# Level Transmitters 27 Liquid-Level Controller

# Introduction

### **Features & Benefits**

- Flexible shaft design has no process-wetted pivots or links to foul
- Actuation motion of 1/32" provides precise measurement
- Wide variety of flange sizes and materials simplify mounting
- Standard process wetted parts are 316SS, improving corrosion resistance

## Description

The Model 27 Liquid-Level Controller consists of a float mounted on a short float arm connected to the free-end of a packless flexible shaft. The fixed-end of this flexible shaft is attached to a standard flange.

The tubular shaft has a formed center section (similar to a bourdon tube in cross section), which permits only vertical float motion. The rigid float arm extension within the shaft transmits the float motion to the air pilot for operation of a diaphragm-type motor control valve.

The Model 27 Liquid-Level Controller operates on the change in buoyant force of the float-not the motion of the float riding on a changing liquid level. A buoyancy change of less than six ounces will provide full actuation of the pilot valve or contact switch. The Model 27 also has limit stops to maintain the shafts within the elastic limit.

The float has a suitable margin of safety, allowing it to operate in liquids having a minimum specific gravity of 0.50. A wide range of specific gravities and level-change requirements can be accommodated via elliptical, cylindrical, and other special floats.

These units can be mounted on the direct side of a vessel flange or externally mounted in a float chamber. Standard piping connections on the float chamber are 1" NPT.

## **Specifications**

Pressure

Full vacuum to flange rating

Temperature

Min. 32° F (0° C), Max. 350° F (177° C)

**Specific Gravity** 

0.50 Min.

Switch Rating

SPDT; 10A contacts; 125, 250, or 480 Vac

#### **Electrical Classification**

FM approved as: Explosion-Proof for Class I, Groups C & D, Div. 1 service.

Dust Ignition-Proof for Class II, Groups E, F & G, Div. 1 service. Suitable for Class III, Div. 1 hazardous locations.

## Float Size Table

Ball Float Size	Mate 316 SST	Suitable for minimum specific gravity of:	
3-1/2" Dia.	Х	Х	0.5
4" Dia.	Х		0.35
5" Dia.	Х		0.25

## Options

Special Temperature Ranges

Elastomers and enclosure construction optimized for the following temperature ranges:

• 300-700°F (150 to 371°Č)

Below 32°F (0°C)

#### **Elastomer Coatings**

Coating of all wetted parts to increase corrosion resistance Available coatings: Neoprene, TFE/PTFE, Kynar

									request.			

1) Chambers are constructed with 1-1/2" female NPT connections, top and bottom.

2) Chambers not listed above are considered special and will be priced on application.

3) F = E + diameter of ball.

# Level Transmitters 27 Liquid-Level Controller

# **Technical data**

## **Vertical Float**

In order to provide for vertical motion of the float, the mounting nozzle should be installed with its flange face vertical and the bolt holes straddling the center line (shown to the left).

Controllers can be furnished for installation in a tee on top of the tank. If the vertical extension is greater than 24", or if the liquid level can be disturbed by surges, a suitable baffle or cage that does not touch the float should be installed.

# **Displacer Chamber**

As shown to the right, a displacer chamber is recommended if the liquid level can be disturbed by surges. Shut-off valves are also advisable to allow the controller to be removed without shut-down. Provisions can be made to periodically flush-out the displacer chamber by connecting a purge line.
