "Bottom" property specifies the bottom distance of the content from the border.

### Type

Int32

### Access

Read-write

### Syntax

`Padding.Bottom`

### See also

[ControlBarSeparator.Padding \(Page 4337\)](#)

## Padding.Left

### Description

The "Left" property specifies the left distance of the content from the border.

### Type

Int32

**Access**

Read-write

**Syntax**`Padding.Left`**See also**

ControlBarSeparator.Padding (Page 4337)

**Padding.Right****Description**

The "Right" property specifies the right distance of the content from the border.

**Type**

Int32

**Access**

Read-write

**Syntax**`Padding.Right`**See also**

ControlBarSeparator.Padding (Page 4337)

**Padding.Top****Description**

The "Top" property specifies the top distance of the content from the border.

**Type**

Int32

### Access

Read-write

### Syntax

`Padding.Top`

### See also

[ControlBarSeparator.Padding \(Page 4337\)](#)

## ControlBarSeparator.RequireExplicitUnlock

### Description

The "RequireExplicitUnlock" property returns whether the disconnecter can only be operated while the associated button is being pressed.

### Type

Bool

### Access

Read-only

### Syntax

`ControlBarSeparator.RequireExplicitUnlock`

### See also

[ControlBarSeparator \(Page 4326\)](#)

## ControlBarSeparator.ToolTipText

### Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

### Type

String

**Access**

Read-write

**Syntax**`ControlBarSeparator.ToolTipText`**See also**

ControlBarSeparator (Page 4326)

**ControlBarSeparator.Visible****Description**

The "Visible" property specifies whether the separator is visible.

**Type**

Bool

**Access**

Read-write

**Syntax**`ControlBarSeparator.Visible`**See also**

ControlBarSeparator (Page 4326)

**ControlBarSeparator.Width****Description**

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

**Type**

UInt32

## Access

Read-write

## Syntax

`ControlBarSeparator.Width`

## ControlBarTextBox

### Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar. You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

### Object type

HmiControlBarTextBoxPart

### Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**  
Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**  
Returns the operator authorization.
- **BackColor**  
Specifies the background color.
- **BorderColor**  
Specifies the line color.
- **BorderWidth**  
Specifies the line thickness.
- **CustomID**  
Returns the custom ID.
- **Enabled**  
Specifies whether the text box can be operated in runtime.
- **ForeColor**  
Specifies the font color.

- **Height**  
Specifies the height.
- **HorizontalTextAlignment**  
Specifies the horizontal alignment of the text.
- **Mapping**  
Returns the function of the text box.
- **Margin**  
Specifies the margin.
- **MaximumHeight**  
Specifies the maximum height.
- **MaximumWidth**  
Specifies the maximum width.
- **MinimumHeight**  
Specifies the minimum height.
- **MinimumWidth**  
Specifies the minimum width.
- **Operability**  
Returns whether the text box is operable.
- **Padding**  
Specifies the distance of the content from the border.
- **ReadOnly**  
Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**  
Returns whether the text box is only operable while the associated button is being pressed.
- **Text**  
Specifies the labeling.
- **ToolTipText**  
Specifies the tooltip text.
- **VerticalTextAlignment**  
Specifies the vertical alignment of the text.
- **Visible**  
Specifies whether the text box is visible.
- **Width**  
Specifies the width.

## Methods

--

## ControlBarTextBox.AlternateBorderColor

### Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.AlternateBorderColor
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.Authorization

### Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

### Type

Object, HmiFunctionRight

### Access

Read-only

### Syntax

```
ControlBarTextBox.Authorization
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.BackColor

### Description

The "BackColor" property specifies the background color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BackColor
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.BorderColor

### Description

The "BorderColor" property specifies the border color.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderColor
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.BorderWidth

### Description

The "BorderWidth" property specifies the border thickness.

### Type

UInt8

### Access

Read-write

### Syntax

```
ControlBarTextBox.BorderWidth
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.CustomID

### Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

### Type

Int32

### Access

Read-only

### Syntax

```
ControlBarTextBox.CustomID
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.Enabled

### Description

The "Enabled" property specifies whether the text box can be operated in runtime.

### Type

Bool

### Access

Read-write

### Syntax

```
ControlBarTextBox.Enabled
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.ForeColor

### Description

The "ForeColor" property specifies the font color of the text.

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.ForeColor
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.Height

### Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

### Type

UInt32

### Access

Read-write

### Syntax

```
ControlBarTextBox.Height
```

### See also

ControlBarTextBox (Page 4342)

## ControlBarTextBox.HorizontalTextAlignment

### Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

### Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

### Access

Read-write

### Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

**See also**

ControlBarTextBox (Page 4342)

**ControlBarTextBox.Mapping****Description**

The "Mapping" property returns the function of an element of an information bar or toolbar.

**Type**

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

**Access**

Read-only

**Syntax**`ControlBarTextBox.Mapping`**See also**[ControlBarTextBox \(Page 4342\)](#)**ControlBarTextBox.Margin****Description**

The "Margin" property specifies the surrounded outer spacing of the text box.

**Type**

Object, HmiMarginPart

**Access**

Read-write
