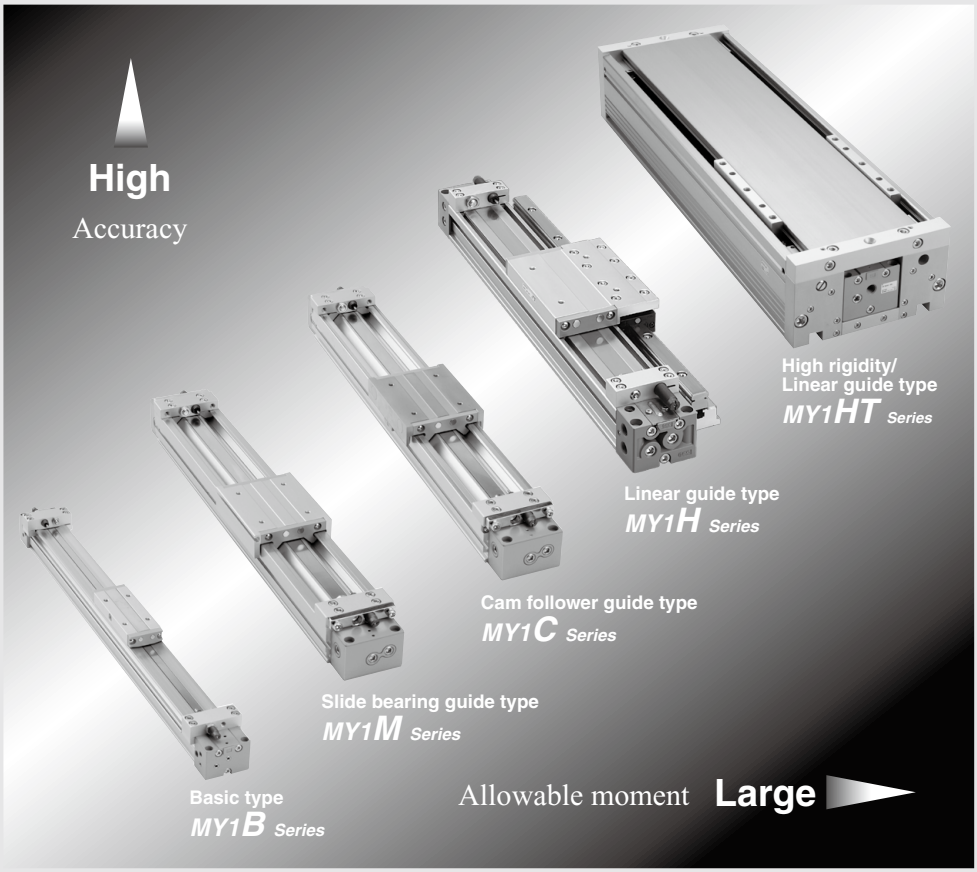
Mechanically Jointed Rodless Cylinder

MY1 Series



Five types of guide allow a wide range of selections.

Series Variations

Series	Guide type	Piping type (1)	Bore size (mm) 10 16 20 25 32 40 50 63 80 100	Air cushion	Stroke adjustment Unit	Side support	Floating bracket	End lock	Made to Order (3)	
MY1B	Basic type	Centralized piping / Standard piping	● ● ● ● ● ● ● ● ● ●	(2)	(4)	●	●		Intermediate stroke / Long stroke / Helical insert thread / Dust seal band NBR lining / Shock absorber soft type RJ series mounted	P. 1233
MY1M	Slide bearing guide type		● ● ● ● ● ● ● ● ● ●							P. 1257
MY1C	Cam follower guide type		● ● ● ● ● ● ● ● ● ●							P. 1277
MY1H	Linear guide type		● ● ● ● ● ● ● ● ● ●	(2)				(5)		P. 1297
MY1HT	High rigidity/Linear guide type		● ● ● ● ● ● ● ● ● ●							P. 1319

Note 1) ø10 is available with central piping only. Note 2) ø10 is available with rubber bumper only.
Note 3) Availability for Made-to-Order differs, depending on the size and the model.
Note 4) Except ø50 to ø100 Note 5) Except ø10

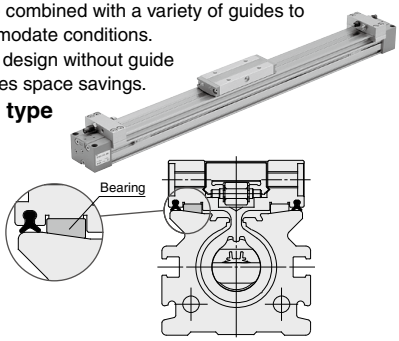
With 5 standardized guide types

Basic Type — *MY1B Series*

Wide variations from ø10 to ø100

Can be combined with a variety of guides to accommodate conditions.
Simple design without guide facilitates space savings.

Basic type

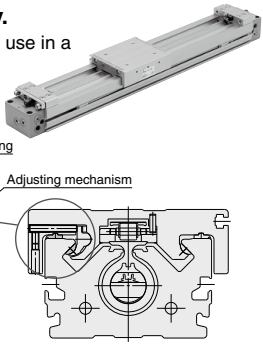


Slide Bearing Type — *MY1M Series*

Simple guide type that can mount a workpiece directly.

Integrated guide allows use in a wide range of conveyor systems.

Moderate type

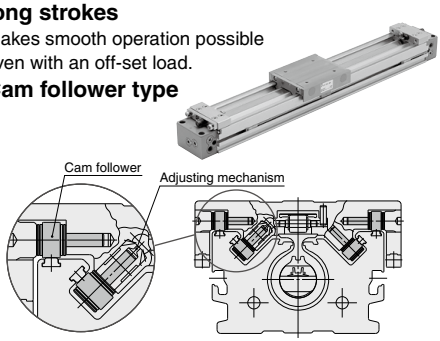


Cam Follower Guide Type — *MY1C Series*

Strong against moment, compatible with long strokes

Makes smooth operation possible even with an off-set load.

Cam follower type

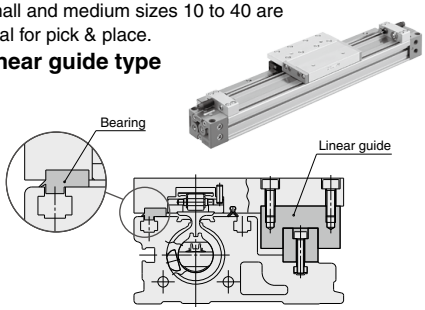


Linear Guide Type — *MY1H Series*

Uses a linear guide to achieve high repeatability

Small and medium sizes 10 to 40 are ideal for pick & place.

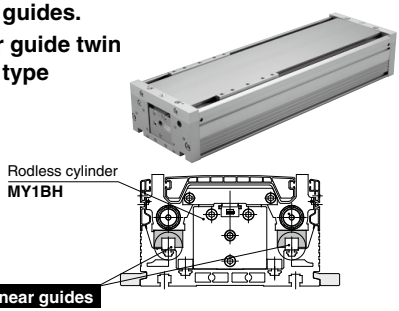
Linear guide type



High Rigidity/Linear Guide Type — *MY1HT Series*

Linear guide heavy loaded workpieces can be accommodated by using two linear guides.

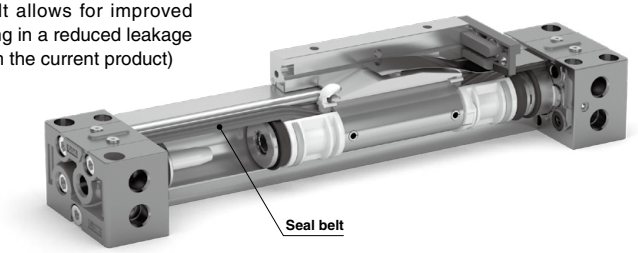
Linear guide twin guide type



Minimal leakage seal construction

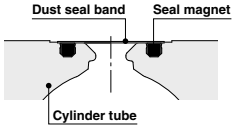
- The flexible material of the seal belt allows for improved adherence to the cylinder tube, resulting in a reduced leakage amount. (50% reduction compared with the current product)

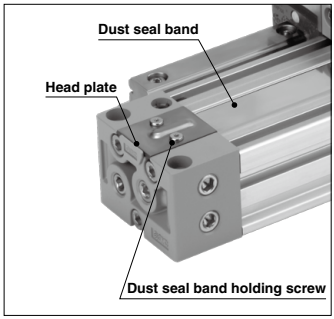
Applicable models
MY1□16 to 50



Dust seal band with improved holding force

- The seal magnet on the cylinder tube adsorbs the dust seal band with magnetic force, resulting in improved holding force.

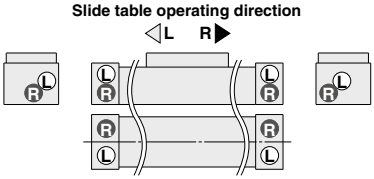


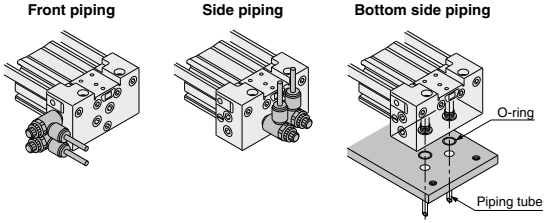


- The dust seal band can be easily removed for replacement by simply loosening the two holding screws. Easier maintenance

Applicable models
MY1B10, 25 to 40, 80, 100
MY1H10, 25 to 40

Allows for piping to be connected according to installation conditions. Centralized piping type for increased piping freedom





Applicable models
All models

MY1M and MY1C compatibility guaranteed

- With the same outer dimensions and workpiece mounting dimensions, both series are compatible with stroke adjustment units, side supports, auto switches, etc.

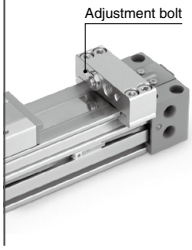
Applicable models
MY1M16 to 63
MY1C16 to 63

Built-in adjustment bolt and shock absorber, 3 stroke adjustment unit types

- The shock absorber softens the impact of workpieces at the stroke end, and the adjustment bolt increases the repeatability of the stopping position.
  The following 3 unit types each meet the specification requirements.
- An intermediate fixing spacer for stopping slide tables in the middle of the stroke is available as well.

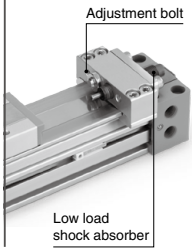
A unit

With adjustment bolt



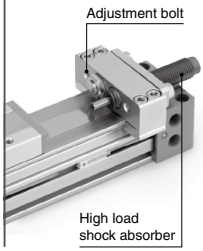
L unit

With adjustment bolt + low load shock absorber



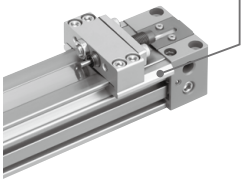
H unit

With adjustment bolt + high load shock absorber



Intermediate fixing spacer as standard

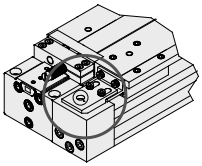
Fixture can be selected to hold the stroke adjustment unit at the intermediate stroke position.



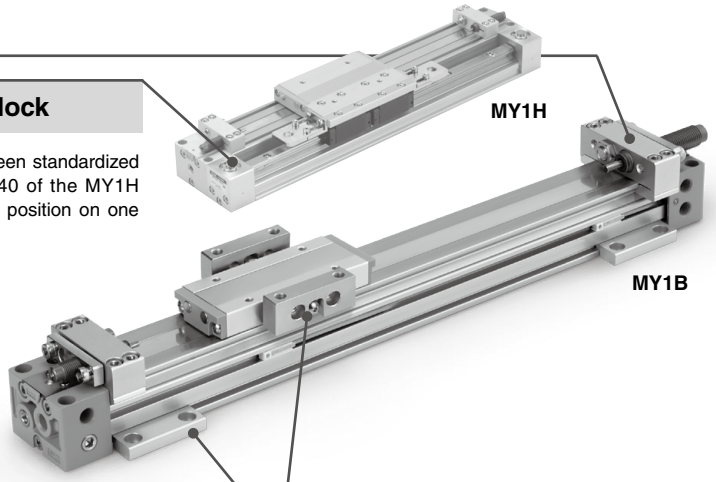
Applicable models
All models
Except MY1B50 to 100

Standardized end lock

- The end lock type has been standardized for bore sizes ø16 to ø40 of the MY1H series. Mountable at any position on one or both sides

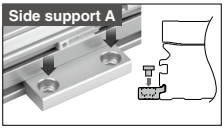


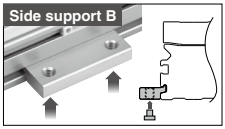
Applicable models
MY1H16 to 40



Side support

- Prevents deflection of the cylinder tube at a long stroke. Makes linear operation possible
- Now with 2 selectable mounting options in order to support mounting frames

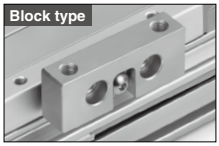


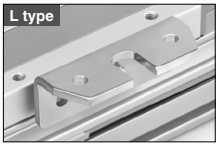


Applicable models
All models

Floating Bracket

- 2 connection types can be selected. (ø25 to ø40) Easier to connect to other guide types.

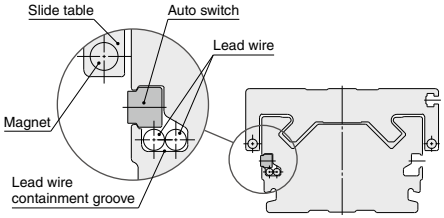




Applicable models
MY1B10 to 100

Auto switch wiring storage system
To increase safety, auto switch lead wires can be stored to prevent accidental contact with slide tables.

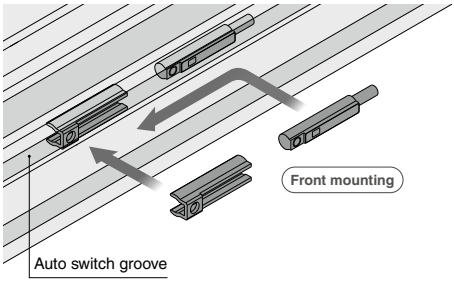
- Improved safety and accuracy of the entire system can be achieved by storing auto switch lead wires in the product's designated lead wire containment grooves.



Applicable models
MY1M16 to 63
MY1C16 to 63

Auto switches can be mounted from the front. Contributes to reduction in mounting time.

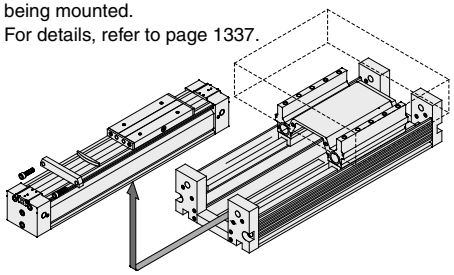
- Auto switches can be mounted from the front at any position on the mounting groove.



Applicable models
MY1B25 to 40
MY1H25 to 40
MY1HT50, 63

Extremely easy to maintain

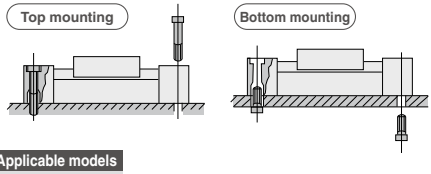
- It is possible to replace cylinders with a workpiece being mounted.
For details, refer to page 1337.



Applicable models
MY1HT50, 63

Two mounting types, Space saving

- The cylinder body can be secured directly from either the top or bottom without the use of mounting brackets. This does not change the overall length dimension.



Applicable models
MY1□16 to 63

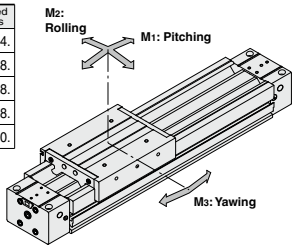
MY1 Series
Model Selection 1

Following are the steps for selecting the most suitable MY1 series to your application.

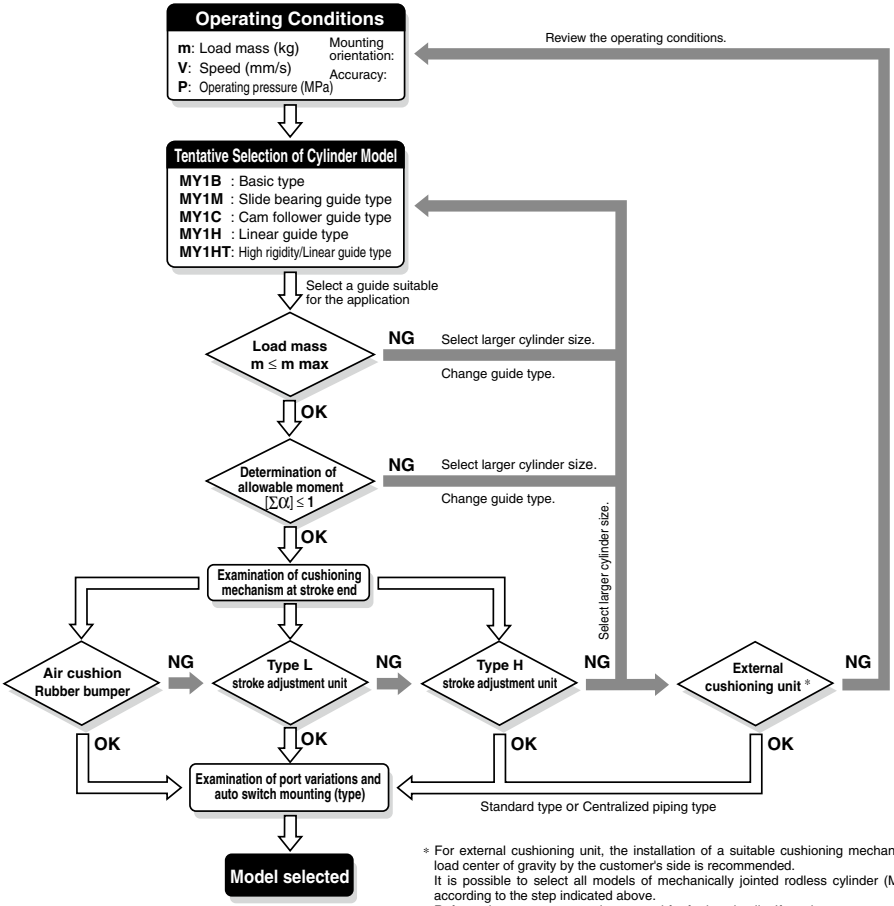
Standards for Tentative Model Selection

Cylinder model	Guide type	Standards for guide selection	Graphs for related allowable values
MY1B	Basic type	Guaranteed accuracy not required, generally combined with separate guide	Refer to P. 1234.
MY1M	Slide bearing guide type	Slide table accuracy approx. ±0.12 mm (2)	Refer to P. 1258.
MY1C	Cam follower guide type	Slide table accuracy approx. ±0.05 mm (2)	Refer to P. 1278.
MY1H	Linear guide type	Slide table accuracy of ±0.05 mm or less required (2)	Refer to P. 1298.
MY1HT	High rigidity/Linear guide type	Slide table accuracy of ±0.05 mm or less required (2)	Refer to P. 1320.

Note 1) These accuracy values for each guide should be used only as a guide during selection. Please contact SMC when guaranteed accuracy for MY1C/MY1H is required.
Note 2) "Accuracy" here means displacement of the slide table (at stroke end) when 50% of the allowable moment shown in the catalog is applied. (reference value).



Selection Flow Chart

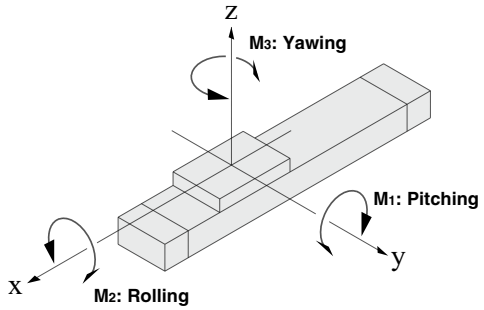


* For external cushioning unit, the installation of a suitable cushioning mechanism near the load center of gravity by the customer's side is recommended.
It is possible to select all models of mechanically jointed rodless cylinder (MY1□ series) according to the step indicated above.
Refer to the separate operation manual for further details. If you have any questions, please contact SMC.

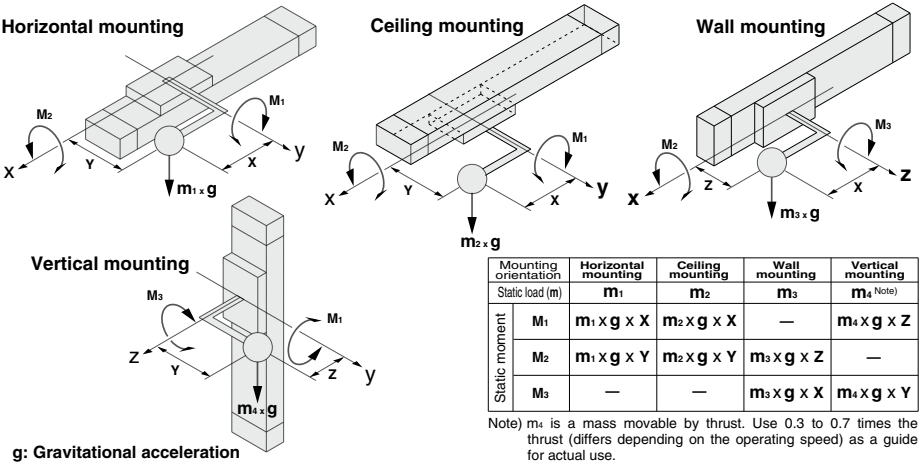
Types of Moment Applied to Rodless Cylinders

Multiple moments may be generated depending on the mounting orientation, load, and position of the center of gravity.

Coordinates and Moments



Static Moment

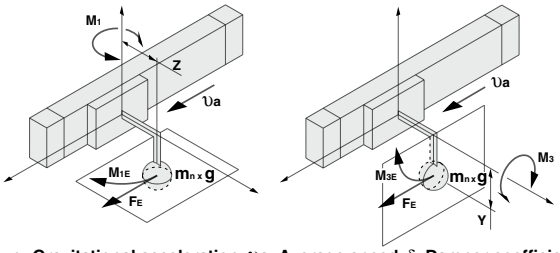


Mounting orientation		Horizontal mounting	Ceiling mounting	Wall mounting	Vertical mounting
Static load (m)		m_1	m_2	m_3	m_4 Note)
Static moment	M_1	$m_1 \times g \times X$	$m_2 \times g \times X$	—	$m_4 \times g \times Z$
	M_2	$m_1 \times g \times Y$	$m_2 \times g \times Y$	$m_3 \times g \times Z$	—
	M_3	—	—	$m_3 \times g \times X$	$m_4 \times g \times Y$

Note) m_4 is a mass movable by thrust. Use 0.3 to 0.7 times the thrust (differs depending on the operating speed) as a guide for actual use.

g: Gravitational acceleration

Dynamic Moment



Mounting orientation		Horizontal mounting	Ceiling mounting	Wall mounting	Vertical mounting
Dynamic load (F_E)		$1.4\ \upsilon a \times \delta \times m_n \times g$			
Dynamic moment	M_{1E}	$\frac{1}{3} \times F_E \times Z$			
	M_{2E}	Dynamic moment M_{2E} is not generated.			
	M_{3E}	$\frac{1}{3} \times F_E \times Y$			

Note) Regardless of the mounting orientation, dynamic moment is calculated with the formulae above.

g: Gravitational acceleration, υa: Average speed, δ: Damper coefficient

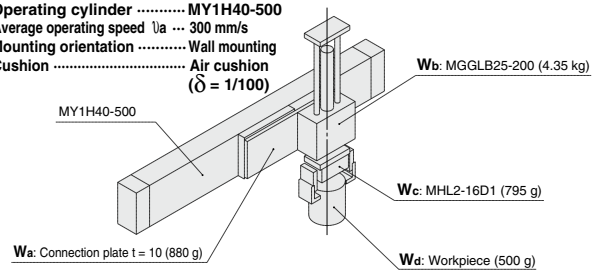
MY1 Series
Model Selection 2

Following are the steps for selecting the most suitable MY1 series to your application.

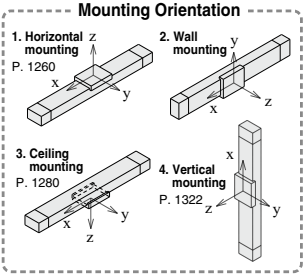
Calculation of Guide Load Factor

1. Operating Conditions

Operating cylinder ····· MY1H40-500
Average operating speed v ··· 300 mm/s
Mounting orientation ····· Wall mounting
Cushion ····· Air cushion
(δ = 1/100)

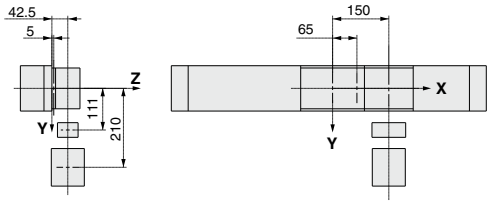


Mounting Orientation



For actual examples of calculation for each orientation, refer to the pages above.

2. Load Blocking



Mass and Center of Gravity for Each Workpiece

Workpiece no. **Wn**	Mass **mn**	Center of gravity		
		X-axis **Xn**	Y-axis **Yn**	Z-axis **Zn**
Wa	0.88 kg	65 mm	0 mm	5 mm
Wb	4.35 kg	150 mm	0 mm	42.5 mm
Wc	0.795 kg	150 mm	111 mm	42.5 mm
Wd	0.5 kg	150 mm	210 mm	42.5 mm

n = a, b, c, d

3. Composite Center of Gravity Calculation

$\mathbf{m_3} = \Sigma m_n$
$= 0.88 + 4.35 + 0.795 + 0.5 = \mathbf{6.525\ kg}$

$\mathbf{X} = \frac{1}{\mathbf{m_3}} \times \Sigma(m_n \times x_n)$
$= \frac{1}{6.525}(0.88 \times 65 + 4.35 \times 150 + 0.795 \times 150 + 0.5 \times 150) = \mathbf{138.5\ mm}$

$\mathbf{Y} = \frac{1}{\mathbf{m_3}} \times \Sigma(m_n \times y_n)$
$= \frac{1}{6.525}(0.88 \times 0 + 4.35 \times 0 + 0.795 \times 111 + 0.5 \times 210) = \mathbf{29.6\ mm}$

$\mathbf{Z} = \frac{1}{\mathbf{m_3}} \times \Sigma(m_n \times z_n)$
$= \frac{1}{6.525}(0.88 \times 5 + 4.35 \times 42.5 + 0.795 \times 42.5 + 0.5 \times 42.5) = \mathbf{37.4\ mm}$

4. Calculation of Load Factor for Static Load

m_3: Mass

m_3 max (from (1) of graph MY1H/**m_3**) = 50 (kg) ·····

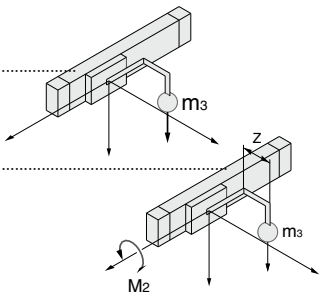
Load factor α_1 = **m_3**/**m_3 max** = 6.525/50 = **0.13**

M_2: Moment

M_2 max (from (2) of graph MY1H/**M_2**) = 50 (N·m) ·····

M_2 = **m_3** x **g** x **Z** = 6.525 x 9.8 x 37.4 x 10^{-3} = 2.39 (N·m)

Load factor α_2 = **M_2**/**M_2 max** = 2.39/50 = **0.05**

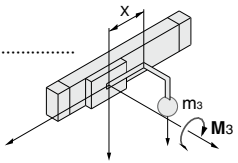


M_3: Moment

M_3 max (from (3) of graph MY1H/**M_3**) = 38.7 (N·m) ·····

M_3 = **m_3** x **g** x **X** = 6.525 x 9.8 x 138.5 x 10^{-3} = 8.86 (N·m)

Load factor α_3 = **M_3**/**M_3 max** = 8.86/38.7 = **0.23**



5. Calculation of Load Factor for Dynamic Moment

Equivalent load F_E at impact

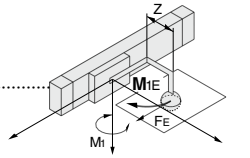
$F_E = 1.4\upsilon a \times \delta \times m \times g = 1.4 \times 300 \times \frac{1}{100} \times 6.525 \times 9.8 = 268.6$ (N)

M_{1E}: Moment

M_{1E} max (from (4) of graph MY1H/**M_1** where 1.4υa = 420 mm/s) = 35.9 (N·m) ·····

$M_{1E} = \frac{1}{3} \times F_E \times Z = \frac{1}{3} \times 268.6 \times 37.4 \times 10^{-3} = 3.35$ (N·m)

Load factor α_4 = **M_{1E}/M_{1E} max** = 3.35/35.9 = **0.09**

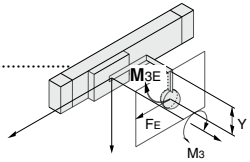


M_{3E}: Moment

M_{3E} max (from (5) of graph MY1H/**M_3** where 1.4υa = 420 mm/s) = 27.6 (N·m)·····

$M_{3E} = \frac{1}{3} \times F_E \times Y = \frac{1}{3} \times 268.6 \times 29.6 \times 10^{-3} = 2.65$ (N·m)

Load factor α_5 = **M_{3E}/M_{3E} max** = 2.65/27.6 = **0.10**



6. Sum and Examination of Guide Load Factors

$\Sigma\alpha = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4 + \alpha_5$ = **0.60** ≤ **1**

The above calculation is within the allowable value, and therefore the selected model can be used.
Select a shock absorber separately.
In an actual calculation, when the sum of guide load factors α in the formula above is more than 1, consider decreasing the speed, increasing the bore size, or changing the product series.
This calculation can be easily made using the "SMC Pneumatics CAD System".

Load Mass

Construction ..... P. 1243
Dimensions ..... P. 1246
Stroke Adjustment Unit ..... P. 1250
Accessory Bracket (Option) ..... P. 1251-1
Floating Bracket ..... P. 1254

Maximum Allowable Moment/Maximum Load Mass

Model	Bore size (mm)	Maximum allowable moment (N·m)			Maximum load mass (kg)		
		M_1	M_2	M_3	m_1	m_2	m_3
MY1B	**10**	0.8	0.1	0.3	5.0	1.0	0.5
	16	2.5	0.3	0.8	15	3.0	1.7
	20	5.0	0.6	1.5	21	4.2	3.0
	25	10	1.2	3.0	29	5.8	5.4
	32	20	2.4	6.0	40	8.0	8.8
	40	40	4.8	12	53	10.6	14
	50	78	9.3	23	70	14	20
	63	160	19	48	83	16.6	29
	80	315	37	95	120	24	42
	100	615	73	184	150	30	60

The above values are the maximum allowable values for moment and load. Refer to each graph regarding the maximum allowable moment and maximum allowable load for a particular piston speed.

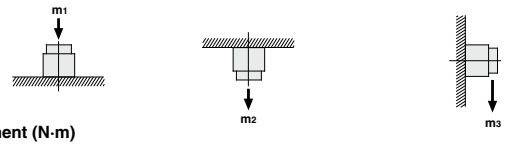
Maximum Allowable Moment

Select the moment from within the range of operating limits shown in the graphs. Note that the maximum allowable load value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable load for the selected conditions.

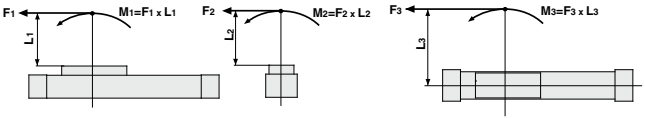
Caution on Design

We recommend installing an external shock absorber when the cylinder is combined with another guide (connection with floating bracket, etc.) and the maximum allowable load is exceeded, or when the operating speed is 1000 to 1500 mm/s for bore sizes ø16, ø50, ø63, ø80 and ø100.

Load mass (kg)



Moment (N·m)



<Calculation of guide load factor>

1. Maximum allowable load (1), static moment (2), and dynamic moment (3) (at the time of impact with stopper) must be examined for the selection calculations.

* To evaluate, use υa (average speed) for (1) and (2), and υ (collision speed $\upsilon = 1.4\,\upsilon a$) for (3). Calculate mmax for (1) from the maximum allowable load graph (m_1, m_2, m_3) and Mmax for (2) and (3) from the maximum allowable moment graph (M_1, M_2, M_3).

Sum of guide load factors

$$\Sigma\alpha = \frac{\text{Load mass [m]}}{\text{Maximum allowable load [mmax]}} + \frac{\text{Static moment [M]}\ ^{(1)}}{\text{Allowable static moment [Mmax]}} + \frac{\text{Dynamic moment [M}_E\text{]}\ ^{(2)}}{\text{Allowable dynamic moment [M}_E\text{max]}} \leq 1$$

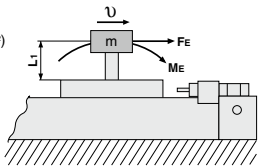
Note 1) Moment caused by the load, etc., with cylinder in resting condition.
Note 2) Moment caused by the impact load equivalent at the stroke end (at the time of impact with stopper).
Note 3) Depending on the shape of the workpiece, multiple moments may occur. When this happens, the sum of the load factors ($\Sigma\alpha$) is the total of all such moments.

2. Reference formula [Dynamic moment at impact]
Use the following formulae to calculate dynamic moment when taking stopper impact into consideration.

m: Load mass (kg)
F: Load (N)
F_E: Load equivalent to impact (at impact with stopper) (N)
υa: Average speed (mm/s)
M: Static moment (N·m)
$\upsilon = 1.4\upsilon a$ (mm/s) $F_E = 1.4\upsilon a \cdot \delta \cdot m \cdot g$ (Note 4)

$$\therefore M_E = \frac{1}{3} F_E \cdot L_1 = 4.57\upsilon a \delta m L, \quad \text{(Note 5)}$$

υ: Collision speed (mm/s)
L_1: Distance to the load's center of gravity (m)
M_E: Dynamic moment (N·m)
δ: Damper coefficient
With rubber bumper = 4/100
(MY1B10, MY1H10)
With air cushion = 1/100
With shock cushion = 1/100
g: Gravitational acceleration (9.8 m/s²)



Note 4) $1.4\upsilon a\delta$ is a dimensionless coefficient for calculating impact force.
Note 5) Average load coefficient ($= \frac{1}{3}$): This coefficient is for averaging the maximum load moment at the time of stopper impact according to service life calculations.

3. For detaild selection procedures, refer to pages 1236 and 1237.

Maximum Load Mass

Select the load from within the range of limits shown in the graphs. Note that the maximum allowable moment value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable moment for the selected conditions.

MY1B/M_1

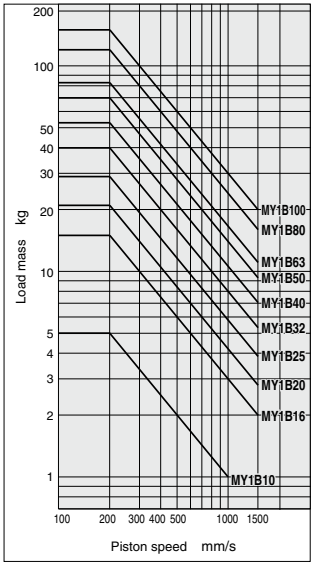
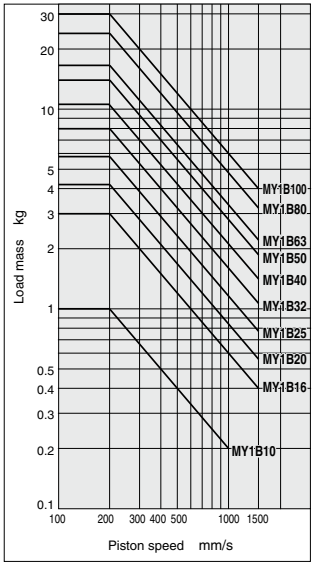
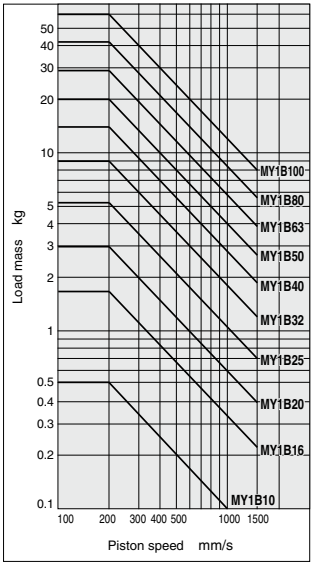
MY1B/m_1



MY1B/m_2



MY1B/m_3



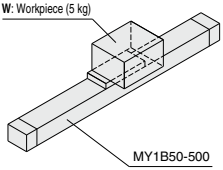
MY1B Series
Model Selection

Following are the steps for selecting the most suitable MY1B series to your application.

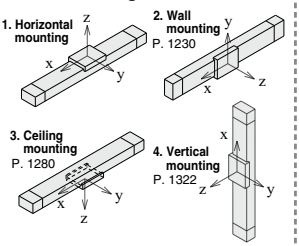
Calculation of Guide Load Factor

1. Operating Conditions

Cylinder **MY1B50-500**
Average operating speed υ**a** .... **300 mm/s**
Mounting orientation ..... **Horizontal mounting**
Cushion ..... **Air cushion**
(δ **= 1/100)**

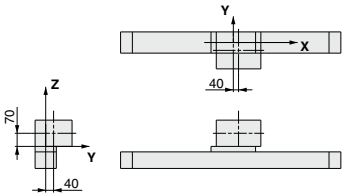


Mounting Orientation



For actual examples of calculation for each orientation, refer to the pages above.

2. Load Blocking



Mass and Center of Gravity for Workpiece

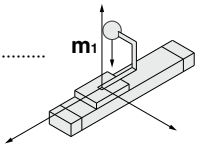
Workpiece no.	Mass **m**	Center of gravity		
		X-axis	**Y**-axis	**Z**-axis
W	5 kg	40 mm	40 mm	70 mm

3. Calculation of Load Factor for Static Load

$\mathbf{m_1}$: Mass

$\mathbf{m_1}$ **max** (from (1) of graph MY1B/$\mathbf{m_1}$) = 47 (kg)·····

Load factor $\alpha_1 = \mathbf{m_1}/\mathbf{m_1}$ **max** = 5/47 = **0.11**

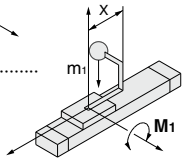


$\mathbf{M_1}$: Moment

$\mathbf{M_1}$ **max** (from (2) of graph MY1B/$\mathbf{M_1}$) = 52 (N·m)·····

$\mathbf{M_1} = \mathbf{m_1} \times \mathbf{g} \times \mathbf{X} = 5 \times 9.8 \times 40 \times 10^{-3} = 1.96$ (N·m)

Load factor $\alpha_2 = \mathbf{M_1}/\mathbf{M_1}$ **max** = 1.96/52 = **0.04**

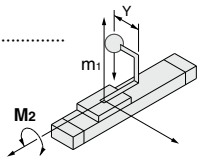


$\mathbf{M_2}$: Moment

$\mathbf{M_2}$ **max** (from (3) of graph MY1B/$\mathbf{M_2}$) = 6.2 (N·m)·····

$\mathbf{M_3} = \mathbf{m_1} \times \mathbf{g} \times \mathbf{Y} = 5 \times 9.8 \times 40 \times 10^{-3} = 1.96$ (N·m)

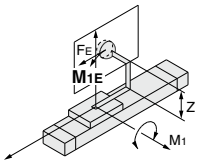
Load factor $\alpha_3 = \mathbf{M_2}/\mathbf{M_2}$ **max** = 1.96/6.2 = **0.32**



4. Calculation of Load Factor for Dynamic Moment

Equivalent load F_E at impact

$F_E = 1.4\upsilon a \times \delta \times m \times g = 1.4 \times 300 \times \frac{1}{100} \times 5 \times 9.8 = 205.8$ (N)

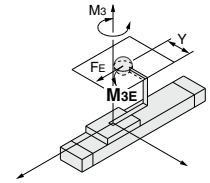


M_{1E}: Moment

M_{1E} max (from (4) of graph MY1B/**M_1** where $1.4\upsilon a$ = 420 mm/s) = 37 (N·m)·····

$M_{1E} = \frac{1}{3} \times F_E \times Z = \frac{1}{3} \times 205.8 \times 70 \times 10^{-3} = 4.81$ (N·m)

Load factor α_4 = **M_{1E}/M_{1E} max** = 4.81/37 = **0.13**



M_{3E}: Moment

M_{3E} max (from (5) of graph MY1B/**M_3** where $1.4\upsilon a$ = 420 mm/s) = 11.0 (N·m)·····

$M_{3E} = \frac{1}{3} \times F_E \times Y = \frac{1}{3} \times 205.8 \times 40 \times 10^{-3} = 2.75$ (N·m)

Load factor α_5 = **M_{3E}/M_{3E} max** = 2.75/11.0 = **0.25**

5. Sum and Examination of Guide Load Factors

$\sum\alpha = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4 + \alpha_5 =$ **0.85** $\leq$ **1**

The above calculation is within the allowable value, and therefore the selected model can be used.
Select a shock absorber separately.
In an actual calculation, when the total sum of guide load factors α in the formula above is more than 1, consider either decreasing the speed, increasing the bore size, or changing the product series. This calculation can be easily made using the "SMC Pneumatics CAD System".

Load Mass

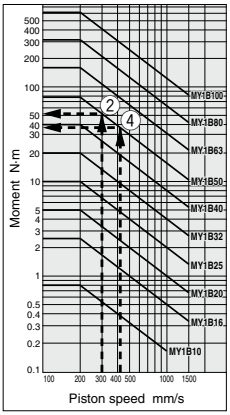
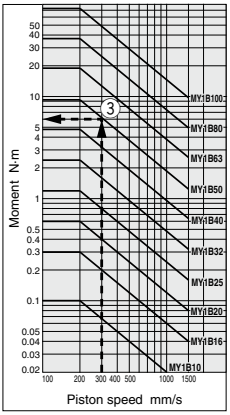
Allowable Moment

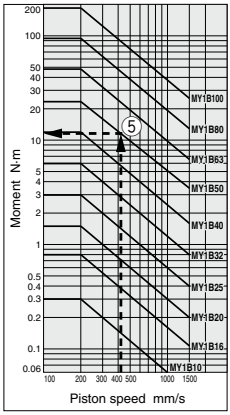
MY1B/M_1



MY1B/M_2



MY1B/M_3



Mechanically Jointed Rodless Cylinder
Basic Type
MY1B Series
ø10, ø16, ø20, ø25, ø32, ø40, ø50, ø63, ø80, ø100

How to Order

ø10, ø16, ø20, ø50, ø63, ø80, ø100: **MY1B 20 ❶ ❷ ❸ – 300 ❹ ❺ – M9BW ❻ ❼ – ❽**

ø25, ø32, ø40: **MY1B 25 ❶ ❷ ❸ – 300 ❹ ❺ Z – M9BW ❻ ❼ – ❽**

Basic type

❶ Bore size

10	10 mm
16	16 mm
20	20 mm
25	25 mm
32	32 mm
40	40 mm
50	50 mm
63	63 mm
80	80 mm
100	100 mm

❷ Port thread type

Symbol	Type	Bore size
Nil	M thread	ø10, ø16, ø20
	Rc	ø25, ø32, ø40, ø50, ø63, ø80, ø100
TN	NPT	
TF	G	

❸ Piping

Nil	Standard type
G	Centralized piping type

Note) For ø10, only G is available.

❹ Cylinder stroke (mm)

Bore size	Standard stroke*1	Long stroke (-XB11)	Maximum manufacturable stroke
10, 16	100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1200, 1400, 1600, 1800, 2000	Strokes of 2001 to 3000 mm (1 mm increments) exceeding the standard stroke	3000
20, 25, 32, 40, 50, 63, 80, 100	*1 The stroke can be manufactured in 1 mm increments from 1 mm stroke.	Strokes of 2001 to 5000 mm (1 mm increments) exceeding the standard stroke	5000

Ordering example

* Add "-XB11" to the end of the part number for long strokes. MY1B20-3000L-M9BW-XB11

Note) Please be advised that with stroke 49 or less, there are cases where auto switch mounting is not possible and the performance of the air cushion may decline.

❺ Stroke adjustment unit symbol

Refer to "Stroke adjustment unit" on page 1239.

❻ Auto switch

Nil	ø10	Without auto switch (Built-in magnet for reed switch)
		Without auto switch (Built-in magnet for solid state switch) (Made to Order: -X1810)
	ø16 to ø100	Without auto switch (Built-in magnet)

* Refer to the table below for the applicable auto switch model.

Applicable auto switches vary depending on the bore size. Select an applicable one referring to the table below.

❼ Number of auto switches

Nil	2 pcs.
S	1 pc.
n	"n" pcs.

❽ Made to Order: Individual Specifications (For details, refer to page 1334.)

Symbol	Specifications
-X168	Helical insert thread specifications
-X1810	Magnet for ø10 solid state auto switch specifications

Made to Order Specifications

Click here for details

Symbol	Specifications
-XB11	Long stroke type
-XB22	Shock absorber soft type RJ series type
-XC67*	NBR rubber lining in dust seal band

* Only ø16, ø20, ø50, and ø63 are available for the -XC67.

Applicable Auto Switches/Refer to pages 1575 to 1701 for further information on auto switches.

*1 Water resistant type auto switches can be mounted on the above models, but in such case SMC cannot guarantee water resistance. Consult with SMC regarding water resistant types with the above model numbers.

*2 For details on switch mounting brackets and part numbers, refer to "Switch Mounting Bracket: Part No." on page 1333-1.

*3 1 m type lead wire is only applicable to D-A93.

* Lead wire length symbols: 0.5 m ····· Nil (Example) M9NW
1 m ····· M (Example) M9NWM
3 m ····· L (Example) M9NWL
5 m ····· Z (Example) M9NWZ

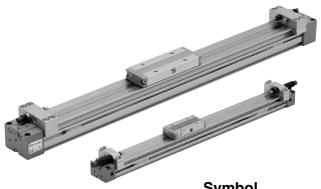
* Solid state auto switches marked with "○" are produced upon receipt of order.

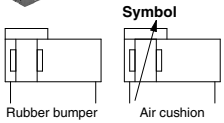
** D-M9□□□ type cannot be mounted on ø50. Select auto switches in brackets.

* There are other applicable auto switches than listed above. For details, refer to page 1333-1.

* Auto switches are shipped together (not assembled).

SMC





Specifications

Bore size (mm)		10	16	20	25	32	40	50	63	80	100
Fluid		Air									
Action		Double acting									
Operating pressure range		0.2 to 0.8 MPa	0.15 to 0.8 MPa		0.1 to 0.8 MPa						
Proof pressure		1.2 MPa									
Ambient and fluid temperature		5 to 60°C									
Cushion		Rubber bumper	Air cushion								
Lubrication		Non-lube									
Stroke length tolerance		1000 or less $^{+1.8}_{0}$ 1001 to 3000 $^{+2.8}_{0}$	2700 or less $^{+1.8}_{0}$, 2701 to 5000 $^{+2.8}_{0}$								
Piping Port size	**Front/Side port**	M5 x 0.8			1/8		1/4	3/8		1/2	
	Bottom port		ø4		ø6		ø8	ø10		ø18	

Piston Speed

Bore size (mm)		10	16	20 to 40	50 to 100
Without stroke adjustment unit		100 to 500 mm/s	100 to 1000 mm/s		
Stroke adjustment unit	**A unit**	100 to 200 mm/s	100 to 1000 mm/s (1)		—
	L unit and H unit	100 to 1000 mm/s	—	100 to 1500 mm/s (1)	—

Note 1) Be aware that when the stroke adjustment range is increased by manipulating the adjustment bolt, the air cushion capacity decreases. Also, when exceeding the air cushion stroke ranges on page 1241, **the piston speed should be 100 to 200 mm per second.**
Note 2) The piston speed is 100 to 1000 mm/s for centralized piping.
Note 3) Use at a speed within the absorption capacity range. Refer to page 1241.
Note 4) Due to the construction of this product, it may have more fluctuation in operating speed compared to a rod type air cylinder. For applications that require constant speed, select the equipment corresponding to the required level.

Stroke Adjustment Unit Specifications

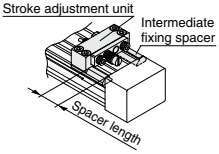
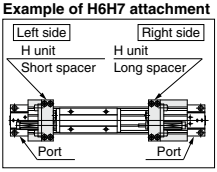
∗ Spacers are used to fix the stroke adjustment unit at an intermediate stroke position.
For details on spacers and stroke adjustment units, refer to "Accessory Bracket (Option)" on page 1251-1.

Stroke adjustment unit mounting diagram



Example of H6H7 attachment



Refer to pages 1331 to 1333-1 for the specifications with auto switch.

Shock Absorbers for L and H Units

Model	Stroke adjustment unit	Bore size (mm)				
		10	20	25	32	40
Standard (Shock absorber/ RB series)	L	—	RB0806	RB1007	RB1412	
	H	RB0805	RB1007	RB1412	RB2015	
Shock absorber/ soft type RJ series mounted (-XB22)	L	—	RJ0806H	RJ1007H	RJ1412H	
	H	RJ0805	RJ1007H	RJ1412H	—	—

∗ The shock absorber service life is different from that of the MY1B cylinder depending on operating conditions. Refer to the RB Series Specific Product Precautions for the replacement period.
∗ Mounted shock absorber soft type RJ series (-XB22) is made to order specifications. For details, refer to page 1752.

Shock Absorber Specifications

Model		RB 0805	RB 0806	RB 1007	RB 1412	RB 2015
Max. energy absorption (J)		1.0	2.9	5.9	19.6	58.8
Stroke absorption (mm)		5	6	7	12	15
Max. collision speed (mm/s)		1000	1500	1500	1500	1500
Max. operating frequency (cycle/min)		80	80	70	45	25
Spring force (N)	Extended	1.96	1.96	4.22	6.86	8.34
	Retracted	3.83	4.22	6.86	15.98	20.50
Operating temperature range (°C)		5 to 60				

∗ The shock absorber service life is different from that of the MY1B cylinder depending on operating conditions. Refer to the RB series Specific Product Precautions for the replacement period.

Theoretical Output

(N)

Bore size (mm)	Piston area (mm^2)	Operating pressure (MPa)						
		0.2	0.3	0.4	0.5	0.6	0.7	0.8
10	78	15	23	31	39	46	54	62
16	200	40	60	80	100	120	140	160
20	314	62	94	125	157	188	219	251
25	490	98	147	196	245	294	343	392
32	804	161	241	322	402	483	563	643
40	1256	251	377	502	628	754	879	1005
50	1962	392	588	784	981	1177	1373	1569
63	3115	623	934	1246	1557	1869	2180	2492
80	5024	1004	1507	2009	2512	3014	3516	4019
100	7850	1570	2355	3140	3925	4710	5495	6280

Note) Theoretical output (N) = Pressure (MPa) x Piston area (mm^2)

Weight

(kg)

Bore size (mm)	Basic weight	Additional weight per each 50 mm of stroke	Weight of moving parts	Side support bracket weight (per set)	Stroke adjustment unit weight (per unit)		
				Type A and B	A unit weight	L unit weight	H unit weight
10	0.15	0.04	0.03	0.003	0.01	—	0.02
16	0.61	0.06	0.07	0.01	0.04	—	—
20	1.06	0.10	0.14	0.02	0.05	0.05	0.10
25	1.14	0.11	0.21	0.02	0.06	0.10	0.18
32	2.28	0.17	0.47	0.02	0.12	0.21	0.40
40	3.11	0.25	0.91	0.04	0.23	0.32	0.49
50	7.78	0.44	1.40	0.04	—	—	—
63	13.10	0.70	2.20	0.08	—	—	—
80	20.70	1.18	4.80	0.17	—	—	—
100	35.70	1.97	8.20	0.17	—	—	—

Calculation: (Example) **MY1B20-300A**
- Basic weight ·····1.06 kg
- Cylinder stroke ·····300 stroke
- Additional weight ·····0.10/50 stroke
  1.06 + 0.10 x 300/50 + 0.05 x 2 ≅ 2.17 kg
- Weight of A unit ·····1.76 kg

⚠Precautions

For details on the MY1B Series Mechanically Jointed Rodless Cylinder, refer to "Specific Product Precautions" on pages 1335 to 1336-2.

Cushion Capacity

Cushion Selection

<Rubber bumper>
Rubber bumpers are a standard feature on MY1B10. Since the stroke absorption of rubber bumpers is short, when adjusting the stroke with an A unit, install an external shock absorber.
The load and speed range which can be absorbed by a rubber bumper is inside the rubber bumper limit line of the graph.

<Air cushion>
Air cushions are a standard feature on mechanically jointed rodless cylinders. (Except ø10.)
The air cushion mechanism is incorporated to prevent excessive impact of the piston at the stroke end during high speed operation. The purpose of air cushion, thus, is not to decelerate the piston near the stroke end.
The ranges of load and speed that air cushions can absorb are within the air cushion limit lines shown in the graphs.

<Stroke adjustment unit with shock ab-sorber>
Use this unit when operating with a load or speed exceeding the air cushion limit line, or when cushioning is required outside of the effective air cushion stroke range due to stroke adjustment.

L unit
Use this unit when cushioning is necessary outside of the effective air cushion range even if the load and speed are within the air cushion limit line, or when the cyl-inder is operated in a load and speed range above the air cushion limit line and below the L unit limit line.

H unit
Use this unit when the cylinder is operated in a load and speed range above the L unit limit line and below the H unit limit line.

* For details on stroke adjustment using the adjustment bolt, refer to page 1336.

Air Cushion Stroke

(mm)

Bore size (mm)	Cushion stroke

∗ Seal kit includes ㉚, ㉛, ㉜, ㉝ and ㉟. Order the seal kit based on each bore size.
∗ Seal kit includes a grease pack (10 g).
When ⑭ and ⑮ are shipped independently, a grease pack is included. (10 g per 1000 strokes)
Order with the following part number when only the grease pack is needed.
Grease pack part number: GR-S-010 (10 g), **GR-S-020** (20 g)

Note) Two kinds of dust seal bands are available for the MY1B16, 20, 50, 63. Since the part number varies depending on the treatment of the hexagon socket head set screw ㉓, please check a proper dust seal band carefully.
A: Black zinc chromated→MY□□-16B-stroke, B: Chromated→MY□□-16BW-stroke

Construction ø25, ø32, ø40

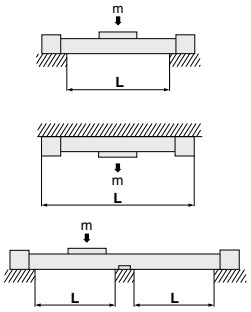
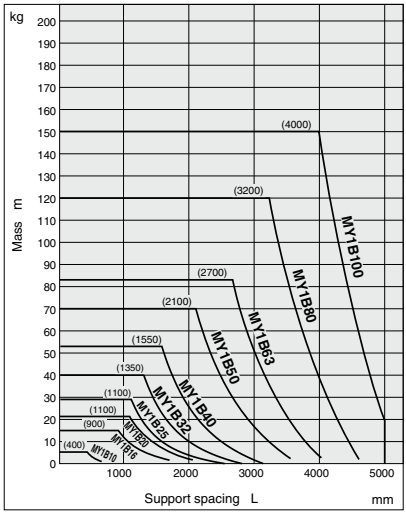
∗ A set of side supports consists of a left support and a right support.

Guide for Side Support Application

For long stroke operation, the cylinder tube may be deflected depending on its own weight and the load mass. In such a case, use a side support in the middle section. The spacing (L) of the support must be no more than the values shown in the graph on the right.





⚠ Caution

1. If the cylinder mounting surfaces are not measured accurately, using a side support may cause poor operation. Therefore, be sure to level the cylinder tube when mounting. Also, for long stroke operation involving vibration and impact, use of a side support is recommended even if the spacing value is within the allowable limits shown in the graph.
2. Support brackets are not for mounting; use them solely for providing support.

Floating Bracket

Facilitates connection to other guide systems.

∗ For details on how to secure the holding bolt, refer to page 1336.

MYAJ25 to 40 (1 set) Component Parts

Description	Qty.	Material
Bracket	2	Rolled steel
Pin	2	Carbon steel
Conical spring washer	2	Carbon steel
Holding bolt	2	Chromium molybdenum steel

Floating Bracket

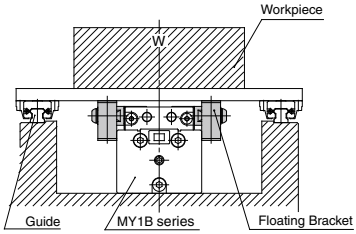
Facilitates connection to other guide systems.

Applicable bore size

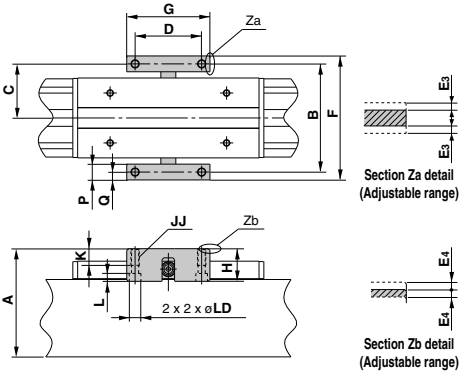
ø50, ø63

MY-J50/MY-J63

Application Example



Mounting Example



(mm)

Model	Applicable bore size	A	B	C	D	F	G	H
MY-J50	**MY1B50□**	110	110	55	70	126	90	37
MY-J63	**MY1B63□**	131	130	65	80	149	100	37

Model	Applicable bore size	JJ	K	L	P	Q	E_3	E_4	LD
MY-J50	**MY1B50□**	M8 x 1.25	20	7.5	16	8	2.5	2.5	11
MY-J63	**MY1B63□**	M10 x 1.5	20	9.5	19	9.5	2.5	2.5	14

Note) A set of brackets with floating mechanism consists of a left bracket and a right bracket.

∗ For details on how to secure the holding bolt, refer to page 1336.

MY-J50, 63 (1 set) Component Parts

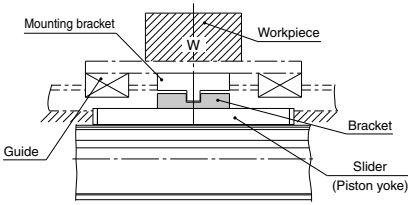
Description	Qty.	Material
Bracket	2	Carbon steel
Pin	2	Carbon steel
Conical spring washer	2	Carbon steel
Holding bolt	2	Chromium molybdenum steel

Applicable bore size

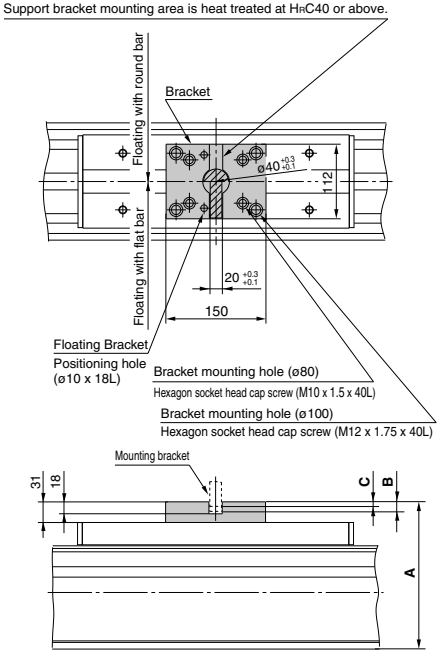
ø80, ø100

MY-J80/MY-J100

Application Example



Mounting Example



Model	Applicable bore size	A	B (max.)	C (min.)
MY-J80	**MY1B 80□**	181	15	9
MY-J100	**MY1B100□**	221	15	9

Note) • Flat bar or round bar mounting are possible for the support bracket (slanted lines) mounted by the customer.
• "B" and "C" indicate the allowable mounting dimensions for the support bracket (flat bar or round bar).
• Consider support brackets with dimensions that allow the floating mechanism to function properly.

MY-J80, 100 (1 set) Component Parts

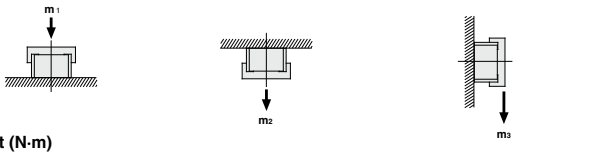
Maximum Allowable Moment/Maximum Load Mass

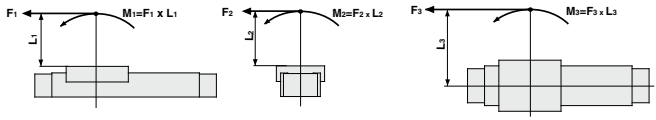
Model	Bore size (mm)	Maximum allowable moment (N·m)			Maximum load mass (kg)		
		M_1	M_2	M_3	m_1	m_2	m_3
MY1M	**16**	6.0	3.0	1.0	18	7	2.1
	20	10	5.2	1.7	26	10.4	3
	25	15	9.0	2.4	38	15	4.5
	32	30	15	5.0	57	23	6.6
	40	59	24	8.0	84	33	10
	50	115	38	15	120	48	14
	63	140	60	19	180	72	21

The above values are the maximum allowable values for moment and load. Refer to each graph regarding the maximum allowable moment and maximum allowable load for a particular piston speed.

Load mass (kg)



Moment (N·m)



<Calculation of guide load factor>

1. Maximum allowable load (1), static moment (2), and dynamic moment (3) (at the time of impact with stopper) must be examined for the selection calculations.
∗ To evaluate, use υa (average speed) for (1) and (2), and υ (collision speed $\upsilon = 1.4\upsilon a$) for (3). Calculate mmax for (1) from the maximum allowable load graph (m_1, m_2, m_3) and Mmax for (2) and (3) from the maximum allowable moment graph (M_1, M_2, M_3).

Sum of guide load factors

$$\Sigma\alpha = \frac{\text{Load mass [m]}}{\text{Maximum allowable load [mmax]}} + \frac{\text{Static moment [M]}\ ^{(1)}}{\text{Allowable static moment [Mmax]}} + \frac{\text{Dynamic moment [M}_E\text{]}\ ^{(2)}}{\text{Allowable dynamic moment [M}_E\text{max]}} \leq 1$$

Note 1) Moment caused by the load, etc., with cylinder in resting condition.
Note 2) Moment caused by the impact load equivalent at the stroke end (at the time of impact with stopper).
Note 3) Depending on the shape of the workpiece, multiple moments may occur. When this happens, the sum of the load factors (α) is the total of all such moments.

2. Reference formula [Dynamic moment at impact]
Use the following formulae to calculate dynamic moment when taking stopper impact into consideration.

m: Load mass (kg)
F: Load (N)
F_E: Load equivalent to impact (at impact with stopper) (N)
υa: Average speed (mm/s)
M: Static moment (N·m)

$\upsilon = 1.4\upsilon a$ (mm/s) $F_E = 1.4\upsilon a \cdot \delta \cdot m \cdot g$ (Note 4)

$\therefore M_E = \frac{1}{3}$ (Note 5) $\cdot F_E \cdot L_1 = 4.57\upsilon a \delta m L_1$ (N·m)

υ: Collision speed (mm/s)
L_1: Distance to the load's center of gravity (m)
M_E: Dynamic moment (N·m)
δ: Damper coefficient At collision: $\upsilon = 1.4\upsilon a$
With rubber bumper = 4/100
(MY1B10, MY1H10)
With air cushion = 1/100
With shock absorber = 1/100
g: Gravitational acceleration (9.8 m/s²)

Note 4) $1.4\upsilon a\delta$ is a dimensionless coefficient for calculating impact force.
Note 5) Average load coefficient ($=\frac{1}{3}$): This coefficient is for averaging the maximum load moment at the time of stopper impact according to service life calculations.

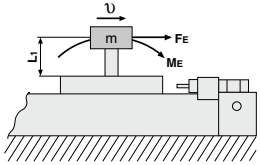
3. For detailed selection procedures, refer to pages 1260 and 1261.

Maximum Allowable Moment

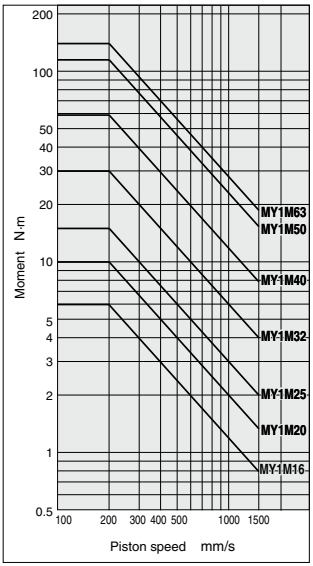
Select the moment from within the range of operating limits shown in the graphs. Note that the maximum allowable load value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable load for the selected conditions.

Maximum Load Mass

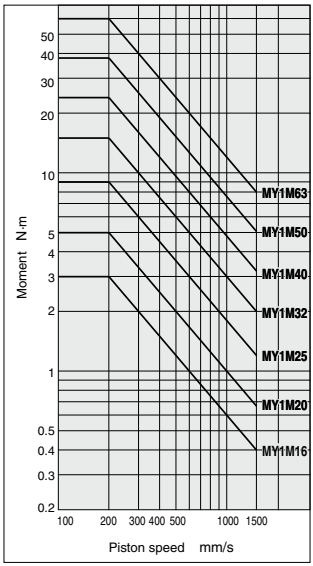
Select the load from within the range of limits shown in the graphs. Note that the maximum allowable moment value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable moment for the selected conditions.



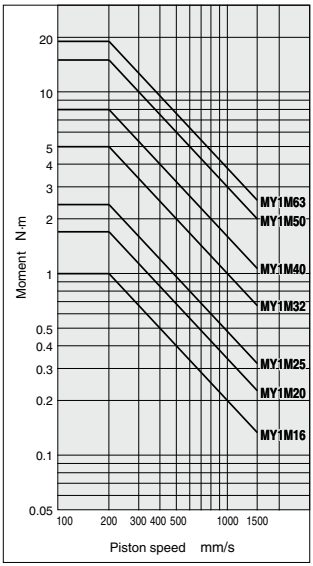
MY1M/M1



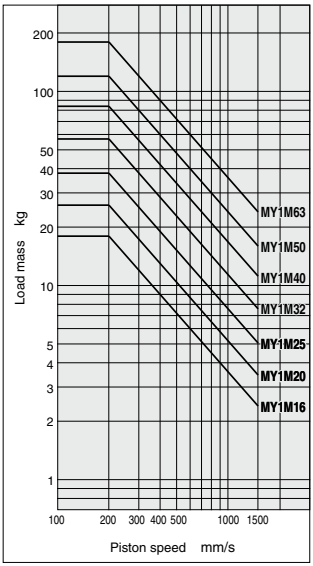
MY1M/M2



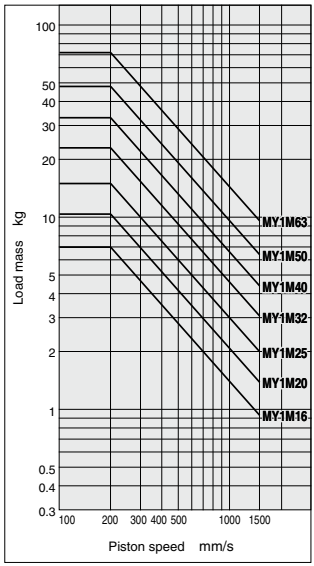
MY1M/M3



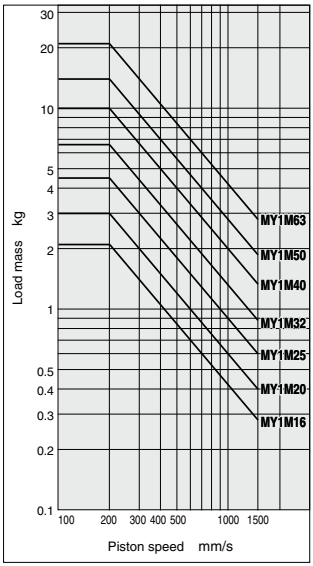
MY1M/m1



MY1M/m2



MY1M/m3



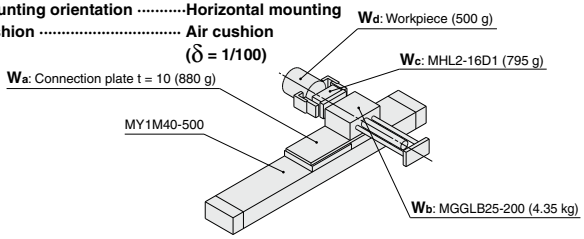
MY1M Series
Model Selection

Following are the steps for selecting the most suitable MY1M series to your application.

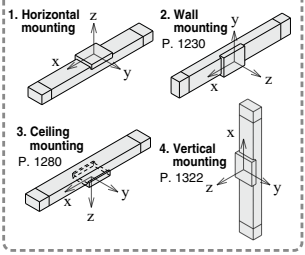
Calculation of Guide Load Factor

1. Operating Conditions

Cylinder ····· **MY1M40-500**
Average operating speed υ**a** ···**200 mm/s**
Mounting orientation ·····**Horizontal mounting**
Cushion ····· **Air cushion**
(δ **= 1/100)**

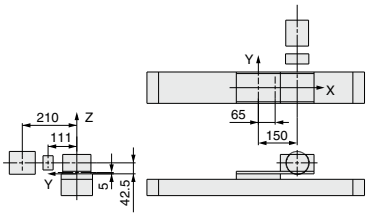


Mounting Orientation



For actual examples of calculation for each orientation, refer to the pages above.

2. Load Blocking



Mass and Center of Gravity for Each Workpiece

Workpiece no. W_n	Mass m_n	Center of gravity		
		X-axis **Xn**	Y-axis **Yn**	Z-axis **Zn**
Wa	0.88 kg	65 mm	0 mm	5 mm
Wb	4.35 kg	150 mm	0 mm	42.5 mm
Wc	0.795 kg	150 mm	111 mm	42.5 mm
Wd	0.5 kg	150 mm	210 mm	42.5 mm

n=a, b, c, d

3. Composite center of Gravity Calculation

$\mathbf{m_1} = \Sigma m_n$
$= 0.88 + 4.35 + 0.795 + 0.5 =$ **6.525 kg**

$$\mathbf{X} = \frac{1}{\mathbf{m_1}} \times \Sigma (\mathbf{m_n} \times \mathbf{x_n})$$
$$= \frac{1}{6.525} (0.88 \times 65 + 4.35 \times 150 + 0.795 \times 150 + 0.5 \times 150) = \mathbf{138.5\ mm}$$

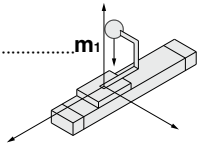
$$\mathbf{Y} = \frac{1}{\mathbf{m_1}} \times \Sigma (\mathbf{m_n} \times \mathbf{y_n})$$
$$= \frac{1}{6.525} (0.88 \times 0 + 4.35 \times 0 + 0.795 \times 111 + 0.5 \times 210) = \mathbf{29.6\ mm}$$

$$\mathbf{Z} = \frac{1}{\mathbf{m_1}} \times \Sigma (\mathbf{m_n} \times \mathbf{z_n})$$
$$= \frac{1}{6.525} (0.88 \times 5 + 4.35 \times 42.5 + 0.795 \times 42.5 + 0.5 \times 42.5) = \mathbf{37.4\ mm}$$

4. Calculation of load factor for static load

m_1: Mass

m_1 max (from (1) of graph MY1M/**m_1**) = 84 (kg)·····



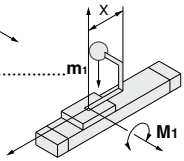
Load factor α_1 = **m_1/m_1 max** = 6.525/84 = 0.08

M_1: Moment

M_1 max (from (2) of graph MY1M/**M_1**) = 59 (N·m)·····

M_1 = **m_1** x **g** x **X** = $6.525 \times 9.8 \times 138.5 \times 10^{-3} = 8.86$ (N·m)

Load factor α_2 = **M_1/M_1 max** = 8.86/59 = 0.15

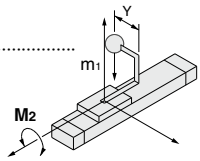


M_2 : Moment

M_2 max (from (3) of graph MY1M/**M_2**) = 24 (N·m)

$\mathbf{M_3} = \mathbf{m_1} \times \mathbf{g} \times \mathbf{Y} = 6.525 \times 9.8 \times 29.6 \times 10^{-3} = 1.89$ (N·m)

Load factor α_3 = **M_2/M_2 max** = 1.89/24 = **0.08**



5. Calculation of Load Factor for Dynamic Moment

Equivalent load F_E at impact

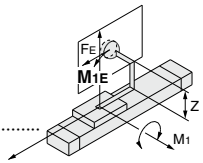
$\mathbf{F_E} = 1.4\upsilon\mathbf{a} \times \delta \times \mathbf{m} \times \mathbf{g} = 1.4 \times 200 \times \frac{1}{100} \times 6.525 \times 9.8 = 179.1$ (N)

M_{1E} : Moment

M_{1E} max (from (4) of graph MY1M/**M_1** where 1.4υa = 280 mm/s) = 42.1 (N·m)

$\mathbf{M_{1E}} = \frac{1}{3} \times \mathbf{F_E} \times \mathbf{Z} = \frac{1}{3} \times 179.1 \times 37.4 \times 10^{-3} = 2.23$ (N·m)

Load factor α_4 = **M_{1E}/M_{1E} max** = 2.23/42.1 = **0.05**

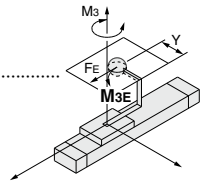


M_{3E}: Moment

M_{3E} max (from (5) of graph MY1M/**M_3** where 1.4υa = 280 mm/s) = 5.7 (N·m)

$\mathbf{M_{3E}} = \frac{1}{3} \times \mathbf{F_E} \times \mathbf{Y} = \frac{1}{3} \times 179.1 \times 29.6 \times 10^{-3} = 1.77$ (N·m)

Load factor α_5 = **M_{3E}/M_{3E} max** = 1.77/5.7 = **0.31**



6. Sum and Examination of Guide Load Factors

$\Sigma\alpha = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4 + \alpha_5 = \mathbf{0.67} \leq \mathbf{1}$

The above calculation is within the allowable value, and therefore the selected model can be used.
Select a shock absorber separately.
In an actual calculation, when the total sum of guide load factors α in the formula above is more than 1, consider either decreasing the speed, increasing the bore size, or changing the product series. This calculation can be easily made using the "SMC Pneumatics CAD System".

Mechanically Jointed Rodless Cylinder
Slide Bearing Guide Type
MY1M Series
ø16, ø20, ø25, ø32, ø40, ø50, ø63

How to Order

Slide bearing guide type **MY1M** **20** ❶ **G** ❸ – **300** ❹ ❺ – **M9BW** ❻ ❼ – ❽

Slide bearing guide type ●

❶ Bore size

16	16 mm
20	20 mm
25	25 mm
32	32 mm
40	40 mm
50	50 mm
63	63 mm

❷ Port thread type

Symbol	Type	Bore size
Nil	M thread	ø16, ø20
	Rc	ø25, ø32,
TN	NPT	ø40, ø50,
TF	G	ø63

❸ Piping

Nil	Standard type
G	Centralized piping type

❹ Cylinder stroke (mm)

Bore size	Standard stroke*1	Long stroke (-XB11)	Maximum manufacturable stroke
16	100, 200, 300, 400, 500 600, 700, 800, 900 1000, 1200,1 400 1600, 1800, 2000 *1 The stroke can be manufactured in 1 mm increments from 1 mm stroke.	Strokes of 2001 to 3000 mm (1 mm increments) exceeding the standard stroke	3000
20, 25, 32 40, 50, 63		Strokes of 2001 to 5000 mm (1 mm increments) exceeding the standard stroke	5000

Ordering example
* Add "-XB11" to the end of the part number for long strokes. MY1M20-3000L-M9BW-XB11

Note) Please be advised that with stroke 49 or less, there are cases where auto switch mounting is not possible and the performance of the air cushion may decline.

❺ Stroke adjustment unit symbol
Refer to "Stroke adjustment unit" on page 1263.

❻ Auto switch

Nil	Without auto switch (Built-in magnet)

Applicable auto switches vary depending on the bore size. Select an applicable one referring to the table below.

❼ Number of auto switches

Nil	2 pcs.
S	1 pc.
n	"n" pcs.

❽ Made to Order
Refer to page 1263 for details.

Applicable Auto Switches
/Refer to pages 1575 to 1701 for further information on auto switches.

Piston Speed

Bore size (mm)		16 to 63
Without stroke adjustment unit		100 to 1000 mm/s
Stroke adjustment unit	**A unit**	100 to 1000 mm/s (1)
	L unit and H unit	100 to 1500 mm/s (2)

Note 1) Be aware that when the stroke adjustment range is increased by manipulating the adjustment bolt, the air cushion capacity decreases. Also, when exceeding the air cushion stroke ranges on page 1266, **the piston speed should be 100 to 200 mm per second.**
Note 2) The piston speed is 100 to 1000 mm/s for centralized piping.
Note 3) Use at a speed within the absorption capacity range. Refer to page 1266.
Note 4) Due to the construction of this product, it may have more fluctuation in operating speed compared to a rod type air cylinder. For applications that require constant speed, select the equipment corresponding to the required level.

Note) Theoretical output (N) = Pressure (MPa) x Piston area (mm²)

Weight

(kg)

Bore size (mm)	Basic weight	Additional weight per each 50 mm of stroke	Weight of moving parts	Side support bracket weight (per set)	Stroke adjustment unit weight (per unit)		
				Type A and B	A unit weight	L unit weight	H unit weight
16	0.67	0.12	0.19	0.01	0.03	0.04	—
20	1.11	0.16	0.28	0.02	0.04	0.05	0.08
25	1.64	0.24	0.39	0.02	0.07	0.11	0.18
32	3.27	0.38	0.81	0.04	0.14	0.23	0.39
40	5.88	0.56	1.41	0.08	0.25	0.34	0.48
50	10.06	0.77	2.51	0.08	0.36	0.51	0.81
63	16.57	1.11	3.99	0.17	0.68	0.83	1.08

Calculation: (Example) **MY1M25-300A**
- Basic weight····· 1.64 kg
- Cylinder stroke····· 300 stroke
- Additional weight····· 0.24/50 stroke
  1.64 + 0.24 x 300/50 + 0.07 x 2 ≅ 3.22 kg
- Weight of A unit····· 0.07 kg

⚠Precautions

For details on the MY1M Series Mechanically Jointed Rodless Cylinder, refer to "Specific Product Precautions" on pages 1335 to 1336-2.

Cushion Capacity

Cushion Selection

<Air cushion>
Air cushions are a standard feature on mechanically jointed rodless cylinders. The air cushion mechanism is incorporated to prevent excessive impact of the piston at the stroke end during high speed operation. The purpose of air cushion, thus, is not to decelerate the piston near the stroke end. The ranges of load and speed that air cushions can absorb are within the air cushion limit lines shown in the graphs.

<Stroke adjustment unit with shock absorber>
Use this unit when operating with a load or speed exceeding the air cushion limit line, or when cushioning is required outside of the effective air cushion stroke range due to stroke adjustment.

<L unit>
Use this unit when the cylinder stroke is outside of the effective air cushion range even if the load and speed are within the air cushion limit line, or when the cylinder is operated in a load and speed range above the air cushion limit line or below the L unit limit line.

<H unit>
Use this unit when the cylinder is operated in a load and speed range above the L unit limit line and below the H unit limit line.

∗ For details on stroke adjustment using the adjustment bolt, refer to page 1336.

∗ Seal kit includes ⑲, ⑳, ㉑, ㉒ and ㊳. Order the seal kit based on each bore size.
∗ Seal kit includes a grease pack (10 g).
When ⑯ and ⑰ are shipped independently, a grease pack is included. (10 g per 1000 strokes)
Order with the following part number when only the grease pack is needed.
Grease pack part number: GR-S-010 (10 g), **GR-S-020** (20 g)

Note) Two kinds of dust seal bands are available. Verify the type to use, since the part number varies depending on the treatmentof the hexagon socket head set screw ㉜.

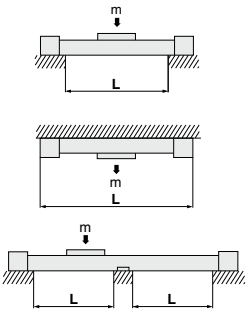
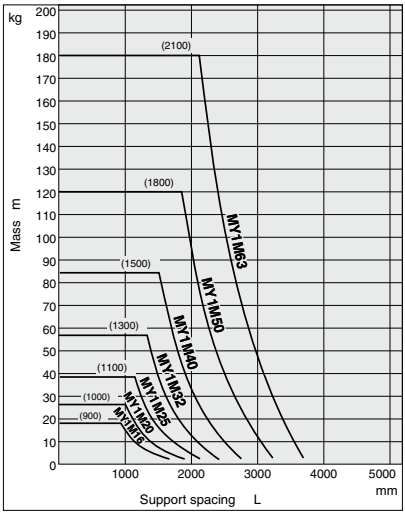
∗ A set of side supports consists of a left support and a right support.

Guide for Side Support Application

For long stroke operation, the cylinder tube may be deflected depending on its own weight and the load mass. In such a case, use a side support in the middle section. The spacing (L) of the support must be no more than the values shown in the graph on the right.





⚠Caution

1. If the cylinder mounting surfaces are not measured accurately, using a side support may cause poor operation. Therefore, be sure to level the cylinder tube when mounting. Also, for long stroke operation involving vibration and impact, use of a side support is recommended even if the spacing value is within the allowable limits shown in the graph.
2. Support brackets are not for mounting; use them solely for providing support.

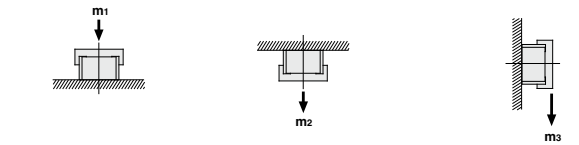
Maximum Allowable Moment/Maximum Load Mass

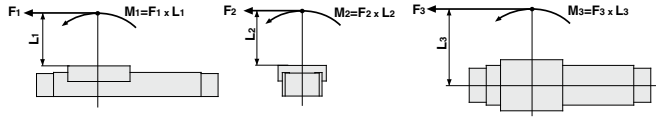
Model	Bore size (mm)	Maximum allowable moment (N·m)			Maximum load mass (kg)		
		M_1	M_2	M_3	m_1	m_2	m_3
MY1C	**16**	6.0	3.0	2.0	18	7	2.1
	20	10	5.0	3.0	25	10	3
	25	15	8.5	5.0	35	14	4.2
	32	30	14	10	49	21	6
	40	60	23	20	68	30	8.2
	50	115	35	35	93	42	11.5
	63	150	50	50	130	60	16

The above values are the maximum allowable values for moment and load. Refer to each graph regarding the maximum allowable moment and maximum allowable load for a particular piston speed.

Load mass (kg)



Moment (N·m)



<Calculation of guide load factor>

1. Maximum allowable load (1), static moment (2), and dynamic moment (3) (at the time of impact with stopper) must be examined for the selection calculations.

∗ To evaluate, use υa (average speed) for (1) and (2), and υ (collision speed $\upsilon = 1.4\upsilon a$) for (3). Calculate mmax for (1) from the maximum allowable load graph (m_1, m_2, m_3) and Mmax for (2) and (3) from the maximum allowable moment graph (M_1, M_2, M_3).

Sum of guide load factors

$$\Sigma\alpha = \frac{\text{Load mass [m]}}{\text{Maximum allowable load [m max]}} + \frac{\text{Static moment [M]}^{(1)}}{\text{Allowable static moment [Mmax]}} + \frac{\text{Dynamic moment [M}_E\text{]}^{(2)}}{\text{Allowable dynamic moment [M}_E\text{max]}} \leq 1$$

Note 1) Moment caused by the load, etc., with cylinder in resting condition.
Note 2) Moment caused by the impact load equivalent at the stroke end (at the time of impact with stopper).
Note 3) Depending on the shape of the workpiece, multiple moments may occur. When this happens, the sum of the load factors ($\Sigma\alpha$) is the total of all such moments.

2. Reference formula [Dynamic moment at impact]
Use the following formulae to calculate dynamic moment when taking stopper impact into consideration.

m: Load mass (kg)
F: Load (N)
F_E: Load equivalent to impact (at impact with stopper) (N)
υa: Average speed (mm/s)
M: Static moment (N·m)

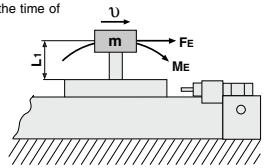
$\upsilon = 1.4\upsilon a$ (mm/s) $F_E = 1.4\upsilon a \cdot \delta \cdot m \cdot g$ Note 4)

$\therefore M_E = \frac{1}{3} \cdot F_E \cdot L_1 = 4.57\upsilon a \delta m L_1$ (N·m) Note 5)

υ: Collision speed (mm/s)
L_1: Distance to the load's center of gravity (m)
M_E: Dynamic moment (N·m)
δ: Damper coefficient At collision: $\upsilon = 1.4\upsilon a$
With rubber bumper = 4/100
(MY1B10, MY1H10)
With air cushion = 1/100
With shock absorber = 1/100
g: Gravitational acceleration (9.8 m/s²)

Note 4) $1.4\upsilon a\delta$ is a dimensionless coefficient for calculating impact force.
Note 5) Average load coefficient (= $\frac{1}{3}$): This coefficient is for averaging the maximum load moment at the time of stopper impact according to service life calculations.

3. For detailed selection procedures, refer to pages 1280 and 1281.



Maximum Allowable Moment

Select the moment from within the range of operating limits shown in the graphs. Note that the maximum allowable load value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable load for the selected conditions.

Maximum Load Mass

Select the load from within the range of limits shown in the graphs. Note that the maximum allowable moment value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable moment for the selected conditions.

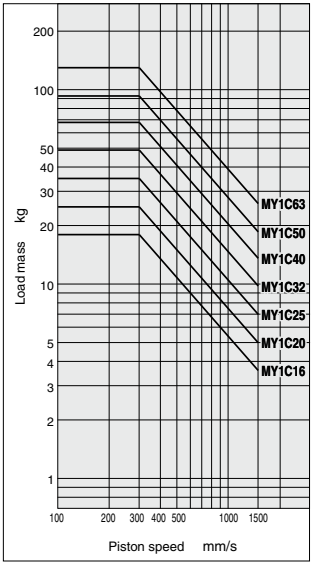
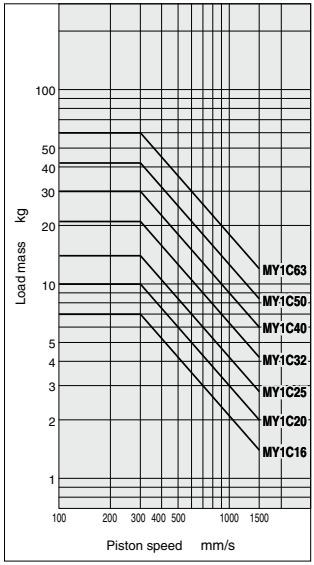
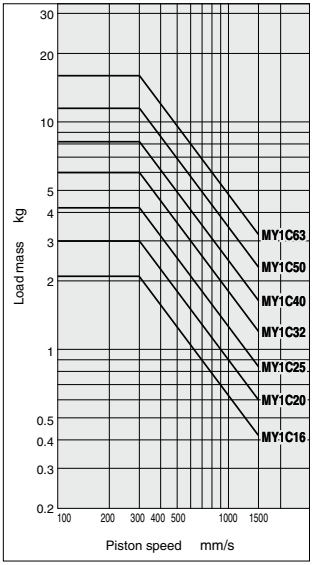
MY1C/m_1



MY1C/m_2



MY1C/m_3



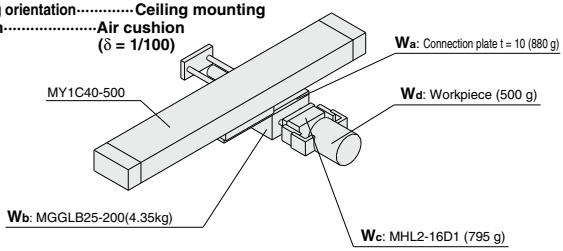
MY1C Series
Model Selection

Following are the steps for selecting the most suitable MY1C series to your application.

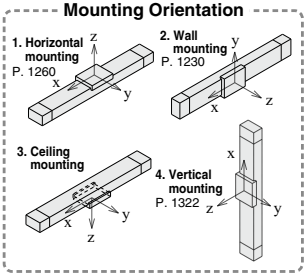
Calculation of Guide Load Factor

1. Operating Conditions

Cylinder·····**MY1C40-500**
Average operating speed υa ··· **300 mm/s**
Mounting orientation·····**Ceiling mounting**
Cushion·····**Air cushion**
(δ **= 1/100)**

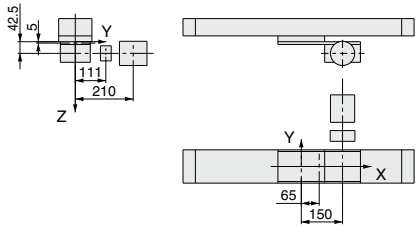


Mounting Orientation



For actual examples of calculation for each orientation, refer to the pages above.

2. Load Blocking



Mass and Center of Gravity for Each Workpiece

Workpiece no. **Wn**	Mass **mn**	Center of gravity		
		X-axis **Xn**	Y-axis **Yn**	Z-axis **Zn**
Wa	0.88 kg	65 mm	0 mm	5 mm
Wb	4.35 kg	150 mm	0 mm	42.5 mm
Wc	0.795 kg	150 mm	111 mm	42.5 mm
Wd	0.5 kg	150 mm	210 mm	42.5 mm

n=a, b, c, d

3. Composite Center of Gravity Calculation

$\mathbf{m_2} = \Sigma m_n$
$= 0.88 + 4.35 + 0.795 + 0.5 =$ **6.525 kg**

$\mathbf{X} = \frac{1}{\mathbf{m_2}} \times \Sigma (\mathbf{m_n} \times \mathbf{x_n})$
$= \frac{1}{6.525}(0.88 \times 65 + 4.35 \times 150 + 0.795 \times 150 + 0.5 \times 150) =$ **138.5 mm**

$\mathbf{Y} = \frac{1}{\mathbf{m_2}} \times \Sigma (\mathbf{m_n} \times \mathbf{y_n})$
$= \frac{1}{6.525}(0.88 \times 0 + 4.35 \times 0 + 0.795 \times 111 + 0.5 \times 210) =$ **29.6 mm**

$\mathbf{Z} = \frac{1}{\mathbf{m_2}} \times \Sigma (\mathbf{m_n} \times \mathbf{z_n})$
$= \frac{1}{6.525}(0.88 \times 5 + 4.35 \times 42.5 + 0.795 \times 42.5 + 0.5 \times 42.5) =$ **37.4 mm**

4. Calculation of Load Factor for Static Load

$\mathbf{m_2}$: Mass

$\mathbf{m_2}$ **max** (from (1) of graph MY1C/$\mathbf{m_2}$) = 30 (kg)·····

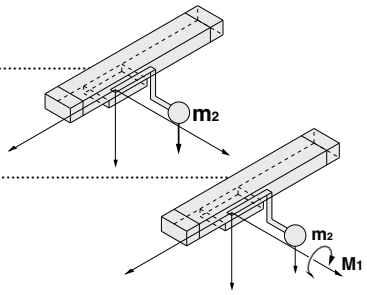
Load factor $\alpha_1 = \mathbf{m_2}/\mathbf{m_2}$ **max** = 6.525/30 = **0.22**

$\mathbf{M_1}$: Moment

$\mathbf{M_1}$ **max** (from (2) of graph MY1C/$\mathbf{M_1}$) = 60 (N·m)·····

$\mathbf{M_1} = \mathbf{m_2} \times \mathbf{g} \times \mathbf{X} = 6.525 \times 9.8 \times 138.5 \times 10^{-3} = 8.86$ (N·m)

Load factor $\alpha_2 = \mathbf{M_1}/\mathbf{M_1}$ **max** = 8.86/60 = **0.15**

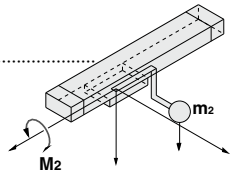


M_2: Moment

M_2 max (from (3) of graph MY1C/**M_2**) = 23.0 (N·m)

M_2 = **m_2** x **g** x **Y** = 6.525 x 9.8 x 29.6 x 10^{-3} = 1.89 (N·m)

Load factor α_3 = **M_2/M_2 max** = 1.89/23.0 = **0.08**



5. Calculation of Load Factor for Dynamic Moment

Equivalent load F_E at impact

$F_E = 1.4\upsilon a \times \delta \times m \times g = 1.4 \times 300 \times \frac{1}{100} \times 6.525 \times 9.8 = 268.6$ (N)

M_{1E}: Moment

M_{1E} max (from (4) of graph MY1C/**M_1** where 1.4υa = 420 mm/s) = 42.9 (N·m)

$M_{1E} = \frac{1}{3} \times F_E \times Z = \frac{1}{3} \times 268.6 \times 37.4 \times 10^{-3} = 3.35$ (N·m)

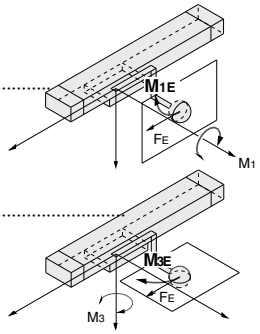
Load factor α_4 = **M_{1E}/M_{1E} max** = 3.35/42.9 = **0.08**

M_{3E}: Moment

M_{3E} max (from (5) of graph MY1C/**M_3** where 1.4υa = 420 mm/s) = 14.3 (N·m)

$M_{3E} = \frac{1}{3} \times F_E \times Y = \frac{1}{3} \times 268.6 \times 29.6 \times 10^{-3} = 2.65$ (N·m)

Load factor α_5 = **M_{3E}/M_{3E} max** = 2.65/14.3 = **0.19**



6. Sum and Examination of Guide Load Factors

$\Sigma\alpha = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4 + \alpha_5 = \mathbf{0.72} \leq \mathbf{1}$

The above calculation is within the allowable value, and therefore the selected model can be used.
Select a shock absorber separately.
In an actual calculation, when the total sum of guide load factors α in the formula above is more than 1, consider either decreasing the speed, increasing the bore size, or changing the product series. This calculation can be easily made using the "SMC Pneumatics CAD System".

Specifications

Bore size (mm)		16	20	25	32	40	50	63
Fluid		Air						
Action		Double acting						
Operating pressure range		0.15 to 0.8 MPa		0.1 to 0.8 MPa				
Proof pressure		1.2 MPa						
Ambient and fluid temperature		5 to 60°C						
Cushion		Air cushion						
Lubrication		Non-lube						
Stroke length tolerance		1000 or less $^{+1.8}_{0}$, 1001 to 3000 $^{+2.8}_{0}$		2700 or less $^{+1.8}_{0}$, 2701 to 5000 $^{+2.8}_{0}$				
Piping port size	**Front/Side port**	M5 x 0.8		1/8		1/4		3/8
	Bottom port	ø4		ø6		ø8		ø10

Piston Speed

Bore size (mm)		16 to 63
Without stroke adjustment unit		100 to 1000 mm/s
Stroke adjustment unit	**A unit**	100 to 1000 mm/s(1)
	L unit and H unit	100 to 1500 mm/s(2)

Note 1) Be aware that when the stroke adjustment range is increased by manipulating the adjustment bolt, the air cushion capacity decreases. Also, when exceeding the air cushion stroke ranges on page 1286, **the piston speed should be 100 to 200 mm per second.**
Note 2) The piston speed is 100 to 1000 mm/s for centralized piping.
Note 3) Use at a speed within the absorption capacity range. Refer to page 1286.
Note 4) Due to the construction of this product, it may have more fluctuation in operating speed compared to a rod type air cylinder. For applications that require constant speed, select the equipment corresponding to the required level.

Calculation: (Example) **MY1C25-300A**
- Basic weight····· 1.58 kg
- Cylinder stroke····· 300 stroke
- Additional weight····· 0.24/50 stroke
  1.58 + 0.24 x 300/50 + 0.07 x 2 ≅ 3.16 kg
- Weight of A unit····· 0.07 kg

⚠Precautions

For details on the MY1C Series Mechanically Jointed Rodless Cylinder, refer to "Specific Product Precautions" on pages 1335 to 1336-2.

Cushion Capacity

Cushion Selection

<Air cushion>

Air cushions are a standard feature on mechanically jointed rodless cylinders.

The air cushion mechanism is incorporated to prevent excessive impact of the piston at the stroke end during high speed operation. The purpose of air cushion, thus, is not to decelerate the piston near the stroke end.

The ranges of load and speed that air cushions can absorb are within the air cushion limit lines shown in the graphs.

<Stroke adjustment unit with shock absorber>

Use this unit when operating with a load or speed exceeding the air cushion limit line, or when cushioning is necessary because the cylinder stroke is outside of the effective air cushion stroke range due to stroke adjustment.

L unit

Use this unit when the cylinder stroke is outside of the effective air cushion range even if the load and speed are within the air cushion limit line, or when the cylinder is operated in a load and speed range above the air cushion limit line or below the L unit limit line.

H unit

Use this unit when the cylinder is operated in a load and speed range above the L unit limit line and below the H unit limit line.

* For details on stroke adjustment using the adjustment bolt, refer to page 1336.

∗ Seal kit includes ㉕, ㉙, ㉚, ㉛ and ㊸. Order the seal kit based on each bore size.
∗ Seal kit includes a grease pack (10 g).
When ⑮ and ⑯ are shipped independently, a grease pack is included. (10 g per 1000 strokes)
Order with the following part number when only the grease pack is needed.
Grease pack part number: GR-S-010 (10 g), **GR-S-020** (20 g)

Note) Two kinds of dust seal bands are available. Verify the type to use, since the part number varies depending on the treatmentof the hexagon socket head set screw ㊲.
A: Black zinc chromated→MY□□-16B-stroke, B: Nickel plated→MY□□-16BW-stroke

Standard Type/Centralized Piping Type ø16, ø20

The stroke adjustment unit for the MY1C is the same as that of the MY1M. For models and external dimensions, refer to pages 1273 to 1274-1.

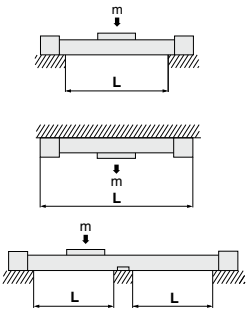
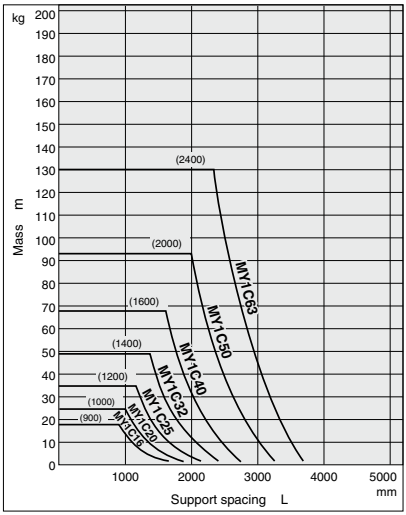
∗ A set of side supports consists of a left support and a right support.

Guide for Side Support Application

For long stroke operation, the cylinder tube may be deflected depending on its own weight and the load weight. In such a case, use a side support in the middle section. The spacing (L) of the support must be no more than the values shown in the graph on the right.





⚠ Caution

1. If the cylinder mounting surfaces are not measured accurately, using a side support may cause poor operation. Therefore, be sure to level the cylinder tube when mounting. Also, for long stroke operation involving vibration and impact, use of a side support is recommended even if the spacing value is within the allowable limits shown in the graph.
2. Support brackets are not for mounting; use them solely for providing support.

Maximum Allowable Moment/Maximum Load Mass

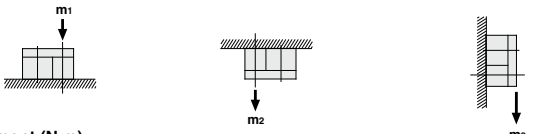
Model	Bore size (mm)	Maximum allowable moment (N·m)			Maximum load mass (kg)		
		M_1	M_2	M_3	m_1	m_2	m_3
MY1H	**10**	0.8	1.1	0.8	6.1	6.1	6.1
	16	3.7	4.9	3.7	10.8	10.8	10.8
	20	11	16	11	17.6	17.6	17.6
	25	23	26	23	27.5	27.5	27.5
	32	39	50	39	39.2	39.2	39.2
	40	50	50	39	50	50	50

The above values are the maximum allowable values for moment and load. Refer to each graph regarding the maximum allowable moment and maximum allowable load for a particular piston speed.

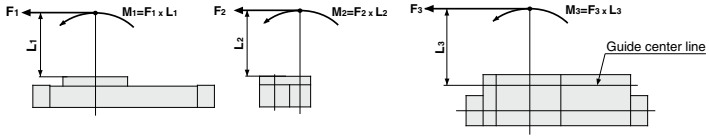
Maximum Allowable Moment

Select the moment from within the range of operating limits shown in the graphs. Note that the maximum allowable load value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable load for the selected conditions.

Load mass (kg)



Moment (N·m)



<Calculation of guide load factor>

1. Maximum allowable load (1), static moment (2), and dynamic moment (3) (at the time of impact with stopper) must be examined for the selection calculations.
∗ To evaluate, use υa (average speed) for (1) and (2), and υ (collision speed $\upsilon = 1.4\upsilon a$) for (3). Calculate mmax for (1) from the maximum allowable load graph (m_1, m_2, m_3) and Mmax for (2) and (3) from the maximum allowable moment graph (M_1, M_2, M_3).

Sum of guide load factors

$$\Sigma\alpha = \frac{\text{Load mass [m]}}{\text{Maximum allowable load [m max]}} + \frac{\text{Static moment [M] (1)}}{\text{Allowable static moment [Mmax]}} + \frac{\text{Dynamic moment [ME] (2)}}{\text{Allowable dynamic moment [MEmax]}} \leq 1$$

Note 1) Moment caused by the load, etc., with cylinder in resting condition.
Note 2) Moment caused by the impact load equivalent at the stroke end (at the time of impact with stopper).
Note 3) Depending on the shape of the workpiece, multiple moments may occur. When this happens, the sum of the load factors ($\Sigma\alpha$) is the total of all such moments.

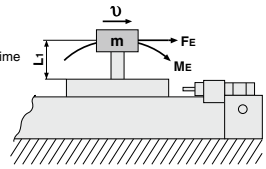
2. Reference formula [Dynamic moment at impact]
Use the following formulae to calculate dynamic moment when taking stopper impact into consideration.

m: Load mass (kg)
F: Load (N)
FE: Load equivalent to impact (at impact with stopper) (N)
υa: Average speed (mm/s)
M: Static moment (N·m)
υ: Collision speed (mm/s)
L1: Distance to the load's center of gravity (m)
ME: Dynamic moment (N·m)
δ: Damper coefficient
With rubber bumper = 4/100
(MY1B10, MY1H10)
With air cushion = 1/100
With shock absorber = 1/100
g: Gravitational acceleration (9.8 m/s²)

$\upsilon = 1.4\upsilon a$ (mm/s) $F_E = 1.4\upsilon a \cdot \delta^{\text{Note 4)}} \cdot m \cdot g$

$\therefore M_E = \frac{1}{3}^{\text{Note 5)}} \cdot F_E \cdot L_1 = 4.57\upsilon a \delta m L_1$ (N·m)

Note 4) $1.4\upsilon a\delta$ is a dimensionless coefficient for calculating impact force.
Note 5) Average load coefficient ($=\frac{1}{3}$): This coefficient is for averaging the maximum load moment at the time of stopper impact according to service life calculations.



3. For detailed selection procedures, refer to pages 1300 and 1301.

Maximum Load Mass

Select the load from within the range of limits shown in the graphs. Note that the maximum allowable moment value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable moment for the selected conditions.

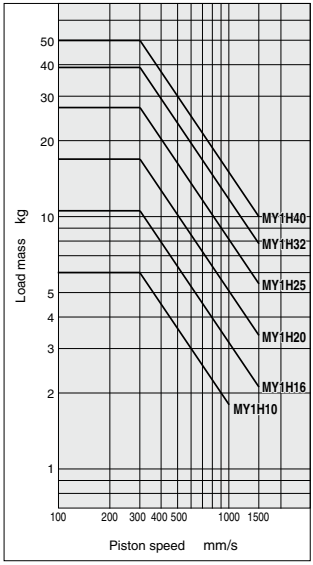
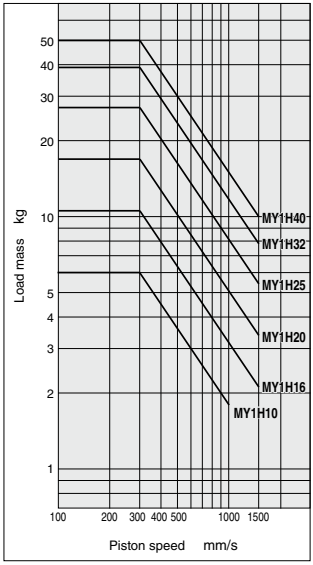
MY1H/m2



MY1H/m3



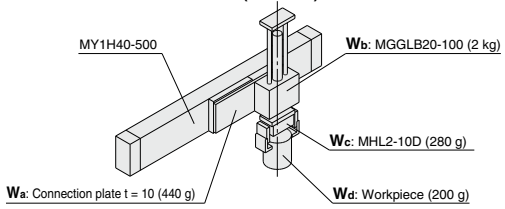
MY1H Series
Model Selection

Following are the steps for selecting the most suitable MY1H series to your application.

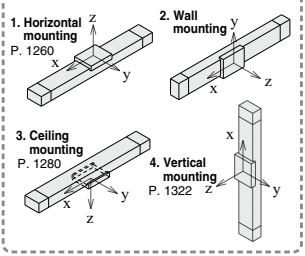
Calculation of Guide Load Factor

1. Operating Conditions

Operating cylinder ····· MY1H20-500
Average operating speed υa ··· 300 mm/s
Mounting orientation ····· Wall mounting
Cushion ····· Air cushion (δ = 1/100)

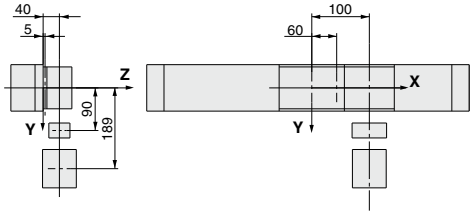


Mounting Orientation



For actual examples of calculation for each orientation, refer to the pages above.

2. Load Blocking



Mass and Center of Gravity for Each Workpiece

Workpiece no. **Wn**	Mass **mn**	Center of gravity		
		X-axis **Xn**	Y-axis **Yn**	Z-axis **Zn**
Wa	0.44 kg	60 mm	0 mm	5 mm
Wb	2.0 kg	100 mm	0 mm	40 mm
Wc	0.280 kg	100 mm	90 mm	40 mm
Wd	0.2 kg	100 mm	189 mm	40 mm

n=a, b, c, d

3. Composite Center of Gravity Calculation

$\mathbf{m_3} = \Sigma m_n$
$= 0.44 + 2.0 + 0.280 + 0.2 = \mathbf{2.92\ kg}$

$\mathbf{X} = \frac{1}{\mathbf{m_3}} \times \Sigma (\mathbf{m_n} \times \mathbf{x_n})$
$= \frac{1}{2.95} (0.44 \times 60 + 2.0 \times 100 + 0.280 \times 100 + 0.2 \times 100) = \mathbf{94.0\ mm}$

$\mathbf{Y} = \frac{1}{\mathbf{m_3}} \times \Sigma (\mathbf{m_n} \times \mathbf{y_n})$
$= \frac{1}{2.95} (0.44 \times 0 + 2.0 \times 0 + 0.280 \times 90 + 0.2 \times 189) = \mathbf{21.6\ mm}$

$\mathbf{Z} = \frac{1}{\mathbf{m_3}} \times \Sigma (\mathbf{m_n} \times \mathbf{z_n})$
$= \frac{1}{2.95} (0.44 \times 5 + 2.0 \times 40 + 0.280 \times 40 + 0.2 \times 40) = \mathbf{34.8\ mm}$

4. Calculation of Load Factor for Static Load

m_3: Mass

m_3 max (from (1) of graph MY1H/**m_3**) = 17.6 (kg)·····

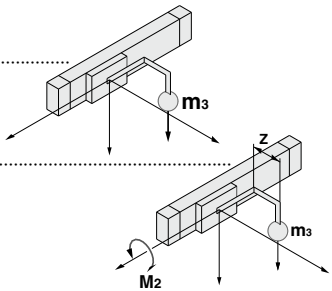
Load factor α_1 = **m_3**/**m_3 max** = 2.92/17.6 = **0.17**

M_2: Moment

m_2 max (from (2) of graph MY1H/**M_2**) = 16.0 (N·m)·····

M_2 = **m_3** x **g** x **Z** = 2.92 x 9.8 x 34.8 x 10^{-3} = 1.00 (N·m)

Load factor α_2 = **M_2**/**M_2 max** = 1.00/16.0 = **0.07**

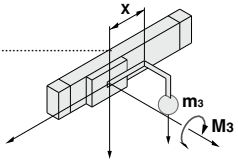


M_3: Moment

M_3 max (from (3) of graph MY1H/**M_3**) = 11.0 (N·m)

M_3 = **m_3** x **g** x **X** = 2.92 x 9.8 x 94.0 x 10^{-3} = 2.69 (N·m)

Load factor α_3 = **M_3/M_3 max** = 2.69/11.0 = **0.25**



5. Calculation of Load Factor for Dynamic Moment

Equivalent load F_E at impact

$F_E = 1.4\upsilon a \times \delta \times m \times g = 1.4 \times 300 \times \frac{1}{100} \times 2.92 \times 9.8 = 120.2$ (N)

M_{1E}: Moment

M_{1E} max (from (4) of graph MY1H/**M_1** where 1.4υa = 420 mm/s) = 7.9 (N·m)

$M_{1E} = \frac{1}{3} \times F_E \times Z = \frac{1}{3} \times 120.2 \times 34.8 \times 10^{-3} = 1.40$ (N·m)

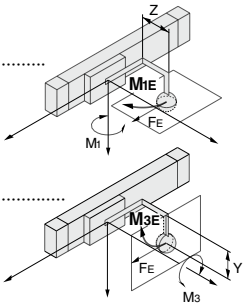
Load factor α_4 = **M_{1E}/M_{1E} max** = 1.40/7.9 = **0.18**

M_{3E}: Moment

M_{3E} max (from (5) of graph MY1H/**M_3** where 1.4υa = 420 mm/s) = 7.9 (N·m)

$M_{3E} = \frac{1}{3} \times F_E \times Y = \frac{1}{3} \times 120.2 \times 21.6 \times 10^{-3} = 0.87$ (N·m)

Load factor α_5 = **M_{3E}/M_{3E} max** = 0.87/7.9 = **0.12**



6. Sum and Examination of Guide Load Factors

$\Sigma\alpha = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4 + \alpha_5$ = **0.79 ≤ 1**

The above calculation is within the allowable value, and therefore the selected model can be used.
Select a shock absorber separately.
In an actual calculation, when the total sum of guide load factors $\Sigma\alpha$ in the formula above is more than 1, consider either decreasing the speed, increasing the bore size, or changing the product series.
This calculation can be easily made using the "SMC Pneumatics CAD System".

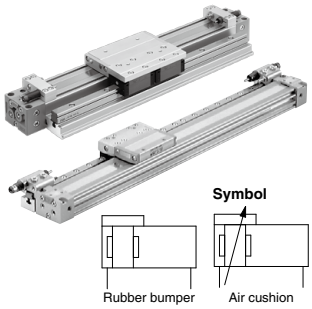
*1 Water resistant type auto switches can be mounted on the above models, but in such case SMC cannot guarantee water resistance. Consult with SMC regarding water resistant types with the above model numbers.
*2 For details on switch mounting brackets and part numbers, refer to "Switch Mounting Bracket: Part No." on page 1333-1.
*3 1 m type lead wire is only applicable to D-A93.

- Lead wire length symbols: 0.5 m ····· Nil (Example) M9NW
  1 m ····· M (Example) M9NWM
  3 m ····· L (Example) M9NWL
  5 m ····· Z (Example) M9NWZ
- Solid state auto switches marked with "○" are produced upon receipt of order.
- There are other applicable auto switches than listed above. For details, refer to page 1333-1.
- Auto switches are shipped together (not assembled). (Refer to page 1331 for the details of auto switch mounting.)



Specifications

Bore size (mm)		10	16	20	25	32	40
Fluid		Air					
Action		Double acting					
Operating pressure range		0.2 to 0.8 MPa	0.15 to 0.8 MPa		0.1 to 0.8 MPa		
Proof pressure		1.2 MPa					
Ambient and fluid temperatures		5 to 60°C					
Cushion		Rubber bumper	Air cushion				
Lubrication		Non-lube					
Stroke length tolerance		+1.8 0					
Piping port size	**Front/Side port**	M5 x 0.8			1/8		1/4
	Bottom port		ø4		ø6		ø8

Piston Speed

Bore size (mm)		10	16 to 40
Without stroke adjustment unit		100 to 500 mm/s	100 to 1000 mm/s
Stroke adjustment unit	**A unit**		100 to 1000 mm/s (1)
	L unit and H unit	100 to 1000 mm/s	100 to 1500 mm/s (2)

Note 1) Be aware that when the stroke adjustment range is increased by manipulating the adjustment bolt, the air cushion capacity decreases. Also, when exceeding the air cushion stroke ranges on page 1306, **the piston speed should be 100 to 200 mm per second.**
Note 2) The piston speed is 100 to 1000 mm/s for centralized piping.
Note 3) Use at a speed within the absorption capacity range. Refer to page 1306.

Made to Order

Made to Order: Individual Specifications
(For details, refer to page 1334.)

Symbol	Specifications
-X168	Helical insert thread specifications
-X1810	Magnet for ø10 solid state auto switch specifications

Made to Order Specifications

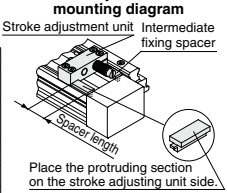
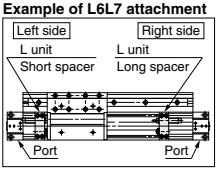
* Intermediate fixing spacer is not available for end lock mounting side.
* Spacers are used to fix the stroke adjustment unit at an intermediate stroke position.
For details on spacers and stroke adjustment units, refer to "Accessory Bracket (Option)" on page 1315.

Stroke adjustment unit mounting diagram



Example of L6L7 attachment



Refer to pages 1331 to 1333-1 for the specifications with auto switch.

Shock Absorbers for L and H Units

Type	Stroke adjustment unit	Bore size (mm)					
		10	16	20	25	32	40
Standard (Shock absorber/ RB series)	L	—	RB0806		RB1007	RB1412	
	H	RB0805	—	RB1007	RB1412	RB2015	
Shock absorber/soft type RJ series mounted (-XB22)	L	—	RJ0806H		RJ1007H	RJ1412H	
	H	RJ0805	—	RJ1007H	RJ1412H	—	—

∗ The shock absorber service life is different from that of the MY1H cylinder depending on operating conditions. Refer to the RB Series Specific Product Precautions for the replacement period.

∗ Mounted shock absorber soft type RJ series (-XB22) is made to order specifications. For details, refer to page 1752.

Shock Absorber Specifications

Model		RB 0805	RB 0806	RB 1007	RB 1412	RB 2015
Max. energy absorption (J)		1.0	2.9	5.9	19.6	58.8
Stroke absorption (mm)		5	6	7	12	15
Max. collision speed (mm/s)		1000	1500	1500	1500	1500
Max. operating frequency (cycle/min)		80	80	70	45	25
Spring force (N)	Extended	1.96	1.96	4.22	6.86	8.34
	Retracted	3.83	4.22	6.86	15.98	20.50
Operating temperature range (°C)		5 to 60				

∗ The shock absorber service life is different from that of the MY1H cylinder depending on operating conditions. Refer to the RB Series Specific Product Precautions for the replacement period.

Theoretical Output

(N)

Bore size (mm)	Piston area (mm^2)	Operating pressure (MPa)						
		0.2	0.3	0.4	0.5	0.6	0.7	0.8
10	78	15	23	31	39	46	54	62
16	200	40	60	80	100	120	140	160
20	314	62	94	125	157	188	219	251
25	490	98	147	196	245	294	343	392
32	804	161	241	322	402	483	563	643
40	1256	251	377	502	628	754	879	1005

Note) Theoretical output (N) = Pressure (MPa) x Piston area (mm^2)

Weight

(kg)

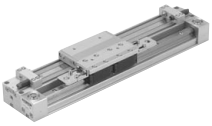
Bore size (mm)	Basic weight	Additional weight per each 50 mm of stroke	Weight of moving parts	Side support bracket weight (per set)	Stroke adjustment unit weight (per unit)		
				Type A and B	A unit weight	L unit weight	H unit weight
10	0.26	0.08	0.05	0.003	—	—	0.02
16	0.74	0.14	0.19	0.01	0.02	0.04	—
20	1.35	0.25	0.40	0.02	0.03	0.05	0.07
25	2.17	0.30	0.73	0.02	0.04	0.07	0.11
32	4.37	0.46	1.30	0.04	0.08	0.14	0.23
40	5.84	0.55	1.89	0.08	0.12	0.19	0.28

Calculation: (Example) **MY1H20-300A**

- Basic weight····· 1.35 kg
- Cylinder stroke····· 300 stroke
- Additional weight····· 0.25/50 stroke

  1.35 + 0.25 x 300/50 + 0.03 x 2 ≅ 2.19 kg
- Weight of A unit····· 0.03 kg

With End Locks



Specifications

Bore size (mm)	16	20	25	32	40
Lock position	One end (Selectable), Both ends				
Holding force (Max.) (N)	110	170	270	450	700
Fine stroke adjustment range (mm)	0 to –5.6	0 to –6	0 to –11.5	0 to –12	0 to –16
Backlash	1 mm or less				
Manual release	Possible (Non-lock type)				

⚠ Precautions

For details on the MY1H Series Mechanically Jointed Rodless Cylinder, refer to "Specific Product Precautions" on pages 1335 to 1336-3.

Cushion Capacity

Cushion Selection

<Rubber bumper>
Rubber bumpers are a standard feature on MY1H10.
Since the stroke absorption of rubber bumpers is short, when adjusting the stroke with an A unit, install an external shock absorber.
The load and speed range which can be absorbed by a rubber bumper is inside the rubber bumper limit line of the graph.
<Air cushion>
Air cushions are a standard feature on mechanically jointed rodless cylinders.
The air cushion mechanism is incorporated to prevent excessive impact of the piston at the stroke end during high speed operation. The purpose of air cushion, thus, is not to decelerate the piston near the stroke end.
The ranges of load and speed that air cushions can absorb are within the air cushion limit lines shown in the graphs.
<Stroke adjustment unit with shock absorber>
Use this unit when operating with a load or speed exceeding the air cushion limit line, or when cushioning is required outside of the effective air cushion stroke range due to stroke adjustment.
L unit
Use this unit when the cylinder stroke is outside of the effective air cushion range even if the load and speed are within the air cushion limit line, or when the cylinder is operated in a load and speed range above the air cushion limit line or below the L unit limit line.
H unit
Use this unit when the cylinder is operated in a load and speed range above the L unit limit line and below the H unit limit line.

∗ For details on stroke adjustment using the adjustment bolt, refer to page 1336.

Air Cushion Stroke (mm)

Bore size (mm)	Cushion stroke
16	12
20	15
25	15
32	19
40	24

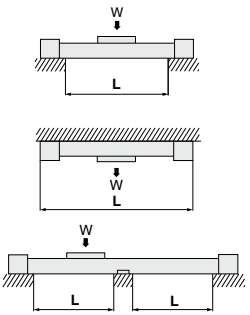
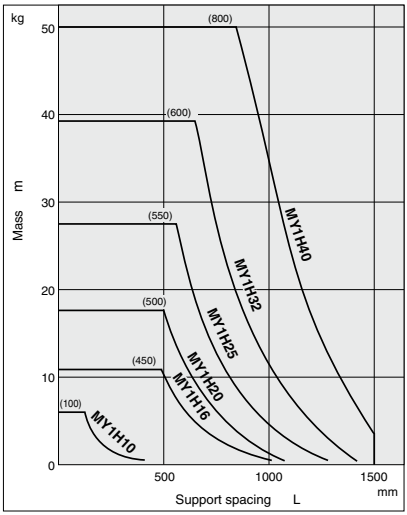
∗ A set of side supports consists of a left support and a right support.

Guide for Side Support Application

For long stroke operation, the cylinder tube may be deflected depending on its own weight and the load mass. In such a case, use a side support in the middle section. The spacing (L) of the support must be no more than the values shown in the graph on the right.





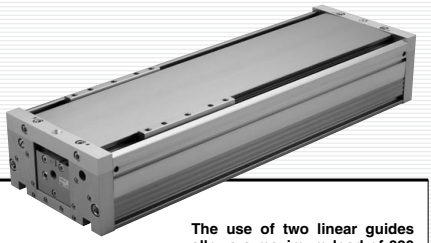
⚠ Caution

1. If the cylinder mounting surfaces are not measured accurately, using a side support may cause poor operation. Therefore, be sure to level the cylinder tube when mounting. Also, for long stroke operation involving vibration and impact, use of a side support is recommended even if the spacing value is within the allowable limits shown in the graph.
2. Support brackets are not for mounting; use them solely for providing support.

MY1HT Series

High Rigidity/Linear Guide Type

ø50, ø63



The use of two linear guides allows a maximum load of 320 kg. (ø63)

Rodless cylinder
MY1BH

Maximum Allowable Moment/Maximum Load Mass

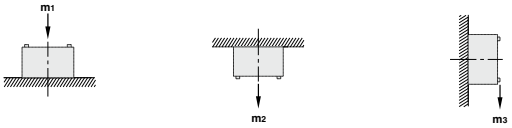
Model	Bore size (mm)	Maximum allowable moment (N·m)			Maximum load mass (kg)		
		M_1	M_2	M_3	m_1	m_2	m_3
MY1HT	**50**	140	180	140	200	140	200
	63	240	300	240	320	220	320

The above values are the maximum allowable values for moment and load. Refer to each graph regarding the maximum allowable moment and maximum allowable load for a particular piston speed.

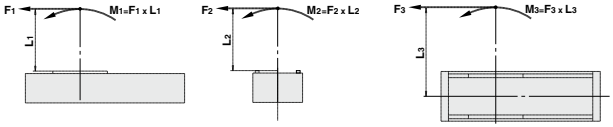
Maximum Allowable Moment

Select the moment from within the range of operating limits shown in the graphs. Note that the maximum allowable load value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable load for the selected conditions.

Load mass (kg)



Moment (N·m)



<Calculation of guide load factor>

1. Maximum allowable load (1), static moment (2), and dynamic moment (3) (at the time of impact with stopper) must be examined for the selection calculations.
∗ To evaluate, use υa (average speed) for (1) and (2), and υ (collision speed $\upsilon = 1.4\upsilon a$) for (3). Calculate mmax for (1) from the maximum allowable load graph (m_1, m_2, m_3) and Mmax for (2) and (3) from the maximum allowable moment graph (M_1, M_2, M_3).

Sum of guide load factors

$$\Sigma\alpha = \frac{\text{Load mass [m]}}{\text{Maximum allowable load [m max]}} + \frac{\text{Static moment [M]}\ ^{(1)}}{\text{Allowable static moment [Mmax]}} + \frac{\text{Dynamic moment [M}_E\text{]}\ ^{(2)}}{\text{Allowable dynamic moment [M}_E\text{max]}} \leq 1$$

Note 1) Moment caused by the load, etc., with cylinder in resting condition.
Note 2) Moment caused by the impact load equivalent at the stroke end (at the time of impact with stopper).
Note 3) Depending on the shape of the workpiece, multiple moments may occur. When this happens, the sum of the load factors ($\Sigma\alpha$) is the total of all such moments.

2. Reference formula [Dynamic moment at impact]
Use the following formulae to calculate dynamic moment when taking stopper impact into consideration.

m: Load mass (kg)
F: Load (N)
F_E: Load equivalent to impact (at impact with stopper) (N)
υa: Average speed (mm/s)
M: Static moment (N·m)

$\upsilon = 1.4\upsilon a$ (mm/s) $F_E = 1.4\upsilon a \cdot \delta \cdot m \cdot g$ (Note 4)

$\therefore M_E = \frac{1}{3} \cdot F_E \cdot L_1 = 4.57\upsilon a \delta m L_1$ (Note 5)

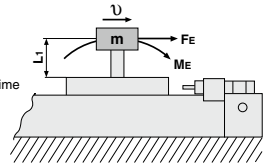
υ: Collision speed (mm/s)
L_1: Distance to the load's center of gravity (m)
M_E: Dynamic moment (N·m)
δ: Damper coefficient
With rubber bumper = 4/100
(MY1B10, MY1H10)
With air cushion = 1/100
With shock absorber = 1/100
g: Gravitational acceleration (9.8 m/s²)

Note 4) $1.4\upsilon a\delta$ is a dimensionless coefficient for calculating impact force.
Note 5) Average load coefficient ($= \frac{1}{3}$): This coefficient is for averaging the maximum load moment at the time of stopper impact according to service life calculations.

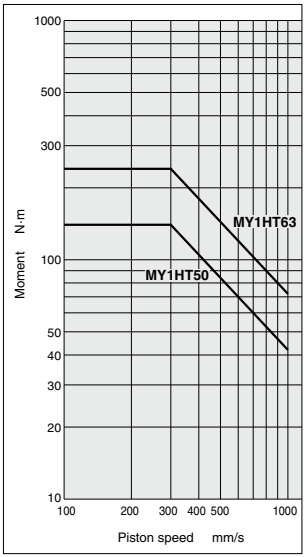
3. For detailed selection procedures, refer to pages 1322 and 1323.

Maximum Load Mass

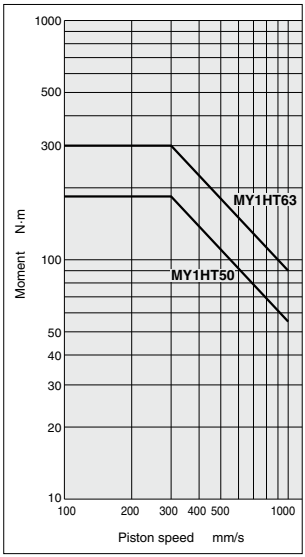
Select the load from within the range of limits shown in the graphs. Note that the maximum allowable moment value may sometimes be exceeded even within the operating limits shown in the graphs. Therefore, also check the allowable moment for the selected conditions.



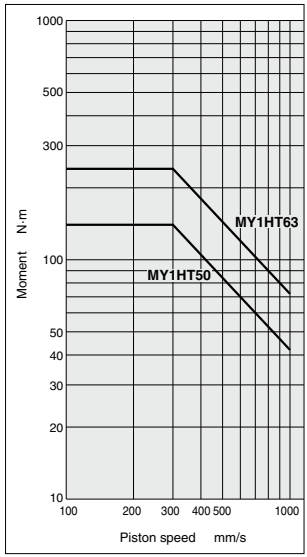
MY1HT/M_1



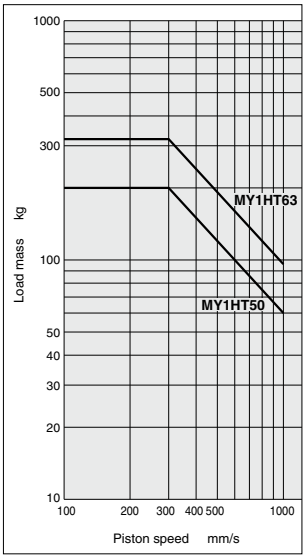
MY1HT/M_2



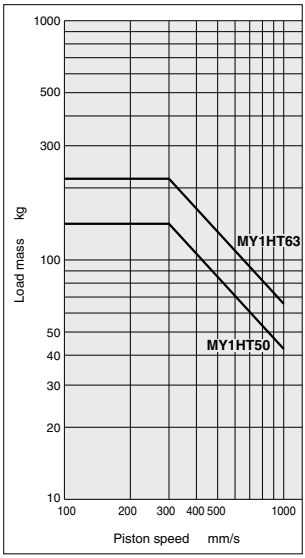
MY1HT/M_3



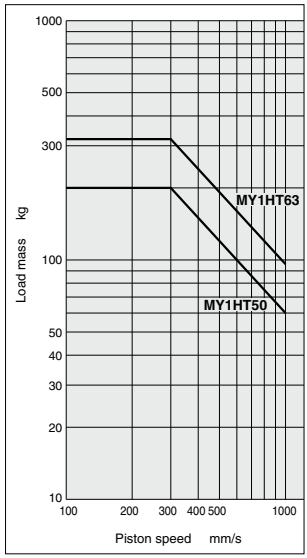
MY1HT/m_1



MY1HT/m_2



MY1HT/m_3



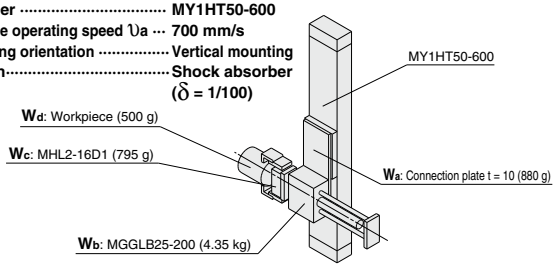
MY1HT Series
Model Selection

Following are the steps for selecting the most suitable MY1HT series to your application.

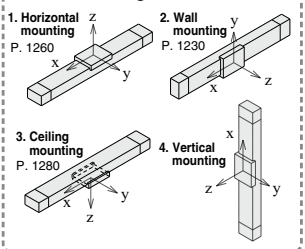
Calculation of Guide Load Factor

1. Operating Conditions

Cylinder **MY1HT50-600**
Average operating speed υ**a** ··· **700 mm/s**
Mounting orientation ..... **Vertical mounting**
Cusion..... **Shock absorber (δ = 1/100)**

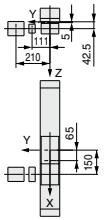


Mounting Orientation



For actual examples of calculation for each orientation, refer to the pages above.

2. Load Blocking



Mass and Center of Gravity for Each Workpiece

Workpiece no. **Wn**	Mass **mn**	Center of gravity		
		X-axis **Xn**	Y-axis **Yn**	Z-axis **Zn**
Wa	0.88 kg	65 mm	0 mm	5 mm
Wb	4.35 kg	150 mm	0 mm	42.5 mm
Wc	0.795 kg	150 mm	111 mm	42.5 mm
Wd	0.5 kg	150 mm	210 mm	42.5 mm

n=a, b, c, d

3. Composite Center of Gravity Calculation

$\mathbf{m_4} = \Sigma \mathbf{m_n}$
$= 0.88 + 4.35 + 0.795 + 0.5 = \mathbf{6.525\ kg}$

$\mathbf{X} = \frac{1}{\mathbf{m_4}} \times \Sigma\ (\mathbf{m_n} \times \mathbf{x_n})$
$= \frac{1}{6.525}\ (0.88 \times 65 + 4.35 \times 150 + 0.795 \times 150 + 0.5 \times 150) = \mathbf{138.5\ mm}$

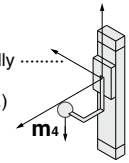
$\mathbf{Y} = \frac{1}{\mathbf{m_4}} \times \Sigma\ (\mathbf{m_n} \times \mathbf{y_n})$
$= \frac{1}{6.525}\ (0.88 \times 0 + 4.35 \times 0 + 0.795 \times 111 + 0.5 \times 210) = \mathbf{29.6\ mm}$

$\mathbf{Z} = \frac{1}{\mathbf{m_4}} \times \Sigma\ (\mathbf{m_n} \times \mathbf{z_n})$
$= \frac{1}{6.525}\ (0.88 \times 5 + 4.35 \times 42.5 + 0.795 \times 42.5 + 0.5 \times 42.5) = \mathbf{37.4\ mm}$

4. Calculation of Load Factor for Static Load

$\mathbf{m_4}$: Mass

$\mathbf{m_4}$ is the mass which can be transferred by the thrust, and as a rule, is actually about 0.3 to 0.7 of the thrust. (This differs depending on the operating speed.)

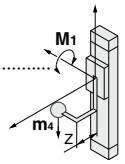


$\mathbf{M_1}$: Moment

M_1 max (from (1) of graph MY1HT/M_1) = 60 (N·m)

$\mathbf{M_1} = \mathbf{m_4} \times \mathbf{g} \times \mathbf{Z} = 6.525 \times 9.8 \times 37.4 \times 10^{-3} = 2.39$ (N·m)

Load factor α_1 = $\mathbf{M_2/M_2}$ **max** = 2.39/60 = **0.04**

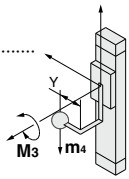


M_3 : Moment

M_3 max (from (2) of graph MY1HT/**M_3**) = 60 (N·m) ·····

M_3 = **m_4** x **g** x **Y** = 6.525 x 9.8 x 29.6 x 10^{-3} = 1.89 (N·m)

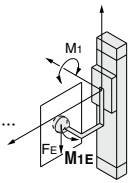
Load factor α_2 = **M_3/M_3 max** = 1.89/60 = **0.03**



5. Calculation of Load Factor for Dynamic Moment

Equivalent load F_E at impact

F_E = **1.4**υ**a** x δ x **m** x **g** = 1.4 x 700 x $\frac{1}{100}$ x 6.525 x 9.8 = 626.7 (N)



M_{1E} : Moment

M_{1E} max (from (3) of graph MY1HT/**M_1** where 1.4υa = 980 mm/s) = 42.9 (N·m) ·····

M_{1E} = $\frac{1}{3}$ x **F_E** x **Z** = $\frac{1}{3}$ x 626.7 x 37.4 x 10^{-3} = 7.82 (N·m)

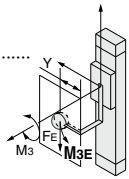
Load factor α_3 = **M_{1E}/M_{1E} max** = 7.82/42.9 = **0.18**

M_{3E} : Moment

M_{3E} max (from (4) of graph MY1HT/**M_3** where 1.4υa = 980 mm/s) = 42.9 (N·m)·····

M_{3E} = $\frac{1}{3}$ x **F_E** x **Y** = $\frac{1}{3}$ x 626.7 x 29.6 x 10^{-3} = 6.19 (N·m)

Load factor α_4 = **M_{3E}/M_{3E} max** = 6.19/42.9 = **0.14**



6. Sum and Examination of Guide Load Factors

$\sum\alpha = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4$ = **0.39** ≤ **1**

The above calculation is within the allowable value, and therefore the selected model can be used.

Select a shock absorber separately.

In an actual calculation, when the total sum of guide load factors $\sum\alpha$ in the formula above is more than 1, consider either decreasing the speed, increasing the bore size, or changing the product series.

This calculation can be easily made using the "SMC Pneumatics CAD System".

∗1 Water resistant type auto switches can be mounted on the above models, but in such case SMC cannot guarantee water resistance. Consult with SMC regarding water resistant types with the above model numbers.

∗2 For details on switch mounting brackets and part numbers, refer to "Switch Mounting Bracket: Part No." on page 1333-1.

∗ Lead wire length symbols: 0.5 m ····· Nil (Example) Y7BW
3 m ····· L (Example) Y7BWL
5 m ····· Z Example) Y7BWZ

∗ Solid state auto switches marked with "○" are produced upon receipt of order.

∗ Separate switch spacers (BMP1-032) are required for retrofitting of auto switches.

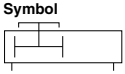
∗ There are other applicable auto switches than listed above. For details, refer to page 1333-1.

∗ Auto switches are shipped together (not assembled). (For details about auto switch mounting, etc., refer to page 1332.)

SMC

Specifications

Symbol



Bore size (mm)		50	63
Fluid		Air	
Action		Double acting	
Operating pressure range		0.1 to 0.8 MPa	
Proof pressure		1.2 MPa	
Ambient and fluid temperature		5 to 60°C	
Piston speed		100 to 1000 mm/s	
Cushion		Shock absorbers on both ends (Standard)	
Lubrication		Non-lube	
Stroke length tolerance		2700 or less $^{+1.8}_{0}$, 2701 to 5000 $^{+2.8}_{0}$	
Port size	**Side port**	3/8	

Note) Use at a speed within the absorption capacity range. Refer to page 1326.

Stroke Adjustment Unit Specifications

Applicable bore size (mm)	50		63	
Unit symbol, contents	L	H	L	H
	RB2015 and adjustment bolt: 1 set each	RB2015 and adjustment bolt: 2 sets each	RB2725 and adjustment bolt: 1 set each	RB2725 and adjustment bolt: 2 sets each
Fine stroke adjustment range (mm)	0 to –20		0 to –25	
Stroke adjustment range	For adjustment method, refer to page 1337.			

∗ Stroke adjustment range is applicable for one side when mounted on a cylinder.

Shock absorber model		**RB2015** x 1 pc.	**RB2015** x 2 pcs.	**RB2725** x 1 pc.	**RB2725** x 2 pcs.
Maximum energy absorption (J)		58.8	88.2 Note)	147	220.5 Note)
Stroke absorption (mm)		15	15	25	25
Maximum collision speed (mm/s)		1000		1000	
Maximum operating frequency (cycle/min)		25	25	10	10
Spring force (N)	**Extended**	8.34	16.68	8.83	17.66
	Retracted	20.50	41.00	20.01	40.02
Operating temperature range (°C)		5 to 60			

Note) Maximum energy absorption for 2 pcs. is calculated by multiplying the value for 1 pc. by 1.5.
∗ The shock absorber service life is different from that of the MY1HT cylinder depending on operating conditions. Refer to the RB Series Specific Product Precautions for the replacement period.

Theoretical Output

(N)

Bore size (mm)	Piston area (mm²)	Operating pressure (MPa)						
		0.2	0.3	0.4	0.5	0.6	0.7	0.8
50	1962	392	588	784	981	1177	1373	1569
63	3115	623	934	1246	1557	1869	2180	2492

Note) Theoretical output (N) = Pressure (MPa) x Piston area (mm²)

∗ Add "-XB10" to the end of the part number for intermediate strokes. MY1HT50-500L-Y7BW-XB10

Weight

(kg)

Bore size (mm)	Basic weight	Additional weight per each 25 mm of stroke	Weight of moving parts	Side support weight (per set)	Stroke adjustment unit weight		
				Type A and B	L unit weight	LH unit weight	H unit weight
50	30.62	0.87	5.80	0.17	0.62	0.93	1.24
63	41.69	1.13	8.10	0.17	1.08	1.62	2.16

Calculation: (Example) **MY1HT50-400L**
• Basic weight ·····30.62 kg
• Additional weight ····0.87/25 st
• L unit weight ·····0.62 kg
• Cylinder stroke····· 400 st
30.62 + 0.87 x 400 ÷ 25 + 0.62 x 2 ≅ 45.8

Refer to pages 1331 to 1333-1 for the specifications with auto switch.

Cushion Capacity

Cushion Selection

<Stroke adjustment unit with built-in shock absorber>

L unit

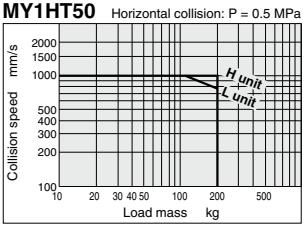
Use this unit when the cylinder stroke is outside of the effective air cushion range even if the load and speed are within the air cushion limit line, or when the cylinder is operated in a load and speed range above the air cushion limit line or below the L unit limit line.

H unit

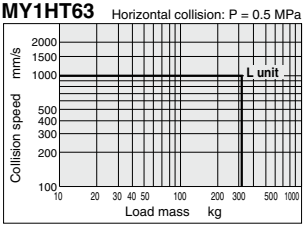
Use this unit when the cylinder is operated in a load and speed range above the L unit limit line and below the H unit limit line.

Stroke Adjustment Unit Absorption Capacity

MY1HT50 Horizontal collision: P = 0.5 MPa



MY1HT63 Horizontal collision: P = 0.5 MPa



⚠ Precautions

For details on the MY1HT Series Mechanically Jointed Rodless Cylinder, refer to "Specific Product Precautions" on pages 1335 to 1337.

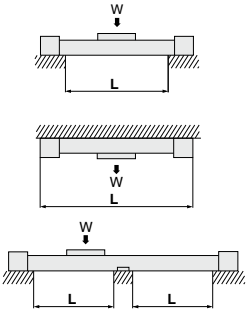
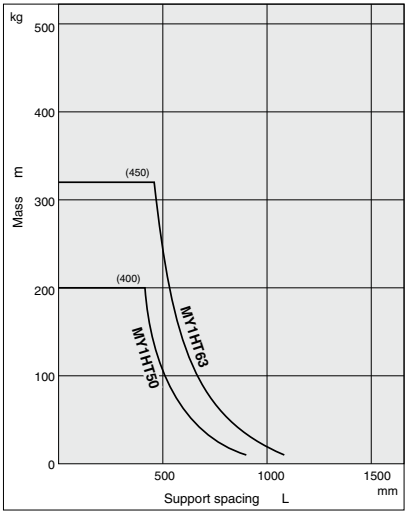
∗ A set of side supports consists of a left support and a right support.

Guide for Side Support Application

For long stroke operation, the cylinder tube may be deflected depending on its own weight and the load mass. In such a case, use a side support in the middle section. The spacing (L) of the support must be no more than the values shown in the graph on the right.





⚠ Caution

1. If the cylinder mounting surfaces are not measured accurately, using a side support may cause poor operation. Therefore, be sure to level the cylinder tube when mounting. Also, for long stroke operation involving vibration and impact, use of a side support is recommended even if the spacing value is within the allowable limits shown in the graph.
2. Support brackets are not for mounting; use them solely for providing support.

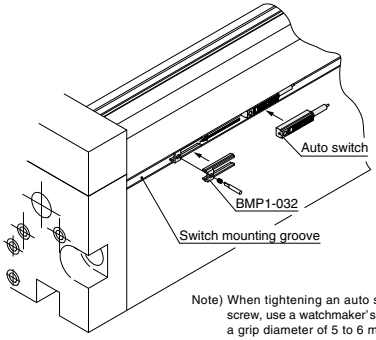
Switch Spacer No.

Cylinder series	Applicable bore size (mm)	
	50	63
MY1HT	BMP1-032	

When attaching an auto switch, first take a switch spacer between your fingers and press it into a switch mounting groove. When doing this, confirm that it is set in the correct mounting orientation, or reattach if necessary.
Next, insert an auto switch into the groove and slide it until it is positioned under the switch spacer.
After establishing the mounting position, use a watchmakers flat head screwdriver to tighten the auto switch mounting screw which is included.



Note) When tightening an auto switch mounting screw, use a watchmaker's screwdriver with a grip diameter of 5 to 6 mm. Also, tighten with a torque of about 0.05 to 0.1 N·m As a guide, it should be turned about 90° past the point at which tightening can be felt.

Besides the models listed in How to Order, the following auto switches are applicable.
For detailed specifications, refer to pages 1575 to 1701.

Type	Model	Electrical entry (Fetching direction)	Features	Applicable bore size
Solid state auto switch	D-Y69A, Y69B, Y7PV	Grommet (Perpendicular)	—	ø25 to ø100
	D-Y7NWV, Y7PWV, Y7BWV		Diagnostic indication (2-color indicator)	
	D-Y59A, Y59B, Y7P	Grommet (In-line)	—	
	D-Y7NW, Y7PW, Y7BW		Diagnostic indication (2-color indicator)	

∗ For solid state auto switches, auto switches with a pre-wired connector are also available. Refer to pages 1648 and 1649 for details.
∗ Normally closed (NC = b contact) solid state auto switches (D-F9G/F9H/Y7G/Y7H types) are also available. Refer to pages 1593 and 1595 for details.

MY1 Series
Specific Product Precautions 1

Be sure to read this before handling the products.
Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

Selection

⚠Caution

1. When using a cylinder with long strokes, implement an intermediate support.

When using a cylinder with long strokes, implement an intermediate support to prevent the tube from sagging and being deflected by vibration or an external load.

Refer to the Guide for Side Support Application on pages 1252, 1275, 1295, 1316 and 1330.

2. For intermediate stops, use a dual-side pressure control circuit.

Since the mechanically jointed rodless cylinders have a unique seal structure, slight external leakage may occur. Controlling intermediate stops with a 3 position valve cannot hold the stopping position of the slide table (slider). The speed at the restarting state also may not be controllable. Use the dual-side pressure control circuit with a PAB-connected 3 position valve for intermediate stops.

3. Constant speed.

Since the mechanically jointed rodless cylinders have a unique seal structure, a slight speed change may occur. For applications that require constant speed, select an applicable equipment for the level of demand.

4. Load factor of 0.5 or less

When the load factor is high against the cylinder output, it may adversely affect the cylinder (condensation, etc.) and cause malfunctions. Select a cylinder to make the load factor less than 0.5. (Mainly when using an external guide)

5. Cautions on less frequent operation

When the cylinder is used extremely infrequently, operation may be interrupted in order for anchoring and a change lubrication to be performed or service life may be reduced.

6. Consider uncalculated loads such as piping, cableveyor, etc., when selecting a load moment

Calculation does not include the external acting force of piping, cableveyor, etc. Select load factors taking into account the external acting force of piping, cableveyor, etc.

7. Accuracy

The mechanical jointed rodless cylinder does not guarantee traveling parallelism. When accuracy in traveling parallelism and a middle position of stroke is required, please consult SMC.

Mounting

⚠Caution

1. Do not apply strong impacts or excessive moment to the slide table (slider).

• The slide table (slider) is supported by precision bearings (MY1C, MY1H) or resin bearings. Therefore, do not apply strong impacts or excessive moment, etc., when mounting workpieces.

Mounting

⚠Caution

2. When connecting to a load which has an external guide mechanism, use a discrepancy absorption mechanism.

• Mechanically jointed rodless cylinders can be used with a direct load within the allowable range for each type of guide. Please note that careful alignment is necessary when connecting to a load having an external guide mechanism. Mount the external guide mounting brackets and floating brackets in a place where the required degree of freedom for the floating Y and Z axes can be secured.

The thrust transmission area of the floating bracket must be fixed so that it does not partially contact the body.

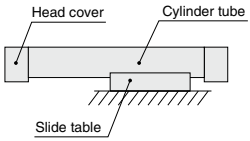
∗ Refer to the Coordinates and Moment in Model Selection on page 1229 for the details of floating Y and Z axes.

3. Do not mount cylinders as they are twisted.

When mounting, be sure for a cylinder tube not to be twisted. The flatness of the mounting surface is not appropriate, the cylinder tube is twisted, which may cause air leakage due to the detachment of a seal belt, damage a dust seal band, and cause malfunctions.

4. Do not mount a slide table on the fixed equipment surface.

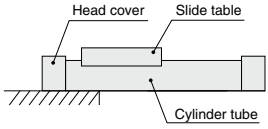
It may cause damage or malfunctions since an excessive load is applied to the bearing.



Mounting with a slide table (slider)

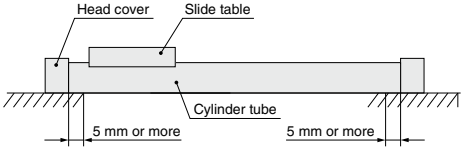
5. Consult SMC when mounting in a cantilevered way.

Since the cylinder body deflects, it may cause malfunctions. Please consult SMC when using it this way.



Mounting in a cantilevered way

6. Fixed parts of the cylinder on both ends must have at least 5 mm of contact between where the bottom of the cylinder tube and the equipment surface.



MY1 Series
Specific Product Precautions 2

Be sure to read this before handling the products.
Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

Mounting

⚠Caution

7. Do not generate negative pressure in the cylinder tube.

When the cylinder is in a non-pressurized state, such as during a test run, maintenance, etc., external or inertial force may cause negative pressure to be generated inside the cylinder. In such cases, the seal belt may come off, resulting in a temporary air leak.

• Examples:

1) When external force is used to move a slide table all at once during installation, a test run, etc.
2) When a vertically-mounted slide table carrying a load drops due to self-weight
(In either case, the smaller the speed controller's opening is set, the more likely negative pressure is to be generated.)

• For negative pressure prevention
When using external force to move a slide table, move it slowly and steadily at about 20 mm/s. (If the speed controller's opening is set extremely small, increase the opening only during manual operation.)

• If the seal belt comes off
If the seal belt comes off due to negative pressure and air is leaking, manually move the slide table from the beginning to the end of the cylinder's full stroke slowly and steadily at about 20 mm/s.
(If the speed controller's opening is set extremely small, increase the opening only during manual operation.)

If air continues to leak even after the above mentioned restoration methods have been tried, please contact your nearest sales office.

8. Do not unnecessarily alter the guide adjustment setting.

• The adjustment of the guide is preset and does not require readjustment under normal operating conditions. Therefore, do not unnecessarily alter the guide adjustment setting. However, series other than the MY1H Series can be readjusted and their bearings can be replaced.
To perform these operations, refer to the bearing replacement procedure given in the operation manual.

9. Do not get your hands caught during cylinder operation.

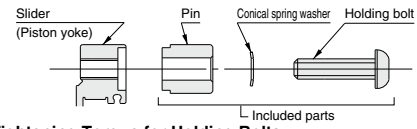
For the cylinder with a stroke adjustment unit, the space between the slide table and stroke adjustment unit is very small, and your hands may get caught. When operating without a protective cover, be careful not to get your hands caught.

10. Do not use a shock absorber together with air cushion.

11. Secure the holding bolt as shown in the diagram below.

<ø10 to ø63>

Installation of Holding Bolts

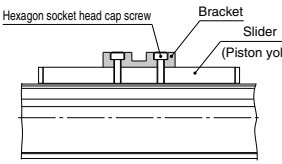


Tightening Torque for Holding Bolts (N·m)

Part no.	Tightening torque	Part no.	Tightening torque	Part no.	Tightening torque
MY-J10	0.6	**MY-J25**	3	**MY-J50**	5
MY-J16	1.5	**MY-J32**	5	**MY-J63**	13
MY-J20	1.5	**MY-J40**	5		

<ø80 to ø100>

Installation of Hexagon Socket Head Cap Screw

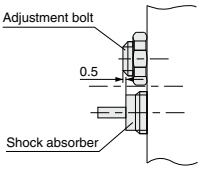


Hexagon Socket Head Cap Screw Tightening Torque (N·m)

Part no.	Tightening torque
MY-J 80	25
MY-J100	44

12. Refer to the figure below when using the adjustment bolt to perform stroke adjustment.

When the effective stroke of the shock absorber decreases as a result of stroke adjustment, the absorption capacity decreases dramatically. Secure the adjustment bolt at the position where it protrudes approximately 0.5 mm from the shock absorber.



MY1 Series
Specific Product Precautions 3

Be sure to read this before handling the products.
Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

Mounting

⚠Caution

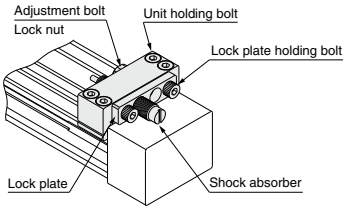
13. Tightening Torque for Stroke Adjustment Unit (Lock Plate) Holding Bolts

Use caution not to get your hands caught in the unit.

When using a product with stroke adjustment unit, the space between the slide table (slider) and the stroke adjustment unit becomes narrow at the stroke end, causing a danger of hands getting caught. Install a protective cover to prevent direct contact with the human body.

<Fastening of unit>

The unit can be secured by evenly tightening the four unit holding bolts.



Caution

Do not operate with the stroke adjustment unit fixed in an intermediate position.

When the stroke adjustment unit is fix in an intermediate position, slippage can occur depending on the amount of energy released at the time of an impact. In such cases, as a stroke adjustment unit with the spacer for intermediate securing is available, it is recommended to use it.

(MY1B: Excludes ø10)

For other lengths, please consult with SMC (Refer to "Tightening Torque for Stroke Adjustment Unit Holding Bolts".)

<Stroke adjustment with adjustment bolt>

Loosen the adjustment bolt lock nut, and adjust the stroke from the lock plate side using a hexagon wrench. Retighten the lock nut.

<Stroke adjustment with shock absorber>

Loosen the two lock plate holding bolts, turn the shock absorber and adjust the stroke. Then, uniformly tighten the lock plate holding bolts to secure the shock absorber.

Take care not to over-tighten the holding bolts. (MY1B: Excludes ø10, ø20 L unit, MY1M/C: Excludes ø16, ø20, ø50, and ø63)

(Refer to "Tightening Torgue for Stroke Adjustment Unit Lock Plate Holding Bolts".)

Note) Although the lock plate may slightly bend due to tightening of the lock plate holding bolt, this does not a affect the shock absorber and locking function.

MY1 Series
Specific Product Precautions 4

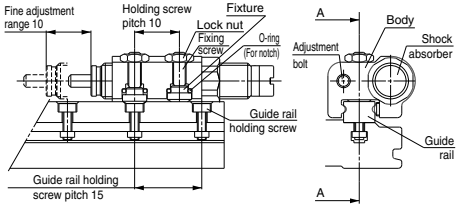
Be sure to read this before handling the products.
Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

Mounting

⚠Caution

<MY1H>

To adjust the stroke adjustment unit of the MY1H10, follow the step shown below.



Section A-A

Adjusting Procedure

1. Loosen the two lock nuts, and then loosen the holding screws by turning them approximately two turns.
2. Move the body to the notch just before the desired stroke. (The notches are found in alternating increments of 5 mm and 10 mm.)
3. Tighten the holding screw to 0.3 N·m. Make sure that the tightening does not cause excessive torque.
   The fixture fits into the fastening hole in the guide rail to prevent slippage, which enables fastening with low torque.
4. Tighten the lock nut to 0.6 N·m.
5. Make fine adjustments with the adjustment bolt and shock absorber.

Tightening Torque for Stroke Adjustment Unit Holding Bolts (N·m)

Bore size (mm)	Tightening torque
10	Refer to "Adjusting Procedure" above.
16	0.7
20	1.8
25	1.8
32	3.5
40	5.8

14. Use the formula below to calculate the absorbed energy of the stroke adjustment unit with shock absorber.

(N·m)

Type of impact	Horizontal collision	Vertical (Downward)	Vertical (Upward)
			Kinetic energy **E₁**	$\frac{1}{2}m\cdot\upsilon^2$		
Thrust energy **E₂**	**F·s**	**F·s + m·g·s**	**F·s – m·g·s**
Absorbed energy **E**	**E₁ + E₂**		

Symbol
υ: Speed of impact object (m/s)
F: Cylinder thrust (N)
s: Shock absorber stroke (m)
m: Mass of impact object (kg)
g: Gravitational acceleration (9.8 m/s²)

Note) The speed of the impact object is measured at the time of impact with the shock absorber.

Operating Environment

⚠Warning

1. Do not use in an environment where the cylinder is exposed to coolant, cutting oil, water drops, adhesive foreign particles, dust, etc. and avoid use with compressed air containing drainage and foreign particles.

• Foreign matter or liquids on the cylinder's interior or exterior can wash out the lubricating grease, which can lead to deterioration and damage of dust seal band and seal materials, causing a danger of malfunction.

When operating in locations with exposure to water and oil, or in dusty locations, provide protection such as a cover to prevent direct contact with the cylinder, or mount so that the dust seal band surface faces downward, and operate with clean compressed air.

2. Carry out cleaning and grease application suitable for the operating environment.

Carry out cleaning regularly when using in an operating environment in which the product is likely to get dirty.

After cleaning, be sure to apply grease to the top side of the cylinder tube and the rotating part of the dust seal band. Apply grease to these parts regularly even if not after cleaning. Please consult SMC for the cleaning of the slide table (slider) interior and grease application.

3. The product is not designed for clean room usage.

If clean room usage is considered, please consult with SMC.

Service Life and Replacement Period of Shock Absorber

⚠Caution

1. Allowable operating cycle under the specifications set in this catalog is shown below.

1.2 million times RB08□□
2 million times RB10□□ to RB2725

Note) Specified service life (suitable replacement period) is the value at room temperature (20 to 25°C). The period may vary depending on the temperature and other conditions. In some cases the absorber may need to be replaced before the allowable operating cycle above.

MY1H Series
Specific Product Precautions 5

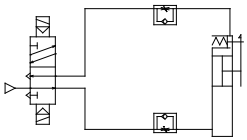
Be sure to read this before handling the products. Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

MY1H: With End Lock

Recommended Pneumatic Circuit

⚠ Caution

This is necessary for the correct locking and unlocking actions.



Operating Precautions

⚠ Caution

1. Do not use 3-position solenoid valves.

Avoid use in combination with 3-position solenoid valves (especially closed center metal seal types). If pressure is trapped in the port on the lock mechanism side, the cylinder cannot be locked.

Furthermore, even after being locked, the lock may be released after some time due to air leaking from the solenoid valve and entering the cylinder.

2. Back pressure is required when releasing the lock.

Before starting operation, be sure to control the system so that air is supplied to the side without the lock mechanism (in case of locks on both ends, the side where the slide table is not locked) as shown in the figure above. There is a possibility that the lock may not be released. (Refer to "Lock Release.")

3. Release the lock when mounting or adjusting the cylinder.

If mounting or other work is performed when the cylinder is locked, the lock unit may be damaged.

4. Operate at 50% or less of the theoretical output.

If the load exceeds 50% of the theoretical output, this may cause problems such as failure of the lock to release, or damage to the lock unit.

5. Do not operate multiple cylinders in synchronization.

Avoid applications in which two or more end lock cylinders are synchronized to move one workpiece, as one of the cylinder locks may not be able to release when required.

6. Use a speed controller with meter-out control.

Lock cannot be released occasionally by meter-in control.

7. Be sure to operate completely to the cylinder stroke end on the side with the lock.

If the cylinder piston does not reach the end of the stroke, locking and unlocking may not be possible. (Refer to "End Lock Mechanism Adjustment.")

Operating Pressure

⚠ Caution

1. Supply air pressure of 0.15 MPa or higher to the port on the side that has the lock mechanism, as it is necessary for disengaging the lock.

Exhaust Speed

⚠ Caution

1. Locking will occur automatically if the pressure applied to the port on the lock mechanism side falls to 0.05 MPa or less. In the cases where the piping on the lock mechanism side is long and thin, or the speed controller is separated at some distance from the cylinder port, the exhaust speed will be reduced. Take note that some time may be required for the lock to engage. In addition, clogging of a silencer mounted on the solenoid valve exhaust port can produce the same effect.

Relation to Cushion

⚠ Caution

1. When the air cushion on the lock mechanism side is in a fully closed or nearly closed state, there is a possibility that the slide table will not reach the stroke end, in which case locking will not occur.

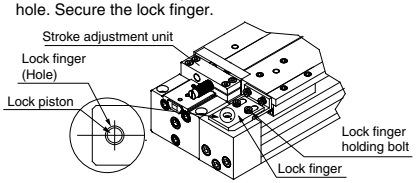
End Lock Mechanism Adjustment

⚠ Caution

1. The end lock mechanism is adjusted at the time of shipping. Therefore, adjustment for operation at the stroke end is unnecessary.

2. Adjust the end lock mechanism after the stroke adjustment unit has been adjusted. The adjustment bolt and shock absorber of the stroke adjustment unit must be adjusted and secured first. Locking and unlocking may not occur otherwise.

3. Perform fine adjustment of the end lock mechanism as follows. Loosen the lock finger holding bolts, and then adjust by aligning the center of the lock piston with the center of the lock finger hole. Secure the lock finger.



Lock Release

⚠ Warning

1. Before releasing the lock, be sure to supply air to the side without the lock mechanism, so that there is no load applied to the lock mechanism when it is released. (Refer to "Recommended Pneumatic Circuit.") If the lock is released when the port on the side without the lock is in an exhaust state, and with a load applied to the lock unit, the lock unit may be subjected to an excessive force and be damaged.

Furthermore, sudden movement of the slide table is very dangerous.

Manual Release

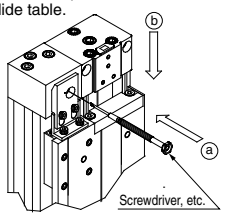
⚠ Caution

1. When manually releasing the end lock, be sure to release the pressure.

If it is unlocked while the air pressure still remains, it will lead to damage a workpiece, etc. due to unexpected lurching.

2. Perform manual release of the end lock mechanism as follows.

Push the lock piston down with a screwdriver, etc., and move the slide table.



Other handling precautions regarding mounting, piping and environment are the same as the standard series.

MY1HT Series
Specific Product Precautions 6

Be sure to read this before handling the products.
Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

MY1HT

Mounting

⚠ Caution

1. Do not put hands or fingers inside when the body is suspended.
Since the body is heavy, use eye bolts when suspending it. (The eye bolts are not included with the body.)

Stroke Adjustment Method

⚠ Caution

1. As shown in Figure (1), to adjust the stopper bolt within the adjustment range A, insert a hexagon wrench from the top to loosen the hexagon socket head set screw by approximately one turn, and then adjust the stopper bolt with a flat head screwdriver.

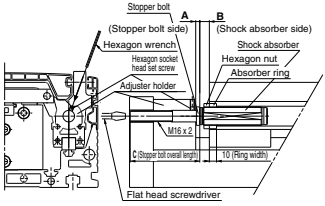


Figure (1) Stroke adjusting section detail

Stopper Bolt Holding Screw Tightening Torque

Stopper Bolt
Tightening Torque for Stroke Adjustment Unit Lock Plate Holding Bolts (N·m)

Bore size (mm)	Tightening torque
50	0.6
63	1.5

2. When the adjustment described in 1 above is insufficient, the shock absorber can be adjusted. Remove the covers as shown in Figure (2) and make further adjustment by loosening the hexagon nut.

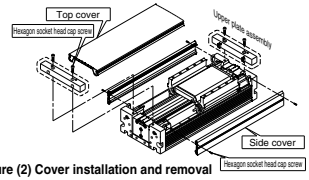

Figure (2) Cover installation and removal

3. Various dimensions are indicated in Table (1). Never make an adjustment that exceeds the dimensions in the table, as it may cause an accident and/or damage.

Table (1) (mm)

Bore size (mm)	50	63
A to AMAX	6 to 26	6 to 31
B to BMAX	14 to 54	14 to 74
C	87	102
Max. adjustment range	60	85

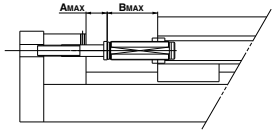

Figure (3) Maximum stroke adjustment detail

Disassembly and Assembly Procedure

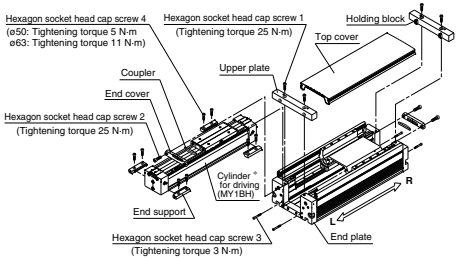
⚠ Caution

Disassembly step

1. Remove the hexagon socket head cap screws 1, and remove the upper plates.
2. Remove the top cover.
3. Remove the hexagon socket head cap screws 2, and remove the end covers and couplers.
4. Remove the hexagon socket head cap screws 3.
5. Remove the hexagon socket head cap screws 4, and remove the end supports.
6. Remove the cylinder.

Assembly step

1. Insert the MY1BH cylinder.
2. Temporarily fasten the end supports with the hexagon socket head cap screws 4.
3. With two hexagon socket head cap screws 3 on the L or R side, pull the end support and the cylinder.
4. Tighten the hexagon socket head cap screws 3 on the other side to eliminate the looseness in the axial direction. (At this point, a space is created between the end support and the end plate on one side, but this is not a problem.)
5. Re-tighten the hexagon socket head cap screws 4.
6. Fasten the end cover with the hexagon head cap screws 2, while making sure that the coupler is in the right direction.
7. Place the top cover on the body.
8. Insert the holding blocks into the top cover and fasten the upper plates with the hexagon socket head cap screws 1.



* Cylinder For Driving (MY1BH Series)

Since the MY1BH series is a cylinder for driving for the MY1HT series, its construction is different from the MY1B series.
Do not use the MY1B series as a cylinder for driving, since it will lead to damage.

How to Order

High rigidity/Linear guide type **MY1HT 50 □ □ – 300 L – Z73 □**
