Legal Information

The Schneider Electric brand and any trademarks of Schneider Electric SE and its subsidiaries referred to in this guide are the property of Schneider Electric SE or its subsidiaries. All other brands may be trademarks of their respective owners.

This guide and its content are protected under applicable copyright laws and furnished for informational use only. No part of this guide may be reproduced or transmitted in any form or by any means (electronic, mechanical, photocopying, recording, or otherwise), for any purpose, without the prior written permission of Schneider Electric.

Schneider Electric does not grant any right or license for commercial use of the guide or its content, except for a non-exclusive and personal license to consult it on an "as is" basis. Schneider Electric products and equipment should be installed, operated, serviced, and maintained only by qualified personnel.

As standards, specifications, and designs change from time to time, information contained in this guide may be subject to change without notice.

To the extent permitted by applicable law, no responsibility or liability is assumed by Schneider Electric and its subsidiaries for any errors or omissions in the informational content of this material or consequences arising out of or resulting from the use of the information contained herein.

Safety Information

Important Information

Read these instructions carefully and look at the equipment to become familiar with the device before trying to install, operate, service or maintain it. The following special messages may appear throughout this bulletin or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of either symbol to a "Danger" or "Warning" safety label indicates that an electrical hazard exists which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

⚠ DANGER

DANGER indicates a hazardous situation which, if not avoided, **will result in** death or serious injury.

⚠ WARNING

WARNING indicates a hazardous situation which, if not avoided, **could result in** death or serious injury.

⚠ CAUTION

CAUTION indicates a hazardous situation which, if not avoided, **could result in** minor or moderate injury.

NOTICE

NOTICE is used to address practices not related to physical injury.

Please Note

Electrical equipment should be installed, operated, serviced and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction, installation, and operation of electrical equipment and has received safety training to recognize and avoid the hazards involved.

Safety Precautions

During installation or use of this software, pay attention to all safety messages that occur in the software and that are included in the documentation. The following safety messages apply to this software in its entirety.

WARNING

UNINTENDED EQUIPMENT OPERATION

- Do not use the software or devices for critical control or protection applications where human or equipment safety relies on the operation of the control action.
- Do not use the software to control time-critical functions.
- Do not use the software to control remote equipment without proper access control and status feedback.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

WARNING

INACCURATE DATA RESULTS

- Do not incorrectly configure the software or the devices.
- Do not base your maintenance or service actions solely on messages and information displayed by the software.
- Do not rely solely on software messages and reports to determine if the system is functioning correctly or meeting all applicable standards and requirements.
- Consider the implications of unanticipated transmission delays or failures of communications links.

Failure to follow these instructions can result in death, serious injury, equipment damage, or permanent loss of data.

WARNING

POTENTIAL COMPROMISE OF SYSTEM AVAILABILITY, INTEGRITY, AND CONFIDENTIALITY

Use cybersecurity best practices to help prevent unauthorized access to the software.

Failure to follow these instructions can result in death, serious injury, equipment damage, or permanent loss of data.

Work with facility IT System Administrators to ensure that the system adheres to the site-specific cybersecurity policies.

Overview

This guide explains how to view the status of isolated power systems using information provided by Power Monitoring Expert configured with the Insulation Monitoring module.

This guide contains information for systems deployed in the ANSI and IEC markets:

- [Insulation Monitoring diagrams for ANSI](#)
- [Insulation Monitoring diagrams for IEC](#)

Insulation Monitoring diagrams for ANSI

The Insulation Monitoring module includes several diagrams that show the electrical status of the areas and circuits that are being monitored.

This section describes each type of diagram.

See the following topics:

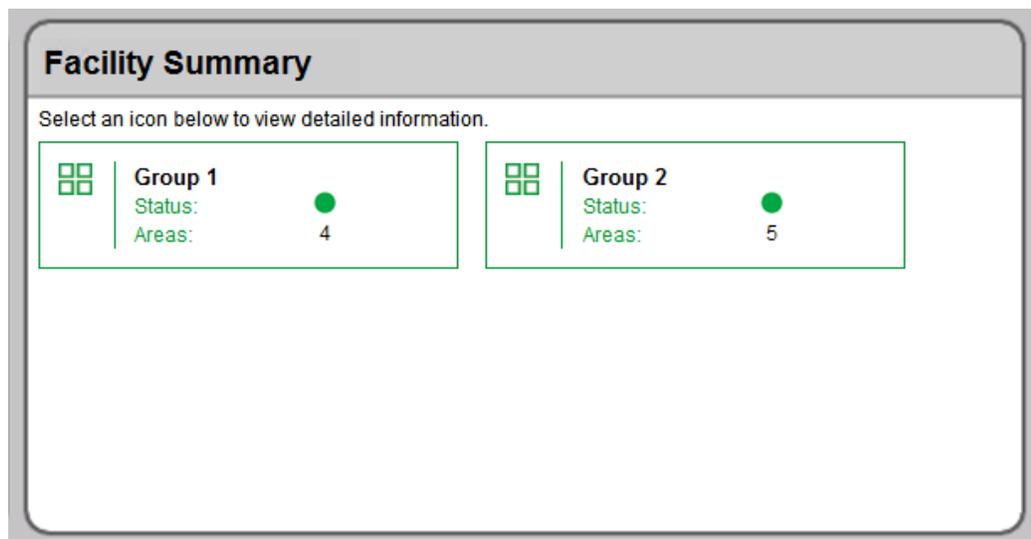

- [Using the diagrams](#)
- [Data logs](#)
- [Generating the Insulation Monitoring Report](#)
- [Insulation Monitoring Report \(ANSI\)](#)

Using the diagrams

The insulation monitoring diagrams display overview or detail information as well as status.

Facility Summary diagram

The Facility Summary diagram shows each group that contains a number of areas.

The Facilities Summary diagram shows all the groups of areas that were configured for the facility. Each box in the main area represents a group of areas. This diagram provides a status overview and links to areas in the facility, as shown next:

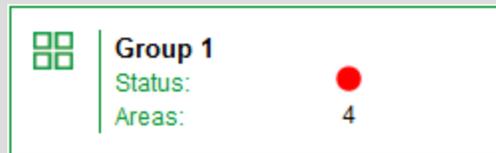

A Group Icon – Click the group icon to see the area diagram.

Status Indicator – This indicator is green or red to show the general status of the isolated power system:

- **Green** – Normal condition. The Total Hazard Current measurements for all areas in this group are below the limit.
- **Red** – Alarm condition. The Total Hazard Current measurement in one or more areas in this group exceeds the limit, or a LIM-IG6 is in test mode.

B **NOTE:** A LIM-IG6 test lasts 5 to 30 seconds. When the test is complete, the status indicator changes back to green. If an insulation fault has occurred, the indicator remains red until the fault is corrected.

Example of an alarm indication:

C **Areas** Total number of monitored areas in this facility.

Recommended Actions for Alarm Condition Indication

1. Click the Group icon to open the Areas diagram. One or more area boxes will show an alarm condition.
2. Click the specific area icons to open the Area Details diagrams. One or more panel boxes will show an alarm condition. If the optional circuit fault locator devices are installed, the panel box also indicates each circuit that has a resistance fault.

NOTE: Some types of electrical faults can occur and not be indicated by the individual circuit fault locators. Only the area status indicator turns red. See [Indicators for capacitive faults](#) for details.

3. Notify the responsible person that can address the condition for the area and specific circuits.

Summary of Areas diagram

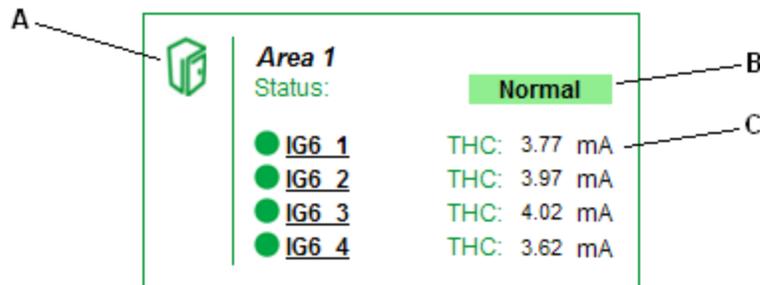

The Summary of Areas diagram shows an overview of each area in the facility. Each box represents a single area.

Example:

Summary: Group 1 - Areas: 4

Area 1	Area 2	Area 3
 Area 1 Status: Normal	 Area 2 Status: Normal	 Area 3 Status: Normal
<ul style="list-style-type: none"> ● <u>IG6 1</u> THC: 3.51 mA ● <u>IG6 2</u> THC: 3.61 mA ● <u>IG6 3</u> THC: 3.71 mA 	<ul style="list-style-type: none"> ● <u>IG6 1</u> THC: 3.51 mA ● <u>IG6 2</u> THC: 3.86 mA 	<ul style="list-style-type: none"> ● <u>IG6 1</u> THC: 3.61 mA ● <u>IG6 2</u> THC: 3.81 mA ● <u>IG6 3</u> THC: 3.86 mA ● <u>IG6 4</u> THC: 3.46 mA

Each box represents a single area and contains the following information:

A  **Area 1**
 Status: Normal

- IG6 1 THC: 3.77 mA
- IG6 2 THC: 3.97 mA
- IG6 3 THC: 4.02 mA
- IG6 4 THC: 3.62 mA

B Normal

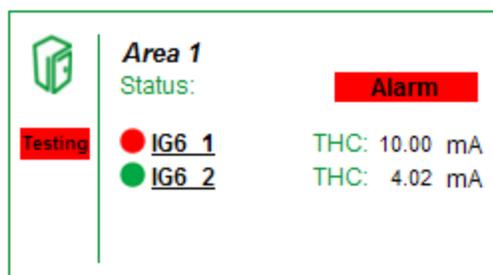

C ● IG6 1 THC: 3.77 mA

A Area Icon – Click the area icon to see LIM-IG6 and circuit details for the area.

B Area Status Indicator – Indicates the general conditions of the area. This indicator is either green "Normal" or red "Alarm". If the indicator is red, one or more IG6 monitors are in test mode or the Total Hazard Current measurement exceeds the limit.

C LIM-IG6 Status and Current Indicators – Displays the insulation status and real-time Total Hazard Current, in mA, for each LIM-IG6 in the area. Up to six LIM-IG6 monitors can be installed in an area. The indicator changes to red if the LIM-IG6 is in test mode or if a THC measurement exceeds the limit. When in test mode, the THC measurement changes to 10.0 mA and the red "Testing" label appears next to the LIM-IG6 name. The test lasts 5 to 30 seconds. When the test is complete, the color changes to green. If a LIM-IG6 detects an insulation alarm, the THC measurement shows the real-time THC value.

LIM-IG6 in test mode:

 **Area 1**
 Status: Alarm

Testing ● IG6 1 THC: 10.00 mA

● IG6 2 THC: 4.02 mA

LIM-IG6 in alarm condition:

Area 1

Status: Alarm

●	IG6 1	THC: 7.31 mA
●	IG6 2	THC: 3.91 mA
●	IG6 3	THC: 4.01 mA

Area Details diagram

The Area Details diagram shows the details for each LIM-IG6 and connected devices in an area. The Area Details diagram can show up to 3 LIM-IG6 monitors. If more than 3 monitors are in the diagram, click the arrow in the upper right corner to see other monitors.

NOTE: For 208/240V systems, one LIM-IG6 can be shared between 2 areas. In this case, the monitor appears on both area diagrams.

For example, the following image shows a diagram of the area and LIM-IG6 details:

Area 1 Details - Page 1

Each LIM-IG6 area contains these sections to provide specific information about the circuit conditions:

The screenshot displays the LIM-IG6 monitoring interface with the following sections:

- IG6 1:** Monitor name.
- No Test In Progress:** Test status indicator.
- Status: Normal:** Overall circuit status indicator.
- Total Hazard Current:** 3.5 mA.
- Load:** 10 %.
- Volts L1 - L2:** 120 V.
- Volts L1 - Ground:** 70 V.
- Volts L2 - Ground:** 70 V.
- Impedance:** 113 kOhm.
- Resistance:** 114 kOhm.
- Leakage Cap:** 3 nF.
- Temperature:** Normal.
- Circuit Fault Location:** A grid of 18 fault location indicators (EDS151_1 1 through EDS151_2 6).
- Bottom Icons:** Two small icons representing a document and a computer monitor.

Labels A, B, C, and D point to the Status, Measurements, Fault Location, and Bottom Icons sections, respectively.

LIM-IG6 Status – Displays the name and status of the monitor, real-time THC measurement, and test status. The THC measurement is taken directly from the LIM-IG6.

A This indicator is either green "Normal" or red "Alarm". If the indicator is red, one or more panels are in test mode or circuits in the area have THC measurements above the limit. The red "Test In Progress" label appears when someone starts a LIM-IG6 test. A test is started by pressing the test button on the LIM-IG6 or by pressing the test button on the remote test device. This label remains visible during the test.

See [Indicators for Test Mode and Alarm condition](#) for details.

B	<p>Measurements – Displays the real-time measurements for the components connected to the LIM-IG6.</p> <ul style="list-style-type: none">• Load – Optional. Displays the transformer load if the circuit transformer is connected to the LIM-IG6. The status indicator turns red if the overload percentage exceeds the threshold defined for the transformer.• Volts L1 - L2 – Voltage between L1 and L2, in V.• Volts L1 - Ground – Voltage between L1 and Ground, in V.• Volts L2 - Ground – Voltage between L2 and Ground, in V.• Impedance – Impedance Z_f in $k\Omega$.• Resistance – Resistance R_f in $k\Omega$.• Leakage – Leakage capacitance in nF.• Temperature – Optional. The status of the transformer temperature, according to the over-temperature sensor. This appears only if the temperature sensor is installed with the transformer. The value changes to red "High" if the temperature exceeds the threshold.
C	<p>Circuit Status – Appears only if the optional circuit fault locator is connected to the LIM-IG6. This area shows the status for each circuit being monitored. If the LIM-IG6 detects a resistance fault, the circuit monitor identifies the specific circuit and the circuit indicator turns red. When any indicator turns red, the alarm status propagates up to the top-level Facility Summary diagram. If the LIM-IG6 is in test mode, all circuit indicators turn red.</p> <p>See examples below for indicators in test or alarm condition.</p>
D	<p>Event Log and Data Log – Contains links to the historical data log and event log for the panel measurements. See Data logs for more information.</p>

Indicators for Test Mode and Alarm condition

Volts L2 - Ground:	70 V
Impedance:	30 kOhm
Resistance:	31 kOhm
Leakage Cap:	12 nF
Temperature::	Normal

Indicators for capacitive faults

⚡ ⚠ DANGER

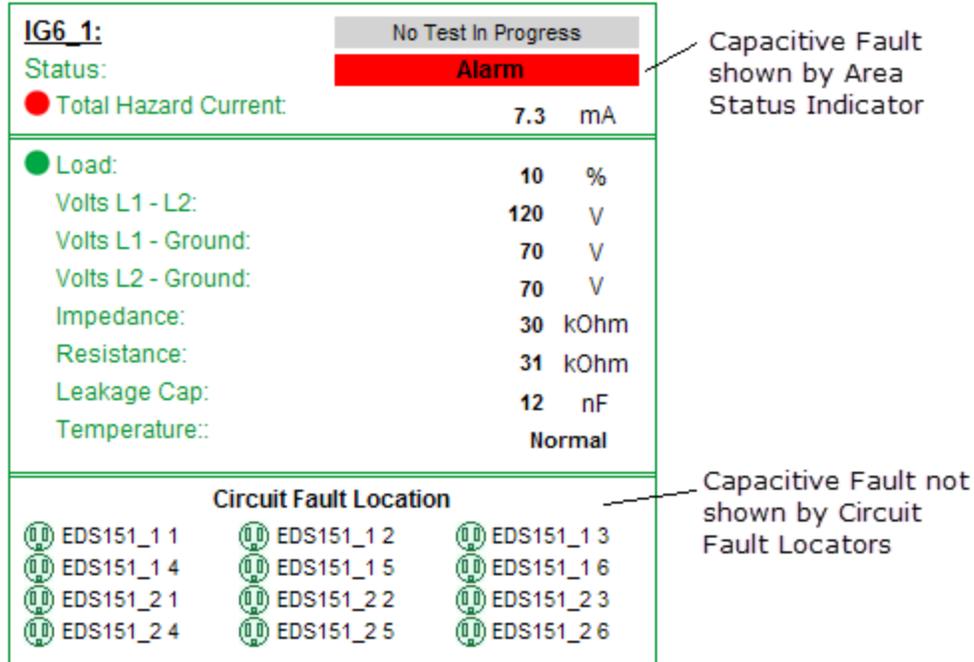

EQUIPMENT ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Do not ignore the main device hazard indicator when all circuit fault locator icons show green status.
- Determine and correct the cause of the fault if the main device hazard indicator shows a hazard.

Failure to follow these instructions will result in death or serious injury.

In some cases, such as when too many equipment items are connected to circuits, the LIM-IG6 detects a capacitance fault that exceeds the total hazard current (THC). For this situation, the

room **Status** area shows the hazard, as shown next. However, if the optional circuit fault locators are installed, the circuit indicators do not indicate the capacitive fault, because they show only resistance faults, as shown next:

If all the circuit fault indicators are green, as above, and the room **Status** area shows a hazard, appropriate personnel must determine and correct the cause of the fault.

Data logs

When you need details about circuit measurements and details, the Area Details diagram provides links to the historical data log and the event log. These logs provide measurement data for the 5-minute polling interval of the LIM-IG6. You can filter the data in the logs by date range.

When using the event log, you can also generate a graph that shows THC measurements plotted across time. If any THC measurement exceeds the hazard threshold, the graph includes a callout at the specific event point.

Historical data log and graph

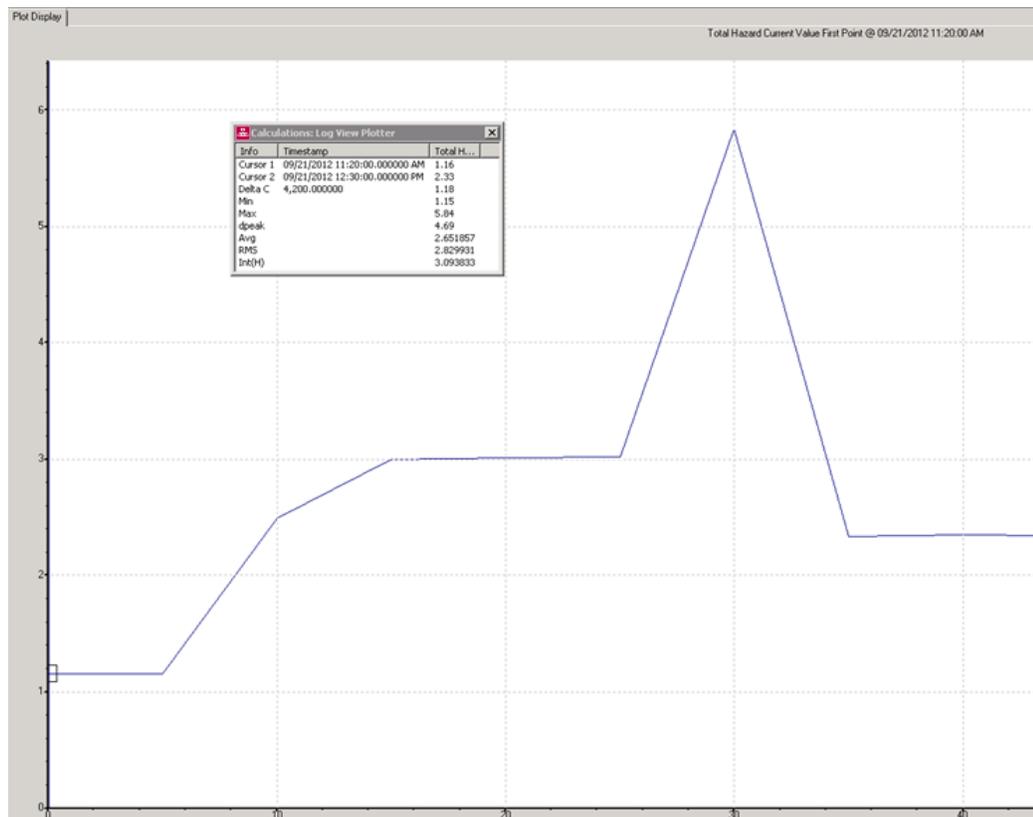

The following figure shows the historical log table.

Node	Timestamp	Total Hazard Current Value	Load Percentage Value	Voltage L1-L2 Value	Voltage L1-Gnd Value	Voltage L2-Gnd Value	Impedance Value	Resistance Value	Capacitance Value
Hospital_IG6_1	1/29/2013 10:55:00.000 AM	3.800	10.000	127.000	10.000	122.000	113.000	114.000	3.000

The buttons located at the top of the table are:

- **Device Diagram** – Click this to return to the diagram.
- **Change Date Range** – Click this to view data for different dates. See "Select Date Range" below for more information.
- **Show Graph** – Select one or more column headers in the table and click this to see a graph of the data. The graph shows the data at 5-minute intervals. For example, you can check the **Total Hazard Current** option in the table and see the values. Click a point on the data line to see details for that value, as shown next.

The following figure shows the historical log table from the Vista client view:

Event Log

The following figure shows the event log table:

The buttons located at the top of the table are:

- **Device Diagram** – Click this to return to the diagram.
- **Change Date Range** – Click this to view data for different dates. See "Select Date Range" below for more information.

Select date range:

For either type of log table, you can select the date range for data you want to see. The default date range is "Today".

1. Click **Select Date Range**.

Please select a date range

Today
 Yesterday
 This week
 Last week
 This month
 Last month

_____ OR _____

Between these dates:
 2013-Jan-31 00:00:00

 AND
 2013-Jan-31 23:59:59

Show Table

2. Select an available range or click **Between these dates** and select specific dates in the calendar.
3. Click **Show Table** to see the data.

If you select a date range of more than one week, a message appears to inform you that the table will be very long.

The new table appears.

Generating the Insulation Monitoring Report

To generate a report:

1. In Reports, open the Report Library and navigate to the location of the Insulation Monitoring report you want to generate.
2. Click the report name to display the report in the Reports Display pane.
3. Set the input parameters for the report and click **Generate Report**.

NOTE: Saved input parameters are preset to their saved values. Not saved input parameters have generic default values.

4. The report output is displayed in the Reports Display pane.

Insulation Monitoring Report (ANSI)

NOTE: This report is part of the Insulation Monitoring Module. This Module requires a separate license.

Summary

The Insulation Monitoring (ANSI) Report shows Total Hazard Current, relevant event log entries, and logged insulation related measurements, over the reporting period. Use this report to analyze and report on the insulation status of your ungrounded IT power system.

Details

The report includes:

- A Total Hazard Current graph, showing measured currents against the Total Hazard Current limits.
- An events table, showing information for each event that occurred in the reporting range.
- A data log table, showing Total Hazard Current measurements and other meter data.

Prerequisites

- The Insulation Monitoring Module must be configured.
- The measurement data must be available as historical data logs in the database.

Report inputs

Title

Type a title for the report in the box.

Area

The area whose panels you want to include in the report.

Reporting Period

Use this input to select the timeframe for the data you want to view in the report.

Select the reporting period from the dropdown list. The timeframe options in the timeframe dropdown are relative to the date the report is run. To run a report that starts and ends in the past, select the fixed date option. Type a start and end date in the date boxes or click the arrows beside the dates to display a pop-up calendar and select a date. Type a time in the time boxes or click the up and down arrows beside the time to adjust the hours or minutes up or down.

Select whether you want to view timestamps in either Server Local Time, UTC (Universal Coordinated Time), or in the timezone of the source.

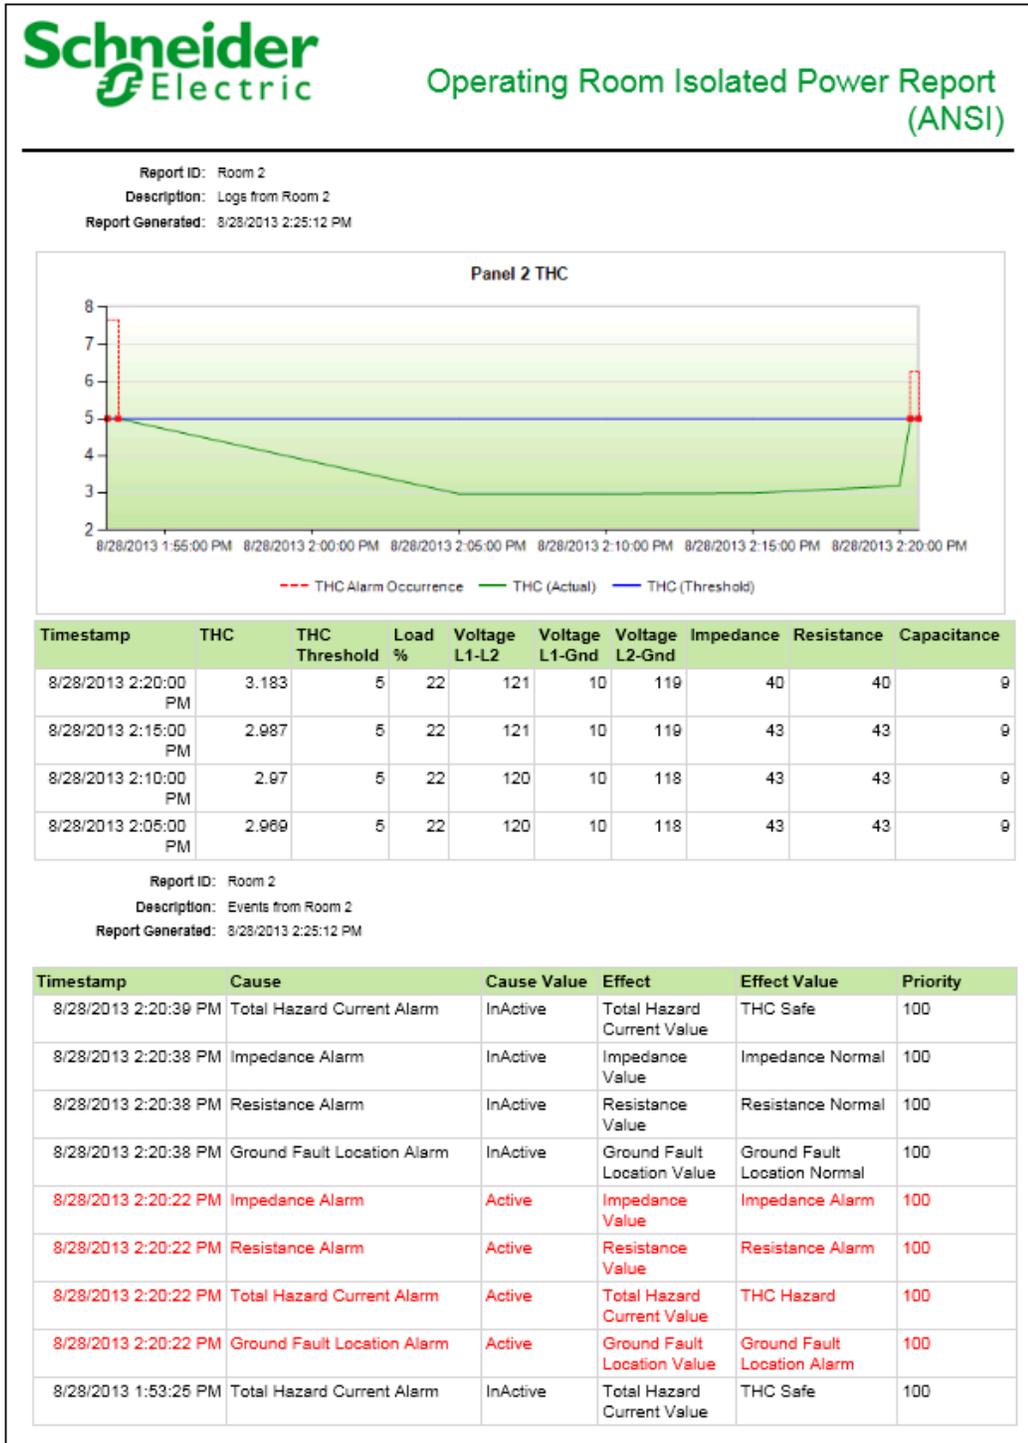

Include Data Table

Select whether or not to show the data table in the generated report. The default is **No**.

Include Data Notification

Click **Yes** to include data warnings in the report. If there are none, the section is not included. Click **No** to exclude this section.

Hospital Operating Room Example:

NOTE: This example only shows selected content from the report, it does not show the entire report.

Insulation Monitoring diagrams for IEC

The Insulation Monitoring module includes several diagrams that show the electrical status of the areas and circuits that are being monitored.

This section describes each type of diagram.

See the following topics:

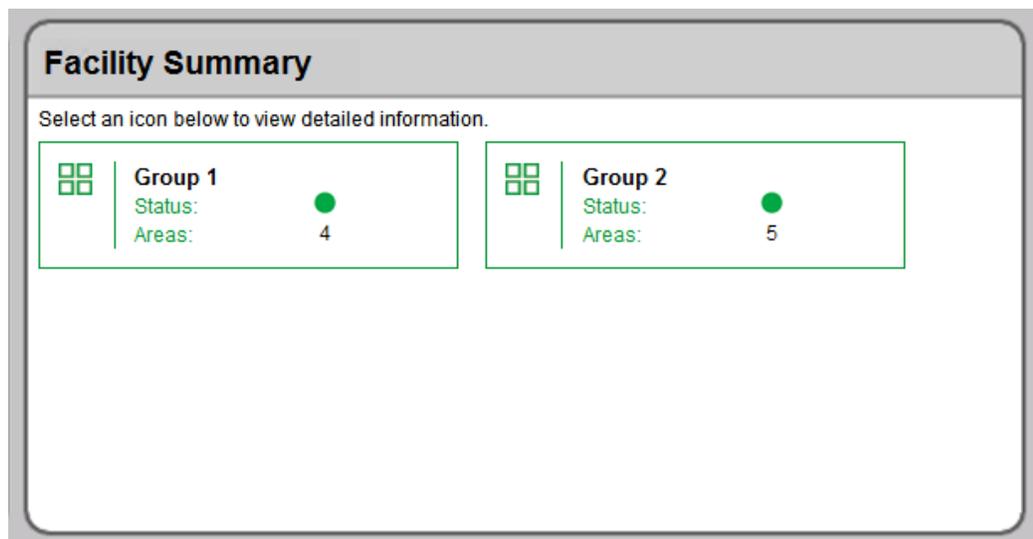

- [Using the diagrams](#)
- [Data logs](#)
- [Generating the Insulation Monitoring Report](#)
- [Insulation Monitoring Report \(IEC\)](#)

Using the diagrams

The insulation monitoring diagrams display overview or detail information as well as status.

Facility Summary diagram

The Facility Summary diagram shows each group that contains a number of areas.

The Facilities Summary diagram shows all the groups of areas that were configured for the facility. Each box in the main area represents a group of areas. This diagram provides a status overview and links to areas in the facility, as shown next:

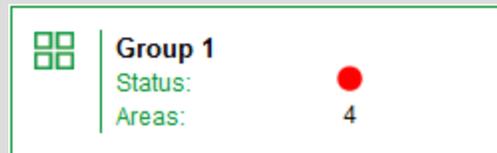

A Group Icon – Click the group icon to see the area diagram.

Status Indicator – This indicator is green or red to show the general status of the isolated power system:

- **Green** – Normal condition. The insulation resistance measurements for all areas in this group is above the limit.
- **Red** – Alarm condition. The insulation resistance measurements for one or more areas in this group are below the limit.

B

Example of an alarm indication:

C Areas – Total number of monitored areas in this facility.

Recommended Actions for Alarm Condition Indication

1. Click the Group icon to open the Areas diagram. One or more area boxes will show an alarm condition. .
2. Click the specific area icons to open the Area Details diagrams. One or more panel boxes will show an alarm condition. If the optional circuit fault locator devices are installed, the panel box also indicates each circuit that has a resistance fault.
3. Notify the responsible person that can address the condition for the area and specific circuits.

Summary of Areas diagram

The Summary of Areas diagram shows an overview of each area in the facility. Each box represents a single area.

Example:

Summary: Group 1 - Areas: 2

Area 1
Status: Normal

C

D

- A** **Area Icon** – Click the area icon to see the details for the insulation monitoring device measurements for this area.
- B** **Area Status Indicator** – Indicates the general conditions of the area. This indicator is either green "Normal" or red "Alarm". If the indicator is red, the insulation resistance measurement from the insulation monitoring device is below the limit.

Area Information and Status Indicators – Displays the area name, the insulation monitoring device, and the status indicators. If an alarm occurs in the room, these indicators show the specific type of alarm.

- **Insulation Status** – Normal condition is green. If the impedance is lower than the threshold, the indicator turns orange. The impedance threshold is set on the insulation monitoring device.
- **Electrical Status** – Normal condition is green. If the current transformer load or temperature exceed the threshold set on the insulation monitoring device, this indicator turns red.
- **Wiring Status** – Normal condition is green. This indicator turns red if the device cannot monitor the isolation transformer.

Circuit Status – Appears only if the optional Insulation Fault Locator (IFL) device is installed. This area shows the status for each circuit being monitored. If the IFL detects a resistance fault, the circuit monitor identifies the specific circuit and the circuit indicator turns red. When any indicator turns red, the alarm status propagates up to the top-level Facility Summary diagram.

Status indicators in an alarm condition:

Area 1
Status:

IM.ICU

 Insulation Status

 Electrical Status

 Wiring Status

Alarm

 Circuit 01	200	kohms	 Circuit 02	200	kohms
 Circuit 03	200	kohms	 Circuit 04	200	kohms
 Circuit 05	200	kohms	 Circuit 06	200	kohms
 Circuit 07	200	kohms	 Circuit 08	200	kohms
 Circuit 09	200	kohms	 Circuit 10	200	kohms
 Circuit 11	200	kohms	 Circuit 12	200	kohms

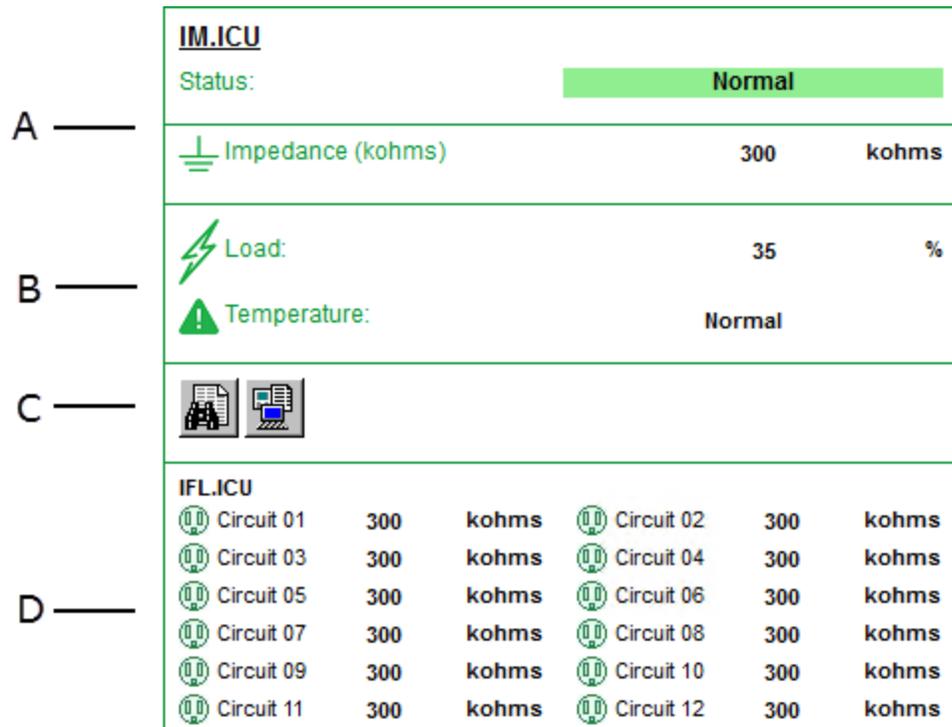

Area Details diagram

The Area Details diagram shows the details for the insulation monitoring and fault locator devices.

Example:

The diagram shows the following details:

Device Name – The group and name of the device in the area.

Insulation Monitoring Device Status – Green = Normal, Red = Alarm.

A Impedance – The real-time measurement of the impedance to ground, in kilohms. If the impedance is lower than the threshold, the indicator turns orange. The impedance limit is set on the insulation monitoring device.

B Transformer Indicators – The load and temperature status for the current transfer

- **Load** – If the current transformer load exceeds the threshold, this indicator turns red and displays the real-time load percentage value.
- **Temperature** – If the current transformer temperature rises above the threshold, this indicator turns red and the status changes to "High."

C Event Log and Data Log – Contains links to the historical data log and event log for the panel measurements. See [Data logs](#) for more information.

D Circuit Status – Appears only if the optional Insulation Fault Locator (IFL) device is installed. This shows the status for each circuit being monitored. If the IFL detects a resistance fault, the circuit monitor identifies the specific circuit and the circuit indicator turns red. When any indicator turns red, the alarm status propagates up to the top-level Facility Summary diagram.

Example of status indicators in an alarm condition:

IM.ICU

Status: Alarm

Impedance (kohms) 300 kohms

Load: 90 %

Temperature: High

IFL.ICU

Circuit 01	300	kohms	Circuit 02	300	kohms

Circuit 05	300	kohms	Circuit 06	300	kohms
Circuit 07	300	kohms	Circuit 08	300	kohms
Circuit 09	300	kohms	Circuit 10	300	kohms
Circuit 11	300	kohms	Circuit 12	300	kohms

Data logs

When you need details about circuit measurements and details, the Area Details diagram provides links to the historical data log and the event log. These logs provide measurement data for the 15-minute polling interval of the Vigilohm IM20-H. You can filter the data in the logs by date range.

Historical data log

The following image shows the historical log table from the Power Monitoring Expert view:

The buttons located at the top of the table are:

- **Device Diagram** – Click this to return to the diagram.
- **Change Date Range** – Click this to view data for different dates. See "Select Date Range" below for more information.

Select date range:

For either type of log table, you can select the date range for data you want to see. The default date range is "Today".

1. Click **Select Date Range**.

Please select a date range

Today
 Yesterday
 This week
 Last week
 This month
 Last month

OR

Between these dates:
 2013-Jan-31 00:00:00

 AND
 2013-Jan-31 23:59:59

Show Table

2. Select an available range or click **Between these dates** and select specific dates in the calendar.
3. Click **Show Table** to see the data.

If you select a date range of more than one week, a message appears to inform you that the table will be very long.

The new table appears.

Generating the Insulation Monitoring Report

To generate a report:

1. In Reports, open the Report Library and navigate to the location of the Insulation Monitoring report you want to generate.
2. Click the report name to display the report in the Reports Display pane.
3. Set the input parameters for the report and click **Generate Report**.

NOTE: Saved input parameters are preset to their saved values. Not saved input parameters have generic default values.

4. The report output is displayed in the Reports Display pane.

Insulation Monitoring Report (IEC)

NOTE: This report is part of the Insulation Monitoring Module. This Module requires a separate license.

Summary

The Insulation Monitoring (IEC) Report shows resistance, transformer load, relevant event log entries, and logged insulation related measurements, over the reporting period. Use this report to analyze and report on the insulation status of your ungrounded IT power system.

Details

The report includes:

- An impedance graph, showing a comparison of impedance measurements to the impedance threshold.
- A transformer load graph, showing a comparison of transformer load measurements to the load threshold.
- An events table, showing information for each event that occurred in the reporting range.
- A data log table, showing measurements for impedance, load, and temperature.

Prerequisites

- The Insulation Monitoring Module must be configured.
- The measurement data must be available as historical data logs in the database.

Report inputs

Title

Type a title for the report in the box.

Area

The area whose panels you want to include in the report.

Reporting Period

Use this input to select the timeframe for the data you want to view in the report.

Select the reporting period from the dropdown list. The timeframe options in the timeframe dropdown are relative to the date the report is run. To run a report that starts and ends in the past, select the fixed date option. Type a start and end date in the date boxes or click the arrows beside the dates to display a pop-up calendar and select a date. Type a time in the time boxes or click the up and down arrows beside the time to adjust the hours or minutes up or down.

Select whether you want to view timestamps in either Server Local Time, UTC (Universal Coordinated Time), or in the timezone of the source.

Include Data Table

Select whether or not to show the data table in the generated report. The default is **No**.

Include Data Notification

Click **Yes** to include data warnings in the report. If there are none, the section is not included.

Click **No** to exclude this section.

Hospital Operating Room Example:

NOTE: This example only shows selected content from the report, it does not show the entire report.
