## 1 Introduction

This document gives the list of data points supported by all the T300 modules. These points are automatically generated by the T300 Generator configuration tool.

Each point is defined by:

- A type of SCADA object,
- The first software version or variable from which the variable has been introduced,
- Its belonging to a generation option in the T300 generator.

Note that the correspondence between the data type and the SCADA objects is defined in the T300 Quick start user guide.

Note also that this list of data points can also be consulted in the RTU configuration interface of Easergy Builder software (in CoreDb tab).

**Note:** in the tables here after, "SCADA Object Type" correspond to the basic object type from a SCADA view: e.g. single or double digital input or outputs, analogue inputs/outputs or counters.

**Note 2:** Some variables have been scaled to harmonize the database format between all T300 modules. Scaling allows you to scale a variable from a T300 module having its own format. This "scaling" carried out in CoreDB must not be modified for the proper functioning of the unit.

Ce document donne la liste des données supportées par tous les modules T300.

Ces points sont automatiquement générés par l'outil de génération de configuration T300 Generator.

Chaque point (ou variable) est défini par :

- Un type d'objet SCADA,
- La première version logicielle à partir de laquelle la variable a été introduite,
- L'appartenance de la variable à une option de génération dans le T300 Generator.

A noter que la correspondance entre le type de donnée et les objets SCADA sont définis dans le Guide de démarrage T300.

A noter également que cette base de données peut être consultée dans l'interface de configuration RTU du logiciel Easergy Builder (onglet CoreDb).

**Remarque :** dans les tableaux ci- après, "SCADA Object Type" correspond au type d'objet basique d'une vue SCADA, par exemple des entrées digitales simples ou doubles ou des sorties, des entrées / sorties analogiques ou des compteurs.

**Remarques 2 :** certaines variables ont été mises à l'échelle afin d'harmoniser le format de la base de données entre tous les modules T300. Le "scaling" permet de mettre à l'échelle une variable issue d'un module T300 ayant son propre format. Ce "scaling" réalisé dans CoreDB ne doit pas être modifié pour le bon fonctionnement de l'équipement.

## 2 Condition monitoring

Condition monitoring (CM) and Zigbee modem related variables have a specific format that describes their emplacement and role in the installation. In this document, they are presented in a generic format, using keys \$ZONE\$, \$LOC\$ and \$ID\$ in the point name and description.

These keys are automatically replaced by texts from the following table, depending on the condition monitoring options selected in T300 generator.

*Les variables associées au condition monitoring (CM) et au modem Zigbee ont un format spécifique qui intègre leur position et leur rôle dans l'installation.*

*Dans ce document, elles sont présentées avec un format générique, utilisant les clés \$ZONE\$, \$LOC\$ et \$ID\$ dans le nom de la donnée et sa description.*

*Ces clés sont automatiquement remplacées par les textes issus du tableau suivant, selon les options condition monitoring choisies dans T300 Generator.*

Key	Label in point name	Description	Meaning
\$ZONE\$	SUB	Substation	Condition monitoring zone : Substation
	FUN	Functional unit	Condition monitoring zone : Switch gear functional unit
	CUB	Cubicle	Condition monitoring zone : Cubicle
	PTR	Transformer	Condition monitoring zone : Power transformer
	LVS	LV Switchboard	Condition monitoring zone : LV Switchboard
\$LOC\$	ENV	Environmental	Environmental monitoring
	BUS	Busbar	Thermal sensor location : Busbar
	CAB1	Cable 1	Thermal sensor location : Cable 1
	CAB2	Cable 2	Thermal sensor location : Cable 2
	CABU	Cable up	Thermal sensor location : Cable up
	CABD	Cable down	Thermal sensor location : Cable down
	MV	MV connection	Thermal sensor location : Transformer MV connection
	LV	LV connection	Thermal sensor location : Transformer LV connection
	IN	Incomer	Thermal sensor location : LV switchboard incomer
	FD	Feeder	Thermal sensor location : LV switchboard feeder
	FLOOD	Flood	Condition monitoring digital input sensor : flood
	PRESLO	Gas pressure low	Condition monitoring digital input sensor : gas pressure low
	PRESVLO	Gas pressure very low	Condition monitoring digital input sensor : gas pressure very low
	FUSE	Blown fuse	Condition monitoring digital input sensor : blown fuse
\$ID\$	SUBDOOR	Substation door	Condition monitoring digital input sensor : substation door
	RTUDOOR	RTU door	Condition monitoring digital input sensor : RTU cabinet door
	0	N.A.	Corresponds to \$LOC\$ = BUS for RMU, to \$LOC\$ = LV for Transformer thermal monitoring
1	1	N.A.	Corresponds to \$LOC\$ = CAB1 for RMU, to \$LOC\$ = MV for Transformer thermal monitoring
	2	N.A.	Corresponds to \$LOC\$ = CAB2 for RMU

### 3 List of data points in CoreDb / Liste de données dans CoreDb

#### 3.1 HU250

### 3.3 SC160

The data points supported by the SC150 are also supported by the SC160. Please refer to chapter SC150 to consult the common variables.

The only exceptions are PDOP variables (PDOP1\_Str\_general, PDOP1\_Op\_general, PDOP1\_FltInd\_general, PDOP1\_Prs\_dGen\_Fwd, PDOP1\_Prs\_dGen\_Bwd) which are not supported by SC160.

The following data points are supported only by SC160.
